TYPE C (Analog speed meter type (without tachometer))

- If there are any non-illuminated area, replace the instrument cluster.

Warning/Indicator Light Illumination Inspection

1. Connect the M-MDS to the DLC-2.
2. After vehicle identification, select the following from the M-MDS initialization screen.

a. “Data logger”

b. “Module”

c. “IC”

3. Using “WL+IL”, verify that the warning/indicator lights in the following table are illuminated.

- If any of the warning/indicator lights are not displayed, replace the instrument cluster.

TYPE A (Digital speedometer type)

—: Not applicable

No.	Warning/Indicator lights	Name	Comment
1		Power steering malfunction indicator light	—
2	OFF	Smart city brake support (SCBS) OFF indicator light	With SCBS
3		Lights-on indicator light	—
4		Smart city brake support (SCBS) warning light (red)/indicator light (amber)	With SCBS
5	i-ELOOP	i-ELOOP indicator light (green)	With i-ELOOP
6		Door-ajar warning light	—
7		Low engine coolant temperature indicator light (blue)/high engine coolant temperature warning light (red)	—
8		Turn signal/hazard warning indicator lights	—
9	SPORT	SPORT indicator light	SKYACTIV-G 2.5
10		Headlight high-beam indicator light	—

11	OFF	DSC OFF indicator light	—
12		TCS/DSC indicator light	—
13		Cruise main indicator light (amber)/cruise set indicator light (green)	With cruise control system
14	AFS OFF	AFS OFF indicator light	With AFS
15		KEY warning light (red)/indicator light (green)	—
16	BSM OFF	BSM OFF indicator light	With BSM
17	BRAKE	Brake system warning light	—
18		Low fuel warning light	—
19		Seat belt warning light	—
20		Check fuel cap warning light	—
21	ABS	ABS warning light	—
22		Master warning light	—
23		Low washer fluid level warning light	—
24	AT	Automatic transaxle warning light	ATX
25		Charging system warning light	—
26		Lane departure warning system (LDWS) warning light (amber)/indicator light (green)	With LDWS
27		High beam control (HBC) system warning light (amber)/indicator light (green)	With HBC system
28		Engine oil pressure warning light	—
29		Wrench indicator light	—
30		Air bag/front seat belt pre-tensioner system warning light	—
31		Security indicator light	—
32		Check engine light	—
33		Tire pressure monitoring system warning light	With TPMS

TYPE B (Analog speedometer type (with tachometer))

—: Not applicable

No.	Warning/Indicator lights	Name	Comment
1		Power steering malfunction indicator light	—
2		Lights-on indicator light	—
3	i-ELOOP	i-ELOOP indicator light (green)	With i-ELOOP
4		Turn signal/hazard warning indicator lights	—
5	SPORT	SPORT indicator light	SKYACTIV-G 2.5
6		Headlight high-beam indicator light	—
7	OFF	DSC OFF indicator light	—
8		TCS/DSC indicator light	—
9		Cruise main indicator light (amber)/cruise set indicator light (green)	With cruise control system
10		KEY warning light (red)/indicator light (green)	—
11	BSM OFF	BSM OFF indicator light	With BSM
12	BRAKE	Brake system warning light	—
13		Low fuel warning light	—
14		Seat belt warning light	—

15		Check fuel cap warning light	—
16		ABS warning light	—
17		Master warning light	—
18		Low washer fluid level warning light	—
19	AT	Automatic transaxle warning light	ATX
20		Charging system warning light	—
21		Door-ajar warning light	—
22		Low engine coolant temperature indicator light (blue)/high engine coolant temperature warning light (red)	—
23		Engine oil pressure warning light	—
24		Wrench indicator light	—
25		Air bag/front seat belt pre-tensioner system warning light	—
26		Security indicator light	—
27		Check engine light	—
28		Tire pressure monitoring system warning light	With TPMS

TYPE C (Analog speedometer type (without tachometer))

—: Not applicable

No.	Warning/Indicator lights	Name	Comment
1		Power steering malfunction indicator light	—
2		Low engine coolant temperature indicator light (blue)/high engine coolant temperature warning light (red)	—
3		Headlight high-beam indicator light	—

24		Check engine light	—

25		Tire pressure monitoring system warning light	With TPMS

Alarm Inspection

1. Connect the M-MDS to the DLC-2.
2. After vehicle identification, select the following from the M-MDS initialization screen.
   a. “Data logger”
   b. “Module”
   c. “IC”
3. Using “ALARM”, verify that the buzzer sounds.
   - If the buzzer does not sound, replace the instrument cluster.

2014 - Mazda3 - Body and Accessories

INSTRUMENT CLUSTER CONFIGURATION (USING READ/WRITE FUNCTION)

NOTE:

- When performing configuration, it is necessary to read the vehicle specification information from the instrument cluster before replacing it. Connect the M-MDS to the vehicle and perform vehicle identification before removing the instrument cluster. The vehicle specification information is temporarily stored in the M-MDS.

1. Connect the M-MDS to the DLC-2.
2. After vehicle identification, select the following from the M-MDS initialization screen.
    - “Module programming”
3. Then, select the following from the screen menu.
    - “Programmable Module Installation”
    - “IC”
4. Perform the configuration following the instructions on the screen.

CAUTION:

- When the configuration is performed, CAN communication between the instrument cluster and control module connected to the CAN line is cut temporarily, and communication error DTCs may be detected. After performing the configuration, verify the DTCs for the control module connected to the CAN line and clear it if any DTC is detected.

5. Verify the DTCs for all of the control modules connected to the CAN line.
    - If any DTC is stored, clear it.
    - If the DTC is cleared, finish the procedure because the configuration has been completed normally.
    - If the DTC remains, perform troubleshooting according to the DTC.

2014 - Mazda3 - Body and Accessories

INSTRUMENT CLUSTER CONFIGURATION (USING AS-BUILT DATA)

NOTE:

- If the configuration is performed using As-Built data, the set value of the personalization function is reset to the initial value (condition when shipped from factory). Verify the set value with the customer and perform the personalization function setting after performing the configuration using As-Built data.

1. Connect the M-MDS to the DLC-2.
2. After vehicle identification, select the following from the M-MDS initialization screen.
    - “Module programming”
3. Then, select the following from the screen menu.
    - “As-Built”
    - “IC”
4. Perform As-Built following the instructions on the screen.

CAUTION:

- When the configuration is performed, CAN communication between the instrument cluster and control module connected to the CAN line is cut temporarily, and communication error DTCs may be detected. After performing the configuration, verify the DTCs for the control module connected to the CAN line and clear it if any DTC is detected.

5. Verify the DTCs for all of the control modules connected to the CAN line.
    - If any DTC is stored, clear it.
    - If the DTC is cleared, finish the procedure because the configuration has been completed normally.
    - If the DTC remains, perform troubleshooting according to the DTC.

2014 - Mazda3 - Body and Accessories

INSTRUMENT CLUSTER OPERATION RECORD

1. Connect the M-MDS to the DLC-2.
2. After vehicle identification, select the following from the M-MDS initial screen.
    - “Operational Record”
3. Then, select the following from the screen menu.
    - “Meter Warning System”
4. Display the instrument cluster operation history according to the screen instructions.

2014 - Mazda3 - Body and Accessories

ACTIVE DRIVING DISPLAY REMOVAL/INSTALLATION

CAUTION:

- Do not open/close the combiner manually. Otherwise, the combiner could be damaged or it may cause a malfunction.

Replacing Active Driving Display as Single Component

1. Disconnect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)
2. Remove the following parts:
   a. Upper column cover (See **COLUMN COVER REMOVAL/INSTALLATION**.)
   b. Meter hood (See **METER HOOD REMOVAL/INSTALLATION**.)
   c. Instrument cluster (See **INSTRUMENT CLUSTER REMOVAL/INSTALLATION**.)
3. Remove the screws.

4. While pressing the instrument cluster tabs in the direction of arrows (1) shown in the figure, pull the wiring harness in the direction of arrow (2) and disconnect the wiring harness from the instrument cluster.

5. Remove the active driving display.

6. Install in the reverse order of removal.

Replacing Combiner

1. Refer to ACTIVE DRIVING DISPLAY INSPECTION and stop the combiner at an angle of 10 degrees. (See **ACTIVE DRIVING DISPLAY INSPECTION**.)

2. Switch the ignition off.

3. Disconnect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)

4. Remove the following parts:
   a. Upper column cover (See **COLUMN COVER REMOVAL/INSTALLATION**.)
   b. Meter hood (See **METER HOOD REMOVAL/INSTALLATION**.)
   c. Instrument cluster (See **INSTRUMENT CLUSTER REMOVAL/INSTALLATION**.)
5. Remove the combiner in the following order:

1	Cover
2	Screw
3	Spring
4	Combiner (See **Combiner assembly note**.)

6. Install in the reverse order of removal.

Combiner assembly note

- For the combiner assembly, verify that the combiner shaft is within 0.5 mm or more from the end surface of the bracket.

ACTIVE DRIVING DISPLAY
BRACKET
COMBINER
0.5 mm OR MORE

2014 - Mazda3 - Body and Accessories

ACTIVE DRIVING DISPLAY INSPECTION

1. Connect the M-MDS to the DLC-2.
2. After vehicle identification, select the following from the M-MDS initialization screen.
    a. "Data logger"
    b. "Module"
    c. "IC"
3. Using "LCD_SEG", verify that the display screen and open/close angle for the combiner change by pressing the tripmeter switch.

Number of times tripmeter switch is pressed	Display screen	Combiner open/close angle
—	ALL ON	1 time	SCREEN NOT ILLUMINATED	2 times		3 times		
4 times		5 times	SCREEN NOT ILLUMINATED 	
6 times*1	SCREEN NOT ILLUMINATED 	
*1

Because the combiner open/close angle cannot switch if the tripmeter switch is pressed before the combiner fully closes, press the tripmeter switch after the combiner is fully closed.

- If the display screen and open/close angle for the active driving display cannot be changed, refer to the symptom troubleshooting.

2014 - Mazda3 - Body and Accessories

INSTRUMENT CLUSTER PERSONALIZATION FEATURES SETTING PROCEDURE

Blind Spot Monitoring (BSM) System

Using M-MDS

1. Connect the M-MDS to the DLC-2.
2. After vehicle identification, select the following from the M-MDS initialization screen.
   a. “Module programming”
   b. “Programmable Parameters”
3. Select menu in the “IC”.
4. Select an item name, and than select option.

Mazda Modular Diagnostic System (M-MDS) display	Function	Initial setting	Setting contents	Control unit
BSM Volume.	The volume of the blind spot monitoring (BSM) warning alarm can be changed.	High	Not Adopted. / OFF / Low / High	Instrument cluster

Using center display

- For the setting procedure of the personalization features using the center display, refer to "CENTER DISPLAY PERSONALIZATION FEATURES". (See **CENTER DISPLAY PERSONALIZATION FEATURES SETTING PROCEDURE**.)

Lane Departure Warning System (LDWS)

NOTE:

- For personalization of the warning timing and sensitivity, refer to the FORWARD SENSING CAMERA (FSC) PERSONALIZATION FEATURES SETTING PROCEDURE. (See **FORWARD SENSING CAMERA (FSC) PERSONALIZATION FEATURES SETTING PROCEDURE**.)

Using M-MDS

1. Connect the M-MDS to the DLC-2.
2. After vehicle identification, select the following from the M-MDS initialization screen.
   a. “Module programming”
   b. “Programmable Parameters”
3. Select menu in the “IC”.
4. Select an item name, and than select option.

Mazda Modular Diagnostic System (M-MDS) display	Function	Initial setting	Setting contents	Control unit

LDWS Sound.	The type of the LDWS warning alarm can be changed.	Rumble	Beep / Rumble	Instrument cluster

Using center display

- For the setting procedure of the personalization features using the center display, refer to "CENTER DISPLAY PERSONALIZATION FEATURES". (See **CENTER DISPLAY PERSONALIZATION FEATURES SETTING PROCEDURE**.)

Turn And Hazard Indicator Alarm

Using M-MDS

1. Connect the M-MDS to the DLC-2.
2. After vehicle identification, select the following from the M-MDS initialization screen.
   a. “Module programming”
   b. “Programmable Parameters”
3. Select menu in the “IC”.
4. Select an item name, and than select option.

Mazda Modular Diagnostic System (M-MDS) display	Function	Initial setting	Setting contents	Control unit
Turn Signal Volume	The volume of the turn and hazard indicator alarm can be changed.	High	Not Adopted / Low / High	Instrument cluster

Using center display

- For the setting procedure of the personalization features using the center display, refer to "CENTER DISPLAY PERSONALIZATION FEATURES". (See **CENTER DISPLAY PERSONALIZATION FEATURES SETTING PROCEDURE**.)

Lights-on Reminder Warning Alarm

Using M-MDS

1. Connect the M-MDS to the DLC-2.
2. After vehicle identification, select the following from the M-MDS initialization screen.
   a. “Module programming”
   b. “Programmable Parameters”
3. Select menu in the “IC”.
4. Select an item name, and than select option.

Mazda Modular Diagnostic System (M-MDS) display	Function	Initial setting	Setting contents	Control unit
Lights-on Reminder Volume.	The volume for the lights-on reminder warning alarm can be changed.	OFF*1	Not Adopted. / OFF / Low / High	Instrument cluster

*1

The setting of the lights-on reminder can be changed with the time setting of auto light off system set to Off.

Using center display

- For the setting procedure of the personalization features using the center display, refer to "CENTER DISPLAY PERSONALIZATION FEATURES". (See **CENTER DISPLAY PERSONALIZATION FEATURES SETTING PROCEDURE**.)

Temperature

NOTE:

- When the ambient temperature display is switched, the set A/C cabin temperature display is also changed.

Using instrument cluster (without center display)

Using center display

- For the setting procedure of the personalization features using the center display, refer to "CENTER DISPLAY PERSONALIZATION FEATURES". (See **CENTER DISPLAY PERSONALIZATION FEATURES SETTING PROCEDURE**.)

2014 - Mazda3 - Body and Accessories

FORWARD SENSING CAMERA (FSC) PERSONALIZATION FEATURES SETTING PROCEDURE

High Beam Control (HBC) System

Using M-MDS

1. Connect the M-MDS to the DLC-2.
2. After vehicle identification, select the following from the M-MDS initialization screen.
   a. “Module programming“
   b. “Programmable Parameters”
3. Select menu in the “FSC”.
4. Select an item name, and than select option.

Mazda Modular Diagnostic System (M-MDS) display	Function	Initial setting	Setting contents	Control unit
High Beam Control.	The high beam control (HBC) system can be switched between operable and inoperable.	ON	Not Adopted. / OFF / ON	Forward sensing camera (FSC)

Using center display

- For the setting procedure of the personalization features using the center display, refer to "CENTER DISPLAY PERSONALIZATION FEATURES". (See **CENTER DISPLAY PERSONALIZATION FEATURES SETTING PROCEDURE**.)

Lane Departure Warning System (LDWS)

NOTE:

- For personalization of the warning sound and volume, refer to the INSTRUMENT CLUSTER PERSONALIZATION FEATURES SETTING PROCEDURE. (See **INSTRUMENT CLUSTER PERSONALIZATION FEATURES SETTING PROCEDURE**.)

Using M-MDS

1. Connect the M-MDS to the DLC-2.
2. After vehicle identification, select the following from the M-MDS initialization screen.
   a. “Module programming“
   b. “Programmable Parameters”
3. Select menu in the “FSC”.
4. Select an item name, and than select option.

Mazda Modular Diagnostic System (M-MDS) display	Function	Initial setting	Setting contents	Control unit
LDWS Timing.	The distance between the warning-trigger lines for the Lane Departure Warning System (LDWS) and vehicle lanes can be changed.	Late	Not Adopted / Adaptive / Early / Medium / Late	Forward sensing camera (FSC)
LDWS Warning.	The warning operation sensitivity of the lane departure warning system (LDWS) can be changed.	Often	Not Adopted. / Often / Medium / Rare	Forward sensing camera (FSC)

Using center display

- For the setting procedure of the personalization features using the center display, refer to "CENTER DISPLAY PERSONALIZATION FEATURES". (See **CENTER DISPLAY PERSONALIZATION FEATURES SETTING PROCEDURE**.)

2014 - Mazda3 - Body and Accessories

INSTRUMENT CLUSTER DATA RESET PROCEDURE

CAUTION:

- Explain the reset items to the customer for their understanding, and then perform the data reset.
- Related information can be reset collectively using the following procedure:

  Trip computer-related information

  - Average fuel economy
  - Average vehicle speed
  - TRIP value

2014 - Mazda3 - Body and Accessories

FUEL GAUGE SENDER UNIT REMOVAL/INSTALLATION

WARNING:

- Always keep sparks and flames away from fuel when servicing the fuel system. Fuel can be easily ignited which could cause serious injury or death, and damage to equipment.
- Fuel line spills and leakage from the pressurized fuel system are dangerous. Fuel can ignite and cause serious injury or death and damage. Fuel can also irritate skin and eyes. To prevent this, always complete the Fuel Line Safety Procedure, while referring to the BEFORE SERVICE PRECAUTION.
- A person charged with static electricity could cause a fire or explosion, resulting in death or serious injury. Before draining fuel, make sure to discharge static electricity by touching a vehicle.

CAUTION:

- If the fuel gauge level indicates 3/4 or more, the fuel surface is higher than the fuel pump unit and fuel gauge sender unit installation surface. If servicing is performed under this condition, fuel leakage could result. Always drain the fuel before performing the operation and keep the fuel in the fuel tank at less than half.

NOTE:

- For the fuel gauge sender unit removal/installation, refer to the fuel pump removal/installation because the fuel gauge sender unit is integrated with the fuel pump. (See **FUEL PUMP UNIT REMOVAL/INSTALLATION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)

2014 - Mazda3 - Body and Accessories

FUEL GAUGE SENDER UNIT INSPECTION

NOTE:

- For the fuel gauge sender unit removal/installation, refer to the fuel pump removal/installation because the fuel gauge sender unit is integrated with the fuel pump. (See **FUEL PUMP UNIT REMOVAL/INSTALLATION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)

1. Verify that the resistance at fuel gauge sender unit terminals D and C is as indicated in the table according to the height of the float.

- If not as indicated in the table, replace the fuel gauge sender unit.

FUEL GAUGE SENDER UNIT INSPECTION

2014 - Mazda3 - Body and Accessories

HORN REMOVAL/INSTALLATION

1. Disconnect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)
2. Remove the set plate. (See **SET PLATE REMOVAL/INSTALLATION**.)
3. Remove the front bumper. (See **FRONT BUMPER REMOVAL/INSTALLATION**.)
4. Disconnect the connector.

5. Remove the bolt.
6. Remove the horn.
7. Install in the reverse order of removal.

2014 - Mazda3 - Body and Accessories

HORN INSPECTION

1. Disconnect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)

2. Remove the set plate. (See **SET PLATE REMOVAL/INSTALLATION**.)

3. Remove the front bumper. (See **FRONT BUMPER REMOVAL/INSTALLATION**.)

4. Remove the horn. (See **HORN REMOVAL/INSTALLATION**.)

5. Apply battery positive voltage to horn terminal, and connect the horn retaining bolt to ground as shown in the figure, and then verify that the horn sounds.

- If the horn does not sound, replace the horn.

2014 - Mazda3 - Body and Accessories

BLIND SPOT MONITORING (BSM) CONTROL MODULE REMOVAL/INSTALLATION

4SD

1. Disconnect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)

2. Remove the rear combination light. (See **REAR COMBINATION LIGHT REMOVAL/INSTALLATION**.)

3. Remove the rear bumper. (See **REAR BUMPER REMOVAL/INSTALLATION**.)

4. Disconnect the connector.

ILLUSTRATION INDICATES LEFT SIDE. (RH SIDE IDENTICAL)

5. Remove the nuts.

6. Remove the BSM control module.

7. Install in the reverse order of removal.

8. Perform the BSM radar test. (See **BLIND SPOT MONITORING (BSM) RADAR TEST**.)

CAUTION:

- If the BSM control module is replaced, not performing the BSM radar test will cause a deviation in the radar emission angle which could result in the system not detecting a vehicle approaching from the rear correctly. If the BSM control module is replaced, perform the BSM radar test.

5HB

1. Disconnect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)

2. Remove the rear combination light. (See **REAR COMBINATION LIGHT REMOVAL/INSTALLATION**.)

3. Remove the rear bumper. (See **REAR BUMPER REMOVAL/INSTALLATION**.)

4. Disconnect the connector.

ILLUSTRATION INDICATES LEFT SIDE. (RH SIDE IDENTICAL)

NUT: **8—10 N·m {82—101 kgf·cm, 71—88 in·lbf}**

5. Remove the nuts.

6. Remove the bolts.

7. Remove the BSM control module.

8. Install in the reverse order of removal.

9. Perform the BSM radar test. (See **BLIND SPOT MONITORING (BSM) RADAR TEST**.)

CAUTION:

- If the BSM control module is replaced, not performing the BSM radar test will cause a deviation in the radar emission angle which could result in the system not detecting a vehicle approaching from the rear correctly. If the BSM control module is replaced, perform the BSM radar test.

2014 - Mazda3 - Body and Accessories

BLIND SPOT MONITORING (BSM) CONTROL MODULE INSPECTION

1. Disconnect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)

2. Remove the rear combination light. (See **REAR COMBINATION LIGHT REMOVAL/INSTALLATION**.)

3. Remove the rear bumper. (See **REAR BUMPER REMOVAL/INSTALLATION**.)

4. Connect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)

5. Verify that the voltages of each of the terminals are as indicated in the terminal voltage table (reference).

- If the voltage is not as specified in the terminal voltage table (reference), inspect the parts under Inspection item(s) and related wiring harnesses.
  - If the system does not operate normally even though the inspection items are normal, replace the BSM control module (RH) or BSM control module (LH).

Terminal Voltage Table (Reference)

BSM control module (LH)

Terminal	Signal name	Connected to	Measurement conditions	Voltage (V)	Inspection item(s)
A	Local CAN_H	BSM control module (RH)	Because this terminal is for communication, determination using terminal voltage inspection is not possible.		
B	Local CAN_L	BSM control module (RH)	Because this terminal is for communication, determination using terminal voltage inspection is not possible.		
C	MS-CAN_H	Related module	Because this terminal is for communication, determination using terminal voltage inspection is not possible.		
D	MS-CAN_L	Related module	Because this terminal is for communication, determination using terminal voltage inspection is not possible.		
E	—	—	—	—	—
F	—	—	—	—	—
G	BSM indicator light (LH) signal	BSM indicator light (LH)	Turn off BSM indicator light using BSM system active command WRN_IND_L	0.8 or less	BSM indicator light (LH)
			Turn on BSM indicator light using rear BSM system active command WRN_IND_L	B+	
H	—	—	—	—	—
I	Power position (IG1)	IG relay	Ignition switched ON (engine off or on)	B+	• C/U IG1 fuse • IG relay
			Ignition switched off or ACC	1.0 or less	
J	Ground	Body ground	Under any condition	1.0 or less	Body ground

BSM control module (RH)

BSM CONTROL MODULE (RH)
WIRING HARNESS SIDE CONNECTOR

Terminal	Signal name	Connected to	Measurement conditions	Voltage (V)	Inspection item(s)
A	Local CAN_H	BSM control module (LH)	Because this terminal is for communication, determination using terminal voltage inspection is not possible.		
B	Local CAN_L	BSM control module (LH)	Because this terminal is for communication, determination using terminal voltage inspection is not possible.		
C	—	—	—	—	—
D	—	—	—	—	—
E	—	—	—	—	—
F	—	—	—	—	—
G	BSM indicator light (RH) signal	BSM indicator light (RH)	Turn off BSM indicator light using BSM system active command WRN_IND_R	0.8 or less	BSM indicator light (RH)
			Turn on BSM indicator light using rear BSM system active command WRN_IND_R	B+	
H	—	—	—	—	—
I	Power position (IG1)	IG relay	Ignition switched ON (engine off or on)	B+	• C/U IG1 fuse • IG relay
			Ignition switched off or ACC	1.0 or less	

J	Ground	Body ground	Under any condition	1.0 or less	Body ground

2014 - Mazda3 - Body and Accessories

BLIND SPOT MONITORING (BSM) BRACKET REMOVAL/INSTALLATION

1. Disconnect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)

2. Remove the rear combination light. (See **REAR COMBINATION LIGHT REMOVAL/INSTALLATION**.)

3. Remove the rear bumper. (See **REAR BUMPER REMOVAL/INSTALLATION**.)

4. Remove the BSM control module. (See **BLIND SPOT MONITORING (BSM) CONTROL MODULE REMOVAL/INSTALLATION**.)

5. Remove the nuts.

ILLUSTRATION INDICATES LEFT SIDE. (RH SIDE IDENTICAL)

NUT: **8—10 N·m {82—101 kgf·cm, 71—88 in·lbf}**

6. Remove the BSM bracket.

7. Install in the reverse order of removal.

8. Perform the BSM radar test. (See **BLIND SPOT MONITORING (BSM) RADAR TEST**.)

CAUTION:

- If the BSM control module is replaced, not performing the BSM radar test will cause a deviation in the radar emission angle which could result in the system not detecting a vehicle approaching from the rear correctly. If the BSM control module is replaced, perform the BSM radar test.

2014 - Mazda3 - Body and Accessories

BLIND SPOT MONITORING (BSM) RADAR TEST

NOTE:

- The BSM radar test stores the radar angles in the BSM control module based on the forced emission of radar at a SST (reflector) and performing aiming based on the induced tolerance with the radar as it is currently installed and reflected from the SST (reflector).
- Perform the BSM radar test when replacing the BSM control module, or the rear bumper.
- As there are two BSM control modules, one each on the left and right, radar aiming is performed for each side.
- The BSM radar test cannot be performed correctly if obstructions which interfere with radar emission are stuck on the BSM control modules or the rear bumper. Perform the following procedure before performing the radar test.
    - Verify that there is no water, dirt, sticker adhesion, or repairs done using putty application on the surface of the rear bumper, and that there is no dirt or scratches on the BSM control modules.

Radar test procedure

1. Empty the vehicle by having all occupants leave the vehicle and remove all the cargo except for the spare tire, jack and tools equipped on the vehicle.

2. Adjust the air pressure of each tire to the specified value. (See **WHEEL AND TIRE SPECIFICATION**.)

3. Move the vehicle to level ground.

CAUTION:

- If the setting surface height and angle between the vehicle and the SST (reflector) differs, a correct radar test cannot be done. Perform the radar test with the vehicle and SST (reflector) set on level ground.

4. Verify that there are no obstructions which interfere with radar emissions such as metal objects in the radar emission area shown in the figure.

CAUTION:

- If the radar test is performed in the shaded area shown in the figure with obstructions such as covered drain gutters in the floor or other metal reflective objects, it could result in the radar test not being performed correctly. Move all obstructions out of the area, and when performing the radar test, do not have personnel standing in the area.

5. Using the M-MDS, perform a DTC inspection of the BSM control modules and verify that no DTCs are displayed. (See **DTC INSPECTION [BLIND SPOT MONITORING (BSM)]**.)

NOTE:

- If any DTCs are displayed, perform malfunction repair referring to the applicable DTC troubleshooting. (See **DTC TABLE [BLIND SPOT MONITORING (BSM)]**.)

6. Adjust the SST (plum-bob) so that it is aligned with the center of the brand emblem, determine the center position at the front of the vehicle, and mark the center position (point A) on the floor surface.

NOTE:

- The center of the brand emblem indicates the center position of the vehicle.

7. Adjust the SST (plum-bob) so that it is aligned with the center of the brand emblem, determine the center position at the rear of the vehicle, and mark the center position (point B) on the floor surface.

NOTE:

- The center of the brand emblem indicates the center position of the vehicle.

8. Secure the end of the leveling line over point A.

NOTE:

- Use a commercially-available leveling line.

9. Pull the unsecured end of the leveling line over the vehicle and to the rear and adjust it so that passes over point B.

10. Mark the line (position C) within the range of **156.8 cm {61.73 in}** from point B and in the direction rearward of the vehicle.

11. Mark the points (points D and E) (SST (reflector) installation reference points) **170.5 cm {67.13 in}** from point C on the line which runs perpendicular to the vehicle center line (SST (reflector) installation reference point).

12. Pull the connected points D, C and E lines (SST (reflector) installation line).

13. Install the SST (reflector and plum bob) to the SST (tripod).

14. Adjust so that the height of the SST (reflector) from the floor surface is **50 cm {20 in}**.

15. Level the SST (reflector) by adjusting the leveling bubble on the SST (tripod) so that it is centered on the bubble reference line.

16. Align point D or point E with the end of the SST (plum bomb).

17. Adjust the reflecting surface of the SST (reflector) so that it faces the radar emission surface (near a rear bumper corner) of BSM control module.

18. Perform the radar test using the M-MDS.

19. Connect the M-MDS to the DLC-2.

20. After vehicle identification, the following can be selected from the M-MDS initialization screen.

- "Electrical"
- "BSM Radar Test"

21. Select either the left or right side of the BSM control module.

NOTE:

- The radar test can be performed on either the left or right side, however, perform aiming on both the left and right sides.

22. Verify the M-MDS display.

- If "TEST PASSED" is displayed

Radar test is completed

- If "TEST FAILED" is displayed
  - Perform an inspection according to the following table.

Step	Inspection	Action	
1	**VERIFY REFLECTOR POSITION** • Verify if the reflector installation position is correct. • Is the reflector set in the correct position?	Yes	Go to the next step.
		No	Set the reflector in the correct position and perform the BSM radar test.
2	**INSPECT REAR BUMPER** • Remove the rear bumper. (See **REAR BUMPER REMOVAL/INSTALLATION**.) • Perform the BSM radar test. • Is "Procedure completed correctly." displayed?	Yes	Replace the rear bumper and perform the BSM radar test. (See **REAR BUMPER REMOVAL/INSTALLATION**.)
		No	Go to the next step.
3	**VERIFY IF BSM CONTROL MODULE OR BSM BRACKET IS MIS-INSTALLED AND IF THERE IS DISTORTION TO VEHICLE INSTALLATION SURFACE** • Verify whether a BSM control module or BSM bracket has been mis-installed, and if there is distortion to the vehicle installation surface. • Is there poor installation or distortion?	Yes	Repair or replace the malfunctioning part and perform the BSM radar test.
		No	Go to the next step.
4	**RE-PERFORM THE BSM RADAR TEST** • Perform the BSM radar test. • Repeat the M-MDS operation for the BSM radar test 2 or 3 times (Steps 20 to 21). • Is "Procedure completed correctly." displayed?	Yes	BSM radar test is completed.
		No	Replace the BSM control module.

2014 - Mazda3 - Body and Accessories

BLIND SPOT MONITORING (BSM) OFF SWITCH REMOVAL/INSTALLATION

NOTE:

- The BSM OFF switch is integrated with the cluster switch.
- For the BSM OFF switch removal/installation, refer to CLUSTER SWITCH REMOVAL/INSTALLATION. (See **CLUSTER SWITCH REMOVAL/INSTALLATION**.)

2014 - Mazda3 - Body and Accessories

BLIND SPOT MONITORING (BSM) OFF SWITCH INSPECTION

NOTE:

- The BSM OFF switch is integrated with the cluster switch.
- For the BSM OFF switch removal/installation, refer to CLUSTER SWITCH REMOVAL/INSTALLATION. (See **CLUSTER SWITCH REMOVAL/INSTALLATION**.)

Resistance Inspection

1. Disconnect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)
2. Remove the BSM OFF switch. (See **BLIND SPOT MONITORING (BSM) OFF SWITCH REMOVAL/INSTALLATION**.)
3. Measure the resistance between BSM OFF switches B and C under the following conditions:
    - Resistance with BSM OFF switch pressed and held
        - 323.24—329.76 ohms
    - Resistance with any switches not pressed
        - 1,139.99—1,163.01 ohms

CIRCUIT WITH BSM OFF SWITCH PRESSED AND HELD

CIRCUIT WITH ANY SWITCHES NOT PRESSED

- If not within the specification, replace the cluster switch. (See **CLUSTER SWITCH REMOVAL/INSTALLATION**.)

LED Illumination Inspection

1. Disconnect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)
2. Remove the BSM OFF switch. (See **BLIND SPOT MONITORING (BSM) OFF SWITCH REMOVAL/INSTALLATION**.)
3. Apply battery positive voltage to cluster switch terminal J, and connect terminal I to ground.

4. Verify that the LED illuminates.

- If there is any malfunction, replace the cluster switch. (See **CLUSTER SWITCH REMOVAL/INSTALLATION**.)

2014 - Mazda3 - Body and Accessories

BLIND SPOT MONITORING (BSM) INDICATOR LIGHT REMOVAL/INSTALLATION

NOTE:

- The BSM indicator lights are integrated into the outer mirror glass.
- For the BSM indicator light removal/installation, refer to the outer mirror glass removal/installation. (See **OUTER MIRROR GLASS REMOVAL**.) (See **OUTER MIRROR GLASS INSTALLATION**.)

2014 - Mazda3 - Body and Accessories

BLIND SPOT MONITORING (BSM) INDICATOR LIGHT INSPECTION

NOTE:

- The BSM indicator lights are integrated into the outer mirror glass.
- For the BSM indicator light inspection, refer to the outer mirror glass inspection. (See **OUTER MIRROR GLASS INSPECTION**.)

2014 - Mazda3 - Body and Accessories

INDICATOR UNIT REMOVAL/INSTALLATION

1. Disconnect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)

2. Remove the following parts:

   a. Glove compartment (See **GLOVE COMPARTMENT REMOVAL/INSTALLATION**.)

   b. Decoration panel (See **DECORATION PANEL REMOVAL/INSTALLATION**.)

   c. Upper panel (See **UPPER PANEL REMOVAL**.) (See **UPPER PANEL INSTALLATION**.)

   d. Rear console (See **REAR CONSOLE REMOVAL/INSTALLATION**.)

   e. Shift lever knob (MTX) (See **MANUAL TRANSAXLE SHIFT MECHANISM REMOVAL/INSTALLATION [C66M-R]**.)

   f. Selector lever knob (ATX) (See **AUTOMATIC TRANSAXLE SHIFT MECHANISM REMOVAL/INSTALLATION**.)

   g. Shift panel (See **SHIFT PANEL REMOVAL/INSTALLATION**.)

   h. Front console box (See **FRONT CONSOLE BOX REMOVAL/INSTALLATION**.)

   i. CD player (with CD player) (See **CD PLAYER REMOVAL**.) (See **CD PLAYER INSTALLATION**.)

   j. Side wall (See **SIDE WALL REMOVAL/INSTALLATION**.)

   k. Front console (See **FRONT CONSOLE REMOVAL/INSTALLATION**.)

   l. Climate control unit (See **CLIMATE CONTROL UNIT REMOVAL/INSTALLATION [FULL-AUTO AIR CONDITIONER]**.)(See **CLIMATE CONTROL UNIT REMOVAL/INSTALLATION [MANUAL AIR CONDITIONER]**.)

3. While pressing the indicator unit tabs in the direction of arrows (1) shown in the figure using the remover tool, press the indicator unit in the direction of arrow (2) to detach the indicator unit tabs from the climate control unit.

4. While pressing the clip tabs in the direction of arrows (3) shown in the figure, press the indicator unit in the direction of arrow (4) to detach the indicator unit tabs from the climate control unit.

:CLIP

5. Remove the indicator unit.

6. Install in the reverse order of removal.

2014 - Mazda3 - Body and Accessories

INDICATOR UNIT INSPECTION

Terminal Voltage Inspection

1. Disconnect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)

2. Remove the following parts:

   a. Glove compartment (See **GLOVE COMPARTMENT REMOVAL/INSTALLATION**.)

   b. Decoration panel (See **DECORATION PANEL REMOVAL/INSTALLATION**.)

   c. Upper panel (See **UPPER PANEL REMOVAL**.) (See **UPPER PANEL INSTALLATION**.)

   d. Rear console (See **REAR CONSOLE REMOVAL/INSTALLATION**.)

   e. Shift lever knob (MTX) (See **MANUAL TRANSAXLE SHIFT MECHANISM REMOVAL/INSTALLATION [C66M-R]**.)

   f. Selector lever knob (ATX) (See **AUTOMATIC TRANSAXLE SHIFT MECHANISM REMOVAL/INSTALLATION**.)

   g. Shift panel (See **SHIFT PANEL REMOVAL/INSTALLATION**.)

   h. Front console box (See **FRONT CONSOLE BOX REMOVAL/INSTALLATION**.)

   i. CD player (with CD player) (See **CD PLAYER REMOVAL**.) (See **CD PLAYER INSTALLATION**.)

   j. Side wall (See **SIDE WALL REMOVAL/INSTALLATION**.)

   k. Front console (See **FRONT CONSOLE REMOVAL/INSTALLATION**.)

   l. Climate control unit (See **CLIMATE CONTROL UNIT REMOVAL/INSTALLATION [FULL-AUTO AIR CONDITIONER]**.) (See **CLIMATE CONTROL UNIT REMOVAL/INSTALLATION [MANUAL AIR CONDITIONER]**.)

3. Reconnect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)

4. Verify that the voltages of each of the terminals are as indicated in the terminal voltage table (reference).

   - If the voltage is not as specified in the terminal voltage table (reference), inspect the parts under Inspection item(s) and related wiring harnesses.

     - If the system does not work normally even though the inspection items or related wiring harnesses do not have any malfunction, replace the indicator unit.

Terminal Voltage Table (Reference)

INDICATOR UNIT WIRING HARNESS SIDE CONNECTOR

Terminal	Signal name	Connected to	Measurement conditions		Voltage (V)	Inspection item(s)
A	Power supply	METER1 10A fuse	Ignition switch ON (engine off or on)		B+	• METER1 10A fuse • Battery
			Ignition switch off or ACC		1.0 or less	
B	Power supply	ROOM 15 A fuse	Under any condition		B+	• ROOM 15 A fuse • Battery
C	Power supply	C/U IG1 15A fuse	Ignition switch ON (engine off or on)		B+	• C/U IG1 15A fuse • Battery
			Ignition switch off or ACC		1.0 or less	
D	Seat warmer switch signal	Seat warmer control unit	Because this terminal is for communication, determination using terminal voltage inspection is not possible.			
E	Passenger air bag deactivation (PAD) indicator	Instrument cluster	Ignition switched ON (engine off)	Luggage of 45 kg or more on front passenger's seat (PAD OFF indicator off)	Approx. 9	Instrument cluster
				No load on front passenger's seat (PAD OFF indicator on)	1.0 or less	

F	Ground	Body ground	Under any condition		1.0 or less	Body ground
G	Instrument cluster signal	Instrument cluster	Because this terminal is for communication, determination using terminal voltage inspection is not possible.			
H	—	—	—		—	—
I	—	—	—		—	—
J	Passenger air bag deactivation (PAD) indicator	Instrument cluster	Ignition switched ON (engine off)	Luggage of 45 kg or more on front passenger's seat (PAD OFF indicator off)	1.0 or less	Instrument cluster
				No load on front passenger's seat (PAD OFF indicator on)	Approx. 7	

LED Illumination Inspection

When using M-MDS

1. Connect the M-MDS to the DLC-2.
2. After vehicle identification, select the following from the M-MDS initialization screen.
   - "Data logger"
   - "Module"
   - "IC"
3. Using "LCD_SEG", verify that the following warning/indicator lights are turned on.

- If any one of the warning/indicator lights is not displayed, replace the indicator unit.

When not using M-MDS

1. Switch the ignition ON (engine off or on).
2. Using a jumper wire, connect indicator unit terminal G and body ground for 5 s or more.

CAUTION:

- If the terminals are mistakenly connected, vehicle damage or fire could occur. When connecting with the jumper wire, thoroughly verify what terminals are being connected to prevent a miss-connection.

3. Verify that the following warning/indicator lights are turned on.

- If any one of the warning/indicator lights is not displayed, replace the indicator unit.

2014 - Mazda3 - Body and Accessories

FORWARD SENSING CAMERA (FSC) REMOVAL/INSTALLATION

CAUTION:

- If configuration is not performed when the FSC is replaced with a new one, the vehicle specification information is not stored in the FSC and the system will not operate normally.
- When performing configuration, it is necessary to read the vehicle specification information from the FSC before replacing it. Connect the M-MDS to the vehicle and perform vehicle identification before removing the FSC. The vehicle specification information is temporarily stored in the M-MDS.

NOTE:

- The FSC prior to replacement stores the vehicle specification information.
- A new FSC does not store any vehicle specification information.
- If the vehicle specification information from the FSC prior to replacement cannot be read, perform the configuration using As-Built data.

1. When replacing the FSC, perform the configuration. (See **FORWARD SENSING CAMERA (FSC) CONFIGURATION (USING READ/WRITE FUNCTION)**.)

2. Disconnect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)

3. Pull cover A in the direction of the arrow shown in the figure and detach tab A of cover A and cover B.

4. Pull cover A in the direction of the arrow shown in the figure, detach the tab B and pin A for cover A and the base, and remove cover A from the base.

5. Remove the wiring harness from the hook.

6. Pull cover B in the direction of the arrow shown in the figure, detach the pin B and tab C for cover B and the base, and remove cover B from the base.

7. Disconnect the connector.

8. Pull the FSC in the direction of the arrow shown in the figure and remove the FSC pin from

FSC clip A.

9. Rotate the FSC in the direction of the arrow shown in the figure, remove the FSC hook from FSC clip B, and remove the FSC.

10. Install in the reverse order of removal.

NOTE:

- If configuration cannot be performed by reading/writing of the vehicle specification information, perform the configuration using As-Built information after replacing the FSC. (See **FORWARD SENSING CAMERA (FSC) CONFIGURATION (USING AS-BUILT DATA)**.)

11. If the FSC is replaced, perform the FSC aiming (See **FORWARD SENSING CAMERA (FSC) AIMING**.).

CAUTION:

- If FSC aiming is not performed after replacing the FSC, the high beam control (HBC) system and the lane departure warning system (LDWS) will not operate because the FSC cannot store the camera shot angle. If the FSC is replaced, perform the FSC aiming.

2014 - Mazda3 - Body and Accessories

FORWARD SENSING CAMERA (FSC) CLIP REMOVAL/INSTALLATION

NOTE:

- The forward sensing camera (FSC) clips include clips A and B.

FSC clip A

1. Disconnect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)

2. Remove the following parts:

   a. Cover (See **FORWARD SENSING CAMERA (FSC) REMOVAL/INSTALLATION**.)

   b. Forward sensing camera (FSC) (See **FORWARD SENSING CAMERA (FSC) REMOVAL/INSTALLATION**.)

   c. Laser sensor (See **LASER SENSOR REMOVAL/INSTALLATION**.)

3. Insert a tape-wrapped flathead screwdriver into the gap between the base and FSC clip A.

4. Move the flathead screwdriver in the direction of the arrow shown in the figure and rotate FSC clip A.

5. In addition, rotate FSC clip A, detach the base pin and FSC clip A, and then remove FSC clip A.

6. Install in the reverse order of removal.

7. If the FSC clip is replaced, perform the FSC aiming. (See **FORWARD SENSING CAMERA (FSC) AIMING**.)

CAUTION:

- If FSC aiming is not performed after replacing the FSC, the high beam control (HBC) system and the lane departure warning system (LDWS) will not operate because the FSC cannot store the camera shot angle. If the FSC clip is replaced, perform the FSC aiming.

FSC clip B

1. Disconnect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)

2. Remove the following parts:

   a. Cover (See **FORWARD SENSING CAMERA (FSC) REMOVAL/INSTALLATION**.)

   b. Forward sensing camera (FSC) (See **FORWARD SENSING CAMERA (FSC) REMOVAL/INSTALLATION**.)

c. Laser sensor (See **LASER SENSOR REMOVAL/INSTALLATION**.)

3. Insert a tape-wrapped flathead screwdriver into the gap between the base and FSC clip B.

4. Move the flathead screwdriver in the direction of the arrow shown in the figure, rotate FSC clip B, and detach base pin A and FSC clip B.

5. Insert a tape-wrapped flathead screwdriver into the gap between the base and FSC clip B.

6. Move the flathead screwdriver in the direction of the arrow shown in the figure, pull down FSC clip B, detach base pin B and FSC clip B, and remove FSC clip B.

7. Install in the reverse order of removal.

8. If the FSC clip is replaced, perform the FSC aiming. (See **FORWARD SENSING CAMERA (FSC) AIMING**.)

CAUTION:

- If FSC aiming is not performed after replacing the FSC, the high beam control (HBC) system and the lane departure warning system (LDWS) will not operate because the FSC cannot store the camera shot angle. If the FSC clip is replaced, perform the FSC aiming.

2014 - Mazda3 - Body and Accessories

FORWARD SENSING CAMERA (FSC) COVER REMOVAL/INSTALLATION

1. Disconnect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)

2. Remove the cover. (See **FORWARD SENSING CAMERA (FSC) REMOVAL/INSTALLATION**.)

3. Remove the forward sensing camera (FSC). (See **FORWARD SENSING CAMERA (FSC) REMOVAL/INSTALLATION**.)

4. Pull the FSC cover in the direction of the arrow shown in the figure and detach tab of FSC cover.

5. Rotate the FSC cover in the direction of the arrow shown in the figure, remove the FSC cover from FSC hook, and remove the FSC cover.

6. Install in the reverse order of removal.

FORWARD SENSING CAMERA (FSC) COVER REMOVAL/INSTALLATION

2014 - Mazda3 - Body and Accessories

FORWARD SENSING CAMERA (FSC) SHORT-CORD REMOVAL/INSTALLATION

1. Disconnect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)

2. Remove the cover. (See **FORWARD SENSING CAMERA (FSC) REMOVAL/INSTALLATION**.)

3. Remove the auto-dimming mirror. (See **AUTO-DIMMING MIRROR REMOVAL/INSTALLATION**.)

4. Disconnect the connector.

5. Pull out the FSC short-cord in the direction of arrow (2) shown in the figure while pressing the clip in the direction of arrow (1) shown in the figure, detach the clip and base, and remove the FSC short-cord.

6. Install in the reverse order of removal.

2014 - Mazda3 - Body and Accessories

FORWARD SENSING CAMERA (FSC) SHORT-CORD INSPECTION

1. Disconnect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)

2. Remove the following parts:

   a. Cover (See **FORWARD SENSING CAMERA (FSC) REMOVAL/INSTALLATION**.)

   b. Auto-dimming mirror (See **AUTO-DIMMING MIRROR REMOVAL/INSTALLATION**.)

   c. FSC short-cord (See **FORWARD SENSING CAMERA (FSC) SHORT-CORD REMOVAL/INSTALLATION**.)

3. Verify that the continuity between the FSC short-cord terminals is as indicated in the table.

○—○ : Continuity

Test condition	Terminal													
	Vehicle wiring harness (C27) side connector							Auto light sensor / rain sensor side connector			FSC side connector			
	A	B	C	D	E	G	H	A	B	D	A	C	E	I
Under any condition	○													○
		○								○				
			○									○		
				○				○						
					○								○	
						○					○			
							○		○					

- If not as indicated in the table, replace the FSC short-cord.

2014 - Mazda3 - Body and Accessories

FORWARD SENSING CAMERA (FSC) AIMING

NOTE:

- The forward sensing camera (FSC) aiming procedure stores the camera shot angle in the FSC by reading a target used for aiming into the FSC.
- Perform the FSC aiming if any of the following procedure is performed.
    - FSC replacement
    - FSC clip replacement
    - Windshield replacement
- If an obstruction on the windshield or camera lens is blocking the scene in front of the vehicle, the target used for aiming cannot be read-in and aiming will not be performed correctly. Perform the following procedure before performing the aiming.
    - Verify that there is no water, dirt or sticker adhesion on the windshield, and that there is nothing on the camera lens such as dust or soiling.

Aiming procedure

1. Empty the vehicle by having all occupants leave the vehicle and remove all the cargo except for the spare tire, jack and tools.
2. Adjust the air pressure of each tire to the specified value. (See **WHEEL AND TIRE SPECIFICATION**.)
3. Move the vehicle to level ground.

CAUTION:

- If the setting surface height and angle between the vehicle and the target differs, correct FSC aiming cannot be done. Perform the FSC aiming with the vehicle and target setting surface on level ground.

4. Verify that there are no obstructions such as metal objects in the shaded areas shown in the figure.

CAUTION:

- If the FSC aiming is performed with obstructions such as white and black patterned objects or reflective metal in the shaded areas, the FSC will determine such obstructions as targets and the FSC aiming procedure will not be performed correctly.

Move all obstructions away from the shaded areas, and when performing the aiming, do not have personnel standing in the shaded areas.

5. Perform the DTC inspection for the FSC using the M-MDS and verify that no DTCs other than B115E:54 are displayed. (See **DTC INSPECTION [FORWARD SENSING CAMERA (FSC)]**.)

NOTE:

- Because DTC B115E:54 is output if aiming is not performed, continue to perform the FSC aiming only if DTC B115E:54 is output. (See **DTC TABLE [FORWARD SENSING CAMERA (FSC)]**.)

6. Adjust the SST (plum-bob) so that it is aligned with the center of the brand emblem, determine the center position at the front of the vehicle, and mark the center position (point A) on the floor surface.

NOTE:

- The center of the brand emblem indicates the center position of the vehicle.

7. Adjust the SST (plum-bob) so that it is aligned with the center of the brand emblem, determine the center position at the rear of the

vehicle, and mark the center position (point B) on the floor surface.

NOTE:

- The center of the brand emblem indicates the center position of the vehicle.

8. Secure the end of the leveling line over point B.

NOTE:

- Use a commercially-available leveling line.

9. Pull the unsecured end of the leveling line over the vehicle and to the front and adjust it so that it passes over point A.

10. Mark the line (position A) at the point **50 cm {20 in}** from point A and in the direction forward of the vehicle.

11. Mark the points (points D and E) **35 cm {14 in}** from point C on the line which runs perpendicular to the vehicle center line.

12. Pull the connected points D, C and E lines (target setting line).

13. Print out 2 sheets of the following target paper without using scaling.

NOTE:

- If the target sheets cannot be printed, follow the dimensions shown in Step 15 to make target sheets.

14. Cut the printed target sheets along the dotted line and line up the two sheets at their respective center marks as shown in the figure, and then affix cellophane tape to the back of the target.

CAUTION:

- When taping the two target sheets together, if cellophane tape is affixed to the front of the target sheets it could reflect light and adversely affect the aiming accuracy. When taping the two target sheets together, affix the cellophane tape to the back of the target pattern.

15. Verify that the taped-together target is of the dimensions shown in the figure.

16. Affix double-sided adhesive tape to the back of the target.

CAUTION:

- When affixing the target, if tape is affixed to the front of the target it could reflect light and adversely affect the aiming accuracy. When affixing the target, affix the double-sided adhesive tape to the back of the target, and then affix it to the board.

17. Align the target to the height shown in the figure, and affix it to a board.

NOTE:

- Use a wooden board which does not reflect light to affix the target.

18. Align the center of the target with point C using the SST (plum bob).

19. Align so that the board and the target setting line are level with the center of point C.

20. Connect the M-MDS (IDS) to the DLC-2.

21. After vehicle identification, the following can be selected from the M-MDS initialization screen.
    - "Electrical"
    - "FSC Aiming"
22. Input the following values according to the instructions on the M-MDS screen.

Item		Value	
		mm	in
Input height from the ground to the wheel house.	Front Left	703	$27\frac{2}{3}$
	Front Right	703	$27\frac{2}{3}$
	Rear Left	699	$27\frac{1}{2}$
	Rear Right	699	$27\frac{1}{2}$
Input the distance from the target to the front wheel center.		-1,424	-56
Input the distance from the lens center to the vehicle center.		26	1
Input the distance from the ground to the target center.		1,285	$50\frac{3}{5}$

23. Perform the FSC aiming procedure according to the directions on the M-MDS.
24. Verify the M-MDS display.
    - If "Procedure successful" is displayed
        - FSC aiming completed
    - If "Procedure unsuccessful" is displayed
        - Perform an inspection according to the following table for the error code procedure.
        - If an error code other than the error codes in the following table is displayed, verify the following and re-perform the FSC aiming if there is no malfunction, as there could be a communication error between the FSC and the diagnostic tester.
            - Is the battery positive voltage for the vehicle 8 V or more?
            - Is the ignition switched ON (engine off or on)?

Error code	Detection condition
01	Target set position or input value is incorrect
02	Visibility where aiming is performed is bright or dark, target soiled
03	Target is not detected
04	Target moves during aiming
05	Input vehicle value exceeds specification
06	Aiming result is required during aiming
08	Aiming result is required for FSC with aiming not completed

FF	Aiming cannot be performed due to communication error

Error code 01/05

Step	Inspection	Action	
1	**VERIFY VEHICLE HEIGHT INPUT VALUE** • Verify the vehicle height indicated in Step 22 for aiming with the input value. • Is the value input correctly?	Yes	Go to the next step.
		No	Input the vehicle height indicated in Step 22 for aiming, then go to the next step.
2	**VERIFY TARGET POSITION** • Verify the following: ▪ Are the vehicle and target set on level ground? ▪ Is the target set to the position indicated in the procedure? ▪ Are the board and the target set line parallel and is the height at the center of the target correct? ▪ Is the target produced as indicated in the procedure? ▪ Is there any dirt, cracks, damage, or wrinkling on the target and board? • Is there any malfunction?	Yes	Repair the target for malfunction and go to the next step.
		No	Go to the next step.
3	**PERFORM FSC AIMING** • Perform the FSC aiming. • Is the FSC aiming completed normally?	Yes	FSC aiming is completed.
		No	**Error code 01 or 05 is displayed** • Go to the next step. **Code other than error cord 01 or 05 is displayed** • Go to the procedure for the displayed error code.
4	**PERFORM FSC AIMING AT ACTUAL MEASURED VALUE OF VEHICLE HEIGHT** • Measure the vehicle height according to the actual measurement procedure for the wheel house height. (See **Wheel house height measurement procedure**.) • Input the actual measured value and perform the FSC aiming. • Is the FSC aiming completed normally?	Yes	The FSC aiming is completed.
		No	Go to the next step.
5	**VERIFY DTC** • Perform the DTC inspection for the FSC. • Is the DTC displayed?	Yes	• Go to the applicable DTC inspection. (See **DTC TABLE [FORWARD SENSING CAMERA (FSC)]**.) • After the diagnostic procedure is completed, perform the FSC aiming.
		No	Re-perform the FSC aiming, and replace the FSC if the FSC aiming is not completed normally. (See **FORWARD SENSING CAMERA (FSC) REMOVAL/INSTALLATION**.)

Error code 02/03/04

Step	Inspection	Action	
1	**VERIFY TARGET AND TARGET SETTING ENVIRONMENT** • Verify the following: ▪ Is there any dirt or damage on the windshield, FSC lens, and FSC cover?	Yes	Repair the malfunctioning part and go to the next step.
		No	Go to the next step.

	▪ Does direct sunlight penetrate the camera or target surroundings? ▪ Is the camera or target surroundings shadowed? ▪ Is there any dirt, cracks, damage, or wrinkling on the target and board? ▪ Is the target produced in white and black? ▪ Is there any obstruction or moving object within the shaded area indicated in Step 4 for aiming? ▪ Is the target produced as indicated in the procedure? ▪ Does the target move during aiming? • Is there any malfunction?		
2	**PERFORM FSC AIMING** • Perform the FSC aiming. • Is the FSC aiming completed normally?	Yes	The FSC aiming is completed.
		No	**Error code 02 or 03 or 04 is displayed** • Go to the next step. **Code other than error code 02 or 03 or 04 is displayed** • Go to the procedure for the displayed error code.
3	**PERFORM FSC AIMING WITH ACTUAL MEASURED VALUE OF VEHICLE HEIGHT** • Measure the vehicle height according to the actual measurement procedure for the wheel house height. (See **Wheel house height measurement procedure**.) • Input the actually measured value and perform the FSC aiming. • Is the FSC aiming completed normally?	Yes	The FSC aiming is completed.
		No	Go to the next step.
4	**VERIFY DTC** • Perform the DTC inspection for the FSC. • Is the DTC displayed?	Yes	• Go to the applicable DTC inspection. (See **DTC TABLE [FORWARD SENSING CAMERA (FSC)]**.) • After the diagnostic procedure is completed, perform the FSC aiming.
		No	Re-perform the FSC aiming, and replace the FSC if the FSC aiming is not completed normally. (See **FORWARD SENSING CAMERA (FSC) REMOVAL/INSTALLATION**.)

Error code 06/08

Step	Inspection	Action	
1	**PERFORM FSC AIMING** • Re-perform the FSC aiming. • Is the FSC aiming completed normally?	Yes	The FSC aiming is completed.
		No	**Error code 06 or 08 is displayed** • Go to the next step. **Code other than error code 06 or 08 is displayed** • Go to the procedure for the displayed error code.
2	**VERIFY DTC** • Perform the DTC inspection for the FSC. • Is the DTC displayed?	Yes	• Go to the applicable DTC inspection. (See **DTC TABLE [FORWARD SENSING CAMERA (FSC)]**.) • After the diagnostic procedure is completed, perform the FSC aiming.
		No	Re-perform the FSC aiming, and replace the FSC if the FSC aiming is not completed

			normally. (See **FORWARD SENSING CAMERA (FSC) REMOVAL/INSTALLATION**.)

Error code FF

Step	Inspection	Action	
1	**VERIFY DTC** • Perform the DTC inspection for the FSC. • Is the DTC displayed?	Yes	• Go to the applicable DTC inspection. (See **DTC TABLE [FORWARD SENSING CAMERA (FSC)]**.) • After the diagnostic procedure is completed, perform the FSC aiming.
		No	Re-perform the FSC aiming, and replace the FSC if the FSC aiming is not completed normally. (See **FORWARD SENSING CAMERA (FSC) REMOVAL/INSTALLATION**.)

Wheel house height measurement procedure

1. Adjust the SST (plum bob) so that it crosses the center of the wheel and identify the center position of the wheel house.

2. Measure the height from the uppermost part of the wheel house to the floor.

2014 - Mazda3 - Body and Accessories

FORWARD SENSING CAMERA (FSC) CONFIGURATION (USING READ/WRITE FUNCTION)

NOTE:

- When performing configuration, it is necessary to read the vehicle specification information from the FSC before replacing it. Connect the M-MDS to the vehicle and perform vehicle identification before removing the FSC. The vehicle specification information is temporarily stored in the M-MDS.

1. Connect the M-MDS to the DLC-2.
2. After vehicle identification, select the following from the M-MDS initialization screen.
    - “Module programming”
3. Then, select the following from the screen menu.
    - “Programmable Module Installation”
    - “FSC”
4. Perform the configuration following the instructions on the screen.

CAUTION:

- When the configuration is performed, CAN communication between the FSC and control module connected to the CAN line is cut temporarily, and communication error DTCs may be detected. After performing the configuration, verify the DTCs for the control module connected to the CAN line and clear it if any DTC is detected.

5. Verify the DTCs for all of the control modules connected to the CAN line.
    - If any DTC is stored, clear it.
    - If the DTC is cleared, finish the procedure because the configuration has been completed normally.
    - If the DTC remains, perform troubleshooting according to the DTC.

2014 - Mazda3 - Body and Accessories

FORWARD SENSING CAMERA (FSC) CONFIGURATION (USING AS-BUILT DATA)

NOTE:

- If the configuration is performed using As-Built data, the set value of the personalization function is reset to the initial value (condition when shipped from factory). Verify the set value with the customer and perform the personalization function setting after performing the configuration using As-Built data.

1. Connect the M-MDS to the DLC-2.
2. After vehicle identification, select the following from the M-MDS initialization screen.
    - “Module programming”
3. Then, select the following from the screen menu.
    - “As-Built”
    - “FSC”
4. Perform As-Built following the instructions on the screen.

CAUTION:

- When the configuration is performed, CAN communication between the FSC and control module connected to the CAN line is cut temporarily, and communication error DTCs may be detected. After performing the configuration, verify the DTCs for the control module connected to the CAN line and clear it if any DTC is detected.

5. Verify the DTCs for all of the control modules connected to the CAN line.
    - If any DTC is stored, clear it.
    - If the DTC is cleared, finish the procedure because the configuration has been completed normally.
    - If the DTC remains, perform troubleshooting according to the DTC.

2014 - Mazda3 - Body and Accessories

LDWS SWITCH REMOVAL/INSTALLATION

NOTE:

- The LDWS switch is integrated with the cluster switch.
- For the LDWS switch removal/installation, refer to CLUSTER SWITCH REMOVAL/INSTALLATION. (See **CLUSTER SWITCH REMOVAL/INSTALLATION**.)

2014 - Mazda3 - Body and Accessories

LDWS SWITCH INSPECTION

NOTE:

- The LDWS switch is integrated with the cluster switch.
- For the LDWS switch removal/installation, refer to CLUSTER SWITCH REMOVAL/INSTALLATION. (See **CLUSTER SWITCH REMOVAL/INSTALLATION**.)

Resistance Inspection

1. Disconnect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)
2. Remove the LDWS switch. (See **LDWS SWITCH REMOVAL/INSTALLATION**.)
3. Measure the resistance between LDWS switches B and C under the following conditions:
    - Resistance with LDWS switch pressed and held
        - 753.89—769.11 ohms
    - Resistance with any switches not pressed
        - 1,139.99—1,163.01 ohms

CIRCUIT WITH LDWS SWITCH PRESSED AND HELD

CIRCUIT WITH ANY SWITCHES NOT PRESSED

- If not within the specification, replace the cluster switch. (See **CLUSTER SWITCH REMOVAL/INSTALLATION**.)

LED Illumination Inspection

1. Disconnect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)

2. Remove the LDWS switch. (See **LDWS SWITCH REMOVAL/INSTALLATION**.)

3. Apply battery positive voltage to LDWS switch terminal J, and connect terminal I to ground.

4. Verify that the LED illuminates.

- If there is any malfunction, replace the cluster switch. (See **CLUSTER SWITCH REMOVAL/INSTALLATION**.)

2014 - Mazda3 - Body and Accessories

ACTIVE AIR SHUTTER LOCATION INDEX

1	Active air shutter (See **ACTIVE AIR SHUTTER REMOVAL/INSTALLATION**.) (See **ACTIVE AIR SHUTTER INSPECTION**.)
2	Active air shutter cover (See **ACTIVE AIR SHUTTER REMOVAL/INSTALLATION**.)

2014 - Mazda3 - Body and Accessories

ACTIVE AIR SHUTTER REMOVAL/INSTALLATION

CAUTION:

- If the active air shutter is disassembled and re-assembled, it may not operate normally. Do not disassemble the active air shutter because it is not designed to be disassembled.

1. Disconnect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)

2. Remove the set plate. (See **SET PLATE REMOVAL/INSTALLATION**.)

3. Remove the front bumper. (See **FRONT BUMPER REMOVAL/INSTALLATION**.)

4. Disconnect the connector.

5. Remove the bolts.

6. Insert the remover tool into the service hole shown in the figure.

7. While moving the remover tool in the direction of arrow (1) shown in the figure, pull the active air shutter in the direction of arrow (2) to detach the tabs of the active air shutter from the shroud panel.

8. Remove the active air shutter.

9. Remove the active air shutter cover. (See **ACTIVE AIR SHUTTER COVER REMOVAL/INSTALLATION**.)

10. Install in the reverse order of removal.

2014 - Mazda3 - Body and Accessories

ACTIVE AIR SHUTTER COVER REMOVAL/INSTALLATION

1. Disconnect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)

2. Remove the set plate. (See **SET PLATE REMOVAL/INSTALLATION**.)

3. Remove the front bumper. (See **FRONT BUMPER REMOVAL/INSTALLATION**.)

4. Remove the active air shutter. (See **ACTIVE AIR SHUTTER REMOVAL/INSTALLATION**.)

5. Remove the screws.

6. While pressing the frame tabs in the direction of arrow (1) shown in the figure, pull the active air shutter cover in the direction of arrow (2) to detach the active air shutter cover from the frame tabs.

7. Detach all tabs and remove the active air shutter cover from the frame.
8. Install in the reverse order of removal.

2014 - Mazda3 - Body and Accessories

ACTIVE AIR SHUTTER INSPECTION

1. Connect the M-MDS to the DLC-2.

2. Perform the KOEO or KOER self-test for the PCM using the M-MDS and verify that PCM DTC P05A0:00, P059F:00, P05C0:00, P05A3:00, or U0284:00 is not output. (See **KOEO/KOER SELF TEST [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)

- If PCM DTC P05A0:00, P059F:00, P05C0:00, P05A3:00, or U0284:00 is output, perform the applicable DTC inspection. (See **DTC TABLE [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)

3. Inspect the active air shutter for foreign material penetration, shutter distortion, sticker adhering, or excessive soiling visually or by touching with a hand.

- If there is any malfunction, repair the malfunctioning location.

4. Using the M-MDS simulation function (simulation item: AIRSHUT_DSD), force operate the active air shutter. (See **ON-BOARD DIAGNOSTIC TEST [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)

NOTE:

- If the active air shutter fully open/closed position learning is not completed, the active air shutter cannot be forcibly operated. If the active air shutter is to be forcibly operated, perform the active air shutter fully open/closed position learning.
- If the active air shutter does not operate, replace the active air shutter. (See **ACTIVE AIR SHUTTER REMOVAL/INSTALLATION**.)

2014 - Mazda3 - Body and Accessories

CONTROL SYSTEM LOCATION INDEX

1	Front body control module (FBCM) (See **FRONT BODY CONTROL MODULE (FBCM) REMOVAL / INSTALLATION**.) (See **FRONT BODY CONTROL MODULE (FBCM) INSPECTION**.) (See **FRONT BODY CONTROL MODULE (FBCM) CONFIGURATION (USING READ / WRITE FUNCTION)**.) (See **FRONT BODY CONTROL MODULE (FBCM) CONFIGURATION (USING AS-BUILT DATA)**.)
2	Rear body control module (RBCM) (See **REAR BODY CONTROL MODULE (RBCM) REMOVAL / INSTALLATION**.) (See **REAR BODY CONTROL MODULE (RBCM) INSPECTION**.) (See **REAR BODY CONTROL MODULE (RBCM) BRACKET REMOVAL / INSTALLATION**.) (See **REAR BODY CONTROL MODULE (RBCM) CONFIGURATION (USING READ / WRITE FUNCTION)**.) (See **REAR BODY CONTROL MODULE (RBCM) CONFIGURATION (USING AS-BUILT DATA)**.) (See **CONTROL SYSTEM PERSONALIZATION FEATURES SETTING PROCEDURE**.)

2014 - Mazda3 - Body and Accessories

FRONT BODY CONTROL MODULE (FBCM) REMOVAL/INSTALLATION

CAUTION:

- If configuration is not performed when the front body control module (FBCM) is replaced with a new one, the vehicle specification information is not stored in the front body control module (FBCM) and the system will not operate normally.
- When performing configuration, it is necessary to read the vehicle specification information from the front body control module (FBCM) before replacing it. Connect the M-MDS to the vehicle and perform vehicle identification before removing the front body control module (FBCM). The vehicle specification information is temporarily stored in the M-MDS.

NOTE:

- The front body control module (FBCM) prior to replacement stores the vehicle specification information.
- A new front body control module (FBCM) does not store any vehicle specification information.
- If the vehicle specification information from the front body control module (FBCM) prior to replacement cannot be read, perform the configuration using As-Built data.

1. When replacing the front body control module (FBCM), perform the configuration. (See **FRONT BODY CONTROL MODULE (FBCM) CONFIGURATION (USING READ/WRITE FUNCTION)**.)

2. Disconnect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)

3. Remove the fuse box cover. (See **RELAY AND FUSE BLOCK REMOVAL/INSTALLATION**.)

4. Insert a remover tool into the position shown in the figure.

5. Move the remover tool in the direction of arrow (1) shown in the figure and lift the front body control module (FBCM) in the direction of arrow (2) to detach its tab from the fuse box.

6. Insert a remover tool into the position shown in the figure.

7. Move the remover tool in the direction of arrow (3) shown in the figure and lift the front body control module (FBCM) in the direction of arrow (4) to detach its tab from the fuse box.

8. Pull the front body control module (FBCM) in the direction of the arrow shown in the figure to remove it from the fuse box.

9. Disconnect the connectors shown in the figure.

10. Install in the reverse order of removal.

NOTE:

- If configuration cannot be performed by reading/writing of the vehicle specification information, perform the configuration using As-Built information after replacing the front body control module (FBCM). (See **FRONT BODY CONTROL MODULE (FBCM) CONFIGURATION (USING AS-BUILT DATA)**.)

2014 - Mazda3 - Body and Accessories

FRONT BODY CONTROL MODULE (FBCM) INSPECTION

1. Remove the fuse box cover. (See **RELAY AND FUSE BLOCK REMOVAL/INSTALLATION**.)

2. Remove the front body control module (FBCM) from the fuse box. (See **FRONT BODY CONTROL MODULE (FBCM) REMOVAL/INSTALLATION**.)

3. Verify that the voltages of each of the terminals are as indicated in the Terminal Voltage Table (Reference). (See **Terminal Voltage Table (Reference)**)

- If the voltage is not as specified in the terminal voltage table (reference), inspect the parts under Inspection item(s) and related wiring harnesses.
  - If the system does not work normally even though the inspection items or related wiring harnesses do not have any malfunction, replace the front body control module (FBCM).

Terminal Voltage Table (Reference)

Terminal	Signal	Connected to	Measurement conditions	Voltage	Inspection item(s)

					(V)	
1A	Power supply	HAZARD 25 A fuse	Under any condition		B+	• HAZARD 25 A fuse • Battery
1B	Power supply	HAZARD 25 A fuse	Under any condition		B+	• HAZARD 25 A fuse • Battery
1C	Ignition power supply	• Climate control unit • Seat warmer control unit • A/C relay	Ignition switched ON (engine off)		B+	• Climate control unit • Seat warmer control unit • A/C relay
			Ignition switched OFF		1.0 or less	
1D	Signal ground	Body ground	Under any condition		1.0 or less	Body ground
1E	Rear turn light (RH) control	• Rear turn light (RH) • Side turn light (RH)	Ignition switched ON (engine off)	Turn switch at right turn light position	1.0 or less B+	• Rear turn light (RH) • Side turn light (RH)
				Turn switch is in position other than above	1.0 or less	
1F	—	—	—		—	—
1G	Front turn light (RH) control	Front turn light (RH)	Ignition switched ON (engine off)	Turn switch at right turn light position	1.0 or less B+	Front turn light (RH)
				Turn switch is in position other than above	1.0 or less	
1H	—	—	—		—	—
1I	License light control	TNS relay	Light switch at TNS position		B+	TNS relay
			Light switch at OFF position		1.0 or less	
1J	—	—	—		—	—
1K	—	—	—		—	—
1L	Horn relay control	Horn relay	Horn switch not pressed		B+	Horn relay
			Horn switch pressed		1.0 or	

					less	
1M	Headlight relay (LO) control	• Headlight LO relay (halogen type) • Headlight LO relay (LH) (discharge type)	Light switch at HEAD position		1.0 or less	• Headlight LO relay (halogen type) • Headlight LO relay (LH) (discharge type)
			Light switch is in position other than above		B+	
1N	—	—	—		—	—
1O*1	Theft-deterrent horn input signal	Rear body control module (RBCM)	M-MDS is connected and theft-deterrent is sounded using data monitor function		1.0 or less	Rear body control module (RBCM)
			M-MDS is connected and theft-deterrent is not sounded using data monitor function		B+	
1P	Rear window defroster relay control	Rear window defroster relay	Ignition switched ON (engine off)	Rear window defroster switch OFF	B+	Rear window defroster relay
				Rear window defroster switch ON	1.0 or less	
1Q	—	—	—		—	—
1R*1	Theft-deterrent horn power supply	R.WIPER 15 A fuse	Under any condition		B+	• R.WIPER 15 A fuse • Battery
1S	—	—	—		—	—
1T*1	Theft-deterrent horn output signal	Theft-deterrent horn	M-MDS is connected and theft-deterrent is sounded using data monitor function		B+	Theft-deterrent horn
			M-MDS is connected and theft-deterrent is not sounded using data monitor function		1.0 or less	
2A	Interior light power supply	ROOM 15 A fuse	Under any condition		B+	• ROOM 15 A fuse • Battery
2B	Front turn light (LH) control	Front turn light (LH)	Ignition switched ON (engine off)	Turn switch at left turn light position	1.0 or less B+	Front turn light (LH)

				Turn switch is in position other than above	1.0 or less	
2C*2	Daytime running light control	• DRL relay (Halogen type) • Front combination light (LH, RH) (Discharge type)	Ignition switched ON (engine off) and light switch OFF	Daytime running light illuminates	B+	• DRL relay (Halogen type) • Front combination light (LH, RH) (Discharge type)
				Daytime running light turns off	1.0 or less	
2D	Rear turn light (LH) control	• Rear turn light (LH) • Side turn light (LH)	Ignition switched ON (engine off)	Turn switch at left turn light position	1.0 or less B+	• Rear turn light (LH) • Side turn light (LH)
				Turn switch is in position other than above	1.0 or less	
2E*7	LIN communication	Current sensor	Terminal used for communication therefore determination based on terminal voltage is not possible.			
2F	—	—	—		—	—
2G*3	LIN communication	Auto-light sensor/rain sensor	Terminal used for communication therefore determination based on terminal voltage is not possible.			
2H	—	—	—		—	—
2I	CAN_L	CAN system related module	Terminal used for communication therefore determination based on terminal voltage is not possible.			
2J*6	LIN communication	Climate control unit	Terminal used for communication therefore determination based on terminal voltage is not possible.			
2K	CAN_H	CAN system related module	Terminal used for communication therefore determination based on terminal voltage is not possible.			
2L	CAN_L	CAN system related module	Terminal used for communication therefore determination based on terminal voltage is not possible.			
2M	Ignition power supply	• Auto-light sensor/rain sensor • C/U IG1 15 A fuse	Ignition switched ON (engine off)		B+	• Auto-light sensor/rain sensor • C/U IG1 15 A fuse
			Ignition switched OFF		1.0 or less	
2N	CAN_L	CAN system related module	Terminal used for communication therefore determination based on terminal voltage is not possible.			
2O	—	—	—		—	—

2P	CAN_H	CAN system related module	Terminal used for communication therefore determination based on terminal voltage is not possible.			
2Q	Brake fluid level switch signal	Brake fluid level sensor	Ignition switched ON (engine off)	Brake fluid level is less than MIN (brake fluid level sensor ON)	1.0 or less	Brake fluid level sensor
				Brake fluid level is MIN or more (brake fluid level sensor OFF)	Wave pattern (See **Pattern 1**.)	
2R	CAN_H	CAN system related module	Terminal used for communication therefore determination based on terminal voltage is not possible.			
2S	Washer level switch signal	Washer fluid-level sensor	Ignition switched ON (engine off)	Washer level is less than MIN (washer fluid-level sensor ON)	1.0 or less	Washer fluid-level sensor
				Washer level is MIN or more (washer fluid-level sensor OFF)	Wave pattern (See **Pattern 1**.)	
2T	—	—	—		—	—
2U	Ignition power supply	Start stop unit	Ignition switched ON (engine off)		B+	Start stop unit
			Ignition switched OFF		1.0 or less	
2V	Headlight relay (LO) control (discharge type)	Headlight LO relay (RH)	Light switch at HEAD position		1.0 or less	Headlight LO relay (RH)
			Light switch is in position other than above		B+	
2W	Headlight (LO) switch signal	Start stop unit	Light switch at HEAD position		1.0 or less	Start stop unit
			Light switch at OFF position		B+

Inspection Using an Oscilloscope (Reference)

Pattern 1

- Terminal:
  - Brake fluid level switch signal: 2Q (+) ground (-)
  - Washer level switch signal: 2S (+) ground (-)
- Oscilloscope setting: 2 V/DIV (Y), 1 ms/DIV (X), DC range

2014 - Mazda3 - Body and Accessories

FRONT BODY CONTROL MODULE (FBCM) CONFIGURATION (USING READ/WRITE FUNCTION)

NOTE:

- When performing configuration, it is necessary to read the vehicle specification information from the front body control module (FBCM) before replacing it. Connect the M-MDS to the vehicle and perform vehicle identification before removing the front body control module (FBCM). The vehicle specification information is temporarily stored in the M-MDS.

1. Connect the M-MDS to the DLC-2.

2. After the vehicle is identified, select the following items from the initialization screen of the M-MDS.

    - Select “Module Programming”.

3. Then, select items from the screen menu in the following order.

    - Select “Programmable Module Installation”.
    - Select “F_BCM”.

4. Perform the configuration according to the directions on the screen.

CAUTION:

- When the configuration is performed, CAN communication between the front body control module (FBCM) and control module connected to the CAN line is cut temporarily, and communication error DTCs may be detected. After performing the configuration, verify the DTCs for the control module connected to the CAN line and clear it if any DTC is detected.

5. Verify the DTCs for all of the control modules connected to the CAN line.

    - If any DTC is stored, clear it.
    - If the DTC is cleared, finish the procedure because the configuration has been completed normally.
    - If the DTC remains, perform troubleshooting according to the DTC.

2014 - Mazda3 - Body and Accessories

FRONT BODY CONTROL MODULE (FBCM) CONFIGURATION (USING AS-BUILT DATA)

NOTE:

- If the configuration is performed using As-Built data, the set value of the personalization function is reset to the initial value (condition when shipped from factory). Verify the set value with the customer and perform the personalization function setting after performing the configuration using As-Built data.

1. Connect the M-MDS to the DLC-2.

2. After the vehicle is identified, select the following items from the initialization screen of the M-MDS.

    - Select “Module Programming”.

3. Then, select items from the screen menu in the following order.

    - Select “As-Built”.
    - Select “F_BCM”.

4. Perform the configuration according to the directions on the screen.

CAUTION:

- When the configuration is performed, CAN communication between the front body control module (FBCM) and control module connected to the CAN line is cut temporarily, and communication error DTCs may be detected. After performing the configuration, verify the DTCs for the control module connected to the CAN line and clear it if any DTC is detected.

5. Verify the DTCs for all of the control modules connected to the CAN line.

    - If any DTC is stored, clear it.
    - If the DTC is cleared, finish the procedure because the configuration has been completed normally.
    - If the DTC remains, perform troubleshooting according to the DTC.

2014 - Mazda3 - Body and Accessories

REAR BODY CONTROL MODULE (RBCM) REMOVAL/INSTALLATION

CAUTION:

- If configuration is not performed when the rear body control module (RBCM) is replaced with a new one, the vehicle specification information is not stored in the rear body control module (RBCM) and the system will not operate normally.
- When performing configuration, it is necessary to read the vehicle specification information from the rear body control module (RBCM) before replacing it. Connect the M-MDS to the vehicle and perform vehicle identification before removing the rear body control module (RBCM). The vehicle specification information is temporarily stored in the M-MDS.

NOTE:

- The rear body control module (RBCM) prior to replacement stores the vehicle specification information.
- A new rear body control module (RBCM) does not store any vehicle specification information.
- If the vehicle specification information from the rear body control module (RBCM) prior to replacement cannot be read, perform the configuration using As-Built data.
- The rear body control module (RBCM) stores personalization setting information. The stored information is not cleared even if the battery power is disconnected.
- Because the personalization setting information stored in the rear body control module (RBCM) cannot be written to a new rear body control module (RBCM), if the rear body control module (RBCM) is replaced, the personalization setting information is at the initial setting. Therefore, before replacing the rear body control module (RBCM), verify the personalization setting information and reset the replaced rear body control module (RBCM) with the information.

1. When replacing the rear body control module (RBCM), perform the configuration. (See **REAR BODY CONTROL MODULE (RBCM) CONFIGURATION (USING READ/WRITE FUNCTION)**.)

2. Disconnect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)

3. Remove the following parts:

   - Rear package tray (5HB only) (See **REAR PACKAGE TRAY REMOVAL/INSTALLATION**.)
   - Trunk covering (5HB only) (See **TRUNK COVERING REMOVAL/INSTALLATION**.)
   - Trunk end trim (5HB only) (See **TRUNK END TRIM REMOVAL/INSTALLATION**.)

4. Pull back the tire house trim (LH) to a position which allows for the removal of the Trunk side upper trim (LH). (5HB only) (See **TIRE HOUSE TRIM REMOVAL/INSTALLATION**.)

5. Remove the trunk side upper trim (LH). (5HB only) (See **TRUNK SIDE UPPER TRIM REMOVAL/INSTALLATION**.)

6. Pull back the trunk side trim (LH) to a position which allows for the removal of the rear body control module (RBCM). (See **TRUNK SIDE TRIM REMOVAL/INSTALLATION**.)

7. While pressing the rear body control module (RBCM) tab in the direction of arrow (1) shown in the figure, pull it in the direction of arrow (2) to detach the tab from the body.

REAR BODY CONTROL MODULE (RBCM) REMOVAL/INSTALLATION

5HB

8. Pull the rear body control module (RBCM) up in the direction of the arrow to detach the hook from the body.

9. Disconnect the connectors shown in the figure.

10. Remove the rear body control module (RBCM).

11. Install in the reverse order of removal.

NOTE:

- If configuration cannot be performed by reading/writing of the vehicle specification information, perform the configuration using As-Built information after replacing the rear body control module (RBCM). (See **REAR BODY CONTROL MODULE (RBCM) CONFIGURATION (USING AS-BUILT DATA)**.)

2014 - Mazda3 - Body and Accessories

REAR BODY CONTROL MODULE (RBCM) INSPECTION

1. Disconnect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)

2. Remove the following parts:

- Rear package tray (5HB only) (See **REAR PACKAGE TRAY REMOVAL/INSTALLATION**.)
- Trunk covering (5HB only) (See **TRUNK COVERING REMOVAL/INSTALLATION**.)
- Trunk end trim (5HB only) (See **TRUNK END TRIM REMOVAL/INSTALLATION**.)
- Rear seat cushion (5HB only) (See **REAR SEAT CUSHION REMOVAL/INSTALLATION**.)
- Rear scuff plate (LH) (5HB only) (See **REAR SCUFF PLATE REMOVAL/INSTALLATION**.)
- Tire house trim (LH) (5HB only) (See **TIRE HOUSE TRIM REMOVAL/INSTALLATION**.)
- Trunk side upper trim (LH) (5HB only) (See **TRUNK SIDE UPPER TRIM REMOVAL/INSTALLATION**.)
- Trunk side trim (LH) (See **TRUNK SIDE TRIM REMOVAL/INSTALLATION**.)

3. Remove the rear body control module (RBCM) from the body with the connector connected. (See **REAR BODY CONTROL MODULE (RBCM) REMOVAL/INSTALLATION**.)

4. Connect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)

5. Verify that the voltages of each of the terminals are as indicated in the Terminal Voltage Table (Reference). (See **Terminal Voltage Table (Reference)**)

- If the voltage is not as specified in the terminal voltage table (reference), inspect the parts under Inspection item(s) and related wiring harnesses.
    - If the system does not work normally even though the inspection items or related wiring harnesses do not have any malfunction, replace the rear body control module (RBCM).

Terminal Voltage Table (Reference)

Terminal	Signal	Connected to	Measurement conditions	Voltage (V)	Inspection item(s)
1A	—	—	—	—	—
1B	Interior light ground	• Front map light • Vanity mirror illumination (LH, RH)*1	Under any condition	1.0 or less	• Front map light • Vanity mirror illumination (LH, RH)*1
1C	—	—	—	—	—
1D	—	—	—	—	—
1E	Interior light control	Front map light	Under any condition	1.0 or less	Front map light
1F	—	—	—	—	—
1G	—	—	—	—	—
		• Front map light			• Front map light

1H	Interior light power supply	• Rear map light • Vanity mirror illumination (LH, RH)*1	Under any condition	B+	• Rear map light • Vanity mirror illumination (LH, RH)*1
2A	—	—	—	—	—
2B	Power supply	D.LOCK 25 A fuse	Under any condition	B+	• D.LOCK 25 A fuse • Battery
2C	Door lock control	Door lock actuator	Lock driver-side door lock switch from unlock	1.0 or less → B+ → 1.0 or less	Door lock actuator
			Unlock driver-side door lock switch from lock	1.0 or less	
2D	Trunk lid opener switch signal (interior)	Trunk lid opener switch (interior)	Trunk lid opener switch (interior) pressed	1.0 or less	Trunk lid opener switch (interior)
			Trunk lid opener switch (interior) not pressed	B+	
2E	Door unlock control	Door lock actuator (driver's door)	Unlock driver-side door lock switch from lock	1.0 or less → B+ → 1.0 or less	Door lock actuator (driver's door)
			Lock driver-side door lock switch from unlock	1.0 or less	
2F*2	Theft-deterrent horn relay control	Front body control module (FBCM)	Connected to M-MDS and using data monitor function, theft-deterrent sound activates	1.0 or less	Front body control module (FBCM)
			Connected to M-MDS and using data monitor function, theft-deterrent sound does not activate	B+	
2G	Double locking system control	Door lock actuator (except driver's door)	Press transmitter lock button two times (double locking system operation condition)	B+ → 1.0 or less	Door lock actuator (except driver's door)
			Except above	1.0 or less	
2H*4	Brake light control	Brake light relay	Connect the M-MDS and turn on the "STOP_LMP_CS" using the rear body control module (RBCM) simulation function	1.0 or less	Brake light relay*4
			Connect the M-MDS and turn off the "STOP_LMP_CS" using the rear body	B+	

			control module (RBCM) simulation function		
2I	Ignition power supply	METER1 10 A fuse	Ignition switched ON (engine off)	B+	• METER1 10 A fuse • Battery
			Ignition switched OFF	1.0 or less	
2J*4	Brake switch signal	• Start stop unit • Brake switch • PCM • Brake light relay	Brake pedal depressed	B+	• Start stop unit • Brake switch • PCM • Brake light relay
			Brake pedal not depressed	1.0 or less	
2K	—	—	—	—	—
2L	—	—	—	—	—
2M	Power supply	R.WIPER 15 A fuse	Under any condition	B+	• R.WIPER 15 A fuse • Battery
2N	—	—	—	—	—
2O	—	—	—	—	—
2P	Power supply	ROOM 15 A fuse	Under any condition	B+	• ROOM 15 A fuse • Battery
3A	—	—	—	—	—
3B	ISO communication	Start stop unit	Terminal used for communication therefore determination based on terminal voltage is not possible.		
3C	Fuel sensor ground	Fuel gauge sender unit	Under any condition	1.0 or less	Fuel gauge sender unit
3D	Serial communication	Power window main switch	Terminal used for communication therefore determination based on terminal voltage is not possible.		
3E	CAN_H	CAN system related module	Terminal used for communication therefore determination based on terminal voltage is not possible.		
3F	Door lock switch signal	Door lock switch (LH, RH)	Door lock switch unlocked	1.0 or less	Door lock switch (LH, RH)
			Other	4.5	
			Door lock switch locked	2.2	
3G	CAN_L	CAN system related module	Terminal used for communication therefore determination based on terminal voltage is not possible.		

3H	Driver-side door key cylinder switch signal	Door key cylinder switch	Door key cylinder is turned to unlock side	1.0 or less	Door key cylinder switch
			Other	4.5	
			Door key cylinder is turned to lock side	2.2	
3I	Fuel sensor signal	Fuel gauge sender unit	Inspect the fuel gauge sender unit and related wiring harnesses because the terminal voltage at this terminal cannot be examined. (See **FUEL GAUGE SENDER UNIT INSPECTION**.)		
3J	Lock input (lock-link switch (passenger's side, rear door))	Door lock-link switch (passenger's side, rear door)	The passenger-side and rear doors are all locked	4.6	Door lock-link switch (passenger's side, rear door)
			Among the passenger-side and rear doors, at least one door is unlocked	1.0 or less	
3K	—	—	—	—	—
3L*3	Hood latch switch signal	Hood latch switch	Hood open (Hood latch switch OFF)	4.6	Hood latch switch
			Hood is closed (Hood latch switch ON)	1.0 or less	
3M	Unlock input (front door lock-link switch (driver's door))	Door lock-link switch (driver's door)	Driver's door locked	4.6	Door lock-link switch (driver's door)
			Driver's door unlocked	1.0 or less	
3N	—	—	—	—	—
3O	Lock input (front door lock-link switch (driver's door))	• Door lock-link switch (driver's door) • Start stop unit	Driver's door locked	1.0 or less	• Door lock-link switch (driver's door) • Start stop unit
			Driver's door unlocked	4.6	
3P	—	—	—	—	—
3Q	Rear door switch (RH) signal	Door latch switch (RR)	Rear door (RH) open	1.0 or less	Rear door switch (RH)
			Rear door (RH) closed	B+	
3R	—	—	—	—	—
3S	Rear door switch (LH)	Door latch switch (LR)	Rear door (LH) open	1.0 or less	Rear door switch (LH)

	signal		Rear door (LH) closed	B+	
3T	—	—	—	—	—
3U	Front door switch (passenger's door) signal	Door latch switch (passenger's door)	Front door (passenger's door) open	1.0 or less	Front door switch (passenger's door)
			Front door (passenger's door) closed	B+	
3V	—	—	—	—	—
3W	Front door switch (driver's door) signal	Door latch switch (driver's door)	Front door (driver's door) open	1.0 or less	Front door switch (driver's door)
			Front door (driver's door) closed	B+	
3X	—	—	—	—	—
4A	Rear window wiper motor power supply	Rear wiper motor	Ignition switched ON (engine off)	B+	Rear wiper motor
			Ignition switched OFF	1.0 or less	
4B	Power ground	Body ground	Under any condition	1.0 or less	• Body ground
4C	Trunk lid release / Liftgate lock actuator control	• Liftgate lock actuator (5HB) • Trunk lid opener (4SD)	• Press liftgate opener switch (5HB) • Press trunk lid opener switch (4SD)	B+ → 1.0 or less	• Liftgate lock actuator (5HB) • Trunk lid opener (4SD)
			Except above	1.0 or less	
4D*4	Brake light control	Brake light relay	Brake pedal is depressed or PID/data monitor command STOP_LMP_CS is on	B+	Brake light relay*4
			Brake pedal not depressed	1.0 or less	
4E	—	—	—	—	—
4F	Cargo compartment light power supply	• Cargo compartment light (5HB) • Trunk compartment light (4SD)	Under any condition	B+	• Cargo compartment light (5HB) • Trunk compartment light (4SD)
4G	CAN_H	CAN system related module	Terminal used for communication therefore determination based on terminal voltage is not possible.		
4H	—	—	—	—	—

4I	—	—	—		—	—
4J	CAN_L	CAN system related module	Terminal used for communication therefore determination based on terminal voltage is not possible.			
4K	Trunk lid / liftgate latch switch signal	• Liftgate lock actuator (5HB) • Trunk lid opener (4SD)	• Liftgate open (5HB) • Trunk lid open (4SD)		1.0 or less	• Liftgate lock actuator (5HB) • Trunk lid opener (4SD)
			• Liftgate closed (5HB) • Trunk lid (4SD)		B+	
4L	—	—	—		—	—
4M	Liftgate opener switch signal (5HB)	Liftgate opener switch	Liftgate opener switch pressed		1.0 or less	• Liftgate opener switch (5HB) • Trunk lid opener switch (4SD)
			Liftgate opener switch not pressed		4.5	
	Trunk lid opener switch signal (exterior) (4SD)	Trunk lid opener switch (exterior)	Trunk lid opener switch (exterior) pressed		1.0 or less	
			Trunk lid opener switch (exterior) not pressed		4.5	
4N	—	—	—		—	—
4O	—	—	—		—	—
4P	Cargo compartment light control	Cargo compartment light (5HB)	Cargo compartment light switched ON	Liftgate open	1.0 or less	Cargo compartment light (5HB)
				Liftgate closed	B+	
	Trunk compartment light control	Trunk compartment light (4SD)	Trunk lid open		1.0 or less	
			Trunk lid closed		B+	
4Q	—	—	—		—	—
4R	Signal ground	Body ground	Under any condition		1.0 or less	Body ground
4S	Back-up light control	• Back-up light (LH, RH) • Auto dimming mirror	Ignition switched ON (engine off)	• Selector lever at R position (AT vehicle) • Shift lever at R position (MT vehicle)	B+	• Back-up light switch • Auto dimming mirror

				Other	1.0 or less	
4T	Rear wiper motor control (LO)	Rear wiper motor	Ignition switched ON (engine off)	Turn rear wiper switch ON and wiper is operated	1.0 or less	Rear wiper motor
				Rear wiper switch at OFF	B+

2014 - Mazda3 - Body and Accessories

REAR BODY CONTROL MODULE (RBCM) BRACKET REMOVAL/INSTALLATION

1. Disconnect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)

2. Remove the following parts:

    - Rear package tray (See **REAR PACKAGE TRAY REMOVAL/INSTALLATION**.)
    - Trunk covering (See **TRUNK COVERING REMOVAL/INSTALLATION**.)
    - Trunk end trim (See **TRUNK END TRIM REMOVAL/INSTALLATION**.)
    - Rear seat cushion (See **REAR SEAT CUSHION REMOVAL/INSTALLATION**.)
    - Rear seat back (See **REAR SEAT BACK REMOVAL/INSTALLATION**.)
    - Rear scuff plate (LH) (See **REAR SCUFF PLATE REMOVAL/INSTALLATION**.)
    - Tire house trim (LH) (See **TIRE HOUSE TRIM REMOVAL/INSTALLATION**.)
    - Trunk side upper trim (LH) (See **TRUNK SIDE UPPER TRIM REMOVAL/INSTALLATION**.)
    - Trunk side trim (LH) (See **TRUNK SIDE TRIM REMOVAL/INSTALLATION**.)
    - Rear body control module (RBCM) (See **REAR BODY CONTROL MODULE (RBCM) REMOVAL/INSTALLATION**.)

3. Remove the bolts.

4. Remove the screw.

5. Remove the rear body control module (RBCM) bracket.

6. Install in the reverse order of removal.

2014 - Mazda3 - Body and Accessories

REAR BODY CONTROL MODULE (RBCM) CONFIGURATION (USING READ/WRITE FUNCTION)

NOTE:

- When performing configuration, it is necessary to read the vehicle specification information from the rear body control module (RBCM) before replacing it. Connect the M-MDS to the vehicle and perform vehicle identification before removing the rear body control module (RBCM). The vehicle specification information is temporarily stored in the M-MDS.

1. Connect the M-MDS to the DLC-2.

2. After the vehicle is identified, select the following items from the initialization screen of the M-MDS.

    - Select “Module Programming”.

3. Then, select items from the screen menu in the following order.

    - Select “Programmable Module Installation”.
    - Select “R_BCM”.

4. Perform the configuration according to the directions on the screen.

CAUTION:

- When the configuration is performed, CAN communication between the rear body control module (RBCM) and control module connected to the CAN line is cut temporarily, and communication error DTCs may be detected. After performing the configuration, verify the DTCs for the control module connected to the CAN line and clear it if any DTC is detected.

5. Verify the DTCs for all of the control modules connected to the CAN line.

    - If any DTC is stored, clear it.
    - If the DTC is cleared, finish the procedure because the configuration has been completed normally.
    - If the DTC remains, perform troubleshooting according to the DTC.

2014 - Mazda3 - Body and Accessories

REAR BODY CONTROL MODULE (RBCM) CONFIGURATION (USING AS-BUILT DATA)

NOTE:

- If the configuration is performed using As-Built data, the set value of the personalization function is reset to the initial value (condition when shipped from factory). Verify the set value with the customer and perform the personalization function setting after performing the configuration using As-Built data.

1. Connect the M-MDS to the DLC-2.

2. After the vehicle is identified, select the following items from the initialization screen of the M-MDS.

    - Select “Module Programming”.

3. Then, select items from the screen menu in the following order.

    - Select “As-Built”.
    - Select “R_BCM”.

4. Perform the configuration according to the directions on the screen.

CAUTION:

- When the configuration is performed, CAN communication between the rear body control module (RBCM) and control module connected to the CAN line is cut temporarily, and communication error DTCs may be detected. After performing the configuration, verify the DTCs for the control module connected to the CAN line and clear it if any DTC is detected.

5. Verify the DTCs for all of the control modules connected to the CAN line.

    - If any DTC is stored, clear it.
    - If the DTC is cleared, finish the procedure because the configuration has been completed normally.
    - If the DTC remains, perform troubleshooting according to the DTC.

2014 - Mazda3 - Body and Accessories

CONTROL SYSTEM PERSONALIZATION FEATURES SETTING PROCEDURE

Security And Locks

Power door lock system (Using M-MDS)

1. Connect the M-MDS to DLC-2.
2. After the vehicle is identified, select the following items from the initial screen of the M-MDS.
    - Select the “Module Programming”.
    - Select “Programmable Parameters”.
    - Select menu in the R_BCM.
3. Select an item name, and then select option.

M-MDS display	Function	Initial setting	Setting contents	Control unit
Auto Door Lock Mode.	Auto door lock function can be changed.	Lock: Driving, Unlock: IGN Off.	Not Adopted./OFF/Lock When Driving./Lock: Driving, Unlock: IGN Off./Lock When Shifting Out Of P./Lock: Shift From P, Unlock: In P.	Rear body control module (RBCM)

Power door lock system (Using center display)

- (See **CENTER DISPLAY PERSONALIZATION FEATURES SETTING PROCEDURE**.)

Lighting Systems

Turn light system (Using M-MDS)

1. Connect the M-MDS to DLC-2.
2. After the vehicle is identified, select the following items from the initial screen of the M-MDS.

- Select the “Module Programming”.
- Select “Programmable Parameters”.
- Select menu in the R_BCM.

3. Select an item name, and then select option.

M-MDS display	Function	Initial setting	Setting contents	Control unit
3-Flash Turn Signal.	The turn light system can be switched between operable and inoperable.	OFF	Not Adopted./OFF/ON	Rear body control module (RBCM)

Turn light system (Using center display)

- (See **CENTER DISPLAY PERSONALIZATION FEATURES SETTING PROCEDURE**.)
- Turn light system

Auto light system (Using M-MDS)

1. Connect the M-MDS to DLC-2.
2. After the vehicle is identified, select the following items from the initial screen of the M-MDS.
   - Select the “Module Programming”.
   - Select “Programmable Parameters”.
   - Select menu in the R_BCM.
3. Select an item name, and then select option.

M-MDS display	Function	Initial setting	Setting contents	Control unit
Auto-headlight On.	Auto light sensor sensitivity can be changed.	Medium	Not Adopted./Dark/Medium Dark/Medium/Medium Light/Light	Rear body control module (RBCM)

Auto light system (Using center display)

- (See **CENTER DISPLAY PERSONALIZATION FEATURES SETTING PROCEDURE**.)

Auto light-off system (Using M-MDS)

1. Connect the M-MDS to DLC-2.
2. After the vehicle is identified, select the following items from the initial screen of the M-MDS.
    - Select the “Module Programming”.
    - Select “Programmable Parameters”.
    - Select menu in the R_BCM.
3. Select an item name, and then select option.

M-MDS display	Function	Initial setting	Setting contents	Control unit
Headlight Off Timer.	The headlight emitted time of the auto light off timer can be changed.	30 seconds.	Not Adopted./0 seconds./30 seconds./60 seconds./90 seconds./120 seconds.	Rear body control module (RBCM)

Auto light-off system (Using center display)

- (See **CENTER DISPLAY PERSONALIZATION FEATURES SETTING PROCEDURE**.)

Room light control system (Using M-MDS)

1. Connect the M-MDS to DLC-2.
2. After the vehicle is identified, select the following items from the initial screen of the M-MDS.
    - Select the “Module Programming”.
    - Select “Programmable Parameters”.
    - Select menu in the R_BCM.
3. Select an item name, and then select option.

M-MDS display	Function	Initial setting	Setting contents	Control unit
Interior Light Timeout-Door	• The front/rear map light and courtesy light illumination time after any door is opened can be changed.	30	Not Adopted./30 minutes./60	Rear body control

Open.	• The trunk compartment light illumination time after the trunk lid is opened can be changed.	minutes.	minutes./10 minutes.	module (RBCM)
Interior Light Timeout-Door Closed.	The front/rear map light and courtesy light illumination time after all the doors are closed can be changed.	15 seconds.	Not Adopted./15 seconds./7.5 seconds./30 seconds./60 seconds.	Rear body control module (RBCM)

Room light control system (Using center display)

- (See **CENTER DISPLAY PERSONALIZATION FEATURES SETTING PROCEDURE**.)

Wiper/washer System

Auto wiper system (Using M-MDS)

1. Connect the M-MDS to DLC-2.
2. After the vehicle is identified, select the following items from the initial screen of the M-MDS.
    - Select the “Module Programming”.
    - Select “Programmable Parameters”.
    - Select menu in the R_BCM.
3. Select an item name, and then select option.

M-MDS display	Function	Initial setting	Setting contents	Control unit
Rain Sensing Wipers.	Auto wiper system can be set to operable or inoperable.	On (Rein Sensing)	Not Adopted./Off (Intermittent)/On (Rein Sensing)	Rear body control module (RBCM)

Auto wiper system (Using center display)

- (See **CENTER DISPLAY PERSONALIZATION FEATURES SETTING PROCEDURE**.)

CONTROL SYSTEM PERSONALIZATION FEATURES SETTING PROCEDURE

2014 - Mazda3 - Body and Accessories

BODY AND ACCESSORIES TECHNICAL DATA

Item			Spec (W) × Quantity
Exterior	Headlight LO bulb	Halogen type	55 × 2
	Headlight HI bulb		60 × 2
	Headlight HI/LO bulb	Discharge type	35 × 2
	Front side marker light/parking light bulb (without discharge headlight system)		5 × 2
	Front side marker light bulb (with discharge headlight system)		5 × 2
	Parking light/DRL (LED)*1 (with discharge headlight system)		4 / 14
	Front turn light bulb		21 × 2
	Front fog light bulb		55 × 2
	Side turn light (LED)		0.6
	Rear turn light bulb		21 × 2
	Brake light/rear side marker light/taillight	Bulb type	21 / 5 × 2
		LED type*2	2.7 / 2.1
	Back-up light bulb	4SD	18 × 2
		5HB	21 × 2
	Taillight (LED) (trunk lid light (4SD)/liftgate light (5HB))		1.3
		Rear window glass: Clear glass (4SD)	1.8

	High-mount brake light (LED)	Rear window glass: Dark tinted glass (4SD)	2.4
		5HB	1.8
	License plate light bulb		5 × 2
Interior	Front map light bulb	Dual light type	8 × 2
		Single light type	10 × 1
	Rear map light bulb		10 × 1
	Trunk compartment light bulb (4SD)		3 × 1
	Cargo compartment light bulb (5HB)		5 × 1
	Vanity mirror illumination bulb		2 × 2

*1

The LED for the parking light cannot be replaced separately. If there is any malfunction in the LED, replace the front combination light as a single unit.

*2

The LED for the LED type brake light/rear side marker light/taillight cannot be replaced separately. If there is any malfunction in the LED, replace the rear combination light as a single unit.

2014 - Mazda3 - Multiplex Communication System

FOREWORD

- If there is any vehicle malfunction complaint lodged by a customer, perform malfunction diagnosis according to the troubleshooting procedure. (See **Troubleshooting Procedure**.)

Troubleshooting Procedure

MALFUNCTIONING VEHICLE ARRIVES
VERIFY REPAIR ORDER AND SYMPTOM.
ACCURATELY VERIFY CUSTOMER COMPLAINT IN REPAIR ORDER FORM.
VERIFY SERVICE INFORMATION.
BROWSE TECHNICAL INFORMATION AND SEARCH SERVICE INFORMATION.
DOES ANY SERVICE INFORMATION MATCH SYMPTOM AND CAUSE?
YES
VERIFY MALFUNCTION USING MALFUNCTION VERIFICATION PROCEDURE IN SERVICE INFORMATION, AND REPAIR ACCORDING TO SERVICE INFORMATION.
NO
DOES MALFUNCTION RECUR?
NO
SEE ACTION FOR NON-REPEATABLE MALFUNCTION.
YES
VERIFY MALFUNCTION SYMPTOM.
VERIFY MALFUNCTION SYMPTOM ON ACTUAL VEHICLE.
PERFORM CAN MALFUNCTION DIAGNOSIS.
SEE "CAN MALFUNCTION DIAGNOSIS FLOW"*1 AND PERFORM DIAGNOSIS FOR CAN RELATED MALFUNCTION.
PERFORM DTC INSPECTION.
INSPECT FOR ANY DTCs USING M-MDS.
ARE ANY DTCs OUTPUT?
YES
SEE ON-BOARD DIAGNOSIS SYSTEM AND PERFORM DTC TROUBLESHOOTING.
NO
SYMPTOM TROUBLESHOOTING
USE M-MDS FUNCTIONS ON THE RIGHT TO PERFORM DIAGNOSIS EFFICIENTLY.
PID/DATA MONITOR INSPECTION
USE M-MDS DATA MONITOR FUNCTION TO PERFORM INSPECTION WHILE MONITORING INPUT/OUTPUT SIGNALS.
ACTIVE COMMAND MODES INSPECTION
USE M-MDS SIMULATION FUNCTION TO INSPECT FOR INCOMPLETE ELECTRICAL CIRCUIT OR VALVE STICKING WHILE OPERATING EACH OUTPUT PART WITH THE IGNITION SWITCHED ON.
VERIFY MALFUNCTION IS REPAIRED.
SERVICE COMPLETED

*1

(See CONTROLLER AREA NETWORK (CAN) MALFUNCTION DIAGNOSIS FLOW.)

Action for non-repeatable malfunction

- If the malfunction does not recur, verify the malfunction cause by performing the following actions:
  - Based on the repair order form, attempt to drive the vehicle or perform tests to replicate the malfunction, record the data (such as CAN circuit voltage) at that time, and detect the malfunction cause.
  - Refer to [Determining Open Circuit Location] based on the recorded DTC, shake the wiring harness or connector of the electrical component which is suspected to be the cause of the malfunction, and inspect for any changes in CAN system voltage or occurrence of any DTCs.

  - Inspect the female terminals on the connector of the electric component which is suspected to be the cause of the malfunction for poor connection.

Next >

2014 - Mazda3 - Multiplex Communication System

CONTROLLER AREA NETWORK (CAN) MALFUNCTION DIAGNOSIS FLOW

- If there is any vehicle malfunction complaint lodged by a customer, refer to “FOREWORD” and perform CAN malfunction diagnosis following the steps in the troubleshooting procedure. (See **FOREWORD**.)

CAN malfunction diagnosis flow

NOTE:

- The flowchart and the diagnosis flow of the diagnosis procedure are the same thing, and the detailed procedure of the flowchart is the diagnosis procedure.
- The step numbers in the flowchart indicate the step numbers of the diagnosis procedure.

Flowchart

Diagnostic procedure

Step	Inspection		Action
1	**INSPECT IF COMMUNICATION BETWEEN M-MDS AND PCM IS POSSIBLE** • Connect the M-MDS to the DLC-2. • Switch the ignition ON (engine off). • Perform vehicle identification. • Can the vehicle be identified?	Yes	Go to the next step.
		No	Go to Step 5 as a malfunction in the HS-CAN circuit has occurred.
2	**INSPECT MODULE FOR INABILITY TO COMMUNICATE DUE TO CAN MALFUNCTION** • Implement the network test using the M-MDS. (See **NETWORK TEST**.) • Is there a module indicating a malfunction?	Yes	Go to Step 12 as a malfunction in the CAN circuit has occurred.
		No	Go to the next step.
3	**INSPECT FOR SHORT TO POWER SUPPLY IN CAN_H SIDE OF MS-CAN OR HS-CAN** • Measure the voltage between the following terminals: ▪ Between DLC-2 terminal F (CAN_H side of HS CAN) and body ground ▪ Between DLC-2 terminal L (CAN_H side of MS CAN) and body ground • Is B+ voltage measured between any of the terminals? **NOTE:** • If a short to power supply other than the B+ power supply has occurred, a constant voltage other than	Yes	A short to power supply in the CAN_H side of MS-CAN or HS-CAN. Determine the location of the short to power supply according to the diagnosis procedure for determining the location of a short to power supply. (See **DETERMINING SHORT TO POWER SUPPLY LOCATION (HS-CAN)**.) (See **DETERMINING SHORT TO POWER SUPPLY LOCATION (MS-CAN)**.)
		No	Go to the next step.

	B+ can be measured.		
4	**INSPECT FOR SHORT TO GROUND IN CAN_L SIDE OF HS-CAN OR MS-CAN** • Measure the voltage between the following terminals: ▪ Between DLC-2 terminal E (CAN_L side of HS-CAN) and ground ▪ Between DLC-2 terminal K (CAN_L side of MS-CAN) and ground • Is the voltage measured as 0 V?	Yes	A short to ground on the CAN_L side of the HS-CAN or MS-CAN has occurred. Determine the location of the short to ground according to the diagnosis procedure for determining the location of a short to ground. (See **DETERMINING SHORT TO GROUND LOCATION (HS-CAN)**.) (See **DETERMINING SHORT TO GROUND LOCATION (MS-CAN)**.)
		No	The current CAN circuit is normal, return to FOREWARD, and go to the next step of the CAN malfunction diagnosis in the troubleshooting procedure. (See **FOREWORD**.)
5	**VERIFY IF PUSH BUTTON START SYSTEM HAS MALFUNCTION** • Switch the ignition ON (engine off). • Can the ignition be switched ON?	Yes	Go to the next step.
		No	A malfunction in the push button start system has occurred. Perform diagnosis according to the symptom troubleshooting.
6	**INSPECT FOR MALFUNCTION IN M-MDS** • Connect the M-MDS to a normal vehicle and implement vehicle identification. • Can the vehicle be identified?	Yes	Go to the next step.
		No	A malfunction in the M-MDS can be considered. Repair the M-MDS.
7	**INSPECT HS-CAN FOR SHORT TO POWER SUPPLY** • Measure the voltage between the following terminals: ▪ Between DLC-2 terminal F (CAN_H side) and body ground ▪ Between DLC-2 terminal E (CAN_L side) and body ground • Is B+ voltage measured between any of the terminals? **NOTE:** ▪ If a short to power supply other than the B+ power supply has occurred, a constant voltage other than B+ can be measured.	Yes	A short to power supply in the CAN_H side or CAN_L of HS-CAN has occurred. Determine the location of the short to power supply according to the diagnosis procedure for determining the location of a short to power supply. (See **DETERMINING SHORT TO POWER SUPPLY LOCATION (HS-CAN)**.)
		No	Go to the next step.
8	**INSPECT HS-CAN FOR OPEN CIRCUIT** • Measure the voltage between the following terminals: ▪ Between DLC-2 terminal F (CAN_H side) and body ground ▪ Between DLC-2 terminal E (CAN_L side) and body ground • Is the voltage between both terminals (CAN_H side and CAN_L side) equal?	Yes	Go to Step 11 as a short to ground or a short between circuits has occurred in the HS-CAN.
		No	Go to the next step.
9	**DETERMINE IF OPEN CIRCUIT LOCATION IN HS-CAN CIRCUIT IS BETWEEN DLC AND CONNECTOR C-33 OR ELSEWHERE** • Start the engine to verify that the immobilizer system operates normally. • Can the engine be started? **NOTE:**	Yes	Go to the next step.
		No	An open circuit has occurred between the PCM and connector C-33 in the HS-CAN. Determine the location of the open circuit according to the diagnosis procedure for determining the location of an open circuit.

	• If there is an open circuit in the wiring harness between the PCM and the start stop unit, the engine cannot be started because the key ID number verification for the immobilizer system is performed by CAN communication.		(See **DETERMINING OPEN CIRCUIT LOCATION (HS-CAN)**.)
10	**DETERMINE IF OPEN CIRCUIT LOCATION IN HS-CAN CIRCUIT IS BETWEEN DLC AND CONNECTOR C-33 OR ELSEWHERE** • Switch the ignition ON (engine off). • Verify if the check engine light in the instrument cluster illuminates. • Start the engine. • Verify if the check engine light turns off. • Does the check engine light turn off?	Yes	An open circuit between DLC-2 and connector C-33 has occurred. Repair or replace the wiring harness for an open circuit, then return to Step 1.
		No	An open circuit has occurred between the PCM and connector C-33 in the HS-CAN. Determine the location of the open circuit according to the diagnosis procedure for determining the location of an open circuit. (See **DETERMINING OPEN CIRCUIT LOCATION (HS-CAN)**.)
11	**VERIFY MALFUNCTION OCCURRED IN HS-CAN CIRCUIT** • Measure the voltage between the following terminals: ▪ Between DLC-2 terminal F (CAN_H side) and body ground ▪ Between DLC-2 terminal E (CAN_L side) and body ground • Is the voltage between both terminals (CAN_H side and CAN_L side) 0 V?	Yes	A short to ground in CAN_H side of HS-CAN has occurred. Determine the location of the short to ground according to the diagnosis procedure for determining the location of a short to ground. (See **DETERMINING SHORT TO GROUND LOCATION (HS-CAN)**.)
		No	A short between circuits in the CAN_H side and the CAN_L side of HS-CAN has occurred. Determine the location of the short between circuits according to the diagnosis procedure for determining the location of a short between circuits. (See **DETERMINING SHORT BETWEEN CIRCUITS LOCATION (HS-CAN)**.)
12	**DETERMINE CAN COMMUNICATION SPECIFICATION IN WHICH MALFUNCTION OCCURS** • Refer to the CAN communication specification quick reference table and verify the CAN communication specification (HS-CAN or MS-CAN) that is connected to the module which is indicating a malfunction. (See **CAN communication specification quick reference table**.) • Is the module that is indicating a malfunction HS-CAN?	Yes	An open circuit in the HS-CAN has occurred. Determine the location of the open circuit according to the diagnosis procedure for determining the location of an open circuit. (See **DETERMINING OPEN CIRCUIT LOCATION (HS-CAN)**.)
		No	Go to the next step.
13	**INSPECT CAN_L SIDE OF MS-CAN FOR SHORT TO POWER SUPPLY** • Measure voltage between DLC-2 terminal K (CAN_L side) and body ground. • Can B+ voltage be measured? **NOTE:** • If a short to power supply other than the B+ power supply has occurred, a constant voltage other than B+ can be measured.	Yes	A short to power supply in the CAN_L side of the MS-CAN has occurred. Determine the location of the short to power supply according to the diagnosis procedure for determining the location of a short to power supply. (See **DETERMINING SHORT TO POWER SUPPLY LOCATION (MS-CAN)**.)
		No	Go to the next step.
14	**INSPECT MS-CAN FOR OPEN CIRCUIT** • Measure the voltage between the following terminals: ▪ Between DLC-2 terminal L (CAN_H side) and body ground	Yes	Go to the next step.
		No	Open circuit in MS-CAN has occurred. Determine the location of the open circuit

	Between DLC-2 terminal K (CAN_L side) and body ground • Is the voltage between both terminals (CAN_H side and CAN_L side) equal?		according to the diagnosis procedure for determining the location of an open circuit. (See **DETERMINING OPEN CIRCUIT LOCATION (MS-CAN)**.)
15	**VERIFY MALFUNCTION OCCURRED IN MS-CAN** • Measure the voltage between the following terminals: ▪ Between DLC-2 terminal L (CAN_H side) and body ground ▪ Between DLC-2 terminal K (CAN_L side) and body ground • Is the voltage between both terminals (CAN_H side and CAN_L side) equal?	Yes	A short to ground in the CAN_H side of the MS-CAN has occurred. Determine the location of the short to ground according to the diagnosis procedure for determining the location of a short to ground. (See **DETERMINING SHORT TO GROUND LOCATION (MS-CAN)**.)
		No	A short between circuits on the CAN_H side and CAN_L side of MS-CAN has occurred. Determine the location of the short between circuits according to the diagnosis procedure for determining the location of a short between circuits. (See **DETERMINING SHORT BETWEEN CIRCUITS LOCATION (MS-CAN)**.)

HS-CAN signal waveform

CAN circuit condition	Signal waveform (reference)
Normal		• CAN_H ▪ Connection terminal: DLC-2: terminal F (+) ↔ body ground (—) ▪ Oscilloscope setting: 0.5 V/DIV (Y), 200 µs/DIV (X), DC range • CAN_L ▪ Connection terminal: DLC-2: terminal E (+) ↔ Body ground (—) ▪ Oscilloscope setting: 0.5 V/DIV (Y), 200 µs/DIV (X), DC range

MS-CAN signal waveform

CAN circuit condition	Signal waveform (reference)
Normal		• CAN_H ▪ Connection terminal: DLC-2: terminal L (+) ↔ Body ground (—) ▪ Oscilloscope setting: 0.5 V/DIV (Y), 1 ms/DIV (X), DC range • CAN_L ▪ Connection terminal: DLC-2: terminal K (+) ↔ Body ground (—) ▪ Oscilloscope setting: 0.5 V/DIV (Y), 1 ms/DIV (X), DC range

2014 - Mazda3 - Multiplex Communication System

NETWORK TEST

1. Connect the M-MDS to the DLC-2.

2. After the vehicle is identified, select the "NETWORK TEST" from the initialization screen of the M-MDS.

3. Verify the unit with a communication error according to the directions on the screen.

2014 - Mazda3 - Multiplex Communication System

DTC TABLE

CAUTION:

- If there is any vehicle malfunction complaint lodged by a customer, refer to "FOREWORD" and perform CAN malfunction diagnosis following the steps in the troubleshooting procedure. (See **FOREWORD**.)

HS-CAN

2014 - Mazda3 - Multiplex Communication System

DETERMINING OPEN CIRCUIT LOCATION (HS-CAN)

CAUTION:

- Perform the following malfunction diagnosis only when it is diagnosed with a open circuit by CONTROLLER AREA NETWORK (CAN) MALFUNCTION DIAGNOSIS FLOW. (See **CONTROLLER AREA NETWORK (CAN) MALFUNCTION DIAGNOSIS FLOW**.)
- If the malfunctioning part is detected in the communication line, before disconnecting the related connector for inspection, press the connector in the connection direction to verify that there is no looseness or disconnection.
- When disconnecting the connector, verify that there is no damage, deformation, or corrosion of the connector terminals.

1. Verify the CAN system-related module DTCs and the failed module on the M-MDS screen.

2. Apply the communication error DTC and the failed module to DTC output pattern and malfunctioning location, and select the possible cause for the diagnostic result and the reference for the inspection item. (See **DTC output pattern and malfunctioning location**.)

NOTE:

- The open circuit location can be determined by the DTC indicated in the DTC output pattern and malfunctioning location chart. DTCs not listed in the chart are not used for the determination of the open circuit location. (See **DTC output pattern and malfunctioning location**.)

3. Inspect the possible cause and inspection item of the applicable malfunctioning part.

4. After repairs, return to CONTROLLER AREA NETWORK (CAN) MALFUNCTION DIAGNOSIS FLOW, and verify that the repairs have been completed. (See **CONTROLLER AREA NETWORK (CAN) MALFUNCTION DIAGNOSIS FLOW**.)

A

Possible cause

- Connector terminal disconnection, poor contact, damage, deformation, corrosion
- PCM power supply voltage or body ground malfunction
- Open circuit in wiring harness between PCM and front body control module (FBCM)
- PCM malfunction
- CAN circuit in front body control module (FBCM) malfunction

System wiring diagram

DETERMINING OPEN CIRCUIT LOCATION (HS-CAN)

Inspection item

- PCM power supply voltage-related wiring harness and fuse
- PCM body ground related wiring harness
- PCM connector
- Front body control module (FBCM) connector
- Wiring harness between PCM terminal 2AK and Front body control module (FBCM) terminal 2P
- Wiring harness between PCM terminal 2AL and Front body control module (FBCM) terminal 2N

PCM

- Front body control module (FBCM)
  - Between front body control module (FBCM) terminal 2P and front body control module (FBCM) terminal 2K
  - Between front body control module (FBCM) terminal 2N and front body control module (FBCM) terminal 2I

B

Possible cause

- Connector terminal disconnection, poor contact, damage, deformation, corrosion
- DSC HU/CM power supply voltage or body ground malfunction
- Open circuit in wiring harness between DSC HU/CM and front body control module (FBCM)
- DSC HU/CM control module malfunction
- CAN circuit in front body control module (FBCM) malfunction

System wiring diagram

Inspection item

- DSC HU/CM power supply voltage-related wiring harness and fuse
- DSC HU/CM body ground related wiring harness
- Front body control module (FBCM) connector
- DSC HU/CM connector
- Wiring harness between front body control module (FBCM) terminal 2R and DSC HU/CM terminal AF
- Wiring harness between front body control module (FBCM) terminal 2L and DSC HU/CM terminal AC
- DSC HU/CM
- Front body control module (FBCM)
    - Between front body control module (FBCM) terminal 2R and front body control module (FBCM) terminal 2K
    - Between front body control module (FBCM) terminal 2L and front body control module (FBCM) terminal 2I

C

Possible cause

- Connector terminal disconnection, poor contact, damage, deformation, corrosion
- Front body control module (FBCM) power supply voltage or body ground malfunction
- Front body control module (FBCM) malfunction

System wiring diagram

Inspection item

- Front body control module (FBCM) power supply voltage-related wiring harness and fuse
- Front body control module (FBCM) body ground related wiring harness
- Front body control module (FBCM)

D

ATX vehicles

Possible cause

- Connector terminal disconnection, poor contact, damage, deformation, corrosion
- Open circuit in wiring harness between front body control module (FBCM) and connector C-01
- Open circuit in wiring harness between connector C-01 and branch A
- Connector C-01 malfunction
- CAN circuit in front body control module (FBCM) malfunction

System wiring diagram

Inspection item

- Front body control module (FBCM) connector
- Connector C-01
- Wiring harness between front body control module (FBCM) terminal 2K and connector C-01

- Wiring harness between front body control module (FBCM) terminal 2I and connector C-01
- Wiring harness between connector C-01 and branch A
- Front body control module (FBCM)
  - Between front body control module (FBCM) terminal 2P and front body control module (FBCM) terminal 2K
  - Between front body control module (FBCM) terminal 2N and front body control module (FBCM) terminal 2I

MTX vehicles

Possible cause

- Connector terminal disconnection, poor contact, damage, deformation, corrosion
- Open circuit in wiring harness between front body control module (FBCM) and connector C-01
- Open circuit in wiring harness between connector C-01 and connector C-01
- Open circuit in wiring harness between connector C-01 and connector C-32
- Connector C-01 malfunction
- Connector C-32 malfunction
- CAN circuit in front body control module (FBCM) malfunction

System wiring diagram

Inspection item

- Front body control module (FBCM) connector
- Connector C-01
- Connector C-32
- Wiring harness between front body control module (FBCM) terminal 2K and connector C-01
- Wiring harness between front body control module (FBCM) terminal 2I and connector C-01
- Wiring harness between connector C-01 and connector C-01
- Wiring harness between connector C-01 and connector C-32
- Front body control module (FBCM)
    - Between front body control module (FBCM) terminal 2P and front body control module (FBCM) terminal 2K
    - Between front body control module (FBCM) terminal 2N and front body control module (FBCM) terminal 2I

E

Possible cause

Connector terminal disconnection, poor contact, damage, deformation, corrosion

- TCM power supply voltage or body ground malfunction
- Open circuit in wiring harness between TCM and branch A
- TCM malfunction

System wiring diagram

Inspection item

- TCM power supply voltage-related wiring harness and fuse
- TCM body ground related wiring harness
- TCM connector
- Wiring harness between TCM terminal E and branch A
- Wiring harness between TCM terminal F and branch A
- TCM

F

Possible cause

- Connector terminal disconnection, poor contact, damage, deformation, corrosion
- Open circuit in wiring harness between branch A and connector C-01
- Open circuit in wiring harness between connector C-01 and connector C-32
- Connector C-01 malfunction
- Connector C-32 malfunction

System wiring diagram

DETERMINING OPEN CIRCUIT LOCATION (HS-CAN)

Inspection item

- Connector C-01
- Connector C-32
- Wiring harness between branch A and connector C-01
- Wiring harness between connector C-01 and connector C-32

G

Possible cause

- Connector terminal disconnection, poor contact, damage, deformation, corrosion
- DC-DC converter power supply voltage or body ground malfunction
- Open circuit in wiring harness between DC-DC converter and connector C-05
- Open circuit in wiring harness between connector C-05 and connector C-32
- Connector C-05 malfunction
- Connector C-32 malfunction
- DC-DC converter malfunction

System wiring diagram

Inspection item

- DC-DC converter power supply voltage-related wiring harness and fuse
- DC-DC converter body ground related wiring harness
- DC-DC converter connector
- Connector C-05
- Connector C-32
- Wiring harness between DC-DC converter terminal A and connector C-05
- Wiring harness between DC-DC converter terminal C and connector C-05
- Wiring harness between connector C-05 and connector C-32
- DC-DC converter

H

Possible cause

- Connector terminal disconnection, poor contact, damage, deformation, corrosion
- AFS control module power supply voltage or body ground malfunction
- Open circuit in wiring harness between AFS control module and connector C-32
- Connector C-32 malfunction
- AFS control module malfunction

System wiring diagram

Inspection item

- AFS control module power supply voltage-related wiring harness and fuse
- AFS control module body ground related wiring harness
- AFS control module connector
- Connector C-32
- Wiring harness between AFS control module terminal A and connector C-32
- Wiring harness between AFS control module terminal B and connector C-32
- AFS control module

I

Possible cause

- Connector terminal disconnection, poor contact, damage, deformation, corrosion
- Open circuit in wiring harness between connector C-32 and connector C-03
- Open circuit in wiring harness between connector C-03 and connector C-12
- Open circuit in wiring harness between connector C-12 and connector C-42
- Connector C-32 malfunction
- Connector C-03 malfunction
- Connector C-12 malfunction
- Connector C-42 malfunction

- Connector C-03
- Connector C-12
- Connector C-42
- Wiring harness between connector C-32 and connector C-03
- Wiring harness between connector C-03 and connector C-12
- Wiring harness between connector C-12 and connector C-42

J

Possible cause

- Connector terminal disconnection, poor contact, damage, deformation, corrosion
- Laser sensor power supply voltage or body ground malfunction
- Open circuit in wiring harness between Laser sensor and connector C-42
- Connector C-42 malfunction
- Laser sensor malfunction

System wiring diagram

Inspection item

- Laser sensor power supply voltage-related wiring harness and fuse
- Laser sensor body ground related wiring harness
- Laser sensor connector

- Connector C-42
- Wiring harness between laser sensor terminal D and connector C-42
- Wiring harness between laser sensor terminal C and connector C-42
- Laser sensor

K

Possible cause

- Connector terminal disconnection, poor contact, damage, deformation, corrosion
- Forward sensing camera (FSC) power supply voltage or body ground malfunction
- Open circuit in wiring harness between forward sensing camera (FSC) and connector C-27
- Open circuit in wiring harness between connector C-27 and connector C-42
- Connector C-27 malfunction
- Connector C-42 malfunction
- Forward sensing camera (FSC) malfunction

DETERMINING SHORT TO GROUND LOCATION (HS-CAN)

CAUTION:

- Perform the following malfunction diagnosis only when it is diagnosed with a short to ground by CONTROLLER AREA NETWORK (CAN) MALFUNCTION DIAGNOSIS FLOW. (See **CONTROLLER AREA NETWORK (CAN) MALFUNCTION DIAGNOSIS FLOW**.)

System wiring diagram

Determination procedure

CAUTION:

- When disconnecting the connector, verify that there is no looseness, damage, deformation, corrosion, or poor connection of the connector terminals.
- When inspecting the DLC-2, touch it with a paper clip or similar thin pin without directly inserting a tester into the terminals.

Step	Inspection		Action
1	**INSPECT FOR SHORT TO GROUND BETWEEN FRONT BODY CONTROL MODULE (FBCM) AND INSTRUMENT CLUSTER** • Disconnect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Disconnect connector 2 which has front body control module (FBCM) terminals 2P and 2N. • Inspect for continuity at the following terminals: ▪ Between DLC-2 terminal F and body ground ▪ Between DLC-2 terminal E and body ground • Is there continuity?	Yes	Go to Step 5.
		No	Go to the next step.
2	**INSPECT CAN LINE IN FRONT BODY CONTROL MODULE (FBCM) FOR SHORT TO GROUND**	Yes	Replace the front body control module (FBCM) because there is a short to ground in the front body control module (FBCM).

	• Inspect for continuity at the following terminals: ▪ Between front body control module (FBCM) terminal 2P and body ground ▪ Between front body control module (FBCM) terminal 2N and body ground • Is there continuity?		(See **FRONT BODY CONTROL MODULE (FBCM) REMOVAL/INSTALLATION**.)
		No	Go to the next step.
3	**INSPECT FOR SHORT TO GROUND BETWEEN DSC HU/CM AND FRONT BODY CONTROL MODULE (FBCM)** • Inspect for continuity at the following terminals: ▪ Between DSC HU/CM terminal AF and body ground ▪ Between DSC HU/CM terminal AC and body ground • Is there continuity?	Yes	Go to the next step.
		No	Go to Step 37.
4	**INSPECT CAN LINE IN DSC HU/CM FOR SHORT TO GROUND** • Disconnect the DSC HU/CM connector. • Inspect for continuity at the following terminals: ▪ Between DSC HU/CM terminal AF (wiring harness side) and body ground ▪ Between DSC HU/CM terminal AC (wiring harness side) and body ground • Is there continuity?	Yes	Repair or replace the wiring harness between the DSC HU/CM and front body control module (FBCM) because the wiring harness is shorted to ground.
		No	Replace the DSC HU/CM because there is a short to ground in the DSC HU/CM. (See **DSC HU/CM REMOVAL/INSTALLATION**.)
5	**INSPECT FOR SHORT TO GROUND BETWEEN CONNECTOR C-01 AND INSTRUMENT CLUSTER** • Disconnect connector C-01. • Inspect for continuity at the following terminals: ▪ Between DLC-2 terminal F and body ground ▪ Between DLC-2 terminal E and body ground • Is there continuity?	Yes	Go to Step 8.
		No	Go to the next step.
6	**INSPECT FOR SHORT TO GROUND BETWEEN CONNECTOR C-01 AND TCM** • Inspect for continuity at the following terminals: ▪ Between TCM terminal E and body ground ▪ Between TCM terminal F	Yes	Go to the next step.
		No	Repair or replace the wiring harness between the front body control module (FBCM) and connector C-01 because the wiring harness is shorted to ground.

	and body ground • Is there continuity?		
7	**INSPECT CAN LINE IN TCM FOR SHORT TO GROUND** • Disconnect the TCM connector. • Inspect for continuity at the following terminals: ▪ Between TCM terminal E (wiring harness side) and body ground ▪ Between TCM terminal F (wiring harness side) and body ground • Is there continuity?	Yes	Repair or replace the wiring harness between the TCM and connector C-01 because the wiring harness is shorted to ground.
		No	Replace the TCM because there is a short to ground in the TCM. (See **CONTROL VALVE BODY REMOVAL/INSTALLATION [FW6A-EL]**.)
8	**INSPECT FOR SHORT TO GROUND BETWEEN CONNECTOR C-32 AND INSTRUMENT CLUSTER** • Disconnect connector C-32. • Inspect for continuity at the following terminals: ▪ Between DLC-2 terminal F and body ground ▪ Between DLC-2 terminal E and body ground • Is there continuity?	Yes	Go to Step 14.
		No	Go to the next step.
9	**INSPECT FOR SHORT TO GROUND BETWEEN DC-DC CONVERTER AND CONNECTOR C-32** • Inspect for continuity at the following terminals: ▪ Between DC-DC converter terminal A and body ground ▪ Between DC-DC converter terminal C and body ground • Is there continuity?	Yes	Go to the next step.
		No	Go to Step 12.
10	**INSPECT FOR SHORT TO GROUND BETWEEN DC-DC CONVERTER AND CONNECTOR C-05** • Disconnect connector C-05. • Inspect for continuity at the following terminals: ▪ Between DC-DC converter terminal A and body ground ▪ Between DC-DC converter terminal C and body ground • Is there continuity?	Yes	Go to the next step.
		No	Repair or replace the wiring harness between connector C-05 and connector C-32 because the wiring harness is shorted to ground.
11	**INSPECT CAN LINE IN DC-DC CONVERTER FOR SHORT TO GROUND** • Disconnect the DC-DC converter connector. • Inspect for continuity at the following	Yes	Repair or replace the wiring harness between the DC-DC converter and connector C-05 because the wiring harness is shorted to ground.
		No	Replace the DC-DC converter because there is a short to ground

	terminals: ▪ Between DC-DC converter terminal A (wiring harness side) and body ground ▪ Between DC-DC converter terminal C (wiring harness side) and body ground • Is there continuity?		in the DC-DC converter. (See **DC-DC CONVERTER REMOVAL/INSTALLATION [i-ELOOP]**.)
12	**INSPECT FOR SHORT TO GROUND BETWEEN CONNECTOR C-32 AND AFS CONTROL MODULE** • Inspect for continuity at the following terminals: ▪ Between AFS control module terminal A and body ground ▪ Between AFS control module terminal B and body ground • Is there continuity?	Yes	Go to the next step.
		No	Repair or replace the wiring harness between the connector C-01 and connector C-32 because the wiring harness is shorted to ground.
13	**INSPECT FOR SHORT TO GROUND BETWEEN AFS CONTROL MODULE AND CONNECTOR C-32** • Disconnect the AFS control module connector. • Inspect for continuity at the following terminals: ▪ Between AFS control module terminal A (wiring harness side) and body ground ▪ Between AFS control module terminal B (wiring harness side) and body ground • Is there continuity?	Yes	Repair or replace the wiring harness between the AFS control module and connector C-32 because the wiring harness is shorted to ground.
		No	Replace the AFS control module because there is a short to ground in the AFS control module. (See **ADAPTIVE FRONT LIGHTING SYSTEM (AFS) CONTROL MODULE REMOVAL/INSTALLATION**.)
14	**INSPECT FOR SHORT TO GROUND BETWEEN CONNECTOR C-03 AND INSTRUMENT CLUSTER** • Disconnect connector C-03. • Inspect for continuity at the following terminals: ▪ Between DLC-2 terminal F and body ground ▪ Between DLC-2 terminal E and body ground • Is there continuity?	Yes	Go to the next step.
		No	Repair or replace the wiring harness between connector C-03 and connector C-32 because the wiring harness is shorted to ground.
15	**INSPECT FOR SHORT TO GROUND BETWEEN CONNECTOR C-12 AND INSTRUMENT CLUSTER** • Disconnect connector C-12. • Inspect for continuity at the following terminals: ▪ Between DLC-2 terminal F and body ground ▪ Between DLC-2 terminal E	Yes	Go to Step 22.
		No	Go to the next step.

	and body ground • Is there continuity?		
16	**INSPECT FOR SHORT TO GROUND BETWEEN LASER SENSOR / FORWARD SENSING CAMERA (FSC) AND CONNECTOR C-12** • Inspect for continuity at the following terminals: ▪ Between laser sensor terminal D and body ground (with smart city brake support) ▪ Between laser sensor terminal C and body ground (with smart city brake support) ▪ Between forward sensing camera (FSC) terminal E and body ground (with forward sensing camera) ▪ Between forward sensing camera (FSC) terminal C and body ground (with forward sensing camera) • Is there continuity?	Yes	Go to the next step.
		No	Repair or replace the wiring harness between connector C-03 and connector C-12 because the wiring harness is shorted to ground.
17	**INSPECT FOR SHORT TO GROUND BETWEEN LASER SENSOR AND CONNECTOR C-42** • Disconnect connector C-42. • Inspect for continuity at the following terminals: ▪ Between laser sensor terminal D and body ground ▪ Between laser sensor terminal C and body ground • Is there continuity?	Yes	Go to the next step.
		No	Go to Step 19.
18	**INSPECT CAN LINE IN LASER SENSOR FOR SHORT TO GROUND** • Disconnect the laser sensor connector. • Inspect for continuity at the following terminals: ▪ Between laser sensor terminal D (wiring harness side) and body ground ▪ Between laser sensor terminal C (wiring harness side) and body ground • Is there continuity?	Yes	Repair or replace the wiring harness between the laser sensor and connector C-42 because the wiring harness is shorted to ground.
		No	Replace the laser sensor because there is a short to ground in the laser sensor. (See **LASER SENSOR REMOVAL/INSTALLATION**.)
19	**INSPECT FOR SHORT TO GROUND BETWEEN FORWARD SENSING CAMERA (FSC) AND CONNECTOR C-42** • Inspect for continuity at the following terminals: ▪ Between forward sensing	Yes	Go to the next step.
		No	Repair or replace the wiring harness between connector C-12 and connector C-42 because the wiring harness is shorted to ground.

	camera (FSC) terminal E and body ground ▪ Between forward sensing camera (FSC) terminal C and body ground • Is there continuity?		
20	**INSPECT FOR SHORT TO GROUND BETWEEN FORWARD SENSING CAMERA (FSC) AND CONNECTOR C-27** • Disconnect connector C-27. • Inspect for continuity at the following terminals: ▪ Between forward sensing camera (FSC) terminal E and body ground ▪ Between forward sensing camera (FSC) terminal C and body ground • Is there continuity?	Yes	Go to the next step.
		No	Repair or replace the wiring harness between connector C-42 and connector C-27 because the wiring harness is shorted to ground.
21	**INSPECT CAN LINE IN FORWARD SENSING CAMERA (FSC) FOR SHORT TO GROUND** • Disconnect the forward sensing camera (FSC) connector. • Inspect for continuity at the following terminals: ▪ Between forward sensing camera (FSC) terminal E (wiring harness side) and body ground ▪ Between forward sensing camera (FSC) terminal C (wiring harness side) and body ground • Is there continuity?	Yes	Repair or replace the wiring harness between the forward sensing camera (FSC) and connector C-27 because the wiring harness is shorted to ground.
		No	Replace the forward sensing camera (FSC) because there is a short to ground in the forward sensing camera (FSC). (See **FORWARD SENSING CAMERA (FSC) REMOVAL/INSTALLATION**.)
22	**INSPECT FOR SHORT TO GROUND BETWEEN CONNECTOR C-33 AND DLC-2** • Disconnect connector C-33. • Inspect for continuity at the following terminals: ▪ Between DLC-2 terminal F and body ground ▪ Between DLC-2 terminal E and body ground • Is there continuity?	Yes	Repair or replace the wiring harness between DLC-2 and connector C-33 because the wiring harness is shorted to ground.
		No	Go to the next step.
23	**INSPECT FOR SHORT TO GROUND BETWEEN START STOP UNIT AND CONNECTOR C-33** • Inspect for continuity at the following terminals: ▪ Between start stop unit terminal 2M and body ground ▪ Between start stop unit terminal 2O and body	Yes	Go to the next step.
		No	Go to Step 25.

	ground • Is there continuity?		
24	**INSPECT CAN LINE IN START STOP UNIT FOR SHORT TO GROUND** • Disconnect the start stop unit connector. • Inspect for continuity at the following terminals: ▪ Between start stop unit terminal 2M (wiring harness side) and body ground ▪ Between start stop unit terminal 2O (wiring harness side) and body ground • Is there continuity?	Yes	Repair or replace the wiring harness between the start stop unit and connector C-33 because the wiring harness is shorted to ground.
		No	Replace the start stop unit because there is a short to ground in the start stop unit. (See **START STOP UNIT REMOVAL/INSTALLATION**.)
25	**INSPECT FOR SHORT TO GROUND BETWEEN EPS CONTROL MODULE AND CONNECTOR C-33** • Inspect for continuity at the following terminals: ▪ Between EPS control module terminal 2B and body ground ▪ Between EPS control module terminal 2D and body ground • Is there continuity?	Yes	Go to the next step.
		No	Go to Step 27.
26	**INSPECT CAN LINE IN EPS CONTROL MODULE FOR SHORT TO GROUND** • Disconnect the EPS control module connector. • Inspect for continuity at the following terminals: ▪ Between EPS control module terminal 2B (wiring harness side) and body ground ▪ Between EPS control module terminal 2D (wiring harness side) and body ground • Is there continuity?	Yes	Repair or replace the wiring harness between the EPS control module and connector C-33 because the wiring harness is shorted to ground.
		No	Replace the EPS control module because there is a short to ground in the EPS control module. (See **STEERING WHEEL AND COLUMN REMOVAL/INSTALLATION**.)
27	**INSPECT FOR SHORT TO GROUND BETWEEN CONNECTOR C-34 AND INSTRUMENT CLUSTER** • Disconnect connector C-34. • Connect connector C-33. • Inspect for continuity at the following terminals: ▪ Between DLC-2 terminal F and body ground ▪ Between DLC-2 terminal E and body ground	Yes	Replace the JB No.2 because there is a short to ground in the JB No.2.
		No	Go to the next step.

	• Is there continuity?		
28	**INSPECT FOR SHORT TO GROUND BETWEEN SAS CONTROL MODULE AND CONNECTOR C-34** • Inspect for continuity at the following terminals: ▪ Between SAS control module terminal 3K and body ground ▪ Between SAS control module terminal 3L and body ground • Is there continuity?	Yes	Go to the next step.
		No	Go to Step 30.
29	**INSPECT CAN LINE IN SAS CONTROL MODULE FOR SHORT TO GROUND** • Disconnect the SAS control module connector. • Inspect for continuity at the following terminals: ▪ Between SAS control module terminal 3K (wiring harness side) and body ground ▪ Between SAS control module terminal 3L (wiring harness side) and body ground • Is there continuity?	Yes	Repair or replace the wiring harness between the SAS control module and connector C-34 because the wiring harness is shorted to ground.
		No	Replace the SAS control module because there is a short to ground in the SAS control module. (See **SAS CONTROL MODULE REMOVAL/INSTALLATION [TWO-STEP DEPLOYMENT CONTROL SYSTEM]**.) (See **SAS CONTROL MODULE REMOVAL/INSTALLATION [STANDARD DEPLOYMENT CONTROL SYSTEM]**.)
30	**INSPECT FOR SHORT TO GROUND BETWEEN CONNECTIVITY MASTER UNIT AND CONNECTOR C-34** • Inspect for continuity at the following terminals: ▪ Between connectivity master unit terminal 2E and body ground ▪ Between connectivity master unit terminal 2F and body ground • Is there continuity?	Yes	Go to the next step.
		No	Go to Step 32.
31	**INSPECT CAN LINE IN CONNECTIVITY MASTER UNIT FOR SHORT TO GROUND** • Disconnect the connectivity master unit connector. • Inspect for continuity at the following terminals: ▪ Between connectivity master unit terminal 2E (wiring harness side) and body ground ▪ Between connectivity master unit terminal 2F (wiring harness side) and body ground • Is there continuity?	Yes	Repair or replace the wiring harness between the connectivity master unit and connector C-34 because the wiring harness is shorted to ground.
		No	Replace the connectivity master unit because there is a short to ground in the connectivity master unit. (See **CONNECTIVITY MASTER UNIT (CMU) REMOVAL/INSTALLATION**.)
	INSPECT FOR SHORT TO GROUND BETWEEN		

32	**CONNECTOR C-09 AND INSTRUMENT CLUSTER** • Disconnect connector C-09. • Connect connector C-34. • Inspect for continuity at the following terminals: ▪ Between DLC-2 terminal F and body ground ▪ Between DLC-2 terminal E and body ground • Is there continuity?	Yes	Repair or replace the wiring harness between the connector C-34 and connector C-09 because the wiring harness is shorted to ground.
		No	Go to the next step.
33	**INSPECT FOR SHORT TO GROUND BETWEEN AUDIO AMPLIFIER AND CONNECTOR C-09** • Inspect for continuity at the following terminals: ▪ Between audio amplifier terminal 2L and body ground ▪ Between audio amplifier terminal 2N and body ground • Is there continuity?	Yes	Go to the next step.
		No	Go to Step 36.
34	**INSPECT FOR SHORT TO GROUND BETWEEN AUDIO AMPLIFIER AND CONNECTOR C-40** • Disconnect connector C-40. • Inspect for continuity at the following terminals: ▪ Between audio amplifier terminal 2L and body ground ▪ Between audio amplifier terminal 2N and body ground • Is there continuity?	Yes	Go to the next step.
		No	Repair or replace the wiring harness between connector C-40 and connector C-09 because the wiring harness is shorted to ground.
35	**INSPECT CAN LINE IN AUDIO AMPLIFIER FOR SHORT TO GROUND** • Disconnect the audio amplifier connector. • Inspect for continuity at the following terminals: ▪ Between audio amplifier terminal 2L (wiring harness side) and body ground ▪ Between audio amplifier terminal 2N (wiring harness side) and body ground • Is there continuity?	Yes	Repair or replace the wiring harness between the audio amplifier and connector C-40 because the wiring harness is shorted to ground.
		No	Replace the audio amplifier because there is a short to ground in the audio amplifier. (See **AUDIO AMPLIFIER REMOVAL/INSTALLATION**.)
36	**INSPECT CAN LINE IN INSTRUMENT CLUSTER FOR SHORT TO GROUND** • Disconnect the instrument cluster connector.	Yes	Repair or replace the wiring harness between the instrument cluster and connector C-09 because the wiring harness is shorted to ground.

	• Inspect for continuity at the following terminals: ▪ Between instrument cluster terminal B (wiring harness side) and body ground ▪ Between instrument cluster terminal D (wiring harness side) and body ground • Is there continuity?	No	Replace the instrument cluster because there is a short to ground in the instrument cluster. (See **INSTRUMENT CLUSTER REMOVAL/INSTALLATION**.)
37	**INSPECT CAN LINE IN PCM FOR SHORT TO GROUND** • Disconnect the PCM connector. • Inspect for continuity at the following terminals: ▪ Between PCM terminal 2AK (wiring harness side) and body ground ▪ Between PCM terminal 2AL (wiring harness side) and body ground • Is there continuity?	Yes	Repair or replace the wiring harness between the PCM and front body control module (FBCM) because the wiring harness is shorted to ground.
		No	Replace the PCM because there is a short to ground in the PCM. (See **PCM REMOVAL/INSTALLATION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)

2014 - Mazda3 - Multiplex Communication System

DETERMINING SHORT TO POWER SUPPLY LOCATION (HS-CAN)

CAUTION:

- Perform the following malfunction diagnosis only when it is diagnosed with a short to power supply by CONTROLLER AREA NETWORK (CAN) MALFUNCTION DIAGNOSIS FLOW. (See **CONTROLLER AREA NETWORK (CAN) MALFUNCTION DIAGNOSIS FLOW**.)

System wiring diagram

Determination procedure

CAUTION:

- When disconnecting the connector, verify that there is no looseness, damage, deformation, corrosion, or poor connection of the connector terminals.
- When inspecting the DLC-2, touch it with a paper clip or similar thin pin without directly inserting a tester into the terminals.
- Disconnect the negative battery cable before performing any work that requires handling of connectors.

NOTE:

- If the ignition does not turn on even if the ignition is switched ON, switch the ignition ON referring to the forced ignition ON procedure. (See **FORCED IGNITION ON**.)

Step	Inspection		Action
1	**INSPECT FOR SHORT TO POWER SUPPLY BETWEEN FRONT BODY CONTROL MODULE (FBCM) AND INSTRUMENT CLUSTER** • Disconnect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Disconnect connector 2 which has front body control module (FBCM) terminals 2K and 2I • Connect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Switch the ignition ON (engine off).	Yes	Go to the next step.
		No	Go to Step 4.

	Measure the voltage at DLC-2 terminals F and E. • Is the voltage between 1.5 — 3.5 V?		
2	**INSPECT CAN LINE BETWEEN DSC HU/CM AND FRONT BODY CONTROL MODULE (FBCM) FOR SHORT TO POWER SUPPLY** • Measure the voltage at DSC HU/CM terminals AF and AC. • Is the voltage between 1.5 — 3.5 V?	Yes	Go to Step 36.
		No	Go to the next step.
3	**INSPECT DSC HU/CM FOR SHORT TO POWER SUPPLY** • Switch the ignition off. • Disconnect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Disconnect the DSC HU/CM connector. • Connect connector 2 which has front body control module (FBCM) terminals 2K and 2I • Connect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Switch the ignition ON (engine off). • Measure the voltage at DLC-2 terminals F and E. • Is the voltage between 1.5 — 3.5 V?	Yes	Replace the DSC HU/CM because there is a short to the power supply in the DSC HU/CM. (See **DSC HU/CM REMOVAL/INSTALLATION**.)
		No	Repair or replace the wiring harness between DSC HU/CM and the front body control module (FBCM) because the wiring harness is shorted to the power supply.
4	**INSPECT CAN LINE BETWEEN CONNECTOR C-01 AND INSTRUMENT CLUSTER FOR SHORT TO POWER SUPPLY** • Switch the ignition off. • Disconnect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Disconnect connector C-01. • Connect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Switch the ignition ON (engine off). • Measure the voltage at DLC-2 terminals F and E. • Is the voltage between 1.5 — 3.5 V?	Yes	Go to the next step.
		No	Go to Step 7.
5	**INSPECT CAN LINE BETWEEN TCM AND CONNECTOR C-01 FOR SHORT TO POWER SUPPLY** • Measure the voltage at TCM terminals E and F. • Is the voltage between 1.5 — 3.5 V?	Yes	Repair or replace the wiring harness between the front body control module (FBCM) and connector C-01 because the wiring harness is shorted to the power supply.
		No	Go to the next step.
6	**INSPECT TCM FOR SHORT TO POWER SUPPLY**	Yes	Replace the TCM because there is a short to the power supply in

	• Switch the ignition off. • Disconnect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Connect connector C-01. • Disconnect the TCM connector. • Connect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Switch the ignition ON (engine off). • Measure the voltage at DLC-2 terminals F and E. • Is the voltage between 1.5 — 3.5 V?		the TCM. (See **CONTROL VALVE BODY REMOVAL/INSTALLATION [FW6A-EL]**.)
		No	Repair or replace the wiring harness between the TCM and connector C-01 because the wiring harness is shorted to the power supply.
7	**INSPECT CAN LINE BETWEEN CONNECTOR C-32 AND INSTRUMENT CLUSTER FOR SHORT TO POWER SUPPLY** • Switch the ignition off. • Disconnect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Disconnect connector C-32. • Connect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Switch the ignition ON (engine off). • Measure the voltage at DLC-2 terminals F and E. • Is the voltage between 1.5 — 3.5 V?	Yes	Go to the next step.
		No	Go to Step 13.
8	**INSPECT CAN LINE BETWEEN DC-DC CONVERTER AND CONNECTOR C-32 FOR SHORT TO POWER SUPPLY** • Measure the voltage at DC-DC converter terminals A and C. • Is the voltage between 1.5 — 3.5 V?	Yes	Go to Step 11.
		No	Go to the next step.
9	**INSPECT CAN LINE BETWEEN DC-DC CONVERTER AND CONNECTOR C-05 FOR SHORT TO POWER SUPPLY** • Switch the ignition off. • Disconnect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Disconnect connector C-05. • Connect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)	Yes	Repair or replace the wiring harness between connector C-32 and connector C-05 because the wiring harness is shorted to the power supply.
		No	Go to the next step.

	Switch the ignition ON (engine off). • Measure the voltage at DC-DC converter terminals A and C. • Is the voltage between 1.5 — 3.5 V?		
10	**INSPECT DC-DC CONVERTER FOR SHORT TO POWER SUPPLY** • Switch the ignition off. • Disconnect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Connect connector C-05. • Connect connector C-32. • Disconnect the DC-DC converter connector. • Connect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Switch the ignition ON (engine off). • Measure the voltage at DLC-2 terminals F and E. • Is the voltage between 1.5 — 3.5 V?	Yes	Replace the DC-DC converter because there is a short to the power supply in the DC-DC converter. (See **DC-DC CONVERTER REMOVAL/INSTALLATION [i-ELOOP]**.)
		No	Repair or replace the wiring harness between the DC-DC converter and connector C-05 because the wiring harness is shorted to the power supply.
11	**INSPECT CAN LINE BETWEEN AFS CONTROL MODULE AND CONNECTOR C-32 FOR SHORT TO POWER SUPPLY** • Measure the voltage at AFS control module terminals A and B. • Is the voltage between 1.5 — 3.5 V?	Yes	Repair or replace the wiring harness between the connector C-01 and connector C-32 because the wiring harness is shorted to the power supply.
		No	Go to the next step.
12	**INSPECT AFS CONTROL MODULE FOR SHORT TO POWER SUPPLY** • Switch the ignition off. • Disconnect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Connect connector C-32. • Disconnect the AFS control module connector. • Connect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Switch the ignition ON (engine off). • Measure the voltage at DLC-2 terminals F and E. • Is the voltage between 1.5 — 3.5 V?	Yes	Replace the AFS control module because there is a short to the power supply in the AFS control module. (See **ADAPTIVE FRONT LIGHTING SYSTEM (AFS) CONTROL MODULE REMOVAL/INSTALLATION**.)
		No	Repair or replace the wiring harness between the AFS control module and connector C-32 because the wiring harness is shorted to the power supply.
13	**INSPECT CAN LINE BETWEEN CONNECTOR C-03 AND INSTRUMENT CLUSTER FOR SHORT TO POWER SUPPLY** • Switch the ignition off.	Yes	Repair or replace the wiring harness between connector C-03 and connector C-32 because the wiring harness is shorted to the power supply.

	• Disconnect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Disconnect connector C-03. • Connect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Switch the ignition ON (engine off). • Measure the voltage at DLC-2 terminals F and E. • Is the voltage between 1.5 — 3.5 V?	No	Go to the next step.
14	**INSPECT CAN LINE BETWEEN CONNECTOR C-12 AND INSTRUMENT CLUSTER FOR SHORT TO POWER SUPPLY** • Switch the ignition off. • Disconnect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Disconnect connector C-12. • Connect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Switch the ignition ON (engine off). • Measure the voltage at DLC-2 terminals F and E. • Is the voltage between 1.5 — 3.5 V?	Yes	Go to the next step.
		No	Go to Step 21.
15	**INSPECT CAN LINE BETWEEN CONNECTOR C-12 AND LASER SENSOR / FORWARD SENSING CAMERA (FSC) FOR SHORT TO POWER SUPPLY** • Measure the voltage at laser sensor terminals D and C (with smart city brake support). • Measure the voltage at the forward sensing camera (FSC) terminals E and C (with forward sensing camera). • Is the voltage between 1.5 — 3.5 V?	Yes	Repair or replace the wiring harness between connector C-03 and connector C-12 because the wiring harness is shorted to the power supply.
		No	Go to the next step.
16	**INSPECT CAN LINE BETWEEN LASER SENSOR AND CONNECTOR C-42 FOR SHORT TO POWER SUPPLY** • Switch the ignition off. • Disconnect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Disconnect connector C-42. • Connect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)	Yes	Go to Step 18.
		No	Go to the next step.

	• Switch the ignition ON (engine off). • Measure the voltage at laser sensor terminals D and C. • Is the voltage between 1.5 — 3.5 V?		
17	**INSPECT LASER SENSOR FOR SHORT TO POWER SUPPLY** • Switch the ignition off. • Disconnect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Disconnect the laser sensor connector. • Connect connector C-42. • Connect connector C-12. • Connect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Switch the ignition ON (engine off). • Measure the voltage at DLC-2 terminals F and E. • Is the voltage between 1.5 — 3.5 V?	Yes	Replace the laser sensor because there is a short to the power supply in the laser sensor. (See **LASER SENSOR REMOVAL/INSTALLATION**.)
		No	Repair or replace the wiring harness between the laser sensor and connector C-42 because the wiring harness is shorted to the power supply.
18	**INSPECT CAN LINE BETWEEN FORWARD SENSING CAMERA (FSC) AND CONNECTOR C-42 FOR SHORT TO POWER SUPPLY** • Measure the voltage at forward sensing camera (FSC) terminals E and C. • Is the voltage between 1.5 — 3.5 V?	Yes	Repair or replace the wiring harness between connector C-12 and connector C-42 because the wiring harness is shorted to the power supply.
		No	Go to the next step.
19	**INSPECT CAN LINE BETWEEN CONNECTOR C-27 AND FORWARD SENSING CAMERA (FSC) FOR SHORT TO POWER SUPPLY** • Switch the ignition off. • Disconnect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Disconnect connector C-27. • Connect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Switch the ignition ON (engine off). • Measure the voltage at the forward sensing camera (FSC) terminals E and C. • Is the voltage between 1.5 — 3.5 V?	Yes	Repair or replace the wiring harness between connector C-42 and connector C-27 because the wiring harness is shorted to the power supply.
		No	Go to the next step.
20	**INSPECT FORWARD SENSING CAMERA (FSC) FOR SHORT TO POWER SUPPLY** • Switch the ignition off.	Yes	Replace the forward sensing camera (FSC) because there is a short to the power supply in the forward sensing camera (FSC). (See **FORWARD SENSING CAMERA (FSC)**

	• Disconnect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Disconnect the forward sensing camera (FSC) connector. • Connect connector C-42. • Connect connector C-12. • Connect connector C-27. • Connect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Switch the ignition ON (engine off). • Measure the voltage at DLC-2 terminals F and E. • Is the voltage between 1.5 — 3.5 V?		**REMOVAL/INSTALLATION**.)
		No	Repair or replace the wiring harness between the forward sensing camera (FSC) and connector C-27 because the wiring harness is shorted to the power supply.
21	**INSPECT CAN LINE BETWEEN CONNECTOR C-33 AND DLC-2 FOR SHORT TO POWER SUPPLY** • Switch the ignition off. • Disconnect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Disconnect connector C-33. • Connect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Switch the ignition ON (engine off). • Measure the voltage at DLC-2 terminals F and E. • Is the voltage 0 V?	Yes	Go to the next step.
		No	Repair or replace the wiring harness between connector C-33 and DLC-2 because the wiring harness is shorted to the power supply.
22	**INSPECT CAN LINE BETWEEN START STOP UNIT AND CONNECTOR C-33 FOR SHORT TO POWER SUPPLY** • Measure the voltage at start stop unit terminals 2M and 2O. • Is the voltage between 1.5 — 3.5 V?	Yes	Go to Step 24.
		No	Go to the next step.
23	**INSPECT START STOP UNIT FOR SHORT TO POWER SUPPLY** • Switch the ignition off. • Disconnect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Disconnect the start stop unit connector. • Connect connector C-33. • Connect the negative battery cable.	Yes	Replace the start stop unit because there is a short to the power supply in the start stop unit. (See **START STOP UNIT REMOVAL/INSTALLATION**.)
		No	Repair or replace the wiring harness between the start stop unit and connector C-33 because the wiring harness is shorted to the power supply.

	(See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Switch the ignition ON (engine off). • Measure the voltage at DLC-2 terminals F and E. • Is the voltage between 1.5 — 3.5 V?		
24	**INSPECT CAN LINE BETWEEN EPS CONTROL MODULE AND CONNECTOR C-33 FOR SHORT TO POWER SUPPLY** • Measure the voltage at EPS control module terminals 2B and 2D. • Is the voltage between 1.5 — 3.5 V?	Yes	Go to Step 26.
		No	Go to the next step.
25	**INSPECT EPS CONTROL MODULE FOR SHORT TO POWER SUPPLY** • Switch the ignition off. • Disconnect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Connect connector C-33. • Disconnect the EPS control module connector. • Connect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Switch the ignition ON (engine off). • Measure the voltage at DLC-2 terminals F and E. • Is the voltage between 1.5 — 3.5 V?	Yes	Replace the EPS control module because there is a short to the power supply in the EPS control module. (See **STEERING WHEEL AND COLUMN REMOVAL/INSTALLATION**.)
		No	Repair or replace the wiring harness between the EPS control module and connector C-33 because the wiring harness is shorted to the power supply.
26	**INSPECT JB No.2 FOR SHORT TO POWER SUPPLY** • Switch the ignition off. • Disconnect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Disconnect connector C-34. • Connect connector C-33. • Connect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Switch the ignition ON (engine off). • Measure the voltage at DLC-2 terminals F and E. • Is the voltage between 1.5 — 3.5 V?	Yes	Go to the next step.
		No	Replace the JB No.2 because there is a short to the power supply in the JB No.2.
27	**INSPECT CAN LINE BETWEEN CONNECTIVITY MASTER UNIT AND CONNECTOR C-34 FOR SHORT TO POWER SUPPLY**	Yes	Go to Step 29.
		No	Go to the next step.

	Measure the voltage at connectivity master unit terminals 2E and 2F. • Is the voltage between 1.5 — 3.5 V?		
28	**INSPECT CONNECTIVITY MASTER UNIT FOR SHORT TO POWER SUPPLY** • Switch the ignition off. • Disconnect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Connect connector C-34. • Disconnect the connectivity master unit connector. • Connect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Switch the ignition ON (engine off). • Measure the voltage at DLC-2 terminals F and E. • Is the voltage between 1.5 — 3.5 V?	Yes	Replace the connectivity master unit because there is a short to the power supply in the connectivity master unit. (See **CONNECTIVITY MASTER UNIT (CMU) REMOVAL/INSTALLATION**.)
		No	Repair or replace the wiring harness between the connectivity master unit and connector C-34 because the wiring harness is shorted to the power supply.
29	**INSPECT CAN LINE BETWEEN INSTRUMENT CLUSTER AND CONNECTOR C-09 FOR SHORT TO POWER SUPPLY** • Switch the ignition off. • Disconnect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Disconnect connector C-09. • Connect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Switch the ignition ON (engine off). • Measure the voltage at instrument cluster terminals B and D. • Is the voltage between 1.5 — 3.5 V?	Yes	Go to the next step.
		No	Go to Step 33.
30	**INSPECT CAN LINE BETWEEN AUDIO AMPLIFIER AND CONNECTOR C-09 FOR SHORT TO POWER SUPPLY** • Measure the voltage at audio amplifier terminals 2L and 2N. • Is the voltage between 1.5 - 3.5 V?	Yes	Go to Step 34.
		No	Go to the next step.
31	**INSPECT CAN LINE BETWEEN AUDIO AMPLIFIER AND CONNECTOR C-40 FOR SHORT TO POWER SUPPLY** • Switch the ignition off. • Disconnect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)	Yes	Repair or replace the wiring harness between connector C-40 and connector C-09 because the wiring harness is shorted to the power supply.
		No	Go to the next step.

	• Disconnect connector C-40. • Connect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Switch the ignition ON (engine off). • Measure the voltage at audio amplifier terminals 2L and 2N. • Is the voltage between 1.5 — 3.5 V?		
32	**INSPECT AUDIO AMPLIFIER FOR SHORT TO POWER SUPPLY** • Switch the ignition off. • Disconnect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Connect connector C-40. • Connect connector C-09. • Disconnect the audio amplifier connector. • Connect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Switch the ignition ON (engine off). • Measure the voltage at DLC-2 terminals F and E. • Is the voltage between 1.5 — 3.5 V?	Yes	Replace the audio amplifier because there is a short to the power supply in the audio amplifier. (See **AUDIO AMPLIFIER REMOVAL/INSTALLATION**.)
		No	Repair or replace the wiring harness between the audio amplifier and connector C-40 because the wiring harness is shorted to the power supply.
33	**INSPECT INSTRUMENT CLUSTER FOR SHORT TO POWER SUPPLY** • Switch the ignition off. • Disconnect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Connect connector C-09. • Disconnect the instrument cluster connector. • Connect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Switch the ignition ON (engine off). • Measure the voltage at DLC-2 terminals F and E. • Is the voltage between 1.5 — 3.5 V?	Yes	Replace the instrument cluster because there is a short to the power supply in the instrument cluster. (See **INSTRUMENT CLUSTER REMOVAL/INSTALLATION**.)
		No	Repair or replace the wiring harness between the instrument cluster and connector C-09 because the wiring harness is shorted to the power supply.
34	**INSPECT SAS CONTROL MODULE FOR SHORT TO POWER SUPPLY** • Switch the ignition off.	Yes	Go to the next step.
		No	Repair or replace the wiring harness between SAS control

	Disconnect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Disconnect the SAS control module connector. • Connect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Switch the ignition ON (engine off). • Measure the voltage at SAS control module terminals 3K and 3L. (wiring harness side) • Is the voltage 0 V?		module and connector C-34 because the wiring harness is shorted to the power supply.
35	**INSPECT CAN LINE BETWEEN CONNECTOR C-09 AND CONNECTOR C-34 FOR SHORT TO POWER SUPPLY** • Switch the ignition off. • Disconnect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Disconnect connector C-34. • Connect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Switch the ignition ON (engine off). • Measure the voltage at DLC-2 terminals F and E. • Is the voltage between 1.5 — 3.5 V?	Yes	Replace the SAS control module connector because there is a short to the power supply in the SAS control module connector. (See **SAS CONTROL MODULE REMOVAL/INSTALLATION [TWO-STEP DEPLOYMENT CONTROL SYSTEM]**.) (See **SAS CONTROL MODULE REMOVAL/INSTALLATION [STANDARD DEPLOYMENT CONTROL SYSTEM]**.)
		No	Repair or replace the wiring harness between connector C-09 and connector C-34 because the wiring harness is shorted to the power supply.
36	**INSPECT CAN LINE BETWEEN PCM AND FRONT BODY CONTROL MODULE (FBCM) FOR SHORT TO POWER SUPPLY** • Measure the voltage at PCM terminals 2AK and 2AL. • Is the voltage between 1.5 — 3.5 V?	Yes	Replace the front body control module (FBCM) because there is a short to the power supply in the front body control module (FBCM). (See **FRONT BODY CONTROL MODULE (FBCM) REMOVAL/INSTALLATION**.)
		No	Go to the next step.
37	**INSPECT PCM FOR SHORT TO POWER SUPPLY** • Switch the ignition off. • Disconnect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Disconnect the PCM connector. • Connect connector 2 which has front body control module (FBCM) terminals 2K and 2I • Connect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G**	Yes	Replace the PCM because there is a short to the power supply in the PCM. (See **PCM REMOVAL/INSTALLATION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)
		No	Repair or replace the wiring harness between the PCM and front body control module (FBCM) because the wiring harness is shorted to the power supply.

	2.0, SKYACTIV-G 2.5].) • Switch the ignition ON (engine off). • Measure the voltage at DLC-2 terminals F and E. • Is the voltage between 1.5 — 3.5 V?		

2014 - Mazda3 - Multiplex Communication System

DETERMINING SHORT BETWEEN CIRCUITS LOCATION (HS-CAN)

CAUTION:

- Perform the following malfunction diagnosis only when it is diagnosed with a short between circuits by CONTROLLER AREA NETWORK (CAN) MALFUNCTION DIAGNOSIS FLOW. (See **CONTROLLER AREA NETWORK (CAN) MALFUNCTION DIAGNOSIS FLOW**.)

System wiring diagram

Determination procedure

CAUTION:

- When disconnecting the connector, verify that there is no looseness, damage, deformation, corrosion, or poor connection of the connector terminals.
- When inspecting the DLC-2, touch it with a paper clip or similar thin pin without directly inserting a tester into the terminals.
- Disconnect the negative battery cable before performing any work that requires handling of connectors.

Step	Inspection		Action
1	**INSPECT BETWEEN FRONT BODY CONTROL MODULE (FBCM) AND INSTRUMENT CLUSTER FOR SHORT BETWEEN CIRCUITS** • Disconnect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Disconnect connector 2 which has front body control module (FBCM) terminals 2K and 2I. • Connect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Switch the ignition ON (engine off). • Measure the voltage at DLC-2 terminals F and E. • Is the voltage at DLC-2 terminals F and E	Yes	Go to Step 5.
		No	Go to the next step.

	the same?		
2	**INSPECT FRONT BODY CONTROL MODULE (FBCM) FOR SHORT BETWEEN CIRCUITS** • Switch the ignition off. • Disconnect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Inspect for continuity between front body control module (FBCM) terminals 2K and 2I. • Is there continuity?	Yes	Replace the front body control module (FBCM) because there is a short between circuits in the front body control module (FBCM). (See **FRONT BODY CONTROL MODULE (FBCM) REMOVAL/INSTALLATION**.)
		No	Go to the next step.
3	**INSPECT BETWEEN DSC HU/CM AND FRONT BODY CONTROL MODULE (FBCM) FOR SHORT BETWEEN CIRCUITS** • Inspect for continuity between DSC HU/CM terminals AF and AC. • Is there continuity?	Yes	Go to the next step.
		No	Go to Step 37.
4	**INSPECT DSC HU/CM FOR SHORT BETWEEN CIRCUITS** • Disconnect the DSC HU/CM connector. • Inspect for continuity between DSC HU/CM terminals AF and AC (wiring harness side). • Is there continuity?	Yes	Repair or replace the wiring harness between the DSC HU/CM and front body control module (FBCM) because the wiring harness is shorted between circuits.
		No	Replace the DSC HU/CM because there is a short between circuits in the DSC HU/CM. (See **DSC HU/CM REMOVAL/INSTALLATION**.)
5	**INSPECT BETWEEN CONNECTOR C-01 AND INSTRUMENT CLUSTER FOR SHORT BETWEEN CIRCUITS** • Switch the ignition off. • Disconnect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Disconnect connector C-01. • Connect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Switch the ignition ON (engine off). • Measure the voltage at DLC-2 terminals F and E. • Is the voltage at DLC-2 terminals F and E the same?	Yes	Go to Step 8.
		No	Go to the next step.
6	**INSPECT BETWEEN TCM AND CONNECTOR C-01 FOR SHORT BETWEEN CIRCUITS** • Switch the ignition off. • Disconnect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Inspect for continuity between TCM	Yes	Go to the next step.
		No	Repair or replace the wiring harness between the front body control module (FBCM) and connector C-01 because the wiring harness is shorted between circuits.

	terminals E and F. • Is there continuity?		
7	**INSPECT TCM FOR SHORT BETWEEN CIRCUITS** • Disconnect the TCM connector. • Inspect for continuity between TCM terminals E and F (wiring harness side). • Is there continuity?	Yes	Repair or replace the wiring harness between the TCM and connector C-01 because the wiring harness is shorted between circuits.
		No	Replace the TCM because there is a short between circuits in the TCM. (See **CONTROL VALVE BODY REMOVAL/INSTALLATION [FW6A-EL]**.)
8	**INSPECT BETWEEN CONNECTORS C-32 AND INSTRUMENT CLUSTER FOR SHORT BETWEEN CIRCUITS** • Disconnect connector C-32. • Connect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Switch the ignition ON (engine off). • Measure the voltage at DLC-2 terminals F and E. • Is the voltage at DLC-2 terminals F and E the same?	Yes	Go to Step 14.
		No	Go to the next step.
9	**INSPECT BETWEEN DC-DC CONVERTER AND CONNECTOR C-32 FOR SHORT BETWEEN CIRCUITS** • Switch the ignition off. • Disconnect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Inspect for continuity between DC-DC converter terminals A and C. • Is there continuity?	Yes	Go to the next step.
		No	Go to Step 12.
10	**INSPECT BETWEEN DC-DC CONVERTER AND CONNECTOR C-05 FOR SHORT BETWEEN CIRCUITS** • Disconnect connector C-05. • Inspect for continuity between DC-DC converter terminals A and C. • Is there continuity?	Yes	Go to the next step.
		No	Repair or replace the wiring harness between connector C-32 and connector C-05 because the wiring harness is shorted between circuits.
11	**INSPECT DC-DC CONVERTER FOR SHORT BETWEEN CIRCUITS** • Disconnect the DC-DC converter connector. • Inspect for continuity between DC-DC converter terminals A and C (wiring harness side). • Is there continuity?	Yes	Repair or replace the wiring harness between the DC-DC converter and connector C-05 because the wiring harness is shorted between circuits.
		No	Replace the DC-DC converter because there is a short between circuits in the DC-DC converter. (See **DC-DC CONVERTER REMOVAL/INSTALLATION [i-ELOOP]**.)
12	**INSPECT BETWEEN AFS CONTROL MODULE AND CONNECTOR C-32 FOR SHORT BETWEEN CIRCUITS** • Inspect for continuity between AFS control module terminals A and B.	Yes	Go to the next step.
		No	Repair or replace the wiring harness between connector C-01 and connector C-32 because the wiring harness is shorted between

	• Is there continuity?		circuits.
13	**INSPECT AFS CONTROL MODULE FOR SHORT BETWEEN CIRCUITS** • Disconnect the AFS control module connector. • Inspect for continuity between AFS control module terminals A and B (wiring harness side). • Is there continuity?	Yes	Repair or replace the wiring harness between the AFS control module and connector C-32 because the wiring harness is shorted between circuits.
		No	Replace the AFS control module because there is a short between circuits in the AFS control module. (See **ADAPTIVE FRONT LIGHTING SYSTEM (AFS) CONTROL MODULE REMOVAL/INSTALLATION**.)
14	**INSPECT BETWEEN CONNECTOR C-03 AND INSTRUMENT CLUSTER FOR SHORT BETWEEN CIRCUITS** • Switch the ignition off. • Disconnect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Disconnect connector C-03. • Connect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Switch the ignition ON (engine off). • Measure the voltage at DLC-2 terminals F and E. • Is the voltage at DLC-2 terminals F and E the same?	Yes	Go to the next step.
		No	Repair or replace the wiring harness between connector C-32 and connector C-03 because the wiring harness is shorted between circuits.
15	**INSPECT BETWEEN CONNECTOR C-12 AND INSTRUMENT CLUSTER FOR SHORT BETWEEN CIRCUITS** • Switch the ignition off. • Disconnect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Disconnect connector C-12. • Connect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Switch the ignition ON (engine off). • Measure the voltage at DLC-2 terminals F and E. • Is the voltage at DLC-2 terminals F and E the same?	Yes	Go to Step 22.
		No	Go to the next step.
16	**INSPECT BETWEEN LASER SENSOR / FORWARD SENSING CAMERA (FSC) AND CONNECTORS C-12 FOR SHORT BETWEEN CIRCUITS** • Switch the ignition off. • Disconnect the negative battery cable.	Yes	Go to the next step.
		No	Repair or replace the wiring harness between connector C-03 and connector C-12 because the wiring harness is shorted between circuits.

	(See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Inspect for continuity between laser sensor terminals D and C (with smart city brake support). • Inspect for continuity between forward sensing camera (FSC) terminals E and C (with forward sensing camera). • Is there continuity?		
17	**INSPECT BETWEEN CONNECTOR C-42 AND LASER SENSOR FOR SHORT BETWEEN CIRCUITS** • Disconnect connector C-42. • Inspect for continuity between laser sensor terminals D and C. • Is there continuity?	Yes	Go to the next step.
		No	Go to Step 19.
18	**INSPECT LASER SENSOR FOR SHORT BETWEEN CIRCUITS** • Disconnect the laser sensor connector. • Inspect for continuity between laser sensor terminals D and C (wiring harness side). • Is there continuity?	Yes	Repair or replace the wiring harness between the laser sensor and connector C-42 because the wiring harness is shorted between circuits.
		No	Replace the laser sensor because there is a short between circuits in the laser sensor. (See **LASER SENSOR REMOVAL/INSTALLATION**.)
19	**INSPECT BETWEEN FORWARD SENSING CAMERA (FSC) AND CONNECTOR C-42 FOR SHORT BETWEEN CIRCUITS** • Inspect for continuity between forward sensing camera (FSC) terminals E and C. • Is there continuity?	Yes	Go to the next step.
		No	Repair or replace the wiring harness between connector C-12 and connector C-42 because the wiring harness is shorted between circuits.
20	**INSPECT BETWEEN FORWARD SENSING CAMERA (FSC) AND CONNECTOR C-27 FOR SHORT BETWEEN CIRCUITS** • Disconnect connector C-27. • Inspect for continuity between forward sensing camera (FSC) terminals E and C. • Is there continuity?	Yes	Go to the next step.
		No	Repair or replace the wiring harness between connector C-42 and connector C-27 because the wiring harness is shorted between circuits.
21	**INSPECT FORWARD SENSING CAMERA (FSC) FOR SHORT BETWEEN CIRCUITS** • Disconnect the forward sensing camera (FSC) connector. • Inspect for continuity between forward sensing camera (FSC) terminals E and C (wiring harness side). • Is there continuity?	Yes	Repair or replace the wiring harness between the forward sensing camera (FSC) and connector C-27 because the wiring harness is shorted between circuits.
		No	Replace the forward sensing camera (FSC) because there is a short between circuits in the forward sensing camera (FSC). (See **FORWARD SENSING CAMERA (FSC) REMOVAL/INSTALLATION**.)
22	**INSPECT BETWEEN CONNECTOR C-33 AND DLC-2 FOR SHORT BETWEEN CIRCUITS** • Switch the ignition off. • Disconnect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)	Yes	Repair or replace the wiring harness between connector C-33 and DLC-2 because the wiring harness is shorted between circuits.
		No	Go to the next step.

	• Disconnect connector C-33. • Inspect for continuity between DLC-2 terminals F and E. • Is there continuity?		
23	**INSPECT BETWEEN START STOP UNIT AND CONNECTOR C-33 FOR SHORT BETWEEN CIRCUITS** • Inspect for continuity between start stop unit terminals 2M and 2O. • Is there continuity?	Yes	Go to the next step.
		No	Go to Step 25.
24	**INSPECT START STOP UNIT FOR SHORT BETWEEN CIRCUITS** • Disconnect the start stop unit connector. • Is there continuity between start stop unit terminals 2M and 2O (wiring harness side). • Is there continuity?	Yes	Repair or replace the wiring harness between the start stop unit and connector C-33 because the wiring harness is shorted between circuits.
		No	Replace the start stop unit because there is a short between circuits in the start stop unit. (See **START STOP UNIT REMOVAL/INSTALLATION**.)
25	**INSPECT BETWEEN EPS CONTROL MODULE AND CONNECTOR C-33 FOR SHORT BETWEEN CIRCUITS** • Inspect for continuity between EPS control module terminals 2B and 2D. • Is there continuity?	Yes	Go to the next step.
		No	Go to Step 27.
26	**INSPECT EPS CONTROL MODULE FOR SHORT BETWEEN CIRCUITS** • Disconnect the EPS control module connector. • Is there continuity between EPS control module terminals 2B and 2D (wiring harness side). • Is there continuity?	Yes	Repair or replace the wiring harness between the EPS control module and connector C-33 because the wiring harness is shorted between circuits.
		No	Replace the EPS control module because there is a short between circuits in the EPS control module. (See **STEERING WHEEL AND COLUMN REMOVAL/INSTALLATION**.)
27	**INSPECT JB No.2 FOR SHORT BETWEEN CIRCUITS** • Connect connector C-33. • Disconnect connector C-34. • Connect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Switch the ignition ON (engine off). • Measure the voltage at DLC-2 terminals F and E. • Is the voltage at DLC-2 terminals F and E the same?	Yes	Replace the JB No.2 because there is a short between circuits in the JB No.2.
		No	Go to the next step.
28	**INSPECT BETWEEN CONNECTIVITY MASTER UNIT AND CONNECTOS C-34 FOR SHORT BETWEEN CIRCUITS** • Switch the ignition off. • Disconnect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Inspect for continuity between connectivity	Yes	Go to the next step.
		No	Go to Step 30.

	master unit terminals 2E and 2F. • Is there continuity?		
29	**INSPECT CONNECTIVITY MASTER UNIT FOR SHORT BETWEEN CIRCUITS** • Disconnect the connectivity master unit. • Inspect for continuity between connectivity master unit terminals 2E and 2F (wiring harness side). • Is there continuity?	Yes	Repair or replace the wiring harness between connectivity master unit and connector C-34 because the wiring harness is shorted between circuits.
		No	Replace the connectivity master unit because there is a short between circuits in the connectivity master unit. (See **CONNECTIVITY MASTER UNIT (CMU) REMOVAL/INSTALLATION**.)
30	**INSPECT BETWEEN SAS CONTORL MODULE AND CONNECTOS C-34 FOR SHORT BETWEEN CIRCUITS** • Inspect for continuity between SAS control module terminals 3K and 3L. • Is there continuity?	Yes	Go to the next step.
		No	Go to Step 32.
31	**INSPECT SAS CONTORL MODULE FOR SHORT BETWEEN CIRCUITS** • Disconnect the SAS control module. • Inspect for continuity between SAS control module terminals 3K and 3L (wiring harness side). • Is there continuity?	Yes	Repair or replace the wiring harness between SAS control module and connector C-34 because the wiring harness is shorted between circuits.
		No	Replace the SAS control module because there is a short between circuits in the SAS control module. (See **SAS CONTROL MODULE REMOVAL/INSTALLATION [TWO-STEP DEPLOYMENT CONTROL SYSTEM]**.) (See **SAS CONTROL MODULE REMOVAL/INSTALLATION [STANDARD DEPLOYMENT CONTROL SYSTEM]**.)
32	**INSPECT BETWEEN CONNECTOR C-09 AND CONNECTOR C-34 FOR SHORT BETWEEN CIRCUITS** • Disconnect connector C-09. • Connect connector C-34. • Connect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Switch the ignition ON (engine off). • Measure the voltage at DLC-2 terminals F and E. • Is the voltage at DLC-2 terminals F and E the same?	Yes	Repair or replace the wiring harness between connector C-34 and connector C-09 because the wiring harness is shorted between circuits.
		No	Go to the next step.
33	**INSPECT BETWEEN AUDIO AMPLIFIER AND CONNECTOR C-09 FOR SHORT BETWEEN CIRCUITS** • Switch the ignition off. • Disconnect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Inspect for continuity between audio amplifier terminals 2L and 2N. • Is there continuity?	Yes	Go to the next step.
		No	Go to Step 36.
34	**INSPECT BETWEEN AUDIO AMPLIFIER AND CONNECTOR C-40 FOR SHORT BETWEEN CIRCUITS**	Yes	Go to the next step.

	• Disconnect connector C-40. • Inspect for continuity between audio amplifier terminals 2L and 2N. • Is there continuity?	No	Repair or replace the wiring harness between connector C-09 and connector C-40 because the wiring harness is shorted between circuits.
35	**INSPECT AUDIO AMPLIFIER FOR SHORT BETWEEN CIRCUITS** • Disconnect the audio amplifier connector. • Is there continuity between audio amplifier terminals 2L and 2N (wiring harness side). • Is there continuity?	Yes	Repair or replace the wiring harness between the audio amplifier and connector C-40 because the wiring harness is shorted between circuits.
		No	Replace the audio amplifier because there is a short between circuits in the audio amplifier. (See **AUDIO AMPLIFIER REMOVAL/INSTALLATION**.)
36	**INSPECT INSTRUMENT CLUSTER FOR SHORT BETWEEN CIRCUITS** • Disconnect the instrument cluster connector. • Is there continuity between instrument cluster terminals B and D (wiring harness side). • Is there continuity?	Yes	Repair or replace the wiring harness between the instrument cluster and connector C-09 because the wiring harness is shorted between circuits.
		No	Replace the instrument cluster because there is a short between circuits in the instrument cluster. (See **INSTRUMENT CLUSTER REMOVAL/INSTALLATION**.)
37	**INSPECT PCM FOR SHORT BETWEEN CIRCUITS** • Disconnect the PCM connector. • Inspect for continuity between PCM terminals 2AK and 2AL (wiring harness side). • Is there continuity?	Yes	Repair or replace the wiring harness between the PCM and front body control module (FBCM) because the wiring harness is shorted between circuits.
		No	Replace the PCM because there is a short between circuits in the PCM. (See **PCM REMOVAL/INSTALLATION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)

2014 - Mazda3 - Multiplex Communication System

DETERMINING OPEN CIRCUIT LOCATION (MS-CAN)

CAUTION:

- Perform the following malfunction diagnosis only when it is diagnosed with a open circuit by CONTROLLER AREA NETWORK (CAN) MALFUNCTION DIAGNOSIS FLOW. (See **CONTROLLER AREA NETWORK (CAN) MALFUNCTION DIAGNOSIS FLOW**.)
- If the malfunctioning part is detected in the communication line, before disconnecting the related connector for inspection, press the connector in the connection direction to verify that there is no looseness or disconnection.
- When disconnecting the connector, verify that there is no damage, deformation, or corrosion of the connector terminals.

1. Verify DTCs of the modules related to the CAN system.

2. Apply the communication error DTC and the failed module to DTC output pattern and malfunctioning location, and select the possible cause for the diagnostic result and the reference for the inspection item. (See **DTC output pattern and malfunctioning location**.)

NOTE:

- The open circuit location can be determined by the DTC indicated in the DTC output pattern and malfunctioning location chart. DTCs not listed in the chart are not used for the determination of the open circuit location. (See **DTC output pattern and malfunctioning location**.)

3. Inspect the possible cause and inspection item of the applicable malfunctioning part.

4. After repairs, return to CONTROLLER AREA NETWORK (CAN) MALFUNCTION DIAGNOSIS FLOW, and verify that the repairs have been completed. (See **CONTROLLER AREA NETWORK (CAN) MALFUNCTION DIAGNOSIS FLOW**.)

Possible cause and inspection item		**A**	**B**	**C**	**D**	**E**

*1 **With BSM system**

A

Possible cause

- Connector terminal disconnection, poor contact, damage, deformation, corrosion
- Instrument cluster power supply voltage or body ground malfunction
- Open circuit in wiring harness between information display and connector C-34
- JB No.2 malfunction
- Connector C-34 malfunction
- Connector C-33 malfunction
- Instrument cluster malfunction

System wiring diagram

Inspection item

- Instrument cluster power supply voltage-related wiring harness and fuse
- Instrument cluster body ground related wiring harness
- JB No.2
- Connector C-34
- Connector C-33
- Wiring harness between Instrument cluster terminal C and connector C-34
- Wiring harness between Instrument cluster terminal E and connector C-34
- Instrument cluster

B

Possible cause

- Connector terminal disconnection, poor contact, damage, deformation, corrosion
- Climate control unit power supply voltage or body ground malfunction
- Open circuit in wiring harness between climate control unit and connector C-33

- Connector C-33 malfunction
- Climate control unit malfunction

System wiring diagram

Inspection item

- Climate control unit power supply voltage-related wiring harness and fuse
- Climate control unit body ground related wiring harness
- Climate control unit connector
- Connector C-33
- Wiring harness between climate control unit D and connector C-33
- Wiring harness between climate control unit B and connector C-33
- Climate control unit

C

Possible cause

- Connector terminal disconnection, poor contact, damage, deformation, corrosion
- Open circuit in wiring harness between connector C-33 and connector C-08
- Open circuit in wiring harness between connector C-08 and rear body control module (RBCM)
- Connector C-08 malfunction
- CAN circuit in rear body control module (RBCM) malfunction

System wiring diagram

Inspection item

- Rear body control module (RBCM) connector
- Connector C-08
- Wiring harness between branch C-33 and connector C-08
- Wiring harness between rear body control module (RBCM) terminal 3E and connector C-08
- Wiring harness between rear body control module (RBCM) terminal 3G and connector C-08
- Rear body control module (RBCM)
    - Between rear body control module (RBCM) terminal 3E and rear body control module (RBCM) terminal 4G
    - Between rear body control module (RBCM) terminal 3G and rear body control module (RBCM)

terminal 4J

D

Possible cause

- Connector terminal disconnection, poor contact, damage, deformation, corrosion
- BSM control module (LH) power supply voltage or body ground malfunction
- Open circuit in wiring harness between BSM control module (LH) and connector C-19
- Open circuit in wiring harness between connector C-19 and rear body control module (RBCM)
- connector C-19 malfunction
- BSM control module (LH) malfunction
- CAN circuit in rear body control module (RBCM) malfunction

System wiring diagram

Inspection item

- BSM control module (LH) power supply voltage-related wiring harness and fuse

- BSM control module (LH) body ground related wiring harness
- BSM control module (LH) connector
- Rear body control module (RBCM) connector
- connector C-19
- Wiring harness between BSM control module (LH) terminal C and connectors C-19
- Wiring harness between BSM control module (LH) terminal D and connectors C-19
- Wiring harness between connector C-19 and rear body control module (RBCM) terminal 4G
- Wiring harness between connector C-19 and rear body control module (RBCM) terminal 4J
- Rear body control module (RBCM)
    - Between rear body control module (RBCM) terminal 4G and rear body control module (RBCM) terminal 3E
    - Between rear body control module (RBCM) terminal 4J and rear body control module (RBCM) terminal 3G

E

Possible cause

- Connector terminal disconnection, poor contact, damage, deformation, corrosion
- Rear body control module (RBCM) power supply voltage or body ground malfunction
- Rear body control module (RBCM) malfunction

System wiring diagram

DETERMINING OPEN CIRCUIT LOCATION (MS-CAN)

Inspection item

- Rear body control module (RBCM) power supply voltage-related wiring harness and fuse
- Rear body control module (RBCM) body ground related wiring harness
- Rear body control module (RBCM)

2014 - Mazda3 - Multiplex Communication System

DETERMINING SHORT TO GROUND LOCATION (MS-CAN)

CAUTION:

- Perform the following malfunction diagnosis only when it is diagnosed with a short to ground by CONTROLLER AREA NETWORK (CAN) MALFUNCTION DIAGNOSIS FLOW. (See **CONTROLLER AREA NETWORK (CAN) MALFUNCTION DIAGNOSIS FLOW**.)

System wiring diagram

Determination procedure

CAUTION:

- When disconnecting the connector, verify that there is no looseness, damage, deformation, corrosion, or poor connection of the connector terminals.
- When inspecting the DLC-2, touch it with a paper clip or similar thin pin without directly inserting a tester into the terminals.

Step	Inspection	Action

1	**INSPECT FOR SHORT TO GROUND BETWEEN CONNECTOR C-34 AND INSTRUMENT CLUSTER** • Disconnect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Disconnect connector C-34. • Inspect for continuity at the following terminals: ▪ Between DLC-2 terminal L and body ground ▪ Between DLC-2 terminal K and body ground • Is there continuity?	Yes	Go to Step 3.
		No	Go to the next step.
2	**INSPECT CAN LINE IN INSTRUMENT CLUSTER FOR SHORT TO GROUND** • Disconnect the instrument cluster connector. • Inspect for continuity at the following terminals: ▪ Between instrument cluster terminal C and body ground ▪ Between instrument cluster terminal E and body ground • Is there continuity?	Yes	Repair or replace the wiring harness between the instrument cluster and connector C-34 because the wiring harness is shorted to ground.
		No	Replace the instrument cluster because there is a short to ground in the instrument cluster. (See **INSTRUMENT CLUSTER REMOVAL/INSTALLATION**.)
3	**INSPECT CAN LINE IN JB No.2 FOR SHORT TO GROUND** • Connect connector C-34. • Disconnect connector C-33. • Inspect for continuity at the following terminals: ▪ Between instrument cluster terminal C and body ground ▪ Between instrument cluster terminal E and body ground • Is there continuity?	Yes	Replace the JB No.2 because there is a short to ground in the JB No.2.
		No	Go to the next step.
4	**INSPECT FOR SHORT TO GROUND BETWEEN CONNECTOR C-33 AND DLC-2** • Inspect for continuity at the following terminals:	Yes	Repair or replace the wiring harness between connector C-33 and DLC-2 because the wiring harness is shorted to ground.

	Between DLC-2 terminal L and body ground ▪ Between DLC-2 terminal K and body ground • Is there continuity?	No	Go to the next step.
5	**INSPECT FOR SHORT TO GROUND BETWEEN CONNECTOR C-33 AND CLIMATE CONTROL UNIT** • Inspect for continuity at the following terminals: ▪ Between climate control unit terminal D and body ground ▪ Between climate control unit terminal B and body ground • Is there continuity?	Yes	Go to the next step.
		No	Go to Step 7.
6	**INSPECT CAN LINE IN CLIMATE CONTROL UNIT FOR SHORT TO GROUND** • Disconnect the climate control unit connector. • Inspect for continuity at the following terminals: ▪ Between climate control unit terminal D (wiring harness side) and body ground ▪ Between climate control unit terminal B (wiring harness side) and body ground • Is there continuity?	Yes	Repair or replace the wiring harness between the climate control unit and connector C-33 because the wiring harness is shorted to ground.
		No	Replace the climate control unit because there is a short to ground inside the climate control unit. (See **CLIMATE CONTROL UNIT REMOVAL/INSTALLATION [FULL-AUTO AIR CONDITIONER]**.)
7	**INSPECT FOR SHORT TO GROUND BETWEEN CONNECTOR C-08 AND CONNECTOR C-33** • Disconnect connector C-08. • Connect connector C-33. • Inspect for continuity at the following terminals: ▪ Between DLC-2 terminal L and body ground ▪ Between DLC-2 terminal K and body ground • Is there continuity?	Yes	Repair or replace the wiring harness between connector C-08 and connector C-33 because the wiring harness is shorted to ground.
		No	Go to the next step.
8	**INSPECT FOR SHORT TO GROUND BETWEEN GROUND BETWEEN BSM CONTROL MODULE (LH)**	Yes	Go to the next step.

	AND REAR BODY CONTROL MODULE (RBCM) • Disconnect the rear body control module (RBCM) connector. • Inspect for continuity at the following terminals: ▪ Between rear body control module (RBCM) terminal 4G (wiring harness side) and body ground ▪ Between rear body control module (RBCM) terminal 4J (wiring harness side) and body ground • Is there continuity?	No	Go to Step 11.
9	**INSPECT FOR SHORT TO GROUND BETWEEN BSM CONTROL MODULE (LH) AND CONNECTOR C-19** • Disconnect connector C-19. • Inspect for continuity at the following terminals: ▪ Between BSM control module (LH) terminal C and body ground ▪ Between BSM control module (LH) terminal D and body ground • Is there continuity?	Yes	Go to the next step.
		No	Repair or replace the wiring harness between the rear body control module (RBCM) and connector C-19 because the wiring harness is shorted to ground.
10	**INSPECT CAN LINE IN BSM CONTROL MODULE (LH) FOR SHORT TO GROUND** • Disconnect the BSM control module (LH) connector. • Inspect for continuity at the following terminals: ▪ Between BSM control module (LH) terminal C (wiring harness side) and body ground ▪ Between BSM control module (LH) terminal D (wiring harness side) and body ground • Is there continuity?	Yes	Repair or replace the wiring harness between the BSM control module (LH) and connector C-19 because the wiring harness is shorted to ground.
		No	Replace the BSM control module (LH) because there is a short to ground in the BSM control module (LH). (See **BLIND SPOT MONITORING (BSM) CONTROL MODULE REMOVAL/INSTALLATION**.)
11	**INSPECT CAN LINE IN REAR BODY CONTROL MODULE (RBCM) FOR SHORT TO GROUND** • Inspect for continuity at the following terminals: ▪ Between rear body control module (RBCM)	Yes	Repair or replace the wiring harness between the rear body control module (RBCM) and connector C-08 because the wiring harness is shorted to ground.
		No	Replace the rear body control module (RBCM) because there is a short to ground in the rear body control

	terminal 3E and body ground ▪ Between rear body control module (RBCM) terminal 3G and body ground • Is there continuity?		module (RBCM). (See **REAR BODY CONTROL MODULE (RBCM) REMOVAL/INSTALLATION**.)

2014 - Mazda3 - Multiplex Communication System

DETERMINING SHORT TO POWER SUPPLY LOCATION (MS-CAN)

CAUTION:

- Perform the following malfunction diagnosis only when it is diagnosed with a short to the power supply by CONTROLLER AREA NETWORK (CAN) MALFUNCTION DIAGNOSIS FLOW. (See **CONTROLLER AREA NETWORK (CAN) MALFUNCTION DIAGNOSIS FLOW**.)

System wiring diagram

Determination procedure

CAUTION:

- When disconnecting the connector, verify that there is no looseness, damage, deformation, corrosion, or poor connection of the connector terminals.
- When inspecting the DLC-2, touch it with a paper clip or similar thin pin without directly inserting a tester into the terminals.
- Disconnect the negative battery cable before performing any work that requires handling of connectors.

Step	Inspection		Action
1	**INSPECT FOR SHORT TO POWER SUPPLY BETWEEN CONNECTOR C-34 AND INSTRUMENT CLUSTER** • Switch the ignition off. • Disconnect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Disconnect connector C-34. • Connect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Switch the ignition ON (engine off). • Measure the voltage at instrument cluster terminals C and E. • Is the voltage between 1.5 — 3.5 V?	Yes	Go to Step 3.
		No	Go to the next step.
2	**INSPECT INSTRUMENT CLUSTER FOR SHORT TO POWER SUPPLY** • Switch the ignition off. • Disconnect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Disconnect the instrument cluster connector. • Connect connector C-34. • Connect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Switch the ignition ON (engine off). • Measure the voltage at DLC-2 terminals L and K. • Is the voltage between 1.5 — 3.5 V?	Yes	Replace the instrument cluster because there is a short to the power supply in the instrument cluster. (See **INSTRUMENT CLUSTER REMOVAL/INSTALLATION**.)
		No	Repair or replace the wiring harness between the instrument cluster and connector C-34 because the wiring harness is shorted to the power supply.
3	**INSPECT JB No.2 FOR SHORT TO POWER SUPPLY** • Switch the ignition off. • Disconnect the negative battery cable.	Yes	Go to the next step.
		No	Replace the JB No.2 because there is a short to the power supply in the JB No.2.

	(See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Connect the instrument cluster connector. • Connect connector C-34. • Disconnect connector C-33. • Connect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Switch the ignition ON (engine off). • Measure the voltage at instrument cluster terminals C and E. • Is the voltage between 1.5 — 3.5 V?		
4	**INSPECT FOR SHORT TO POWER SUPPLY BETWEEN CONNECTOR C-33 AND DLC-2** • Measure the voltage at DLC-2 terminals L and K. • Is the voltage 0 V?	Yes	Go to the next step.
		No	Repair or replace the wiring harness between the DLC-2 and connector C-33 because the wiring harness is shorted to the power supply.
5	**INSPECT FOR SHORT TO POWER SUPPLY BETWEEN CONNECTOR C-33 AND CLIMATE CONTROL UNIT** • Measure the voltage at climate control unit terminals D and B. • Is the voltage between 1.5 — 3.5 V?	Yes	Go to Step 7.
		No	Go to the next step.
6	**INSPECT CLIMATE CONTROL UNIT FOR SHORT TO POWER SUPPLY** • Switch the ignition off. • Disconnect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Disconnect the climate control unit connector. • Connect connector C-33. • Connect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Switch the ignition ON (engine off). • Measure the voltage at DLC-2 terminals L and K.	Yes	Replace the climate control unit because there is a short to the power supply in the climate control unit. (See **CLIMATE CONTROL UNIT REMOVAL/INSTALLATION [FULL-AUTO AIR CONDITIONER]**.)
		No	Repair or replace the wiring harness between the climate control unit and connector C-33 because the wiring harness is shorted to the power supply.

	• Is the voltage between 1.5 — 3.5 V?		
7	**INSPECT FOR SHORT TO POWER SUPPLY BETWEEN CONNECTOR C-33 AND CONNECTOR C-08** • Switch the ignition off. • Disconnect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Connect connector C-33. • Disconnect the connector C-08. • Connect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Switch the ignition ON (engine off). • Measure the voltage at DLC-2 terminals L and K. • Is the voltage between 1.5 — 3.5 V?	Yes	Go to the next step.
		No	Repair or replace the wiring harness between connector C-33 and connector C-08 because the wiring harness is shorted to the power supply.
8	**INSPECT FOR SHORT TO POWER SUPPLY BETWEEN BSM CONTROL MODULE (LH) AND REAR BODY CONTROL MODULE (RBCM)** • Switch the ignition off. • Disconnect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Disconnect the rear body control module (RBCM) connector. • Connect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Switch the ignition ON (engine off). • Measure the voltage at BSM control modules (LH) terminals C and D. • Is the voltage between 1.5 — 3.5 V?	Yes	Go to Step 11.
		No	Go to the next step.
9	**INSPECT FOR SHORT TO POWER SUPPLY BETWEEN BSM CONTROL MODULE (LH) AND CONNECTOR C-19** • Switch the ignition off.	Yes	Repair or replace the wiring harness between the rear body control module (RBCM) and connector C-19 because the wiring harness is shorted to the power supply.

	• Disconnect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Disconnect connector C-19. • Connect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Switch the ignition ON (engine off). • Measure the voltage at BSM control modules (LH) terminals C and D. • Is the voltage between 1.5 — 3.5 V?	No	Go to the next step.
10	**INSPECT BSM CONTROL MODULE (LH) FOR SHORT TO POWER SUPPLY** • Switch the ignition off. • Disconnect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Disconnect the BSM control modules (LH) connector. • Connect connector C-19. • Connect the rear body control module (RBCM) connector. • Connect connector C-08. • Connect connector C-33. • Connect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Switch the ignition ON (engine off). • Measure the voltage at DLC-2 terminals L and K. • Is the voltage between 1.5 - 3.5 V?	Yes	Replace the BSM control modules (LH) because there is a short to power supply in the BSM control modules (LH). (See **BLIND SPOT MONITORING (BSM) CONTROL MODULE REMOVAL/INSTALLATION**.)
		No	Repair or replace the wiring harness between the BSM control modules (LH) and connector C-19 because the wiring harness is shorted to the power supply.
11	**INSPECT REAR BODY CONTROL MODULE (RBCM) FOR SHORT TO POWER SUPPLY** • Switch the ignition off. • Disconnect the negative battery cable. (See **NEGATIVE BATTERY CABLE**	Yes	Replace the rear body control module (RBCM) because there is a short to the power supply in the rear body control module (RBCM). (See **REAR BODY CONTROL MODULE (RBCM) REMOVAL/INSTALLATION**.)

	DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5].) • Connect connector C-08. • Connect connector C-33. • Connect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Switch the ignition ON (engine off). • Measure the voltage at DLC-2 terminals L and K. • Is the voltage between 1.5 - 3.5 V?	No	Repair or replace the wiring harness between the rear body control module (RBCM) and connector C-08 because the wiring harness is shorted to the power supply.

DETERMINING SHORT BETWEEN CIRCUITS LOCATION (MS-CAN)

CAUTION:

- Perform the following malfunction diagnosis only when it is diagnosed with a short between circuits by CONTROLLER AREA NETWORK (CAN) MALFUNCTION DIAGNOSIS FLOW. (See **CONTROLLER AREA NETWORK (CAN) MALFUNCTION DIAGNOSIS FLOW**.)

System wiring diagram

Determination procedure

CAUTION:

- When disconnecting the connector, verify that there is no looseness, damage, deformation, corrosion, or poor connection of the connector terminals.
- When inspecting the DLC-2, touch it with a paper clip or similar thin pin without directly inserting a tester into the terminals.
- Disconnect the negative battery cable before performing any work that requires handling of connectors.

Step	Inspection		Action
1	**INSPECT BETWEEN CONNECTOR C-34 AND INSTRUMENT CLUSTER FOR SHORT BETWEEN CIRCUITS** • Disconnect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**) • Disconnect connector C-34. • Connect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**) • Switch the ignition ON (engine off). • Measure the voltage at instrument cluster terminals C and E. • Is the voltage at instrument cluster terminals C and E the same?	Yes	Go to the next step.
		No	Go to Step 3.
2	**INSPECT INSTRUMENT CLUSTER FOR SHORT BETWEEN CIRCUITS** • Switch the ignition off. • Disconnect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**) • Disconnect the instrument cluster connector. • Inspect for continuity between instrument cluster terminals C and E (wiring harness side). • Is there continuity?	Yes	Repair or replace the wiring harness between the instrument cluster and connector C-34 because the wiring harness is shorted between circuits.
		No	Replace the instrument cluster because there is a short between circuits in the instrument cluster. (See **INSTRUMENT CLUSTER REMOVAL/INSTALLATION**)
3	**INSPECT JB No.2 FOR SHORT BETWEEN CIRCUITS** • Disconnect connector C-33. • Connect connector C-34. • Inspect for continuity between instrument cluster terminals C and E (wiring harness side). • Is there continuity?	Yes	Replace the JB No.2 because there is a short between circuits in the JB No.2.
		No	Go to the next step.
4	**INSPECT BETWEEN CONNECTOR C-33 AND DLC-2 FOR SHORT BETWEEN CIRCUITS** • Inspect for continuity between DLC-2 terminals L and K.	Yes	Repair or replace the wiring harness between connector C-33 and DLC-2 because the wiring harness is shorted between circuits.
		No	Go to the next step.

	Is there continuity?		
5	**INSPECT BETWEEN CONNECTOR C-33 AND CLIMATE CONTROL UNIT FOR SHORT BETWEEN CIRCUITS** • Inspect for continuity between climate control unit terminals D and B. • Is there continuity?	Yes	Go to the next step.
		No	Go to Step 7.
6	**INSPECT CLIMATE CONTROL UNIT FOR SHORT BETWEEN CIRCUITS** • Disconnect the climate control unit connector. • Inspect for continuity between climate control unit terminals D and B (wiring harness side). • Is there continuity?	Yes	Repair or replace the wiring harness between the climate control unit and connector C-33 because the wiring harness is shorted between circuits.
		No	Replace the climate control unit because there is a short between circuits inside the climate control unit. (See **CLIMATE CONTROL UNIT REMOVAL / INSTALLATION [FULL-AUTO AIR CONDITIONER]**)
7	**INSPECT BETWEEN CONNECTOR C-08 AND CONNECTOR C-33 FOR SHORT BETWEEN CIRCUITS** • Disconnect connector C-08. • Connect connector C-33. • Inspect for continuity between DLC-2 terminals L and K. • Is there continuity?	Yes	Repair or replace the wiring harness between connector C-08 and connector C-33 because the wiring harness is shorted between circuits.
		No	Go to the next step.
8	**INSPECT BETWEEN BSM CONTROL MODULE (LH) AND REAR BODY CONTROL MODULE (RBCM) FOR SHORT BETWEEN CIRCUITS** • Disconnect the rear body control module (RBCM) connector. • Inspect the continuity between BSM control module (LH) terminals C and D. • Is there continuity?	Yes	Go to the next step.
		No	Go to Step 11.
9	**INSPECT BETWEEN BSM CONTROL MODULE (LH) AND CONNECTOR C-19 FOR SHORT BETWEEN CIRCUITS** • Disconnect connector C-19. • Inspect the continuity between BSM control module (LH) terminals C and D. • Is there continuity?	Yes	Go to the next step.
		No	Repair or replace the wiring harness between the rear body control module (RBCM) and connector C-19 because the wiring harness is shorted between circuits.
10	**INSPECT BSM CONTROL MODULE (LH) FOR SHORT BETWEEN CIRCUITS** • Disconnect the BSM control module (LH) connector. • Inspect for continuity between BSM	Yes	Repair or replace the wiring harness between the BSM control module (LH) and connector C-19 because the wiring harness is shorted between circuits.
		No	Replace the BSM control module (LH) because there is a

	control module (LH) terminals C and D (wiring harness side). • Is there continuity?		short between circuits in the BSM control module (LH). (See **BLIND SPOT MONITORING (BSM) CONTROL MODULE REMOVAL/INSTALLATION**)
11	**INSPECT REAR BODY CONTROL MODULE (RBCM) FOR SHORT BETWEEN CIRCUITS** • Inspect for continuity between rear body control module (RBCM) terminals 3E and 3G (wiring harness side). • Is there continuity?	Yes	Repair or replace the wiring harness between the rear body control module (RBCM) and connector C-08 because the wiring harness is shorted between circuits.
		No	Replace the rear body control module (RBCM) because there is a short between circuits in the rear body control module (RBCM). (See **REAR BODY CONTROL MODULE (RBCM) REMOVAL/INSTALLATION**)

2014 - Mazda3 - Personalized Features

PERSONALIZATION FEATURES

- The following systems can be personalized.
- When performing a personalization setting, refer to the referenced section for the detailed setting procedure.

Security And Locks

Advanced keyless entry system

NOTE:

- There are two types of personalization procedures; one using the M-MDS and the other using the center display.

Personalization features	Setting contents	Setting procedure
The advanced keyless entry system and push button start system functions can be disabled.	Enabled. / Disabled.	M-MDS is used. (See **SECURITY AND LOCKS PERSONALIZATION FEATURES SETTING PROCEDURE**.)
The out-of-area (reception area) type auto lock function can be set.	Not Adopted. / OFF / ON	M-MDS is used. (See **SECURITY AND LOCKS PERSONALIZATION FEATURES SETTING PROCEDURE**.)
	Off / On	Center display is used for the setting. (See **CENTER DISPLAY PERSONALIZATION FEATURES SETTING PROCEDURE**.)
The operation start time of the auto re-lock	Not Adopted. / 30 seconds / 60 seconds / 90 seconds	M-MDS is used. (See **SECURITY AND LOCKS PERSONALIZATION FEATURES SETTING PROCEDURE**.)

function can be changed.	30 seconds / 60 seconds / 90 seconds	Center display is used for the setting. (See **CENTER DISPLAY PERSONALIZATION FEATURES SETTING PROCEDURE**.)
The keyless beeper volume can be adjusted.	Not Adopted. / Off / Low / Medium / High	M-MDS is used. (See **SECURITY AND LOCKS PERSONALIZATION FEATURES SETTING PROCEDURE**.)
	High / Medium / Low / Off	Center display is used for the setting. (See **CENTER DISPLAY PERSONALIZATION FEATURES SETTING PROCEDURE**.)
Returns the setting content of the door lock system to the initial setting.	No / Yes	Center display is used for the setting. (See **CENTER DISPLAY PERSONALIZATION FEATURES SETTING PROCEDURE**.)

Keyless entry system

NOTE:

- There are two types of personalization procedures; one using the M-MDS and the other using the center display.

Personalization features	Setting contents	Setting procedure
The keyless entry system and push button start system functions can be disabled.	Enabled. / Disabled.	M-MDS is used. (See **SECURITY AND LOCKS PERSONALIZATION FEATURES SETTING PROCEDURE**.)
The operation start time of the auto re-lock function can be changed.	Not Adopted. / 30 seconds / 60 seconds / 90 seconds	M-MDS is used. (See **SECURITY AND LOCKS PERSONALIZATION FEATURES SETTING PROCEDURE**.)
	30 seconds / 60 seconds / 90 seconds	Center display is used for the setting. (See **CENTER DISPLAY PERSONALIZATION FEATURES SETTING**

		PROCEDURE.)
Returns the setting content of the door lock system to the initial setting.	No / Yes	Center display is used for the setting. (See **CENTER DISPLAY PERSONALIZATION FEATURES SETTING PROCEDURE**.)

Power door lock system

NOTE:

- There are two types of personalization procedures; one using the M-MDS and the other using the center display.

Personalization features	Setting contents	Setting procedure
2-step unlocking system can be set.	Not Adopted. / Touch Once: All Doors. / Once: Driver's, Twice: All Doors.	M-MDS is used. (See **SECURITY AND LOCKS PERSONALIZATION FEATURES SETTING PROCEDURE**.)
	Once Driver's, Twice: All Doors	Center display is used for the setting. (See **CENTER DISPLAY PERSONALIZATION FEATURES SETTING PROCEDURE**.)
Auto door lock function can be changed.	Not Adopted. / OFF / Lock When Driving. / Lock: Driving, Unlock: IGN Off. / Lock When Shifting Out Of P. / Lock: Shift From P, Unlock: In P.	M-MDS is used. (See **CONTROL SYSTEM PERSONALIZATION FEATURES SETTING PROCEDURE**.)
	Lock:When Driving, Unlock: IGN Off	Center display is used for the setting. (See **CENTER DISPLAY PERSONALIZATION FEATURES SETTING PROCEDURE**.)
Returns the setting content of the door lock system to the initial setting.	No / Yes	Center display is used for the setting. (See **CENTER DISPLAY PERSONALIZATION FEATURES SETTING PROCEDURE**.)

Lighting Systems

Auto light system

NOTE:

- There are two types of personalization procedures; one using the M-MDS and the other using the center display.

Personalization features	Setting contents	Setting procedure
Auto light sensor sensitivity can be changed.	Not Adopted./Dark/Medium Dark/Medium/Medium Light/Light	M-MDS is used. (See **CONTROL SYSTEM PERSONALIZATION FEATURES SETTING PROCEDURE**.)
	Light/Medium Light/ Medium/Medium Dark/Dark	Center display is used for the setting. (See **CENTER DISPLAY PERSONALIZATION FEATURES SETTING PROCEDURE**.)
Returns the setting content of the lighting system to the initial setting.	No / Yes	Center display is used for the setting. (See **CENTER DISPLAY PERSONALIZATION FEATURES SETTING PROCEDURE**.)

Auto light-off system

NOTE:

- There are two types of personalization procedures; one using the M-MDS and the other using the center display.

Personalization features	Setting contents	Setting procedure
	Not Adopted./0 seconds./30 seconds./60 seconds./90 seconds./120 seconds.	M-MDS is used. (See **CONTROL SYSTEM PERSONALIZATION FEATURES SETTING PROCEDURE**.)

The headlight emitted time of the auto light off timer can be changed.		
	120 seconds / 90 seconds / 60 seconds / 30 seconds / Off	Center display is used for the setting. (See **CENTER DISPLAY PERSONALIZATION FEATURES SETTING PROCEDURE**.)
Returns the setting content of the lighting system to the initial setting.	No / Yes	Center display is used for the setting. (See **CENTER DISPLAY PERSONALIZATION FEATURES SETTING PROCEDURE**.)

DRL system (Except canada specs.)

NOTE:

- There are two types of personalization procedures; one using the M-MDS and the other using the center display.

Personalization features	Setting contents	Setting procedure
The DRL system function can be set.	Off (DRL non-illumination)/On (DRL illumination)	M-MDS is used. (See **LIGHTING SYSTEM PERSONALIZATION FEATURES SETTING PROCEDURE**.)
	On / Off	Center display is used for the setting. (See **CENTER DISPLAY PERSONALIZATION FEATURES SETTING PROCEDURE**.)
Returns the setting content of the lighting system to the initial setting.	No / Yes	Center display is used for the setting. (See **CENTER DISPLAY PERSONALIZATION FEATURES SETTING PROCEDURE**.)

Turn light system

NOTE:

- There are two types of personalization procedures; one using the M-MDS and the other using the center display.

Personalization features	Setting contents	Setting procedure
The turn light system can be switched between operable and inoperable.	Not Adopted./OFF/ON	M-MDS is used. (See **CONTROL SYSTEM PERSONALIZATION FEATURES SETTING PROCEDURE**.)
	On / Off	Center display is used for the setting. (See **CENTER DISPLAY PERSONALIZATION FEATURES SETTING PROCEDURE**.)
Returns the setting content of the lighting system to the initial setting.	No / Yes	Center display is used for the setting. (See **CENTER DISPLAY PERSONALIZATION FEATURES SETTING PROCEDURE**.)

Room light control system

NOTE:

- There are two types of personalization procedures; one using the M-MDS and the other using the center display.

Personalization features	Setting contents	Setting procedure
• The front/rear map light illumination time after any door is opened can be changed. • The trunk compartment light (4SD)/cargo compartment light (5HB) illumination time after the trunk lid (4SD)/liftgate (5HB) is opened can be changed.	Not Adopted./30 minutes./60 minutes./10 minutes.	M-MDS is used. (See **CONTROL SYSTEM PERSONALIZATION FEATURES SETTING PROCEDURE**.)
	60 minutes / 30 minutes / 10 minutes	Center display is used for the setting. (See **CENTER DISPLAY PERSONALIZATION FEATURES SETTING PROCEDURE**.)
	Not Adopted./15 seconds./7.5 seconds./30 seconds./60 seconds.	M-MDS is used. (See **CONTROL SYSTEM PERSONALIZATION FEATURES SETTING PROCEDURE**.)

The front/rear map light illumination time after all the doors are closed can be changed.	60 seconds / 30 seconds / 15 seconds / 7.5 seconds	Center display is used for the setting. (See **CENTER DISPLAY PERSONALIZATION FEATURES SETTING PROCEDURE**.)
Returns the setting content of the lighting system to the initial setting.	No / Yes	Center display is used for the setting. (See **CENTER DISPLAY PERSONALIZATION FEATURES SETTING PROCEDURE**.)

High Beam Control (HBC) System

NOTE:

- There are two types of personalization procedures; one using the M-MDS and the other using the center display.

Personalization features	Setting contents	Setting procedure
The high beam control (HBC) system can be switched between operable and inoperable.	Not Adopted./OFF/ON	M-MDS is used. (See **FORWARD SENSING CAMERA (FSC) PERSONALIZATION FEATURES SETTING PROCEDURE**.)
	On / Off	Center display is used for the setting. (See **CENTER DISPLAY PERSONALIZATION FEATURES SETTING PROCEDURE**.)
Returns the setting content of the lighting system to the initial setting.	No / Yes	Center display is used for the setting. (See **CENTER DISPLAY PERSONALIZATION FEATURES SETTING PROCEDURE**.)

Wiper / Washer System

Auto wiper system

NOTE:

- There are two types of personalization procedures; one using the M-MDS and the other using the center display.

Personalization features	Setting contents	Setting procedure
Auto wiper system can be set to operable or inoperable.	Not Adopted./ Off (Intermittent)/On (Rain Sensing)	M-MDS is used. (See **CONTROL SYSTEM PERSONALIZATION FEATURES SETTING PROCEDURE**.)
	On / Off	Center display is used for the setting. (See **CENTER DISPLAY PERSONALIZATION FEATURES SETTING PROCEDURE**.)

Instrumentation/Driver Info.

Temperature

Personalization features	Setting contents	Setting procedure
The temperature unit can be changed. *1	F°/ C°	Center display is used for the setting. (See **CENTER DISPLAY PERSONALIZATION FEATURES SETTING PROCEDURE**.)

*1

When the ambient temperature display is switched, the set A/C cabin temperature display is also changed. (with dual type)

Distance

Personalization features	Setting contents	Setting procedure

The distance unit can be changed.	Miles / Km	Center display is used for the setting. (See **CENTER DISPLAY PERSONALIZATION FEATURES SETTING PROCEDURE**.)

Language

Personalization features	Setting contents	Setting procedure
The display language can be changed.	English / Français / Español	Center display is used for the setting. (See **CENTER DISPLAY PERSONALIZATION FEATURES SETTING PROCEDURE**.)

Turn And Hazard Indicator Alarm

NOTE:

- There are two types of personalization procedures; one using the M-MDS and the other using the center display.

Personalization features	Setting contents	Setting procedure
The volume of the turn and hazard indicator alarm can be changed.	Not Adopted. / Low / High	M-MDS is used. (See **INSTRUMENT CLUSTER PERSONALIZATION FEATURES SETTING PROCEDURE**.)
	High / Low	Center display is used for the setting. (See **CENTER DISPLAY PERSONALIZATION FEATURES SETTING PROCEDURE**.)

Lights-on Reminder Warning Alarm

NOTE:

- There are two types of personalization procedures; one using the M-MDS and the other using the center display.

Personalization features	Setting contents	Setting procedure

The volume for the lights-on reminder warning alarm can be changed.	Not Adopted. / OFF / Low / High	M-MDS is used. (See **INSTRUMENT CLUSTER PERSONALIZATION FEATURES SETTING PROCEDURE**.)
	High / Low / Off	Center display is used for the setting. (See **CENTER DISPLAY PERSONALIZATION FEATURES SETTING PROCEDURE**.)

Blind Spot Monitoring (BSM) System

NOTE:

- There are two types of personalization procedures; one using the M-MDS and the other using the center display.

Personalization features	Setting contents	Setting procedure
The volume of the blind spot monitoring (BSM) warning alarm can be changed.	Not Adopted. / OFF / Low / High	M-MDS is used. (See **INSTRUMENT CLUSTER PERSONALIZATION FEATURES SETTING PROCEDURE**.)
	High / Low / Off	Center display is used for the setting. (See **CENTER DISPLAY PERSONALIZATION FEATURES SETTING PROCEDURE**.)

Lane Departure Warning System (LDWS)

NOTE:

- There are two types of personalization procedures; one using the M-MDS and the other using the center display.

Personalization features	Setting contents	Setting procedure
The volume of the LDWS warning alarm (Rumble) can be changed.	High / Mid / Low	Center display is used for the setting. (See **CENTER DISPLAY PERSONALIZATION FEATURES SETTING PROCEDURE**.)

The volume of the LDWS warning alarm (Beep) can be changed.	High / Low	Center display is used for the setting. (See **CENTER DISPLAY PERSONALIZATION FEATURES SETTING PROCEDURE**.)
The type of the LDWS warning alarm can be changed.	Beep / Rumble	M-MDS is used. (See **INSTRUMENT CLUSTER PERSONALIZATION FEATURES SETTING PROCEDURE**.)
	Beep / Rumble	Center display is used for the setting. (See **CENTER DISPLAY PERSONALIZATION FEATURES SETTING PROCEDURE**.)
The distance between the warning-trigger lines for the Lane Departure Warning System (LDWS) and vehicle lanes can be changed.	Not Adopted / Adaptive / Early / Medium / Late	M-MDS is used. (See **FORWARD SENSING CAMERA (FSC) PERSONALIZATION FEATURES SETTING PROCEDURE**.)
	At Line / Before Line	Center display is used for the setting. (See **CENTER DISPLAY PERSONALIZATION FEATURES SETTING PROCEDURE**.)
The warning operation sensitivity of the lane departure warning system (LDWS) can be changed.	Not Adopted. / Often / Medium / Rare	M-MDS is used. (See **FORWARD SENSING CAMERA (FSC) PERSONALIZATION FEATURES SETTING PROCEDURE**.)
	High / Low	Center display is used for the setting. (See **CENTER DISPLAY PERSONALIZATION FEATURES SETTING PROCEDURE**.)
Returns the setting content of the lane departure warning system to the initial setting.	No / Yes	Center display is used for the setting. (See **CENTER DISPLAY PERSONALIZATION FEATURES SETTING PROCEDURE**.)

Smart City Brake Support (SCBS)

Personalization features	Setting contents	Setting procedure
The operation of smart city brake support (SCBS) can be turned off.	On / Off	Center display is used for the setting. (See **CENTER DISPLAY PERSONALIZATION FEATURES SETTING PROCEDURE**.)

2014 - Mazda3 - I-ELOOP

FOREWORD [i-ELOOP]

Procedure Before i-ELOOP-Related Part Servicing

WARNING:

- If the terminal of one of the i-ELOOP-related parts contacts the vehicle body with the service plug of the capacitor (i-ELOOP) connected, it could cause a fire and damage to electrical parts. In addition, if the terminal contacts your body, it could cause electrocution. Disconnect the service plug of the capacitor (i-ELOOP) before disconnecting the i-ELOOP-related part terminal. (See **SERVICE PLUG DISCONNECTION/CONNECTION [i-ELOOP]**.)
    - For the i-ELOOP-related part terminals, refer to the “PROCEDURE BEFORE i-ELOOP-RELATED PART SERVICING”. (See **PROCEDURE BEFORE i-ELOOP-RELATED PART SERVICING [i-ELOOP]**.)

Troubleshooting Procedure

- If there is any vehicle malfunction complaint lodged by a customer, perform malfunction diagnosis according to the troubleshooting procedure.

MALFUNCTIONING VEHICLE ARRIVES
VERIFY REPAIR ORDER AND SYMPTOM.
ACCURATELY VERIFY CUSTOMER COMPLAINT IN REPAIR ORDER FORM.
VERIFY TECHNICAL SERVICE BULLETINS.
VERIFY RELATED SERVICE BULLETINS AND/OR ON-LINE REPAIR INFORMATION AVAILABILITY.
IS ANY RELATED REPAIR INFORMATION AVAILABLE?
YES
PERFORM REPAIR OR DIAGNOSIS ACCORDING TO THE AVAILABLE REPAIR INFORMATION.
NO
DOES MALFUNCTION RECUR?
NO
SEE ACTION FOR NON-REPEATABLE MALFUNCTION.
YES
VERIFY MALFUNCTION SYMPTOM.
VERIFY MALFUNCTION SYMPTOM ON ACTUAL VEHICLE.
PERFORM CAN MALFUNCTION DIAGNOSIS.
SEE "CAN MALFUNCTION DIAGNOSIS FLOW"*1 AND PERFORM DIAGNOSIS FOR CAN RELATED MALFUNCTION.
PERFORM DTC INSPECTION.
INSPECT FOR ANY DTCs USING M-MDS.
ARE ANY DTCs OUTPUT?
YES
SEE ON-BOARD DIAGNOSIS SYSTEM AND PERFORM DTC TROUBLESHOOTING.
NO
SYMPTOM TROUBLESHOOTING
USE M-MDS FUNCTIONS ON THE RIGHT TO PERFORM DIAGNOSIS EFFICIENTLY.
PID/DATA MONITOR INSPECTION
USE M-MDS DATA MONITOR FUNCTION TO PERFORM INSPECTION WHILE MONITORING INPUT/OUTPUT SIGNALS.
ACTIVE COMMAND MODES INSPECTION
USE M-MDS SIMULATION FUNCTION TO INSPECT FOR INCOMPLETE ELECTRICAL CIRCUIT OR VALVE STICKING WHILE OPERATING EACH OUTPUT PART WITH THE IGNITION SWITCHED ON.
VERIFY MALFUNCTION IS REPAIRED.
SERVICE COMPLETED

*1

(See CONTROLLER AREA NETWORK (CAN) MALFUNCTION DIAGNOSIS FLOW.)

Action for Non-repeatable Malfunction

- If the malfunction does not recur, verify the malfunction cause by performing the following actions:
  - Based on the repair order form, attempt to drive the vehicle or perform tests to replicate the malfunction, record the data (such as PCM circuit voltage) at that time, and detect the malfunction cause.
  - Shake the wiring harness or connector of the electrical component which is suspected to be the cause of the malfunction, and inspect for malfunction or occurrence of any DTCs.

  - Inspect the female terminals on the connector of the electric component which is suspected to be the cause of the malfunction for poor connection.

Next >

2014 - Mazda3 - I-ELOOP

DTC INSPECTION [i-ELOOP]

CMDTC Self Test

1. Connect the M-MDS to the DLC-2.
2. After the vehicle is identified, select the following items from the initialization screen of the M-MDS.
   a. Select “Self Test”.
   b. Select “All CMDTCs”.
3. Verify the DTC according to the directions on the screen.
   - If any DTCs are displayed, perform troubleshooting according to the corresponding DTC inspection after recording the snapshot data.
4. After completion of repairs, clear all DTCs stored in the DC-DC converter (See **CLEARING DTC [i-ELOOP]**.)

ODDTC Self Test

1. Connect the M-MDS to the DLC-2.
2. After the vehicle is identified, select the following items from the initialization screen of the M-MDS.
   a. Select “Self Test”.
   b. Select “Modules”.
   c. Select “DCDC”.
3. Verify the DTC according to the directions on the screen.
   - If any DTCs are displayed, perform troubleshooting according to the corresponding DTC inspection after recording the snapshot data.
4. After completion of repairs, clear all DTCs stored in the DC-DC converter (See **CLEARING DTC [i-ELOOP]**.)

Snapshot Data

NOTE:

- Snapshot data items are not displayed, according to detected DTC.
- The data for all DTCs currently detected is stored.

—: Not applicable

Snapshot data item	Unit	Data contents	Data read/use method	Corresponding data monitor items
VPWR	V	Power supply voltage	—	—
		DC-DC converter input		

DCDC_IN_V	V	voltage (input terminal voltage)	—	DCDC_IN_V
CONV_OUT_V	V	DC-DC converter circuit output voltage	—	CONV_OUT_V
DCDC_OUT_V	V	DC-DC converter output voltage (output terminal voltage)	—	DCDC_OUT_V
DCDC_OUT_I	A	DC-DC converter output current	—	DCDC_OUT_I
IR_LOAD_I	A	Output current to compensating load at IR	—	IR_LOAD_I
CFG_STATUS	Config Complete/Not Configured/Config Error	Instrument cluster configuration status	—	—
ECT_STATUS	Under 0 degrees C/0 - Under 80 degrees C/Over 80 degrees C/FAIL	Engine coolant temperature status	—	—
SHIFT_STATUS	P/N/D/R/FAIL	Selector lever position status	When DTC is detected, instrument cluster displays selector lever position in M-MDS.	—
APP_STATUS	Accelerator Pedal Off/Under20%/Over20%/FAIL	Accelerator pedal position status	—	—
RPM_STATUS	Engine Stop/Under1500rpm/Over1500rpm/FAIL	Engine speed status	When DTC is detected, instrument cluster displays engine speed in M-MDS.	—
VSPD_STATUS	Stop/0-10km/h/Over10km/h/FAIL	Vehicle speed status	When DTC is detected, instrument cluster displays vehicle speed in M-MDS.	—
IG-ON_TIMER	hh:mm:ss*1	Elapsed time since ignition was switched ON **NOTE:** • The instrument cluster records the elapsed time since the ignition was switched ON.	When DTC is detected, instrument cluster displays elapsed time since ignition was switched on in M-MDS.	—
		Accumulated total elapsed time since vehicle completion until detects a DTC	The elapsed time when the DC-DC converter detected a DTC can be calculated by performing the following procedure.	

TOTAL_TIME	hh:mm:ss*1		**NOTE:** • When the ROOM removed, and the ignition is switched to off, the time is not included in the elapsed time.	• Verify the PID item TOTAL_TIME of the instrument cluster. • Verify the snapshot data item TOTAL_TIME. • Subtract 2 from 1.	—
TOTAL_DIST	km	Miles	Accumulated total traveled distance from completion of vehicle until instrument cluster detects DTC (Odometer value in instrument cluster)	The distance traveled when the DC-DC converter detected a DTC can be calculated by performing the following procedure. • Verify the odometer value in the instrument cluster. • Verify the snapshot data item TOTAL_DIST. • Subtract 2 from 1.	—
IC_VPWR	V		Instrument cluster power supply voltage	When DTC is detected, instrument cluster displays power supply voltage value of instrument cluster in M-MDS.	—
AAT	°C	°F	Ambient temperature	—	—
			• Key Out: Ignition switched to off • Key Recently Out (Position 0): Elapsed time **within 3 s** since ignition was switched to off • Accessory (Position 1): Ignition is switched		

PWR_MODE_KEY	Key Out/Key Recently Out (Position 0)/Accessory (Position 1)/Post Ignition (Position 2)/Ignition On (Position 2)/Running (Position 2)/Running - Starting	to ACC • Post Ignition (Position 2): Elapsed time **within 3 s** since ignition was switched ON • Ignition On (Position 2): Ignition switched ON (engine off) • Running (Position 2): Ignition switched ON (engine on) • Running - Starting: Cranking condition	When DTC is detected, instrument cluster displays ignition switch status in M-MDS.	—

*1

The seconds may be indicated after the decimal point.

2014 - Mazda3 - I-ELOOP

CLEARING DTC [i-ELOOP]

1. Connect the M-MDS to the DLC 2.

2. After the vehicle is identified, select the following items from the initialization screen of the M-MDS.

    a. Select “Self Test”.

    b. Select “Modules”.

    c. Select “DCDC”.

3. Then, select the “Retrieve CMDTCs” and perform procedures according to directions on the M-MDS screen.

4. Verify the DTC according to the directions on the M-MDS screen.

5. Press the clear button on the DTC screen to clear the DTC.

6. Verify that no DTCs are displayed.

7. Switch the ignition off.

2014 - Mazda3 - I-ELOOP

PID/DATA MONITOR INSPECTION [i-ELOOP]

1. Connect the M-MDS to the DLC-2.

2. After the vehicle is identified, select the following items from the initialization screen of the M-MDS.

    a. Select “DataLogger”.

    b. Select “Modules”.

    c. Select “DCDC”.

3. Select the applicable PID from the PID table.

4. Verify the PID data according to the directions on the screen.

NOTE:

- The PID data screen function is used for monitoring the calculated value of input/output signals in the module. Therefore, if the monitored value of the output component is not within the specification, it is necessary to inspect the monitored value of input component corresponding to the applicable output part control. In addition, because the system does not display an output part malfunction as an abnormality in the monitored value, it is necessary to inspect the output component individually.
- When detecting DTCs, PIDs related to a malfunctioning system may not display even if the module is normal. Therefore, if a PID is not displayed, it is necessary to verify the DTC, perform malfunction diagnosis of the DTC that was detected, and do repairs.

—: Not applicable

Item	Unit/Condition	description	Condition/Specification (Reference)
BYPS_COUNT	—	Count of Bypass Relay actuation	• Displays operation amount of the bypass relay.
BYPS_RLY_STAT1	Low/High	State of Bypass Relay Signal 1	• Displays the bypass relay signal status.
BYPS_RLY_STAT2	Low/High	State of Bypass Relay Signal 2	• Displays the bypass relay signal status.
			• Displays the bypass relay status. ▪ Bypass relay OFF: Bypass OFF

BYPS_STAT	Bypass Off/Bypass On/Bypass Off fault/Bypass On fault	State of Bypass circuit within DC-DC Converter	▪ Bypass relay ON: Bypass On ▪ Bypass relay OFF (Fail): Off fault ▪ Bypass relay ON (Fail): On fault
C_MEAS_END_V	V	DCDC Input Voltage at end of measurement of capacitance at IR	• Displays the DC-DC converter input voltage when the measurement of the capacitor (i-ELOOP) capacitance is completed.
C_MEAS_STAT	Completion/Incompletion/No directions	State of Electric capacity measurement	• Displays the measurement status of capacitor (i-ELOOP) capacitance. ▪ Measurement completed: Completion ▪ Measurement not completed: Incompletion ▪ No indication of measurement: No directions
C_MEAS_STR_V	V	DCDC Input Voltage at start of measurement of capacitance at IR	• Displays the DC-DC converter input voltage when measurement of capacitor (i-ELOOP) capacitance is started.
			• Displays the charge circuit status. ▪ Charge circuit stopped: Off ▪ Charged by capacitor (i-ELOOP) and battery: Charge (to Bat) ▪ Charged by capacitor (i-ELOOP) and

CHG/DIS_STAT	Off/Charge (to Bat)/Discharge (to GND)/Fault (Off)/Fault (to Bat)/Fault (to GND))	State of charge/discharge circuit within DC-DC Converter	GND: Discharge (to GND) ▪ Charge circuit malfunction (charge circuit stopped): Fault (Off) ▪ Charge circuit malfunction (charged by capacitor (i-ELOOP) and battery): Fault (to Bat) ▪ Charge circuit malfunction (charged by capacitor (i-ELOOP) and GND): Fault (to GND)
CONV_OUT_V	V	Converter circuit Output Voltage	• Displays the output voltage in voltage reduction circuit.
CONV_STAT	Ready/Power Output (Stop)/Power Output (Normal)/Power Output (Limit)/Safe Mode/Error	State of Converter circuit within DC-DC Converter	• Displays the voltage reduction circuit operation status. ▪ Preparation for voltage reduction completed: Ready ▪ Output stopped: Power Output (Stop) ▪ During output: Power Output (Normal) ▪ Target output value not achieved due to limit: Power Output (Limit) ▪ Self-protection status (voltage

			reduction circuit inoperable): Safe Mode ▪ Voltage reduction circuit malfunction: Error
CAPA_TEMP	°C, °F	Capacitor (i-ELOOP) temperature	• Displays the capacitor (i-ELOOP) temperature.
DCDC_IN_V	V	DCDC Input Voltage (Input Terminal Voltage)	• Displays the DC-DC converter input voltage.
DCDC_OUT_I	A	DCDC Output Current	• Displays the DC-DC converter output current.
DCDC_OUT_V	V	DCDC Output Voltage (Output Terminal Voltage)	• Displays the DC-DC converter output voltage.
DCDC_TEMP	—	DC-DC converter temperature	• Displays the DC-DC converter temperature
DEGEN_COUNT	—	Count of Degeneracy shift	• Displays the number of times the system switches to safe mode due to high temperature in the DC-DC converter.
DEGEN_WARN	Ok/Degeneration warning/Degeneration	Warning of Degeneracy	• Displays the control status due to high temperature in the DC-DC converter.
IG_STAT	Off/On	State of IG signal input	• Displays the power supply status from the IG1 relay.
IR_SW_STAT	Connect (On)/Disconnect (Off)/Fault (On)/Fault (Off)	State of IG ON circuit within DC-DC converter	• Displays the IG ON relay operation status. ▪ IG ON relay ON: Connect (On) ▪ IG ON relay OFF: Disconnect (Off)

			▪ IG ON relay ON (Fail): Fault (On) ▪ IG ON relay OFF (Fail): Fault (Off)
OUT_M_CUR1	A	Output Mean Current in IG On (last time)	• Displays the average value of the DC-DC converter output current from the previous time the ignition was switched ON.
OUT_M_CUR2	A	Output Mean Current in IG On (2 times before)	• Displays the average value of the DC-DC converter output current from the previous 2 times that the ignition was switched ON.
OUT_M_CUR3	A	Output Mean Current in IG On (3 times before)	• Displays the average value of the DC-DC converter output current from the previous 3 times that the ignition was switched ON.
OUT_M_CUR4	A	Output Mean Current in IG On (4 times before)	• Displays the average value of the DC-DC converter output current from the previous 4 times that the ignition was switched ON.
OUT_M_CUR5	A	Output Mean Current in IG On (5 times before)	• Displays the average value of the DC-DC converter output current from the previous 5 times that the ignition was switched ON.
PURGE_RESLT	Charged/Purged/Fault	Result of charge purge on capacitor (i-ELOOP) after IG Off	• Displays the purge result of the capacitor (i-ELOOP) electrical charge after the ignition is switched off.
SAFE_M_COUNT	—	Count of Safe Mode shift	• Displays the number of times the system switches to safe mode for the DC-DC converter.

2014 - Mazda3 - I-ELOOP

DTC TABLE [i-ELOOP]

×: Applicable—: Not applicable

DTC No.	Check engine light	Master warning light	Charging system warning light	Condition	Fail-safe function	Drive cycle	Self test type*1	Memory function	Page
P0C39:00	OFF	ON	OFF	Capacitor (i-ELOOP) temperature sensor system: function/circuit malfunction	—	1	C, D	×	(See **DTC P0C39:00 [i-ELOOP]**.)
P1628:11	OFF	OFF	ON	DC-DC converter system: power supply voltage low input	—	1	C, D	×	(See **DTC P1628:11 [i-ELOOP]**.)
U0001:88	OFF	OFF	OFF	CAN system communication error (HS-CAN)	—	1	C, D	×	(See **DTC U0001:88, U0100:00, U0155:00 [i-ELOOP]**.)
U0100:00	OFF	OFF	OFF	CAN communication: communication error to PCM	—	1	C, D	×	
U0155:00	OFF	OFF	OFF	CAN communication: communication error to instrument cluster	—	1	C, D	×	
U0401:68	OFF	OFF	OFF	Signal error from PCM	—	1	C, D	×	(See **DTC U0401:68 [i-ELOOP]**.)
U3000:44	OFF	OFF	OFF	DC-DC converter internal malfunction	—	1	C, D	×	(See **DTC U3000:44 [i-ELOOP]**.)
U3000:49	OFF	OFF	OFF	DC-DC converter internal malfunction	—	1	C, D	×	(See **DTC U3000:49 [i-ELOOP]**.)
U3000:4B	OFF	OFF	OFF	DC-DC converter internal temperature malfunction	—	1	C, D	×	(See **DTC U3000:4B [i-ELOOP]**.)

U3003:16	OFF	OFF	OFF	DC-DC converter system: power supply voltage low input	—	1	C, D	×	(See **DTC U3003:16 [i-ELOOP]**.)
U3003:17	OFF	OFF	OFF	DC-DC converter system: power supply voltage high input	—	1	C, D	×	(See **DTC U3003:17 [i-ELOOP]**.)

2014 - Mazda3 - I-ELOOP

DTC P0C39:00 [i-ELOOP]

DTC P0C39:00	Capacitor (i-ELOOP) temperature sensor system: function/circuit malfunction
DETECTION CONDITION	• Any one of the following conditions is met: ▪ A condition in which the capacitor (i-ELOOP) temperature sensor voltage is **less than 0.05 V** (**less than −50 °C {−58 °F}**) continues for **1 s**. ▪ A condition in which the capacitor (i-ELOOP) temperature sensor voltage is **4.95 V or more** (**90 °C {194 °F} or more**) continues for **1 s**.
FAIL-SAFE FUNCTION	• Not applicable
POSSIBLE CAUSE	• Capacitor (i-ELOOP) connector or terminals malfunction • DC-DC converter connector or terminals malfunction • Short to ground in wiring harness between capacitor (i-ELOOP) terminal 1A and DC-DC converter terminal 1E • Short to power supply in wiring harness between capacitor (i-ELOOP) terminal 1A and DC-DC converter terminal 1E • Capacitor (i-ELOOP) temperature sensor signal circuit and ground circuit are shorted to each other • Open circuit in wiring harness between the following terminals: ▪ Capacitor (i-ELOOP) terminal 1A—DC-DC converter terminal 1E ▪ Capacitor (i-ELOOP) terminal 1B—DC-DC converter terminal 1D • Capacitor (i-ELOOP) temperature sensor malfunction • DC-DC converter malfunction

Diagnostic Procedure

STEP	INSPECTION		ACTION
1	**VERIFY RELATED REPAIR INFORMATION AVAILABILITY** • Verify related Service Bulletins and/or on-line repair information availability. • Is any related repair information available?	Yes	Perform repair or diagnosis according to the available repair information. • If the vehicle is not repaired, go to the next step.
		No	Go to the next step.
2	**INSPECT CAPACITOR (i-ELOOP) CONNECTOR CONDITION** • Switch the ignition off. • Disconnect the negative battery cable.	Yes	Repair or replace the connector and/or terminals, then go to Step 9.
		No	Go to the next step.

	(See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Remove the service plug. (See **SERVICE PLUG DISCONNECTION/CONNECTION [i-ELOOP]**.) • Disconnect the capacitor (i-ELOOP) connector. • Inspect for poor connection (such as damaged/pulled-out pins, corrosion). • Is there any malfunction?		
3	**INSPECT DC-DC CONVERTER CONNECTOR CONDITION** • Disconnect the DC-DC converter connector. • Inspect for poor connection (such as damaged/pulled-out pins, corrosion). • Is there any malfunction?	Yes	Repair or replace the connector and/or terminals, then go to Step 9.
		No	Go to the next step.
4	**INSPECT CAPACITOR (i-ELOOP) TEMPERATURE SENSOR SIGNAL CIRCUIT FOR SHORT TO GROUND** • Verify that the capacitor (i-ELOOP) and DC-DC converter connectors are disconnected. • Inspect for continuity between capacitor (i-ELOOP) terminal 1A (wiring harness-side) and body ground. • Is there continuity?	Yes	Refer to the wiring diagram and verify whether or not there is a common connector between capacitor (i-ELOOP) terminal 1A and DC-DC converter terminal 1E. **If there is a common connector:** • Determine the malfunctioning part by inspecting the common connector and the terminal for corrosion, damage, or pin disconnection, and the common wiring harness for a short to ground. • Repair or replace the malfunctioning part. **If there is no common connector:** • Repair or replace the wiring harness which has a short to ground. Go to Step 9.

		No	Go to the next step.
5	**INSPECT CAPACITOR (i-ELOOP) TEMPERATURE SENSOR SIGNAL CIRCUIT FOR SHORT TO POWER SUPPLY** • Verify that the capacitor (i-ELOOP) and DC-DC converter connectors are disconnected. • Reconnect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Switch the ignition ON (engine off). • Measure the voltage at the capacitor (i-ELOOP) terminal 1A (wiring harness-side). • Is the voltage **0 V**?	Yes	Go to the next step.
		No	Refer to the wiring diagram and verify whether or not there is a common connector between capacitor (i-ELOOP) terminal 1A and DC-DC converter terminal 1E. **If there is a common connector:** • Determine the malfunctioning part by inspecting the common connector and the terminal for corrosion, damage, or pin disconnection, and the common wiring harness for a short to power supply. • Repair or replace the malfunctioning part. **If there is no common connector:** • Repair or replace the wiring harness which has a short to power supply. Go to Step 9.
6	**INSPECT CAPACITOR (i-ELOOP) TEMPERATURE SENSOR SIGNAL CIRCUIT AND GROUND CIRCUIT FOR SHORT TO EACH OTHER** • Verify that the capacitor (i-ELOOP) and DC-DC converter connectors are disconnected. • Switch the ignition off. • Disconnect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Inspect for continuity between capacitor (i-ELOOP) terminals 1A and 1B (wiring harness-side).	Yes	Refer to the wiring diagram and verify whether or not there is a common connector between the following terminals: • Capacitor (i-ELOOP) terminal 1A—DC-DC converter terminal 1E • Capacitor (i-ELOOP) terminal 1B—DC-DC converter terminal 1D **If there is a common connector:** • Determine the malfunctioning part by inspecting the common connector and the terminal for corrosion, damage, or pin disconnection, and the common wiring harness for a short to each other. • Repair or replace the malfunctioning part.

	• Is there continuity?		**If there is no common connector:** • Repair or replace the wiring harness which has a short to each other. Go to Step 9.
		No	Go to the next step.
7	**INSPECT CAPACITOR (i-ELOOP) TEMPERATURE SENSOR CIRCUIT FOR OPEN CIRCUIT** • Verify that the capacitor (i-ELOOP) and DC-DC converter connectors are disconnected. • Inspect for continuity between the following terminals (wiring harness-side): ▪ Capacitor (i-ELOOP) terminal 1A—DC-DC converter terminal 1E ▪ Capacitor (i-ELOOP) terminal 1B—DC-DC converter terminal 1D • Is there continuity?	Yes	Go to the next step.
		No	Refer to the wiring diagram and verify whether or not there is a common connector between the following terminals: • Capacitor (i-ELOOP) terminal 1A—DC-DC converter terminal 1E • Capacitor (i-ELOOP) terminal 1B—DC-DC converter terminal 1D **If there is a common connector:** • Determine the malfunctioning part by inspecting the common connector and the terminal for corrosion, damage, or pin disconnection, and the common wiring harness for an open circuit. • Repair or replace the malfunctioning part. **If there is no common connector:** • Repair or replace the wiring harness which has an open circuit. Go to Step 9.
8	**INSPECT CAPACITOR (i-ELOOP) TEMPERATURE SENSOR** • Inspect the capacitor (i-ELOOP) temperature sensor. (See **CAPACITOR (i-ELOOP) INSPECTION [i-ELOOP]**.) • Is there any malfunction?	Yes	Replace the capacitor (i-ELOOP), then go to the next step. (See **CAPACITOR (i-ELOOP) REMOVAL/INSTALLATION [i-ELOOP]**.)
		No	Go to the next step.
9	**VERIFY DTC TROUBLESHOOTING COMPLETED** • Always reconnect all	Yes	Repeat the inspection from Step 1. • If the malfunction recurs, replace

	disconnected connectors. • Reconnect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Reinstall the service plug. (See **SERVICE PLUG DISCONNECTION/CONNECTION [i-ELOOP]**.) • Clear the DTC for the DC-DC converter using the M-MDS. (See **CLEARING DTC [i-ELOOP]**.) • Switch the ignition off. • Switch the ignition ON (engine on) and wait for **1 s or more**. • Retrieve the DC-DC converter DTCs using the M-MDS. (See **DTC INSPECTION [i-ELOOP]**.) • Is the same DTC present?		the DC-DC converter. (See **DC-DC CONVERTER REMOVAL/INSTALLATION [i-ELOOP]**.) Go to the next step.
		No	Go to the next step.
10	**VERIFY IF OTHER DTCs DISPLAYED** • Are any other DTCs displayed?	Yes	Repair or replace the malfunctioning part according to the applicable DTC troubleshooting. (See **DTC TABLE [i-ELOOP]**.)
		No	DTC troubleshooting completed.

2014 - Mazda3 - I-ELOOP

DTC P1628:11 [i-ELOOP]

DTC P1628:00	DC-DC converter system: power supply voltage low input
DETECTION CONDITION	• An ignition off determination continues while the DC-DC converter receives signals during a **5 s** period from the PCM at intervals of **less than 0.1 s**.
FAIL-SAFE FUNCTION	• Not applicable

POSSIBLE CAUSE	• DC-DC converter connector or terminals malfunction
	• Short to ground or open circuit in DC-DC converter power supply circuit
	  ▪ Short to ground in wiring harness between IG1 relay terminal C and DC-DC converter terminal 1H
	  ▪ C/U IG1 15 A fuse malfunction
	  ▪ Open circuit in wiring harness between IG1 relay terminal C and DC-DC converter terminal 1H
	• Short to ground in wiring harness between electric load (such as start stop unit or non-genuine part) connected to C/U IG1 15 A fuse and C/U IG1 15 A fuse, or short to ground in electric load part
	• DC-DC converter malfunction

Diagnostic Procedure

STEP	INSPECTION		ACTION
1	**VERIFY RELATED REPAIR INFORMATION AVAILABILITY** • Verify related Service Bulletins and/or on-line repair information availability. • Is any related repair information available?	Yes	Perform repair or diagnosis according to the available repair information. • If the vehicle is not repaired, go to the next step.
		No	Go to the next step.
2	**INSPECT DC-DC CONVERTER CONNECTOR CONDITION** • Switch the ignition off. • Disconnect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Remove the service plug. (See **SERVICE PLUG DISCONNECTION/CONNECTION [i-ELOOP]**.)	Yes	Repair or replace the connector and/or terminals, then go to Step 5.
		No	Go to the next step.

	• Disconnect the DC-DC converter connector.Disconnect the DC-DC converter connector. • Inspect for poor connection (such as damaged/pulled-out pins, corrosion). • Is there any malfunction?		
3	**INSPECT DC-DC CONVERTER POWER SUPPLY CIRCUIT FOR SHORT TO GROUND OR OPEN CIRCUIT** • Verify that the DC-DC converter connector is disconnected. • Reconnect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Switch the ignition ON (engine off). • Measure the voltage at the DC-DC converter terminal 1H (wiring harness-side). • Is the voltage **B+**?	Yes	Go to the next step.
		No	Inspect the C/U IG1 15 A fuse. • If the fuse is blown: ▪ Refer to the wiring diagram and verify whether or not there is a common connector between IG1 relay terminal C and DC-DC converter terminal 1H. **If there is a common connector:** • Determine the malfunctioning part by inspecting the common connector and the terminal for corrosion, damage, or pin disconnection, and the common wiring harness for a short to ground. • Repair or replace the malfunctioning part. **If there is no common connector:** • Repair or replace the wiring harness which has a short to ground. • Replace the fuse.

			• If the fuse is damaged: ▪ Replace the fuse. • If the fuse is normal: ▪ Refer to the wiring diagram and verify whether or not there is a common connector between IG1 relay terminal C and DC-DC converter terminal 1H. **If there is a common connector:** • Determine the malfunctioning part by inspecting the common connector and the terminal for corrosion, damage, or pin disconnection, and the common wiring harness for an open circuit. • Repair or replace the malfunctioning part. **If there is no common connector:** • Repair or replace the wiring harness which has an open circuit. Go to Step 5.
4	**VERIFY WIRING HARNESS RELATED TO ELECTRIC LOAD PART CONNECTED TO C/U IG1 15 A FUSE** • Switch the ignition off. • Disconnect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)	Yes	Repair or replace the malfunction part, then go to the next step.
		No	Go to the next step.

	• Verify the wiring harness condition related to the electric load part connected to the C/U IG1 15 A fuse. • Is there any malfunction?		
5	**VERIFY DTC TROUBLESHOOTING COMPLETED** • Always reconnect all disconnected connectors. • Reconnect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Reinstall the service plug. (See **SERVICE PLUG DISCONNECTION/CONNECTION [i-ELOOP]**.) • Clear the DTC for the DC-DC converter using the M-MDS. (See **CLEARING DTC [i-ELOOP]**.) • Switch the ignition off. • Switch the ignition ON (engine off) and wait for **5 s or more**. • Retrieve the DC-DC converter DTCs using the M-MDS. (See **DTC INSPECTION [i-ELOOP]**.) • Is the same DTC present?	Yes	Repeat the inspection from Step 1. • If the malfunction recurs, replace the DC-DC converter. (See **DC-DC CONVERTER REMOVAL/INSTALLATION [i-ELOOP]**.) Go to the next step.
		No	Go to the next step.
6	**VERIFY IF OTHER DTCs DISPLAYED** • Are any other DTCs displayed?	Yes	Repair or replace the malfunctioning part according to the applicable DTC troubleshooting. (See **DTC TABLE [i-ELOOP]**.)
		No	DTC troubleshooting completed.

2014 - Mazda3 - I-ELOOP

DTC U0001:88, U0100:00, U0155:00 [i-ELOOP]

DTC U0001:88	CAN system communication error (HS-CAN)
DETECTION CONDITION	• Malfunction in CAN bus communication line.
FAIL-SAFE FUNCTION	• Not applicable
POSSIBLE CAUSE	• CAN bus communication line malfunction • DC-DC converter malfunction
SYSTEM WIRING DIAGRAM	• Not applicable

DTC U0100:00	CAN communication: communication error to PCM
DETECTION CONDITION	• Communication error between the DC-DC converter and PCM continues for **5 s or more**.
FAIL-SAFE FUNCTION	• Not applicable
POSSIBLE CAUSE	• CAN communication line between DC-DC converter and PCM malfunction • PCM malfunction • DC-DC converter malfunction
SYSTEM WIRING DIAGRAM	• Not applicable

DTC U0155:00	CAN communication: communication error to instrument cluster

DETECTION CONDITION	• Communication error between the DC-DC converter and instrument cluster continues for **5 s or more**.
FAIL-SAFE FUNCTION	• Not applicable
POSSIBLE CAUSE	• CAN communication line between DC-DC converter and instrument cluster malfunction • Instrument cluster malfunction • DC-DC converter malfunction
SYSTEM WIRING DIAGRAM	• Not applicable

Diagnostic Procedure

- Inspect according to the diagnostic procedure in ON-BOARD DIAGNOSTIC [MULTIPLEX COMMUNICATION SYSTEM]. (See **FOREWORD**.)

2014 - Mazda3 - I-ELOOP

DTC U0401:68 [i-ELOOP]

DTC U0401:68	Signal error from PCM

DETECTION CONDITION	• When any of the following conditions is met:
	  ▪ PCM internal malfunction
	  ▪ CAN communication line between PCM and DC-DC converter malfunction

FAIL-SAFE FUNCTION	• Not applicable

POSSIBLE CAUSE	• CAN drive error (DC-DC converter or PCM)
	• CAN communication line between PCM and DC-DC converter malfunction
	  ▪ PCM terminal 2AK—Front body control module (FBCM) terminal 2P
	  ▪ PCM terminal 2AL—Front body control module (FBCM) terminal 2N
	  ▪ Front body control module (FBCM) terminal 2K—DC-DC converter terminal 1A
	  ▪ Front body control module (FBCM) terminal 2I—DC-DC converter terminal 1C
	• Front body control module (FBCM) malfunction
	• DC-DC converter connector or terminals malfunction
	• PCM connector or terminals malfunction
	• DC-DC converter malfunction
	• PCM malfunction

Diagnostic Procedure

STEP	INSPECTION		ACTION
1	**VERIFY RELATED REPAIR INFORMATION AVAILABILITY** • Verify related Service Bulletins and/or on-line repair information availability. • Is any related repair information available?	Yes	Perform repair or diagnosis according to the available repair information. • If the vehicle is not repaired, go to the next step.
		No	Go to the next step.

2	**VERIFY PCM DTCs** • Switch the ignition off, then ON (engine off). • Retrieve the PCM DTCs using the M-MDS. (See **ON-BOARD DIAGNOSTIC TEST [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Are any DTCs present?	Yes	Repair or replace the malfunctioning part according to the applicable DTC troubleshooting. (See **DTC TABLE [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)
		No	Go to the next step.
3	**CONFIRM FRONT BODY CONTROL MODULE (FBCM) DTC** • Perform the front body control module (FBCM) DTC inspection using the M-MDS. (See **DTC INSPECTION [FRONT BODY CONTROL MODULE (FBCM)]**.) • Are any DTCs present?	Yes	Repair or replace the malfunctioning part according to the applicable DTC troubleshooting. (See **DTC TABLE [FRONT BODY CONTROL MODULE (FBCM)]**.)
		No	Go to the next step.
4	**CONFIRM INSTRUMENT CLUSTER DTC** • Perform the instrument cluster DTC inspection using the M-MDS. (See **DTC INSPECTION [INSTRUMENT CLUSTER]**.) • Are any DTCs present?	Yes	Repair or replace the malfunctioning part according to the applicable DTC troubleshooting. (See **DTC TABLE [INSTRUMENT CLUSTER]**.)
		No	Go to the next step.
5	**INSPECT DC-DC CONVERTER CONNECTOR CONDITION** • Switch the ignition off. • Disconnect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Remove the service plug. (See **SERVICE PLUG DISCONNECTION/CONNECTION [i-ELOOP]**.) • Disconnect the DC-DC converter connector. • Inspect for poor connection (such as damaged/pulled-out pins, corrosion). • Is there any malfunction?	Yes	Repair or replace the connector and/or terminals, then go to Step 7.
		No	Go to the next step.
	INSPECT PCM CONNECTOR CONDITION		

6	• Disconnect the PCM connector. • Inspect for poor connection (such as damaged/pulled-out pins, corrosion). • Is there any malfunction?	Yes	Repair or replace the connector and/or terminals, then go to the next step.
		No	CAN communication line can be considered the cause. • Refer to the wiring diagram and verify whether or not there is a common connector between the following terminals: ▪ PCM terminal 2AK—Front body control module (FBCM) terminal 2P ▪ PCM terminal 2AL—Front body control module (FBCM) terminal 2N ▪ Front body control module (FBCM) terminal 2K—DC-DC converter terminal 1A ▪ Front body control module (FBCM) terminal 2I—DC-DC converter terminal 1C **If there is a common connector:** ▪ Determine the malfunctioning part by inspecting the common connector and the terminal for corrosion, damage, or pin disconnection, and the common wiring harness for a malfunction. ▪ Repair or replace the malfunctioning part. **If there is no common connector:** ▪ Repair or replace the wiring harness. If the malfunction recurs, replace the DC-DC converter. (See **DC-DC CONVERTER REMOVAL/INSTALLATION [i-ELOOP]**.) Go to the next step.
7	**VERIFY DTC TROUBLESHOOTING COMPLETED** • Always reconnect all disconnected connectors. • Reconnect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Reinstall the service plug.	Yes	Repeat the inspection from Step 1. • If the malfunction recurs, replace the PCM. (See **PCM REMOVAL/INSTALLATION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) Go to the next step.
		No	Go to the next step.

	(See **SERVICE PLUG DISCONNECTION/CONNECTION [i-ELOOP]**.) • Clear the DTC for the DC-DC converter using the M-MDS. (See **CLEARING DTC [i-ELOOP]**.) • Switch the ignition off. • Switch the ignition ON (engine off) and wait for **5 s or more**. • Retrieve the DC-DC converter DTCs using the M-MDS. (See **DTC INSPECTION [i-ELOOP]**.) • Is the same DTC present?		
8	**VERIFY IF OTHER DTCs DISPLAYED** • Are any other DTCs displayed?	Yes	Repair or replace the malfunctioning part according to the applicable DTC troubleshooting. (See **DTC TABLE [i-ELOOP]**.)
		No	DTC troubleshooting completed.

2014 - Mazda3 - I-ELOOP

DTC U3000:44 [i-ELOOP]

DTC U3000:44	DC-DC converter internal malfunction
DETECTION CONDITION	• A malfunction in the DC-DC converter is detected.
FAIL-SAFE FUNCTION	• Not applicable
POSSIBLE CAUSE	• DC-DC converter internal malfunction
SYSTEM WIRING DIAGRAM	• Not applicable

Diagnostic Procedure

STEP	INSPECTION		ACTION
1	**VERIFY RELATED REPAIR INFORMATION AVAILABILITY** • Verify related Service Bulletins and/or on-line repair information availability. • Is any related repair information available?	Yes	Perform repair or diagnosis according to the available repair information. • If the vehicle is not repaired, go to the next step.
		No	Go to the next step.
2	**PERFORM DTC INSPECTION AND VERIFY DC-DC CONVERTER MALFUNCTION** • Clear the DTC for the DC-DC converter using the M-MDS. (See **CLEARING DTC [i-ELOOP]**.) • Switch the ignition off. • Switch the ignition ON (engine off) and wait for **5 s or more**. • Retrieve the DC-DC converter DTCs using the M-MDS. (See **DTC INSPECTION [i-ELOOP]**.)	Yes	Replace the DC-DC converter, then go to the next step. (See **DC-DC CONVERTER REMOVAL/INSTALLATION [i-ELOOP]**.)
		No	Go to the next step.

	Is the same DTC present?		
3	**VERIFY IF OTHER DTCs DISPLAYED** • Are any other DTCs displayed?	Yes	Repair or replace the malfunctioning part according to the applicable DTC troubleshooting. (See **DTC TABLE [i-ELOOP]**.)
		No	DTC troubleshooting completed.

2014 - Mazda3 - I-ELOOP

DTC U3000:49 [i-ELOOP]

DTC U3000:49	DC-DC converter internal malfunction
DETECTION CONDITION	• A malfunction in the DC-DC converter is detected.
FAIL-SAFE FUNCTION	• Not applicable
POSSIBLE CAUSE	• DC-DC converter internal malfunction
SYSTEM WIRING DIAGRAM	• Not applicable

Diagnostic Procedure

STEP	INSPECTION		ACTION
1	**VERIFY RELATED REPAIR INFORMATION AVAILABILITY** • Verify related Service Bulletins and/or on-line repair information availability. • Is any related repair information available?	Yes	Perform repair or diagnosis according to the available repair information. • If the vehicle is not repaired, go to the next step.
		No	Go to the next step.
2	**PERFORM DTC INSPECTION AND VERIFY DC-DC CONVERTER MALFUNCTION** • Clear the DTC for the DC-DC converter using the M-MDS. (See **CLEARING DTC [i-ELOOP]**.) • Start the engine. • Leave for **1 min** while idling with no electrical load. • Leave for **1 min** while racing with high electrical load.(DC-DC converter terminal 3A voltage is **16 V or more**) • Switch the ignition off.	Yes	Replace the DC-DC converter, then go to the next step. (See **DC-DC CONVERTER REMOVAL/INSTALLATION [i-ELOOP]**.)
		No	Go to the next step.

	• Switch the ignition ON. • Retrieve the DC-DC converter DTCs using the M-MDS. (See **DTC INSPECTION [i-ELOOP]**.) • Is the same DTC present?		
3	**PERFORM DTC INSPECTION AND VERIFY DC-DC CONVERTER MALFUNCTION** • Start the engine. • Leave for **1 min** while racing with high electrical load. (DC-DC converter terminal 3A voltage is **18 V or more**.) • Switch the ignition off. • Remove the service plug. (See **SERVICE PLUG DISCONNECTION/CONNECTION [i-ELOOP]**.) • Disconnect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Wait for **2 min**. • Reconnect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Reinstall the service plug. (See **SERVICE PLUG DISCONNECTION/CONNECTION [i-ELOOP]**.) • Wait for **1 min**. • Switch the ignition ON. • Retrieve the DC-DC converter DTCs using the M-MDS. (See **DTC INSPECTION [i-ELOOP]**.) • Is the same DTC present?	Yes	Replace the DC-DC converter, then go to the next step. (See **DC-DC CONVERTER REMOVAL/INSTALLATION [i-ELOOP]**.)
		No	Go to the next step.
4	**VERIFY IF OTHER DTCs DISPLAYED** • Are any other DTCs displayed?	Yes	Repair or replace the malfunctioning part according to the applicable DTC troubleshooting. (See **DTC TABLE [i-ELOOP]**.)

		No	DTC troubleshooting completed.

2014 - Mazda3 - I-ELOOP

DTC U3000:4B [i-ELOOP]

DTC U3000:4B	DC-DC converter internal temperature malfunction
DETECTION CONDITION	• A condition in which the DC-DC converter internal temperature is abnormally high or low is detected.
FAIL-SAFE FUNCTION	• Not applicable
POSSIBLE CAUSE	• DC-DC converter malfunction
SYSTEM WIRING DIAGRAM	• Not applicable

Diagnostic Procedure

STEP	INSPECTION		ACTION
1	**VERIFY RELATED REPAIR INFORMATION AVAILABILITY** • Verify related Service Bulletins and/or on-line repair information availability. • Is any related repair information available?	Yes	Perform repair or diagnosis according to the available repair information. • If the vehicle is not repaired, go to the next step.
		No	Go to the next step.
2	**PERFORM DTC INSPECTION AND VERIFY DC-DC CONVERTER MALFUNCTION** • Clear the DTC for the DC-DC converter using the M-MDS. (See **CLEARING DTC [i-ELOOP]**.) • Switch the ignition off. • Switch the ignition ON (engine off) and wait for **5 s or more**. • Retrieve the DC-DC converter DTCs using the M-MDS.	Yes	Replace the DC-DC converter, then go to the next step. (See **DC-DC CONVERTER REMOVAL/INSTALLATION [i-ELOOP]**.)
		No	Go to the next step.

	(See **DTC INSPECTION [i-ELOOP]**.) • Is the same DTC present?		
3	**VERIFY IF OTHER DTCs DISPLAYED** • Are any other DTCs displayed?	Yes	Repair or replace the malfunctioning part according to the applicable DTC troubleshooting. (See **DTC TABLE [i-ELOOP]**.)
		No	DTC troubleshooting completed.

2014 - Mazda3 - I-ELOOP

DTC U3003:16 [i-ELOOP]

DTC U3003:16	DC-DC converter system: power supply voltage low input
DETECTION CONDITION	• The following condition is met for a continuous **5 s** period: ▪ DC-DC converter terminal 4A voltage: **8 V or less**
FAIL-SAFE FUNCTION	• Not applicable
POSSIBLE CAUSE	• PCM DTC or pending code is stored. • Battery malfunction • DC-DC converter connector or terminals malfunction • STARTER 250 A fuse malfunction • Short to ground in wiring harness between battery positive terminal and DC-DC converter terminal 4A • Open circuit in wiring harness between battery positive terminal and DC-DC converter terminal 4A • Generator malfunction • DC-DC converter malfunction

Diagnostic Procedure

STEP	INSPECTION		ACTION
1	**VERIFY RELATED REPAIR INFORMATION AVAILABILITY** • Verify related Service Bulletins and/or on-line repair information availability. • Is any related repair information available?	Yes	Perform repair or diagnosis according to the available repair information. • If the vehicle is not repaired, go to the next step.
		No	Go to the next step.
2	**VERIFY PCM DTCs** • Switch the ignition off, then ON (engine off). • Retrieve the PCM DTCs using the M-MDS. (See **ON-BOARD DIAGNOSTIC TEST [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)	Yes	Repair or replace the malfunctioning part according to the applicable DTC troubleshooting. (See **DTC TABLE [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)
		No	Go to the next step.

	• Are any DTCs present?		
3	**INSPECT BATTERY** • Inspect the battery. (See **BATTERY INSPECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Is there any malfunction?	Yes	Recharge or replace the battery, then go to Step 9. (See **BATTERY RECHARGING [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) (See **BATTERY REMOVAL/INSTALLATION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)
		No	Go to the next step.
4	**INSPECT DC-DC CONVERTER CONNECTOR CONDITION** • Switch the ignition off. • Disconnect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Remove the service plug. (See **SERVICE PLUG DISCONNECTION/CONNECTION [i-ELOOP]**.) • Disconnect the DC-DC converter connector. • Inspect for poor connection (such as damaged/pulled-out pins, corrosion). • Is there any malfunction?	Yes	Repair or replace the connector and/or terminals, then go to Step 9.
		No	Go to the next step.
5	**INSPECT STARTER 250 A FUSE** • Remove the STARTER 250 A fuse. • Inspect the STARTER 250 A fuse. • Is there any malfunction?	Yes	If the fuse is blown: • Refer to the wiring diagram and verify whether or not there is a common connector between battery positive terminal and DC-DC converter terminal 4A. **If there is a common connector:** ▪ Determine the malfunctioning part by inspecting the common connector and the

			terminal for corrosion, damage, or pin disconnection, and the common wiring harness for a short to ground. ▪ Repair or replace the malfunctioning part. **If there is no common connector:** ▪ Repair or replace the wiring harness which has a short to ground. ▪ Replace the fuse. If the fuse is damaged: • Replace the fuse. Go to Step 9.
		No	Reinstall the STARTER 250 A fuse, then go to the next step.
6	**INSPECT DC-DC CONVERTER CIRCUIT FOR SHORT TO GROUND** • Verify that the DC-DC converter connector is disconnected. • Inspect for continuity between DC-DC converter terminal 4A (wiring harness-side) and body ground. • Is there continuity?	Yes	Refer to the wiring diagram and verify whether or not there is a common connector between battery positive terminal and DC-DC converter terminal 4A. **If there is a common connector:** • Determine the malfunctioning part by inspecting the common connector and the terminal for corrosion, damage, or pin disconnection, and the common wiring harness for a short to ground. • Repair or replace the malfunctioning part. **If there is no common connector:** • Repair or replace the wiring harness which has a short to ground.

			Go to Step 9.
		No	Go to the next step.
7	**INSPECT DC-DC CONVERTER CIRCUIT FOR OPEN CIRCUIT** • Verify that the DC-DC converter connector is disconnected. • Inspect for continuity between battery positive terminal and DC-DC converter terminal 4A (wiring harness-side). • Is there continuity?	Yes	Go to the next step.
		No	Refer to the wiring diagram and verify whether or not there is a common connector between battery positive terminal and DC-DC converter terminal 4A. **If there is a common connector:** • Determine the malfunctioning part by inspecting the common connector and the terminal for corrosion, damage, or pin disconnection, and the common wiring harness for an open circuit. • Repair or replace the malfunctioning part. **If there is no common connector:** • Repair or replace the wiring harness which has an open circuit. Go to Step 9.
8	**INSPECT GENERATOR** • Inspect the generator. (See **GENERATOR INSPECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5 (WITH i-ELOOP)]**.) • Is there any malfunction?	Yes	Replace the generator, then go to the next step. (See **GENERATOR REMOVAL/INSTALLATION [SKYACTIV-G 2.0, SKYACTIV-G 2.5 (WITH i-ELOOP)]**.)
		No	Go to the next step.
9	**VERIFY DTC TROUBLESHOOTING COMPLETED** • Always reconnect all disconnected connectors. • Reconnect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Reinstall the service plug. (See **SERVICE PLUG**	Yes	Repeat the inspection from Step 1. • If the malfunction recurs, replace the DC-DC converter. (See **DC-DC CONVERTER REMOVAL/INSTALLATION [i-ELOOP]**.) Go to the next step.
		No	Go to the next step.

	DISCONNECTION/CONNECTION [i-ELOOP].) • Clear the DTC for the DC-DC converter using the M-MDS. (See **CLEARING DTC [i-ELOOP]**.) • Switch the ignition off. • Switch the ignition ON (engine off) and wait for **5 s or more**. • Retrieve the DC-DC converter DTCs using the M-MDS. (See **DTC INSPECTION [i-ELOOP]**.) • Is the same DTC present?		
10	**VERIFY IF OTHER DTCs DISPLAYED** • Are any other DTCs displayed?	Yes	Repair or replace the malfunctioning part according to the applicable DTC troubleshooting. (See **DTC TABLE [i-ELOOP]**.)
		No	DTC troubleshooting completed.

2014 - Mazda3 - I-ELOOP

DTC U3003:17 [i-ELOOP]

DTC U3003:17	DC-DC converter system: power supply voltage high input
DETECTION CONDITION	• The following condition is met for a continuous **5 s** period: ▪ DC-DC converter terminal 4A voltage: **16 V or more**
FAIL-SAFE FUNCTION	• Not applicable
POSSIBLE CAUSE	• PCM DTC or pending code is stored. • Battery malfunction • Generator malfunction • DC-DC converter malfunction
SYSTEM WIRING DIAGRAM	• Not applicable

Diagnostic Procedure

STEP	INSPECTION		ACTION
1	**VERIFY RELATED REPAIR INFORMATION AVAILABILITY** • Verify related Service Bulletins and/or on-line repair information availability. • Is any related repair information available?	Yes	Perform repair or diagnosis according to the available repair information. • If the vehicle is not repaired, go to the next step.
		No	Go to the next step.
2	**VERIFY PCM DTCs** • Switch the ignition off, then ON (engine off). • Retrieve the PCM DTCs using the M-MDS.	Yes	Repair or replace the malfunctioning part according to the applicable DTC troubleshooting. (See **DTC TABLE [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)

	(See **ON-BOARD DIAGNOSTIC TEST [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Are any DTCs present?	No	Go to the next step.
3	**INSPECT BATTERY** • Inspect the battery. (See **BATTERY INSPECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Is there any malfunction?	Yes	Recharge or replace the battery, then go to Step 5. (See **BATTERY RECHARGING [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) (See **BATTERY REMOVAL/INSTALLATION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)
		No	Go to the next step.
4	**INSPECT GENERATOR** • Inspect the generator. (See **GENERATOR INSPECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5 (WITH i-ELOOP)]**.) • Is there any malfunction?	Yes	Replace the generator, then go to the next step. (See **GENERATOR REMOVAL/INSTALLATION [SKYACTIV-G 2.0, SKYACTIV-G 2.5 (WITH i-ELOOP)]**.)
		No	Go to the next step.
5	**VERIFY DTC TROUBLESHOOTING COMPLETED** • Clear the DTC for the DC-DC converter using the M-MDS. (See **CLEARING DTC [i-ELOOP]**.) • Switch the ignition off. • Switch the ignition ON (engine off) and wait for **5 s or more**. • Retrieve the DC-DC converter DTCs using the M-MDS. (See **DTC INSPECTION [i-ELOOP]**.) • Is the same DTC present?	Yes	Repeat the inspection from Step 1. • If the malfunction recurs, replace the DC-DC converter. (See **DC-DC CONVERTER REMOVAL/INSTALLATION [i-ELOOP]**.) Go to the next step.
		No	Go to the next step.
6	**VERIFY IF OTHER DTCs DISPLAYED** • Are any other DTCs displayed?	Yes	Repair or replace the malfunctioning part according to the applicable DTC troubleshooting. (See **DTC TABLE [i-ELOOP]**.)
		No	DTC troubleshooting completed.

DTC U3003:17 [i-ELOOP]

2014 - Mazda3 - I-ELOOP

SYMPTOM DIAGNOSTIC INDEX [i-ELOOP]

- Verify the malfunctioning symptom and perform malfunction diagnosis according to the applicable No. item.
- The diagnostic troubleshooting procedure includes many steps in which inspection/verification should be performed while the malfunction symptom is occurring.

NO.	Malfunction symptom	Description
1	No.1 “i-ELOOP Inspection Required” is displayed in LCD	• “i-ELOOP Inspection Required” is displayed in LCD • Master warning light is illuminated
2	No.2 Pre-charge mode is performed frequently	• “i-ELOOP changing”is displayed in LCD frequently
3	No.3 i-ELOOP-related gauge in LCD does not move	• Only three gauge segments of the regenerative braking power generation gauge are displayed/only one gauge segment of the capacitor (i-ELOOP) accumulation gauge is displayed

2014 - Mazda3 - I-ELOOP

QUICK DIAGNOSTIC CHART [i-ELOOP]

×: Applicable

		Generator malfunction	Generator drive belt malfunction	Capacitor (i-ELOOP) malfunction	DC-DC converter malfunction	PCM malfunction	Instrument cluster malfunction	i-ELOOP-related part wiring harness malfunction	Engine-related part malfunction	Transmission-related part malfunction	Low battery recharge efficiency	Bypass mode operating
1	"i-ELOOP Inspection Required" is displayed in LCD			×	×	×	×	×				
2	Pre-charge mode is performed frequently	×	×	×	×	×	×	×				
3	i-ELOOP-related gauge in LCD does not move						×		×	×	×	×

2014 - Mazda3 - I-ELOOP

No.1 "i-ELOOP Inspection Required" IS DISPLAYED IN LCD [i-ELOOP]

Description

- “i-ELOOP Inspection Required” is displayed in LCD
- Master warning light is illuminated

Possible Cause

i-ELOOP-related component malfunction (DTCs are detected)

- Capacitor (i-ELOOP) malfunction
- DC-DC converter malfunction
- PCM malfunction
- i-ELOOP-related part wiring harness malfunction

Instrument cluster incorrect display

- Instrument cluster malfunction

Diagnostic Procedure

STEP	INSPECTION	RESULTS	ACTION
1	**VERIFY DTCs** • Using the M-MDS, display the DTCs related to the PCM, DC-DC converter, and instrument cluster. (See **ON-BOARD DIAGNOSTIC TEST [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) (See **DTC INSPECTION [i-ELOOP]**.)	Yes	Repair the malfunctioning part according to the applicable DTC troubleshooting. (See **DTC TABLE [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) (See **DTC TABLE [i-ELOOP]**.) (See **DTC TABLE [INSTRUMENT**

	(See **DTC INSPECTION [INSTRUMENT CLUSTER]**.) • Are any DTCs displayed?		**CLUSTER]**.)
		No	Inspect the instrument cluster and replace it if there is any malfunction. (See **INSTRUMENT CLUSTER REMOVAL/INSTALLATION**.)

2014 - Mazda3 - I-ELOOP

No.2 PRE-CHARGE MODE IS PERFORMED FREQUENTLY [i-ELOOP]

Description

NOTE:

- If the vehicle is jump started, leave the jumper connected until the warning message is no longer displayed.
- If vehicle is driven while the warning is displayed, a warning sound will be heard and power steering assist will be limited.
- “i-ELOOP changing” is displayed in the LCD frequently.

Possible Cause

Capacitor (i-ELOOP) voltage is low

- Vehicle is left for a long period
- Capacitor (i-ELOOP) malfunction (if DTC is not detected)

i-ELOOP-related part wiring harness malfunction

- Independently and frequently displayed DTC
    - P0A12:00, P0A94:00, P1794:00, U3000:49
- DTC which is displayed frequently after a malfunction occurs caused in combination with a capacitor (i-ELOOP) voltage decrease due to the capacitor (i-ELOOP) not being used for long periods
    - P0A12:00, P0A94:00, P1628:11, P2502:00, P2503:00, U3000:49

Instrument cluster incorrect display

- Instrument cluster malfunction

Diagnostic Procedure

No.2 PRE-CHARGE MODE IS PERFORMED FREQUENTLY [i-ELOOP]

STEP	INSPECTION	RESULTS	ACTION
1	**VERIFY DTCs** • Using the M-MDS, display the DTCs related to the PCM, DC-DC converter, and instrument cluster. (See **ON-BOARD DIAGNOSTIC TEST [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) (See **DTC INSPECTION [i-ELOOP]**.) (See **DTC INSPECTION [INSTRUMENT CLUSTER]**.) • Are any DTCs displayed?	Yes	Repair the malfunctioning part according to the applicable DTC troubleshooting. (See **DTC TABLE [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) (See **DTC TABLE [i-ELOOP]**.) (See **DTC TABLE [INSTRUMENT CLUSTER]**.)
		No	Go to the next step.
2	**ASK CUSTOMER** • Ask the customer if the vehicle is left undriven for long periods frequently. • Does the customer tends to leave the vehicle undriven for long periods?	Yes	Explain to the customer that the vehicle is normal and that if the vehicle is left undriven for long periods the capacitor (i-ELOOP) voltage is lowered and charging is required.
		No	Go to the next step.
3	**VERIFY IF CAPACITOR (i-ELOOP) HAS MALFUNCTION** • Inspect the capacitor (i-ELOOP). (See **CAPACITOR (i-ELOOP) INSPECTION [i-ELOOP]**.) • Is the capacitor (i-ELOOP) normal?	Yes	Inspect the instrument cluster and replace it if there is any malfunction. (See **INSTRUMENT CLUSTER REMOVAL/INSTALLATION**.)
		No	Replace the capacitor (i-ELOOP). (See **CAPACITOR (i-ELOOP) REMOVAL/INSTALLATION [i-ELOOP]**.)

2014 - Mazda3 - I-ELOOP

No.3 i-ELOOP-RELATED GAUGE IN LCD DOES NOT MOVE [i-ELOOP]

Description

- Only three gauge segments of the regenerative braking power generation gauge are displayed/only one gauge segment of the capacitor (i-ELOOP) accumulation gauge is displayed

Possible Cause

Bypass Mode Is Operating

- Vehicle electric load (current consumption) is **50 A or more**
- Voltage reduction circuit in DC-DC converter is malfunctioning
- Ambient temperature is **less than 0 °C {32 °F}**
- Battery charge condition is **less than 65 %**

Instrument cluster incorrect display

- Instrument cluster malfunction

Other

- Engine-related part malfunction
- Transmission-related part malfunction

Diagnostic Procedure

STEP	INSPECTION	RESULTS	ACTION
1	**VERIFY DTCs**	Yes	Repair the malfunctioning part according to the

	Using the M-MDS, display the DTCs related to the PCM, TCM (ATX), and instrument cluster. (See **ON-BOARD DIAGNOSTIC TEST [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) (See **ON-BOARD DIAGNOSTIC SYSTEM DTC INSPECTION [FW6A-EL]**.) (See **DTC INSPECTION [INSTRUMENT CLUSTER]**.) • Are any DTCs displayed?		applicable DTC troubleshooting. (See **DTC TABLE [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) (See **ON-BOARD DIAGNOSTIC SYSTEM DTC TABLE [FW6A-EL]**.) (See **DTC TABLE [INSTRUMENT CLUSTER]**.)
		No	Go to the next step.
2	**VERIFY MALFUNCTION CONDITION** • Verify the current display condition of the LCD. • Does the i-ELOOP-related gauge in the LCD operate?	Yes	Go to the next step.
		No	Go to Step 4.
3	**ASK CUSTOMER** • Was the ambient temperature low when the symptom occurred?	Yes	Explain to the customer that the vehicle is normal and that i-ELOOP does not operate to assure battery power supply.
		No	Explain to the customer that the vehicle is normal and that i-ELOOP does not operate to prioritize battery charging.
4	**VERIFY BYPASS MODE OPERATION CONDITION** • Access the DC-DC converter PID BYPS_STAT using the M-MDS. (See **PID/DATA MONITOR INSPECTION [i-ELOOP]**.) • Is BYPS_STAT display "Bypass On"?	Yes	Go to the next step.
		No	Inspect the instrument cluster and replace it if there is any malfunction. (See **INSTRUMENT CLUSTER REMOVAL/INSTALLATION**)
5	**VERIFY CAUSE OF BYPASS MODE OPERATION** • Access the DC-DC converter PID DCDC_OUT_I using the M-MDS. (See **PID/DATA MONITOR INSPECTION [i-ELOOP]**.) • Is DCDC_OUT_I value **50 A or more**?	Yes	Explain to the customer that the vehicle is normal and that i-ELOOP does not operate because of the vehicle electrical load.
		No	Go to the next step.

6	**VERIFY AMBIENT TEMPERATURE** • Access the PCM PID AMB_TEMP using the M-MDS. (See **ON-BOARD DIAGNOSTIC TEST [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Is AMB_TEMP value **less than 0 °C {32 °F}**?	Yes	Explain to the customer that the vehicle is normal and that i-ELOOP does not operate to assure battery power supply.
		No	Go to the next step.
7	**VERIFY BATTERY CHARGE CONDITION** • Access the PCM PID BATT_SOC using the M-MDS. (See **ON-BOARD DIAGNOSTIC TEST [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) • Is BATT_SOC value **less than 65%**?	Yes	Explain to the customer that the vehicle is normal and that i-ELOOP does not operate to prioritize battery charging.
		No	Inspect the instrument cluster and replace it if there is any malfunction. (See **INSTRUMENT CLUSTER REMOVAL/INSTALLATION**)

2014 - Mazda3 - I-ELOOP

CHARGING SYSTEM LOCATION INDEX [SKYACTIV-G 2.0, SKYACTIV-G 2.5 (WITH i-ELOOP)]

1	Generator (See **GENERATOR REMOVAL/INSTALLATION [SKYACTIV-G 2.0, SKYACTIV-G 2.5 (WITH i-ELOOP)]**.) (See **GENERATOR INSPECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5 (WITH i-ELOOP)]**.) (See **GENERATOR DISASSEMBLY/ASSEMBLY [SKYACTIV-G 2.0, SKYACTIV-G 2.5 (WITH i-ELOOP)]**.)
2	Battery (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) (See **BATTERY REMOVAL/INSTALLATION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) (See **BATTERY INSPECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) (See **BATTERY RECHARGING [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)
3	Service plug (See **SERVICE PLUG DISCONNECTION/CONNECTION [i-ELOOP]**.)
4	Capacitor (i-ELOOP) (See **CAPACITOR (i-ELOOP) REMOVAL/INSTALLATION [i-ELOOP]**.) (See **CAPACITOR (i-ELOOP) INSPECTION [i-ELOOP]**.) (See **CAPACITOR (i-ELOOP) COMPULSORY DISCHARGE [i-ELOOP]**.)
5	DC-DC converter (See **DC-DC CONVERTER REMOVAL/INSTALLATION [i-ELOOP]**.) (See **DC-DC CONVERTER INSPECTION [i-ELOOP]**.)

2014 - Mazda3 - I-ELOOP

PROCEDURE BEFORE i-ELOOP-RELATED PART SERVICING [i-ELOOP]

Procedure Before i-ELOOP-Related Part Servicing

WARNING:

- If the terminal of one of the i-ELOOP-related parts contacts the vehicle body with the service plug of the capacitor connected, it could cause a fire and damage to electrical parts. In addition, if the terminal contacts your body, it could cause electrocution. Disconnect the service plug of the capacitor before disconnecting the i-ELOOP-related part terminal. (See **SERVICE PLUG DISCONNECTION/CONNECTION [i-ELOOP]**.)

  i-ELOOP-related part terminal

  - Battery cable terminal of capacitor (i-ELOOP)
  - Engine wiring harness terminal of capacitor (i-ELOOP)
  - Battery cable terminal of DC-DC converter
  - Generator terminal B cable

GENERATOR
GENERATOR
TERMINAL B CABLE
CAPACITOR
(i-ELOOP)
BATTERY
CABLE
TERMINAL
ENGINE
WIRING
HARNESS
TERMINAL

2014 - Mazda3 - I-ELOOP

SERVICE PLUG DISCONNECTION/CONNECTION [i-ELOOP]

Procedure Before i-ELOOP-Related Part Servicing

WARNING:

- If the terminal of one of the i-ELOOP-related parts contacts the vehicle body with the service plug of the capacitor connected, it could cause a fire and damage to electrical parts. In addition, if the terminal contacts your body, it could cause electrocution. Disconnect the service plug of the capacitor before disconnecting the i-ELOOP-related part terminal. (See **Service Plug Disconnection/Connection**.)
    - For the i-ELOOP-related part terminals, refer to the “PROCEDURE BEFORE i-ELOOP-RELATED PART SERVICING”. (See **PROCEDURE BEFORE i-ELOOP-RELATED PART SERVICING [i-ELOOP]**.)

Service Plug Disconnection/Connection

CAUTION:

- Do not get dust or oil on the service plug because it could increase the resistance in the capacitor (i-ELOOP).

1. Disconnect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)
2. Turn the steering wheel completely to the right.
3. Remove the 3 fasteners for the front mudguard (LH) shown in the figure.

4. Remove the service plug installation bolt shown in the figure.

5. Pull the service plug in the direction of the arrow shown in the figure.

NOTE:

- The service plug cannot be completely removed.

6. Using the removed installation bolt, fix the service plug at the position to which it was pulled out.

7. Perform removal/installation of target i-ELOOP related parts.

8. Install in the reverse order of removal.

2014 - Mazda3 - I-ELOOP

GENERATOR REMOVAL/INSTALLATION [SKYACTIV-G 2.0, SKYACTIV-G 2.5 (WITH i-ELOOP)]

WARNING:

- Remove and install all parts when the engine is cold, otherwise they can cause severe burns or serious injury.

Procedure Before i-ELOOP-Related Part Servicing

WARNING:

- If the terminal of one of the i-ELOOP-related parts contacts the vehicle body with the service plug of the capacitor connected, it could cause a fire and damage to electrical parts. In addition, if the terminal contacts your body, it could cause electrocution. Disconnect the service plug of the capacitor before disconnecting the i-ELOOP-related part terminal. (See **SERVICE PLUG DISCONNECTION/CONNECTION [i-ELOOP]**.)
    - For the i-ELOOP-related part terminals, refer to the “PROCEDURE BEFORE i-ELOOP-RELATED PART SERVICING”. (See **PROCEDURE BEFORE i-ELOOP-RELATED PART SERVICING [i-ELOOP]**.)

Generator Removal/Installation

1. Disconnect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)
2. Disconnect the service plug. (See **SERVICE PLUG DISCONNECTION/CONNECTION [i-ELOOP]**.)
3. Remove the front under cover No.2. (See **FRONT UNDER COVER No.2 REMOVAL/INSTALLATION**.)
4. Remove the generator drive belt. (See **DRIVE BELT REMOVAL/INSTALLATION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)
5. Remove the A/C compressor with the cooler hose still connected and secure it using wire or rope so that it is out of the way. (with A/C) (See **A/C COMPRESSOR REMOVAL/INSTALLATION**.)
6. Remove in the order indicated in the table.
7. Install in the reverse order of removal.

1	Drive belt auto tensioner (See **Drive belt auto tensioner installation note**.)
2	Terminal B cable
3	Generator connector
4	Generator (See **Generator removal note**.) (See **Generator installation note**.)

Generator removal note

1. Fully loosen the generator lower bolt and pull it outward until it contacts the body frame.

NOTE:

The generator can be removed without fully removing the lower bolt from the engine.

2. Remove the generator upper bolt.
3. Remove the generator together with the lower bolt from the engine.
4. Remove the generator from above the engine compartment.

Generator installation note

1. To facilitate the installation of the generator to the engine, grasp the spacer in the bolt installation hole using pliers and push it down to the nut side.

2. Temporarily install the generator to the engine with the bolt C.

3. Align the generator fixing hole with the engine side hole, then temporarily tighten the generator installation bolt B.
4. Securely tighten the generator installation bolts in the order of B, C.

Drive belt auto tensioner installation note

CAUTION:

- To allow the drive belt auto tensioner to function correctly, always bleed the air from the drive belt auto tensioner using the following procedure after assembling the drive belt auto tensioner.

1. Install the drive belt auto tensioner to the engine.

CAUTION:

- To prevent damage to the drive belt auto tensioner, do not apply excessive torque after the tensioner moves full-stroke.

2. Insert the wrench onto the cast hexagon on the drive belt auto tensioner, move the drive belt auto tensioner up and down at full-stroke three times to bleed the air.

NOTE:

- By moving the drive belt auto tensioner up and down full-stroke three times, the piston inside the tensioner moves to bleed the air.

2014 - Mazda3 - I-ELOOP

GENERATOR INSPECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5 (WITH i-ELOOP)]

CAUTION:

1. Do not apply direct battery positive voltage to generator terminal 2A and 2B, otherwise it could cause damage to the internal parts (regulator) of the generator.

Charging System Warning Light

1. Verify that the battery is fully charged.

2. Verify that the assembly condition of the drive belt is normal. (See **DRIVE BELT INSPECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)

3. Switch the ignition ON (engine off), verify that the charging system warning light illuminates.

   - If it does not illuminate, inspect the charging system warning light and the wiring harness.

     1. If the charging system warning light and the wiring harness are normal, inspect the PCM.

4. Verify that the charging system warning light turns off after the engine is started.

   - If the charging system warning light does not turn off, perform the DTC inspection, then perform troubleshooting according to the corresponding diagnostic procedure. (See **ON-BOARD DIAGNOSTIC TEST [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) (See **DTC TABLE [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)

Generator

Generator voltage inspection

1. Verify that the battery is fully charged.

2. Verify that the assembly condition of the drive belt is normal. (See **DRIVE BELT INSPECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)

3. Turn off all electrical loads.

4. Start the engine.

5. Verify that the generator rotates smoothly without any noise while the engine is running.

   - If there is any noise, find the cause and repair or replace the generator.

6. Measure the voltage at each terminal using a tester.

- If not as specified, find the cause and repair or replace the applicable part.

Generator standard voltage [IG-ON]

- Terminal 1A: Capacitor voltage
- Terminal 2A: Approx. 1.0 V
- Terminal 2B: Approx. 1.0 V
- Terminal 2C: B+

Generator standard voltage [Idle, 20 °C {68 °F}]

- Terminal 1A: Capacitor voltage
- Terminal 2A, 2B: Turn the electrical loads (such as headlights, blower motor, rear window defroster, brake lights) on and verify that the voltage reading increases.
- Terminal 2C: B+

Generator current inspection

NOTE:

1. Since the charging current decreases rapidly after starting the engine, carry out the following procedure quickly, and read the maximum current value.

1. Verify that the battery is fully charged.

2. Verify that the assembly condition of the drive belt is normal. (See **DRIVE BELT INSPECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)

3. Disconnect the negative battery cable.

4. Connect a tester, which can read **120 A or more**, between generator terminal B and generator terminal B cable.

5. Connect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)

6. Turn off all electrical loads.

7. Start the engine.

NOTE:

1. When the electrical load on the vehicle is low, the specified current cannot be verified although the generator is normal. In this case, increase the electrical load (Leave the headlights turned on for a while, then discharge the battery, or use a similar method.) and recheck.
2. If the generator itself or the ambient temperature are too high, the specified current also cannot be verified. In this case, cool down the generator and recheck.

8. With the electric loads such as headlights, blower motor, rear window defroster, brake lights turned on, verify that the current increases.

   1. If not as specified, replace the generator. (See **GENERATOR REMOVAL/INSTALLATION [SKYACTIV-G 2.0, SKYACTIV-G 2.5 (WITH i-ELOOP)]**.)

Generator generated current maximum value (with i-ELOOP) (reference value) [Ambient temperature: 20 °C {68 °F}, Engine hot]

Engine speed (rpm)	Terminal 1A voltage (V)	Generator output current (A)
1,000	15	130
2,000	15	150

Generator Internal Parts

Rotor

1. Measure the resistance between the slip rings using a tester.

- If not within specification, replace the rotor.

  Generator rotor resistance (between slip rings) [20 °C {68 °F}]

- 1.8—2.1 ohms

2. Verify that there is no continuity between the slip ring and core using a tester.

- If there is continuity, replace the rotor.

3. Inspect the slip ring surface condition.

- If the slip ring surface is rough, use a lathe or fine sandpaper to make it smooth.

Stator coil

1. Verify that the continuity is as indicated in the table.

○—○ : Continuity

Terminal					
1	2	3	4	5	6
○—○					
○		○			
	○—○				
			○—○		
			○		○
				○—○	

- If there is any malfunction, replace the stator.

2. Verify that there is no continuity between the stator coil leads and core using a tester.

- If there is continuity, replace the stator coil.

Brush

1. Inspect brushes for wear.

- If any brush is worn almost to or beyond the limit, replace all of the brushes.

  Generator brush length

- Standard: 22.5 mm {0.886 in}
- Minimum: 5.0 mm {0.20 in}

Brush spring

1. Measure the force of the brush spring using a spring pressure gauge.
2. Read the spring pressure gauge at the brush tip projection of **2 mm {0.08 in}.**

- If not within specification, replace the brush spring.

  Generator brush spring force

- Standard: 4.1—5.3 N {0.42—0.54 kgf, 1.0—1.1 lbf}
- Minimum: 1.7 N {0.17 kgf, 0.38 lbf}

Rectifier (Using an analog circuit tester)

1. Inspect for continuity of the diodes using an analog circuit tester.

- If not as specified, replace the rectifier.

Specification

Negative	Positive	Continuity
E	P1, P2, P3, P4, P5, P6	Yes
B		No
P1, P2, P3, P4, P5, P6	E	No
	B	Yes

Rectifier (Using a digital circuit tester)

1. Inspect for continuity of the diodes using a digital circuit tester.
   - If not as specified, replace the rectifier.

Specification

Negative	Positive	Continuity
E	P1, P2, P3, P4, P5, P6	No
B		Yes
P1, P2, P3, P4, P5, P6	E	Yes
	B	No

Bearing

1. Inspect for abnormal noise, looseness, and sticking.

   - Replace the bearing if necessary.

2014 - Mazda3 - I-ELOOP

GENERATOR DISASSEMBLY/ASSEMBLY [SKYACTIV-G 2.0, SKYACTIV-G 2.5 (WITH i-ELOOP)]

1. Disassemble in the order indicated in the table.
2. Assemble in the reverse order of disassembly.

1	Rotor component

2	Stator coil component
3	Pulley
4	Rotor
5	Front bearing
6	Rear bearing
7	Front cover
8	Stator coil (See **Stator Coil Disassembly/Assembly Note**.)
9	Rectifier
10	Regulator component
11	Rear cover
12	Terminal B component

Stator Coil Disassembly/Assembly Note

CAUTION:

- Melt the solder quickly, otherwise the diodes (rectifier) and regulator will be damaged by excessive heat.

2014 - Mazda3 - I-ELOOP

CAPACITOR (i-ELOOP) REMOVAL/INSTALLATION [i-ELOOP]

Procedure Before i-ELOOP-Related Part Servicing

WARNING:

- If the terminal of one of the i-ELOOP-related parts contacts the vehicle body with the service plug of the capacitor connected, it could cause a fire and damage to electrical parts. In addition, if the terminal contacts your body, it could cause electrocution. Disconnect the service plug of the capacitor before disconnecting the i-ELOOP-related part terminal. (See **SERVICE PLUG DISCONNECTION/CONNECTION [i-ELOOP]**.)
    - For the i-ELOOP-related part terminals, refer to the “PROCEDURE BEFORE i-ELOOP-RELATED PART SERVICING”. (See **PROCEDURE BEFORE i-ELOOP-RELATED PART SERVICING [i-ELOOP]**.)

Cautions On Handling Capacitor (i-ELOOP)

CAUTION:

- If the capacitor (i-ELOOP) is placed on its side, its function may be lost. When storing/transporting the capacitor, do not place it on its side. (Store/transport in upright position)
- Do not use a capacitor (i-ELOOP) that has been dropped because it may not operate correctly.
- When disposing of the capacitor (i-ELOOP), perform compulsory discharge of the capacitor before disposal. (See **CAPACITOR (i-ELOOP) COMPULSORY DISCHARGE [i-ELOOP]**.)

Capacitor (i-ELOOP) Removal/Installation

1. Disconnect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)
2. Remove the front under cover No.1. (See **FRONT UNDER COVER No.1 REMOVAL/INSTALLATION**.)
3. Set the front mudguard (LH) aside as shown in the figure. (See **MUDGUARD REMOVAL/INSTALLATION**.)

4. Disconnect the service plug. (See **SERVICE PLUG DISCONNECTION/CONNECTION [i-ELOOP]**.)

5. Remove in the order indicated in the table.

6. Install in the reverse order of removal.

7. When disposing of the capacitor (i-ELOOP), perform compulsory discharge of the capacitor before disposal. (See **CAPACITOR (i-ELOOP) COMPULSORY DISCHARGE [i-ELOOP]**.)

8. If the capacitor (i-ELOOP) is replaced with a new one, idle the engine to charge the capacitor.

NOTE:

- A warning message is displayed in the instrument cluster while the capacitor is charging. Continue idling the engine until the warning message no longer appears.

1	Fuse cover (for fuse removal/installation only)
2	Fuse (for fuse removal/replacement only)
3	Capacitor connector, wiring harness
4	Battery cable
5	Engine wiring harness
6	Capacitor (i-ELOOP) (See **Capacitor (i-ELOOP) installation note**.)

Capacitor (i-ELOOP) installation note

1. When replacing a capacitor (i-ELOOP) with a new one, remove the short-wire installed to the new capacitor.

NOTE:

- Dispose of the removed short-wire and nuts as they are unnecessary.

2014 - Mazda3 - I-ELOOP

CAPACITOR (i-ELOOP) INSPECTION [i-ELOOP]

1. Verify that the capacitor (i-ELOOP) related DTC is detected. (See **DTC INSPECTION [i-ELOOP]**.) (See **ON-BOARD DIAGNOSTIC TEST [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)

- If DTCs are detected, repair the malfunctioning part according to the applicable DTC troubleshooting.
- If a DTC is not detected, go to the next step.

2. Turn the steering wheel completely to the right.

3. Remove the front under cover No.1. (See **FRONT UNDER COVER No.1 REMOVAL/INSTALLATION**.)

4. Remove the 3 fasteners for the front mudguard (LH) shown in the figure.

5. Do a visual inspection of the capacitor (i-ELOOP).

- If the capacitor (i-ELOOP) is damaged, replace it. (See **CAPACITOR (i-ELOOP)**

REMOVAL / INSTALLATION [i-ELOOP].)

6. Install in the reverse order of removal.

2014 - Mazda3 - I-ELOOP

CAPACITOR (i-ELOOP) COMPULSORY DISCHARGE [i-ELOOP]

Capacitor (i-ELOOP) Disposal Note

WARNING:

- If the vehicle or parts are disposed of (scrapped) while the capacitor (i-ELOOP) is charged with electricity, it could cause the following accidents. Before disposing of the vehicle or parts, always discharge the capacitor (i-ELOOP) to prevent the following accidents from occurring:

  (See **Capacitor (i-ELOOP) Compulsory Discharge**.)

  - Ignition generated by a shorted current may ignite flammable objects
  - The wiring harness temperature increases by the shorted current while it is disconnected and cause severe burns and serious injury if the wiring harness is touched
  - Touching the wiring harness while your body is wet with the wiring harness disconnected may result in electrical shock

Capacitor (i-ELOOP) Compulsory Discharge

1. Disconnect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)
2. Disconnect the service plug. (See **SERVICE PLUG DISCONNECTION/CONNECTION [i-ELOOP]**.)
3. Remove the discharge box cover.

4. Connect the connector in the discharge box to the plug.

5. Verify that the LED which displays during discharging is displayed.

CAUTION:

- Do not touch the discharge box because the inside of the box becomes hot during discharging.

NOTE:

- The LED turns off when the discharge is completed. Completion of discharge takes a maximum of approx. 2 hours.

6. Verify that the LED turns off.

CAUTION:

- Do not return the service plug to the original position even after discharging is finished.

7. Dispose of the vehicle or the parts.

2014 - Mazda3 - I-ELOOP

DC-DC CONVERTER REMOVAL/INSTALLATION [i-ELOOP]

Procedure Before i-ELOOP-Related Part Servicing

WARNING:

- If the terminal of one of the i-ELOOP-related parts contacts the vehicle body with the service plug of the capacitor connected, it could cause a fire and damage to electrical parts. In addition, if the terminal contacts your body, it could cause electrocution. Disconnect the service plug of the capacitor before disconnecting the i-ELOOP-related part terminal. (See **SERVICE PLUG DISCONNECTION/CONNECTION [i-ELOOP]**.)
    - For the i-ELOOP-related part terminals, refer to the “PROCEDURE BEFORE i-ELOOP-RELATED PART SERVICING”. (See **PROCEDURE BEFORE i-ELOOP-RELATED PART SERVICING [i-ELOOP]**.)

DC-DC Converter Removal/Installation

1. Disconnect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)
2. Disconnect the service plug. (See **SERVICE PLUG DISCONNECTION/CONNECTION [i-ELOOP]**.)
3. Remove the front seat component (LH). (See **FRONT SEAT REMOVAL/INSTALLATION**.)
4. Remove in the order indicated in the table.
5. Install in the reverse order of removal.

1	Cover (See **Cover installation note**.)
2	DC-DC converter connector
3	Battery cable (See **Battery cable removal note**.)
4	DC-DC converter

Battery cable removal note

1. Remove the battery cable terminal nuts.

2. Using a flathead screwdriver, shift the battery cable tab in the direction of the arrow, raise the battery cable and remove it.

Cover installation note

1. Install the cover by attaching the cover hooks to the front end of the bracket as shown in the figure.

2014 - Mazda3 - I-ELOOP

DC-DC CONVERTER INSPECTION [i-ELOOP]

1. Verify that the DC-DC converter related DTC is detected. (See **DTC INSPECTION [i-ELOOP]**.) (See **ON-BOARD DIAGNOSTIC TEST [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)

    - If DTCs are detected, repair the malfunctioning part according to the applicable DTC troubleshooting.
    - If a DTC is not detected, go to the next step.

2. Disconnect the negative battery cable. (See **NEGATIVE BATTERY CABLE DISCONNECTION/CONNECTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)

3. Disconnect the service plug. (See **SERVICE PLUG DISCONNECTION/CONNECTION [i-ELOOP]**.)

4. Remove the front seat component (LH). (See **FRONT SEAT REMOVAL/INSTALLATION**.)

5. Remove the DC-DC converter cover. (See **DC-DC CONVERTER REMOVAL/INSTALLATION [i-ELOOP]**.)

6. Do a visual inspection of the DC-DC converter.

    - If the DC-DC converter is damaged, replace it. (See **DC-DC CONVERTER REMOVAL/INSTALLATION [i-ELOOP]**.)

7. Install in the reverse order of removal.

2014 - Mazda3 - I-ELOOP

i-ELOOP TECHNICAL DATA

Item	Specification
Generator standard voltage [IG-ON]	Terminal 1A: Capacitor voltage Terminal 2A: Approx. 1.0 V Terminal 2B: Approx. 1.0 V Terminal 2C: B+
Generator standard voltage [Idle, 20 °C {68 °F}]	Terminal 1A: Capacitor voltage Terminal 2A, 2B: Turn the electrical loads (such as headlights, blower motor, rear window defroster, brake lights) on and verify that the voltage reading increases. Terminal 2C: B+
Generator rotor resistance (between slip rings) [20 °C {68 °F}]	1.8—2.1 ohms
Generator brush length	Standard: 22.5 mm {0.886 in} Minimum: 5.0 mm {0.20 in}
Generator brush spring force	Standard: 4.1—5.3 N {0.42—0.54 kgf, 1.0—1.1 lbf} Minimum: 1.7 N {0.17 kgf, 0.38 lbf}

Generator generated current maximum value (with i-ELOOP) (reference value) [Ambient temperature: 20 °C {68 °F}, Engine hot]

Engine speed (rpm)	Terminal 1A voltage (V)	Generator output current (A)
1,000	15	130
2,000	15	150

2014 - Mazda3 - Body and Accessories

FILAMENT REPAIR

1. Clean the filament using isopropyl alcohol.
2. Attach tape to both sides of the filament.

3. Using a small brush or marking pen, apply silver paint.
4. After **2—3 min,** carefully remove the tape without damaging the applied area.

CAUTION:

- Do not operate the rear window defroster until the paint is completely dry. It may cause other malfunctions if it is used before the paint is dry.

5. Dry the repaired part according to the following procedure.
   - When the room temperature is **25 °C {77 °F},** leave it as it is for **24 h.**
   - When a hot air blower is used, dry with the **150 °C {302 °F}** air for **30 min.**

GROUND POINTS

- This shows ground points of the harness.

Ground indication	
On vehide	Indication
	To circuit 
On circuit diagrams and ground points

The ground connection numbers in system circuit diagrams correspond to those in the ground point diagram.

SYSTEM CIRCUIT DIAGRAM/CONNECTOR DIAGRAM

- These diagrams show the circuits for each system, from the power supply to the ground. The power supply side is on the upper part of the page, the ground side on the lower part. The diagrams describe circuits with the ignition switch off.
  Below is an explanation of the various points in the diagram.

System name

The number indicates that the circuit continues to the related system diagram.

{ } : Name indicated on fuse box cover

Indicates shielded wire.*

* Shielded wire :
Prevents signal disturbances from electrical interference.
Wire is covered by a metal meshing for grounding.

Connector code

The prefix letter indicates the system in which the connector is used.

- **F**: Fuse box connectors
- **J**: Joint box/Junction box connectors
- **C**: Common connectors
- **G**: Ground point connectors
- **D**: Data link connector
- **0112**: Cooling system connectors
- **0113**: Intake air system connectors
- **0114**: Fuel system connectors
- **0117**: Charging system connectors
- **0118**: Ignition system connectors
- **0119**: Starting system connectors
- **0120**: Cruise control system connectors
- **0140**: Engine control system connectors
- **0212**: Wheel and tires connectors
- **0318**: 4-Wheel drive connectors
- **0413**: Antilock brake system connectors
- **0414**: Traction control system connectors
- **0415**: Dynamic stability control connectors
- **0418**: Dynamic stability control/Roll stability control connectors
- **0513**: Automatic transmission connectors
- **0514**: Automatic transmission shift mechanism connectors
- **0517**: Automatic transaxle connectors
- **0518**: Automatic transaxle shift mechanism connectors
- **0613**: Electric power steering (EPS) connectors
- **0614**: Power steering connectors
- **0740**: Heater, ventilation & air conditioning (HVAC) control system connectors
- **0810**: Air bag system connectors
- **0811**: Seat belt connectors
- **0912**: Glass/Windows/Mirrors connectors
- **0913**: Seats connectors
- **0914**: Security and locks connectors
- **0915**: Sunroof connectors
- **0916**: Exterior trim connectors
- **0918**: Lighting systems connectors
- **0919**: Wiper/Washer system connectors
- **0920**: Entertainment connectors
- **0921**: Power systems
- **0922**: Instrumentation/Driver info. Connectors
- **0940**: Control system

Current symbol

Current flows in the direction of the arrow.

Multiplex communication

Indicates communication with connected parts.
Signals are transmitted back and forth between connected parts.

System code

0740-2a

Wire color code (harness symbol)

- Two-color wires are indicated by a two-letter symbol.The first indicates the base color of the wire, the second the color of the stripe.
  For example:
  W/R is a white wire with a red strip
  BR/Y is a brown wire with a yellow strip

Symbol
(Example)

- The harness symbol is in ( ) following the harness symbols (refer to P-9.).

Connector symbols

- Male and female connectors are represented as follows in the circuit and connector diagrams.

		Circuit diagram symbol	Connector diagram symbol
Male		 Male	
Female		Female	

- Like connectors are linked by dashed lines between the connector symbols.
- Connector diagrams show connectors on the harness side. The terminal indicates the view from the harness side.

(Example)

- Colors for connectors except white are given in locations.
- Unused terminals are indicated by ∗.

Ground numbers

A harness ground is represented differently than a unit ground.

Types of grounds	Symbol
Harness 	Unit 	
ROUTING DIAGRAM

- The routing diagram shows where electrical components are on the system circuit diagram by call out line and connector symbols.

Connector symbol

Shows the system that uses the connector.

(Example)

Connector	Symbol
Common connectors	C-11
System connectors	0912-301

Ground symbol

Shows the ground in system diagrams.

Component name

Shows the names of components in routing diagrams.

REAR WINDOW DEFROSTER (INCLUDES HEATED OUTER MIRROR INFORMATION) 0912-1

HARNESS SYMBOLS

DESCRIPTION OF HARNESS	SYMBOL		DESCRIPTION OF HARNESS	SYMBOL	
FRONT HARNESS	(F)		DOOR No. 1 HARNESS	(DR1)	—
FRONT No. 2 HARNESS	(F2)		DOOR No. 2 HARNESS	(DR2)	
ENGINE HARNESS	(E)		DOOR No. 3 HARNESS	(DR3)	
DASH HARNESS	(D)		DOOR No. 4 HARNESS	(DR4)	
REAR HARNESS	(R)		FLOOR HARNESS	(FR)	—
REAR No. 2 HARNESS	(R2)		INTERIOR LIGHT HARNESS	(IN)	—
REAR No. 3 HARNESS	(R3)		A/C HARNESS	(AC)	—
INSTRUMENT PANEL HARNESS	(I)	—	INJECTION HARNESS	(INJ)	—
EMISSION HARNESS	(EM)	—	HAND BRAKE HARNESS	(HB)	—
EMISSION No. 2 HARNESS	(EM2)				
EMISSION No. 3 HARNESS	(EM3)				

WIRING COLOR CODE

COLOR	CODE	COLOR	CODE
BLACK	B	ORANGE	O
BLUE	L	PINK	P
BROWN	BR	RED	R
DARK BLUE	DL	SKY BLUE	SB
DARK GREEN	DG	TAN	T
GRAY	GY	VIOLET	V
GREEN	G	WHITE	W
LIGHT BLUE	LB	YELLOW	Y
LIGHT GREEN	LG		

SYMBOLS

Symbol	Meaning	Symbol	Meaning
Battery	• Generates electricity through chemical reaction. • Supplies direct current to circuits.	Light 3.4W	• Emits light and generates heat when current flows through filament.
Ground (1) G01	• Connecting point to vehicle body or other ground wire where current flows from positive to negative terminal of battery. • Ground (1) indicates a ground point to body through wire harness. • Ground (2) indicates point where component is grounded directly to body. Remarks • Current will not flow through a circuit if ground is faulty.		
Ground (2)		Resistance	• A resistor with a constant value. • Mainly used to protect electrical components in circuits by maintaining rated voltage.
Ground (3)		Motor M	• Converts electrical energy into mechanical energy.

Reading Wiring Diagrams

Symbol	Meaning
Fuse	• Melts when current flow exceeds that specified for circuit, interrupts current flow. Precautions • Do not replace with fuses exceeding specified capacity. <Blade type> <Tube type> <Cartridge type> <Fusible link>
Fuse (For high current fuse)/ Fusible link	
Transistor (1) Collector (C) Base (B) **NPN** Emitter (E)	• Electrical switching component. • Turns on when voltage is applied to the base (B). Collector indication mark B E C E C B C E B
Transistor (2) Collector (C) Base (B) **PNP** Emitter (E)	• Reading code. 2 S C 828 A Revision mark A:High-frequency PNP B:Low-frequency PNP C:High-frequency NPN D:Low-frequency NPN Semiconductor Number of terminals
Switch (1) Normally open	• Allows or breaks current flow by opening and closing curcuits.
Switch (2) Normally closed	
Autostop switch	• Automatically shuts off circuit when certain conditions are met.

Symbol	Meaning
Pump	• Pulls in and discharges gases and liquids.
Cigarette lighter	• Electrical coil that generates heat.
Accessory socket	• Interior power supply.
Horn	• Generates sound when current flows.
Speaker	
Heater	• Generates heat when current flows.
Ignition switch ST B2 B1 IG2 OFF IG1 OFF ACC	• Turning ignition key switches circuit to operate various component. (NOTE) Ignition switch is called engine switch on diesel vehicles.
Harness **Connection** When circuit C-D is connected to circuit A-B, the connection D is indicated by a black mdot. **Selection** Diversion point D for the different circuits according to the vehicle's specification is indicated by a white dot.	A D B C For vehicles with ABS, use the A-B circuit. WITH ABS A D B WITHOUT ABS C For vehicles without ABS, use the C-B circuit.

Symbol	Meaning
Relay (1) Normally open	• Current flowing through coil produces electromagnetic force causing contact to close. No current to coil: No flow Current to coil: Flow

Symbol	Meaning	Symbol	Meaning
Relay (2) Normally closed	• Current flowing through coil produces electromagnetic force causing contact to open. No current to coil — Flow Current to coil — No flow		
Sensor (1)	• Detects characteristics such as intake manifold vacuum and airflow amount according to resistance variation.	Solenoid	• Current flowing through coil generates electromagnetic force to operate plungers.
Sensor (2)	• Detects resistance variation according to operation of other parts.	Diode	• Known as a semiconductor rectifier, the diode allows current flow in one direction only. Cathode(K) — Anode(A) Flow of electric current K A K A K A
Sensor (3)	• A resistor whose resistance variation according to temperature variation. • When temperature increases, resistance decreases.		
Sensor (4)	• Detects pulse signals from rotating object.	Light-emitting diode (LED)	• A diode that lights when current flows. • Unlike ordinary bulbs, the diode does not generate heat when lit. Cathode(K) — Anode(A) Cathode(K) Anode(A) Flow of current
Sensor (5)	• Generates potential difference when tension or pressure is applied.		
Capacitor	• Component that temporarily stores electrical charge.	Reference diode (Zener diode)	• Allows current to flow in one direction up to a certain voltage; allows current to flow in the other direction once that voltage is exceeded.

Symbol	Meaning
Extent of the change in the wiring position (1) E C A B B B B B B F D B E C A F D B	• The wiring position can be exchanged freely within the connector.
Extent of the change in the wiring position (2) E C A B B B B B B F D B E C A F D B	• The wiring position can be exchanged according to the following combinations only. Between A and B, Between C and D, Between E and F
Extent of the change in the wiring position (3) 3 L 2 B 1 B 5 L 4 B 8 B/Y 7 B 6 R 2 1 4 7	• The wiring position can be exchanged according to the following combinations only. Between 1, 2, 4 and 7. • The wiring positions may be indicated by numbers for some connectors.

SERVICE WARNING AND CAUTION FOR VEHICLES WITH SRS AIR BAG SYSTEM

If the SRS air bag system inspection is not performed correctly in accordance with the workshop manual procedures it could cause the system to operate (deploy) accidentally, resulting in injury.
Always follow the service warnings and cautions in the workshop manual when performing the SRS air bag system-related inspection or servicing.

SERVICE WARNING FOR VEHICLES WITH DISCHARGE HEADLIGHTS

If the discharge headlight inspection and servicing is not done using the correct procedures in the workshop manual, it could result in electrical shock.
Always follow the service warnings and cautions in the workshop manual when performing the discharge headlight-related inspection or servicing.

ABBREVIATIONS USED IN THIS MANUAL

3GR	THIRD GEAR
4GR	FOURTH GEAR
A	AMPERE
A/C	AIR CONDITIONING
A/F	AIR FUEL RATIO
AAS	AUTO ADJUSTING SUSPENSION
ABS	ANTILOCK BRAKE SYSTEM
ACC	ACCESSORIES
ACV	AIR CONTROL VALVE
ADD	ADDITIONAL
AIS	AIR INJECTION SYSTEM
ALL	AUTOMATIC LOAD LEVELING
AM	AMPLITUDE MODULATION
AMP	AMPLIFIER
ANT	ANTENNA
ASV	AIR SUPPLY VALVE
AT	AUTOMATIC TRANSMISSION
ATX	AUTOMATIC TRANSAXLE
B+	BATTERY POSITIVE VOLTAGE
BAC	BYPASS AIR CONTROL
BTN	BRAKE TAIL NUMBER
CAN	CONTROLLER AREA NETWORK
CIGAR	CIGARETTE
CIS	CONTINUOUS FUEL INJECTION SYSTEM
CKP	CRANKSHAFT POSITION SENSOR
CM	CONTROL MODULE
CMP	CAMSHAFT POSITION SENSOR
COMBI	COMBINATION
CON	CONDITIONER
CONT	CONTROL
CPU	CENTRAL PROCESSING UNIT
CV	CANISTER VENT
DEF	DEFROSTER
DI	DISTRIBUTOR IGNITION
DLC	DATA LINK CONNECTOR
DLI	DISTRIBUTORLESS IGNITION
DOHC	DOUBLE-OVERHEAD CAMSHAFT
DRL	DAYTIME RUNNING LIGHT

DSC	DYNAMIC STABILITY CONTROL
DTC	DIAGNOSTIC TROUBLE CODE(S)
DTM	DIAGNOSTIC TEST MODE
ECPS	ELECTRONICALLY CONTROLLED POWER STEERING
ECT	ENGINE CONTROL TEMPERATURE
EGR	EXHAUST GAS RECIRCULATION
EHPAS	ELECTRO HYDRAULIC POWER ASSIST STEERING
EI	ELECTRONIC IGNITION
ELEC	ELECTRIC
ELR	EMERGENCY LOCKING RETRACTOR
ET	ELECTRONIC THROTTLE
ETC	ELECTRONIC THROTTLE CONTROL
EPS	ELECTRIC POWER STEERING
EVAP	EVAPORATIVE EMISSION
F	FRONT
F/I	FUEL INJECTOR
FICB	FAST-IDLE CAM BREAKER
FM	FREQUENCY MODULATION
FP	FUEL PUMP
FPR	FUEL PUMP RELAY
GEN	GENERATOR
GND	GROUND
H/D	HEATER/DEFROSTER
HEAT	HEATER
HI	HIGH
HO2S	HEATED OXYGEN SENSOR
HS	HIGH SPEED
HU	HYDRAULIC UNIT
IAC	IDLE AIR CONTROL
IAT	INTAKE AIR TEMPERATURE
IG	IGNITION
ILLUMI	ILLUMINATION
INT	INTERMITTENT
JB	JOINT BOX
KS	KNOCK SENSOR
LCD	LIQUID CRYSTAL DISPLAY
LF	LEFT FRONT

LH	LEFT HAND
LO	LOW
LR	LEFT REAR
M	MOTOR
MAF	MASS AIR FLOW
MAP	MANIFOLD ABSOLUTE PRESSURE
MFI	MULTIPORT FUEL INJECTION
MID	MIDDLE
MIL	MALFUNCTION INDICATOR LAMP
MIN	MINUTE
MIX	MIXTURE
MPX	MULTIPLEX
MS	MIDDLE SPEED
MT	MANUAL TRANSMISSION
MTX	MANUAL TRANSAXLE
N	NEUTRAL
NC	NORMALLY CLOSED
NO	NORMALLY OPEN
O2S	OXYGEN SENSOR
OBD	ON-BOARD DIAGNOSTIC
O/D	OVER DRIVE
OFF	SWITCH OFF
ON	SWITCH ON
OSC	OSCILLATOR
P	POWER
P/S	POWER STEERING
PCM	POWERTRAIN CONTROL MODULE
PJB	PASSENGER JUNCTION BOX
PNP	PARK/NEUTRAL POSITION
PRC	PRESSURE REGULATOR CONTROL
PRG	PURGE SOLENOID VALVE
PSP	POWER STEERING PRESSURE
PTC	POSITIVE TEMPERATURE COEFFICIENT HEATER
PWM	PULSE WIDTH MODULATION
QSS	QUICK-START SYSTEM
R	REAR
REC	RECIRCULATION
RES	REAR ENTERTAINMENT SYSTEM
RF	RIGHT FRONT
RH	RIGHT HAND
RPM	REVOLUTIONS PER MINUTE
RR	RIGHT REAR
RSC	ROLL STABILITY CONTROL
SAS	SOPHISTICATED AIR BAG SENSOR
SFI	SEQUENTIAL MULTIPOINT FUEL INJECTION
SOL	SOLENOID

SPV	SPILL VALVE
ST	START
SW	SWITCH
TC	TURBOCHARGER
TCC	TORQUE CONVERTER CLUTCH
TCM	TRANSMISSION(TRANSAXLE) CONTROL MODULE
TCS	TRACTION CONTROL SYSTEM
TEMP	TEMPERATURE
TFT	TRANSAXLE FLUID TEMPERATURE
TICS	TRIPLE INDUCTION CONTROL SYSTEM
TNS	TAIL NUMBER SIDE LIGHTS
TP	THROTTLE POSITION SENSOR
TR	TRANSMISSION(TRANSAXLE) RANGE
TWS	TOTAL WIRING SYSTEM
V	VOLT
VAF	VOLUME AIR FLOW SENSOR
VENT	VENTILATION
VICS	VARIABLE INERTIA CHARGING SYSTEM
VOL	VOLUME
VR	VOLTAGE REGULATOR
VRIS	VARIABLE RESONANCE INDUCTION SYSTEM
VSS	VEHICLE SPEED SENSOR
VTCS	VARIABLE TUMBLE CONTROL SYSTEM
W	WATT(S)
WOT	WIDE OPEN THROTTLE

ELECTRICAL PARTS

B6U000000006W03

Battery Cable

- Before disconnecting connectors or removing electrical parts, disconnect the negative battery cable.

WGIWXX0007E

Wiring Harness

- To remove the wiring harness from the clip in the engine room, pry up the hook of the clip using a flathead screwdriver.

WGIWXX0039E

Caution

- **Do not remove the Harness protective tape. Otherwise, the wires could rub against the body, which could result in water penetration and electrical shorting.**

WGIWXX0040E

CONNECTORS

Disconnecting Connectors

- When disconnecting connector, grasp the connectors, not the wires.

WGIWXX0041E

- Connectors can be disconnected by pressing or pulling the lock lever as shown.

WGIWXX0042E

Locking Connector

- When locking connectors, listen for a click indicating they are securely locked.

X3U000WB1

Inspection

- When a tester is used to inspect for continuity or measuring voltage, insert the tester probe from the wiring harness side.

WGIWXX0044E

- Inspect the terminals of waterproof connectors from the connector side since they cannot be accessed from the wiring harness side.

  Caution
  - **To prevent damage to the terminal, wrap a thin wire around the tester probe before inserting into terminal.**

WGIWXX0045E

Terminals

Inspection

- Pull lightly on individual wires to verify that they are secured in the terminal.

X3U000WB4

Replacement

- Use the appropriate tools to remove a terminal as shown. When installing a terminal, be sure to insert it until it locks securely.
- Insert a thin piece of metal from the terminal side of the connector and with the terminal locking tab pressed down, pull the terminal out from the connector.

X3U000WB5

Sensors, Switches, And Relays

- Handle sensors, switches, and relays carefully. Do not drop them or strike them against other objects.

X3U000WB6

Fuse

Replacement

- When replacing a fuse, be sure to replace it with one of the same capacity. If a fuse fails again, the circuit probably has a short and the wiring should be inspected.
- Be sure the negative battery terminal is disconnected before replacing a main fuse.

YMU000WA1

- When replacing a pullout fuse, use the fuse puller.

YMU000WAK

ELECTRICAL TROUBLESHOOTING TOOLS

Jumper Wire

- A jumper wire is used to create a temporary circuit. Connect the jumper wire between the terminals of a circuit to bypass a switch.

  Caution
  - **Do not connect a jumper wire from the power source line to a body ground. This may cause burning or other damage to wiring harnesses or electronic components.**

X3U000WBB

Voltmeter

- The DC voltmeter is used to measure circuit voltage. A voltmeter with a range of **15 V or more** is used by connecting the positive (+) probe (red lead wire) to the point where voltage will be measured and the negative (-) probe (black lead wire) to a body ground.

X3U000WBC

Ohmmeter

- The ohmmeter is used to measure the resistance between two points in a circuit and to inspect for continuity and short circuits.

  Caution
  - **Do not connect the ohmmeter to any circuit where voltage is applied. This will damage the ohmmeter.**

YMU000WAL

HOW TO USE THIS MANUAL

Efficient Replacement of Body Panels

- This section contains information on the body panels in regard to the welding types, number of spot welds, and cut and join locations that are necessary for panel removal and installation.
- The type of weld and position are indicated by symbols.
- Some sections have notes concerning the operation being performed. Thoroughly read and understand the notes before carrying out any procedures.

Example

Symbols of Panel Replacement

- The following 6 symbols are used to indicate the type of weld that is used when replacing body panels.

SYMBOL	MEANING
●	Spot welding
■	Arc welding (plug welding)
+	Arc welding (spot welding)

SYMBOL	MEANING
|||||||||	Continuous arc welding (Cut-and-join location)
○○○	Brazing welding (oxyacetylene welding)
∧∨∧∨	Rough cut location

Body Dimensions (Flat plane Dimensions)

- Flat plane dimensions are the dimensions measured by projecting certain reference points onto a plane surface.

- When there are no specific indications, the standard points and dimensions are symmetrical in regard to the center of the vehicle.
- The hypothetical lines may differ according to the vehicle model.
- The schematic diagram shows the vehicle as it is projected from the underbody.

Example

Shows vehicle section

UNDERBODY FLAT-PLANE DIMENSIONS

Point symbol	Designation	Hole diameter or bolt or nut size mm {in}
A	Crossmember No,1 standard hole	ϕ 16 {0.62}
B	Front side frame standard hole	ϕ 16 {0.62}
C	Front suspension mounting block surface hole center	ϕ 80 {3.14}
D	Front suspension mounting bolt	M14 {0.55}
E	Front frame rear standard hole	ϕ 16 {0.62}

Shows bolt size

Point symbol	Designation	Hole diameter or bolt or nut size mm {in}
F	Front frame rear standard hole	ϕ 18 {0.62}
G	Rear side frame standard hole	ϕ 16 {0.62}
H	Link bracket	17 × 29.5 {0.66×1.16}
I	Rear suspension housing	ϕ 12 {0.47}
J	Rear side frame standard hole	ϕ 16 {0.62}
K	Rear suspension housing	ϕ 31 {1.22}
L	Rear side frame standard hole	ϕ 12 {0.47}

Shows slot

Shows hole diameter

Body Dimensions (Straight line Dimensions)

- Straight line dimensions are the actual dimensions between two standard points.

- When there are no specific indications, the standard points and dimensions are symmetrical in regard to the center of the vehicle.

Example

Point symbol	Designation	Hole diameter or bolt or nut size mm {in}
A	Front pillar inner designation	ϕ 16 {0.62}
B	Front pillar inner designation	ϕ 17 {0.67}
C	Harness installation hole	ϕ 31 {1.22}
D	Front floor pan designation	M14 {0.55}
E	Adjuster installation hole	ϕ 16 {0.62}

Point symbol	Designation	Hole diameter or bolt or nut size mm {in}
F	Trim installation hole	ϕ 18 {0.71}
G	Harness installation hole	ϕ 16 {0.62}
H	Chaker bracket installation hole	17 × 29.5 {0.66×1.16}
I	Chaker bracket installation hole	ϕ 12 {0.47}

Symbols of Body Dimensions

- The following 8 symbols are used to indicate the standard points.

SYMBOL	MEANING
	Center of circular hole
	Center elliptical hole
	Notch
	Panel seam, bead, etc.

SYMBOL	MEANING
(arrow only)	Bolt tip
	Center of rectangular-shaped hole
	Edge of rectangular-shaped hole

2014 - Mazda3 - General Information

AIR BAG SYSTEM SERVICE WARNINGS [STANDARD DEPLOYMENT CONTROL SYSTEM]

Air Bag Module Inspection

- **Inspecting an air bag module using a tester can operate (deploy) the air bag module, which may cause serious injury. Do not use a tester to inspect an air bag module. Always use the on-board diagnostic function to diagnose the air bag module for malfunctions.**

Air Bag Module Handling

- **Before removing the air bag module or disconnecting the air bag module connector, always switch the ignition off, disconnect the negative battery cable, and then wait for 1 min or more to allow the backup power supply of the SAS control module to deplete its stored power.**
- **Handling a live (undeployed) air bag module that is pointed toward your body could result in serious injury if the air bag module were to accidentally operate (deploy). When carrying a live (undeployed) air bag module, point the deployment surface away from your body to lessen the chance of injury in case it operates (deploys).**

- **A live (undeployed) air bag module placed with its deployment surface to the ground is dangerous. If the air bag module were to accidentally operate (deploy), it could cause serious injury. Always place a live (undeployed) air bag module with its deployment surface up.**

Side Air Bag Module Handling

- **Before removing the side air bag module or disconnecting the side air bag module connector, always switch the ignition off, disconnect the negative battery cable, and then wait for 1 min or more to allow the backup power supply of the SAS control module to deplete its stored power.**
- **When a side air bag module operates (deploys) due to a collision, the interior of the seat back (pad, frame, trim) may become damaged. If a side air bag does not operate (deploy) normally from a seat back that has been reused, a serious accident may result. After a side air bag has operated (deployed), always replace both the side air bag module and the seat back (pad, frame, trim) with new parts. After servicing, verify that the seat operates normally and that the wiring harness is not caught.**

SAS Control Module Handling

- **When connecting or disconnecting the SAS control module connector, a person**

charged with static electricity could accidentally operate (deploy) each air bag module. Before connecting or disconnecting the SAS control module connector, discharge any charged static electricity from your body.

- **Removing the SAS control module or disconnecting the SAS control module connector with the ignition ON can activate the sensor in the SAS control module and operate (deploy) the air bags and pre-tensioner seat belts, which may cause serious injury. Before removing the SAS control module or disconnecting the SAS control module connector, always switch the ignition off, disconnect the negative battery cable, and then wait for 1 min or more to allow the backup power supply of the SAS control module to deplete its stored power.**
- **Connecting the SAS control module connector with the SAS control module not securely fixed to the vehicle is dangerous. The sensor in the SAS control module could send an electrical signal to the air bag modules and pre-tensioner seat belts. This will operate (deploy) the air bags and pre-tensioner seat belts, which may result in serious injury. Therefore, before connecting the connector, securely fix the SAS control module to the vehicle.**
- **Because a sensor is built into the SAS control module, once the air bags and pre-tensioner seat belts have operated (deployed) due to a collision or other causes, the SAS control module must be replaced with a new one even if the used one does not have any visible external damage or deformation. The used SAS control module may have been damaged internally, which may cause improper operation. If the SAS control module is reused, the air bags and pre-tensioner seat belts may not operate (deploy) normally, which could result in a serious accident. Always replace the SAS control module with a new one. The SAS control module cannot be bench-checked or self-checked.**

Crash Zone Sensor Handling

- **Removing the crash zone sensor or disconnecting the crash zone sensor connector with the ignition ON can activate the crash zone sensor and operate (deploy) the air bags and pre-tensioner seat belts, which may cause serious injury. Before removing the crash zone sensor or disconnecting the crash zone sensor connector, always switch the ignition off, disconnect the negative battery cable, and then wait for 1 min or more to allow the backup power supply of the SAS control module to deplete its stored power.**
- **If the crash zone sensor is subjected to shock or the sensor is disassembled, the air bags and pre-tensioner seat belts may accidentally operate (deploy) and cause injury, or the system may fail to operate normally and cause a serious accident. Do not subject the crash zone sensor to shock or disassemble the sensor.**
- **Because a sensor is built into the crash zone sensor, once the air bags and pre-tensioner seat belts have operated (deployed) due to a collision or other causes, the crash zone sensor must be replaced with a new one even if the used one does not have any visible external damage or deformation. If the crash zone sensor is reused, the air bags and pre-tensioner seat belts may not operate (deploy) normally, which could result in a serious accident. Always replace the crash zone sensor with a new one. The crash zone sensor cannot be bench-checked or self-checked.**

Side Air Bag Sensor Handling

- **Removing the side air bag sensor or disconnecting the side air bag sensor connector with the ignition ON can activate the side air bag sensor and operate (deploy) the side air bag, which may cause serious injury. Before removing the side air bag sensor or disconnecting the side air bag sensor connector, always switch the ignition off, disconnect the negative battery cable, and then wait for 1 min or more to allow the backup power supply of the SAS control module to deplete its stored power.**
- **If the side air bag sensor is subjected to shock or the sensor is disassembled, the side air bag may accidentally operate (deploy) and cause injury, or the system may fail to operate normally and cause a serious accident. Do not subject the side air bag sensor to shock or disassemble the sensor.**
- **Because a sensor is built into the side air bag sensor, once the air bag has operated (deployed) due to a collision or other causes, the side air bag sensor must be replaced with a new one even if the used one does not have any visible external damage or deformation. If the side air bag sensor is reused, the side air bag may not operate (deploy) normally, which could result in a serious accident. Always replace the side air bag sensor with a new one. The side air bag sensor cannot be bench-checked or self-checked.**

Pre-tensioner Seat Belt Inspection

- **Inspecting a pre-tensioner seat belt using a tester can operate (deploy) the pre-tensioner seat belt, which may cause serious injury. Do not use a tester to inspect a pre-tensioner seat belt. Always use the on-board diagnostic function to diagnose the pre-tensioner seat belt for malfunctions.**

2014 - Mazda3 - General Information

AIR BAG SYSTEM SERVICE WARNINGS [TWO-STEP DEPLOYMENT CONTROL SYSTEM]

Air Bag Module Inspection

- **Inspecting an air bag module using a tester can operate (deploy) the air bag module, which may cause serious injury. Do not use a tester to inspect an air bag module. Always use the on-board diagnostic function to diagnose the air bag module for malfunctions.**

Air Bag Module Handling

- **Before removing the air bag module or disconnecting the air bag module connector, always switch the ignition off, disconnect the negative battery cable, and then wait for 1 min or more to allow the backup power supply of the SAS control module to deplete its stored power.**
- **Handling a live (undeployed) air bag module that is pointed toward your body could result in serious injury if the air bag module were to accidentally operate (deploy). When carrying a live (undeployed) air bag module, point the deployment surface away from your body to lessen the chance of injury in case it operates (deploys).**

- **A live (undeployed) air bag module placed with its deployment surface to the ground is dangerous. If the air bag module were to accidentally operate (deploy), it could cause serious injury. Always place a live (undeployed) air bag module with its deployment surface up.**

Side Air Bag Module Handling

- **Before removing the side air bag module or disconnecting the side air bag module connector, always switch the ignition off, disconnect the negative battery cable, and then wait for 1 min or more to allow the backup power supply of the SAS control module to deplete its stored power.**
- **When a side air bag module operates (deploys) due to a collision, the interior of the seat back (pad, frame, trim) may become damaged. If a side air bag does not operate (deploy) normally from a seat back that has been reused, a serious accident may result. After a side air bag has operated (deployed), always replace both the side air bag module and the seat back (pad, frame, trim) with new parts. After servicing, verify that the seat operates normally and that the wiring harness is not caught.**

SAS Control Module Handling

- **When connecting or disconnecting the SAS control module connector, a person**

charged with static electricity could accidentally operate (deploy) each air bag module and pre-tensioner seat belt. Before connecting or disconnecting the SAS control module connector, discharge any charged static electricity from your body.

- **Removing the SAS control module or disconnecting the SAS control module connector with the ignition ON can activate the sensor in the SAS control module and operate (deploy) the air bags, pre-tensioner seat belts and lap pre-tensioner seat belts which may cause serious injury. Before removing the SAS control module or disconnecting the SAS control module connector, always switch the ignition off, disconnect the negative battery cable, and then wait for 1 min or more to allow the backup power supply of the SAS control module to deplete its stored power.**
- **Connecting the SAS control module connector with the SAS control module not securely fixed to the vehicle is dangerous. The sensor in the SAS control module could send an electrical signal to the air bag modules, pre-tensioner seat belts and lap pre-tensioner seat belts. This will operate (deploy) the air bags, pre-tensioner seat belts and lap pre-tensioner seat belts, which may result in serious injury. Therefore, before connecting the connector, securely fix the SAS control module to the vehicle.**
- **Because a sensor is built into the SAS control module, once the air bags, pre-tensioner seat belts and lap pre-tensioner seat belts have operated (deployed) due to a collision or other causes, the SAS control module must be replaced with a new one even if the used one does not have any visible external damage or deformation. The used SAS control module may have been damaged internally, which may cause improper operation. If the SAS control module is reused, the air bags, pre-tensioner seat belts and lap pre-tensioner seat belts may not operate (deploy) normally, which could result in a serious accident. Always replace the SAS control module with a new one. The SAS control module cannot be bench-checked or self-checked.**

Crash Zone Sensor Handling

- **Removing the crash zone sensor or disconnecting the crash zone sensor connector with the ignition ON can activate the crash zone sensor and operate (deploy) the air bags, pre-tensioner seat belts and lap pre-tensioner seat belts which may cause serious injury. Before removing the crash zone sensor or disconnecting the crash zone sensor connector, always switch the ignition off, disconnect the negative battery cable, and then wait for 1 min or more to allow the backup power supply of the SAS control module to deplete its stored power.**
- **If the crash zone sensor is subjected to shock or the sensor is disassembled, the air bags, pre-tensioner seat belts and lap pre-tensioner seat belts may accidentally operate (deploy) and cause injury, or the system may fail to operate normally and cause a serious accident. Do not subject the crash zone sensor to shock or disassemble the sensor.**
- **Because a sensor is built into the crash zone sensor, once the air bags, pre-tensioner seat belts and lap pre-tensioner seat belts have operated (deployed) due to a collision or other causes, the crash zone sensor must be replaced with a new one even if the used one does not have any visible external damage or deformation. If the crash zone sensor is reused, the air bags, pre-tensioner seat belts and lap pre-tensioner seat belts may not operate (deploy) normally, which could result in a serious accident. Always replace the crash zone sensor with a**

new one. The crash zone sensor cannot be bench-checked or self-checked.

Side Air Bag Sensor Handling

- **Removing the side air bag sensor or disconnecting the side air bag sensor connector with the ignition ON can activate the side air bag sensor and operate (deploy) the side air bag, which may cause serious injury. Before removing the side air bag sensor or disconnecting the side air bag sensor connector, always switch the ignition off, disconnect the negative battery cable, and then wait for 1 min or more to allow the backup power supply of the SAS control module to deplete its stored power.**
- **If the side air bag sensor is subjected to shock or the sensor is disassembled, the side air bag may accidentally operate (deploy) and cause injury, or the system may fail to operate normally and cause a serious accident. Do not subject the side air bag sensor to shock or disassemble the sensor.**
- **Because a sensor is built into the side air bag sensor, once the air bag has operated (deployed) due to a collision or other causes, the side air bag sensor must be replaced with a new one even if the used one does not have any visible external damage or deformation. If the side air bag sensor is reused, the side air bag may not operate (deploy) normally, which could result in a serious accident. Always replace the side air bag sensor with a new one. The side air bag sensor cannot be bench-checked or self-checked.**

Pressure Sensor Handling

- **Removing the pressure sensor or disconnecting the pressure sensor connector with the ignition ON can activate the pressure sensor and operate (deploy) the side air bag, which may cause serious injury. Before removing the pressure sensor or disconnecting the pressure sensor connector, always switch the ignition off, disconnect the negative battery cable, and then wait for 1 min or more to allow the backup power supply of the SAS control module to deplete its stored power.**
- **If the pressure sensor is subjected to shock or the sensor is disassembled, the side air bag may accidentally operate (deploy) and cause injury, or the system may fail to operate normally and cause a serious accident. Do not subject the pressure sensor to shock or disassemble the sensor.**
- **Because a sensor is built into the pressure sensor, once the air bag has operated (deployed) due to a collision or other causes, the pressure sensor must be replaced with a new one even if the used one does not have any visible external damage or deformation. If the pressure sensor is reused, the side air bag may not operate (deploy) normally, which could result in a serious accident. Always replace the pressure sensor with a new one. The pressure sensor cannot be bench-checked or self-checked.**

Pre-tensioner Seat Belt Inspection

- **Inspecting a pre-tensioner seat belt using a tester can operate (deploy) the pre-tensioner seat belt, which may cause serious injury. Do not use a tester to**

inspect a pre-tensioner seat belt. Always use the on-board diagnostic function to diagnose the pre-tensioner seat belt for malfunctions.

Lap Pre-tensioner Seat Belt Inspection

- **Inspecting a lap pre-tensioner seat belt using a tester can operate (deploy) the lap pre-tensioner seat belt, which may cause serious injury. Do not use a tester to inspect a lap pre-tensioner seat belt. Always use the on-board diagnostic function to diagnose the lap pre-tensioner seat belt for malfunctions.**

2014 - Mazda3 - General Information

SERVICE PRECAUTIONS

Arrangement of Workshop

- Arrangement of the workshop is important for safe and efficient work.

Safety Precautions

- Protective head covering and safety shoes should always be worn. Depending upon the nature of the work, gloves, safety glasses, ear protectors, face shield, etc., should also be used.

Vehicle Protection

- Use seat covers and floor covers.
- Use heat resistant protective covers to protect glass areas and seats from heat or sparks during welding.
- Protect items such as moldings, garnishes, and ornaments with tape when welding.

Remove Dangerous Articles

- Remove the fuel tank before using an open flame in that area. Plug connection piping to prevent fuel leakage.

Use of Pulling Equipment

- When using pulling equipment, keep away from the pulling area and use safety wires to prevent accidents.

Prevent Short Circuits

- Switch the ignition to off.
- Disconnect the battery cables.

1. Securely connect the welding machine ground near the welding area.

2014 - Mazda3 - General Information

EFFICIENT REMOVAL OF BODY PANELS

Body Measurements

- Before removal or rough cutting, first measure the body at and around the damaged area against the standard reference dimension specifications. If there is deformation, use frame repair equipment to make a rough correction.

Prevention of Body Deformation

- Use a clamp or a jack for removal and reinforce at and around the rough cutting location to prevent deforming of the body.

Selection of Cut and join Locations

- For parts where complete replacement is not feasible, careful cutting and joining operations should be followed. If the location to be cut is a flat area where there is no reinforcement, the selected cutting location should be where the welding distortion will be minimal.

Removal of Associated Parts

- Protect moldings, garnishes, and ornaments with tape when removing associated parts.

Rough Cutting of Damaged Panel

- Verify that there are no parts (such as pipes, hoses, and wiring harness) nearby or on the opposite side of a panel which could be damaged by heat.
- For cut and join areas, allow for an overlap of 30—50 mm {1.2—1.9 in} and then rough cut the damaged panel.

EFFICIENT REMOVAL OF BODY PANELS

2014 - Mazda3 - General Information

EFFICIENT INSTALLATION OF BODY PANELS

Checking Preweld Measurements And Watching

- Align to the standard reference dimensions, based upon the body dimensions illustration, so that new parts are installed in the correct position.

Welding Notes

- For the number of weld points, welding should be performed in accordance with the following reference standards.

Spot Welding Notes

- The shape of the spot welder tip is D=(2×t)+3. If the upper panel thickness is different from that of the under panel, adjust to the thinner one.

- Because the weld strength is affected by the shape of the spot welder tip, the optimum condition of the tip should always be maintained.

- Spot welds should be made at points other than the originally welded points.
- Before spot welding, make a trial weld using the same material as the body panel to check the weld strength.

Checking Weld Strength

- Installation locations of the engine, chassis, and seat belts are designated as important safety locations for weld strength. Check weld strength by driving a chisel between the panels at every fourth or fifth weld spot, and every tenth regular weld location.

- Drive the chisel between the panels according to the number of panels as shown below.

- To determine weld strength, drive the chisel between the panel and check whether the panels come apart. If the panels come apart, make another weld near the original weld.
- Restore the shape of the checked area.

2014 - Mazda3 - General Information

INSTALLATION PREPARATIONS

Rough Cutting of New Parts

- For cut and join areas, allow for an overlap of 30—50 mm {1.2—1.9 in} with the remaining area on the body side and then rough cut the new parts.

Determination of Welding Method

- If the total thickness at the area to be welded is 3 mm {0.12 in} or more, use a gas shielded arc welder to make the plug welds.

Making Holes for Arc Welding

- For places that cannot be spot welded, make a hole for arc welding using a punch or drill as follows.

(mm {in})

Panel thickness (φ)	Hole diameter (φ)
0.60—0.90 {0.024—0.035}	5.0 {0.20}
0.91—1.20 {0.036—0.047}	6.0 {0.24}
1.21—1.80 {0.0477—0.0708}	8.0 {0.31}
1.81—4.50 {0.072—0.177}	10.0 {0.394}

- Grind the shaded section indicated in the diagram below and create a hole in the part where the 3—4 plates are put together. Also, weld the plates together tightly so that gaps do not develop.

Application of Weld through Primer

- For treatment against corrosion, remove the paint grease, and other material from the portion of new part and body to be welded, and apply weld through primer.

2014 - Mazda3 - General Information

ANTICORROSION, SOUND INSULATION, AND VIBRATION INSULATION

Body Sealing

- Apply body sealer where necessary.
- For locations where application of body sealer is difficult after installation, apply it before installation.

Application of Undercoating

- Apply an undercoat to the required location of the body.

Application of Rust Inhibitor

- Apply rust inhibitor (wax, oil, etc.) to the back of the welded areas.

Application of Dumping Sheet

- Apply dumping sheet by heating with an infrared ray lamp.

AIM OF DEVELOPMENT

Vehicle Outline

External view

4SD

5HB

Interior design

Engine

Engine mechanical

- For SKYACTIV-G 2.0 and SKYACTIV-G 2.5, the following have been adopted to lower fuel consumption.
    - Mechanical resistance loss improvement from:
        - Narrowed down crankshaft journal
        - Optimized piston skirt shape
        - Lowered piston ring tension
        - Roller follower adopted
        - Reduction of valve spring load
        - Stabilization of timing chain behavior
        - Optimized engine coolant passage
        - Optimized water pump impeller shape
        - Lowered drive belt tension

        - Optimized oil passage
        - Optimized oil pump shape
        - Oil pump discharging pressure control has been adopted.
    - Pumping loss improvement from:
        - Variable valve timing mechanism adopted on both sides of intake and exhaust.

Engine control

- L-jetronic and D-jetronic type detectors have been combined for intake air amount detection, improving the accuracy of the intake air amount measurement.
- Electric variable valve timing control has been adopted on the intake side by variably controlling the intake valve timing without any influence from the engine conditions, fuel efficiency and pumping loss reduction have been adopted.
- With the adoption of the i-ELOOP, charging efficiency during deceleration is improved. Because loss of engine force does not occur when the battery is recharged during deceleration, fuel economy is improved.

Suspension

- Front suspension
    - Strut-type suspension adopted
    - For the front crossmember, the welded flange has been eliminated (flange-less), the cross-section expanded and the connection rigidity of the welded parts improved to achieve both rigidity and light weight.
    - By adopting a 6-point rigid mount-type front crossmember, the force generated from the tires is transmitted directly, and an agile vehicle response in low-to-mid speed range has been adopted.

- Rear suspension
  - An E-type multi-link rear suspension has been adopted.
  - For the front crossmember, the welded flange has been eliminated (flange-less), the cross-section expanded, and the connection rigidity of the welded parts improved to achieve both rigidity and light weight.

Brakes

- Conventional brake system

- A vacuum pump has been adopted, improving brake force.
- A large diameter, ventilated disc-type front brake has been adopted, improving braking force.
- A large diameter, solid disc-type rear brake has been adopted, improving braking force.

Vehicle front side

Vehicle rear side

- Dynamic stability control
  - Electrical brake assist control has been adopted, improving safety.
  - The DSC HU/CM, integrating both the hydraulic unit (HU) and control module (CM), has been adopted, resulting in a size and weight reduction.
  - An enhanced malfunction diagnosis system, used with the Mazda Modular Diagnostic System (M-MDS) adopted, improving serviceability.
  - An automatic configuration function is being used, improving serviceability.
  - The lateral-G and yaw rate signals received between the sophisticated air bag sensor (SAS) control module and the DSC HU/CM via controller area network (CAN) lines instead of the conventional combined sensor has been adopted, improving serviceability.

Vehicle front side

Warning light and indicator light

Vehicle rear side

Transaxle

- Manual transaxle (C66M-R)
  - For SKYACTIV-G 2.0, six-speed C66M-R manual transaxle has been adopted.

REVERSE GEAR SHAFT
PRIMARY SHAFT
1ST GEAR
SECONDARY SHAFT
SECONDARY 4TH GEAR
SECONDARY 3RD GEAR
SECONDARY 6TH GEAR
DIFFERENTIAL
SECONDARY
SECONDARY
CLUTCH HUB SLEEVE
SECONDARY

5TH GEAR 2ND GEAR (REVERSE GEAR) 1ST GEAR

- Automatic transaxle (FW6A-EL)
  - For SKYACTIV-G 2.0 and SKYACTIV-G 2.5, six-speed FW6A-EL automatic transaxle has been adopted.

Steering

- Power steering
  - A column assist-type Electronic Power Steering (EPS) has been adopted.
  - EPS provides smooth handling from low to high speeds. This is a result of the excellent steering feel provided by the electronic control and the vehicle-speed responsive control.
  - EPS does not require a power steering oil pump and generates assist force only when the steering wheel is steered. As result, engine load is lowered and fuel efficiency is improved.
  - An automatic configuration and steering angle neutral position auto-learning function has been adopted, improving serviceability.

Safety

- A straight body structure has been adopted which is both highly rigid and light.
- A multi-load path body structure has been adopted which assures a high level of impact safety.
- A ring body structure has been adopted which improves the overall rigidity.
- An immobilizer system has been adopted. This anti-theft device prevents the engine from being started unless the encrypted identification code, transmitted from a special electronic chip embedded in the key, corresponds with the identification code registered in the vehicle.
- Curtain air bags have been adopted that deploy and cover the front and rear side windows to protect the heads of front and rear passengers.
- Side air bags that effectively protect the chest area have been adopted for the front seats.
- Pre-tensioner and load limiter mechanisms have been adopted for the front seat belts.

- Steering shaft with energy adsorbing mechanism adopted.
- An intrusion minimizing brake pedal has been adopted.
- Both ISOFIX and top tether anchors are provided in the rear seat for child-seat fixing.
- An auto-dimming mirror has adopted.
- ABS/DSC adopted.
- Hill launch assist (HLA) adopted.
- Smart city brake support (SCBC) adopted.

Driver's support

- Blind spot monitoring (BSM) system adopted.
- High beam control (HBC) system adopted.
- Lane departure warning system (LDWS) adopted.

Weight	g (gram)
	oz (ounce)

Conversion From SI Units

- All numerical values in this manual are based on SI units. Numbers shown in conventional units are converted from these values.

Number Of Digits For Converted Values

- The number digits for converted values is the same as the number of significant figures[*1] of the SI unit.
- For the torque value, the number of significant figures is, in principle, 2 digits, in consideration of market practicalities. However, if the number of decimal places at the upper and lower limits of the converted value differs, the one with least number of decimal places is used. In addition, if the integer part is 3 digits or more, the integer part becomes the significant number of figures.

*1 **The number of significant figures is the number of digits from the left-most non-zero digit to the right-most digit including 0. (Example: 0.12 is 2 digits, 41.0 is 3 digits)**

Converted Value Rounding Off And Rounding Up/down

- If there is no tolerance in the SI unit value, after conversion, rounding off is to within the number of significant digits.

If there is tolerance in the SI unit value and the figure after conversion indicates the upper limit, the number of digits is rounded down to within the number of significant figures. If it indicates the lower limit, they are rounded up to within the number of significant figures.

- Even if the SI unit value is the same, the converted value may differ based on whether that value is the upper or lower limit.

2014 - Mazda3 - General Information

SAE STANDARDS

- In accordance with new regulations, SAE (Society of Automotive Engineers) standard names and abbreviations are now used in this manual. The table below lists the names and abbreviations that have been used in Mazda manuals up to now and their SAE equivalents.

SAE Standard		Remark	SAE Standard		Remark
Abbreviation	Name		Abbreviation	Name	
AP	Accelerator Pedal		MIL	Malfunction Indicator Lamp	
APP	Accelerator Pedal Position		MAP	Manifold Absolute Pressure	
ACL	Air Cleaner		MAF sensor	Mass Air Flow Sensor	
A/C	Air Conditioning		MFI	Multiport Fuel Injection	
A/F sensor	Air Fuel Ratio Sensor		OBD	On board Diagnostic System	
BARO	Barometric Pressure		OL	Open Loop	
B+	Battery Positive Voltage		OC	Oxidation Catalytic Converter	
CMP sensor	Camshaft Position Sensor		O2S	Oxygen sensor	
CAC	Charge Air Cooler		PNP	Park/Neutral Position	
CLS	Closed Loop System		PSP	Power Steering Pressure	
CTP	Closed Throttle Position		PCM	Powertrain Control Module	#3
CPP	Clutch Pedal Position		PAIR	Pulsed Secondary Air Injection	Pulsed injection
CIS	Continuous Fuel Injection System				

CKP sensor	Crankshaft Position Sensor		AIR	Secondary Air Injection	Injection with air pump
DLC	Data Link Connector				
DTM	Diagnostic Test Mode	#1			
DTC	Diagnostic Test Code(s)		SAPV	Secondary Air Pulse Valve	
DI	Distributor Ignition		SFI	Sequential Multiport Fuel Injection	
DLI	Distributorless Ignition				
EI	Electronic Ignition	#2	3GR	Third Gear	
ECT	Engine Coolant Temperature		TWC	Three Way Catalytic Converter	
EM	Engine Modification		TB	Throttle Body	
EVAP	Evaporative Emission		TP sensor	Throttle Position Sensor	
EGR	Exhaust Gas Recirculation		TCC	Torque Converter Clutch	
FC	Fan Control		TCM	Transmission (Transaxle) Control Module	
FF	Flexible Fuel				
4GR	Fourth Gear		TR	Transmission (Transaxle) Range	
GEN	Generator		TC	Turbocharger	
GND	Ground		VSS	Vehicle Speed Sensor	
HO2S	Heated Oxygen Sensor	With heater	VR	Voltage Regulator	
			VAF sensor	Volume Air Flow Sensor	
IAC	Idle Air Control		WU-TWC	Warm Up Three Way Catalytic Converter	#4
IAT	Intake Air Temperature				
KS	Knock Sensor		WOT	Wide Open Throttle	

- #1: Diagnostic trouble codes depend on the diagnostic test mode.
- #2: Controlled by the PCM
- #3: Device that controls engine and powertrain
- #4: Directly connected to exhaust manifold

2014 - Mazda3 - Engine

ENGINE [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Special Features

- For SKYACTIV-G 2.0 and SKYACTIV-G 2.5, the following is have been adopted to lower fuel consumption.
    - Mechanical resistance loss improvement from:
        - Narrowed down crankshaft journal
        - Optimized piston skirt shape
        - Lowered piston ring tension
        - Roller follower adopted
        - Reduction of valve spring load
        - Stabilization of timing chain behavior
        - Optimized engine coolant passage
        - Optimized water pump impeller shape
        - Lowered drive belt tension
        - Optimized oil passage
        - Optimized oil pump shape
        - Oil pump discharging pressure control has been adopted.
    - Pumping loss improvement from:
        - Variable valve timing mechanism adopted on both sides of intake and exhaust.
- L-jetronic*1 and D-jetronic*2 type detectors have been combined for intake air amount detection, improving the accuracy of the intake air amount measurement.
    - MAF sensor adopted
    - MAP sensor adopted
    - IAT sensor No.1 and No.2 adopted
- Valve timing control has been adopted on both sides of the intake and exhaust, improving fuel economy and emission performance.

Intake side: Electric variable valve timing control

- Intake CMP sensor adopted
- Electric variable valve timing motor/driver adopted
- Electric variable valve timing relay adopted

Exhaust side: Hydraulic variable valve timing control

- Exhaust CMP sensor adopted

- Engine oil control has been adopted reducing engine load.
  - Engine oil solenoid valve adopted
- With the adoption of fuel pump control, fuel pump power consumption has been reduced, improving fuel economy.
  - Fuel pump control module adopted
- Generator output control adopted, fuel economy/idling stability improved.
  - Current sensor adopted
- With the adoption of the ion sensor, which detects pre-ignition, engine reliability has been improved.
- LIN communication has been adopted to the current sensor and active air shutter for simplified wiring harnesses. (with i-ELOOP)
- With the adoption of the i-ELOOP, charging efficiency during deceleration is improved. Because loss of engine force does not occur when the battery is recharged during deceleration, fuel economy is improved.

*1

Measures the intake air amount directly using the MAF sensor.

*2

Measures the intake air pressure introduced into the cylinder using the MAP sensor and calculates the intake air amount indirectly.

Specification

Item	Specification	
	SKYACTIV-G 2.0	SKYACTIV-G 2.5
MECHANICAL		
Type	Gasoline, 4 cycle	
Cylinder arrangement and number	In-line, 4 cylinder	
Combustion chamber	Pentroof	

Valve system			DOHC, timing chain driven, 16 valves	
Displacement		(ml {cc, cu in})	1,998 {1,998, 121.9}	2,488 {2,488, 151.8}
Bore × stroke		(mm {in})	83.5 × 91.2 {3.29 × 3.59}	89.0 × 100 {3.50 × 3.94}
Compression ratio			13.0:1	
Compression pressure		(kPa {kgf/cm^2, psi} [rpm])	885 {9.02, 128} [300]	954 {9.73, 138} [300]
LUBRICATION SYSTEM				
Type			Force-fed type	
Oil pressure (reference value) [Water temperature 80—90 °C {176—194°F}]		(kPa {kgf/cm^2, psi} [rpm])	Low oil pressure: 110—175 {1.13—1.78, 16.0—25.3}[1,500] High oil pressure: 300—430 {3.06—4.38, 43.6—62.3}[4,500]	
Oil pump	Type		Trochoid gear type	
Oil filter	Type		Full-flow, paper element	
	Bypass pressure	(kPa {kgf/cm^2, psi})	78—118 {0.80—1.20, 12.0—17.1}	
Oil capacity (approx. quantity)	Total (dry engine)	(L {US qt, Imp qt})	4.9 {5.2, 4.3}	5.4 {5.7, 4.8}
	Oil replacement	(L {US qt, Imp qt})	4.0 {4.2, 3.5}	4.3 {4.5, 3.8}
	Oil and oil filter replacement	(L {US qt, Imp qt})	4.2 {4.4, 3.7}	4.5 {4.8, 4.0}
COOLING SYSTEM				
Type			Water-cooled, Electromotive	
Coolant capacity (approx. quantity)		(L {US qt, Imp qt})	MTX : 6.3 {6.7, 5.5} ATX : 6.5 {6.9, 5.7}	6.8 {7.2, 6.0}
Water pump	Type		Centrifugal, V-belt-driven	

Thermostat	Type		Wax type
	Opening temperature	(°C {°F})	U.S.A. and Canada: 80.5—83.5 {177—182} Except U.S.A. and Canada: 86.5—89.5 {188—193}
	Full-open temperature	(°C {°F})	95 {203}
	Full-open lift	(mm {in})	8.5 {0.33} or more
Radiator	Type		Corrugated fin type
Cooling system cap	Valve opening pressure	(kPa {kgf/cm^2, psi})	93.2—122.6 {0.951—1.250, 13.6—17.7}
Cooling fan	Type		Electric type
	Number of blades		7
	Outer diameter	(mm {in})	Cooling fan No.1: 333 {13.1} Cooling fan No.2: 308 {12.1}
	Cooling fan motor output	(W)	Cooling fan No.1: 76 Cooling fan No.2: 74
FUEL SYSTEM			
Fuel injector	Type		High resistance
	Fuel supply method		Top-feed
	Drive types		Electronic type
Pressure regulator control pressure		(kPa {kgf/cm^2, psi})	Approx. 430 {4.38, 62.4}
Fuel pump	Type		Electric
Fuel tank	Capacity	(L {US gal, Imp gal})	50.0 {13.2, 11.0}
EMISSION SYSTEM			
			WU-TWC (monolith)

Catalyst	Type		TWC (monolith)	
EVAP control system	Type		Charcoal canister type	
PCV system	Type		Closed type	
CHARGING SYSTEM				
Battery	Voltage	(V)	12	
	Type		With i-ELOOP: Q-85 Without i-ELOOP: 55D23L (60 A·h/20HR), 75D23L (65 A·h/20HR)	
Generator	Output	(V-A)	With i-ELOOP: 12-150 Without i-ELOOP: 12-100	
Ignition system	Type		SEI	
	Spark advance		Electronic	
	Firing order		1—3—4—2 (all cylinders independent firing)	
				
Spark plug	Type		PE5R-18-110, PE5S-18-110	
STARTING SYSTEM				
Starter	Type		Coaxial reduction	
	Output	(kW)	1.0	1.4

CONTROL SYSTEM	
Neutral switch	ON/OFF
CPP switch	ON/OFF
MAF sensor	Hot film
IAT sensor	Cold resistor
MAP sensor	Sealant diaphragm
TP sensor	Hall element
APP sensor	Hall element
CKP sensor	MR element
CMP sensor	GMR element
ECT sensor	Thermistor
BARO sensor	Piezoelectric element
Fuel pressure sensor	Metal diaphragm
KS	Piezoelectric element
A/F sensor	Zirconia element
HO2S	Zirconia element
Fuel tank pressure sensor	Piezoelectric element

Valve timing

Item				Specification
	IN	Open	(°)	BTDC 42—ATDC 32
		Close	(°)	ABDC 36—ABDC 110
				SKYACTIV-G 2.0: BBDC 54—BBDC 9

Valve timing	EX	Open	(°)	SKYACTIV-G 2.5: BBDC 58—BBDC 13
		Close	(°)	SKYACTIV-G 2.0: ATDC 7—ATDC 52
				SKYACTIV-G 2.5: ATDC 6—ATDC 51

Engine oil specification

Item	U.S.A., Canada and Puerto Rico	Except U.S.A., Canada and Puerto Rico
Engine oil grade	(ILSAC)	API SERVICE SM SAE 5W-30 ENERGY CONSERVING II (ILSAC)
		API SM or ILSAC
Engine oil viscosity	0W-20	5W-30 (If SAE 5W-30 engine oil is not available, use SAE 5W-20 engine oil.)

Fuel type

Fuel	Octane Rating* (Anti-knock index)
Regular unleaded fuel	87 [(R+M)/2 method] or above (91 RON or above)

*
U.S. federal law requires that octane ratings be posted on gasoline station pumps.

2014 - Mazda3 - Engine

ON-BOARD DIAGNOSTIC OUTLINE [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Features

- The PCM performs self-diagnosis to check for malfunctions in the engine control system.
- If a malfunction occurs in the engine control system, the driver is notified.
- On-board diagnosis can be performed easily using an external tester.

To meet the OBD-II regulations	• Diagnostic test modes adopted
Improved serviceability	• DTCs adopted • KOEO/KOER self test function adopted • PID/DATA monitor function adopted • Active command modes function adopted

Block Diagram

ON-BOARD DIAGNOSTIC OUTLINE [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

2014 - Mazda3 - Engine

ON-BOARD DIAGNOSTIC SYSTEM TEST MODE [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Diagnostic Test Mode

- To match the OBD-II regulations, the following diagnostic test modes are supported.

Diagnostic test mode	Item
Mode 01	Sending diagnostic data (PID data monitor/On-board system readiness test)
Mode 02	Sending freeze frame data
Mode 03	Sending emission-related malfunction code (Diagnostic trouble code: DTC)
Mode 04	Clearing/resetting emission-related malfunction information
Mode 06	Sending intermittent monitoring system test results (DMTR)
Mode 07	Sending continuous monitoring system test results (Pending code)
Mode 08	On-board device control (Simulation test, active command mode)
Mode 09	Request vehicle information

Sending Diagnostic Data (Mode 01)

PID data monitor

- The PID data monitor items are shown below.

PID data monitor table—: Not applicable

Full names	Unit
Monitor status since DTCs cleared	No unit
Fuel system loop status	Refer to list below.
LOAD	%
ECT	°C, °F
Short term fuel trim	%
Long term fuel trim	%
MAP	KPa {MPa}, mBar {Bar}, psi, in H20

Engine speed	rpm
Vehicle speed	km/h, mph
Spark advance	°
IAT	°C, °F
MAF	g/s
Absolute TP	%
A/F sensor and HO2S location	No unit
Input voltage from HO2S	V
OBD requirement according to vehicle design	No unit
Time since engine start	s
Distance travelled while check engine light is activated	km, miles
Fuel pressure	KPa {MPa}, mBar {Bar}, psi, in H20
Purge solenoid valve control signal	%
Fuel level input	%
Number of warm-up since DTCs cleared	No unit
Distance travelled since DTCs cleared	km, miles
EVAP system vapor pressure	KPa {MPa}, mBar {Bar}, psi, in H20
Barometric pressure	KPa {MPa}, mBar {Bar}, psi, in H20
A/F sensor output current	mA
Estimated catalyst converter temperature	°C, °F
Monitor status this driving cycle	—
PCM voltage	V
Absolute load value	%
Theoretical air/fuel ratio coefficient to calculate target air/fuel ratio	No unit
Relative TP	%
Ambient air temperature	°C, °F
TP from TP sensor No.2	%
APP from APP sensor No.1	%
APP from APP sensor No.2	%

Throttle valve actuator control signal	%
Short term fuel trim (HO2S)	%
Long term fuel trim (HO2S)	%

Meaning of fuel system loop status

- The following information is displayed on the tester
  - Feedback stops: ECT is lower than the determined feedback zone
  - Feedback operating: A/F sensor, HO2S being used for feedback is normal
  - Feedback stops: Open loop due to driving condition
  - Feedback stops: Open loop due to detected system fault
  - Feedback operating: Malfunction occurred in HO2S system

Sending Freeze Frame Data (Mode 02)

Freeze frame data

- The freeze frame data consists of data for vehicle and engine control system operation conditions when malfunctions in the engine control system are detected and stored in the PCM.
- Freeze frame data is stored at the instant the check engine light illuminates, and only a part of the DTC data is stored.
- If there are several malfunctions in the engine control system, only the data for the first malfunction will be stored.
- If a misfire or fuel injection control malfunction occurs, this data will overwrite the first malfunction that was stored.
- If the first stored freeze frame data is a misfire or fuel injection control malfunction, the data will not be overwritten.

Snapshot data

- The snapshot data stores the currently detected DTC data.
- The recording timing for the freeze frame data/snapshot data differs depending on the number of DTC drive cycles.
  - For a DTC with a drive cycle number 1, only the malfunction determination data is recorded.
  - For a DTC with a drive cycle number 2, both the malfunction determination and undetermined data is recorded.

Freeze frame data table

—: Not applicable

Freeze frame data item	Unit	Description	Corresponding PID data monitor item
FUELSYS1	OL/CL/OL-Drive/OL-Fault/CL-Fault	Fuel system status	FUELSYS
LOAD	%	Calculated engine load	—
ECT	°C, °F	Engine coolant temperature	ECT
SFT1	%	Short term fuel trim	SHRTFT1
LFT1	%	Long term fuel trim	LONGFT1
MAP	KPa {MPa}, mBar {Bar}, psi, in H20	Manifold absolute pressure	MAP
RPM	RPM	Engine speed	RPM

VS	KPH, MPH	Vehicle speed	VSS
SPARKADV	°	Ignition timing	SPARKADV
IAT	°C, °F	Intake air temperature	IAT
MAF	g/sec	Mass airflow	MAF
TP	%	Throttle valve position No.1	TP1
RUNTM	hh:mm:ss	Time from engine start	—
EVAPPCT	%	Purge solenoid valve controlled value	EVAPCP
FLI	%	Fuel level in fuel tank	FLI
WARMUPS	—	Number of warm-up cycle after DTC cleared	—
CLRDIST	km, ft {mi}	Mileage after DTC cleared	—
FTP	KPa {MPa}, mBar {Bar}, psi, in H20	Evaporative (EVAP) system vapor pressure	FTP
BARO	KPa {MPa}, mBar {Bar}, psi, in H20	Barometric pressure	BARO
CATTEMP11	°C, °F	Estimated catalytic converter temperature	CATT11_DSD
VPWR	V	Module supply voltage	VPWR
ALV	%	Engine load	LOAD
EQ_RAT	—	Target equivalence ratio (lambda)	EQ_RAT11_DSD
TP_REL	%	Relative throttle position	TP REL
AAT	°C, °F	Ambient air temperature	AAT
TP_B	%	Throttle valve position No.2	TP2
APP_D	%	Accelerator pedal position No.1	APP1
APP_E	%	Accelerator pedal position No.2	APP2
TAC_PCT	%	Target throttle valve position	ETC_DSD
FUEL_TYP	—	Type of fuel currently being utilized by the vehicle	—
STSO2FT1	%	Short term fuel trim (HO2S)	—
LGSO2FT1	%	Long term fuel trim (HO2S)	—
FRP	KPa {MPa}, mBar {Bar}, psi, in H20	Fuel pressure (absolute)	FUEL_PRES
ECT1_SUP	—	Engine coolant temperature No.1 support	—
ECT2_SUP	—	Engine coolant temperature No.2 support	—

ECT1	°C, °F	Engine coolant temperature No.1	ECT
ECT2	°C, °F	Engine coolant temperature No.2	ECT2_V
IAT11_SUP	—	Intake air temperature No.1 support	—
IAT12_SUP	—	Intake air temperature No.2 support	—
IAT11	°C, °F	Intake air temperature No.1	IAT
IAT12	°C, °F	Intake air temperature No.2	IAT2

Snapshot data table

—: Not applicable

Snapshot data item	Unit	Definition	Data read/use method	Corresponding PID data monitor item
ALTT_V	V	Generator output voltage	—	—
MIL	Off/On	Check engine light illumination status	—	MIL
APP1	V %	Accelerator pedal position No.1	—	APP1
APP2	V %	Accelerator pedal position No.2	—	APP2

DTC 7-Digit Code Definition

- When related systems or components have failed, the CM stores the DTC of the malfunctioning part in the CM memory, and allows for the retrieval of the stored data using a scan tool when necessary. The DTCs are indicated using seven digits. Each digit indicates the following.

P 0 0 10:00

- Specify the malfunction area sub type
  - 00: No sub type information
  - 41: General checksum malfunction
- Manufacturer controlled
- Indicates subgroup

Powertrain (P code)	Network Electrical (U code)
0: Fuel and air metering and auxiliary emission controls	0: Network electrical
1: Fuel and air metering	1: Network communication
2: Fuel and air metering	2: Network communication
3: Ignition system or misfire	3: Network software
4: Auxiliary emission controls and auxiliary input	
5: Vehicle speed, idle control, and auxiliary input	
6: Computer and auxiliary output	
7: Transmission	
8: Transmission	

- Indicates who was responsible for DTC definition
  - 0: ISO/SAE controlled
  - 1: Manufacturer controlled
  - 2: There are ISO/SAE controlled just for powertrain, all others are manufacturer controlled.
  - 3: For P3000 to P3399 is manufacturer controlled, all others are ISO/SAE controlled.
- Indicates DTC function
  - B: Body
  - P: Powertrain
  - U: Network Electrical

Status Byte for DTC

- The two digits (two digits after hyphen (-)) after the 7-digit DTC.

P0010:00 - **

STATUS BYTE

- A code which indicates the pending code, current/past malfunction status, or warning illumination status.
- Can be read by performing a CMDTC self-test using the Mazda Modular Diagnostic System (M-MDS).
- For details on the status byte, refer to the explanation on the Mazda Modular Diagnostic System (M-MDS) when reading the DTC.

Sending Emission-related Malfunction Code (DTC) (Mode 03)

- The DTCs are shown below.

×: Applicable—: Not applicable

DTC No.	Check engine light	Master warning light	Charging system warning light	Engine oil warning light	Wrench warning indicator light	Check fuel cap warning light	Condition	Fail-safe function	Drive cycle	Monitor item	Self test type*1	Memory function

OBD-II Diagnostic Monitoring System Test Results (Mode 06)

- The items supported by the sending intermittent monitoring system are shown below.

OBD Monitor ID	Test ID	Description	Related system	Scaling ID	Unit
01	80	A/F sensor lean-to-rich response time (calculated)		20	Ratio
01	81	A/F sensor rich-to-lean response time (calculated)		20	Ratio

Sending Continuous Monitoring System Test Results (pending code) (Mode 07)

- These appear when a problem is detected in a monitored system.

1-drive cycle type

- If any problems are detected in the first drive cycle, pending codes will be stored in the PCM memory, as well as DTCs.
- After pending codes are stored, if the PCM determines that the system is normal in any future drive cycle, the PCM deletes the pending codes.

2-drive cycle type

- The code for a failed system is stored in the PCM memory in the first drive cycle. If the PCM determines that the system returned to normal or the problem was mistakenly detected, PCM deletes the pending codes. If the problem is also found in the second drive cycle, the PCM determines that the system is malfunctioning, and stores the pending codes and the DTCs.
- After pending codes are stored, if the PCM determines that the system is normal in any future drive cycle, the PCM deletes the pending codes.

2014 - Mazda3 - Engine

DTC DETECTION LOGIC AND CONDITIONS [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

DTC No.	Condition	Detection condition
B10A2:00	Vehicle collision	• A collision signal from the SAS control module is received.
P0010:00	Electric variable valve timing control circuit range/performance problem	• Any one of the following conditions is met: ▪ A malfunction is detected in the results of the on-board diagnostic test received from the electric variable valve timing driver. ▪ The motor speed signal received from the electric variable valve timing driver is in error.
P0011:00	Electric variable valve timing control system: over-advanced	• A condition in which the actual intake valve timing advances (excess advance) compared to the target intake valve timing continues for the specified period.
P0012:00	Electric variable valve timing control system: over-retarded	• A condition in which the actual intake valve timing retards (excess retard) compared to the target intake valve timing continues for the specified period.
P0014:00	Hydraulic variable valve timing control system: over-advanced	• A condition in which the actual exhaust valve timing advances (excess advance) compared to the target exhaust valve timing continues for the specified period.
P0015:00	Hydraulic variable valve timing control system: over-retarded	• A condition in which the actual exhaust valve timing retards (excess retard) compared to the target exhaust valve timing continues for the specified period.
P0016:00*4	CKP-CMP (intake side) correlation problem	• The PCM monitors the input pulses from the CKP sensor and intake CMP sensor. If the input pulse pick-up timing do not match each other, the PCM determines that the camshaft position does not coincide with the

		crankshaft position.
P0017:00*4	CKP-CMP (exhaust side) correlation problem	• The PCM monitors the input pulses from the CKP sensor and exhaust CMP sensor. If the input pulse pick-up timing do not match each other, the PCM determines that the camshaft position does not coincide with the crankshaft position.
P0031:00	A/F sensor heater control circuit low input	• When the PCM controls the A/F sensor heater, the voltage input to the PCM is too low.
P0032:00	A/F sensor heater control circuit high input	• When the PCM controls the A/F sensor heater, the voltage input to the PCM is too high.
P0037:00	HO2S heater control circuit low input	• When the PCM controls the HO2S heater, the voltage input to the PCM is too low.
P0038:00	HO2S heater control circuit high input	• When the PCM controls the HO2S heater, the voltage input to the PCM is too high.
P0053:00*4	A/F sensor heater resistance	• The PCM monitors the A/F sensor heater resistance when under the A/F sensor heater control. If the resistance is **more than 30 ohms**, the PCM determines that there is a A/F sensor circuit problem.
P0054:00*4	HO2S heater resistance	• The PCM monitors the HO2S heater resistance when under the HO2S heater control. If the resistance is **more than 34 ohms**, the PCM determines that there is a HO2S heater circuit problem.
P0069:00	Manifold absolute pressure/atmospheric pressure correlation problem	• The PCM monitors the difference between the intake manifold vacuum and the atmospheric pressure. If the difference is **below −12 kPa {−0.12 kgf/cm^2, −1.7 psi}** or **above 12 kPa {0.12 kgf/cm^2, 1.7 psi}** when the following conditions are met, the PCM determines that there is a MAP sensor performance problem. **MONITORING CONDITIONS** ▪ **12—15 s** from when ignition is switched off.
P0072:00	Ambient temperature sensor circuit low input	• The PCM monitors the input signal from the ambient temperature sensor. If the voltage from the ambient temperature sensor is **below 0.18 V**, the PCM determines that the ambient temperature sensor circuit has a malfunction.
		• The PCM monitors the input signal from the ambient

P0073:00	Ambient temperature sensor circuit high input	temperature sensor. If the voltage from the ambient temperature sensor is **above 4.88 V**, the PCM determines that the ambient temperature sensor circuit has a malfunction.
P0088:00	Fuel pressure sensor circuit range/performance problem	• The difference between the actual and target fuel pressure is equal to or **more than the 1.2 MPa {12 kgf/cm^2, 174 psi}**, even though the fuel pressure feedback amount is maintained low or high.
P0089:00	Spill valve control solenoid valve control circuit range/performance problem	• The average fuel pressure on the high pressure side, measured by the fuel pressure sensor, exceeds the specified value.
P0091:00	Fuel pressure regulator control circuit low input	• When the PCM turns the spill valve control solenoid valve off but the spill valve control solenoid valve control circuit voltage is low for **5 s**, the PCM determines that the spill valve control solenoid valve control circuit has a malfunction. **MONITORING CONDITIONS** ▪ The following conditions are met: • Engine speed: **5,700 rpm or less** • Battery voltage: **10.5 V or more**
P0092:00	Fuel pressure regulator control circuit high input	• When the PCM turns the spill valve control solenoid valve on but the spill valve control solenoid valve circuit voltage is high for **5 s**, the PCM determines that the spill valve control solenoid valve control circuit has a malfunction. **MONITORING CONDITIONS** ▪ The following conditions are met: • Engine speed: **5,700 rpm or less** • Battery voltage: **10.5 V or more**
P0097:00	IAT sensor No.2 circuit low input	• If the PCM detects that the IAT sensor No.2 voltage at the PCM terminal 1CE is **0.33 V or less** for **5 s**, the PCM determines that the IAT sensor No.2 circuit voltage is low.
P0098:00	IAT sensor No.2	• If the PCM detects that the IAT sensor No.2 voltage at the PCM terminal 1CE is **4.96 V or more** for **5 s**, the

	circuit high input	PCM determines that the IAT sensor No.2 circuit voltage is high.
P0101:00	MAF sensor circuit range/performance problem	• The difference between the intake air amount measured by the MAF sensor and the estimated intake air amount estimated by the MAP sensor is outside of the specified value.
P0102:00	MAF sensor circuit low input	• The PCM monitors input voltage from the MAF sensor. If the input voltage at the PCM terminal 2BC is **below 0.2 V** for **5 s**, the PCM determines that the MAF sensor circuit has a malfunction.
P0103:00	MAF sensor circuit high input	• The PCM monitors the input voltage from the MAF sensor. If the input voltage at the PCM terminal 2BC is **above 4.94 V** for **5 s**, the PCM determines that the MAF sensor circuit has a malfunction.
P0107:00	MAP sensor circuit low input	• The PCM monitors the input voltage from the MAP sensor. If the input voltage at the PCM terminal 1BW is **below 0.08 V** for **5 s**, the PCM determines that the MAP sensor circuit has a malfunction.
P0108:00	MAP sensor circuit high input	• The PCM monitors the input voltage from the MAP sensor. If the input voltage at the PCM terminal 1BW is **above 4.89 V** for **5 s**, the PCM determines that the MAP sensor circuit has a malfunction.
P0112:00	IAT sensor No.1 circuit low input	• The PCM monitors the IAT sensor No.1 signal. If the PCM detects that the IAT sensor No.1 voltage at the PCM terminal 2U is **below 0.19 V** for **5 s**, the PCM determines that the IAT sensor No.1 circuit has a malfunction.
P0113:00	IAT sensor No.1 circuit high input	• The PCM monitors the IAT sensor No.1 signal. If the PCM detects that the IAT sensor No.1 voltage at the PCM terminal 2U is **above 4.62 V** for **5 s**, the PCM determines that the IAT sensor No.1 circuit has a malfunction.
P0116:00	ECT sensor No.1 circuit range/performance problem	• During the **5 min** after the engine is started, the engine coolant temperature does not increase **above 6 °C {11 °F}**.
P0117:00	ECT sensor No.1 circuit low input	• The PCM monitors the ECT sensor No.1 signal. If the PCM detects that the ECT sensor No.1 voltage at the PCM terminal 1AK is **below 0.2 V** for **5 s**, the PCM determines that the ECT sensor No.1 circuit has a malfunction.

P0118:00	ECT sensor No.1 circuit high input	• The PCM monitors the ECT sensor No.1 signal. If the PCM detects that the ECT sensor No.1 voltage at the PCM terminal 1AK is **above 4.9 V** for **5 s**, the PCM determines that the ECT sensor No.1 circuit has a malfunction.
P011A:00*4	ECT sensor No.1/No.2 performance problem	• Any of the following conditions is met after the ignition is switched ON*1: ▪ The ECT sensor No.2 detected temperature is **approx. 25.0 °C {45.0 °F}** higher than the ECT sensor No.1. ▪ The ECT sensor No.2 detected temperature is **approx. −48.0 °C {−54.0 °F}**. ▪ The ECT sensor No.2 detected temperature is **approx. −28 °C {−50 °F}** lower than the ECT sensor No.1 when the intake air temperature is **15 °C {59 °F} or more***2. • *1: Ignition switch is ON when **6 h** or more have passed since the ignition was switched off. • *2: Perform determination according to the intake air temperature conditions when the calculated intake air amount **exceeds 5,000 g {176.4 oz}** (difference between ECT sensors No.1 and No.2 is determined engine coolant temperature value at engine start).
P0122:00	TP sensor No.1 circuit low input	• If the PCM detects that the TP sensor No.1 voltage at the PCM terminal 1BP is **below 0.1 V**, the PCM determines that the TP sensor No.1 circuit has a malfunction.
P0123:00	TP sensor No.1 circuit high input	• If the PCM detects that the TP sensor No.1 voltage at the PCM terminal 1BP is **above 4.9 V**, the PCM determines that the TP sensor No.1 circuit has a malfunction.
P0126:00*4	Thermostat stuck open	• Actual engine coolant temperature does not exceed **71 °C {160 °F}** even though the estimated engine coolant temperature after the engine is started exceeds **71 °C {160 °F}**.
P0130:00	Voltage problem between PCM terminal 1AB and PCM terminal 1AG	• A condition in which the voltage between PCM terminals 1AB and 1AG exceeds the specified range continues for the specified period or more.
		• Any one of the following conditions is met:

P0131:00	A/F sensor circuit low input	▪ Voltage of A/F sensor terminal F is less than specified value ▪ Voltage of A/F sensor terminal D is less than specified value ▪ Voltage of A/F sensor terminal B is less than specified value
P0132:00	A/F sensor circuit high input	• Any one of the following conditions is met: ▪ Voltage of A/F sensor terminal F is more than specified value ▪ Voltage of A/F sensor terminal D is more than specified value ▪ Voltage of A/F sensor terminal B is more than specified value
P0133:00	A/F sensor circuit slow response	• The response speed of the A/F sensor input signal when the air/fuel ratio is fluctuated is slow.
P0134:00	A/F sensor circuit no activity detected	• The condition in which the A/F sensor element impedance is the specified value or more continues for **35 s**.
P0137:00*4	HO2S circuit low input	• A condition in which the HO2S input voltage is less than the specified value continues for the specified period.
P0138:00	HO2S circuit high input	• A condition in which the HO2S input voltage exceeds the specified value continues for the specified period.
P013A:00*4	HO2S: Slow response (during transition from rich to lean)	• The response speed of the HO2S input signal when the air/fuel ratio is fluctuated from rich to lean is slow.
P013B:00*4	HO2S: Slow response (during transition from lean to rich)	• The response speed of the HO2S input signal when the air/fuel ratio is fluctuated from lean to rich is slow.
P0140:00	HO2S circuit no activity detected	• With the estimated temperature of the HO2S element exceeding the specified value, a condition in which the HO2S signal voltage is less than the specified value continues for the specified period.
P0171:00	Fuel trim system too	• Any one of the following conditions is met: ▪ While the engine is idling or the vehicle is driven, the fuel feedback correction amount (**30 %**) is the threshold or more, and the fuel learning correction amount is the specified value (**15 %**)

	lean	or more for **10 s or more**. ▪ While the engine is idling or the vehicle is driven, the fuel feedback correction amount reaches the upper limit (**25 % or more**) for **20 s or more**.
P0172:00	Fuel trim system too rich	• Any one of the following conditions is met: ▪ While the engine is idling or the vehicle is driven, the fuel feedback correction amount (SHRTFT1) is the threshold (**−25 %**) or less, and the fuel learning correction amount (LONGFT1) is the threshold (**−15 %**) or less for **10 s or more**. ▪ While the engine is idling or the vehicle is driven, the fuel feedback correction amount reaches the lower limit (**−25 % or less**) for **20 s or more**.
P0192:00	Fuel pressure sensor circuit low input	• If the input voltage at the PCM terminal 1CA is **less than 0.16 V** for **5 s**, the PCM determines that the fuel pressure sensor circuit is low.
P0193:00	Fuel pressure sensor circuit high input	• If the input voltage at the PCM terminal 1CA is **more than 4.86 V** for **5 s**, the PCM determines that the fuel pressure sensor circuit is high.
P0201:00	Fuel injector circuit/open cylinder No.1	• If the fuel injection verification signal is not input at **25 times** continuously even though the PCM drives the fuel injector No.1, the PCM determines that there is an open circuit in the fuel injector No.1 control circuit. **MONITORING CONDITIONS** ▪ The following conditions are met: • Battery voltage: **10.5 V or more** • Fuel injection control: except during fuel cut
P0202:00	Fuel injector circuit/open cylinder No.2	• If the fuel injection verification signal is not input at **25 times** continuously even though the PCM drives the fuel injector No.2, the PCM determines that there is an open circuit in the fuel injector No.2 control circuit. **MONITORING CONDITIONS** ▪ The following conditions are met: • Battery voltage: **10.5 V or more**

		• Fuel injection control: except during fuel cut
P0203:00	Fuel injector circuit/open cylinder No.3	• If the fuel injection verification signal is not input at **25 times** continuously even though the PCM drives the fuel injector No.3, the PCM determines that there is an open circuit in the fuel injector No.3 control circuit. **MONITORING CONDITIONS** ▪ The following conditions are met: • Battery voltage: **10.5 V or more** • Fuel injection control: except during fuel cut
P0204:00	Fuel injector circuit/open cylinder No.4	• If the fuel injection verification signal is not input at **25 times** continuously even though the PCM drives the fuel injector No.4, the PCM determines that there is an open circuit in the fuel injector No.4 control circuit. **MONITORING CONDITIONS** ▪ The following conditions are met: • Battery voltage: **10.5 V or more** • Fuel injection control: except during fuel cut
P0222:00	TP sensor No.2 circuit low input	• If the PCM detects that the TP sensor No.2 voltage at the PCM terminal 1BU is **below 0.1 V**, the PCM determines that the TP sensor No.2 circuit has a malfunction.
P0223:00	TP sensor No.2 circuit high input	• If the PCM detects that the TP sensor No.2 voltage at the PCM terminal 1BU is **above 4.9 V**, the PCM determines that the TP sensor No.2 circuit has a malfunction.
P025B:00	Fuel pump control module circuit range/performance problem	• When any of the following conditions is met: ▪ The temperature in the fuel pump control module is too high. ▪ Output duty ratio signal received from PCM is in error. ▪ Output signal from fuel pump control module is erratic (noise overlap).
	Fuel pump control	

P025C:00	module result of on-board diagnostic test low input	• Result of on-board test cannot be received from fuel pump control module (voltage is too low).
P025D:00	Fuel pump control module result of on-board diagnostic test high input	• Result of on-board test cannot be received from fuel pump control module (voltage is too high).
P0300:00	Random misfire detected	• Any one of the following conditions is met: ▪ The misfire rate for **every 200 rotations** of the crankshaft exceeds the specified value (misfire which may damage catalytic converter). ▪ The misfire rate for **every 1,000 rotations** of the crankshaft exceeds the specified value (misfire going against emission regulations).
P0301:00	Cylinder No.1 misfire detected	• Any one of the following conditions is met: ▪ The misfire rate of specific cylinders for **every 200 rotations** of the crankshaft exceeds the specified value (misfire which may damage catalytic converter). ▪ The misfire rate of specific cylinders for **every 1,000 rotations** of the crankshaft exceeds the specified value (misfire going against emission regulations).
P0302:00	Cylinder No.2 misfire detected	
P0303:00	Cylinder No.3 misfire detected	
P0304:00	Cylinder No.4 misfire detected	
P0327:00	KS circuit low input	• The PCM monitors input signal from the KS. If the input voltage is low for **5 s**, the PCM determines that the KS circuit has a malfunction.
P0328:00	KS circuit high input	• The PCM monitors input signal from the KS. If the input voltage is high for **5 s**, the PCM determines that the KS circuit has a malfunction.
P0335:00	CKP sensor circuit problem	• There is no CKP sensor signal input while the exhaust camshaft rotates **5 times**. • The CKP sensor input signal pattern, received while the crankshaft rotates **10 times**, is incorrect.
P0340:00	Intake CMP sensor circuit problem	• The intake CMP sensor input signal pattern, received while the crankshaft rotates **24 times**, is incorrect.
		• The exhaust CMP sensor input signal pattern, received

P0365:00	Exhaust CMP sensor circuit problem	while the crankshaft rotates **24 times**, is incorrect. • Cylinder identification is not completed while the crankshaft rotates **15 times**.
P0421:00	Catalytic converter system	• The fuel amount*1 supplied to the catalyst, from an HO2S output voltage of around **0 V** and until increasing to the specified value or more after recovery from fuel cut control, decreases below the specified value. However, determination must have been performed **11 times or more** after resetting battery and clearing DTCs. • *1: The estimated value is calculated based on the A/F sensor signal.
P0442:00*4	Evaporative gas leakage (leakage amount: low)	• Hole of **0.04 in (1.0 mm) or more** in evaporative gas passage
P0443:00	Purge solenoid valve circuit problem	• The purge control voltage at the PCM terminal 1AI is low or high relative to the PCM control condition.
P0446:00*4	CV solenoid valve control circuit problem	• The PCM monitors the CV solenoid valve circuit for an electrical failure. The test fails when the signal moves outside the minimum or maximum allowable calibrated parameters for a specified canister vent duty cycle by the PCM command.
P0451:00*4	Fuel tank pressure sensor: sensor characteristic malfunction	• The fuel tank pressure sensor input voltage is the threshold or more.
P0452:00*4	Fuel tank pressure sensor low input	• The PCM monitors the EVAP control system fuel tank pressure sensor input signal to the PCM. The test fails when the signal average drops below a minimum allowable calibrated parameter.
P0453:00*4	Fuel tank pressure sensor high input	• The PCM monitors the EVAP control system fuel tank pressure sensor input signal to the PCM. The test fails when the signal average jumps above a maximum allowable calibrated parameter.
P0454:00*4	Fuel tank pressure sensor intermittent malfunction	• Any one of the following conditions is met: ▪ The difference between the currently detected fuel tank pressure sensor input voltage and the previously detected input voltage is large. ▪ The input voltage of the fuel tank pressure sensor remains low or high.

P0455:00*4	Evaporative gas leakage (leakage amount: large)	• Hole of **0.09 in (2.25 mm) or more** in evaporative gas passage
P0456:00*5	Evaporative gas leakage (leakage amount: extremely low)	• Hole of **0.02 in (0.5 mm) or more** in evaporative gas passage
P0457:00*4	Fuel-filler cap installation malfunction	• Hole of **0.09 in (2.25 mm) or more** in evaporative gas passage
P0460:00*4	Fuel level sensor circuit malfunction	• The PCM monitors the fuel tank level sensor output signal. If the difference between maximum and minimum value of input signal is **25 % or more** for **14 s**, the PCM determines that there is a fuel level sensor circuit malfunction.
P0461:00	Fuel gauge sender unit circuit range/performance problem	• The change in the remaining fuel quantity in the fuel tank is **less than 5 %** when the amount of fuel consumption by fuel injection reaches **25 L {26 US qt, 22 Imp qt}**.
P0462:00	Fuel gauge sender unit circuit low input	• The PCM monitors the fuel level signal and fuel gauge sender unit output voltage from the instrument cluster. If the PCM detects a fuel level or fuel gauge sender unit output voltage that is too low, the PCM determines that the fuel gauge sender unit circuit has a malfunction.
P0463:00	Fuel gauge sender unit circuit high input	• The PCM monitors the fuel level signal and fuel gauge sender unit output voltage from the instrument cluster. If the PCM detects a fuel level or fuel gauge sender unit output voltage that is too high, the PCM determines that the fuel gauge sender unit circuit has a malfunction.
P0480:00	Cooling fan relay No.1 control circuit malfunction	• The cooling fan relay No.1 control voltage at the PCM terminal 2AU is low or cooling fan relay No.1 control current is high for a continuous **5 s** relative to the PCM control signal.
P0482:00	Cooling fan relay No.2 and No.3 control circuit malfunction	• The cooling fan relay No.2 and No.3 control voltage at the PCM terminal 2AV is low or cooling fan relay No.2 and No.3 control current is high for a continuous **5 s** relative to the PCM control signal.
		• An error in the wheel speed signal from the DSC HU/CM is detected by CAN when the following conditions are met:

P0500:00	VSS circuit problem	▪ Neutral switch and CPP switch: OFF (MTX) ▪ Shift position: except P or N position (ATX) ▪ Absolute load: **above 40 %** ▪ Engine speed: **above 2,000 rpm** ▪ Brake switch: OFF
P0504:00	Brake switch circuit problem	• The condition in which the brake switch No.1 and No.2 signals are both on or off for **3 s or more** is repeated five times when performing the brake operation.
P0506:00	IAC system RPM lower than expected	• The actual idle speed is lower than expected by **100 rpm** for **14 s**, when the brake pedal is depressed (brake switch is on). **NOTE:** • If the atmospheric pressure is **less than 72.3 kPa {0.737 kgf/cm^2, 10.5 psi}** or the intake air temperature is **below −10 °C {14 °F}**, the PCM cancels the diagnosis of DTC P0506:00.
P0507:00	IAC system RPM higher than expected	• The actual idle speed is higher than expected by **200 rpm** for **14 s**, when the brake pedal is depressed (brake switch is on). **NOTE:** • If the atmospheric pressure is **less than 72.3 kPa {0.737 kgf/cm^2, 10.5 psi}** or the intake air temperature is **below −10 °C {14 °F}**, the PCM cancels the diagnosis of DTC P0507:00.
P050A:00*4	Cold start IAC system performance problem	• The difference between the actual engine speed and the target engine speed is **100 rpm or more**.
P050B:00*4	Cold start ignition timing performance problem	• PCM internal RAM malfunction.
P0520:00	Oil pressure switch circuit problem	• The oil pressure switch is off for a continuous **5 s** even though the engine is stopped.
		• The oil pressure switch is on for a continuous **5 s** with the following condition met: (engine oil warning light

P0524:00	Engine oil pressure too low	illuminates when **1 s** has elapsed) ▪ When engine speed is **above 650 rpm** and engine coolant temperature is **30 °C {86 °F} or less** ▪ When engine speed is **above 1,500 rpm** and engine coolant temperature is **68 °C {154 °F} or less** ▪ When engine speed is **above 2,500 rpm** and engine coolant temperature is **68 °C {154 °F} or more**
P0532:00	Refrigerant pressure sensor circuit low input	• The PCM monitors input voltage from the refrigerant pressure sensor. If the input voltage at the PCM terminal 2AX is **below 0.1 V** for **5 s**, the PCM determines that the refrigerant pressure sensor circuit has a malfunction.
P0533:00	Refrigerant pressure sensor circuit high input	• The PCM monitors input voltage from the refrigerant pressure sensor. If the input voltage at the PCM terminal 2AX is **above 4.9 V** for **5 s**, the PCM determines that the refrigerant pressure sensor circuit has a malfunction.
P057F:00*6	Power system: Battery deterioration	• The battery charge/discharge flow exceeds the specification.
P058A:00*6	Current sensor: Function malfunction	• Error signal from the current sensor is received.
P059F:00*6	Active air shutter: Opening angle abnormality (spinning free)	• Active air shutter opening angle is certain value or more.
P05A0:00*6	Active air shutter: Opening angle abnormality (sticking)	• Active air shutter opening angle is certain value or less while intake air temperature is **5 °C {41 °F} or more**.
P05A3:00*6	Active air shutter: Actuator internal malfunction	• Any of the following conditions is met: ▪ Internal circuit of active air shutter actuator is malfunctioning ▪ Active air shutter Hall sensor is malfunctioning
P05C0:00*6	Active air shutter: Actuator temperature abnormality	• Internal temperature of active air shutter actuator is certain value or more.

P0600:00	Serial communication link	• PCM internal malfunction.
P0601:00	PCM memory check sum error	• PCM internal memory check sum error.
P0602:00	PCM programming error	• No configuration data in the PCM. **NOTE:** • If the “PCM CONFIGURATION” is successful, the PCM stores the DTC P0602:00 and illuminates the check engine light (system is normal). Clear the DTC P0602:00 using the M-MDS after the “PCM CONFIGURATION”. • The check engine light turns off after three drive cycles with no malfunction (DTCs remain in PCM).
P0604:00	PCM RAM error	• PCM internal RAM malfunction.
P0606:00	PCM processor error	• PCM internal CPU malfunction.
P0607:00	Control module performance problem	• PCM internal malfunction.
P0610:00	PCM vehicle configuration error	• PCM data configuration error.
P061B:00	Internal control module torque calculation performance problem	• Indicates an error occurred in the PCM. • There is a malfunction in the sensor input signal to the PCM.
P061D:00	Internal control module engine air mass performance problem	• Indicates an error occurred in the PCM.
P061F:00	Internal control module throttle valve actuator controller performance problem	• When any of the following conditions is met: ▪ Start stop unit internal malfunction ▪ CAN communication line malfunction between start stop unit and PCM ▪ PCM internal malfunction
P0628:00	Fuel pump control module circuit low	• When the PCM outputs a duty signal to the fuel pump control module, the difference in voltage between fuel

	input	pump unit terminals A and B is **less than 1.5 V** for a continuous **5 s**.
P0629:00	Fuel pump control module circuit high input	• The PCM detects over-current during the fuel pump control module control.
P0638:00	Throttle valve actuator control range/performance problem	• The PCM compares the actual TP with the target TP. If the difference is more than the threshold value, the PCM determines that there is a throttle valve actuator control range/performance problem.
P064D:00	Internal control module A/F sensor processor performance problem	• Malfunction in A/F sensor signal circuit in PCM occurs.
P0685:00	Main relay control circuit open	• The period of time in which the PCM power supply remains on after the ignition is switched off is not within the specified time.
P06B8:00	Internal control module non-volatile RAM error	• PCM internal EEPROM malfunction.
P06DA:00	Engine oil solenoid valve circuit problem	• The engine oil solenoid valve control current is high or the control voltage at the PCM terminal 1AS is low relative to the PCM control condition.
P0703:00	Brake switch input circuit problem	• The brake switch does not switch even though the vehicle is stopped **8 times** repeatedly from a vehicle speed of **30 km/h {19 mph} or more**.
P0704:00*2	CPP switch input circuit problem	• The PCM monitors changes in input voltage from the CPP switch. If the PCM does not detect a voltage change while the vehicle runs with vehicle speed **above 30 km/h {19 mph}** and stops **8 times** alternately, the PCM determines that the CPP switch circuit has a malfunction.
P0850:00*2	Neutral switch input circuit problem	• The PCM monitors changes in input voltage from the neutral switch. If the PCM does not detect a voltage change while driving the vehicle at a vehicle speed **above 30 km/h {19 mph}** and the clutch pedal is pressed and released **10 times** repeatedly, the PCM determines that the neutral switch circuit has a malfunction.
		• Any one of the following conditions is met: ▪ Any DC-DC converter terminal value,

P0A12:00*6	DC-DC converter: low input/output	either 3A or 4A, is specified value or less ▪ Ignition switch ON condition detected by DC-DC converter and PCM differ
P0A8D:00*6	Power supply system circuit low input	• Any one of the following conditions is met: ▪ PCM terminal voltage is **6.2 V or less** when engine starts. ▪ Battery internal resistance is specified value or more. ▪ Battery voltage is **11 V or less** after 30 s since system began switch to relay mode
P0A8F:00*6	Power system: Low input	• Any one of the following conditions is met: ▪ Battery voltage is **11 V or less** when ignition is switched off after leaving vehicle for **30 days or more**. ▪ Battery voltage is **11 V or less** for a continuous **5 days** when ignition is switched off.
P0A94:00*6	DC-DC converter: control circuit signal error	• Internal malfunction signal from DC-DC converter is received. • Condition in which DC-DC converter output voltage, based on demand voltage of PCM, is low continues. • When PCM outputs drive command signal for each type of relay in DC-DC converter, relay condition signal returned from DC-DC converter differs from drive command, or not returned
P111A:00	Engine coolant temperature is high	• The engine coolant temperature is **122 °C {252 °F} or more**.
P117A:00	Engine oil temperature is high	• Any one of the following conditions is met: ▪ With the transmission in 5th gear or lower gear, an engine speed of **6,100 rpm** (SKYACTIV-G 2.0)/**5,800 rpm** (SKYACTIV-G 2.5) **or more** continues for **6 min**. ▪ The estimated engine oil temperature **exceeds 140 °C {284 °F}** continues for **6 min** (with active air shutter).
P1260:00	Immobilizer system problem	• The start stop unit detects an immobilizer system malfunction.

P130C:00*4	Pre-ignition detected	• Pre-ignition is detected a few times continuously with the engine coolant temperature at **80 °C {176 °F} or more**.
P1380:00	Electric variable valve timing control circuit problem	• A malfunction is detected in the results of the on-board diagnostic test received from the electric variable valve timing driver.
P144A:00*4	Evaporator system: clogging between fuel tank and fuel tank pressure sensor	• The following conditions are all met while the vehicle is being driven: ▪ If negative pressure is inducted to the fuel tank via the intake manifold by the operation of the purge solenoid valve with the fuel tank in a sealed condition and the target negative pressure is reached within a shorter period of time than the estimated time. ▪ When the barometric pressure in the fuel tank is fixed and the purge solenoid valve is opened/closed, the negative pressure fluctuation in the fuel tank generates negative pressure exceeding the threshold.
P1450:00*4	Evaporator system: abnormal negative pressure in fuel tank	• Target negative pressure exceeding the specified time or more is generated from negative pressure inducted to the fuel tank by the operation of the purge solenoid valve after the fuel tank is sealed (CV solenoid valve ON).
P151B:00*1	IAC system problem	• The PCM cannot control the idle speed toward the target idle speed during the KOER self test.
P1794:00	Capacitor (i-ELOOP) system: Capacitor (i-	• Capacitor malfunction determined • Any one of the following conditions is met: ▪ Capacitor (i-ELOOP) internal resistance exceeds the specification. ▪ Capacitor (i-ELOOP) capacitance exceeds the specification. ▪ Capacitor (i-ELOOP) voltage exceeds the specification. • Capacitor (i-ELOOP) deterioration determined

	ELOOP) malfunction	• Any one of the following conditions is met: ▪ Capacitor (i-ELOOP) internal resistance exceeds the specification. ▪ Capacitor (i-ELOOP) capacitance is less the than specification. • Over-charge determined • Capacitor (i-ELOOP) voltage exceeds the specification.
P2090:00	OCV circuit low input	• The OCV control voltage relative to the PCM control is too low.
P2091:00	OCV circuit high input	• The OCV control voltage relative to the PCM control is too high.
P2096:00	HO2S fuel injection control system: Air fuel too lean	• Depending on the correction deviation of the A/F sensor, a condition in which the fuel feedback correction amount (SHRTFT12) for the HO2S is the specified value (**2 %**) or more and the sum (SHRTFT12+LONGFT12) of the fuel feedback correction amount and the fuel learning correction amount is the specified value (**2.3—2.5 %**) or more continues for a period of **25 s**.
P2097:00	HO2S fuel injection control system: Air fuel too rich	• Depending on the correction deviation of the A/F sensor, a condition in which the fuel feedback correction amount (SHRTFT12) for the HO2S is the specified value (**−2 %**) or less and the sum (SHRTFT12+LONGFT12) of the fuel feedback correction amount and the fuel learning correction amount is the specified value (**−2.5 — −2.3 %**) or less continues for a period of **25 s**.
P2101:00	Throttle valve actuator control motor circuit range/performance problem	• The PCM turns the main relay on, but if the input voltage is **6.0 V or less**, then the PCM determines that the main relay control circuit voltage is low. • There is a system error in the electrical throttle control system of the PCM.
P2107:00	Throttle valve actuator control module processor error	• PCM internal malfunction.
	TP sensor minimum stop	• If the fully-close throttle position is **5.1 ° or lower**, or **15.9 ° or more** (even though fully-closed throttle

P2109:00	range/performance problem	position learning is finished), the PCM determines there is a malfunction.
P2110:00	Throttle valve actuator control system-forced limited RPM	• PCM internal malfunction.
P2112:00	Throttle valve actuator motor current range/performance problem	• The throttle valve actuator control duty ratio is **95 % or more** with the ignition switched ON (engine on).
P2119:00	Throttle valve actuator control throttle body range/performance problem	• The PCM compares the actual TP with initial setting TP when the ignition is switched off. If the actual TP is higher than the initial setting TP, the PCM determines that there is a throttle valve return spring malfunction.
P2122:00	APP sensor No.1 circuit low input	• The PCM monitors the input voltage from APP sensor No.1. If the input voltage at the PCM terminal 2AN is **less than 0.1 V**, the PCM determines that the APP sensor No.1 circuit input voltage is low.
P2123:00	APP sensor No.1 circuit high input	• The PCM monitors the input voltage from APP sensor No.1. If the input voltage at the PCM terminal 2AN is **above 4.9 V**, the PCM determines that the APP sensor No.1 circuit input voltage is high.
P2127:00	APP sensor No.2 circuit low input	• The PCM monitors the input voltage from APP sensor No.2. If the input voltage at the PCM terminal 2AS is **less than 0.1 V**, the PCM determines that the APP sensor No.2 circuit has a malfunction.
P2128:00	APP sensor No.2 circuit high input	• The PCM monitors the input voltage from APP sensor No.2. If the input voltage at the PCM terminal 2AS is **more than 4.9 V**, the PCM determines that the APP sensor No.2 circuit has a malfunction.
P2135:00	TP sensor No.1/No.2 voltage correlation problem	• The PCM compares the input voltage from TP sensor No.1 with the input voltage from TP sensor No.2. If the difference is more than the specification, the PCM determines that there is a TP sensor No.1/No.2 voltage correlation problem.
P2138:00	APP sensor No.1/No.2 voltage correlation problem	• The PCM compares the input voltage from APP sensor No.1 with the input voltage from APP sensor No.2. If the difference is more than the specification, the PCM determines that there is an APP sensor No.1/No.2 angle correlation problem.

P2183:00*4	ECT sensor No.2 circuit range/performance problem	• When the ECT sensor No.2 detected temperature is **approx. 12.1 °C {21.8 °F}** higher than the IAT sensor No.1, or the ECT sensor No.2 detected temperature is **approx. −14.3 °C {−25.7 °F}** less than the IAT sensor No.1 with the ignition switched ON, the PCM detects a circuit range/performance problem.
P2184:00*4	ECT sensor No.2 circuit low input	• The PCM monitors the ECT sensor No.2 signal. If the PCM detects that the ECT sensor No.2 voltage at the PCM terminal 2F is **below 0.16 V** for **5 s**, the PCM determines that the ECT sensor No.2 circuit has a malfunction.
P2185:00*4	ECT sensor No.2 circuit high input	• The PCM monitors the ECT sensor No.2 signal. If the PCM detects that the ECT sensor No.2 voltage at the PCM terminal 2F is **above 4.92 V** for **5 s**, the PCM determines that the ECT sensor No.2 circuit has a malfunction.
P2199:00	IAT sensor No.2 correlation problem	• IAT sensor No.1 and IAT sensor No.2 are compared and correlation error occurs.
P2228:00	BARO sensor circuit low input	• The PCM monitors input voltage from the BARO sensor. If the input voltage is low for **5 s**, the PCM determines that the BARO sensor circuit has a malfunction.
P2229:00	BARO sensor circuit high input	• The PCM monitors input voltage from the BARO sensor. If the input voltage is high for **5 s**, the PCM determines that the BARO sensor circuit has a malfunction.
P2237:00	Open circuit between A/F sensor terminal B and PCM terminal 1AG	• After A/F sensor activation, a condition in which PCM terminal 1AB voltage is within the specified range continues for **5 s or more**.
P2243:00	A/F sensor reference voltage circuit open	• A condition in which the PCM terminal 1W voltage is the specified value or more continues for **30 s**.
P2251:00	Open circuit between A/F sensor terminal D and PCM terminal 1AB	• The following conditions are met: ▪ A/F sensor element impedance is specified value or more ▪ A/F sensor terminal F voltage (B+ terminal) is less than specified value or unstable.
	Accelerator pedal:	• When under the following conditions it is detected that the brake pedal is depressed during driving for the specified time*.

P2299:00	spring back malfunction	▪ Racing ▪ Engine speed: **875 rpm or more** • *: Specified time is **0.6—10 s** according to braking force calculated in PCM.
P2302:00	Ion sensor No.1 circuit problem	• After the engine is started, when the engine speed is **2,000 rpm or less**, the signal input to the PCM from ion sensor No.1 is in error.
P2305:00	Ion sensor No.2 circuit problem	• After the engine is started, when the engine speed is **2,000 rpm or less**, the signal input to the PCM from ion sensor No.2 is in error.
P2308:00	Ion sensor No.3 circuit problem	• After the engine is started, when the engine speed is **2,000 rpm or less**, the signal input to the PCM from ion sensor No.3 is in error.
P2311:00	Ion sensor No.4 circuit problem	• After the engine is started, when the engine speed is **2,000 rpm or less**, the signal input to the PCM from ion sensor No.4 is in error.
P2502:00	Generator system: Malfunction in voltage generated by generator	• The voltage generated by the generator is **17 V or higher** and the battery voltage is **11 V or less** for a continuous specified time.
P2503:00	Generator system: Voltage generated by generator is low	• A condition continues for a specified period of time in which the target generator output current calculated by the PCM is **20 A or more** and the generator output voltage is **8.5 V or less**.
P2504:00	Generator system: Voltage generated by generator is high	• The voltage generated by the generator is **18.5 V or higher** or the battery voltage is **16 V or higher** for a continuous specified time.
P2507:00	PCM battery voltage low input	• The PCM monitors the voltage of backup battery positive terminal. If the PCM detects that the battery positive terminal voltage is **below 6 V** for **5 s**, the PCM determines that the backup voltage circuit has a malfunction.
P2610:00	Malfunction in instrument cluster	• Malfunction detected in instrument cluster.
U0073:00	CAN system communication error (HS CAN)	• Malfunction in CAN bus communication line.
	CAN system	

U0074:00*3	communication error (local CAN between PCM and TCM)	• Malfunction in CAN bus communication line.
U0101:00*3	CAN communication: communication error to TCM	• Communication error between the PCM and TCM continues for **5 s or more**.
U0121:00	CAN communication: communication error to DSC HU/CM	• Communication error between the PCM and DSC HU/CM continues for **5 s or more**.
U0131:00	CAN communication: communication error to EPS control module	• Communication error between the PCM and EPS control module continues for **5 s or more**.
U0140:00	CAN communication: communication error to front body control module (FBCM)	• Communication error between the PCM and front body control module (FBCM) continues for **5 s or more**.
U0151:00	CAN communication: communication error to SAS control module	• Communication error between the PCM and SAS control module continues for **5 s or more**.
U0155:00	CAN communication: communication error to instrument cluster	• Communication error between the PCM and instrument cluster continues for **5 s or more**.
U0214:00	CAN communication: communication error to start stop unit	• Communication error between the PCM and start stop unit continues for **5 s or more**.
U0235:00	CAN communication: communication error to laser sensor	• Communication error between the PCM and laser sensor continues for **5 s or more**.
U0284:00*6	LIN communication system: communication error between active air shutter and PCM	• PCM detects a communication error between the PCM and active air shutter.
U0298:00*6	CAN communication: communication error to DC-DC converter	• PCM detects a communication error between the PCM and DC-DC converter.
U0302:00*3	TCM processor error	• When any of the following conditions is met: ▪ CAN communication line malfunction between TCM and PCM

		▪ TCM internal malfunction
U0315:00	DSC HU/CM error	• When any of the following conditions is met: ▪ CAN communication line malfunction between DSC HU/CM and PCM ▪ DSC HU/CM internal malfunction
U0320:00	EPS control module error	• When any of the following conditions is met: ▪ CAN communication line malfunction between EPS control module and PCM ▪ EPS control module internal malfunction
U0323:00	Instrument cluster error	• When any of the following conditions is met: ▪ CAN communication line malfunction between instrument cluster and PCM ▪ Instrument cluster internal malfunction
U0336:00	SAS control module error	• When any of the following conditions is met: ▪ CAN communication line malfunction between SAS control module and PCM ▪ SAS control module internal malfunction
U0338:00	Start stop unit error	• When any of the following conditions is met: ▪ CAN communication line malfunction between start stop unit and PCM ▪ Start stop unit internal malfunction
U0433:00	Abnormal message from rear body control module (RBCM)	• Correct data cannot be received from rear body control module (RBCM).
U1007:00 *6	CAN/LIN communication system: current sensor information communication error with front body control module (FBCM)	• PCM detects a current sensor information communication error from front body control module (FBCM).
		• Any of following conditions occurs:

U2300:00	Global central configuration error	▪ No configuration of the instrument cluster. ▪ The configuration signal with the estimated CAN ID is not sent from the instrument cluster. ▪ The configuration signal value sent via CAN from the instrument cluster is unknown or invalid. ▪ The configuration signal value sent via CAN from the instrument cluster is a value other than the estimated value. ▪ The configuration signal value sent via CAN from the instrument cluster does not match the PCM value.
U3000:41	PCM processor error	• Communication error in the PCM.

2014 - Mazda3 - Engine

KOEO/KOER SELF-TEST [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

- On-board diagnosis is performed using the flow pre-set in the PCM, and according to the test execute command sent to the PCM from the external tester.
- If a malfunction is detected as a result of the on-board diagnosis, a DTC is recorded in the PCM.

KOEO (Key ON, Engine Off) Self Test

- The KOEO self test is a powertrain control system self-diagnosis, performed when the ignition is switched ON (engine off). A KOEO self test begins when the connected M-MDS sends an execute command to the PCM.
- As the KOEO self test is performed, the PCM performs the inspection for set DTCs and if a malfunction is detected, the DTC is displayed on the M-MDS.

KOER (Key ON, Engine Running) Self Test

- The KOER self test is a powertrain control system self-diagnosis, performed when the ignition is switched ON and the engine is idling. A KOER self test begins when the connected M-MDS sends an execute command to the PCM.
- As the KOER self test is performed, the PCM performs the inspection for set DTCs and if a malfunction is detected the DTC is displayed on the M-MDS.

2014 - Mazda3 - Engine

ON-BOARD DIAGNOSTIC SYSTEM PID/DATA MONITOR FUNCTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

- The PID/DATA monitor items are shown below.

PID/DATA monitor item table—: Not applicable

Item (definition)	Definition	Unit/Condition
AAT*5	Ambient air temperature	°C, °F
AC_PRES*6	Refrigerant pressure input from refrigerant pressure sensor	KPa {MPa}, mBar {Bar}, psi, in H20
	Refrigerant pressure sensor voltage	V
AC_REQ	A/C switch status received by PCM via CAN	Off/On
ACCS	A/C relay status input from A/C relay	Off/On
AIRSHUT_ACT*1	Active air shutter position	%
AIRSHUT_CAL*1	Active air shutter fully open/closed position learning status	Not Done/Completed
ALTF	Field coil current control signal output to generator	%
ALTF_ACT*1	Actually measured value of field coil current signal input from generator	%
ALTT V*2	Generator output voltage	V
AMB_TEMP	Actually measured ambient temperature input from ambient temperature sensor	°C, °F
APP	Accelerator pedal opening angle (relative value) with the fully released status as 0% and fully depressed	%

	status as 100%	
APP1	Accelerator pedal opening angle (absolute value) input from APP sensor No.1	%
	APP sensor No.1 voltage	V
APP2	Accelerator pedal opening angle (absolute value) input from APP sensor No.2	%
	APP sensor No.2 voltage	V
ARPMDES	Target engine speed	RPM
BARO	Actually measured barometric pressure input from barometric pressure sensor built into PCM	KPa {MPa}, mBar {Bar}, psi, in H20
	BARO sensor voltage	V
BATT_CUR*1	Battery current	A
BATT_DAY*1	Number of days elapsed since current sensor initialization	—
BATT_RES*1	Battery internal resistance (estimated)	—
BATT_SOC*1	Battery charge condition (estimated)	%
BATT_TEMP*1	Battery temperature	°C, °F
BATT_V*1	Battery voltage	V
BOO	Brake switch (No.1 signal) ON/OFF status	High/Low
BPA	Brake switch (No.2 signal) ON/OFF status	High/Low
CAP_SYS_10*1	Open circuit in capacitor (i-ELOOP) (power cannot be supplied from capacitor)	Off/On
CAP_SYS 13*1	Capacitor (i-ELOOP) capacitance	Off/On

	malfunction	
CAP_SYS 14*1	Capacitor (i-ELOOP) capacitance deterioration	Off/On
CAP_SYS 15*1	Capacitor (i-ELOOP) internal resistance malfunction	Off/On
CAP_SYS 16*1	Capacitor (i-ELOOP) internal resistance deterioration	Off/On
CATT11_DSD	Estimated catalytic converter temperature	°C, °F
CHRGLP	Charging system warning light illumination status	Off/On
CPP*3	Clutch pedal position	Off/On
CPP/PNP*3	Shift lever position	Off/On
ECT	Engine coolant temperature	°C, °F
	ECT sensor No.1 voltage	V
ECT2_V*5	ECT sensor No.2 voltage	V
EQ_RAT11	Excess air factor (estimated value) to theoretical air/fuel ratio (14.7) by fuel feedback control	—
EQ_RAT11_DSD	Target excess air factor (estimated value) to theoretical air/fuel ratio (14.7) by fuel feedback control	—
ETC_ACT	Actual throttle valve opening angle	°
ETC_DSD	Target throttle valve opening angle (percent)	%
	Target throttle valve opening angle	°
EVAPCP	Purge solenoid valve control duty value	%
EVAPCV*5	CV solenoid valve operation status	Off/On

FAN1	Cooling fan relay No.1 operation status	Off/On
FAN3	Cooling fan relay No.2 and No.3 operation status	Off/On
FCL*5	Check fuel cap warning light illumination status	Off/On
FIA	Fuel injection amount	—
FLI	Fuel level	%
FP	Fuel pump relay operation status	Off/On
FP_DUTY	Fuel pump control module control duty value	%
FTP*5	Fuel tank pressure	KPa {MPa}, mBar {Bar}, psi, in H20
	Fuel tank pressure sensor voltage	V
FUEL_P_DSD	Target fuel pressure (high pressure fuel pump)	KPa {MPa}, mBar {Bar}, psi, in H20
FUEL_PRES	Fuel pressure	KPa {MPa}, mBar {Bar}, psi, in H20
	Fuel pressure sensor voltage	V
FUELPW	Fuel injection pulse width (fuel injector energization time) output to fuel injector	Sec
FUELSYS	Feedback status of fuel injection control is displayed OL: Feedback control is disabled at cold engine start CL: During feedback control by A/F sensor and HO2S OL_Drive: While feedback control is stopped OL_Fault: Feedback control is disable due to system malfunction CL_Fault: During feedback control	OL/CL/ OL_Drive/ OL_Fault/ CL_Fault

	with either A/F sensor or HO2S having a malfunction	
GEAR*4	Gear commanded	Unknown/1st/2nd/3rd/4th/5th/6th/Not in P/Park/Neutral/Drive/Reverse
HTR11	A/F sensor heater operation status	Off/On
	A/F sensor heater control duty value	%
HTR12	HO2S heater operation status	Off/On
	HO2S heater control duty value	%
IAT	Intake air temperature (No.1)	°C, °F
	IAT sensor No.1 voltage	V
IAT2	Intake air temperature (No.2)	°C, °F
	IAT sensor No.2 voltage	V
INGEAR*3	Gears are engaged	Off/On
ISC_FBK	ISC feedback value	%
ISC_FBK_LRN	Learning value for calculating ISC feedback amount	%
IVS	CTP condition	Off Idle/Idle
KNOCKR	Camshaft retard amount when knocking determined	°
LOAD	Ratio of actual amount of intake air to the maximum air charging amount (mass volume) of cylinder	%
LONGFT1	Fuel learning correction amount estimated based on A/F sensor signal	%
LONGFT12	Fuel learning correction amount estimated based on heated oxygen sensor signal	%
	Engine oil pressure condition	

LOW_OIL	Never Detected: Engine oil pressure is high Detected: Engine oil pressure is low	Never Detected/Detected
M_GEAR*3	Manual gear position	Neutral/1st gear/2nd gear/3rd gear/4th gear/5th gear/6th gear/Reverse/Undefined/Auto/In_Progress/YSF/Error
MAF	Mass air flow	g/Sec
	MAF sensor voltage	V
MAP	Manifold absolute pressure	KPa {MPa}, mBar {Bar}, psi, in H20
	MAP sensor voltage	V
MF_CAT1	Number of misfires in No.1 cylinder leading to catalytic converter temperature increase (catalytic converter temperature increases due to fuel combustion around catalytic converter after misfire)	—
MF_CAT_2	Number of misfires in No.2 cylinder leading to catalytic converter temperature increase (catalytic converter temperature increases due to fuel combustion around catalytic converter after misfire)	—
MF_CAT_3	Number of misfires in No.3 cylinder leading to catalytic converter temperature increase (catalytic converter temperature increases due to fuel combustion around catalytic converter after misfire)	—
MF_CAT_4	Number of misfires in No.4 cylinder leading to catalytic converter temperature increase (catalytic converter temperature increases due to fuel combustion around catalytic converter after misfire)	—
MF_CAT_FCC	Threshold of malfunction determination for number of misfires (total number in all cylinders) leading to catalytic converter temperature increase	—

MF_CAT_TTL	Number of misfires (total number in all cylinders) leading to catalytic converter temperature increase	—
MF_EMI1	Number of misfires in No.1 cylinder under conditions required by emission regulations	—
MF_EMI_2	Number of misfires in No.2 cylinder under conditions required by emission regulations	—
MF_EMI_3	Number of misfires in No.3 cylinder under conditions required by emission regulations	—
MF_EMI_4	Number of misfires in No.4 cylinder under conditions required by emission regulations	—
MF_EMI_FCC	Threshold of malfunction determination for number of misfires (total number in all cylinders) under conditions required by emission regulations	—
MF_EMI_TTL	Number of misfires (total number in all cylinders) under conditions required by emission regulations	—
MIL	Check engine light illumination status	Off/On
MIL_DIS	Travelled distance since check engine light illuminated	km {mph}, ft, mi
O2S11	A/F sensor current	μA
O2S12	HO2S voltage	V
OIL_P_SOL	Engine oil solenoid valve operation status	Off/On
OIL_TEMP	Estimated engine oil temperature	°C, °F
PN_SW*4	Parking/neutral	Open/Closed
PRE_CHG_DIS*1	Distance at pre-charge	km, ft {mi}

RO2FT1	Fuel correction amount based on HO2S signal including SHRTFT12 and LONGFT12	%
RPM	Engine speed	RPM
SHRTFT1	Fuel feedback correction amount estimated based on A/F sensor signal	%
SHRTFT12	Fuel feedback correction amount estimated based on HO2S signal	%
SPARKADV	Ignition timing	°
Test	Test mode operation condition due to forced override operation	Off/On
TH_M*5	Thermostat monitor	—
TH_M_MAX*5	Thermostat monitor max	—
TH_M_MIN*5	Thermostat monitor min	—
TP_REL	Throttle valve opening angle (relative value) with value at throttle valve fully open timing as the start point	%
TP1	TP sensor No.1 voltage	V
	Throttle valve position No.1	%
TP2	TP sensor No.2 voltage	V
	Throttle valve position No.2	%
TPCT	TP sensor No.1 voltage at CTP	V
TPCT2	TP sensor No.2 voltage at CTP	V
VPWR	Battery positive voltage	V
VSS	Vehicle speed	KPH, MPH
VT EX_DES	Desired exhaust valve timing	°

VT IN_ACT	Actual intake valve timing	°
VT IN_DES	Desired intake valve timing	°
VT_EX_ACT	Actual exhaust valve timing	°
VT_EX_DUTY	OCV control duty value	%

ON-BOARD DIAGNOSTIC SYSTEM ACTIVE COMMAND MODES FUNCTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

- The simulation items are shown below.

Simulation item table

Item	Applicable component	Unit/Condition	Operation condition
ACCS	A/C relay	Off/On	• Under the following conditions: ▪ Vehicle stopped ▪ Idling at P or N position
AIRSHUT_DSD	Active air shutter	%	**NOTE:** • If the active air shutter fully open/closed position learning is not completed, the active air shutter cannot be forcibly operated. When the active air shutter is forcibly operated, perform the active air shutter fully open/closed position learning. • Under the following conditions: ▪ Vehicle stopped ▪ Idling at P or N position ▪ Shutter fully open/closed position learning: completed

ON-BOARD DIAGNOSTIC SYSTEM EXTERNAL DIAGNOSTIC UNIT COMMUNICATION FUNCTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Outline

- Function for allowing both the PCM and external tester to receive and send data.
- The DLC-2 has been adopted as the communication medium.

Function

- The types of data which the PCM and external tester can receive and send using the external tester communication function include the following items:
    - Recording of engine control system information in the PCM.
    - Data related to exhaust emission such as input/output signals, the PCM-calculated values and system status.

DLC-2 Outline

- The DLC-2 located in the driver compartment is a service connector defined by OBD-II regulations.
- The following are functions for each terminal.

DLC-2

—: Not applicable

Terminal	Function
A	Battery positive voltage

B	—
C	—
D	—
E	CAN communication line LO (HS)
F	CAN communication line HI (HS)

ON-BOARD DIAGNOSTIC SYSTEM MALFUNCTION DISPLAY FUNCTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Outline

- Illuminates the check engine light to notify the driver of a malfunction occurring in the engine control system.
- The check engine light is built into the instrument cluster.

Function

- The check engine light illuminates when a malfunction occurs in the engine control system, and it illuminates at the same time a DTC is recorded in the PCM.
- The illumination/non-illumination conditions of the check engine light are determined by the number of drive cycles. (See **ON-BOARD DIAGNOSTIC SYSTEM TEST MODE [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)

ON-BOARD DIAGNOSTIC SYSTEM MALFUNCTION DISPLAY FUNCTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

2014 - Mazda3 - Engine

ON-BOARD DIAGNOSTIC SYSTEM DIAGNOSTIC DATA MEMORY FUNCTION [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Outline

- Records diagnostic data related to the engine control system in the PCM.

Function

- The diagnostic data recording/erasing conditions are determined by the number of drive cycles set for each item. (See **ON-BOARD DIAGNOSTIC SYSTEM TEST MODE [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)
- Diagnostic data which can be recorded in the PCM are as follows:
    - Number of DTCs
    - DTC
    - Pending code
    - Freeze frame data
    - On-board diagnostic system diagnosis condition
    - On-board monitoring test results
- Another method for erasing diagnostic data is by using the memory clearing function of the external tester.

2014 - Mazda3 - Engine

CHECK ENGINE LIGHT [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose / Function

- If a malfunction occurs in the engine control system, the light illuminates to warn the driver of the malfunction.

Construction

- The check engine light is built into the instrument cluster.

Operation

- The check engine light illuminates when a malfunction occurs in the engine control system, and it illuminates at the same time a DTC is recorded in the PCM.
- The illumination conditions for the check engine light are determined by the number of drive cycles set for each DTC. For details on the drive cycle, refer to “ON-BOARD DIAGNOSTIC SYSTEM TEST MODE”. (See **ON-BOARD DIAGNOSTIC SYSTEM TEST MODE [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)

- For DTCs with one drive cycle, if a malfunction is detected in the first drive cycle, the check engine light illuminates.
- For DTCs with two drive cycles, if each malfunction is detected in the first and second drive cycles, the check engine light illuminates. However, if the same malfunction as the DTC stored in the PCM is detected, the check engine light illuminates in the first drive cycle even if the DTC is two drive cycles.
- If the PCM detects that the engine control system is continuously normal for three drive cycles, the illuminated check engine light turns off. However, the DTC is not cleared from the PCM at this time. If the PCM determines that the engine control system is continuously normal for **41** warm-up cycles*, the DTC is cleared.

*

A warm-up cycle is a drive cycle including the period until the engine is completely warmed up after a cold-engine starts. This cycle repeated 41 times is a 41 warm-up cycle.

- The PCM sends a check engine light illumination request to the instrument cluster via CAN communication.

2014 - Mazda3 - Engine

MECHANICAL [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Outline

- The sliding resistance*1 has been reduced by:
  - Adoption of a rocker arm (built in needle roller bearing)
  - Reducing load on the valve spring
  - Narrowing down the crankshaft journal
  - Optimizing the piston skirt shape
  - Adoption of a low-tension piston ring
  - Lowered tensioning of the drive belt
- A maintenance-free design for valve clearance has been achieved with the adoption of the HLA.
- With the adoption of a piston cavity, cooling loss has been reduced.
- The pumping loss*2 has been reduced with the adoption of the variable valve timing mechanism on both sides of the intake and exhaust.
- The timing chain behavior has been stabilized and sliding resistance has been reduced by optimizing the shape and rigidity of the timing chain-related parts.

*1 **Resistance (friction force) which occurs when two object slide against each other. The larger the sliding resistance, the greater the energy loss.**

*2 **Energy loss which occurs from each type of resistance corresponding to intake and exhaust is called pumping loss.**

MILLER CYCLE ENGINE [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Outline

- The Miller cycle engine is a high-efficiency engine which achieves high fuel economy performance by obtaining a high-expansion ratio.
- The Miller cycle engine achieves a high-expansion ratio without increasing its effective compression ratio by retarding the intake air valve close timing.

Operation

1. Intake air is introduced into the cylinder.

2. The intake valve is kept open after the intake stroke is finished to force the air in the cylinder to flow back to the intake pipe.

3. The compression stroke starts from the position in which the intake valve is closed (small compression).

4. The air-fuel mixture is combusted and the piston is pushed down to BDC (large expansion).

MILLER CYCLE ENGINE [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

2014 - Mazda3 - Engine

CYLINDER HEAD COVER [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose, Function

- The cylinder head cover prevents foreign matter penetration and engine oil spatter.
- The oil baffle plate reduces engine oil consumption by separating the engine oil from the blow-by gas.

Construction

- The lightweight cylinder head cover is made of hard plastic with excellent noise absorption.
- The cylinder head cover has the following parts:

CYLINDER HEAD COVER [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

2014 - Mazda3 - Engine

CYLINDER HEAD [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Outline

- With the adoption of the rocker arm (built in needle roller bearing), the sliding resistance has been reduced.
- With the adoption of the HLA, the valve clearance is maintained at 0 mm at all times.
- The contact point of the rocker arm and cam is lubricated by the engine oil injected from the oil shower pipe.
- Because the SKYACTIV-G is implemented on the Miller cycle, the intake manifold vacuum is insufficient during the intake valve opening timing. To improve this, the intake manifold vacuum insufficiency is supplemented by the adoption of the vacuum pump. (See **VACUUM PUMP [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)

Purpose, Function

- The cylinder head forms the combustion chamber and intake and exhaust ports.

Construction

- The lightweight cylinder head is made of aluminum alloy with excellent thermal conductivity.
- Designing a compact pentroof combustion chamber and positioning the spark plugs on the top of the combustion chamber has improved the combustion efficiency.
- There are two intake valves and two exhaust valves per cylinder for a total of four valves and the intake/exhaust type has been changed to a cross-flow type, improving intake and exhaust efficiency.
- High pressurization is achieved by optimizing the intake port shape, improving the tumble ratio, increasing the combustion speed, and suppressing knocking.

*

With the adoption of plastic region tightening for the cylinder head bolts, axial force has been stabilized.

*

Plastic region tightening is a method of controlling the tightening using the rotation angle of a bolt. By tightening to the region (plastic tightening region) in which bolt deformation does not become irreversible, variation in axial force is suppressed.

2014 - Mazda3 - Engine

CYLINDER HEAD GASKET [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose, Function

- The cylinder head gasket is installed between the cylinder head and cylinder block to prevent leakage of air-fuel mixture, combustion gas, engine oil, and engine coolant.

Construction

- A four-layer type metal gasket has been adopted for the cylinder head gasket.

2014 - Mazda3 - Engine

CYLINDER BLOCK [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose, Function

- The cylinder block forms the cylinder and crankcase.

Construction

- The cylinder block consists of the upper cylinder block and lower cylinder block.
- The cylinder block is an open deck type with excellent cooling performance.
- The lightweight cylinder block is made of aluminum alloy with excellent heat dispersion.
- With the adoption of the lower cylinder block, the coupling rigidity of the transaxle and support rigidity of the crankshaft have been improved reducing engine vibration.
- The oil separator function is set to the upper cylinder block, enhancing ventilation of the blow-by gas.

2014 - Mazda3 - Engine

CRANKSHAFT, MAIN BEARING [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose, Function

- The crankshaft converts the reciprocating movement of the piston to a rotational movement via the connecting rod.
- The main bearing forms an oil film on the outer surface of the crankshaft journal to prevent wear due to sliding.

Construction

Crankshaft

- The crankshaft is installed to the inside (crankcase) of the cylinder block.

- The crankshaft has a key groove to match timing to the crankshaft pulley.
- The crankshaft has the following parts shown in the figure.

- The optimized shaft diameter ratio of the crankshaft journal and crank pin has reduced sliding resistance while maintaining rigidity.
- The steel crankshaft has five bearings and eight counterweights for improved accuracy in the rotational balance.
- The crankshaft journal and crank pin have been induction hardened* to bear high loads.
- The crankshaft has an oil passage for supplying engine oil to the crankshaft journal and crank pin.

*
A type of heat processing method which improves hardness and strength only at the surface of the metal.

Main bearing

- The main bearing is installed to the outer surface of the crankshaft journal.
- The upper main bearing and lower main bearing are made of aluminum alloy.
- The upper main bearing has an oil groove and oil hole.
- Thrust force is suppressed by the thrust bearings on both sides of the No.3 journal.

THRUST BEARING
UPPER MAIN BEARING
LOWER MAIN BEARING
ENGINE FRONT

2014 - Mazda3 - Engine

PISTON, PISTON RING, PISTON PIN [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose, Function

Piston

- The piston in the cylinder of the cylinder block moves reciprocally by the pressure received when the air-fuel mixture combusts.

Piston ring

- The piston ring consists of the compression ring (top ring, second ring) and the oil ring, and has the following function.
    - The compression ring prevents leakage of pressure in the cylinder from the piston circumference.
    - The oil ring clears off extra engine oil adhered to the cylinder wall.
- The piston ring transmits piston heat to the cylinder wall to cool the piston.

Piston pin

- The reciprocating movement of the piston is transmitted to the connecting rod by the connection of the piston pin to connecting rod.

Construction

Piston

- The high-temperature strength piston is made of aluminum alloy with excellent thermal conductivity.
- The piston has a cavity on the top surface. As a result, the initial combustion flame is prevented from hitting the top surface of the piston to reduce cooling loss.

- The sliding resistance has been reduced by optimizing the piston skirt shape.
- A weight reduction is archived by optimizing the piston shape.
- With the adoption of the offset piston, piston slap is suppressed.

Piston ring

- A barrel-face ring for the top ring and a taper under cut ring for the second ring have been adopted.
- A three-piece oil ring consisting of a side rail and spacer have been adopted for the oil ring.
- Tracking capability to the cylinder wall has been improved by thinning down the piston ring. As a result, a low-tension piston ring has been implemented without increasing the engine oil consumption, and the sliding resistance has been reduced during reciprocating movement.

Piston pin

- The piston is a full-floating type.

2014 - Mazda3 - Engine

CONNECTING ROD, CONNECTING ROD BEARING [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose, Function

Connecting rod

- The connecting rod transmits the reciprocating movement of the piston to the crankshaft by engaging the piston pin and crank pin.

Connecting rod bearing

- The connecting rod bearing forms an oil film on the outer surface of the crank pin to prevent wear due to sliding.

Construction

Connecting rod

- The connecting rod is installed between the piston pin and crank pin.
- High-strength, forged carbon steel has been adopted for weight reduction.
- A cracking method*1 for breaking off and separating the connecting rod from the connecting rod cap has been adopted for improved accuracy.
- Weight has been reduced by optimizing the shape from the I shaft to the large end.
- Reciprocating inertial weight, including the piston, has been reduced with the use of a full-float type for the connection with the piston and further tapering of the small end shape.
- With the adoption of the plastic region tightening method*2 for the connecting rod bolt, the stability of the axial force has been improved.

*1

Method of breaking off the large end proportion of the connecting rod after it has been integrally molded to separate the connecting rod from the connecting rod cap. When assembling the connecting rod and connecting rod cap, dowel pins are required to use the mating surface shape which was created during breaking process.

*2

Plastic region tightening is a method of controlling the tightening using the rotation angle of a bolt. By tightening to the region (plastic tightening region) in which bolt deformation does not become irreversible, variation in axial force is suppressed.

Connecting rod bearing

- The connecting rod bearing is installed on the outer surface of the crank pin.
- The upper and lower connecting rod bearings are made of aluminum alloy.

2014 - Mazda3 - Engine

ENGINE FRONT COVER [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose, Function

- The engine front cover covers the front of the engine to prevent engine oil spillage, noise leakage, and foreign matter penetration.

Construction

- The engine front cover is installed to the front of the engine.

- The lightweight engine front cover is made of aluminum alloy with excellent noise absorption.
- The engine front cover has the following parts shown in the figure.

ELECTRIC VARIABLE VALVE TIMING MOTOR/DRIVER INSTALLATION AREA
SERVICE HOLE FOR SECURING CHAIN TENSIONER ARM
SERVICE HOLE FOR CHAIN TENSIONER RACHET RELEASE
NO.3 ENGINE MOUNT INSTALLATION AREA
FRONT OIL SEAL

ENGINE OIL INJECTION HOLE

2014 - Mazda3 - Engine

CRANKSHAFT PULLEY [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose, Function

- The crankshaft pulley transmits the drive force to the auxiliary parts via the drive belt.
- The crankshaft pulley suppresses torsional vibration of the crankshaft.

Construction

- The crankshaft pulley is installed to the front of the crankshaft.

- The crankshaft pulley has a torsional damper for suppressing torsional vibration of the crankshaft.
- The crankshaft pulley has key groove to match the timing to the crankshaft.
- The crankshaft pulley has a timing mark indicating the piston position.

2014 - Mazda3 - Engine

DRIVE BELT [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose, Function

- The drive belt transmits rotation force of the crankshaft pulley to the pulley for the auxiliary parts.

Construction

- The drive belt is installed to the front of the engine.

- A V-ribbed belt has been adopted for the drive belt.

- The water pump drive belt is a stretch type.
- Drive belt vibration is suppressed by shortening the distance between each pulley.
- With the adoption of the oil pressure type drive belt auto tensioner, the change in tension by the oil pressure damper operation is absorbed. As a result, the sliding resistance has been reduced by lowering the drive belt tension setting.

2014 - Mazda3 - Engine

VALVE MECHANISM [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Outline

- A DOHC type valve system has been adopted and consists of four valves (two intake valves and two exhaust valves) per cylinder for a total of 16 valves operated by two camshafts.

Structural View

ILLUSTRATION SHOWS WITH SKYACTIV-G 2.0

2014 - Mazda3 - Engine

VALVE, VALVE SPRING, VALVE SEAL, VALVE GUIDE [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose, Function

Valve

- The intake valve is pressed down by the cam, the intake air passage is opened, and air is introduced into the cylinder.
- The exhaust valve is pressed down by the cam, the exhaust air passage is opened, and combustion gas is exhausted from the cylinder.

Valve spring

- The valve spring adheres to the valve seat by pulling up the valve by spring force, and air tightness in the combustion chamber is maintained.

Valve seal

- The valve seal prevents engine oil from entering combustion chamber through the valve guide, and engine oil consumption is suppressed.

Valve guide

- The valve guide maintains the valve stem to open and close the valve smoothly.
- The valve guide cools the valve by transmitting valve heat to the cylinder head.

Construction

- The valve, valve spring, valve seal, and valve guide are assembled to the cylinder head as a single unit.

- The sliding resistance has been reduced by setting the valve spring load to the required minimum.
- The intake valve and exhaust valve are subjected to a salt-bath, soft-nitriding treatment to enhance wear resistance.
- Unequal pitch valve spring has been adopted. In addition, the upper diameter is smaller compared to the bottom diameter.
- The valve guide is made of sintered alloy with excellent wear resistance.

2014 - Mazda3 - Engine

CAMSHAFT [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose, Function

- The camshaft is rotated by receiving the rotation force of the crankshaft via the timing chain. The valve is opened and closed according to the cam shape at this time.

Construction

- The camshaft is installed to the cylinder head.

- The intake camshaft is a five-bearing type and the exhaust camshaft is a six-bearing type.
- The camshaft thrust force is suppressed by the No.1 journal.
- The camshaft has the following parts shown in the figure.

Valve timing

- SKYACTIV-G 2.0

- SKYACTIV-G 2.5

Item				Specification
Valve timing	IN	Open	(°)	BTDC 42—ATDC 32
		Close	(°)	ABDC 36—ABDC 110
	EX	Open	(°)	SKYACTIV-G 2.0: BBDC 54—BBDC 9
				SKYACTIV-G 2.5: BBDC 58—BBDC 13
		Close	(°)	SKYACTIV-G 2.0: ATDC 7—ATDC 52
				SKYACTIV-G 2.5: ATDC 6—ATDC 51

2014 - Mazda3 - Engine

TIMING CHAIN, CHAIN TENSIONER [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose, Function

Timing chain

- The timing chain transmits the rotation force of the crankshaft to the camshaft to perform the rotation timing of the crankshaft and camshaft.

Chain tensioner

- The chain tensioner constantly maintains the timing chain tension and the timing chain operation is stabilized.

Construction

Timing chain

- The timing chain is installed between the camshaft sprocket and crankshaft sprocket.

- Lubrication of the timing chain and each sprocket is performed using the engine oil from the engine front cover.
- Improvement of the rigidity of the chain guide and tensioner arm and the stability of the timing chain operation have reduced the sliding resistance.

Chain tensioner

- The chain tensioner is installed to the cylinder block (engine front).
- An oil pressure type chain tensioner has been adopted for the chain tensioner.

OPERATION

Chain tensioner

- Fluctuation in the timing chain tension by oil pressure and spring force is suppressed, and the tension is maintained at a constant.

2014 - Mazda3 - Engine

HYDRAULIC LASH ADJUSTER, ROCKER ARM [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose, Function

HLA

- The HLA maintains the valve clearance at a constant 0 mm and maintenance-free valve clearance is archived.

Rocker arm

- With the adoption of the needle roller bearing built into the rocker arm, the contact to the cam employs rolling contact to reduce sliding resistance.

Construction

HLA

- The HLA is installed to the cylinder head.

Rocker arm

- The rocker arm is installed to the HLA and upper area of the valve.
- The needle roller bearing is built into the rocker arm.

Operation

Before valve opening

1. The plunger presses up the rocker arm by the spring force of the plunger spring to maintain the valve clearance at 0 mm.

During valve opening

1. If the cam presses down the rocker arm, load is applied to the plunger and valve.

2. If load is applied to the plunger, the hydraulic pressure in the high pressure chamber (A chamber) increases and the check ball closes the hydraulic passage.

3. If the hydraulic passage is closed, the plunger is fixed becoming the rocker arm pivot point because the volume of the engine oil in the high pressure chamber is not changed.

4. The rocker arm presses down the valve.

After valve opening

1. If load is not applied to the plunger, the plunger spring presses up the plunger (maintains valve clearance at 0 mm).

2. Because the capacity of the high pressure chamber (A chamber) increases in Step 1, the check ball is opened and engine oil flows from the reserve chamber (B chamber) to the high pressure chamber (A chamber) to prepare for the next step.

3. The oil in the reserve chamber (B chamber) which is decreased by supplying it to the high pressure chamber (A chamber), is supplied from the oil passage of the cylinder head.

2014 - Mazda3 - Engine

VARIABLE VALVE TIMING MECHANISM [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Outline

- Achieves optimum valve timing according to the driving conditions by the variable valve timing mechanism changing the phases of the camshaft.
- An electric type variable valve timing mechanism on the intake side and a hydraulic pressure type on the exhaust side has been adopted. The expansion of the valve opening angle and the accuracy of the intake and exhaust controls have been improved.
- The electric variable valve timing mechanism obtains higher response than the hydraulic variable valve timing mechanism. As a result, expansion of overlap and the closing timing of the intake valve are achieved.

Structural View

Structure

Part name	Function
Hydraulic variable valve timing actuator	The hydraulic variable valve timing actuator operates according to the hydraulic pressure and changes the phases of the exhaust camshaft.
Electric variable valve timing actuator	The electric variable valve timing actuator changes the phases of the intake camshaft.

Electric variable valve timing motor/driver	Operates the electric variable valve timing actuator based on the signals from the PCM.
OCV	Operated by current (duty signal) from the PCM. Controls the hydraulic oil passages to the variable valve timing actuator.
Intake camshaft position sensor	Sends the intake camshaft position signal to the PCM.
Exhaust camshaft position sensor	Sends the exhaust camshaft position signal to the PCM.
Crankshaft position sensor	Sends the crankshaft position signal to the PCM.

Operation

At engine start

- Engine startability has been improved by utilizing the features of the operable electric VVT even under the engine stop condition and controlling the optimal timing according to engine conditions.

Light/medium load range

- Pumping loss* is reduced by properly controlling the timing of intake and exhaust, improving the fuel consumption rate.

*
Energy loss which occurs from each type of resistance corresponding to intake and exhaust is called pumping loss.

High load range

- By properly controlling the timing of the intake and exhaust and using the effect of scavenging residual gas in the cylinder and the inertia charging effect, the volumetric efficiency and the output are improved.

2014 - Mazda3 - Engine

ENGINE MOUNT [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose, Function

- The engine mount secures the engine and transaxle to the vehicle body, reducing vibration and noise.

Construction

- The three points at the engine front (No.3 engine mount), one side of the transaxle (No.1 engine mount), and the rear upper part of the transaxle (No.4 engine mount) are supported.

- With the adoption of the oil-filled bushing type for the No.3 engine mount and No.4 engine mount rubber, the damper effect has been improved.

NO.1 ENGINE MOUNT RUBBER

NO.3 ENGINE MOUNT

NO.4 ENGINE MOUNT RUBBER

NO.1 ENGINE MOUNT BRACKET

NO.4 ENGINE MOUNT BRACKET

Operation

- By locating the one side of the transaxle (No.1 engine mount) to the transaxle lower end, the No.1 engine mount absorbs the rotation force to the powertrain generated during engine torque fluctuation. The layout is designed to disperse the rotation force to the front/back directions of the engine.

2014 - Mazda3 - Engine

OIL CONTROL VALVE (OCV) [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose, Function

- The OCV switches the oil passage to the hydraulic variable valve timing actuator to control the opening/closing period of the exhaust valve.

Construction

- The OCV is installed to the exhaust camshaft cap (No.1).
- The OCV consists of a spool valve which switches the engine oil passage and a plunger, coil, and return spring which operate the spool valve.

Operation

At retard

- The spool valve is moved to the retard side by the signal from the PCM and engine oil is lead to the retard oil passage of the exhaust camshaft.

At advance

- The spool valve is moved to the advance side by the signal from the PCM and engine oil is lead to the advance oil passage of the exhaust camshaft.

Middle point maintenance

- The spool valve is moved to the closed position of the oil passage to the exhaust camshaft by the signal from the PCM.
- The construction is designed to supply a small amount of oil to the advance and retard oil passages even while the middle point is maintained, improving holding stability while at low oil pressure.

HYDRAULIC VARIABLE VALVE TIMING ACTUATOR [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose, Function

- The hydraulic variable valve timing actuator operates according to the hydraulic pressure and changes the phases of the exhaust camshaft. As a result, the open/close period of the exhaust valve is changed, optimized valve timing in accordance with driving conditions is archived, and the output and combustion efficiency is improved.

Construction

- The hydraulic variable valve timing actuator is installed to the exhaust camshaft.
- The hydraulic variable valve timing actuator has an assist spring to move the rotor in the advance direction while the engine is stopped.

Operation

At engine start

- Because the stopper pin in the hydraulic variable valve timing actuator is engaged with the rotor at the maximum advance position by the spring force, the camshaft sprocket and camshaft are rotated as a single unit.

Retarding valve timing

- Engine oil is lead to the retard oil passage by the OCV to apply oil pressure to the stopper pin and retard chamber. As a result, the engagement of the stopper pin is released, the rotor connected to the camshaft rotates in the retard direction against the camshaft sprocket driven by the crankshaft, and the valve timing is retarded.

Advancing valve timing

- Engine oil is lead to the advance oil passage by the OCV to apply oil pressure to the advance chamber. As a result, the rotor connected to the camshaft rotates in the advance direction against the camshaft sprocket driven by the crankshaft, and the valve timing is advanced.

Maintaining intermediate valve timing

- The retard and advance oil passages is closed by the OCV. As a result, the relative angle of the rotor and camshaft sprocket is maintained at a constant to hold the valve timing.

2014 - Mazda3 - Engine

ELECTRIC VARIABLE VALVE TIMING ACTUATOR [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose, Function

- The electric variable valve timing actuator changes the phases of the intake camshaft relative to the crankshaft. As a result, the open/close period of the intake valve is changed, optimized valve timing in accordance with driving conditions is archived, output is improved, and emission reduction is archived.

Construction

- The electric variable valve timing actuator is installed to the intake camshaft.

- The electric variable valve timing actuator consists of the following parts:

- The sprocket gear rotates together with the intake camshaft sprocket.
- The camshaft gear rotates together with the intake camshaft.
- The eccentric shaft is an eccentric shape relative to the rotation axis of the intake camshaft.
- The planetary gear is engaged with the eccentric shaft. In addition, the planetary gear is engaged with the sprocket gear and the camshaft gear.
- The number of teeth for the planetary gear (large) is one tooth fewer than the number of teeth for the sprocket gear.
- The number of teeth for the planetary gear (small) is one tooth fewer than the number of teeth for the camshaft gear.
- The planetary gear rotates by receiving the rotation force from the eccentric shaft.
- The camshaft gear rotates by receiving the rotation force from the planetary gear.

Operation

Advancing valve timing

- The electric variable valve timing motor rotation speed is faster than the intake camshaft sprocket rotation speed. As a result, the camshaft gear rotates in the advance direction relative to the intake camshaft sprocket, and the valve timing is advanced.

Retarding valve timing

- The electric variable valve timing motor rotation speed is slower than the intake camshaft sprocket rotation speed. As a result, the camshaft gear rotates in the retard direction relative to the intake camshaft sprocket, and the valve timing is retarded. (If engine rotation speed is slow, the electric variable valve timing motor may be rotating in reverse and the camshaft gear may be rotating in the retard direction.)

Maintaining intermediate valve timing

- The electric variable valve timing motor rotation speed is the same as the intake camshaft sprocket rotation speed. As a result, the phase difference of the camshaft gear relative to the intake camshaft sprocket is maintained, the camshaft gear rotation speed is the same as the intake camshaft sprocket rotation speed, and the valve timing is maintained.

Fail-safe

ELECTRIC VARIABLE VALVE TIMING RELAY [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose, Function

- The electric variable valve timing actuator relay supplies power to the electric variable valve timing motor/driver after receiving the signal from the PCM.

Construction

- The electric variable valve timing actuator relay is installed to the relay block. (See **RELAY AND FUSE BLOCK**.)

Operation

1. When current flows between A—B shown in the figure, electromagnetic power is generated, the switch between C—D is turned on, and the current flows between C—D.

2. Current flows between C—D and power is supplied to the electric variable valve timing motor/driver.

Fail-safe

- Function not equipped.

ELECTRIC VARIABLE VALVE TIMING RELAY [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

2014 - Mazda3 - Engine

BALANCER UNIT [SKYACTIV-G 2.5]

Purpose, Function

- The balancer unit eliminates the secondary inertia force occurring in the in-line 4-cylinder engine which reduces engine vibration. As a result, booming noise (low frequency noise which causes the feeling of ear compression) is suppressed and a high-level quietness has been archived.

Construction

- The balancer unit is installed on the lower part of the cylinder block.

- The balancer unit consists of two balancer shafts with weights (No.1 and No.2) and the balancer unit case.
- Agitation resistance has been reduced by covering the balancer shafts and gears with the balancer unit case.

Operation

- The balancer shaft rotates by receiving the crankshaft rotation force via the balancer shaft sprocket.
- The balancer shaft rotation speed is twice the rotation speed of the crankshaft. As a result, the balancer shaft can generate inertia force (eliminates secondary inertia force) in the opposite direction in response to the occurrence of secondary inertia force.

2014 - Mazda3 - Engine

LUBRICATION SYSTEM [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Outline

- Pressure loss is reduced by optimizing the oil passage.
- With the adoption of the chain drive type oil pump, oil pump drive force has been reduced.
- With the adoption of the oil shower pipe, sliding resistance has been reduced.
- With the adoption of the engine oil solenoid valve, oil pump discharge pressure can be controlled (hydraulic two-step control).

2014 - Mazda3 - Engine

OIL FILTER [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose, Function

- Engine oil is filtered by passing engine oil through the oil filter element.

Construction

- The oil filter is installed on the right side surface of the cylinder block.
- A spin-on type (full-flow type) oil filter has been adopted.

- The bypass valve is equipped as a detour if the oil filter element becomes clogged.

OIL FILTER [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

2014 - Mazda3 - Engine

OIL PAN [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose, Function

- The engine oil required for lubrication in the engine accumulates in the oil pan.

Construction

- The oil pan is installed on the lower part of the cylinder block.

SKYACTIV-G 2.0

SKYACTIV-G 2.5

- Silicone sealant with excellent sealing has been adopted for the oil pan gasket.

2014 - Mazda3 - Engine

OIL STRAINER [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose, Function

- The oil strainer suctions the engine oil in the oil pan using the oil pump vacuum. The engine oil is filtered by the internal filter at that time.

Construction

- The oil strainer is installed on the suction port of the oil pump.

SKYACTIV-G 2.0

SKYACTIV-G 2.5

- The oil strainer has a filter in the inside.

OIL PUMP [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Outline

- The oil pump has a mechanism for feedback control of oil pressure. As a result, an oil pressure increase of more than the set pressure is suppressed and oil pump drive resistance is reduced. In addition, because the set pressure can be changed (oil pressure two-step control) by operating the engine oil solenoid valve, the oil pump drive resistance is reduced even during low speed/low to medium loads.

Purpose, Function

- The oil pump suctions the engine oil in the oil pan through the oil strainer and pumps engine oil into the engine.

Construction

- The oil pump is installed on the lower part of the cylinder block (in oil pan).

SKYACTIV-G 2.0

SKYACTIV-G 2.5

- With the adoption of the chain drive type oil pump, the diameter of the rotor is reduced. As a result, the oil pump drive resistance has been reduced.
- The oil pump consists of the following parts:

SKYACTIV-G 2.0

SKYACTIV-G 2.5

- The relief valve and bypass valve is pushed and opened if oil pressure increases excessively when starting an extremely cold engine. As a result, the engine oil flows and excessive oil pressure increase is suppressed.
- When the relief valve is pushed and opened, engine oil flows. As a result, the oil pressure decreases and the oil pump drive resistance is reduced.

SKYACTIV-G 2.0

OIL PUMP CROSS SECTION

SKYACTIV-G 2.5

Operation

- The oil pump adjusts oil pressure in two steps (low oil pressure setting, high oil pressure setting) by switching the oil passage with the operation of the engine oil solenoid valve. For the operation condition of the engine oil solenoid valve, refer to CONTROL SYSTEM. (See **ENGINE OIL CONTROL [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)

  Engine oil flow when setting low oil pressure (engine oil solenoid valve ON)

  - When the engine oil solenoid valve is turned ON, oil pressure is also applied to the upper part of the pilot valve. Because the oil pressure applied to the upper and lower parts of the pilot valve is almost the same, the pilot valve is pressed up by the spring force.
  - Oil pressure is applied to the upper part of the relief valve.
  - When the oil pressure exceeds the relief valve opening pressure, the relief valve is pressed down and engine oil flow stops (oil pressure decrease).
  - When the oil pressure is less than the relief valve opening pressure, the relief valve closes. As a result, engine oil flow stops (oil pressure increase).

- Oil pressure is adjusted by repeating Step (c) to (d).

Engine oil flow when setting high oil pressure (engine oil solenoid valve OFF)

- When oil pressure exceeds the pilot valve opening pressure, the pilot valve is pressed up and oil pressure is applied to the upper part of the relief valve.
- Because the relief valve opening pressure is exceeded by applying oil pressure to the upper part of the relief valve, the relief valve is pressed down and engine oil flows (oil pressure decrease).
- When the oil pressure is less than the pilot valve opening pressure, the pilot valve closes. As a result, the relief valve closes and engine oil flow stops (oil pressure increase).
- Oil pressure is adjusted by repeating Step (b) to (c).

2014 - Mazda3 - Engine

OIL JET VALVE [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose, Function

- The oil jet valve injects engine oil on the back of the piston to cool the piston.

Construction

- The oil jet valve is installed into the cylinder block.

- The oil jet valve is built into the check ball and spring.

Operation

1. When the oil pressure applied to the check ball exceeds the spring force, the check ball and spring are pressed down.
2. The oil passage is opened to the nozzle and engine oil is injected to the back side of the piston.

3. When the oil pressure applied to the check ball is lower than the spring force, the spring presses up the check ball.
4. The oil passage to the nozzle is closed and the injection of engine oil stops.

2014 - Mazda3 - Engine

ENGINE OIL SOLENOID VALVE [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose, Function

- The engine oil solenoid valve switches the hydraulic transmission passage in accordance with the driving conditions and the oil pump drive resistance is reduced by controlling oil pump discharging pressure in two steps.

Construction

- The engine oil solenoid valve is installed on the right side of the cylinder block.

- The engine oil solenoid valve has the following parts:

- A duty drive type has been adopted.

Operation

- The oil passage in the solenoid valve is switched according to the control signal (duty signal) from the PCM.

Fail-safe

- Function not equipped.

2014 - Mazda3 - Engine

OIL SHOWER PIPE [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Outline

- Mechanical resistance loss has been reduced through structural changes to achieve optimum fuel economy. An oil shower pipe has been adopted as a part of this structural change.

Purpose, Function

- The oil shower pipe injects engine oil to lubricate the contact points of the cam and rocker arm. As a result, wear resistance of sliding part is reduced.

Construction

- The oil shower pipe is installed to the camshaft cap.

- The oil shower pipe utilizes the engine oil injection holes at the top of the camshaft.

Operation

- The oil shower pipe injects engine oil from the engine oil injection holes using hydraulic pressure.

OIL SHOWER PIPE [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

2014 - Mazda3 - Engine

COOLING SYSTEM [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Outline

- Passing water resistance is reduced by improvement of the engine coolant passage shape.
- Pump efficiency has been improved by changing the water pump impeller to a closed impeller.

2014 - Mazda3 - Engine

RADIATOR [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose, Function

- The radiator disperses the engine coolant heat flowing internally by receiving the air flow against the vehicle while it is driven or the air flow produced by the cooling fan.

Construction

- The radiator is installed to the front of the engine compartment.
- Four mounting rubbers are utilized to decrease vibration.

- A down-flow radiator with corrugated fins has been adopted.
- The radiator tanks are made of plastic and the core is made of aluminum for weight reduction.

CORE
TANK
TANK
ECT SENSOR NO.2

2014 - Mazda3 - Engine

COOLING SYSTEM CAP [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose, Function

- The cooling system cap maintains appropriate pressure in the engine coolant passage. In addition, cooling efficiency has been improved by increasing the engine coolant boiling point.

Construction

- The cooling system cap is installed to the upper part of the radiator.

Operation

When engine coolant temperature is high

1. When the engine coolant temperature is high, the pressure in the engine coolant passage increases and the pressure valve is pressed and opened.

2. Engine coolant flows into the coolant reserve tank when the pressure valve is open.

When engine coolant temperature is low

1. When the engine coolant temperature is low, the pressure in the engine coolant passage decreases and the vacuum valve is opened.

2. Engine coolant in the coolant reserve tank flows into the engine coolant passage when the vacuum valve is open.

ENGINE COOLANT TEMPERATURE IS LOW

2014 - Mazda3 - Engine

THERMOSTAT [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose, Function

- When the engine coolant temperature is low, the thermostat blocks the engine coolant passage between the radiator and engine. As a result, because engine coolant cycles without passing through the radiator, faster warming is promoted.

Construction

- The thermostat is installed to the rear part of the cylinder head.

- The thermostat has the following parts:

U.S.A. and Canada

Except U.S.A. and Canada

Operation

1. When the engine coolant temperature decreases, the thermostat valve closes and engine coolant circulates without passing through the radiator.

2. When the engine coolant temperature reaches one of the following temperature ranges, the thermostat valve starts to open and the engine coolant passed through the radiator flows to the engine.

- U.S.A. and Canada: 80.5—83.5 °C {145—150 °F}
- Except U.S.A. and Canada: 86.5—89.5 °C {156—161 °F}

WATER PUMP [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose, Function

- The water pump operates by obtaining drive force from the engine via the drive belt to pump engine coolant.

Construction

- The water pump is installed to the engine front.

- The water pump consists of the following parts:

- A hard plastic shroud impeller has been adopted to the impeller. As a result, leakage loss from the front and back surfaces of the impeller is reduced and the pump efficiency is improved.

Operation

1. The water pump pulley rotates by obtaining drive force from the engine via the drive belt.
2. The impeller with the water pump pulley and shaft connected rotates to pump engine coolant.

2014 - Mazda3 - Engine

COOLING FAN COMPONENT [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose, Function

- The cooling fan rotates according to vehicle conditions and enhances the cooling efficiency of the radiator.

Structural View

- 
Operation

- For electrical fan control details, refer to CONTROL SYSTEM. (See **ELECTRICAL FAN CONTROL [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)

Fail-safe

- Function not equipped.

2014 - Mazda3 - Engine

COOLING FAN RELAY [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose, Function

- The cooling fan relay operates by receiving the signal from the PCM to supply power to the cooling fan motor.

Construction

- The cooling fan relay is installed on the relay and fuse block.

Operation

- The contact point is on when the battery voltage is supplied to the coil based on the signal

from the PCM, and the battery voltage is supplied to the cooling fan motor.

Fail-safe

- Function not equipped.

2014 - Mazda3 - Engine

INTAKE-AIR SYSTEM [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose, Outline

- A vacuum pump has been adopted which supplies stable vacuum to the power brake unit.

Accelerator pedal	(See **ACCELERATOR PEDAL, KICKDOWN SWITCH [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)

2014 - Mazda3 - Engine

FRESH-AIR DUCT [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose, Function

- Conducts fresh air from outside the engine compartment.
- Increases air density by taking fresh air, which is cooler than the engine compartment, to enhance the charging efficiency, ensuring the combustion stability.

Construction

- The fresh-air duct is installed to the air cleaner.

FRESH-AIR DUCT [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

2014 - Mazda3 - Engine

RESONANCE CHAMBER [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose, Function

- Pulsation of intake air is controlled and intake air noise is reduced by adding an intake air passage.

Construction

- The resonance chamber is installed to fresh-air duct.

RESONANCE CHAMBER [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

2014 - Mazda3 - Engine

AIR CLEANER [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose, Function

- Prevents engine internal damage caused by penetration of dust or foreign material.

Construction

- The air cleaner is installed in front of the battery.

- The air cleaner consists of the air cleaner case, air cleaner cover, and air cleaner element.

- Non-woven fabric (dry type) air cleaner element has been adopted to remove dust and foreign material in the intake air.

AIR CLEANER ELEMENT

2014 - Mazda3 - Engine

THROTTLE BODY [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose, Function

- Opens/closes the throttle valve to adjust the amount of air supplied to the cylinder.
- Opens/closes the throttle valve according to the control signal from the PCM.

Construction

- The throttle body is installed to the intake manifold.

- The throttle body consists of a throttle valve, throttle valve actuator, TP sensor, and return spring.

- For the throttle position sensor, refer to CONTROL SYSTEM. (See **THROTTLE POSITION (TP) SENSOR [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)

Operation

- The throttle valve actuator opens/closes the throttle valve according to the control signal from the PCM. If there is a malfunction in the throttle valve actuator, the throttle valve is closed by the return spring in the throttle body.

- For the drive-by-wire control, refer to CONTROL SYSTEM. (See **DRIVE-BY-WIRE CONTROL [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)

Fail-safe

P2110:00	
P2112:00	
P2119:00	• Restricts the upper limit of the engine speed.

2014 - Mazda3 - Engine

VACUUM PUMP [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose, Function

- Ensures vacuum required for braking force to compensate for the decrease in intake manifold vacuum applied to the power brake unit caused by the retard intake valve closing.

Construction

- The vacuum pump is installed to the rear housing.

- For smooth vane rotation, a single-vane type vacuum pump has been adopted which is equipped with an engine oil lubrication passage.

Operation

- Because the vacuum pump is directly engaged with the exhaust camshaft, the vane in the vacuum pump rotates together with the exhaust camshaft, and the vacuum chamber is expanded and vacuum is generated.

Vacuum generation mechanism

2014 - Mazda3 - Engine

INTAKE MANIFOLD [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose, Function

- Distributes intake air to each cylinder evenly.
- Optimizes the combustion efficiency and performance of the engine by distributing intake air to each cylinder.

Construction

- The intake manifold is installed to the cylinder head.

INTAKE MANIFOLD [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

2014 - Mazda3 - Engine

ACCELERATOR PEDAL, KICKDOWN SWITCH [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose, Function

- The driver's intentions are transmitted to the PCM via the accelerator pedal.

  Kickdown switch (ATX)

- If the accelerator pedal is depressed carelessly, kickdown control will be implemented based on the accelerator pedal being determined as fully open, and vehicle shock will occur. A kickdown switch has been adopted so that it can be determined that the accelerator pedal is fully open based on the driver's intention of depressing the accelerator pedal for kickdown.

Construction

- The accelerator pedal has a built-in APP sensor and kickdown switch (ATX).

- For the APP sensor, refer to CONTROL SYSTEM. (See **ACCELERATOR PEDAL POSITION (APP) SENSOR [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)

Kickdown Switch (ATX)

- A load can be felt while the accelerator pedal is being depressed and when it is further depressed the kickdown switch turns on.

The driver can control the kickdown by knowing the amount of accelerator depression.

- The kickdown switch is only a measure of the kickdown. An electrical signal is not transmitted by the kickdown switch turning on/off, and vehicle control is not affected.

2014 - Mazda3 - Engine

FUEL SYSTEM [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose, Outline

- A multiple hole type fuel injector has been adopted which provides higher fuel injection accuracy for improved fuel efficiency and output.
- Piston movement-compression by the 4-head cam inside the high pressure fuel pump heightens the fuel pressure, achieving improved fuel efficiency and output.

Structural View

Fuel type

Fuel	Octane Rating* (Anti-knock index)
Regular unleaded fuel	87 [(R+M)/2 method] or above (91 RON or above)

* **U.S. federal law requires that octane ratings be posted on gasoline station pumps.**

2014 - Mazda3 - Engine

RETURNLESS FUEL SYSTEM [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose, Outline

- Fuel evaporation in the fuel tank is reduced by adjusting the fuel amount (fuel pressure) ejected from the fuel pump and preventing fuel warmed in the engine compartment from returning.

System Diagram

Structure

- The returnless fuel system consists of the following parts:

Part name	Reference

Fuel filter (low-pressure)	(See **FUEL PUMP UNIT [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)
Fuel filter (high-pressure)	
Pressure regulator	
Fuel pump	

Operation

- Fuel in the fuel tank is pumped out through the fuel filter (low-pressure) by the fuel pump, filtered by the fuel filter (high-pressure), and then regulated to a specified pressure by the pressure regulator. The regulated fuel is sent to the high pressure fuel pump, and unnecessary regulated fuel is returned from the pressure regulator to the fuel tank.

2014 - Mazda3 - Engine

FUEL TANK [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose, Function

- Store fuel safely and supply fuel to the engine.

Construction

- The fuel tank is installed below the rear seat.

U.S.A. and CANADA

Except U.S.A. and CANADA

- The fuel tank is made of steel.
- The following parts are integrated in the fuel tank.

  U.S.A. and CANADA

  - Non-return valve

    (See **NON-RETURN VALVE [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)
  - Rollover valve

(See **ROLLOVER VALVE [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)

- Fuel shut-off valve

  (See **FUEL SHUT-OFF VALVE [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)

Except U.S.A. and CANADA

- Non-return valve

  (See **NON-RETURN VALVE [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)

- Rollover valve

  (See **ROLLOVER VALVE [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)

2014 - Mazda3 - Engine

NON-RETURN VALVE [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose, Function

- Assures safety by preventing fuel from returning to the fuel filler opening.

Construction

- The non-return valve cannot be removed as it is installed inside the fuel tank.

U.S.A. and CANADA

Except U.S.A. and CANADA

- A single valve type has been adopted for the non-return valve.

Operation

- Normally, the valve is closed as shown by the dotted line in the figure. When refueling, it opens as shown by the solid line due to the force caused by the flow of fuel. When

refueling is finished, the valve returns to the normal valve position by spring force.

2014 - Mazda3 - Engine

FUEL PUMP UNIT [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose, Function

- Supplies fuel in the fuel tank to the high pressure fuel pump.
- Based on the control signal from the PCM, the fuel pump operates by the operation of the fuel pump relay and the fuel pump control module.

Construction

- The fuel pump unit is installed to the fuel tank.

U.S.A. and CANADA

Except U.S.A. and CANADA

- The fuel pump unit consists of a fuel pump, fuel filter (low-pressure) fuel filter (high-pressure), pressure regulator, and lower cover.

Operation

- Based on the control signal from the PCM, the fuel pump suctions fuel in the lower cover and pumps it to the high pressure fuel pump. After fuel is sufficiently filtered through the fuel filter (low-pressure) and fuel filter (high-pressure), fuel pressure is adjusted to **approx. 430 kPa {4.38 kgf/cm^2, 62.4 psi}** by the pressure regulator.

Fail-safe

- Function not equipped.

2014 - Mazda3 - Engine

FUEL DISTRIBUTOR [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose, Function

- Distributes fuel pumped from the high pressure fuel pump to each fuel injector.

Construction

- The fuel distributor is installed to the cylinder head.

- The fuel distributor is integrated with the fuel pressure sensor.

FUEL DISTRIBUTOR [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

2014 - Mazda3 - Engine

FUEL INJECTOR [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose, Function

- Promotes atomization of fuel by injecting it from the multiple holes.
- Injects fuel according to the control signal from the PCM.

Construction

- The fuel injector is installed to the cylinder head.

- The fuel injector has multiple injection holes in area A shown in the figure.

Operation

- Injects fuel according to the signal from the PCM. The fuel injection time is determined by the energization time of the coil.

- For fuel injection control details, refer to CONTROL SYSTEM. (See **FUEL INJECTION CONTROL SYSTEM [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)

Fail-safe

- Function not equipped.

FUEL INJECTOR [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

2014 - Mazda3 - Engine

QUICK RELEASE (FUEL SYSTEM) CONNECTOR [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose, Function

- Serviceability has been improved by the easy disconnection/connection.

Construction

- The following types of the quick release connectors are used.

U.S.A. and CANADA

Except U.S.A. and CANADA

Type A

- An SST is not used with this type.
- Mainly consists of a retainer and O-ring. The quick release connector is integrated with the fuel hose and therefore cannot be disassembled.
- When the quick release connector is connected, the fuel pipe projection is locked at the clamp lock point. To release the quick connector lock for each type, follow the procedure in the order shown in each figure.

Type B

- An SST is used with this type.

- Consists of a retainer and O-ring. The quick release connector is integrated with the fuel hose and therefore cannot be disassembled.
- To connect the quick release connector properly, push it into the fuel pipe until a click sound is heard.
- New quick release connectors are fitted with a checker tab that prevent improper installation. This checker tab cannot normally be removed. When the quick release connector is properly connected to the fuel pipe, the lock is released and the checker tab comes off. Due to this, it can be verified that the quick release connector is completely connected.

2014 - Mazda3 - Engine

FUEL PUMP RELAY [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose, Function

- Controls the fuel pump on/off according to control signals from the PCM.
- The fuel pump is operated only at engine start or when the engine is running to improve safety.

Construction

- The fuel pump relay is installed in the relay and fuse block.

Operation

- The contact point is on when the battery voltage is supplied to the coil based on the signal from the PCM, and the battery voltage is supplied to the fuel pump control module.

Fail-safe

- Function not equipped.

2014 - Mazda3 - Engine

FUEL INJECTOR RELAY [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose, Function

- Supplies power to the PCM for the fuel injector and spill valve control solenoid valve operation.

Construction

- The fuel injector relay is installed in the relay and fuse block.

Operation

- When the ignition is switched ON, the battery voltage is supplied to the coil and the contact point is on, thus the battery voltage is supplied to the PCM.

Fail-safe

- Function not equipped.

2014 - Mazda3 - Engine

DIRECT FUEL INJECTION SYSTEM [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose, Outline

- Engine output has been improved through the direct injection of fuel into the combustion chamber.
- High response can be achieved because there is no time lag from when the fuel injection starts until the fuel is provided to the combustion chamber.

Structure

- The direct fuel injection system consists of the following parts.

Part name	Reference
High pressure fuel pump	(See **HIGH PRESSURE FUEL PUMP [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)
Fuel injector	(See **FUEL INJECTOR [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)
Fuel distributor	(See **FUEL DISTRIBUTOR [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)
Fuel pressure sensor	(See **FUEL PRESSURE SENSOR [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)
Relief valve	—

Operation

- Fuel is supplied from the high pressure fuel pump into the fuel distributor, and the fuel injector injects the fuel into the cylinder. Fuel is injected during the intake stroke and diffused uniformly in the combustion chamber by the flow of intake air. For the fuel injection control, refer to the CONTROL SYSTEM. (See **FUEL INJECTION CONTROL SYSTEM [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)
- The fuel pressure sensor detects the fuel pressure in the fuel distributor and sends a fuel pressure signal to the PCM. Based on the signal from the fuel pressure sensor, the PCM controls the high pressure fuel pump so that the fuel pressure is in accordance with the driving conditions. For the high pressure fuel pump control, refer to CONTROL SYSTEM. (See **HIGH PRESSURE FUEL PUMP CONTROL [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)
- Fuel pressure is adjusted by the spill valve control solenoid valve, and a relief valve is equipped to ensure safety in case of a malfunction. If the fuel pressure in the high pressure fuel pump reaches the set pressure, the relief valve is mechanically opened and fuel is returned to the fuel tank side.

ENGINE COMPARTMENT SIDE
FUEL TANK SIDE
FUEL INJECTOR
HIGH PRESSURE
FUEL PUMP
FUEL TANK
FUEL PRESSURE SENSOR

2014 - Mazda3 - Engine

HIGH PRESSURE FUEL PUMP [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose, Function

- Applies pressure to fuel sent from the fuel pump equipped on the fuel tank, and then pumps it to the fuel delivery pipe.
- Fuel is sectioned and pumped by the up and down movement of the piston caused by the rotation of the cam installed to the rear end of the exhaust camshaft.

Construction

- The high pressure fuel pump is installed to the exhaust camshaft with the vacuum pump.

- The high pressure fuel pump consists of a spill valve control solenoid valve, spill valve, piston, and spring.

Operation

- Based on the control signal from the PCM, the spill valve solenoid valve opens and closes in the high pressure fuel pump.
- For the high pressure fuel pump control details, refer to CONTROL SYSTEM. (See **HIGH PRESSURE FUEL PUMP CONTROL [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)

Fail-safe

DTC	Fail-safe
P0089:00	• Limits the intake air amount. • Stops the high pressure fuel pump control. • The upper limit of the engine speed is 2,500 rpm.
P0091:00	• Limits the intake air amount. • Stops the high pressure fuel pump control.
P0092:00	

2014 - Mazda3 - Engine

FUEL PUMP CONTROL MODULE [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose, Function

- Controls the voltage applied to the fuel pump for reducing fuel pump load and improving fuel economy.
- Controls the voltage applied to the fuel pump based on the control signal from the PCM.

Construction

- The fuel pump control module is installed below the rear seat.

Operation

- Controls the voltage applied to the fuel pump based on the control signal from the PCM. In addition, the on-board diagnostic function is equipped and if there is a malfunction in the fuel pump control module, a diagnostic signal is sent to the PCM. The PCM stores a DTC if necessary according to the received diagnostic signal.

- For the fuel pump control module, refer to CONTROL SYSTEM. (See **FUEL PUMP CONTROL [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)

Fail-safe

P025B:00	• Stops the fuel pump control (when overheating is detected).
P0629:00	• Stops the fuel pump control.

2014 - Mazda3 - Engine

EXHAUST SYSTEM [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose, Outline

- A high compression ratio has been realized by adopting 4-2-1 exhaust pipes and reducing residual gas in the cylinders.
- The loop structure of the exhaust pipes for the 4-2-1 system takes up less space.

Structural View

System Diagram

Structure

- The exhaust system consists of the following parts:

Part name	Reference
Main silencer	(See **MAIN SILENCER [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)
Presilencer	(See **PRESILENCER [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)
TWC	(See **CATALYTIC CONVERTER [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)
WU-TWC	
Exhaust manifold	(See **EXHAUST MANIFOLD [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)

2014 - Mazda3 - Engine

EXHAUST MANIFOLD [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose, Function

- By lengthening the exhaust passage, the transmission of exhaust pressure waves to other cylinders can be delayed, therefore the amount of exhaust gas forced back into the combustion chamber is reduced. By reducing the residual gas, the temperature inside the combustion chamber is lowered and the occurrence of knocking is suppressed even at a high compression ratio.

Construction

- The exhaust manifold is installed to the rear of the engine. In addition, the catalytic converter (WU-TWC) is integrated (WU-TWC).

Residual gas occurrence mechanism

1. When exhaust gas is exhausted from the cylinder, a pressure wave occurs inside the exhaust pipe.

2. The pressure wave reaches each cylinder and the high-temperature exhaust gas in the exhaust manifold is pushed back into the cylinder, which is in overlap.

3. The exhaust valve closes and the exhaust gas pushed back into the cylinder remains in the cylinder (Residual gas increases the temperature inside the cylinder and causes engine knocking).

Advantages of 4-2-1 exhaust pipes

- Suppresses engine knocking by reducing the residual gas and preventing the temperature inside the cylinder from increasing. A high compression ratio has been realized by suppressing engine knocking.
- With conventional short exhaust pipes, the pressure wave which occurs during the exhaust stroke of the No. 3 cylinder reaches the No.1 cylinder, which is in overlap. Because the exhaust valve of the No.1 cylinder is open while in overlap, high-temperature exhaust gas in the exhaust manifold is pushed back into the No.1 cylinder. With the 4-2-1 exhaust pipes, because the length of the pipes is long, it takes time for the pressure wave to reach each cylinder. When the pressure wave occurring from the No.3 cylinder reaches the No.1 cylinder, the exhaust valve has already been closed, therefore the amount of exhaust gas which is pushed backed at almost all engine speeds is reduced.

SHORT EXHAUST PIPES

LONG EXHAUST PIPES (4-2-1 TYPE)

2014 - Mazda3 - Engine

MAIN SILENCER [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose, Function

- Reduces the exhaust noise.

Construction

- The main silencer is installed to the vehicle rear, under the trunk compartment.

- The main silencer consists of the filters, holder, set plates and stiffener.

MAIN SILENCER [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

2014 - Mazda3 - Engine

PRESILENCER [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose, Function

- Reduces the exhaust noise.

Construction

- The presilencer is installed to the rear of the TWC.

- The presilencer consists of the filters, stuffing and wool-stainless.

2014 - Mazda3 - Engine

EMISSION SYSTEM [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose, Outline

- A single-nano catalyst has been adopted for the under-floor, three-way catalyst to improve emission gas purification efficiency.

2014 - Mazda3 - Engine

EXHAUST GAS PURIFICATION SYSTEM [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose, Outline

- Purifies contaminants (HC, CO, NOx) in the exhaust gas by utilizing the chemical reactions of the three-way catalytic converter.

System Diagram

Structure

- The exhaust gas purification system consists of the following parts:

Part name	Reference
WU-TWC	(See **CATALYTIC CONVERTER [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)
TWC	

2014 - Mazda3 - Engine

CATALYTIC CONVERTER [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose, Function

- Purifies contaminants in the exhaust gas by utilizing the chemical reactions of the three-way catalytic converter.
- A WU-TWC and a TWC have been adopted.

  WU-TWC

  - The warm up three-way catalyst is integrated with the exhaust manifold.
  - Because the catalyst receives the high temperature exhaust gas just after the gas is exhausted, it activates quickly and achieves an improved purification performance.

  TWC

  - A single-nano catalyst has been adopted in which the purification performance can be maintained using less precious metal materials than conventional catalysts.

Construction

WU-TWC

- The WU-TWC is installed to the rear of the engine.

- The WU-TWC is integrated with the exhaust manifold.

TWC

- The TWC is installed to the rear of the WU-TWC.

- A single-nano catalyst has been adopted for the under-floor three-way catalyst. With a conventional three-way catalyst, the precious metals move and agglutinate to each other by the heat of the exhaust gas because they are structured such that they adhere on catalyst material. Therefore, it was necessary to use a large amount of precious metal because it is estimated that the purification performance lowers due to the decrease in the surface area of the precious metals. The single-nano catalyst is structured such that it embeds small precious metal particles into the catalyst material. Because the precious metal particles do not agglutinate on the surface of the three-way catalyst, it can maintain superior purification performance using less precious metal than the conventional system.

Operation

- Contaminants in the exhaust gas (HC, CO, NOx) are purified by oxidization and deoxidization while they are passing through the catalytic converter.
  - Oxidization process
    - Noxious hydrocarbon (HC) and carbon monoxide (CO) are bound with oxygen and converted to non-noxious carbon dioxide and water.

      $O_2+HC+CO \rightarrow CO_2+H_2O$
  - Deoxidization process
    - Noxious nitrogen oxide (NOx) is converted to non-noxious nitrogen and oxygen. A part of the oxygen generated in this process is used in the oxidization process.

      $NOx \rightarrow N_2+O_2$

2014 - Mazda3 - Engine

POSITIVE CRANKCASE VENTILATION (PCV) SYSTEM [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose, Outline

- Prevents release of blow-by gas (unburnt gas) into the atmosphere.
- The intake manifold vacuum introduces blow-by gas to the intake manifold via the PCV valve and the ventilation hose.

System Diagram

Structure

- The positive crankcase ventilation system consists of the following parts:

Part name	Reference
PCV valve	(See **POSITIVE CRANKCASE VENTILATION (PCV) VALVE [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)
Ventilation hose	—

2014 - Mazda3 - Engine

POSITIVE CRANKCASE VENTILATION (PCV) VALVE [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose, Function

- Prevents release of blow-by gas (unburnt gas) into the atmosphere.
- The PCV valve is open/closed by the intake manifold vacuum.

Construction

- The PCV valve is installed to the oil separator.

- The PCV valve consists of a spring and valve.

SKYACTIV-G 2.0

SKYACTIV-G 2.5

Operation

When the valve is pulled by the intake manifold vacuum, blow-by gas flows to the intake manifold.

SKYACTIV-G 2.0

SKYACTIV-G 2.5

- Blow-by gas flow amount is adjusted by the spring according to the intake manifold vacuum.

2014 - Mazda3 - Engine

EVAPORATIVE EMISSION (EVAP) CONTROL SYSTEM [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose, Outline

- Prevents release of evaporative gas into the atmosphere.
- The intake manifold vacuum introduces evaporative gas to the intake manifold via the charcoal canister and the purge solenoid valve.

System Diagram

U.S.A. and CANADA

Except U.S.A. and CANADA

Structure

- The evaporative emission control system consists of the following parts:

U.S.A. and CANADA

Part name	Reference
Purge solenoid valve	(See **PURGE SOLENOID VALVE [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)

Fuel-filler cap	(See **FUEL-FILLER CAP [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)

2014 - Mazda3 - Engine

PURGE SOLENOID VALVE [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose, Function

- Introduces evaporative gas absorbed by the charcoal canister to the intake manifold.
- The purge solenoid valve opens according to the control signal from the PCM.

Construction

- The purge solenoid valve is installed in the engine compartment.

- The purge solenoid valve consists of a coil, spring, and plunger.

Operation

- According to the control signal from the PCM, the coil is energized and the plunger is operated to open/close the purge solenoid valve.

- When the purge solenoid valve is open, evaporative gas flows from the charcoal canister to the intake manifold side.

Purge solenoid valve open/closed view

- For evaporative purge control details, refer to CONTROL SYSTEM. (See **PURGE CONTROL [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)

Fail-safe

- Function not equipped.

2014 - Mazda3 - Engine

CATCH TANK [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose, Function

- Suppresses pulsation occurring before evaporative gas is inducted into the intake manifold.

Construction

- The catch tank is installed in the engine compartment.

Operation

- When evaporative gas flows from the charcoal canister to the purge solenoid valve, pulsation is suppressed by passing the evaporative gas through the hollowing of the catch tank.

SKYACTIV-G 2.0

SKYACTIV-G 2.5

CATCH TANK [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

2014 - Mazda3 - Engine

FUEL-FILLER CAP [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose, Function

- Releases evaporative gas from the fuel tank if there is a malfunction in the evaporative gas passage between the fuel tank and the intake manifold. As a result, deformation of the fuel tank caused by evaporative gas pressure is prevented.

Construction

- The fuel-filler cap is installed to the fuel filler opening.

- The fuel-filler cap consists of a valves, retainer, and springs.

Operation

- When there is positive pressure in the fuel tank due to evaporative gas, evaporative gas is released into the atmosphere. When there is negative pressure, air is introduced to the fuel tank.

2014 - Mazda3 - Engine

CHARCOAL CANISTER [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose, Function

- Absorbs evaporative gas flowing from the fuel tank to prevent release of the gas into the atmosphere.

Construction

- The charcoal canister is installed near the fuel tank.

U.S.A. and CANADA

Except U.S.A. and CANADA

- The charcoal canister has activated charcoal to absorb evaporative gas.

Operation

- When the purge solenoid valve is open, evaporative gas, which is absorbed by the activated charcoal, is released by the intake manifold vacuum and the gas flows to the intake manifold.

U.S.A. and CANADA

Except U.S.A. and CANADA

2014 - Mazda3 - Engine

CANISTER VENT (CV) SOLENOID VALVE [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

U.S.A. and CANADA

Purpose, function

- Seals the atmosphere side of the charcoal canister during EVAP leak check monitoring.

Construction

- Included in the charcoal canister.

- The CV solenoid valve is consists of O-rings.

Operation

- According to the control signal from the PCM, the coil is energized and the plunger opens/closes the CV solenoid valve.

Fail-safe

- Function not equipped.

2014 - Mazda3 - Engine

FUEL SHUT-OFF VALVE [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

U.S.A. And CANADA

Purpose, function

- Prevents fuel from flowing to the charcoal canister during tight turns or vehicle rollover.
- Releases evaporative gas to the charcoal canister.
- While refueling, the fuel shut-off valve closes to prevent a fuel overflow.

Construction

- The fuel shut-off valve is built into the fuel tank.

- The fuel shut-off valve consists of float and spring.

Operation

- While refueling or due to fuel sloshing, the float is flooded with fuel and the floating force causes the valve to close. Also, during a vehicle rollover, the valve closes due to balance between the float gravity and spring.

FUEL SHUT-OFF VALVE [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

2014 - Mazda3 - Engine

ROLLOVER VALVE [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose, Function

- Prevents fuel from flowing into the evaporative gas passage during sudden cornering or vehicle rollover.

Construction

- The rollover valve is built into the fuel tank.

U.S.A. and CANADA

Except U.S.A. and CANADA

- The rollover valve consists of a float, O-ring and spring.

Operation

- The rollover valve utilizes a combination of float weight, spring force, and buoyancy. When the float is immersed in the fuel, the float (valve) closes to block the sealing surface of the passage.

ROLLOVER VALVE [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

2014 - Mazda3 - Engine

CHECK VALVE [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose, Function

- The check valve maintains constant pressure in the fuel tank.

Construction

- The check valve is installed to the side of the charcoal canister.

U.S.A. and CANADA

Except U.S.A. and CANADA

- Mainly consists of valve, umbrella, and spring.

U.S.A. and CANADA

Except U.S.A. and CANADA

Operation

- The valve moves in response to the difference in air pressure between the fuel tank side and the atmospheric side, thereby changing the path of airflow.
- When the pressure in the fuel tank becomes negative due to fuel consumption or other factors, the path opens, drawing atmospheric air into the fuel tank.

2014 - Mazda3 - Engine

EVAPORATIVE CHAMBER [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose, Function

- The evaporative chamber prevents penetration of water and dust in the charcoal canister.

Construction

- The evaporative chamber is installed to the side of the charcoal canister.

U.S.A. and CANADA (4SD)

U.S.A. and CANADA (5HB)

Except U.S.A. and CANADA

- A small section with partitions is located in the evaporative chamber.

Operation

- There partitions protect the charcoal canister by preventing flooding as atmospheric air enters from the airflow holes.

2014 - Mazda3 - Engine

QUICK RELEASE CONNECTOR (EMISSION SYSTEM) [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose, Function

- Serviceability has been improved by the easy disconnection/connection.

Construction

- The following types of quick release connectors are used.

U.S.A. and CANADA

Except U.S.A and CANADA

Type A

- An SST is not used with this type.
- Mainly consists of a retainer and O-ring. The quick release connector is integrated with the evaporative hose and therefore cannot be disassembled.
- When the quick release connector is connected, the evaporative pipe projection is locked at the clamp lock point. To release the quick connector lock for each type, follow the procedure in the order shown in each figure.

Type B

- An SST is used with this type.

- Consists of a retainer and O-ring. The quick release connector is integrated with the evaporative hose and therefore cannot be disassembled.
- To connect the quick release connector properly, push it into the evaporative pipe until a click sound is heard.
- New quick release connectors are fitted with a checker tab that prevent improper installation. This checker tab cannot normally be removed. When the quick release connector is properly connected to the evaporative pipe, the lock is released and the checker tab comes off. Due to this, it can be verified that the quick release connector is completely connected.

2014 - Mazda3 - Engine

CHARGING SYSTEM [SKYACTIV-G 2.0, SKYACTIV-G 2.5 (WITHOUT i-ELOOP)]

Outline

- Regulator-less generator (built-in power transistor) has been adopted.
- A generator using two delta connection type stator coils has been adopted.

Structural View

Structure

- Consists of the following parts:

Battery	• (See **BATTERY [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)
Generator	• (See **GENERATOR [SKYACTIV-G 2.0, SKYACTIV-G 2.5 (WITHOUT i-ELOOP)]**.)
Charging system warning light	• (See **CHARGING SYSTEM WARNING LIGHT [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)

2014 - Mazda3 - Engine

BATTERY [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose, Function

- The battery stores electricity generated by the generator. In addition, it supplies power to electronic devices if necessary.

Construction

- The battery is installed in the engine compartment. (vehicle left)

Fail-safe

DTC	Fail-safe
P057F:00	• Inhibits a part of the generator output control.

BATTERY [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

2014 - Mazda3 - Engine

GENERATOR [SKYACTIV-G 2.0, SKYACTIV-G 2.5 (WITHOUT i-ELOOP)]

Purpose, Function

- The generator operates by obtaining drive force from the engine via the drive belt and generates the required electricity for electronic devices.

Construction

- The generator is installed on the engine left front side.

- Output control is performed by the PCM resulting in the elimination of the IC regulator and the simplification of the construction.
- Two delta connection type stator coils have been adopted.

- The two stator coils form the circuit having a phase difference, and magnetic pull, which operates between the rotor and stator coil by the phase difference, is theoretically eliminated. Due to this, electromagnetic vibration and generator operation noise (electromagnetic noise) have been reduced.

- Pulsation occurring through voltage rectifying using two stator coils having a phase difference is minimized and stable voltage output is supplied.

Operation

- For generator control details, refer to CONTROL SYSTEM. (See **GENERATOR CONTROL [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)

Fail-safe

- Function not equipped.

2014 - Mazda3 - Engine

CHARGING SYSTEM WARNING LIGHT [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose, Function

- Warns the driver of a charging system malfunction.
    - For details on DTCs which illuminate the charging system warning light, refer to ON-BOARD DIAGNOSTIC SYSTEM. (See **ON-BOARD DIAGNOSTIC SYSTEM TEST MODE [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)

Construction

- The charging system warning light is built into the instrument cluster. (See **INSTRUMENT CLUSTER**.)

Operation

- Illuminates when a malfunction occurs in the charging system and a DTC is stored in the PCM.
- For vehicles with center display, a warning message in the center display is displayed when the charging system warning light is turned on. For the message content and verification method, refer to the CENTER DISPLAY. (See **CENTER DISPLAY [WITH CENTER**

DISPLAY].)

2014 - Mazda3 - Engine

IGNITION SYSTEM [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Outline

- A direct ignition coil for independent ignition control has been adopted.
- An ignition coil built-into the ion sensor has been adopted.
- An iridium spark plug has been adopted.

Structural View

IGNITION COIL
SPARK PLUG

Structure

- Consists of the following parts:

Spark plug	• (See **SPARK PLUG [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)
Ignition coil	• (See **IGNITION COIL [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)

2014 - Mazda3 - Engine

SPARK PLUG [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose, Function

- The spark plug generates spark, ignition of the air-fuel mixture occurs, and combustion of the air-fuel mixture is triggered.

Construction

- The spark plug is installed to the cylinder head.

- Iridium on the center electrode and platinum on the ground electrode are used (iridium spark plug).

- Because iridium has excellent durability, extreme thinning on the center electrode is achieved.

2014 - Mazda3 - Engine

IGNITION COIL [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose, Function

- The ignition coil generates high voltage by electromagnetic induction to discharge the spark plug.

Construction

- The ignition coil is installed to the upper part of the spark plug (direct ignition coil).
- With the adoption of the direct ignition coil, the ignition system parts have been simplified. As a result, voltage decrease is suppressed and ignition performance for the spark plug is stabilized.

- The ignition coil is built into the igniter and ion sensor. For the ion sensor, refer to CONTROL SYSTEM. (See **ION SENSOR [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)

Operation

- Optimum ignition timing is performed according to the driving conditions by integrating the ignition control function into the PCM.

Fail-safe

DTC	Fail-safe
P0300:00	• Limits the intake air amount.
P0301:00 P0302:00 P0303:00 P0304:00	• Stops the fuel injection to the misfiring cylinder. • Limits the intake air amount.

2014 - Mazda3 - Engine

STARTING SYSTEM [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Outline

- A coaxial reduction type starter has been adopted.

Structural View

Structure

- Consists of the following parts:

Starter	• (See **STARTER [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)
Starter relay	• (See **STARTER RELAY [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)
	STARTER INTERLOCK SWITCH [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Starter interlock switch (MTX)	(See .)

2014 - Mazda3 - Engine

STARTER [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose, Function

- The starter rotates the crankshaft via the ring gear and it serves as a trigger to start the engine.

Construction

- The starter is installed to the rear part of the engine on the left side.

- The starter is a coaxial reduction type which can obtain high torque.

Operation

- For starter cut-off control details, refer to CONTROL SYSTEM. (See **STARTER CUT-OFF CONTROL [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)

Fail-safe

- Function not equipped.

2014 - Mazda3 - Engine

STARTER RELAY [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose, Function

- The starter relay supplies power to the starter by receiving the signal from the PCM.

Construction

- The starter relay is installed to the relay and fuse block.

Operation

- The contact point is on when the voltage is supplied to the coil based on the signal from the start stop unit, and the battery voltage is supplied to the starter.

Fail-safe

- Function not equipped.

2014 - Mazda3 - Engine

STARTER INTERLOCK SWITCH [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose, Function

- The starter interlock switch mechanism prevents vehicle surge when the engine is started, enhancing safety. The engine cannot be started unless the clutch is depressed.

Construction

- The mechanism is provided with a starter interlock switch on the circuit under the START STOP UNIT and the PCM.

Operation

- Depressing the clutch pedal presses the starter interlock switch rod. At this time, the starter interlock switch is on, and the power circuit to the starter closes. Accordingly, the starter operates only when the clutch is depressed and the engine can be started.

Fail-safe

- Function not equipped.

2014 - Mazda3 - Engine

CRUISE CONTROL SYSTEM [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Outline

- Enables driving at a constant speed by setting the vehicle speed with the cruise control switch instead of operating the accelerator pedal.
- The PCM controls the throttle valve actuator to maintain the vehicle at a constant speed.

Component and function

Component		Function
DSC HU/CM (CAN communication: Vehicle speed signal)		The vehicle speed signal is sent to the PCM from the DSC HU/CM.
Cruise control switch	ON	The cruise control system main switch. The cruise control system goes on standby with the operation of the switch.
	OFF	The cruise control system main switch. The cruise control system is turned off with the operation of the switch.
	SET (+)	• If the switch is pressed when the vehicle speed **exceeds 25 km/h {16 mph}** with the system on standby, the vehicle speed at the point when the switch is pressed is stored in the PCM and the system initiates the cruise control. • The PCM controls acceleration by the pressing of the switch or when the switch is continuously pressed during cruise control.
	SET (−)	• If the switch is pressed when the vehicle speed **exceeds 25 km/h {16 mph}** with the system on standby, the vehicle speed at the point when the switch is pressed is stored in the PCM and the system initiates the cruise control. • The PCM controls deceleration by the pressing of the switch or when the switch is continuously pressed during cruise control.
	RESUME	If the switch is pressed when the vehicle speed **exceeds 25 km/h {16 mph}** with the system on standby and the previous pre-set vehicle speed is stored in the PCM, the system initiates the cruise control so that the vehicle speed is the pre-set vehicle speed stored in the PCM.
	CANCEL	If the switch is pressed during cruise control, the cruise control system goes on standby (pre-set vehicle speed is stored).
Brake switch		Depressing the brake pedal during cruise control switches the cruise control system to standby mode (pre-set vehicle speed is stored).
CPP switch (MTX)		Depressing the clutch pedal during cruise control switches the cruise control system to standby mode (pre-set vehicle speed is stored).
Neutral switch (MTX)		Shifting to neutral during cruise control switches the cruise control system to standby mode (pre-set vehicle speed is stored).
TCM (ATX) (CAN communication: gear signal)		If the following operation is performed during cruise control, the cruise control system goes on standby mode (pre-set vehicle speed is stored). • The selector lever is shifted from D position to N position.
DSC HU/CM		If the brake pressure **exceeds 0.3 MPa {3 kgf/cm^2, 44 psi}**, the cruise control system goes on standby mode (pre-

(CAN communication: Brake pressure)	set vehicle speed is stored).
Parking brake switch	If the parking brake is applied, the cruise control system goes on standby mode (pre-set vehicle speed is stored).
TCM (ATX) (CAN communication: diagnostic signal)	If there is a malfunction with the ATX, the cruise control system goes on standby mode (pre-set vehicle speed is stored).
PCM	The cruise control system is executed or stopped according to the cruise control switch signals. The throttle valve actuator is operated so that the vehicle speed is the pre-set vehicle speed during cruise control.
Throttle valve actuator	The duty signal sent from the PCM adjusts the throttle valve opening angle.
Cruise main indicator light (Amber)	(See **CRUISE MAIN INDICATOR LIGHT (AMBER), CRUISE SET INDICATOR LIGHT (GREEN) [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)
Cruise set indicator light (Green)	

Structural View

Block Diagram

2014 - Mazda3 - Engine

CRUISE MAIN INDICATOR LIGHT (AMBER), CRUISE SET INDICATOR LIGHT (GREEN) [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose/Function

Cruise main indicator light (amber)

- Illuminates while the cruise control system is in standby mode to inform the driver that the cruise control system is on standby.

Cruise set indicator light (green)

- Illuminates during the cruise control system operation to inform the driver that the cruise control system is operating.

Construction

- Built into the instrument cluster.

Operation

- The illumination conditions for the cruise main indicator light (amber) and cruise set indicator light (green) are as follows:

- The PCM sends a cruise main indicator light (amber) or cruise set indicator light (green) illumination request signal to the instrument

cluster via CAN communication through the front body control module (FBCM).

Fail-safe

- Function not equipped.

2014 - Mazda3 - Engine

ENGINE CONTROL SYSTEM [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Outline

- L-jetronic*1 and D-jetronic*2 type detectors have been combined for intake air amount detection, improving the accuracy of the intake air amount measurement.
    - MAF sensor adopted
    - MAP sensor adopted
    - IAT sensor No.1 and No.2 adopted
- Valve timing control has been adopted on both sides of the intake and exhaust, improving fuel economy and emission performance.

    Intake side: Electric variable valve timing control

    - Intake CMP sensor adopted
    - Electric variable valve timing motor/driver adopted
    - Electric variable valve timing relay adopted

    Exhaust side: Hydraulic variable valve timing control

    - Exhaust CMP sensor adopted
- Engine oil control has been adopted reducing engine load.
    - Engine oil solenoid valve adopted
- With the adoption of fuel pump control, fuel pump power consumption has been reduced, improving fuel economy.
    - Fuel pump control module adopted
- Generator output control adopted, fuel economy/idling stability improved.
    - Current sensor adopted
- With the adoption of the ion sensor, which detects pre-ignition, engine reliability has been improved.
- LIN communication has been adopted to the current sensor and active air shutter for simplified wiring harnesses. (with i-ELOOP)
- With the adoption of the i-ELOOP, charging efficiency during deceleration is improved. Because loss of engine force does not occur when the battery is recharged during deceleration, fuel economy is improved. (with i-ELOOP)

*1

Measures the intake air amount directly using the MAF sensor.

*2

Measures the intake air pressure introduced into the cylinder using the MAP sensor and calculates the intake air amount indirectly.

2014 - Mazda3 - Engine

MAIN RELAY CONTROL [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Outline

- Supplies power to each part by switching the main relay on/off at the optimal timing according to the vehicle conditions.

Block Diagram

Operation

- When the ignition is switched ON, the main relay turns on and electrical power is supplied to each sensor and device.
- When the ignition is switched off from ON, an on-request signal is received from each control (such as drive-by-wire control, electric variable valve timing control) and the main relay turns on for a specified period.

2014 - Mazda3 - Engine

DRIVE-BY-WIRE CONTROL [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Outline

- Calculates the optimum target throttle valve opening angle and controls the throttle valve actuator, which allows the driver to drive the vehicle at will.
- The drive-by-wire control is composed of the idle air control, accelerator control, traction control, excess engine speed control, overspeed control, electric variable valve timing cooperation control, engine oil temperature control, cruise control system, and the brake override system.

Control Table

Control name	Control outline
Idle air control	• While idling, the throttle valve opening is controlled so that the idle speed is at the target idle speed.
Accelerator control	• The throttle valve opening angle is controlled according to the amount the accelerator pedal is depressed. In addition, there is a fully closed learning function for learning deterioration over time and constant correction of the optimum throttle opening angle.
Traction control	• The throttle valve opening angle is controlled by the torque up/reduction request signal from the DSC HU/CM.
Excess engine speed control	• If the engine reaches a high engine speed, the throttle valve opening angle is controlled to protect the engine.
Overspeed control	• If the vehicle reaches a high speed, the throttle valve is closed to keep the vehicle speed below the speed limit.
Electric variable valve timing cooperation control	• Pumping loss is reduced by controlling the throttle valve opening angle according to the phase of the intake valve timing.
Engine oil temperature control	• If the PCM determines that the engine oil temperature is too high, the throttle valve opening angle is decreased and the engine speed is reduced.
Cruise control system (with cruise control system)	• Sets the vehicle speed by operation of the cruise control switch and controls the throttle valve opening angle so that it becomes close to the set vehicle speed.
Brake override system	• If the brake pedal is depressed with the accelerator pedal depressed, the vehicle can be stopped safely by closing the throttle valve. As a result, the brake operation takes priority over the accelerator pedal operation.

Block Diagram

Operation

Idle air control

- The idle speed control controls the throttle valve opening angle according to the engine torque to achieve the target idle speed.
- The PCM drives the throttle valve actuator so that the actual idle speed approaches the target idle speed.

  Target idle speed calculation

- Calculates the target idle speed according to the purpose of use such as the basic idle speed and fast idle up*.
  - *: The catalytic converter is activated quickly after cold-engine starts. (Engine speed increases up to **approx. 2,000 rpm**)

Engine torque calculation to realize target idle speed

- The engine torque is controlled in consideration of the following factors to realize the target idle speed.
  - Feedback: The torque difference is added so that the actual idle speed approaches the target idle speed.
  - Engine mechanical resistance: Changes according to the engine coolant temperature.
  - Pumping loss: Changes based on the valve timing and intake air pressure.
  - External electric load: Changes depending on the A/C ON/OFF, generator power generation amount.
  - D position torque: Adds load torque from torque converter. (ATX)

Accelerator control

- The accelerator control controls the throttle valve opening angle according to the accelerator pedal depression amount.
- The PCM controls the throttle valve actuator so that the actual throttle valve opening angle approaches the final target throttle valve opening angle.
- The target throttle valve opening angle is determined by the transmission gear position, accelerator pedal depression amount, and vehicle speed.
- Because deviation in the throttle valve opening angle due to deterioration over time is corrected when the ignition is switched off, the PCM operates the fully-closed learning function. The fully-closed learning function is a function for learning the fully-closed throttle valve position.

Traction control

- The PCM calculates the target throttle valve opening angle based on torque up/reduction request signal and engine speed from the DSC HU/CM.

Excess engine speed control

- If the engine reaches high-speed rotation*, the throttle valve is closed to maintain the engine speed at the limit speed or less to protect the engine.

*

Value fluctuates depending on various conditions.

Overspeed control

- If the vehicle reaches a high speed, the throttle valve is closed to keep the vehicle speed below the speed limit.

Electric variable valve timing cooperation control

- The PCM calculates the target throttle valve opening angle according to change in the phase of the intake valve timing due to electric variable valve timing control.

Engine oil temperature control

- If **6 minutes** have elapsed with the following condition met, the engine speed is reduced by decreasing the throttle valve opening angle to protect the engine (determination of engine oil temperature is high). DTC P117A:00 is recorded simultaneously.
  - Transmission in 5th
  - Engine speed: **6,100 rpm or more** (SKYACTIV-G 2.0)
  - Engine speed: **5,800 rpm or more** (SKYACTIV-G 2.5)
  - ECT: **88.5 °C {191 °F} or more**

Cruise Control

- Calculates the throttle valve opening angle based on the deviation of the actual vehicle speed from the set vehicle speed which was set with the cruise control switch and the throttle valve actuator.
- The PCM controls the actual vehicle speed so that it is close to the set vehicle speed.
- The cruise control includes the cruise control operation condition and the cruise control stop condition.

Cruise control operation condition

- When all of the following conditions are met, execution of the cruise control system is enabled (cruise control standby status).
    - ON switch: ON
    - Vehicle speed: **Exceeds 25 km/h {16 mph}**

Cruise control stop condition

- When any of the following conditions are met even while in cruise control, the PCM stops the cruise control and clears the set vehicle speed.
    - Ignition: OFF
    - ON switch: OFF
    - Cruise control related DTCs (P0504:00) detected
- When any of the following conditions are met even while in cruise control, the PCM stops the cruise control while storing the set vehicle speed.
    - CANCEL switch: ON
    - Transaxle range sensor: P/N position (ATX)
    - CPP switch: ON (clutch pedal depressed) (MTX)
    - Neutral switch: ON (neutral position) (MTX)
    - Vehicle speed: **Less than 20.5 km/h {12.7 mph}**
    - Brake switch: ON (brake pedal depressed)
    - Brake fluid pressure: **0.3 MPa {3 kgf/cm^2, 44 psi} or more**
    - ATX malfunction (ATX)

Cruise control function

- The cruise control includes accelerating, coasting, resume, tap-down, tap-up and downshift functions.

Function List

Function	Contents
Accelerating	• When any of the following conditions are met while driving in cruise control and when the SET+ switch is continuously pressed, the PCM gradually increases the set vehicle speed. ▪ The SET+ switch is on one time or more during resume operation.
Coasting	• When the SET− switch is continuously pressed, the PCM gradually decreases the set vehicle speed.
Resume	• When the RESUME (RES) switch signal is send to the PCM during regular driving (cruise control is stopped) and the previously set vehicle speed is stored in the PCM, the PCM sets the set vehicle speed to the previously set vehicle speed and begins control.
Tap down	• When all of the following conditions are met while driving in cruise control, the PCM decreases the set vehicle speed by **1 km/h {0.6 mph}**. ▪ SET+ switch off ▪ The SET− switch switches from off to on ▪ When actual vehicle speed is lower (set vehicle speed +2 km/h {+1 mph})

Tap-up	• When all of the following conditions are met, the PCM increases the set vehicle speed by 1 km/h {0.6 mph}. ▪ During cruise control ▪ The SET+ switch switches from off to on ▪ When actual vehicle speed is lower (set vehicle speed +2 km/h {+1 mph})
Downshift	• When the following conditions are met, a downshift signal is sent to the TCM (ATX) via CAN. ▪ SET+ switch on ▪ Target vehicle acceleration is not reached • If the increase in vehicle speed on the down slope is high, the PCM sends a down shift signal to the TCM (ATX).

Brake override system

Brake override system operation conditions

- It gives priority to the brake operation if a malfunction occurs with the accelerator pedal such as if the accelerator pedal is depressed and does not return. The throttle valve is closed if the brake pedal is depressed while the accelerator pedal is in a depressed condition until the vehicle is safely decelerated and comes to a complete stop.

Operation start conditions	• If either one of the following conditions is met with the brake pedal depressed for the specified time*1 or more while the accelerator pedal is depressed, the PCM adjusts the throttle valve opening angle so that the engine speed is at specification*2. **While driving vehicle** ▪ Accelerator pedal opening angle: **5% or more** from full-close ▪ Vehicle speed: **10 km/h {6.2 mph} or more** ▪ Engine speed: **875 rpm or more** **While vehicle stopped** ▪ Accelerator pedal opening angle: **5% or more** from full-close ▪ Shift position: neutral (MTX) ▪ Selector lever position: N position (ATX) ▪ Engine speed: **875 rpm or more**
Operation complete conditions	• If the following conditions are met while operating the brake override system, the PCM stops the operation of the brake override system and controls the throttle valve opening angle in accordance with the accelerator pedal opening angle. ▪ Accelerator pedal not depressed ▪ Brake pedal not depressed **NOTE:** • The brake override system operation stops by switching the ignition off.

*1 **Specified time is 0.6 to 10 s according to braking force calculated in PCM.**

*2 **Specification is 1,200 rpm while vehicle is stopped and 1,100 rpm while vehicle is driven.**

Prevention of brake override system unnecessary operation

- If a servicing procedure requiring the brake pedal and the accelerator pedal to be depressed simultaneously is performed, unnecessary operation of the brake override system can be prevented, if necessary.

Cancel conditions	• If the releasing procedure is implemented with the following conditions met within **30 s** after switching the ignition ON (KOEO), the brake override system does not operate until the recovery condition is met. ▪ Shift position: neutral (MTX) ▪ Selector lever position: N position (ATX) ▪ Vehicle speed: **0 km/h {0 mph}** **Releasing procedure** ▪ Depress the brake pedal for **10 s** with the accelerator pedal released. ▪ Repeatedly depress and release the accelerator pedal fully three times with the brake pedal depressed. ▪ Release the brake pedal.
Recovery condition	• The cancel conditions are reset when the ignition is switched off while the brake override system is canceled. As a result, the brake override system can operate.

Master warning light illumination request

- If any of the following conditions is met, the PCM sends the master warning light illumination request signal to the instrument cluster. The master warning light illuminates to alert the driver that there is a malfunction in the brake system.
  - Brake switch (No.1 signal) has a malfunction
  - Brake switch (No.2 signal) has a malfunction

Master warning light flash request

- If the cancel condition for preventing unnecessary operation of the brake override system is implemented, the PCM sends a brake override system cancel execution signal to the instrument cluster. The master warning light flashes to alert the driver that the brake override system is released.

2014 - Mazda3 - Engine

HYDRAULIC VARIABLE VALVE TIMING CONTROL [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Outline

- Changes the exhaust valve timing according to engine operation conditions to improve engine output, fuel economy, and emission performance.
- Based on each input signal, the PCM determines the optimum exhaust valve timing according to the engine operation conditions. The PCM drives the OCV, and switches the oil passages of the hydraulic variable valve timing actuator to control the exhaust valve timing at optimum.
- Based on the coordination with the electric variable valve timing control and by increasing the amount of overlap during high engine loads, nitrogen oxide (NOx) occurring largely at high temperatures is reduced by re-circulating exhaust gas into the combustion chamber, which also reduces combustion temperature.

Block Diagram

Operation

Exhaust valve timing determination

- The PCM controls current to the OCV to obtain optimum exhaust valve timing according to the engine operation conditions (target exhaust valve timing).
- In addition to controlling the OCV drive current value to obtain the target exhaust valve timing, the PCM compares the

value with the actual exhaust valve timing to correct the OCV drive current value if necessary.

Target exhaust valve timing

- The target exhaust valve timing is determined by the engine speed and the charging efficiency.

Actual exhaust valve timing

- The actual exhaust valve timing is calculated by subtracting the cam maximum advance learning value from the value (retard amount) detected by the exhaust CMP sensor and CKP sensor.

Cam maximum advance learning value

- Though the exhaust camshaft valve timing (including maximum advance position) is detected based on the difference in the rise between the exhaust CMP sensor and the CKP sensor signals, variation in signals from the assembly of each sensor occurs. As a result, the PCM stores the difference in the rise of the exhaust CMP sensor and crankshaft position signals to prevent detection of variations in the exhaust valve timing.

OCV drive current determination

- The PCM divides the oil control valve OCV drive range into three modes according to engine operation conditions. The OCV drive current is determined based on the target current calculated in each mode.

Range mode table

Mode name	Control description
Feedback mode	• The feedback mode constantly monitors whether the target exhaust valve timing is the determined value according to the engine operation conditions and controls the OCV drive current based on the results. **Mode execution condition** ▪ Except cleaning mode, cam maximum retard mode
Cleaning mode	• Cleaning mode is to remove foreign matter in the OCV oil passages. **Mode execution condition** ▪ During deceleration fuel cut ▪ Engine speed: **2,250—3,500 rpm** ▪ Engine coolant temperature: **80 °C {176 °F} or more**
Cam advance mode	• If the cam advance is appropriate according to engine operation conditions such as while in torque down execution during idling, the cam advance mode advances the exhaust valve timing and stabilizes the engine speed. **Mode execution condition** • When any of the following conditions is met: ▪ During engine cranking ▪ Engine speed: **Less than 875 rpm** ▪ Engine coolant temperature: **Less than 35 °C {95 °F}** ▪ Other conditions such as when maximum advance is appropriate according to engine rotation and load conditions

2014 - Mazda3 - Engine

ELECTRIC VARIABLE VALVE TIMING CONTROL [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Outline

- The PCM determines the optimum intake valve timing according to the engine operation conditions, and sends the motor drive signals to the electric variable valve timing driver. With the adoption of the electric drive system, variable intake valve timing can be controlled without any influence from the engine conditions, thus the fuel economy has been improved and pumping loss has been decreased.
- Based on the coordination with the hydraulic variable valve timing control and by increasing the amount of overlap during high engine loads, nitrogen oxide (NOx) occurring largely at high temperatures is reduced by re-circulating exhaust gas into the combustion chamber which reduces combustion temperature.

Block Diagram

Operation

Intake valve timing determination

- The PCM determines the optimum target intake valve timing according to the engine operation conditions, and controls the output duty ratio to the electric variable valve timing driver so that the actual intake valve timing approaches close to the target intake valve timing.

Target valve timing

- The target intake valve timing is determined according to the engine speed, charging efficiency, and engine coolant temperature.

Actual valve timing

- The actual intake valve timing is calculated by adding a correction, which is based on the electric variable valve timing actuator signal value, to the value calculated by subtracting the cam maximum retard learning value from the standard intake valve timing.
- The standard intake valve timing is calculated based on the signals from the CKP and CMP sensors.

Cam maximum retard learning value

- The cam maximum retard learning value is determined by the maximum retard indication output from the PCM and the standard intake valve timing when the standard intake valve timing is stabilized.

Output duty ratio determination

- The PCM divides the electric variable valve timing motor drive range modes according to the engine operation conditions, and determines the output duty ratio to the electric variable valve timing actuator in each mode.

Mode name	Control description	Control conditions
Feedback mode	• Continuously monitors the intake valve timing if it matches the target intake valve timing determined according to the engine operation condition, and controls the output duty ratio based on the result.	• Except for energization cut mode and phase holding mode
Energization cut mode	• If there is any malfunction in the electric variable valve timing driver, the intake valve timing is held at the maximum retard position to stabilize the engine speed.	• Electric variable valve timing driver malfunction
Phase holding mode	• To improve the startability, the phase of the electric variable valve timing actuator is held at the intermediate position after the engine is stopped.	• After the engine is stopped (Depending on the engine coolant temperature, operates after a certain period has elapsed from when the engine was stopped to suppress heating of the electric variable valve timing motor.)

2014 - Mazda3 - Engine

FUEL INJECTION CONTROL SYSTEM [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Outline

- Performs optimum fuel injection according to engine operation conditions.
- The PCM determines the engine operation conditions based on the signals from each input device and drives the fuel injectors at the optimal fuel injection time (fuel injection amount) and the fuel injection timing to inject fuel.
- Optimally controls combustion based on fuel injection amount, fuel injection timing, number of fuel injections, and the fuel pressure to achieve emission performance improvement and higher engine output.

Block Diagram

Operation

Injection timing

- Fuel injection timing is switched according to the engine operation conditions.
- Fuel injection is performed at the appropriate injection timing and amount based on the following sensor input signals synchronized with the crankshaft rotation during the intake or compression stroke at each cylinder.
    - MAF sensor
    - MAP sensor
    - IAT sensor No.1
    - IAT sensor No.2
    - BARO sensor
    - CKP sensor
    - ECT sensor No.1

Injection time

- The PCM calculates the fuel injection amount according to the engine operation conditions as the fuel injection time and energizes the fuel injectors.

  Fuel injector energization time and operation conditions

- The fuel injectors cause an operation delay with the start of energization from the PCM. The PCM calculates the fuel injection time by adding the non-injection time (ineffective injection time) due to the operation delay to the actual injection time (effective injection time), and energizes the fuel injectors for this time.

- The fuel injection time is based on the following formula:

  Fuel injection time = effective injection time + ineffective injection time

  Ineffective injection time

  - The fuel injectors cause an operation delay with the start of energization due to a delay in the rise of operation current by coil inductance, mass of the needle valve and plunger, and spring resistance. This delay is the ineffective injection time.
  - The non-injection time is affected by the change in fuel pressure and the battery voltage.

Accordingly, the PCM sets the non-injection time according to the fuel pressure and the battery voltage.

Effective injection time

- The time when the fuel injector valve is open, which is the actual fuel injection time, is called the effective injection time.

Determination of effective injection time

- The PCM divides the engine operation conditions into control zones according to engine speed and intake air amount, and determines the effective injection time at each control zone to perform optimum air/fuel ratio control in all engine driving ranges.

Control zone table

Control name	Control outline
Start zone	**Purpose** • Improved startability **Control condition** • When engine speed is **less than 500 rpm**
Feedback zone (λ = 1)	**Purpose** • Improved fuel economy • Improved exhaust gas purification **Control condition** • During engine operation condition except for engine start zone and feedback zone (λ rich) and fuel cut zone
Feedback zone (λ rich)	**Purpose** • Improved driveability **Control condition** • The accelerator pedal opening angle is the specified value or more
	Purpose

	• Protection of catalytic converter and exhaust system components (suppression of gas temperature) **Control condition** • The estimated exhaust temperature and estimated catalytic converter temperature are the specified value or more.
Excessive speed fuel cut zone	**Purpose** • Engine protection **Control condition** • When engine speed is **6,800 rpm or more*** (SKYACTIV-G 2.0) • When engine speed is **6,500 rpm or more*** (SKYACTIV-G 2.5) ○ *: If the PCM stores DTC P0089:00, an engine speed of **2,500 rpm or more** becomes the control condition.

Deceleration fuel cut zone	**Purpose**
	• Improved fuel economy
	Control condition
	• If all of the following conditions are met while the vehicle is decelerating
	  ▪ Accelerator pedal is fully closed
	  ▪ Engine speed is specified value or more
	  ▪ Vehicle speed is specified value or more

Fuel injection time calculation method table

(A: Fuel injection time base, B: Correction for fuel injection time)

Contents **(Calculation or determination method for fuel injection time and correction)**			**Control zone**				
			START ENGINE	FEEDBACK (λ=1)	FEEDBACK (λ RICH)	ENGINE SPEED AT EXCESSIVE FUEL CUT	DECELERATION FUEL CUT
Ineffective injection time		Set time according to fuel injector performance	A	A	A		
Effective injection time	Injection time at engine start	Set value according to engine coolant temperature (low engine coolant temperature→long injection time)	A				
	Basic injection time	Basic injection time = charging efficiency*1 × fuel flow coefficient*2 × target equivalent		A	A		

Fuel cut		Fuel injection time = 0				A	A
Correction	Volume increase correction at engine start	Purpose: Ensures engine speed stability just after engine start **Correction condition** • Specified time according to engine coolant temperature directly after engine start **Correction amount** • Low engine coolant temperature→large correction • Low intake air temperature→large correction	B	B			
	Feedback correction (A/F sensor)	Purpose: Controls air/fuel ratio to theoretical air/fuel ratio **Correction amount** • A/F sensor output current is **0 mA or less**→volume decrease correction • A/F sensor output current is **0 mA or more**→volume increase correction		B	B		
	Feedback correction (HO2S)	Purpose: Controls air/fuel ratio to theoretical air/fuel ratio **Correction amount** • HO2S output voltage is **approx. 0.7 V or more**→volume decrease correction • HO2S output voltage is **approx. 0.7 V or less**→volume increase correction		B			
	Warm-up volume increase correction	Purpose: Ensures combustion stability when engine coolant temperature is low **Correction condition** • When engine coolant temperature is at set value **Correction amount** • High charging efficiency, low engine coolant temperature→large correction		B	B		
	Learning correction	Purpose: Corrects deviation in air/fuel ratio from deterioration over time of mechanical devices **Correction amount** • Learned value based on average value of A/F deviation amount (feedback amount)		B	B		
	Heavy load volume increase correction	Purpose: Improved engine output, decrease of exhaust gas temperature **Correction condition** • Based on the fixed value when the accelerator pedal opening angle is a certain value or more, otherwise, based on engine speed and charging efficiency. **Correction amount** • High engine speed, high charging efficiency→large correction			B		

*1

Charging efficiency is the ratio of the actual amount of intake air to the maximum air charging amount (mass

volume) of the cylinder. The value increases as the engine load increases.

*2 **Fuel flow coefficient is a coefficient to calculate a fuel injection time from a fuel injection amount required for an intake air amount.**

Fuel cut

- Includes fuel cut under the following conditions, except fuel cut at excessive engine speed and deceleration fuel cut according to engine operation.

Fuel cut table

Control name	Control outline
Fuel cut during selector lever shifting in D position (ATX)	**Purpose** • ATX protection **Control conditions** • When shifting while vehicle is stopped and engine raced
Sensor malfunction fuel cut	**Purpose** • To prevent engine damage from abnormal ignition due to a malfunction input of a cylinder identification or the engine speed signal. **Control conditions** • When a malfunction in the CKP sensor or exhaust CMP sensor is detected
Dechoke control	**Purpose** • To improve engine startability when spark plugs are flooded (scavenging) **Control conditions** • When cranking close to fully-open throttle valve
Theft prevention	**Purpose** • To prevent theft **Control conditions** • Immobilizer system related information (engine start prohibited) received from start stop unit
Fuel-cut at time of collision	**Purpose** • For safety assurance **Control conditions** • Collision signal from SAS control module is received

Boost Circuit

- The battery positive voltage input via the fuel injector relay is boosted up to **40 V**.

Output Circuit

To improve fuel injection response, the plunger pulling force is strengthened by providing high current (over excitation current) when the fuel injector is open.

- To reduce fuel injector heat generation, the opening of the fuel injector is kept open using low current after it opens.

Fuel injector status	PCM operation
Opening starts	1. Provides specified value, boosted by the boost circuit, to the opening transistor. 2. Voltage is provided to the fuel injector, the ground transistor is turned on and grounded, and the fuel injector opens. 3. After the fuel injector is opened, the opening transistor is turned off.
Opening held	• Controls the on/off of the holding transistor (**12 V** output) so that the hold current of the fuel injector is constant.
Closing	• Turns off the holding and ground transistors at the same time the fuel injection signal from the PCM is stopped, and cuts the current.

2014 - Mazda3 - Engine

FUEL PUMP CONTROL [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Outline

- By switching the fuel pump discharge amount, reduced power consumption and improved fuel economy have been achieved.
- The PCM determines the optimum fuel pump discharge amount according to the engine operation conditions, and sends the fuel pump drive signal to the fuel pump control module.

Block Diagram

Operation

Fuel pump relay

- The PCM switches the fuel pump relay on/off according to the engine operation conditions.

Relay ON/OFF	Control conditions
ON	• When any of the following conditions is met: ▪ When ignition is switched ON (**for approx. 1 s**) ▪ During engine cranking ▪ While engine is running
OFF	• When engine is stopped • Immobilizer system related information (engine start prohibited) received from start stop unit • Collision signal from SAS control module is received

Fuel pump control module

The PCM determines the fuel pump discharge amount according to the engine operation conditions, and controls the output duty ratio to the fuel pump control module according to the discharge amount.

Output duty ratio	Control conditions
95%	• When any of the following conditions is met: ▪ At engine start ▪ Fuel pump control module malfunction (if request voltage is unobtainable)
10—90%	• Except for control conditions with output duty ratio of 5% or 95%
5%	• When engine is stopped

Fuel pump operation circuit diagram

2014 - Mazda3 - Engine

HIGH PRESSURE FUEL PUMP CONTROL [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Outline

- Changes the fuel pressure applied to the fuel injector (according to engine operation conditions) to improve engine output and startability.
- The PCM determines the fuel pressure value corresponding to the engine operation conditions based on each input signal, and drives the spill valve control solenoid valve for optimum control of fuel pressure.

Block Diagram

OPERATION

Directly after engine start

- During a cold engine start, the fuel pressure is raised to promote fuel atomization.

Basic Control

- The PCM determines the target fuel pressure according to charging efficiency and performs feedback control by monitoring the fuel pressure in the fuel distributor using the fuel pressure sensor.
  - When idling after engine warm up: **Approx. 3 MPa {31 kgf/cm^2, 435 psi}**
  - After engine warm up, engine speed is **3,000 rpm or more**, charging efficiency is **60 % or more**: **Approx. 15.0 MPa {153 kgf/cm^2, 2,176 psi}**

2014 - Mazda3 - Engine

ELECTRONIC SPARK ADVANCE CONTROL [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Outline

- Controls ignition for optimum timing (according to engine operation conditions).
- Serviceability has been improved by eliminating the necessity of ignition timing adjustment.
- The PCM determines the engine operation conditions (based on input signals from each sensor) and blocks current to the ignition coils at the calculated ignition timing. This causes the spark plugs to discharge (ignite) by the effect of electromagnetic mutual induction.

Block Diagram

Operation

Ignition method

- The PCM energizes the ignition coils according to the ignition timing calculated from the engine operation conditions and the igniter energization time.
- The igniter energization time (ignition coil energization time) is determined according to battery voltage and engine speed.

Timing chart

Determination of Ignition Timing

Division of control zones

- The PCM performs different ignition controls for engine starting and those other than engine starting to stabilize the engine starting.

Control zone	Control condition	Ignition method
Engine start zone	Engine speed is **less than 500 rpm**	Engine starting
Normal zone	Engine operation except start and idling zones	Cycle estimated ignition (Determines ignition timing adding each correction to basic spark advance)

Ignition timing calculation method tableA: Ignition timing base, B: Correction for ignition timing

		Control zone	

Contents		Calculation method or determination method for ignition timing, spark advance, and correction	ENGINE START ZONE	NORMAL ZONE
Starting ignition		Determination based on engine coolant temperature	A	
Cycle estimated ignition	Basic spark advance	Set value according to engine speed and charging efficiency*		A
Correction	Engine coolant temperature spark advance correction	Purpose: Ensures combustion stability when engine coolant temperature is low **According to engine coolant temperature** • High charging efficiency*, low engine coolant temperature→large correction		B
	Intake air temperature correction	Purpose: Suppresses knocking when engine intake air temperature is high **According to engine intake air temperature and engine coolant temperature** • High engine intake air temperature, high engine intake air temperature→large correction		B
	Warm-up promotion spark retard correction	Purpose: Activates the catalytic converter earlier **Maximum 50 s after engine start** • According to engine coolant temperature→correction		B
	Torque reduction correction	Purpose: Such as reduction of shift shock, traction control, or suppression of vehicle vibration **According to torque reduction request from TCM, or DSC HU/CM** • Large torque reduction request→large correction		B
	Knocking spark retard correction	Purpose: Knocking suppression **Acceleration when charging efficiency* volume increase (acceleration amount) is given value or more** • Large acceleration amount→large correction		B
	Valve timing correction	Purpose: Ensures combustion stability **When phase difference changes due to electric variable valve timing control and hydraulic variable valve timing control** • Correction according to change in phase difference		B

*

Charging efficiency is the ratio of the actual amount of intake air to the maximum air charging amount (mass volume) of the cylinder. This value increases proportionately to the increase in engine load.

- If immobilizer system related information (engine start prohibited) is received from the start stop unit, the PCM stops ignition.
- When a collision signal is received from the SAS control module, the PCM stops the ignition.

2014 - Mazda3 - Engine

PURGE CONTROL [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Outline

- An appropriate amount of evaporative gas is fed into the intake manifold by the purge solenoid valve operation (according to the engine operation conditions). This ensures driveability and prevents release of evaporative gas into the atmosphere.
- The PCM drives the purge solenoid valve based on the signal from each control part.

Block Diagram

Operation

Calculation method for purge flow amount

- The PCM calculates the purge flow amount in which the intake airflow amount and the amount of fuel vapor gas passing through the purge solenoid value are a certain ratio. The purge flow amount is corrected by the fuel vapor gas concentration and the intake air temperature.

Determination of purge solenoid valve energization time

- The PCM determines the drive duty of the purge solenoid valve through which the purge flow amount passes. The drive duty value is corrected by the battery voltage.

Operation condition

- In evaporative purge control during normal driving, the PCM sends a duty signal to the purge solenoid valve when all of the following conditions are met.
    - Fuel injection control is in feedback zone (λ=1)
    - Engine coolant temperature **60 °C {140 °F} or more**

2014 - Mazda3 - Engine

AIR FUEL RATIO (A/F) SENSOR HEATER CONTROL [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Outline

- Based on the control of the A/F sensor heater, a stabilized oxygen concentration is detected (even at low exhaust temperatures), and feedback control of fuel injection (even at cold engine start) is made possible for improved cold temperature exhaust emission performance.
- Both emission performance and sensor protection have been improved by duty control of the heater (according to engine operation conditions (exhaust gas temperature)).
- A pre-heat has been adopted to prevent water, (produced from the exhaust system when the engine is started), from adhering to the sensor and damaging it.

Block Diagram

Operation

Pre-heat control

- The A/F sensor heater is operated at a duty ratio of approx. 15% within the specified time directly after the engine is started.

Normal control

- The PCM operates the A/F sensor heater based on the following control conditions:

Output duty ratio	Control condition

0%	• Ignition switched off • Engine stopped • Engine start (cranking)
0—100% (Duty ratio determined by measuring the element temperature by the A/F sensor heater element impedance)	• After engine warm-up (such as value fluctuates by battery condition)

2014 - Mazda3 - Engine

HEATED OXYGEN SENSOR (HO2S) HEATER CONTROL [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Outline

- Based on the control of the HO2S heater, a stabilized oxygen concentration is detected (even at low exhaust temperatures), and feedback control of fuel injection (even at cold engine start) is made possible for improved cold temperature exhaust emission performance.
- Both emission performance and sensor protection have been improved by duty control of the heater (according to engine operation conditions (exhaust gas temperature)).

Block Diagram

Operation

- The PCM operates the HO2S heater based on the following control conditions.

Output duty ratio	Control condition
0%	• Engine stopped • Fuel cut injection control is in engine start zone • Engine coolant temperature is **−10 °C {14 °F} or less** • Other than battery voltage of **10—16 V** • Within a fixed period of time after engine start (varies according to engine coolant temperature)
30—50%	• HO2S not activated

0—100% (Determined by engine speed and charging efficiency)	• Other than the above

2014 - Mazda3 - Engine

A/C CUT-OFF CONTROL [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Outline

- To improve drive performance and A/C compressor reliability, the A/C relay is turned off at the appropriate timing (according to the engine operation conditions), and the A/C operation is controlled.

Block Diagram

Operation

- The PCM stops current to the A/C relay when any of the following conditions are met:

A/C cut-off control operation conditions—: Not applicable

Operation condition	While A/C relay not energized	Purpose
At engine start	**Approx. 4 s**	Improved startability

When high engine speed (**approx. 6,700 rpm or more**)	—	A/C compressor reliability assurance
Accelerated	**Approx. 5 s**	Acceleration from standstill/acceleration performance improvement
Refrigerant pressure **3.14 MPa {32.0 kgf/cm^2, 455 psi} or more**	—	A/C compressor reliability assurance
Refrigerant pressure of **0.196 MPa {2.00 kgf/cm^2, 28.4 psi} or less** continues for **5 s or more**	—	A/C compressor reliability assurance
Drive-by-wire control malfunction	—	Reverse driving performance assurance
Panic braking determined	—	Load performance assurance
ECT sensor No.1 malfunction	—	Engine protection
When high engine coolant temperature (**approx. 113 °C {235 °F} or more**)	Cuts off the A/C intermittently, and if the engine coolant temperature does not decrease, cuts off the A/C continuously.	Engine protection
Travel on ascending road	—	Ascent performance improvement

2014 - Mazda3 - Engine

ELECTRICAL FAN CONTROL [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Outline

- Through cooling of the radiator and condenser by operation of the cooling fan (according to vehicle conditions), engine reliability and cooling performance have been improved.
- The PCM determines the engine operation conditions (based on the signals from each sensor), and turns cooling fan relays No.1, No.2, and No.3 on/off to control the rotation speed of the cooling fan motor.

Block Diagram

Operation

- The PCM controls the cooling fan motor rotation speed by turning cooling fan relays No.1, No.2, and No.3 on/off based on each demand airflow volume.

Operation Pattern

Demand airflow volume	Cooling fan relay		Cooling fan motor	
	No.1	No.2/No.3	No.1	No.2
No airflow	OFF	OFF	Stop	Stop
Small	ON	OFF	Low-speed	Low-speed
Large	ON	ON	High-speed	High-speed

Engine coolant temperature condition

- Changes the demand airflow volume according to the engine coolant temperature.
- To suppress overheating, the cooling fan is operated when the engine coolant temperature is high. The demand airflow volume is large or small depending on the engine coolant temperature.

A/C operation condition

- Controls the demand airflow volume depending on the refrigerant pressure and vehicle speed when the A/C switch is on.

Operation condition	Demand airflow volume
• When all of the following conditions are met. ▪ Refrigerant pressure: **1.3 MPa {13 kgf/cm^2, 189 psi} or less**, vehicle speed: **45 km/h {28 mph} or more** ▪ Refrigerant pressure: **2.2 MPa {22 kgf/cm^2, 319 psi} or less**, vehicle speed: **85 km/h {53 mph} or more**	No airflow
• When all of the following conditions are met. ▪ Refrigerant pressure: **1.3 MPa {13 kgf/cm^2, 189 psi} or less**, vehicle speed: **45 km/h {28 mph} or less** ▪ Refrigerant pressure: **1.3—1.5 MPa {14—15 kgf/cm^2, 189—217 psi}**, vehicle speed: **85 km/h {53 mph} or less** ▪ Refrigerant pressure: **1.5—2.2 MPa {16—22 kgf/cm^2, 218—319 psi}**, vehicle speed: **65—85 km/h {41—52 mph}**	Small
• When all of the following conditions are met. ▪ Refrigerant pressure: **1.5—2.2 MPa {16—22 kgf/cm^2, 218—319 psi}**, vehicle speed: **65 km/h {40 mph} or less** ▪ Refrigerant pressure: **2.2 MPa {22 kgf/cm^2, 319 psi} or more**	Large

After Cooling Control

- After continuous, high-load driving, the cooling fan operates (demand airflow volume: small) for up to **9 min** under the following conditions to suppress temperature increase inside the engine compartment.
  - Driving on ascending roads or after continuing to drive under high-load conditions
  - After continuous, sudden acceleration from standstill and repeated, sudden acceleration

- Engine coolant temperature: **80 °C {176 °F} or more**

Conditions during collision

- If a collision signal from the SAS control module is received, the PCM stops the engine cooling fan to avoid use of battery voltage.

2014 - Mazda3 - Engine

STARTER CUT-OFF CONTROL [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Outline

- The PCM controls energization to the starter relay (according to an immobilizer system request) to improve security.
- While not in P or N position, the starter relay energization by the push button start is inhibited. (ATX)
- When the clutch pedal is not depressed, starter relay energization using the push button start is inhibited. (MTX)

Block Diagram

Operation

When engine stop request signal is not received

- The PCM establishes a ground to the starter circuit. Therefore when the ignition is switched to START, the starter relay is energized and the starter motor rotates. As a result, the engine starts normally.

When engine stop request signal is received.

- The PCM does not establish a ground to the starter circuit. Therefore, even if the ignition is switched to START, the starter motor does not rotate because the starter relay does not energize, and the engine does not start.

- The PCM turns the starter relay off with the engine speed at the set value or more (value varies depending on the engine coolant temperature).

2014 - Mazda3 - Engine

GENERATOR CONTROL [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Outline

- Idling stability has been improved by optimum control of generator voltage (according to engine operation and electrical load conditions).
- The PCM determines the engine operation and electrical load conditions based on the input signals from each control part. It then uses this information to control the energization time of the generator field coils.

Block Diagram

Operation

Determination method for target excitation current

- The battery condition is determined based on the current sensor signal and the target excitation current is calculated according to the battery condition. If the current sensor is malfunctioning, the target excitation current is calculated from the generator target output amount (determined by battery fluid temperature, engine speed, and vehicle speed) and the actual generator rotation speed.

Determination method for field coil excitation time

- The PCM increases or decreases the field coil excitation current by sending a duty signal to the power transistor built into the generator.
- The field coil energization current changes according to changes in the power transistor excitation time. This is accomplished by changing the duty signal duty ratio. For example, when the battery positive voltage drops,

the duty ratio of the duty signal sent to the power transistor is larger, increasing the field coil excitation current.

- During deceleration fuel-cut, the PCM increases the generator voltage and stores electricity in the battery. In conditions other than deceleration fuel-cut, only the required amount of electricity is charged (according to the battery status) to lower the load to the generator. (with i-ELOOP)

2014 - Mazda3 - Engine

ENGINE OIL CONTROL [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Outline

- The PCM reduces the oil pump load applied to the engine by controlling the appropriate engine hydraulic pressure (according to the engine operation conditions).
- The engine hydraulic pressure switches in two steps. When hydraulic pressure is not needed, the oil pump discharge amount is reduced by the operation of the engine oil solenoid valve.

Block Diagram

Operation

- The PCM switches the engine oil pressure (which lubricates the engine) in two steps. It does this by driving the engine oil solenoid valve according to the engine operation conditions.

Output duty value determination

- The PCM controls the operational voltage energized to the engine oil solenoid according to the duty signal. After opening the engine oil solenoid valve at the output duty ratio of 100%, load applied to the parts is reduced by lowering the duty value to the output duty value at which the open valve condition can be maintained. The output duty value for maintaining the opening value changes according to the battery voltage.

Engine oil solenoid valve operation conditions

- The operation conditions for the engine hydraulic pressure switching control vary according to the vehicle conditions.

  Normal control

  - The PCM operates the engine oil solenoid valve when all of the following conditions are met:
    - Engine speed: **Less than 4,000 rpm**
    - Engine coolant temperature: **Less than 98 °C {208 °F}**
    - Charging efficiency: Less than specification (varies according to engine speed.)

  Air bleeding control

  - If all of the following conditions are met, the PCM operates the engine oil solenoid valve several times to bleed air from inside the hydraulic circuit. (Engine oil solenoid operation amount varies depending on engine speed and engine coolant temperature.)
    - Engine speed: **500—900 rpm**
    - Engine coolant temperature: **50—70 °C {122—158 °F}**
- For details on the engine oil solenoid valve, refer to the LUBRICATION SYSTEM. (See **ENGINE OIL SOLENOID VALVE [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)

Hydraulic pressure switching mechanism

- When the engine oil solenoid valve operates, the hydraulic circuit changes according to the following. The engine oil supply amount is controlled by changing the hydraulic circuit.

  Engine oil flow during low hydraulic pressure setting (engine oil solenoid valve ON)

  - When the engine oil solenoid valve turns on, hydraulic pressure is also applied to the top of the pilot valve. The pilot valve presses downward by spring force because the hydraulic pressure applied to the top and bottom of the pilot valve is nearly equal.
  - Hydraulic pressure is applied to the top of the relief valve.
  - When the hydraulic pressure exceeds the relief valve opening pressure, the relief valve is pressed downward and engine oil flows out (hydraulic pressure decrease).
  - When the hydraulic pressure is less than the relief valve opening pressure, the relief valve closes. As a result, engine oil outflow stops (hydraulic pressure increase).
  - (c)-(d) is performed repeatedly to adjust the hydraulic pressure.

2014 - Mazda3 - Engine

ENGINE OIL WARNING LIGHT [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose / Function

- The engine oil warning light warns the driver that the engine oil level is insufficient.
- When the instrument cluster receives the engine oil warning light request signal sent from the PCM via the CAN signal, it illuminates the engine oil warning light.

Construction

- The instrument cluster controls illumination on/off of the engine oil warning light using the instrument cluster microcomputer based on the engine oil warning light request signal from the PCM.
- The engine oil warning light is set in the instrument cluster.

Operation

- If the engine oil pressure is low, the PCM sends an engine oil pressure warning light on request to the instrument cluster.

Type A instrument cluster

1. The instrument cluster receives (1) the engine oil warning light request signal from the PCM.

2. The instrument cluster microcomputer displays (2) the engine oil warning light in the LCD screen.

Type B or type C instrument cluster

1. The instrument cluster receives (1) the engine oil warning light request signal from the PCM.

2. The instrument cluster microcomputer turns the transistor on (2) based on the engine oil warning light request signal.

3. When the transistor turns on, a ground circuit with the engine oil warning light is established and the engine oil warning light illuminates (3).

Fail-safe

- Function not equipped.

2014 - Mazda3 - Engine

WRENCH WARNING INDICATOR LIGHT [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose / Function

- The wrench warning indicator light illumination is indicated together with a message in the LCD when the engine oil replacement period is reached.

Construction

- The wrench warning indicator light is built into the instrument cluster.

Operation

- The wrench warning indicator light illumination conditions are as follows:

  Wrench warning indicator light illumination conditions

  - Ignition switch ON (turns off after several second)

  Wrench warning indicator light flash conditions

    - PCM determines engine oil replacement period reached. (See **ENGINE OIL MAINTENANCE MONITOR [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)

- The PCM sends a wrench warning indicator light illumination or flash request to the instrument cluster via CAN communication.

2014 - Mazda3 - Engine

GEAR SHIFT INDICATOR [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose / Function

- The gear shift indicator, built into the instrument cluster, informs the driver that a gear position or shift up/down operation is recommended according to the driving conditions.
- The PCM sends a gear shift indicator illumination request to the instrument cluster via CAN communication.

Construction

- The gear shift indicator is built into the instrument cluster. (See **INSTRUMENT CLUSTER**.)

Operation

- The PCM compares the target gear speed (calculated from each signal) and the actual gear speed to determine a gear shift indicator illumination request.

Target gear speed (recommended gear position)

- The target gear speed is determined by the vehicle speed, accelerator pedal opening angle, ascent rate, altitude, and steering angle.

Actual gear speed (current gear position)

- The actual gear speed is determined by the vehicle speed, engine speed, tire diameter, final gear ratio, and gear engagement.

- The gear shift indicator illumination/off conditions are as follows:

Gear Shift Indicator Illumination Condition

- There are three gear shift indicator illumination patterns; normal operation, shift-down recommended operation, and shift-up recommended operation.

Normal operation

- When the following condition is met, the currently selected gear position is indicated.
  - Target gear speed and actual gear speed are equal
  - Example: the following figure indicates that the currently selected gear position is 5th gear.

Shift-down recommended operation

- If a shift-down operation is performed when the following condition is met (determines smooth driveability is difficult), the recommended gear position is indicated at the same time.
    - Target gear speed is lower than actual gear speed
    - Example: The following figure indicates that a shift-down operation to 4th gear is recommended.

Shift-up recommended operation

- If a shift-up operation is performed when the following condition is met (determines fuel economy worsens), the recommended gear position is indicated at the same time.
    - Target gear speed is higher than actual gear speed
    - Example: The following figure indicates that a shift-up operation to 6th gear is recommended.

Gear Shift Indicator Off Condition

- When any one of the following conditions is met, the gear shift indicator turns off.
    - Vehicle is stopped

    - Gear is in neutral position or reverse position
    - Until clutch is completely engaged when vehicle is started
    - Clutch pedal is depressed for **2 s or more** while driving
- If the vehicle is driven with the gear not changed when a shift-down/up operation is recommended, the gear shift indicator may temporarily turn off

2014 - Mazda3 - Engine

CHECK FUEL CAP WARNING LIGHT [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose / Function

- The check fuel cap warning light is built into the instrument cluster.
- If the PCM detects that the fuel cap is open, the light illuminates to warn the driver that the fuel cap is open.

Construction

- The check fuel cap warning light is built into the instrument cluster.

Operation

- The illumination condition of the check fuel cap warning light is as follows:

Check fuel cap warning light illumination condition

- DTC P0457:00 is stored (PCM detects that fuel cap is open)

- The PCM sends a check fuel cap warning light illumination request to the instrument cluster via CAN communication.

2014 - Mazda3 - Engine

ENGINE OIL MAINTENANCE MONITOR [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Outline

- Calculates the engine oil replacement period as an appropriate target period for replacing the engine oil.

Block Diagram

Flexible

Fixed

Operation

NOTE:

- During shipment, the engine oil maintenance monitor function is stopped.
- The engine oil maintenance monitor function can be operated using the Mazda Modular Diagnostic System (M-MDS) or center display (with center diplay).

Flexible

- The PCM calculates the traveled distance and the number of elapsed days since the engine oil maintenance monitor function was activated, and if the traveled distance and number of elapsed days exceeds the specified value, it determines that engine oil replacement period is reached.
- The PCM determines engine oil deterioration using information other than the distance travelled and the number of elapsed days. When the PCM determines engine oil deterioration, it determines that the engine oil replacement period has been reached.

Fixed

- The PCM calculates the traveled distance and the number of elapsed days since the engine oil maintenance monitor function was activated, and if the traveled distance and number of elapsed days exceeds the specified value, it determines that engine oil replacement period is reached.
- When the PCM determines that the engine oil replacement period has been reached, the wrench warning indicator light illumination request signal is sent to the instrument cluster.

2014 - Mazda3 - Engine

OVER REV. WARNING ALARM [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose

- The over-rev warning alarm notifies the user that the engine speed is too high.

Function

- The Over rev. warning alarm sound pattern is as shown in the figure.

Construction

- The Over rev. warning alarm sounds using the buzzer built into the instrument cluster.

Operation

1. The instrument cluster receives (1) the Over rev. warning alarm request signal from the PCM.

2. The instrument cluster microcomputer turns the transistor on (2) based on the Over rev. warning alarm request signal.

3. When the transistor turns on, a ground circuit with the alarm is established and the alarm sounds (3).

Fail-safe

- Function not equipped.

2014 - Mazda3 - Engine

PCM [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose / Function

- High-level driveability and lower fuel consumption have been achieved by controlling the appropriate engine conditions (fuel injection/ignition timing) according to operation conditions.
- Controls each output part based on the signal from each input part.
- The control descriptions are as shown below.

Function	Description
Main relay control	• Supplies power to each part by switching the main relay on/off at the optimal timing according to the vehicle conditions.
Drive-by-wire control	• Calculates the optimum target throttle valve opening angle and controls the throttle valve actuator, which allows the driver to drive the vehicle at will. • The drive-by-wire control is composed of the idle air control, accelerator control, traction control, excess engine speed control, overspeed control, electric variable valve timing cooperation control, engine oil temperature control, cruise control system, and the brake override system.
Hydraulic variable valve timing control	• Changes the exhaust valve timing according to engine operation conditions to improve engine output, fuel economy, and emission performance. • Based on each input signal, the PCM determines the optimum exhaust valve timing according to the engine operation conditions. The PCM drives the OCV, and switches the oil passages of the hydraulic variable valve timing actuator to control the exhaust valve timing at optimum. • Based on the coordination with the electric variable valve timing control and by increasing the amount of overlap during high engine loads, nitrogen oxide (NOx) occurring largely at high temperatures is reduced by re-circulating exhaust gas into the combustion chamber, which also reduces combustion temperature.
Electric variable valve timing control	• The PCM determines the optimum intake valve timing according to the engine operation conditions, and sends the motor drive signals to the electric variable valve timing driver. With the adoption of the electric drive system, variable intake valve timing can be controlled without any influence from the engine conditions, thus the fuel economy has been improved and pumping loss has been decreased. • Based on the coordination with the hydraulic variable valve timing control and by increasing the amount of overlap during high engine loads, nitrogen oxide (NOx) occurring largely at high temperatures is reduced by re-circulating exhaust gas into the combustion chamber which reduces combustion temperature.
Fuel injection control	• Performs optimum fuel injection according to engine operation conditions. • The PCM determines the engine operation conditions based on the signals from each input device and drives the fuel injectors at the optimal fuel injection time (fuel injection amount) and the fuel injection timing to inject fuel. • Optimally controls combustion based on fuel injection amount, fuel injection timing, number of fuel injections, and the fuel pressure to achieve emission performance improvement and higher engine output.
Fuel pump control	• By switching the fuel pump discharge amount, reduced power consumption and improved fuel economy have been achieved. • The PCM determines the optimum fuel pump discharge amount according to the engine operation conditions, and sends the fuel pump drive signal to the fuel pump control module.
High pressure fuel pump control	• Changes the fuel pressure applied to the fuel injector (according to engine operation conditions) to improve engine output and startability. • The PCM determines the fuel pressure value corresponding to the engine operation conditions based on each input signal, and drives the spill valve control solenoid valve for optimum control of fuel pressure.

Electronic spark advance control	• Controls ignition for optimum timing (according to engine operation conditions). • Serviceability has been improved by eliminating the necessity of ignition timing adjustment. • The PCM determines the engine operation conditions (based on input signals from each sensor) and blocks current to the ignition coils at the calculated ignition timing. This causes the spark plugs to discharge (ignite) by the effect of electromagnetic mutual induction.
Purge control	• An appropriate amount of evaporative gas is fed into the intake manifold by the purge solenoid valve operation (according to the engine operation conditions). This ensures driveability and prevents release of evaporative gas into the atmosphere. • The PCM drives the purge solenoid valve based on the signal from each control part.
A/F sensor heater control	• Based on the control of the A/F sensor heater, a stabilized oxygen concentration is detected (even at low exhaust temperatures), and feedback control of fuel injection (even at cold engine start) is made possible for improved cold temperature exhaust emission performance. • Both emission performance and sensor protection have been improved by duty control of the heater (according to engine operation conditions (exhaust gas temperature)). • A pre-heat has been adopted to prevent water, (produced from the exhaust system when the engine is started), from adhering to the sensor and damaging it.
HO2S heater control	• Based on the control of the HO2S heater, a stabilized oxygen concentration is detected (even at low exhaust temperatures), and feedback control of fuel injection (even at cold engine start) is made possible for improved cold temperature exhaust emission performance. • Both emission performance and sensor protection have been improved by duty control of the heater (according to engine operation conditions (exhaust gas temperature)).
A/C cut-off control	• To improve drive performance and A/C compressor reliability, the A/C relay is turned off at the appropriate timing (according to the engine operation conditions), and the A/C operation is controlled.
Electrical fan control	• Through cooling of the radiator and condenser by operation of the cooling fan (according to vehicle conditions), engine reliability and cooling performance have been improved. • The PCM determines the engine operation conditions (based on the signals from each sensor), and turns cooling fan relays No.1, No.2, and No.3 on/off to control the rotation speed of the cooling fan motor.
Starter cut-off control	• The PCM controls energization to the starter relay (according to an immobilizer system request) to improve security. • While not in P or N position, the starter relay energization by the push button start is inhibited. (ATX) • When the clutch pedal is not depressed, starter relay energization using the push button start is inhibited. (MTX)
Generator control	• Idling stability has been improved by optimum control of generator voltage (according to engine operation and electrical load conditions). • The PCM determines the engine operation and electrical load conditions based on the input signals from each control part. It then uses this information to control the energization time of the generator field coils.
Immobilizer system	• The immobilizer system is a vehicle theft prevention device that only allows remote transmitters that have been previously programmed to the vehicle to start the engine.
Engine oil control	• The PCM reduces the oil pump load applied to the engine by controlling the appropriate engine hydraulic pressure (according to the engine operation conditions). • The engine hydraulic pressure switches in two steps. When hydraulic pressure is not needed, the oil pump discharge amount is reduced by the operation of the engine oil solenoid valve.
Active air shutter control	• In the active air shutter control, the PCM controls the active air shutter actuator to open/close the shutter.

Construction

- Installed on the battery tray.

- A 200-pin (two-block) connector has been adopted.

- BARO sensor is integrated.

2014 - Mazda3 - Engine

MAIN RELAY [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose / Function

- Supplies power to each part.
- Supplies battery voltage to each part based on the signals from the PCM even though the ignition is switched on or off.

Construction

- Installed in the relay and fuse block.

Operation

- After the contact point is on battery voltage is supplied to the coil based on the signals from the PCM.

Fail-safe

- Function not equipped.

2014 - Mazda3 - Engine

NEUTRAL SWITCH [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose / Function

- Detects the neutral position of the shift lever.

Construction

- Installed to the manual transaxle.

MANUAL TRANSAXLE

- An ON/OFF type switch has been adopted.

Operation

Sends the neutral switch on/off signal to the PCM.

- The contact point is on when in neutral (to output voltage) and off when not in neutral.

Fail-safe

- Function not equipped.

2014 - Mazda3 - Engine

CLUTCH PEDAL POSITION (CPP) SWITCH [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose / Function

- Detects the connection status of the clutch.

Construction

- Installed on the clutch pedal.

CLUTCH PEDAL

- An ON/OFF type switch has been adopted.

Operation

- Sends the CPP switch on/off signal to the PCM.

- The contact point is on when the clutch pedal is engaged (voltage is output) and off when the clutch pedal is not engaged.

Fail-safe

- Function not equipped.

2014 - Mazda3 - Engine

MASS AIR FLOW (MAF) SENSOR [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose / Function

- Detects the intake airflow amount introduced into the cylinder as basic information (mainly used to determine the fuel injection amount) and sends it to the PCM as an intake airflow amount signal.

Construction

- Installed on the air cleaner.

- A hot film has been adopted as the detecting element for detecting the intake airflow amount.

IAT sensor No.1 is integrated.

Operation

- Sends the signal, which fluctuates according to the intake airflow amount, to the PCM.

MAF sensor characteristic

Fail-safe

DTC No.	Fail-safe function
P0102:00	• Restricts the upper limit of the engine speed. • Inhibits the evaporative purge control.

2014 - Mazda3 - Engine

INTAKE AIR TEMPERATURE (IAT) SENSOR [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

IAT Sensor No.1

Purpose/Function

- Detects the IAT before it passes through the throttle body as basic information (mainly used to determine the fuel injection amount) and sends it to the PCM as an IAT signal.

Construction

- Built into the MAF sensor.

- A cold resistor has been adopted (as the detecting element) for detecting the IAT.

Operation

- Sends the signal, which fluctuates according to the IAT (after passing through the air cleaner), to the PCM.

IAT sensor No.1 characteristic

Fail-safe

DTC No.	Fail-safe function

IAT Sensor No.2

Purpose / Function

- Detects the IAT (in intake manifold) after it passes through the throttle body as basic information (mainly used to determine the fuel injection amount) and sends it to the PCM

as an intake air temperature signal.

Construction

- Built into the MAP sensor.

- A cold resistor has been adopted (as the detecting element) for detecting the IAT.

Operation

- Sends the signal, which fluctuates according to the IAT (in the intake manifold), to the PCM.

IAT sensor No.2 characteristic

Fail-safe

- Function not equipped.

MANIFOLD ABSOLUTE PRESSURE (MAP) SENSOR [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose/Function

- Detects the intake air pressure introduced into the cylinder as basic information (mainly used to determine the fuel injection amount) and sends it to the PCM as an intake air pressure signal.

Construction

- Installed on the intake manifold.

- A sealant diaphragm has been adopted as the detecting element for detecting the intake air pressure.
- IAT sensor No.2 is integrated.

Operation

- Sends the signal, which fluctuates according to the intake air pressure, to the PCM.

2014 - Mazda3 - Engine

THROTTLE POSITION (TP) SENSOR [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose / Function

- Detects the throttle valve opening/closing condition, which operates in accordance with the accelerator pedal operation, as basic information (mainly used to determine the fuel injection amount) and sends it to the PCM as the throttle valve opening angle signal.

Construction

- Built into the throttle body.

- A Hall element has been adopted (as the detecting element) for detecting the throttle valve opening/closing condition.
- The TP sensor has a main sensor (No.1) and a sub sensor (No.2) for improved detection accuracy.

Operation

- Sends the signal, which fluctuates according to the throttle valve opening/closing, to the PCM.

2014 - Mazda3 - Engine

ACCELERATOR PEDAL POSITION (APP) SENSOR [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose / Function

- Detects the accelerator pedal depression amount as basic information (mainly used to determine the throttle valve opening) and sends it to the PCM as an accelerator pedal opening angle signal.

Construction

- Built into the accelerator pedal.

- A Hall element has been adopted (as the detecting element) for detecting the accelerator pedal depression amount.
- The APP sensor has a main sensor (No.1) and a sub sensor (No.2) for improved detection accuracy.

Operation

- Sends the signal, which fluctuates according to the accelerator pedal depression amount, to the PCM.

APP sensor characteristic

2014 - Mazda3 - Engine

CRANKSHAFT POSITION (CKP) SENSOR [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose / Function

- Detects the crankshaft speed as basic information (mainly used to determine the fuel injection timing and ignition timing) and sends it to the PCM as a CKP signal.

Construction

- Installed on the side of the cylinder block (right side).

- A MR (Magnetic Resistance) element has been adopted (as the detecting element) for detecting the crankshaft speed.

Operation

- Sends the signal, which fluctuates according to the crankshaft speed, to the PCM.

CKP sensor characteristic

P0335:00	• Stops fuel injection • Stops ignition

2014 - Mazda3 - Engine

CAMSHAFT POSITION (CMP) SENSOR [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose / Function

- Detects the camshaft speed as basic information (mainly used to determine the fuel injection timing and ignition timing) and sends it to the PCM as a CMP signal.

Construction

Intake CMP sensor

- Installed on the cylinder head.

- A GMR element has been adopted (as the detecting element) for detecting the intake camshaft speed.

Exhaust CMP sensor

- Installed on the rear housing.

- A GMR element has been adopted (as the detecting element) for detecting the exhaust camshaft speed.

Operation

- Sends the signal, which fluctuates according to the camshaft speed, to the PCM.

CMP sensor characteristic

Fail-safe

Intake CMP sensor

DTC No.	Fail-safe function
P0340:00	• Set the electric variable valve timing control to the maximum cam retard mode.

Exhaust CMP sensor

DTC No.	Fail-safe function
P0365:00	• Stops fuel injection • Stops ignition

2014 - Mazda3 - Engine

ENGINE COOLANT TEMPERATURE (ECT) SENSOR [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose / Function

- Detects the ECT as basic information (mainly used to determine the fuel injection amount) and sends it to the PCM as an ECT signal.
- The ECT sensor No.2 is only used for OBD.

Construction

ECT sensor No.1

- Installed to the water outlet case.

- A thermistor has been adopted (as the detecting element) for detecting the ECT.

ECT sensor No.2

- Installed to the radiator.

- A thermistor has been adopted (as the detecting element) for detecting the ECT.

Operation

- Sends the signal, which fluctuates according to the ECT, to the PCM.

ECT sensor characteristic

Fail-safe

ECT sensor No.1

DTC No.	Fail-safe function
P0117:00	• Fixes the water temperature for the engine control at 40 °C {104 °F}, and for the idle air control at 80 °C {176 °F}. • Operates the cooling fan (high speed rotation). • Inhibits the fuel cut control during shift change.
P0118:00	• Fixes the water temperature for the engine control at 40 °C {104 °F}, and for the idle air control at 80 °C {176 °F}. • Operates the cooling fan (high speed rotation). • Inhibits the fuel cut control during shift change.

ECT sensor No.2

- Function not equipped.

2014 - Mazda3 - Engine

BAROMETRIC PRESSURE (BARO) SENSOR [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose / Function

- Detects the BARO as basic information (mainly used to determine the fuel injection amount) and sends it to the PCM as a BARO signal.

Construction

- Built into the PCM.

- A piezoelectric element has been adopted for detecting the BARO.

Operation

- Sends the signal, which fluctuates according to the BARO, to the PCM.

BARO sensor characteristic

Fail-safe

DTC No.	Fail-safe function
P2228:00	• Fixes the barometric pressure for the engine control at 101.32 kPa {1.0332 kgf/cm^2, 14.695 psi}.
P2229:00	• Fixes the barometric pressure for the engine control at 101.32 kPa {1.0332 kgf/cm^2, 14.695 psi}.

2014 - Mazda3 - Engine

FUEL PRESSURE SENSOR [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose / Function

- Detects the fuel pressure in the fuel distributor as basic information (mainly used to determine the fuel injection amount) and sends it to the PCM as a fuel pressure signal.

Construction

- Installed on the fuel distributor.

- A metal diaphragm thin film distortion gauge has been adopted (as the detecting element) for detecting the fuel pressure.

Operation

- Sends the signal, which fluctuates according to the fuel pressure, to the PCM.

Fuel pressure sensor characteristic

Fail-safe

DTC No.	Fail-safe function
P0088:00	• Stops high pressure fuel pump control • Limits intake air amount
P0192:00	• Stops high pressure fuel pump control • Limits intake air amount
P0193:00	• Stops high pressure fuel pump control • Limits intake air amount

2014 - Mazda3 - Engine

KNOCK SENSOR (KS) [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose / Function

- Detects abnormal combustion in the cylinder as basic information (mainly used to determine the ignition timing) and sends it to the PCM as a knocking signal.

Construction

- Installed on the cylinder block.

- A piezoelectric element has been adopted (as the detecting element) for detecting abnormal combustion.

Operation

- Sends the signal, which fluctuates according to abnormal combustion, to the PCM.

KS characteristic

Fail-safe

DTC No.	Fail-safe function
P0327:00	• Sets the knocking spark retard correction value of the ignition control to the fixed value.
P0328:00	• Sets the knocking spark retard correction value of the ignition control to the fixed value.

2014 - Mazda3 - Engine

CURRENT SENSOR [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose/Function

- The battery conditions are monitored as basic information (to determine the generator output current) and sent to the PCM by LIN communication via the front body control module (FBCM).

Construction

- Installed to the negative battery cable.

- The current sensor has adopted shunt resistance on the detection area and a thermistor for detecting the battery condition.

Operation

- The battery charge/discharge flow, battery voltage, and the battery terminal temperature are send to the PCM by LIN communication.

Fail-safe

DTC No.	Fail-safe function
P058A:00	• Inhibits the i-ELOOP control.
U1007:00	• Inhibits a part of the generator output control.

2014 - Mazda3 - Engine

AIR FUEL RATIO (A/F) SENSOR [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose/Function

- Detects the oxygen concentration (all-range air/fuel ratio) in the exhaust gas as basic information (mainly used to determine the fuel injection amount) and sends it to the PCM as an oxygen concentration (all-range air/fuel ratio) signal.
- Because the A/F sensor has an output characteristics proportional to the actual air/fuel ratio, a detailed air/fuel ratio can be detected and compared using the HO2S, which detects the rich/lean of the oxygen concentration in relation to the theoretical air/fuel ratio.

Construction

- Installed to the exhaust manifold.

- A zirconia element has been adopted (as the detecting element) for detecting the oxygen concentration (all-range air/fuel ratio).

Operation

- The A/F sensor has an oxygen standard chamber, which is always kept at **100%** of oxygen concentration, and an oxygen concentration detection chamber, where the oxygen concentration in the exhaust gas is detected.
- A zirconia element has the characteristic of moving oxygen when electrical current flows. The oxygen standard chamber is kept at **100%** oxygen concentration using this characteristic, and by comparing it with the oxygen concentration inside the oxygen concentration detection chamber, the oxygen concentration in the exhaust gas can be detected.

A/F sensor characteristic

Fail-safe

DTC No.	Fail-safe function
P0031:00	• Stops fuel feedback control
P0032:00	• Stops fuel feedback control
P0130:00	• Fixes duty value of A/F sensor heater • Stops fuel feedback control of A/F sensor
P0131:00	• Fixes duty value of A/F sensor heater • Stops fuel feedback control of A/F sensor
P0132:00	• Fixes duty value of A/F sensor heater • Stops fuel feedback control of A/F sensor
P0133:00	• Fixes duty value of A/F sensor heater • Stops fuel feedback control of A/F sensor
P0134:00	• Fixes duty value of A/F sensor heater • Stops fuel feedback control of A/F sensor
P2237:00	• Fixes duty value of A/F sensor heater • Stops fuel feedback control of A/F sensor

2014 - Mazda3 - Engine

HEATED OXYGEN SENSOR (HO2S) [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose / Function

- Detects the oxygen concentration (theoretical air/fuel ratio) in the exhaust gas as basic information (mainly used to determine the fuel injection amount and the deterioration of catalytic converter) and sends it to the PCM as an oxygen concentration (theoretical air/fuel ratio) signal.

Construction

- Installed on the rear side of the exhaust manifold.

- A zirconia element has been adopted (as the detecting element) for detecting the oxygen concentration (theoretical air/fuel ratio).

Operation

- Sends the signal, which fluctuates according to the oxygen concentration (theoretical air/fuel ratio), to the PCM.
- The PCM applies **approx. 1.5 V** to the HO2S input voltage to prevent incorrect diagnosis of the HO2S input voltage.

HO2S characteristic

Fail-safe

DTC No.	Fail-safe function
P0037:00	• Stops fuel feedback control
P0038:00	• Stops fuel feedback control
P0137:00	• Fixes duty value of A/F sensor heater • Stops fuel feedback control of A/F sensor

2014 - Mazda3 - Engine

FUEL TANK PRESSURE SENSOR [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose / Function

- Detects the fuel tank pressure.
- Only used for OBD.

Construction

- The fuel tank pressure sensor is equipped to the charcoal canister.

- A piezoelectric-type sensor has been adopted.

Operation

- Sends the pressure in the fuel tank to the PCM.

Fuel tank pressure sensor characteristic

Fail-safe

- Function not equipped.

2014 - Mazda3 - Engine

ION SENSOR [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose/Function

- Detects ion generation in the combustion chamber for detecting pre-ignition.
- Detects ions, which occur due to fuel combustion as current, by applying bias voltage to the spark plug, which is amplified in the ignition coil internal circuit and sent to the PCM.

Construction

- Built into the ignition coil.

Operation

- Accumulates the secondary current of the ignition coil in bias condenser (1), and detects ion current (2) by applying the bias voltage to the spark plug.
- Pulls in current (4), increased by current amplification circuit (3), to the ignition coil from the PCM.
- The PCM measures/converts the current sent to the ignition coil and monitors.

Ion generation mechanism

- Ions are generated based on: fuel combustion = chemical reaction / disassociation. The generated negative ions move to the center electrode of the spark plug to which bias voltage is applied, and positive ions move to the grounded engine wall surface,

then current flows from the spark plug to the ignition coil.

Fail-safe

- Function not equipped.

2014 - Mazda3 - Engine

DRIVE SELECTION SYSTEM [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Outline

- Switching between sport mode and normal mode is possible depending on how the drive selection switch is operated. When sport mode is selected, the operating force relative to the throttle opening angle is greater than normal mode.

Block Diagram

Operation

- Switching between sport mode and normal mode is possible depending on how the drive selection switch is operated.
- When normal mode is selected and the drive selection switch is pressed, the drive mode is switched to sport mode. When sport mode is selected and the drive selection switch is pressed, the drive mode is switched to normal mode.

- When sport mode is selected, the operating force relative to the throttle opening angle is greater than normal mode.
- When sport mode is selected, the PCM sends the following signals to each unit.

  Drive selection signal

  - When the PCM sends a drive selection signal to the TCM, the TCM will change the shift points.

  Sport mode indicator light illumination request signal

  - The PCM sends a sport mode indicator light illumination request signal to the instrument cluster. The instrument cluster turns on the sport mode indicator light to notify the driver that the drive selection control condition has been switched to sport mode.

Drive selection switch inhibition conditions

- If any of the following conditions is met, the mode is not switched even if the drive selection switch is operated.
    - During sudden maneuvering
    - During DSC control
    - During ABS control
    - During TCS control
- If the drive selection switch has been operated with a drive selection switching inhibition condition being met, the PCM sends a sport mode indicator light flash request signal to the instrument cluster.
- The instrument cluster flashes the sport lamp to notify the driver that drive selection is currently prohibited.

Drive selection stop conditions

- If any of the following conditions is met while in sport mode, the drive mode is switched to normal mode.
    - Ignition is switched off
    - During cruise control operation
    - Malfunction with PCM control-related part

2014 - Mazda3 - Engine

DRIVE SELECTION SWITCH [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Purpose / Function

- The drive selection switch detects the drive selection switching operation.
- The drive selection switch signal is sent to the instrument cluster.

Construction

- The drive selection switch is installed to the shift panel.
- The drive selection switch is a momentary type.

Operation

- When the driver presses the drive selection switch, the drive selection switch contact point closes.
- By opening/closing the contact point of the drive selection switch, SPORT mode is selected or canceled.

DRIVE SELECTION SWITCH [SKYACTIV-G 2.0, SKYACTIV-G 2.5]

Features

Improved rigidity and handling stability	• Strut type front suspension adopted. • E-type multi-link rear suspension adopted • For the front/rear crossmembers, the welded flange has been eliminated (flange-less), the cross-section expanded and the connection rigidity of the welded parts improved to achieve both rigidity and light weight. • By adopting a 6-point rigid mount-type front crossmember, the force generated from the tires is transmitted directly, and an agile vehicle response in low-to-mid speed range has been achieved. • The caster angle and caster trail was increased on the front suspension. • The cross-section on the center member of the front crossmember has been expanded and the longitudinal offset of the front lower arm installation position reduced to achieve an optimized framework. • The longitudinal span of the rear crossmember has been expanded and the longitudinal offset of the rear lateral link installation position reduced to achieve an optimized framework.

Improved handling stability and ride comfort	• By raising the installation position of the rear trailing link, the longitudinal input has been reduced, ride comfort improved, and the sense of safety during braking improved. • Positions of the links and rigidity of the bushes were reviewed to increase toe-in for the lateral force input to the tires. • Grip of the rear tires was increased by the increased toe-in, and a mild vehicle response in high-speed range has been achieved.
Improved marketability	• Tire pressure monitoring system adopted • Adhesive-type balance weights adopted
Environmental consideration	• Tires with optimized characteristics and low rolling resistance have been adopted.

TIRE PRESSURE MONITORING SYSTEM (TPMS)

Purpose, Outline

- The tire pressure monitoring system monitors the tire pressure of all 4 tires. If the tire pressure of 1 tire or more becomes excessively low, the driver is notified.
- A tire pressure monitoring system has been adopted which indirectly inspects the tire pressures and warns the driver.
- A switch for initializing the tire pressure monitoring system after the tire pressures have been adjusted is installed to the dashboard. (See **TIRE PRESSURE MONITORING SYSTEM SET SWITCH**.)

Detection method

Detection of the tire air pressure is performed by combining the following two methods.

- Dynamic loaded radius detection

  Detects the tire rotation speed using the ABS wheel speed sensor. The rotation speed of each of the wheels is compared to detect decreases in air pressure. Normally, the rotation speed of the 4 wheels is nearly the same, however, if a decrease in air pressure occurs in one tire, the dynamic loaded radius of the tire becomes smaller, the rotation speed of that tire increases, and a difference in rotation speed occurs. This method of detection is dynamic loaded radius detection. With the dynamic loaded radius detection method, if the tire pressure of all 4 tires decreases at the same level, a difference in tire rotation speed for each wheel does not occur and, therefore, detection is not possible.

- Torsion resonant frequency detection

  With torsion resonant frequency detection, detection of differences in tire air pressure is possible even if the tire pressure of all 4 tires decreases at the same level. This detection method uses the ABS wheel speed sensor signal the same as the dynamic loaded radius detection method. With resonant frequency detection, the signal from the ABS wheel speed sensor is analyzed in single pulse units and various wave frequencies are detected. Among these wave frequencies, the wave frequency synchronized to the air pressure is the torsion resonant frequency. Therefore, by monitoring the torsion resonant frequency, decreases in air pressure can be detected indirectly.

Function

- The tire pressure monitoring system consists of the following parts.

Part name	Function
DSC HU/CM	• Calculates the change in tire pressure for each wheel based on the tire rotation speed signal from the ABS wheel-speed sensor and monitors the fluctuation value. • If the fluctuation value of the tire pressure decreases to the specified value, the system determines that a tire pressure has decreased and turns on the tire pressure monitoring system warning light. • The tire pressure monitoring system warning light illumination signal is sent to the instrument cluster via a CAN signal. • If a malfunction occurs in the tire pressure monitoring system, determination is made to flash the

		tire pressure monitoring system warning light. • The tire pressure monitoring system warning light flash signal is sent to the instrument cluster via a CAN signal.
ABS wheel-speed sensor		• The wheel speed is sent to the DSC HU/CM.
Ambient temperature sensor		• The ambient temperature is sent to the PCM.
PCM		• The ambient temperature is sent to the DSC HU/CM via a CAN signal.
Instrument cluster	Tire pressure monitoring system warning light	• The tire pressure monitoring system warning light illuminates by the illumination signal from the DSC HU/CM. • The tire pressure monitoring system warning light flashes for approx. 1 min by the flash signal from the DSC HU/CM, and then it illuminates.
	Tire pressure monitoring system warning alarm	• The tire pressure monitoring system warning alarm sound is triggered by the warning alarm request signal from the DSC HU/CM.
Tire pressure monitoring system set switch		• The initialization signal is sent to the instrument cluster.
Instrument cluster		• The initialization signal is sent to the DSC HU/CM via a CAN signal.

Operation

The tire pressure monitoring system operates as shown in the following figure.

Mis-use prevention logic

- The tire pressure monitoring system has a mis-use prevention logic which illuminates the tire pressure monitoring system warning light if the tire pressure monitoring system initialization is performed two times without adjusting the tire pressures even though the tire pressure monitoring system warning light was illuminated.

  The data at the point in time that the tire pressure monitoring system warning light was illuminated is compared with the data at the point in time that the tire pressure monitoring system was initialized, and if the difference is within the specified value, the mis-use prevention logic detects and counts the number of detections.

  If the detection is the first time, the tire pressure monitoring system warning light is not illuminated.

  If the detection is the second time, the tire pressure monitoring system warning light is illuminated.

- If the M-MDS is used to initialize the tire pressure monitoring system, the mis-use prevention logic is disabled.
- The mis-use prevention logic operates as shown in the following figure.

Tire pressure monitoring system warning light does not illuminate

- Even if the tire pressure monitoring system is normal, if the following items apply, the tire pressure monitoring system warning light may not illuminate.
  - Brake pedal is depressed
  - DSC is operating
  - Sudden steering wheel maneuvering
  - Sudden acceleration/deceleration
  - When vehicle is parked, stopped

Tire pressure monitoring system does not operate normally

- If the following items apply, the tire pressure monitoring system may not operate correctly.
    - Initialized using tire pressure outside of tire pressure specification
    - Tire pressure suddenly decreases (Ex. tire burst)
    - During tire pressure monitoring system learning

2014 - Mazda3 - Suspension

TIRE PRESSURE MONITORING SYSTEM WARNING LIGHT

Purpose, Function

- The tire pressure monitoring system warning light notifies the driver that it was determined that a tire pressure has decreased below the specified value based on the initialization.
- The tire pressure monitoring system warning light notifies the driver that a malfunction has occurred in the tire pressure monitoring system.
- For vehicles with center display, a warning message in the center display is displayed when the tire pressure monitoring system warning light is illuminated or flashes. For the message content and verification method, refer to the CENTER DISPLAY. (See **CENTER DISPLAY [WITH CENTER DISPLAY]**.)

Construction, Operation

- The tire pressure monitoring system warning light is built into the instrument cluster.

- The tire pressure monitoring system warning light illuminates/flashes based on the DSC HU/CM command.
- The tire pressure monitoring system warning light illuminates if a tire pressure decreases below the specified value based on the initialization.
- The tire pressure monitoring system warning light flashes for 1 min if a malfunction is detected in the tire pressure monitoring system, and then it illuminates.
- If the tire pressure monitoring system warning light has illuminated, it will turn off by performing the initialization. If the initialization is not performed, the light will illuminate again when the ignition is switched from off to ON.

Fail-safe

- Function not equipped.

2014 - Mazda3 - Suspension

TIRE PRESSURE MONITORING SYSTEM WARNING ALARM

Purpose

- The tire pressure monitoring system warning alarm warns the user that a tire pressure has decreased or notifies the user that the tire pressure monitoring alarm has been reset.

Function

- If the instrument cluster receives a tire pressure monitoring alarm request signal sent from the DSC HU/CM via the CAN signal, the tire pressure monitoring alarm is sounded.
- The tire pressure monitoring alarm sound pattern is as shown in the figure: For the conditions in which each alarm pattern sounds. (See **TIRE PRESSURE MONITORING SYSTEM (TPMS)**.)

Tire pressure monitoring system operating

Tire pressure monitoring system initialization

Construction

- The tire pressure monitoring alarm sounds using the buzzer built into the instrument cluster.

Operation

1. The instrument cluster receives (1) the tire pressure monitoring alarm request signal from the DSC HU/CM.

2. The instrument cluster microcomputer turns the transistor on (2) based on the tire pressure monitoring alarm request signal.

3. When the transistor turns on, the ground circuit of the alarm is established and the alarm sounds (3).

Fail-safe

- Function not equipped.

2014 - Mazda3 - Suspension

TIRE PRESSURE MONITORING SYSTEM SET SWITCH

Purpose

- The tire pressure monitoring system set switch is used to initialize the tire pressure monitoring system.

Construction, Operation

- The tire pressure monitoring system set switch is installed to the dashboard.

- The tire pressure monitoring system set switch has adopted a monitoring type switch.
- The tire pressure monitoring system set switch sends a tire pressure monitoring system initialization signal to the instrument cluster.

Fail-safe

DTC	Fail-safe
C1031:35	• Illuminates the tire pressure monitoring system warning light. • Inhibits the TPMS control.

TIRE PRESSURE MONITORING SYSTEM SET SWITCH

2014 - Mazda3 - Suspension

TIRE PRESSURE MONITORING SYSTEM OPERATION RECORD

Purpose

- Customers can verify if they know how to correctly use the tire pressure monitoring system set switch by verifying the tire pressure monitoring system operation record.

Function, Display

- The DSC HU/CM stores the operation records and the Mazda Modular Diagnostic System (M-MDS) reads out the operation records and indicates them as shown in the figure below:

MAZDA MODULAR DIAGNOSTIC SYSTEM (M-MDS) DISPLAY

NOTE:

- M-MDS indication is indicated in brackets

Tire pressure monitoring system set switch operation record (TPMS Learning Reset Button Record)

- The DSC HU/CM implements the tire pressure monitoring system initialization by pressing

the tire pressure monitoring system set switch, and it simultaneously records the following items for a maximum 3 times from the current record as the operation record.

- Elapsed days (Elapsed days)

  NOTE:

  - The M-MDS displays the elapsed days from the start of initialization until the operation record verification with the M-MDS.
  - If the operation record has not been recorded, 65,535 days is displayed however this does not indicate a malfunction.

- Total traveled distance (Odometer)

Tire pressure monitoring system warning light illumination operation record (TPMS Warning Lamp illumination)

- If the DSC HU/CM detects a low tire pressure, it outputs a tire pressure monitoring system warning light illumination signal, and it simultaneously records the following items for a maximum 3 times from the current record as the operation record.

  - Elapsed days (Elapsed days)

    NOTE:

    - The M-MDS displays the elapsed days from when the low tire pressure was detected until the operation record verification with the M-MDS.
    - If the operation record has not been recorded, 65,535 days is displayed however this does not indicate a malfunction.

  - Total traveled distance (Odometer)
  - Vehicle speed (Speed)
  - Maximum vehicle speed (Maximum vehicle speed)

    NOTE:

    - Vehicle speed until the tire pressure monitoring system set switch is pressed from the illumination of the tire pressure monitoring warning light due to a low tire pressure
    - For the Mazda6, the maximum vehicle speed is not supported, therefore Not Supported is displayed, however this does not indicated a malfunction.

2014 - Mazda3 - Suspension

FRONT SUSPENSION

Outline

- A strut type front suspension has been adopted.
- The connection area of the front crossmember and body is a 6-point rigid mount type.

- The cross-section on the center member of the front crossmember has been expanded and the longitudinal offset of the front lower arm installation position reduced to realize an optimized framework.

: BETWEEN FRONT LOWER ARM ATTACHMENT POSITION AND FRONT CROSSMEMBER (CENTER MEMBER)

: FRONT CROSSMEMBER (CENTER MEMBER) WIDTH

- For the front crossmember, the welded part of the flange has been eliminated (flange-less), the cross-section expanded and the connection rigidity of the welded parts improved to achieve both rigidity and light weight.

- The caster angle and caster trail of the front suspension have been increased.

REAR SUSPENSION

Outline

- E-type multi-link rear suspension has been adopted.
- The longitudinal span of the rear crossmember has been expanded and the longitudinal offset of the rear lateral link installation position reduced to realize an optimized framework.

- Welding flanges were removed from the rear crossmember to enhance the coupling rigidity of the welded sections and reduce the weight.

- The installation position of the rear trailing link was moved upward so that the longitudinal impact from the road is more easily absorbed in the vertical movement of the rear trailing link. This reduces the longitudinal force input to the rear trailing link bush, improving the ride comfort.

Features

Improved driveability	• Unit-design, double angular ball bearings with low rotational resistance adopted for front and rear axles • Bell-shaped constant velocity joint adopted for wheel-side joint of front drive shaft • Tripod-shaped constant velocity joint adopted for differential-side joint of front drive shaft (ATX) and rear drive shaft • Double offset-shaped constant velocity joint adopted for differential-side joint of front drive shaft (MTX)
Improved rigidity, reduced noise and vibration	• By integrating the right-side front drive shaft and joint shaft, vibration and noise occurrence while the vehicle is driven, due to the conventional spline-engaging structure, has been reduced
Improved serviceability	• Unit bearings that require no preload adjustment adopted for the front and rear wheels

2014 - Mazda3 - DriveLine/Axle

FRONT DRIVE SHAFT

Purpose, Function

- A bell joint has been adopted for the wheel-side constant velocity joint, reducing vibration and noise.
- A tripod joint has been adopted for the differential side constant velocity joint to reduce booming noise during high-speed driving and vibration when idling (ATX).
- A low noise and vibration double offset joint with low slide resistance has been adopted for the differential side of the constant velocity joint (MTX). Due to this booming resonance at high speed is reduced.
- An extremely durable plastic has been adopted for the wheel side boot.
- By integrating the drive shaft on the right side with the joint shaft, vibration and noise during driving, which occurred from the previous spline connection construction, has been reduced.

Features

Improved safety	• Intrusion minimizing brake pedal adopted • Antilock Brake System (ABS) adopted • Electronic Brakeforce Distribution (EBD) control adopted • Traction Control System (TCS) adopted • Dynamic Stability Control (DSC) adopted • Electrical brake assist control adopted • Hill Launch Assist (HLA) adopted • Tire Pressure Monitoring System (TPMS) adopted (vehicles with tire pressure monitoring system (TPMS)) • Smart City Brake Support (SCBS) adopted (vehicles with Smart City Brake Support (SCBS))
Improved braking force	• Large diameter front disc brakes adopted • Large diameter rear disc brakes adopted

	• Vacuum pump adopted
Improved serviceability	• Enhanced malfunction diagnosis system for use with Mazda Modular Diagnostic System (M-MDS) • Center lever type parking brake, adjustable from vehicle interior, adopted
Size and weight reduction	• Integrated construction of the Hydraulic Unit (HU) and Control Module (CM) adopted for the DSC HU/CM
Improved reliability	• Semi-conductor element type ABS wheel-speed sensor adopted • Magnetic encoder type ABS sensor rotor adopted • DSC HU/CM with built-in brake fluid pressure sensor

Specifications

Item			Specification
Brake pedal	Type		Suspended design
	Pedal lever ratio		2.7
	Max. stroke	(mm {in})	128.7 {5.067}
Master cylinder	Type		Tandem
	Cylinder bore	(mm {in})	20.64 {0.8126}
Front brake (disc)	Type		Ventilated disc
	Cylinder bore	(mm {in})	54 {2.1}
	Pad dimensions (area x thickness)		5,350 × 10 {8.293 × 0.39}
		(mm^2 x mm {in^2 x in})	
	Disc plate dimensions	(mm {in})	SKYACTIV-G 2.0: 280 × 25 {11.0 × 0.98} SKYACTIV-G 2.5: 295 × 25 {11.6 ×

			0.98}
Rear brake (disc)	Type		Solid disc
	Cylinder bore	(mm {in})	36 {1.4}
	Pad dimensions (area x thickness)		2,650 × 9.0 {4.108 × 0.35}
	(mm^2 x mm {in^2 x in})		
	Disc plate dimensions	(mm {in})	265 × 9.0 {10.4 × 0.35}
Power brake unit	Type		Vacuum multiplier, single diaphragm
	Outer diameter	(mm {in})	248.5 {9.783}
Rear wheel braking force control device	Type		Electronic Brakeforce Distribution (EBD)
Brake piping	Piping layout		X pattern
Parking brake	Type		Mechanical design, rear two-wheel braking
	Operating method (application/release)		Manually operated lever design
	Play adjustment method		Auto-adjusting
Brake fluid	Type		SAE J1703 or FMVSS116 DOT-3

2014 - Mazda3 - Brakes

ON-BOARD DIAGNOSTIC SYSTEM [DYNAMIC STABILITY CONTROL (DSC)]

OUTLINE

- The on-board diagnostic system consists of a malfunction detection system that detects malfunctions in input/output signals when the ignition is switched ON, a PID/data monitor function that reads out specified input/output signals, and an active command mode function that allows for override operation of output parts (such as solenoid valves).
- The data link connector 2 (DLC-2), which groups together all the connectors used for malfunction diagnosis and detecting/repair into a single location, has been adopted, thereby improving serviceability. Diagnosis is performed by connecting the Mazda modular diagnostic system (M-MDS) to the DLC-2.
- In addition to DTC read-out, the Mazda modular diagnostic system (M-MDS) is used to clear DTCs using the display screen of the diagnostic tester, and to access the PID/data monitor and active command modes functions, providing enhanced malfunction diagnosis and improved serviceability.

Block diagram

FUNCTION

Malfunction detection function

- The malfunction detection function detects and displays malfunctions in the input/output signal system of the DSC HU/CM when the ignition is switched ON.
- When the DSC HU/CM is activated, the following malfunction detection is performed.
  - The ABS warning light, brake system warning light, TCS/DSC indicator light, DSC OFF indicator light, and tire pressure monitoring system warning light illuminate for **approx. 3.0 s** when the ignition is switched ON to inspect for open circuits in the lights. At the same time, the input/output signals of each part are monitored for malfunction diagnosis. After starting to drive, the first time the vehicle speed is **approx. 10 km/h {6.2 mph} or more** the pump motor is operated and malfunction diagnosis is performed again. The input/output signals of each part are then constantly monitored and malfunctions are diagnosed.

    NOTE:

    - The sound of the pump motor operation can be heard.
- If the above malfunctions are detected, the corresponding lights are illuminated to alert the driver. DTCs can be output through the CAN_H and CAN_L of the DLC-2 using the external tester communication function. At the same time, malfunction detection results are sent to the memory and fail-safe functions.

Memory function

- The memory function stores DTCs of malfunctions in input/output signal systems. With this function, once a DTC is stored it is not cleared after the ignition has been switched off, even if the malfunctioning signal system has returned to normal.
- Since the DSC HU/CM has a built-in non-volatile memory, DTCs are not cleared even if the battery is removed. Therefore, it is necessary to clear the memory after performing repairs. Refer to the Workshop Manual for the DTC clearing procedure.

DTC 7-digit code definition

- When related systems or components have failed, the CM stores the DTC of the malfunctioning part in the CM memory, and allows for the retrieval of the stored data using the scanning tool when necessary. The DTCs are indicated using seven digits. Each digit indicates the following.

C 0 0 0 1 : 0 1

- Specify the area failure sub type

00: No sub type information
01: General electrical malfunction
07: Mechanical malfunctions
08: Bus signal/message malfunctions
09: Component malfunctions
11: Circuit short to ground
12: Circuit short to battery
13: Open circuit
15: Circuit short to battery or open circuit
16: Circuit voltage below threshold
17: Circuit voltage above threshold
1C: Circuit voltage out of range
28: Signal bias level out of range/zero adjustment malfunction
29: Signal signal invalid
2F: Signal erratic
35: Signal high time > maximum
41: General checksum malfunction
46: Calibration/parameter memory malfunction
47: Watchdog/safety μC malfunction
49: Internal electronic
51: Not programmed
52: Not activated
54: Missing calibration
55: Not configured
56-5F: ISO/SAE reserved
62: Signal compare malfunction
64: Signal plausibility malfunction
67: Signal incorrect after event
68: Event information
71: Actuator stuck
76: Wrong mounting position
85: Signal above allowable range
86: Signal invalid
88: Bus off
8F: Erratic

- Manufacturer controlled

- Indicates subgroup

Network Electrical (U code)	Body (B code)	Chassis (C code)
0: Network Electrical	Manufacturer controlled	Manufacturer controlled
1: Network communication		
2: Network communication		
3: Network software		
4: Network data		

- Indicates who was responsible for DTC definition

0: ISO/SAE controlled
1: Manufacturer controlled
2: There are ISO/SAE controlled just for powertrain, all others are manufacturer controlled.
3: For P3000 to P3399 is manufacturer controlled, all others are ISO/SAE controlled.

- Indicates DTC function

P: Powertrain
B: Body
C: Chassis
U: Network Electrical

Fail-safe function

- When the malfunction detection function determines a malfunction, the warning indicator light illuminates to alert the driver. At this time, the fail-safe function controls as indicated in the fail-safe function malfunction contents table.

WARNING:

- If EBD control is prohibited, the rear wheels could lock-up before the front wheels. If this occurs, the vehicle could yaw and become unstable. Therefore, always inspect the system immediately if EBD control is prohibited.

Status byte for DTC

- The status byte is the two-digit code (two digits after hyphen (-)) after the DTC.

- The status byte is a code which indicates the pending code, current/past malfunction status, or warning illumination status.
- The status byte can be read by performing a CMDTC self test using the Mazda Modular Diagnostic System (M-MDS).
- For details on the status byte, refer to the explanation on the Mazda Modular Diagnostic System (M-MDS) when reading the DTC.

Snapshot data

NOTE:

- The EPS CM stores the following two types of information when a DTC is detected and displays snap shot data in the M-MDS.

- Vehicle information detected by EPS CM
- Vehicle information detected by instrument cluster and received by start stop unit via CAN signal

- The snapshot data stores the currently detected DTC data

Snapshot data item	Unit	Data contents	Data read/use method	Corresponding data monitor items
AAT	°C, °F	Ambient air temperature	Not applicable.	Not applicable.
ABS	Inactive/ Active	Antilock braking system	Not applicable.	Not applicable.
APP_STATUS	Accelerator Pedal Off/ Under 20%/ Over 20%/ FAIL	Accelerator pedal position	Not applicable.	Not applicable.
AYC	Inactive/ Active	Active yaw control	Not applicable.	Not applicable.
BRK_F_P_R	Pa, psi	Brake fluid line hydraulic pressure (Raw Value)	BRK_F_P_R	BRK_F_P_R
BTCS	Inactive/ Active	Brake traction control system	Not applicable.	Not applicable.
CFG_STATUS	Config Complete/ Not Configured/ Config Error	Instrument cluster configuration status	Not applicable.	Not applicable.
ECT_STATUS	Under 0 degrees C/ 0 - Under 80 degrees C/ Over 80 degrees C/ FAIL	Engine coolant temperature status	Not applicable.	Not applicable.
EDC	Inactive/ Active	Engine drag control	Not applicable.	Not applicable.
IC_VPWR	V	Instrument cluster power supply	• The DSC HU/CM constantly receives the power supply voltage value of the instrument cluster sent via CAN signal from the instrument cluster. • If a DTC is detected, the DSC HU/CM records the power supply voltage of the instrument cluster when the DTC was detected, and it is displayed in the M-MDS.	VRWR*2
IG-ON_TIMER	hh:mm:ss*1	Elapsed time since ignition was switched ON **NOTE:**	• The DSC HU/CM constantly receives the elapsed time since the ignition was switched ON sent via CAN signal from the instrument cluster.	Not

		• The instrument cluster records the elapsed time since the ignition was switched ON.	If a DTC is detected, the DSC HU/CM records the elapsed time since the ignition was switched ON when the DTC was detected, and it is displayed in the M-MDS.	applicable.
LAT_ACCL_R	G	Lateral acceleration (Raw Value)	LAT_ACCL_R	LAT_ACCL_R
LON_ACCL_R	G	Longitudinal acceleration (Raw Value)	LON_ACCL_R	LON_ACCL_R
PMP_MT	Off/On	Pump motor	PMP_MT	PMP_MT
PWR_MODE_KEY	Key Out/Key Recently Out (Position 0)/Accessory (Position 1)/Post Ignition (Position 2)/Ignition On (Position 2)/Running (Position 2)/Running - Starting	• Key Out: Ignition switched off • Key Recently Out (Position 0): Elapsed time **within 3 s** since ignition was switched off • Accessory (Position 1): Ignition is switched to ACC • Post Ignition (Position 2): Elapsed time **within 3 s** since ignition was switched ON • Ignition On (Position 2): Ignition switched ON (engine off) • Running (Position 2): Ignition switched ON (engine on) • Running - Starting: Cranking condition	• The DSC HU/CM constantly receives the ignition switch status sent via CAN signal from the instrument cluster. • If a DTC is detected, the DSC HU/CM records the ignition switch status when the DTC was detected, and it is displayed in the M-MDS.	Not applicable.
RPM_STATUS	Engine Stop/ Under 1500rpm/ Over 1500rpm/ FAIL	Engine RPM status	• The DSC HU/CM constantly receives the ignition switch status sent via CAN signal from the instrument cluster. • If a DTC is detected, the DSC HU/CM records the ignition switch status when the DTC was detected, and it is displayed in the M-MDS.	TACHOMTR*2
SHIFT_STATUS	P/N D/ R/ FAIL	Shift position status	• The DSC HU/CM constantly receives the selector lever position sent via CAN signal from the instrument cluster. • If a DTC is detected, the DSC HU/CM records the selector lever position when the DTC was detected, and it is displayed in the M-MDS.	Not applicable.
STR_ANG_C	°	Steering wheel angle (Calculated Value)	STR_ANG_C	STR_ANG_C
TCS	Inactive/ Active	Traction control system	Not applicable.	Not applicable.
			The distance traveled when the DSC HU/CM detected a DTC can be calculated by performing the following procedure.	

TOTAL_DIST	km, ft, mi	Accumulated total traveled distance from completion of vehicle until DSC HU/CM detects DTC (Odometer value in instrument cluster)	• Verify the odometer value in the instrument cluster. • Verify the snap shot data item TOTAL_DIST. • Subtract 2 from 1.	Not applicable.
TOTAL_TIME	hh:mm:ss*1	Accumulated total elapsed time since vehicle completion until DSC HU/CM detects a DTC **NOTE:** • When the ROOM fuse is removed, and the ignition is switched off, the time is not included in the elapsed time.	The elapsed time when the DSC HU/CM detected a DTC can be calculated by performing the following procedure. • Verify the PID item TOTAL_TIME of the instrument cluster. • Verify the snap shot data item TOTAL_TIME. • Subtract 2 from 1.	Not applicable.
VPWR	V	Power supply	VPWR_B_SOL	VPWR_B_SOL
VSPD	KPH, MPH	Vehicle speed	VSPD	VSPD
VSPD_STATUS	Stop/ 0 - 10km/h/ Over 10km/h/ FAIL	When a DTC is detected, the DSC HU/CM receives the vehicle speed being detected by the instrument cluster via CAN signals and displays it in the M-MDS.	• The DSC HU/CM constantly receives the vehicle speed sent via CAN signal from the instrument cluster. • If a DTC is detected, the DSC HU/CM records the vehicle speed when the DTC was detected, and it is displayed in the M-MDS.	SPEEDOMTR*2
YAW_RATE_R	°/S	Yaw Rate (Raw Value)	YAW_RATE_R	YAW_RATE_R

*1 **Fractions of seconds may be indicated after the decimal point.**

*2 **Instrument cluster PID.**

PID/data monitor function

- The PID/data monitor function is used for optionally selecting input/output signal monitor items preset in the DSC HU/CM and reading them out in real-time.

PID/data monitor table

Mazda Modular Diagnostic System (M-MDS) display	Data contents	Unit/Operation (Mazda Modular Diagnostic System (M-MDS) display)

V_TRC_LF/RR	Traction control solenoid valve condition (LF/RR)	Off/On
V_TRC_RF/LR	Traction control solenoid valve condition (RF/LR)	
VPWR_B_SOL	Module supply voltage	V
VSPD	Vehicle speed	KPH, MPH
WSPD_SEN_LF	LF ABS wheel-speed sensor signal	KPH, MPH
WSPD_SEN_LR	LR ABS wheel-speed sensor signal	
WSPD_SEN_RF	RF ABS wheel-speed sensor signal	
WSPD_SEN_RR	RR ABS wheel-speed sensor signal	
YAW_RATE_C	Yaw rate value (calculated Value)	°/s
YAW_RATE_R	Yaw rate value (raw Value)	

Active command modes function

- The active command modes function is used for optionally selecting simulation items of input/output parts preset in the DSC HU/CM, and to operate them regardless of CM control.
- To protect the hydraulic unit interior, operate output related parts for only **2 s or less** when using the active command modes function.

Active command mode table

Command name	Output part	Operation	Operating condition
PMP_MT_SP	Pump motor	Off/On	Switch the ignition ON
V_INLET_LF	LF inlet solenoid valve		
V_INLET_LR	LR inlet solenoid valve		
V_INLET_RF	RF inlet solenoid valve		
V_INLET_RR	RR inlet solenoid valve		
V_OUTLET_LF	LF outlet solenoid valve		
V_OUTLET_LR	LR outlet solenoid valve		
V_OUTLET_RF	RF outlet solenoid valve		
V_OUTLET_RR	RR outlet solenoid valve		
V_STB_LF/RR	LF/RR stability control solenoid valve	Off/On	Switch the ignition ON
V_STB_RF/LR	RF/LR stability control solenoid valve		
V_TRC_LF/RR	LF/RR linear control solenoid valve	Off/On	Switch the ignition ON
V_TRC_RF/LR	RF/LR linear control solenoid valve		

External tester communication function

- The external tester communication function enables communication of diagnostic data (DTC read-outs, input/output signal read-outs, operation of input/output parts) between the DSC HU/CM and an external tester.

Connections/communication contents

	External tester	
	Mazda Modular Diagnostic System (M-MDS)	
	Connection	Communication method
On-board diagnostic (malfunction detection) function	Input/output: CAN_H (HS), CAN_L (HS) terminals	Serial communication
PID/data monitor function	Input/output: CAN_H (HS), CAN_L (HS) terminals	Serial communication
Active command modes function	Input/output: CAN_H (HS), CAN_L (HS) terminals	Serial communication

Serial communication

- Serial communication (two-way communication) allows for multiple data to be sent and received instantly along the same line.
- By connecting the Mazda Modular Diagnostic System (M-MDS) to the DLC-2, diagnostic data can be sent and received between the Mazda Modular Diagnostic System (M-MDS) and the DSC HU/CM using the CAN_H and CAN_L terminals (within the DLC-2).
- The DSC HU/CM receives the command signals of the malfunction detection function, PID/data monitor function, and the active command modes function based on the Mazda Modular Diagnostic System (M-MDS), and sends DTCs and data regarding the operating condition

and status of each input/output part to the Mazda Modular Diagnostic System (M-MDS).

Diagnostic function name	Signal received	Signal sent
Malfunction detection function	DTC verification signal	DTC
PID/data monitor function	Command signal to read selected monitor item	Monitored data for requested monitor item
Active command modes function	Operation command signal for selected active command modes item	Output part drive signal

2014 - Mazda3 - Brakes

DLC-2 [DYNAMIC STABILITY CONTROL (DSC)]

OUTLINE

- A connector (DLC-2) conforming to International Organization for Standardization (ISO) standards has been added.

CONSTRUCTION

- Shape and terminal arrangement as stipulated by the ISO 15031-3 (SAE J1962) international standard has been adopted for this connector. The 16-pin connector consists of a CAN_H (HS) terminal, CAN_L (HS) terminal, CAN_H (MS) terminal, CAN_L (MS) terminal, GND1 terminal, GND2 terminal, and B+ terminal.

DLC-2

Terminal	Function
A	Battery power supply terminal
B	-
C	-
D	-
E	Serial communication Lo terminal (HS)

F	Serial communication Hi terminal (HS)
G	-
H	Serial communication ground terminal
I	-
J	Body ground terminal
K	Serial communication Lo terminal (MS)
L	Serial communication Hi terminal (MS)
N	-

2014 - Mazda3 - Brakes

ON-BOARD DIAGNOSTIC SYSTEM [LASER SENSOR]

OUTLINE

- The on-board diagnostic system consists of a malfunction detection system that detects malfunctions in input/output signals when the ignition is switched ON, a PID/data monitor function that reads out specified input/output signals, and an active command mode function that allows for override operation of output parts (such as solenoid valves).
- The Data Link Connector 2 (DLC-2), which groups together all the connectors used for malfunction diagnosis and detecting/repair into a single location, has been adopted, thereby improving serviceability. Diagnosis is performed by connecting the Mazda Modular Diagnostic System (M-MDS) to the DLC-2.
- In addition to DTC read-out, the Mazda Modular Diagnostic System (M-MDS) is used to clear DTCs using the display screen of the diagnostic tester, and to access the PID/data monitor and active command modes functions, providing enhanced malfunction diagnosis and improved serviceability.

Block diagram

FUNCTION

Malfunction detection function

- The malfunction detection function detects and displays malfunctions in the input/output signal system of the laser sensor when the ignition is switched ON.
- If the laser sensor malfunction is detected, the Smart City Brake Support (SCBS) indicator light (amber) is illuminated. DTCs can be output through the CAN_H and CAN_L of the DLC-2 using the external tester communication function. At the same time, malfunction detection results are sent to the memory and fail-safe functions.

Memory function

- The memory function stores DTCs of malfunctions in input/output signal systems. With this function, once a DTC is stored it is not cleared after the ignition has been switched off, even if the malfunctioning signal system has returned to normal.
- Since the laser sensor has a built-in non-volatile memory, DTCs are not cleared even if the battery is removed. Therefore, it is necessary to clear the memory after performing repairs. Refer to the Workshop Manual for the DTC clearing procedure.

DTC 7-digit code definition

- When related systems or components have failed, the sensor stores the DTC of the malfunctioning part in the sensor memory, and allows for the retrieval of the stored data using the scanning tool when necessary. The DTCs are indicated using seven digits. Each digit indicates the following.

Fail-safe function

- When the malfunction detection function determines a malfunction, the Smart City Brake Support (SCBS) indicator light (amber) illuminates to alert the driver. At this time, the Smart City Brake Support (SCBS) is inhibited.

NOTE:

- A warning message in the center display is displayed with the Smart City Brake Support (SCBS) indicator light (amber) turned on or flashed. For the message content and verification method, refer to the CENTER DISPLAY.

Status byte for DTC

- The status byte is the two-digit code (two digits after hyphen (-)) after the DTC.

- The status byte is a code which indicates the pending code, current/past malfunction status, or warning illumination status.
- The status byte can be read by performing a CMDTC self test using the Mazda Modular Diagnostic System (M-MDS).
- For details on the status byte, refer to the explanation on the Mazda Modular Diagnostic System (M-MDS) when reading the DTC.

Snapshot data

- The snapshot data stores the currently detected DTC data

Snapshot data item	Unit	Definition	Corresponding data monitor items

DSC_R_BRK	OK/Error	DSC response against brake request from SCBS module	—

PID/data monitor function

- The PID/data monitor function is used for optionally selecting input/output signal monitor items preset in the laser sensor and reading them out in real-time.

PID/data monitor table

Mazda Modular Diagnostic System (M-MDS) display	Data contents	Unit/Operation (Mazda Modular Diagnostic System (M-MDS) display)
DIST_BMP_TGT	Distance from bumper to target that sensor has detected	m
VPWR_IG1	Module supply voltage (IG1)	V
VSPD	Vehicle speed	KPH, MPH

External tester communication function

- The external tester communication function enables communication of diagnostic data (DTC read-outs, input/output signal read-outs, operation of input/output parts) between the laser sensor and an external tester.

Connections/communication contents

	External tester	
	Mazda Modular Diagnostic System (M-MDS)	
	Connection	Communication method
On-board diagnostic (malfunction detection) function	Input/output: CAN_H (HS), CAN_L (HS) terminals	Serial communication
PID/data monitor function	Input/output: CAN_H (HS), CAN_L (HS) terminals	Serial communication

Serial communication

- Serial communication (two-way communication) allows for multiple data to be sent and received instantly along the same line.
- By connecting the Mazda Modular Diagnostic System (M-MDS) to the DLC-2, diagnostic data can be sent and received between the Mazda Modular Diagnostic System (M-MDS) and the laser sensor using the CAN_H and CAN_L terminals (within the DLC-2).
- The laser sensor receives the command signals of the malfunction detection function and PID/data monitor function based on the Mazda Modular Diagnostic System (M-MDS), and sends DTCs and data regarding the operating condition and status of each input/output part to the Mazda Modular Diagnostic System (M-MDS).

Diagnostic function name	Signal received	Signal sent
Malfunction detection function	DTC verification signal	DTC
PID/data monitor function	Command signal to read selected monitor item	Monitored data for requested monitor item

2014 - Mazda3 - Brakes

DLC-2 CONSTRUCTION [LASER SENSOR]

- A connector (DLC-2) conforming to International Organization for Standardization (ISO) standards has been added.
- Shape and terminal arrangement as stipulated by the ISO 15031-3 (SAE J1962) international standard has been adopted for this connector. The 16-pin connector consists of a CAN_H (HS) terminal, CAN_L (HS) terminal, CAN_H (MS) terminal, CAN_L (MS) terminal, GND1 terminal, GND2 terminal, and B+ terminal.

2014 - Mazda3 - Brakes

CONVENTIONAL BRAKE SYSTEM

Outline

- A brake pedal with an intrusion minimizing mechanism has been adopted. As a result, driver safety has been improved.
- A vacuum pump has been adopted, improving braking force.
- A large diameter, ventilated disc-type front brake has been adopted, improving braking force.
- A large diameter, solid disc-type rear brake has been adopted, improving braking force.

Structural View

REAR BRAKE (DISC)

2014 - Mazda3 - Brakes

BRAKE PEDAL

Purpose / Function

- An intrusion-minimizing brake pedal has been adopted to the brake pedal to provide for a measure of safety in the event of an accident.
- The intrusion-minimizing brake pedal mechanism reduces impact to the lower extremities of the driver by minimizing the amount of rearward brake pedal thrust in a frontal collision.

Construction

- The intrusion minimizing brake pedal mechanism is structured on the brake pedal and consists of the following parts.
    - Pedal arm
    - Lever
    - Pin A
    - Pin B
    - Pin C
    - Bracket

Operation

During normal braking

- When the brake pedal is depressed, the pedal arm rotates at the pin A fulcrum point, and the pedal depression force is transmitted to the fork of the power brake unit.
- This pedal depression force pushes in the fork to operate the brakes.

Intrusion-minimizing operation

- In a frontal collision, the brake pedal is forced rearward by the movement of the dashboard.
- In response to this, force in the direction of X is applied to the brake pedal lever because the dashboard member and brake pedal lever interfere.
- With the addition of force in the direction of X, pin C releases from the lever, and the lever rotates around the pin B fulcrum point.
- When the lever rotates, it obstructs pin A at the fulcrum point of the pedal arm.
- If the pedal rotates further, pin A separates from the bracket (notch), and the pedal is freed.
- By freeing the pedal arm, the force applied to the lower extremities is reduced.

2014 - Mazda3 - Brakes

MASTER CYLINDER

Purpose/Function

- With the adoption of the master cylinder having an enlarged diameter (20.64 mm {0.8126 in}), brake pedal operability has been improved.
- The diameter of the pipe between the master cylinder and the DSC HU/CM has been increased, improving response during DSC operation.

Construction

- Except for the cap and brake fluid reserve tank, the master cylinder cannot be disassembled. Therefore, if there is any malfunction in the interior of the master cylinder, replace the cylinder component without disassembling.

Operation

- When the brake pedal is depressed, the push rod of the power brake unit presses in the master cylinder piston. By pressing in the piston, pressure is applied to the brake fluid to operate the brakes.

2014 - Mazda3 - Brakes

POWER BRAKE UNIT

Purpose / Function

- A 9.8-inch, single diaphragm type power brake unit has been adopted, achieving compatibility between high braking performance and excellent brake feeling.

Construction

- The power brake unit cannot be disassembled. Therefore, if there is any malfunction in the power brake unit, replace the power brake unit without disassembling.

Operation

- The depression force of the brake pedal is increased using the vacuum from the vacuum pump, and the force is transmitted to the master cylinder.

2014 - Mazda3 - Brakes

FRONT BRAKE (DISC)

Purpose / Function

- Large diameter, ventilated disc type front brakes with a 280 mm {11.0 in} diameter and 25 mm {0.98 in} thickness have been adopted, improving braking force and fade resistance. (SKYACTIV-G 2.0)
- Large diameter, ventilated disc type front brakes with a 295 mm {11.6 in} diameter and 25 mm {0.98 in} thickness have been adopted, improving braking force and fade resistance. (SKYACTIV-G 2.5)

Construction

Operation

- When brake fluid is applied, the piston equipped on one side of the caliper is pushed out and the brake pad is pushed against the disc plate. At the same time, the caliper body moves in the direction opposite of the direction

in which the piston is pushed out so as to push the brake pad on the other side and generate brake force.

2014 - Mazda3 - Brakes

REAR BRAKE (DISC)

Purpose / Function

- Large diameter, solid-disc type front brakes with a 265 mm {10.4 in} diameter and 9.0 mm {0.35 in} thickness have been adopted, improving braking force and fade resistance.

Construction

Operation

- When brake fluid is applied, the piston equipped on one side of the caliper is pushed out and the brake pad is pushed against the disc plate. At the same time, the caliper body moves in the direction opposite of the direction in which the piston is pushed out so as to push the brake pad on the other side and generate brake force.

2014 - Mazda3 - Brakes

PARKING BRAKE SYSTEM

Outline

- A center lever type parking brake has been adopted, improving operability.
- Serviceability has been improved by enabling adjustment of the parking brake lever from the vehicle interior.

Structural View

2014 - Mazda3 - Brakes

DYNAMIC STABILITY CONTROL (DSC)

Outline

- Electrical brake assist control has been adopted, improving safety.
- The DSC HU/CM, integrating both the Hydraulic Unit (HU) and Control Module (CM), has been adopted, resulting in a size and weight reduction.
- An enhanced malfunction diagnosis system, used with the Mazda Modular Diagnostic System (M-MDS), has been adopted, improving serviceability.
- Serviceability improved by the automatic configuration function.
- The Hill Launch Assist (HLA), Tire Pressure Monitoring System (TPMS)*1, and Smart City Brake Support (SCBS)*2 have been adopted, improving safety.

*1 **Vehicles with Tire Pressure Monitoring System (TPMS)**

*2 **Vehicles with Smart City Brake Support (SCBS)**

DSC operation outline

- The ABS prevents wheel lock-up during braking. The TCS detects drive wheel spin due to the accelerator pedal being pressed too hard or similar causes and controls engine speed to suppress wheel spin. With these systems, safety is assured when driving or stopping.
- Additionally, sudden changes in vehicle attitude, due to evasive steering or road conditions, are controlled by the DSC. The DSC suppresses vehicle sideslip when driving due to vehicle spin (oversteer) or drift-out (understeer) by controlling braking and engine speed. At this time, the TCS/DSC indicator light illuminates to alert the driver that the DSC is operating due to a dangerous situation. As a result, the driver can calmly react and is provided leeway for the next maneuver, resulting in safe driving conditions.
- In this way the combination of DSC + ABS + TCS ensures driving, stopping and turning safety in all aspects.

Results of DSC operation

CAUTION:

- While the DSC is a steering safety system, it does not improve normal steering function. Therefore, always drive carefully, even if the vehicle has DSC, and do not overestimate the DSC capability.
- If the initialization procedures for the brake fluid pressure, low-G, and yaw rate sensors are not performed correctly, an incorrectly determined initial point may cause a discrepancy between the actual driving conditions of the vehicle and the signals from the sensors, resulting in improper DSC operation. Therefore, after replacing the following parts, make sure to perform the DSC HU/CM initialization procedures of the sensors with the vehicle stopped on a level ground to insure proper DSC operation. For the initialization procedures of the sensors, refer to the Workshop Manual.
    - DSC HU/CM
    - SAS control module
- The DSC and ABS will not operate normally under the following conditions:
    - With tires that are not of the specified size, manufacturer or tread pattern, or not inflated according to specification
    - With tires that have significant comparative wear variation
    - With tire chains
    - With an emergency spare tire

ABS WHEEL-SPEED SENSOR

Construction

- The DSC system consists of the following parts. While each part has a regular function in other systems, only the function during DSC control is listed.

Part name	Function
DSC HU/CM	• Makes calculations using input signals from each sensor, controls brake fluid pressure to each wheel, and actuates function (ABS, EBD, TCS, DSC, brake assist control, Hill Launch Assist (HLA), TPMS*1, and Smart City Brake Support (SCBS)*2) of the DSC system. • Outputs the torque reduction request signal, wheel speed signal, and DSC system warning control data via CAN lines. • Controls the on-board diagnostic system and fail-safe function when there is a malfunction in the DSC system.

PCM	• Controls engine output based on signals from the DSC HU/CM. • Transmits engine speed, engine torque, brake switch status, and accelerator pedal position data via CAN communication to the DSC HU/CM. • Transmits gear/shift lever position data via CAN communication to the DSC HU/CM. (MTX)
TCM (ATX)	• Transmits gear/selector lever position data via CAN communication to the DSC HU/CM.
EPS CM	• Transmits steering angle data via CAN communication to the DSC HU/CM.
SAS control module	• Detects the lateral-G (vehicle lateral acceleration speed), the yaw rate (vehicle turning angle speed), and the longitudinal-G (vehicle longitudinal acceleration speed) via CAN communication to the DSC HU/CM.
Brake system warning light	• Notifies the driver that the parking brake is applied. • Notifies the driver of an ABS or EBD malfunction.
ABS warning light	• Notifies the driver of an ABS malfunction.
TCS/DSC indicator light	• Informs the driver that the TCS is operating (drive wheel is spinning). • Informs the driver that the DSC is operating (vehicle sideslip occurring). • Informs the driver of DSC system malfunction.
DSC OFF switch	• Transmits driver intention to release TCS/DSC control to the DSC HU/CM.
DSC OFF indicator light	• Informs driver that TCS/DSC control has been released due to DSC OFF switch operation.
TPMS set switch*1	• Data initialization after adjusting the tire pressures can be done.
TPMS warning light*1	• Notifies the driver that the tire pressure is not normal. • Notifies the driver of an TPMS malfunction.
ABS wheel-speed sensor	• Detects the rotation condition of each wheel and transmits it to the DSC HU/CM.
Brake fluid pressure sensor (Built into DSC HU/CM)	• Detects the fluid pressure from the master cylinder.
Smart City Brake Support (SCBS) indicator light*2	• Informs the driver of Smart City Brake Support (SCBS) system malfunction.
Smart City Brake Support (SCBS) warning light*2	• Informs the driver that the Smart City Brake Support (SCBS) is operating.
Smart City Brake Support (SCBS) OFF indicator light*2	• Notifies driver that Smart City Brake Support (SCBS) system control inhibited.
Laser sensor*2	• Emits near-infrared laser and detects the distance between the vehicle and a vehicle or an obstruction ahead based on the reflection.

*2 **Vehicles with Smart City Brake Support (SCBS)**

2014 - Mazda3 - Brakes

DSC HU/CM

Outline

- A high reliability, reduced size and weight DSC HU/CM, integrating both the DSC HU and the DSC CM, has been adopted.

DSC HU Part Purpose/Function

- According to DSC CM signals, the DSC HU controls (on/off) each solenoid valve and the pump motor, adjusts fluid pressure in each caliper piston, and actuates each function (ABS, EBD, TCS, DSC, brake assist control, Hill Launch Assist (HLA), Tire Pressure Monitoring System (TPMS)*1, and Smart City Brake Support (SCBS)*2) of the DSC system.

*1 **Vehicles with Tire Pressure Monitoring System (TPMS)**

*2 **Vehicles with Smart City Brake Support (SCBS)**

DSC HU Part Construction

- The DSC HU mainly consists of the inlet/outlet solenoid valves, pump motor (pump), traction control solenoid valves, and stability control solenoid valves.

Function of main component parts

Part name	Function
Inlet solenoid valve	• Adjusts the fluid pressure in each brake system according to DSC HU/CM signals.
Outlet solenoid valve	• Adjusts the fluid pressure in each brake system according to DSC HU/CM signals.
Stability control solenoid valve	• Switches the brake hydraulic circuits during and according to normal braking, ABS and EBD control, TCS control, DSC control, and brake assist control.
Traction control solenoid valve	• Switches the brake hydraulic circuits during and according to normal braking, ABS and EBD control, TCS control, DSC control, and brake assist control.
Reservoir	• Temporarily stores brake fluid from the caliper piston to ensure smooth pressure reduction during ABS and EBD control, TCS control, and DSC control.
Pump	• Returns the brake fluid stored in the reservoir to the master cylinder during ABS and EBD control. • Increases brake fluid pressure and sends brake fluid to each caliper piston during TCS control and DSC control.

Pump motor	• Operates the pump according to DSC HU/CM signals.

DSC HU Part Operation

During normal braking

- During normal braking, the solenoid valves are not energized and all of them are off. When the brake pedal is depressed, brake fluid pressure is transmitted from the master cylinder, through the traction control solenoid and inlet solenoid valves, and then to the caliper piston.

Solenoid valve operation table

Traction control solenoid valve		Stability control solenoid valve		Inlet solenoid valve				Outlet solenoid valve				Pump motor and pump
LF—RR	RF—LR	LF—RR	RF—LR	LF	RF	LR	RR	LF	RF	LR	RR	

OFF (open)	OFF (closed)	OFF (open)	OFF (closed)	Stopped

Hydraulic Circuit Diagram

During ABS and EBD control

- During ABS and EBD control when wheel lock-up is about to occur, the traction control solenoid and stability control solenoid valves are not energized, and the inlet and outlet solenoid valves are energized and controlled in three pressure modes (increase, reduction or maintain), thereby adjusting brake fluid pressure. Brake fluid during pressure reduction is temporarily stored in the reservoir and afterwards the pump motor operates the pump to return the fluid to the master cylinder. (The following figure shows these conditions: right front wheel pressure increased, left front wheel pressure maintained, and both rear wheels pressure decreased.)

Solenoid valve operation table

During pressure reduction mode	OFF (open)		OFF (closed)		ON (closed)				ON (open)				Operating

Hydraulic Circuit Diagram

During DSC control (to suppress oversteer tendency) and TCS control

- When a large oversteer tendency or driving wheel spin is determined, the traction control solenoid and stability control solenoid valves are energized, switching the hydraulic circuits. At the same time, the pump motor is actuated to operate the pump, thereby increasing pressure by supplying brake fluid pressure to the caliper piston of the outer front wheel or the slipping driving wheel. Also at this time, the inlet solenoid valve of the inner rear wheel is energized and the hydraulic circuit of this wheel is closed.
- After a pressure increase, brake fluid pressure is adjusted using the three pressure modes (reduction, maintain, increase) so that the target wheel speed is obtained. (The following figure shows a left turn, or control of right front wheel spin (during pressure increase mode).)

Hydraulic Circuit Diagram

During DSC control (to suppress understeer tendency)

- When a large understeer tendency is determined, the traction control solenoid and stability control solenoid valves are energized, switching the hydraulic circuits. At the same time, the pump motor is actuated to operate the pump, supplying brake fluid pressure from the reservoir to the inner rear caliper piston. Also at this time, the inlet solenoid valve of the outer front wheel is energized and the hydraulic circuit of this wheel is closed.
- After a pressure increase, brake fluid pressure is adjusted using the three pressure modes (reduction, maintain, increase) so that the target wheel speed is obtained. (The following figure shows control during a left turn during pressure increase mode.)

Solenoid valve operation table

Hydraulic Circuit Diagram

DSC CM Part Function

- The DSC CM makes calculations using signals input from each sensor, and outputs a brake fluid pressure control signal to the DSC HU to actuate DSC system functions. It also outputs an engine output control signal to the PCM.

- The DSC HU/CM controls the following functions:

Function table

Function name	Contents
ABS control function	• Controls brake fluid pressure when braking to maintain directional stability, ensure steerability, and reduce stopping distance.
Electronic brakeforce distribution (EBD) control function	• Constantly controls proper distribution of brake fluid pressure to the front and rear wheels according to vehicle load, road surface, and vehicle speed conditions to prevent early lock-up of the rear wheels.
TCS control function	• Controls traction to within the road surface friction limit and according to road and driving conditions to improve starting and acceleration performance, and safety.
DSC control function	• Suppresses strong over-steer and under-steer tendencies when turning by controlling engine output and braking of each wheel to assure driving safety.
Brake assist control function	• The brake pedal depression speed and force is calculated from the brake fluid pressure sensor signal. If it exceeds the specification, an emergency braking situation is determined and a higher amount of hydraulic pressure than the normal specified amount is generated in the hydraulic unit and supplied to each wheel based on the activation of each solenoid valve, pump motor, and pump. • If a condition is detected in which emergency braking is anticipated by the change in speed of the accelerator pedal position, the gap between the brake pad and disc plate is reduced to enhance the response when braking.
Hill Launch Assist (HLA) control function	• For detailed information on the Hill Launch Assist (HLA), refer to HILL LAUNCH ASSIST (HLA). (See **HILL LAUNCH ASSIST (HLA)**.)
Tire Pressure Monitoring System (TPMS) control function*1	• For detailed information on the TPMS, refer to TIRE PRESSURE MONITORING SYSTEM (TPMS). (See **TIRE PRESSURE MONITORING SYSTEM (TPMS)**.)
Smart City Brake Support (SCBS) control function*2	• For detailed information on the Smart City Brake Support (SCBS), refer to SMART CITY BRAKE SUPPORT (SCBS). (See **SMART CITY BRAKE SUPPORT (SCBS)**.)
CAN communication function	• Outputs the vehicle speed signal and DSC system warning control data via CAN lines.
On-board diagnostic system	• A function that allows important parts of the DSC control system to perform self-diagnosis. In case a malfunction occurs, the warning lights illuminate to alert the driver, and at the same time a DTC is stored in the DSC HU/CM. • When a malfunction is determined as a result of the on-board diagnostic test, system control is suspended or limited to prevent any dangerous situation while driving.
Automatic configuration function	• When the ignition is switched ON or the engine is started after the DSC HU/CM have been replaced, the DSC CM reads data from the instrument cluster via CAN communication to perform automatic configuration.

*2 **Vehicles with Smart City Brake Support (SCBS)**

Block diagram

2014 - Mazda3 - Brakes

ABS CONTROL

Outline

- ABS control occurs when wheel slip is determined by the DSC CM (based on the four ABS wheel-speed sensors). Then, the DSC HU inlet and outlet solenoid valves are operated and brake fluid pressure is controlled accordingly to prevent wheel lock-up.

Feature

- Use of ABS control during emergency braking or on slippery road surfaces allows directional stability to be maintained, steerability ensured, and stopping distance to be reduced.
- The ABS control system has independent front wheel control and unified control (select low) for the rear wheels.

  NOTE:

  - Select low control: A control system in which the left and right vehicle wheel speeds are compared and brake fluid pressure is controlled according to the wheel most likely to lock-up.

Construction

Block Diagram

Operation

- When the DSC CM determines wheel slip conditions based on the signals from the ABS wheel-speed sensors during braking, the DSC CM operates the DSC HU inlet and outlet solenoid valves, reducing and maintaining brake fluid pressure in accordance with the wheel slip factors. Then, when the wheel slip condition has passed, brake fluid pressure is increased and maintained, ensuring braking with a constantly stable brake force.

EBD CONTROL

Outline

- EBD control uses the ABS system to control brake fluid pressure distribution to the rear wheels so that they do not lock-up prior to the front wheels during braking, thereby preventing the loss of handling stability.

Feature

- EBD control has independent control systems for both the front and rear wheels.
- EBD control constantly and properly distributes brake fluid pressure regardless of vehicle weight.

Construction

Block Diagram

Operation

- EBD control detects the slip ratio between the estimated vehicle speed and rear wheels from the ABS wheel-speed sensor signals. If the slip ratio of the rear wheels as compared to the front wheels is larger than the fixed limit, the DSC HU/CM reduces brake pressure being distributed to the rear wheels. Due to this, brake pressure distribution is constantly controlled in the proper proportion and in relation to vehicle load, road surface conditions, and vehicle speed.
- Determination of the rear wheel slip ratio, based on a comparison of the lowest front wheel speed and the estimated vehicle speed with the rear wheel speeds, is divided into conditions 0-3 shown in the table below.
- The DSC HU outlet and inlet solenoid valves are operated and the brake fluid pressure controlled according to these conditions.
- If ABS control conditions are met during EBD control, EBD control is stopped and ABS control is given priority.

Status	Rear wheel slip ratio determination	EBD control	Solenoid valve	Comment
0	No slip	No control	Pressure increase	—
1	α%—β%	Control	Pressure maintained	—
2	After EBD control, slip ratio is γ%	Control	Increase/maintain	—
3	Front wheel slip ratio is δ% or more	Control	Pressure reduction/maintained/increase	ABS control operates

α—δ

Specified value

Operating Condition Transition Diagram

2014 - Mazda3 - Brakes

TCS CONTROL

Outline

- The TCS control actuates torque reduction through engine control, as well as using brake control to control traction.

NOTE:

- Engine control: Engine output is lowered by fuel cut and ignition timing control to reduce the traction, preventing driving wheel slip.
- Brake control: Brake fluid pressure from the Hydraulic Unit (HU) to the driving wheel that is slipping is increased, operating the brake and preventing driving wheel slip.

Features

- The left and right wheels are controlled at the same time by engine control. Therefore, when the road surface friction coefficients differ between the left and right wheels, proper torque reduction cannot be performed separately for each wheel. When this occurs, torque reduction is performed by independent left and right wheel brake control, providing more stable vehicle control.
- The DSC OFF switch allows the driver to optionally enable/disable the TCS control at the driver's discretion.
    - When both driving wheels are stuck, traction control according to the driver's operation can be performed by inhibiting the TCS control.
    - The TCS control returns to normal operation automatically at the next ignition cycle.

Construction

Block Diagram

Operation

- TCS control detects driving wheel spin based on the signals listed below, sends torque reduction request signals to the PCM, and also controls the solenoid valves and pump motor in the DSC HU/CM.
    - Vehicle wheel speed signals from the front and rear ABS wheel-speed sensors
    - Engine torque signal from the PCM
    - Steering angle signal from the EPS CM
    - Yaw rate and lateral-G signals from the SAS control module
    - Fluid pressure signal from the brake fluid pressure sensor (built into the DSC HU/CM)

2014 - Mazda3 - Brakes

DSC CONTROL

Outline

- While a vehicle normally turns safely in response to steering operation, there are instances when the limits of tire lateral grip is surpassed due to road surface conditions or vehicle speed, and the influence of evasive steering to avoid an accident or similar situations.
- Tires surpassing lateral grip exhibit one of the following conditions: Strong oversteer tendency (rear wheel grip is less than front wheels) and strong understeer tendency (front wheel grip is less than rear wheels)
- DSC operates at vehicle speeds of approx. 15 km/h {9.3 mph} or more in the conditions described above, controlling engine output and wheel braking to suppress oversteer and understeer tendencies.

Function

Vehicle condition determination

- The vehicle speed, steering angle, lateral-G, and yaw rate are detected by the sensors and used in calculations by the DSC HU/CM to determine the vehicle condition. Then, depending on the difference between the target yaw rate, calculated with the values input from each sensor and the value detected by the yaw rate sensor, an oversteer or understeer tendency can be determined.

Oversteer tendency determination

- When turning, if the actual vehicle yaw rate is larger than the target yaw rate (the yaw rate that should normally be formed as determined by the steering angle and vehicle speed), it means that the vehicle is in or about to be in a spin. Therefore the vehicle is determined to have an oversteer tendency.

Understeer tendency determination

- When turning, if the actual vehicle yaw rate is less than the target yaw rate (the yaw rate that should normally be formed as determined by the steering angle and vehicle speed), it means that the vehicle is not properly turning. Therefore the vehicle is determined to have an understeer tendency.

Construction

Block diagram

Operation

- When the DSC HU/CM determines that the vehicle has a strong oversteer or understeer tendency, engine output is lowered and, at the same time, it suppresses the yaw moment by affecting the braking of the front or rear wheels to inhibit the oversteer or understeer tendency.

Oversteer tendency suppression

- When a large oversteer tendency is determined, braking is applied to the outer front wheel according to the degree of the tendency. As a result, a yaw moment is formed towards the outer side of the vehicle and the oversteer tendency is suppressed.

Understeer tendency suppression

- When a large understeer tendency is determined, engine output is controlled and braking is applied to the inner rear wheel according to the degree of the tendency. As a result, a yaw moment is formed towards the inner side of the vehicle and the understeer tendency is suppressed.

2014 - Mazda3 - Brakes

HILL LAUNCH ASSIST (HLA)

Purpose / Function

- Hill Launch Assist (HLA) functions to assist in accelerating the vehicle from a stop on uphill slopes. When the vehicle is held at a stop by depressing the brake pedal on a slope with a grade of 3 % (MTX vehicle), or 6 % or more (ATX vehicle), the brake fluid pressure is maintained to prevent the vehicle from rolling backwards even after the driver's foot is released from the brake pedal.
- Hill Launch Assist (HLA) operates when the selector lever is in the D/M position and the R position. For MTX vehicles, it operates when the shift lever is in a forward drive position and the R position.

Structure

Block diagram

Hydraulic circuit diagram

Operation

- Hill Launch Assist (HLA) is controlled by the DSC HU/CM. When the input signals from each module meet the operation conditions, the DSC HU/CM maintains the brake fluid pressure when the driver depressed the brake pedal (hold control). When the engine torque increases to the point of enabling the vehicle to move forward by depressing the accelerator pedal (ATX vehicles) or depressing the clutch (MTX vehicles), the brake fluid pressure is released (release control) according to the engine torque value.
- In the event that a malfunction occurs in the DSC system during hold control, the DSC HU/CM releases the brake fluid pressure. When the brake fluid is released due to a DSC system malfunction, slow release control or fast release control is performed according to the nature of the malfunction.

NOTE:

- Hill Launch Assist (HLA) operates during forward and reverse travel (grade on which system operates changes slightly depending on vehicle conditions such as load, tire wear, tire air pressure).
- Hill Launch Assist (HLA) operates continuously regardless of the DSC OFF switch operation effect.
- If a malfunction occurs in the parking brake switch or there is an error in the parking brake signal from the instrument cluster, Hill Launch Assist (HLA) does not operate. In this case, the TCS/DSC indicator light are illuminated simultaneously.

- If a malfunction occurs in the DSC system, Hill Launch Assist (HLA) does not operate.

Hold control

- Control conditions (all of the following conditions met):
  - Slope of approx. 3 % or more (MTX)
  - Slope of approx. 6 % or more (ATX)
  - Wheel speed is 0 km/h {0 mph}
  - Parking brake not operated
  - Accelerator pedal not depressed
  - No fail-safe mode is present
  - Upslope: The selector lever position is in the D/M position (ATX)
  - Upslope: The shift lever position is in the position other than R (MTX)
  - Downslope: The selector/shift lever position is in the R position
  - Brake pedal is depressed
  - Clutch pedal depressed (MTX)

NOTE:

- If the parking brake is operated during hold control, slow release control is executed and the brake fluid pressure is released. After this, if the brake pedal is depressed again and the parking brake is released, the system transitions to hold control again.
- Control description
  - If all of the control conditions are met, the DSC HU/CM controls the traction control solenoid valves and maintains brake fluid pressure (driver can depress brake pedal more at this time).

  - If the brake pedal is released, brake fluid pressure (hold-pressure stored in memory) is maintained for a maximum of 1.5 s (MTX) or 2.0 s (ATX).

Release control

- Control condition
  - After the accelerator pedal is depressed, the required engine torque for accelerating the vehicle on a slope is produced
- Control description
  - Brake fluid pressure being maintained is lowered depending on produced engine torque.

Slow release control

- Control condition (one or more of following conditions are met):
  - Parking brake applied
  - Clutch pedal released (MTX)
  - DSC HU/CM has malfunction (performs slow release control only if solenoid valve control is available)
  - 1.5 s have elapsed with brake pedal released (MTX)
  - 2.0 s have elapsed with brake pedal released (ATX)
- Control description
  - Brake fluid pressure being maintained is lowered within 1.5 s

Fast release control

- Control condition
  - DSC HU/CM has malfunction and solenoid valve control is not available

- Control description
    - Brake fluid pressure being maintained is reduced to 0 kPa {0 mmHg, 0 inHg} immediately

2014 - Mazda3 - Brakes

SMART CITY BRAKE SUPPORT (SCBS)

Purpose

- The Smart City Brake Support (SCBS) operates the automatic brakes (brake control (SCBS brake)) when the vehicle approaches a vehicle ahead at a vehicle speed between **approx. 4 km/h {2 mph}** to **30 km/h {19 mph}** to reduce collision impact.

WARNING:

- The Smart City Brake Support (SCBS) performs the brake control (SCBS brake), however, it is not a system which guarantees collision prevention under all conditions. Because deceleration by the brake control (SCBS brake) is limited, always verify the safety of the surrounding area and keep a safe distance from a vehicle ahead.
- The Smart City Brake Support (SCBS) does not operate when the vehicle speed is less than approx. 4 km {2 mph} or approx. 30 km/h {19 mph} or more. It also does not operate when the vehicle is in reverse.
- Do not apply stickers to the surface of the windshield near the laser sensor (including transparent stickers). Otherwise, the laser sensor may not be able to detect vehicles or obstructions ahead which could result in an accident.

CAUTION:

- Always use tires for all wheels that are of the specified size, and the same manufacture, brand, and tread pattern. In addition, do not use tires with significantly different wear patterns on the same vehicle. If such improper tires are used, the Smart City Brake Support (SCBS) system may not operate normally.

NOTE:

- The Smart City Brake Support (SCBS) is a system for assisting driver operations. Accordingly, if the conditions for the Smart City Brake Support (SCBS) are met, or even when the Smart City Brake Support (SCBS) is operating, if the driver operates the steering wheel, accelerator pedal, and the brake pedal, the driver's operations take precedence and the Smart City Brake Support (SCBS) operation is canceled.
- Turn off the Smart City Brake Support (SCBS) system to prevent mistaken operation when the vehicle is running on a chassis roller.

Function

- The Smart City Brake Support (SCBS) functions are categorized as follows:
    - Brake prefill which reduces the clearance between the brake pads and the disc plate when the laser sensor detects the vehicle approaching a vehicle ahead to enable brake force generation immediately when the brake is operated.

Brake control (SCBS brake) which operates the automatic brakes when the laser sensor detects the risk of a collision.

- When the laser sensor detects that the vehicle is approaching a vehicle ahead, the system operates the brake prefill. When the driver depresses the brake pedal, the brakes are applied firmly and quickly to assist, and if the driver does not perform an avoidance maneuver, it operates the brake control (SCBS brake).
- The laser sensor installed on the upper area of the windshield detects a vehicle running ahead within **approx. 6 m {20 ft}** from the laser sensor.

Smart City Brake Support (SCBS) display

- The Smart City Brake Support (SCBS) display which displays in the Active Drive Display is as follows:

  NOTE:

  - A warning message in the center display is displayed with the Smart City Brake Support (SCBS) indicator light (amber) turned on or flashed. For the message content and verification method, refer to the CENTER DISPLAY. (See **CENTER DISPLAY [WITH CENTER DISPLAY]**.)
  - When the Smart City Brake Support (SCBS) system operates, the user is notified by the flashing warning light and the Active Driving Display.

Smart City Brake Support (SCBS) operating condition		Content	Smart City Brake Support (SCBS) warning light (red)	Smart City Brake Support (SCBS) indicator light (amber)	Active driving display
ON	When there is the possibility of a collision with a vehicle ahead or an obstruction	Brake control (SCBS brake) is in operation	Flashes	Not illuminated/Not flashed	Smart City Brake Support Activated
	When a malfunction occurred in the Smart City Brake Support (SCBS) system	The Smart City Brake Support (SCBS) system malfunction is occurred	Not illuminated/Not flashed	Illuminated	No display
		The laser sensor capability is impaired			

		by rainfall, snowfall, dirty windshield and so forth.	Not illuminated/Not flashed	Illuminated	No display

Construction / Operation

- The Smart City Brake Support (SCBS) system will operate under the following conditions:
  - The engine is running.
  - The center display in the instrument cluster does not indicate that the system requires inspection.
  - The vehicle speed is between **approx. 4 km/h {2 mph}** to **30 km/h {19 mph}**.
  - The Smart City Brake Support (SCBS) system is not turned off.
  - The DSC operation is not turned off using the DSC OFF switch.
  - The DSC is not malfunctioning.
  - The driver is not deliberately performing driving operations (accelerator pedal, steering wheel, and braking operations).

NOTE:

- The Smart City Brake Support (SCBS) detects a vehicle ahead by emitting a near infrared laser beam and receiving the beam reflected off the reflector or the vehicle ahead, and then using it for the measurement. Consequently, the Smart City Brake Support (SCBS) may not operate under the following conditions:
  - Reflection of laser sensor is poor due to the shape of the vehicle ahead.
  - The vehicle ahead is significantly dirty.
  - Under bad weather condition such as rain, fog, and snow.
  - When the window washer is being used or the windshield wipers are not used when it is raining.
  - The windshield is dirty.
  - The steering wheel is turned completely left or right, or the vehicle is accelerated rapidly and comes close to the vehicle ahead.
  - Trucks with low loading platforms, vehicles traveling at extremely low speeds, and vehicles with high profile.
  - Vehicles with certain shapes such as a vehicle carrier.
- Under the following conditions, the Smart City Brake Support (SCBS) system may not operate normally:
  - Heavy luggage is loaded in the luggage compartment or on the rear seat.
  - When there is the possibility of a partial contact with a vehicle or obstruction ahead.
  - When driving on continuously curving roads, entering and existing curves, and unstable driving due to a vehicle accident or breakdown in a driving lane.
  - Elongated luggage or cargo is loaded onto installed roof rails and covers the laser sensor.
  - Exhaust gas from the vehicle ahead, sand, snow, and water vapor rising from manholes and grating, and water splashed into the air.
- In the following cases, if the laser sensor determines that there is a vehicle ahead and the Smart City Brake Support (SCBS) system may operate:
  - Object on the road at the entrance to a curve.
  - Vehicles passing in the opposite lane while making a curve.
  - Metal objects, bumps, or protruding objects on the road.
  - When passing through a toll gate.
  - When passing under a vinyl curtain or flag.
  - Plastic objects such as pylons.
  - Two-wheeled vehicles, pedestrians, animals or standing trees.

Brake prefill operation

Solenoid valve operation table

Traction control solenoid valve		Stability control solenoid valve		Inlet solenoid valve				Outlet solenoid valve				Pump motor, pump
LF—RR	RF—LR	LF—RR	RF—LR	LF	RF	LR	RR	LF	RF	LR	RR	
OFF (open)		OFF (close)		OFF (open)				OFF (close)				Operating

Hydraulic circuit diagram

Block diagram

- When the laser sensor detects that the vehicle is approaching a vehicle ahead, it outputs a brake prefill request signal (1) to the DSC HU/CM.
- The DSC HU/CM operates the pump motor (2) to activate the pump so that the brake fluid pressure is lead to the caliper piston (3) and the brake pads are kept near the disc plate.
- As a result, if the driver realizes that he/she is approaching a vehicle ahead and depresses the brake pedal, or if the driver does not perform an avoidance maneuver and the automatic brakes are operated, the brake force is generated immediately and the braking distance is reduced.

Brake control (SCBS brake) operation

Solenoid valve operation table

Traction control solenoid valve		Stability control solenoid valve		Inlet solenoid valve				Outlet solenoid valve				Pump motor, pump
LF—RR	RF—LR	LF—RR	RF—LR	LF	RF	LR	RR	LF	RF	LR	RR	
ON (close)		ON (open)		OFF (open)				OFF (close)				Operating

Hydraulic circuit

Block diagram

- After the brake prefill operates, if the driver does not perform an avoidance maneuver and the laser sensor determines that a collision may occur, it outputs a brake control (SCBS brake) request signal (4) to the DSC HU/CM.
- The DSC HU/CM energizes the linear control solenoid valve to switch the hydraulic circuits and to increase the brake fluid pressure. Therefore the brake is operated automatically (5). At this time, the DSC HU/CM outputs a brake light signal to the Rear Body Control Module (RBCM) (6). While the brake control (SCBS brake) is operating, turns on the brake lights automatically (7), and at the same time the brake light unit outputs a brake light operation signal to the DSC HU/CM (8).
- When the Smart City Brake Support (SCBS) operates and the brakes are applied, the Smart City Brake Support (SCBS) warning light (red) is flashed and the message “Smart City Brake Support Activated” is indicated in the Active Drive Display.
- The brake control (SCBS brake) is kept operated for **2 s.** To keep the vehicle stopped after the brake control (SCBS brake) operation ends, the brake pedal has to be depressed to operate the brake.

CAUTION:

- If the DSC system has a malfunction and the DSC control is inhibited, or if the DSC OFF switch is operated and the DSC control is disabled, the Smart City Brake Support (SCBS) does not operate.
- When the laser sensor malfunction is determined as a result of the on-board diagnostic test, the Smart City Brake Support (SCBS) is suspended while driving.
- When the DTC is stored in the PCM, DSC HU/CM, and/or instrument cluster, the Smart City Brake Support (SCBS) is suspended depending on the malfunctioning situation.

2014 - Mazda3 - Brakes

SMART CITY BRAKE SUPPORT (SCBS) PERSONALIZATION

- A personalization function has been adopted with which setting for the Smart City Brake Support (SCBS) can be changed by operation of the steering switch.

Smart City Brake Support (SCBS) setting

Display	Function	Initial setting	Setting contents	Smart City Brake Support (SCBS) OFF indicator light	Control unit
SCBS	The operation of Smart City Brake Support (SCBS) can be turned off.	ON	ON/OFF	ON: Not illuminate OFF: illuminate	Instrument cluster

2014 - Mazda3 - Brakes

CONTROLLER AREA NETWORK (CAN)

Outline

- The DSC HU/CM sends and receives data to and from other modules via the CAN system. Refer to MULTIPLEX COMMUNICATION SYSTEM for a detailed explanation of the CAN system. (See **MULTIPLEX COMMUNICATION SYSTEM**.)

Data sent

- Cruise control system-related information
- DSC system-related information
- Vehicle speed
- Wheel speed (LF, RF, LR, RR)
- Yaw rate

Data received

- Acceleration signal status
- Accelerator pedal opening angle
- Air bag system warning light on request
- Ambient temperature
- Back-up light on request
- Back-up light switch
- Battery charge status
- Brake light status
- Brake switch (No.1 signal)
- Clutch pedal stroke sensor
- Collision detection (front, side, roll over)
- Collision detection (rear)
- Cruise control control status

- Cruise control set speed
- Cruise control switch
- Cruise control switch signal
- Cruise control system-related information
- Driving condition
- DSC OFF switch status
- Engine displacement
- Engine speed
- Engine torque
- Fuel cut request
- Ignition key status
- Ignition off timer
- Manual shift control
- Parking brake status
- Rolling counter
- Selector lever position
- Shift range position
- Steering angle (relative steering angle) signal
- Target gear position
- Tire size
- TPMS OFF switch status
- Traveled distance
- Vehicle speed
- Yaw rate

2014 - Mazda3 - Brakes

ABS WHEEL-SPEED SENSOR AND ABS SENSOR ROTOR

Purpose / Function

- The ABS wheel-speed sensor and ABS sensor rotor detect the rotation condition of each wheel and transmit this information to the DSC HU/CM.
- The signal from the ABS wheel-speed sensor is the primary signal that the DSC HU/CM uses when carrying out control.

Construction

- The ABS wheel-speed sensor utilizes a semi-conductor element that contains an active drive circuit (MR element*). The front sensor is installed on the steering knuckle and the rear sensor is installed on the wheel hub.
- The front ABS sensor rotor utilizes a magnetic encoder system that functions with magnetic rubber, and is integrated into the front wheel hub. Therefore, if there is any malfunction of the front ABS sensor rotor, replace the front wheel hub.
- The rear ABS sensor rotor utilizes a magnetic encoder system that functions with magnetic rubber, and is integrated into the rear wheel hub. Therefore, if there is any malfunction of the rear ABS sensor rotor, replace the rear wheel hub.

*

A magneto-resistive force means that an exterior magnetic field acts on the element, changing the resistance of the element.

CAUTION:

- When inspecting the ABS wheel-speed sensor, do not use a tester to inspect resistance. It is possible that the voltage from the tester could damage the semiconductor inside the ABS wheel-speed sensor. Inspect using the PID data monitor of the Mazda Modular Diagnostic System (M-MDS).

NOTE:

- Magnetic encoder: A plate that has positive and negative poles (marked out) in a continuous, alternating line.

Front ABS wheel-speed sensor and sensor rotor

Rear ABS wheel-speed sensor and sensor rotor

Operation

- As the ABS sensor rotor rotates, the magnetic flux between the ABS wheel-speed sensor and the ABS sensor rotor change periodically. This periodic change is in proportion to the rotation speed.
- The semiconductor element in the wheel speed sensor detects the change in magnetic flux, and the active drive circuit converts it to a rectangular wave signal for the current, which is transmitted to the DSC HU/CM.
- For every single rotation of the ABS sensor rotor, 48 rectangular wave pulse signals are output. The CM in the DSC HU/CM calculates the wheel speed from the periodicity of these pulses.

BRAKE FLUID PRESSURE SENSOR

Purpose/Function

- The brake fluid pressure sensor detects the fluid pressure from the master cylinder and transmits it to the DSC HU/CM.

Construction

- The brake fluid pressure sensor is built into the DSC HU/CM. Therefore, if there is any malfunction of the brake fluid pressure sensor, replace the DSC HU/CM.

2014 - Mazda3 - Brakes

BRAKE SYSTEM / ABS WARNING LIGHT

Purpose / Function

- The brake system/ABS warning light is built into the instrument cluster. If a malfunction is detected in the system with the parking brake released, the warning light illuminates to notify the driver.

Construction / Operation

- When the DSC system and CAN lines are functioning normally, the brake system/ABS warning light illuminates when the ignition is switched ON to check for a burned-out bulb, and then turns off after approx. 3 s. At this time, while the parking brake is activated, the brake system warning light remains illuminated, however, it turns off after the parking brake is released.
- The brake system/ABS warning light illuminates during a system malfunction, and the control is as follows:

  ABS warning light illuminated:

  - ABS control disabled.

  ABS warning light and brake system warning light illuminated:

  - ABS and EBD controls disabled.
- For vehicles with center display, a warning message in the center display is displayed when the ABS warning light is turned on. For the message content and verification method, refer

to the CENTER DISPLAY. (See **CENTER DISPLAY [WITH CENTER DISPLAY]**.)

- For vehicles with center display, a warning message in the center display is displayed when the brake system warning light is turned on. For the message content and verification method, refer to the CENTER DISPLAY. (See **CENTER DISPLAY [WITH CENTER DISPLAY]**.)

Fail-safe

- Function not equipped.

2014 - Mazda3 - Brakes

TCS/DSC INDICATOR LIGHT

Purpose/Function

- The TCS/DSC indicator light, built into the instrument cluster, informs the driver of the following vehicle conditions.
    - TCS is operating. (Drive wheel is slipping.)
    - DSC is operating. (Vehicle side-slip condition.)
    - DSC system malfunction.

Operation

- When the DSC system and CAN lines are normal, the TCS/DSC indicator light illuminates for approx. 3.0 s when the ignition is switched ON to check the light function. When the system is malfunctioning, the TCS/DSC indicator light remains illuminated.
- When the TCS or DSC are non-operational, operational and malfunctioning, the TCS/DSC indicator light operates according to the following table.

TCS/DSC indicator light operation

Item	TCS/DSC indicator light

TCS and DSC not operating	Not illuminated
TCS operating	Flashes (0.5 s intervals)
DSC operating	
DSC system malfunction	Illuminated

- For vehicles with center display, a warning message in the center display is displayed when the TCS/DSC indicator light is turned on. For the message content and verification method, refer to the CENTER DISPLAY. (See **CENTER DISPLAY [WITH CENTER DISPLAY]**.)

Fail-safe

- Function not equipped.

2014 - Mazda3 - Brakes

DSC OFF SWITCH, DSC OFF INDICATOR LIGHT

Purpose/Function

- The DSC OFF switch, located on the dashboard, allows for optionally enabling/disabling the TCS/DSC control at driver discretion.

- The DSC OFF indicator light, built into the instrument cluster, informs the driver that TCS/DSC control has been disabled by operation of the DSC OFF switch.

Operation

- When the DSC system and CAN lines are functionally normally, the DSC OFF indicator light illuminates for approx. 3.0 s when the ignition is switched ON to check the light function.
- When the DSC OFF switch is pressed to disable TCS/DSC control, the DSC OFF indicator light illuminates.

- The DSC OFF indicator light illumination and TCS/DSC control conditions while operating the DSC OFF switch are as indicated in the table.

Mode	DSC OFF indicator light illumination conditions	TCS control conditions		DSC control conditions	
		Brake control	Engine control	Brake control	Engine control
TCS/DSC ON	Not illuminated	Permitted	Permitted	Permitted	Permitted
TCS/DSC OFF	Illuminated	Inhibited*1*2/permitted*3	Inhibited	Inhibited	Inhibited

*1

LASER SENSOR

Purpose / Function

WARNING:

- As there is the possibility of eye damage occurring from the laser, always heed the following precautions:
  - Do not peer directly into the laser sensor using optical instruments with a magnification such as magnifying glasses, microscopic and objective lens within a distance of 100 mm {3.94 in} from the sensor.
  - Do not disassemble the laser sensor (including the lens). A disassembled sensor will not meet the conditions for a class 1M laser under the IEC 60825-1 specification and therefore eye safety cannot be assured.
- Installed to the upper area of the windshield and detects a vehicle or an obstruction ahead.

- The laser sensor specification is as follows.
  - Maximum average power: 45 mW
  - Pulse duration: 33 ns
  - Wavelength: 905 nm
  - Divergence angle (horizontal × vertical): 28°×12°

Automatic configuration function

- When the ignition is switched to ON or the engine is started, the laser sensor reads data from the instrument cluster via CAN communication each time to perform automatic configuration.

On-board diagnostic system

- A function that allows the laser sensor to perform self-diagnosis.
- In case a malfunction occurs, the Smart City Brake Support (SCBS) indicator light (amber) is illuminated, and at the same time a DTC is stored in the laser sensor.

- When a malfunction is determined as a result of the on-board diagnostic test, the Smart City Brake Support (SCBS) is suspended while driving

Construction / Operation

- Emits near-infrared laser and detects the distance between the vehicle and a vehicle or an obstruction ahead based on the reflection.
- A vehicle or an obstruction within approx. 6 m {20 ft} from the laser sensor can be detected.
- Adjustment such as aiming adjustment is not required even if the laser sensor is removed and reinstalled or replaced.

2014 - Mazda3 - Transmission/Transaxle

TRANSMISSION/TRANSAXLE FEATURES

Clutch and Manual Transaxle [C66M-R]

- A newly developed, C66M-R-type manual transaxle (SKYACTIV-MT) with 6 forward gears and 1 reverse gear has been adopted.

Automatic Transaxle [FW6A-EL]

- A newly developed, FW6A-EL-type electronically controlled automatic transaxle (SKYACTIV-DRIVE) with 6 forward gears, 1 reverse gear, and a TCC mechanism has been adopted.
- Using the existing automatic transaxle as a base, fuel economy improvement, direct feel, and smooth shifting have been thoroughly pursued to make one of the most optimized automatic transaxles.

Main features

- With the adoption of a full range TCC mechanism, a contribution to low fuel consumption and the direct feel of a manual transaxle have been achieved.
- A control valve body has been adopted with an integrated TCM and improved responsiveness to achieve smooth and precise shifting.

2014 - Mazda3 - Transmission/Transaxle

TRANSMISSION/TRANSAXLE SPECIFICATIONS

Clutch [C66M-R]

Item			Specifications
Engine type			SKYACTIV-G 2.0
Clutch control			Hydraulic
Clutch pedal	Type		Suspended

	Full stroke (reference value)	(mm {in})	141 {5.55}
Clutch master cylinder inner diameter		(mm {in})	15.87 {0.6248}
Clutch release cylinder inner diameter		(mm {in})	20.64 {0.8126}
Clutch cover	Spring type		Diaphragm
	Set load	(N {kgf, lbf})	6400 {652.6, 1439}
Clutch disc	Outer diameter	(mm {in})	240 {9.45}
	Inner diameter	(mm {in})	155 {6.10}
Clutch fluid type			SAE J1703 or FMVSS116 DOT-3

Manual Transaxle [C66M-R]

Item			Specifications
Engine type			SKYACTIV-G 2.0
Transaxle control			Floor-shift
Operation system			Cable
Shift assist	Forward		Synchromesh
	Reverse		Synchromesh
Gear ratio	1GR		3.363
	2GR		1.947
	3GR		1.300
	4GR		1.029
	5GR		0.837
	6GR		0.680
	Reverse		3.385
Final gear ratio			U.S.A. and Canada: 3.850 Except U.S.A. and Canada: 4.105
Manual transaxle oil	Grade		API service GL-4
	Viscosity	All season	SAE 75W-80
	Capacity (approx. quantity)	(L {US qt, Imp qt})	1.70 {1.80, 1.50}

Automatic Transaxle [FW6A-EL]

Output gear (number of teeth)		U.S.A. and Canada: 22 Except U.S.A. and Canada: 21	U.S.A. and Canada: 23 Except U.S.A. and Canada: 21
Ring gear (number of teeth)		U.S.A. and Canada: 75 Except U.S.A. and Canada: 76	U.S.A. and Canada: 74 Except U.S.A. and Canada: 76

2014 - Mazda3 - Transmission/Transaxle

TRANSMISSION/TRANSAXLE IDENTIFICATION

- Each transmission/transaxle is assigned a specific Mazda type code. The code can be broken down as follows:

Manual Transaxle

C66M-R

- Shift control type
  R: Remote shift control
- Transmission/transaxle type
  M: Manual transmission/transaxle
- Transmission/transaxle speed
  6: 6-speed
- Transmission/transaxle model
  C6: C6-type

Automatic Transaxle

FW6A-EL

- Converter type
  L: With lockup clutch
- Shift control type
  E: Electronic shift control
- Transmission/transaxle type
  A: Automatic transmission/transaxle
- Transmission/transaxle speed
  6: 6-speed
- Transmission/transaxle model
  FW: FW-type

TRANSMISSION/TRANSAXLE IDENTIFICATION

2014 - Mazda3 - Transmission/Transaxle

ON-BOARD DIAGNOSTIC SYSTEM OUTLINE [FW6A-EL]

Purpose/Function

- An on-board diagnostic system has been adopted to improve serviceability.
- An on-board diagnostic system has been adopted consisting of the following functions:
    - Malfunction detection function
    - Fail-safe function
    - Diagnostic data memory function
    - Malfunction indication function
        - Check engine light
        - Automatic transaxle warning light
    - External tester communication function
        - DLC-2
        - CAN
    - PID/DATA monitor function
    - Simulation function

Construction/Operation

Block Diagram

ON-BOARD DIAGNOSTIC SYSTEM OUTLINE [FW6A-EL]

2014 - Mazda3 - Transmission / Transaxle

ON-BOARD DIAGNOSTIC SYSTEM MALFUNCTION DETECTION FUNCTION [FW6A-EL]

Purpose / Function

- The malfunction diagnostic function detects transaxle malfunctions.
- Accurate and quick repair/service can be performed to facilitate malfunction cause determination using the malfunction detection function.

Construction / Operation

- If a malfunction occurs in the transaxle, it is recorded as a DTC. A DTC can be read by the Mazda Modular Diagnostic System (M-MDS).

DTC 7-digit code definition

- When related systems or components have failed, the CM stores the DTC of the malfunctioning part in the CM memory, and allows for the retrieval of the stored data using the scanning tool when necessary. The DTCs are indicated using seven digits. Each digit indicates the following.

DTC table

×: Applicable—: Not applicable

DTC No.	Check engine light	Automatic transaxle warning light	Description	Fail-safe function	Drive cycle	Self test type*1	Memory function
P0218:00	Illuminated	Illuminated	Automatic transaxle protection control	×	1	C	×

C: CMDTC self test, O: KOEO self test

DTC separate detection condition

DTC No.	Description	Detection condition
P0218:00	Automatic transaxle protection control	• Under the following conditions, the ATF temperature is **135 °C {275 °F} or more** for **10 s**: ▪ Engine is running. ▪ TFT sensor related DTC is not recorded.
P0500:00	Vehicle speed signal circuit malfunction	• Under the following conditions, the vehicle speed signal input from DSC HU/CM is incorrect for **10 s**: ▪ Engine is running. ▪ The vehicle is driven in D position or R position. ▪ Output shaft speed sensor related DTC is not recorded ▪ There is no difference between vehicle speed signal from DSC HU/CM and turbine/input shaft speed sensor signal.
P0666:00	ECU internal temperature sensor circuit malfunction	• Under the following condition, there is malfunction in circuit of ECU internal temperature sensor: ▪ Battery voltage is **8 V or more**.
P0667:00	ECU internal temperature sensor/performance problem	• Under the following conditions, the difference between ECU internal temperatures of three ECU internal temperature sensors are **15 °C {27 °F} or more**: ▪ Engine is running. ▪ Soaked for **6 hours or more**. ▪ No malfunction in ECU internal temperature sensor circuit
		• Under the following condition, TCM internal NVRAM data retention/read/write disabled:

P06B8:00	NVRAM malfunction	▪ Battery voltage is **8 V or more**.
P0706:00	Transaxle range sensor range/performance problem	• Under the following condition, pattern identification error in switch condition of transaxle range sensors 1 to 4: ▪ Battery voltage is **8 V or more**.
P0707:00	Transaxle range sensor circuit low input	• Under the following condition, incorrect voltage in any one of transaxle range sensors 1 to 4: ▪ Battery voltage is **8 V or more**.
P0708:00	Transaxle range sensor circuit high input	• Under the following condition, incorrect voltage in any one of transaxle range sensors 1 to 4: ▪ Battery voltage is **8 V or more**.
P0711:00	TFT sensor range/performance problem	• Under the following conditions, the ATF temperature is **40 °C {104 °F} or less**: ▪ Certain period has elapsed since engine start. ▪ ECU internal temperature sensor related DTC is not recorded. ▪ Soaked for **6 hours or more**. ▪ ECU internal temperature is **60 °C {140 °F} or more**. • Under the following conditions, the ATF temperature is **120 °C {248 °F} or more**: ▪ Certain period has elapsed since engine start. ▪ ECU internal temperature sensor related DTC is not recorded. ▪ Soaked for **6 hours or more**. ▪ ECU internal temperature is **95 °C {203 °F} or less**.
P0712:00	TFT sensor circuit low input	• Under the following condition, the TFT sensor voltage is **0.12 V or less** for **5 s**: ▪ Battery voltage is **8 V or more**.
P0713:00	TFT sensor circuit high input	• Under the following conditions, the ATF temperature is **−40 °C {−40 °F} or less** for **5 s**: ▪ Battery voltage is **8 V or more**. ▪ IAT is **−25 °C {−13 °F} or more**. ▪ IAT sensor related DTC is not recorded.
P0715:00	Turbine/input shaft speed sensor/sensor output range malfunction	• Under the following conditions, the difference between engine speed signal and turbine/input shaft speed signal is **400 rpm or more** for **1 s**: ▪ Engine is running. ▪ Turbine/input shaft speed sensor is **9,000 rpm or less**. ▪ The gear shift position is in the neutral condition.
P0716:00	Turbine/input shaft speed sensor range/performance problem	• Under the following condition, the turbine/input shaft speed is **9,000 rpm or more** for **1 s**: ▪ Battery voltage is **8 V or more**.
P0717:00	Open circuit in turbine/input shaft speed sensor circuit	• Under the following conditions, the turbine/input shaft speed sensor signal is not input for **1 s**: ▪ Engine is running. ▪ Vehicle speed signal related DTC is not recorded. ▪ Vehicle speed is **16 km/h {9.9 mph} or more**. ▪ There is no difference between vehicle speed signal from DSC HU/CM and output shaft speed sensor signal. ▪ DTC U0121:00 is not recorded.

P0720:00	Output shaft speed sensor range/performance problem	• Under the following conditions, there is difference between vehicle speed signal from DSC HU/CM and output shaft speed sensor signal for **1 s**: ▪ Engine is running. ▪ The vehicle is driven in D position or R position. ▪ Vehicle speed signal related DTC is not recorded. ▪ There is no difference between vehicle speed signal from DSC HU/CM and turbine/input shaft speed sensor signal. ▪ Output shaft speed sensor signal is input. ▪ Forward: Output shaft speed is **13,560rpm or less**. ▪ Reverse: Output shaft speed is **2,000 rpm or less**.
P0721:00	Output shaft speed sensor/sensor output range malfunction	• Under the following condition, the output shaft speed is **13,560 rpm or more** in forward or **2,000 rpm or more** in reverse for a continuous **1 s**: ▪ Battery voltage is **8 V or more**.
P0722:00	Open circuit in output shaft speed sensor circuit	• Under the following conditions, the output shaft speed sensor signal is not input for **1 s**: ▪ Engine is running. ▪ Vehicle speed signal related DTC is not recorded. ▪ Vehicle speed is **16 km/h {9.9 mph} or more**. ▪ There is no difference between vehicle speed signal from DSC HU/CM and output shaft speed sensor signal. ▪ DTC U0121:00 is not recorded.
P0729:00	6GR incorrect ratio	• In D position, 6GR, the following phenomenon occurs: ▪ There is difference between turbine/input shaft speed and output shaft speed sensor speed for **230 to 1,980 ms** (varies with ATF temperature and ECT) during shift-up. ▪ There is difference between turbine/input shaft speed and output shaft speed sensor speed for **1,500 to 3,900 ms** (varies with ATF temperature) while driving without shifting.
P0731:00	1GR incorrect ratio	• In D position, 1GR, the following phenomenon occurs: ▪ Speed ratio is **0.75 to 1.2** for **2,000 ms** while vehicle is stopped in D position. ▪ There is difference between turbine/input shaft speed and output shaft speed sensor speed for **230 to 1,980 ms** (varies with ATF temperature and ECT) during shift-up. ▪ There is difference between turbine/input shaft speed and output shaft speed sensor speed for **1,500 to 3,900 ms** (varies with ATF temperature) while driving without shifting.
P0732:00	2GR incorrect ratio	• In D position, 2GR, the following phenomenon occurs: ▪ There is difference between turbine/input shaft speed and output shaft speed sensor speed for **230 to 1,980 ms** (varies with ATF temperature and ECT) during shift-up. ▪ There is difference between turbine/input shaft speed and output shaft speed sensor speed for **1,500 to 3,900 ms** (varies with ATF temperature) while driving without shifting.
P0733:00	3GR incorrect ratio	• In D position, 3GR, the following phenomenon occurs: ▪ There is difference between turbine/input shaft speed and output shaft speed sensor speed for **230 to 1,980 ms** (varies with ATF temperature and ECT) during shift-up. ▪ There is difference between turbine/input shaft speed and output shaft speed sensor speed for **1,500 to 3,900 ms** (varies with ATF temperature) while driving without shifting.

P0734:00	4GR incorrect ratio	• In D position, 4GR, the following phenomenon occurs: ▪ There is difference between turbine/input shaft speed and output shaft speed sensor speed for **230 to 1,980 ms** (varies with ATF temperature and ECT) during shift-up. ▪ There is difference between turbine/input shaft speed and output shaft speed sensor speed for **1,500 to 3,900 ms** (varies with ATF temperature) while driving without shifting.
P0735:00	5GR incorrect ratio	• In D position, 5GR, the following phenomenon occurs: ▪ There is difference between turbine/input shaft speed and output shaft speed sensor speed for **230 to 1,980 ms** (varies with ATF temperature and ECT) during shift-up. ▪ There is difference between turbine/input shaft speed and output shaft speed sensor speed for **1,500 to 3,900 ms** (varies with ATF temperature) while driving without shifting.
P0736:00	Gear reverse incorrect ratio	• Speed ratio is **0.75 to 1.2** for **2,000 ms** while vehicle is stopped in R position.
P073D:00	Neutral incorrect ratio	• In P or N position, the following phenomenon occurs: ▪ Speed ratio is **0.5 or less** for **2 s** while vehicle is stopped in P or N position.
P0741:00	TCC control solenoid stuck off	• Under the following conditions, difference in slip amount **over 5 s** compared to target slip amount is **200 rpm or more**, and TCC feedback hydraulic pressure is **200 kPa {2.04 kgf/cm^2, 29.0 psi} or more** occurs: ▪ Selector lever position is D position. ▪ No electrical malfunction in TCC control solenoid ▪ During TCC or TCC feedback ▪ There is no difference between vehicle speed signal from DSC HU/CM and output shaft speed sensor signal. ▪ Engine is running. ▪ ATF temperature is **−25 °C {−13 °F} or more**. ▪ Turbine/input shaft speed sensor and output shaft speed sensor DTC is not recorded.
P0743:00	TCC control solenoid circuit malfunction	• Under the following condition, the TCM detects the TCC control solenoid circuit malfunction: ▪ Battery voltage is **10.5 V or more**.
P0746:00	Pressure control solenoid stuck off	• Under the following conditions, pressure control solenoid stuck-off detected by combination of gear ratio malfunction and oil pressure switch pattern malfunction: ▪ Engine is running. ▪ ATF temperature is **20 °C {68 °F} or more**. ▪ There is no difference between vehicle speed signal from DSC HU/CM and output shaft speed sensor signal. ▪ Turbine/input shaft speed sensor and output shaft speed sensor DTC is not recorded.
P0748:00	Pressure control solenoid circuit malfunction	• Under the following condition, the TCM detects the pressure control solenoid circuit malfunction: ▪ Battery voltage is **10.5 V or more**.
		• Under the following conditions, shift solenoid No.1 stuck-off detected by combination of gear ratio malfunction and oil pressure switch pattern malfunction: ▪ Engine is running. ▪ ATF temperature is **20 °C {68 °F} or more**.

P0751:00	Shift solenoid No.1 stuck off	▪ There is no difference between vehicle speed signal from DSC HU/CM and output shaft speed sensor signal. ▪ Turbine/input shaft speed sensor and output shaft speed sensor DTC is not recorded.
P0752:00	Shift solenoid No.1 stuck on	• Under the following conditions, shift solenoid No.1 stuck-on detected by combination of gear ratio malfunction and oil pressure switch pattern malfunction: ▪ Engine is running. ▪ ATF temperature is **20 °C {68 °F} or more**. ▪ There is no difference between vehicle speed signal from DSC HU/CM and output shaft speed sensor signal. ▪ Turbine/input shaft speed sensor and output shaft speed sensor DTC is not recorded.
P0753:00	Shift solenoid No.1 circuit malfunction	• Under the following condition, the TCM detects the shift solenoid No.1 circuit malfunction: ▪ Battery voltage is **10.5 V or more**.
P0756:00	Shift solenoid No.2 stuck off	• Under the following conditions, shift solenoid No.2 stuck-off detected by combination of gear ratio malfunction and oil pressure switch pattern malfunction: ▪ Engine is running. ▪ ATF temperature is **20 °C {68 °F} or more**. ▪ There is no difference between vehicle speed signal from DSC HU/CM and output shaft speed sensor signal. ▪ Turbine/input shaft speed sensor and output shaft speed sensor DTC is not recorded.
P0757:00	Shift solenoid No.2 stuck on	• Under the following conditions, shift solenoid No.2 stuck-on detected by combination of gear ratio malfunction and oil pressure switch pattern malfunction: ▪ Engine is running. ▪ ATF temperature is **20 °C {68 °F} or more**. ▪ There is no difference between vehicle speed signal from DSC HU/CM and output shaft speed sensor signal. ▪ Turbine/input shaft speed sensor and output shaft speed sensor DTC is not recorded.
P0758:00	Shift solenoid No.2 circuit malfunction	• Under the following condition, the TCM detects the shift solenoid No.2 circuit malfunction: ▪ Battery voltage is **10.5 V or more**.
P0761:00	Shift solenoid No.3 stuck off	• Under the following conditions, shift solenoid No.3 stuck-off detected by combination of gear ratio malfunction and oil pressure switch pattern malfunction: ▪ Engine is running. ▪ ATF temperature is **20 °C {68 °F} or more**. ▪ There is no difference between vehicle speed signal from DSC HU/CM and output shaft speed sensor signal. ▪ Turbine/input shaft speed sensor and output shaft speed sensor DTC is not recorded.
P0762:00	Shift solenoid No.3 stuck on	• Under the following conditions, shift solenoid No.3 stuck-on detected by combination of gear ratio malfunction and oil pressure switch pattern malfunction: ▪ Engine is running. ▪ ATF temperature is **20 °C {68 °F} or more**. ▪ There is no difference between vehicle speed signal from DSC HU/CM and output shaft speed sensor signal.

		▪ Turbine/input shaft speed sensor and output shaft speed sensor DTC is not recorded.
P0763:00	Shift solenoid No.3 circuit malfunction	• Under the following condition, the TCM detects the shift solenoid No.3 circuit malfunction: ▪ Battery voltage is **10.5 V or more**.
P0766:00	Shift solenoid No.4 stuck off	• Under the following conditions, shift solenoid No.4 stuck-off detected by combination of gear ratio malfunction and oil pressure switch pattern malfunction: ▪ Engine is running. ▪ ATF temperature is **20 °C {68 °F} or more**. ▪ There is no difference between vehicle speed signal from DSC HU/CM and output shaft speed sensor signal. ▪ Turbine/input shaft speed sensor and output shaft speed sensor DTC is not recorded.
P0767:00	Shift solenoid No.4 stuck on	• Under the following conditions, shift solenoid No.4 stuck-on detected by combination of gear ratio malfunction and oil pressure switch pattern malfunction: ▪ Engine is running. ▪ ATF temperature is **20 °C {68 °F} or more**. ▪ There is no difference between vehicle speed signal from DSC HU/CM and output shaft speed sensor signal. ▪ Turbine/input shaft speed sensor and output shaft speed sensor DTC is not recorded.
P0768:00	Shift solenoid No.4 circuit malfunction	• Under the following condition, the TCM detects the shift solenoid No.4 circuit malfunction: ▪ Battery voltage is **10.5 V or more**.
P0771:00	On/off solenoid stuck off	• Under the following conditions, on/off solenoid stuck-off detected by combination of gear ratio malfunction and oil pressure switch pattern malfunction: ▪ Engine is running. ▪ ATF temperature is **20 °C {68 °F} or more**. ▪ There is no difference between vehicle speed signal from DSC HU/CM and output shaft speed sensor signal. ▪ Turbine/input shaft speed sensor and output shaft speed sensor DTC is not recorded.
P0772:00	On/off solenoid stuck on	• Under the following conditions, on/off solenoid stuck-on detected by combination of gear ratio malfunction and oil pressure switch pattern malfunction: ▪ Engine is running. ▪ ATF temperature is **20 °C {68 °F} or more**. ▪ There is no difference between vehicle speed signal from DSC HU/CM and output shaft speed sensor signal. ▪ Turbine/input shaft speed sensor and output shaft speed sensor DTC is not recorded.
P0773:00	On/off solenoid circuit malfunction	• Under the following condition, the TCM detects the on/off solenoid circuit malfunction: ▪ Battery voltage is **10.5 V or more**.
P0780:00	Gear shifting malfunction	• Under the following condition, the gear shifting inhibited: ▪ Engine is running.
		• Under the following conditions, any of (1) to (4) conditions occurs for **1 s**: ▪ Engine is running.

P0819:00	M position switch/Up switch/Down switch signal error	▪ Battery voltage is **8 V or more**. ▪ Transaxle range sensor related DTC is not recorded. ▪ (1) M position switch signal is on even though forward oil pressure switch is on in any position other than D position. ▪ (2) M position switch signal is off even though up or down switch signal is on in D position. ▪ (3) Up switch signal is on even though M position switch signal is off in any position other than D position. ▪ (4) Down switch signal is on even though M position switch signal is off in any position other than D position.
P0842:00	Oil pressure switch No.1 stuck on	• Under the following conditions, oil pressure switch No.1 stuck-on detected by combination of gear ratio malfunction and oil pressure switch pattern malfunction: ▪ Engine is running. ▪ ATF temperature is **20 °C {68 °F} or more**. ▪ There is no difference between vehicle speed signal from DSC HU/CM and output shaft speed sensor signal. ▪ Turbine/input shaft speed sensor and output shaft speed sensor DTC is not recorded.
P0843:00	Oil pressure switch No.1 stuck off	• Under the following conditions, oil pressure switch No.1 stuck-off detected by combination of gear ratio malfunction and oil pressure switch pattern malfunction: ▪ Engine is running. ▪ ATF temperature is **20 °C {68 °F} or more**. ▪ There is no difference between vehicle speed signal from DSC HU/CM and output shaft speed sensor signal. ▪ Turbine/input shaft speed sensor and output shaft speed sensor DTC is not recorded.
P0847:00	Oil pressure switch No.2 stuck on	• Under the following conditions, oil pressure switch No.2 stuck-on detected by combination of gear ratio malfunction and oil pressure switch pattern malfunction: ▪ Engine is running. ▪ ATF temperature is **20 °C {68 °F} or more**. ▪ There is no difference between vehicle speed signal from DSC HU/CM and output shaft speed sensor signal. ▪ Turbine/input shaft speed sensor and output shaft speed sensor DTC is not recorded.
P0848:00	Oil pressure switch No.2 stuck off	• Under the following conditions, oil pressure switch No.2 stuck-off detected by combination of gear ratio malfunction and oil pressure switch pattern malfunction: ▪ Engine is running. ▪ ATF temperature is **20 °C {68 °F} or more**. ▪ There is no difference between vehicle speed signal from DSC HU/CM and output shaft speed sensor signal. ▪ Turbine/input shaft speed sensor and output shaft speed sensor DTC is not recorded.
P0872:00	Oil pressure switch No.3 stuck on	• Under the following conditions, oil pressure switch No.3 stuck-on detected by combination of gear ratio malfunction and oil pressure switch pattern malfunction: ▪ Engine is running. ▪ ATF temperature is **20 °C {68 °F} or more**. ▪ There is no difference between vehicle speed signal from DSC HU/CM and output shaft speed sensor signal.

		▪ Turbine/input shaft speed sensor and output shaft speed sensor DTC is not recorded.
P0873:00	Oil pressure switch No.3 stuck off	• Under the following conditions, oil pressure switch No.3 stuck-off detected by combination of gear ratio malfunction and oil pressure switch pattern malfunction: ▪ Engine is running. ▪ ATF temperature is **20 °C {68 °F} or more**. ▪ There is no difference between vehicle speed signal from DSC HU/CM and output shaft speed sensor signal. ▪ Turbine/input shaft speed sensor and output shaft speed sensor DTC is not recorded.
P0877:00	Oil pressure switch No.4 stuck on	• Under the following conditions, oil pressure switch No.4 stuck-on detected by combination of gear ratio malfunction and oil pressure switch pattern malfunction: ▪ Engine is running. ▪ ATF temperature is **20 °C {68 °F} or more**. ▪ There is no difference between vehicle speed signal from DSC HU/CM and output shaft speed sensor signal. ▪ Turbine/input shaft speed sensor and output shaft speed sensor DTC is not recorded.
P0878:00	Oil pressure switch No.4 stuck off	• Under the following conditions, oil pressure switch No.4 stuck-off detected by combination of gear ratio malfunction and oil pressure switch pattern malfunction: ▪ Engine is running. ▪ ATF temperature is **20 °C {68 °F} or more**. ▪ There is no difference between vehicle speed signal from DSC HU/CM and output shaft speed sensor signal. ▪ Turbine/input shaft speed sensor and output shaft speed sensor DTC is not recorded.
P0882:00	TCM power supply voltage low	• Under the following conditions, the TCM power supply voltage is **8—10.5 V or less** (varies with ATF temperature): ▪ **5 s or more** has elapsed or battery voltage exceeds **11 V or more** for **0.2 s** since engine speed increases **−200 rpm or more** of target idle speed. ▪ Selector lever position is D or R position.
P0883:00	TCM power supply voltage high	• TCM power supply voltage is **18 V or more** for **5 s**.
P1728:00	Clutch slippage	• Under the following conditions, turbine/input shaft speed suddenly increases **300 rpm or more** for **1,450 ms**: ▪ Engine is running. ▪ Vehicle speed is **5 km/h {3 mph} or more**. ▪ There is no difference between vehicle speed signal from DSC HU/CM and output shaft speed sensor signal. ▪ Not shifting ▪ Selector lever position is D position. ▪ Turbine/input shaft speed is **1,200 rpm or more**. ▪ Oil pressure switch pattern (1st—6th) is normal.
P1738:00	Automatic transaxle internal malfunction	• Malfunction location cannot be determined based on combination of gear ratio malfunction and oil pressure switch pattern malfunction.
		• Under the following conditions, hi cut valve stuck-off or R-3-5 cut valve stuck-on detected by combination of gear ratio malfunction and oil pressure switch pattern

P1784:00	Hi cut valve stuck off/R-3-5 cut valve stuck on	malfunction: ▪ Engine is running. ▪ ATF temperature is **20 °C {68 °F} or more**. ▪ There is no difference between vehicle speed signal from DSC HU/CM and output shaft speed sensor signal. ▪ Turbine/input shaft speed sensor and output shaft speed sensor DTC is not recorded.
P2530:00	Ignition switch stuck off	• If the IG ON time count of the instrument cluster proceeds **5 s** under the following condition: ▪ Ignition switch signal off
P2855:00	Low clutch hydraulic circuit/sealing malfunction	• Slow engaging after operating selector lever from N to D position.
U0073:00	CAN system communication error (HS CAN)	• Under the following condition, a communication error (HS CAN) occurs: ▪ Battery voltage is **10 V or more**.
U0074:00	CAN system communication error (local CAN between TCM and PCM)	• Under the following condition, a communication error (local CAN between TCM and PCM) occurs: ▪ Battery voltage is **10 V or more**.
U0100:00	Communication error to PCM (HS CAN)	• Under the following condition, the TCM cannot receive the signal from PCM (HS CAN): ▪ Battery voltage is **10 V or more**.
U0115:00	Communication error to PCM (local CAN between TCM and PCM)	• Under the following condition, the TCM cannot receive the signal from PCM (local CAN between TCM and PCM): ▪ Battery voltage is **10 V or more**.
U0121:00	Communication error to DSC HU/CM	• Under the following condition, the TCM cannot receive the signal from DSC HU/CM: ▪ Battery voltage is **10 V or more**.
U0131:00	Communication error to EPS control module	• Under the following condition, the TCM cannot receive the signal from EPS control module: ▪ Battery voltage is **10 V or more**.
U0155:00	Communication error to instrument cluster	• Under the following condition, the TCM cannot receive the signal from instrument cluster: ▪ Battery voltage is **10 V or more**.
U0442:00	Invalid data received from PCM (local CAN between TCM and PCM)	• Under the following condition, the TCM detects the invalid PCM signal for **0.5 s**: ▪ Battery voltage is **10 V or more**.

Drive cycle

- The drive cycle is the period of time from when the engine is started to the next time the engine is started.
- One drive cycle, as shown in the figure, indicates the period from the time engine is started to the next time the engine is started. If this period is repeated twice it then becomes two drive cycles.

- To detect DTCs, a required number of drive cycles for pre-detection has been set. For the number of drive cycles required for detection, refer to the DTC table.

Pending code

- The pending code is temporary malfunction code which differs from DTCs which are recorded when the TCM detects a transaxle malfunction.
- DTCs are recorded in the TCM according to the number of drive cycles when the TCM detects a transaxle malfunction. At the same time, pending code is recorded in the TCM regardless of the number of drive cycles.
- Pending code recorded in the TCM is erased from the TCM, from the next drive cycle, when the TCM determines that the transaxle is normal.

Status byte for DTC

- The status byte is the two-digit code (two digits after hyphen (-)) after the DTC.

- The status byte is a code which indicates the pending code, current/past malfunction status, or warning illumination status.
- The status byte can be read by performing a CMDTC self test using the Mazda Modular Diagnostic System (M-MDS).
- For details on the status byte, refer to the explanation on the Mazda Modular Diagnostic System (M-MDS) when reading the DTC.

Self test function

- When the self test is implemented, the TCM performs diagnosis of the transaxle control system. If a malfunction is detected with the results of the diagnosis, an applicable DTC is recorded. A recorded DTC can be read by the Mazda Modular Diagnostic System (M-MDS).
- By implementing the self test function, verification of the current malfunction and verification after repair is facilitated.

CMDTC (Continuous Memory Diagnostic Trouble Code) self test

- The CMDTC self test is a function which reads all DTCs recorded in the TCM after the previous DTCs are erased no matter whether they are past malfunctions or current malfunctions.

KOEO (Key On Engine Off) self test

- The KOEO self test can perform malfunction diagnosis of DTCs corresponding to this self test function when the ignition is switched ON and the engine is stopped. This self test implements based on the test implementation command signal sent to the TCM from the Mazda Modular Diagnostic System (M-MDS).

Freeze frame data/Snapshot data

Freeze frame data

- The freeze frame data consists of data for vehicle and transaxle control system operation conditions when malfunctions in the transaxle control system are detected and stored in the TCM.
- Freeze frame data is stored at the instant the malfunction indicator lamp illuminates, and only a part of the DTC data is stored.

  Snapshot data

- The data for all DTCs currently detected is stored.

  Recorded DTC timing

  - For DTCs with one drive cycle, data is recorded during the malfunction determination period.
  - For DTCs with two drive cycles, data is recorded during non-determination (1st diagnosis) periods.

Freeze frame data item table—: Not applicable

Freeze frame data item	Unit	Description	Corresponding PID/DATA monitor item
LOAD	%	Calculated engine load	—
ECT	°C {°F}	Engine coolant temperature	ECT
RPM	RPM	Engine speed	RPM
VS	KPH {MPH}	Vehicle speed	VSS
IAT	°C {°F}	Intake air temperature	—

2014 - Mazda3 - Transmission / Transaxle

ON-BOARD DIAGNOSTIC SYSTEM FAIL-SAFE FUNCTION [FW6A-EL]

Purpose / Function

- If a transaxle malfunction is detected by the malfunction detection function, the fail-safe function limits the transaxle control.
- Even if the transaxle has a malfunction, the fail-safe function assures the minimum vehicle driveability.

Construction / Operation

DTC separate fail-safe function

DTC No.	Description	Fail-safe function
P0218:00	Automatic transaxle protection control	• Inhibits learning control. • Inhibits manual mode. • Inhibits neutral idle control. • Inhibits AAS.
P0500:00	Vehicle speed signal circuit malfunction	• Inhibits learning control. • Inhibits neutral idle control. • Inhibits AAS.
P0666:00	ECU internal temperature sensor circuit malfunction	• Inhibits learning control. • Inhibits neutral idle control.
P0667:00	ECU internal temperature sensor/performance problem	• Inhibits learning control. • Inhibits neutral idle control.
P06B8:00	NVRAM malfunction	Not applicable
		• Inhibits learning control. • Inhibits manual mode.

P0706:00	Transaxle range sensor range/performance problem	• Inhibits neutral idle control. • Inhibits AAS.
P0707:00	Transaxle range sensor circuit low input	• Inhibits learning control. • Inhibits manual mode. • Inhibits neutral idle control. • Inhibits AAS.
P0708:00	Transaxle range sensor circuit high input	• Inhibits learning control. • Inhibits manual mode. • Inhibits neutral idle control. • Inhibits AAS.
P0711:00	TFT sensor range/performance problem	• Inhibits learning control. • Inhibits neutral idle control.
P0712:00	TFT sensor circuit low input	• Inhibits learning control. • Inhibits neutral idle control.
P0713:00	TFT sensor circuit high input	• Inhibits learning control. • Inhibits neutral idle control.
P0715:00	Turbine/input shaft speed sensor/sensor output range malfunction	• Set to TCC control. • Inhibits learning control. • Inhibits manual mode. • Inhibits neutral idle control. • Inhibits AAS. • Inhibits 5GR and 6GR. • Inhibits shift down when the accelerator pedal is depressed.
P0716:00	Turbine/input shaft speed sensor range/performance problem	• Set to TCC control. • Inhibits learning control. • Inhibits manual mode. • Inhibits neutral idle control. • Inhibits AAS.

		• Inhibits 5GR and 6GR. • Inhibits shift down when the accelerator pedal is depressed.
P0717:00	Open circuit in turbine/input shaft speed sensor circuit	• Set to TCC control. • Inhibits learning control. • Inhibits manual mode. • Inhibits neutral idle control. • Inhibits AAS. • Inhibits 5GR and 6GR. • Inhibits shift down when the accelerator pedal is depressed.
P0720:00	Output shaft speed sensor range/performance problem	• Inhibits learning control. • Inhibits manual mode. • Inhibits neutral idle control. • Inhibits AAS.
P0721:00	Output shaft speed sensor/sensor output range malfunction	• Inhibits learning control. • Inhibits manual mode. • Inhibits neutral idle control. • Inhibits AAS.
P0722:00	Open circuit in output shaft speed sensor circuit	• Inhibits learning control. • Inhibits manual mode. • Inhibits neutral idle control. • Inhibits AAS.
P0729:00	6GR incorrect ratio	• Inhibits malfunctioning gear. • Limits engine torque. • Inhibits learning control. • Inhibits manual mode. • Inhibits neutral idle control. • Inhibits AAS.
		• Inhibits malfunctioning gear.

P0731:00	1GR incorrect ratio	• Limits engine torque. • Inhibits learning control. • Inhibits manual mode. • Inhibits neutral idle control. • Inhibits AAS.
P0732:00	2GR incorrect ratio	• Inhibits malfunctioning gear. • Limits engine torque. • Inhibits learning control. • Inhibits manual mode. • Inhibits neutral idle control. • Inhibits AAS.
P0733:00	3GR incorrect ratio	• Inhibits malfunctioning gear. • Limits engine torque. • Inhibits learning control. • Inhibits manual mode. • Inhibits neutral idle control. • Inhibits AAS.
P0734:00	4GR incorrect ratio	• Inhibits malfunctioning gear. • Limits engine torque. • Inhibits learning control. • Inhibits manual mode. • Inhibits neutral idle control. • Inhibits AAS.
P0735:00	5GR incorrect ratio	• Inhibits malfunctioning gear. • Limits engine torque. • Inhibits learning control. • Inhibits manual mode. • Inhibits neutral idle control. • Inhibits AAS.
P0736:00	Gear reverse incorrect ratio	• Inhibits learning control.

		• Inhibits neutral idle control.
P073D:00	Neutral incorrect ratio	Not applicable
P0741:00	TCC control solenoid stuck off	• Inhibits TCC control. • Inhibits learning control. • Inhibits manual mode. • Inhibits neutral idle control. • Inhibits AAS.
P0743:00	TCC control solenoid circuit malfunction	• Set to emergency mode. • Inhibits learning control. • Inhibits manual mode. • Inhibits neutral idle control. • Inhibits AAS.
P0746:00	Pressure control solenoid stuck off	• Inhibits malfunctioning gear. • Limits engine torque. • Inhibits learning control. • Inhibits manual mode. • Inhibits neutral idle control. • Inhibits AAS.
P0748:00	Pressure control solenoid circuit malfunction	• Set to emergency mode. • Inhibits learning control. • Inhibits manual mode. • Inhibits neutral idle control. • Inhibits AAS.
P0751:00	Shift solenoid No.1 stuck off	• Inhibits malfunctioning gear. • Limits engine torque. • Inhibits learning control. • Inhibits manual mode. • Inhibits neutral idle control. • Inhibits AAS.

P0752:00	Shift solenoid No.1 stuck on	• Inhibits malfunctioning gear. • Limits engine torque. • Inhibits learning control. • Inhibits manual mode. • Inhibits neutral idle control. • Inhibits AAS.
P0753:00	Shift solenoid No.1 circuit malfunction	• Set to emergency mode. • Inhibits learning control. • Inhibits manual mode. • Inhibits neutral idle control. • Inhibits AAS.
P0756:00	Shift solenoid No.2 stuck off	• Inhibits malfunctioning gear. • Limits engine torque. • Inhibits learning control. • Inhibits manual mode. • Inhibits neutral idle control. • Inhibits AAS.
P0757:00	Shift solenoid No.2 stuck on	• Inhibits malfunctioning gear. • Limits engine torque. • Inhibits learning control. • Inhibits manual mode. • Inhibits neutral idle control. • Inhibits AAS.
P0758:00	Shift solenoid No.2 circuit malfunction	• Set to emergency mode. • Inhibits learning control. • Inhibits manual mode. • Inhibits neutral idle control. • Inhibits AAS.
		• Inhibits malfunctioning gear. • Limits engine torque.

P0761:00	Shift solenoid No.3 stuck off	• Inhibits learning control. • Inhibits manual mode. • Inhibits neutral idle control. • Inhibits AAS.
P0762:00	Shift solenoid No.3 stuck on	• Inhibits malfunctioning gear. • Limits engine torque. • Inhibits learning control. • Inhibits manual mode. • Inhibits neutral idle control. • Inhibits AAS.
P0763:00	Shift solenoid No.3 circuit malfunction	• Set to emergency mode. • Inhibits learning control. • Inhibits manual mode. • Inhibits neutral idle control. • Inhibits AAS.
P0766:00	Shift solenoid No.4 stuck off	• Inhibits malfunctioning gear. • Limits engine torque. • Inhibits learning control. • Inhibits manual mode. • Inhibits neutral idle control. • Inhibits AAS.
P0767:00	Shift solenoid No.4 stuck on	• Inhibits malfunctioning gear. • Limits engine torque. • Inhibits learning control. • Inhibits manual mode. • Inhibits neutral idle control. • Inhibits AAS.
P0768:00	Shift solenoid No.4 circuit malfunction	• Set to emergency mode. • Inhibits learning control. • Inhibits manual mode.

		• Inhibits neutral idle control. • Inhibits AAS.
P0771:00	On/off solenoid stuck off	• Inhibits malfunctioning gear. • Limits engine torque. • Inhibits learning control. • Inhibits manual mode. • Inhibits neutral idle control. • Inhibits AAS.
P0772:00	On/off solenoid stuck on	• Inhibits malfunctioning gear. • Limits engine torque. • Inhibits learning control. • Inhibits manual mode. • Inhibits neutral idle control. • Inhibits AAS.
P0773:00	On/off solenoid circuit malfunction	• Set to emergency mode. • Inhibits learning control. • Inhibits manual mode. • Inhibits neutral idle control. • Inhibits AAS.
P0780:00	Gear shifting malfunction	• Inhibits learning control. • Inhibits manual mode. • Inhibits neutral idle control. • Inhibits AAS.
P0819:00	M position switch/Up switch/Down switch signal error	• Inhibits manual mode.
P0842:00	Oil pressure switch No.1 stuck on	• Limits engine torque. • Inhibits learning control. • Inhibits manual mode. • Inhibits neutral idle control. • Inhibits AAS.

P0843:00	Oil pressure switch No.1 stuck off	• Inhibits malfunctioning gear. • Limits engine torque. • Inhibits learning control. • Inhibits manual mode. • Inhibits neutral idle control. • Inhibits AAS.
P0847:00	Oil pressure switch No.2 stuck on	• Limits engine torque. • Inhibits learning control. • Inhibits manual mode. • Inhibits neutral idle control. • Inhibits AAS.
P0848:00	Oil pressure switch No.2 stuck off	• Inhibits malfunctioning gear. • Limits engine torque. • Inhibits learning control. • Inhibits manual mode. • Inhibits neutral idle control. • Inhibits AAS.
P0872:00	Oil pressure switch No.3 stuck on	• Limits engine torque. • Inhibits learning control. • Inhibits manual mode. • Inhibits neutral idle control. • Inhibits AAS.
P0873:00	Oil pressure switch No.3 stuck off	• Inhibits malfunctioning gear. • Limits engine torque. • Inhibits learning control. • Inhibits manual mode. • Inhibits neutral idle control. • Inhibits AAS.
		• Limits engine torque. • Inhibits learning control.

P0877:00	Oil pressure switch No.4 stuck on	• Inhibits manual mode. • Inhibits neutral idle control. • Inhibits AAS.
P0878:00	Oil pressure switch No.4 stuck off	• Inhibits malfunctioning gear. • Limits engine torque. • Inhibits learning control. • Inhibits manual mode. • Inhibits neutral idle control. • Inhibits AAS.
P0882:00	TCM power supply voltage low	• Set to emergency mode. • Inhibits learning control. • Inhibits manual mode. • Inhibits neutral idle control. • Inhibits AAS.
P0883:00	TCM power supply voltage high	• Set to emergency mode. • Inhibits learning control. • Inhibits manual mode. • Inhibits neutral idle control. • Inhibits AAS.
P1728:00	Clutch slippage	• Inhibits malfunctioning gear. • Limits engine torque. • Maximizes the line pressure. • Inhibits learning control. • Inhibits manual mode. • Inhibits neutral idle control. • Inhibits AAS.
P1738:00	Automatic transaxle internal malfunction	• Inhibits learning control. • Inhibits manual mode. • Inhibits neutral idle control. • Inhibits AAS.

P1784:00	Hi cut valve stuck off/R-3-5 cut valve stuck on	• Inhibits malfunctioning gear. • Limits engine torque. • Inhibits learning control. • Inhibits neutral idle control.
P2530:00	Ignition switch stuck off	Not applicable
P2855:00	Low clutch hydraulic circuit/sealing malfunction	Not applicable
U0073:00	CAN system communication error (HS CAN)	• Inhibits learning control. • Inhibits neutral idle control. • Inhibits AAS.
U0074:00	CAN system communication error (local CAN between TCM and PCM)	• Set to TCC control. • Inhibits learning control. • Inhibits manual mode. • Inhibits neutral idle control. • Inhibits AAS. • Inhibits 5GR and 6GR. • Inhibits shift down when the accelerator pedal is depressed.
U0100:00	Communication error to PCM (HS CAN)	• Inhibits learning control. • Inhibits neutral idle control. • Inhibits AAS.
U0115:00	Communication error to PCM (local CAN between TCM and PCM)	• Set to TCC control. • Inhibits learning control. • Inhibits manual mode. • Inhibits neutral idle control. • Inhibits AAS. • Inhibits 5GR and 6GR. • Inhibits shift down when the accelerator pedal is depressed.
		• Inhibits learning control.

U0121:00	Communication error to DSC HU/CM	• Inhibits neutral idle control. • Inhibits AAS.
U0131:00	Communication error to EPS control module	• Inhibits learning control. • Inhibits neutral idle control.
U0155:00	Communication error to instrument cluster	• Inhibits learning control. • Inhibits manual mode. • Inhibits neutral idle control.
U0442:00	Invalid data received from PCM (local CAN between TCM and PCM)	• Set to TCC control. • Inhibits learning control. • Inhibits manual mode. • Inhibits neutral idle control. • Inhibits 5GR and 6GR. • Inhibits shift down when the accelerator pedal is depressed.

Emergency mode

- The emergency mode is a control for preventing transaxle damage or vehicle inoperability.
- If these modes are set, the TCM output is inhibited. Therefore, all solenoids are turned off and the following conditions occur:
    - When the accelerator pedal is depressed, the engine speed is higher than normal.
    - When N to D position and N to R position are selected, the shift shock is greater than during normal shifting.

Neutral idle control

- System which automatically switches the transaxle to neutral internally while the vehicle is stopped in the D position.

2014 - Mazda3 - Transmission / Transaxle

ON-BOARD DIAGNOSTIC SYSTEM DIAGNOSTIC DATA MEMORY FUNCTION [FW6A-EL]

Purpose / Function

- The on-board diagnostic system diagnostic data memory function records/erases the following diagnostic data:
    - Number of DTCs
    - DTCs
    - Pending code
- Determination of a malfunction cause is facilitated by the on-board diagnostic system data memory function. Therefore, accurate and quick repair/service can be performed.

Construction / Operation

- The conditions for recording/erasing diagnostic data are determined by the number of drive cycles set for each DTC.
- Using the memory deletion function of the Mazda Modular Diagnostic System (M-MDS), diagnostic data can be deleted.

2014 - Mazda3 - Transmission / Transaxle

ON-BOARD DIAGNOSTIC SYSTEM MALFUNCTION INDICATION FUNCTION [FW6A-EL]

Purpose / Function

- The on-board diagnostic system malfunction indication function notifies the driver of a transaxle malfunction.
- The malfunction indication function notifies the driver of a transaxle malfunction by illuminating the check engine light and automatic transaxle warning light.

Construction / Operation

2014 - Mazda3 - Transmission / Transaxle

ON-BOARD DIAGNOSTIC SYSTEM EXTERNAL TESTER COMMUNICATION FUNCTION [FW6A-EL]

Purpose / Function

- The on-board diagnostic system external tester communication function transmits data between an external tester and each control module of the vehicle.
- Because the DTCs recorded in the vehicle can be read by an external tester, determination of a malfunction location is facilitated.

Construction / Operation

- A connector (DLC-2) conforming to International Organization for Standardization (ISO) standards has been adopted.
- A connector shape and 16-pin terminal arrangement as stipulated by the ISO 15031-3 (SAE J1962) international standard has been adopted for this DLC-2.

Terminal	Function
A	Battery positive voltage
B	AFS control module (With headlight auto leveling system)
C	SAS control module
D	—
E	HS CAN communication line Lo

F	HS CAN communication line Hi
G	—
H	Serial communication ground
I	—
J	Body ground
K	MS CAN communication line Lo
L	MS CAN communication line Hi
M	—
N	—
O	—
P	—

2014 - Mazda3 - Transmission/Transaxle

ON-BOARD DIAGNOSTIC SYSTEM PID/DATA MONITOR FUNCTION [FW6A-EL]

Purpose/Function

- The PID/DATA monitor function can monitor control data such as input signals/internal calculation values/output signals using the Mazda Modular Diagnostic System (M-MDS).
- The module control condition can be verified in real-time by the PID/DATA monitor function.

Construction/Operation

PID/DATA monitor item table—: Not applicable

Item	Unit/Condition	Definition
APP	%	Accelerator pedal position
APP1	%	APP sensor No.1
DGP_DIS_1	km {mile}	Traveled distance after differential protection control operated
DGP_DIS_2	km {mile}	Traveled distance after DGP_MAX_DIF updated
DGP_MAX_DIF	RPM	Maximum rotation difference after differential protection control operated due to excessive rotation difference between left/right drive wheels
		Vehicle speed with trailing wheels after

DGP_SPD	KPH {MPH}	differential protection control operated due to excessive rotation difference between left/right drive wheels
ECT	°C {°F}	Engine coolant temperature
ECU_A	°C {°F}	ECU internal temperature A
ECU_B	°C {°F}	ECU internal temperature B
ECU_C	°C {°F}	ECU internal temperature C
GEAR_RA	Ratio	Gear ratio
GEAR_SEL	1/2/3/4/5/6	Gear shift position
HI_TEMP	—	ATF high temperature mode determination amount
HTM_CNT	—	ATF high temperature mode counter
HTM_DIS	km {mile}	Travel distance since determination of ATF high temperature mode
LINEDES	kPa {kgf/cm^2, psi}	Target modifier pressure/Target pressure control solenoid pressure
LN_C_CLUTCH	kPa {kgf/cm^2, psi}	Hydraulic control learning value (engaged)
LN_O_CLUTCH	kPa {kgf/cm^2, psi}	Hydraulic control learning value (released)
		Hydraulic control

LN_OV_SCOPE	—	learning value (mis-learning)
LN_T_CLUTCH	kPa {kgf/cm^2, psi}	Hydraulic control learning value (torque converter)
LOCK_UP	OFF/SLIP/ON	Torque converter (TCC condition)
LONGI_ACCEL	—	Longitudinal acceleration
OP_SW1	Off/On	Oil pressure switch No.1 condition
OP_SW1_OFF	kPa {kgf/cm^2, psi}	After performing on-board diagnostic test mode
OP_SW1_ON	kPa {kgf/cm^2, psi}	After performing on-board diagnostic test mode
OP_SW2	Off/On	Oil pressure switch No.2 condition

ON-BOARD DIAGNOSTIC SYSTEM SIMULATION FUNCTION [FW6A-EL]

Purpose / Function

- The simulation function can drive output parts based on use of the Mazda Modular Diagnostic System (M-MDS).
- Inspection of an individual output part is facilitated by the simulation function because the output part is driven forcibly.

Construction / Operation

Simulation item table

Item	Output part name	Unit/Condition	Operation condition
SS_ON-OFF	On/off solenoid condition	Off/On	Under the following conditions: • Vehicle stopped • Idling at P or N position
SS1_C	Shift solenoid No.1 target current	A	Under the following conditions: • Vehicle stopped • Idling at P or N position
SS2_C	Shift solenoid No.2 target current	A	Under the following conditions: • Vehicle stopped • Idling at P or N position
SS3_C	Shift solenoid No.3 target current	A	Under the following conditions: • Vehicle stopped • Idling at P or N position
SS4_C	Shift solenoid No.4 target current	A	Under the following conditions: • Vehicle stopped

			• Idling at P or N position
SSLU_C	TCC control solenoid target current	A	Under the following conditions: • ATF temperature (PID: TFT) is 20 °C {68 °F} or more. • Output shaft rotation speed (PID: OSS) is 10 rpm or more. • Turbine shaft rotation speed (PID: TSS) is 1,000 rpm or more. • Brake pedal released
SSP_C	Pressure control solenoid target current	A	Idling at P or N position

2014 - Mazda3 - Transmission / Transaxle

CLUTCH [C66M-R]

Purpose, Function

- The clutch unit transmits or cuts the drive force between the engine and MTX according to the clutch pedal operation.

Construction / Operation

- The construction/operation of the clutch unit is the same as the original MTX (ex: G66M-R).

2014 - Mazda3 - Transmission / Transaxle

MANUAL TRANSAXLE [C66M-R]

Purpose, Function

- The MTX converts the drive force (speed, torque, rotation direction) input from the engine according to the shift lever operation inside the vehicle.

SHIFT AND SELECT MECHANISM [C66M-R]

Purpose, Function

- The shift and select mechanism moves the shift fork to change gears according to the operation of the shift lever in the cabin.

Construction

Shift control module

- The moving parts of the shift control module are vertically positioned.

- In this module, the control lever which moves the shift rod end is directly assembled to the control rod. In addition, because the control rod moves up and down, the weight of the control rod is utilized when the control rod moves down.

Slide ball bearing

- A slide ball bearing has been adopted to the sliding area between the control rod and the transaxle case, and between the control rod and the control case.

- In this part, the bearing case moves in the drive and thrust directions.
- Compared to the conventional bushing, sliding resistance between the control rod and the transaxle case, and between the control rod and the control case has been reduced.

Operation

NOTE:

- Shifting operations from neutral to each gear are explained in this section.

1GR

1. When the shift lever in the cabin is tilted to the left to shift to 1GR, the select lever moves in the direction of arrow 1 shown in the figure.

2. Following the movement of the select lever, the shift lever moves in the direction of arrow 2 shown in the figure.

3. Following the movement of the select lever, the shift lever moves in the direction of arrow 3 shown in the figure.

4. Following the movement of the select lever, the control lever and the guide pin move in the direction of arrow 4 shown in the figure.

5. When the shift lever in the cabin is tilted forward to shift to 1GR, the shift lever in the engine compartment moves in the direction of arrow 5 shown in the figure.

6. Following the movement of the shift lever in the engine compartment, the control rod moves in the direction of arrow 6 shown in the figure.

7. Following the movement of the shift lever in the engine compartment, the control lever and the guide pin move in the direction of arrow 7 shown in the figure.

8. Because the control rod turns with the control lever, the control lever pushes the shift rod end and moves it in the direction of arrow 8 shown in the figure.

9. The shift rod end and the shift fork are integrated with the shift rod. Therefore, the movement of the shift rod end is transmitted to the shift fork via the shift rod, and the shift fork moves in the direction of arrow 9.

10. The shift fork moves the clutch hub sleeve in the direction of arrow 10 shown in the figure.

11. The shift change to 1GR is completed.

2GR

1. When the shift lever in the cabin is tilted to the left to shift to 2GR, the select lever moves in the direction of arrow 1 shown in the figure.

2. Following the movement of the select lever, the shift lever moves in the direction of arrow 2 shown in the figure.

3. Following the movement of the select lever, the shift lever moves in the direction of arrow 3 shown in the figure.

4. Following the movement of the select lever, the control lever and the guide pin move in the direction of arrow 4 shown in the figure.

5. When the shift lever in the cabin is tilted rearward to shift to 2GR, the shift lever in the engine compartment moves in the direction of arrow 5 shown in the figure.

6. Following the movement of the shift lever in the engine compartment, the control rod moves in the direction of arrow 6 shown in the figure.

7. Following the movement of the shift lever in the engine compartment, the control lever and the guide pin move in the direction of arrow 7 shown in the figure.

8. Because the control rod turns with the control lever, the control lever pushes the shift rod end and moves it in the direction of arrow 8 shown in the figure.

9. The shift rod end and the shift fork are integrated with the shift rod. Therefore, the movement of the shift rod end is transmitted to the shift fork via the shift rod, and the shift fork moves in the direction of arrow 9.

10. The shift fork moves the clutch hub sleeve in the direction of arrow 10 shown in the figure.

11. The shift change to 2GR is completed.

3GR

1. When the shift lever in the cabin is tilted forward to shift to 3GR, the shift lever in the engine compartment moves in the direction of arrow 1 shown in the figure.

2. Following the movement of the shift lever in the engine compartment, the control rod moves in the direction of arrow 2 shown in the figure.

3. Following the movement of the shift lever in the engine compartment, the control lever and the guide pin move in the direction of arrow 3 shown in the figure.

4. Because the control rod turns with the control lever, the control lever pushes the shift rod end and moves it in the direction of arrow 4 shown in the figure.

5. The shift rod end and the shift fork are integrated with the shift rod. Therefore, the movement of the shift rod end is transmitted to the shift fork via the shift rod, and the shift fork moves in the direction of arrow 5.

6. The shift fork moves the clutch hub sleeve in the direction of arrow 6 shown in the figure.

7. The shift change to 3GR is completed.

4GR

1. When the shift lever in the cabin is tilted rearward to shift to 4GR, the shift lever in the engine compartment moves in the direction of arrow 1 shown in the figure.

2. Following the movement of the shift lever in the engine compartment, the control rod moves in the direction of arrow 2 shown in the figure.

3. Following the movement of the shift lever in the engine compartment, the control lever and the guide pin move in the direction of arrow 3 shown in the figure.

4. Because the control rod turns with the control lever, the control lever pushes the shift rod end and moves it in the direction of arrow 4 shown in the figure.

5. The shift rod end and the shift fork are integrated with the shift rod. Therefore, the movement of the shift rod end is transmitted to the shift fork via the shift rod, and the shift fork moves in the direction of arrow 5.

6. The shift fork moves the clutch hub sleeve in the direction of arrow 6 shown in the figure.

7. The shift change to 4GR is completed.

5GR

1. When the shift lever in the cabin is tilted to the right to shift to 5GR, the select lever moves in the direction of arrow 1 shown in the figure.

2. Following the movement of the select lever, the shift lever moves in the direction of arrow 2 shown in the figure.

3. Following the movement of the select lever, the shift lever moves in the direction of arrow 3 shown in the figure.

4. Following the movement of the select lever, the control lever and the guide pin move in the direction of arrow 4 shown in the figure.

5. When the shift lever in the cabin is tilted forward to shift to 5GR, the shift lever in the engine compartment moves in the direction of arrow 5 shown in the figure.

6. Following the movement of the shift lever in the engine compartment, the control rod moves in the direction of arrow 6 shown in the figure.

7. Following the movement of the shift lever in the engine compartment, the control lever and the guide pin move in the direction of arrow 7 shown in the figure.

8. Because the control rod turns with the control lever, the control lever pushes the shift rod end and moves it in the direction of arrow 8 shown in the figure.

9. The shift rod end and the shift fork are integrated with the shift rod. Therefore, the movement of the shift rod end is transmitted to the shift fork via the shift rod, and the shift fork moves in the direction of arrow 9.

10. The shift fork moves the clutch hub sleeve in the direction of arrow 10 shown in the figure.

11. The shift change to 5GR is completed.

6GR

1. When the shift lever in the cabin is tilted to the right to shift to 6GR, the select lever moves in the direction of arrow 1 shown in the figure.

2. Following the movement of the select lever, the shift lever moves in the direction of arrow 2 shown in the figure.

3. Following the movement of the select lever, the shift lever moves in the direction of arrow 3 shown in the figure.

4. Following the movement of the select lever, the control lever and the guide pin move in the direction of arrow 4 shown in the figure.

5. When the shift lever in the cabin is tilted rearward to shift to 6GR, the shift lever in the engine compartment moves in the direction of arrow 5 shown in the figure.

6. Following the movement of the shift lever in the engine compartment, the control rod moves in the direction of arrow 6 shown in the figure.

7. Following the movement of the shift lever in the engine compartment, the control lever and the guide pin move in the direction of arrow 7 shown in the figure.

8. Because the control rod turns with the control lever, the control lever pushes the shift rod end and moves it in the direction of arrow 8 shown in the figure.

9. The shift rod end and the shift fork are integrated with the shift rod. Therefore, the movement of the shift rod end is transmitted to the shift fork via the shift rod, and the shift fork moves in the direction of arrow 9.

10. The shift fork moves the clutch hub sleeve in the direction of arrow 10 shown in the figure.

11. The shift change to 6GR is completed.

Reverse

1. When the shift lever in the cabin is tilted to the left to shift to the reverse gear, the select lever moves in the direction of arrow 1 shown in the figure.

2. Following the movement of the select lever, the shift lever moves in the direction of arrow 2 shown in the figure.

3. Following the movement of the select lever, the shift lever moves in the direction of arrow 3 shown in the figure.

4. Following the movement of the select lever, the control lever and the guide pin move in the direction of arrow 4 shown in the figure.

5. When the shift lever in the cabin is tilted forward to shift to the reverse gear, the shift lever in the engine compartment moves in the direction of arrow 5 shown in the figure.

6. Following the movement of the shift lever in the engine compartment, the control rod moves in the direction of arrow 6 shown in the figure.

7. Following the movement of the shift lever in the engine compartment, the control lever and the guide pin move in the direction of arrow 7 shown in the figure.

8. Because the control rod turns with the control lever, the control lever pushes the shift rod end and moves it in the direction of arrow 8 shown in the figure.

9. The shift rod end and the shift fork are integrated with the shift rod. Therefore, the movement of the shift rod end is transmitted to the shift fork via the shift rod, and the shift fork moves in the direction of arrow 9.

10. The shift fork moves the clutch hub sleeve in the direction of arrow 10 shown in the figure.

11. The shift change to the reverse gear is completed.

2014 - Mazda3 - Transmission/Transaxle

SYNCHRONIZER MECHANISM [C66M-R]

Purpose, Function

- For smooth gear changes, the synchronizer mechanism synchronizes the rotation of the engaging area and engages gears.

Construction

Detent ball-type synchronizer key

- A detent ball-type synchronizer key has been adopted for the synchronizer mechanism except for the reverse gear.

- The detent ball of this part provides the driver a crisp feel which the driver can realize completed gear changes.
- Because this part is smaller compared to the conventional synchronizer key, it has contributed to the size reduction of the synchronizer mechanism, and also to the shortened length of the primary and secondary shafts.
- Because the smaller synchronizer mechanism has reduced the stroke amount of the clutch hub sleeve, the stroke of the shift lever in the cabin has been shortened.

Operation

1GR, 2GR operation

NOTE:

- For 1st and 2nd gears, a triple-cone synchronizer mechanism has been adopted with which a stronger synchronizing force is provided to synchronize the rotation of the clutch hub and the gear.
- Here, operation during 2GR operation is described as an example.

1. When the clutch hub sleeve moves toward the 2nd gear side, the synchronizer key follows, and the synchronizer key contacts the end surface of the synchronizer ring.

2. When the clutch hub sleeve moves toward the 2nd gear side, the synchronizer key which follows applies load to the synchronizer ring, and the load is transmitted from the synchronizer ring to the middle cone ring, inner cone ring, and the gear.

3. The friction force on the contacting surface of the parts is generated by applying load to the parts between the synchronizer ring and the gear.

4. For the friction force for the parts, the synchronizer ring rotates only the round groove gap of the clutch hub.

5. Because the synchronizer ring rotates, the spline of the clutch hub sleeve which moves toward the secondary 2nd gear side and the chamfer of the synchronizer ring are opposed to each other.

6. When the clutch hub sleeve moves toward the secondary 2nd gear side, the transmitted load to the gear from the clutch hub sleeve increases because the spline of the clutch hub sleeve pushes the chamfer of the synchronizer ring.

7. The friction force on the contacting surface of the parts is increased by increasing the load transmitted from the clutch hub sleeve to the gear.

8. The increased friction force decreases the difference in rotation speed between the synchronizer ring, middle cone ring, inner cone ring, and the gear and the rotation speed for the parts is synchronized.

9. When synchronization in rotation speed of the gear and the clutch hub sleeve is performed, the spline of the clutch hub sleeve passes through the synchronizer ring.

10. When the spline of the clutch hub sleeve passes through the synchronizer ring, the clutch hub sleeve presses down the detent ball and the detent ball is removed from the positioning groove of the clutch hub sleeve because the clutch hub sleeve moves toward the secondary 2nd gear side.

11. When the clutch hub sleeve moves toward the secondary 2nd gear side, the spline of the clutch hub sleeve and the spline of the gear are engaged, and the shifting operation is completed.

3GR, 4GR, 5GR, 6GR, reverse operation

NOTE:

Here, operation during 4GR operation is described as an example.

1. When the clutch hub sleeve moves toward the 4th gear side, the synchronizer key follows, and the synchronizer key contacts the end surface of the synchronizer ring.

2. When the clutch hub sleeve moves toward the 4th gear side, the following synchronizer key applies load to the synchronizer ring, and the load is transmitted from the synchronizer ring to the gear.

3. The friction force on the contacting surface of the synchronizer ring and the gear is generated by applying load to the parts between the synchronizer ring and the gear.

4. For the friction force of the synchronizer ring and the gear, synchronizer ring rotates only the key groove gap of the clutch hub.

5. Because the synchronizer ring rotates, the spline of the clutch hub sleeve which moves toward the 4th gear side and the chamfer of the synchronizer ring are opposed to each other.

6. When the clutch hub sleeve moves toward the 4th gear, the load transmitted from the clutch hub sleeve to the gear increases because the spline of the clutch hub sleeve pushes the chamfer of the synchronizer ring.

7. The friction force on the contacting surface of the parts is increased by increasing the load transmitted from the clutch hub sleeve to the gear.

8. The increased friction force disappears the difference in the rotation speed between the synchronizer ring and the gear, and the rotation is synchronized.

9. When synchronization in rotation speed of the gear and the clutch hub sleeve is performed, the spline of the clutch hub sleeve passes through the synchronizer ring.

10. When the spline of the clutch hub sleeve passes through the synchronizer ring, the clutch hub sleeve presses down the ball and the ball is removed from the positioning groove of the clutch hub sleeve because the clutch hub sleeve moves toward the secondary 4th gear side.

11. When the clutch hub sleeve moves toward the secondary 4th gear side, the spline of the clutch hub sleeve and the spline of the gear are engaged, and the shifting operation is completed.

2014 - Mazda3 - Transmission/Transaxle

POWERTRAIN SYSTEM [C66M-R]

Purpose, Function

- The powertrain mechanism changes the gear combination by engaging or releasing the clutch hub and gear, and changes the power transmission route. Because of the change in the power transmission route, the drive force (speed, torque, rotation direction) input from the engine is converted.

SHIFT LEVER [C66M-R]

Purpose, Function

- The shift lever operates the MTX via the control cable.

Construction

Shift lever

- The shift lever is designed to prevent improper shifting to 1st gear and reverse.

Operation

1GR shifting

- A guide plate, attached to the shift lever assembly, prevents accidental shifting into reverse when shifting into 1st gear by restricting the movement of the shift lever.

SHIFTING WHEN THE SHIFT LEVER
IS NOT PRESSED DOWN

GUIDE PLATE FUNCTION

Reverse shifting

- When shifting into reverse, once the shift lever is pressed down and moved towards the reverse position.

SHIFTING WHEN THE SHIFT LEVER
IS PRESSED DOWN

GUIDE PLATE FUNCTION

- The projection on the lever goes under the guide plate, releasing the reverse shift restriction and allowing for shifting into reverse.

2014 - Mazda3 - Transmission/Transaxle

AUTOMATIC TRANSAXLE OUTLINE [FW6A-EL]

Outline

Contribution to low fuel economy	• Wide TCC range • Clutch/brake resistance reduction
Realized direct feel and quick shifting	• Oil passage resistance reduction and improved clutch/brake response by optimizing clutch rigidity • Improved solenoid valve response
Smooth and powerful start-up	• Torque converter characteristics when accelerating and optimized range
Smooth shifting	• Control valve body integrated with TCM adopted • Direct linear solenoid valve has been adopted to improve shift accuracy

Construction

Cross-sectional view

- The electronic control automatic transaxle consists of three systems which are divided into the powertrain with a torque converter, the hydraulic control mechanism, and the electronic control mechanism.

Operation

Automatic transaxle operation chart

POWERTRAIN SYSTEM OUTLINE [FW6A-EL]

Outline

- The powertrain consists of a 2-piece multi-plate clutch, 3-piece multi-plate brake, a one-way clutch, and a 3-piece single-type planetary gear.

Construction

Component parts list

Component parts		Movement
Multi-plate clutch	Low clutch	Transmits drive force from turbine shaft to front and rear sun gears
	High clutch	Transmits drive force from turbine shaft to rear planetary carrier
Multi-plate brake	R-3-5 brake	Locks reduction internal gear against rotation
	2-6 brake	Locks rear internal gear and reduction planetary gear against rotation
	Low and reverse brake	Locks front internal gear and rear planetary gear against rotation
One-way clutch		Restricts counterclockwise rotation (when viewed from torque converter side) of front internal gear
Single type planetary gear	Front planetary gear	Converts drive force transmitted from engine by operation of each clutch and brake, and transmits it to primary gear. (Operates transaxle.)
	Rear planetary gear	
	Reduction planetary gear

2014 - Mazda3 - Transmission / Transaxle

TORQUE CONVERTER [FW6A-EL]

Purpose / Function

- By use of an optimized torus shape (wing) matching the output characteristics of the engine, the torque converter achieves efficient force transmission and reduced fuel consumption.

Construction / Operation

- A three-member, single-stage two-phase type torque converter with a torque converter clutch (TCC) mechanism has been adopted.
    - Three-member: Indicates that the torque converter consists of a pump impeller, turbine runner, and stator.
    - Single stage: Indicates the number of turbine runners.
    - Two-phase: Indicates that there are two conditions; torque converter range and fluid coupling range.

TCC mechanism

- A TCC piston built into the torque converter operates during TCC control. When hydraulic pressure is applied to the TCC piston, the TCC clutch engages to mechanically connect the pump impeller to the turbine runner. The TCC mechanism achieves excellent fuel economy as a result of no loss in drive force transmission due to torque converter slippage. In addition, precise hydraulic control is made possible by a multi-plate clutch equipped with an independent piston housing. With the adoption of this mechanism, the achievable range of TCC control has widened dramatically.

TORQUE CONVERTER [FW6A-EL]

2014 - Mazda3 - Transmission / Transaxle

LOW CLUTCH [FW6A-EL]

Purpose / Function

- The low clutch operates in 1GR, 2GR, 3GR and 4GR and intermittently operates the sun gear by drive force from the turbine shaft.
- For the low clutch, a centrifugal balance clutch has been adopted to prevent clutch drag and to assure stabilized piston thrust in all engine speed ranges.

Construction

- The low clutch consists of the following parts shown in the figure.

- The driven plate of the low clutch is engaged with the low clutch drum. The low clutch drum is engaged with the turbine shaft and spline, and when the turbine shaft rotates, the low clutch drum and driven plate rotate as a single unit.

- The low clutch drive plate is engaged with the low clutch hub. The low clutch hub is engaged with the front and rear sun gears, and the drive plate, low clutch hub, front sun gear and rear sun gear rotate as a single unit.

- For the low clutch piston, a compact and highly reliable bonded seal piston has been adopted in which the piston and seal are molded together.

Centrifugal balance clutch

- The centrifugal balance clutch is built into the low clutch.The centrifugal balance chamber is positioned opposing the clutch chamber for the low clutch.
- In the centrifugal balance chamber, ATF is constantly charged through a specialized hydraulic circuit.

Operation

- If hydraulic pressure is applied to the low clutch piston, the drive plate and driven plate are pressure bonded and drive force from the turbine shaft is transmitted to the front and rear sun gears.
- Therefore, the following gears become the input shafts:
    - 1GR by operation of the front sun gear
    - 2GR by operation of the front and rear sun gears
    - 3GR by operation of the front and rear sun gears and the reduction planetary carrier
- In 4GR, the rear planetary carrier also becomes the input shaft by the operation of the high clutch together with both the front and rear sun gears.

Centrifugal balance clutch

Clutch pressure not applied

- When the clutch drum rotates, centrifugal force is applied to the remaining ATF in the clutch chamber to push the piston, but centrifugal force is also applied to the ATF in the centrifugal balance chamber to force the piston to move back. As a result, the opposing forces of the clutch and balance chambers are offset and the piston does not move, preventing clutch drag.

Clutch pressure applied

- When clutch pressure is applied to the clutch chamber, the piston, which overcomes the opposing centrifugal hydraulic pressure from the balance chamber and the spring force, is pushed in the direction of clutch engagement and the clutch is engaged. At this time, because the centrifugal hydraulic pressure applied to the clutch pressure in the clutch chamber is offset by the centrifugal hydraulic pressure applied to the balance chamber, the effect of piston thrust by the centrifugal force from the clutch drum rotation is eliminated. As a result, stabilized piston force in all engine speed ranges is assured, thus reducing shift shock.

2014 - Mazda3 - Transmission/Transaxle

HIGH CLUTCH [FW6A-EL]

Purpose/Function

- The high clutch operates in 4GR, 5GR, and 6GR and intermittently operates the rear carrier by drive force from the turbine shaft.
- For the high clutch, a centrifugal balance clutch has been adopted to prevent clutch drag and to assure stabilized piston thrust in all engine speed ranges.

Construction

- The high clutch consists of the following parts shown in the figure.

- The driven plate of the high clutch is engaged with the high clutch drum. The high clutch drum is engaged with the turbine shaft and spline, and when the turbine shaft rotates, the high clutch drum and driven plate rotate as a single unit.

- The drive plate of the high clutch is engaged with the high clutch hub. The high clutch hub is engaged with the rear carrier, and the drive plate, high clutch hub, and rear carrier rotate as a single unit.

- For the high clutch piston, a compact and highly reliable bonded seal piston has been adopted in which the piston and seal are molded together.

Centrifugal balance clutch

- The centrifugal balance clutch is built into the high clutch.
- The centrifugal balance chamber is positioned opposing the clutch chamber for the high clutch. In the centrifugal balance chamber, ATF is constantly charged through a specialized hydraulic circuit.

Operation

- If hydraulic pressure is applied to the high clutch piston, the drive plate and driven plate are pressure coupled and drive force from the turbine shaft is transmitted to the rear planetary carrier. In addition, drive force is also transmitted to the front internal gear through the rear planetary gear.

Centrifugal balance clutch

Clutch pressure not applied

- When the clutch drum rotates, centrifugal force is applied to the remaining ATF in the clutch chamber to push the piston, but centrifugal force is also applied to the ATF in the centrifugal balance chamber to force the piston to move back. As a result, the opposing forces of the clutch and balance chambers are offset and the piston does not move, preventing clutch drag.

Clutch pressure applied

- When clutch pressure is applied to the clutch chamber, the piston, which overcomes the opposing centrifugal hydraulic pressure from the balance chamber and the spring force, is pushed in the direction of clutch engagement and the clutch is engaged. At this time, because the centrifugal hydraulic pressure applied to the clutch pressure in the clutch chamber is offset by the centrifugal hydraulic pressure applied to the balance chamber, the effect of piston thrust by the centrifugal force from the clutch drum rotation is eliminated. As a result, stabilized piston force in all engine speed ranges is assured, thus reducing shift shock.

2014 - Mazda3 - Transmission / Transaxle

R-3-5 BRAKE [FW6A-EL]

Purpose / Function

- The R-3-5 brake operates in 3GR, 5GR and in reverse to lock the reduction internal gear against rotation.

Construction

- The R-3-5 brake consists of the following parts shown in the figure.

- The driven plate of the R-3-5 brake does not rotate because it is connected to the end cover component.

- The R-3-5 brake drive plate is engaged with the R-3-5 brake hub and reduction internal gear, and locks the reduction internal gear.

- For the R-3-5 brake piston, a compact and highly reliable bonded seal piston has been adopted in which the piston and seal are molded together.

Operation

- When hydraulic pressure is applied to the R-3-5 brake piston, the drive plate and driven plate are pressure bonded to lock the reduction internal gear.

R-3-5 BRAKE [FW6A-EL]

2014 - Mazda3 - Transmission/Transaxle

2-6 BRAKE [FW6A-EL]

Purpose/Function

- The 2-6 brake locks the rear internal gear and reduction planetary carrier while in 2GR and 6GR.

Construction

- The 2-6 brake consists of the following parts shown in the figure.

- The driven plate of the 2-6 brake does not rotate because it is connected to the end cover component.

- The driven plate of the 2-6 brake is engaged with the 2-6 brake hub and rear internal carrier, and the rear internal carrier is engaged with the reduction planetary carrier through the rear internal gear. Therefore, the rear internal gear and reduction planetary gear are locked by the 2-6 brake.

- For the 2-6 brake piston, a compact and highly reliable bonded seal piston has been adopted in which the piston and seal are molded together.

Operation

- When hydraulic pressure is applied to the 2-6 brake piston, the drive plate and driven plate are pressure bonded to lock the rear internal gear and reduction planetary carrier.

2014 - Mazda3 - Transmission / Transaxle

LOW AND REVERSE BRAKE [FW6A-EL]

Purpose / Function

- The low and reverse brake stops the rotation of the front internal gear and rear planetary carrier while in 1GR and in reverse, locking them to the transaxle case.

Construction

- The low and reverse brake consist of the following parts shown in the figure.

- The driven plate of the low and reverse brake does not rotate because it is connected to the transaxle case.

- The drive plate of the low and reverse brake is engaged with the low and reverse brake hub and front internal gear. Therefore, the rear planetary carrier is locked via the front internal gear.

- For the low and reverse brake piston, a compact and highly reliable bonded seal piston has been adopted in which the piston and seal are molded together.

Operation

- When hydraulic pressure is applied to the low and reverse brake piston, the drive plate and driven plate are pressure bonded to lock the front internal gear and rear planetary gear to the transaxle case.

LOW AND REVERSE BRAKE [FW6A-EL]

2014 - Mazda3 - Transmission / Transaxle

ONE-WAY CLUTCH [FW6A-EL]

Purpose / Function

- The one-way clutch operates in 1GR and suppresses the counterclockwise rotation of the front internal gear (as viewed from torque converter side).

Construction

- The one-way clutch consists of a mechanical diode-type one-way clutch, inner plate, and outer plate.
- The inner plate for the one-way clutch is connected to the front internal gear and the outer plate is connected to the transaxle.

Operation

- The connected inner plate also rotates clockwise during the clockwise rotation of the front internal gear. Therefore, the rotation is not regulated and the inner plate spins because the strut installed to the inner plate is pressed toward the inner plate along the slope of the outer plate.
- The strut engages the notch of the outer plate by the rotation of the inner plate which also rotates counterclockwise during the counterclockwise rotation of the front internal gear. Due to this, the rotation of the inner plate is regulated and the rotation of the front internal gear is suppressed.
- As a result, the front internal gear suppresses the counterclockwise rotation of the rear pinion gear via the rear planetary carrier.

FREE SPIN (CLOCKWISE ROTATION)

LOCK (COUNTERCLOCKWISE ROTATION)

2014 - Mazda3 - Transmission / Transaxle

PLANETARY GEAR [FW6A-EL]

Purpose / Function

- The planetary gear is a mechanism which shifts the drive force from the engine. The planetary gear consists of multiple gears which rotate individually while revolving. By controlling the individual rotation and revolving of the gears, the transaxle performs gear shifting at the optimum gear speed according to the driving conditions.

Construction

- The planetary gear is positioned in the order of the front planetary gear, rear planetary gear, and reduction planetary gear from the torque converter side. The planetary gear is a single planetary gear type. For the component parts of each planetary gear, refer to the following figure.

- The planetary gear is composed of the sun gear, pinion gear, planetary carrier, and internal gear as shown in the figure.

- There are two types of pinion gear rotation, rotation (rotation) on an axis of the center for each pinion gear and rotation (revolution) on an axis of center for the planetary carrier. The planetary gear operates shifting function by switching the input, fixed, or output of the internal gear, pinion gear, and planetary carrier.

- The relation of rotation speed of each element for the planetary gear set is generally indicated as follows:

  $(Z_R + Z_S)\ N_C = Z_R\ N_R + Z_S\ N_S$: (1)

  Meaning of symbols

  - Z: Number of teeth
  - N: Rotation speed
  - Additional character R: Internal gear
  - Additional character S: Sun gear
  - Additional character C: Planetary carrier (pinion gear)

2014 - Mazda3 - Transmission/Transaxle

PRIMARY GEAR [FW6A-EL]

Purpose/Function

- The primary gear transmits the drive force converted by the 3-piece planetary gear to the secondary gear.

Construction

- The primary gear is engaged with the front planetary carrier and rotates as a single unit.

PRIMARY GEAR [FW6A-EL]

2014 - Mazda3 - Transmission/Transaxle

SECONDARY GEAR [FW6A-EL]

Purpose/Function

- The secondary gear transmits the drive force from the primary gear to the output gear.

Construction

- The secondary gear is engaged with the output gear and rotates as a single unit.

SECONDARY GEAR [FW6A-EL]

2014 - Mazda3 - Transmission / Transaxle

OUTPUT GEAR [FW6A-EL]

Purpose / Function

- The output gear transmits the drive force transmitted from the primary gear and secondary gear to the differential.

Construction

- The output gear is engaged with the secondary gear and rotates as a single unit.

OUTPUT GEAR [FW6A-EL]

2014 - Mazda3 - Transmission / Transaxle

DIFFERENTIAL [FW6A-EL]

Purpose / Function

- The differential absorbs the difference in the rotation speed between the left and right driving wheels so that the vehicle drives smoothly when differences occur due to cornering or driving on rough roads.

Construction

- The differential consists of the ring gear, differential gear case, side gears, pinion gears, and pinion shaft.
- The differential gear case is engaged with the ring gear and rotates as a single unit.
- The side gears are engaged with the drive shaft (LH) and drive shaft (RH) and rotates as a single unit for each.

Operation

- If there is no difference in rotation speed between the left and right driving wheels, the left and right side gears rotate together with the differential gear case and pinion gears.

- If there is a difference in the rotation speed between the left and right driving wheels, the difference in the rotation speed between the left and right side gears is absorbed by the pinion gears rotating around the pinion shaft.

PARKING MECHANISM [FW6A-EL]

Purpose / Function

- The parking mechanism locks the output gear when the selector lever is shifted to the P position which locks the driving wheels against rotation to prevent coasting when parking the vehicle.

Construction / Operation

- For component parts related to the parking mechanism, refer to the following figure.
- When the selector lever is shifted to the P position, the manual plate is rotated in the direction of arrow A via the manual shaft. As a result, the parking rod component moves in the direction of arrow B. As a result, the cam on the end of the parking rod component presses the parking pawl against the parking gear, the parking pawl and parking gear are engaged, and the rotation of the output gear is locked. Even if the parking pawl is positioned at the projection of the parking gear and cannot be engaged, the driving wheels together with the parking gear are rotated by moving the vehicle slightly so that the parking pawl and parking gear engage.

2014 - Mazda3 - Transmission/Transaxle

HYDRAULIC PRESSURE CONTROL SYSTEM OUTLINE [FW6A-EL]

Outline

- The hydraulic control mechanism consists of an oil cooler which maintains the hydraulic pressure at the optimum temperature, a control valve body and each shift valve which perform adjustment and circuit switching of the hydraulic pressure based on the control content calculated by the TCM, and the oil pump which generates the hydraulic pressure of each clutch and brake.

Construction

Structural view

HYDRAULIC PRESSURE CONTROL SYSTEM OUTLINE [FW6A-EL]

2014 - Mazda3 - Transmission / Transaxle

OIL PUMP [FW6A-EL]

Purpose / Function

- The oil pump generates hydraulic pressure in the oil line of the automatic transaxle together with supplying lubrication to powertrain related parts.

Construction

- The oil pump has adopted a gear type with built-in outer and inner rotors.
- The inner rotor engages with the torque converter and rotates in conjunction with the rotation of the torque converter.

Operation

- When the inner rotor in the oil pump rotates, vacuum is generated in the outer rotor. As a result, ATF in the oil pan is suctioned to the oil pump. Further rotation of the inner rotor causes the inner rotor blades to push the ATF and discharge it from the oil pump.
- The ATF discharge flow amount increases or decreases in proportion to the rotation speed of the inner rotor.

IN
OUT

2014 - Mazda3 - Transmission/Transaxle

OIL STRAINER [FW6A-EL]

Purpose/Function

- The oil strainer filters particulate matter in the ATF by passing it through the built-in filter.

Construction

- The oil strainer is a built-in, non-woven fabric filter installed to the position shown in the following figure.

2014 - Mazda3 - Transmission / Transaxle

CONTROL VALVE BODY [FW6A-EL]

Purpose / Function

- The control valve body controls the hydraulic pressure generated by the oil pump by each solenoid valve. In addition, the oil passages which introduce hydraulic pressure to the pistons for each clutch and brake is formed by the switching of each built-in shift valve.

Construction

- The control valve body consists of integrated hydraulic control related parts and electronic control related parts.
- The hydraulic control related parts basically consist of the upper control valve body and main control valve body each with built-in shift valves, and the solenoid control valve body with built-in solenoid valves.

2014 - Mazda3 - Transmission / Transaxle

OIL COOLER [FW6A-EL]

Purpose / Function

- The oil cooler constantly maintains maximum ATF performance in the transaxle by maintaining an optimum ATF temperature which has the effect of achieving reduced fuel consumption.

Construction / Operation

- The oil cooler performs the following operations according to the ATF temperature condition:
    - Heating function: Warms the ATF using the radiator coolant to promote an earlier increase in the ATF temperature when its temperature is low. As a result of the earlier temperature increase, the ATF viscosity decreases which reduces drag in the transaxle.
    - Cooling function: Cools the ATF using the radiator coolant to maintain optimum conditions and prevent ATF expansion and deterioration.

OIL COOLER [FW6A-EL]

2014 - Mazda3 - Transmission/Transaxle

ELECTRONIC CONTROL SYSTEM OUTLINE [FW6A-EL]

Outline

- In the electronic control system, the TCM calculates the control content based on signals from each type of sensor and switch to operate output parts such as each solenoid. In consideration of suppressed shift shock, smooth driving, and improved fuel economy, the TCM performs controls so as to maintain the optimum driving performance in response to the vehicles driving scenario.

CONTROL VALVE BODY [FW6A-EL]

Purpose / Function

- A direct linear solenoid has been adopted for the solenoid valve which contributes to improved shift response, drive feel and reduced shift shock by the improved precision of the hydraulic pressure control.

Construction

- The control valve body consists of integrated hydraulic control related parts and electronic control related parts.
    - The transaxle range sensor, output shaft speed sensor, turbine/input shaft speed sensor, and the control valve body connector are built into the TCM and integrated with the automatic transaxle.
    - The transaxle fluid temperature (TFT) sensor, wiring harness, and the wiring harness cover bracket are built into the coupler component.
- If any of the component parts of the control valve body has a malfunction, the control valve body must be replaced because the replacement of a single part is not possible except for the following parts:
    - On/off solenoid
    - Oil pressure switch A, oil pressure switch B
    - Coupler component (built into transaxle fluid temperature (TFT) sensor)

CONTROL VALVE BODY [FW6A-EL]

2014 - Mazda3 - Transmission / Transaxle

TRANSAXLE RANGE SENSOR [FW6A-EL]

Purpose / Function

- The transaxle range sensor detects the position of the manual valve and selector lever.
- The transaxle range sensor signal is used for automatic shift control, manual shift control, TCC control, line pressure control, direct electric shift control, learning control, engine-transaxle integration control, and the on-board diagnostic system.

Construction

- The transaxle range sensor consists of a housing and slider which are installed to the control valve body as a part of the TCM.
- The slider is assembled to the housing and the pin which projects from the slider and is connected to the manual valve.

Operation

- When the selector lever is operated, the manual valve strokes via the manual shaft while the slider strokes via the slider pin.
- The transaxle range sensor detects the signal corresponding to the manual valve position according to the slider stroke. This signal is calculated in the TCM and detected as a range position.

2014 - Mazda3 - Transmission/Transaxle

M POSITION SWITCH [FW6A-EL]

Purpose/Function

- The M position switch detects that the selector lever is in the M position.
- The M position switch signal is sent to the TCM via CAN, and is used for manual shift control and engine-transaxle integration control.

Construction

- The M position switch is installed to the selector lever.
- The M position switch is an on/off type switch.

Operation

- When the selector lever is in the M position, the M position switch contact point closes.
- By opening and closing the M position switch contact point, the TCM detects that the selector lever is in the M position.

2014 - Mazda3 - Transmission/Transaxle

UP SWITCH [FW6A-EL]

Purpose/Function

- The up switch detects the shift up operation of the selector lever.
- The up switch signal is sent to the TCM via CAN and is used for manual shift control and engine-transaxle integration control.

Construction

- The up switch is installed to the selector lever.
- The up switch is an on/off type switch.

Operation

- When the selector lever is in the shift up position (+), the up switch contact point closes.
- Based on the opening and closing of the up switch contact point, the TCM detects that the shift up has been operated.

UP SWITCH [FW6A-EL]

2014 - Mazda3 - Transmission / Transaxle

DOWN SWITCH [FW6A-EL]

Purpose / Function

- The down switch detects the shift down operation of the selector lever.
- The down switch signal is sent to the TCM via CAN and is used for manual shift control and engine-transaxle integration control.

Construction

- The down switch is installed to the selector lever.
- The down switch is an on/off type switch.

Operation

- When the selector lever is in the shift down position (-), the down switch contact point closes.
- Based on the opening and closing of the down switch contact point, the TCM detects that the shift down has been operated.

DOWN SWITCH [FW6A-EL]

2014 - Mazda3 - Transmission/Transaxle

STEERING SHIFT SWITCH [FW6A-EL]

Purpose, Function

- The steering shift switch detects the shift-up and shift-down operations of the steering shift.
- Steering shift switch signal sends to the TCM via the CAN and is used for the manual shift control and engine transaxle total control.

Construction

- The steering shift switches are installed on the back side of the steering wheel; the up switch on the right side and the down switch on the left side.

- By positioning the steering shift switches optimally for ease of driver operations, operability of the switches has been improved while ensuring an easy-to-grip steering wheel.

Operation

- The steering shift switches are a momentary-type switch, thus the contact point closes only when a switch is operated (pulled).
- The TCM detects the steering shift switch operation condition by opening/closing the up or down switch contact point for the steering shift switch.

2014 - Mazda3 - Transmission / Transaxle

TRANSAXLE FLUID TEMPERATURE (TFT) SENSOR [FW6A-EL]

Purpose / Function

- The transaxle fluid temperature (TFT) sensor detects the ATF temperature in the oil pan.
- The transaxle fluid temperature (TFT) sensor signal is used for automatic shift control, TCC control, line pressure control, direct electric shift control, learning control, and the on-board diagnostic system.

Construction

- The transaxle fluid temperature (TFT) sensor is integrated with the coupler component and installed to the control valve body.

Operation

- The transaxle fluid temperature (TFT) sensor outputs the signal corresponding to the ATF temperature in the oil pan to the TCM.

2014 - Mazda3 - Transmission / Transaxle

OIL PRESSURE SWITCH [FW6A-EL]

Purpose / Function

- The oil pressure switch detects the engagement pressures of the low clutch, 2-6 brake, R-3-5 brake, and the high clutch.
- The oil pressure switch signal is used for automatic shift control, manual shift control, TCC control, line pressure control, direct electric shift control, and the on-board diagnostic system.

Construction

- The oil pressure switch contacts the oil passages of the low clutch, 2-6 brake, R-3-5 brake, and the high clutch and is installed to the control valve body.
- The oil pressure switch is an on/off type switch.

Relation of oil pressure switch and engagement pressure detection targets

Oil pressure switch		Clutch/brake
Oil pressure switch A	Oil pressure switch No.2	2-6 brake
	Oil pressure switch No.3	R-3-5 brake
Oil pressure switch B	Oil pressure switch No.1	Low clutch
	Oil pressure switch No.4	High clutch

Oil pressure switch A consists of oil pressure switch No.2 and No.3. If there is a malfunction in oil pressure switch No.2 and No.3, replace oil pressure switch A.

Oil pressure switch B consists of oil pressure switch No.1 and No.4. If there is a malfunction in oil pressure switch No.1 and No.4, replace oil pressure switch B.

Operation

- When engagement pressure is supplied to the applicable clutch and brake, the oil pressure switch contact point closes.
- The TCM detects that clutch engagement pressure is supplied to the applicable clutch/brake by opening/closing the oil pressure switch contact point.

X: Contact point is closed

Oil pressure switch	1GR	2GR	3GR	4GR	5GR	6GR
Oil pressure switch No.1	X	X	X	X		
Oil pressure switch No.2		X				X
Oil pressure switch No.3			X		X	
Oil pressure switch No.4				X	X	X

2014 - Mazda3 - Transmission/Transaxle

TURBINE/INPUT SHAFT SPEED SENSOR, OUTPUT SHAFT SPEED SENSOR [FW6A-EL]

Purpose/Function

- The turbine/input shaft speed sensor detects the rotation speed of the input shaft (low clutch drum).
- The output shaft speed sensor detects the rotation speed of the output shaft (primary gear).
- The turbine/input shaft speed sensor and output shaft speed sensor signals are used for automatic shift control, manual shift control, and the on-board diagnostic system.

Construction

- The turbine/input shaft speed sensor and output shaft speed sensor are both integrated with the TCM and built-into the control valve body.

Operation

- The turbine/input shaft speed sensor changes the output signal according to the rotation speed of the low clutch drum.
- The output shaft speed sensor changes the output signal according to the rotation speed of the primary gear.

2014 - Mazda3 - Transmission/Transaxle

PRESSURE CONTROL SOLENOID [FW6A-EL]

Purpose/Function

- The pressure control solenoid adjusts the pressure control solenoid pressure and controls the line pressure based on the control signal from the TCM.

Construction

- The pressure control solenoid is installed to the solenoid control valve body.
- The pressure control solenoid is a normal open-type linear solenoid.

Operation

- Adjusts the pressure control solenoid pressure by increasing/decreasing the energization current to the pressure control solenoid according to the signal from the TCM.

PRESSURE CONTROL SOLENOID [FW6A-EL]

2014 - Mazda3 - Transmission/Transaxle

SHIFT SOLENOID NO.1 [FW6A-EL]

Purpose/Function

- Shift solenoid No.1 adjusts the hydraulic pressure in the low clutch circuit based on the current demand from the TCM according to the vehicle conditions.

Construction

- Shift solenoid No.1 is installed to the solenoid control valve body.
- Shift solenoid No.1 is a normal closed-type linear solenoid.

Operation

- Adjusts the low clutch pressure by increasing/decreasing the energization current to shift solenoid No.1 according to the signal from the TCM.

2014 - Mazda3 - Transmission/Transaxle

SHIFT SOLENOID NO.2 [FW6A-EL]

Purpose/Function

- Shift solenoid No.2 adjusts the hydraulic pressure in the 2-6 brake circuit based on the current demand from the TCM according to the vehicle conditions.

Construction

- Shift solenoid No.2 is installed to the solenoid control valve body.
- Shift solenoid No.2 is a normal closed-type linear solenoid.

Operation

- Adjusts the 2-6 brake pressure by increasing/decreasing the energization current to shift solenoid No.2 according to the signal from the TCM.

2014 - Mazda3 - Transmission/Transaxle

SHIFT SOLENOID NO.3 [FW6A-EL]

Purpose/Function

- Shift solenoid No.3 adjusts the hydraulic pressure in the R-3-5 brake circuit based on the current demand from the TCM according to the vehicle conditions.

Construction

- Shift solenoid No.3 is installed to the solenoid control valve body.
- Shift solenoid No.3 is a normal open-type linear solenoid.

Operation

- Adjusts the R-3-5 brake pressure by increasing/decreasing the energization current to shift solenoid No.3 according to the signal from the TCM.

2014 - Mazda3 - Transmission/Transaxle

SHIFT SOLENOID NO.4 [FW6A-EL]

Purpose/Function

- Shift solenoid No.4 adjusts the hydraulic pressure in the high clutch circuit and the low and reverse brake circuit based on the current demand from the TCM according to the vehicle conditions.

Construction

- Shift solenoid No.4 is installed to the solenoid control valve body.
- Shift solenoid No.4 is a normal open-type linear solenoid.

Operation

- Adjusts the high clutch pressure and the low and reverse brake pressure by increasing/decreasing the energization current to shift solenoid No.4 according to the signal from the TCM.

2014 - Mazda3 - Transmission/Transaxle

TORQUE CONVERTER CLUTCH (TCC) CONTROL SOLENOID [FW6A-EL]

Purpose/Function

- The torque converter clutch (TCC) control solenoid adjusts the hydraulic pressure in the TCC control circuit based on the current demand from the TCM according to the vehicle conditions.

Construction

- The TCC control solenoid is installed to the solenoid control body.
- The TCC control solenoid is a normal closed-type linear solenoid.

Operation

- Adjusts the TCC control clutch pressure by increasing/decreasing the energization current to the TCC control solenoid according to the signal from the TCM.

2014 - Mazda3 - Transmission/Transaxle

ON/OFF SOLENOID [FW6A-EL]

Purpose/Function

- The on/off solenoid performs switching of the shift valve in the control valve body according to the vehicle conditions.

Construction

- The on/off solenoid is installed to the solenoid control valve body.
- The on/off solenoid is a normal open-type on/off solenoid.

Operation

Non-energization (OFF)

- When the on/off solenoid is off, the supply port in the solenoid opens. As a result, hydraulic pressure is supplied to operate the shift valve.

Energized (ON)

- When the on/off solenoid is on, the drain port in the solenoid opens. As a result, hydraulic pressure which operates

the shift valve is drained.

2014 - Mazda3 - Transmission/Transaxle

SHIFT POSITION INDICATOR LIGHT [FW6A-EL]

Purpose/Function

- The shift position indicator light indicates the selector lever position.

Construction

- The shift position indicator light is built into the instrument cluster.

TYPE A (DIGITAL SPEED METER TYPE) OR TYPE B
(ANALOG SPEED METER TYPE (WITH TACHOMETER))

SHIFT POSITION
INDICATOR LIGHT

TYPE C (ANALOG SPEED METER TYPE (WITHOUT TACHOMETER))

SHIFT POSITION
INDICATOR LIGHT

Operation

- The TCM sends a shift position indicator light illumination request signal to the instrument cluster via CAN based on the signal from the integrated transaxle range sensor signal received via CAN.

2014 - Mazda3 - Transmission/Transaxle

GEAR POSITION INDICATOR [FW6A-EL]

Purpose/Function

- The gear position indicator illuminates while under manual shift control and displays the gear number while driving.

Construction

- The gear position indicator is built into the instrument cluster.

Operation

- The TCM sends a gear position indicator illumination/flash request signal to the instrument cluster based on the signal from the M position switch, the up switch and the down switch via the CAN.

- If the shift down operation is inhibited during manual shift control, the TCM flashes the

gear position indicator 2 times. As a result, the driver is notified that the shift down operation has been canceled.

- If the ATF temperature is 132 °C {270 °F} or more while in manual shift control, the TCM turns the gear position indicator off and switches to automatic shift control to reduce the transaxle load. When the ATF temperature is 122 °C {252 °F} or less for a specified time, manual shift control is enabled and the gear position indicator is re-illuminated.

2014 - Mazda3 - Transmission/Transaxle

AUTOMATIC TRANSAXLE WARNING LIGHT [FW6A-EL]

Purpose/Function

- The automatic transaxle warning light illuminates when the transaxle has malfunction.
- For vehicles with center display, a warning message in the center display is displayed when the automatic transaxle warning light is turned on. For the message content and verification method, refer to the CENTER DISPLAY. (See **CENTER DISPLAY [WITH CENTER DISPLAY]**.)

Construction

- The automatic transaxle warning light is built into the instrument cluster.

Operation

- If the transmission has a malfunction, the TCM sends an automatic transaxle warning light illumination request signal to the instrument cluster.

- The TCM illuminates the automatic transaxle warning light for **approx. 2 s** after the ignition is switched ON to perform a bulb check of the automatic transaxle warning light.

2014 - Mazda3 - Transmission / Transaxle

TCM [FW6A-EL]

Purpose / Function

- The TCM detects the vehicle conditions and performs calculations and processing based on input information from each type of sensor and switch.
- Outputs control signals to each solenoid valve so that each type of control is optimally implemented according to the vehicle conditions.

Function Table

Control item				Main control content
Shift point control	Automatic shift control (D position)	Driving mode	Normal mode	• Mode selection during normal driving (without drive selection switch) • Normal mode selected using drive selection (with drive selection switch) • Performs automatic shift corresponding to vehicle speed and accelerator pedal depression amount
			SPORT mode (with drive selection switch)	• SPORT mode selected using drive selection • Performs automatic shifting corresponding to vehicle speed and accelerator pedal depression amount • Lower gear is selected than while in the Normal mode
			Active Adaptive Shift (AAS) mode	• Unnecessary shift up is suppressed for several seconds by maintaining the gear corresponding to the operation speed at which the accelerator pedal is released • The optimum gear on the low vehicle-speed side is selected and shift down is executed corresponding to the operation force at which the brake pedal is depressed • During cornering, shift up is suppressed in preparation for acceleration after cornering • In regions of high elevation, the optimum gear is selected corresponding to the environment • The slope is estimated in the TCM to select the appropriate gear for ascent and descent • When SPORT mode is selected, the AAS selects a lower gear compared to when normal mode is selected, and maintains it for a longer period of time (with drive selection switch)
			High ATF temperature mode	• Controls engine torque when the ATF temperature is high
	Manual shift control (M position)			• When M position is selected, manual shifting is prioritized according to the driver's shift up/shift down operation.
Shift	Line pressure control			• Controls line pressure with high accuracy and fine control corresponding to engine load conditions and vehicle driving conditions
				• Performs direct, electronic control of clutch engagement pressure appropriate to

pressure control	Direct electric shift control	engine load conditions and vehicle driving conditions
	Learning control	• Learns engine performance changes and transaxle deterioration over time to optimally correct clutch engagement pressure
Torque converter clutch (TCC) control		• Based on adoption of full range TCC control, active TCC control directly after acceleration from stop • By gradually engaging/disengaging TCC piston, shock during operation is reduced • Implements TCC control when accelerator pedal is fully closed for improved fuel economy and emission performance
Engine-transaxle integration control		• Optimally controls engine output torque when shifting • Calculates optimum clutch engagement pressure according to engine output torque
On-board diagnostic system		• Main part of transaxle control includes self-diagnosis function. In case of malfunction, automatic transmission warning light illuminates to alert driver, and DTC is stored in TCM • When transaxle malfunction is determined resulting from on-board diagnostic test, system control is switched to prevent any dangerous situation while driving

2014 - Mazda3 - Transmission/Transaxle

SHIFT POINT CONTROL (AUTOMATIC SHIFT CONTROL) [FW6A-EL]

Outline

- The TCM implements auto shift control according to the vehicle speed and accelerator pedal depression amount while in D position.
- When the vehicle is stopped with the selector lever is in the D position and the brake pedal depressed, the neutral idle control is performed which internally controls the automatic transaxle to be in the neutral condition while the selector lever is in the D position. When the brake pedal is being released, the clutch is engaged immediately and the automatic transaxle returns to the normal D position condition.
- When SPORT mode is selected using the drive selection switch, a lower gear relative to normal mode is selected, and control is performed so that a higher operating force can be assured. (with drive selection switch)
- When implementing the automatic shift control, the TCM determines the driving conditions based on each input signal and selects the drive mode appropriate to the driving conditions. In addition, information such as torque and gear changes is exchanged via PCM and CAN communication and control is performed so as to achieve optimum drive force according to the driving scenario.

Construction

Operation

Driving range determination

- If a D position signal is input and an M position signal is not input, the TCM implements auto shift control.

Driving mode determination

- For the auto shift control, NORMAL mode is usually selected, however it automatically switches to driving mode depending on the driving conditions. (without drive selection switch)
    - AAS (Active Adaptive Shift) mode: Automatically controls the optimum shift point according to the road

conditions and the driver operation.

- High ATF temperature mode: When the ATF temperature rises to a high temperature, the engine torque is restricted so that the increase in ATF temperature is suppressed to protect the transaxle.

- Normal mode and SPORT mode can be selected using the drive selection switch and the following modes are switched automatically based on the driving conditions in conjunction with normal mode/SPORT mode. (with drive selection switch)
  - AAS (Active Adaptive Shift) mode: Automatically controls the optimum shift point according to the road conditions and the driver operation.
  - High ATF temperature mode: When the ATF temperature rises to a high temperature, the engine torque is restricted so that the increase in ATF temperature is suppressed to protect the transaxle.

AAS (Active Adaptive Shift) mode operation

- When SPORT mode is selected, the AAS selects a lower gear compared to when normal mode is selected, and maintains it for a longer period of time. (with drive selection switch)
- Accelerator pedal fully closed suddenly and returned
  - When the accelerator pedal is fully closed and returned at a certain speed or more, shift-up is inhibited for specified time to improve speed control and reacceleration performance.
- Brake is strongly depressed
  - When decelerating at a certain speed or more, a lower gear is selected so that re-acceleration is performed smoothly.
  - During a shift change with the brake pedal depressed firmly, blipping control (synchronization to engine speed) is performed to shorten the shifting time.
  - When the ambient temperature is approx. 15 degrees C or less, shift down control using the brakes cannot be performed for a while after beginning to drive the vehicle.
  - When driving on slippery roads such as snow covered roads, the shift down control using the brakes may not operate.
- When cornering
  - While cornering at a turn with a radius of less than a specified value, shift up is suppressed to improve vehicle speed performance while cornering and reacceleration performance after cornering.
- During high degree of vehicle ascent/descent
  - During a certain level of vehicle ascent/descent, gears are selected appropriate to the driving conditions for driving comfort.
- During ascent
  - While ascending a slope of a certain grade or more, slope mode control prevents unnecessary shift-up by maintaining the appropriate gear.
- During descent
  - While descending a slope of a certain grade or more and depressing the brake pedal, the gears are appropriately shifted down according to the estimated slope angle for effective use of engine braking. As a result, frequent brake pedal operation is reduced.

AAS (active adaptive shift) operation scenario and effect

- The AAS (active adaptive shift) is a mode which estimates the driving environment and driver's intentions according to the vehicle driving conditions and the driver's operations, and selects the optimum gear for driving.

Ex.1: Cornering

- During cornering, shift up is suppressed to improve acceleration performance after cornering.

The selected gear is an example of normal mode.

Ex. 2) Merging onto high speed expressways

- In a scenario such as temporarily decelerating while merging onto a high speed expressway, shift up is suppressed directly afterwards to improve re-acceleration performance.

The selected gear is an example of normal mode.

Automatic transaxle operation chart

Position	Mode	Gear position	Gear ratio	TCC	Operation of powertrain parts						Operation of shift solenoid

OPEN: Engages the line pressure to the clutch pressure
CLOSE: Drains the clutch pressure
ON: Engages the output port and the supply port
OFF: Engages the output port and the drain port (Drains the output port)

2014 - Mazda3 - Transmission/Transaxle

SHIFT POINT CONTROL (MANUAL SHIFT CONTROL) [FW6A-EL]

Outline

- The TCM operates the manual shift control when the M position is selected.
- If the M position is selected, manual shifting is prioritized according to the driver's shift up/shift down operation. However, to assure driving safety and protect the ATX, minimum automatic shifting may occur.

Construction

Operation

- Gears can be selected by moving the selector lever back and forth while driving in the M position.
- When shifting the selector lever from the D to M position while driving, the gear being used while driving in the D position is maintained. For driving in D position 6th gear, however, when shifting the selector lever from the D to M position with the accelerator pedal not depressed, the gear shifts from 6th to 5th gear. For driving in 5th gear, when shifting the selector lever from the D to M position with the accelerator pedal not depressed, the gear shifts from 5th to 4th gear.
- When a shift down is performed using the selector lever with the accelerator pedal not depressed and the selector lever in the M position, blipping control (synchronization to engine speed) is performed.
- When the accelerator pedal is fully depressed while driving in the M position, kickdown shifting is performed.
- If the ATF temperature exceeds the specified temperature while in manual mode, the TCM switches control to automatic shift control and turns the gear position indicator off to reduce the transaxle load. When the ATF temperature decreases to the appropriate temperature, the TCM enables driving in manual mode and re-illuminates the gear position indicator.
- During manual shift control, in every gear speed, engine brake force can be obtained corresponding to the gear ratio. In addition, if the vehicle speed reaches a constant speed or less, shift-down is performed automatically.

Shifting operation and manual transmission

Shift operation		Gear	Gear shift enabled/disabled
Shift-up operation	Operates once	1GR to 2GR	Enabled when both driving and stopped
		2GR to 3GR	Enabled when driving at specified vehicle speed or more
		3GR to 4GR	
		4GR to 5GR	
		5GR to 6GR	
	Operates 2 times consecutively	1GR to 3GR	
		2GR to 4GR	
		3GR to 5GR	
		4GR to 6GR	
	Operates 3 times consecutively	1GR to 4GR	
		2GR to 5GR	
		3GR to 6GR	
	Operates 4 times consecutively	1GR to 5GR	
		2GR to 6GR	
Shift-down operation	Operates once	6GR to 5GR	Enabled when driving at specified vehicle speed or less
		5GR to 4GR	
		4GR to 3GR	
		3GR to 2GR	
		2GR to 1GR	
	Operates 2 times consecutively	6GR to 4GR	
		5GR to 3GR	
		4GR to 2GR	
		3GR to 1GR	
	Operates 3 times consecutively	6GR to 3GR	
		5GR to 2GR	
		4GR to 1GR	
		6GR to 2GR	

	Operates 4 times consecutively	5GR to 1GR	

- The gear shifting operation may cancel depending on the vehicle speed. If a shift-down operation is canceled, the gear position indicator illuminates to alert the driver.
- If the engine reaches a high engine speed, the following controls are performed to protect the engine:
    - The throttle valve is squeezed so that the engine speed does not exceed the excess speed range and the engine speed is stabilized at a lower speed than the excess speed range.
    - If the high engine speed condition continues, the engine speed is lowered by a forced shift-up of the gears.

2nd gear fixed mode

- When the vehicle is stopped or the vehicle speed is extremely low, the selector lever is moved to the + side and the transaxle is in 2nd gear.
- On slippery surfaces such as snow-bound roads, forward acceleration and driving is facilitated. While in 2nd gear fixed mode and the selector lever is shifted to gears other than 2nd gear, the 2nd gear fixed mode is canceled.
- If the accelerator pedal is fully depressed in 2nd gear fixed mode, kickdown shifting is performed and the 2nd gear fixed mode is cancelled.

Direct mode (with steering shift switch)

- When the steering shift switch is operated while driving with the selector lever in the D position, the gear position may temporarily switch. While in the direct mode, D and M illuminate in the indicator light and the operating gear position is displayed. The direct mode is canceled under the following conditions:
    - Specified time has elapsed while driving at constant speed
    - Vehicle stopped or driving at low speed
    - Up switch for steering shift switch is pulled for certain period of time or more

2014 - Mazda3 - Transmission/Transaxle

TORQUE CONVERTER CLUTCH (TCC) CONTROL [FW6A-EL]

Outline

- For TCC control, a newly developed, full range TCC control has been adopted. The TCC range has been significantly widened by having the smoothness unique to the torque converter during acceleration from a stop take precedence and actively controlling TCC directly after acceleration from a stop. Therefore, a contribution to low fuel consumption and vehicle operability with a direct feel have been achieved.
- Lower fuel consumption and improved emission performance have been achieved by performing the TCC control during deceleration with the accelerator pedal fully closed and by fuel-cut during TCC.

Construction

- The TCC mechanism consists of a torque converter clutch, TCC piston, and a damper which are installed inside the torque converter.
- A multi-plate type torque converter clutch has been adopted for improved durability. Also, by reducing the size of the clutch diameter, improved handling is achieved by the ability to respond to the precise control by the full range TCC.

- Vibration during TCC engagement is suppressed by the improved damper performance.

Operation

TCC engagement

- A current signal is sent from the TCM to the TCC control solenoid during TCC engagement. At the same time, the TCC piston engagement pressure is gradually increased.
- As a result, the TCC piston is pressure-bonded to the TCC clutch slowly to perform smooth TCC engagement.

TCC release

- A current signal is sent from the TCM to the TCC control solenoid during TCC release. At the same time, the TCC piston engagement pressure is gradually drained.
- As a result, the TCC piston releases the TCC clutch slowly to release the TCC smoothly.

Inhibition of TCC control

- If any one of the following conditions is met, the torque converter clutch control is inhibited.
    - TCC solenoid malfunction
    - ATF temperature is specified value or less
    - Engine speed signal is specified value or less
    - Turbine shaft speed is specified value or less
    - Other than D/M position

2014 - Mazda3 - Transmission/Transaxle

SHIFT PRESSURE CONTROL (LINE PRESSURE CONTROL) [FW6A-EL]

Outline

- The TCM drives the pressure control solenoid and adjusts the pressure based on the accelerator pedal depression amount, vehicle speed, ATF temperature, and gear shift signal. As a result, line pressure is controlled finely and with high accuracy according to the engine load condition and vehicle driving conditions.

Construction

Operation

- The TCM adjusts the pressure control solenoid pressure applied to the pressure regulator valve by increasing/decreasing the energization current to the pressure control solenoid. As a result, the ATF amount passing through the pressure regulator valve is adjusted and the line pressure is adjusted.

2014 - Mazda3 - Transmission/Transaxle

SHIFT PRESSURE CONTROL (DIRECT ELECTRIC SHIFT CONTROL) [FW6A-EL]

Outline

- The TCM drives shift solenoids No.1, 2, 3, 4, the pressure control solenoid, and the on/off solenoid based on inputs signals from each switch and sensor, and performs direct electronic control of the clutch engagement pressure. As a result, precise hydraulic pressure control of the clutch engagement, not possible using a conventional accumulator, is achieved.

Construction

Operation

N to D, and N to R selected

- When N to D, and N to R are selected, the TCM drives the pressure control solenoid and shift solenoids No. 1 and 3 for optimum clutch engagement pressure control.

Shifting

- During shifting, the TCM drives shift solenoids No.1, 2, 3, and 4 to directly control the clutch engagement pressure for optimum clutch engagement pressure control.
- During each gear shift, the engagement side clutch pressure and release side clutch pressure are controlled simultaneously. As a result, the torque capacities of both clutches can be controlled in connection to each other when switching clutches, engine over-speed during shifting and interlock among clutches is prevented, and smooth and responsive shifting is achieved.

2014 - Mazda3 - Transmission/Transaxle

SHIFT PRESSURE CONTROL (LEARNING CONTROL) [FW6A-EL]

Outline

- The TCM optimizes the hydraulic pressure for clutch engagement and disengagement through learning correction of the clutch engagement pressure.

NOTE:

- The clutch engagement learning value is not recorded in the TCM installed to the control valve body for the replacement. If the clutch engagement learning value is not recorded in the TCM, engine racing may occur or shift shock may increase. Therefore, when the control valve body is replaced, always perform the initial learning.

Construction

Operation

- The TCM learns engine performance changes resulting from past shifting and deterioration over time of the transaxle and performs learning correction for optimum clutch engagement pressure during initial shifting.

2014 - Mazda3 - Transmission/Transaxle

ENGINE-TRANSAXLE INTEGRATION CONTROL [FW6A-EL]

Outline

- The TCM controls engine output torque and reduces transaxle output shaft torque fluctuation during auto shifting, and reduces shock occurring from the vehicle during shifting.

Construction

Operation

- During auto shifting, the TCM sends the torque reduction request signal using the CAN system and temporarily reduces the engine output torque by the engine ignition timing retard control. As a result, transaxle output shaft torque fluctuation is reduced during auto shifting by smooth engagement of the clutch.

- In addition, the TCM receives the engine output torque from the PCM via the CAN signal to determine the clutch engagement pressure according to the engine output torque. As a result, the clutch hydraulic control setting accuracy is increased and smooth shift performance is achieved.

2014 - Mazda3 - Transmission/Transaxle

AUTOMATIC TRANSAXLE SHIFT MECHANISM

Outline

- A sport AT-type shift mechanism has been adopted for all models.
- An electric shift-lock system has been adopted to prevent driver mis-operation.
- An emergency manual shift-lock release system has been adopted to ensure emergency bypass if shifting operations cannot be performed.

Structural view

< Previous

2014 - Mazda3 - Transmission/Transaxle

SHIFT-LOCK SYSTEM

Purpose, Function

- The shift-lock system operates when the ignition is switched ON and the brake pedal is not depressed, and inhibits the selector lever from being shifted from the P position to other positions.
- If the shift-lock cannot be released by the normal operation, it can be released manually by inserting a flathead screwdriver into the shift-lock release hole (emergency manual shift-lock release system).

Construction

Wiring diagram

Structural view

Operation

Shift-lock Release Conditions

- The shift-lock is released when all of the following conditions are met (except emergency manual shift-lock release system is operated).
    - Selector lever is in P position
    - Ignition is switched to ON
    - Brake pedal is depressed (brake light switch is on)

Shift-lock operation conditions (shift-lock release conditions not satisfied)

- When the shift-lock release conditions are not met, the shift-lock operates (The selector lever cannot be moved to any position other than P).
- Because there is no energization to the shift-lock solenoid at this time, the shift-lock solenoid is not energized.
- As a result, the lock slider is in the position shown in the figure and the movement of the guide pin in the downward direction is controlled by the lock slider.
- For selector levers in which movement is controlled by the guide pin, the selector lever cannot be moved to a position other than the P position.

Shift-lock release (Shift-lock release conditions are satisfied)

- When the shift-lock release conditions are met, the shift-lock does not operate (The selector lever can be moved out of P).
- At this time, the shift-lock solenoid is energized because there is energization to the shift-lock solenoid.
- As a result, the lock slider moves in the direction shown by arrow (1) in the figure. Then, the guide pin can move in the direction of arrow (2) shown in the figure.
- For selector levers in which movement is not controlled by the guide pin, the selector lever can be moved to any position.

Emergency manual shift-lock release system operation

- The emergency manual shift-lock release system can be released manually even if the shift-lock release conditions are not met.
- The guide pin restriction can be cancelled forcibly by pressing in the shift-lock override button using a flathead screwdriver, and moving the lock slider.
- As a result, the selector lever can be moved to any position.

ON-BOARD DIAGNOSTIC SYSTEM [ELECTRIC POWER STEERING (EPS)]

Outline

- The on-board diagnostic system consists of a malfunction detection system that detects abnormalities in input/output signals when the ignition switch is at the ON position, a data monitor function that reads out specified input/output signals.
- The data link connector 2 (DLC-2), which groups together all the connectors used for malfunction diagnosis into a single location, has been adopted, thereby improving serviceability. Diagnosis is performed by connecting the Mazda Modular Diagnostic System (M-MDS) to the DLC-2.
- In addition to DTC read-out, the Mazda Modular Diagnostic System (M-MDS) is used to clear DTCs using the display screen of the diagnostic tester, and to access the PID/data monitor, providing enhanced malfunction diagnosis and improved serviceability.

Block diagram

Function

Malfunction detection function

- The malfunction detection function detects malfunctions in the input/output signal system of the EPS control module when the ignition switched ON or driving the vehicle.

Malfunction display function

- When the malfunction detection function detects a malfunction, the power steering malfunction indicator light illuminates or flashes to advise the driver. Using the external tester communication function, DTCs can be output to the DLC-2 via the CAN line. At the same time, malfunction detection results are sent to the memory and fail-safe functions.
- The power steering malfunction indicator light may not illuminate depending on the detected malfunction.

Memory function

- The memory function stores DTCs of malfunctions in input/output signal systems. With this function, once a DTC is stored it is not cleared after the ignition switch has been switched OFF, even if the malfunctioning signal system has returned to normal.
- Since the EPS control module has a built-in non-volatile memory, DTCs are not cleared even if the battery is removed. Therefore, it is necessary to clear the memory after performing repairs. Refer to the Workshop Manual for the DTC clearing procedure.

*1

C: CMDTC self test, D: ODDTC self test

*2

If the EPS CM detects an internal circuit malfunction in the resolver sensor, it flashes the power steering malfunction indicator light. At this time, if EPS system internal temperature increases, the assist force gradually weakens. Then if assist force decreases above the specified value, the power steering malfunction indicator light switches from flashing to illumination.

*3

If the EPS CM detects the signal that a engine speed is below the specified value, it illuminates the power steering malfunction indicator light.

Status byte for DTC

- The status byte is the two-digit code (two digits after hyphen (-)) after the DTC.

- The status byte is a code which indicates the pending code, current/past malfunction status, or warning illumination status.
- The status byte can be read by performing a CMDTC self test using the Mazda Modular Diagnostic System (M-MDS).
- For details on the status byte, refer to the explanation on the M-MDS when reading the DTC.

DTC 7-digit code definition

- When related systems or components have failed, the CM stores the DTC of the malfunctioning part in the CM memory, and allows for the retrieval of the store data using scanning tool when necessary. The DTCs are indicated using seven digits. Each digit indicates the following.

C 2 0 0 B : 0 2

Specify the area failure sub type

00: No sub type information	61: Signal calculation malfunction
01: General electrical malfunction	62: Signal compare malfunction
16: Circuit voltage below threshold	64: Signal plausibility malfunction
17: Circuit voltage above threshold	88: Bus off
1C: Circuit voltage out of range	96: Component internal malfunction
28: Signal bias level out of range /zero adjustment malfunction	
54: Missing calibration	

Manufacturer controlled

Indicates subgroup

Network Electrical (U code)	**Chassis (C code)**
0: Network Electrical	Manufacturer controlled
1: Network communication	
3: Network data	
4: Network data	
5: Network data	

Indicates who was responsible for DTC definition

0: ISO/SAE controlled
2: There are ISO/SAE controlled just for powertrain, all others are manufacturer controlled.
3: For P3000 to P3399 is manufacturer controlled, all others are ISO/SAE controlled.

Indicates DTC function

C: Chassis
U: Network Electrical

Fail-safe function

- When the malfunction detection function determines a malfunction, the power steering malfunction indicator light illuminates to advise the driver. At this time, the fail-safe function disables system control or gradually reduces the assist power.

Fail-safe Function Table

DTC M-MDS	Fail-safe control status
C200B:02	Control disabled
C200B:16	Control disabled
C200B:1C	Control disabled

C200B:62	Control disabled
C200B:64	Control is maintained in the backup control
C200B:85	Control disabled
C200C:1C	Control disabled
C200D:1C	Control is maintained in the backup control and EPS warning alarm is sounded ▪ If EPS system internal temperature increases above the specified value, the EPS CM disables assistance and stops the EPS warning alarm
C200D:64	Control disabled
U0001:88	Control enabled
U0100:00	Control is maintained by gradually changing the controlled vehicle speed and setting it to **100 km/h {62.1 mph}**
U0121:00	Control enabled
U0155:00	Control enabled
U0214:00	Control enabled
U0338:00	Control enabled
U0401:00	• Vehicle speed signal malfunction ▪ Control is maintained by gradually changing the controlled vehicle speed and setting it to **100 km/h {62.1 mph}** • Engine speed signal malfunction ▪ Control enabled
U0415:00	Control enabled
U0423:00	Control enabled ▪ If the EPS CM detects the signal that a engine speed is below the specified value, it disables assistance
U0515:00	Control enabled
U2011:19	Control disabled
U2011:1C	Control disabled
U2011:62	Control disabled
U2011:72	• An open circuit malfunction is detected in one phase of the three-phase stator in the EPS motor ▪ Control is maintained in the backup control • Other malfunction detected in EPS motor internal circuit ▪ Control disabled

U2011:92	Control disabled
U2300:54	Control enabled
U2300:55	Control enabled
U2300:56	Control enabled
U3000:16	Control disabled
U3000:1C	Control disabled
U3000:28	Control disabled
U3000:41	Control disabled
U3000:46	Control is maintained in fail mode
U3000:47	Control disabled
U3000:49	Control disabled
U3000:4B	Control is maintained in fail mode
U3000:61	Control disabled
U3000:73	Control disabled
U3000:96	Control disabled
U3003:16	Control is maintained by gradually decreasing the motor control current However, control is inhibited if the power supply voltage is the specified value of less.
U3003:17	Control disabled

Snapshot data

- The snapshot data stores the currently detected DTC data.

PID/Data Monitor Function

- The PID/data monitor function is used for optionally selecting input/output signal monitor items preset in the EPS control module (CM) and reading them out in real-time.

Monitor item (Mazda Modular Diagnostic System (M-MDS) display)	Data contents	Unit/operation
CEN_TRQ_S	• Torque sensor neutral position: Near 0 Nm	Nm
ECU_IN_TMP	• Displays temperature of board in EPS control module: -40°C—+215°C {-40°F—419°F}	°C, °F
ENG_RPM	• Engine stopped: 0 RPM • Engine rotating at **3,000 RPM**: 3,000 RPM	RPM
MT_CURRENT	• When not steered: Near 0 A • Steered: Changes to positive or negative	A
OH_CR_C	• Is the overheating prevention control (Complete) operating?	Yes/No
OH_CR_M	• Is the overheating prevention control (Middle) operating?	Yes/No

OH_HIST_C	• Has the overheating prevention control (Complete) operated before?	Yes/No
OH_HIST_M	• Has the overheating prevention control (Middle) operated before?	Yes/No
OH_IG_CNT_C	• History of overheating prevention control (Complete) • Number of times vehicle is driven (ignition switched ON (engine off or on)) after overheating prevention control operates	—
OH_IG_CNT_M	• History of overheating prevention control (Middle) • Number of times vehicle is driven (ignition switched ON (engine off or on)) after overheating prevention control operates	—
STR_AB_EST	• Steering wheel in neutral position (not turned): 0° • Steered left: Changes to 0°—Positive • Steered right: Changes to 0°—Negative **NOTE:** • The signal displayed in this item is a estimated absolute steering angle signal output.	°
STR_ANG	• Steering wheel position when ignition is switched ON (engine off or on): 0° • Steered left: Changes to 0°—Positive • Steered right: Changes to 0°—Negative **NOTE:** • The signal displayed in this item is a steering angle (relative angle) signal output.	°
STR_ROT_SPD	• Not steered: Near 0 °/s • Steered: Changes according to steering speed	°/s
STR_TRQ_S_M	• Not steered: Near 0 Nm • Steered left: Changes to 0 Nm—Positive • Steered right: Changes to 0 Nm—Negative	Nm
STR_TRQ_S_S	• Not steered: Near 0 Nm • Steered left: Changes to 0 Nm—Positive • Steered right: Changes to 0 Nm—Negative	Nm
VPWR	• Engine stopped: Approx. **12 V** • Idling: Approx. **14 V**	V
VSPD	• Vehicle stopped: 0 KPH, 0 MPH • Vehicle speed **20 km/h {12 mph}**: 20 KPH, 12 MPH	KPH, MPH

External Tester Communication Function

Outline

- The external tester communication function enables communication of diagnostic data (DTC read-outs, input/output signal read-outs) between the EPS control module (CM) and an external tester.

Connections/Communication Contents

	External tester	
	Mazda modular diagnostic system (M-MDS)	
	Connection	Communication method
On-board diagnostic (malfunction detection) function	Input/output: CAN_H (HS), CAN_L (HS)	Serial communication
PID/DATA monitor function	Input/output: CAN_H (HS), CAN_L (HS)	Serial communication

Serial communication

- Serial communication (two-way communication) allows for multiple data to be sent and received instantly along the same line.
- By connecting the Mazda modular diagnostic system (M-MDS) to the DLC-2, diagnostic data can be sent and received between the Mazda modular diagnostic system (M-MDS) and the EPS CM via CAN lines.
- The EPS CM receives the command signals of the malfunction detection function and PID/data monitor function from the Mazda modular diagnostic system (M-MDS), and sends DTCs and data regarding the operating status of each input/output part to the Mazda modular diagnostic system (M-MDS).

Diagnostic function name	Signal received	Signal sent
Malfunction detection function	DTC verification signal	Diagnostic trouble code
PID/DATA monitor function	Command signal to read selected monitor item	Monitored data for requested monitor item

2014 - Mazda3 - Steering

DLC-2 [ELECTRIC POWER STEERING (EPS)]

Outline

- A connector (DLC-2) conforming to International Organization for Standardization (ISO) standards has been added.

Construction

- Shape and terminal arrangement as stipulated by the ISO 15031-3 (SAE J1962) international standard has been adopted for this connector. The connector has a 16-pin construction that includes the CAN_H (HS), CAN_L (HS), CAN_H (MS), CAN_L (MS), GND1, GND2 and B+ terminals.

DLC-2

Terminal	Function
A	Battery power supply terminal
B	—

2014 - Mazda3 - Steering

ELECTRIC POWER STEERING SYSTEM

Outline

- A column assist type EPS has been adopted for all models.
- EPS provides smooth handling from low to high speeds as a result of the excellent steering feel provided by the electronic control and the vehicle-speed responsive control.
- EPS does not require a power steering oil pump and generates assist force only when the steering wheel is steered. As a result, engine load is lowered and fuel efficiency is improved.
- A high output efficiency motor has been adopted, improving responsiveness to steering operation.
- The EPS CM has been integrated with the EPS motor, resulting in a size and weight reduction.
- Serviceability improved by the automatic configuration function and the steering wheel angle neutral position auto-learning function.

Structural View

System Wiring Diagram

Purpose / Function

- The EPS assists the manual steering mechanism operation using the EPS motor to provide supplemental manual power during steering operation, reducing the load on the driver.

Construction

- The EPS consists of the following parts:
  - Manual steering mechanism
    - Consists of the steering wheel, steering column and shaft, steering gear and linkage.
  - Electric assist mechanism
    - Consists of the EPS CM (control module) built in the steering column, torque sensor, reduction gear, and EPS motor integrated in the EPS CM.
  - Control system
    - Controls based on the EPS CM, torque sensor, reduction gear, EPS motor, and vehicle speed and engine speed signals input from the PCM.

Operation

1. Steering force generated by the driver's steering wheel operation is detected by the torque sensor which is built in the steering column and shaft, and is output to the EPS CM as a steering torque signal.

2. The EPS CM calculates optimum assist force based on the steering torque signal from the torque sensor and the vehicle speed and engine speed signals from the PCM, and outputs electric current to drive the EPS motor.

3. The EPS motor is driven by the current from the EPS CM and the force is transmitted to the intermediate shaft via the reduction gears, thus assisting steering operation of the driver.

2014 - Mazda3 - Steering

STEERING COLUMN AND SHAFT

Purpose / Function

- The steering input force, generated when the driver operates the steering wheel, is transmitted to the steering gear.

Construction

- The steering column and shaft consists of the steering column with a built-in EPS mechanism and the intermediate shaft.
- As a result of impact absorbing mechanisms on the steering column and intermediate shaft, when a collision occurs, the steering shaft effectively absorbs the impact energy that would be transmitted to the driver, thereby reducing injury.
- Due to the adoption of a tilt/telescope mechanism for the steering shaft on all vehicles, operability has been improved.

Operation

EPS mechanism

- Based on the steering torque signal from the torque sensor and the vehicle speed and engine speed signals from the PCM, the EPS CM drives the EPS motor and transmits the assist torque to the intermediate shaft via the deceleration mechanism.

Energy absorbing system

- At the moment of a collision, when impact energy (first stage impact) is input from the vehicle front due to the rearward collapse of the steering gear, the intermediate shaft contracts to absorb the impact from

the vehicle front. (Section X in the figure)

- When the body of the driver contacts the steering wheel (second stage impact), the fixing bracket comes off the dashboard member, and the upper shaft and the outer column slide forward. At this time, the impact absorption plate (one part secured to instrument panel member, another part to fixing bracket) deforms (area A shown in figure cracks) to absorb the impact to the driver. (Section Y in the figure)

Tilt/telescope mechanism

- The steering wheel can be moved in the up/down and forward/backward direction when the adjusting lever is pressed towards the front of the vehicle to release the lock of the tilt/telescope system.
- The tilt/telescope mechanism has a movement range of **45 mm {1.8 in}** (tilt)/ **50 mm {2.0 in}** (telescope) and can be adjusted, without steps, to anywhere in this range.

Fail-safe

- Function not equipped.

2014 - Mazda3 - Steering

STEERING GEAR AND LINKAGE

Purpose / Function

- The rotational movement input from the intermediate shaft is converted to a linear movement in the horizontal direction of the steering rack by the rack and pinion mechanism, and then transmitted to the tires and wheels.

Construction

- A size and weight-reduced rack and pinion system steering gear has been adopted.
- Response and handling stability have been improved by the heightened support rigidity due to the integration of the steering gear mounts (three locations) and gear housing.
- By using a higher steering gear ratio (14.1), the steerability has been improved.
- By using O-rings on the support yoke and rack bushing, quietness has been improved.

Operation

- The rotational movement input from the steering shaft is converted to a linear movement in the horizontal direction of the steering rack by engaging the pinion shaft connected to the steering shaft and teeth of the steering rack. This linear movement is transmitted via the inner and outer ball joints to the steering knuckle to steer the tires left or right.

Fail-safe

- Function not equipped.

2014 - Mazda3 - Steering

ELECTRIC POWER STEERING (EPS) CONTROL MODULE

Purpose / Function

- The EPS control module (CM) calculates the optimum assist current based on the steering torque signal from the torque sensor installed to the steering column and the vehicle speed signal sent via CAN transmission from the PCM.
- The following steering angle signals are output via CAN communication.
  - Steering angle (relative angle) signal
    - Set the steering position to 0 degrees when the ignition is switched ON (engine off or on) to output the steering angle when steering from that position.
  - Steering angle (estimated absolute angle) signal
    - The EPS CM outputs the calculated steering angle value to the CAN as a steering angle (estimated absolute angle) signal for other systems requiring steering angle information.
    - The EPS CM performs the steering wheel angle neutral position determination using the steering wheel angle neutral position automatic learning function based on the wheel speed signal, lateral-G signal, and yaw rate signal while driving.
    - Set the angle to 0 degrees during the steering wheel angle neutral position determination and the EPS CM calculates the steering angle, and outputs it.

      NOTE:

      - The steering angle sensor signal is not used for the steering angle (estimated absolute angle) signal calculation.
      - Before the steering wheel angle neutral position auto learning is completed, the EPS CM receives a steering angle (absolute angle) signal from the steering angle sensor via the start stop unit and outputs the signal to the other modules through the CAN communication (with adaptive front lighting system (AFS), and/or Smart City Brake Support (SCBS)).
      - After the steering angle neutral position auto learning is completed, the EPS CM outputs an EPS status signal, which is calculated by EPS CM itself, through the CAN communication.
      - The steering wheel angle neutral position is cleared when **1 min or more** has elapsed after the ignition is switched off.
- The EPS CM controls the following functions:

Function Table

Control item	Function

EPS motor current control	• Normal control
	  ▪ Calculates the proper assist current based on the steering torque, and the vehicle and engine speeds, and outputs a target current to the EPS motor.
	• System overheating protection control
	  ▪ Monitors the temperature of the motherboard in the EPS CM and controls the motor current gradually to prevent overheating of the system.
	• EPS motor backup control
	  ▪ Even if a phase 1 open circuit malfunction in the EPS motor occurs, output current to the EPS motor is controlled so that steering assist is maintained.
	• Torque sensor backup control
	  ▪ Even if an error occurs in the torque sensor signal, the torque sensor backup

	control performs control to maintain steering assist to the extent possible. • Resolver sensor backup control ▪ Even if an open circuit malfunction occurs in the resolver sensor, the resolver sensor backup control performs control to maintain steering assist to the extent possible. ▪ Monitors the temperature of the motherboard in the EPS CM and controls the motor current in steps to prevent overheating of the system.
On-board diagnostic function	• The main part of the system control includes the self-diagnosis function. In case a malfunction occurs, the power steering malfunction indicator light/master warning light illuminates to alert the driver, and a DTC is stored in the EPS CM at the same time. • As a result of the on-board diagnosis, when a malfunction is determined, system control is suspended or limited to assure safety while driving.
CAN communication function	• Outputs the EPS status signal and the power steering malfunction indicator light illuminates on request via CAN lines. • Outputs the steering angle (absolute angle) signal, steering angle (relative angle) signal and steering angle (estimated absolute angle) signal
Automatic configuration function	• When the ignition is switched to ON or the engine is started after the EPS CM have been replaced, the EPS CM reads data from the instrument cluster via CAN communication to perform automatic configuration.
Steering wheel angle neutral position automatic learning function	• When the ignition is switched from OFF to ON (engine on) and the vehicle is driven normally, the steering wheel angle neutral position is learned automatically based on the wheel speed signal, lateral-G signal, and yaw rate signal.

Block Diagram

Construction

- The EPS CM is installed to the steering column and integrated with the EPS motor.
- For vehicles equipped with a system requiring steering angle information directly after the vehicle starts to be driven, a steering angle sensor is equipped.

Operation

- The EPS CM calculates the required assist torque based on the steering torque signal from the torque sensor. When the vehicle starts to be driven, the required assist torque is calculated based on the vehicle speed signal sent from the PCM via CAN in addition to the steering torque signal.
- When the required assist torque is determined, the EPS CM outputs the control current to the EPS motor and the EPS motor generates the assist torque.
- The EPS system control uses the steering angle (estimated absolute angle) signal.

Ignition is switched ON (engine off or on)

- For vehicle equipped with a system requiring steering angle information directly after the vehicle starts to be driven, a steering angle sensor is equipped.
- For vehicles with a steering angle sensor, the EPS CM receives the steering angle sensor signal via the start stop unit. The EPS CM outputs the steering angle value as a steering angle (absolute angle) signal.

- The following systems perform control using a steering angle (absolute angle) signal until the EPS CM completes steering wheel angle neutral position determination after the vehicle starts to be driven.
    - AFS (Adaptive Front lighting System)
    - Smart City Brake Support (SCBS)

    NOTE:

    - Because the accuracy of the steering angle (absolute angle) signal is lower than the steering angle (estimated absolute angle) signal, if the EPS CM completes steering wheel angle neutral position determination, each system requiring steering angle information performs control using a steering angle (estimated absolute angle) signal instead of a steering angle (absolute angle) signal.
- The EPS CM regards the steering position when the ignition is switched ON (engine off or on) as 0 degrees, and outputs the steering angle value steered from that position as a steering angle (relative angle) signal.

Vehicle driving

- When the vehicle starts to be driven, the EPS CM performs steering wheel angle neutral position determination based on the following signals:
    - Wheel speed signal: Determines straight-driving if there is no rotation speed difference between the left/right wheels.
    - Lateral-G signal: Determines straight-driving if lateral-G is not produced.
    - Yaw rate signal: Determines straight-driving if yaw momentum is not produced.
- If the EPS CM completes steering wheel angle neutral position determination, the steering angle neutral position is set. The EPS CM regards the steering wheel angle neutral position as 0 degrees, calculates the estimated absolute steering angle, and outputs the steering angle (estimated absolute angle) signal to CAN.

Ignition is switched off

- The steering wheel angle neutral position is cleared when **1 min or more** has elapsed after the ignition is switched off.

EPS Motor Current Control

Normal control

- The optimum assist current is calculated based on the steering force signal from the torque sensor and the vehicle and the engine speed signal from the PCM, and then the control current is output to the EPS motor.

System overheating protection control

- The system overheating protection control lowers the current output to the EPS motor if the steering mechanism is turned from lock to lock continuously or the steering rack turning limit is reached repeatedly.

  NOTE:

  - During system overheating protection control, the assist force will feel weaker due to a decrease in the control current. This is normal for the EPS CM to prevent the EPS motor from burning or seizure, and it does not indicate a malfunction.
  - While the assist force weakens during this period of time, steering operation can be performed.
- The system overheating protection control has middle and complete steps, and it can verify current conditions and the history using the PID/data monitor function and snap shot data.
    - System overheating protection control (middle): Motor output is 40 % or less (reference)
    - System overheating protection control (complete): Motor output is 20 % or less (reference)
- The current output returns to normal if the temperature in the system decreases to the normal operation temperature.

EPS motor backup control

- Even if an open circuit malfunction occurs in 1 out of the 3 phases in the EPS motor line, the EPS motor backup control performs control to maintain steering assist.
- If the EPS CM detects a phase 1 open circuit malfunction in the EPS motor, the EPS CM controls output current to the EPS motor using a calculation method different than during normal EPS CM control. As a result, even with a phase 1 open circuit malfunction, the steering assist can be maintained.

NOTE:

  - If a phase 1 open circuit malfunction is detected in the EPS motor, the EPS CM stores DTC U2011:72 and illuminates the electric power steering malfunction indicator light.
  - If the steering wheel is operated during EPS motor backup control, the steering wheel operation may feel heavier (resistance).

Torque sensor backup control

- Even if an error is detected in the torque sensor signal, the torque sensor backup control performs control to maintain steering assist.
- If the EPS CM detects a torque sensor signal error, the EPS CM controls output current to the EPS motor using a calculation method different from that during normal EPS CM control, and maintains steering assist.
- A steering wheel vibrates when steering wheel is operated during torque sensor backup control.

NOTE:

- When the torque sensor backup control is performed, the EPS CM stores DTC C200B:64 and turns the power steering malfunction indicator light on.
- If the steering wheel is operated during torque sensor backup control, normal assist force may not be generated.

Resolver sensor backup control

- Even if an open circuit malfunction occurs in the resolver sensor, the resolver sensor backup control performs control to maintain steering assist.
- If the EPS CM detects an open circuit malfunction in the resolver sensor, the EPS CM controls output current to the EPS motor using a calculation method different from that during normal EPS CM control. As a result, even with an open circuit in the resolver sensor, the steering assist can be maintained.
- A steering wheel vibrates when steering wheel is operated during resolver sensor backup control.
- The EPS CM flashes the power steering malfunction indicator light and the EPS warning alarm sounds intermittently to alert the driver.

NOTE:

  - If an open circuit malfunction is detected in the resolver sensor, the EPS CM stores DTC C200D:1C.

- The EPS CM cannot calculate the optimum output current to the EPS motor during the resolver sensor backup control. Therefore, the temperature in the EPS system may increase only by operating the normal steering wheel repeatedly.
- If the temperature in the EPS system increases, the EPS CM controls the output current to the EPS motor and lowers output to the EPS motor to prevent the EPS motor from burning or seizure. Although the assist force weakens when output to the EPS motor is lowered, steering operation can be performed.

- If output to the EPS motor decreases below the specified value, the flashing interval for the power steering malfunction indicator light and the EPS warning alarm sound interval are shortened to warn the driver.
- If output to the EPS motor decreases further, the power steering malfunction indicator light switches from flashing to illumination and the EPS warning alarm sounds continuously.
- If EPS system overheating continues, the EPS CM stops the output current to the EPS motor and cancels assistance. At this time, the power steering malfunction indicator light remains illuminated, however, the warning beep sound stops.

2014 - Mazda3 - Steering

ELECTRIC POWER STEERING (EPS) MOTOR

Purpose, Function

- The EPS motor is driven by the control current from the EPS CM (control module) and generates assist torque to manual steering mechanism.

Construction

- The EPS motor is installed to the steering column with an integrated EPS CM.
- The EPS motor is a brushless motor which consists of a three-phase star-connected stator, a permanent magnet rotor, and resolver sensor.

Operation

- Current flows from the EPS CM to the stator to rotate the motor axis which is integrated with the rotor.
- A resolver sensor for detecting rotation angle is built into the EPS motor and outputs a motor rotation angle signal to the EPS CM.
- The EPS CM switches the current flowing to each stator based on the rotation angle signal from the resolver sensor.

Fail-safe

U2011:92	• Control disabled • Power steering malfunction indicator light: Illuminated

2014 - Mazda3 - Steering

TORQUE SENSOR

Purpose / Function

- The torque sensor detects the steering torque and the steering direction, and outputs the signal to the Electric Power Steering (EPS) control module (CM).

Construction, Operation

- The Hall IC-type torque sensor is installed to the top of the steering column and consists of the following parts.
    - Magnet: Assembled in a ring shape to the input shaft, it generates magnetic flux.
    - Magnetic yoke: Assembled to the lower shaft, it converts magnetic flux transmitted to the flux concentration ring according to the position of the tooth area and the magnet.
    - Flux concentration ring: Equipped with 2 Hall ICs at the front edge, it reads the change in magnetic flux.

- When the steering wheel is centered (not steered), magnetic flux is not transmitted to the Hall ICs because the tooth area of the magnetic yoke shunts the magnetic flux of the magnet.
- Magnetic flux is transmitted to the Hall ICs when the steering wheel is operated because the positions of the magnet and the tooth area of the magnetic yoke change as the torsion bar connected to the input shaft and lower shaft twists.

- The Hall ICs convert the change in magnetic flux to an electric signal and output it to the EPS CM.
- Electrical signals from each of the two Hall ICs in the torque sensor are calculated in the EPS CM and used for each type of control as steering torque signals.
- By the detection of two signals, the reliability of the steering torque calculated by the EPS CM and the malfunction detection performance of the torque sensor have been improved.

2014 - Mazda3 - Steering

REDUCTION GEAR

Purpose / Function

- The reduction gear transmits the rotation input from the EPS motor, decreasing the rotation speed and increasing the torque simultaneously.

Construction

- The reduction gear consists of the worm wheel located on the steering column main shaft and the worm shaft connected to the EPS motor, and is integrated with the steering column.

Operation

- The assist torque generated by the EPS motor is transmitted to the worm wheel via the worm shaft drives the steering column main shaft.
- The assist torque from the EPS motor is amplified by the reduction ratio (20.33:1) between the worm shaft and worm wheel, and is transmitted to the steering column main shaft.

2014 - Mazda3 - Steering

CONTROLLER AREA NETWORK (CAN) OUTLINE

- The Electric Power Steering (EPS) control module sends and receives data to and from other modules via the CAN. (See **MULTIPLEX COMMUNICATION SYSTEM**.)

Data sent

- EPS status
- Power steering malfunction indicator light on request
- Steering angle
- Steering torque
- Motor current
- Power consumption

Data received

- Vehicle speed
- Engine speed
- Lateral-G
- Yaw rate
- Wheel-speed
- Steering angle
- Central configuration data

2014 - Mazda3 - Steering

POWER STEERING WARNING BUZZER

Purpose

- The power steering warning buzzer warns the driver that EPS system is overheating and the EPS assist force is weakening during the resolver sensor backup control. (See **ELECTRIC POWER STEERING (EPS) CONTROL MODULE**.)

Function

- If the EPS CM detects an internal circuit malfunction in the resolver sensor, it sends the power steering warning buzzer request signal to the instrument cluster via CAN.
- The instrument cluster sounds the power steering warning buzzer intermittently when it receives the power steering warning buzzer request signal (pattern A).
- If the EPS assist force weakens below the specified value, the power steering warning buzzer sound interval is shortened to warn the driver (pattern B).

- If the EPS assist force weakens further, the power steering warning buzzer sounds continuously.
- If EPS system stops assistance for steering, the power steering warning buzzer stops.

Construction

- The power steering warning buzzer sounds using the buzzer built into the instrument cluster.

Operation

1. The instrument cluster received (1) the power steering warning buzzer request signal from the EPS CM.

2. The instrument cluster microcomputer turns the transistor on (2) based on power steering warning buzzer request signal.

3. When the transistor turns on, a ground circuit with the alarm is established and the alarm sounds (3).

Fail-safe

- Function not equipped.

POWER STEERING MALFUNCTION INDICATOR LIGHT

Purpose

- The power steering malfunction indicator light warns the driver that there is a malfunction with the electric power steering (EPS) system.

Function

- If there is a malfunction in the EPS system, the power steering malfunction indicator light illuminates.
- If the EPS system and CAN lines are normal, it illuminates when the ignition is switched ON (engine off), and turns off after the engine is started.
- If there is an internal circuit malfunction in the resolver sensor, the power steering malfunction indicator light flashes to warn the driver that EPS assist force is weakening. (See **ELECTRIC POWER STEERING (EPS) CONTROL MODULE**.)

Construction

- The power steering malfunction indicator light is built into the instrument cluster.

Operation

EPS system malfunction detection

- If the EPS control module (CM) detects a system malfunction, it sends a power steering malfunction indicator light illumination on request signal to the instrument cluster via CAN.
- The instrument cluster illuminates the power steering malfunction indicator light when it receives a power steering malfunction indicator light illumination on request signal.

NOTE:

- A warning message in the center display is displayed with the power steering malfunction indicator light turned on or flashed. For the message content and verification method, refer to the CENTER DISPLAY.

Resolver sensor backup control

- If the EPS CM detects an internal circuit malfunction in the resolver sensor, it sends the power steering malfunction indicator light flashing on request signal to the instrument cluster via CAN.
- To warn the driver that the EPS assist force is weakening, the instrument cluster flashes the power steering malfunction indicator light when it receives the power steering malfunction indicator light flashing on request signal.
    - If the temperature in the EPS system increases above the specified value, the flashing interval for the power steering malfunction indicator light is shortened to warm the driver.

- If the temperature in the EPS system increases further, the power steering malfunction indicator light switches from flashing to illumination.

Initial check

- If the EPS system and CAN lines are normal, it illuminates when the ignition is switched ON (engine off), and turns off after the engine is started. If there is a system malfunction, the power steering malfunction indicator light illuminates.

Fail-safe

- Function not equipped.

ON-BOARD DIAGNOSTIC

Outline

- The on-board diagnostic system has on-board diagnostic, PID/data monitor, and A/C operation check functions.
- The on-board diagnostic function has the following functions:
  - Malfunction detection function
    - Detects errors in input and output signals
  - Memory function
    - Stores detected malfunctions
  - Malfunction indication function
    - Displays detected malfunctions
- The malfunction indication function, PID/data monitor, and A/C operation check functions can be performed by connecting the Mazda Modular Diagnostic System (M-MDS) to the DLC-2.

Block Diagram

Function

Malfunction detection function

- The malfunction detection function detects errors in the input and output signals. (Ignition is switched ON (engine off or on))
- If a malfunction is detected, a DTC is output to the DLC-2 through the malfunction indication function.
- At the same time, malfunction detection results are sent to the fail-safe and memory functions.

Memory function

- The memory function stores malfunctioning signal systems which are detected to be malfunctioning by the malfunction detection function.
- The stored malfunction information is not cleared even when the ignition is switched off (LOCK) or the malfunction is repaired.
- The stored malfunction information can be cleared by connecting the Mazda Modular Diagnostic System (M-MDS) to the DLC-2 and operating it.

Malfunction indication function

- The malfunction indication function outputs present or past malfunctions to the DLC-2 as DTCs.
- The DTCs can be read by connecting the Mazda Modular Diagnostic System (M-MDS) to the DLC-2 and operating it.

Malfunction display mode

- The climate control unit detects present and past malfunctions in the control system circuits (open/short circuits) and indicates the DTCs shown in the table on the Mazda Modular Diagnostic System (M-MDS).
- Clear past malfunctions after completing repairs because once a past malfunction is stored, it will remain stored even after the malfunction has been repaired.
- The stored past malfunction can be cleared by connecting the Mazda Modular Diagnostic System (M-MDS) to the DLC-2 and operating it.

DTC 7-digit code definition

- When related systems or components have failed, the CM stores the DTC of the malfunctioning part in the CM memory, and

allows for the retrieval of the stored data using the scanning tool when necessary. The DTCs are indicated using seven digits. Each digit indicates the following.

Status byte for DTC

- The two digits (after hyphen) after the 7-digit DTC.

- A code which indicates the pending code, current/past malfunction status, or warning illumination status.
- Can be read by performing a CMDTC self-test using the Mazda Modular Diagnostic System (M-MDS).
- For details on the status byte, refer to the explanation on the Mazda Modular Diagnostic System (M-MDS) when reading the DTC.

PID/data monitor

- The PID/data monitor function is used for optionally selecting input signal monitor items preset in the climate control unit and reading them out in real-time.

A/C Operation Check Mode (With Dual Type Climate Control Unit)

- The A/C operation check mode forcibly operates the output devices as shown in the operation check table regardless of the signals input to the climate control unit.
- During an A/C operation check mode operation, indication in the display panel and the illumination of the indicator light on the switches are automatically controlled.
- Determine the malfunctioning part by visual inspection, listening to the operation sound, placing a hand on the air vents, or checking that each transition is as indicated in the operation check table.

A/C Operation Check Mode (With Single Type Climate Control Unit)

- The A/C operation check mode forcibly operates the output devices as shown in the operation check table regardless of the signals input to the climate control unit.
- During an A/C operation check mode operation, indication in the display panel and the illumination of the indicator light on the switches are automatically controlled.
- Determine the malfunctioning part by visual inspection, listening to the operation sound, placing a hand on the air vents, or checking that each transition is as indicated in the operation check table.

2014 - Mazda3 - HVAC

VENTILATION SYSTEM

Outline

- The ventilation system adjusts the airflow temperature sent from the blower unit or the air vent mode.

Function

- The ventilation system adjusts the airflow temperature based on the position of the air mix door.
- The ventilation system adjusts the airflow mode based on the position of the airflow mode door.

Structural View

- The ventilation system consists of the following parts.

Operation

Air mix door

Full-auto air conditioner

- The air mix actuator operates according to the temperature control dial operation or the automatic control of the climate control unit.
- The air mix door moves in the COLD or HOT direction according to the operation of the air mix actuator.
- The airflow volume blowing from the evaporator to the heater core changes by the movement of the air mix door, and the temperature of the air which passes is adjusted.

Dual mode (with dual type climate control unit)

- When the DUAL mode is ON, the driver and passenger-side air mix actuators operate independently according to the temperature control dial operation or the automatic control of the climate control unit.
- The driver and passenger-side air mix doors move independently according to the air mix actuator operation.

- For the DUAL mode, refer to the CLIMATE CONTROL UNIT. (See **CLIMATE CONTROL UNIT [FULL-AUTO AIR CONDITIONER]**.)

Manual air conditioner

- The air mix wire operates by operating the temperature control dial of the climate control unit.
- The air mix door moves in the COLD or HOT direction according to the operation of the air mix wire.
- The airflow volume blowing from the evaporator to the heater core changes by the movement of the air mix door, and the temperature of the air which passes is adjusted.

Airflow mode door

Full-auto air conditioner

- The airflow mode actuator operates according to the mode switch operation and the automatic control of the climate control unit.
- The airflow mode main link operates according to the airflow mode actuator operation.
- The airflow mode door moves in the VENT, BI-LEVEL, HEAT, DEF/HEAT, or DEFROSTER direction according to the airflow mode main link. The air vent changes by the movement of the airflow mode door.

Manual air conditioner

- The mode wire operates by operating the mode dial of the climate control unit.
- The airflow mode main link operates according to the mode wire operation.
- The airflow mode door moves in the VENT, BI-LEVEL, HEAT, DEF/HEAT, or DEFROSTER direction according to the airflow mode main link. The air vent changes by the movement of the airflow mode door.

- The airflow distributed by the mode door passes through the duct and the air is blown from each air vent shown in the figure to the cabin.

2014 - Mazda3 - HVAC

A/C UNIT

Purpose, Function

- The A/C unit opens/closes the air mix door and the mode door.

Construction

- The A/C unit which integrates the cooling and heater units.
- The A/C unit consists of the following parts.

Operation

- For the operation, refer to VENTILATION SYSTEM (See **VENTILATION SYSTEM**.)

Fail-safe

- Function not equipped.

2014 - Mazda3 - HVAC

BLOWER SYSTEM

Outline

- The blower system intakes air outside of the vehicle or the cabin, and sends the air passing through the air filter to the A/C unit.

Function

- Air is blown by the blower motor in the blower system.
- The blower system switches the air intake port to FRESH or REC based on the position of the air intake door.

Structural View

- The blower system consists of the following parts.

Operation

1. When the ignition is switched ON (engine off or on), the front body control module (FBCM) turns the blower relay on.

NOTE:

- The front body control module (FBCM) may stop the air conditioner system forcibly after turning the blower relay off due to the battery discharge suppression function.

2. When the blower motor operation is requested by the airflow volume control switch operation or the automatic control, the climate control unit (full-auto air conditioner) sends a blower speed signal to the blower fan controller.

3. When the blower motor operation is requested by the airflow volume control dial operation, the climate control unit (manual air conditioner) sends a blower speed signal to the blower fan controller.

4. When a blower speed signal is received, the blower fan controller rotates the blower motor.

5. The rotation speed of the blower fan is determined by the transistor in the blower fan controller. If the current value flowing through the blower fan controller is high, the rotation speed increases, if the current value is low, the speed decreases.

6. When the blower motor rotates, air is taken in from the outside of the vehicle or the cabin.

7. The air taken in flows in the fresh air direction or recirculate direction according to the operation of the air intake link. The air intake port changes by the movement of the air intake door.

RECIRCULATE

FRESH

2014 - Mazda3 - HVAC

BLOWER UNIT

Purpose, Function

- The blower unit switches between fresh air and recirculated air (FRESH/REC) and sends airflow into the cabin.

Construction

- The blower motor consists of the following parts:
  - Blower motor
  - Air intake door
  - Air intake actuator
  - Air filter

Operation

- For the operation, refer to BLOWER SYSTEM. (See **BLOWER SYSTEM**.)

Fail-safe

- Function not equipped.

2014 - Mazda3 - HVAC

BLOWER MOTOR

Purpose, Function

- The blower motor rotates the blower fan to create airflow.

Construction

- The blower motor is installed to the blower unit.
- The blower motor consists of the blower fan and motor.
- A sirocco fan has been adopted for the blower fan.

Operation

- For the operation, refer to BLOWER SYSTEM. (See **BLOWER SYSTEM**.)

Fail-safe

- Function not equipped.

2014 - Mazda3 - HVAC

BLOWER FAN CONTROLLER

Purpose

- The blower fan controller controls the blower motor rotation speed.

Function

- The blower fan controller controls the built-in power MOS FET using pulse signals and changes the blower motor operational voltage.
- Temperature increase is suppressed by installing the fin to the upper part of the blower fan controller.
- The blower fan controller is equipped with a fail-safe function for the purpose of protecting the internal circuits.

Construction

- The blower fan controller is installed to the A/C unit.
- The blower fan controller is built into the PWM circuit.

PWM (Pulse Width Modulation) circuit

- The PWM circuit controls the blower motor rotation speed using pulse.

- The PWM circuit decides duty ratio (pulse ON time) based on the signals from the climate control unit and turns the power MOS FET on/off at high speed.
- With the power MOS FET turned on, current flows between the drain and source while current is flowing to the gate.

- The rotation of the blower motor is fast when the power MOS FET ON period is long (duty ratio is high), and it is slow when the period is short (duty ratio is low).

- The PWM circuit lowers the electric power loss to suppress heat generation in the circuit by performing duty control which uses power MOS FET ON/OFF operation.

Operation

1. When the blower fan controller receives a blower speed request signal from the climate control unit, it controls the drive circuit to determine the duty ratio for the blower motor rotation.

2. The power MOS FET is turned on or off based on the duty ratio determined by the drive circuit.

3. When the power MOS FET is turned on, the blower motor circuit is established and the motor rotates.

4. The power MOS FET is turned on or off at high speed repeatedly to control the blower motor rotation. Therefore the motor rotation speed is controlled.

Fail-safe

- The blower fan controller stops output when the following conditions are detected:
  - Motor lock
    - The blower motor locks and over-current flows.
  - Abnormal temperature
    - The power MOS FET increases abnormal temperature due to half-lock (over-current such as motor-lock is not detected) of the blower motor.

2014 - Mazda3 - HVAC

AIR FILTER

Purpose

- The air filter removes pollen and dust in the intake air and purifies air flowing into the cabin.

Function

- The air filter removes pollen and dust using a dust collecting filter.

Construction

- The air filter is installed to the blower unit.
- It is necessary to periodically replace the air filter because it cannot be reused by cleaning.

Fail-safe

- Function not equipped.

2014 - Mazda3 - HVAC

REFRIGERANT SYSTEM

Outline

- The refrigerant system circulates the refrigerant to cool the evaporator.

Function

- The refrigerant system has the following functions:

	Function	Related parts
1	Connects each part of refrigerant system	Refrigerant line
2	Engages or disengages magnetic clutch to control A/C compressor operation	Magnetic clutch
3	• Compresses gaseous refrigerant • Circulates refrigerant	A/C compressor
4	Cools compressed gaseous refrigerant to change it to liquid refrigerant	Condenser
5	Purifies refrigerant and eliminates moisture	Receiver/drier
6	Atomizes highly pressurized liquid refrigerant	Expansion valve
7	Vaporizes atomized refrigerant	Evaporator

Construction

- The refrigerant system consists of the following parts.

Operation

- The refrigerant system circulates the refrigerant in conjunction with the function of each part as follows:

	Operation	Related parts
1	When A/C relay turns on, magnetic clutch engages to operate A/C compressor	Magnetic clutch

2	• A/C compressor operates to compress gaseous refrigerant • Sends compressed gaseous refrigerant to condenser	A/C compressor
3	Gaseous refrigerant is cooled to change it to liquid refrigerant and then sent to receiver/drier	Condenser
4	Liquid refrigerant is purified and moisture is eliminated, and then sent to expansion valve	Receiver/drier
5	Atomizes liquid refrigerant and sends it to evaporator	Expansion valve
6	Atomized refrigerant is vaporized and sent to A/C compressor	Evaporator

2014 - Mazda3 - HVAC

A/C COMPRESSOR

Purpose

- The A/C compressor circulates the refrigerant in the refrigerant cycle.
- The A/C compressor compresses the gaseous refrigerant atomized by the evaporator, and by pressurizing the gaseous refrigerant, liquefaction by the condenser is facilitated.

Function

- The A/C compressor compresses the gaseous refrigerant by driving the piston in the compressor using the drive force from the engine. In addition, it sends the compressed refrigerant to the condenser.

Construction

- The A/C compressor has adopted a swash plate type compressor.
- The A/C compressor consists of the following parts:

  - Shaft
  - Swash plate
  - Cylinder
  - Piston

Operation

- When the drive force from the engine is transmitted to the compressor shaft by the operation of

the magnetic clutch, the A/C compressor rotates the swash plate in the compressor. The rotation of the swash plate generates compression in the cylinder by the reciprocating movement of the piston.

1. When the piston moves downward, the suction valve opens and the refrigerant is discharged to the cylinder.

2. When the piston reaches the BDC, refrigerant charging is completed and the suction valve is closed.

3. When the piston moves upward, the refrigerant in the cylinder is compressed.

4. The compressed refrigerant presses open the discharge valve, and the high-temperature, highly pressurized refrigerant from the cylinder is discharged.

Fail-safe

- Function not equipped.

2014 - Mazda3 - HVAC

MAGNET CLUTCH

Purpose

- The magnetic clutch transmits the rotation force from the engine to the shaft in the A/C compressor.

Function

- The magnetic clutch engages or disengages the magnetic clutch and the A/C turns on or off by switching the power transmission from the engine.

Construction

- The magnetic clutch is installed to the A/C compressor.
- The magnetic clutch consists of the following parts:

  - Pressure plate
  - A/C compressor pulley
  - Stator
  - Snap ring
  - Shim

Operation

Magnetic clutch disengagement

1. If there is no energization in the magnetic clutch stator from the A/C relay, the pressure plate cannot be engaged with the A/C compressor pulley because the magnetic clutch stator does not operate.

MAGNETIC CLUTCH DISENGAGEMENT

2. The rotation force from the drive belt is only transmitted to the A/C compressor pulley and the pulley spins.

Magnetic clutch engagement

1. If there is energization in the magnetic clutch stator from the A/C relay, the magnetic clutch stator operates and the pressure plate is engaged with the A/C compressor pulley.

MAGNETIC CLUTCH ENGAGEMENT

2. The rotation force from the drive belt is transmitted to the compressor shaft through the pressure plate from the A/C compressor

pulley.

Fail-safe

- Function not equipped.

2014 - Mazda3 - HVAC

EXPANSION VALVE

Purpose

- The expansion valve atomizes liquid refrigerant to facilitate cooling of the evaporator.

Function

- The expansion valve reduces the pressure of liquid refrigerant rapidly to facilitate vaporization of the atomized refrigerant at the evaporator, and adjusts the refrigerant amount sent into the evaporator.

Construction

- The expansion valve consists of the following parts:
    - Diaphragm
    - Temperature sensor
    - Shaft
    - Expansion valve body
    - Ball valve
    - Spring

Operation

- Adjustment of the refrigerant amount supplied to the evaporator is performed by the ball valve opening angle in the expansion valve.
- The opening angle adjustment is performed according to the balance of the following forces:

- Refrigerant pressure (Pd) in diaphragm
- Refrigerant gas pressure (PI) of evaporator under diaphragm
- Spring force (Fs) pushing up ball valve

- If the refrigerant gas temperature from the evaporator increases, the expansion valve increases the amount of refrigerant according to the following operations:

  - The temperature of the temperature sensor tightly sealed against the diaphragm increases.
  - The refrigerant in the diaphragm warms and the Pd increases.
  - If this Pd increases more than PI + Fs, the diaphragm is pressed down.
  - The shaft installed to the temperature sensor end presses down the ball valve.
  - The amount of refrigerant is increased.

- If the refrigerant gas temperature from the evaporator decreases, the expansion valve decreases the amount of refrigerant flow according to the following operation:

  - The temperature of the temperature sensor tightly sealed against the diaphragm decreases.
  - The refrigerant temperature in the diaphragm decreases and the Pd decreases.
  - The Pd decreases less than PI + Fs.
  - The ball valve installed to the temperature sensor end is pressed up.
  - The amount of refrigerant is decreased.

Fail-safe

- Function not equipped.

2014 - Mazda3 - HVAC

EVAPORATOR

Purpose

- The evaporator cools the passing air.

Function

- The evaporator vaporizes the atomized refrigerant flowing internally, and the air passing through the evaporator is cooled by the release of latent heat. The moisture in the air is condensed at this time and dehumidified air is blown into the cabin.

Construction

- The evaporator consists of the tube which passes refrigerant, and the heat radiation fin.

- The cooling medium flow pattern shown in the figure has been adopted for the evaporator.

Operation

- The atomized refrigerant sent from the expansion valve is captured by heat from the outside. As a result, the evaporator is cooled.
- The air blown by the blower motor is cooled by heat exchange when it passes the heat radiation fin of the heater core.

Fail-safe

- Function not equipped.

EVAPORATOR

2014 - Mazda3 - HVAC

CONDENSER

Purpose

- The condenser cools the high-temperature, highly pressurized refrigerant.

Function

- The condenser cools the high-temperature, highly pressurized gaseous refrigerant compressed by the A/C compressor using the outside air, and changes it to liquid refrigerant.

Construction

- The condenser is installed to the front of the radiator.
- The condenser consists of the tube which passes refrigerant, and the heat radiation fin.

- A sub-cooling condenser has been adopted.

- The sub-cooling condenser is integrated with the multi-flow condenser and the receiver driver.
- The sub-cooling condenser separates the refrigerant, cooled once by the condenser, into vapor and liquid using the receiver/drier, and by returning it to the sub-cooling part of the condenser again to cool.
- As a result, liquefaction of the refrigerant is promoted and cooling performance is improved.

Operation

- The high-temperature, highly pressurized gaseous refrigerant sent from the A/C compressor passes through the tube in the condenser.
- When the air blown from the outside is exposed to the heat radiation fin, the heat of the refrigerant is captured by heat exchange, and the refrigerant changes from a gas to a liquid.
- The liquid refrigerant is sent to the expansion valve via the receiver/drier.

Fail-safe

- Function not equipped.

2014 - Mazda3 - HVAC

RECEIVER/DRIER

Purpose

- The receiver/drier supplies a stable amount of purified, complete liquid refrigerant to the expansion valve.

Function

- The receiver/drier temporarily stores refrigerant and extracts only liquid refrigerant. As a result, outflow to the expansion valve of refrigerant, which could not be liquefied completely by the condenser, is prevented, and the discharge pulsation of the A/C compressor is stopped.

- The refrigerant is purified and moisture is eliminated by desiccant in the receiver/drier and strainer.

Fail-safe

- Function not equipped.

RECEIVER/DRIER

2014 - Mazda3 - HVAC

REFRIGERANT LINE

Purpose

- The system piping connects each related part of the refrigerant system.

Construction

- Block-type piping has been adopted to the pipe connection, improving the efficiency of piping related servicing.
- The pipes in the piping system consist of the following parts:
    - Cooler hose (HI)
    - Cooler hose (LO)
    - Cooler pipe
- The pipes in the piping system are made of aluminum alloy and the hoses are made of rubber (flexible hose).
- A high-pressure charging valve is located on the cooler pipe (HI) and a low-pressure charging valve is located on the cooler pipe (LO).

Fail-safe

- Function not equipped.

2014 - Mazda3 - HVAC

HEATER SYSTEM

Outline

- The heater system warms the heater core using the engine coolant warmed by the engine operation.

Construction

- The heater system consists of the following parts.

Function

- The heater system shuttles a portion of the engine coolant into the heater core.

- For the engine coolant flow, refer to the COOLING SYSTEM. (See **COOLING SYSTEM [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)

Operation

- The engine coolant warmed by the engine heat is sent to the heater core.
- The air blown by the blower motor is warmed up by heat exchange when it passes through the heat radiation fin of the heater core.

2014 - Mazda3 - HVAC

HEATER CORE

Purpose, Function

- A portion of the engine coolant is taken into the heater core to heat the air passing through the heater core.

Construction

- The heater core consists of a tube which passes engine coolant, and the heat radiation fin.

Operation

- For the operation, refer to HEATER SYSTEM. (See **HEATER SYSTEM**.)

Fail-safe

- Function not equipped.

2014 - Mazda3 - HVAC

FULL-AUTO AIR CONDITIONER SYSTEM [FULL-AUTO AIR CONDITIONER]

Outline

- The climate control unit performs the following controls based on the signals from each switch/dial and the sensor.

Basic control	Control description	Correction control
Airflow temperature control	Airflow temperature automatic control	• MAX HOT and MAX COLD correction • Engine coolant temperature correction
Airflow volume control	Airflow volume automatic control	• Engine coolant temperature correction (warm-up correction) • Mild start correction • MAX HOT and MAX COLD correction • Defroster correction • Start-up window fogging prevention correction • Starting compensation correction • Start-up burnt-out prevention function
	Airflow volume manual control	• Defroster correction • Starting burnt-out prevention function
Airflow mode control	Airflow mode automatic control	• Engine coolant temperature correction (warm-up correction)
	Airflow mode manual control	—
Air intake control	Air intake automatic control	• Defroster correction • Ambient temperature correction
	Air intake manual control	• Defroster correction
A/C compressor control	A/C compressor automatic control	• Defroster correction
	A/C compressor manual control	
	A/C cut-off control	

Supplementary function
Fail-safe function
Sensor signal delay function
On-board diagnostic function (See **ON-BOARD DIAGNOSTIC**.)

Function

Airflow temperature control

- The air mix actuator is driven and the air mix door position is changed according to the set temperature and the vehicle environment.
- The climate control unit calculates the air mix actuator opening angle characteristic based on the set temperature, solar radiation amount, and airflow mode.
- The air mix actuator opening angle characteristic is set lower as the sunlight intensity increases.

- The airflow temperature is automatically controlled continuously.
- The airflow temperature control performs the following corrections:
  - MAX HOT and MAX COLD correction
  - Engine coolant temperature correction

MAX HOT and MAX COLD correction

- Under the MAX HOT and MAX COLD correction, the air mix actuator opening angle is fixed at fully open when the temperature is set to **29.0/84**, and fixed at fully closed when the temperature is set to **15.0/60**.

Engine coolant temperature correction

- The engine coolant temperature correction prevents cold air from passing through the air vents after the engine is started in winter.
- When the engine coolant temperature is lower than the specified value, the air mix actuator opening angle is corrected to the HOT side.
- The engine coolant temperature correction is not performed when the ambient temperature is **15 °C {59 °F}** or more.

Airflow volume control

- The airflow volume control changes the operation of the blower motor according to the operations of the airflow volume control dial or temperature control dial and the vehicle environment to change the airflow volume.
- The airflow volume control has automatic and manual controls.
- The airflow volume automatic control performs the following correction:
  - Engine coolant temperature correction (warm-up correction)
  - Mild start correction
  - MAX HOT and MAX COLD correction
  - Start-up window fogging prevention correction
  - Starting compensation correction

Defroster correction

- Start-up burn-out prevention function

Airflow Volume Automatic Control

- The climate control unit calculates the blower motor applied voltage characteristic based on the set temperature, ambient temperature, and solar radiation amount.
- The climate control unit compares the blower motor applied voltage characteristic with the target temperature (calculated control value T3) and then determines the blower motor applied voltage (AUTO voltage).
- Calculated control value T3 is the target cabin temperature as set by the climate control unit based on differences between the set temperatures and temperatures input from the sensors.
- Calculated control value T3 is constantly calculated according to the changes in the set temperature and the signals input from the sensors.

Airflow Volume Manual Control

- The climate control unit changes the blower fan motor applied voltage in seven steps according to the operation of the airflow volume control switch or dial.

Airflow volume control dial	Blower motor applied voltage
1st	3.2 V
2nd	4.8 V
3rd	6.4 V
4th	7.9 V
5th	10.1 V
6th	11.2 V
7th	12.5 V

Engine coolant temperature correction (warm-up correction)

- The engine coolant temperature correction (warm-up correction) prevents high volume of cold air from passing through the air vents after engine start in winter.
- The engine coolant temperature correction (warm-up correction) controls the blower motor applied voltage according to the increase in the engine coolant temperature.

The engine coolant temperature correction is not performed during defroster correction, or when the cabin temperature is **20 °C {68 °F}** or more and the airflow mode is in VENT mode.

Mild start correction

- The mild start correction prevents a high volume of warm air from coming out of the air vents when the blower motor is started in summer.
- The mild start correction limits the blower motor applied voltage for **3 s** after the blower motor is started.
- The mild start correction is not performed when the cabin temperature is **20 °C {68 °F}** or less or the airflow is in any mode other than VENT.

MAX HOT and MAX COLD correction

- The MAX HOT and MAX COLD correction fixes the blower motor applied voltage as indicated in the table when the temperature is set to MAX HOT or MAX COLD.
- The MAX HOT correction is not performed during engine coolant temperature correction.

Correction name	Set temperature	Blower motor applied voltage
MAX HOT correction	29.0/84	12.1 (V): AUTO-HI
MAX COLD correction	15.0/60	14.6 (V): MAX-HI

Start-up window fogging prevention correction

- The start-up window fogging prevention correction prevents the windows from easily fogging when the following conditions are all met:
  - Right after engine start
  - Heater is operated
  - Air is blowing from vents for defrosting
- The start-up window fogging prevention correction fixes the blower motor applied voltage at **0 V** for **6 s** after the ignition is switched ON.
- The start-up window fogging prevention correction is not performed when the airflow mode is in any mode other than HEAT, DEF/HEAT and defroster.

Starting compensation correction

- When the blower motor is started-up from the stopped status at the lowest speed (**3.2 V**), the starting compensation correction fixes the blower motor applied voltage at **4.4 V** for **2 s** to stabilize blower motor start-up operation.

Defroster correction

- When the defroster switch is turned on, the defroster correction adds a correction (**+2 V**) to the blower motor applied voltage to increase airflow volume.

Start-up burn-out prevention function

- The start-up burn-out prevention function prevents the blower motor from being burnt out because of excess current.
- When the blower motor is started-up from the stopped status with a blower motor applied voltage of **4.4 V** or more, the blower motor applied voltage is fixed at **4.4 V** for **1 s**.

Airflow mode control

- The airflow mode control drives the airflow mode actuator according to the mode switch, defroster switch, and the vehicle environment and switches the position of the airflow mode door.
- The airflow mode control has automatic and manual controls.
- The airflow mode automatic control performs the following correction:
    - Engine coolant temperature correction (warm-up correction)

Airflow mode automatic control

- The climate control unit determines the airflow mode based on the current air mix actuator opening angle and solar radiation amount.

- Determined value used for the airflow mode is changed according to the signal from the solar radiation sensor.

Airflow mode manual control

- The climate control unit switches the airflow mode based on the MODE switch operation.

Airflow mode	Operation switch	Air vent
VENT	Mode switch	CENTER VENT, SIDE VENT
BI-LEVEL		CENTER VENT, SIDE VENT, FRONT HEAT, REAR HEAT
HEAT		FRONT HEAT, REAR HEAT, SIDE DEMISTER (low volume), DEFROSTER (low volume), SIDE VENT (low volume)
DEF/HEAT		FRONT HEAT, REAR HEAT, SIDE DEMISTER, DEFROSTER, SIDE VENT (low volume)
DEFROSTER	DEFROSTER switch	SIDE DEMISTER, DEFROSTER, SIDE VENT (low volume)

Engine coolant temperature correction (warm-up correction)

- The engine coolant temperature correction (warm-up correction) prevents cold air from passing through the lower vents after

engine start in winter.

- The engine coolant temperature correction (warm-up correction) switches the airflow mode according to the increase in the engine coolant temperature.

Air intake control

- The air intake control drives the air intake actuator and switches the air intake door position according to the operations of the REC, FRESH and defroster switches and the vehicle environment.
- The air intake control has automatic and manual controls.
- The air intake automatic control performs the following correction:
  - Defroster correction
  - Ambient temperature correction

Air intake automatic control

- The climate control unit performs the control as follows so that the cabin temperature lowers quickly according to the cooling conditions.

1. Calculates the cabin temperature value based on the ambient temperature and sunlight intensity.
2. Compares the calculated cabin temperature value and current cabin temperature.
3. Determines the air intake mode.

Air intake manual control

- The climate control unit switches the air intake mode based on the REC/FRESH switch operation.

Air intake mode	REC switch operation
FRESH	Fixed to FRESH when the FRESH switch is turned on during REC mode
REC	Fixed to REC when the RECIRCULATE switch is turned on during FRESH mode

REC mode control under severe heat

- When the vehicle is driven at a very low speed with the A/C on under a severe heat condition, the climate control unit may change the air intake mode from FRESH to REC automatically.
- Due to this, load to the A/C compressor is reduced.
- When the air intake mode is switched to REC, the indicator on the REC switch illuminates.

Defroster correction

- The defroster correction improves the effect of defrosting.
- The air intake is fixed at FRESH when the defroster switch is turned on.
- The air intake is fixed at FRESH even if it has been set to REC manually.

Ambient temperature correction

- When the ambient temperature is **15 °C {59 °F}** or less, the air intake is fixed at FRESH to prevent window fogging.

A/C compressor control

- The A/C compressor control turns the A/C compressor on/off based on the climate control unit operation and signals from each sensor.
- The A/C compressor control has automatic and manual controls.
- The A/C compressor automatic control performs the following correction:
  - Defroster correction

A/C compressor automatic control

- The climate control unit determines the A/C ON/OFF mode based on the ambient temperature.

- The climate control unit determines the A/C signal on/off according to the air conditioner operation such as A/C ON mode (A/C switch ON) or AUTO mode (AUTO switch ON).
- In A/C ON mode, the A/C signal (magnetic clutch) on/off is determined based on the ambient temperature and the temperature of the air passing through the evaporator.

- In AUTO mode, the A/C signal (magnetic clutch) on/off is determined based on the ambient temperature calculation value and the temperature of the air passing through the evaporator.

- The ambient temperature calculation value is calculated based on the ambient temperature, set temperature, cabin temperature, and sunlight intensity.
- When the ambient temperature is low, the A/C signal (magnetic clutch) OFF temperature is set lower to prevent window fogging.

A/C compressor manual control

- The climate control unit switches the A/C ON/OFF mode according to the A/C switch operation.

A/C mode	Operation condition
A/C ON mode (A/C display)	Fixed in A/C mode.
A/C OFF mode (No display)	Fixed in A/C OFF mode.

Defroster correction

- When the defroster switch is turned on, the system is switched to A/C ON mode to improve defogging.

A/C cut-off control

- Controls the A/C operation by switching the A/C relay on/off at the optimal timing according to engine operation conditions. (See **A/C CUT-OFF CONTROL [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)

Sensor Signal Delay Function

- The amount of solar radiation, and the ambient and cabin temperatures may change due to factors such as direct and intermittent sunlight (traveling through a city or a highway tunnel), or radiant heat from the ground under parked vehicles as

well as the opening and closing of doors.

- If control was performed based exactly on these variations, the air conditioning function would be negatively affected and smooth control could not occur.
- In order to prevent this, the climate control unit delays and smooths the input signals for solar radiation, and the ambient and cabin temperature as shown in the following figure, realizing stable control.

- When the engine is restarted after being temporarily stopped, the ambient temperature sensor may detect a temperature higher than the actual ambient temperature.
- To prevent this, if the engine coolant temperature exceeds **55 °C {131 °F}**, control of each system is performed based on the ambient temperature data before the engine was stopped, which is stored in the climate control unit.

Fail-safe

- If a malfunction is detected by the malfunction detection function, the fail-safe function performs the following controls to prevent an operation malfunction of the full-auto air conditioner and malfunction of output devices.

Fail-safe function table

Part where malfunction is determined	Malfunction determined when ignition switched ON	Malfunction already exists when ignition switched ON
Ambient temperature sensor	Ambient temperature sensor input value is fixed at the value right before the malfunction.	Ambient temperature sensor input value is fixed at **15 °C {59 °F}.**
Passenger compartment temperature sensor	Passenger compartment temperature sensor input value is fixed at the value right before the malfunction.	Passenger compartment temperature sensor input value is fixed at **25 °C {77 °F}.**
Evaporator temperature sensor	A/C output OFF is controlled when the evaporator temperature sensor input value is at **0 °C {32 °F}**.	←
Solar radiation sensor	The solar radiation sensor input value is fixed at the value directly before the malfunction only when the valve is **1,450 W/m^2 or more**.	Solar radiation sensor value is fixed at **0 W/m^2**.
Engine coolant temperature sensor	Engine coolant temperature sensor input value is fixed at **85 °C {185 °F}**.	←
Air mix actuator (potentiometer)	Air mix actuator drive signal is stopped right when the malfunction is determined. However, it is fixed at MAX COLD when the manually set temperature is at **15 °C {60 °F}** and fixed at MAX HOT when the manually set temperature is at **29 °C {84 °F}**.	Control based on ambient temperature. (See Graph 1.) However, it is fixed at MAX COLD when the manually set temperature is at **15 {60 °F}** and fixed at MAX HOT when the manually set temperature is at **29 °C {84 °F}**.
Airflow mode actuator (potentiometer)	Airflow mode actuator drive signal is stopped right when the malfunction is determined. • However, the operation is change to VENT or DEF when the manual operation is set to VENT or DEF.	Control based on ambient temperature. (See Graph 2.) • However, the operation is change to VENT or DEF when the manual operation is set to VENT or DEF.
Air mix actuator (motor lock)	• Air mix actuator drive signal is stopped right when the malfunction is determined.	• Twenty seconds after ignition is switched ON, the air mix actuator drive signal is output normally again. Afterwards, motor output is stopped during malfunction determination.
Airflow mode actuator (motor lock)	• Airflow mode actuator drive signal is stopped right when the malfunction is determined.	• Nine seconds after ignition is switched ON, the airflow mode actuator drive signal is output normally again. Afterwards, motor output is stopped during malfunction determination.

Construction

Block diagram

Structural view

Operation

Airflow temperature control

1. The climate control unit determines the airflow temperature based on the temperature control dial operation and signals from each sensor which changes according to the vehicle environment.

2. The climate control unit drives the air mix actuator according to the results of the airflow temperature determination and corrections.

Airflow volume control

1. When the ignition is switched ON (engine off or on), the front body control module (FBCM) turns the blower relay on.

2. When the airflow volume control dial on the climate control unit is turned on, the blower motor rotates.

3. The climate control determines the airflow volume based on the operations of the airflow volume control dial and the temperature setting dial, airflow mode condition, and signals from each sensor.

4. Based on the result of the airflow volume determination and correction, the climate control unit control the blower fan controller and changes the airflow volume (blower motor applied voltage).

5. The rotation speed of the blower motor changes according to the applied voltage from the blower fan controller.

Airflow mode control

1. The climate control unit determines the airflow mode based on the operations of the mode and defroster switches and signals from each sensor which changes according to the vehicle environment.

2. The climate control unit drives the airflow mode actuator according to the results of the airflow mode determination and corrections.

Air intake control

1. The climate control determines the air intake mode based on the operations of the REC, FRESH, defroster switches and signals from each sensor which changes according to the vehicle environment.

2. The climate control unit drives the air intake actuator according to the result of the air intake mode determination and corrections.

A/C compressor control

1. The climate control determines the A/C ON/OFF based on the operations of each switch/dial and signals from each sensor which changes according to the vehicle environment.

2. The climate control unit sends the A/C signal to the PCM according to the result of the A/C ON/OFF determination and corrections.

3. When the PCM turns the A/C relay on based on the A/C signal, the magnetic clutch of the A/C compressor turns on.

CLIMATE CONTROL UNIT [FULL-AUTO AIR CONDITIONER]

Purpose

- The climate control unit performs air conditioning according to the operation by the users and the driving conditions of the vehicle.

Function

- The climate control unit determines optimum air-conditioning based on the input signals from each sensor and the control module and the operation signals from the control panel, and controls each actuator, A/C compressor, and the blower motor. (See **FULL-AUTO AIR CONDITIONER SYSTEM [FULL-AUTO AIR CONDITIONER]**.)

Set temperature display switching function (dual type)

- When the ambient temperature display in the instrument cluster is switched between Centigrade and Fahrenheit, the set temperature display in the climate control unit is switched between Centigrade and Fahrenheit. (See **INSTRUMENTATION/DRIVER INFO. PERSONALIZATION**.)

Automatic configuration function

- When the ignition is switched ON after the climate control unit is replaced, the climate control unit reads the vehicle specification information sent via CAN transmission from the instrument cluster using the automatic configuration function, and stores it.

Dual mode (dual type)

- When the DUAL switch of the climate control unit is pressed or the RH-side temperature setting dial is operated, the DUAL mode turns on (DUAL switch indicator turns on).
- When the DUAL mode turns on, the driver and passenger-side temperature settings can be performed independently by operating the RH and LH-side temperature setting dial.
- When the DUAL mode turns on, the temperature setting display in the display panel is displayed independently according to each setting temperature for the driver and passenger sides.

Construction

Dual type

- A logic-type climate control unit has been adopted.
- The climate control unit consists of a control panel, display panel, and a control unit.
- The switches and dials shown in the figure are positioned on the control panel.
- The air conditioner setting is displayed in the display panel.

Single type

- A logic-type climate control unit has been adopted.
- The climate control unit consists of a control panel and a control unit.
- The switches and dials shown in the figure are positioned on the control panel.

Control Type Transition by Switch Operation

Dual type

Airflow temperature control, airflow volume control

Operation switch		Airflow temperature control	Airflow volume control								
		Control prior to switch operation	Control prior to switch operation								
		Automatic control	Automatic control	Defroster control	Manual control						
					OFF	1	2	3	4	5	6	7
OFF switch		No change	OFF	OFF	OFF							
AUTO switch		No change	No change	Automatic control	Automatic control							
Airflow volume control switch	UP	No change	Manual control*2	Manual control*2	1	2	3	4	5	6	7	7
	DOWN	No change	Manual control*3	Manual control*3	1	1	1	2	3	4	5	6
MODE switch		No change	No change	Automatic control*4	No change							
DEFROSTER switch		No change	Defroster control	Automatic control*4	Defroster control							
A/C switch		No change	No change	No change	*5	No change						
RECIRCULATE switch		No change	No change	No change	No change							
FRESH switch		No change	No change	No change	No change							
Driver-side temperature setting dial*1	15.0/60	MAX control	MAX control	MAX HI	No change							
	15.5—28.5/61—83	Automatic control	Automatic control	No change	No change							
	29.0/84	MAX control	MAX control	AUTO HI	No change							
Passenger-side temperature setting dial*1	15.0/60	MAX control	MAX control	MAX HI	No change							
	15.5—28.5/61—83	Automatic control	Automatic control	No change	No change							
	29.0/84	MAX control	MAX control	AUTO HI	No change							
Dual switch		Automatic control	No change	No change	No change							
Rear window defroster switch		No change	No change	No change	No change							

*1 **Adjusted up or down in increments of 0.5 with a range of 15.0—29.0 or 1 with a range of 60—84.**

*2 **Increases to the manual voltage that is closest to the auto or defroster control voltage.**

*3

*4 **Decreases to the manual voltage that is closest to the auto or defroster control voltage.**

*5 **Returns to condition prior to defroster operation. However, if it had been off prior to defroster operation, it switches to automatic control.**

Returns to fan condition before fan off. However, if it was defroster control (manual control), it returns to condition as follows:

- The condition before fan off defroster control, the fan condition returns to the condition before defroster control.
- The condition before fan off defroster control and furthermore the condition before defroster control is fan off, the fan condition changes to automatic control. (It has higher priority than 1)
- The condition before fan off defroster control and fan is manually operated during that defroster control, the fan condition return to manually operated condition. (It has higher priority than 1 and 2)

2014 - Mazda3 - HVAC

AMBIENT TEMPERATURE SENSOR [FULL-AUTO AIR CONDITIONER]

Purpose

- The ambient temperature sensor detects the ambient temperature.

Function

- The ambient temperature sensor converts the detected temperature to an electric signal.

Construction

- A thermistor-type ambient temperature sensor has been adopted.
- The ambient temperature sensor is installed to the shroud panel on the back side of the front bumper.

Operation

- The thermistor changes the resistance according to the surrounding temperature.
- The resistance decreases if the temperature increases, and conversely increases if the temperature decreases as shown in the figure.

AMBIENT TEMPERATURE SENSOR

Fail-safe

- Function not equipped.

2014 - Mazda3 - HVAC

PASSENGER COMPARTMENT TEMPERATURE SENSOR [FULL-AUTO AIR CONDITIONER]

Purpose

- The passenger compartment temperature sensor detects the cabin temperature.

Function

- The passenger compartment temperature sensor converts the detected temperature to an electric signal.

Construction

- A thermistor-type passenger compartment temperature sensor has been adopted.
- The passenger compartment temperature sensor is installed to the lower panel (driver's side).

Construction / operation

- The thermistor changes the resistance according to the surrounding temperature.
- The resistance decreases if the temperature increases, and conversely increases if the temperature decreases as shown in the figure.

Fail-safe

- Function not equipped.

2014 - Mazda3 - HVAC

EVAPORATOR TEMPERATURE SENSOR [FULL-AUTO AIR CONDITIONER]

Purpose

- The evaporator temperature sensor detects the airflow temperature passing through the evaporator.

Function

- The evaporator temperature sensor converts the detected temperature to an electric signal.

Construction

- A thermistor-type evaporator temperature sensor has been adopted.
- A fin-thermo-type sensor has been adopted to the sensor area of the evaporator temperature sensor which inserts between the evaporator fins.
- The evaporator temperature sensor is installed to the A/C unit.

Operation

- The thermistor changes the resistance according to the surrounding temperature.
- The resistance decreases if the temperature increases, and conversely increases if the temperature decreases as shown in the figure.

EVAPORATOR TEMPERATURE SENSOR

Fail-safe

- Function not equipped.

2014 - Mazda3 - HVAC

SOLAR RADIATION SENSOR [FULL-AUTO AIR CONDITIONER]

Purpose

- The solar radiation sensor detects the sunlight intensity emitted to the cabin.

Function

- The solar radiation sensor converts the detected solar radiation amount to an electric signal.

Construction

- A photodiode (light receiving diode) has been adopted for the solar radiation sensor.

- The solar radiation sensor is installed to the passenger's side in the dashboard.

Operation

- The photodiode (light receiving diode) generates electrical current when light shines on the connecting area of the semiconductor. The generated electrical current increases if the sunlight intensity increases, and conversely decreases if the sunlight intensity decreases.
- The climate control unit determines the sunlight intensity according to the amount of electrical current sent from the solar radiation sensor.

Fail-safe

- Function not equipped.

2014 - Mazda3 - HVAC

REFRIGERANT PRESSURE SENSOR [FULL-AUTO AIR CONDITIONER]

Purpose

- The refrigerant pressure sensor detects the refrigerant pressure in the refrigerant cycle.

Function

- The refrigerant pressure sensor converts the detected refrigerant pressure to an electric signal and sends it to the PCM.

Construction

- The refrigerant pressure sensor is installed on the cooler pipe.

- A capacitance type refrigerant pressure sensor, which converts refrigerant pressure into a linear electric signal, has been adopted.
- Consists of a pressure detecting part and signal processing part.
- The pressure detecting part is a variable capacity condenser, which changes capacitance according to the pressure.
- The signal processing part detects the capacitance of the pressure detecting part, converts it to voltage, then outputs it to the climate control unit.

Operation

Capacitance type

- There is a clearance between the movable ceramic diaphragm and the ceramic base, and each side has an electrode.
- When pressure is applied from the ceramic diaphragm side, the ceramic diaphragm deforms, and the clearance between the electrodes changes. As a result, capacitance is changed and pressure is detected.

Fail-safe

- Function not equipped.

2014 - Mazda3 - HVAC

AIR MIX ACTUATOR [FULL-AUTO AIR CONDITIONER]

Purpose

- The air mix actuator moves the air mix door in the A/C unit to adjust the temperature of the air blown from the air vent.

Function

Door open/close function

- The air mix actuator drives the motor based on the signals from the climate control unit and moves the air mix door in the HOT or COLD direction.

Door position detection function

- The air mix actuator detects the change in the air mix door position using the potentiometer in conjunction with the motor drive, and gives feedback to the climate control unit based on electric signals.

Construction

- A potentiometer-type air mix actuator has been adopted.
- The air mix actuator is installed to both the driver and front passenger sides in the A/C unit.

Operation

1. The climate control unit calculates the target air mix actuator opening angle (target actuator opening angle) according to the airflow temperature control.

2. The climate control unit detects the current air mix actuator opening angle based on the voltage detected by the potentiometer in the air mix actuator.

3. The climate control unit compares the target actuator opening angle with the voltage from the potentiometer.

4. When the voltage detected by the potentiometer differs from the target actuator opening angle, the climate control unit outputs a motor drive signal to the air mix actuator.

5. When the voltage detected by the potentiometer is equal to the target actuator opening angle, the climate control unit stops the motor drive signal to the air mix actuator.

TEMPERATURE SETTING DIAL SET TO HOT SIDE

Fail-safe

- Function not equipped.

2014 - Mazda3 - HVAC

AIR INTAKE ACTUATOR [FULL-AUTO AIR CONDITIONER]

Purpose

- The air intake actuator moves the air intake door in the blower unit to switch the air intake port.

Function

- The air intake actuator drives the motor based on the signal from the climate control unit and moves the air intake door to the FRESH or REC position.

Construction

- A mechanical lock type air intake actuator has been adopted.
- The air intake actuator is installed to the blower unit.

Operation

1. The climate control unit outputs a motor drive signal to the air intake actuator based on the air intake mode determined by the air intake control.

2. When the air intake actuator moves to FRESH or REC, the motor locks.

3. When the motor locks and is under excessive load, the current value flowing from the climate control unit increases more than the specification (lock current).

4. When the lock current is detected, the climate control unit stops the motor drive signal to the air intake actuator.

SWITCHING FROM FRESH TO RECIRCULATE

Fail-safe

- Function not equipped.

2014 - Mazda3 - HVAC

AIRFLOW MODE ACTUATOR [FULL-AUTO AIR CONDITIONER]

Purpose

- The airflow mode actuator moves the mode door in the A/C unit to switch the air vent.

Function

Door open/close function

- The airflow mode actuator drives the motor based on the signal from the climate control unit and moves the mode door to the VENT, BI-LEVEL, HEAT, DEF/HEAT, or DEFROSTER position.

Door position detection function

- The airflow mode actuator detects the changes in the mode door position using the potentiometer in conjunction with the motor drive and gives feedback to the climate control unit based on the electric signals.

Construction

- A potentiometer-type airflow mode actuator has been adopted.
- The airflow mode actuator is installed to the passenger's side in the A/C unit.

Operation

1. The climate control unit determines the airflow mode actuator target voltage based on the mode position determined by the airflow mode control.

2. The climate control unit compares the voltage detected by the potentiometer in the airflow mode actuator with the target voltage.

3. When the voltage detected by the potentiometer differs from the target voltage, the climate control unit outputs a motor drive signal.

4. When the voltage detected by the potentiometer is equal to the target voltage, the climate control unit stops the motor drive signal to the airflow mode actuator.

MODE SWITCH SET TO VENT

Fail-safe

- Function not equipped.

2014 - Mazda3 - HVAC

MANUAL AIR CONDITIONER SYSTEM [MANUAL AIR CONDITIONER]

Outline

- The climate control unit performs the following controls based on the signals from each switch/dial and the sensor.

Basic control	Control description
Airflow volume control	• Start-up burnt-out prevention function • Delay control
Air intake control	• Defroster control • REC mode control under severe heat
A/C compressor control	• A/C signal on/off control • MAX A/C control • A/C cut-off control

Supplementary function
Fail-safe function

Function

Airflow volume control

- The climate control unit changes the blower motor applied voltage in seven steps according to the operation of the airflow volume control dial.

Airflow volume control dial	Blower motor applied voltage
1st	3.2 V
2nd	4.8 V
3rd	6.4 V
4th	7.9 V
5th	10.1 V
6th	11.2 V
7th	12.5 V

Start-up burn-out prevention function

- The start-up burn-out prevention function prevents the blower motor from being burnt out because of excess current.
- When the blower motor is started-up from the stopped status, the blower motor applied voltage is fixed at **3.1 V** for **1 s**.

Delay control

- When the blower motor rotation exceeds and rises above the blower motor applied voltage from a low speed condition, the delay control delays the blower motor applied voltage and stabilizes the motor operation.

Air intake control

- The climate control unit switches the air intake mode based on the REC/FRESH switch operation.

Air intake mode	REC switch operation
FRESH	Fixed to FRESH when the FRESH switch is turned on during REC mode
REC	Fixed to REC when the RECIRCULATE switch is turned on during FRESH mode

Defroster control

- The defroster control improves the defrosting effect.
- When the defroster switch turns on, the climate control unit fixes the air intake mode to FRESH.
- The defroster correction fixes the air intake mode to FRESH when the airflow mode is DEFROSTER.
- The air intake is fixed at FRESH even if it has been set to REC manually.

REC mode control under severe heat

- When the vehicle is driven at a very low speed with the A/C on under a severe heat condition, the climate control unit may change the air intake mode from FRESH to REC automatically.
- Due to this, load to the A/C compressor is reduced.
- When the air intake mode is switched to REC, the indicator on the REC switch illuminates.

A/C compressor control

A/C signal on/off control

- When the A/C switch and fan switch are turned on, the climate control unit turns the A/C signal (magnetic clutch) on/off based on the temperature of the air passing through the evaporator.

- When the fan switch and A/C switch are turned on, the climate control unit controls the surface temperature of the evaporator so that it is within a certain range to prevent the evaporator from freezing.
- When the ambient temperature is low, the climate control unit sets the A/C signal (magnetic clutch) off-temperature to low to prevent window fogging.

MAX A/C control

- When the temperature control dial is set to the MAX COLD position, the climate control unit performs the MAX A/C control (when the airflow mode is VENT or BI-LEVEL).
- The MAX A/C control controls the air conditioner as follows:
  - Sets the intake mode to REC.
  - Turns on the A/C compressor.

A/C cut-off control

- Controls the A/C operation by switching the A/C relay on/off at the optimal timing according to engine operation conditions. (See **A/C CUT-OFF CONTROL [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)

Fail-safe

- If a malfunction is detected by the malfunction detection function, the fail-safe function performs the following controls to prevent an operation malfunction of the air conditioner and malfunction of output devices.

Fail-safe function table

Part where malfunction is determined	Malfunction determined when ignition switched ON	Malfunction already exists when ignition switched ON
Ambient temperature sensor	Ambient temperature sensor input value is fixed at the value right before the malfunction.	Ambient temperature sensor input value is fixed at **15 °C {59 °F}.**
Evaporator temperature sensor	A/C output OFF is controlled when the evaporator temperature sensor input value is at **0 °C {32 °F}**.	←
Engine coolant temperature sensor	Engine coolant temperature sensor input value is fixed at **85 °C {185 °F}**.	←

Construction

Block diagram

Structural view

Operation

Airflow volume control

1. When the ignition is switched ON (engine off or on), the front body control module (FBCM) turns the blower relay on.

2. When the airflow volume control dial on the climate control unit is turned on, the blower motor rotates.

3. The climate control determines the airflow volume based on the operations of the airflow volume control dial and the temperature setting dial, airflow mode condition, and signals from each sensor.

4. Based on the result of the airflow volume determination and correction, the climate control unit control the blower fan controller and changes the airflow volume (blower motor applied voltage).

5. The rotation speed of the blower motor changes according to the applied voltage from the blower fan controller.

Air intake control

1. The climate control determines the air intake mode based on the operations of the FRESH switch, RECIRCULATE switch, mode dial and signals from each sensor which changes according to the vehicle environment.

2. The climate control unit drives the air intake actuator according to the result of the air intake mode determination and corrections.

A/C compressor control

- The climate control unit sends the A/C signal to the PCM based on the signals sent from the A/C switch, airflow volume control dial, and evaporator temperature sensor.
- The PCM turns the A/C relay on/off based on the input signals from the A/C signal and A/C pressure sensor and controls the A/C compressor (magnetic clutch) operation.

CLIMATE CONTROL UNIT [MANUAL AIR CONDITIONER]

Purpose

- The climate control unit performs air conditioning according to the operation by the users and the driving conditions of the vehicle.

Function

- The climate control unit determines optimum air-conditioning based on the input signals from each sensor and the control module and the operation signals from the control panel, and controls each actuator, A/C compressor, and the blower motor. (See **MANUAL AIR CONDITIONER SYSTEM [MANUAL AIR CONDITIONER]**.)

Construction

- A wire-type climate control unit has been adopted.
- The climate control unit consists of a control panel and a control unit.
- The switches and dials shown in the figure are positioned on the control panel.

If the MAX A/C control conditions are met, it switches to MAX A/C control.

2014 - Mazda3 - HVAC

AMBIENT TEMPERATURE SENSOR [MANUAL AIR CONDITIONER]

Purpose

- The ambient temperature sensor detects the ambient temperature.

Function

- The ambient temperature sensor converts the detected temperature to an electric signal.

Construction

- A thermistor-type ambient temperature sensor has been adopted.
- The ambient temperature sensor is installed to the shroud panel on the back side of the front bumper.

Operation

- The thermistor changes the resistance according to the surrounding temperature.
- The resistance decreases if the temperature increases, and conversely increases if the temperature decreases as shown in the figure.

AMBIENT TEMPERATURE SENSOR

Fail-safe

- Function not equipped.

2014 - Mazda3 - HVAC

EVAPORATOR TEMPERATURE SENSOR [MANUAL AIR CONDITIONER]

Purpose

- The evaporator temperature sensor detects the airflow temperature passing through the evaporator.

Function

- The evaporator temperature sensor converts the detected temperature to an electric signal.

Construction

- A thermistor-type evaporator temperature sensor has been adopted.
- A fin-thermo-type sensor has been adopted to the sensor area of the evaporator temperature sensor which inserts between the evaporator fins.
- The evaporator temperature sensor is installed to the A/C unit.

Operation

- The thermistor changes the resistance according to the surrounding temperature.
- The resistance decreases if the temperature increases, and conversely increases if the temperature decreases as shown in the figure.

EVAPORATOR TEMPERATURE SENSOR

Fail-safe

- Function not equipped.

2014 - Mazda3 - HVAC

REFRIGERANT PRESSURE SENSOR [MANUAL AIR CONDITIONER]

Purpose

- The refrigerant pressure sensor detects the refrigerant pressure in the refrigerant cycle.

Function

- The refrigerant pressure sensor converts the detected refrigerant pressure to an electric signal and sends it to the PCM.

Construction

- The refrigerant pressure sensor is installed on the cooler pipe.

REFRIGERANT PRESSURE SENSOR

- A capacitance type refrigerant pressure sensor, which converts refrigerant pressure into a linear electric signal, has been adopted.
- Consists of a pressure detecting part and signal processing part.
- The pressure detecting part is a variable capacity condenser, which changes capacitance according to the pressure.
- The signal processing part detects the capacitance of the pressure detecting part, converts it to voltage, then outputs it to the climate control unit.

Operation

Capacitance type

- There is a clearance between the movable ceramic diaphragm and the ceramic base, and each side has an electrode.
- When pressure is applied from the ceramic diaphragm side, the ceramic diaphragm deforms, and the clearance between the electrodes changes. As a result, capacitance is changed and pressure is detected.

Fail-safe

- Function not equipped.

2014 - Mazda3 - HVAC

AIR INTAKE ACTUATOR [MANUAL AIR CONDITIONER]

Purpose

- The air intake actuator moves the air intake door in the blower unit to switch the air intake port.

Function

- The air intake actuator drives the motor based on the signal from the climate control unit and moves the air intake door to the FRESH or REC position.

Construction

- A mechanical lock-type air intake actuator has been adopted.
- The air intake actuator is installed to the blower unit.

Operation

1. The climate control unit outputs a motor drive signal to the air intake actuator based on the air intake mode determined by the air intake control.

2. When the air intake actuator moves to FRESH or REC, the motor locks.

3. When the motor locks and is under excessive load, the current value flowing from the climate control unit increases more than the specification (lock current).

4. When the lock current is detected, the climate control unit stops the motor drive signal to the air intake actuator.

SWITCHING FROM FRESH TO RECIRCULATE

Fail-safe

- Function not equipped.

Features

Two-step deployment control system

- A driver-side air bag module has been adopted.
- A passenger-side air bag module has been adopted.
- A side air bag module has been adopted.
- A curtain air bag module has been adopted.
- Three-point front seat belts with the following functions for front seat passengers have been adopted.
    - ELR (Emergency Locking Retractor: emergency locking mechanism)
    - ALR (Automatic Locking Retractor: child-restraint seat locking mechanism) (passenger-side)
    - Load limiter
    - Pre-tensioner seat belt (See **PRE-TENSIONER SEAT BELT [TWO-STEP DEPLOYMENT CONTROL SYSTEM]**.)
    - Lap pre-tensioner seat belt (See **LAP PRE-TENSIONER SEAT BELT [TWO-**

STEP DEPLOYMENT CONTROL SYSTEM].)

- Three-point seat belts with the following functions for rear seat passengers have been adopted.
    - ELR
    - ALR

Standard deployment control system

- A driver-side air bag module has been adopted.
- A passenger-side air bag module has been adopted.
- A side air bag module has been adopted. (with side air bag system)
- A curtain air bag module has been adopted. (with side air bag system)
- Three-point front seat belts with the following functions for front seat passengers have been adopted.
    - ELR (Emergency Locking Retractor: emergency locking mechanism)
    - Load limiter
    - Pre-tensioner seat belt (See **PRE-TENSIONER SEAT BELT [STANDARD DEPLOYMENT CONTROL SYSTEM]**.)
- Three-point rear seat belts with the following functions for rear seat (left and right seats) passengers adopted.
    - ELR
- Two-point seat belt for rear seat passenger (center seat) adopted.

ON-BOARD DIAGNOSTIC [STANDARD DEPLOYMENT CONTROL SYSTEM]

Outline

- The air bag system has an on-board diagnostic function to facilitate the system diagnosis.
- The on-board diagnostic function consists of the following functions:
  - A malfunction detection function, which detects overall malfunctions in the air bag system-related parts.
  - A memory function, which stores detected DTCs.
  - A display function, which indicates malfunction locations and status via DTC output.
  - A PID/data monitoring function, which reads out specific input/output signals and verifies the input/output condition.
- Using the Mazda Modular Diagnostic System (M-MDS), DTCs can be read out and deleted, and the PID/data monitoring function can be activated.
- The system has a fail-safe function to prevent the accidental activation of the air bags in case of an air bag system malfunction.

Function

Self-diagnostic function

Memory function

- Stores malfunctions detected in the air bag system-related parts using the malfunction detection function, and the stored malfunction contents are not cleared even if the ignition is switched off or the negative battery cable is disconnected.

Display function

- When the malfunction detection function detects a malfunction, the air bag system warning light illuminates to advise the driver. Using the external tester communication function, DTCs can be output to the DLC-2 via the CAN.

C: CMDTC self test, D: ODDTC self test

DTC 7-digit code definition

- When related systems or components have failed, the CM stores the DTC of the malfunctioning part in the CM memory, and allows for the retrieval of the stored data using the scanning tool when necessary. The DTCs are indicated using seven digits. Each digit indicates the following.

B 1 0 8 1:7 1

• Specify the area failure sub type

00: No sub type information
01: General electrical malfunction
11: Circuit short to ground
12: Circuit short to battery
13: Open circuit
16: Circuit voltage below threshold
17: Circuit voltage above threshold
19: Circuit current above threshold
1A: Circuit resistance below threshold
29: Signal signal invalid
49: Internal electronic malfunction
53: Deactivated
55: Not configured
68: Event information
87: Missing message
88: Bus off
95: Incorrect assembly
96: Component internal failure

• Manufacturer controlled

• Indicates subgroup

Network Electrical (U code)
0: Network Electrical
1: Network communication
3: Network software

Body (B code)
Manufacturer controlled

Chassis (C code)
Manufacturer controlled

Powertrain (P code)
6: Computer and auxiliary output

• Indicates who was responsible for DTC definition

0: ISO/SAE controlled
1: Manufacturer controlled
2: There are ISO/SAE controlled just for powertrain, all others are manufacturer controlled.
3: For P3000 to P3399 is manufacturer controlled, all others are ISO/SAE controlled.

• Indicates DTC function

B: Body
C: Chassis
P: Powertrain
U: Network Electrical

Status byte for DTC

- The two digits (after hyphen) after the 7-digit DTC.

7-DIGIT DTC
P1260:00−**
STATUS BYTE

- A code which indicates the pending code, current/past malfunction status, or warning illumination status.
- Can be read by performing a CMDTC self-test using the Mazda Modular Diagnostic System (M-MDS).
- For details on the status byte, refer to the explanation on the Mazda Modular Diagnostic System (M-MDS) when reading the DTC.

Snapshot data

NOTE:

- The SAS control module stores the following two types of information when a DTC is detected and displays snap shot data in the Mazda Modular Diagnostic System (M-MDS).

- Vehicle information detected by SAS control module
- Vehicle information detected by instrument cluster and received by SAS control module via CAN signal

- The data for all DTCs currently detected is stored.

Snapshot data item	Unit		Definition	Data read/use method	Corresponding PID data monitor item
AAT	°C	°F	Ambient temperature	—	—
APP_STATUS	Accelerator Pedal Off/ Under20%/ Over20%/ FAIL		Accelerator pedal position status	—	—
CFG_STATUS	Config Complete/ Not Configured/ Config Error		Instrument cluster configuration status	—	—
ECT_STATUS	Under 0 degrees C/ 0-Under 80 degrees C/ Over 80 degrees C/ FAIL		Engine coolant temperature status	—	—
FAULT_CNT	—		Number of malfunction detections	—	—
FIRST_DET_IG	hh:mm:ss*1		Time when initial malfunction occurs (IG-ON counter) • Elapsed time from when ignition is switched ON (engine off or on) until SAS control module detects first malfunction*3	—	—
IC_VPWR	V		Instrument cluster power supply voltage	• The SAS control module constantly receives the power supply voltage value of the instrument cluster sent via CAN signal from the instrument cluster. • If a DTC is detected, the SAS control module records the power supply voltage of the instrument cluster when the DTC was detected, and it is displayed in the Mazda Modular Diagnostic System (M-MDS).	VPWR*2
			Elapsed time since ignition was switched ON (engine off or on) **NOTE:**	• The SAS control module constantly receives the elapsed time since the ignition was switched ON (engine off or on) sent via CAN signal from the instrument cluster.	

IG-ON_TIMER	hh:mm:ss*1	The instrument cluster records the elapsed time since the ignition was switched ON (engine off or on).	• If a DTC is detected, the SAS control module records the elapsed time since the ignition was switched ON (engine off or on) when the DTC was detected, and it is displayed in the Mazda Modular Diagnostic System (M-MDS).	—
LAST_CLR	hh:mm:ss*1	Repair time for last malfunction (B+ counter) • Elapsed time from when battery is connected until SAS control module detects that last malfunction is repaired*3	—	—
LAST_CLR_IG	hh:mm:ss*1	Repair time for last malfunction (IG-ON counter) • Elapsed time from when ignition is switched ON (engine off or on) until SAS control module detects that last malfunction is repaired*3	—	—
LAST_DET	hh:mm:ss*1	Time when last malfunction occurs (B+ counter) • Elapsed time from when battery is connected until SAS control module detects last malfunction*3	—	—
LAST_DET_IG	hh:mm:ss*1	Time when last malfunction occurs (IG-ON counter) • Elapsed time from when ignition is switched ON (engine off or on) until SAS control module detects last malfunction*3	—	—
PWR_MODE_KEY	Key Out/ Key Recently Out (Position 0)/ Accessory (Position 1)/ Post Ignition (Position 2)/ Ignition On (Position 2)/ Running	• Key Out: Ignition switched off • Key Recently Out (Position 0): Elapsed time **within 3 s** since ignition was switched off • Accessory (Position 1): Ignition is switched to ACC • Post Ignition (Position 2): Elapsed time **within 3 s** since ignition was switched ON (engine off or on) • Ignition On (Position 2): Ignition	• The SAS control module constantly receives the ignition switch status sent via CAN signal from the instrument cluster. • If a DTC is detected, the SAS control module records the ignition switch status when the DTC was detected, and it is displayed in the Mazda Modular Diagnostic System (M-MDS).	—

	(Position 2)/ Running - Starting		switched ON (engine off) • Running (Position 2): Ignition switched ON (engine on) • Running - Starting: Cranking condition		
RPM_STATUS	Engine Stop/ Under1500rpm/ Over1500rpm/ FAIL		Engine speed status	• The SAS control module constantly receives the engine speed sent via CAN signal from the instrument cluster. • If a DTC is detected, the SAS control module records the engine speed when the DTC was detected, and it is displayed in the Mazda Modular Diagnostic System (M-MDS).	TACHOMTR*2
SHIFT_STATUS	P/N/ D/ R/ FAIL		Selector lever position status	• The SAS control module constantly receives the selector lever position sent via CAN signal from the instrument cluster. • If a DTC is detected, the SAS control module records the selector lever position when the DTC was detected, and it is displayed in the Mazda Modular Diagnostic System (M-MDS).	—
TOTAL_DIST	km	miles	Accumulated total traveled distance from completion of vehicle until SAS control module detects DTC (Odometer value in instrument cluster)	The total traveled distance from which the SAS control module detects DTCs to the present can be calculated by performing the following procedure. • Verify the odometer value in the instrument cluster. • Verify the snapshot data item TOTAL_DIST. • Subtract 2 from 1.	—
TOTAL_TIME	hh:mm:ss*1		Accumulated total elapsed time since vehicle completion until SAS control module detects a DTC*3 **NOTE:** • When the ROOM fuse is removed, and the ignition is switched off, the time is not included in the elapsed time.	The elapsed time from which the SAS control module detects DTCs to the present can be calculated by performing the following procedure. • Verify the instrument cluster PID item TOTAL_TIME. • Verify the snapshot data item TOTAL_TIME. • Subtract 2 from 1.	TOTAL_TIME*2
VPWR	V		SAS control module power supply malfunction	—	VPWR_IGA
VSPD_STATUS	Stop/ 0-10km/h/ Over10km/h/ FAIL		Vehicle speed status	• The SAS control module constantly receives the vehicle speed sent via CAN signal from the instrument cluster. • If a DTC is detected, the SAS control module records the vehicle speed when the DTC was detected, and it is displayed in the Mazda Modular Diagnostic System (M-MDS).	SPEEDOMTR*2

*1
The seconds may be indicated after the decimal point.

*2

Instrument cluster PID (See ON-BOARD DIAGNOSTIC [INSTRUMENT CLUSTER].)

*3

The snap shot data of the number of stored malfunction detections, B+ counters, or IG ON counters is combined with the DTC detection conditions of the SAS control module, and the point-in-time data in the following table is stored.

SAS control module DTC detection period	Snapshot data						
	FAULT_CNT (Number of malfunction detections)	TOTAL_TIME	FIRST_DET_IG	LAST_DET	LAST_DET_IG	LAST_CLR	LAST_CLR_IG
	Number of malfunction detections	Time when first malfunction occurs (B+ counter)	Time when initial malfunction occurs (IG-ON counter)	Time when last malfunction occurs (B+ counter)	Time when last malfunction occurs (IG-ON counter)	Repair time for last malfunction (B+ counter)	Repair time for last malfunction (IG-ON counter)
(1)	1	A	G	A	G	-	-
(2)	1	A	G	A	G	B	H
(3)	2	A	G	C	I	B	H
(4)	2	A	G	C	I	D	J
(5)	3	A	G	E	K	D	J
(6)	3	A	G	E	K	F	L

PID/Data monitoring function

1. By using the PID/data monitoring function, the monitored item of the input/output signal, as set on the SAS control module, can be freely selected and read out in real-time.
2. The Mazda Modular Diagnostic System (M-MDS) is used to read out PID/data monitor information.

PID/data monitor table

PID	Unit/Condition	Data contents	SAS control module terminal
AB_WL (Air bag system warning light status)	Lamp_Off/Lamp_On/Plant_Mode/Unknown	• Air bag system warning light off: Lamp_Off • Air bag system warning light on: Lamp_On • Air bag system warning light status: Plant_Mode • Air bag system warning light status: Unknown	3K, 3L
B_SW_P_FLT (Passenger-side buckle switch malfunction status)	**NOTE:** • Displays in the M-MDS but it does not operate.		
OCS_DTC_CLR (Seat weight sensor DTC cleared status)	**NOTE:** • Displays in the M-MDS but it does not operate.		
P_OCS_ST (Seat weight sensor status)	**NOTE:** • Displays in the M-MDS but it does not operate.		
P_WEIGHT (Seat weight sensor measured weight of passenger)	**NOTE:** • Displays in the M-MDS but it does not operate.		
RES_C_AB_D (Driver-side curtain air bag module resistance nominal)	ohm	Continuous: 0.81–6.42 ohms	1S, 1V
RES_C_AB_P (Passenger-side curtain air bag module resistance nominal)	ohm	Continuous: 0.81–6.42 ohms	1W, 1T
RES_F_AB1_D (Driver-side air bag module (inflatorNo.1) resistance nominal)	ohm	Continuous: 0.99–6.42 ohms	3A, 3D
RES_F_AB1_P (Passenger-side air bag module (inflatorNo.1) resistance nominal)	ohm	Continuous: 0.81–6.42 ohms	3G, 3J
RES_F_AB2_D (Driver-side air bag module (inflatorNo.2) resistance nominal)	**NOTE:** • Displays in the M-MDS but it does not operate.		

RES_F_AB2_P (Passenger-side air bag module (inflator No.2) resistance nominal)	**NOTE:** • Displays in the M-MDS but it does not operate.		
RES_PCD_BAR (Poorly connected detector bar terminals resistance nominal (all of SAS control module connectors))	ohm	• Normal connected: 100 ohm or less • Poor connected: 20 kilohm or more	1a, 1b, 2a, 2b, 3a, 3b
RES_S_AB_D (Driver-side side air bag module resistance nominal)	ohm	Continuous: 0.81–9.85 ohms	1A, 1D
RES_S_AB_P (Passenger-side side air bag module resistance nominal)	ohm	Continuous: 0.81–9.85 ohms	1J, 1G
RES_SB_LP_D (Driver-side lap pre-tensioner seat belt resistance nominal)	**NOTE:** • Displays in the M-MDS but it does not operate.		
RES_SB_LP_P (Passenger-side lap pre-tensioner seat belt resistance nominal)	**NOTE:** • Displays in the M-MDS but it does not operate.		
RES_SB_P_D (Driver-side pre-tensioner seat belt resistance nominal)	ohm	Continuous: 0.81–6.42 ohms	2D, 2A
RES_SB_P_P (Passenger-side pre-tensioner seat belt resistance nominal)	ohm	Continuous: 0.81–6.42 ohms	2G, 2J
SEAT_B_D (Driver-side buckle switch status)	Unbuckled/Buckled	• Driver-side front seat belt fastened (Driver-side buckle switch off): Buckled • Driver-side front seat belt not fastened (Driver-side buckle switch on): Unbuckled	2U
SEAT_B_P (Passenger-side buckle switch status)	**NOTE:** • Displays in the M-MDS but it does not operate.		
VPWR_IGA (SAS control module power voltage)	V	Ignition is switched ON: IG1 voltage	3C

2014 - Mazda3 - Restraints

ON-BOARD DIAGNOSTIC [TWO-STEP DEPLOYMENT CONTROL SYSTEM]

Outline

- The air bag system has an on-board diagnostic function to facilitate the system diagnosis.
- The on-board diagnostic function consists of the following functions:
  - A malfunction detection function, which detects overall malfunctions in the air bag system-related parts.
  - A memory function, which stores detected DTCs.
  - A display function, which indicates malfunction locations and status via DTC output.
  - A PID/data monitoring function, which reads out specific input/output signals and verifies the input/output condition.
- Using the Mazda Modular Diagnostic System (M-MDS), DTCs can be read out and deleted, and the PID/data monitoring function can be activated.
- The system has a fail-safe function to prevent the accidental activation of the air bags in case of an air bag system malfunction.

Function

Self-diagnostic function

Memory function

- Stores malfunctions detected in the air bag system-related parts using the malfunction detection function, and the stored malfunction contents are not cleared even if the ignition is switched off or the negative battery cable is disconnected.

Display function

- When the malfunction detection function detects a malfunction, the air bag system warning light illuminates to advise the driver. Using the external tester communication function, DTCs can be output to the DLC-2 via the CAN.

DTC 7-digit code definition

- When related systems or components have failed, the CM stores the DTC of the malfunctioning part in the CM memory, and allows for the retrieval of the stored data using the scanning tool when necessary. The DTCs are indicated using seven digits. Each digit indicates the following.

B 1 0 8 1:7 1

• Specify the area failure sub type

00: No sub type information
01: General electrical malfunction
07: Mechanical failures
09: Component failures
11: Circuit short to ground
12: Circuit short to battery
13: Open circuit
14: Circuit short to ground or open
16: Circuit voltage below threshold
17: Circuit voltage above threshold
19: Circuit current above threshold
1A: Circuit resistance below threshold
1C: Circuit voltage out of range
1D: Circuit current out of range
28: Signal bias level out of range / zero adjustment failure
29: Signal signal invalid
49: Internal electronic malfunction
4A: Incorrect component installed
53: Deactivated
54: Missing calibration
55: Not configured
68: Event information
81: Invalid serial data received
87: Missing message
88: Bus off
89-8E: ISO/SAE reserved
95: Incorrect assembly
96: Component internal failure
93: No operation

• Manufacturer controlled

• Indicates subgroup

Network Electrical (U code)
0: Network Electrical
1: Network communication
3: Network software

Body (B code)
Manufacturer controlled

Chassis (C code)
Manufacturer controlled

Powertrain (P code)
6: Computer and auxiliary output

• Indicates who was responsible for DTC definition

0: ISO/SAE controlled
1: Manufacturer controlled
2: There are ISO/SAE controlled just for powertrain, all others are manufacturer controlled.
3: For P3000 to P3399 is manufacturer controlled, all others are ISO/SAE controlled.

• Indicates DTC function

B: Body
C: Chassis
P: Powertrain
U: Network Electrical

Status byte for DTC

- The two digits (after hyphen) after the 7-digit DTC.

7-DIGIT DTC
P 1 2 6 0 : 0 0 − ＊＊
STATUS BYTE

- A code which indicates the pending code, current/past malfunction status, or warning illumination status.
- Can be read by performing a CMDTC self-test using the Mazda Modular Diagnostic System (M-MDS).
- For details on the status byte, refer to the explanation on the Mazda Modular Diagnostic System (M-MDS) when reading the DTC.

Snapshot data

NOTE:

- The SAS control module stores the following two types of information when a DTC is detected and displays snap shot data in the Mazda Modular Diagnostic System (M-MDS).
  - Vehicle information detected by SAS control module
  - Vehicle information detected by instrument cluster and received by SAS control module via CAN signal
- The data for all DTCs currently detected is stored.

Snapshot data item	Unit		Definition	Data read/use method	Corresponding PID data monitor item
AAT	°C	°F	Ambient temperature	—	—
APP_STATUS	Accelerator Pedal Off/ Under20%/ Over20%/ FAIL		Accelerator pedal position status	—	—
CFG_STATUS	Config Complete/ Not Configured/ Config Error		Instrument cluster configuration status	—	—
ECT_STATUS	Under 0 degrees C/ 0-Under 80 degrees C/ Over 80 degrees C/ FAIL		Engine coolant temperature status	—	—
FAULT_CNT	—		Number of malfunction detections	—	—
FIRST_DET_IG	hh:mm:ss*1		Time when initial malfunction occurs (IG-ON counter) • Elapsed time from when ignition is switched ON (engine off or on) until SAS control module detects first malfunction*3	—	—
IC_VPWR	V		Instrument cluster power supply voltage	• The SAS control module constantly receives the power supply voltage value of the instrument cluster sent via CAN signal from the instrument cluster. • If a DTC is detected, the SAS control module records the power supply voltage of the instrument cluster when the DTC was detected, and it is displayed in the Mazda Modular Diagnostic System (M-MDS).	VPWR*2

IG-ON_TIMER	hh:mm:ss*1	Elapsed time since ignition was switched ON (engine off or on) **NOTE:** • The instrument cluster records the elapsed time since the ignition was switched ON (engine off or on).	• The SAS control module constantly receives the elapsed time since the ignition was switched ON (engine off or on) sent via CAN signal from the instrument cluster. • If a DTC is detected, the SAS control module records the elapsed time since the ignition was switched ON (engine off or on) when the DTC was detected, and it is displayed in the Mazda Modular Diagnostic System (M-MDS).	—
LAST_CLR	hh:mm:ss*1	Repair time for last malfunction (B+ counter) • Elapsed time from when battery is connected until SAS control module detects that last malfunction is repaired*3	—	—
LAST_CLR_IG	hh:mm:ss*1	Repair time for last malfunction (IG-ON counter) • Elapsed time from when ignition is switched ON (engine off or on) until SAS control module detects that last malfunction is repaired*3	—	—
LAST_DET	hh:mm:ss*1	Time when last malfunction occurs (B+ counter) • Elapsed time from when battery is connected until SAS control module detects last malfunction*3	—	—
LAST_DET_IG	hh:mm:ss*1	Time when last malfunction occurs (IG-ON counter) • Elapsed time from when ignition is switched ON (engine off or on) until SAS control module detects last malfunction*3	—	—
	Key Out/ Key Recently Out (Position 0)/ Accessory (Position 1)/	• Key Out: Ignition switched off • Key Recently Out (Position 0): Elapsed time **within 3 s** since ignition was switched off • Accessory (Position 1): Ignition is switched to ACC • Post Ignition (Position 2):	• The SAS control module constantly receives the ignition switch status sent via CAN signal from the instrument cluster.	

PWR_MODE_KEY	Post Ignition (Position 2)/ Ignition On (Position 2)/ Running (Position 2)/ Running - Starting		Elapsed time **within 3 s** since ignition was switched ON (engine off or on) • Ignition On (Position 2): Ignition switched ON (engine off) • Running (Position 2): Ignition switched ON (engine on) • Running - Starting: Cranking condition	• If a DTC is detected, the SAS control module records the ignition switch status when the DTC was detected, and it is displayed in the Mazda Modular Diagnostic System (M-MDS).	—
RPM_STATUS	Engine Stop/ Under1500rpm/ Over1500rpm/ FAIL		Engine speed status	• The SAS control module constantly receives the engine speed sent via CAN signal from the instrument cluster. • If a DTC is detected, the SAS control module records the engine speed when the DTC was detected, and it is displayed in the Mazda Modular Diagnostic System (M-MDS).	TACHOMTR*2
SHIFT_STATUS	P/N/ D/ R/ FAIL		Selector lever position status	• The SAS control module constantly receives the selector lever position sent via CAN signal from the instrument cluster. • If a DTC is detected, the SAS control module records the selector lever position when the DTC was detected, and it is displayed in the Mazda Modular Diagnostic System (M-MDS).	—
TOTAL_DIST	km	miles	Accumulated total traveled distance from completion of vehicle until SAS control module detects DTC (Odometer value in instrument cluster)	The total traveled distance from which the SAS control module detects DTCs to the present can be calculated by performing the following procedure. • Verify the odometer value in the instrument cluster. • Verify the snapshot data item TOTAL_DIST. • Subtract 2 from 1.	—
TOTAL_TIME	hh:mm:ss*1		Accumulated total elapsed time since vehicle completion until SAS control module detects a DTC*3 **NOTE:** • When the ROOM fuse is removed, and the ignition is switched off, the time is not included in the elapsed time.	The elapsed time from which the SAS control module detects DTCs to the present can be calculated by performing the following procedure. • Verify the instrument cluster PID item TOTAL_TIME. • Verify the snapshot data item TOTAL_TIME. • Subtract 2 from 1.	TOTAL_TIME*2
VPWR	V		SAS control module power supply malfunction	—	VPWR_IGA
VSPD_STATUS	Stop/ 0-10km/h/ Over10km/h/		Vehicle speed status	• The SAS control module constantly receives the vehicle speed sent via CAN signal from the instrument cluster. • If a DTC is detected, the SAS control module records the vehicle speed when the DTC was detected, and it is	SPEEDOMTR*2

	FAIL		displayed in the Mazda Modular Diagnostic System (M-MDS).

2014 - Mazda3 - Restraints

AIR BAG SYSTEM [TWO-STEP DEPLOYMENT CONTROL SYSTEM]

Outline

- During a collision, the air bag system operates (deploys) the air bag to assist the occupant protection function for the seat belt.

  WARNING:

  - The air bag system assists the occupant protection function for the seat belt, the intended effect of the SRS air bag system cannot be obtained if the seat belt is not fastened correctly. When driving the vehicle, always fasten the seat belt correctly.

Function

- For the air bag system, the SAS control module calculates the degree of impact based on a collision detection signal from the following each sensor, and operates (deploys) the required parts.

Detection signal	Sensor				Operation (deployment) part					
	SAS control module (integrated sensor)	Crash zone sensor (driver/passenger-side)	Side air bag sensor (driver/passenger-side)	Pressure sensor (driver/passenger-side)	Driver-side air bag module	Passenger-side air bag module	Curtain air bag module (driver/passenger-side)	Side air bag module (driver/passenger-side)	Pre-tensioner seat belt (driver/passenger-side)	Lap pre-tensioner seat belts (driver/passenger-side)
Detects frontal or frontal offset collision	×	×	-	-	×	× *2	× *1	-	× *2	× *2
Detects lateral collision	×	-	×	×	-	-	× *1	× *1	× *1	× *1
Detects collision from rear of vehicle	×	×	-	-	-	-	-	-	-	-

Detects vehicle rollover	×	-	-	-	-	-	×	-	× *2	× *2

*1 **Operates (deploys) the air bag module on the side where the collision is detected.**

*2 **For the passenger-side, operates (deploys) when seated in passenger-side seat.**

Two-step deployment control function

- The two-step deployment control function switches between one-step deployment (high-output deployment) or two-step deployment (low-output deployment) of the driver-side and passenger-side air bag modules according to the degree of impact from a frontal or frontal offset collision and the front seat belt status.

Air bag module	Front seat belt status (buckle switch)	Degree of impact	
		Small	Large
Driver-side air bag module	Equipped	Two-step deployment	One-step deployment
	Not equipped	One-step deployment	One-step deployment
Passenger-side air bag module	Equipped	Two-step deployment	One-step deployment
	Not equipped	One-step deployment	One-step deployment

System conditions display function

- The air bag system detects each part condition and sends a system condition signal from the SAS control module to the instrument cluster.
- The instrument cluster displays the following warning lights and sounds alarm based on the system condition signal.

Warning light and alarm	Reference
Air bag system warning light	(See **AIR BAG SYSTEM WARNING LIGHT [TWO-STEP DEPLOYMENT CONTROL SYSTEM]**.)
Air bag system warning alarm	(See **AIR BAG SYSTEM WARNING ALARM [TWO-STEP DEPLOYMENT CONTROL SYSTEM]**.)
Seat belt warning light	(See **SEAT BELT WARNING ALARM**.)

	(See **INDICATOR UNIT**.)
Passenger air bag deactivation (PAD) indicator light	(See **PASSENGER SENSING SYSTEM [TWO-STEP DEPLOYMENT CONTROL SYSTEM]**.)

Structural View

System Wiring Diagram

Operation

Operation (deployment) during a frontal or frontal offset collision

1. When the vehicle receives an impact from a frontal or frontal offset collision, the crash sensors built into the crash zone sensor, and the SAS control module detect the impact and convert the impact into an electrical signal at the signal processing circuit.

2. The crash zone sensor outputs the electrical signal to the SAS control module.

3. The SAS control module calculates the degree of impact at the determination and safing circuit based on the electrical signals from the crash zone sensor and the crash sensor.

4. If the calculated degree of impact exceeds the previously set threshold, the SAS control module outputs an operation (deployment) signal to each air bag module/pre-tensioner seat belt/lap pre-tensioner seat belt at the output control circuit.

5. Each air bag module/pre-tensioner seat belt/lap pre-tensioner seat belt operates (deploys) based on the operation (deployment) signal from the SAS control module.

INFLATOR NO.1
FRONT AIR BAG MODULE (DRIVER OR PASSENGER-SIDE AIR BAG MODULE)

Operation (deployment) during a lateral collision

1. When the vehicle receives an impact from a lateral collision, the following sensors detect impact and convert the impact or the pressure into an electrical signal at the signal processing circuit.

- Crash sensor on side air bag sensor detects impact
- Crash sensor on SAS control module detects impact
- Pressure detection sensor on pressure sensor detects pressure

2. The side air bag sensor and the pressure sensor output an electrical signal to the SAS control module.

3. The SAS control module calculates the degree of impact at the determination/safing circuit based on the electrical signals from the side air bag sensor, crash sensor, and pressure sensor.

4. If the calculated degree of impact exceeds the previously set threshold, the SAS control module outputs an operation (deployment) signal at the output control circuit.

5. Each air bag module/pre-tensioner seat belt/lap pre-tensioner seat belt operates (deploys) based on the operation (deployment) signal from the SAS control module.

Roll over control

1. When the vehicle starts to rollover, the roll rate sensor in the SAS control module detects the vehicle rolling angle speed, and the low-G sensor in the SAS control module detects lateral and vertical accelerations.

2. When the angular speed detected by the roll rate sensor exceeds the specification, an initial rollover condition is determined and the operational circuit calculates the rolling angle based on the angular speed detected by the roll rate sensor.

3. When the rollover control operation conditions of angular speed and rolling angle are met and the vehicle is determined to be in a rollover condition based on the acceleration detected by the low-G sensor, an electronic signal is output to the output signal circuit.

4. The output signal circuit completes an ignition circuit, and an operation (deployment) signal is sent to the air bag module, pre-tensioner seat belts and lap pre-tensioner seat belts indicated in the table below.

×:Possible-:Not possible

SAS CONTROL MODULE [TWO-STEP DEPLOYMENT CONTROL SYSTEM]

Purpose

- The SAS control module controls the air bag system.

Function

Backup power supply function

- The backup power supply function enables the condenser to discharge and supply power to assure air bag system operation/deployment properly for a specified time even if the power supply to the SAS control module is cut due to a collision.

Vehicle travel condition detection function

- The SAS control module detects the vehicle travel conditions based on the signals from the following integrated sensors.
- The SAS control module sends the vehicle travel conditions detected by the following sensors to the DSC HU/CM via a CAN signal.

Sensor	Signal
Low-G sensor	• Vehicle longitudinal acceleration speed signal • Vehicle lateral acceleration speed signal
Yaw rate sensor	• Vehicle steering angle speed signal
Roll rate sensor	• Vehicle lateral roll speed signal

Collision detection signal output function

- The air bag system output signals to the following units when it determines that it

necessary for the SAS control module to operate (deploy) the air bag system.

- When each unit receives the signal, they perform controls to mediate damage from the vehicle collision.

Related unit	Signal	Reference
• Front body control module (FBCM) • Rear body control module (RBCM)	Secondary collision reduction signal	(See **POWER DOOR LOCK SYSTEM**.) (See **EXTERIOR LIGHTING SYSTEM**.)
• PCM • Instrument cluster • Center display	Fuel-cut request signal	(See **FUEL INJECTION CONTROL SYSTEM [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) (See **ENTERTAINMENT SYSTEM [WITH CENTER DISPLAY]**.)

Construction

- SAS control module installed under the rear console.
- The following circuits are built into the SAS control module.
    - Determination and safing circuit
    - Output control circuit
- The following sensors are built into the SAS control module.
    - Crash sensor
    - Yaw rate sensor
    - Low-G sensor
    - Roll rate sensor

Operation

- For the operation, refer to AIR BAG SYSTEM (See **AIR BAG SYSTEM [TWO-STEP DEPLOYMENT CONTROL SYSTEM]**.)

Fail-safe

- If the SAS control module performance/function cannot be maintained due to any cause, the fail-safe function stops air bag system control and flashes the air bag system warning light to prevent the air bags from operating (deploying) accidentally.

2014 - Mazda3 - Restraints

AIR BAG SYSTEM WARNING LIGHT [TWO-STEP DEPLOYMENT CONTROL SYSTEM]

Purpose

- The air bag system warning light notifies the driver of a malfunction in the SRS air bag system.

Function

- If a malfunction occurs in the SRS air bag system, the air bag system warning light illuminates or flashes.

- For vehicles with center display, a warning message in the center display is displayed when the air bag system warning light is turned on or flashing. For the message content and verification method, refer to the CENTER DISPLAY. (See **CENTER DISPLAY [WITH CENTER DISPLAY]**.)

Construction

- LEDs (light-emitting diode) have been adopted for the air bag system warning light.
- The air bag system warning light is built into the instrument cluster.

Operation

- When the ignition is switched ON, the instrument cluster illuminates the air bag system warning light for a specified period to indicate that the SRS air bag system is performing initialization diagnostics. If there is no malfunction in the SRS air bag system, the indicator light turns off.

- If the SAS control module detects a malfunction in the SRS air bag system, it sends a warning signal to the instrument cluster via CAN communication. The instrument cluster illuminates or flashes the air bag system warning light based on the warning signal it receives to display the DTC.
- If there is a malfunction in the SRS air bag system, the air bag system warning light displays DTCs according to the following patterns:

- If there are several malfunctions in the SRS air bag system, the DTC of the highest priority ranking is displayed first.

Fail-safe

- Function not equipped.

2014 - Mazda3 - Restraints

AIR BAG SYSTEM WARNING ALARM [TWO-STEP DEPLOYMENT CONTROL SYSTEM]

Purpose

- The air bag system warning alarm notifies the driver that a malfunction occurred in the air bag system instead of the air bag system warning light.

Function

- If a malfunction occurs in the air bag system while the air bag system warning light cannot illuminate, the air bag system warning alarm sounds.
- If all of the following conditions are met, the SAS control module sends the air bag system warning alarm request signal to the instrument cluster.
  - SAS control module detects DTC B00D2:29 (air bag system warning light (during communication related malfunction))
  - SAS control module detects DTCs other than DTC B00D2:29 (Except for air bag system warning light does not illuminate DTC)

- When the instrument cluster receives the air bag system warning alarm request signal sent from the SAS control module via the CAN signal, the air bag system warning alarm sounds.
- The air bag system warning alarm sound pattern is as shown in the figure.

Construction

- The air bag system warning alarm sounds a buzzer in the instrument cluster.

Operation

1. When the ignition is switched ON (while engine is stopped or running), the instrument cluster receives (1) the air bag system warning alarm request signal from the SAS control module.

2. The instrument cluster microcomputer turns the transistor on (2) based on the air bag system warning alarm request signal.
3. When the transistor turns on, the ground circuit of the alarm is established and the alarm sounds (3).

Fail-safe

- Function not equipped.

2014 - Mazda3 - Restraints

PASSENGER SENSING SYSTEM [TWO-STEP DEPLOYMENT CONTROL SYSTEM]

Purpose

- The passenger sensing system detects whether or not there is an occupant on the passenger seat to control the operation (deployment) of the passenger-side air bag system corresponding to the detected condition.

Function

- Measures the total seated weight on the passenger-side seat, determines whether there is an adult or child present (including a child-restraint seat), or that it is empty, and then controls operation (deployment) or non-operation (non-deployment) of the passenger-side air bag module, pre-tensioner seat belt and lap pre-tensioner seat belt.

Construction

- Consists of seat weight sensors installed above the passenger-side seat rails, a seat weight sensor control module installed on the back side of the passenger-side seat cushion, the PAD indicator (indicator unit), and SAS control module installed in the console.

Operation

1. The load on the passenger-side front seat is converted into an electric signal by the strain gauge built into the seat weight sensor, and this signal is sent to the seat weight sensor control module.

2. The electronic signals from the four seat weight sensor are used for calculation by the seat weight sensor control module, which divides the result and then determines whether there is an adult or child (including a child-restraint seat) in the passenger-side seat, or that it is empty. The determined result is sent to the SAS control module.

3. The SAS control module performs control based on this determined result as shown in the following table when the module detects a level of impact requiring operation (deployment).

×: Possible-: Not possible

Determined result	Determined weight	Passenger-side air bag module operation (deployment)	Passenger-side side air bag module operation (deployment)	Passenger-side pre-tensioner seat belt operation (deployment)	Passenger-side lap pre-tensioner seat belt operation (deployment)	PAD indicator
Adult	Approx. **42 kg {93 lb}** or more*1	×	×	×	×	Not illuminated
Child (including child-restraint seat)	Approx. **30 kg {66 lb}** or less*1	-	-	-	-	Illuminated
Empty	Approx. **0 kg {0 lb}**	-	-	-	-	Illuminated

NOTE:

- The passenger-side air bag module, the passenger-side side air bag module and the passenger-side pre-tensioner seat belt system will be turned off as the total seated weight drops toward **30 kg {66 lb}** and they will be turned on again before the weight exceeds **42 kg {93 lb}**.

*1

Figure is the determination result when a weight is placed on the seat surface. It does not indicate the weight of a passenger. The amount of weight that the system determines differs depending on how the passenger is seated on the seat.

CAUTION:

If any of the following work is performed, perform the seat weight sensor calibration using the Mazda Modular Diagnostic System (M-MDS).

- Replacement with a new seat weight sensor
- Replacement with a new seat weight sensor control module
- Replacement with new passenger-side seat parts
- Disassembly of the passenger-side seat

- If any of the following work is performed, perform the seat weight sensor inspection using the Mazda Modular Diagnostic System (M-MDS).
  - Removal of the passenger-side seat
  - Loosening and retightening of passenger-seat fixing bolts
  - Or, the vehicle is involved in a collision

DRIVER-SIDE AIR BAG MODULE [TWO-STEP DEPLOYMENT CONTROL SYSTEM]

Purpose

- When the driver-side air bag module receives an impact from a frontal or frontal offset collision, the operation (deployment) of the air bag mediates the impact to the head and face of the driver.

Function

- When the driver-side air bag module receives an impact from a frontal or frontal offset collision, the air bag is operated (deployed) by the operation signal sent from the SAS control module.

Construction

- The driver-side air bag module is installed to the center area of the steering wheel.
- The driver-side air bag module consists of the inflator and air bag.
- The inflator consists of the igniter, inflation agent, gas generating agent and filter.

Operation

Inflator operation

- The driver-side air bag module operates (deploys) the air bag by activating the internal inflator.
- The inflator operates (deploys) in the following order:

Inflator No.1

1. When the driver-side air bag module receives an operation (deployment) signal from the SAS control module, the igniter built into inflator No.1 builds up heat and ignites the inflation agent.

2. The ignition of the inflation agent causes the combustion of a gas-generating agent which releases nitrogen gas.

3. The nitrogen gas is cooled at the filter and the filtrate is injected into the air bag.

Inflator No.2

1. When the driver-side air bag module receives an operation (deployment) signal from the SAS control module, the igniter built into inflator No.2 builds up heat and ignites the inflation agent.

2. The ignition of the inflation agent causes the combustion of a gas-generating agent which releases nitrogen gas.

3. The nitrogen gas is cooled at the filter and the filtrate is injected into the air bag.

Fail-safe

- Function not equipped.

2014 - Mazda3 - Restraints

PASSENGER-SIDE AIR BAG MODULE [TWO-STEP DEPLOYMENT CONTROL SYSTEM]

Purpose

- When the passenger-side air bag module receives an impact from a frontal or frontal offset collision, the operation (deployment) of the air bag mediates the impact to the head and face of the front passenger.

Function

- When the passenger-side air bag module receives an impact from a frontal or frontal offset collision, the air bag is operated (deployed) by the operation signal sent from the SAS control module.

- A twin-bag type air bag has been adopted for the passenger-side air bag module.
- The twin bags protect occupants by the following operations:
  - The head goes between the bags to softly restrain the face as a result of the low reaction force.
  - Occupant shoulders are supported by the projection of the bag to restrain the upper body of the occupant.

Construction

- The passenger-side air bag module is installed to the instrument panel.
- The passenger-side air bag module consists of the inflator and air bag.
- The inflator consists of the igniter, inflation agent, gas generating agent and filter.

Operation

- The passenger-side air bag module operates (deploys) the air bag by activating the internal inflator.
- The inflator operates (deploys) in the following order:

Inflator No.1

1. When the driver-side air bag module receives an operation (deployment) signal from the SAS control module, the igniter built into inflator No.1 builds up heat and ignites the inflation agent.

2. The ignition of the inflation agent causes the combustion of a gas-generating agent which releases nitrogen gas.

3. The nitrogen gas is cooled at the filter and the filtrate is injected into the air bag.

Inflator No.2

1. When the passenger-side air bag module receives an operation (deployment) signal from the SAS control module, the igniter built into inflator No.2 builds up heat and ignites the inflation agent.

2. The ignition of the inflation agent causes the combustion of a gas-generating agent which releases nitrogen gas.

3. The nitrogen gas is cooled at the filter and the filtrate is injected into the air bag.

Fail-safe

- Function not equipped.

2014 - Mazda3 - Restraints

SIDE AIR BAG MODULE [TWO-STEP DEPLOYMENT CONTROL SYSTEM]

Purpose

- When a side air bag module receives an impact from a lateral collision, the operation (deployment) of the air bag mediates the impact to the chest, stomach, and waist of the driver and front passenger.

Function

- When a side air bag module receives an impact from a lateral collision, the air bag is operated (deployed) by the operation signal sent from the SAS control module.

Construction

- The side air bag modules are installed on the door side of the front seat backs.
- The side air bag module consists of the inflator and air bag.
- The inflator consists of an initiator, ignition chamber, gas-generating agent, and filter.

Operation

- The side air bag module operates (deploys) the air bag by activating the internal inflator.
- The inflator operates (deploys) in the following order:

1. When an operation (deployment) signal is received from the SAS control module, the initiator built into the inflator ignites.

2. The ignition of the initiator causes the ignition of the gas-generating agent.
3. The end of the ignition chamber is broken by the combustion gas pressure, and the combustion gas is supplied into the filter.
4. The combustion gas, which is cooled by the filter, is sprayed to the air bag through the diffuser (diffusion devise).

5. When the side air bag module operates (deploys), the air bag operates (deploys) while breaking open the seat back trim by the force of the gas sprayed out of the inflator.

Fail-safe

- Function not equipped.

2014 - Mazda3 - Restraints

CURTAIN AIR BAG MODULE [TWO-STEP DEPLOYMENT CONTROL SYSTEM]

Purpose

- When a curtain air bag module receives an impact from a lateral collision or a rollover, the operation (deployment) of the air bag mediates the impact to the head of the driver and front passenger.

Function

- When a curtain air bag module receives an impact from a lateral collision, the air bag is operated (deployed) by the operation signal sent from the SAS control module.

Construction

- The curtain air bag module is installed along the roof edge between the A and C pillars.
- The curtain air bag module consists of the inflator and air bag.
- The inflator consists of an initiator, gas-generating agent, charged gas, and an orifice.

Operation

- The curtain air bag module operates (deploys) the air bag by activating the internal inflator.
- The inflator operates (deploys) in the following order:

1. When an operation (deployment) signal is received from the SAS control module, the initiator built into the inflator ignites.

2. The ignition of the initiator causes the ignition of the gas-generating agent. The section of the wall from which the air bag deploys is broken by this impact wave.

3. The charged gas and the gas generated by the gas-generating agent mix and pass through the orifice.

4. The combined gas, which passed though the orifice, is sprayed into the air bag through the diffuser (diffusion devise).

5. When the curtain air bag module operates (deploys), the air bag operates (deploys) while breaking open the A-pillar trim and headliner by the force of the combined gas sprayed out of the inflator.

Fail-safe

- Function not equipped.

2014 - Mazda3 - Restraints

PRE-TENSIONER SEAT BELT [TWO-STEP DEPLOYMENT CONTROL SYSTEM]

Purpose

- The pre-tensioner seat belt retracts and tightens the seat belt webbing to protect the front passengers during a collision.

Function

- The pre-tensioner seat belts operate (deploy) based on the operation signal from the SAS control module to instantly retract and tighten the belt webbing, restraining the driver and front passenger.
- The pre-tensioner seat belts operate in conjunction with the lap pre-tensioner seat belts.

Construction

- The pre-tensioner seat belt is installed to the front seat belt retractor.

- The pre-tensioner seat belt consists of the following parts shown in the figure:

Operation

Normal operation (pre-tensioner non-operation)

- Normally, there is a gap between the locking base and the ring gear.
- The ring gear rotates in conjunction with the withdrawal and retraction of the front seat belts, however, in the pre-tensioner part it is kept separated.

Pre-tensioner activation

1. The gas generator produces gas when it receives an operation signal from the SAS control module.
2. The ball in the cylinder is pressed by the gas pressure and the ring gear is removed from its securement.
3. The ring gear is engaged with the locking base and the force of the ball being pressed out is transmitted to the retraction shaft.
4. The front seat belt is retracted in conjunction with the rotation of the retraction shaft.

Fail-safe

- Function not equipped.

2014 - Mazda3 - Restraints

LAP PRE-TENSIONER SEAT BELT [TWO-STEP DEPLOYMENT CONTROL SYSTEM]

Purpose

- The lap pre-tensioner seat belts retract and tighten the seat belt webbing to protect the front passengers during a collision.

Function

- The lap pre-tensioner seat belts operate (deploy) based on the operation signal from the SAS control module to instantly retract and tighten the belt webbing, restraining the driver.
- The lap pre-tensioner seat belts operate in conjunction with the pre-tensioner seat belts.

Construction

- The lap pre-tensioner seat belts are installed to the anchors of the front seat belts.

- The lap pre-tensioner seat belts consist of the following parts shown in the figure:

Operation

Lap pre-tensioner activation

1. The gas generator emits a spark when a signal is received from the SAS control module, causing gas to form.
2. The gas pressure pushes the piston inside the cylinder, pulling the lead wire.

3. As the lead wire is pulled, the part of the seat belt attached to the wire is also pulled.

4. The slack in the belt is tightened by the front seat belt being pulled by the lap pre-tensioner seat belt and the seat belt ELR mechanism, restraining the passengers.

After activation

1. After operating (deploying) the pre-tensioner, the lead wire is pulled back. However the front seat belts are locked by activation of the stopper function so that the belt webbing is not released.

2. The restraint force of the seat belt is adjusted by the front seat belt load limiter mechanism, preventing injury to the driver and passenger from seat belt pressure.

Fail-safe

- Function not equipped.

2014 - Mazda3 - Restraints

CRASH ZONE SENSOR [TWO-STEP DEPLOYMENT CONTROL SYSTEM]

Purpose

- The crash zone sensor detects an impact during a frontal or frontal offset collision to the vehicle.

Function

- The crash zone sensor converts the detected impact to an electrical signal.

Construction

- The crash zone sensor consists of the crash sensor and signal processing circuit.
- The crash zone sensor is installed to the shroud panel of the front bumper backside.
- Two crash zone sensors are installed for independent collision detection on the left and right due to a small over-lap collision.

Operation

- For the operation, refer to AIR BAG SYSTEM (See **AIR BAG SYSTEM [TWO-STEP DEPLOYMENT CONTROL SYSTEM]**.)

Fail-safe

- Function not equipped.

2014 - Mazda3 - Restraints

SIDE AIR BAG SENSOR [TWO-STEP DEPLOYMENT CONTROL SYSTEM]

Purpose

- The side air bag sensor detects an impact during a lateral collision.

Function

- The side air bag sensor converts the detected impact to an electrical signal.

Construction

- The side air bag sensor consists of the crash sensor and signal processing circuit.
- Side air bag sensor is placed in the trunk side trim of the C-pillar.

Operation

- For the operation, refer to AIR BAG SYSTEM (See **AIR BAG SYSTEM [TWO-STEP DEPLOYMENT CONTROL SYSTEM]**.)

Fail-safe

- Function not equipped.

2014 - Mazda3 - Restraints

PRESSURE SENSOR [TWO-STEP DEPLOYMENT CONTROL SYSTEM]

Purpose

- The pressure sensor detects deformation of a front door by a collision to the vehicle side and shortens the time to operate (deploy) the air bag from the collision.

Function

- The pressure sensor converts the pressure of the air against the internal part of a front door to an electrical signal when the vehicle receives a side impact from a collision.

Construction

- The pressure sensor consists of the pressure detection sensor and signal processing circuit.
- Located inside the center of the front doors.

Operation

1. If the vehicle receives a side impact and a front door deforms, the pressure of the air inside the sealed front door is added and air flows into the opening of the pressure sensor.

2. The amount of air flowing into the pressure sensor is detected by the pressure detection sensor and the pressure value at the signal processing circuit is converted to an electrical signal.

3. The pressure sensor sends the converted electrical signal to the SAS control module.

Fail-safe

- Function not equipped.

2014 - Mazda3 - Restraints

AIR BAG SYSTEM [STANDARD DEPLOYMENT CONTROL SYSTEM]

Outline

- During a collision, the air bag system operates (deploys) the air bag to assist the occupant protection function for the seat belt.

  WARNING:

  - The air bag system assists the occupant protection function for the seat belt, the intended effect of the SRS air bag system cannot be obtained if the seat belt is not fastened correctly. When driving the vehicle, always fasten the seat belt correctly.

Function

- For the air bag system, the SAS control module calculates the degree of impact based on a collision detection signal from the following each sensor, and operates (deploys) the required parts.

Detection signal	Sensor			Operation (deployment) part				
	SAS control module (integrated sensor)	Crash zone sensor	Side air bag sensor*1 (driver/passenger-side)	Driver-side air bag module	Passenger-side air bag module	Curtain air bag module*1 (driver/passenger-side)	Side air bag module*1 (driver/passenger-side)	Pre-tensioner seat belt (driver/passenger-side)
Detects frontal or frontal offset collision	×	×	-	×	×	-	-	×
Detects lateral collision	×	-	×	-	-	×*2	×*2	×
Detects collision from rear of vehicle	×	-	-	-	-	-	-	-

*1 **With side air bag system**

*2 **Operates (deploys) the air bag module on the side where the collision is detected.**

System conditions display function

- The air bag system detects each part condition and sends a system condition signal from the SAS control module to the instrument cluster.
- The instrument cluster displays the following warning lights and sounds alarm based on the system condition signal.

Warning light and alarm	Reference
Air bag system warning light	(See **AIR BAG SYSTEM WARNING LIGHT [STANDARD DEPLOYMENT CONTROL SYSTEM]**.)

Air bag system warning alarm	(See **AIR BAG SYSTEM WARNING ALARM [STANDARD DEPLOYMENT CONTROL SYSTEM]**.)
Seat belt warning light	(See **SEAT BELT WARNING ALARM**.) (See **INDICATOR UNIT**.)

Structural View

System Wiring Diagram

Operation

Operation (deployment) during a frontal or frontal offset collision

1. When the vehicle receives an impact from a frontal or frontal offset collision, the crash sensors built into the crash zone sensor, and the SAS control module detect the impact and convert the impact into an electrical signal at the signal processing circuit.

2. The crash zone sensor outputs the electrical signal to the SAS control module.

3. The SAS control module calculates the degree of impact at the determination and safing circuit based on the electrical signals from the crash zone sensor and the crash sensor.

4. If the calculated degree of impact exceeds the previously set threshold, the SAS control module outputs an operation (deployment) signal to each air bag module/pre-tensioner seat belt at the output control circuit.

5. Each air bag module/pre-tensioner seat belt operates (deploys) based on the operation (deployment) signal from the SAS control module.

Operation (deployment) during a lateral collision (with side air bag system)

1. When the vehicle receives an impact from a lateral collision, the crash sensors built into the side air bag sensor, and the SAS control module detect the impact and convert the impact into an electrical signal at the signal processing circuit.

2. The side air bag sensor outputs the electrical signal to the SAS control module.

3. The SAS control module calculates the degree of impact at the determination and safing circuit based on the electrical signals from the side air bag sensor and the crash sensor.

4. If the calculated degree of impact exceeds the previously set threshold, the SAS control module outputs an operation (deployment) signal to each air bag module/pre-tensioner seat belt at the output control circuit.

5. Each air bag module/pre-tensioner seat belt operates (deploys) based on the operation (deployment) signal from the SAS control module.

2014 - Mazda3 - Restraints

SAS CONTROL MODULE [STANDARD DEPLOYMENT CONTROL SYSTEM]

Purpose

- The SAS control module controls the air bag system.

Function

Backup power supply function

- The backup power supply function enables the condenser to discharge and supply power to assure air bag system operation/deployment properly for a specified time even if the power supply to the SAS control module is cut due to a collision.

Vehicle travel condition detection function

- The SAS control module detects the vehicle travel conditions based on the signals from the following integrated sensors.
- The SAS control module sends the vehicle travel conditions detected by the following sensors to the DSC HU/CM via a CAN signal.

Sensor	Signal
Low-G sensor	• Vehicle longitudinal acceleration speed signal • Vehicle lateral acceleration speed signal
Yaw rate sensor	• Vehicle steering angle speed signal

Collision detection signal output function

- The air bag system output signals to the following units when it determines that it necessary for the SAS control module to operate (deploy) the air bag system.
- When each unit receives the signal, they perform controls to mediate damage from the

vehicle collision.

Related unit	Signal	Reference
• Front body control module (FBCM) • Rear body control module (RBCM)	Secondary collision reduction signal	(See **POWER DOOR LOCK SYSTEM**.) (See **EXTERIOR LIGHTING SYSTEM**.)
• PCM • Instrument cluster • Center display	Fuel-cut request signal	(See **FUEL INJECTION CONTROL SYSTEM [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) (See **ENTERTAINMENT SYSTEM [WITH CENTER DISPLAY]**.)

Construction

- SAS control module installed under the rear console.
- The following circuits are built into the SAS control module.
    - Determination and safing circuit
    - Output control circuit
- The following sensors are built into the SAS control module.
    - Crash sensor
    - Yaw rate sensor
    - Low-G sensor

Operation

- For the operation, refer to AIR BAG SYSTEM (See **AIR BAG SYSTEM [STANDARD DEPLOYMENT CONTROL SYSTEM]**.)

Fail-safe

- If the SAS control module performance/function cannot be maintained due to any cause, the fail-safe function stops air bag system control and flashes the air bag system warning light to prevent the air bags from operating (deploying) accidentally.

SAS CONTROL MODULE [STANDARD DEPLOYMENT CONTROL SYSTEM]

2014 - Mazda3 - Restraints

AIR BAG SYSTEM WARNING LIGHT [STANDARD DEPLOYMENT CONTROL SYSTEM]

Purpose

- The air bag system warning light notifies the driver of a malfunction in the SRS air bag system.

Function

- If a malfunction occurs in the SRS air bag system, the air bag system warning light illuminates or flashes.

- For vehicles with center display, a warning message in the center display is displayed when the air bag system warning light is turned on or flashing. For the message content and verification method, refer to the CENTER DISPLAY. (See **CENTER DISPLAY [WITH CENTER DISPLAY]**.)

Construction

- LEDs (light-emitting diode) have been adopted for the air bag system warning light.
- The air bag system warning light is built into the instrument cluster.

Operation

- When the ignition is switched ON, the instrument cluster illuminates the air bag system warning light for a specified period to indicate that the SRS air bag system is performing initialization diagnostics. If there is no malfunction in the SRS air bag system, the indicator light turns off.

- If the SAS control module detects a malfunction in the SRS air bag system, it sends a warning signal to the instrument cluster via CAN communication. The instrument cluster illuminates or flashes the air bag system warning light based on the warning signal it receives to display the DTC.
- If there is a malfunction in the SRS air bag system, the air bag system warning light displays DTCs according to the following patterns:

- If there are several malfunctions in the SRS air bag system, the DTC of the highest priority ranking is displayed first.

Fail-safe

- Function not equipped.

2014 - Mazda3 - Restraints

AIR BAG SYSTEM WARNING ALARM [STANDARD DEPLOYMENT CONTROL SYSTEM]

Purpose

- The air bag system warning alarm notifies the driver that a malfunction occurred in the air bag system instead of the air bag system warning light.

Function

- If a malfunction occurs in the air bag system while the air bag system warning light cannot illuminate, the air bag system warning alarm sounds.
- If all of the following conditions are met, the SAS control module sends the air bag system warning alarm request signal to the instrument cluster.
  - SAS control module detects DTC B00D2:29 (air bag system warning light (during communication related malfunction))
  - SAS control module detects DTCs other than DTC B00D2:29 (Except for air bag system warning light does not illuminate DTC)

- When the instrument cluster receives the air bag system warning alarm request signal sent from the SAS control module via the CAN signal, the air bag system warning alarm sounds.
- The air bag system warning alarm sound pattern is as shown in the figure.

Construction

- The air bag system warning alarm sounds a buzzer in the instrument cluster.

Operation

1. When the ignition is switched ON (while engine is stopped or running), the instrument cluster receives (1) the air bag system warning alarm request signal from the SAS control module.

2. The instrument cluster microcomputer turns the transistor on (2) based on the air bag system warning alarm request signal.
3. When the transistor turns on, the ground circuit of the alarm is established and the alarm sounds (3).

Fail-safe

- Function not equipped.

2014 - Mazda3 - Restraints

DRIVER-SIDE AIR BAG MODULE [STANDARD DEPLOYMENT CONTROL SYSTEM]

Purpose

- When the driver-side air bag module receives an impact from a frontal or frontal offset collision, the operation (deployment) of the air bag mediates the impact to the head and face of the driver.

Function

- When the driver-side air bag module receives an impact from a frontal or frontal offset collision, the air bag is operated (deployed) by the operation signal sent from the SAS control module.

Construction

- The driver-side air bag module is installed to the center area of the steering wheel.
- The driver-side air bag module consists of the inflator and air bag.
- The inflator consists of the igniter, inflation agent and gas generating agent and filter.

Operation

Inflator operation

- The driver-side air bag module operates (deploys) the air bag by activating the internal inflator.
- The inflator operates (deploys) in the following order:

1. When an operation (deployment) signal is received from the SAS control module, the igniter built into the inflator generates heat and ignites the inflation agent.

2. The ignition of the inflation agent causes the combustion of a gas generating agent which forms nitrogen gas.
3. The nitrogen gas is cooled at the filter and the filtrate is injected into the air bag.

Fail-safe

- Function not equipped.

2014 - Mazda3 - Restraints

PASSENGER-SIDE AIR BAG MODULE [STANDARD DEPLOYMENT CONTROL SYSTEM]

Purpose

- When the passenger-side air bag module receives an impact from a frontal or frontal offset collision, the operation (deployment) of the air bag mediates the impact to the head and face of the front passenger.

Function

- When the passenger-side air bag module receives an impact from a frontal or frontal offset collision, the air bag is operated (deployed) by the operation signal sent from the SAS control module.

Construction

- The passenger-side air bag module is installed to the instrument panel.
- The passenger-side air bag module consists of the inflator and air bag.
- The inflator consists of the igniter, inflation agent and gas generating agent and filter.

Operation

- The passenger-side air bag module operates (deploys) the air bag by activating the internal inflator.
- The inflator operates (deploys) in the following order:

1. When an operation (deployment) signal is received from the SAS control module, the igniter built into the inflator generates heat and ignites the inflation agent.

2. The ignition of the inflation agent causes the combustion of a gas generating agent which forms nitrogen gas.

3. The nitrogen gas is cooled at the filter and the filtrate is injected into the air bag.

Fail-safe

- Function not equipped.

2014 - Mazda3 - Restraints

SIDE AIR BAG MODULE [STANDARD DEPLOYMENT CONTROL SYSTEM]

Purpose

- When a side air bag module receives an impact from a lateral collision, the operation (deployment) of the air bag mediates the impact to the chest, stomach, and waist of the driver and front passenger.

Function

- When a side air bag module receives an impact from a lateral collision, the air bag is operated (deployed) by the operation signal sent from the SAS control module.

Construction

- The side air bag modules are installed on the door side of the front seat backs.
- The side air bag module consists of the inflator and air bag.
- The inflator consists of an initiator, ignition chamber, gas-generating agent, and filter.

Operation

- The side air bag module operates (deploys) the air bag by activating the internal inflator.
- The inflator operates (deploys) in the following order:

1. When an operation (deployment) signal is received from the SAS control module, the initiator built into the inflator ignites.

2. The ignition of the initiator causes the ignition of the gas-generating agent.
3. The end of the ignition chamber is broken by the combustion gas pressure, and the combustion gas is supplied into the filter.
4. The combustion gas, which is cooled by the filter, is sprayed to the air bag through the diffuser (diffusion devise).

5. When the side air bag module operates (deploys), the air bag operates (deploys) while breaking open the seat back trim by the force of the gas sprayed out of the inflator.

Fail-safe

- Function not equipped.

2014 - Mazda3 - Restraints

CURTAIN AIR BAG MODULE [STANDARD DEPLOYMENT CONTROL SYSTEM]

Purpose

- When a curtain air bag module receives an impact from a lateral collision, the operation (deployment) of the air bag mediates the impact to the head of the driver and front passenger.

Function

- When a curtain air bag module receives an impact from a lateral collision, the air bag is operated (deployed) by the operation signal sent from the SAS control module.

Construction

- The curtain air bag module is installed along the roof edge between the A and C pillars.
- The curtain air bag module consists of the inflator and air bag.
- The inflator consists of an initiator, gas-generating agent, charged gas, and an orifice.

Operation

- The curtain air bag module operates (deploys) the air bag by activating the internal inflator.
- The inflator operates (deploys) in the following order:

1. When an operation (deployment) signal is received from the SAS control module, the initiator built into the inflator ignites.

2. The ignition of the initiator causes the ignition of the gas-generating agent. The section of the wall from which the air bag deploys is broken by this impact wave.

3. The charged gas and the gas generated by the gas-generating agent mix and pass through the orifice.

4. The combined gas, which passed though the orifice, is sprayed into the air bag through the diffuser (diffusion devise).

5. When the curtain air bag module operates (deploys), the air bag operates (deploys) while breaking open the A-pillar trim and headliner by the force of the combined gas sprayed out of the inflator.

Fail-safe

- Function not equipped.

2014 - Mazda3 - Restraints

PRE-TENSIONER SEAT BELT [STANDARD DEPLOYMENT CONTROL SYSTEM]

Purpose

- The pre-tensioner seat belt retracts and tightens the seat belt webbing to protect the front passengers during a collision.

Function

- The pre-tensioner seat belts operate (deploy) based on the operation signal from the SAS control module to instantly retract and tighten the belt webbing, restraining the driver and front passenger.

Construction

- The pre-tensioner seat belt is installed to the front seat belt retractor.

- The pre-tensioner seat belt consists of the following parts shown in the figure:

Operation

Normal operation (pre-tensioner non-operation)

- Normally, there is a gap between the locking base and the ring gear.
- The ring gear rotates in conjunction with the withdrawal and retraction of the front seat belts, however, in the pre-tensioner part it is kept separated.

Pre-tensioner activation

1. The gas generator produces gas when it receives an operation signal from the SAS control module.
2. The ball in the cylinder is pressed by the gas pressure and the ring gear is removed from its securement.
3. The ring gear is engaged with the locking base and the force of the ball being pressed out is transmitted to the retraction shaft.
4. The front seat belt is retracted in conjunction with the rotation of the retraction shaft.

Fail-safe

- Function not equipped.

2014 - Mazda3 - Restraints

CRASH ZONE SENSOR [STANDARD DEPLOYMENT CONTROL SYSTEM]

Purpose

- The crash zone sensor detects an impact during a frontal or frontal offset collision to the vehicle.

Function

- The crash zone sensor converts the detected impact to an electrical signal.

Construction

- The crash zone sensor consists of the crash sensor and signal processing circuit.
- The crash zone sensor is installed to the shroud panel of the front bumper backside.

Operation

- For the operation, refer to AIR BAG SYSTEM (See **AIR BAG SYSTEM [STANDARD DEPLOYMENT CONTROL SYSTEM]**.)

Fail-safe

SEAT BELT

Outline (With Two-step Deployment Air Bag Control System)

- Three-point front seat belts with the following functions for front seat passengers have been adopted.
  - ELR (Emergency Locking Retractor: emergency locking mechanism)
  - ALR (Automatic Locking Retractor: child-restraint seat locking mechanism) (passenger-side)
  - Load limiter
  - Pre-tensioner seat belt (See **PRE-TENSIONER SEAT BELT [TWO-STEP DEPLOYMENT CONTROL SYSTEM]**.)
  - Lap pre-tensioner seat belt (See **LAP PRE-TENSIONER SEAT BELT [TWO-STEP DEPLOYMENT CONTROL SYSTEM]**.)
- Three-point seat belts with the following functions for rear seat passengers have been adopted.
  - ELR
  - ALR

Outline (With Standard Deployment Air Bag Control System)

- Three-point front seat belts with the following functions for front seat passengers have been adopted.
  - ELR
  - Load limiter
  - Pre-tensioner seat belt (See **PRE-TENSIONER SEAT BELT [STANDARD DEPLOYMENT CONTROL SYSTEM]**.)
- Three-point rear seat belts with the following functions for rear seat (left and right seats) passengers adopted.
  - ELR
- Two-point seat belt for rear seat passenger (center seat) adopted.

Structural View

Purpose

- The seat belts prevent the driver and passengers from being thrown from their seats and injured due to an emergency vehicle stop or impact by being hit.

Function

- The seat belts are belt type safety devices which restrain the driver and passengers in their seats.
- The specifications for each seat belt are as indicated in the table.

With two-step deployment air bag control system

Seat belt	Type	Function
Front seat belt (Driver-side)	Three-point	• Load limiter • ELR • Pre-tensioner seat belt • Lap pre-tensioner seat belt
Front seat belt (Passenger-side)	Three-point	• Load limiter • ELR • ALR • Pre-tensioner seat belt • Lap pre-tensioner seat belt
Rear seat belt	Three-point	• ELR • ALR

With standard deployment air bag control system

Seat belt	Type	Function
Front seat belt (Driver-side, passenger-side)	Three-point	• Load limiter • ELR • Pre-tensioner seat belt
Rear seat belt (RH, LH)	Three-point	ELR
Rear center seat belt	Two-point	—

Load limiter

- The load limiter adjusts the restraint force of the seat belt by slightly loosening the seat belt tightened by the pre-tensioner operation, preventing injury to the driver and passenger from seat belt pressure.

ELR

- If a sudden force is applied to the seat belt such as by a collision or emergency braking, the ELR locks the seat belt so that it cannot be pulled out any more.

ALR

- When the seat belt is pulled out and fastened, the ALR locks the seat belt at that length and it cannot be pulled out any more.
- The ALR is mainly used for installing a child-restraint.

Pre-tensioner seat belt

- Refer to PRE-TENSIONER SEAT BELT. (See **PRE-TENSIONER SEAT BELT [STANDARD DEPLOYMENT CONTROL SYSTEM]**.) (See **PRE-TENSIONER SEAT BELT [TWO-STEP DEPLOYMENT CONTROL SYSTEM]**.)

Lap pre-tensioner seat belt

- Refer to LAP PRE-TENSIONER SEAT BELT. (See **LAP PRE-TENSIONER SEAT BELT [TWO-STEP DEPLOYMENT CONTROL SYSTEM]**.)

Construction

- For the three-point seat belt, the seat belt is secured to the drum in the retractor and wrapped.

- The seat belt is pulled out or retrieved by the rotation of the drum to adjust the length of the seat belt.

Fail-safe

- Function not equipped.

FEATURES

- The following window glass has been adopted.
    - Windshield
    - Front door glass
    - Rear door glass
    - Rear door quarter glass
    - Rear window glass
    - Outer mirror glass
- The following mirrors have been adopted.
    - Power outer mirror
    - Rearview mirror
    - Auto-dimming mirror (With auto-dimming mirror)
- Rear window defroster has been adopted on the rear window glass.
- Heated outer mirror has been adopted on the power outer mirrors. (With heated outer mirror system)

- UV protection glass has been adopted. (With UV protection glass)
- The following systems have been adopted to the front seats.
    - Power seat system (With power seat system)
    - Seat warmer system (With seat warmer system)
- A side air bag module is built into the front seats.
- The following two types of child restraint seat anchors have been adopted which enable securing of ISOFIX-applicable child restraint seats on the rear seat.
    - Top tether anchor
    - ISOFIX anchor
- The following security and locks system has been adopted.
    - Power door lock system
    - Liftgate opener system
    - Trunk lid opener system
    - Keyless entry system
    - Advanced keyless entry system
    - Push button start system
    - Immobilizer system
    - Theft-deterrent system
- An electric sunroof with tilt up mechanism has been adopted.
- A deflector has been added to reduce noise.
- A system control using pulse sensors (Hall effect switches) has been adopted for system simplification.
- A sunroof motor with an integrated CPU has been adopted.
- Front combination lights have been adopted with parts related to the front exterior lights grouped and housed together.
- The following systems have been adopted to the headlights.
    - Discharge headlight system (With discharge headlight system)
    - Auto light system (With auto light system)
    - Headlight manual leveling system (With headlight manual leveling system)
    - Headlight auto leveling system (With headlight auto leveling system)
    - Adaptive front lighting system (AFS) (With adaptive front lighting system (AFS))
    - High beam control (HBC) system (With high beam control (HBC) system)
    - Auto light-off system

- Front fog lights have been adopted. (With front fog lights)
- LED type parking lights have been adopted. (With discharge headlight system)
- LED type side turn lights have been adopted. (With side turn light)
- LED type brake lights/taillights have been adopted. (With LED type brake light/taillight)
- LED type high-mount brake light has been adopted.
- A room light control system has been adopted in which illumination time and illumination level of the room lights change.
- The following wiper/washer system has been adopted.
    - Windshield wiper/washer system
    - Rear wiper/washer system (5HB)
    - Auto wiper system (With auto wiper system)
    - Washer fluid-level warning system (With washer fluid-level sensor)
- The following entertainment system has been adopted.
    - Entertainment system (Without center display)
    - Entertainment system (With center display)
    - Car-navigation system (With car-navigation system)
    - Park assist system (With park assist system)
- An instrument cluster integrated with an active driving display has been adopted which displays the driving speed, warning screen, and direction of vehicle travel (With car-navigation system). (Type A instrument cluster)
- A blind spot monitoring (BSM) system has been adopted which notifies the driver of vehicles approaching from behind on the left or right adjacent lanes in the driver's blind spot, and warns the driver if the driver tries to change lanes to the side of the approaching vehicle. (With blind spot monitoring (BSM) system)
- A lane departure warning system (LDWS) has been adopted which recognizes vehicle lane lines on the road using the forward sensing camera (FSC) installed to the windshield and notifies the driver if the vehicle may depart from its lane unbeknownst to the driver. (With lane departure warning system (LDWS))
- An indicator unit has been adopted which displays the passenger seat belt warning light and PAD indicator light.
- Active air shutter system have been adopted.
- A front body control module (FBCM) has been adopted for the vehicle front which controls systems such as the headlights, windshield wipers, and turn lights.
- A rear body control module (RBCM) has been adopted for the vehicle rear which controls systems such as the power door lock, rear wiper, and interior light.

BODY PANEL

Structural View

BODY PANEL

2014 - Mazda3 - Body and Accessories

BODY SHELL

Outline

- A straight structure has been adopted which is both highly rigid and light.
- A multi-load path structure has been adopted which assures a high level of impact safety.
- A ring structure has been adopted which improves the overall rigidity.

Structural View

Construction

Straight construction

- The straight shape of the frame creates a continuous configuration from the front to the rear.
- For sections of the frame that still require some curvature, continuous bonding with the horizontal frame was implemented and a closed sectional structure was made to the maximum extent possible.

Multi-load path construction

- Collision impact is distributed in multiple directions and absorbed efficiently.

Ring shape construction

- Overall body rigidity has been improved using a four-ring structure created by the upper body including the roof rail and B-pillar combined with the entire underbody reinforcement.
- Cabin deformation in a collision is suppressed by creating a ring structure.

Fail-safe

- Not applicable

2014 - Mazda3 - Body and Accessories

FRONT BUMPER

Purpose

- A thinner front bumper has been adopted for weight reduction and improved fuel economy.

Construction

- High rigidity material has been adopted on the front bumper for ensuring high rigidity.

Fail-safe

- Not applicable

2014 - Mazda3 - Body and Accessories

REAR BUMPER

Purpose, Function

- A thinner rear bumper has been adopted for weight reduction and improved fuel economy.

Construction

- High rigidity material has been adopted on the rear bumper for ensuring high rigidity.

Fail-safe

- Not applicable

2014 - Mazda3 - Body and Accessories

DOORS AND LIFTGATE

Structural view

2014 - Mazda3 - Body and Accessories

SIDE IMPACT BAR

Purpose, Function

- The side-impact bars prevent the doors from deforming inwards during a side-impact collision.

Construction

- The front door side-impact bar lower and rear door side-impact bar upper are corrugated in shape to assure high rigidity.

- The side-impact bars disperse the impact during a side-impact collision.

- Inward penetration of a front door during a side-impact collision is suppressed by positioning the upper and lower side-impact bars of the front door so that they overlap the hinge pillar and center pillar.
- Inward penetration of a rear door during a side-impact collision is suppressed by positioning the upper and lower side-impact bars of the rear door so that they overlap the center pillar and side sill.

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

DOOR MODULE PANEL

Purpose, Function

- The door module panels include parts integrated inside the doors and those belonging to the doors.

Construction

- Cellular plastic has been adopted in the hatch-marked areas of the door module panel for weight reduction.

FRONT DOOR MODULE PANEL

REAR DOOR MODULE PANEL

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

DOOR PANEL

Outline

- High rigidity, lightweight, and quietness have been realized by creating an integrated press structure for the door inner panel.

Construction

LH (EXAMPLES)

Fail-safe

- Function not equipped.

GLASS/WINDOWS/MIRRORS

Outline

- The following window glass has been adopted.
  - Windshield
  - Front door glass
  - Rear door glass
  - Rear door quarter glass
  - Rear window glass
  - Outer mirror glass
- The following mirrors have been adopted.
  - Power outer mirror
  - Rearview mirror
  - Auto-dimming mirror (with auto-dimming mirror)
- Rear window defroster has been adopted on the rear window glass.
- Heated outer mirror has been adopted on the power outer mirrors. (with heated outer mirror system)
- UV protection glass has been adopted. (with UV protection glass)

REAR WINDOW DEFROSTER/OUTER MIRROR HEATER

Outline

- Fogging is cleared from the rear window and outer mirror glass by heating of the filament.

Structural view

System wiring diagram

With full-auto air conditioner system

With manual air conditioner system

Construction

Rear window defroster

- The rear window defroster is inside the rear window glass.

Heated outer mirror

- The heated outer mirror filament is integrated in the outer mirror glass.

Operation

With full-auto air conditioner system

1. When the rear window defroster switch on the climate control unit is turned on, an ON/OFF control request signal is sent to the front body control module (FBCM) through the instrument cluster as a CAN signal.

2. When the front body control module (FBCM) receives the ON/OFF control request signal, it supplies the battery voltage to the rear window defroster relay.

3. When the battery voltage is supplied to the rear window defroster relay, a switch inside the rear window defroster relay is turned on.

4. When the switch inside the rear window defroster relay is turned on, the battery voltage is supplied to the rear window defroster/heated outer mirrors to operate them.

- When **approx. 15 min.** has elapsed after the rear window defroster switch was turned on, the timer control of the front body control module (FBCM) turns off the rear window defroster relay automatically to turn off the rear window defroster/heated outer mirror.
- When the rear window defroster switch is pressed while the rear window defroster/heated outer mirrors are operating, they stop operating.

With manual air conditioner system

1. When the rear window defroster switch on the climate control unit is turned on, a signal is sent from the climate control unit to the front body control module (FBCM) and the battery voltage is supplied to the rear window defroster relay.

2. When the battery voltage is supplied to the rear window defroster relay, a switch inside the rear window defroster relay is turned on.

3. When the switch inside the rear window defroster relay is turned on, the battery voltage is supplied to the rear window defroster/heated outer mirrors to operate them.

- When **approx. 15 min.** has elapsed after the rear window defroster switch was turned on, the timer control of the front body control module (FBCM) turns off the rear window defroster relay automatically to turn off the rear window defroster/heated outer mirror.
- When the rear window defroster switch is pressed while the rear window defroster/heated outer mirrors are operating, they stop operating.

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

POWER WINDOW SYSTEM

Outline

- A power window system that enables automatic opening/closing of the door glass has been adopted.
- The driver's side door glass can be opened/closed automatically or manually by operating the power window main switch.
- Front and rear passenger door glass can be opened/closed manually by operating the power window main switch or the power window sub switches.

Structural View

System Wiring Diagram

Function

Driver's seat

- Manual open/close
  - When the power window main switch is operated using the manual operation, the door glass opens/closes manually.
- Auto open/close
  - When the power window main switch is operated using the auto operation, the door glass opens/closes automatically.
- Power window system initial setting
  - Records the position of the driver's side door glass.
- Auto reverse pinch protection function
  - If an obstruction by a foreign object is detected during the auto close operation, the operation changes from close to open.
- IG OFF timer function
  - The driver's side power window can be operated using the power window main switch for **approx. 40 s** after the ignition is switched from ON (engine on or off) to ACC or OFF.
- IG OFF timer cancel
  - The IG OFF timer is canceled when a**pprox. 40 s** or more have elapsed since the ignition was switched to ACC or OFF or any door is opened during IG OFF timer operation.

Front passenger's seat and rear seats

- Manual open/close
  - When the power window main switch or power window subswitches is operated using the manual operation, the door glass opens/closes manually.
- IG OFF timer function
  - The front passenger's seat and rear seats power window can be operated using the power window subswitches for **approx. 40 s** after the ignition is switched from ON (engine on or off) to ACC or OFF.
- IG OFF timer cancel
  - The IG OFF timer is canceled when a**pprox. 40 s** or more have elapsed since the ignition was switched to ACC or OFF or any door is opened during IG OFF timer operation.

Construction

- A P/W CM is integrated in the power window main switch.
- The P/W CM controls the power window system based on the pulse signals from the power window motor.

Operation

Driver's side manual open/close operation (Example: close operation)

1. When the power window main switch is operated for manual close operation, the P/W CM receives a manual close signal. (1)
2. When the P/W CM receives a manual close signal, it turns on the close relay. (2)
3. When the close relay is turned on, the power window motor (RF) starts manual close operation.(3)

Driver's side auto open/close operation (Example: close operation)

1. When the power window main switch is operated for auto close operation, the P/W CM receives an auto close signal. (1)
2. When the P/W CM receives an auto close signal, it turns on the close relay. (2)
3. When the close relay is turned on, the power window motor (RF) starts auto close operation.(3)

Passenger's side and rear side manual open/close operation (Example: Passenger's side close operation)

1. When the power window subswitch is operated for manual close operation (1), the power window motor (LF) starts manual close operation.(2)

Power window system initial setting

1. The P/W CM records the driver's side door glass position when the switch is pulled and held **approx. 2 s** after the driver's side door glass is fully closed from the fully opened position with the ignition is switched ON (engine off or on).

- Performing the following procedures will reset the initial setting and disables auto operation. Re-perform the initial setting.
    - Negative battery cable is disconnected
    - Power window main switch connector is disconnected
    - Power window system power supply fuse is removed

Auto reverse pinch protection

1. When the P/W CM detects a change in the pulse signal from the power window motor for **0.3 s or more** during the auto close operation, it reverses the power window motor and the door glass opens **approx. 200 mm {7.87 in}** automatically.

IG OFF timer (Example: Manual close operation)

1. When the ignition is switched from ON (engine off or on) to ACC or OFF, the IG OFF timer function of the P/W CM is turned on and the power window main switch can be operated for **approx. 40 s** after IG OFF is detected.

2. When the power window main switch is operated for manual close operation while the IG OFF timer is on, the P/W CM receives a manual close signal.(1)

3. When the P/W CM receives a manual close signal, it turns on the close relay. (2)

4. When the close relay is turned on, the power window motor (RF) starts manual close operation.(3)

5. The P/W CM turns off the IG OFF timer function when **approx. 40 s** has elapsed since IG OFF is detected.

IG OFF timer cancel

1. The P/W CM detects the open/close conditions of all the doors based on the door open/close signal sent from the rear body control module (RBCM).

2. When a door open signal is sent from the rear body control module (RBCM) while the IG OFF timer is on, the IG OFF timer function is canceled.

Fail-safe

- When the P/W CM detects an error in the pulse signal (Hall effect switch), it switches the power window system to fail-safe mode to prevent incorrect operation.

Malfunction condition	Ignition is switched ON (engine on or off)	Ignition switched OFF	Recovery condition
P/W CM detected pulse 1 error (for pinching and door glass position detection) stop malfunction • Pulse 2 detected but pulse 1 is not detected during close or open operation	Auto operation is prohibited (Manual operation is enabled) Operation of power window main switch except for the driver's seat is prohibited	Auto and manual operations are prohibited	Pulse signals 1 and 2 detected normally during close operation, and re-detection of fully-closed position return/non-return ranges
P/W CM detected pulse 2 error (for door glass direction detection) stop malfunction • Pulse 1 detected but pulse 2 is not detected during close or open operation			
P/W CM detected pulse signal error (inversion of pulse 1 and pulse 2 input signals or large phase deviation between pulses 1 and 2) • Difference detected between the direction detected by the signals of pulses 1 and 2, and the actual direction during close or open operation			
P/W CM detected pulse 1 error (Non-return range lowering malfunction) • During close operation, a pulse 1 signal from the power window motor is detected more than the number of set times even after the window reaches the fully-closed position recorded by the power window main switch.			
P/W CM detected pulse 1 and 2 stop malfunction • Pulse signals 1 and 2 are not detected for 1 s after the open operation is started from the fully closed position			

2014 - Mazda3 - Body and Accessories

POWER WINDOW MOTOR

Purpose

The power window motor transmits rotation force to the power window regulator to open/close the door glass.

Function

The power window motor rotates clockwise/counterclockwise when it receives an open/close signal from the power window main switch or the power window subswitch.

Construction

- The power window motor consists of the following parts:
  - Motor
  - Connector
  - Gear
- Two Hall effect switches are located in the driver's side connector.
  - The Hall effect switches output pulse to the P/W CM.

Operation

- The Hall effect switch utilizes magnets set on a rotating axis to detect the motor rotation, and outputs a synchronized pulse to the P/W CM.
- The Hall effect switch 1 outputs one pulse cycle for each rotation of the power window motor axle, and the P/W CM detects motor rotation speed.
- Hall effect switch 2 outputs pulse according to the motor rotation in the same manner as Hall effect switch 1. The high and low pulse points of Hall effect switches 1 and 2 are different during opening and closing because the phase difference shifts by 90°, allowing the power window main switch to detect the rotational direction of the power window motor.

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

POWER WINDOW REGULATOR

Purpose

- The power window regulator moves the carrier plate up and down to open/close the door glass using the rotation force transmitted from the power window motor.

Function

- The power window regulator transmits the rotation force from the power window motor to the inner wire and moves the carrier plate up and down.

Construction

- The power window regulator consists of the following parts:
    - Drum housing
    - Regulator guide
    - Carrier plate
    - Inner wire
- The inner wire is assembled to the inner side of the regulator guide and wrapped to the drum housing.
- The carrier plate is fixed to the inner wire.

Operation

1. When the drum housing of the power window regulator receives the rotation force from the power window motor, it rotates in the same rotation direction as the power window motor.

2. When the drum housing rotates, the inner wire is pulled in the direction the drum housing rotates.

3. The carrier plate moves up and down according to the rotational direction of the inner wire.

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

POWER WINDOW MAIN SWITCH

Purpose

- Remote control of door glass open/close and power outer mirror adjustment are possible with occupant seated in the drivers seat.

Function

Power window main switch

- Manual
  - When the power window main switch is operated for manual open/close operation, it sends a manual open/close signal to the P/W CM (power window control module).
- Auto
  - When the power window main switch is operated for auto open/close operation, it sends an auto open/close signal to the P/W CM.
- Power cut
  - When the power-cut switch is pressed (contact point: Open), operation of the power window sub-switches for the front and rear passenger seats is disabled.

Power outer mirror switch

- Up-down/left-right adjustment
  - The power outer mirror switch switches the contact point according to the switch operation. As a result, the circuit to the up-down/left-right adjustment motor is switched.
- Left/right selection
  - The power outer mirror switch is used to select the side on which adjustment of the power outer mirror glass is desired.

Construction

- The power window main switch consists of the following parts:
  - Driver's side switch
  - Passenger's side switch
  - Rear side switch (LR)
  - Rear side switch (RR)
  - Power-cut switch
  - Power outer mirror switch
    - Up/down/left/right adjustment
    - Left/right selection
- The power window main switch has a built-in P/W CM, and controls the auto reverse pinch protection, IG OFF timer, and IG OFF timer cancel functions.

POWER WINDOW MAIN SWITCH

Operation

Power window main switch

1. Contact points for door glass opening/closing can be changed by operating the power window main switch. The P/W CM monitors the operation conditions of the driver's side switch and power window motor.

MANUAL CLOSE (EXAMPLES)

Power-cut switch

1. When the power-cut switch of the power window main switch is pressed (contact point: Open), current from each power window sub-switch is interrupted.

Power outer mirror switch

1. Up/down/left/right contact points for the power outer mirror can be switched by operating the power outer mirror switch.

POWER OUTER MIRROR SWITCH IS PRESSED IN THE UPWARD DIRECTION (EXAMPLE)

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

POWER WINDOW SUBSWITCH

Purpose

- Each door glass except for the driver-side can be opened/closed with occupant seated in the cabin using the power window subswitch.

Function

Manual switch

- The power window subswitch switches the contact point according to the switch operation and switches the circuit to the power window motor.

Construction

- The power window subswitch is equipped on the front passenger side and the rear passenger sides.

Operation

Manual operation (Example: close operation)

1. When the power window subswitch is turned to the manual close position (1), a manual close signal is sent to the power window motor.(2)

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

POWER OUTER MIRROR SYSTEM

Outline

- Power outer mirrors which can be operated remotely have been adopted.

Structural View

System Wiring Diagram

Function

Mirror glass adjustment function

- Outer mirror glass can be adjusted up/down and left/right electrically.

Operation

Mirror glass adjustment (Example: Left outer mirror is adjusted upward)

1. When the upward switch is turned on (1), the up/down adjustment motor operates upward.(2)

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

POWER OUTER MIRROR

Outline

- The power outer mirror adjusts the outer mirror glass position up/down and left/right using the up/down adjustment motor and, left/right adjustment motor.
- The up/down adjustment motor and, left/right adjustment motor turns clockwise (down/right direction) or counterclockwise (up/left direction).

Function

Up/down adjustment

- When the up/down adjustment motor operates, the power outer mirror operates in the up/down directions.

Left/right adjustment

- When the left/right adjustment motor operates, the power outer mirror operates in the left/right directions.

Construction

- The up/down adjustment motor and left/right adjustment motor are equipped in the power outer mirror.

Operation

Up/down adjustment motor (Example: power outer mirror is operated upward)

1. The up/down adjustment motor receives an up signal from the power outer mirror switch, and when the up switch is turned

on, it rotates counterclockwise.

Left/right adjustment motor (Example: power outer mirror is operated in left direction)

1. The left/right adjustment motor receives a left signal from the power outer mirror switch, and when the left switch is turned on, it rotates counterclockwise.

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

AUTO-DIMMING MIRROR

Purpose

- The automatic glare prevention rearview mirror prevents the driver from being dazzled by light from vehicles at the rear.

Structural View

System Wiring Diagram

TYPE A

TYPE B

Function

- The automatic glare prevention rearview mirror detects the level of the surrounding light and glare from vehicles at the rear using the light sensor.

- The automatic glare prevention rearview mirror combines the level of the surrounding light and the glare from vehicles at the rear and changes the reflection rate of the mirror between 10% and 70%.
- When the automatic glare prevention rearview mirror receives a reverse signal from the rear body control module (RBCM), the reflection rate of the mirror is fixed at 70% or more.

Operation

- When the automatic glare prevention rearview mirror switch is turned on, the mirror switches to automatic glare prevention mode.
- While in automatic glare prevention mode, the light sensor detects the level of surrounding light and the glare from vehicles at the rear. (1)
- The automatic glare prevention rearview mirror changes the voltage applied to the mirror according to the level of the surrounding light and the glare from vehicles at the rear. (2)
- The mirror changes the reflection rate between 10% and 70% according to the voltage that is applied.
- However, if it receives a reverse signal from the rear body control module (RBCM) (3), the reflection rate of the mirror is fixed at 70% or more.

TYPE A

TYPE B

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

SEAT

Outline

Front seat

- The following systems have been adopted for the front seats. (See **FRONT SEAT**.)
  - Power seat system (with power seat system) (See **POWER SEAT SYSTEM**.)
  - Seat warmer system (with seat warmer system) (See **SEAT WARMER SYSTEM**.)
  - Air bag system (side air bag module) (See **SIDE AIR BAG MODULE [STANDARD DEPLOYMENT CONTROL SYSTEM]**.) (See **SIDE AIR BAG MODULE [TWO-STEP DEPLOYMENT CONTROL SYSTEM]**.)

Rear seat

- The following 2 types of rear seat backs have been adopted. (See **REAR SEAT**.)
  - 6:4 split type
  - Single type
- A center armrest has been adopted on the 6:4 split-type rear seat.
- The following two types of child restraint seat anchors have been adopted which enable securing of ISOFIX-applicable child restraint seats on the rear seat.
  - Top tether anchor
  - ISOFIX anchor

2014 - Mazda3 - Body and Accessories

FRONT SEAT

Purpose, Function

- The front seats are structured to reduce impact force applied to the head of the occupant in a vehicle collision.
- 6-WAY power seats have been adopted on the driver's seat. (With power seat system) (See **POWER SEAT SYSTEM**.)
- A seat warmer system has been adopted on the front seat backs and front seat cushion. (With seat warmer system) (See **SEAT WARMER SYSTEM**.)

Construction, Operation

- The front seats reduce the impact force applied to the head of the occupant in a vehicle collision by:
    - Improving the rigidity of the pole guides.
    - Setting the head restraints so that they tilt forward.
- The front seat adjuster unit has improved rigidity by:
    - Locating the front seat recliner mechanism to the area around the connection part on both sides of the front seat back.
    - The front seat cushion.
- As a result, the backward lean of the front seat back when the occupant's body is pushed backward in a vehicle collision is controlled.

- Suspension mats built into the front seat backs support the occupant's back over a wide area.
- The suspension mat can be moved forward and rearward in conjunction with the lumbar support lever operation.

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

REAR SEAT

Purpose, Function

- The following 2 types of rear seat backs have been adopted.
    - 6:4 split type
    - Single type
- A top tether anchor and ISO FIX anchor have been adopted to enable securing of child-restraint seats on the rear seat.
- A prevention of trunk compartment cargo from forward intrusion function has been adopted for the rear seat to protect passengers during a collision or emergency braking.

Construction, Operation

- The child-restraint seat anchors include a top tether anchor and ISO FIX anchor to secure the child-restrain seats and prevent them from deviating or falling off the rear seat.

- During a collision, a moving load is stopped by the reinforced rear seat back frame and each support point to prevent the rear seat back from collapsing forward and the luggage intruding into the cabin.

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

SEAT WARMER SYSTEM

Purpose

- The seat warmer system warms the front seat cushion and front seat back using the seat warmer unit.

Function

- The seat warmer unit warms the seat cushion and seat back by supplying power to the built-in filaments.
- The seat warmer unit can adjust the temperature between 3 levels.
- The temperature level of the seat warmer unit changes each time the seat warmer switch is pressed.

- The seat warmer control unit supplies power to the seat warmer unit and increases the temperature around the seat back and seat cushion up to the average temperature which is applied to the temperature level.

Switch display	Temperature level	Average temperature around seat warmer unit	
		Seat cushion side	Seat back side
	0	—	
	1	**Approx. 37 °C {99 °F}**	
	2	**Approx. 40 °C {104 °F}**	**Approx. 42 °C {108 °F}**
	3	**Approx. 42 °C {108 °F}**	**Approx. 47 °C {117 °F}**

- The seat warmer control unit detects:
  - The average temperature around the seat warmer unit (seat cushion side) based on a signal from the thermostat (seat cushion side) to prevent overheating.
  - Cuts off the power supply to the seat warmer unit when the temperature reaches the specification.

- Decreases the average temperature below the specified temperature.

- When the seat warmer control unit detects that the average temperature around the seat warmer unit (seat cushion side) has decreased below the specified temperature based on a signal from the thermostat, power is supplied to the seat warmer unit again to increase the temperature up to the specified temperature.

Temperature level	Average temperature around seat warmer unit (seat cushion side)			
	Cloth type		Leather type	
	Increase start temperature	Decrease start temperature	Increase start temperature	Decrease start temperature
0	—			
1	**Approx. 20 °C {68 °F}**	**Approx. 22 °C {72 °F}**	**Approx. 20 °C {68 °F}**	**Approx. 22 °C {72 °F}**
2	**Approx. 28 °C {82 °F}**	**Approx. 30 °C {86 °F}**	**Approx. 32 °C {90 °F}**	**Approx. 34 °C {93 °F}**
3	**Approx. 40 °C {104 °F}**	**Approx. 42 °C {108 °F}**	**Approx. 50 °C {122 °F}**	**Approx. 52 °C {126 °F}**

- The seat warmer control unit maintains a constant average temperature around the seat warmer unit by continuing to supply power to the seat warmer unit.

Ex.) Cloth-type temperature level is 3:

Structural view

- The seat warmer switch is built into the indicator unit.
- The seat warmer unit is sewed into the front seat back trim and the front seat cushion trim.
- The seat warmer control unit is located on the bottom of the passenger-side front seat.

System wiring diagram

Operation

Ex.) Seat warmer temperature level on cloth-type driver's seat is set at 3

1. The indicator unit determines (1) the average increase temperature of the seat warmer unit by operating the seat warmer switch (driver-side).

2. The indicator unit sends (2) the temperature level "3" signal for the seat warmer unit to the CPU of the seat warmer control unit.

3. When the CPU of the seat warmer control unit receives the operation level "3" signal from the indicator unit, it supplies the base current to the transistor built into the seat warmer control unit (3), and the gate voltage is applied to the FET simultaneously (4).

4. If the base current is supplied, the transistor supplies collector current to the relay coil (5).

5. If collector current is supplied, the relay coil energizes and turns on the relay switch (6).

6. When the gate voltage is applied, the FET completes the circuit between seat warmer control unit terminal A and ground (7).

7. When the relay switch built into the seat warmer control unit turns on and the FET circuit is completed, the driver-side seat warmer unit circuit is completed (8) and the driver-side front seat cushion and seat back warm up.

- When the seat warmer control unit detects that the temperature around the seat reaches **approx. 42°C {108 °F}**, the power supply is cut off.

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

POWER SEAT SYSTEM

Outline

- 6-WAY power seats have been adopted on the driver's seat.
- The power seat system:
  - Drives the electric motor
  - Operates the front seats safely
  - Changes the driving posture to suit the occupant by operating the power seat switch

Function

- The 6-WAY power seats are equipped with the following functions:
  - Slide mechanism
  - Recliner mechanism
  - Lift mechanism

Slide mechanism

- The sliding function adjusts the front and back positions of the front seats.

Recliner mechanism

- The recliner function adjusts the angle of the front seat backs.

Lift mechanism

- The lift function adjusts the height of the front seats.

Structural View

System Diagram

Operation

Recliner operation

1. When the recliner switch is operated forward or backward (1), current from the battery flows to the recliner motor (2).

2. When the current flows to the recliner motor, the motor operates to tilt the front seat back forward or backward.

Lift operation

1. When the lift switch is operated upward or downward (1), current from the battery flows to the lift motor (2).
2. When the current flows to the lift motor, the motor operates to lift up or lower the front seat.

Slide operation

1. When the slide switch is operated forward or backward (1), current from the battery flows to the slide motor (2).
2. When the current flows to the slide motor, the motor operates to slide the front seat forward or backward.

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

SECURITY AND LOCKS

Outline

- Power door lock system adopted
- Liftgate opener system adopted
- Trunk lid opener system adopted
- Keyless entry system adopted
- Advanced keyless entry system adopted
- Push button start system adopted

SECURITY AND LOCKS PERSONALIZATION

- Personalization features that switch the activation/deactivation of each function have been adopted.
- The setting of the following system functions, and warning and guidance functions can be turned on/off optionally.
- Refer to the Workshop Manual for the detailed setting procedure.

Advanced keyless entry system

Using Mazda Modular Diagnostic System (M-MDS)

Mazda Modular Diagnostic System (M-MDS) display	Function	Initial setting	Setting contents	Control unit
Advanced keyless function.*1	The advanced keyless entry system and push button start system functions can be disabled.	Enabled.	Enabled. / Disabled.	Start stop unit
Walk Away Lock.	The out-of-area (reception area) type auto lock function can be set.	OFF	Not Adopted. / OFF / ON	Start stop unit
Auto Re-lock Time.	The operation start time of the auto re-lock function can be changed.	60 seconds	Not Adopted. / 30 seconds / 60 seconds / 90 seconds	Start stop unit
Lock Beep Volume.	The keyless beeper volume can be adjusted.	Medium	Not Adopted. / Off / Low / Medium / High	Start stop unit

*1

Because the push button start system function has been disabled, to start the engine press the upper part of the remote transmitter against the center of the push button start.

Using center display

2014 - Mazda3 - Body and Accessories

POWER DOOR LOCK SYSTEM

Outline

- When the door lock switch or the front door key cylinder is operated to lock/unlock, all the doors lock/unlock.
- The rear body control module (RBCM) performs power door lock system fail-safe. (See **REAR BODY CONTROL MODULE (RBCM)**.)

Function

Door lock switch interlock function

- When the door lock switch is operated to lock/unlock, all the doors lock/unlock.

Door key interlock function

- When the front door key cylinder is operated to lock/unlock, all the doors lock/unlock.

2-step unlocking function

- When an unlock operation is performed using the door key cylinder or the keyless entry remote transmitter, only the door lock on the driver-side door unlocks. In addition, when an unlock operation is performed, the door locks on all the doors unlock.

Collision detection unlock function

- This function unlocks the doors in case of a collision to enhance rescue operation from outside the vehicle.

Auto door lock function

- All doors automatically lock/unlock in conjunction with the vehicle speed and the operation of the selector lever (ATX) and the ignition switch.

Structural view

System wiring diagram

Operation

Lock operation using door key cylinder

1. When the key is inserted in the front door key cylinder and a lock operation is performed, the front door key cylinder switch switches to the lock side.

2. When the rear body control module (RBCM) detects a front door key cylinder switch lock signal (1), it turns the transistor on (2), and turns the door lock relay (lock side) on.

3. When the door lock relay (lock side) turns on (3), the front and rear door lock actuator motors perform a lock operation (4), and the front and rear doors lock.

Lock operation using door lock switch

1. When the door lock switch is operated to lock, the door lock switch switches to the lock side.

2. When the rear body control module (RBCM) detects a door lock switch lock signal (1), it turns the transistor on (2), and turns the door lock relay (lock side) on.

3. When the door lock relay (lock side) turns on (3), the front and rear door lock actuator motors perform a lock operation (4), and the front and rear doors lock.

Unlock operation using the door lock switch

1. When the door lock switch is operated to unlock, the door lock switch switches to the unlock side.

2. When the rear body control module (RBCM) detects a door lock switch unlock signal (1), it turns the transistor on (2), and turns the door lock relay (unlock side) on.

3. When the door lock relay (unlock side) turns on (3), the front and rear door lock actuator motors perform an unlock operation (4), and the front and rear doors unlock.

2-step Unlocking Function Operation Using Door Key Cylinder

Timing chart of 2-step unlocking function operation using door key cylinder

- If the driver's door key cylinder switch is held in the unlock position for approx. 2 s with all the doors locked, the 2-step unlocking function operates.

1. When the driver's key cylinder switch is unlocked (1), the rear body control module (RBCM) turns the transistor on (2).
2. When the transistor turns on, the door lock relay turns on (3), and the driver's door unlocks (4).

3. When the rear body control module (RBCM) receives an unlock signal for approx. 2 s, it turns the transistor on (5).

4. When the transistor turns on, the 2-step unlocking relay turns on (6), then all the doors unlock (7).

2-Step Unlocking Function Operation Using Keyless Entry Remote Transmitter

Timing chart of 2-step unlocking function operation using keyless entry remote transmitter

- If the following condition is met with all the doors locked, the 2-step unlocking function operates.
  - The rear body control module (RBCM) receives an unlock signal, and within 3 s it receives another unlock signal.

1. When the UNLOCK button on the keyless entry remote transmitter is operated, the keyless entry remote transmitter sends ID data and rolling code to the keyless receiver (1).

2. The keyless receiver sends an unlock signal to the start stop unit (2).

3. The start stop unit sends an unlock signal to the rear body control module (RBCM) (3).

4. When the rear body control module (RBCM) receives the unlock signal, it turns the transistor on (4).

5. When the transistor turns on, the door lock relay turns on (5) and the driver's door unlocks (6).

6. If the rear body control module (RBCM) receives another unlock signal within 5 s after it received the first unlock signal, it turns the transistor on (7).

7. When the transistor turns on, the 2-step unlocking relay turns on (8), then all the doors unlock (9).

Collision detection unlock function operation

1. When an air bag deploys, the SAS control module sends an air bag deployment signal to the instrument cluster as a CAN signal.

2. The instrument cluster sends the air bag deployment signal to the rear body control module (RBCM) as a CAN signal.

3. The rear body control module (RBCM) receives the air bag deployment signal and after approx. 6 s, it operates the front and rear door lock actuator motors, and the front and rear doors unlock.

Auto Door Lock Operation

- The auto door lock system functions to automatically lock and unlock all the doors and the liftgate.
- The auto lock function automatically locks all the doors and the liftgate based on the vehicle speed or the selector lever range operation.
- The auto unlock function unlocks all the doors and the liftgate based on the selector lever range or the operation of the ignition switch.

NOTE:

- The auto door lock operation setting can be changed using the personalization function. (See **SECURITY AND LOCKS PERSONALIZATION**.)

  Auto door lock operation based on vehicle speed

- When the vehicle speed reaches approx. 20 km/h {12 mph}, the rear body control module (RBCM) turns on the door lock relay based on the vehicle speed signal from the PCM (CAN signal), and locks all the doors and the liftgate.

  Auto door lock operation based on shift position

- When the selector lever is shifted from the park (P) position to any other position, the rear body control module (RBCM) turns on the door lock relay based on the selector lever input signal from the TCM (CAN signal), and locks all the doors and the liftgate.

Auto Door Unlock Operation

Auto door unlock operation based on shift position

- When the selector lever is shifted from any position other than the park (P) position to the park (P) position, the rear body control module (RBCM) turns on the driver-side door unlock relay and the door unlock relay based on the selector lever input signal from the TCM (CAN signal), and unlocks all the doors.

Auto door unlock operation based on ignition switch position

- If the engine is being started or the ignition is switched from on to off, the rear body control module (RBCM) turns on the driver-side door unlock relay and the door unlock relay and unlocks all the doors.

2014 - Mazda3 - Body and Accessories

FRONT DOOR LOCK ACTUATOR

Purpose

- Performs lock/unlock switching of the front doors electrically based on the signal from the rear body control module (RBCM).

Function

Lock function

- The built-in motor is operated in the lock direction, and the latch lever will not release even if an outer handle is operated.

Unlock function

- The built-in motor is operated in the unlock direction and the latch lever releases when an inner/outer handle is operated.

Construction

- The front door lock actuator has a built-in motor, and the link installed to the motor moves in the lock/unlock direction in conjunction with the motor rotation.
- The link for the outer handle and latch lever can be disconnected by the movement of the link installed to the motor.
- When the door lock is unlocked, the link for the inner/outer handle and latch lever release is connected.
- When the door lock is locked, the link for the outer handle and latch lever release is disconnected.

Operation

Lock operation

1. The front door lock actuator rotates the built-in motor to the lock side.

2. When the motor rotates to the lock side, the link installed to the motor moves in the lock direction, and the link for the outer handle and latch lever release disconnects.

3. When the link connection is disconnected, the latch lever cannot be released even if an outer handle is operated.

Unlock operation

1. The front door lock actuator rotates the built-in motor to the unlock side.

2. When the motor rotates to the unlock side, the link installed to the motor moves in the unlock direction, and the link for the outer handle and latch lever release connects.

3. When the link connects, the latch lever is released by the inner and outer handle operation.

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

FRONT DOOR LATCH SWITCH

Purpose, Function

- Switches on/off in conjunction with the latch lever rotation, and detects the front door open/closed condition by the voltage which is changed by the rear body control module (RBCM).

Construction

- The switch is turned on/off by the rotation of the latch lever.
- When a front door is completely opened, the front door latch switch turns on (contact point: Closed).

Operation

Door open (unlatch) operation

1. When the inner or outer handle is operated, the door opens, the latch lever is in an unlatched condition, and the front door latch switch turns on.

Door closed (latched) operation

1. When a door is closed, the front door lock striker enters the latch lever groove.

2. When the door is further closed, the latch lever is pressed by the front door lock striker and it rotates.
3. When the door is completely closed, the latch lever is in a latched condition, the front door latch switch turns off.

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

FRONT DOOR LOCK-LINK SWITCH

Purpose

- Switches on/off in conjunction with a front door lock knob lock/unlock operation, and detects the front door lock/unlock condition by the voltage which is changed by the rear body control module (RBCM).

Function

- The door lock-link switch contact point changes in conjunction with the front door lock knob lock/unlock operation.

Construction

- The front door lock knob and door lock-link switch are connected by the door lock-link cable, and are built into the front door latch and lock actuator.

Operation

Lock operation

- When the front door lock knob is turned to the lock position, the door lock-link cable is pressed, and the door lock-link switch is switched to the lock side.

Unlock operation

- When the front door lock knob is turned to the unlock position, the door lock-link cable is pulled, and the door lock-link switch is switched to the unlock side.

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

KEY CYLINDER SWITCH

Purpose

- The switch turns on/off in conjunction with a front door key cylinder lock/unlock operation and the rear body control module (RBCM) detects the key cylinder operation condition by the change in the voltage.

Function

- The key cylinder switch contact point changes in conjunction with the front door key cylinder lock/unlock operation.

Construction

- Built into the driver's front door latch and lock actuator.
- The front door key cylinder is connected to the front door latch and lock actuator, and the front door key cylinder is rotated to directly switch the key cylinder switch.
- When the front door key cylinder is not operated, the key cylinder switch is off (contact point: Open).

Operation

Lock operation

- When the key is inserted in a front door key cylinder and it is rotated in the lock direction, the key cylinder switch switches to the lock side, and the lock-side switch turns on (contact point: Closed).

Unlock operation

- When the key is inserted in a front door key cylinder and it is rotated in the unlock direction, the key cylinder switch switches to the unlock side, and the unlock-side switch turns on (contact point: Closed).

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

REAR DOOR LOCK ACTUATOR

Purpose

- Performs lock/unlock switching of the rear doors electrically based on the signal from the rear body control module (RBCM).

Function

Lock function

- The built-in motor is operated in the lock direction, and the latch lever will not release even if an outer handle is operated.

Unlock function

- The built-in motor is operated in the unlock direction and the latch lever releases when an inner/outer handle is operated.

Construction

- The rear door lock actuator has a built-in motor, and the link installed to the motor moves in the lock/unlock direction in conjunction with the motor rotation.
- The link for the outer handle and latch lever can be disconnected by the movement of the link installed to the motor.
- When the door lock is unlocked, the link for the inner/outer handle and latch lever release is connected.
- When the door lock is locked, the link for the outer handle and latch lever release is disconnected.

Operation

Lock operation

1. The rear door lock actuator rotates the built-in motor to the lock side.

2. When the motor rotates to the lock side, the link installed to the motor moves in the lock direction, and the link for the inner/outer handle and latch lever release disconnects.

3. When the link connection is disconnected, the latch lever cannot be released even if an outer handle is operated.

Unlock operation

1. The rear door lock actuator rotates the built-in motor to the unlock side.

2. When the motor rotates to the unlock side, the link installed to the motor moves in the unlock direction, and the link for the inner/outer handle and latch lever release connects.

3. When the link connects, the latch lever releases by the inner and outer handle operation.

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

REAR DOOR LATCH SWITCH

Purpose, Function

- The switch turns on/off in conjunction with the rotation of the latch lever, and it detects the open/closed condition of a rear door by the voltage value which is changed by the rear body control module (RBCM).

Construction

- The switch is turned on/off by the rotation of the latch lever.
- When a rear door is completely opened, the rear door latch switch is on (contact point: Closed).

Operation

Door open (unlatch) operation

1. When the inner or outer handle is operated, the door opens, the latch lever is in an unlatched condition, and the rear door latch switch turns on.

Door closed (latched) operation

1. When a door is closed, the rear door lock striker enters the latch lever groove.
2. When the door is further closed, the latch lever is pressed by the rear door lock striker and it rotates.

3. When the door is completely closed, the latch lever is in a latched condition, the rear door latch switch turns off.

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

REAR DOOR LOCK-LINK SWITCH

Purpose

- Switches on/off in conjunction with the rear door lock knob lock/unlock operation, and detects the rear door lock/unlock condition by the voltage which is changed by the rear body control module (RBCM).

Function

- The door lock-link switch contact point changes in conjunction with the rear door lock knob lock/unlock operation.

Construction

- The rear door lock knob and door lock-link switch are connected by the door lock-link cable, and are built into the rear door latch and lock actuator.

Operation

Lock operation

- When a rear door lock knob is turned to the lock position, the door lock-link cable is pressed, and the door lock-link switch is switched to the lock side.

Unlock operation

- When a rear door lock knob is turned to the unlock position, the door lock-link cable is pulled, and the door lock-link switch is switched to the unlock side.

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

LIFTGATE OPENER SYSTEM

Outline

- A liftgate opener system has been adopted in which the liftgate can be opened just by pressing the liftgate opener switch.
- The rear body control module (RBCM) performs liftgate opener system fail-safe. (See **REAR BODY CONTROL MODULE (RBCM)**.)

Function

- When the liftgate opener switch is pressed, the liftgate lock actuator operates to open the liftgate.
- The liftgate opener system is controlled based on the following CAN signals:

CAN signal sending module	Signal name
Instrument cluster	Parking brake status signal (MTX)
Via instrument cluster from TCM	Shift range position signal (ATX)
Via instrument cluster from PCM	Vehicle speed signal

Structural view

System wiring diagram

Operation

Operation condition

When all of the following conditions are met, the liftgate opener system operates.

- Ignition is switched ON (engine off or on)
  - Selector lever is in P position (ATX)
  - Parking brake lever is pulled (MTX)
  - Vehicle speed is 3 km/h {2 mph} or less
  - Driver's door is unlocked
- Ignition is switched off
  - Vehicle is stopped (no vehicle speed input)
  - Driver's door is unlocked

Open operation

1. When the liftgate opener switch is pressed, it turns on (1).

2. When the operation condition of the liftgate opener system is met, the rear body control module (RBCM) turns the transistor on for approx. 0.7 s (2) and turns on the liftgate release relay.

3. When the liftgate release relay turns on, the liftgate lock actuator operates (3).

4. When the liftgate lock actuator operates, the latch lever is freed and the liftgate lifts up simultaneously via the spring force of the liftgate weatherstrip and stopper rubber, and opens.

2014 - Mazda3 - Body and Accessories

LIFTGATE LOCK ACTUATOR

Purpose, Function

- The latch of the liftgate latch lever is released based on the signal from the rear body control module (RBCM).

Construction

- Motor is built-in.
- Installed to the liftgate latch and lock actuator.

Operation

1. The liftgate lock actuator rotates the built-in motor based on the liftgate opener system operation signal from the rear body control module (RBCM), and releases the latch of the liftgate

latch lever.

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

LIFTGATE LATCH SWITCH

Purpose, Function

- The switch turns on/off in conjunction with the rotation of the latch lever, and it detects the open/closed condition of the liftgate by the voltage value which is changed by the rear body control module (RBCM).

Construction

- The switch is turned on/off by the rotation of the latch lever.
- When the liftgate is completely closed, the switch turns off (contact point: Open)

Operation

Liftgate closed (latched) operation

1. When the liftgate is closed, the liftgate lock striker enters the latch lever groove.
2. When the liftgate further closes, the latch lever is pressed by the liftgate lock striker and it rotates.
3. When the liftgate is completely closed, the latch lever is in the latched condition pressing the liftgate latch switch, which turns the switch off.

Liftgate open (unlatch) operation

1. When the liftgate lock actuator operates to open the liftgate, the latch lever is in an unlatched condition, and the liftgate latch switch turns on.

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

LIFTGATE OPENER SWITCH

Purpose

- Transmits the liftgate opener switch operation of the user to the rear body control module (RBCM).

Function

- The liftgate opener switch ON signal is sent to the rear body control module (RBCM) by operating the liftgate opener switch.

Construction, Operation

- Installed on the liftgate.
- While the liftgate opener switch is pressed, the switch turns on (contact point: closed).

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

TRUNK LID OPENER SYSTEM

Outline

- A trunk lid opener system has been adopted in which the trunk lid can be opened just by pressing the trunk lid opener switch.
- The rear body control module (RBCM) performs the trunk lid opener system fail-safe. (See **REAR BODY CONTROL MODULE (RBCM)**.)

Function

- When the trunk lid opener switch is pressed, the trunk lid release actuator operates to open the trunk lid.
- The trunk lid opener system is controlled based on the following CAN signal:

CAN signal sending module	Signal name
Via instrument cluster from PCM	Vehicle speed signal

Structural view

System wiring diagram

Operation

Operation condition

When all of the following conditions are met, the trunk lid opener system operates.

- Vehicle speed is **3 km/h {2 mph} or less**

Trunk lid opener switch (Interior) open operation

1. When the trunk lid opener switch is pressed, it turns on (1).

2. When the operation condition of the trunk lid opener system is met, the rear body control module (RBCM) turns the transistor on for **approx. 0.7 s** (2) and turns on the trunk lid release relay.

3. When the trunk lid release relay turns on, the trunk lid release actuator operates (3).

4. When the trunk lid release actuator operates, the latch lever is freed and the trunk lid lifts up simultaneously via the spring force of the trunk lid weatherstrip and stopper rubber, and opens.

Trunk lid opener switch (exterior) open operation

1. When the trunk lid opener switch is pressed, it turns on (1).

2. When the operation condition of the trunk lid opener system is met, the rear body control module (RBCM) turns the transistor on for **approx. 0.7 s** (2) and turns on the trunk lid release relay.

3. When the trunk lid release relay turns on, the trunk lid release actuator operates (3).

4. When the trunk lid release actuator operates, the latch lever is freed and the trunk lid lifts up simultaneously via the spring force of the trunk lid weatherstrip and stopper rubber, and opens.

TRUNK LID OPENER SYSTEM

2014 - Mazda3 - Body and Accessories

TRUNK LID RELEASE ACTUATOR

Purpose, Function

- The latch of the trunk lid latch lever is released based on the signal from the rear body control module (RBCM).

Construction

- Motor is built-in.
- Installed to the trunk lid latch and release actuator.

Operation

- The trunk lid release actuator rotates the built-in motor based on the trunk lid opener system operation signal from the rear body control module (RBCM), and releases the latch of the trunk lid latch lever.

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

TRUNK LID LATCH SWITCH

Purpose, Function

- The switch turns on/off in conjunction with the rotation of the latch lever, and it detects the open/closed condition of the trunk lid by the voltage value which is changed by the rear body control module (RBCM).

Construction

- The switch is turned on/off by the rotation of the latch lever.
- When the trunk lid is completely closed, the switch turns off (contact point: Open)

Operation

Trunk lid closed (latched) operation

1. When the trunk lid is closed, the trunk lid lock striker enters the latch lever groove.
2. When the trunk lid further closes, the latch lever is pressed by the trunk lid lock striker and it rotates.
3. When the trunk lid is completely closed, the latch lever is in the latched condition pressing the trunk lid latch

switch, which turns the switch off.

Trunk lid open (unlatch) operation

- When the trunk lid release actuator operates to open the trunk lid, the latch lever is in an unlatched condition, and the trunk lid latch switch turns on.

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

TRUNK LID OPENER SWITCH

Purpose

- Transmits the trunk lid opener switch operation of the user to the rear body control module (RBCM).

Function

- The trunk lid opener switch ON signal is sent to the rear body control module (RBCM) by operating the trunk lid opener switch.

Construction, Operation

- Installed on the trunk lid.
- While the trunk lid opener switch is pressed, the switch turns on (contact point: closed).

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

KEYLESS ENTRY SYSTEM

Outline

- A keyless entry system has been adopted in which locking/locking is performed by operation of the remote transmitter button, even from a location away front the vehicle.
- The start stop unit performs keyless entry system fail-safe. (See **START STOP UNIT**.)

Function

- When the following operation is performed, the start stop unit verifies the remote transmitter ID data.
    - Locking/unlocking using a remote transmitter
    - Trunk lid opening using remote transmitter (4SD)
- The keyless entry system has the following functions in the event that the user operates the system incorrectly or to prevent the user from leaving the vehicle without locking.
    - Auto re-lock function: After unlocking, if any door or the liftgate/trunk lid is not opened and a period of time according to the personalization setting has elapsed, all doors are automatically locked.
    - Remote transmitter pause function: All the functions of the remote transmitter other than the remote transmitter used for the door lock are paused.
    - Warning function: Function which warns the user of a keyless entry system malfunction using the KEY warning light (red), KEY indicator light (green), keyless warning alarm in the instrument cluster.

Remote transmitter battery voltage low indication function

- This function notifies the user that the battery voltage of the remote transmitter is low.

System Wiring Diagram

Operation

Lock / unlock operation using remote transmitter

NOTE:

- If the lock button of the remote transmitter is operated when all of the following conditions are met, all the doors and the liftgate are locked.
    - Ignition is switched off
    - All doors are closed
- If the unlock button of the remote transmitter is operated when all of the following conditions are met, all the doors and the liftgate are unlocked.
    - Ignition is switched off

1. When the lock or unlock button of the remote transmitter is pressed, the remote transmitter sends ID data.

2. The keyless receiver receives ID data and transmits the data to the start stop unit.

3. The start stop unit verifies the ID data, and if the ID data matches, it sends a lock/unlock request signal to the rear body control module (RBCM).

4. The rear body control module (RBCM) operates the front/rear door lock actuator motor to lock/unlock the front/rear doors.

5. At the same time as the door lock/unlock operation, it sends a hazard light flash request signal to the instrument cluster as a CAN signal.

6. The instrument cluster sends the hazard light flash request signal to the front body control module (FBCM) as a CAN signal.

7. The front body control module (FBCM) controls the hazard lights to flash for the following number of times to signal that the lock/unlock operation is completed.

- Lock: Flashed once
- Unlock: Flashed twice

Trunk lid opening operation using remote transmitter

NOTE:

- The trunk lid opens when the trunk lid open button on the remote transmitter is pressed with the ignition switched off.

1. When the trunk lid open button is pressed for approx. 0.5 s, the remote transmitter sends ID data to the keyless receiver.

2. The keyless receiver receives ID data and transmits the data to the start stop unit.

3. The start stop unit verifies the ID data, and if the ID data matches, it sends a trunk lid release signal to the rear body control module (RBCM).

4. When the rear body control module (RBCM) receives the trunk lid release signal, it operates the trunk lid release actuator motor to release the trunk lid.

Auto re-lock function operation

- After the start stop unit sends an unlock request signal to the rear body control module (RBCM), if any of the following operations is not performed in 60 s *1, it sends a lock request signal to the rear body control module (RBCM) to lock the front/rear doors.
  - A door or the liftgate/trunk lid is opened
  - A lock/unlock operation is performed using the driver's side front door key cylinder.
  - A lock/unlock operation is performed using the driver's side front door lock knob.
  - A lock/unlock operation is performed using the remote transmitter.
  - The ignition is switched to ACC or ON (engine off).

*1
Personalization setting time

Remote transmitter pause function operation

When door locking is performed

- If a door is locked by the remote transmitter operation when all the following conditions are met, all the functions of the remote transmitter other than the remote transmitter used for the door lock operation are paused.
  - All doors and liftgate/trunk lid are closed
  - Ignition is switched off

Remote transmitter pause cancel operation

- The functions of the paused remote transmitter are restored when the following conditions are met:
  - A remote transmitter with which the engine can be started is brought inside the vehicle.
  - The lock/unlock button on the paused remote transmitter is pressed.

Alert function operation

- Under the following conditions, the start stop unit sends a warning request signal to the instrument cluster via CAN communication to illuminate the push button start indicator light (amber).
- The instrument cluster flashes the KEY warning light when it receives the warning request signal.

Condition	Instrument cluster		Push button start
	Keyless warning alarm	KEY warning light (red)	Indicator light (amber)
Keyless entry system malfunction*1	—	On	Flash
Driver's door is opened with ignition in ACC	Pattern A*2×Continuous	—	—

Remote transmitter cannot be detected inside vehicle when all doors are closed with ignition not switched off	Pattern B*2	Flash	—

*1 **For vehicles with center display, a warning message in the center display is displayed when the KEY warning light (red) is turned on. For the message content and verification method, refer to the CENTER DISPLAY. (See CENTER DISPLAY [WITH CENTER DISPLAY].)**

*2 **For the keyless warning alarm sound pattern, refer to the keyless warning alarm. (See KEYLESS WARNING ALARM.)**

Remote transmitter battery voltage low indication function operation

- When the ignition is switched from ON (engine off or on) to off under the condition indicated in the table, the start stop unit sends a battery voltage low indication request signal to the instrument cluster as a CAN signal.
- The instrument cluster flashes the KEY indicator light when it receives the battery voltage low indication request signal.

Condition	Instrument cluster
	KEY indicator light (green)
Start stop unit receives code for low remote transmitter battery voltage	Flash (for approx. 30 s after ignition switched off)

- For vehicles with center display, a warning message in the center display is displayed when the KEY indicator light (green) is flashing. For the message content and verification method, refer to the CENTER DISPLAY. (See **CENTER DISPLAY [WITH CENTER DISPLAY]**.)

2014 - Mazda3 - Body and Accessories

ADVANCED KEYLESS ENTRY SYSTEM

Outline

- An advanced keyless entry system has been adopted which performs automatic authorization of the remote transmitter that is carried and locking/unlocking of the doors.
- The start stop unit performs advanced keyless entry system fail-safe. (See **START STOP UNIT**.)

Function

- The advanced keyless entry system performs remote transmitter authorization when any of the following operations is performed.
    - Locking/unlocking using request switch on outer door
    - Locking using the request switch on the liftgate (5HB)
    - Locking/unlocking using remote transmitter
    - Trunk lid opening using remote transmitter (4SD)
    - Opening liftgate/trunk lid
- The advanced keyless entry system has the following functions in the event that the user operates the system incorrectly or to prevent the user from leaving the vehicle without locking it.
    - Auto re-lock function: After unlocking, if any door or the liftgate/trunk lid is not opened and a period of time according to the personalization setting has elapsed, all doors are automatically locked.
    - Out-of-area (reception area) type auto lock function: After closing all doors, when the remote transmitter is brought out of the reception area of the keyless antenna, all doors are automatically locked.
    - Remote transmitter pause function: If all doors are locked with a transmitter left in the vehicle, the functions of the remote transmitter inside the vehicle are paused.
    - Remote transmitter left-in-vehicle prevention function: If the liftgate/trunk lid is closed with a remote transmitter left in the vehicle, the liftgate/trunk lid can be opened by pressing the liftgate/trunk lid opener switch.
    - Warning function: If the system is operated incorrectly which results in a possible problem occurring, the system warns the user by using the indicator light, warning light, and buzzer in the instrument cluster, or by using the keyless beeper.

Remote transmitter battery voltage low indication function

- This function signals the user that the battery voltage of the remote transmitter is low.

Operation

Lock/unlock operation using request switch on outer handle

NOTE:

- Lock/unlock operation is performed when a request switch on an outer handle is pressed with all the following conditions met.
  - Ignition is switched off
  - All doors are closed

- The remote transmitter is within the reception area outside the vehicle.

1. When the driver's or the front passenger's request switch is pressed, a request switch on signal is input to the start stop unit via the LF control unit.

2. Based on the request switch on signal, the start stop unit sends a request output signal to the LF control unit to verify that the remote transmitter is inside the reception area.

3. The LF control unit sends a request signal from the keyless antenna of the door in which the request switch was pressed and all keyless antennas for the vehicle interior.

4. The remote transmitter receives the request signal from the outside antenna, and sends ID data to the keyless receiver.

5. The keyless receiver transmits the received ID data to the start stop unit.

6. The start stop unit verifies the ID data, and if it determines a programmed remote transmitter is outside the vehicle, it sends a lock/unlock signal to the rear body control module (RBCM) and at the same time, it sends a beeper sound request signal to the LF control unit.

7. When the rear body control module (RBCM) receives the lock/unlock signal, it operates the front/rear door lock actuator motor to lock/unlock the front/rear doors.

NOTE:

- It takes approx. 1—2 s from when a request switch is pressed until the lock/unlock operation is completed.

8. At the same time as the door lock/unlock operation, it sends a hazard light flash request signal to the instrument cluster as a CAN signal.

9. When the LF control unit receives the beeper sound request signal, it operates the keyless beeper for the following number of times:

- When locking: Keyless beeper sounds once
- When unlocking: Keyless beeper sounds twice

10. The instrument cluster sends the hazard light flash request signal to the front body control module (FBCM) as a CAN signal.

11. When the front body control module (FBCM) receives the hazard light flash request signal, it controls the hazard light to flash for the following number of times to signal that the lock/unlock operation is completed.

- When locking: Hazard light flashes once
- When unlocking: Hazard light flashes twice

Lock operation using request switch on liftgate

NOTE:

- Lock operation is performed when the request switch on the liftgate is pressed with all the following conditions met.
  - Ignition is switched off
  - All doors and liftgate are closed
  - The remote transmitter is within the reception area outside the vehicle.

1. When the request switch is pressed, a request switch on signal is input to the start stop unit via the LF control unit.

2. Based on the request switch on signal, the start stop unit sends a request output signal to the LF control unit to verify that the remote transmitter is inside the reception area.

3. The LF control unit sends a request signal from the outside keyless antenna (rear) and all keyless antennas for the vehicle interior.

4. The remote transmitter receives the request signal from the outside antenna, and sends ID data to the keyless receiver.

5. The keyless receiver transmits the received ID data to the start stop unit.

6. The start stop unit verifies the ID data, and if it determines a programmed remote transmitter is outside the vehicle, it sends a lock signal to the rear body control module (RBCM) and at the same time, it sends a beeper sound request signal to the LF control unit.

7. When the rear body control module (RBCM) receives the lock signal, it operates the front/rear door lock actuator motor to lock the front/rear doors.

NOTE:

- It takes approx. 1—2 s from when the request switch is pressed until the lock operation is completed.

8. At the same time as the door lock/unlock operation, it sends a hazard light flash request signal to the instrument cluster as a CAN signal.

9. When the LF control unit receives the beeper sound request signal, it operates the keyless beeper once.

10. The instrument cluster sends the hazard light flash request signal to the front body control module (FBCM) as a CAN signal.

11. When the front body control module (FBCM) receives the hazard light flash request signal, it controls the hazard light to flash once to signal that the lock operation is completed.

Lock/unlock operation using remote transmitter

NOTE:

- The lock/unlock operation is performed when the lock button of the remote transmitter is pressed with all the following conditions met.
    - Ignition is switched off
    - All doors are closed
    - The remote transmitter is within the operable range

1. When the lock or unlock button of the remote transmitter is pressed, the remote transmitter sends ID data.

2. When the keyless receiver receives ID data, it transmits the data to the start stop unit.

3. The start stop unit verifies the ID data, and if the ID data match, it sends a lock/unlock signal to the rear body control module (RBCM) and at the same time, it sends a beeper sound request signal to the LF control unit.

4. The rear body control module (RBCM) operates the front/rear door lock actuator motor to lock/unlock the front/rear doors.

5. At the same time as the door lock/unlock operation, it sends a hazard light flash request signal to the instrument cluster as a CAN signal.

6. The LF control unit operates the keyless beeper for the following number of times:

    - When locking: Keyless beeper sounds once
    - When unlocking: Keyless beeper sounds twice

7. The instrument cluster sends the hazard light flash request signal to the front body control module (FBCM) as a CAN signal.

8. The front body control module (FBCM) controls the hazard light to flash for the following number of times to signal that the lock/unlock operation is completed.

    - When locking: Hazard light flashes once
    - When unlocking: Hazard light flashes twice

Trunk lid opening operation using remote transmitter

NOTE:

- The trunk lid opens when the trunk lid open button on the remote transmitter is pressed with the ignition switched off.

1. When the trunk lid open button is pressed for approx. 0.5 s, the remote transmitter sends ID data to the keyless receiver.

2. The keyless receiver receives ID data and transmits the data to the start stop unit.

3. The start stop unit verifies the ID data, and if the ID data matches, it sends a trunk lid release signal to the rear body control module (RBCM).

4. When the rear body control module (RBCM) receives the trunk lid release signal, it operates the trunk lid release actuator motor to release the trunk lid.

Liftgate/trunk lid open operation

1. When the liftgate/trunk lid opener switch is pressed, a liftgate/trunk lid open signal is input to the rear body control module (RBCM).

2. The rear body control module (RBCM) sends the liftgate/trunk lid open signal to the start stop unit.

3. Based on the liftgate/trunk lid open signal, the start stop unit sends a request output signal to the LF control unit to verify that the remote transmitter is inside the reception area.

4. Based on the request output signal from the start stop unit, the LF control unit outputs a request signal using the keyless antenna inside the rear bumper.

5. The remote transmitter receives the request signal from the antenna (outside, rear), and sends ID data to the keyless receiver.

6. The keyless receiver transmits the received ID data to the start stop unit.

7. The start stop unit verifies the ID data, and if the ID data matches, it sends a liftgate/trunk lid release signal to the rear body control module (RBCM).

8. When the rear body control module (RBCM) receives the liftgate/trunk lid release signal, it operates the liftgate lock actuator/trunk lid release actuator motor to release the liftgate/trunk lid.

Auto re-lock function operation

- After the start stop unit sends an unlock request signal to the rear body control module (RBCM), if any of the following operations is not performed in 60 s *1, it sends a lock request signal to the rear body control module (RBCM) to lock the front/rear doors.
    - A door or the liftgate/trunk lid is opened
    - A lock/unlock operation is performed using the driver's side front door key cylinder.
    - A lock/unlock operation is performed using the driver's side front door lock knob.
    - A lock/unlock operation is performed using the remote transmitter.
    - The ignition is switched to ACC or ON (engine off).

*1

Personalization setting time

Out-of-area (reception area) type auto lock function operation

1. When all doors and the liftgate are closed after any door or the liftgate was opened, the start stop unit goes on auto lock standby if all the following conditions are met.

- There is no remote transmitter inside the vehicle.
- The remote transmitter is within the reception area outside the vehicle.
- The ignition is switched off.

2. After entering the standby status, if the remote transmitter is moved out of the keyless antenna reception area and the ID data cannot be received from the keyless receiver, the start stop unit operates all the lock actuators for a lock operation.

NOTE:

- The keyless beeper sounds once when switching to stand-by and the door is locked.

Remote transmitter pause function operation

When door locking is performed

- If a lock signal is input with a remote transmitter detected inside the vehicle, the start stop unit outputs a request signal using the outside/inside keyless antennas.
- When the remote transmitter inside the vehicle sends the ID data to the keyless receiver, the keyless receiver transmits the received ID data to the start stop unit.
- The start stop unit receives the ID data, and after approx. 32 s, it suspends the functions of the transmitter inside the vehicle. It also operates the keyless beeper for 10 s.

When the liftgate/trunk lid is closed

- When the liftgate/trunk lid is closed with all the following conditions met, the start stop unit outputs a request signal using the interior keyless antennas.
  - All doors are locked.
  - The liftgate/trunk lid is open.
  - The start stop unit identifies a remote transmitter inside the vehicle.
- When the remote transmitter inside the vehicle sends the ID data to the keyless receiver, the keyless receiver transmits the received ID data to the start stop unit.
- The start stop unit receives the ID data, and after approx. 32 s, it suspends the functions of the transmitter inside the vehicle.

Remote transmitter pause cancel operation

- The functions of the paused remote transmitter are restored when any one of the following conditions is met:
  - A remote transmitter with which the engine can be started is brought inside the vehicle.
  - The lock/unlock button on the paused remote transmitter is pressed.

Remote transmitter left-in-vehicle prevention function operation

- When the liftgate/trunk lid is closed with all the following conditions met, the start stop unit operates the keyless beeper (See **Alert function operation**) and puts the remote transmitter left-in-vehicle prevention function on standby.
  - The liftgate/trunk lid is open.
  - All doors are closed and locked.
- When the liftgate/trunk lid opener switch is pressed while the remote transmitter left-in-vehicle prevention function is on standby, the start stop unit verifies the remote transmitter ID data and if it determines that the transmitter is inside the vehicle, it operates the left-in-vehicle function and sends a latch lever release signal to the rear body control module (RBCM) to release the liftgate/trunk lid latch lever.
- When any of the following conditions is met while the remote transmitter left-in-vehicle prevention function is on standby, the remote transmitter left-in-vehicle prevention function is canceled.
  - The lock/unlock button of the remote transmitter is pressed.

A request switch is pressed.

- Any door is opened.
- The vehicle speed exceeds 10 km/h {6.2 mph}.
- The liftgate/trunk lid is opened and closed.

Alert function operation

- Under the following conditions, the start stop unit sends a security warning request signal to the instrument cluster via CAN communication to illuminate the push button start indicator light (amber).
- The instrument cluster flashes the KEY warning light when it receives the warning request signal.

Condition	Keyless beeper	Instrument cluster		Push button start
		Keyless warning alarm	KEY warning light (red)	Indicator light (amber)
The advanced keyless entry system has a malfunction.*1	—	—	On	Flash
The driver's door is opened with the ignition in ACC.	—	Pattern A*2×Continuous	—	—
The remote transmitter cannot be detected inside the vehicle when all doors are closed with the ignition not switched off.	Sounds 6 times	Pattern B*2	Flash	—
A door lock operation is performed using a request switch with any door or the liftgate is open.	Sounds 2 times	—	—	—
A door lock operation is performed using a request switch with ignition not switched off.	Sounds 2 times	—	—	—

*1
For vehicles with center display, a warning message in the center display is displayed when the KEY warning light (red) is turned on. For the message content and verification method, refer to the CENTER DISPLAY. (See CENTER DISPLAY [WITH CENTER DISPLAY].)

*2
For the keyless warning alarm sound pattern, refer to the keyless warning alarm. (See KEYLESS WARNING ALARM.)

Remote transmitter battery voltage low indication function operation

- When the ignition is switched from ON (engine off or on) to off under the condition indicated in the table, the start stop unit sends a battery voltage low indication request signal to the instrument cluster as a CAN signal.
- The instrument cluster flashes the KEY indicator light when it receives the battery voltage low indication request signal.

Condition	Instrument cluster
	KEY indicator light (green)
The start stop unit receives a code for remote transmitter battery voltage low.	Flash (for approx. 30 s after ignition switched off)

- For vehicles with center display, a warning message in the center display is displayed when the KEY indicator light (green) is flashing. For the message content and verification method, refer to the CENTER DISPLAY. (See **CENTER DISPLAY [WITH CENTER DISPLAY]**.)

2014 - Mazda3 - Body and Accessories

PUSH BUTTON START SYSTEM [ADVANCED KEYLESS ENTRY SYSTEM]

Outline

- A push button start system has been adopted that automatically performs authorization of the remote transmitter brought into the vehicle.
- The start stop unit performs push button start system fail-safe. (See **START STOP UNIT**.)

Function

- When the push button start is pressed, the push button start system performs authorization of the remote transmitter in the vehicle.
    - Engine start: When the remote transmitter authorization is performed while the engine starting conditions are met, the engine starts.
    - Power supply switching: When the remote transmitter authorization is performed, the ignition can be switched between OFF, ACC, and ON (engine on).
- The guidance function notifies the user of the push button start system conditions using the KEY indicator/warning lights in the instrument cluster to help the user's operation.

Operation

Remote transmitter verification

1. When the push button start is pressed, a push button start signal is input to the start stop unit.

2. When the start stop unit detects a push button start signal, it sends a request outgoing command signal to the LF control unit.

3. When the LF control unit detects the request outgoing command signal, it sends a request signal using all the keyless antennas in the vehicle interior.

4. The remote transmitter receives the request signal from the interior keyless antennas, and transmits ID data to the keyless receiver.

5. The keyless receiver transmits the received ID data to the start stop unit.

6. The start stop unit verifies the ID data and if it matches, the power supply is switched to turn the push button start indicator light (amber) on.

NOTE:

- The power supply switches according to the vehicle conditions such as the shift lever (MTX)/selector lever (ATX) position and the pedal depression/release.

ACC						
ON (ENGINE OFF)						
ON (ENGINE ON)						

*

To switch the ignition to ACC or off from ON (engine on), a vehicle speed of 5 km/h {3 mph} or less is required.

Engine-start operation

- The remote transmitter authorization is performed and the engine starts by pressing the push button start when all the following conditions are met:

  Engine start conditions

  - Clutch pedal is depressed (MTX)
  - Brake pedal is depressed (ATX)
  - Selector lever is in P or N position (ATX)
  - Remote transmitter is within request output range of keyless antennas in vehicle interior

Automatic ignition switch off

- If the ignition has been switched to ACC for 25 min or more, the start stop unit automatically switches the ignition off.

Engine emergency stop

- If an ignition switch on signal is input for 3 s or more (ignition switch held pressed) with the engine running, or a push button start ON signal is input 3 times within 1.5 s, the start stop unit switches the ignition to ACC or off according to the position of the shift lever (MTX)/selector lever (ATX).

Back-up mode (MTX) for engine-start

- If the start stop unit determines that either the clutch pedal position switch or clutch cut switch is malfunctioning, the system switches to back-up mode.
- If the push button start is pressed when all the following conditions are met while in the back-up mode, the remote transmitter authorization is performed and the engine starts.
    - Start stop unit detects that either clutch pedal position switch or clutch cut switch is on
    - Neutral switch signal is received via CAN communication from PCM
    - Remote transmitter is within request signal output range of keyless antennas in vehicle interior

Guidance function

- Under the following conditions, the start stop unit sends a warning request signal via CAN transmission to the instrument cluster to flash the push button start indicator (green).
- The instrument cluster illuminates/flashes the KEY indicator light/KEY warning light when it receives the warning request signal.

Condition	Instrument cluster		Push button start
	KEY indicator light (green)	KEY warning light (red)	Indicator light (green)
Engine start conditions are met	On	—	On
ID data cannot be verified	—	Flashes	—

2014 - Mazda3 - Body and Accessories

PUSH BUTTON START SYSTEM [KEYLESS ENTRY SYSTEM]

Outline

- A push button start system has been adopted that automatically performs authorization of the remote transmitter being brought within the request signal output range of the keyless antennas.
- The start stop unit performs push button start system fail-safe. (See **START STOP UNIT**.)

Function

- When the push button start is pressed, the push button start system performs authorization of the remote transmitter that is within the request signal output range of the keyless antennas.
    - Engine start: When the remote transmitter authorization is performed while the engine starting conditions are met, the engine starts.
    - Power supply switching: When the remote transmitter authorization is performed, the ignition can be switched between OFF, ACC, and ON (engine on).
- The guidance function notifies the user of the push button start system conditions using the KEY indicator/warning lights in the instrument cluster to help the user's operation.

Operation

Remote transmitter verification

1. When the push button start is pressed, a push button start signal is input to the start stop unit.
2. When the start stop unit detects a push button start signal, it sends a request signal via the keyless antennas.
3. The remote transmitter receives the request signal from the keyless antennas, and transmits ID data to the keyless receiver.
4. The keyless receiver transmits the received ID data to the start stop unit.
5. The start stop unit verifies the ID data and if it matches, the power supply is switched to turn the push button start indicator light (amber) on.

NOTE:

2014 - Mazda3 - Body and Accessories

START STOP UNIT

Purpose

- Performs control of several systems based on input/output signals from switches.

Function

- The start stop unit controls systems based on the input/output signals.
- The functions which are controlled are as follows:

Control Table

Control	Content	Reference
Advanced keyless entry system control	Authorization of the remote transmitter being carried is automatically performed using radio waves, and all the doors lock/unlock according to the switch operation.	(See **ADVANCED KEYLESS ENTRY SYSTEM**.)
Keyless entry system control	When the lock/unlock buttons on the transmitter are pressed at a distance away from the vehicle (within approx. 1 m {3 ft}), all the doors lock/unlock.	(See **KEYLESS ENTRY SYSTEM**.)
Push button start system control	When the push button start is pressed, authorization of the remote transmitter brought into the vehicle is automatically performed.	(See **PUSH BUTTON START SYSTEM [ADVANCED KEYLESS ENTRY SYSTEM]**.) (See **PUSH BUTTON START SYSTEM [KEYLESS ENTRY SYSTEM]**.)
Immobilizer system control	The immobilizer system is a vehicle theft prevention device that only allows a remote transmitter that has been previously programmed to the vehicle to start the engine.	(See **IMMOBILIZER SYSTEM**.)
On-board diagnostic system control	The start stop unit is equipped with an on-board diagnosis function which records DTCs in the event of a malfunction.	(See **ON-BOARD DIAGNOSIS SYSTEM [START STOP UNIT]**.) (See **ON-BOARD DIAGNOSIS SYSTEM [ADVANCED KEYLESS ENTRY SYSTEM]**.) (See **ON-BOARD DIAGNOSIS SYSTEM [IMMOBILIZER SYSTEM]**.)
CAN (Controller Area Network)	Sends and receives signals between CAN system-related modules using CAN system.	(See **MULTIPLEX COMMUNICATION SYSTEM**.)

Fail-safe

Keyless entry system

- KEY warning light (red) illuminates.

Advanced keyless entry system

- KEY warning light (red) illuminates.

Push button start system

- If a malfunction is detected in the push button start system, the engine can be started by pressing and holding the push button start. In addition, if the following conditions are met, engine starting is inhibited.
    - Certain period of time has elapsed since malfunction is detected in push button start
    - Engine is started a certain number of times by pressing and holding push button start
- Flashes the push button start indicator light (amber).

Immobilizer system

- Flashes the push button start indicator light (amber).

2014 - Mazda3 - Body and Accessories

LF CONTROL UNIT

Purpose

- The keyless beeper and keyless antenna are controlled by the input/output signals from the start stop unit.

Function

- The LF control unit controls the keyless beeper sound based on the signal from the start stop unit.
- The LF control unit sends the request signal from the keyless antenna based on the signal from the start stop unit.

Construction

- Installed inside the front side trim.

Operation

Keyless beeper control

1. The LF control unit sends the beeper sound request signal from the start stop unit.

2. The LF control unit sounds the keyless beeper when it receives the beeper sound request signal.

Keyless antenna control

1. The LF control unit sends the request send signal from the start stop unit.

2. The LF control unit sends the request signal from the keyless antenna when it receives the request send signal.

Fail-safe

- Function not equipped.

LF CONTROL UNIT

2014 - Mazda3 - Body and Accessories

KEYLESS ANTENNA [ADVANCED KEYLESS ENTRY SYSTEM]

Purpose

- Outputs a request signal and specifies the remote transmitter location.

Function

- The keyless antenna outputs request signals to the inside and outside of the vehicle based on the signals from the LF control unit.

Construction, Operation

- The antennas for request signal output form the request signal output range at 5 locations.

Request signal output range

- The keyless antennas for the vehicle exterior (driver-side, passenger-side, rear) form the request signal output area in the range of an **approx. 80 cm {31 in}** radius from each location and communicate with the advanced key.
- The keyless antennas for the vehicle interior (front, rear) form the output range inside the vehicle.

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

KEYLESS ANTENNA [KEYLESS ENTRY SYSTEM]

Purpose

- Outputs a request signal and specifies the remote transmitter location.

Function

- The keyless antennas output request signals based on the signals from the start stop unit.

Construction, Operation

- Request signals are output by the keyless antenna installed in the rear console to produce the keyless antenna output range inside the vehicle.

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

REMOTE TRANSMITTER

Purpose

- When the lock button/unlock button of the remote transmitter is pressed, ID data is sent to the keyless receiver.

Function

- When the remote transmitter sends ID data, the operation indicator light illuminates.

Construction

- The remote transmitter is built into the operation indicator light.
- The remote transmitter secures specific electronic codes (key ID number) built into the electronic communication device (transponder).
- In case the transmitter is inoperable due to battery depletion, the doors can be locked/unlocked using the auxiliary key.

Operation

- When a remote transmitter button is pressed, ID data at a radio frequency of 315 MHz is sent to the keyless receiver.

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

REQUEST SWITCH

Purpose

- Transmits the request switch operation of the user to the LF control unit.

Function

- The request switch ON signal is sent to the LF control unit by operating the request switch.

Construction, Operation

- Installed on the outer handle of the driver-side/passenger side front door and liftgate garnish (5HB).
- While the request switch is pressed, the switch turns on (contact point: closed).

Fail-safe

Function not equipped.

2014 - Mazda3 - Body and Accessories

KEYLESS BEEPER

Purpose, Function

- Notifies the user that the lock/unlock operation of the advanced keyless entry system is completed, and warns if the system is operated incorrectly.

Construction, Operation

- Installed inside the cowl grille.
- The keyless beeper operates based on the LF control unit signals. For the details of the beeper operation, see [ALERT FUNCTION OPERATION] in **ADVANCED KEYLESS ENTRY SYSTEM**.

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

KEYLESS RECEIVER

Purpose, Function

- Receives ID data from the remote transmitter and sends the received ID data to the start stop unit.

Construction

- Installed inside the tire house trim.

Operation

1. The ID data sent from the remote transmitter is received by the keyless receiver.
2. The keyless receiver transmits the received ID data to the start stop unit.

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

PUSH BUTTON START

Purpose

- By pressing the switch ON/OFF, the push button start notifies the start stop unit of the user power supply switching operation.

Function

Push button start indicator light

- Illuminates the push button start indicator light to notify the driver of the power supply status.

START/STOP/ENGINE indicator light

- The characters in the push button start illuminate to notify the user of the button position.

Construction

- The push button start is installed in the meter hood.
- Two types of switches are integrated in the push button start.
- The push button start has the following integrated indicators. For the indicator inspection conditions, refer to the **PUSH BUTTON START SYSTEM [ADVANCED KEYLESS ENTRY SYSTEM]** or **PUSH BUTTON START SYSTEM [KEYLESS ENTRY SYSTEM]**.
    - ACC indicator
    - ON indicator
    - Indicator (green)
    - Indicator (amber)
- The push button start has an integrated coil antenna for the immobilizer system. (See **COIL ANTENNA**.)

Operation

- When the push button start is pressed, switches 1 and 2 turn on (contact point: closed), and when released, it turns off (contact point: open).

Push button start indicator light

Green illumination

- Illuminates if the conditions necessary for engine-start are met.

Amber illumination

- It illuminates when a malfunction is detected.

  Amber flashing

- Flashes when a malfunction is detected.

START/STOP/ENGINE indicator light

- When a door is open/closed, the START/STOP/ENGINE indicator light illuminates when the headlights are turned on.

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

KEYLESS WARNING ALARM

Purpose

- The keyless warning alarm notifies the driver that the presence of the remote transmitter cannot be verified.

Function

- When the instrument cluster receives the keyless warning alarm request signal sent from the start stop unit via the CAN signal, the keyless warning alarm sounds.
- The start stop unit sends a keyless warning alarm request signal to the instrument cluster via CAN signal.
    - Driver's door latch switch on signal (door open) is received with ignition switched to ACC (pattern A)
    - Remote transmitter cannot be detected inside vehicle when off signals for all door latch switches (doors closed) is received with ignition not switched to off (pattern B)
- The keyless warning alarm sound pattern is as follows:

Pattern A

Pattern B

Construction

- The keyless warning alarm sounds using the buzzer built into the instrument cluster.

Operation

1. The start stop unit sends (1) a keyless warning alarm request signal to the instrument cluster.

2. The instrument cluster microcomputer turns the transistor on (2) based on the keyless warning alarm request signal.

3. When the transistor turns on, the ground circuit of the alarm is established and the alarm sounds (3).

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

ON-BOARD DIAGNOSIS SYSTEM [ADVANCED KEYLESS ENTRY SYSTEM]

Outline

- The advanced keyless entry system has an on-board diagnostic function to facilitate system diagnosis.
- The on-board diagnostic function consists of the following functions:
  - A malfunction detection function, which detects overall malfunctions in the advanced keyless entry system-related parts.
  - A memory function, which stores detected DTCs.
  - A display function, which indicates malfunction locations and status via DTC output.
  - A PID/data monitoring function, which reads out specific input/output signals and verifies the input/output condition.
- Using the Mazda Modular Diagnostic System (M-MDS), DTCs can be read out and deleted, and the PID/data monitoring function can be activated.

Malfunction detection function

- Detects malfunctions in input/output signals.
- If a malfunction occurs, the start stop unit records the malfunction as a DTC. A recorded DTC can be read by the Mazda Modular Diagnostic System (M-MDS).

DTC 7-digit code definition

- When related systems or components have failed, the CM stores the DTC of the malfunctioning part in the CM memory, and allows for the retrieval of the store data using scanning tool when necessary. The DTCs are indicated using seven digits. Each digit indicates the following.

B 1 0 D 5 : 1 F

· Specify the area failure sub type
1F: Circuit intermittent
16: Circuit voltage below threshold
04: System Internal Failures
23: Signal stuck low
09: Component Failures
29: Signal signal invalid

· Manufacturer controlled

· Indicates subgroup

Powertrain (P code)	Network Electrical (U code)	Body (B code)	Chassis (C code)
0: Fuel and air metering and auxiliary emission controls	0: Network Electrical	Manufacturer controlled	Manufacturer controlled
	1: Network communication		
	2: Network communication		
	3: Network software		
	4: Network data		
	5: Network data		

· Indicates who was responsible for DTC definition
0: ISO/SAE controlled
1: Manufacturer controlled
2: There are ISO/SAE controlled just for powertrain, all others are manufacturer controlled.
3: For P3000 to P3399 is manufacturer controlled, all others are ISO/SAE controlled.

· Indicates DTC function
P: Powertrain
B: Body
C: Chassis
U: Network Electrical

Status byte for DTC

- The two digits (two digits after hyphen (-)) after the seven-digit DTC.

P 0 0 1 1 : 0 0 − * *

STATUS BYTE

- A code which indicates the pending code, current/past malfunction status, or warning illumination status.
- Can be read by performing a CMDTC self-test using the Mazda Modular Diagnostic System (M-MDS).

For details on the status byte, refer to the explanation on the Mazda Modular Diagnostic System (M-MDS) when reading the DTC.

Detection condition for the applicable DTC

DTC	System malfunction location	Detection condition
B10C6:1F	Keyless antenna (exterior, rear) circuit malfunction	Start stop unit detects an open circuit or short to ground in the keyless antenna (exterior, rear) circuit with the ignition switched off.
B10C7:1F	Keyless antenna (interior, rear) circuit malfunction	Start stop unit detects an open circuit or short to ground in the keyless antenna (interior, rear) circuit with the ignition switched off.
B10C9:1F	Keyless antenna (interior, front) circuit malfunction	Start stop unit detects an open circuit or short to ground in the keyless antenna (interior, front) circuit with the ignition switched off.
B10D1:23	Request switch (LF) circuit malfunction	• Start stop unit detected any of the following conditions at a vehicle speed of 5 km/h {3 mph} or more. ▪ The request switch (LF) is continuously ON for 2 min or more. ▪ The request switch (LF) was ON 7 times before the vehicle speed decreased to less than 5 km/h {3 mph}.
B10D3:23	Request switch (RF) circuit malfunction	• Start stop unit detected any of the following conditions at a vehicle speed of 5 km/h {3 mph} or more. ▪ The request switch (RF) is continuously ON for 2 min or more. ▪ The request switch (RF) was ON 7 times before the vehicle speed decreased to less than 5 km/h {3 mph}.
B11C4:23*1	Request switch (liftgate) circuit malfunction	• Start stop unit detected any of the following conditions at a vehicle speed of 5 km/h {3 mph} or more. ▪ The request switch (liftgate) is continuously ON for 2 min or more. ▪ The request switch (liftgate) was ON 7 times before the vehicle speed decreased to less than 5 km/h {3 mph}.
	Keyless antenna	Start stop unit detects an open circuit or short to ground in the keyless antenna (exterior, LF) circuit with the ignition

B11FD:1F	(exterior, LF) circuit malfunction	switched off.
B1210:1F	Keyless antenna (exterior, RF) circuit malfunction	Start stop unit detects an open circuit or short to ground in the keyless antenna (exterior, RF) circuit with the ignition switched off.
B13C3:04	LF control unit internal malfunction	Start stop unit detects the LF control unit internal malfunction.
B13C3:09	LF control unit malfunction	• Start stop unit detects that the LF state signal of the LF control unit is low for 5 s or more. • With the communication between the start stop unit and LF control unit being performed normally, there is no response from the LF control unit even though there is the signal transmission request from the start stop unit to the LF control unit, and the LF state signal becomes low.
B13C3:16	LF control unit power supply voltage low input	Start stop unit power supply circuit voltage of 8.5 V or more or less than 16.5 V and LF control unit power supply circuit voltage of 5 V or more or less than 8.5 V are detected for 5 s or more.
B13C3:29	Communication error between start stop unit and LF control unit	Start stop unit detects the communication error with the LF control unit 10 times.

*1

5HB

Data monitor function

- With the PID/data monitor function, input/output signal monitor items set in the start stop unit can be selected and read out in real-time.

PID	Unit/Operation	Data contents	Data read/use method	Module control terminal
LG/T_LK_SW*1	Off/On	Request switch (liftgate) operation condition • Off: Request switch (liftgate) is off. • On: Request switch (liftgate) is on.	The request switch (liftgate) input is an input signal to the start stop unit through the LF control unit.	2F (LF control unit communication)

RQ_SW_LF	Off/On	Request switch (LF) operation condition • Off: Request switch (LF) is off. • On: Request switch (LF) is on.	The signal is input to the start stop unit through the LF control unit of the request switch (LF).	2F (LF control unit communication)
RQ_SW_RF	Off/On	Request switch (RF) operation condition • Off: Request switch (RF) is off. • On: Request switch (RF) is on.	The signal is input to the start stop unit through the LF control unit of the request switch (RF).	2F (LF control unit communication)

*1

5HB

Active Command Modes Function

- The active command modes are shown below.

Simulation item	Unit/Operation	Data contents	Data read/use method	Output part name
BZR_OUT	Off/On	• Off: Keyless beeper does not sound. • On: Keyless	• When the simulation item BZR_OUT is turned on, a force override signal is sent to the LF control unit from the start stop unit, and the LF control unit drives (sounds) the keyless beeper. • With adoption of a separate excitation buzzer to the keyless beeper, buzzer does not sound normally even if the voltage is applied to the buzzer unit because there is no oscillation circuit. The integrity of the keyless beeper is determined using the simulation item BZR_OUT. • If the keyless buzzer does not sound even though the simulation function BZR_OUT is on, perform diagnosis using the following procedure. ▪ Press the remote transmitter lock/unlock button repeatedly and measure the terminal voltage of the keyless buzzer when the button is pressed.	Keyless beeper

		beeper sounds.	**Voltage is output** • Keyless buzzer malfunction may have occurred. **Voltage is not output** • Related wiring harness, or LF control unit malfunction may have occurred.	

2014 - Mazda3 - Body and Accessories

ON-BOARD DIAGNOSIS SYSTEM [START STOP UNIT]

Outline

- The on-board diagnostic function consists of the following functions:
  - A malfunction detection function, which detects overall malfunctions in the start stop unit-related parts.
  - A memory function, which stores detected DTCs.
  - A display function, which indicates malfunction locations and status via DTC output.
  - A PID/data monitoring function, which reads out specific input/output signals and verifies the input/output condition.
- Using the Mazda Modular Diagnostic System (M-MDS), DTCs can be read out and deleted, and the PID/data monitoring function can be activated.

Malfunction detection function

- Detects malfunctions in input/output signals.
- If a malfunction occurs, the start stop unit records the malfunction as a DTC. A recorded DTC can be read by the Mazda Modular Diagnostic System (M-MDS).

Snapshot Data

NOTE:

- The start stop unit stores the following two types of information when a DTC is detected and displays snapshot data in the Mazda Modular Diagnostic System (M-MDS).
  - Vehicle information detected by start stop unit
  - Vehicle information detected by instrument cluster and received by start stop unit via CAN signal
- The data for all DTCs currently detected is stored.

—: Not applicable

Snapshot data item	Unit		Data contents	Data read/use method	Corresponding data monitor items
AAT	°C	°F	Ambient temperature	—	—
APP_STATUS	Accelerator Pedal Off/Under20%/Over20%/FAIL		Accelerator pedal position status	—	—
CFG_STATUS	Config Complete/Not Configured/Config Error		Instrument cluster configuration status	—	—

ECT_STATUS	Under 0 degrees C/0 - Under 80 degrees C/Over 80 degrees C/FAIL	Engine coolant temperature status	—	—
IC_VPWR	V	Instrument cluster power supply voltage	• The start stop unit constantly receives the power supply voltage value of the instrument cluster sent via CAN signal from the instrument cluster. • If a DTC is detected, the start stop unit records the power supply voltage of the instrument cluster when the DTC was detected, and it is displayed in the Mazda Modular Diagnostic System (M-MDS).	VPWR*1
IG-ON_TIMER	hh:mm:ss*2	Elapsed time since ignition was switched ON (engine off or on) **NOTE:** • The instrument cluster records the elapsed time since the ignition was switched ON (engine off or on).	• The start stop unit constantly receives the elapsed time since the ignition was switched ON (engine off or on) sent via CAN signal from the instrument cluster. • If a DTC is detected, the start stop unit records the elapsed time since the ignition was switched ON (engine off or on) when the DTC was detected, and it is displayed in the Mazda Modular Diagnostic System (M-MDS).	—
PWR_MODE_KEY	Key Out/Key Recently Out (Position 0)/Accessory (Position 1)/Post Ignition (Position 2)/Ignition On (Position 2)/Running (Position 2)/Running - Starting	• Key Out: Ignition switched off • Key Recently Out (Position 0): Elapsed time **within 3 s** since ignition was switched off • Accessory (Position 1): Ignition is switched to ACC • Post Ignition (Position 2): Elapsed time **within 3 s** since ignition was switched ON (engine off	• The start stop unit constantly receives the ignition switch status sent via CAN signal from the instrument cluster. • If a DTC is detected, the start stop unit records the ignition switch status when the DTC was detected, and it is displayed in the Mazda Modular Diagnostic System	—

			or on) • Ignition On (Position 2): Ignition switched ON (engine off) • Running (Position 2): Ignition switched ON (engine on) • Running - Starting: Cranking condition	(M-MDS).	
RPM_STATUS	Engine Stop/Under1500rpm/Over1500rpm/FAIL		Engine speed status	• The start stop unit constantly receives the engine speed sent via CAN signal from the instrument cluster. • If a DTC is detected, the start stop unit records the engine speed when the DTC was detected, and it is displayed in the Mazda Modular Diagnostic System (M-MDS).	TACHOMTR*1
SHIFT_STATUS	P/N/D/R/FAIL		Selector lever position status	• The start stop unit constantly receives the selector lever position sent via CAN signal from the instrument cluster. • If a DTC is detected, the start stop unit records the selector lever position when the DTC was detected, and it is displayed in the Mazda Modular Diagnostic System (M-MDS).	—
TOTAL_DIST	km	Miles	Accumulated total traveled distance from completion of vehicle until start stop unit detects DTC (Odometer value in instrument cluster)	The total traveled distance from which the start stop unit detects DTCs to the present can be calculated by performing the following procedure. • Verify the odometer value in the instrument cluster. • Verify the snapshot data item TOTAL_DIST. • Subtract 2 from 1.	—
			Accumulated total elapsed time since vehicle completion until start stop unit detects a DTC	The elapsed time from which the start stop unit detects	

TOTAL_TIME	hh:mm:ss*2	**NOTE:** • When the ROOM fuse is removed, and the ignition is switched off, the time is not included in the elapsed time.	DTCs to the present can be calculated by performing the following procedure. • Verify the instrument cluster PID item TOTAL_TIME. • Verify the snapshot data item TOTAL_TIME. • Subtract 2 from 1.	TOTAL_TIME*1
TRNS_NUM_L	Initial/No.1/No.2/No.3/No.4/No.5/No.6	Registration number of the remote transmitter	If the start stop unit detects DTC B13D3:16 (Low remote transmitter battery voltage), inspect the remote transmitter in which the malfunction is occurring using the following procedure to display the registration number of the remote transmitter that was operated. • Verify the registration number of the remote transmitter in the snapshot data. • Display the start stop unit PID item RF_TRNS_NUM and inspect the battery voltage of the remote transmitter having the same registration number as the recorded remote transmitter registration number.	—
VPWR	V	Start stop unit power supply voltage	—	VPWR_B2
VPWR_B1	V	Start stop unit power supply voltage (ROOM fuse)	—	VPWR_B1
VSPD_STATUS	Stop/0-10km/h/Over10km/h/FAIL	Vehicle speed status	• The start stop unit constantly receives the vehicle speed sent via CAN signal from the instrument cluster. • If a DTC is detected, the start stop unit records the vehicle speed when the DTC was detected, and it is displayed in the Mazda Modular Diagnostic System (M-MDS).	SPEEDOMTR*1

*1

Instrument cluster PID (See ON-BOARD DIAGNOSTIC [INSTRUMENT CLUSTER].)

*2

The seconds may be indicated after the decimal point.

DTC 7-digit code definition

- When related systems or components have failed, the CM stores the DTC of the malfunctioning part in the CM memory, and allows for the retrieval of the store data using scanning tool when necessary. The DTCs are indicated using seven digits. Each digit indicates the following.

B 1 0 D 5 : 1 3

· Specify the area failure sub type

1F: Circuit intermittent
2F: Signal erratic
4A: Incorrect component installed
00: No sub type information
01: General electrical failure
04: System internal failures
05: System programming malfunctions
09: Component failures
11: Circuit short to ground
12: Circuit short to battery
13: Open circuit
14: Circuit short to ground or open
16: Circuit voltage below threshold
17: Circuit voltage above threshold
23: Signal stuck low
24: Signal stuck high
29: Signal signal invalid
49: Internal electronic malfunction
51: Not programmed
56: ISO/SAE reserved
62: Signal compare malfunction
71: Actuator stuck
81: Invalid serial data received
86: Signal invalid
87: Missing message
88: Bus off
92: Performance or incorrect operation
94: Unexpected operation
95: Incorrect assembly
96: Component internal malfunction
97: Component or system operation obstructed or blocked

· Manufacturer controlled

· Indicates subgroup

Powertrain (P code)	Network Electrical (U code)	Body (B code)	Chassis (C code)
0: Fuel and air metering and auxiliary emission controls	0: Network Electrical	Manufacturer controlled	Manufacturer controlled
	1: Network communication		
	2: Network communication		
	3: Network software		
	4: Network data		
	5: Network data		

· Indicates who was responsible for DTC definition

0: ISO/SAE controlled
1: Manufacturer controlled
2: There are ISO/SAE controlled just for powertrain, all others are manufacturer controlled.
3: For P3000 to P3399 is manufacturer controlled, all others are ISO/SAE controlled.

· Indicates DTC function

P: Powertrain
B: Body
C: Chassis
U: Network Electrical

Status byte for DTC

- The two digits (two digits after hyphen (-)) after the seven-digit DTC.

- A code which indicates the pending code, current/past malfunction status, or warning illumination status.
- Can be read by performing a CMDTC self-test using the Mazda Modular Diagnostic System (M-MDS).
- For details on the status byte, refer to the explanation on the Mazda Modular Diagnostic System (M-MDS) when reading the DTC.

Detection condition for the applicable DTC

DTC	System malfunction location	Detection condition
B108B:23	Push button start switch 1 circuit malfunction	Start stop unit detects that the push button start switch 1 is stuck on for 120 s or more.
B108B:24	Push button start switch 1 circuit malfunction	Start stop unit detects that the push button start switch 1 is kept in an off condition 5 times or more even though the push button start switch 2 is on.
B108C:23	Push button start switch 2 circuit malfunction	Start stop unit detects the push button start switch 2 is stuck on for 120 s or more.
B108C:24	Push button start switch 2 circuit malfunction	Start stop unit detects that the push button start switch 2 is kept in an off condition 5 times or more even though the push button start switch 1 is on.
B10AC:13*1	Cruise control switch circuit malfunction	Start stop unit detected an open circuit in the cruise control switch circuit for 5 s or more with the ignition switched ON (engine off or on).
B10AC:23*1	Cruise control switch circuit malfunction	Start stop unit detects any cruise control switch stuck on for 2 min or more with the ignition switched ON (engine off or on).
B10C9:1F	Keyless antenna (interior, center) circuit malfunction (With keyless entry system)	Start stop unit detects an open circuit or short to ground in the keyless antenna (interior, center) with the ignition switched off.
B10E7:11	IG1 relay circuit malfunction	Start stop unit detects the voltage from the IG1 relay output monitor as less than 2.5 V for 0.5 s or more while the engine is not being cranked with the ignition switched ON (engine off or on).
		Start stop unit detects the IG1 relay output monitor voltage of 2.5 V or more for 0.5 s or more with the ignition

B10E7:12	IG1 relay circuit malfunction	switched off or ACC.
B10E7:16	IG1 relay circuit malfunction	Start stop unit detects the IG1 monitor voltage of less than 2.5 V for 1 s or more while the engine is not being cranked with the ignition switched ON (engine off or on).
B10E7:17	IG1 relay circuit malfunction	Start stop unit detects the IG1 monitor voltage of 2.5 V or more for 1 s or more with the ignition switched off or ACC.
B112A:11	IG2 relay circuit malfunction	Start stop unit detects the IG2 relay output monitor voltage of 2.5 V or less for 0.5 s or more with the ignition switched ON (engine off or on).
B112A:12	IG2 relay circuit malfunction	Start stop unit detects the IG2 relay output monitor voltage of 2.5 V or more for 0.5 s or more with the ignition switched off or to ACC.
B124C:56	Turn switch circuit malfunction	Start stop unit detects that the turn switch LH and RH are turned on simultaneously for 5 s or more.
B13D3:16	Low remote transmitter battery voltage	Start stop unit detects the low remote transmitter battery voltage in any of the programmed transmitters 3 times continuously.
B13D3:4A	Remote transmitter assembly malfunction	Start stop unit detects a remote transmitter different from the one equipped to the vehicle.
B13D3:97	Remote transmitter registration work not completed	Start stop unit detects that the registration of a remote transmitter has not been completed.
B1C53:13	Windshield wiper switch circuit malfunction	Start stop unit detects an open circuit, short to ground, or short to power supply in the windshield wiper switch circuit for 5 s or more with the ignition switched ON (engine off or on).
C0040:23*3	Brake switch (No.1 signal) circuit malfunction	Start stop unit detects that the brake switch No.1 signal is in the off condition for 3 s or more continuously for a continuous 5 times even though brake switch No.2 signal changes with the ignition switched ON (engine off or on).
C0040:24*3	Brake switch (No.1 signal) circuit malfunction	Start stop unit detects that the brake switch No.1 signal is in the on condition for 3 s or more continuously for a continuous 5 times even though brake switch No.2 signal changes with the ignition switched ON (engine off or on).
C0051:2F*2	Steering angle sensor signal error	Start stop unit detects the steering angle sensor signal error for 5 s or more with the ignition switched ON (engine off or on).
C0051:95*2	Steering angle sensor assembly malfunction	• Start stop unit receives the following signals with the ignition switched ON (engine off or on). ▪ Steering angle sensor assembly malfunction from EPS control module for 1 s or more ▪ Improper assembly of steering angle sensor at 360° ▪ Steering wheel angle of 720° or more for 0.048 s or more

C0052:14*2	Steering angle sensor A signal circuit malfunction	Start stop unit detects an open circuit or short to ground in the steering angle sensor A signal circuit.
C0052:2F*2	Steering angle sensor A signal malfunction	• Start stop unit detected the sudden change in steering angle sensor A signal. • Start stop unit detected that the steering angle sensor A signal is stuck with the ignition switched ON (engine off or on).
C0053:14*2	Steering angle sensor B signal circuit malfunction	Start stop unit detects an open circuit or short to ground in steering angle sensor B signal circuit.
C0053:2F*2	Steering angle sensor B signal malfunction	• Start stop unit detects the sudden change in steering angle sensor B signal. • Start stop unit detects that the steering angle sensor B signal is stuck with the ignition switched ON (engine off or on).
C2003:13	Open circuit in steering switch	Start stop unit detects an open circuit in the steering switch circuit for 5 s or more with the ignition switched ON (engine off or on).
P0615:11	Starter relay circuit malfunction	Start stop unit detects that the starter relay monitor circuit voltage of less than 2.2 V for 0.2 s or more with the ignition switched off.
P0615:12	Starter relay circuit malfunction	Start stop unit detects that the starter relay circuit voltage of specification or more for 0.1 s or more with the ignition switched off.
P0615:13	Starter relay circuit malfunction	Start stop unit detects an open circuit in the starter relay circuit for 0.075 s or more with the ignition switched off.
P0615:16	Starter relay circuit malfunction	Start stop unit detects that the starter relay circuit voltage that is less than the specification for 0.05 s or more during cranking.
P0616:23	Circuit malfunction on downstream side of starter relay	Start stop unit detects a short to ground in the starter relay downstream circuit continuously for 0.5 s or more for a continuous 5 times.
P0616:24	Circuit malfunction on downstream side of starter relay	Start stop unit detects an open circuit in the starter relay downstream circuit continuously for 0.5 s or more for a continuous 5 times.
P0616:29	Downstream side of starter relay signal malfunction	• Start stop unit detects that the following signals are unmatched for 0.5 s or more for a continuous 5 times. ▪ Transaxle range sensor (ATX) or starter interlock switch (MTX) condition ▪ Starter relay downstream circuit condition ▪ PCM control result ▪ CAN signal condition output from PCM

P081C:23*3	NOT P position switch circuit malfunction	Start stop unit detects that the NOT P position switch is stuck on for 5 s or more for a continuous 5 times with the ignition switched ON (engine off or on).
P081C:24*3	NOT P position switch circuit malfunction	Start stop unit detects that the NOT P position switch is stuck off for 5 s or more for a continuous 5 times with the ignition switched ON (engine off or on).
P081D:29*4	Neutral switch error signal received	Start stop unit receives the neutral switch signal error signal from the PCM for 1 min or more with the ignition switched ON (engine off or on).
P081D:2F*4	Neutral switch signal mismatch	Start stop unit detects that the vehicle speed changes from 0 km/h {0 mph} to 10 km/h {6.2 mph} for a continuous 5 times or more even though the neutral signal from the PCM is being received with the ignition switched ON (engine off or on).
P0830:23*4	CPP switch circuit malfunction	Start stop unit detects that the CPP switch is stuck on for 10 min or more.
P0850:23*3	Transaxle range sensor circuit malfunction	Start stop unit detects that the transaxle range sensor signal is P or N position for 1 s or more continuously for a continuous 5 times or more even though the TCM CAN signal is other than P and N position with the ignition switched ON (engine off or on).
P0850:24*3	Transaxle range sensor circuit malfunction	Start stop unit detects that the transaxle range sensor signal is other than P and N position for 1 s or more continuously for a continuous 5 times or more even though the TCM CAN signal is in P or N position with the ignition switched ON (engine off or on).
P0930:71*3	Shift-lock solenoid circuit malfunction	Start stop unit detects the shift-lock solenoid is stuck on for 30 min or more with the ignition switched ON (engine off or on).
P1708:24*4	Starter interlock switch circuit malfunction	Start stop unit detects an open circuit in the starter interlock switch circuit for 0.5 s or more for a continuous 5 times with the ignition switched ON (engine off or on).
P1708:29*4	Starter interlock switch circuit or CPP switch circuit malfunction	Start stop unit detects that the starter interlock switch circuit is stuck on for 0.2 s or more, or the CPP switch circuit is stuck off for 0.25 s or more.
P1794:16	Start stop unit power supply voltage (terminal 2W) low input	Start stop unit power supply circuit voltage (terminal 2W) of less than 6.5 V is detected for 5 s or more.
U0001:88	Module communication error (HS-CAN)	Start stop unit detects the CAN bus communication line (HS-CAN) malfunction 10 times continuously.
U0028:87	Communication error with rear body control module (RBCM)	Start stop unit detects the communication error with rear body control module (RBCM) 10 times continuously.
U0100:00	Communication error with PCM	Start stop unit could not receive the CAN signal from the PCM for 1 s or more.
U0101:00*3	Communication error with TCM	Start stop unit could not receive the CAN signal from the TCM for 1 s or more.

U0121:00	Communication error with DSC HU/CM	Start stop unit could not receive the CAN signal from the DSC HU/CM for 1 s or more.
U0121:87	Communication error with DSC HU/CM	Start stop unit could not receive the CAN signal from the DSC HU/CM for 10 s or more.
U0131:00	Communication error with EPS control module	Start stop unit could not receive the CAN signal from the EPS control module for 1.2 s or more.
U0140:00	Communication error with front body control module (FBCM)	Start stop unit could not receive the CAN signal from the front body control module (FBCM) for 5 s or more.
U0146:00	Communication error with instrument cluster	Start stop unit cannot receive the CAN signal from the instrument cluster for 5 s or more with the ignition switched ON (engine off or on).
U0151:00	Communication error with SAS control module	Start stop unit could not receive the CAN signal from the SAS control module for 1 s or more.
U0155:00	Communication error with instrument cluster	Start stop unit could not receive the CAN signal from the instrument cluster for 5 s or more.
U0447:86	Error signal received from instrument cluster	Start stop unit receives the error signals from the instrument cluster for 5 s or more with the ignition switched ON (engine off or on).
U201F:11	Keyless receiver circuit malfunction	Start stop unit detects that the keyless receiver circuit voltage of less than 3.4 V for 0.5 s or more.
U201F:12	Keyless receiver circuit malfunction	Start stop unit detects that the keyless receiver circuit voltage of 6.2 V or more for 0.5 s or more.
U2100:00	Start stop unit configuration not completed	Start stop unit configuration not completed.
U2300:00	Configuration data not received from instrument cluster	Start stop unit cannot receive the configuration data from the instrument cluster for 1 s or more with the ignition switched ON (engine off or on).
U3000:01 *2	Start stop unit internal malfunction	Start stop unit detects the internal malfunction.
U3000:49	Start stop unit internal malfunction	Start stop unit detects the internal malfunction.
U3000:96	Start stop unit malfunction	Start stop unit malfunction detected.
U3003:16	Start stop unit power supply voltage (terminal 1A) low input	Start stop unit power supply circuit voltage (terminal 1A) of 5V or more, less than 8.5 V is detected for 5 s or more.
U3004:11	ACC relay circuit malfunction	Start stop unit detects that the ACC relay output monitor voltage of less than specification for 0.05 s or more with the ignition switched to ACC or ON (engine off or on).

U3004:12	ACC relay circuit malfunction	Start stop unit detects that the ACC relay output monitor voltage of 2.5 V or more for 0.5 s or more with the ignition switched off.
U3004:16	ACC relay circuit malfunction	Start stop unit detects that the ACC monitor voltage of less than 2.5 V for 1 s or more with the ignition switched to ACC or ON (engine off or on).
U3004:17	ACC relay circuit malfunction	Start stop unit detects that the ACC monitor voltage of 2.5 V or more for 5 s or more with the ignition switched off.

ES_ULL_SW_M	Off/On	**NOTE:** • Displays in the Mazda Modular Diagnostic System (M-MDS) but it does not operate.	—	—
F_FOG_SW	Off/On	Front fog light switch operation condition • Off: Fog light switch is not in F.FOG position. • On: Fog light switch is in F.FOG position.	—	—
H/L_SW_HI	Off/On	Headlight switch (HI) operation condition • Off: Light switch is not in HI position. • On: Light switch is in HI position.	—	—
		Displays dimmer switch position of		

H/L_SW_LOW	Off/On	the light switch that is being input to the start stop unit • Off: Dimmer switch of light switch is not in LO position • On: Dimmer switch of light switch is in LO position	Verify if the monitor value switches when the dimmer switch of the light switch is switched between LO and HI positions. If the dimmer switch operation and monitor values do not match, inspect the light switch.	—
H/L_SW_OFF	Off/On	Headlight light switch (OFF) operation condition • Off: Light switch is not in OFF position. • On: Light switch is in OFF position.	—	—
H/L_SW_PASS	Off/On	Headlight switch (PASS) operation condition • Off: Light switch is not in passing position. • On: Light switch is in passing position.	—	—
H/L_SW_TNS	Off/On	Headlight switch (TNS) operation condition • Off: Light switch is not in TNS position. • On: Light switch is in TNS position.	—	—
HAZARD_SW	Off/On	Displays condition of hazard warning switch input to start stop unit • Off: Hazard warning switch is off. • On: Hazard warning switch is on.	—	1G (Hazard warning switch signal)
			• When the push button start is operated, the start	

IG_POSITION	OFF/ACC/ON/CRANK	Displays power status controlled by the start stop unit • OFF: Start stop unit controls ignition switch off • ACC: Start stop unit controls ignition switch ACC • ON: Start stop unit controls ignition switch ON (engine off) • CRANK: Start stop unit controls cranking at ignition switch ON	stop unit performs power source switching and displays the PID value of the power source position in which control was performed. • If the push button start operation and PID value do not match, and a power source status of another unit differs from the PID value, inspect the input power source of the other unit because the power source control of the start stop unit is normal.	—
		Steering switch operation condition • Off: Steering switch UP/DOWN/INFO switch is not pressed. • SW1_On: UP switch is pressed.		• 1AA

INFO_SW*4	Off/SW1_On/SW2_On/SW3_On/Unknown/Invalid	• SW2_On: DOWN switch is pressed. • SW3_On: INFO switch is pressed. • Unknown: Steering switch UP/DOWN/INFO switch signal is not determined. • Invalid: Steering switch malfunction is received.	Displays INFO switch position of steering switch input to start stop unit. Steering switch signal is input to start stop unit via clock spring.	(Steering switch signal) • 1AB (Steering switch ground)
INHIBIT_SW*1	Off/On	Transaxle range switch input status • Off: Selector lever is not in P and N positions. • On: Selector lever is in P or N position.	—	1F (Selector lever position switch)
LG/T_LK_SW*5	Off/On	Request switch (liftgate) operation condition • Off: Request switch (liftgate) is off. • On: Request switch (liftgate) is on.	The request switch (liftgate) input is an input signal to the start stop unit through the LF control unit.	2F (LF control unit communication)
LG/T_UNL_SW	Off/On	Trunk lid opener switch (exterior) (4SD)/liftgate opener switch (5HB) operation condition • Off: Trunk lid opener switch (exterior) (4SD)/liftgate opener switch (5HB) is off. • On: Trunk lid opener switch (exterior) (4SD)/liftgate opener switch (5HB) is on.	Trunk lid opener switch (exterior) (4SD)/liftgate opener switch (5HB) operation signal. The start stop unit and rear body control module (RBCM) transmit signals to perform trunk (4SD)/liftgate (5HB) unlatch operation.	1Q (Rear body control module (RBCM) communication)
LL_SW_D_LK	Off/On	Driver's door lock link switch (lock side) operation condition • Off: Front door lock-link switch (LH) is in unlock.	Driver's door lock link switch lock signal is input to start stop unit. The same signal may also be	1P (Lock input)

		• On: Front door lock-link switch (LH) is in lock.	sent to rear body control module (RBCM).	
NUM_TRNSMIT	—	Displays number of the remote transmitters programmed to the start stop unit	—	—
P_RANGE_SW*1	Off/On	P position switch condition • Off: NOT P position switch is off. • On: NOT P position switch is on.	—	1J (P position)
PAD_DOWN_SW*6	Off/On	Steering shift switch (DOWN) condition • Off: DOWN switch of steering shift switch is off. • On: DOWN switch of steering shift switch is on.	—	1N (Steering shift switch (down))
PAD_UP_SW*6	Off/On	Steering shift switch (UP) condition • Off: UP switch of steering shift switch is off. • On: UP switch of steering shift switch is on.	—	1L (Steering shift switch (up))
R_FOG_SW	Off/On	**NOTE:** • Displays in the Mazda Modular Diagnostic System (M-MDS) but it does not operate.	—	—
RELAY_ACC	Off/On	ACC relay operation condition • Off: ACC relay drive is off. • On: ACC relay drive is on.	—	2C (ACC relay control)

RELAY_IG1	Off/On	IG1 relay operation condition • Off: IG1 relay drive is off. • On: IG1 relay drive is on.	—	2S (IG1 relay control)
RELAY_IG2	Off/On	IG2 relay operation condition • Off: IG2 relay drive is off. • On: IG2 relay drive is on.	—	2D (IG2 relay control)
RF_RECEP_ST	Initial/Transmitter/RF_Response	Displays radio reception status from the remote transmitter • Initial: Signal from remote transmitter is not received by start stop unit • Transmitter: Signal by button operation on remote transmitter is received by start stop unit • RF_Response: During remote transmitter authorization, response signal from remote transmitter is received by start stop unit	When verifying the PID value while operating the remote transmitter buttons, if “Transmitter” is displayed it can be determined that the transmission between the remote transmitter, keyless receiver, and start stop unit is normal.	2R (Keyless receiver communication)
		When pressing the unlock button of the remote transmitter, the registration number of the remote transmitter sending radio waves to the start stop unit is displayed. • Initial: Registration number of remote transmitter cannot be received • No.1: Registration number No.1 remote transmitter is	When DTC B13D3:16 (Low remote transmitter battery	

RF_TRNS_NUM	Initial/No.1/No.2/No.3/No.4/No.5/No.6	received • No.2: Registration number No.2 remote transmitter is received • No.3: Registration number No.3 remote transmitter is received • No.4: Registration number No.4 remote transmitter is received • No.5: Registration number No.5 remote transmitter is received • No.6: Registration number No.6 remote transmitter is received	voltage) is detected, the registration number of the remote transmitter in which the battery voltage has decreased is displayed in the snapshot data item TRNS_NUM_L. Display the registration number of the remote transmitter using the PID, verify the remote transmitter with the low battery voltage, and inspect the battery condition of the target remote transmitter.	2R (Keyless receiver communication)
RQ_SW_LF*5	Off/On	Request switch (LF) operation condition • Off: Request switch (LF) is off. • On: Request switch (LF) is on.	The signal is input to the start stop unit through the LF control unit of the request switch (LF).	2F (LF control unit communication)
RQ_SW_RF*5	Off/On	Request switch (RF) operation condition • Off: Request switch (RF) is off. • On: Request switch (RF) is on.	The signal is input to the start stop unit through the LF control unit of the request switch (RF).	2F (LF control unit communication)
SECURITY_I	Off/On	Output condition of security indicator • Off: Security indicator light is turned off. • On: Security indicator light is illuminated.	Security indicator on request to instrument cluster	2M, 2O (CAN)

SFT_LK_SOL*1	Off (Lock)/On (Unlock)	Shift lock solenoid operation condition • Off (Lock): Shift-lock is operated. • On (Unlock): Shift-lock is released.	—	2G (Shift lock)
SPD_LIM_SW	Off/On/Unknown	**NOTE:** • Displays in the Mazda Modular Diagnostic System (M-MDS) but it does not operate.	—	—
SSB_1	Off/On	Push button start switch 1 input signal • Off: Push button start switch 1 is off. • On: Push button start switch 1 is on.	—	1H (Push button start 1)
SSB_2	Off/On	Push button start switch 2 input signal • Off: Push button start switch 2 is off. • On: Push button start switch 2 is on.	—	2J (Push button start 2)
SSB_AMBER	Off/On	Push button start indicator light (amber) illumination request • Off: Push button start indicator light (amber) is turned off. • On: Push button start indicator light (amber) is illuminated.	—	1M (Push button illumination (amber))
SSB_GREEN	Off/On	Push button start indicator light (green) illumination request • Off: Push button start indicator light (green) is turned off.	—	1K (Push button illumination (green))

		• On: Push button start indicator light (green) is illuminated.		
SSB_ILLMI	Off/On	Push button start illumination request • Off: START/STOP/ENGINE indicator light is turned off. • On: START/STOP/ENGINE indicator light is illuminated.	—	1I (Push button illumination)
START_RLY_1	V	Displays voltage at start stop unit terminal 2V	—	2V (Starter relay)
START_RLY_2	V	Displays voltage at start stop unit terminal 1D	—	1D (Starter monitor)
STR_A_ANG_A*7	° (deg)	Displays steering angle sensor A signal aiming angle	—	—
STR_A_ANG_B*7	° (deg)	Displays steering angle sensor B signal aiming angle	—	—
STR_AB_ANG*7	° (deg)	Displays steering angle signal (absolute angle) • Steering wheel in neutral position: Near **0 degrees** • Steering wheel turned to left: Changes from **0 degrees** to positive • Steering wheel turned to right: Changes from **0 degrees** to negative	—	—
STR_ANG_S*7	Without/With	Vehicle with/without steering angle sensor • Without: Steering angle sensor is not equipped.	—	—

		• With: Steering angle sensor is equipped.		
STR_ANG_S_A*7	V	Displays voltage at the steering angle sensor A signal	—	1U (Steering angle sensor (signal A/D1))
STR_ANG_S_B*7	V	Displays voltage at the steering angle sensor B signal	—	1W (Steering angle sensor (signal A/D1))
STR_ANG_S_V*7	V	Displays steering angle sensor power supply voltage **NOTE:** • “5 V” is displayed even if the voltage is **5 V or more**.	—	1S (Steering angle sensor power supply)
TURN_SW_L	Off/On	Turn switch (RH) input • Off: Turn switch is in position other than LH. • On: Turn switch is in LH position.	—	—
TURN_SW_R	Off/On	Turn switch (LH) input • Off: Turn switch is in position other than RH. • On: Turn switch is in RH position.	—	—
VPWR_ACC	V	Displays ACC power supply voltage input to start stop unit	If there is a malfunction in the ACC power supply voltage input to the start stop unit, the keyless entry system and push button start system do not operate normally because PID item VPWR_ACC is used for ACC power on/off determination.	1E (ACC monitor)
			If there is a malfunction in the B+ power supply (ROOM fuse) voltage input to the start stop unit, the	

VPWR_B1	V	Displays B+ power supply (ROOM fuse) voltage input to start stop unit	keyless entry system does not operate normally because PID item VPWR_B1 is used for determining whether or not there is a ROOM fuse inserted.	1A (Power supply)
VPWR_B2	V	Displays B+ power supply (AT fuse) voltage input to start stop unit	When the ROOM fuse is removed, the B+ power supply (AT fuse) is the start stop unit power supply. If there is a malfunction in the B+ power supply (AT fuse) voltage input to the start stop unit when the ROOM fuse is removed, the push button start system does not operate normally.	2W (Power supply)
VPWR_B3	V	**NOTE:** • Displays in the Mazda Modular Diagnostic System (M-MDS) but it does not operate.	—	—
VPWR_IG1	V	Displays IG1 power supply voltage input to start stop unit	If there is a malfunction in the IG1 power supply voltage input to the start stop unit, the keyless entry system and the push button start system do not operate normally because PID item VPWR_IG1 is used for IG1 power on/off determination.	1B (Power supply)
WASHER_F	Off/On	Windshield washer switch signal input status • Off: Windshield washer switch is in OFF position. • On: Windshield washer switch is in ON position.	—	—
		Rear washer switch signal input		

WASHER_R	Off/On	status • Off: Rear washer switch is not in ON position. • On: Rear washer switch is in ON position.	—	—
WIP_F_INT	Off/On	Windshield wiper switch (INT) signal input status • Off: Windshield wiper switch is not in INT and AUTO positions. • On: Windshield wiper switch is in INT or AUTO position.	—	—
WIP_F_LOW	Off/On	Windshield wiper switch (LO) signal input status • Off: Windshield wiper switch is not in LO position. • On: Windshield wiper switch is in LO position.	—	—
WIP_INT_E_A	Low/High	Wiper INT encoder A signal input status • Low: Windshield wiper switch INT encoder A value is low. • High: Windshield wiper switch INT encoder A value is high.	—	—
WIP_INT_E_B	Low/High	Wiper INT encoder B signal input status • Low: Windshield wiper switch INT encoder B value is low.	—	—

		• High: Windshield wiper switch INT encoder B value is high.		
WIP_INT_E_C	Low/High	Wiper INT encoder C signal input status • Low: Windshield wiper switch INT encoder C value is low. • High: Windshield wiper switch INT encoder C value is high.	—	—
WIP_R_INT	Off/On	Rear wiper switch (INT) signal input status • Off: Rear wiper switch is not in INT position. • On: Rear wiper switch is in INT position.	—	—
WIP_R_ON	Off/On	Rear wiper switch (ON) signal input status • Off: Rear wiper switch is not in ON position. • On: Rear wiper switch is in ON position.	—	—

2014 - Mazda3 - Body and Accessories

IMMOBILIZER SYSTEM

Outline

- The immobilizer system is a vehicle theft prevention device that only allows remote transmitters that have been previously programmed to the vehicle to start the engine.
- The start stop unit performs immobilizer system fail-safe. (See **START STOP UNIT**.)

Structural View

System Wiring Diagram

Function

- The immobilizer system-related parts programmed to the immobilizer system have a programmed key ID number, and starting the engine is only permitted when the key ID number matches.
- Immobilizer system-related parts can be programmed using the Mazda Modular Diagnostic System (M-MDS).
- A maximum 6 remote transmitters can be programmed to one vehicle.
- If the following parts are replaced, it is necessary to program them to the immobilizer system.
    - Remote transmitter (transponder)
    - PCM
    - Start stop unit

Key code read function

- The coil antenna is integrated with the push button start.
- By touching the upper part of the remote transmitter to the push button start, the coil antenna reads the key code from the transponder integrated with the remote transmitter.

Operation

- Operate in the following order to allow engine starting.

*: Data A and C are different random values each time

2014 - Mazda3 - Body and Accessories

COIL ANTENNA

Purpose

- Sends the ID data programmed to the electronic transmission device (transponder) in the remote transmitter to the start stop unit.

Function

- A magnetic field occurs around the push button start.

Construction, Operation

- The coil antenna built into the push button start sends a signal to the transponder and sends the returned signal to the start stop unit.

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

KEY WARNING LIGHT (RED)/KEY INDICATOR LIGHT (GREEN)

Purpose

KEY warning light (red)

- The KEY warning light (red) notifies the user that the engine cannot be started, the remote transmitter is outside of the vehicle, or that there is a malfunction in the system.

KEY indicator light (green)

- The KEY indicator light (green) notifies the user that the engine starting conditions have been met or that the remote transmitter battery voltage is depleted.

Function

KEY warning light (red)

- When a malfunction is detected in the system, the KEY warning light (red) illuminates. (See **ON-BOARD DIAGNOSIS SYSTEM [ADVANCED KEYLESS ENTRY SYSTEM]**.)(See **ON-BOARD DIAGNOSIS SYSTEM [START STOP UNIT]**.)
    - For vehicles with center display, a warning message in the center display is displayed when the KEY warning light (red) is turned on. For the message content and verification method, refer to the CENTER DISPLAY. (See **CENTER DISPLAY [WITH CENTER DISPLAY]**.)
- The KEY warning light (red) flashes if the engine cannot be started and when the ignition is switched to ACC or ON (engine off or on) and the transmitter is taken outside of the vehicle. (See **ADVANCED KEYLESS ENTRY SYSTEM**.)(See **KEYLESS ENTRY SYSTEM**.)(See **PUSH BUTTON START SYSTEM [ADVANCED KEYLESS ENTRY SYSTEM]**.)(See **PUSH BUTTON START SYSTEM [KEYLESS ENTRY SYSTEM]**.)

KEY indicator light (green)

- When the engine-starting conditions have been met, the KEY indicator light (green) illuminates. (See **PUSH BUTTON START SYSTEM [ADVANCED KEYLESS ENTRY SYSTEM]**.)(See **PUSH BUTTON START SYSTEM [KEYLESS ENTRY SYSTEM]**.)
- If the remote transmitter battery voltage is depleted, the KEY indicator light (green) flashes. (See **ADVANCED KEYLESS ENTRY SYSTEM**.)(See **KEYLESS ENTRY SYSTEM**.)
    - For vehicles with center display, a warning message in the center display is displayed when the KEY indicator light (green) is flashing. For the message content and verification method, refer to the CENTER DISPLAY. (See **CENTER DISPLAY [WITH CENTER DISPLAY]**.)

Construction

- The KEY warning light (red)/KEY indicator light (green) are built into the instrument cluster.

Operation

KEY warning light (red)

- If a malfunction is detected in the system, the engine cannot be started, or the remote transmitter is outside of the vehicle, the start stop unit sends a warning request signal via CAN transmission to the instrument cluster.

KEY indicator light (green)

- If the engine starting conditions have been met, the start stop unit sends a KEY indicator light (green) illumination request signal via CAN transmission to the instrument cluster.
- If the remote transmitter battery voltage has been depleted, the start stop unit sends a battery voltage depletion display request signal via CAN transmission to the instrument cluster.

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

SECURITY INDICATOR LIGHT

Purpose

- Notifies the driver that the immobilizer system is operating.

Function

- If a malfunction is detected in the immobilizer system, the DTC can be verified by the flashing pattern of the security indicator light.

Construction

- The security indicator light is built into the instrument cluster.

Operation

- When the immobilizer system is operating, it illuminates for **0.1 s every approx. 2 s**.

- If the immobilizer system is normal, the security indicator light illuminates for **approx. 3 s** and then

turns off after the push button start is pressed.

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

ON-BOARD DIAGNOSIS SYSTEM [IMMOBILIZER SYSTEM]

Outline

- The immobilizer system has an on-board diagnostic function to facilitate system diagnosis.

Function

- The on-board diagnostic function consists of the following functions:
    - A malfunction detection function, which detects overall malfunctions in the immobilizer system-related parts.
    - A memory function, which stores detected DTCs.
    - A display function, which indicates system malfunctions via DTC display.
    - A PID/data monitoring function, which reads out specific input/output signals.
- Using the Mazda Modular Diagnostic System (M-MDS), DTCs can be read out and deleted, and PID/data monitoring can be performed.

On-board Diagnostic Function

Malfunction detection function

- Detects overall malfunctions in the immobilizer system-related parts.
- Malfunction diagnosis of the immobilizer system is automatically performed every time the engine is switched from OFF/LOCK (ACC) to ON (START).

Memory Function

- Malfunctions detected by the malfunction detection function are all recorded as DTCs in the following modules.
    - Start stop unit
    - PCM

CAUTION:

- Recorded immobilizer system DTCs are cleared when the ignition is switched ON from off/ACC.

Display Function

- If there is a malfunction in the immobilizer system, the security indicator light in the instrument cluster is illuminated to notify the driver. In addition, DTCs are displayed by the number of times that the security indicator light flashes.

  NOTE:

  - If two or more malfunctions are detected as a result of malfunction diagnosis, only the DTC with the lowest number of those detected will be indicated by the security indicator light.

- In the approx. 1 min after detecting a malfunction and before indicating the DTC, the security indicator light illuminates or flashes in the following patterns:

Security indicator light flash pattern (before displaying DTC)	DTC
	09, 11, 13, 15, 16
	22, 23

- DTC 21 is displayed when the ignition is switched ON (engine off or on) and the security indicator light illumination turns off for approx. 1 min.
- Using the Mazda Modular Diagnostic System (M-MDS), DTCs can be read out and deleted.

  CAUTION:

  - If the security indicator light itself has a malfunction, it is possible that a DTC may not be indicated properly.

DTC table

×: Applicable—: Not applicable

DTC			KEY warning indicator light (red)	Push button start indicator light (amber)	Description	Fail-safe function	Drive cycle	Self test type*2	Memory function

*1

The letters at the beginning of each DTC are only displayed when using the Mazda Modular Diagnostic System (M-MDS), and refer to the following: B= Body system, P= Powertrain system, U= Network communication system.

*2

C: CMDTC self test, D: ODDTC self test

DTC 7-digit code definition

- When related systems or components have failed, the CM stores the DTC of the malfunctioning part in the CM memory, and allows for the retrieval of the store data using scanning tool when necessary. The DTCs are indicated using seven digits. Each digit indicates the following.

B 1 0 D 5 : 1 F

· Specify the area failure sub type

00: No sub type information
05: System programming malfunctions
13: Open circuit
14: Circuit short to ground or open
16: Circuit voltage below threshold
41: General checksum malfunction
42: General memory malfunction
49: Internal electronic malfunction
51: Not programmed
62: Signal compare malfunction
68: Event information
94: Unexpected operation
86: Signal invalid
87: Missing message
88: Bus off
92: Performance or incorrect operation
96: Component internal failure

· Manufacturer controlled

· Indicates subgroup

Powertrain (P code)	Network Electrical (U code)	Body (B code)	Chassis (C code)
0: Fuel and air metering and auxiliary emission controls	0: Network Electrical	Manufacturer controlled	Manufacturer controlled
	1: Network communication		
	2: Network communication		
	3: Network software		
	4: Network data		
	5: Network data		

· Indicates who was responsible for DTC definition

0: ISO/SAE controlled
1: Manufacturer controlled
2: There are ISO/SAE controlled just for powertrain, all others are manufacturer controlled.
3: For P3000 to P3399 is manufacturer controlled, all others are ISO/SAE controlled.

· Indicates DTC function

P: Powertrain
B: Body
C: Chassis
U: Network Electrical

Status byte for DTC

- The two digits (two digits after hyphen (-)) after the seven-digit DTC.

- A code which indicates the pending code, current/past malfunction status, or warning illumination status.
- Can be read by performing a CMDTC self-test using the Mazda Modular Diagnostic System (M-MDS).
- For details on the status byte, refer to the explanation on the Mazda Modular Diagnostic System (M-MDS) when reading the DTC.

Detection condition for the applicable DTC

DTC	System malfunction location	Detection condition
U3000:96/P1260:00	Start stop unit malfunction	Start stop unit malfunction detected.
B10D9:87/P1260:00	Coil antenna (built into push button start) error	Start stop unit detected a malfunction in the coil antenna, and remote transmitter communication is not possible.
B13D3:05/P1260:00	Remote transmitter program error	Start stop unit detects a remote transmitter program error.
B13D3:94/P1260:00	Communication error with remote transmitter	Start stop unit could not detect the remote transmitter communication or communication error was detected.
B13D3:51/P1260:00	Unregistered remote transmitter is detected	Start stop unit detects that the remote transmitter has not been programmed.
U0100:87/P1260:00	Communication error with PCM (no response or data mis-match)	Start stop unit detects a communication error (no response or immobilizer system cancel not possible) with the PCM.
B13D4:00/P1260:00	Insufficient remote transmitter programming number	Start stop unit detects that the number of programmed remote transmitters is less than 2.
B10DA:51/P1260:00	Communication error with PCM (data received failure)	Start stop unit detects a communication error (data received failure) with PCM.
B10DA:62/P1260:00	Communication error with PCM (code mis-matched)	Start stop unit detects a communication error (code mis-matched) with the PCM.

PID/data Monitor Function

- With the PID/data monitor function, items set in the module can be selected and read out in real-time.

—: Not applicable

PID	Unit/Operation	Data contents	Data read/use method	Module control terminal
NUM_TRNSMIT	—	Displays number of the remote transmitters programmed to the start stop unit	—	—

THEFT-DETERRENT SYSTEM

Outline

- The theft-deterrent system operates the theft-deterrent horn and hazard warning lights if a door, liftgate/trunk lid or the hood is improperly opened.
- An answer-back function has been adopted which allows visual verification of the theft-deterrent system operation.
- Signal input/output of the theft-deterrent system is controlled by the rear body control module (RBCM).
- The rear body control module (RBCM) performs theft-deterrent system fail-safe. (See **REAR BODY CONTROL MODULE (RBCM)**.)

Structural View

4SD

5HB

System Wiring Diagram

Function

Answer back function

- When a locking operation is performed using the remote transmitter is in stand-by preparation mode, stand-by mode, the hazard warning lights flash once.
- When an unlocking operation is performed using the remote transmitter is in initial mode, the hazard warning lights flash twice.

Operation

Mode transition

- The rear body control module (RBCM) switches the theft-deterrent system mode based on the ignition switch and door conditions.

Operation stop mode

- In this mode, all theft-deterrent system operations are stopped.
- The system changes to the operation stop mode when ACC or ON the following condition is met.
    - Ignition is switched to ACC or ON (engine off).

Initial mode

- This mode is the preparatory mode before changing to the stand-by mode. The system does not change directly to the alert mode from this mode.

Transition condition to the initial mode

- The system changes from the operation stop mode to the initial mode if the following condition is met.
    - Ignition is switched off
- The system transitions from stand-by preparatory mode, stand-by mode, alert mode, and alert preparatory mode to the initial mode if the cancel conditions in each mode are met.

Transition condition to the stand-by preparatory mode

- The system changes to the stand-by preparatory mode if the following condition is met.
    - A lock operation was performed using the remote transmitter lock button or key with all the doors, trunk lid, and hood closed.

Stand-by preparatory mode

- This is the mode prior to the stand-by mode.
- If the cancel conditions are met, the system changes to the initial mode.

Transition condition to the stand-by mode

- If the stand-by preparatory mode continues for approx. 20 s, the system changes to the stand-by mode.

Cancel conditions

- If any of the following conditions is met, the stand-by preparation mode is canceled and the system changes to the initial mode.
    - Any front door latch switch is on (door is open), or any rear door latch switch is on (rear door is open), or liftgate/trunk lid latch switch is on (liftgate/trunk lid is open), or hood latch switch is off (hood is open)
    - Any door lock-link switch UNLOCK
    - Switch the ignition to ACC or ON (engine off)
    - Unlock operation using remote transmitter
    - Open the liftgate/trunk lid using the liftgate/trunk lid opener switch (With advanced keyless entry system)

Stand-by mode

- The system starts monitoring approx. 20 s after the doors are locked for unauthorized door opening/closing. If any unauthorized operation is detected, the system changes to the alert mode.
- If the cancel conditions are met, the system changes to the initial mode.

Transition condition to the alert mode

- If any of the following conditions is met, the system changes to the alert mode.
    - Ignition is switched ON (engine off)
    - Door latch switch on (door is open)
    - Liftgate/trunk lid latch switch on (liftgate/trunk lid is open)
    - Hood latch switch off (hood is open)
    - Door lock-link switch UNLOCK
    - Unlock operation using front door key cylinder

Cancel condition

- If any of the following conditions is met, the stand-by mode is canceled and the system changes to the initial mode.
    - Unlock operation using remote transmitter
    - Ignition is switched to ACC or ON (engine off).

Alert mode

- In this mode, the theft-deterrent horn and hazard warning lights are operated to alert the surrounding area.
- When the alarm period (approx. 30 s) has elapsed, the system changes to the alert preparatory mode.

- If the cancel conditions are met, the system changes to the initial mode.

Transition condition to the alert preparatory mode

- When the alarm period (approx. 30 s) has elapsed, the system changes to the alert preparatory mode.
- The alarm period is not extended even if a transition condition to alert mode is met again during an alarm period.

Cancel condition

- If any of the following conditions is met, the alert mode is canceled, and the system changes to the initial mode.
    - Unlock operation using remote transmitter
    - Ignition is switched ON (engine off), and engine started
    - Open the liftgate/trunk lid using the liftgate/trunk lid opener switch (With advanced keyless entry system)

Alert preparatory mode

- In the alert preparatory mode, the theft-deterrent horn and hazard warning light are not operated, however, the alarm triggers immediately if the condition is changed.
- If the cancel conditions are met, the system changes to the initial mode.

Transition condition to alert mode

- The system changes to the alert mode if any of the following conditions is met.
    - Ignition switched from ON to off, or from off to ON
    - Door latch switch turned from on (door open) to off (door closed), or from off (door closed) to on (door open)
    - Liftgate/trunk lid latch switch turned from on (liftgate/trunk lid open) to off (liftgate/trunk lid closed), or from off (liftgate/trunk lid closed) to on (liftgate/trunk lid open)
    - Hood latch switch turned from off (hood open) to on (hood closed) or from on (hood closed) to off (hood open)
    - Door lock-link switch locked from unlock, or unlocked from lock
    - The front door key cylinder is locked from unlock, or unlocked from lock

Cancel condition

- If any of the following conditions is met, the alert preparatory mode is canceled and the system changes to the initial mode.
    - Unlock operation using remote transmitter
    - Ignition is switched ON, and engine started
    - Liftgate/trunk lid opened using the liftgate/trunk lid opener switch (With advanced keyless entry system)

2014 - Mazda3 - Body and Accessories

HOOD LATCH SWITCH

Purpose

- Detects the open/closed condition of the hood.

Function

- The hood latch switch is utilized in the theft-deterrent system control.
    - For the theft-deterrent system, refer to (see **THEFT-DETERRENT SYSTEM**.).

Construction

- Built into the hood latch.
- Switch turns on and off by the rotation of the latch bar.
- When the hood is completely closed, the hood latch switch is on (contact point: closed).

HOOD OPEN : OFF

HOOD CLOSE : ON

Operation

Hood close (latch) operation

1. When the hood is closed, the hood lock striker enters the latch lever groove.

2. When the hood is then further closed, the latch lever is pressed by the hood lock striker and rotates.

3. When the hood is completely closed, the latch lever is in a latched condition and presses the hood latch switch which turns the switch on.

Hood open (unlatch) operation

1. When the hood release lever is pulled, the hood opens and the latch lever is in an unlatched condition, and the hood latch switch turns off.

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

DOOR LOCK SYSTEM OPERATION RECORD

Purpose

- Stores the record of the user's operation and the door lock system operation corresponding to the user's operation.

Function

- The door lock system operation record is stored by the rear body control module (RBCM) and displayed using the Mazda Modular Diagnostic System (M-MDS).
- The rear body control module (RBCM) stores the following when the front/rear door lock actuator operates.
    - Time and date
    - Part or function which output unlock signal
    - Part or function which output lock signal
    - Operated actuator
    - Vehicle condition

Construction

- Based on the stored record, the rear body control module (RBCM) displays the following operation record on the M-MDS screen.

Operation

- Based on the lock/unlock signal, the rear body control module (RBCM) sends an operation signal to the front/rear door lock actuator motor, and stores the operation record at the same time.

  CAUTION:

    - Because it takes time from when the front/rear door lock actuator motor operates until lock/unlock is performed, the

operation record may be stored before the lock/unlock switching is completed.

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

THEFT-DETERRENT SYSTEM OPERATION RECORD

Purpose

- The theft-deterrent system operation history is a record of the theft-deterrent system operation.

Function

- The theft-deterrent system operation record is stored by the rear body control module (RBCM) and displayed using the Mazda Modular Diagnostic System (M-MDS).
- The rear body control module (RBCM) records the following when the theft-deterrent system is operated.
    - Time and date
    - Theft-deterrent system operation time
    - Location in theft-deterrent system where operation was triggered

Construction

- Based on the stored record, the rear body control module (RBCM) displays the following operation record on the M-MDS screen.

MAZDA MODULAR DIAGNOSTIC SYSTEM (M-MDS) SCREEN

Displays the elapsed time from the operation of the theft-deterrent system (elapsed days, elapsed time, elapsed minutes)

Operation

- The rear body control module (RBCM) sends an alarm sound signal to the theft-deterrent siren or theft-deterrent horn, and records the operation history simultaneously.

Fail-safe

- Function not equipped.

THEFT-DETERRENT SYSTEM OPERATION RECORD

2014 - Mazda3 - Body and Accessories

SUNROOF

Outline

- An electric sunroof with tilt up mechanism has been adopted.
- A deflector has been added to reduce noise.
- A system control using pulse sensors (Hall effect switches) has been adopted for system simplification.
- A sunroof motor with an integrated CPU has been adopted.

Specification

Item		Specification
Slide system		Inner slide
Opening measurement	(mm {in})	280 × 740 {11.0 × 29.1}
Tilt-up amount	(mm {in})	27—31 {1.1—1.2}
Opening/closing time	(s)	Slide: 3.0—6.0, Tilt: 0.5—1.5

Function

Tilt up/open/close

- When the sunroof switch (tilt position) is operated, the sunroof tilts up.
- When the sunroof switch (open position) is operated, the sunroof opens.
- When the sunroof switch (close position) is operated, the sunroof closes and tilts down.

Initial setting

- If the following operations have been performed, the initial setting is reset, and operation is disabled except for the tilt operation. Therefore, performing the initial setting is necessary.
    - Negative battery cable is disconnected.
    - Sunroof system power supply fuse is removed.

Sunroof System Structural View

System Wiring Diagram

Operation

- The glass panel opens/closes using tilting and sliding operations.
- When the ignition is switched ON (engine off or on), the sunroof operates by use of the sunroof switch.
- If the ignition is switched OFF or switched to ACC position while the sunroof is operating, it will stop.
- One-touch operation of the tilt or the slide open switch provides auto-operation.
- If any switch is operated during auto-operation, the sunroof stops.

Tilt up operation

1. When the sunroof switch is operated for tilt up operation, the CPU receives a tilt up signal. (1)
2. When the CPU receives a tilt up signal, it turns on relay No.2. (2)
3. When relay No.2 is turned on, the sunroof motor starts tilt up operation.(3)
4. When **approx. 1 s.** has elapsed after the sunroof motor was started, the timer control of the CPU turns off sunroof relay No.2 automatically to stop the tilt up operation.

Open operation

1. When the sunroof switch is operated for an open operation, the CPU receives an open signal. (1)
2. When the CPU receives an open signal, it turns on relay No.1. (2)
3. When the relay No.1 is turned on, the sunroof motor starts the open operation.(3)

Close operation (glass panel open)

1. When the sunroof switch is operated for a close operation, the CPU receives a close signal. (1)
2. When the CPU receives the close signal, it turns on relay No.2. (2)
3. When relay No.2 is turned on, the sunroof motor starts the close operation.(3)

Close operation (glass panel tilt up)

1. When the sunroof switch is operated for a close operation, the CPU receives a close signal. (1)
2. When the CPU receives the close signal, it turns on relay No.1. (2)
3. When relay No.1 is turned on, the sunroof motor starts the close operation.(3)

2014 - Mazda3 - Body and Accessories

SUNROOF UNIT

Purpose / Function

- The glass panel tilts up/down or slides open/closed by the operation of the sunroof unit.

Construction / Operation

- The drive cables inside the frame of the sunroof unit are engaged to the sunroof motor drive gear.
- When the sunroof motor rotates normally or in reverse, the drive cables operate in the same direction.
- The glass panel is fixed to the guides so that the panel moves by the drive cables sliding the guides.

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

SUNROOF MOTOR

Purpose / Function

- The sunroof motor transmits drive force to the drive cables.
- When the sunroof motor rotates normally or in reverse, the tilt up and open/close of the glass panel operates.

Construction / Operation

- The sunroof motor built-in the following parts:
    - CPU
    - Hall effect switch
    - Sunroof relay
    - Motor shaft
    - Gear
- Two Hall effect switches are provided in the control part.
- The control module detects the rotation direction, speed and amount based on pulse signals from the two Hall effect switches, and controls the position and static load of the glass panel accordingly.

Fail-safe

- Function not equipped.

EXTERIOR TRIM

Structure View

UNDERSIDE OF VEHICLE

2014 - Mazda3 - Body and Accessories

AERODYNAMIC

Purpose, Function

- Undercovers have been adopted which flatten out the irregularities on the underside of the engine compartment and floor to rectify wind flowing under the vehicle while the vehicle is being driven.

UNDERSIDE OF VEHICLE

Construction

- The following 4 types of undercovers are equipped.
  - Front undercover No.1
  - Front undercover No.2
  - Floor under cover No.1
  - Floor under cover No.2

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

FRONT CONSOLE BOX

Purpose, Function

- A front console box has been adopted which allows storage of small objects such as a smartphone.

Construction

- Effective vibration and sound absorbing material has been adopted on the front console box to reduce vibration and noise transmitted to small objects such as a smartphone.

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

REAR CONSOLE

Purpose, Function

- A rear console has been adopted which assures a storage space with a capacity of approx. 4.0 L. In addition, a storage box which allows storage of small objects such as a smartphone has been adopted.

Construction

- The rear console consists of the following parts.
    - Armrest
    - Parking brake lever
    - Cup holder
    - Storage box
- Sound absorbing material has been adopted on the storage box to reduce vibration and noise transmitted during travel to small objects such as a smartphone.

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

DOOR TRIM

Purpose

- The door trim mediates impact to occupants in the event of a vehicle collision.

Function

- If an occupant hits the door trim, the slit in the armrest panel splits and the impact is mediated by the change in the shape of the hollow space in the armrest.

Construction

- A slit has been made in the door armrest panel.
- The interior of the door armrest panel has been hollowed.

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

TRUNK SIDE TRIM

Purpose, Function, Construction

- Fuel economy improvement and road noise reduction have been achieved by adopting lightweight, sound absorbing material to the trunk side trim (5HB) lower area.

Construction

Fail-safe

- Function not equipped.

TRUNK SIDE TRIM

LIGHTING SYSTEMS

Outline

- Front combination lights have been adopted with parts related to the front exterior lights grouped and housed together.
- The following systems have been adopted to the headlights.
    - Discharge headlight system (With discharge headlight system)
    - Auto light system (With auto light system)
    - Headlight manual leveling system (With headlight manual leveling system)
    - Headlight auto leveling system (With headlight auto leveling system)
    - Adaptive front lighting system (AFS) (With adaptive front lighting system (AFS))
    - High beam control (HBC) system (With high beam control (HBC) system)
    - Auto light-off system
- Front fog lights have been adopted. (With front fog lights)
- LED type parking lights have been adopted. (With discharge headlight system)
- LED type side turn lights have been adopted. (With side turn light)
- LED type brake lights/taillights have been adopted. (With LED type brake light/taillight)
- LED type high-mount brake light has been adopted.
- A room light control system has been adopted in which illumination time and illumination level of the room lights change.

Specification

Item			Spec (W) × Quantity
Exterior	Headlight LO bulb	Halogen type	55 × 2
	Headlight HI bulb		60 × 2
	Headlight HI/LO bulb	Discharge type	35 × 2
	Front side marker light/parking light bulb (without discharge headlight system)		5 × 2
	Front side marker light bulb (with discharge headlight system)		5 × 2
	Parking light/DRL (LED)*1 (with discharge headlight system)		4 / 14
	Front turn light bulb		21 × 2
	Front fog light bulb		55 × 2
	Side turn light (LED)		0.6
	Rear turn light bulb		21 × 2

The DRL system function can be set.	On (DRL illumination)	Off (DRL non-illumination)/On (DRL illumination)	Front body control module (FBCM)

2014 - Mazda3 - Body and Accessories

EXTERIOR LIGHTING SYSTEM

Outline

- Projector type headlights have been adopted to the front combination lights.
- Auto light system has been adopted in which TNS and headlights automatically and optimally illuminate and turn off. (With auto light system)
- A high beam control (HBC) system has been adopted which automatically changes the headlights to low beams when it recognizes an oncoming vehicle, a vehicle ahead, or travel through city streets. (With high beam control (HBC) system)
- Discharge headlights that emit light over a wide area have been adopted. (With discharge headlight system)
- A headlight manual leveling system has been adopted which changes the headlight LO optical axis according to the operation of the headlight leveling switch. (With headlight manual leveling system)
- A headlight auto leveling system has been adopted which automatically adjusts the headlight optical axis up and down. (With headlight auto leveling system)
- An adaptive front lighting system (AFS) has been adopted which changes the optical axis to the direction in which the vehicle is moving according to the amount of steering operation. (With adaptive front lighting system (AFS))
- Front turn lights have been adopted in the front bumper.
- Front fog lights have been adopted in the front bumper. (With front fog lights)
- Outer mirrors with built-in front side turn lights have been adopted. (With side turn lights)
- LED type parking lights have been adopted. (With discharge headlight system)
- LED type side turn lights have been adopted. (With side turn lights)
- LED type brake lights/taillights have been adopted. (With LED type brake light/taillight)
- LED type high-mount brake light has been adopted.
- Secondary collision reduction (SCR) hazard warning light has been adopted.
- The front body control module (FBCM) performs exterior lighting system fail-safe. (See **FRONT BODY CONTROL MODULE (FBCM)**.)

Operation

Headlights LO (halogen type), headlights HI (halogen type), parking lights, front side marker lights

- Refer to the front combination light. (See **FRONT COMBINATION LIGHT**.)

Headlights HI/LO (discharge type)

- Refer to the discharge headlight system. (See **DISCHARGE HEADLIGHT SYSTEM**.)

Front turn lights

- Refer to the front turn light. (See **FRONT TURN LIGHT**.)

Front fog lights (with front fog lights)

- Refer to the front fog light. (See **FRONT FOG LIGHT**.)

Side turn lights (with side turn lights)

- Refer to the side turn light. (See **SIDE TURN LIGHT**.)

Rear turn lights, brake lights, taillights, rear side marker lights

- Refer to the rear combination light. (See **REAR COMBINATION LIGHT**.)

Back-up lights, taillights (with taillights)

- Refer to the trunk lid light (4SD)/liftgate light (5HB). (See **TRUNK LID LIGHT (4SD)/LIFTGATE LIGHT (5HB)**.)

Hazard warning lights

- Refer to the front turn light. (See **FRONT TURN LIGHT**.)
- Refer to the side turn light. (with side turn lights) (See **SIDE TURN LIGHT**.)
- Refer to the rear combination light. (See **REAR COMBINATION LIGHT**.)

Secondary collision reduction (SCR) hazard warning light

- If the SAS control module detects a collision with another vehicle, it outputs a secondary collision reduction signal to the front body control module (FBCM).
- The front body control module (FBCM) flashes the turn lights during a collision to caution surrounding vehicles when it detects a certain amount of impact.

- While the secondary collision reduction (SCR) hazard warning light is operating, all the turn lights are flashed automatically. The secondary collision reduction (SCR) hazard warning light can be turned off by pressing the hazard warning switch two times.

High-mount brake light

- Refer to the high-mount brake light. (See **HIGH-MOUNT BRAKE LIGHT**.)

License plate lights

- Refer to the license plate light. (See **LICENSE PLATE LIGHT**.)

2014 - Mazda3 - Body and Accessories

FRONT COMBINATION LIGHT

Purpose

- Parts related to the front exterior lights are grouped and housed together such as the headlight, parking light, headlight leveling actuator, wiring harnesses, and connectors.

Function

- Each light illuminates or flashes when the light switch, turn switch, or hazard warning switch is operated.

Construction

- A halogen type or discharge type headlight is available for the front combination light.

Halogen type

- The following parts are an integrated structure.
  - Headlight LO bulb
  - Headlight HI bulb
  - Front side marker light/parking light bulb
- A projector type headlight has been adopted for the headlight LO.
- A clear lens has been adopted for the front combination lights.

  NOTE:

  - Fogging or condensation on the inside of the front combination lights may occur, however, it is a natural phenomenon occurring as a result of a temperature difference between the interior and exterior of the front combination lights and has no effect on the light performance.
  - Fogging or condensation occurring as a natural phenomenon will dissipate when the temperature inside the front combination lights rises after the headlights are illuminated and a period of time has elapsed.

Discharge type

- The following parts are an integrated structure.
    - Headlight HI/LO bulb
    - Parking light (LED)
    - Front side marker light bulb
    - Igniter
    - Discharge headlight control module
    - Headlight leveling actuator
    - Swivel actuator
- A projector type headlight has been adopted for the headlight HI/LO.
- A clear lens has been adopted for the front combination lights.

NOTE:

- Fogging or condensation on the inside of the front combination lights may occur, however, it is a natural phenomenon occurring as a result of a temperature difference between the interior and exterior of the front combination lights and has no effect on the light performance.
- Fogging or condensation occurring as a natural phenomenon will dissipate when the temperature inside the front combination lights rises after the headlights are illuminated and a period of time has elapsed.

Operation

Headlight LO

Halogen type

- When the light switch is operated to the HEAD position, the start stop unit detects a light switch LO signal.
- The start stop unit sends the light switch LO signal to the front body control module (FBCM) as a CAN signal.
- When the front body control module (FBCM) receives the light switch LO signal, it turns the headlight LO relay on.
- When the headlight LO relay turns on, the headlight LO is illuminated.

Discharge type

- Refer to the discharge headlight system. (See **DISCHARGE HEADLIGHT SYSTEM**.)

Headlight HI

Halogen type

- When the light switch is operated to the HI position while the headlight LO is turned on, the start stop unit detects a light switch HI signal.
- The start stop unit sends the light switch HI signal to the front body control module (FBCM) as a CAN signal.
- When the front body control module (FBCM) receives the light switch HI signal, it turns the headlight HI relay on.
- When the headlight HI relay turns on, the headlight HI is illuminated.

Discharge type

- Refer to the discharge headlight system. (See **DISCHARGE HEADLIGHT SYSTEM**.)

Flash-to-pass

Halogen type

- When the light switch is operated to the FLASH-TO-PASS position, the start stop unit detects a light switch FLASH-TO-PASS signal.
- The start stop unit sends the light switch FLASH-TO-PASS signal to the front body control module (FBCM) as a CAN signal.
- When the front body control module (FBCM) receives the light switch FLASH-TO-PASS signal, it turns the headlight LO and HI relays on.
- When the headlight LO and HI relays turn on, the headlight LO and HI are illuminated.

Discharge type

- Refer to the discharge headlight system. (See **DISCHARGE HEADLIGHT SYSTEM**.)

Front side marker light, parking light

Without discharge headlight system

- When the light switch is operated to the TNS position, the start stop unit detects a light switch TNS signal.
- The start stop unit sends the light switch TNS signal to the front body control module (FBCM) as a CAN signal.
- When the front body control module (FBCM) receives the light switch TNS signal, it turns the TNS relay on.
- When the TNS relay turns on, the parking lights/front side marker lights are illuminated.

With discharge headlight system

- When the light switch is operated to the TNS position, the start stop unit detects a light switch TNS signal.
- The start stop unit sends the light switch TNS signal to the front body control module (FBCM) as a CAN signal.
- When the front body control module (FBCM) receives the light switch TNS signal, it turns the TNS relay on.
- When the TNS relay turns on, the parking lights and front side marker lights are illuminated.

Headlight leveling actuator

- Refer to the headlight leveling actuator. (See **HEADLIGHT LEVELING ACTUATOR**.)

Swivel actuator (With adaptive front lighting system (AFS))

- Refer to the swivel actuator. (See **SWIVEL ACTUATOR**.)

Fail-safe

- Function not equipped.

FRONT COMBINATION LIGHT

2014 - Mazda3 - Body and Accessories

LIGHTS-ON INDICATOR LIGHT

Purpose

- Notifies the user that the TNS or the headlights LO are on.

Function

- Illuminates when the illumination conditions for the TNS, headlights LO, or flash-to-pass are met.

Construction

- Displayed in the instrument cluster.

Operation

1. When the light switch is operated to the TNS, HEAD, or FLASH-TO-PASS position, the start stop unit detects a light switch TNS, LO, or FLASH-TO-PASS signal.

2. The start stop unit sends the light switch TNS, LO, or FLASH-TO-PASS signal to the front body control module (FBCM) as a CAN signal.

3. The front body control module (FBCM) sends the light switch TNS, LO, or FLASH-TO-PASS signal to the instrument cluster as a TNS illumination or headlight LO illumination signal.

4. When the instrument cluster receives the TNS illumination, or headlight LO illumination signal, it illuminates the lights-on indicator light.

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

HEADLIGHT HIGH-BEAM INDICATOR LIGHT

Purpose

- Notifies the user that the headlights HI are illuminated.

Function

- Illuminates when the headlight HI or flash-to-pass illumination conditions are met.

Construction

- Displayed in the instrument cluster.

Operation

1. When the light switch is operated to the HI position while the headlight LO is turned on or FLASH-TO-PASS position, the start stop unit detects a light switch HI or FLASH-TO-PASS signal.

2. The start stop unit sends the light switch HI or FLASH-TO-PASS signal to the front body control module (FBCM) as a CAN signal.

3. The front body control module (FBCM) sends the light switch HI or FLASH-TO-PASS signal to the instrument cluster as a headlight HI illumination signal.

4. When the instrument cluster receives the headlight HI illumination signal, it illuminates the headlight high-beam indicator light.

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

TURN SIGNAL/HAZARD WARNING INDICATOR LIGHTS

Purpose

- Notifies the user that the turn lights are flashing.

Function

- Flashes according to the turn switch and hazard warning switch operations.

Construction

- Displayed in the instrument cluster.

Operation

Turn light system

1. When the turn switch is operated to the LH or RH position, the start stop unit detects a turn switch LH or RH signal.
2. The start stop unit sends the turn switch LH or RH signal to the front body control module (FBCM) as a CAN signal.
3. The front body control module (FBCM) sends the turn switch RH or LH signal to the instrument cluster as a turn signal indicator signal.
4. When a turn signal indicator signal is received, the instrument cluster flashes the turn signal indicator light.

Hazard warning system

1. When the hazard warning switch is turned on, the start stop unit detects a hazard warning switch on signal.
2. When the start stop unit detects a hazard warning switch on signal, it sends a hazard warning signal to the front body control module (FBCM) as a CAN signal.
3. The front body control module (FBCM) sends the hazard warning signal to the instrument cluster as a hazard warning indicator signal.
4. When the hazard warning indicator signal is received, the instrument cluster flashes the hazard warning indicator light.

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

DISCHARGE HEADLIGHT SYSTEM

Outline

- The discharge headlight system utilizes a gas discharge type light to emit a white light resembling sunlight over a wide area. Also, use of the gas discharge type light realizes high efficiency, low power consumption lighting.
- The discharge headlight control module performs discharge headlight system fail-safe. (See **DISCHARGE HEADLIGHT CONTROL MODULE**.)

Structural View

System Wiring Diagram

Operation

Headlight low beam

- When the light switch is operated to the HEAD position, the start stop unit detects a light switch LO signal.
- The start stop unit sends the light switch LO signal to the front body control module (FBCM) as a CAN signal.
- When the front body control module (FBCM) receives the light switch LO signal, it turns the headlight LO relay on.
- When the headlight LO relay turns on, the igniter raises the DC voltage from the battery to approx. 25,000 V and outputs it to the discharge headlight bulb so that the xenon gas emits light.
- When the discharge headlight bulb (xenon gas) emits light, the discharge headlight control module converts the DC voltage from the battery to AC voltage (approx. 42 V) and outputs it to the discharge headlight bulb.
- The shade blocks the high beam light and only the low beam light is illuminated forward.

Headlight high beam

- When the light switch is operated to the HI position while the headlight LO is turned on or FLASH-TO-PASS position, the start stop unit detects a light switch HI or FLASH-TO-PASS signal.
- The start stop unit sends the light switch HI or FLASH-TO-PASS signal to the front body control module (FBCM) as a CAN signal.
- When the front body control module (FBCM) receives the light switch HI or FLASH-TO-PASS signal, it turns the headlight HI relay on.
- When the headlight HI relay is turned on, the high-beam solenoid is energized and the shade is rotated.
- When the shade is rotated, the high-beam light which was blocked by the shade is illuminated forward.

2014 - Mazda3 - Body and Accessories

DISCHARGE HEADLIGHT CONTROL MODULE

Purpose

- Converts DC voltage from the battery to AC voltage and outputs the stabilized voltage to the discharge headlight.

Function

- The discharge headlight control module controls the voltage from the battery to illuminate the discharge headlight.
- The discharge headlight control module has a fail-safe function which turns off the discharge headlight if an input/output voltage malfunction occurs for the prevention of part mis-operation and protection.

Construction

- The discharge headlight control module consists of an igniter which raises the voltage from the battery to approx. 25,000 V, and an inverter which converts the DC voltage from the battery to AC voltage.
- The inverter is integrated with the discharge headlight control module.
- The igniter is installed to the discharge headlight bulb.

Operation

1. When the headlight LO relay turns on, the discharge headlight control module raises the DC voltage from the battery from approx. 12 V to approx. 25,000 V using the igniter, and outputs it to the discharge headlight bulb.

2. After the discharge headlight is illuminated, the discharge headlight control module converts the DC voltage from the battery to AC voltage (approx. 42 V) using the inverter, and outputs it to the discharge headlight bulb.

Fail-safe

- If the following input/output voltage malfunctions occur, the fail-safe function is activated.

Operation condition	Fail-safe	Recovery condition
Input voltage from discharge headlight control module is outside of 6—18 V range (except for voltage reduction directly after discharge headlight illumination).	Turns off discharge headlights	Normal input voltage detected
Malfunction is detected in output voltage from discharge headlight control module (open circuit or short to ground in wiring harness).	Turns off discharge headlights	Light switch turned to OFF position, and then back to HEAD position.

2014 - Mazda3 - Body and Accessories

DISCHARGE HEADLIGHT BULB

Purpose, Function

- Charges the internal metallic element and emits white light resembling sunlight.

Construction

- A mercury-free bulb has been adopted for the discharge headlight bulb.
- The discharge headlight bulb is assembled to the front combination light.
- The discharge headlight bulb consists of xenon gas, a luminous tube in which metallic iodide is enclosed, a lead wire and electrodes which pass electricity, and an exterior tube.

Operation

1. When high DC voltage (approx. 25,000 V) from the discharge headlight control module is input to the electrodes, the insulation between the electrodes is broken down and electrical current flows between the electrodes.

2. When electrical current flows between the electrodes of the discharge headlight bulb, the xenon gas is energized and emits light.

3. When the xenon gas emits light, temperature inside the discharge headlight bulb rises, the metallic iodide vaporizes/separates, and the metallic element discharges and emits light.

4. Luminance of the metallic element is maintained by the DC voltage (approx. 42 V) from the discharge headlight control module.

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

AUTO LIGHT-OFF SYSTEM

Outline

- The auto light-off system turns off the TNS or headlights automatically.
- The front body control module (FBCM) performs auto light-off system fail-safe. (See **FRONT BODY CONTROL MODULE (FBCM)**.)

Function

- The auto light-off system controls the front body control module (FBCM).
- The front body control module (FBCM) controls the auto light-off system based on the following signals and conditions:
    - IG power supply condition
    - TNS or headlight illumination condition
    - Light switch signal sent from start stop unit via CAN signal
- If the front body control module (FBCM) detects that the ignition is switched off when the TNS and headlights are turned on, the TNS and headlights are turned on for a certain period of time and turned off after a certain period of time has elapsed.
- A personalization feature has been adopted which can change the illumination time of the TNS or headlights. For details on the personalization features, refer to the **LIGHTING SYSTEM PERSONALIZATION**.

Operation

1. When the front body control module (FBCM) receives a light switch TNS or HEAD signal from the start stop unit with the ignition switched ACC or off, the TNS or headlights are turned on and counting of the illumination time begins.

2. When the pre-set time has passed, the front body control module (FBCM) turns off the TNS or headlights.

NOTE:

- When the front body control module (FBCM) detects the change in the light switch HEAD signal from the TNS signal or the TNS signal from the HEAD signal during counting of the illumination time, the count is reset and counting is restarted.
- The flash-to-pass function operates independently regardless of whether it is during or after the illumination time counting.

2014 - Mazda3 - Body and Accessories

AUTO LIGHT SYSTEM

Outline

- The auto light system automatically turns the TNS and headlights on/off according to the illumination level above and in front of the vehicle.
- The auto light system is controlled by the front body control module (FBCM).
- The front body control module (FBCM) performs auto light system fail-safe. (See **FRONT BODY CONTROL MODULE (FBCM)**.)

Function

- The auto light system receives a headlight illumination/off request signal from the auto light sensor and the front body control module (FBCM) turns the headlights on and off.
- If the upward and forward illumination sensors detect the illumination level at which the headlights should be illuminated/turned off, the auto light sensor sends a headlight illumination/off request signal.
- The front body control module (FBCM) does not illuminate the headlights for a 15 s period after the front body control module (FBCM) receives the headlight illumination request signal from the auto light system while the daytime vehicle speed is 1 km/h {0.6 mph} or more. As a result, headlight flicker occurring by the headlights being illuminated for a short period while in places such as a short tunnel is prevented.

Structural View

System Wiring Diagram

Operation

- The auto light system operates when the ignition is switched ON (engine off or on) and the light switch is in the AUTO

position.

NOTE:

- The following illumination level is for reference because it varies depending on the surrounding conditions (weather, reflection off buildings).
- The illumination level sensitivity of the auto light sensor can be changed. The illumination level in the explanation for the following operations is the value when setting to "Medium". (See **LIGHTING SYSTEM PERSONALIZATION**.)

Illumination operation

1. When the light switch is operated to the AUTO position with the ignition switched ON (engine off or on), the start stop unit detects a light switch AUTO signal.

2. The start stop unit sends the light switch AUTO signal to the front body control module (FBCM) as a CAN signal.

3. The auto light sensor detects the illumination level above the vehicle.

4. If the auto light sensor detects an average lux value of 2,000 or less of upward illumination during a 1 min period, it sends a TNS and headlight on signal to the front body control module (FBCM) via a LIN signal.

5. When the front body control module (FBCM) receives a TNS and headlight on signal, it turns the TNS relay and headlight LO relay on and illuminates the TNS and headlights.

Lights off operation

1. When the light switch is operated to the AUTO position with the ignition switched ON (engine off or on), the start stop unit detects a light switch AUTO signal.

2. The start stop unit sends the light switch AUTO signal to the front body control module (FBCM) as a CAN signal.

3. The auto light sensor detects the illumination level above and in front of the vehicle.

4. If the auto light sensor detects the following illumination, it sends a TNS and headlight off signal to the front body control

module (FBCM) via a LIN signal.

After ignition is switched ON, 30 min have not elapsed:

- Upward and forward illumination is 4,000 lux or more

After ignition is switched ON, 30 min have elapsed:

- Average value of upward and forward illumination during 1 min period is 4,000 lux or more

5. When the front body control module (FBCM) receives a TNS and headlight off signal, it turns the TNS relay and headlight LO relay off and turns the TNS and headlights off.

2014 - Mazda3 - Body and Accessories

AUTO LIGHT SENSOR

Purpose

- The auto light sensor detects the illumination level above and in front of the vehicle and outputs it to the front body control module (FBCM).

Function

- The auto light sensor uses the upward illumination level sensor to detect the illumination level above the vehicle, and uses the forward illumination level sensor to detect the illumination level in front of the vehicle.

Illumination level adjustment function

- The illumination level can be switched through 5 levels using the Mazda Modular Diagnostic System (M-MDS) or the center display (with center display). (See **LIGHTING SYSTEM PERSONALIZATION**.)

On-board diagnostic function

- Notifies front body control module (FBCM) of a malfunction in the auto light sensor, and a DTC is detected from the front body control module (FBCM).
- For details on DTCs, refer to the ON-BOARD DIAGNOSTIC [FRONT BODY CONTROL MODULE (FBCM)], DTC table in the Workshop Manual.

Construction

- The auto light sensor is integrated with the rain sensor as a single unit.
- The auto light sensor consists of the lens, forward illumination level sensor (photodiode), upward illumination level sensor (photodiode), and microcomputer.

Operation

CAUTION:

Correct illumination level detection is not be possible under the following conditions and could cause the system to operate incorrectly.

- Stickers or labels are attached to the auto-light sensor detection area on the windshield.
- The auto-light sensor detection area on the windshield is dirty.

1. The auto light sensor detects the illumination level above and in front of the vehicle when the ignition is switched ON (engine off or on) and the light switch is operated to the AUTO position.

2. The auto light sensor outputs a TNS and headlight LO on or off signal to the front body control module (FBCM) according to the detected illumination level.

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

HEADLIGHT MANUAL LEVELING SYSTEM

Outline

- The headlight manual leveling system changes the headlight LO optical axis according to the operation of the headlight leveling switch to prevent driver dazzle in oncoming vehicles from headlight glare and to assure a range of visibility.

Structural View

System Wiring Diagram

Operation

1. When the headlight leveling switch is operated with the headlights LO turned on, the resistance value changes according to the changed position, and electric current flows to the headlight leveling actuator.

2. When electric current flows to the headlight leveling actuator, the motor inside the actuator operates and the headlight LO optical axis changes.

HEADLIGHT LEVELING SWITCH

HEADLIGHT LEVELING ACTUATOR
(2)
OPTICAL AXIS CHANGE

2014 - Mazda3 - Body and Accessories

HEADLIGHT LEVELING SWITCH

Purpose

- Changes the resistance value according to the position which the headlight leveling switch has been changed.

Function

- The position of the headlight leveling switch can be switched between 11 levels: 0 to 5.
- When the headlight leveling switch is turned upward, the headlight LO optical axis moves upward. When the switch is turned downward, the axis moves downward.

Construction

- Built into the cluster switch.

Operation

1. When the headlight leveling switch is operated with the headlights turned on, the resistance value changes according to the changed position, and electric current flows to the headlight leveling actuator.

2. When the motor is driven, the shaft moves back and forth and the reflector moves to change the optical axis.

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

HEADLIGHT AUTO LEVELING SYSTEM

Outline

- Automatically adjusts the headlight optical axis in response to changes in load and passenger conditions to prevent blinding of oncoming vehicles from headlight glare and to assure a range of visibility.
- The AFS control module performs headlight auto leveling system fail-safe. (See **ADAPTIVE FRONT LIGHTING SYSTEM (AFS) CONTROL MODULE**.)

Function

- The headlight auto leveling system is controlled by the AFS control module.
- The AFS control module also controls the adaptive front lighting system (AFS) which changes the optical axis to the direction in which the vehicle is travelling according to the steering wheel operation and vehicle speed while the headlights are turned on. (See **ADAPTIVE FRONT LIGHTING SYSTEM (AFS)**.)

Optical axis adjustment function

- If the ignition is switched ON (engine on or off) and there is a vehicle height change when the headlights LO are illuminated, the AFS control module automatically adjusts the headlight optical axis.
- The AFS control module controls the optical axis adjustment function based on the following CAN signals.

CAN signal sending module	Signal name
PCM	Vehicle speed signal
Instrument cluster	Ignition switch status signal
Front body control module (FBCM)	Headlight illumination status signal

Structural View

System Wiring Diagram

Operation

Vehicle height changes while vehicle is stopped

Operation condition

- Operates when all of the following conditions are met:
  - Vehicle speed is 0 km/h {0 mph}
  - Ignition switch ON (engine off or on)
  - Headlight LO illumination (headlight LO illumination signal reception)
  - Detects change in vehicle height amount* at specified value or more

Operation

- When the ignition is switched ON (engine off or on), the auto leveling sensor sends a vehicle height signal to the AFS control module.
- When the headlights LO turn on, the AFS control module calculates the amount of change in the vehicle height* based on the vehicle height signal.

- When the amount of change in the vehicle height * is the specified value or more, the AFS control module calculates the target optical axis based on the calculated amount of change in the vehicle height*.
- The AFS control module outputs the calculated target optical axis signal to the headlight leveling actuator.
- The headlight leveling actuator drives the motor when the target optical axis signal is input.

Vehicle height changes while vehicle is moving

Operation condition

- Operates when all of the following conditions are met:
  - Vehicle speed 30 km/h {19 mph} or more
  - Headlight LO illumination (headlight LO illumination signal reception)
  - Detects change in vehicle speed of 3 km/h {2 mph} or less for continuous period of 25 s
  - Detects change in vehicle height amount* at specified value or more

Operation

- While the vehicle is travelling, the auto leveling sensor sends a vehicle height signal to the AFS control module.
- When the headlights LO turn on, the AFS control module calculates the amount of change in the vehicle height* based on the vehicle height signal.
- When the vehicle speed is 30 km/h {19 mph} or more, the detected change in vehicle speed is 3 km/h {2 mph} or less for a continuous 25 s, and the change in the amount of vehicle height* is the specified value or more, the AFS control module calculates the target optical axis based on the calculated change in the amount of vehicle height*.
- The AFS control module outputs the calculated target optical axis signal to the headlight leveling actuator.
- The headlight leveling actuator drives the motor when the target optical axis signal is input.

*

The change in the amount of vehicle height is the calculated 1 s average value of the vehicle height signal which the AFS control module detects every 0.1 s.

2014 - Mazda3 - Body and Accessories

AUTO LEVELING SENSOR

Purpose

- Detects the vehicle height and outputs it to the AFS control module.

Function

- Changes the detected vehicle height into a voltage value and outputs it to the AFS control module.

Construction

- Installed to the rear crossmember.
- Consists of link No. 1, link No.2 and the Hall sensor.

Operation

1. If the rear crossmember slumps under a load and passengers, the auto leveling sensor link changes.
2. The auto leveling sensor changes the voltage value according to the angles of the links and outputs to the AFS control module.

VEHICLES CONDITION

AUTO LEVELING SENSOR CONDITION

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

HEADLIGHT LEVELING ACTUATOR

Purpose, Function

With headlight manual leveling system

- The headlight leveling actuator drives the motor using the electrical current from the headlight leveling switch to change the optical axis of the headlights.

With headlight auto leveling system

- The headlight leveling actuator drives the motor based on the target optical axis voltage, which is input from the AFS control module, to change the optical axis of the headlights.

Construction

- Built into the front combination lights.
- Consists of a motor which expands/retracts the shaft, a shaft, and a microcomputer which calculates the shaft expansion/contraction amount.

Operation

With headlight manual leveling system

1. The headlight leveling actuator drives the motor using the electrical current from the headlight leveling switch until the optical axis reaches the target optical axis position.

2. When the motor is driven, the shaft moves back and forth and the reflector moves to change the optical axis.

With headlight auto leveling system

1. The headlight leveling actuator calculates the motor drive amount based on the target optical axis signal from the AFS control module and drives the motor until the headlight reaches the target optical axis.

2. When the motor is driven, the shaft moves back and forth and the reflector moves to change the optical axis.

Fail-safe

- Function not equipped.

HEADLIGHT LEVELING ACTUATOR

2014 - Mazda3 - Body and Accessories

ADAPTIVE FRONT LIGHTING SYSTEM (AFS)

Outline

- The adaptive lighting system (AFS) is a system which enhances the range of visibility when the headlights are turned on by pointing the optical axis of the headlights in the direction in which the vehicle is advancing according to the steering operation.
- The AFS control module performs adaptive front lighting system (AFS) fail-safe. (See **ADAPTIVE FRONT LIGHTING SYSTEM (AFS) CONTROL MODULE**.)

Function

- The adaptive front lighting system (AFS) is controlled by the AFS control module.
- The AFS control module controls the auto leveling function to adjust the headlight optical axis up or down in response to changes in load and passenger conditions. (See **HEADLIGHT AUTO LEVELING SYSTEM**.)

Swivel function

- The AFS control module changes the optical axis to the direction in which the vehicle is travelling according to the steering wheel operation and vehicle speed while the headlights are turned on.
- The AFS control module controls the swivel function based on the following CAN signals.

CAN signal sending module	Signal name
EPS control module	Steering angle signal (absolute steering angle)
	Steering angle signal (estimated steering angle)
PCM	Vehicle speed signal
Instrument cluster	Ignition switch status signal
	Back-up light illumination request signal
	AFS OFF switch status signal
Front body control module (FBCM)	Headlight illumination status signal

Initial position learning function

- When the ignition is switched ON (engine on) at a vehicle speed of 0 km/h {0 mph}, the AFS control module calculates the initial position of the swivel actuator for left/right operation, and the headlight optical axis stops at the front position.
- The AFS control module controls the initial position learning function based on the following CAN signals.

CAN signal sending module	Signal name
PCM	Vehicle speed signal
Instrument cluster	Ignition switch status signal

Construction

- The swivel actuator for adjusting the optical axis is built into the front combination light, and it is an integrated construction with the headlights.
- The swivel actuator has an internal Hall sensor and sends the current position of the headlight to the AFS control module.
- The variation (swivel angle) of the optical axis of the headlights is 15 degrees for the right and left.
- Changes in the headlight optical axis (swivel angle) are controlled freely (non-step) based on the vehicle speed and the steering angle, and the swivel angle differs for each of the conditions.
- The steering wheel angle amount changes according to the vehicle speed until reaching the maximum value of the swivel angle (15 degrees).

Structural View

- The adaptive front lighting system (AFS) consists of the following parts:

System Wiring Diagram

Operation

Swivel function

- When the ignition is switched ON (engine off or on), the AFS control module constantly calculates the swivel actuator control amount based on the steering angle signal and vehicle speed signal.
- If the following operation conditions are met, the AFS control module controls the swivel actuator based on the calculated amount of control, and adjusts the headlight optical axis.

Operation condition

Item	Condition
Initial position learning	After normal completion
Headlight	ON (illumination)
AFS OFF switch	OFF (control status)
Gear position signal	• Except R position (ATX) • Except reverse position (MTX)

Vehicle speed	Control start: 2 km/h {1 mph} or more

- The swivel actuator drives the motor based on the signal from the AFS control module.
- Changes in the swivel angle of the headlights are detected by the Hall sensor and input to the AFS control module.

2014 - Mazda3 - Body and Accessories

ADAPTIVE FRONT LIGHTING SYSTEM (AFS) CONTROL MODULE

Purpose

- The AFS control module calculates the target optical axis based on the vehicle height signal and outputs the target optical axis signal to the headlight leveling actuator.
- The AFS control module outputs the target headlight optical axis signal to the swivel actuator according to the steering wheel operation while the headlights are turned on.

Function

- The AFS control module performs control of the adaptive front lighting system (AFS) and headlight auto leveling system.
- The AFS control module records the vehicle height while it is unoccupied.
- Even if the battery is disconnected, the unoccupied vehicle height recorded by the AFS control module is not erased.
- The new AFS control module does not record the vehicle height while it is unoccupied.
- When the headlight auto leveling system initialization is performed after the AFS control module is replaced, the AFS control module inputs the vehicle height from the auto leveling sensor and records the vehicle height in unloaded condition.

Automatic configuration function

- The AFS control module prior to replacement stores the vehicle specification information.
- A new AFS control module does not store any vehicle specification information.
- When the ignition is switched ON after the AFS control module is replaced, the AFS control module reads the vehicle specification information sent via CAN transmission from the instrument cluster using the automatic configuration function, and stores it.

On-board diagnostic function

- The AFS control module is equipped with an on-board diagnosis function which records DTCs in the event of a malfunction.

  Malfunction detection function

  - Detects malfunctions of the adaptive front lighting system (AFS) and the

headlight auto leveling system related parts.

Display Function

- If any malfunction is detected, the AFS OFF indicator light in the instrument cluster flashes to notify the driver of a system malfunction.

Operation

- For the AFS control module operation, refer to "**HEADLIGHT AUTO LEVELING SYSTEM**" and "**ADAPTIVE FRONT LIGHTING SYSTEM (AFS)**".

U3000:49	• RAM/ROM malfunction ▪ The swivel actuator is moved to the center. ▪ The headlight leveling actuator is stopped at the position when the malfunction is determined. • AFS function malfunction ▪ Not applicable • CAN hardware malfunction ▪ The swivel actuator is moved to the center. ▪ The headlight leveling actuator is stopped at the position when

	the malfunction is determined.
U3003:16	• The swivel actuator is stopped at the position when the malfunction is determined. • The headlight leveling actuator is stopped at the position when the malfunction is determined.
U3003:17	• The swivel actuator is stopped at the position when the malfunction is determined. • The headlight leveling actuator is stopped at the position when the malfunction is determined.

2014 - Mazda3 - Body and Accessories

SWIVEL ACTUATOR

Purpose

- The swivel actuator drives the motor based on the signal from the AFS control module when the headlights are illuminated to change the direction of the optical axis of the headlights according to the steering wheel operation.

Function

- The swivel actuator constantly detects the headlight swivel angle from the Hall sensor built into the actuator, and inputs the swivel angle to the AFS control module via LIN communication.

Construction

- The swivel actuator is built into the front combination lights.
- The swivel actuator has an integrated Hall sensor.

Operation

1. The AFS control module sends the target optical axis signal to the swivel actuator based on the headlight current position signal from the swivel actuator.

2. The swivel actuator calculates the amount of motor drive based on the target headlight optical axis signal from the AFS control module and drives the motor until the headlights reach the target headlight optical axis position.

3. The motor is driven and changes the optical axis by moving the reflector left and right.

4. The swivel actuator detects the current position of the headlights based on the Hall sensor, and sends the current position of the headlights to the AFS control module.

Fail-safe

- Function not equipped.

SWIVEL ACTUATOR

2014 - Mazda3 - Body and Accessories

AFS OFF INDICATOR LIGHT

Purpose

- The AFS OFF indicator light notifies the user that the adaptive front lighting system (AFS) is stopped or a malfunction occurs in the adaptive front lighting system (AFS).

Function

- The AFS OFF indicator light illuminates when the adaptive front lighting system (AFS) is stopped and flashes when a malfunction occurs in the adaptive front lighting system (AFS) or the headlight auto leveling system.
- For vehicles with center display, a warning message in the center display is displayed when the AFS OFF indicator light is flashed. For the message content and verification method, refer to the CENTER DISPLAY. (See **CENTER DISPLAY [WITH CENTER DISPLAY]**.)

Construction

- Displayed in the instrument cluster.

Operation

NOTE:

- When the ignition is switched ON (engine off or on), the AFS control module illuminates the AFS OFF indicator light for 3 s to check the light bulb and notifies that the AFS OFF indicator light bulb is normal.
- The AFS control module sends a AFS OFF indicator light illumination/flash request signal to the instrument cluster via the CAN signal when the adaptive front lighting system (AFS) is stopped or a malfunction occurs in the adaptive front lighting system (AFS) or the headlight auto leveling system.
- The instrument cluster illuminates/flashes the AFS OFF indicator light based on the AFS OFF indicator light illumination/flash request signal.

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

ON-BOARD DIAGNOSTIC [ADAPTIVE FRONT LIGHTING SYSTEM (AFS)]

Outline

- The on-board diagnostic function consists of the following functions.
    - A malfunction detection function, which detects overall malfunctions in the AFS control module-related parts.
    - A memory function, which stores detected DTCs.
    - A display function, which indicates malfunction locations and status via DTC output.
    - A PID/data monitor function, which reads out specific input/output signals and verifies the input/output condition.
- Using the Mazda Modular Diagnostic System (M-MDS), DTCs can be read out and deleted, and the PID/data monitor function can be activated.

Malfunction Detection Function

- Detects malfunctions in input/output signals.
- If a malfunction occurs, the AFS control module records the malfunction as a DTC. A recorded DTC can be read by the Mazda Modular Diagnostic System (M-MDS).

NOTE:

- AFS control module flashes the AFS OFF indicator light as follows if there is a malfunction in the system.

DTC 7-digit code definition

- When related systems or components have failed, the CM stores the DTC of the malfunctioning part in the CM memory, and allows for the retrieval of the store data using scanning tool when necessary. The DTCs are indicated using seven digits. Each digit indicates the following.

B 1 0 D 5 : 1 3

· Specify the area failure sub type

00: No sub type information
01: General electrical failure
05: System programming malfunctions
09: Component failures
13: Open circuit
14: Circuit short to ground or open
16: Circuit voltage below threshold
17: Circuit voltage above threshold
41: General checksum malfunction
42: General memory malfunction
49: Internal electronic malfunction
51: Not programmed
54: Missing calibration
55: Not configured
62: Signal compare malfunction
68: Event information
81: Invalid serial data received
86: Signal invalid
87: Missing message
88: Bus off
92: Performance or incorrect operation
94: Unexpected operation

· Manufacturer controlled

· Indicates subgroup

Powertrain (P code)	Network Electrical (U code)	Body (B code)	Chassis (C code)
0: Fuel and air metering and auxiliary emission controls	0: Network Electrical	Manufacturer controlled	Manufacturer controlled
	1: Network communication		
	2: Network communication		
	3: Network software		
	4: Network data		
	5: Network data		

· Indicates who was responsible for DTC definition

0: ISO/SAE controlled
1: Manufacturer controlled
2: There are ISO/SAE controlled just for powertrain, all others are manufacturer controlled.
3: For P3000 to P3399 is manufacturer controlled, all others are ISO/SAE controlled.

· Indicates DTC function

P: Powertrain
B: Body
C: Chassis
U: Network Electrical

Status byte for DTC

- The two digits (two digits after hyphen (-)) after the 7-digit DTC.

7-DIGIT DTC

P 1 2 6 0 : 0 0 − * *

STATUS BYTE

- A code which indicates the pending code, current/past malfunction status, or warning illumination status.
- Can be read by performing a CMDTC self-test using the Mazda Modular Diagnostic System (M-MDS).
- For details on the status byte, refer to the explanation on the Mazda Modular Diagnostic System (M-MDS) when reading the DTC.

Detection condition for the applicable DTC

DTC No.	Description	Detection condition
B1041:54	Headlight auto leveling system initialization error	• Headlight auto leveling system initialization is not performed.
B1044:01	Auto leveling sensor circuit malfunction	• AFS control module detected the auto leveling sensor circuit voltage of **0.25 V or less** or **4.75 V or more** for **10 s or more** with the ignition switched ON (engine off or on).
B10A3:86	Communication error with swivel actuator (LH)	• AFS control module received error signals from the swivel actuator (LH) **three times** continuously with the ignition switched ON (engine off or on). • AFS control module could not receive the signal from the swivel actuator (LH) for **5 s** or more with the ignition switched ON (engine off or on).
B10A3:87	Communication error with swivel actuator (LH)	• AFS control module detected communication error with the swivel actuator (LH) for **5 s or more** with the ignition switched ON (engine off or on).
B10A4:86	Communication error with swivel actuator (RH)	• AFS control module received error signals from the swivel actuator (RH) **three times** continuously with the ignition switched ON (engine off or on). • AFS control module could not receive the signal from the swivel actuator (RH) for **5 s** or more with the ignition switched ON (engine off or on).
B10A4:87	Communication error with swivel actuator (RH)	• AFS control module detected communication error with the swivel actuator (RH) for **5 s or more** with the ignition switched ON (engine off or on).
C0051:86	Steering angle error signal received from EPS control module	• Either a condition in which the steering angle sensor has a malfunction and the EPS control module has not performed steering angle neutral position auto learning, or a condition in which the EPS control module has a malfunction is detected for **5 s or more** with the ignition switched ON (engine off or on).
U0001:88	Unit communication error (HS-CAN)	• AFS control module detected the CAN bus communication line (HS-CAN) malfunction **10 times** continuously.
U0100:00	Communication error with PCM	• AFS control module could not receive the CAN signal from the PCM for **5 s or more**.

U0131:00	Communication error with EPS control module	• AFS control module could not receive the CAN signal from the EPS control module for **5 s or more**.
U0140:00	Communication error with front body control module (FBCM)	• AFS control module could not receive the CAN signal from the front body control module (FBCM) for **5 s or more**.
U0155:00	Communication error with instrument cluster	• AFS control module could not receive the CAN signal from the instrument cluster for **5 s or more**.
U0320:09	Error signal received from EPS control module	• AFS control module received the error signal from the EPS control module for **5 s or more** with the ignition switched ON (engine off or on).
U0420:68	Error signal received from EPS control module	• AFS control module received the error signal from the EPS control module for **5 s or more** with the ignition switched ON (engine off or on).
U0423:68	Error signal received from instrument cluster • AFS OFF switch error signal	• AFS control module received the AFS OFF switch error signal for **5 s or more** with the ignition switched ON (engine off or on).
	Error signal received from instrument cluster • Ignition switch error signal	• AFS control module received the ignition switch error signal for **5 s or more** with the ignition switched ON (engine off or on).
	Error signal received from instrument cluster • Selector lever R position (ATX)/shift lever reverse (MTX) signal error	• AFS control module received the selector lever R position (ATX)/shift lever reverse (MTX) signal error for **5 s or more** with the ignition switched ON (engine off or on).
	Error signal received from instrument cluster • Selector lever R position (ATX)/shift lever reverse (MTX) signal not determined	• AFS control module detected the undetermined selector lever R position (ATX)/shift lever reverse (MTX) signal.

U2005:86	Error signal received from PCM	• AFS control module received the vehicle speed signal error from the PCM for **5 s or more** with the ignition switched ON (engine off or on).
U2300:54	Error configuration data received from instrument cluster	• AFS control module received the error configuration data from the instrument cluster for **30 s or more** with the ignition switched ON (engine off or on).
U2300:55	Instrument cluster configuration not implemented	• AFS control module received a signal which indicates the instrument cluster configuration is not performed.
U2300:56	Configuration data unmatched with instrument cluster	• Configuration data of the AFS control module and instrument cluster are not matched.
U3000:42	AFS control module internal malfunction	• AFS control module detects the internal EEPROM malfunction.
U3000:49	AFS control module internal malfunction • RAM/ROM malfunction	• AFS control module detected a malfunction in the internal RAM/ROM.
	AFS control module internal malfunction • AFS function malfunction	• AFS control module detected AFS function malfunction **three times** continuously.
	AFS control module internal malfunction • CAN hardware malfunction	• AFS control module detected CAN hardware malfunction **three times** continuously.
U3003:16	AFS control module low power supply voltage input	• AFS control module power supply circuit voltage of **9.0 V or less** is detected for **5 s or more** with the ignition switched ON (engine off or on).
U3003:17	AFS control module high power supply voltage input	• AFS control module power supply circuit voltage of **18.1 V or more** is detected for **5 s or more** with the ignition switched ON (engine off or on).

Snapshot data

- The data for all DTCs currently detected is stored.

Snapshot data table—: Not applicable

Snapshot data item	Unit		Data contents	Data read/use method	Corresponding data monitor items
AAT	°C	°F	Ambient temperature	—	—
APP_STATUS	Accelerator Pedal Off/Under20%/Over20%/FAIL		Accelerator pedal position status	—	—
CFG_STATUS	Config Complete/Not Configured/Config Error		Instrument cluster configuration status	—	—
ECT_STATUS	Under 0 degrees C/0 - Under 80 degrees C/Over 80 degrees C/FAIL		Engine coolant temperature status	—	—
IC_VPWR	V		Instrument cluster power supply voltage	• The AFS control module constantly receives the power supply voltage value of the instrument cluster sent via CAN signal from the instrument cluster. • If a DTC is detected, the AFS control module records the power supply voltage of the instrument cluster when the DTC was detected, and it is displayed in the Mazda Modular Diagnostic System (M-MDS).	VPWR*1
IG-ON_TIMER	hh:mm:ss*2		Elapsed time since ignition was switched ON (engine off or on) **NOTE:** • The instrument cluster records the elapsed time since the ignition was switched ON (engine off or on).	• The AFS control module constantly receives the elapsed time since the ignition was switched ON (engine off or on) sent via CAN signal from the instrument cluster. • If a DTC is detected, the AFS control module records the elapsed time since the ignition was switched ON (engine off or on) when the DTC was detected, and it is displayed in the Mazda Modular Diagnostic System (M-MDS).	—
			• Key Out: Ignition switched off		

PWR_MODE_KEY	Key Out/Key Recently Out (Position 0)/Accessory (Position 1)/Post Ignition (Position 2)/Ignition On (Position 2)/Running (Position 2)/Running - Starting	• Key Recently Out (Position 0): Elapsed time **within 3 s** since ignition was switched off • Accessory (Position 1): Ignition is switched to ACC • Post Ignition (Position 2): Elapsed time **within 3 s** since ignition was switched ON (engine off or on) • Ignition On (Position 2): Ignition switched ON (engine off) • Running (Position 2): Ignition switched ON (engine on) • Running - Starting: Cranking condition	• The AFS control module constantly receives the ignition switch status sent via CAN signal from the instrument cluster. • If a DTC is detected, the AFS control module records the ignition switch status when the DTC was detected, and it is displayed in the Mazda Modular Diagnostic System (M-MDS).	—
RPM_STATUS	Engine Stop/Under1500rpm/Over1500rpm/FAIL	Engine speed status	• The AFS control module constantly receives the engine speed sent via CAN signal from the instrument cluster. • If a DTC is detected, the AFS control module records the engine speed when the DTC was detected, and it is displayed in the Mazda Modular Diagnostic System (M-MDS).	TACHOMTR*1

SHIFT_STATUS	P/N/D/R/FAIL		Selector lever position status	• The AFS control module constantly receives the selector lever position sent via CAN signal from the instrument cluster. • If a DTC is detected, the AFS control module records the selector lever position when the DTC was detected, and it is displayed in the Mazda Modular Diagnostic System (M-MDS).	—
TOTAL_DIST	km	Miles	Accumulated total traveled distance from completion of vehicle until AFS control module detects DTC (Odometer value in instrument cluster)	The total traveled distance from which the AFS control module detects DTCs to the present can be calculated by performing the following procedure. • Verify the odometer value in the instrument cluster. • Verify the snapshot data item TOTAL_DIST. • Subtract 2 from 1.	—
TOTAL_TIME	hh:mm:ss*2		Accumulated total elapsed time since vehicle completion until AFS control module detects a DTC **NOTE:** • When the ROOM fuse is removed, and the ignition is switched off, the time is not included in the elapsed time.	The elapsed time from which the AFS control module detects DTCs to the present can be calculated by performing the following procedure. • Verify the instrument cluster PID item TOTAL_TIME. • Verify the snapshot data item TOTAL_TIME. • Subtract 2 from 1.	TOTAL_TIME*1
VPWR	V		AFS control module power supply voltage	—	VPWR_IG
VSPD_STATUS	Stop/0-10km/h/Over10km/h/FAIL		Vehicle speed status	• The AFS control module constantly receives the vehicle speed sent via CAN signal from the instrument cluster. • If a DTC is detected, the AFS control module records the vehicle speed when the DTC was	SPEEDOMTR*1

			detected, and it is displayed in the Mazda Modular Diagnostic System (M-MDS).	

*1

Instrument cluster PID (See ON-BOARD DIAGNOSTIC [INSTRUMENT CLUSTER].)

*2

The seconds may be indicated after the decimal point.

PID/Data Monitor Function

- With the PID/data monitor function, input/output signal monitor items set in the AFS control module can be selected and read out in real-time.

PID/data monitor table

PID	Unit/Operation	Data contents	Module control terminal
AFS_ST	Off/On	• Off: AFS is not operated. • On: AFS is operated.	A, B (CAN)

2014 - Mazda3 - Body and Accessories

DRL (DAYTIME RUNNING LIGHT) SYSTEM

Outline

- The DRL system automatically switches the headlights to HI beams (50 % dim) or illuminates the DRL when the ignition is switched ON (engine off or on), the parking brake is released, and the selector lever is in a position other than P (ATX).
- The front body control module (FBCM) performs DRL system fail-safe. (See **FRONT BODY CONTROL MODULE (FBCM)**.)

Structural View

System Wiring Diagram

Without discharge headlight system

DRL (DAYTIME RUNNING LIGHT) SYSTEM

With discharge headlight system

Operation

Operation condition—: Not applicable

Engine switch	Parking brake	Selector lever position (ATX)	Light switch	Dimmer switch	Auto light system	DRL
			OFF	LO	—	On
				HI		On
				FLASH-TO-PASS		Off
			AUTO	LO	Off	On
					On	Off
				HI	Off	On
					On	Off
ON (engine off or on)	Released	Except P			Off	Off

				FLASH-TO-PASS	On	Off
			TNS	LO	—	On
				HI		On
				FLASH-TO-PASS		Off
			HEAD	LO	—	Off
				HI		Off
				FLASH-TO-PASS		Off

Without discharge headlight system

1. If the operation conditions are met, the front body control module (FBCM) turns on the DRL circuit transistor.

2. When the transistor turns on, the DRL relay turns on.

3. If the DRL relay turns on, the electrical current flows in-line relative to the left/right headlight HI circuits and the headlights HI turn on at half the brightness of normal illumination.

With discharge headlight system

1. If the operation conditions are met, the front body control module (FBCM) turns on the DRL circuit transistor.
2. When the transistor turns on, the DRLs are illuminated.

DRL (DAYTIME RUNNING LIGHT) SYSTEM

2014 - Mazda3 - Body and Accessories

HIGH BEAM CONTROL (HBC) SYSTEM

Outline

- The high beam control (HBC) system performs automatic switching to low beams only when the forward sensing camera (FSC) installed to the windshield recognizes an on-coming vehicle, a vehicle that is ahead or when traveling through towns and cities to prevent blinding of other vehicles from headlight glare and to assure visibility of drivers.

CAUTION:

- Under the following conditions the ability of the forward sensing camera (FSC) to detect light-emitting objects decreases, which could result in the system not operating normally and the inability to detect on-coming vehicles or vehicles ahead.
    - Brightness of moonlight in surrounding area
    - Poor visibility due to rain and fog
    - Scratches or soiling on the camera lens or windshield glass
- Do not rely solely on the high beam control (HBC) system, and perform the appropriate switching operation based on a visual determination of the conditions.
- If the FSC aiming for the high beam control (HBC) system is not completed, the camera shot angle for the FSC cannot be recorded and the high beam control (HBC) system may not operate. When performing the following servicing, always perform the FSC aiming. Refer to the FSC aiming procedure in the workshop manual.
    - FSC replacement
    - FSC clip replacement
    - Windshield replacement

Function

- With the light switch in the AUTO and HI position and when the headlights are turned on, the forward sensing camera (FSC) automatically switches to low beams when it recognizes a light-emitting object (on-coming vehicle, vehicle ahead, town and city streets).
- Refer to FORWARD SENSING CAMERA (FSC) for details on the forward sensing camera (FSC). (See **FORWARD SENSING CAMERA (FSC)**.)

Setting function for control order of precedence

- If several light-emitting objects are recognized (on-coming vehicles, vehicles ahead, town/city streets), control is conducted according to the following order of precedence.
    - Closest on-coming vehicle
    - Closest vehicle ahead (no on-coming vehicles)
    - Traveling through towns and cities

System conditions display function

- The forward sensing camera (FSC) displays system conditions using the HBC indicator light (green), and HBC warning light (amber).

Condition	HBC indicator light (green)	HBC warning light (amber)
Light switch is in position other than AUTO and HI position		

Headlights off	Illumination off	Illumination off
While vehicle is stopped		
System set to off by personalization		
Light switch is in AUTO and HI position and headlights turned on	Illumination on	Illumination off
Forward sensing camera (FSC) detects camera fogging	Illumination off	Illumination on
Forward sensing camera (FSC) detects camera soiling		
Malfunction in high beam control (HBC) occurs		Flashes
Malfunction in forward sensing camera (FSC) occurs		

Structural View

System Wiring Diagram

Block Diagram

Operation

Low beam switching operation

Operation condition

- With the light switch in the AUTO and HI position and when the headlights are turned on, the headlights are switched to low beams when any of the following conditions are met:
    - On-coming vehicles, vehicles ahead, town/city streets are recognized.
    - Vehicle speed is 20 km/h {12 mph} or less.
- When the forward sensing camera (FSC) recognizes a light-emitting object (on-coming vehicles, vehicles ahead, town/city streets) or detects a vehicle speed of 20 km/h {12 mph} or less, it sends a headlight low beam switching request signal to the front body control module (FBCM).
- When the front body control module (FBCM) receives the headlight low beam switching request signal from the forward sensing camera (FSC), it switches the headlight to low beams.

High beam return operation

Operation condition

- If the following conditions are met, the headlights are switched to high beams.
  - If vehicle speed is 30 km/h {19 mph} and on-coming vehicles, vehicles ahead or street lights are not recognized.

On-coming vehicles

- If a recognized on-coming vehicle moves away from the camera range, the forward sensing camera (FSC) sends a headlight high beam switching request signal to the front body control module (FBCM).
- When the front body control module (FBCM) receives the headlight high beam switching request signal from the forward sensing camera (FSC), it switches the headlight to high beams.

Vehicle ahead or town/city streets (street lights)

- If a recognized vehicle ahead moves away from the camera range, or town/city streets (street lights) are no longer detected in the camera range, the low beams are maintained for a certain period of time.
- If a vehicle ahead or town/city streets (street lights) are not detected for a certain period of time, the forward sensing camera (FSC) sends a headlight high beam switching request signal to the front body control module (FBCM).
- When the front body control module (FBCM) receives the headlight high beam switching request signal from the forward sensing camera (FSC), it switches the headlight to high beams.

Forward sensing camera (FSC) loses sight of vehicle ahead which is cornering

- If the forward sensing camera (FSC) loses sight of a recognized vehicle which is cornering, the forward sensing camera (FSC) maintains the low beams until reaching the locus at which the forward sensing camera (FSC) lost sight of it.
- If the vehicle ahead is not detected at the locus at which the forward sensing camera (FSC) had lost sight of it, the headlights

are switched to high beams. If the vehicle ahead is detected, the low beams are maintained.

Forward sensing camera (FSC) suddenly loses sight of light-emitting object (on-coming vehicles, vehicles

ahead, town/city streets (street lights))

- If the forward sensing camera (FSC) suddenly loses sight of a recognized light-emitting object in the camera range, the low beams are maintained for a certain period of time.
- Depending on whether a light-emitting object is detected or not after the certain period of time has elapsed, the headlights are switched to high beams or the system determines that the low beams are to be maintained.

Fail-safe

- If a malfunction is detected in the system, control is inhibited and the headlights are switched to high beams.

2014 - Mazda3 - Body and Accessories

HBC INDICATOR LIGHT (GREEN)/HBC WARNING LIGHT (AMBER)

Purpose

HBC indicator light (green)

- The HBC indicator light (green) notifies the driver that the high beam control (HBC) system is operating.

HBC warning light (amber)

- The HBC warning light (amber) warns the driver that a malfunction is occurring in the high beam control (HBC) system.

Function

HBC indicator light (green)

- The instrument cluster illuminates the HBC indicator light (green) based on the system conditions display request signal sent via a CAN signal from the forward sensing camera (FSC).

HBC warning light (amber)

- The instrument cluster illuminates the HBC warning light (amber) based on the system conditions display request signal sent via a CAN signal from the forward sensing camera (FSC).
- The instrument cluster flashes the HBC warning light (amber) based on the system malfunction display request signal sent via a CAN signal from the forward sensing camera (FSC).
- The flash pattern of the HBC warning light (amber) is as shown in the figure.

- For vehicles with center display, a warning message in the center display is displayed when the HBC warning light (amber) is flashed. For the message content and verification method, refer to the

CENTER DISPLAY. (See **CENTER DISPLAY [WITH CENTER DISPLAY]**.)

Construction

- The HBC indicator light (green) and HBC warning light (amber) are equipped in the instrument cluster.

INSTRUMENT CLUSTER

Operation

HBC indicator light (green)

1. The instrument cluster receives the system conditions display request signal from the forward sensing camera (FSC) via the CAN signal.

2. The instrument cluster turns the transistor on based on the system conditions display request signal.

3. When the transistor turns on, a ground circuit with the HBC indicator light (green) is established, and the HBC indicator light (green) illuminates.

HBC warning light (amber)

1. The instrument cluster receives the system conditions display request signal or a system malfunction display request signal from the forward sensing camera (FSC) via a CAN signal.

2. The instrument cluster turns the transistor on intermittently for a system malfunction display request signal, and continuously for a system conditions display request signal.

3. When the transistor is turned on intermittently, the HBC warning light (amber) flashes, and when it is turned on continuously, the HBC warning light (amber) illuminates.

Fail-safe

- Function not equipped.

HBC INDICATOR LIGHT (GREEN)/HBC WARNING LIGHT (AMBER)

2014 - Mazda3 - Body and Accessories

FRONT TURN LIGHT

Purpose

- The front turn lights notify pedestrians and other vehicles of the vehicle making a left or right turn.

Function

- The front turn lights flash according to the operation of the turn switch or the hazard warning switch.

Construction

- The front turn lights are assembled to the front bumper.
- Clear lenses have been adopted on the front turn lights.

Operation

Turn light system

1. When the turn switch is operated to the LH or RH position, the start stop unit detects a turn switch LH or RH signal.

2. The start stop unit sends the turn switch LH or RH signal to the front body control module (FBCM) as a CAN signal.

3. When the front body control module (FBCM) receives the turn switch LH or RH signal, the front turn light (LH) or (RH) is flashed.

Hazard warning system

1. When the hazard warning switch is turned on, the start stop unit detects a hazard warning switch on signal.

2. When the start stop unit detects a hazard warning switch on signal, it sends the hazard warning signal to the front body control module (FBCM) via a CAN signal.

3. When the front body control module (FBCM) receives the hazard warning signal, the front turn lights (RH) and (LH) flash.

Fail-safe

- Function not equipped.

FRONT TURN LIGHT

2014 - Mazda3 - Body and Accessories

FRONT FOG LIGHT

Purpose

- By shining light in a wider area in front of the vehicle than the light from the headlights, visibility during poor weather conditions, such as rain and fog, has been improved. In addition, the visibility of the vehicle from on-coming vehicles, pedestrians, and other people has been improved.

Function

- Illuminates according to the light switch and front fog light switch operation.

Construction

- Round-type front fog lights are installed to the front bumper.
- Clear lenses have been adopted to the front fog lights.

Operation

1. With the light switch in the TNS or HEAD position, the start stop unit detects a front fog light switch signal when the fog light switch is operated to the F.FOG position.
2. The start stop unit sends the front fog light switch signal to the front body control module (FBCM) as a CAN signal.
3. When the front body control module (FBCM) receives the front fog light switch signal, it turns the front fog light relay on.
4. When the front fog light relay turns on, the front fog light illuminates.

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

TURN LIGHT SYSTEM

Purpose

- The turn light system flashes the turn light three times automatically according to the turn switch operation.
- The front body control module (FBCM) performs turn light system fail-safe. (See **FRONT BODY CONTROL MODULE (FBCM)**.)

Function

- The front body control module (FBCM) performs control based on the turn switch LH or RH signal sent from the start stop unit via the CAN signal as follows:
    - On-signal receive time of turn switch is less than 0.65 s: Operates the turn light system.
    - On-signal receive time of turn switch is 0.65 s or more: Flashes the turn light according to the receive time.

Structural View

System Wiring Diagram

Operation

- If the front body control module (FBCM) receives the turn switch LH or RH signal from the start stop unit for less than 0.65 s when the ignition is switched ON (engine off or on), it flashes the turn light LH or RH three times.
- While the turn light system is operating, if the front body control module (FBCM) receives a turn switch on signal from the opposite side, the turn light system is cancelled. However, if the front body control module (FBCM) receives the turn switch on signal from the opposite side for 0.2 s or more, it flashes the turn lights while receiving the turn switch on signal.

2014 - Mazda3 - Body and Accessories

SIDE TURN LIGHT

Purpose

- The side turn lights are used to signal vehicles/people at the side of the vehicle that the vehicle is going to make a right or left turn.

Function

- The side turn lights flash according to the operation of the turn switch or the hazard warning switch.

Construction

- Side turn lights built into the outer mirrors have been adopted.
- LED type side turn lights have been adopted.

Operation

Turn light system

1. When the turn switch is operated to the LH or RH position, the start stop unit detects a turn switch LH or RH signal.
2. The start stop unit sends the turn switch LH or RH signal to the front body control module (FBCM) as a CAN signal.
3. When the front body control module (FBCM) receives the turn switch LH or RH signal, the side turn light (LH) or (RH) flashes.

Hazard warning system

1. When the hazard warning switch is turned on, the start stop unit detects a hazard warning switch on signal.

2. When the start stop unit detects a hazard warning switch on signal, it sends a hazard warning signal to the front body control module (FBCM) as a CAN signal.

3. When the front body control module (FBCM) receives the hazard warning signal, the side turn light (LH) and (RH) flash.

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

REAR COMBINATION LIGHT

Purpose

- The rear combination lights are used to signal the following conditions to vehicles/people at the rear.
    - Rear turn lights: Signals a left or right turn of the vehicle.
    - Brake lights: Signals a vehicle stop.
    - Taillights: Signals the presence of the vehicle to vehicles/people at the rear during nighttime.
    - Rear side marker lights: Signals the presence of the vehicle to vehicles/people at the adjacent rear during nighttime.

Function

- The related light turns on or flashes according to the operation of each switch.

Operation switch	Related light	Operation condition
Light switch (TNS)	Taillight	Turns on
	Rear side marker light	Turns on
Brake switch	Brake light	Turns on
Turn switch	Rear turn light	Flashes
Hazard warning switch		

Construction

- The following parts are an integrated structure.
    - Rear turn light bulb
    - Brake light/rear side marker light/taillight bulb (with bulb type)
    - Brake light/rear side marker light/taillight (LED) (with LED type)
- The brake light/rear side marker light/taillight has adopted a LED. (with LED type)
- A clear lens has been adopted for the rear combination light.

NOTE:

- Fogging or condensation on the inside of the rear combination lights may occur, however, it is a natural phenomenon occurring as a result of a temperature difference between the interior and exterior of the combination lights and has no effect on the light performance. Fogging or condensation will dissipate when the temperature inside the rear combination lights rises after the rear turn lights are illuminated and a period of time has elapsed.

Operation

Rear side marker lights/taillights

1. When the light switch is operated to the TNS position, the start stop unit detects a light switch TNS signal.
2. The start stop unit sends the light switch TNS signal to the front body control module (FBCM) as a CAN signal.
3. When the front body control module (FBCM) receives the light switch TNS signal, it turns the TNS relay on.
4. When the TNS relay turns on, the rear side marker lights/taillights are illuminated.

Brake lights

- **Operation due to brake pedal operation**

  Without smart city brake support (SCBS) system

  - When the brake pedal is depressed, the brake switch (No.1 signal) turns on.
  - When the brake switch (No.1 signal) turns on, current flows from the battery to the brake lights.
  - The brake lights turn on.

  With smart city brake support (SCBS) system

  - When the brake pedal is depressed, the brake switch (No.1 signal) turns on.
  - When the brake switch (No.1 signal) turns on, current flows from the battery to the brake lights.
  - The brake lights turn on.

- **Operation due to operation request signal from rear body control module (RBCM)**

  NOTE:

  - Refer to "**SMART CITY BRAKE SUPPORT (SCBS)**" for details.

With smart city brake support (SCBS) system

- When the operation conditions are met, the rear body control module (RBCM) turns on the transistor inside the rear body control module (RBCM).
- When the transistor inside the rear body control module (RBCM) turns on, the brake light relay turns on.
- When the brake light relay turns on, current flows from the battery to the brake lights.
- The brake lights turn on.

Rear turn lights (Turn light system)

1. When the turn switch is operated to the LH or RH position, the start stop unit detects a turn switch LH or RH signal.

2. The start stop unit sends the turn switch LH or RH signal to the front body control module (FBCM) as a CAN signal.

3. When the front body control module (FBCM) receives the turn switch LH or RH signal, the rear turn light (LH) or (RH) flashes.

Rear turn lights (Hazard warning system)

1. When the hazard warning switch is turned on, the start stop unit detects a hazard warning switch on signal.

2. The start stop unit detects a hazard warning switch on signal, it sends a hazard warning signal to the front body control module (FBCM) as a CAN signal.

3. When the front body control module (FBCM) receives the hazard warning signal, the rear turn light (LH) and (RH) flash.

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

TRUNK LID LIGHT (4SD)/LIFTGATE LIGHT (5HB)

Purpose

- The trunk lid lights (4SD)/liftgate lights (5HB) are used to signal the following conditions to vehicles/people at the rear.
    - Back-up lights: Signals that the vehicle is backing up.
    - Taillights (with taillights): Signals the presence of the vehicle during nighttime.

Function

- The back-up lights are illuminated in conjunction with the selector lever (ATX)/shift lever (MTX) operation.
- The taillights are illuminated in conjunction with the light switch operation (TNS). (with taillights)

Construction

- The following parts are an integrated structure.
    - Back-up light bulb
    - Taillight (LED) (with taillights)
- A clear lens has been adopted for the trunk lid light (4SD)/liftgate light (5HB).

NOTE:

- Fogging or condensation may occur inside the trunk lid lights (4SD)/liftgate lights (5HB), however, it is a natural phenomenon occurring as a result of a temperature difference between the interior and exterior of the trunk lid lights (4SD)/liftgate lights (5HB) and has no effect on the light performance. Fogging or condensation will dissipate when the temperature inside the trunk lid lights (4SD)/liftgate lights (5HB) rises after the back-up light is illuminated and a period of time has elapsed.

Operation

Taillights (with taillights)

1. When the light switch is operated to the TNS position, the start stop unit detects a light switch TNS signal.
2. The start stop unit sends the light switch TNS signal to the front body control module (FBCM) as a CAN signal.
3. When the front body control module (FBCM) receives the light switch TNS signal, it turns the TNS relay on.
4. When the TNS relay turns on, the taillights are illuminated.

Buck-up lights (ATX)

1. When the selector lever is operated to the R position, the TCM sends a R position signal to the PCM as a CAN signal.
2. When the PCM receives the R position signal, it sends a back-up light on signal to the instrument cluster.
3. The instrument cluster sends the back-up light on signal to the rear body control module (RBCM).
4. When the rear body control module (RBCM) receives the back-up light on signal, the back-up lights are illuminated.

Buck-up lights (MTX)

1. When the shift lever is operated to the reverse position, the back-up light switch is turned on.
2. When the back-up light switch is turned on, the PCM detects a back-up light switch on signal.
3. When the PCM detects a back-up light switch on signal, it sends the back-up light signal to the instrument cluster as a CAN signal.
4. The instrument cluster sends the back-up light signal to the rear body control module (RBCM).
5. When the rear body control module (RBCM) receives the back-up light signal, the back-up lights are illuminated.

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

HIGH-MOUNT BRAKE LIGHT

Purpose

- The high-mount brake light signals vehicles to the rear that the vehicle is stopped.

Function

- The high-mount brake light illuminates in conjunction with the operation of the brake pedal.

Construction

- The high-mount brake light is installed to the rear package trim (4SD)/rear spoiler (5HB).
- The high-mount brake light has adopted a LED.

NOTE:

- Fogging or condensation on the inside of the high-mount brake light may occur, however, it is a natural phenomenon occurring as a result of a temperature difference between the interior and exterior of the high-mount brake light and has no effect on the light performance. Fogging or condensation will dissipate when the temperature inside the high-mount brake light rises after the high-mount brake light is illuminated and a period of time has elapsed.

LICENSE PLATE LIGHT

Purpose

- The license plate lights shine light on the license plate during nighttime driving.

Function

- The license plate lights illuminate in conjunction with the operation of the light switch (TNS).

Construction

- The license plate lights are installed to the trunk lid (4SD)/liftgate (5HB).

Operation

1. When the light switch is operated to the TNS position, the start stop unit detects a light switch TNS signal.
2. The start stop unit sends the light switch TNS signal to the front body control module (FBCM) as a CAN signal.
3. When the front body control module (FBCM) receives the light switch TNS signal, it turns the TNS relay on.
4. When the TNS relay turns on, the license plate lights are illuminated.

Fail-safe

- Function not equipped.

FRONT MAP LIGHT

Purpose

- The front map lights shine light at the front of the vehicle interior.

Function

- The front map lights illuminate when the front map light switch is turned on or room light switch is in the ON position.
- The front map lights illuminate according to the lock condition of the driver's door and open/close conditions of the doors under the rear body control module (RBCM) control when the room light switch is in the DOOR position.

Construction

- The front map lights are assembled to front area of the headliner.

Operation

Front map light switch operation (Dual light type)

1. Turn the front map light switch on.
2. The battery current flows to the front map light bulb from the rear body control module (RBCM).
3. The front map lights illuminate.

Room light switch operation

ON position

- Room light switch is in the ON position.
- The battery current flows to the front map light bulb from the rear body control module (RBCM).
- The front map lights illuminate.

DOOR position

- Room light switch is in the DOOR position.
- When any door is opened, the door open signal is input to the rear body control module (RBCM).
- When the rear body control module (RBCM) receives the door open signal, it turns on the transistor.
- When the transistor turns on, the battery current flows to the front map light bulbs from the rear body control module (RBCM).
- The front map lights illuminate.

NOTE:

- When the room light switch is in the DOOR position, the front map light illumination on/off timing is controlled by the room light control system. For details, refer to the "**ROOM LIGHT CONTROL SYSTEM**".

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

REAR MAP LIGHT

Purpose

- The rear map light shines light at the center of the vehicle interior.

Function

- The rear map light illuminates when the room light switch for front map light is in the ON position.
- The rear map light illuminates according to the lock condition of the driver's door and open/close conditions of the doors under the rear body control module (RBCM) control when the room light switch for front map light is in the DOOR position.

Construction

- The rear map light is assembled to center area of the headliner.

Operation

Room light switch for front map light operation

ON position

- Room light switch for front map light is in the ON position.

- The battery current flows to the rear map light bulb from the rear body control module (RBCM).
- The rear map light illuminates.

DOOR position

- Room light switch for front map light is in the DOOR position.
- When any door is opened, the door open signal is input to the rear body control module (RBCM).
- When the rear body control module (RBCM) receives the door open signal, it turns on the transistor.
- When the transistor turns on, the battery current flows to the rear map light bulb from the rear body control module (RBCM).
- The rear map light illuminates.

NOTE:

- When the room light switch for front map light is in the DOOR position, the rear map light illumination on/off timing is controlled by the room light control system. For details, refer to the "**ROOM LIGHT CONTROL SYSTEM**".

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

CARGO COMPARTMENT LIGHT

Purpose

- The cargo compartment light illuminates the cargo compartment interior when the liftgate is opened.

Function

- When the liftgate is opened, illuminates by the cargo compartment light switch turning on.

Construction

- The cargo compartment light is installed to the trunk side upper trim.

Operation

1. When the liftgate opens, the liftgate latch switch turns on and the rear body control module (RBCM) detects a liftgate latch switch on signal.

2. When the rear body control module (RBCM) detects the liftgate latch switch on signal, electric current flows to the cargo compartment light.

3. When the cargo compartment light switch turns on, electric current flows to the cargo

compartment light bulb.

4. When electric current flows to the cargo compartment light bulb, the cargo room light bulb illuminates.

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

STEERING ANGLE SENSOR

Purpose, Function

- The steering angle sensor detects the steering angle and sends it to the start stop unit as a steering angle (absolute steering angle) signal.

NOTE:

- The steering angle sensor is equipped if any of the following systems is equipped.
    - Adaptive front lighting system (AFS)
    - Smart city brake support (SCBS)

Construction

- The steering angle sensor is installed to the clock spring.
- Consists of a sensor unit in which a photo transistor and LED are positioned opposite each other, and a slit disc which moves together with the steering wheel.

Operation

- As the disc moves with the steering wheel operation, the LED light received by the photo transistor varies due to the slits on the disc.
- The photo transistor reads the variation of the light and outputs the steering angle (absolute steering angle) signal to the start stop unit.

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

WIPER/WASHER SYSTEM

Outline

- The following wiper/washer system has been adopted.
    - Windshield wiper/washer system
    - Rear wiper/washer system (5HB)
    - Auto wiper system (with auto wiper system)
    - Washer fluid-level warning system (with washer fluid-level sensor)

Specification

- Windshield wiper system with continuous (low/high), auto-stop, one-touch wiper, intermittent wiper, and synchronized washer and wiper operation adopted.
    - CAN communication has been adopted for the windshield wiper/washer system.
    - Windshield washer nozzles have been adopted in which the area where the washer fluid is sprayed can be adjusted.
- Rear wiper system with continuous, auto-stop, intermittent wiper, and synchronized washer and wiper operation adopted. (5HB)
    - CAN communication has been adopted for the rear wiper/washer system.
    - Rear washer nozzle have been adopted in which the area where the washer fluid is sprayed can be adjusted.
- An auto wiper system adopted which enables fully automatic windshield wiper operation. (with auto wiper system)
    - CAN communication has been adopted for the auto wiper system.
    - A rain sensor integrated with the lens has been adopted which aggregates infrared light to detect the amount of rainfall.
    - Auto wiper system personalization features has been adopted.
- A washer fluid-level sensor is installed in the washer tank. (with washer fluid-level sensor)
- Washer tank capacity
    - With the washer fluid-level sensor: **4.2 L {4.4 US qt, 3.7 Imp qt}**
    - Without the washer fluid-level sensor: **2.2 L {2.3 US qt, 1.9 Imp qt}**

WIPER/WASHER SYSTEM PERSONALIZATION

- A customize function has been adopted which switches the auto wiper system between operable/inoperable.

Auto Wiper System

Using mazda modular diagnostic system (M-MDS)

- The auto wiper function can be enabled or disabled using the Mazda Modular Diagnostic System (M-MDS). Refer to the Workshop Manual for the customize function setting procedure.

Mazda Modular Diagnostic System (M-MDS) display	Function	Initial setting	Setting contents	Control module
Rain Sensing Wipers.	Auto wiper system can be set to operable or inoperable.	On (Rain Sensing)	Not Adopted./ Off (Intermittent)/On (Rain Sensing)	Rear body control module (RBCM)

Using center display

- The user can enable or disable the auto wiper function by operating the center display. Refer to the Workshop Manual for the detailed customize function setting procedure.

Display of center display	Function	Initial setting	Setting contents	Control module
Wipers	Auto wiper system can be set to operable or inoperable.	On (Rain Sensing)	On (Rain Sensing) / Off (Intermittent)	Rear body control module (RBCM)

2014 - Mazda3 - Body and Accessories

WINDSHIELD WIPER/WASHER SYSTEM

Outline

- Equipped with continuous (low/high), auto-stop, one-touch wiper, intermittent wiper (without auto wiper system), auto wiper (with auto wiper system), windshield washer, and synchronized washer and wiper operation.
- The front body control module (FBCM) performs windshield wiper and washer system fail-safe. (See **FRONT BODY CONTROL MODULE (FBCM)**.)

Structural View

System Wiring Diagram

Operation

Continuous low operation

1. When the windshield wiper switch is moved to the LO position with the ignition switched ON (engine off or on), the start stop unit detects a windshield wiper switch signal (LO).

2. When the start stop unit detects the windshield wiper switch signal (LO), it send a windshield wiper switch position signal (LO) to the front body control module (FBCM) as a CAN signal.

3. When the front body control module (FBCM) receives the windshield wiper switch position signal (LO), it supplies the base current from the internal CPU to transistor A, and turns transistor A on.

4. When the transistor A is turned on, collector current flows from the internal power supply, turning the windshield wiper low relay on.

5. When the windshield wiper low relay is turned on, current flows from the battery to the windshield wiper motor and the windshield wipers operate continuously at low speed.

R2: WINDSHIELD WIPER HIGH RELAY
R3: WINDSHIELD WASHER RELAY
R4: REAR WASHER RELAY
T1: TRANSISTOR A
T2: TRANSISTOR B
T3: TRANSISTOR C
T4: TRANSISTOR D

Continuous high operation

1. When the windshield wiper switch is moved to the HI position with the ignition switched ON (engine off or on), the start stop unit detects a windshield wiper switch signal (HI).

2. When the start stop unit detects the windshield wiper switch signal (HI), it send a windshield wiper switch position signal (HI) to the front body control module (FBCM) as a CAN signal.

3. When the front body control module (FBCM) receives the windshield wiper switch position signal (HI), it supplies the base current from the internal CPU to transistors A and B, and turns transistors A and B on.

4. When the transistors A and B are turned on, collector current flows from the internal power supply, turning the windshield wiper low relay and windshield wiper high relay on.

5. When the windshield wiper low relay and windshield wiper high relay are turned on, current flows from the battery to the windshield wiper motor and the windshield wipers operate continuously at high speed.

WINDSHIELD WIPER AND WASHER SWITCH

R3: WINDSHIELD WASHER RELAY
R4: REAR WASHER RELAY
T1: TRANSISTOR A
T2: TRANSISTOR B
T3: TRANSISTOR C
T4: TRANSISTOR D

Auto-stop operation

1. The auto-stop switch inside the windshield wiper motor operates as follows according to the operation position of the windshield wipers.

- Windshield wipers stopped in park position: On
- Windshield wipers stopped in position other than park: Off

2. When the windshield wiper switch is in the OFF position during windshield wiper operation, the windshield wipers operate continuously because the auto-stop switch is off.

3. The auto-stop switch turns on when the windshield wipers move to the park position.

4. When the front body control module (FBCM) detects that the auto-stop switch is on, it stops the base current to transistor A and turns off transistor A.

5. When transistor A is turned off, collector current stops and the windshield wiper low relay turns off.

6. When the windshield wiper low relay is turned off, the windshield wipers stop at the park position.

One-touch wiper operation

1. When the windshield wiper switch is moved up (MIST position) with the ignition switched ON (engine off or on), the start stop unit detects a windshield wiper switch signal (LO).

2. When the start stop unit detects a windshield wiper switch signal (LO), it send a windshield wiper switch position signal (LO) to the front body control module (FBCM) as a CAN signal.

3. When the front body control module (FBCM) receives the windshield wiper switch position signal (LO), it supplies the base current from the internal CPU to transistor A, and turns transistor A on.

4. When the transistor A is turned on, collector current flows from the internal power supply, turning the windshield wiper low relay on.

5. When the windshield wiper low relay is turned on, current flows from the battery to the windshield wiper motor and the windshield wipers operate continuously at low speed.

R1: WINDSHIELD WIPER LOW RELAY
R2: WINDSHIELD WIPER HIGH RELAY
R3: WINDSHIELD WASHER RELAY
R4: REAR WASHER RELAY
T1: TRANSISTOR A
T2: TRANSISTOR B
T3: TRANSISTOR C
T4: TRANSISTOR D

Intermittent wiper operation (without auto wiper system)

1. When the windshield wiper switch is moved to the INT position with the ignition switched ON (engine off or on), the start stop unit detects a windshield wiper switch signal (INT).

2. When the start stop unit detects a windshield wiper switch signal (INT), it send a windshield wiper switch position signal (INT) and an INT volume signal to the front body control module (FBCM) as CAN signals.

3. When the front body control module (FBCM) receives the windshield wiper switch position signal (INT), it supplies the base current from the internal CPU to transistor A, and collector current flows from the internal power supply, and turns transistor A on.

4. When the transistor A is turned on, collector current flows from the internal power supply, turning the windshield wiper low relay on.

5. When the windshield wiper low relay is turned on, current flows from the battery to the windshield wiper motor and the windshield wipers operate continuously at low speed.

6. The windshield wipers stop at the park position due to the auto-stop operation, and after a certain period of time has elapsed, which was calculated based on the INT volume signal, the front body control module (FBCM) operates the windshield wipers at a low speed. By repeating this, the windshield wipers operate intermittently.

WINDSHIELD WIPER AND WASHER SWITCH

R1: WINDSHIELD WIPER LOW RELAY
R2: WINDSHIELD WIPER HIGH RELAY
R3: WINDSHIELD WASHER RELAY
R4: REAR WASHER RELAY
T1: TRANSISTOR A
T2: TRANSISTOR B
T3: TRANSISTOR C
T4: TRANSISTOR D

Auto wiper operation (with auto wiper system)

- Refer to AUTO WIPER SYSTEM for a detailed explanation of the auto wiper operation. (See **AUTO WIPER SYSTEM**.)

Synchronized washer and wiper operation

1. When the windshield washer switch is turned on with the ignition switched ON (engine off or on) and the windshield wipers not operated, the start stop unit detects a windshield washer switch ON signal.

2. When the start stop unit detects a windshield washer switch ON signal, it send a windshield washer switch position signal (ON) to the front body control module (FBCM) as a CAN signal.

3. When the front body control module (FBCM) receives the windshield washer switch position signal (ON), it supplies the base current from the internal CPU to transistor C, and collector current flows from the internal power supply, and turns transistor C on.

4. When the transistor C is turned on, collector current flows from the internal power supply, turning the windshield washer relay on.

5. When the windshield washer relay is turned on, current flows from the power supply inside the front body control module (FBCM) to the washer motor and the washer motor operates, and washer fluid is sprayed from the windshield washer nozzles.

6. When the front body control module (FBCM) receives the windshield washer switch position signal (ON) for a certain period of time, it operates the windshield wipers at low speed.

7. When the windshield washer switch is turned off, the operation stops after the windshield wipers operate two times.

NOTE:

- If the windshield washer switch is turned on while the windshield wipers are operating, windshield wiper operation is continued and the windshield washer operation, from (3) to (7), is performed.

R1: WINDSHIELD WIPER LOW RELAY
R2: WINDSHIELD WIPER HIGH RELAY
R3: WINDSHIELD WASHER RELAY
R4: REAR WASHER RELAY

T2: TRANSISTOR B
T3: TRANSISTOR C
T4: TRANSISTOR D

LO/HI Detection Function

- The LO/HI detection function is used in the fail-safe function during a system malfunction.
  - The front body control module (FBCM) detects that the windshield wiper switch is in the LO or HI position and monitors it.

WINDSHIELD WIPER AND WASHER SWITCH

2014 - Mazda3 - Body and Accessories

WINDSHIELD WIPER MOTOR

Purpose

- The windshield wiper motor transmits rotation force to the windshield wiper link to operate the windshield wiper arms and blades.

Function

- The windshield wiper motor operates using the current from the front body control module (FBCM) which is input according to the windshield wiper and washer switch operation, and generates rotation force for the low/high 2 system.

Construction

- The windshield wiper motor is integrated with the windshield wiper link.

Operation

1. The windshield wiper motor rotates the motor based on the current from the front body control module (FBCM).

2. When the motor rotates, rotation force is transmitted to the windshield wiper link and converted to the reciprocating movement of the windshield wiper link.

3. When the reciprocating movement of the windshield wiper link is converted, the windshield wiper arm and blade operates.

4. When the windshield wiper arms and blades are operated to the park position, the auto stop switch turns on and the windshield wiper arms and blades stop at the park position.

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

WINDSHIELD WASHER NOZZLE

Purpose

- The windshield washer nozzle sprays the washer fluid sent from the washer motor to the optimum positions on the windshield.

Construction

- A ball-shaped spray orifice is set inside the windshield washer nozzle which can be adjusted up, down, left or right.
- The windshield washer nozzle is moved up, down, left and right using the adjustment holes.

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

REAR WIPER/WASHER SYSTEM

Outline

- Equipped with continuous, auto-stop, intermittent wiper, and synchronized washer and wiper operation.
- The front body control module (FBCM) and rear body control module (RBCM) perform rear wiper and washer system fail-safe. (See **FRONT BODY CONTROL MODULE (FBCM)**.) (See **REAR BODY CONTROL MODULE (RBCM)**.)

Structural View

System Wiring Diagram

Operation

Continuous operation

1. When with the ignition switched ON (engine off or on), the rear body control module (RBCM) turns FET A on.

2. When the rear wiper and washer switch is turned to the ON position, the start stop unit detects a rear wiper switch ON signal.

3. When the start stop unit detects a rear wiper switch ON signal, it send a rear wiper switch position signal (ON) to the front body control module (FBCM) as a CAN signal.

4. When the front body control module (FBCM) receives the rear wiper switch position signal (ON), it sends a rear wiper operation request signal to the rear body control module (RBCM) via the instrument cluster as a CAN signal.

5. When the rear body control module (RBCM) receives the rear wiper operation request signal, it supplies the gate current from the internal CPU to FET B, and turns FET B on.

6. When FET B is turned on, and current flows from the battery to the rear wiper motor and the rear wiper operates continuously.

Auto-stop operation

1. The auto-stop switch inside the rear wiper motor operates as follows according to the operation position of the rear wipers.
   - Rear wiper stopped in park position: Off
   - Rear wiper stopped in position other than park: On

2. When the rear wiper and washer switch is in the OFF position during rear wiper operation, the rear wiper operation request signal sent to the rear body control module (RBCM) via the instrument cluster from the front body control module (FBCM) turns off.

3. When the rear wiper operation request signal turns off, the rear body control module (RBCM) turns the FET B off.

4. The rear wiper operates continuously because the auto-stop switch is on.

5. The auto-stop switch in the rear wiper motor turns off if the rear wiper stops at the correct position, and the rear wiper stops based on this.

Intermittent wiper operation

1. When the ignition is switched ON (engine on or off), the rear body control module (RBCM) turns FET A on.

2. When the rear wiper and washer switch is moved to the INT position, the start stop unit detects a rear wiper switch signal (INT).

3. When the start stop unit detects a rear wiper switch signal (INT), it send a rear wiper switch position signal (INT) to the front body control module (FBCM) as a CAN signal.

4. When the front body control module (FBCM) receives the rear wiper switch position signal (INT), it sends a rear wiper operation request signal to the rear body control module (RBCM) via the instrument cluster as a CAN signal.

5. When the rear body control module (RBCM) receives the rear wiper operation request signal, it supplies the gate current from the internal CPU to FET B, and turns FET B on.

6. When FET B is turned on, and current flows from the battery to the rear wiper motor and the rear wiper operates continuously.

7. The front body control module (FBCM) sends a rear wiper operation request signal to the rear body control module (RBCM) via the instrument cluster at regular intervals. Due to this, the rear wiper operates intermittently.

Synchronized washer and wiper operation

1. When the rear wiper and washer switch is turned to the rear washer 2 position with the ignition switched ON (engine off or on), the start stop unit detects a rear washer switch ON signal.

2. When the start stop unit detects a rear washer switch ON signal, it send a rear washer switch position signal (ON) to the front body control module (FBCM) as a CAN signal.

3. When the front body control module (FBCM) receives the rear washer switch position signal (ON), it supplies the base current from the internal CPU to transistor D, and collector current flows from the internal power supply, and turns transistor D on.

4. When the transistor D is turned on, collector current flows from the internal power supply, turning the rear washer relay on.

5. When the rear washer relay is turned on, current flows to the washer motor and the washer motor operates, and washer fluid is sprayed from the rear washer nozzle.

6. When the front body control module (FBCM) receives the rear washer switch position signal (ON) for a certain period of time, it sends a rear wiper operation request signal to the rear body control module (RBCM) via the instrument cluster as a CAN signal.

7. When the rear body control module (RBCM) receives the rear wiper operation request signal, it operates the rear wiper.

8. When the rear washer switch is turned off, the rear wiper stops after it operates for **approx. 2.6 s**.

2014 - Mazda3 - Body and Accessories

REAR WIPER MOTOR

Purpose

- The rear wiper motor operates the rear wiper arm and blade using the motor rotation.

Function

- The rear wiper motor generates rotation force using the current from the rear body control module (RBCM) which is input according to the rear wiper and washer switch operation.

Construction

Operation

1. The rear wiper motor rotates the motor based on the current from the rear body control module (RBCM).
2. When the motor rotates, rotation force is transmitted to the rear wiper arm and blade to operate it.
3. When the rear wiper arm and blade is operated to the park position, the auto stop switch turns on and the rear wiper arm and blade stops at the park position.

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

REAR WASHER NOZZLE

Purpose

- The rear washer nozzle sprays the washer fluid sent from the washer motor to the optimum positions on the rear window glass.

Construction

- The rear washer nozzle which can be adjusted up, down, left or right.
- The rear washer nozzle is moved up, down, left and right using the injection nozzles.

REAR WASHER NOZZLE

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

WASHER MOTOR

Purpose, Function

- Supplies washer fluid in the washer tank to the washer nozzles.

Construction

- The washer motor is installed to the washer tank.

Operation

Windshield washer

1. When the windshield washer switch is on, the windshield washer relay turns on and current flows to the washer motor.

2. When current flows from the windshield washer relay to the washer motor, the washer motor operates to supply washer fluid to the windshield washer nozzles.

Rear washer (5HB)

1. When the rear washer switch is on, the rear washer relay turns on and current flows to the washer motor.

2. When current flows from the rear washer relay to the washer motor, the washer motor operates to supply washer fluid to the rear washer nozzle.

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

AUTO WIPER SYSTEM

Outline

- The auto wiper system performs windshield wiper operation and stopping according to the rainfall amount on the windshield glass.
- Equipped with intermittent, and continuous low and high operation.
- The front body control module (FBCM) performs auto wiper system fail-safe. (See **FRONT BODY CONTROL MODULE (FBCM)**.)

Function

- The front body control module (FBCM) control the windshield wipers based on the windshield wiper operation signal from the rain sensor.
  - Intermittent operation control
    - When the rain sensor detects an amount of rainfall, the windshield wipers are operated once at low speed.
    - The intermittent operation of the windshield wipers is switched at 5 levels according to the amount of rainfall detected by the rain sensor.
  - Continuous low speed operation control
    - When the rain sensor detects an amount of rainfall greater than the amount required for intermittent operation control, the windshield wipers are operated continuously at low speed.
  - High speed operation control
    - When the vehicle speed is **4 km/h {2 mph} or more** and the rain sensor detects an amount of rainfall greater than the amount required for continuous low speed operation control, the windshield wipers are operated twice at high speed.
    - Afterwards, if the rain sensor detects the necessary amount of rainfall for high speed operation, the windshield wipers are operated continuously at high speed.
    - When the vehicle speed is **4 km/h {2 mph} or less** and the rain sensor detects an amount of rainfall greater than the amount required for continuous low speed operation, the windshield wipers are operated continuously at low speed.
  - Sensitivity adjustment function
    - The sensitivity adjustment function can adjust the rain sensor rain detection sensitivity by operation of the wiper and washer switch sensitivity adjustment volume.
    - When the windshield wipers are stopped during an interval and the sensitivity adjustment volume is operated in the direction of high sensitivity, the windshield wipers operate one time to notify the driver that the rain detection sensitivity has been changed.

Customize function

- The auto wiper system customize function uses the rear body control module (RBCM) control to enable or disable the auto wiper functions.
- If the auto wiper system is set to disabled, intermittent operation is performed.
- Refer to **WIPER/WASHER SYSTEM PERSONALIZATION** for the detailed customize function.

On-board diagnostic function

- If a malfunction occurs in the auto wiper control-related switch, sensor, and circuit, the front body control module (FBCM) detects DTCs.

- For details on DTCs, refer to the ON-BOARD DIAGNOSTIC [FRONT BODY CONTROL MODULE (FBCM)], DTC table in the Workshop Manual.

Structural View

System Wiring Diagram

Operation

WARNING:

- If servicing such as vehicle washing is performed with the ignition switched ON (engine off or on) and the wiper and washer switch in the AUTO position, the windshield wipers may operate automatically and your finger or hand is pinched, leading to an injury or wiper system malfunction. Always switch the ignition off or turn the wiper and washer switch to the OFF position before servicing.

Intermittent operation/continuous low speed operation

1. When the windshield wiper switch is moved to the AUTO position with the ignition switched ON (engine off or on), the start stop unit detects a windshield wiper switch signal (AUTO).

2. When the start stop unit detects a windshield wiper switch signal (AUTO), it sends a windshield wiper switch position signal (AUTO) and an AUTO volume signal to the front body control module (FBCM) as CAN signals.

3. When the front body control module (FBCM) receives the windshield wiper switch position signal (AUTO), it sends the windshield wiper switch position signal (AUTO) and the AUTO volume signal to the rain sensor as LIN signals. At the same time, it sends a vehicle speed signal from the PCM to the rain sensor as a LIN signal.

4. When the rain sensor receives the windshield wiper switch position signal (AUTO), it detects amount of rainfall and illumination

level.

5. The rain sensor determines the operation interval of the windshield wipers based on the detected rainfall amount, illumination level and the signal from the front body control module (FBCM), and sends a windshield wiper low speed operation signal to the front body control module (FBCM).

6. When the front body control module (FBCM) receives the windshield wiper low speed operation signal, it supplies the base current from the internal CPU to transistor A, and collector current flows from the internal power supply, and turns transistor A on.

7. When the transistor A is turned on, collector current flows from the internal power supply, turning the windshield wiper low relay on.

8. When the windshield wiper low relay is turned on, current flows from the battery to the windshield wiper motor and the windshield wipers operate intermittently or continuously at low speed.

WINDSHIELD WIPER AND WASHER SWITCH

R1: WINDSHIELD WIPER LOW RELAY

R2: WINDSHIELD WIPER HIGH RELAY

T1: TRANSISTOR A

T2: TRANSISTOR B

High speed operation

1. When the windshield wiper switch is moved to the AUTO position with the ignition switched ON (engine off or on), the start stop unit detects a windshield wiper switch signal (AUTO).

2. When the start stop unit detects a windshield wiper switch signal (AUTO), it sends a windshield wiper switch position signal (AUTO) and an AUTO volume signal to the front body control module (FBCM) as CAN signals.

3. When the front body control module (FBCM) receives the windshield wiper switch position signal (AUTO), it sends the windshield wiper switch position signal (AUTO) and the AUTO volume signal to the rain sensor as LIN signals. At the same time, it sends a vehicle speed signal from the PCM to the rain sensor as a LIN signal.

4. When the rain sensor receives the windshield wiper switch position signal (AUTO), it detects amount of rainfall and illumination level.

5. Based on the detected rainfall amount, illumination level and the signal from the front body control module (FBCM), the rain sensor sends a windshield wiper high speed operation signal to the front body control module (FBCM).

6. When the front body control module (FBCM) receives the windshield wiper high speed operation signal, it supplies the base current from the internal CPU to transistors A and B, and collector current flows from the internal power supply, and turns transistor A and B on.

7. When the transistor A and B are turned on, collector current flows from the internal power supply, turning the windshield wiper low relay and windshield wiper high relay on.

8. When the windshield wiper low relay and windshield wiper high relay are turned on, current flows from the battery to the windshield wiper motor and the windshield wipers operate at high speed.

R2: WINDSHIELD WIPER HIGH RELAY

T1: TRANSISTOR A

T2: TRANSISTOR B

2014 - Mazda3 - Body and Accessories

RAIN SENSOR

Outline

- The rain sensor detects the amount of rainfall on the windshield and calculates the windshield wiper operation speed based on the detected amount of rainfall.
- The rain sensor outputs the calculated windshield wiper operation signal to the front body control module (FBCM).
- The front body control module (FBCM) performs rain sensor fail-safe. (See **FRONT BODY CONTROL MODULE (FBCM)**.)

Function

Rainfall amount detection function

CAUTION:

- If the windshield is under any of the following conditions, the rain sensor cannot detect the amount of rainfall correctly and the windshield wipers operate incorrectly.
    - Stickers or labels are adhered to the rain sensor detection area in the upper part of the windshield.
    - The rain sensor detection area in the upper part of the windshield is dirty.
- The rain sensor detects the amount of rainfall by the rate of reflected infrared light emitted from the built-in LED.
- The windshield wiper operation signal is calculated based on the detected amount of rainfall.

Initial setting function

- When the ignition is switched ON (engine off or on), the rain sensor detects and records the transparency of the windshield surface, which varies depending on wear and accumulation of dust.
- As a result, the rain sensor determines the optimal speed (LO/HI) for the windshield wipers and sends the windshield wiper operation signal to the front body control module (FBCM).
- The initial setting is performed every time the ignition is switched ON (engine off or on).

Sensitivity adjustment function

- While the auto wiper is operating, sensitivity of the rain sensor can be optionally adjusted by operating the sensitivity adjustment volume on the wiper and washer switch which changes the volume signal input to the front body control module (FBCM).
- Sensitivity of the rain sensor can be adjusted between 1 (low sensitivity) and 5 (high sensitivity) by operating the sensitivity adjustment volume according to the conditions such as rain intensity.
- While the auto wiper is operating, the sensitivity of the rain sensor is adjusted automatically according to the vehicle speed signal sent from the PCM via the front body control module (FBCM).
- While the auto wiper is operating, the rain sensor (auto light sensor) detects the illumination level above and in front of the vehicle.
- When the rain sensor detects an illumination level higher than a level required for turning on the TNS, the sensitivity of the rain sensor increases.

On-board diagnostic function

- The rain sensor performs on-board diagnostics when the ignition is switched ON (engine off or on).
- If a malfunction is detected in the rain sensor, an error signal is sent to the front body control module (FBCM).
- The front body control module (FBCM) outputs DTCs based on error signals from the rain sensor.
- For details on DTCs, refer to the ON-BOARD DIAGNOSTIC [FRONT BODY CONTROL MODULE (FBCM)], DTC table in the Workshop Manual.

Construction

- The rain sensor is installed to the bracket in the upper center part of the windshield.

- The rain sensor is integrated with the auto light sensor.
- The rain sensor consists of the lens, LED, photodiode, and microcomputer.
- The rain sensor sends/receives signals between the front body control module (FBCM) using LIN communication.

Operation

Operation with no rainfall contacting windshield

1. Infrared light is emitted from the LED in the rain sensor towards the windshield.
2. The emitted infrared light reflects off the windshield.
3. The infrared light reflected off the windshield is received by the photodiode in the rain sensor.
4. When the photodiode receives the light, the microcomputer in the rain sensor calculates the rainfall amount from the reflection rate, and sends a windshield wiper control signal to the front body control module (FBCM).

Operation with rainfall contacting windshield

1. Infrared light is emitted from the LED in the rain sensor towards the windshield.

2. Emitted infrared light goes through the windshield and penetrates the rain drops on the windshield.

3. The infrared light which cannot penetrate is reflected off the windshield and is received by the photodiode in the rain sensor.

4. When the photodiode receives the light, the microcomputer in the rain sensor calculates the rainfall amount from the reflection rate, converts this to an electrical signal and sends a windshield wiper control signal to the front body control module (FBCM).

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

WASHER FLUID LEVEL WARNING SYSTEM

Outline

- The washer fluid level warning system notifies the user of a low washer fluid level in the washer tank.

Function

- The front body control module (FBCM) controls the washer fluid level warning system based on the signals from the washer fluid-level sensor.
- When the washer fluid level in the washer tank becomes low, the front body control module (FBCM) turns the low washer fluid level warning light on in the instrument cluster.
- For vehicles with center display, a warning message in the center display is displayed when the low washer fluid level warning light is turned on. For the message content and verification method, refer to the CENTER DISPLAY. (See **CENTER DISPLAY [WITH CENTER DISPLAY]**.)

Structural View

System Wiring Diagram

Operation

1. When the washer fluid level in the washer tank becomes low, the front body control module (FBCM) detects a washer fluid-level sensor on signal.

2. When the front body control module (FBCM) receives the washer fluid-level sensor on signal, it sends a low washer fluid level warning light on request signal to the instrument cluster as a CAN signal.

3. When the instrument cluster receives the low washer fluid level warning light on request signal, it turns the low washer fluid level warning light on.

2014 - Mazda3 - Body and Accessories

WASHER FLUID-LEVEL SENSOR

Purpose

- The washer fluid-level sensor illuminates the low washer fluid level warning light when the washer fluid level is lowered.

Function

- The washer fluid-level sensor detects the decrease in the washer fluid level.

Construction

- The washer fluid-level sensor consists of the following parts:
    - Connector (switch)
    - Float
    - Grommet
    - Case
- The float has an integrated magnet which creates a magnetic field.

Operation

When washer fluid is added

1. Washer fluid enters the case of the washer fluid-level sensor, the float rises, and the connector switch turns off.

When washer fluid is decreased

1. When washer fluid inside the case of the washer fluid-level sensor decreases, the float comes close to the connector switch.

2. When the float approaches the switch, the magnetic field inside the float acts on the switch and the switch turns on.

3. When the switch is turned on, the front body control module (FBCM) detects that a washer fluid-level sensor on signal and sends a low washer fluid level warning light on request signal to the instrument cluster as a CAN signal.

4. When the instrument cluster receives a low washer fluid level warning light on request signal, it illuminates the low washer fluid level warning light.

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

ENTERTAINMENT SYSTEM [WITHOUT CENTER DISPLAY]

Outline

- The entertainment system enables listening of radio, CD and music information over the unit equipped on the vehicle.

Function

AM/FM radio

- AM and FM radio broadcast can be listened to.

AUX/USB audio

- By connecting an on-market portable audio/USB device/iPod to the auxiliary jack/USB port, audio from the external device can be listened to.

CD playback (with CD player)

- CDs and CD-R (MP3/WMA (Windows Media Audio)/ACC (Advanced Audio Coding)) can be listened to.

Bluetooth® audio (with Bluetooth® unit)

- By pairing a Bluetooth® enabled device with the audio unit, audio from the Bluetooth® device can be listened to.

Hands-free telephone (HF/TEL) function (with Bluetooth® unit)

- Answering and receiving telephone calls can be performed without having to directly connect a Bluetooth® enabled mobile device such as a mobile phone or Smartphone.

Bluetooth® pairing (with Bluetooth® unit)

- Pairing of a Bluetooth® enabled device can be performed.

NOTE:

- For the Bluetooth® pairing set up method, refer to the workshop manual.

Voice recognition function (with Bluetooth® unit)

- The Bluetooth® unit is preset with voice commands. If the voice spoken into the microphone for the voice recognition matches the voice command, the Bluetooth® unit performs the task set to the voice command.

ANTENNA FEEDER NO.2
CENTER ROOF ANTENNA

System diagram

ENTERTAINMENT SYSTEM [WITHOUT CENTER DISPLAY]

Operation

AM radio/FM radio

- If the radio mode is selected when the ignition is switched to ACC or ON (engine off), the audio unit supplies power to the antenna amplifier (4SD)/amplifier (5HB) in the center roof antenna.
- The audio unit detects the radio broadcast selected by the user using the radio tuner in the audio unit based on the electrical signal sent from the antenna amplifier (4SD)/center roof antenna (5HB). The audio signal from the detected radio broadcast is sent to the speakers, and the image signal of the detected radio broadcast is sent to the display of the audio unit.
- The speakers output the audio based on the audio signal sent from the audio unit. The display of the audio unit displays the radio information based on the image signal.

AUX/USB audio (AUX)

- When the plug of a portable audio unit is connected to the auxiliary jack/USB port, the auxiliary jack/USB port sends an analog signal (audio signal) from the portable audio device to the audio unit.
- The audio unit sends the audio signal received from the auxiliary jack/USB port to the speakers.
- The speakers output the audio based on the received audio signal.

AUX/USB audio (USB)

- When the USB media such as a USB device/iPod is connected to the USB port of the auxiliary jack/USB port, the auxiliary jack/USB port sends the digital data (audio signal/text data signal) of the USB media to the audio unit.
- The audio unit sends the audio signal received from the auxiliary jack/USB port to the speakers.
- The speakers output the audio based on the received audio signal.

CD playback (with CD player)

- With a CD inserted in the CD player and the CD mode selected, the audio unit sends a control signal to the CD player.
- The CD player emits laser light to the inserted CD when the control signal is received. The reflected light is detected by the light sensor and the data recorded in the CD is converted from a digital signal to an electric signal.
- The CD player converts the electric signal to an audio signal and video signal using the electrical circuit in the CD player. The converted audio and video signals are sent to the audio unit.

- The audio unit sends the audio signal received from the CD player to the speakers. In addition, the CD information based on the text data signal is displayed in the display.
- The speakers output the audio based on the received audio signal.

Bluetooth® audio (with Bluetooth® unit)

- The Bluetooth® unit sends the digital data received from the Bluetooth® enabled device to the audio unit.
- The audio unit sends the audio signal of the digital data to the speakers, and the text data signal signal to the display of the audio unit.
- The speakers output the audio based on the received audio signal, and the audio unit display displays the Bluetooth® audio information based on the video signal.
- When the audio panel is operated, the audio unit sends the operation information to the Bluetooth® unit.
- The Bluetooth® unit sends an operation signal to a Bluetooth® enabled device such as a Smartphone.

Hands-free telephone (HF/TEL) function (incoming call)

- When an incoming call is received, a mobile device such as a Smartphone/Bluetooth® enabled mobile phone sends the incoming call signal to the Bluetooth® unit.
- The Bluetooth® unit sends the incoming call signal to the audio unit when it receives the incoming call signal.
- The audio unit switches the tuner inside the unit to HF/TEL mode when it receives the incoming call signal. In addition, the incoming call number is displayed in the display of the audio unit.

- If the TALK button on the steering switch is pressed while the incoming call number is displayed, the Bluetooth® unit detects the steering switch operation.
- The Bluetooth® unit sends a call answer signal to a mobile device such as a Smartphone/Bluetooth® enabled mobile phone when the steering switch operation is detected, and the call is initiated.
- The mobile device, such as a Smartphone/Bluetooth® enabled mobile phone, sends a receive audio signal to the Bluetooth® unit, which is output from the speakers via the audio unit.
- The voice recognition-use microphone sends the send audio signal to the Bluetooth® unit.
- The Bluetooth® unit sends the signal to a mobile device such as a Smartphone/Bluetooth® enabled mobile telephone.

Hands-free telephone (HF/TEL) function (outgoing call)

- When the TALK button on the steering switch is pressed, the Bluetooth® unit detects the steering switch operation.
- When the steering switch operation is detected, the Bluetooth® unit sends a steering switch operation signal to the audio unit.
- When the steering switch operation signal is received, the audio unit sends a guidance audio signal to the speakers, and the speakers output the guidance audio.
- The voice recognition microphone converts the words (voice commands) produced by the user after the guidance audio output to an audio signal and sends it to the Bluetooth® unit.
- The Bluetooth® unit sends the voice signal to a mobile device such as a Smartphone or Bluetooth® enabled mobile phone when the audio signal from the voice recognition microphone is received, and the call is initiated.
- The mobile device, such as a Smartphone or Bluetooth® enabled mobile phone, sends the received audio signal to the Bluetooth® unit, and the signal is output from the speakers via the audio unit.
- The voice recognition microphone sends the send audio signal of the user to the Bluetooth® unit, and the Bluetooth® unit

sends the received send audio signal to a mobile device such as Smartphone or Bluetooth® enabled mobile phone.

Bluetooth® pairing

- When the audio unit panel button is operated and [PAIR DEVICE] is selected, "PIN 0000" is displayed after "ENTER PIN" is displayed for approx. 3 s in the display of the audio unit.
- If the audio unit panel button is operated while "PIN 0000" is displayed and a pair code (optional 4-digit number) is input, the audio unit sends a control signal to the Bluetooth® unit. Additionally, "PAIRING" flashes in the display of the audio unit.
- The Bluetooth® unit sends a search signal to a Bluetooth® enabled device near the Bluetooth® unit.
- If a Bluetooth®-enabled device receives a search signal, the Bluetooth® unit is displayed on the Bluetooth® setting screen.
- If a Bluetooth®-enabled device is operated, the Bluetooth® unit is selected, and a pairing code is input, the Bluetooth®-enabled device sends the input pairing code to the Bluetooth® unit.
- When the Bluetooth® unit receives the pairing code, it stores the Bluetooth® enabled device information and sends a notification control signal indicating pairing completion with the audio unit.
- When the audio unit receives the control signal, it displays "Musical note symbol" and "PAIR SUCCESS" in the display for approx. 3 s, and the pairing is completed.

NOTE:

- If 7 Bluetooth® devices (maximum) have been programmed, "MEMORY FULL" is indicated in the audio unit display, and Bluetooth® pairing is canceled.
- If the pairing programming fails, "Err" flashes in the audio unit display for approx. 3 s and the screen returns to the [PAIR DEVICE] screen.

AUDIO UNIT [WITHOUT CENTER DISPLAY]

NOTE:

- “iPod” is a registered trademark of Apple Inc.

Purpose

- The audio unit controls the entertainment system-related parts.

Function

Display Function

- Displays audio information such as radio and CD related information in the audio unit display.

ALC (auto level control) function

- Compensates for the passengers' sense of a lack of audio volume which occurs as a result of external noise while driving.

Audio sound adjustment function

- Operates the MENU button and the POWER/VOLUME button on the audio panel to change the sound quality as follows:

Indication	Setting value	
	Turn Left	Turn Right
ALC (Automatic volume adjustment)	Level decrease	Level increase
BASS (Low pitch sound)	Decrease bass	Increase bass
TREB (Treble sound)	Decrease treble	Increase treble
FADE (Front/back volume balance)	Shift the sound to the front	Shift the sound to the rear
BAL (Left/right volume balance)	Shift the sound to the left	Shift the sound to the right
BEEP (Audio operation sound)	Off	On
BT SETUP*1	Select mode	
12Hr< >24Hr	12Hr (Flashing)	24Hr (Flashing)

*1

With Bluetooth® unit

On-board diagnostic function

- The audio unit has an on-board diagnostic function to facilitate system diagnosis. In case a malfunction occurs, DTCs are recorded. For details, refer to the DIAGNOSTIC SYSTEM. (See **ON-BOARD DIAGNOSTIC [ENTERTAINMENT SYSTEM (WITHOUT CENTER DISPLAY)]**.)

Diagnostic Assist Function

- A diagnostic assist function is equipped which can verify the following. For details, refer to the DIAGNOSTIC SYSTEM. (See **ON-BOARD DIAGNOSTIC [ENTERTAINMENT SYSTEM (WITHOUT CENTER DISPLAY)]**.)
    - Related-part connection condition
    - Related-part operation condition

15	FOLDER button (up)	Selects folder to be played.

Operation

ALC (auto level control) operation

- The audio unit automatically changes the volume and audio quality based on the vehicle speed signal sent from the instrument cluster.

HIGHER VEHICLE SPEED

LOWER VEHICLE SPEED

- The ALC function is divided into 7 levels. When the level is in the high range, the volume correction range and correction amount is large. The maximum correction amount is 14dB. The ALC function can be stopped by selecting ALC OFF.

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

CD PLAYER [WITHOUT CENTER DISPLAY]

Purpose, Function

- The CD player sends the audio signal and text data of the inserted CD to the audio unit.

Specification

Type	Playback function file
Music/MP3/WMA/AAC CD player	• Music data (CD-DA) • MP3/WMA (Windows Media Audio)/AAC (Advanced Audio Coding) file

Construction

- A CD player is installed to the front console.

2014 - Mazda3 - Body and Accessories

SPEAKER [WITHOUT Bose®, WITHOUT CENTER DISPLAY]

Purpose

- Converts the audio signal from the audio unit to sound.

Function

- Full-range speakers, which can output wide-range sound from low to high frequency, have been adopted.

Specification

Item		Front door speaker	Rear speaker
Max. input	(W)	25	25
Rated impedance	(ohm)	3.4 — 4.6	3.4 — 4.6
Size	(cm {in})	16.5 {6.5}	16.5 {6.5}

Construction

- A cone-shaped dynamic speaker has been adopted for each speaker.
- A weight reduction was achieved by using pulp for the cone material and adopting a ferrite magnet.

Operation

- The speaker sends the audio signal (current) from the audio unit to the voice coil.
- When the audio signal (current) is sent to the voice coil, the coil becomes magnetized and a magnetic field occurs. Because the voice coil and the magnet pull and repel each other in the magnetic field, the voice coil vibrates.
- Because the voice coil is wrapped around the voice coil bobbin, the voice coil bobbin vibrates when the voice coil vibrates.
- When the voice coil bobbin vibrates, the cone (diaphragm) installed to the voice coil bobbin vibrates and generates sound.

SPEAKER [WITHOUT Bose®, WITHOUT CENTER DISPLAY]

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

CENTER ROOF ANTENNA [WITHOUT CENTER DISPLAY]

Purpose, Function

- Converts radio broadcast waves to electric signals and sends the signals to the audio unit.

Construction

- The center roof antenna consists of an antenna rod which converts the received radio waves to electric signals, and an antenna base with a built-in antenna amplifier which amplifies the electric signals.
- To prevent the roof antenna from contacting obstructions above the vehicle, the antenna rod is manually foldable to 127 ° It is also removable.

Operation

- When the ignition is switched to ACC or ON (engine off or on), power is supplied from the audio unit to the antenna amplifier inside the center roof antenna.
- The center roof antenna converts the received radio waves of a radio broadcast to an electric signal.
- The center roof antenna amplifies the converted electric signal using the antenna amplifier and sends the signal to the audio unit.

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

GLASS ANTENNA [WITHOUT CENTER DISPLAY]

Purpose, Function

- Converts radio broadcast waves to electric signals and sends the signals to the antenna amplifier.

Construction

- An antenna with excellent noise resistance has been adopted to the rear window glass.

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

ANTENNA AMPLIFIER [WITHOUT CENTER DISPLAY]

Purpose, Function

- Amplifies the electric signal from the glass antenna and sends it to the audio unit.

Construction

- The antenna amplifier is positioned in the rear header.

Fail-safe

- Function not equipped.

ANTENNA AMPLIFIER [WITHOUT CENTER DISPLAY]

2014 - Mazda3 - Body and Accessories

STEERING SWITCH [WITHOUT CENTER DISPLAY]

Purpose, Function

- Operation of the audio system and change of the instrument cluster display are possible without a change in driving posture.

Construction

- The steering switch is located on the spoke of the steering wheel.
- The resistance is built into each switch.

Without Bluetooth® system

- The steering switch consists of a volume adjustment (+) or (-) switch, cue/automatic band selector (up) or (down) switch, INFO button, up switch, down switch, and mute button.

With Bluetooth® system

- The steering switch consists of a volume adjustment (+) or (-) switch, cue/automatic band selector (up) or (down) switch, INFO button, up switch, down switch, TALK button, PICK-UP button, and HANG-UP button.

Operation

Switch name	Operation
Volume adjustment switch	Audio volume can be adjusted.
Cue/Automatic band selector switch	Cue of CD tracks and selection of radio band are possible.
Mute button (Without Bluetooth® system)	Audio volume can be muted. Pressing again after muting returns to previous volume level.
INFO button	Instrument cluster display can be changed. Refer to trip computer information system for display content. (See **TRIP COMPUTER INFORMATION SYSTEM**.)
Up/down switch	Instrument cluster display can be changed. trip computer information system for display content. (See **TRIP COMPUTER INFORMATION SYSTEM**.)
TALK button (With Bluetooth® unit)	Launches the voice recognition function.
Pick-up button (With Bluetooth® unit)	Receives a phone call.

Hang-up button (With Bluetooth® unit)	Hangs up a phone call.

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

AUXILIARY JACK/USB PORT [WITHOUT CENTER DISPLAY]

NOTE:

- “iPod” is a registered trademark of Apple Inc.

Purpose, Function

- The auxiliary jack/USB port outputs the audio signal from an on-market, portable audio or USB device, connected to the auxiliary jack/USB port, to the audio unit.

Specification

Type	Playable data
USB mode	MP3/WMA/AAC file

Construction

Without CD player

- The auxiliary jack/USB port is installed to the front console.

With CD player

- The auxiliary jack/USB port is installed inside the rear console.

Operation

Auxiliary jack

1. When the plug of a portable audio unit is connected to the auxiliary jack/USB port, the auxiliary jack/USB port sends the audio signal from the portable audio device to the audio unit.

2. The audio unit sends the audio signal received from the auxiliary jack/USB port to the speakers.

3. The speakers output the audio based on the received audio signal.

USB port

1. When the USB device/iPod is connected to the USB port of the auxiliary jack/USB port, the auxiliary jack/USB port sends the audio signal of the USB device/iPod to the audio unit.

2. The audio unit sends the audio signal received from the auxiliary jack/USB port to the speakers.

3. The speakers output the audio based on the received audio signal.

Fail-safe

USB port

- If a short circuit is detected between the USB power supply and ground, the auxiliary jack/USB port cuts the power supply to the USB media.

2014 - Mazda3 - Body and Accessories

Bluetooth® UNIT [WITHOUT CENTER DISPLAY]

Purpose, Function

- The Bluetooth® unit performs wireless transmission with a paired, Bluetooth® enabled mobile phone/portable audio device.

Specification

Item		Function
Profile	A2DP (Advanced audio distribution profile)	A2DP is a profile for transmitting high quality audio data by means of a Bluetooth® device and wireless transmission technology.
	AVRCP 1.0/1.3 (Audio/video remote control profile)	AVRCP is a profile which provides a standard interface which controls television and audio devices. The function differs depending on the version.
	HFP 1.5 (Hands-free profile)	HFP is a profile for making and receiving telephone calls by means of a Bluetooth® device and wireless transmission technology.
	DUN 1.1 (Dial-up Networking Profile)	DUN is a profile for accessing a dial-up service such as the Internet or other service via a Bluetooth® radio wave connection.
	PBAP 1.0 (Phone book access profile)	PBAP is a profile for transmitting telephone book data.
Maximum number of programmable devices		7
Number of programmed devices which can be used simultaneously		1

Construction

- The Bluetooth® unit is installed inside the glove compartment.

Operation

- For the Bluetooth® unit operation, refer to ENTERTAINMENT SYSTEM. (See **ENTERTAINMENT SYSTEM [WITHOUT CENTER DISPLAY]**.)

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

MICROPHONE [WITHOUT CENTER DISPLAY]

Purpose, Function

- Converts the voice commands spoken into the microphone by the user to an electrical signal and sends the signal to the Bluetooth® unit.

Construction

- Noise due to the vehicle being driving or air blown by the air conditioner has been reduced by locating the microphone next to the map light.

Operation

- For the voice recognition microphone operation, refer to the ENTERTAINMENT SYSTEM. (See **ENTERTAINMENT SYSTEM [WITHOUT CENTER DISPLAY]**.)

Fail-safe

- Function not equipped.

MICROPHONE [WITHOUT CENTER DISPLAY]

2014 - Mazda3 - Body and Accessories

ON-BOARD DIAGNOSTIC [ENTERTAINMENT SYSTEM (WITHOUT CENTER DISPLAY)]

NOTE:

- “iPod” is a registered trademark of Apple Inc.

Outline

- The entertainment system has an on-board diagnostic function and diagnostic assist function to facilitate system diagnosis.

On-board Diagnostic Function

Malfunction detection function

- The on-board diagnostic function consists of the following functions:
    - A malfunction detection function, which detects overall malfunctions in the audio system-related parts.
    - A memory function, which stores detected DTCs.
    - A display function, which indicates system malfunctions via a DTC display.
- Detects a malfunction in the entertainment system.

Memory function

- If the audio unit detects a malfunction in the entertainment system, it stores the DTC in the audio unit.

Target	Maximum memory number
Audio unit	3
CD player	3
Bluetooth® unit	0*

*

Because the Bluetooth® unit only displays the currently detected DTC, the memory function is not available.

- If the audio unit has already stored the maximum number of DTCs and detects another malfunction, it clears the oldest DTC and stores the new DTC.
- DTCs stored in the audio unit are cleared if the negative battery cable is disconnected (if backup power is interrupted).

Display Function

- To display DTCs in the audio unit display that have been recorded in the memory function, activate the on-board diagnostic function by operating the audio unit. Refer to the Workshop Manual for the activation procedure of the on-board diagnostic function.

  The DTCs consist of the following:

  - Supplier code (supplier name)

  - Device code (malfunction location)
  - Error code (malfunction contents)

Supplier code	Supplier name
01	SANYO Automedia
02	Panasonic
03	CLARION
04	PIONEER
05	VISTEON
06	DESAY

Device code	Device name
09	Audio unit
16	CAN system
26	Bluetooth® unit

28	USB
29	iPod
30	MCP3CD player

Error code	Malfunction contents
01	Mechanical malfunction
07	Poor data read-outs
09	No playable File/Track
12	CAN line (communication line) error
20	Insufficient power supply
21	Amplifier related circuit
30	Temperature abnormality

DTC table

× **Applicable**

No Err	DTCs are not stored.	—	—	—

Diagnostic Assist Function

- The entertainment system related parts are forcibly operated to enable verification of the connection condition and operation status of the entertainment system related parts. In addition, the specifications for the entertainment system related parts are displayed in the audio unit display to enable their verification. Refer to the workshop manual for the diagnostic assist function activation procedure.

Diagnostic assist function table

Display	Function	Content

	LCD inspection	Displays all characters in the audio unit display.
—	Button inspection	Sounds buzzer when the audio unit button is operated.
—	Speaker inspection	• Outputs sound from the speakers in the following order: 1. Front door speaker (LH) and tweeter (LH) 2. Front door speaker (RH) and tweeter (RH) 3. Rear door speaker (RH) 4. Rear door speaker (LH)
	Radio reception condition inspection	Displays the radio reception status in the audio unit display.
 	Antenna control inspection	Displays the power supply output status to the antenna amplifier in the information display.
 	Dial inspection	Displays the rotation direction of the operated dial switch in the audio unit display.

88:88 N	Audio amplifier specification verification	Displays the audio amplifier specification in the audio unit display.
88:88 CD DEFECTIVE 88:88 CD-DRIVE DISPLAYS ALTERNATELY EVERY 2 S 88:88 MALFUNCTION	CD inspection	Displays the result of the CD inspection in the audio unit display. **NOTE:** • If the CD inspection cannot be performed normally, “TEST REJECTED” is displayed in the audio unit display.
—	Hands-free password clearing	Clears the Hands-free password.
88:88 CD UPDATING	Software reset	Resets the audio unit software. **NOTE:** • If the software is reset, the radio preset is reset simultaneously.
88:88 CD RESET	CD software reset	Resets the CD player software.
88:88 CD UPDATING	CD software update	Updates the CD player software.
88:88 BHN9-669G0-A	CD part number verification	Displays the CD player part number in the audio unit display.

2014 - Mazda3 - Body and Accessories

ENTERTAINMENT SYSTEM [WITH CENTER DISPLAY]

Outline

- In addition to the conventional audio and navigation functions, communication tools such as Internet radio and e-mail, SMS (Short Message Service), SNS (Social Networking Service), and Hands-free telephone (HF/TEL) functions can be operated as one function of the vehicle by connecting a mobile device such as a customer's Smartphone or tablet terminal.

Schematic Diagram

Reference List Table

Item	Content/function	Reference
Operation signal reception	The entertainment system receives operation signals sent from the center display, command switch, or the voice recognition function to operate each function.	**Operation** • (See .)
Audio function	Music media listening such as radio, CD, and iPod is available.	**Function** • (See) **Operation** • (See)
Communication function	E-mail, SMS (Short Message Service), SNS (Social Networking Service), and Hands-free telephone (HF/TEL) functions can be used.	**Function** • (See) **Operation** • (See)
Navigation function	Provides guidance and information to destination.	**Function** • (See) **Operation** • (See)
Setting function	Changes the vehicle settings such as the display and sound.	**Function** • (See) **Operation** • (See)
Application function	Average fuel consumption, maintenance information, and warning information can be verified.	**Function** • (See) **Operation** • (See)
Structural diagram	—	(See)
System diagram	—	(See)

Function

Audio function

AM/FM radio

- AM and FM radio broadcast can be listened to.

RBDS

- RBDS can be listened to. When RBDS begins, the audio switches automatically to traffic information.

HD radio™

- HD radio™ can be listened to.

NOTE:

- HD radio broadcasts deliver digital audio quality like a CD. Display of song information (genre type, song title, artist name, album title) during a broadcast is also available. HD radio™ broadcasts may also include several channels (multi-cast channels) in the same frequency. A maximum of 7 multi-cast channels can be received.

SiriusXM satellite radio

- Satellite radio broadcasts can be listened to.

Aha™ radio*1/Pandora®*2/Sticher™ radio*3

- By downloading an application to a mobile device such as a Smartphone and pairing with the connectivity master unit (CMU), Internet broadcasts (Aha™ radio/Pandora® /Stitcher™radio) can be listened to.

NOTE:

- Aha™ radio is an application which personalizes various Internet content such as Internet radio and podcasts, and allows easy access. Feeds of friends linked to Facebook and Twitter can be verified. Local restaurants and coffee shops can be searched using the Location Based Services, and by obtaining traffic information in real time, the user's travel is supported. The service content provided by Aha™ differs depending on the country in which the user resides. For detailed information regarding Aha™ radio, go to http://www.aharadio.com/.
- Pandora® is non-fee, personalized Internet radio. Pandora® is not simply an application for playing user requests, rather it is used to create a personalized station by matching the user's likes using key words such as artist and song name input by the user, and providing the music.
- Stitcher™ radio is an application which streams Internet radio and podcasts on demand. Desired content can be registered to the user's likes, and by giving a Thumbs-up or down, recommended content is automatically selected. For detailed information regarding Stitcher™ radio, go to http://stitcher.com/.

*1

Aha™, the Aha™ logo, and the Aha™ are trademarks or registered trademarks of Harman International Industries, Inc., used with permission.

*2

***Pandora®, the Pandora® logo, and the Pandora® are trademarks or registered trademarks of Pandora Media, Inc., used with permission.**

*3

Stitcher™, the Stitcher™ logo, and the Stitcher™ are trademarks or registered trademarks of Stitcher, Inc., used with permission.

AUX/USB audio

- By connecting an on-market portable audio/USB device/iPod to the auxiliary jack/USB port/SD card slot hub, audio from the external device can be listened to.

Bluetooth® audio

- By pairing a Bluetooth® enabled device with the CMU, audio from the Bluetooth® device can be listened to.

CD playback

- CDs and CD-R (MP3/WMA (Windows Media Audio)/ACC (Advanced Audio Coding)) can be listened to.

Gracenote

- The CMU supports Gracenote. Gracenote can perform updates by connecting a USB, in which update information has been saved, to the auxiliary jack/USB port/SD card slot hub.

NOTE:

- Music recognition technology and related data are provided by Gracenote®. Gracenote is the industry standard in music recognition technology and related content delivery. For more information visit www.gracenote.com.
- The Gracenote update information can be installed from the Mazda Handsfree website. Regarding information related to the most recent Gracenote database available and installation specifications, go to the Mazda Handsfree website (http://www.mazdahandsfree.com).

Centerpoint®2*4 (with Bose®)

- Centerpoint®2 is a virtual surround sound function for vehicles. The 5.1-channel surround signal converted using an independently optimized algorithm delivers three-dimensional, well-balanced surround acoustics from the 9 speakers equipped on the vehicle to passengers. Centerpoint®2 can be set to ON/OFF.

*4

Centerpoint®2 is a registered trademark of Bose Corporation.

Communication function

E-mail/SMS (Short Message Service)

- Additionally, read-out using voice recognition is possible.

Hands-free telephone (HF/TEL) function

- Answering and receiving telephone calls can be performed without having to directly connect a Bluetooth® enabled mobile device such as a mobile phone or Smartphone.

Mobile 911 (U.S.A./Canada)

- Mobile 911 is a function which automatically calls a PSAP (Public Safety Answering Point) in the event that the vehicle is involved in an accident using a mobile device such as a Bluetooth® enabled mobile phone or Smartphone to notify the PSAP of the vehicle position and to conduct a call.

NOTE:

- Depending on how the vehicle was affected by the collision, a malfunction in the communication system could occur, and depending on the condition of the related parts, Mobile 911 may not operate normally.

Navigation function

Displays maps and provides route guidance

- Calculates routes to the destination set by the user and provides guidance using maps and audio.

Turn-by-turn (TBT)

- Displays the direction of travel in the active driving display.

Setting function

Bluetooth® pairing

- Pairing of a Bluetooth® enabled device can be performed.

NOTE:

- For the Bluetooth® pairing set up method, refer to the workshop manual.

Clock setting

- The following items can be set using the clock setting.

Item	Content
Adjust Time	Displays the currently set time. When + is selected, the time/minutes move forward, and when - is selected, the time/minutes move back. AM/PM selection is only possible during 12-hour clock time display.
GPS Sync	When ON is selected, “Adjust Time“ and “Time Zone Select“ are disabled.
Time Format	Changes the display between 12 and 24-hour clock time.
Time Zone Select	Selects the time zone.

System setting

- The following items can be set using the system setting.

Item	Content
Language	The language can be changed.
Temp	Switches temperature unit between F°/C° *5.
Distance	The distance unit can be switched between miles/km*6.

Music Database Update	Initiates the music database update.
Factory Reset	Settings other than sound are reset to the factory settings.
Agreements and Disclaimers	Agreement and disclaimer items can be verified.

*5

When the temperature unit is changed using Temp, the displayed unit on the climate control unit (dial type) also changes simultaneously.

*6

When the distance unit is changed using Distance, the displayed unit in the instrument cluster also changes simultaneously.

Display setting

- The following items can be set using the display setting.

Item	Content
Display	The display can be switched ON/OFF. When CLOCK is displayed, the display turns off and the time is displayed.
Mode	Switches the display between daytime mode/nighttime mode. When AUTO is selected, the mode switches automatically between daytime/nighttime mode depending on the headlight illumination condition.
Brightness	Adjusts the display brightness.
Contrast	Adjusts the display contrast.
Reset	Resets the display to the factory settings.

Sound setting

- The following items can be set using the sound setting.

Item	Setting contents
Bass(Low pitch sound)	+ side:Low pitch enhancement - side:Low pitch reduction
Treble(Treble sound)	+ side:Treble enhancement - side:Treble reduction
Fade(Front/back volume balance)	Back side:Front speaker volume reduction Front side:Rear speaker volume reduction
Balance(Left/right volume balance)	Right side:Left side volume reduction Left side:Right side volume reduction
Auto Level Control*7 (Automatic volume adjustment)	OFF/LEVEL 1/LEVEL 2/LEVEL 3/LEVEL 4/LEVEL 5/LEVEL 6/LEVEL 7
Centerpoint*8 (Automatic surround level adjustment)	ON/OFF
AudioPilot*8	ON/OFF

(Automatic volume adjustment)	
Beep (Audio operation sound)	ON/OFF

*7

Without Bose®

*8

With Bose®

Volume setting

- The volume can be adjusted by operating the volume dial on the command switch or the volume button on the steering switch.

Personalization setting feature

- The following personalization settings for the system can be changed using the center display. For details, refer to the each system personalization feature.

System name		Reference
Smart City Brake Support (SCBS) System		(See **SMART CITY BRAKE SUPPORT (SCBS) PERSONALIZATION**.)
Blind Spot Monitoring (BSM) System		(See **INSTRUMENTATION/DRIVER INFO. PERSONALIZATION**.)
Lane Departure Warning System (LDWS)		
Auto Wiper System		(See **WIPER/WASHER SYSTEM PERSONALIZATION**.)
Door Locks Systems	Power door lock system	(See **SECURITY AND LOCKS PERSONALIZATION**.)
	Advanced keyless entry system	
	Keyless entry system	
Turn Light System		(See **LIGHTING SYSTEM PERSONALIZATION**.)
Lighting Systems	Room light control system	
	High beam control (HBC) system	
	Lights-on reminder warning alarm	
	Auto light-off system	
	DRL system (Except Canada specs.)	
	Auto light system	

Active driving display setting

- Each type of setting for the active driving display can be performed. For details, refer to the active driving display. (See **ACTIVE DRIVING DISPLAY**.)

Application function

Fuel economy monitor

- The fuel consumption display displays the following information in the center display. For details, refer to the fuel consumption display of the center display. (See **CENTER DISPLAY [WITH CENTER DISPLAY]**.)
    - Fuel Consumption Display

- Control Status Display (With i-ELOOP)

Maintenance monitor

- The maintenance monitor displays the following information in the center display. For details, refer to the maintenance monitor of the center display. (See CENTER DISPLAY [WITH CENTER DISPLAY])
  - Scheduled maintenance
  - Tire rotation
  - Oil change

Warning guidance

- Currently activated warnings can be verified. For details, refer to the warning guidance of the center display. (See **CENTER DISPLAY [WITH CENTER DISPLAY]**.)

Operation signal reception from center display

- When the center display is operated, the center display detects the touch position.
- The center display sends a touch position signal to the CMU based on the detected touch position.
- The CMU sends the control signal to the related units based on the received touch position signal.

Operation signal reception from command switch

- When the command switch is operated, the CMU detects the command switch operation.
- The CMU sends the display signal to the center display based on the detected command switch operation. In addition, it sends a control signal to the related units.

Operation signal reception from voice recognition function

- When the TALK button on the steering switch is pressed, the CMU detects the steering switch operation.
- The CMU sends a guidance audio signal to the tuner and amplifier unit (TAU) when it detects the TALK button operation.
- The TAU sends the guidance audio signal to the speakers and the speakers output guidance audio.
- The microphone converts the words (voice commands) produced by the user after the guidance audio output to an audio signal and sends it to the CMU.
- The CMU sends the control signal to the related parts based on the audio signal received from the voice recognition microphone.

Audio function

AM radio/FM radio

- When the CMU receives an operation signal/detects a switch operation, it sends a control signal to the TAU.

- When the TAU receives the control signal, it switches the tuner in the TAU to radio mode and initiates the reception of radio broadcasts.
- The TAU detects the radio station of the radio broadcast selected by the user using the tuner in the TAU based on the electrical signal sent from the antenna amplifier (4SD)/center roof antenna. The audio signal from the detected radio broadcast is sent to the speakers. Additionally, the frequency of the radio station being listened to is sent to the CMU.
- The CMU converts the radio broadcast received from the TAU to a LVDS signal and sends the LVDS signal to the center display.
- The speakers output the audio based on the audio signal sent from the TAU. In addition, the center display indicates the radio station based on the LVDS signal.

RBDS

- The antenna amplifier (4SD)/center roof antenna (5HB) converts the radio waves to an electric signal and sends it to the TAU.
- When RBDS data from the electric signal is detected, the TAU converts information such as radio station name and song information to a RS485 signal and sends the converted RS485 *9 signal to the CMU.
- The CMU converts the text information received from the TAU to a LVDS signal and sends the LVDS signal to the center display.
- The center display displays the traffic information based on the received LVDS signal.

*9

RS485 corresponds to a linear, multi-drop configuration with bi-directional transmission, which is one of the possible types of serial communication standards, having a maximum transmission speed of 10 Mbps.

HD radio™

- When the CMU receives the operation signal/detects the switch operation, is sends the control signal to the TAU.
- When the TAU receives the control signal, it switches the tuner in the TAU to radio mode and initiates reception of the radio broadcast.
- The TAU detects the radio broadcast selected by the user using the tuner in the TAU based on the electrical signal sent from the antenna amplifier (4SD)/center roof antenna (5HB). The audio signal from the detected radio broadcast is sent to the speakers. In addition, the detected radio broadcast logo or album is converted to the RS485 signal and the signal is sent to the CMU.
- The CMU converts the video signal sent from the TAU to a LVDS signal and sends the LVDS signal to the center display.
- The speakers output the audio based on the audio signal sent from the TAU. In addition, the center display indicates the HD radio™ information based on the LVDS signal.

SiriusXM satellite radio

- When the CMU receives the operation signal/detects the switch operation, it sends the control signal to the TAU.
- When the TAU receives the control signal, it switches the tuner inside the TAU to SiriusXM satellite radio mode and initiates reception of radio broadcasts.
- The TAU detects the radio broadcast selected by the user using the tuner in the TAU based on the radio station selected by the user. The audio signal from the detected radio broadcast is sent to the speakers. The speakers output the audio based on the audio signal.
- The center display displays the SiriusXM satellite radio information based on the LVDS signal sent from the CMU.

Aha™ radio / Pandora® / Stitcher™ radio

- When the CMU receives the operation signal/detects the switch operation, it sends the control signal to the TAU and a mobile device such as a Smartphone.
- When the mobile device such as a Smartphone receives the control signal it receives the Aha™ radio/Pandora® /Stitcher™ radio and sends the digital data to the CMU.
- The CMU converts the received video signal of the digital data to a LVDS signal and sends the LVDS signal to the center display. In addition, it sends the audio signal to the TAU.
- The center display indicates the radio information based on the LVDS signal received from the CMU. In addition, the TAU sends the received audio signal to the speakers. The speakers output the audio based on the received audio signal.

AUX / USB audio (AUX)

- When the CMU receives the operation signal/detects the switch operation, it sends the control signal to the TAU.
- The TAU sends the received audio signal to the speakers and the speakers output the audio based on the received audio signal.

AUX / USB audio (USB)

- When the CMU receives the operation signal/detects the switch operation, it sends the control signal to the TAU.
- The TAU sends the received audio signal to the speakers and the speakers output the audio based on the audio signal.

Bluetooth® audio function

- When the CMU receives the operation signal/detects the switch operation, it sends the control signal to the TAU and a mobile device such as Smartphone or a Bluetooth® enabled device.
- When the mobile device such as a Smartphone or a Bluetooth® enabled device receives the control signal, the digital data is sent to the CMU.
- The CMU converts the video signal of the digital data to a LVDS signal and sends it to the center display. In addition, it sends the audio signal to the TAU.
- The TAU switches the received audio signal to an audio signal for output to the speakers, and sends it to the speakers.
- The center display indicates the music information based on the LVDS signal. In addition, the speakers output the audio based on the received audio signal.

CD playback

- When the CMU receives the operation signal/detects the switch operation, it sends the control signal to the TAU and the CD player.
- When the CD player receives the control signal, it sends music information such as the song name and artist name of the inserted CD to the CMU and sends the audio signal to the TAU.
- The CMU converts the received video signal to a LVDS signal and sends it to the center display. The TAU sends the received audio signal to the speakers.
- The center display displays the video based on the LVDS signal, and the speakers output the audio based on the received audio signal.

Gracenote updating

- The auxiliary jack/USB port/SD card slot hub sends the Gracenote update information on the USB device.
- The CMU verifies the Gracenote update information received from the auxiliary jack/USB port/SD card slot hub and performs the update.

Communication function

E-mail/SMS (Short Message Service)

- When the CMU receives the operation signal/detects the switch operation, is sends a control signal to a mobile device such as a Smartphone or Bluetooth® enabled mobile phone.
- When the device receives the control signal, it sends the E-mail/SMS information digital data to the CMU.
- The CMU converts the video signal of the digital data to a LVDS signal and sends the LVDS signal to the center display.
- The center display indicates the E-mail/SMS information based on the received LVDS signal.

Hands-free telephone (HF/TEL) function (incoming call)

- When an incoming call is received, a mobile device such as a Smartphone/Bluetooth® enabled mobile phone sends the incoming call signal to the CMU.
- When the CMU receives the incoming call signal, it sends the incoming call pop-up screen display signal (LVDS signal) to the center display.
- When the center display receives the signal, it displays the incoming call pop-up screen.
- If the TALK button on the steering switch is pressed while the incoming call pop-up screen is displayed, the CMU detects the steering switch operation.
- When the CMU detects the steering switch operation, the call answer signal is sent to a mobile device such as a Smartphone/Bluetooth® enabled mobile phone, and the call is initiated.
- The mobile device, such as a Smartphone/Bluetooth® enabled mobile phone, sends a receive audio signal to the CMU, which is output from the speakers via the TAU.
- The microphone sends the send audio signal of the user to the CMU, and the CMU sends the received send audio signal to a mobile device such as Smartphone or Bluetooth® enabled mobile phone.

NOTE:

- When the call initiates, the incoming call pop-up screen switches to the call screen.

Hands-free telephone (HF/TEL) function (outgoing call)

- When the TALK button on the steering switch is pressed, the CMU detects the steering switch operation.
- When the CMU detects the steering switch operation, the CMU sends a guidance audio signal to the TAU.
- The TAU sends the guidance audio signal to the speakers and the speakers output the guidance audio.
- The microphone converts the words (voice commands) produced by the user after the guidance audio output to an audio signal and sends it to the CMU.
- The Bluetooth® sends the outgoing call signal to a mobile device such as a Smartphone or Bluetooth® enabled mobile phone when the CMU receives the audio signal from the microphone, and the call is initiated.
- The mobile device, such as a Smartphone or Bluetooth® enabled mobile phone, sends the receive audio signal to the CMU, and the signal is output from the speakers via the TAU.
- The voice recognition-use microphone sends the send audio signal of the user to the CMU, and the CMU sends the received send audio signal to a mobile device such as Smartphone or Bluetooth® enabled mobile phone.

Mobile 911 (Auto outgoing call performed)

- When an accident occurs under specified conditions, the SAS control module sends a fuel cut request signal to the CMU.
- When the CMU receives the fuel cut request signal from the SAS control module, it sends the guidance audio signal to the TAU. In addition, it sends the Mobile 911 screen display signal (LVDS signal) to the center display.
- The TAU sends the guidance audio signal to the speakers and the speakers output the guidance audio. In addition, the center display displays the Mobile 911 screen.
- The CMU executes the 10 s timer after the guidance audio output.
- After 10 s have elapsed on the timer, the CMU sends an outgoing call signal to a mobile device such as a Smartphone or Bluetooth® enabled mobile telephone.
- The mobile device calls the PSAP (Public Safety Answering Point) when it receives the outgoing call signal.
- After connecting to the PSAP (Public Safety Answering Point), the CMU outputs the vehicle position information from the vehicle speakers and initiates the call.

Mobile 911 (auto outgoing call canceled)

- When the SAS control module operates the air bags, a fuel cut request signal is sent to the CMU.
- When the CMU receives the fuel cut request signal from the SAS control module, it sends the guidance audio signal to the TAU. In addition, it sends the Mobile 911 screen display signal (LVDS signal) to the center display.
- The TAU sends the guidance audio signal to the speakers and the speakers output the guidance audio. In addition, the center display displays the Mobile 911 screen.
- The CMU executes the 10 s timer after the guidance audio output.
- If the Cancel Call to 911 operator is selected on the center display/Hang-up button on the steering switch is pressed while the timer executes the 10 s timer, the center display/steering switch sends a cancel signal to the CMU.
- When the CMU receives the cancel signal, it stops the 10 s timer and cancels the auto outgoing call to the PSAP (Public Safety Answering Point).

Navigation function

Map display, route guidance

- When the CMU receives the operation signal/detects the switch operation, it sends the control signal to the TAU.
- The CMU reads the map data of the SD card inserted in the auxiliary jack/USB port/SD card slot hub. In addition, reception of the GPS information from the GPS antenna is initiated.
- The CMU sends the navigation screen display signal (LVDS signal) to the center display based on the SD card map data and the position information from the GPS antenna.
- The center display displays the navigation screen based on the received navigation screen display signal (LVDS signal).
- The CMU detects the route to the destination set by the user and sends the guidance audio signal to the TAU after deciding the route.
- The TAU sends the guidance audio signal to the speakers and the speakers output the guidance audio.

Turn-by-turn (TBT)

- The CMU sends the travel direction display request signal to the instrument cluster.
- The instrument cluster displays the travel direction in the active driving display based on the received travel direction display request signal.

Setting function

Bluetooth® pairing

- When the CMU receives the operation signal/detects the switch operation, is transmits a search signal to a Bluetooth® enabled device near the CMU and sends the Bluetooth® device search screen signal to the center display.
- The Bluetooth® enabled device near the CMU sends a Bluetooth® device signal to the CMU. In addition, the center display displays the Bluetooth® device search screen (LVDS signal).
- The CMU programs the Bluetooth® enabled device information based on the Bluetooth® device signal (LVDS signal).

NOTE:

- In the following cases, Bluetooth® pairing is canceled.
  - Seven (maximum of 7) Bluetooth® devices have been programmed
  - Bluetooth® device signal is not received during period of 180 s
  - Cancel is selected during Bluetooth® device search screen display

System setting / display setting / clock setting

- When an operation signal is received/switch operation is detected, the CMU changes each function setting based on the information from the user operations.

Sound setting / volume setting

- When an operation signal is received/switch operation is detected, the CMU sends a sound setting information signal to the TAU based on the information from the user operations.
- The TAU changes the setting value for each function based on the received sound setting information signal.

Active driving display setting

- When an operation signal is received/switch operation is detected, the CMU sends a setting information signal to the instrument cluster based on the information from the user operations.
- The instrument cluster changes the setting value of the active driving display based on the setting information signal.

Personalization feature setting

- When an operation signal is received/switch operation is detected, the CMU sends a personalization operation signal to related units based on the information from the user operations.
- The related unit changes each function setting based on the personalization operation signal.

Application function

Fuel economy monitor

- For details on the fuel economy monitor operation, refer to the fuel consumption display of the center display. (See **CENTER DISPLAY [WITH CENTER DISPLAY]**.)

Warning guidance

- For details on the warning guidance, refer to the warning guidance of the center display. (See **CENTER DISPLAY [WITH CENTER DISPLAY]**.)

Maintenance monitor

- For details on the maintenance monitor operation, refer to the maintenance monitor of the center display. (See **CENTER DISPLAY [WITH CENTER DISPLAY]**.)

2014 - Mazda3 - Body and Accessories

CONNECTIVITY MASTER UNIT [WITH CENTER DISPLAY]

Purpose, Function

- The connectivity master unit (CMU) controls the entire system such as communication between mobile devices and Bluetooth®, and the sending/receiving of video/audio signals from units related to the entertainment system.

Bluetooth® communication function

- The CMU uses the integrated Bluetooth® driver and antenna to perform communication between Bluetooth® enabled mobile devices, such as a Smartphone, and Bluetooth®.
- To perform Bluetooth® communication, pairing of mobile device with the CMU is required to specify the Bluetooth® enabled mobile device. Refer to the workshop manual for the pairing method.

Specification

Item		Content
Profile	A2DP 1.0/1.2 (Advanced audio distribution profile)	A2DP is a profile for transmitting high quality audio data by means of a Bluetooth® device and wireless transmission technology.
	AVRCP 1.0/1.3/1.4 (Audio/video remote control profile)	AVRCP is a profile which provides a standard interface which controls television and audio devices. The function differ depending on the version.
Maximum number of programmable devices		7
Number of programmed devices which can be used simultaneously		1

NOTE:

- The profile indicates the wireless communication standard. If the profile of Bluetooth®-enabled devices differs from the CMU, wireless communication is not possible. In addition, depending on the profile version, corresponding functions differ.

Operation signal reception function

- The CMU controls units related to the entertainment system based on the following operation signals which are sent in conjunction with the user operations.

Operation signal output unit	Operation signal
Center display	LVDS signal (touch position operation signal)
Commander switch	Command switch operation signal
Steering switch	Steering switch operation signal
Microphone	Voice signal (voice command)

LVDS *1 signal conversion function

- LVDS communication occurring between CMU and center display.
- The CMU converts signals sent from the following units to a LVDS *1 signal and displays each type of information in the center display. (See **CENTER DISPLAY [WITH CENTER DISPLAY]**.)

Output unit	Video signal/display request signal
TAU	• Radio broadcast logo, album art, song name (RS485*2 signal)
CD player	• Playback file information (artist/song name)
Auxiliary jack/USB port/SD card slot hub	• Information for file being played (artist/song name)
Mobile device such as Smartphone	• Telephone book, incoming call record • Radio broadcast logo, album art, song name
Rear mount camera	• Image at rear of vehicle
	• Incoming call pop-up screen display • Fuel economy monitor screen

CMU	• Mobile 911 screen display (U.S.A./Canada) • Navigation screen display • Warning guidance screen display

- By converting the video signal to a LVDS*1 signal, the CMU is able to display stable images in the center display virtually free from the effects of noise.
- The communication pathway between the CMU and the center display corresponds to HDCP*3.

*1

The LVDS displays the electrical properties of the signal using low-voltage differential signaling. The LVDS is a digital, wired transmission technology for short range which adopts a differential interface having the characteristics of low voltage and low power consumption.

*2

RS485 corresponds to a linear, multi-drop configuration with bi-directional transmission, which is one of the possible types of serial communication standards, having a maximum transmission speed of 10 Mbps.

*3

HDCP (High-bandwidth Digital Content Protection system) is a copyright protection technology which prevents content from being copied fraudulently. The pathway in a display device such as a display, which sends/receives digital signals from a video playback device such as a computer, is encrypted.

Audio transmission signal function

- The CMU transmits the audio signal received from a mobile device such as the following auxiliary jack/USB port/SD card slot hub and Smartphone devices to the TAU. The CMU receives audio signals from the voice recognition microphone and performs operations according to the commands.

Fuel economy monitor function

- The CMU receives fuel consumption amount and travel distance information sent from the instrument cluster via CAN to calculate the average fuel consumption. The calculated average fuel consumption information is displayed as fuel economy monitor in the center display. For details, refer to the fuel economy monitor of the center display. (See **CENTER DISPLAY [WITH CENTER DISPLAY]**.)

Mobile 911 function

- The CMU receives the fuel cut request signal sent from the SAS control module via CAN, executes the Mobile 911 function, and performs the following. For details, refer to the entertainment system Mobile 911 operation. (See **ENTERTAINMENT SYSTEM [WITH CENTER DISPLAY]**.)
    - Mobile 911 guidance audio signal transmission

- Mobile 911 screen display signal transmission
- Auto dial to PSAP (call initialized)
- Auto replay of location information audio

Navigation function

- The CMU performs map display and route guidance based on the map data received from the GPS signal and the auxiliary jack/USB port/SD card slot hub. For details, refer to the entertainment system navigation function. (See **ENTERTAINMENT SYSTEM [WITH CENTER DISPLAY]**.)

  Turn-by-turn (TBT)

- The TBT function displays the travel direction of the route guidance in the active driving display. The TBT operates when all of the following conditions have been met. For details, refer to the TBT of entertainment system navigation function. (See **ENTERTAINMENT SYSTEM [WITH CENTER DISPLAY]**.)
  - Route guidance of navigation function is operating
  - Navigation is set to ON using the active driving display personalization feature
- The CMU sends the TBT display request signal to the instrument cluster to display the travel direction in the active driving display (See **ACTIVE DRIVING DISPLAY**.)

Automatic configuration function

- When the ignition is switched ON (engine off or on) after the CMU is replaced, the CMU reads the vehicle specification information sent via CAN communication from the instrument cluster, and stores the vehicle specification information.

On-board diagnostic function

- The CMU has an on-board diagnostic function to facilitate system diagnosis. DTCs are stored in the event of a malfunction occurring. For details, refer to the on-board diagnostic system. (See **ON-BOARD DIAGNOSTIC [ENTERTAINMENT SYSTEM (WITH CENTER DISPLAY)]**.)

Diagnostic Assist Function

- The CMU has a diagnostic assist function which can verify the following. For details, refer to the on-board diagnostic system. (See **ON-BOARD DIAGNOSTIC [ENTERTAINMENT SYSTEM (WITH CENTER DISPLAY)]**.)
  - Connection status of related parts
  - Operation status of related parts
  - Related part specifications

Construction

- The CMU is installed centrally to the inside of the dashboard.
- The CMU has an integrated Bluetooth® driver and antenna.

TUNER AND AMP UNIT [WITH CENTER DISPLAY]

Purpose

- Controls the audio signal from the entertainment system-related parts.

Function

Tuner switching function

- The tuner and amp unit (TAU) switches the tuner mode built-into the TAU based on the operation signal sent from the connectivity master unit (CMU).

Audio signal output function

- The TAU outputs the audio signal sent from the following units to the speakers.
    - CMU
    - CD player
    - Auxiliary jack/USB port/SD card slot hub (auxiliary jack only)

RS485*1 signal conversion function (HD radio™, RBDS)

- The TAU creates data from the radio waves received from the antenna amplifier (4SD)/center roof antenna (5HB) and converts the created image data to a RS485*1 signal and sends it to the CMU.

*1

RS485 corresponds to a linear, multi-drop configuration with bi-directional transmission, which is one of the possible types of serial communication standards, having a maximum transmission speed of 10 Mbps.

ALC (auto level control) function (without Bose®)

- When the TAU receives the vehicle speed signal sent from the CMU, it automatically changes the volume and audio quality according to the vehicle speed and compensates for the passengers' sense of a lack of audio volume which occurs as a result of external noise

while driving.

Road noise correction system (AudioPilot®2) (with Bose®)

- The volume of the music constituent covered by noise is corrected by the audio amplifier based on the cabin noise measured by the AudioPilot®2 microphone and the vehicle speed signal sent from the CMU as a local CAN.

CENTER DISPLAY [WITH CENTER DISPLAY]

Outline

- The center display displays vehicle information and entertainment system information.

Function

- The center display displays images based on the signals sent from the connectivity master unit (CMU) as LVDS*1 signals.
- The center display is a touch panel-type LCD. It sends the touch-position information to the CMU as LVDS*1 signals.
- The communication pathway between the CMU and the center display corresponds to HDCP*2.

*1

Low-Voltage Differential Signaling indicates the electrical characteristics of the signal. LVDS is a digital, wired transmission technology for the short range which adopts a differential interface having the characteristics of low voltage and low power consumption.

*2

HDCP (High-bandwidth Digital Content Protection system) is a copyright protection technology which prevents unauthorized copying of content by encrypting the digital signal transmission pathway from a video playback device such as a personal computer to a display device such as a display.

Display information

- The center display displays the following information. Refer to the referenced section for details of the displayed information.

Display content	Reference
Home screen	(See **Home screen**.)
Applications screen	(See **Applications screen**.)
Audio screen	(See **Audio screen**.)

Communication screen	(See **Communication screen**.)
Navigation screen	(See **Navigation screen**.)
Settings screen	(See **Settings screen**.)

Home screen

- The home screen displays the entertainment system information.
- When the ignition is switched to ACC or ON (engine off or on), the center display displays the home screen.

Display area	Button name
1	Applications
2	Audio
3	Communication
4	Navigation (with car-navigation system)
5	Settings

Applications screen

- Information concerning fuel economy, maintenance, and warnings can be verified.

Display content (item name)	Reference
HD Traffic Image	—
Fuel economy monitor	(See **Fuel Economy Monitor**.)
Maintenance monitor	(See **MAINTENANCE MONITOR [WITH CENTER DISPLAY]**.)
Warning guidance	(See **Warning guidance**.)

Fuel Economy Monitor

- Displays the fuel economy and i-ELOOP system information.

Fuel economy monitor verification procedure

- Select the “Applications” button on the Home screen.
- Select “Fuel Economy Monitor” on the Applications screen to display the warning guidance.

- The buttons on the menu screen operate as follows:

Display		Content	Reference
	1	Switches display/non-display of the menu screen.	—
	2	Displays the application menu screen.	
	3	Switches the Fuel Economy Monitor in the order of Control Status, Fuel Consumption, and Effectiveness.	
	4	Resets the fuel economy data.	
	5	• Displays the following SETTING screen. ▪ Ending screen on/off switching ▪ On/off switching for function which synchronizes reset fuel economy data to trip meter	

Fuel Consumption Display

- The information regarding the fuel economy is displayed.

Display		Content	Reference
	1	• Displays the fuel economy for the past 60 minutes. ▪ Displays the fuel economy every minute for the past 1 to 10 minutes. ▪ Displays the fuel economy every 10 minutes for the past 10 to 60 minutes.	—
	2	Displays the average fuel economy over the past 5 resets and after the current reset.	
	3	• Displays the average fuel economy from when the ignition is switched ON (engine on) to the current time. • The average fuel economy is updated every 60 s. • If there is no average fuel economy data, displays "——".	

Control Status Display

- The power generating status is displayed.

Display		Content	Reference
	1	Displays the level of electricity generated by regenerative braking.	
	2	Displays the amount of the electricity stored in the capacitor.	

		(See **i-ELOOP [i-ELOOP]**.)
	3 Displays the status of the electricity stored in the capacitor and being supplied to the electrical devices (whole vehicle in display is illuminated simultaneously).	
	4 Displays the accumulated fuel economy.	

Warning guidance

- When the center display receives a warning guidance display signal (LVDS signal) from the CMU, it displays the warning guidance screen.

NOTE:

- Display method of the warning guidance varies depending on the emergency level.

  Pop-up display

  - Warning message of a higher emergency level is displayed on the pop-up screen at the time the warning occurred regardless of the display content of the center display. When “OK” on the pop-up screen is selected, it switches to the previous screen before the pop-up display. The pop-up display warning can also be verified in the warning guidance list.

  List display

  - Warning messages displayed by methods other than pop-up display can be verified in the warning guidance screen.

Warning guidance verification procedure

- Select the “Applications” button on the Home screen.
- Select “Warning Guidance” on the Applications screen to display the warning guidance.

- Select a desired warning from the warning guidance screen.

NOTE:

- If there is no warning, No Warnings found is displayed on the warning guidance screen.

Pop-up display

Screen display		Related	Reference/function

Pop-up screen	Message (list display)	unit	
	There is an error in the charging system Stop car immediately in a safe place, and contact a Mazda dealer	PCM	(See **CHARGING SYSTEM WARNING LIGHT [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)
	i-ELOOP Charging. With the engine running, check that the charging is complete and the warning indicator is off.	PCM	(See **i-ELOOP [i-ELOOP]**.)
	Engine Coolant Temperature High. Stop vehicle immediately in a safe place.	Instrument cluster	(See **LOW ENGINE COOLANT TEMPERATURE INDICATOR LIGHT (BLUE) / HIGH ENGINE COOLANT TEMPERATURE WARNING LIGHT (RED)**.)

List display

Screen display			Related unit	Reference/function
Warning light	Title	Message		
	Engine hydraulic pressure malfunction	Low engine oil pressure.Stop the vehicle immediately in a safe place, turn off the engine, and inspect the engine oil level. Add oil if necessary. Have the vehicle checked by a dealer immediately if this indicator turns on after adding oil or the engine oil level is OK.	PCM	(See **ENGINE OIL WARNING LIGHT [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)

	i-ELOOP system malfunction	i-ELOOP system malfunction. Have the vehicle checked by a dealer if this indicator stays on.	PCM (i-ELOOP)	(See **MASTER WARNING LIGHT**.)
BRAKE	Low brake fluid level	Brake fluid level is low. Stop the vehicle immediately in a safe place and have the vehicle checked by a dealer.	Front body control module (FBCM)	(See **BRAKE SYSTEM / ABS WARNING LIGHT**.)
BRAKE	Brake system malfunction	Electronically-controlled brake system malfunction. Stop the vehicle immediately in a safe place and have the vehicle checked by a dealer.	DSC	
	Low tire air pressure	Low tire air pressure in one or more tires. Check the air pressure of the tires and adjust to the correct air pressure. Press the TPMS SET switch after adjusting the tire pressure until you hear a beep.	DSC	(See **TIRE PRESSURE MONITORING SYSTEM WARNING LIGHT**.)
	High engine coolant temperature	Engine is starting to run hot. Drive slowly or stop the vehicle until the indicator stops flashing. If it keeps flashing, even after stopping the vehicle, take proper actions. Refer to the Owner's Manual.	Instrument cluster	(See **LOW ENGINE COOLANT TEMPERATURE INDICATOR LIGHT (BLUE) / HIGH ENGINE COOLANT TEMPERATURE WARNING LIGHT (RED)**.)
	Low remaining fuel amount	Fuel tank level is low. Refuel the vehicle soon.	Instrument cluster	(See **LOW FUEL WARNING LIGHT**.)
	Fuel cap inspection	The fuel cap may not be installed properly. Check that the fuel cap has been installed and tightened properly. After installing and tightening the fuel cap properly, this indicator will not turn off for a few drive cycles until it can be confirmed that the system is OK. Have the vehicle checked by a dealer if this indicator stays on.	PCM	(See **CHECK FUEL CAP WARNING LIGHT [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)
	Power steering system malfunction	Electric power steering malfunction. Stop the vehicle in a safe place and turn off the engine. Have the vehicle checked by a dealer if this indicator stays on.	EPS control module	(See **POWER STEERING MALFUNCTION INDICATOR LIGHT**.)

	Engine system malfunction	Engine system malfunction. Have the vehicle checked by a dealer immediately.	PCM	(See **CHECK ENGINE LIGHT [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)
	Air bag system malfunction	Airbag/seatbelt malfunction. Have the vehicle checked by a dealer immediately	SAS control module	(See **AIR BAG SYSTEM WARNING LIGHT [TWO-STEP DEPLOYMENT CONTROL SYSTEM]**.) (See **AIR BAG SYSTEM WARNING LIGHT [STANDARD DEPLOYMENT CONTROL SYSTEM]**.)
ABS	ABS system malfunction	Anti-lock brake system (ABS) malfunction. Have the vehicle checked by a dealer immediately.	DSC	(See **BRAKE SYSTEM/ABS WARNING LIGHT**.)
	DSC system malfunction	Dynamic stability control (DSC) or traction control system (TCS) malfunction. Have the vehicle checked by a dealer immediately.	DSC	(See **TCS/DSC INDICATOR LIGHT**.)
BSM OFF	BSM system malfunction	Blind spot monitoring (BSM)/Rear cross traffic alert (RCTA) malfunction. Check for abnormalities in the rear bumper surface and clean if dirty or covered with snow. Have the vehicle checked by a dealer if this indicator stays on.	BSM control module	(See **BLIND SPOT MONITORING (BSM) OFF INDICATOR LIGHT**.)
AFS OFF	AFS system malfunction	Adaptive front-lighting system (AFS) malfunction. Have the vehicle checked by a dealer if this indicator keeps flashing.	AFS control module	(See **AFS OFF INDICATOR LIGHT**.)
	TPMS system malfunction	Tire pressure monitoring system (TPMS) malfunction. Have the vehicle checked by a dealer.	DSC HU/CM	(See **TIRE PRESSURE MONITORING SYSTEM WARNING LIGHT**.)
	Key Battery Low	Key battery is low. Replace the key battery immediately.	Start stop unit	(See **KEY WARNING LIGHT (RED)/KEY INDICATOR LIGHT (GREEN)**.)
	Keyless system malfunction	Keyless entry system malfunction. Have the vehicle checked by a dealer.	Start stop unit	
	Automatic	Automatic transmission malfunction.		

AT	transmission system malfunction	Damage to the vehicle may occur if you continue to drive. Have the vehicle checked by a dealer immediately.	TCM	(See **AUTOMATIC TRANSAXLE WARNING LIGHT [FW6A-EL]**.)
	Battery management system malfunction	Battery management system malfunction. Have the vehicle checked by a dealer.	PCM	(See **MASTER WARNING LIGHT**.)
	Brake override system malfunction	Brake switch malfunction. Have the vehicle checked by a dealer immediately.	PCM	
	SCBS system malfunction	Smart city brake support (SCBS) malfunction. Have the vehicle checked by a dealer immediately.	Laser sensor	
	SCBS Clean front windshield	Smart city brake support (SCBS) malfunction. Clean the front windshield. Have the vehicle checked by a dealer if this indicator stays on.	Laser sensor	
	SCBS not available	Smart city brake support (SCBS) currently unavailable.	Laser sensor	
	LDWS system malfunction	Lane departure warning system (LDWS) malfunction. Have the vehicle checked by a dealer.	FSC	(See **LDWS INDICATOR LIGHT (GREEN) / LDWS WARNING LIGHT (AMBER)**.)
	HBC system malfunction	High beam control (HBC) malfunction. Have the vehicle checked by a dealer.	FSC	(See **HBC INDICATOR LIGHT (GREEN) / HBC WARNING LIGHT (AMBER)**.)
	HBC/LDWS camera interrupted	High beam control (HBC)/Lane departure warning system (LDWS) malfunction. Clean the windshield. Have the vehicle checked by a dealer if this indicator stays on.	FSC	(See **MASTER WARNING LIGHT**.)
	HBC/LDWS system malfunction	High beam control (HBC)/Lane departure warning system (LDWS) malfunction. Have the vehicle checked by a dealer if this indicator stays on.	FSC	
	HBC/LDWS windshield fogged	High beam control (HBC)/Lane departure warning system (LDWS) malfunction. Defrost the windshield. Have the vehicle checked by	FSC	

		a dealer if this indicator stays on.		
	Vehicle system malfunction	Vehicle system malfunction. Have the vehicle checked by a dealer.	PCM	
	Low washer fluid level	Washer fluid level is low. Refill the washer fluid.	Front body control module (FBCM)	(See **WASHER FLUID-LEVEL SENSOR**.)
	Low engine coolant temperature	Engine coolant is cold and no warm air is available for heater/defroster. Vehicle can be driven with the indicator on or off. Have the vehicle checked by a dealer if this indicator stays on.	Instrument cluster	(See **LOW ENGINE COOLANT TEMPERATURE INDICATOR LIGHT (BLUE)/HIGH ENGINE COOLANT TEMPERATURE WARNING LIGHT (RED)**.)

Audio screen

- When the audio button on the home screen is selected, the audio screen is displayed. The following audio functions in the table below are available.

Display content (item name)	Function
Traffic Information	If a particular equipment item is not available, the item is not indicated in the center display.
FM	Switches to FM radio screen.

AM	Switches to AM radio screen.
XM	Switches to SiriusXM satellite radio screen.
Pandora®	Switches to Pandora® screen. **NOTE:** • Pandora® is not displayed in gray even if the connected mobile device is not compatible with Pandora®.
Stitcher™	Switches to Stitcher. **NOTE:** • Stitcher™ is not displayed in gray even if the connected mobile device is not compatible with Stitcher™.
Aha™ Radio	Switches to Aha™ radio screen. **NOTE:** • Aha™ radio is not displayed in gray even if the connected mobile device is not compatible with Aha™ radio.
Bluetooth <Device Name>	Switches to Bluetooth® audio screen. **NOTE:** • If available, the connecting device name is displayed. When Bluetooth® is not available, such as no device is connected, only Bluetooth® is displayed.
USB1 <Device Name>	Switches to USB audio screen. **NOTE:** • If available, the connecting device name is displayed. When USB1 is not available, such as no device is connected, only USB1 is displayed.
USB2 <Device Name>	Switches to USB audio screen. **NOTE:** • If available, the connecting device name is displayed. When USB2 is not available, such as no device is connected, only USB2 is displayed.
CD	Switches to CD screen.
AUX	Switches to AUX screen.

DVD	If a particular equipment item is not available, the item is not indicated in the center display.
TV	If a particular equipment item is not available, the item is not indicated in the center display.

NOTE:

- Items requiring media, such as CDs or AUX, are displayed in gray and not available if connection of the media cannot be detected.

Communication screen

- E-mail, SMS (Short Message Service), and Hands-free telephone (HF/TEL) functions can be used.

Display content (item name)	Function
Active Call	Switches to the incoming call screen. (when receiving an incoming call)
Notifications	Switches to the notification screen. **NOTE:** • When there is no notification, displayed in gray and not available.
Favorites	Switches to the favorite screen.
Contacts	Displays the phone book.
Call History	Displays the call history.

Dial Phoned	Switches to the dial screen for phone number input.
SMS	Switches to the SMS screen.
E-mail	Switches to the e-mail screen.
Setting	Switches ON/OFF of the e-mail/SMS notification function.

NOTE:

- If Bluetooth® communication is not established between a mobile device such as a Bluetooth®-enabled smart phone, the functions dependent on the mobile device are displayed in gray and they are not available.
- When there is unread notification, e-mail. or SMS, the number of unread messages is displayed beside each item name. The number of missed call is displayed next to “Call History”.

Navigation screen

- When the navigation button on the home screen is selected, the navigation screen is displayed. Navigation information such as the current position and route guidance to destination is displayed on this screen.

Settings screen

- The following settings can be changed. For details, refer to the entertainment system setting function. (See **ENTERTAINMENT SYSTEM [WITH CENTER DISPLAY]**.)

MAINTENANCE MONITOR [WITH CENTER DISPLAY]

Outline

- When the preset maintenance period approaches, the maintenance monitor displays a message in the center display to inform the driver.

Function / Construction

- The maintenance monitor has the following items.
- Display/non-display of the scheduled maintenance, tire rotation, and oil change*1*2 can be optionally set by the user. Refer to the Workshop Manual for the setting procedure.
- The connectivity master unit (CMU) stores the maintenance monitor setting content, and the elapsed time and traveled distance from when the setting was made. The stored information is not cleared even if the battery cables are disconnected.

NOTE:

- The maintenance monitor setting information recorded in the CMU cannot be written to a new CMU, therefore, the maintenance monitor is set to the initial setting value if the CMU is replaced. Before replacing the CMU, explain to the customer that the maintenance monitor is reset to the initial setting value.

*1

The engine oil maintenance monitor can be set using the center display or the Mazda modular diagnostic unit (M-MDS). Refer to the Workshop Manual for the setting procedure.

*2

The engine oil maintenance monitor is displayed in the center display based on the received display request signal which the CMU receives from the PCM. For details, refer to the engine oil maintenance monitor. (See ENGINE OIL MAINTENANCE MONITOR [SKYACTIV-G 2.0, SKYACTIV-G 2.5].)

Maintenance monitor table

NOTE:

- For vehicles without the center display, the oil inspection period setting can only be changed using the Mazda Modular Diagnostic System (M-MDS). For details, refer to the wrench indication light. (See **WRENCH WARNING INDICATOR LIGHT [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)
- If the Setting Interval setting of the oil inspection period is changed using the Mazda Modular Diagnostic System (M-MDS), only select Flexible.

Tab	Item	Content
Scheduled Maintenance	Setting (ON/OFF)	The notifications can be switched on/off.
	Time (months)	Displays the period and distance until maintenance. When selected, the maintenance period can be set. When the set period has elapsed, Scheduled Maintenance Due! is displayed in red.
	Distance (mile or km)	
	Reset	Returns the remaining time and distance to the initial values.
Tire Rotation	Setting (ON/OFF)	The notifications can be switched on/off.
	Distance (mile or km)	Displays the distance until tire rotation. When selected, the tire rotation period can be set. When the set period has elapsed, Tire Rotation Due! is displayed in red.
	Reset	Returns the remaining time and distance to the initial values.
Oil Change	**Setting interval (Canada)** • ON*3/OFF **Setting interval (U.S.A. and Puerto Rico)** • OFF/Fixed/Flexible*3	**Canada** • Display/non-display of the oil inspection/replacement period can be set. **U.S.A. and Puerto Rico** • Display (Fixed, Flexible)/non-display of the oil inspection/replacement period can be set.
	Distance (mile or km)*4	Distance to display of oil inspection/replacement period can be set. When the set period has elapsed, Oil Change Due! is displayed in red.
	Oil life (%)*5	Oil life to oil inspection/replacement period can be displayed. Displays the percentage of the engine oil amount which has not deteriorated out of the total engine oil amount. When the scheduled maintenance period has elapsed, Oil Change Due! is displayed in red.
	Reset	Maintenance monitor setting can be reset to the initial value.

*3

When "Flexible" is selected, the engine oil deterioration condition is calculated based on the frequency of engine starts and the distance travelled. Because the engine oil deterioration condition cannot be calculated correctly if engine oil other than Mazda genuine oil (0W-20) or Castrol oil (0W-20) is used, use Mazda genuine oil (0W-20) or Castrol oil (0W-20) when selecting "Flexible".

*4

If "Fixed" is selected in setting

*5

If "Flexible" is selected in setting

Operation

- If any of the following display conditions is met during the preset maintenance period, the maintenance monitor displays a message.

  Display condition

  - Day setting: Remaining days are 15 days or less
  - Distance setting: Remaining distance is 250 mile/500 km
  - Display request signal is sent from PCM (oil inspection period only)

2014 - Mazda3 - Body and Accessories

CD PLAYER [WITH CENTER DISPLAY]

Purpose, Function

- The CD player sends the inserted CD file information to the connectivity master unit (CMU), and an audio signal to the tuner and amp unit (TAU).

Specification

Type	Playback function file
Music/MP3/WMA/AAC CD player	• Music data (CD-DA) • MP3/WMA (Windows Media Audio)/AAC (Advanced Audio Coding) file

Construction

- A CD player is installed to the front console.

CD PLAYER [WITH CENTER DISPLAY]

Input/output signal table

Terminal		Signal

Operation

- For the CD player operation, refer to the ENTERTAINMENT SYSTEM. (See **ENTERTAINMENT SYSTEM [WITH CENTER DISPLAY]**.)

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

SPEAKER [WITHOUT Bose®, WITH CENTER DISPLAY]

Purpose

- Converts the audio signal from the audio unit to sound.

Function

- Full-range speakers, which can output wide-range sound from low to high frequency, have been adopted.

Specification

Item		Front door speaker	Rear speaker	Tweeter
Max. input	(W)	25	25	25
Rated impedance	(ohm)	3.4 — 4.6	3.4 — 4.6	3.4 — 4.6
Size	(cm {in})	16.5 {6.5}	16.5 {6.5}	3 {1}

Construction

Front door speaker, rear door speaker

- A cone-shaped dynamic speaker has been adopted for each speaker.
- A weight reduction was achieved by using pulp for the cone material and adopting a ferrite magnet.

Tweeter

- A cone-shaped dynamic speaker has been adopted for each speaker.
- A weight reduction was achieved by using polyetherimide for the cone material and adopting a ferrite magnet.

Operation

- The speaker sends the audio signal (current) from the audio unit to the voice coil.
- When the audio signal (current) is sent to the voice coil, the coil becomes magnetized and a magnetic field occurs. Because the voice coil and the magnet pull and repel each other in the magnetic field, the voice coil vibrates.
- Because the voice coil is wrapped around the voice coil bobbin, the voice coil bobbin vibrates when the voice coil vibrates.
- When the voice coil bobbin vibrates, the cone (diaphragm) installed to the voice coil bobbin vibrates and generates sound.

SPEAKER [WITHOUT Bose®, WITH CENTER DISPLAY]

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

SPEAKER [WITH Bose®, WITH CENTER DISPLAY]

Purpose

- Converts the audio signal from the audio unit to sound.
- High quality sound is provided for the driver and passengers.

Function

- Full-range speakers, which can output wide-range sound from low to high frequency, have been adopted.
- A better sound effect and clear sound have been achieved by using tweeters (speaker for upper register sound range) which differ the range of the output sound and front door speaker (speaker for lower register sound range).

Specification

Item		Front door speaker	Rear door speaker	Front side speaker	Front center speaker	Rear speaker (4SD)	Rear speaker (5HB)
Rated impedance	(ohm)	1.25	3.7	3.4 — 4.6	3.24 — 3.96	3.24 — 3.96	3.24 — 3.96
Size	(cm {in})	16.5 {6.5}	16.5 {6.5}	8 {3}	8 {3}	8 {3}	8 {3}

Construction

Front door speaker, front center speaker

- A cone-shaped dynamic speaker has been adopted for each speaker.
- A weight reduction was achieved by using pulp for the cone material and adopting a neodymium magnet.

Rear door speaker, front side speaker, rear door speaker

- A cone-shaped dynamic speaker has been adopted for each speaker.
- A weight reduction was achieved by using pulp for the cone material and adopting a ferrite magnet.

- A better sound effect is achieved by the use of speakers which differ the range of the output sound.
    - Front door speaker (speaker for deep bass sound range)
    - Rear door speaker (speaker for all sound ranges)
    - Front center speaker (speaker for medium-to-high-sound range)
    - Front side speaker (speaker for medium-to-high-sound range)
    - Rear door speaker (speaker for medium-to-high-sound range)

Operation

- The speaker sends the audio signal (current) from the audio unit to the voice coil.
- When the audio signal (current) is sent to the voice coil, the coil becomes magnetized and a magnetic field occurs. Because the voice coil and the magnet pull and repel each other in the magnetic field, the voice coil vibrates.
- Because the voice coil is wrapped around the voice coil bobbin, the voice coil bobbin vibrates when the voice coil vibrates.
- When the voice coil bobbin vibrates, the cone (diaphragm) installed to the voice coil bobbin vibrates and generates sound.

SPEAKER [WITH Bose®, WITH CENTER DISPLAY]

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

AUDIO AMPLIFIER [WITH CENTER DISPLAY]

Purpose, Function

- The audio signal (analog voltage waveform) output from the unit equipped on the vehicle is converted into a digital pulse. The converted digital pulse signal is amplified, converted to an analog signal again, and sent to the speakers.

Construction

- The audio amplifier is positioned under the front seat (RH).

	3G	Rear door speaker output LH (-)
	3H	Rear door speaker output LH (+)

Operation

- The audio amplifier amplifies the audio signal sent from the tuner and amp unit (TAU) and sends it to the speakers.
- The speakers produce audio based on the audio signal sent from the TAU.

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

CENTER ROOF ANTENNA [WITH CENTER DISPLAY]

Purpose, Function

- Converts radio broadcast waves to electric signals and sends the signals to the tuner and amp unit (TAU).
- Satellite radio programming (SIRIUS XM radio) can be listened to (with SIRIUS XM radio).

Construction

- Two types of center roof antennas are available as follows:
    - Type A (with rod)
    - Type B (without rod)

Type A

- The center roof antenna consists of an antenna rod which converts the received radio waves to electric signals, and an antenna base with a built-in antenna amplifier which amplifies the electric signals.
- To prevent the roof antenna from contacting obstructions above the vehicle, the antenna rod is manually foldable to 127°. It is also removable.

Type B

- A center roof antenna has been adopted which does not require retraction or removal before going through an automatic car wash machine.
- The center roof antenna has an integrated antenna amplifier which amplifies the electric signal.

Operation

- When the ignition is switched to ACC or ON (engine off or on), power is supplied from the TAU to the antenna amplifier inside the center roof antenna.
- The center roof antenna converts the received radio waves of a radio broadcast to an electric signal.
- The center roof antenna amplifies the converted electric signal using the antenna amplifier and sends the signal to the TAU.

Fail-safe

- Function not equipped.

CENTER ROOF ANTENNA [WITH CENTER DISPLAY]

2014 - Mazda3 - Body and Accessories

GLASS ANTENNA [WITH CENTER DISPLAY]

Purpose, Function

- Converts radio broadcast waves to electric signals and sends the signals to the antenna amplifier.

Construction

- An antenna with excellent noise resistance has been adopted to the rear window glass.

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

GLOBAL POSITIONING SYSTEM (GPS) ANTENNA [WITH CENTER DISPLAY]

Purpose, Function

- The GPS antenna receives signals sent from GPS satellites and sends them to the connectivity master unit (CMU).

NOTE:

- GPS (Global Positioning System) was developed by the Pentagon (U.S.A.) as an object locating system using satellites. The GPS antenna receives signals from several of the satellites orbiting at an altitude of approx. 21, 000 km {13,049 mile} to detect the current position of the vehicle.

Construction

- The GPS antenna is installed inside the center part of the instrument panel.

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

ANTENNA AMPLIFIER [WITH CENTER DISPLAY]

Purpose, Function

- Amplifies the electric signal from the glass antenna and sends it to the tuner and amp unit (TAU).

Construction

- The antenna amplifier is positioned in the rear header.

Fail-safe

- Function not equipped.

ANTENNA AMPLIFIER [WITH CENTER DISPLAY]

2014 - Mazda3 - Body and Accessories

STEERING SWITCH [WITH CENTER DISPLAY]

Purpose, Function

- Operation of the entertainment system and change of the instrument cluster display are possible without a change in driving posture.

Construction

- The steering switch is located on the spoke of the steering wheel.
- The resistance is built into each switch.
- The steering switch consists of a volume adjustment (+) or (-) switch, cue/automatic band selector (up) or (down) switch, INFO button, up switch, down switch, TALK button, PICK-UP button, and HANG-UP button.

Operation

Switch name	Operation
Volume adjustment switch	Audio volume can be adjusted.

Cue/Automatic band selector switch	Cue of CD tracks and selection of radio band are possible.
Mute button (Without Bluetooth system)	Audio volume can be muted. Pressing again after muting returns to previous volume level.
INFO button	Instrument cluster display can be changed. Refer to **TRIP COMPUTER INFORMATION SYSTEM** for display content.
Up/down switch	Instrument cluster display can be changed. Refer to **TRIP COMPUTER INFORMATION SYSTEM** for display content.
TALK button	Launches the Bluetooth® mode.
Pick-up button	Receives a phone call.
Hang-up button	Hangs up a phone call.

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

COMMANDER SWITCH [WITH CENTER DISPLAY]

Purpose, Function

- The entertainment system can be operated without having to change the driving posture.
- The commander switch consists of the following buttons, dial, and knobs.

Button/knob/dial name	Function
AUDIO button	Switches the display screen of the center display to the audio screen.
HOME button	Switches the display screen of the center display to the home screen.
NAV button	Switches the display screen of the center display to the navigation screen.

BACK button	Switches to the screen directly previous to the currently displayed screen. • If at the top tier, the display content does not change even if the BACK button is pressed down again.
FAVORITE button	• Switches the display screen of the center display to the favorite screen. After changing to the favorite screen, the display content does not change even if the switch is pressed down again. • When the FAVORITE button is long-pressed with the item to be added selected, the targeted item is added to favorites.
Volume dial	• When the volume dial is rotated, the volume can be adjusted. • When the volume dial is pressed, the volume can be muted. Pressing again after muting returns to previous volume level.
Commander knob (tilt*1)	Moves the selection area on the center display screen. The selection area can be tilted in the lateral direction for left/right, and the longitudinal direction for forward/back.
Commander knob (rotation)	Moves the selection area on the center display screen. The selection area moves according to the rotation direction.
Commander knob (click*2)	• Switches to the selected menu screen. • Launches the selected menu.

*1
Tilting of the commander knob forward/back, left/right.
*2
Pressing down of the commander knob.

Construction

- Installed to the upper part of the rear console.

PARK ASSIST SYSTEM [WITH CENTER DISPLAY]

CAUTION:

- The park assist system is a supplementary system which displays the conditions at the rear of the vehicle when reversing. Always directly confirm the safety of the surrounding area visually when reversing.

Outline

- When the vehicle is reversing, the rear mount camera installed to the trunk lid (4SD)/liftgate (5HB) displays the images at the rear of the vehicle in the center display for verification of the presence of pedestrians and obstructions at the rear of the vehicle.

Function

Guide line display

- The rear mount camera displays the distance reference lines and vehicle width extension lines based on the images shot at the rear of the vehicle by the camera.

Structural View

Block diagram

Image range

NOTE:

- The image range may differ depending on the road surface conditions and the vehicle conditions. In addition, images near both sides of the rear bumper and below the rear bumper cannot be obtained.

Rear view monitor screen

Display item	Display line color	Function
		• Shows distance reference line 0.5 m from the rear of the rear bumper.

Distance reference lines (fixed)	Red	• Not in conjunction with steering operation.
	Yellow	• Shows distance reference line 1.0 m from the rear of the rear bumper. • Not in conjunction with steering operation.
	Yellow	• Shows distance reference line 2.7 m from the rear of the rear bumper. • Not in conjunction with steering operation.
Vehicle width extension line	Yellow	• Vehicle width extension line. (Length: 2.7 m, width: vehicle width)

Operation

CAUTION:

- Images displayed by the rear mount monitor camera differ depending on the actual conditions resulting from road surface conditions, the number of passengers, and cargo load. Even though it may appear that the vehicle will not come into contact with an object as seen in the image, it may actually come into contact with it. When reversing the vehicle, always verify the surroundings visually.
- When the ignition is switched to ACC or ON (engine off or on) and an R position signal from the selector lever is received, the CMU supplies power to the rear mount camera.
- The rear mount camera shoots the conditions at the rear of the vehicle in color which is converted to a video signal.
- The rear mount camera combines the distance reference lines (fixed lines) and the vehicle width extension lines with the camera images and converts them to a video signal.
- The rear mount camera sends the converted video signal to the connectivity master unit (CMU).
- When a video signal is received from the rear mount camera, the CMU sends the received video signal (LVDS signal) to the center display.
- The center display displays the images at the rear of the vehicle taken by the rear mount camera based on the received video signal (LVDS signal).

NOTE:

- It may be difficult to see the display under the following conditions; however, it does not indicate a malfunction:
  - When the temperature around the lens is high/low.
  - When the camera is wet such as on a rainy day or during period of high humidity.
  - When foreign material such as mud is stuck around the camera.
  - When the camera lens reflects sunlight or headlight beams.

2014 - Mazda3 - Body and Accessories

REAR MOUNT CAMERA [WITH CENTER DISPLAY]

Purpose

- The rear mount camera has the purpose of assuring visibility at the rear of the vehicle which cannot be directly verified from the driver's seat.

Function

- The rear mount camera shoots the conditions at the rear of the vehicle in color, and after converting the video signal, it outputs the signal to the connectivity master unit (CMU).

Construction

- The rear mount camera is installed to the trunk lid (4SD)/liftgate (5HB).

- A super-wide angle lens which can shoot images in a wide parameter is assembled to the compact (1/3.6 in), color CMOS camera which has a high precision CMOS *1 imaging element.

*1

Complementary Metal-Oxide Semiconductor

Operation

- For the rear mount camera operation, refer to the park assist system. (See **PARK ASSIST SYSTEM [WITH CENTER DISPLAY]**.)

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

AUXILIARY JACK/USB PORT/SD SLOT HUB [WITH CENTER DISPLAY]

NOTE:

- “iPod” is a registered trademark of Apple Inc.

Purpose, Function

- The auxiliary jack/USB port/SD card slot hub outputs the audio signal from an on-market, portable audio or USB device, connected to the auxiliary jack/USB port/SD card slot hub, and the map information of the SD card to the connectivity master unit (CMU).

Specification

Type	Playable data
USB mode	MP3/WMA/AAC/OGG file

Construction

- The auxiliary jack, USB port and SD card slot are built into the auxiliary jack/USB port/SD card slot hub.
- The auxiliary jack/USB port/SD card slot hub is installed to the rear console.

Operation

Auxiliary jack

- When the AUX mode is selected by operating the center display or the commander switch, the CMU sends a control signal to the tuner and amp unit (TAU).
- The auxiliary jack/USB port/SD card slot hub sends the audio signal sent from the portable audio device connected to the auxiliary jack.
- The TAU sends the received audio signal to the speakers and the speakers output the audio based on the received audio signal. (See **ENTERTAINMENT SYSTEM [WITH CENTER DISPLAY]**.)

USB port

- When the USB mode is selected by operating the center display or the commander switch, the CMU sends a control signal to the TAU.
- The auxiliary jack/USB port/SD card slot hub sends the audio signal and video signal of the USB device/iPod connected to the USB port to the CMU.
- The CMU transmits the received audio signal to the TAU, converts the video signal to a LVDS signal, and displays the signal in the center display.
- The TAU sends the received audio signal to the speakers and the speakers output the audio based on the received audio signal. (See **ENTERTAINMENT SYSTEM [WITH CENTER DISPLAY]**.)

SD card slot

NOTE:

- The auxiliary jack/USB port/SD card slot hub can only read map information on the SD card (genuine Mazda). Music and image information stored on an SD card (genuine Mazda) and the information stored on an SD card other than a genuine Mazda SD card cannot be read.
- When the navigation mode is selected by operating the center display or the commander switch, the CMU sends a control signal to the TAU.
- The auxiliary jack/USB port/SD card slot hub sends the map information of the SD card inserted into the SD card slot to the CMU.
- The CMU converts the video signal to a LVDS signal based on the received map information, and displays the signal in the center display. (See **ENTERTAINMENT SYSTEM [WITH CENTER DISPLAY]**.)

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

MICROPHONE [WITH CENTER DISPLAY]

Purpose, Function

- Converts the voice commands spoken into the microphone by the user to an electrical signal and sends the signal to the connectivity master unit (CMU).

Construction

- Noise due to the vehicle being driving or air blown by the air conditioner has been reduced by locating the microphone next to the map light.

Operation

- For the microphone operation, refer to the ENTERTAINMENT SYSTEM. (See **ENTERTAINMENT SYSTEM [WITH CENTER DISPLAY]**.)

Fail-safe

- Function not equipped.

MICROPHONE [WITH CENTER DISPLAY]

2014 - Mazda3 - Body and Accessories

ON-BOARD DIAGNOSTIC [ENTERTAINMENT SYSTEM (WITH CENTER DISPLAY)]

NOTE:

- “iPod” is a registered trademark of Apple Inc.

Outline

- The entertainment system (vehicles with center display) has an on-board diagnostic function and diagnostic assist function to facilitate system diagnosis.

On-board diagnostic function

- The on-board diagnostic function consists of the following functions:
    - A malfunction detection function, which detects overall malfunctions in the entertainment system-related parts (with center display)
    - A memory function, which stores detected DTCs
    - A display function, which indicates system malfunctions via a DTC display.

Malfunction detection function

- Detects malfunctions in the entertainment system (with center display).

Memory function

- If a malfunction is detected in the entertainment system, the connectivity master unit (CMU) stores a DTC.

Display Function

Mazda Modular Diagnostic System (M-MDS) not used

- To display DTCs on the center display that have been recorded in the memory function, activate the on-board diagnostic function in the CMU. Refer to the Workshop Manual for the activation procedure of the on-board diagnostic function.

Mazda Modular Diagnostic System (M-MDS) used

- When DTC inspection is performed using the Mazda modular diagnostic system (M-MDS), the audio system malfunction diagnosis begins. Refer to the Workshop Manual for the DTC troubleshooting procedure.

*4 **With SiriusXM satellite radio system**

*5 **With CD player**

*6 **ATX**

*7 **With AFS (Adaptive Front Lighting System)**

*8 **With smart city brake support (SCBS)**

*9 **With forward sensing camera (FSC)**

Diagnostic Assist Function

- The diagnostic assist function is a function for forcibly operating entertainment system related parts to verify their connection condition and operation status. In addition, the specifications of the entertainment system related parts are displayed in the center display where they can be verified. Refer to the workshop manual for the diagnostic assist function activation procedure.

Diagnostic assist code list

No.	Center display (diagnostic content)	Function	Content
01	CD Test	CD player inspection	The CD player inspection results are displayed in the center display.
02	Clear DTC	DTC clear	Clears the DTCs. **NOTE:** • DTC clearing is performed in the following order, and a message is displayed each time to indicate the DTCs are cleared. ▪ CMU ▪ TAU ▪ CD player
03	Read AVC DTC	DTC inspection	Displays the DTCs of the entertainment system related parts. **NOTE:** • Detection of DTCs is limited if the ignition is in the ACC position. Refer to the workshop manual for details.
04	Read CMU DTC	DTC inspection	The CMU DTCs are displayed in the center display.

05	Read TAU DTC	DTC inspection	The tuner and amplifier unit (TAU) DTCs are displayed in the center display.
06	Read CD DTC	Does not operate due to unavailability of applicable DTC.	Does not operate due to unavailability of applicable DTC.
07	Read DTV DTC	Do not operate because not equipped to vehicle.	Do not operate because not equipped to vehicle.
08	Software Reset AVC	Software reset	Resets the software.
09	Software Version Display (CD)	Software version verification	Displays the CD player software version.
10	Part Number Readout CD/DVD	Part number verification	Displays the CD player part number (first four digits)
25	Antenna Continuity Status	Antenna control output condition inspection	Displays the power supply output status to the center roof antenna to the audio unit display for examination of the center roof antenna, audio unit and wiring harness (between audio unit and center roof antenna). **NOTE:** • Even if the system is normal, radio reception may be difficult depending on where the system is inspected (indoors/outdoors, or conditions at the location). Before inspecting the system, verify that radio reception is adequate. • When performing the inspection, select the best area for receiving radio frequencies.
26	DTV TEST ON	Do not operate because item is for manufacturer use.	Do not operate because item is for manufacturer use.
27	DTV TEST ON	Do not operate because item is for manufacturer use.	Do not operate because item is for manufacturer use.

53	Software Version Display (CMU)	Software version verification	Displays the CMU (overall entertainment system) software version.
57	Software Version Display (VIP)	Software version verification	Displays the CMU (overall communication with vehicle) software version.
58	Vehicle Info	Configuration information verification	• Displays the following configuration information in the center display. ▪ Destination ▪ CMU Types
59	CMU Serial Number Readout	Unique number verification	Displays the unique number verification of the CMU in the center display.
61	Vehicle Signal (Unit Status)	Vehicle signal verification	• Displays the following vehicle number information in the center display. ▪ Steering switch signal input condition ▪ Commander switch signal input condition ▪ GPS antenna signal input condition ▪ Voice recognition-use microphone signal input condition ▪ Auxiliary jack/USB port/SD card slot hub 1 signal input condition ▪ Auxiliary jack/USB port/SD card slot hub 2 signal input condition ▪ RS-485 signal input condition ▪ SD card insertion condition ▪ CD or DVD equipment recognition condition ▪ DVD equipment recognition condition
65	Commander and Switch Check	Switch Inspection	Displays the steering switch or commander switch operation content in the center display. **NOTE:** • If the operation content previously detected is being displayed in the center display, newly detected content is added over it.
68	Software version display (TFT Display)	Software version verification	Displays the center display (TFT LCD screen control) software version.

69	Software version display (Touch Panel)	Software version verification	Displays the center display (touch panel control) software version.

70	Display Check	Display/touch panel inspection	• Displays the display/touch panel inspection results in the center display.
			  ◦ Unicolor screen in the following colors
			  ▪ White→Black→Red→Green→Blue
			  ◦ Horizontal-striped screen in black and the following colors
			  ▪ Red→Green→Blue
			  ◦ Vertical-striped screen in black and the following colors
			  ▪ Red→Green→Blue
			  ◦ Checkered screen in black and the following colors
			  ▪ Red→Green→Blue
			  ◦ Returns to 1.
			NOTE:
			• The display/touch panel inspection is repeated periodically until the same location on the center display is touched for **10 s or more**.

72	GPS Data	GPS information verification	• Displays the following GPS information in the center display.
			  ▪ Degree of longitude in GPS information of the current location
			  ▪ Degree of latitude in GPS information of the current location
			  ▪ Date and time information (GMT)
			  ▪ Number of satellites being received

84	Manufacturer Code Display TAU	Manufacturer name verification	Displays the TAU manufacturer in the center display.
85	Part Number Readout TAU	Part number verification	Displays the TAU part number (first 4 digits).
87	HD Certification (Main Tuner)	Do not operate because item is for	Do not operate because item is for manufacturer use.

		manufacturer use.	
88	HD Certification (Sub Tuner)	Do not operate because item is for manufacturer use.	Do not operate because item is for manufacturer use.
89	Part Number Readout TAU	XM Certification	Do not operate because item is for manufacturer use.
90	AM Reception Sensitivity Level Test	Radio reception condition verification	Displays the radio reception condition in the center display.
91	Radio Test Mode (Main)	Do not operate because not equipped to vehicle.	Do not operate because not equipped to vehicle.
92	Radio Test Mode (Sub)	Do not operate because not equipped to vehicle.	Do not operate because not equipped to vehicle.
93	Software Version Display (TAU)	Software version verification	Displays the TAU software version.
94	Speaker Cyclic Test	Speaker Inspection	• Outputs sound from the speakers in the following order: **Without Bose®** 1. Front door speaker (LH) and tweeter (LH) 2. Front door speaker (RH) and tweeter (RH) 3. Rear door speaker (RH) 4. Rear door speaker (LH) **With Bose®** 1. Front door speaker (LH) 2. Front door speaker (RH) 3. Rear door speaker (RH) 4. Rear door speaker (LH)

95	Vehicle Info Display (TAU)	Do not operate because not equipped to vehicle.	Do not operate because not equipped to vehicle.
96	XM Serial Number	XM tuner unique number (ESN) verification	Displays the unique number (ESN) of the XM tuner in the TAU in the center display.
97	Radio Electric Field Strength (AM)	AM radio field strength verification	• Displays the following information in the center display. ▪ AM radio station frequency (kHz) being received ▪ Frequency field strength (dBuV) **NOTE:** • Frequencies can be changed by turning the commander knob.
98	Radio Electric Field Strength (FM)	FM radio electric field strength verification	• Displays the following information in the center display. ▪ FM radio station frequency (MHz) being received ▪ Frequency field strength (dBuV) **NOTE:** • Frequencies can be changed by turning the commander knob.
99	Software Update	Do not operate because not equipped to vehicle.	Do not operate because not equipped to vehicle.

2014 - Mazda3 - Body and Accessories

ON-BOARD DIAGNOSTIC [AUDIO AMPLIFIER (WITH CENTER DISPLAY)]

Outline

- The audio amplifier has an on-board diagnostic function to facilitate system diagnosis.

Function

- The on-board diagnostic function consists of the following functions:
  - A malfunction detection function, which detects overall malfunctions in the audio amplifier-related parts.
  - A memory function, which stores detected DTCs; a display function, which indicates system malfunctions via DTC display.

On-board Diagnostic Function

Malfunction detection function

- Detects overall malfunctions in the immobilizer system-related parts.
- If a malfunction occurs, the start stop unit records the malfunction as a DTC. A recorded DTC can be read by the Mazda Modular Diagnostic System (M-MDS).

C: CMDTC self test

DTC 7-digit code definition

- When related systems or components have failed, the CM stores the DTC of the malfunctioning part in the CM memory, and allows for

the retrieval of the store data using scanning tool when necessary. The DTCs are indicated using seven digits. Each digit indicates the following.

Status byte for DTC

- The two digits (two digits after hyphen (-)) after the seven-digit DTC.

- A code which indicates the pending code, current/past malfunction status, or warning illumination status.
- Can be read by performing a CMDTC self-test using the Mazda Modular Diagnostic System (M-MDS).
- For details, refer to the explanation on the M-MDS when reading the DTC.

2014 - Mazda3 - Body and Accessories

POWER SYSTEMS

Outline

- System in which electric current from the battery supplies power to each electrical part.
- There are mainly three types of electric power supply as follows, which are divided into system-supplied power and power used by parts.
    - Supply of direct power from battery
    - Supply of power by switching ignition ON (engine off)
    - Supply of power by switching ignition ON (engine on)

Specification

Component parts	Specification	
Relay and fuse block	Wiring harness-integrated type	
Fuse block	Wiring harness-integrated type	
Main fuse	EPS fuse rating	60 A
	MAIN fuse rating	200 A
	STARTER fuse rating	250 A
Multiplex slow blow fuse	CABIN+B fuse rating	50 A
	ABS/DSCM fuse rating	50 A
	ENG.MAIN fuse rating	40 A
	HEATER fuse rating	40 A
	DEFOG fuse rating	40 A
	INJECTOR fuse rating	30 A
	ADD FAN GE fuse rating	30 A
	FAN GE fuse rating	30 A
Accessory socket	Rated voltage	DC 12 V
	Rated load	10 A

Structural view

2014 - Mazda3 - Body and Accessories

RELAY AND FUSE BLOCK

Purpose

- Relays and fuses used by each system are grouped and housed together for smooth inspection and replacement servicing.

Function

- Relays and fuses used by each system are grouped and housed together.

Construction

- Installed in the engine compartment.

Operation

Relay operation

1. When electric current flows to the coil, electromagnetic power is generated.
2. The switch is attracted by the generated electromagnetic power and switches on.

Fuse operation

1. If electric current to each fuse is the specified value or more, the fuse melts due to heat generation.
2. Current between the fuse and ground is interrupted.

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

MULTIPLEX SLOW BLOW FUSE

Purpose

- Size reduction of the relay and fuse block has been realized by aggregating 8 fuses together and downsizing.

Function

- Fuses used by each system are grouped and housed together.

Construction

- Installed in the relay and fuse block.
- The multiplex slow blow fuse is installed to the relay and fuse block using a bolt. Refer to the workshop manual for the multiplex slow blow fuse removal/installation.

Operation

Fuse operation

1. If electric current to each fuse is the specified value or more, the fuse melts due to heat generation.

2. Current between the fuse and ground is interrupted.

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

FUSE BLOCK

Purpose

- Fuses used by each system are grouped and housed together for smooth inspection and replacement servicing.

Function

- Fuses used by each system are grouped and housed together.

Construction

- Installed inside the front side trim (LH).

Operation

Fuse operation

1. If electric current to each fuse is the specified value or more, the fuse melts due to heat generation.

2. Current between the fuse and ground is interrupted.

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

MAIN FUSE

Purpose

- If electric current of the specified value or more flows to each fuse, the fuse melts due to heat generation to protect the systems and parts downstream of the fuse.

Function

- If electric current to each fuse is the specified value or more, the fuse melts due to heat generation.

Construction

- Installed to the battery terminal (+).

Operation

1. If electric current to each fuse is the specified value or more, the fuse melts due to heat generation.
2. Current between the fuse and ground is interrupted.

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

ACCESSORY SOCKET

Purpose

- By inserting the plug of an electrical device, 12 V (maximum 120 W) of power is supplied enabling use of the electrical device in the vehicle.

Function

- When the ignition is switched to ACC or ON (engine off or on), 12 V (maximum 120 W) of power is supplied.

Construction

- A cap is installed to prevent penetration of foreign matter in the socket such as dust.
- A front accessory socket is installed to the front console. (With front accessory socket)
- A center accessory socket is installed inside the rear console. (With center accessory socket)

Operation

Front accessory socket

1. When the ignition is switched to ACC or ON (engine on or off), power is supplied constantly.

Center accessory socket

1. Power is supplied constantly.

Fail-safe

- Function not equipped.

ACCESSORY SOCKET

2014 - Mazda3 - Body and Accessories

INSTRUMENTATION/DRIVER INFO.

Outline

- The following warning/indication systems have been adopted.
  - Instrument cluster
  - Blind spot monitoring (BSM) system (with blind spot monitoring (BSM) system)
  - Lane departure warning system (LDWS) (With lane departure warning system (LDWS))
  - Indicator unit
- An instrument cluster integrated with an active driving display has been adopted which displays the driving speed, warning screen, and direction of vehicle travel (with car-navigation system). (Type A instrument cluster)
- A blind spot monitoring (BSM) system has been adopted which notifies the driver of vehicles approaching from behind on the left or right adjacent lanes in the driver's blind spot, and warns the driver if the driver tries to change lanes to the side of the approaching vehicle. (With blind spot monitoring (BSM) system)
- A lane departure warning system (LDWS) has been adopted which recognizes vehicle lane lines on the road using the forward sensing camera (FSC) installed to the windshield and notifies the driver if the vehicle may depart from its lane unbeknownst to the driver. (With lane departure warning system (LDWS))
- An indicator unit has been adopted which displays the passenger seat belt warning light and PAD indicator light.

INSTRUMENT CLUSTER

Outline

- The following three types of instrument clusters have been set.
  - TYPE A (Digital speedometer type)

    Specification

    - Digital speedometer
    - Analog tachometer
    - Odometer/tripmeter
    - Fuel gauge
    - Indicator/warning lights
    - Alarm
    - Trip computer
    - Active driving display
  - TYPE B (Analog speedometer type (with tachometer))

    Specification

    - Analog speedometer
    - Digital tachometer
    - Odometer/tripmeter
    - Fuel gauge
    - Indicator/warning lights
    - Alarm
    - Trip computer
  - TYPE C (Analog speedometer type (without tachometer))

    Specification

    - Analog speedometer
    - Odometer/tripmeter
    - Fuel gauge
    - Indicator/warning lights
    - Alarm

Function

- The instrument cluster displays the following information to notify the user of the vehicle conditions.

- Vehicle speed (speedometer)
- Engine speed (tachometer)
- Remaining fuel quantity (fuel gauge)
- Traveled distance (odometer/tripmeter)
- Average fuel economy, average vehicle speed, instantaneous fuel economy, remaining distance to empty (trip computer)
- Indicator/warning lights

Speedometer display function

- The instrument cluster controls the speedometer based on the vehicle speed signal sent via CAN transmission from the PCM, and displays the current vehicle speed. For details on the speedometer, refer to SPEEDOMETER. (See **SPEEDOMETER**.)

Tachometer display function

- The instrument cluster controls the tachometer based on the engine speed signal sent via CAN transmission from the PCM, and displays the current engine speed. For details on the tachometer, refer to TACHOMETER. (See **TACHOMETER**.)

Fuel gauge display function

- The instrument cluster displays the remaining fuel quantity based on the fuel gauge resistance signal sent via CAN transmission from the RBCM, and the fuel injection amount signal sent via CAN transmission from the PCM. For details on the fuel gauge, refer to FUEL GAUGE. (See **FUEL GAUGE**.)

Odometer/tripmeter display function

- The instrument cluster displays the total traveled distance/traveled distance over a specific interval based on the travel distance signal sent via CAN transmission from the PCM. For details on the odometer/tripmeter, refer to ODOMETER/TRIPMETER. (See **ODOMETER/TRIPMETER**.)

Trip computer calculation function

- The instrument cluster calculates the average fuel economy, average vehicle speed, instantaneous fuel economy, and the remaining distance to empty, and displays it on the LCD in the instrument cluster. For details on the trip computer, refer to TRIP COMPUTER INFORMATION SYSTEM. (See **TRIP COMPUTER INFORMATION SYSTEM**.)

Warning/Indicator lights illuminate/flash function

- The instrument cluster illuminates/flashes the indicator/warning lights to notify the user of the vehicle system conditions.
- The types of indicator/warning lights are as follows: Refer to reference for details on each indicator/warning light.
- For vehicles with the center display, a warning message in the center display is displayed when the indicator/warning light is turned on or flashed. For the message content and verification method, refer to the CENTER DISPLAY. (See **CENTER DISPLAY [WITH CENTER DISPLAY]**.)

TYPE A (Digital speedometer type)

Alarm operation function

- The instrument cluster sounds the alarm using the buzzer built into the instrument cluster to notify the user of the vehicle conditions.
- The alarm types are as follows: Refer to reference for details on each alarm.

Name	Reference
Lights-on reminder warning alarm	(See **LIGHTS-ON REMINDER WARNING ALARM**.)
Seat belt warning alarm	(See **SEAT BELT WARNING ALARM**.)
Air bag system warning alarm	(See **AIR BAG SYSTEM WARNING ALARM [TWO-STEP DEPLOYMENT CONTROL SYSTEM]**.) (See **AIR BAG SYSTEM WARNING ALARM [STANDARD DEPLOYMENT CONTROL SYSTEM]**.)
Keyless warning alarm	(See **KEYLESS WARNING ALARM**.)
Tire pressure monitoring sysstem warning alarm (with TPMS)	(See **TIRE PRESSURE MONITORING SYSTEM WARNING ALARM**.)
Panel light control indicator alarm	(See **PANEL LIGHT CONTROL INDICATOR ALARM**.)
Turn and hazard indicator alarm	(See **TURN AND HAZARD INDICATOR ALARM**.)
Smart city brake support (SCBS) warning alarm (with SCBS)	(See **SMART CITY BRAKE SUPPORT (SCBS)**.)
RCTA warning alarm (with BSM system)	(See **BLIND SPOT MONITORING (BSM) SYSTEM**.)
Blind spot monitoring (BSM) warning alarm (with BSM system)	(See **BLIND SPOT MONITORING (BSM) WARNING ALARM**.)
LDWS warning alarm (with lane departure warning system (LDWS))	(See **LDWS WARNING ALARM**.)
i-ELOOP warning alarm	(See **i-ELOOP WARNING ALARM [i-ELOOP]**.)
Power steering warning buzzer	(See **POWER STEERING WARNING BUZZER**.)
Over rev. warning alarm (Type C instrument cluster only)	(See **OVER REV. WARNING ALARM [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)

- If several alarm request signals are received simultaneously, the alarms sound according to the order of precedence in the following table.

Ignition is switched off

Order or precedence	Name

1	Keyless warning alarm (pattern A)
2	Lights-on reminder warning alarm
3	Keyless warning alarm (pattern B, C)
4	Turn and hazard indicator alarm
5	Panel light control indicator alarm

Ignition switch ON (engine off or on)

Order or precedence	Name
1	Over rev. warning alarm (Type C instrument cluster only)
2	Seat belt warning alarm (Driver/passenger)
3	Tire pressure warning alarm (Tire pressure monitoring system initialization) (with TPMS)
4	Tire pressure warning alarm (Tire pressure monitoring system operating) (with TPMS)
5	Smart city brake support (SCBS) warning alarm (with SCBS)
6	RCTA warning alarm (with BSM system)
7	Blind spot monitoring (BSM) warning alarm (with BSM system)
8	LDWS warning alarm (with lane departure warning system (LDWS))
9	Keyless warning alarm
10	Air bag system warning alarm
11	i-ELOOP warning alarm
12	Power steering warning buzzer
13	Turn and hazard indicator alarm
14	Panel light control indicator alarm

Panel light control function

- The instrument cluster changes the panel light brightness according to the ignition switch being turned ON (engine off or on) or the TNS being illuminated. For details on the panel light, refer to PANEL LIGHT. (See **PANEL LIGHT**.)

Vehicle specification information transmission function

- The instrument cluster sends vehicle specification information stored during configuration to the following modules via CAN transmission.
    - PCM
    - TCM (ATX)
    - DSC HU/CM
    - EPS control module
    - SAS control module
    - Start stop unit
    - AFS control module (with AFS)
    - Laser sensor (with smart city brake support (SCBS))
    - Connectivity master unit (CMU)
    - Audio amplifier (with Bose®)
    - Rear body control module (RBCM)
    - Climate control unit (with full-auto A/C)
    - Blind spot monitoring (BSM) control module (with BSM system)

Battery discharge suppression function

NOTE:

- This function is established for suppressing battery discharge during vehicle manufacture and shipment, however, if a room fuse is removed from a vehicle while the total traveled distance is low, the function may operate when the vehicle is in the market.
- The battery discharge suppression is a function in which the instrument cluster sends a battery discharge suppression signal to the following units based on the room fuse condition and the total traveled distance, and suppresses battery discharge by restricting the operation of electric load for the following units.

Unit	Control description
Front body control module (FBCM)	Day time running light turns off 5 min after it is illuminated. (Only when engine stopped)
Start stop unit	Ignition is switched off 25 min after ignition is switched to ACC or ON (engine off) (For ATX, only when selector lever is in P position).

- The battery discharge suppression function operates when the total traveled distance is the threshold or less and the room fuse has been removed.
- When the battery discharge suppression function is operated, the instrument cluster displays F0-002, F0-HHH, F0-LLL in the odometer/tripmeter of the instrument cluster to indicate that the battery discharge suppression function is operating.
- The battery discharge suppression function is stopped under the following conditions.
    - Room fuse is installed
    - Engine is started
    - Total traveled distance exceeds the threshold value

Memory function

- The instrument cluster stores personalization setting information. The stored information is not cleared even if the battery power is disconnected.

NOTE:

- Because the personalization setting information stored in the instrument cluster cannot be written to a new instrument cluster, if the instrument cluster is replaced, the personalization setting information is at the initial setting. Therefore, before replacing the instrument cluster, verify the personalization setting information and reset the replaced instrument cluster with the information.

Fail-safe

Speedometer

- If the CAN signal cannot be received normally, the instrument cluster displays the 0 mark.

Tachometer

- If the CAN signal cannot be received normally, the instrument cluster displays the 0 mark.

Fuel gauge

- If the CAN signal cannot be received normally, the instrument cluster turns off one segment at regular time intervals since the segments calculated based on the signal last received are displayed.

Odometer/tripmeter

- If the instrument cluster detects a malfunction in the internal CPU, the instrument cluster displays the “— —“.

Warning lights

- If the CAN signal cannot be received normally, the instrument cluster turns the warning light on.

Indicator lights

- If the CAN signal cannot be received normally, the instrument cluster turns the indicator light off.

Alarm

- If the CAN signal cannot be received normally, the instrument cluster stops the alarm.

Panel light

- If the CAN signal cannot be received normally, the instrument cluster turns the panel light on.

Trip computer information system

- If the instrument cluster detects a malfunction in the internal CPU, the instrument cluster displays the “— —“.

Ambient temperature display

- If the CAN signal cannot be received normally, the instrument cluster displays the “— —“.

2014 - Mazda3 - Body and Accessories

LIGHTS-ON REMINDER WARNING ALARM

Purpose

- The lights-on reminder warning alarm notifies the driver that the TNS and headlights are not turned off.

Function

- The instrument cluster receives the following vehicle condition signals via the CAN signal from the start stop unit, rear body control module (RBCM) and front body control module (FBCM).
    - TNS switch ON signal from start stop unit (TNS and headlights illuminate)
    - Driver's front door latch switch ON signal from rear body control module (RBCM)
    - Auto light OFF system OFF signal from front body control module (FBCM)
- If the ignition is switched to OFF or ACC when all the above vehicle condition signals are received, the instrument cluster operates the lights-on reminder alarm.
- The lights-on reminder warning alarm sound pattern is as shown in the figure.

Construction

- The lights-on reminder warning alarm sounds using the buzzer built into the instrument cluster.

Operation

1. The instrument cluster receives (1) the TNS switch ON signal from the start stop unit, the driver’s front door latch switch ON signal from the rear body control module (RBCM), and the auto light OFF system OFF signal from the front body control module (FBCM).

2. When the ignition is switched to OFF or ACC while each signal is received, the instrument cluster turns on (2) the transistor.

3. When the transistor turns on, the ground circuit of the alarm is established and the alarm sounds (3).

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

SEAT BELT WARNING ALARM

Purpose

- The seat belt warning alarm warns occupants that a seat belt is not fastened.

Function

- The instrument cluster sounds the seat belt warning alarm based on the following CAN signals:
  - Vehicle speed signal sent from PCM
  - Driver/passenger buckle switch signal, occupancy sensor signal sent from SAS control module

Driver/passenger seat belt warning alarm sound function

- The driver/passenger seat belt warning alarm has a warning for when the vehicle is stopped, while the vehicle is being driven, and subsequent warnings while the vehicle is being driven.

Warning while vehicle is stopped

- When all of the following conditions have been met, the alarm sounds.
  - Ignition switch ON (engine off or on)
  - Driver/passenger buckle switch on signal (seat belt unfastened) is detected
  - Occupancy sensor on signal (occupant in passenger seat) is detected (passenger seat belt warning light only)
- The driver/passenger seat belt warning alarm sound pattern is as shown in the figure.

DRIVER/PASSENGER SEAT BELT WARNING ALARM

Warning while vehicle is being driven

- When all of the following conditions are met, the alarm sounds.
  - Vehicle speed is approx. 20 km/h {12 mph} or more
  - Driver/passenger buckle switch on signal (seat belt unfastened) is detected

- Occupancy sensor on signal (occupant in passenger seat) is detected (passenger seat belt warning light only)

- The driver/passenger seat belt warning alarm sound pattern is as shown in the figure.

DRIVER/PASSENGER SEAT BELT WARNING ALARM

Subsequent warning

- When all of the following conditions are met, the alarm sounds.
  - Vehicle speed is approx. 20 km/h {12 mph} or more
  - Occupancy sensor on signal (occupant in passenger seat) is detected (passenger seat belt warning light only)
  - After initial warning operates, buckle switch off signal (seat belt fastened) to on signal (seat belt unfastened) is detected
- The driver/passenger seat belt warning alarm sound pattern is as shown in the figure.

DRIVER/PASSENGER SEAT BELT WARNING ALARM

Construction

- The seat belt warning alarm sounds using the buzzer built into the instrument cluster.

Operation

1. The instrument cluster receives (1) the vehicle speed signal from the PCM, the driver/passenger buckle switch signal and occupancy sensor signal from the SAS control module when the ignition is switched ON (engine off or on).

2. The instrument cluster microcomputer turns the transistor on (2) based on each signal.

3. When the transistor turns on, a ground circuit with the alarm is established and the alarm sounds (3).

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

PANEL LIGHT CONTROL INDICATOR ALARM

Purpose

- The panel light control indicator alarm notifies the driver that the panel light brightness is either at maximum or minimum.

Function

- If the panel light control switch is in the maximum rotation position right or left when the TNS switch ON signal (TNS and headlights illuminate) sent from the start stop unit via the CAN signal is received, the instrument cluster sounds the panel light control indicator alarm.
- The panel light control indicator alarm sound pattern is as shown in the figure.

Construction

- The panel light control indicator alarm sounds using the buzzer built into the instrument cluster.

Operation

1. The instrument cluster receives (1) the TNS switch ON signal from the start stop unit.

2. If the maximum rotation position of the panel light control switch is detected (2) when the TNS switch ON signal is received, the instrument cluster microcomputer turns on (3) the transistor.

3. When the transistor turns on, a ground circuit with the alarm is established and the alarm sounds (4).

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

TURN AND HAZARD INDICATOR ALARM

Purpose

- The turn and hazard indicator alarm notifies the driver that a turn light or the hazard warning lights are flashing.

Function

- When the instrument cluster receives the turn signal/hazard warning indicator light illumination request signal sent from the front body control module (FBCM) via the CAN signal, the turn and hazard indicator alarm sounds simultaneously with illumination on/off of the direction/hazard warning indicator lights.
- The turn and hazard indicator alarm sound pattern is as follows:

Sound frequency (Hz)	Alarm when turn signal/hazard warning indicator lights illumination off → on: 1,400 Alarm when turn signal/hazard warning indicator lights illumination on → off: 1,300
Sound frequency	Continuously
Wave pattern	
Construction

- The turn and hazard indicator alarm sounds using the buzzer built into the instrument cluster.

Construction, Operation

1. The instrument cluster receives (1) the turn signal/hazard warning indicator light request signal from the front body control module (FBCM).

2. The instrument cluster microcomputer turns the transistor on (2) based on the turn signal/hazard warning indicator light request signal.

3. When the transistor turns on, a ground circuit with the alarm is established and the alarm sounds (3).

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

LOW ENGINE COOLANT TEMPERATURE INDICATOR LIGHT (BLUE)/HIGH ENGINE COOLANT TEMPERATURE WARNING LIGHT (RED)

Purpose

Low engine coolant temperature indicator light (blue)

- The low engine coolant temperature indicator light (blue) notifies the driver that the engine coolant temperature is low and vaporization of the fuel is difficult.

High engine coolant temperature warning light (red)

- The high engine coolant temperature warning light (red) notifies the driver that the engine coolant temperature is high and that there is the danger of overheating.

Function

Low engine coolant temperature indicator light (blue)

- The low engine coolant temperature indicator light (blue) illuminates when the engine coolant temperature is low.
- The illumination condition of the low engine coolant temperature indicator light (blue) is as shown in the figure.

- For vehicles with center display, a warning message in the center display is displayed when the low engine coolant temperature indicator light (blue) is turned on. For the message content and verification method, refer to the CENTER DISPLAY. (See **CENTER DISPLAY [WITH CENTER DISPLAY]**.)

High engine coolant temperature warning light (red)

- The high engine coolant temperature warning light (red) flashes at 0.5 s intervals when the engine coolant temperature exceeds the set value, and illuminates if the temperature increases further.
- The flashing/illumination condition of the high engine coolant temperature warning light (red) is as shown in the figure.

- For vehicles with center display, a warning message in the center display is displayed when the high engine coolant temperature warning light (red) is turned on or flashing. For the message content and verification method, refer to the CENTER DISPLAY. (See **CENTER DISPLAY [WITH CENTER DISPLAY]**.)

Construction

- Illumination, flashing, or turning off of the low engine coolant temperature indicator light (blue)/high engine coolant temperature warning light (red) is controlled by the instrument cluster microcomputer based on the engine coolant temperature signal from the PCM.
- The low engine coolant temperature indicator light (blue)/high engine coolant temperature warning light (red) is set in the instrument cluster.

Operation

Low engine coolant temperature indicator light (blue)

1. When the ignition is switched ON (while engine is running), the instrument cluster receives (1) the engine coolant temperature signal from the PCM via the CAN signal.

2. The instrument cluster turns the transistor on (2) based on the engine coolant temperature signal.

3. When the transistor turns on, the ground circuit of the low engine coolant temperature indicator light (blue) is established and the low engine coolant temperature indicator light (blue) illuminates (3).

High engine coolant temperature warning light (red)

1. When the ignition is switched ON (while engine is running), the instrument cluster receives (1) the engine coolant temperature signal from the PCM via the CAN signal.

2. The instrument cluster turns the transistor on (2) intermittently for flashing and continuously for illumination based on the engine coolant temperature signal.

3. The high engine coolant temperature warning light (red) flashes (3) when the transistor is turned on intermittently, and it illuminates (3) when the transistor is turned on continuously.

LOW ENGINE COOLANT TEMPERATURE INDICATOR LIGHT (BLUE)/HIGH ENGINE COOLANT TEMPERATURE WARNING LIGHT (RED)

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

DOOR-AJAR WARNING LIGHT

Purpose

- The door-ajar warning light notifies the driver that any door or the trunk lid (4SD)/liftgate (5HB) is open.

Function

- When the instrument cluster receives any of the following signals sent from the rear body control module (RBCM) via the CAN signal, the door-ajar warning light illuminates.
    - Door latch switch ON signal (door open)
    - Trunk lid latch switch ON signal (trunk lid open) (4SD)
    - Liftgate latch switch ON signal (liftgate open) (5HB)

Construction

- The instrument cluster controls illumination on/off of the door-ajar warning light using the instrument cluster microcomputer based on the door latch or trunk lid (4SD)/liftgate (5HB) latch position signal from the rear body control module (RBCM).
- The door-ajar warning light is set in the instrument cluster.

Operation

1. The instrument cluster receives (1) the door latch switch ON signal or trunk lid (4SD)/liftgate (5HB) latch switch ON signal from the rear body control module (RBCM).

2. The instrument cluster microcomputer turns the transistor on (2) based on each signal.

3. When the transistor turns on, a ground circuit with the door-ajar warning light is established and the door-ajar warning light illuminates (3).

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

SEAT BELT WARNING LIGHT

Purpose

- The seat belt warning light warns the driver that a seat belt is not fastened.

Function

- The instrument cluster flashes/illuminates the seat belt warning light based on the following CAN signals:
  - Vehicle speed signal sent from PCM
  - Driver/passenger buckle switch signal, occupancy detection sensor signal sent from SAS control module

Driver/passenger seat belt warning light display function

- The driver/passenger seat belt warning light has a warning for when the vehicle is stopped, while the vehicle is being driven, and subsequent warnings while the vehicle is being driven.

Warning when vehicle is stopped

- When all of the following conditions are met, it flashes/illuminates.
  - Ignition switch ON (engine off or on)
  - Driver/passenger buckle switch on signal (seat belt unfastened) is detected
  - Occupancy sensor on signal (occupant in passenger seat) is detected (passenger seat belt warning light only)
- The driver/passenger seat belt warning flash/illumination pattern is as shown in the figure.

Warning while vehicle is driven

- When all of the following conditions are met, it flashes/illuminates
  - Vehicle speed is approx. 20 km/h {12 mph} or more
  - Driver/passenger buckle switch on signal (seat belt unfastened) is detected
  - Occupancy sensor on signal (occupant in passenger seat) is detected (passenger seat belt warning light only)
- The driver/passenger seat belt warning flash/illumination pattern is as shown in the figure.

Subsequent warning while vehicle is driven

- When all of the following conditions are met, it flashes/illuminates
  - Vehicle speed is approx. 20 km/h {12 mph} or more
  - Occupancy sensor on signal (occupant in passenger seat) is detected (passenger seat belt warning light only)
  - After warning while vehicle is being driven operates, buckle switch off signal (seat belt fastened) to on signal (seat belt unfastened) is detected
- The driver/passenger seat belt warning flash/illumination pattern is as shown in the figure.

Construction

- The microcomputer in the instrument cluster controls the illumination/flashing/turning off of the seat belt warning light based on the driver/passenger buckle switch signal and occupancy sensor signal from the SAS control module, and the vehicle speed signal from the PCM.
- The driver seat belt warning light is set in the instrument cluster.

- The passenger seat belt warning light are set in the indicator unit. For details on the passenger seat belt warning light,

refer to INDICATOR UNIT. (See **INDICATOR UNIT**.)

Operation

1. The instrument cluster receives (1) a vehicle speed signal from the PCM, and a driver/passenger seat buckle switch signal and occupancy sensor signal from the SAS control module.

2. The instrument cluster microcomputer turns the transistor on (2) intermittently for flashing and continuously for illumination based on the each signal. In addition, it sends a passenger seat belt warning request signal to the indicator unit.

3. When the transistor turns on intermittently, the driver seat belt warning light flashes (3), when it turns on continuously, the driver seat belt warning light illuminates (3).

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

LOW FUEL WARNING LIGHT

Purpose

- The low fuel warning light warns the driver that the remaining fuel level is low.

Function

- The instrument cluster calculates the fuel quantity based on the following CAN signals, and if a remaining fuel amount of approx. 9 L {2 US gal, 2 Imp gal} (fuel gauge displays remaining two segments) is detected, the low fuel warning light illuminates.
    - Fuel gauge sender unit voltage signal sent from rear body control module (RBCM)
    - Fuel injection amount signal, vehicle speed signal sent from PCM
- For vehicles with center display, a warning message in the center display is displayed when the low fuel warning light is turned on. For the message content and verification method, refer to the CENTER DISPLAY. (See **CENTER DISPLAY [WITH CENTER DISPLAY]**.)

Construction

- The instrument cluster microcomputer controls the low fuel warning light illumination on/off based on the remaining fuel amount calculation that is calculated by the instrument cluster.
- The low fuel warning light is set in the instrument cluster.

Operation

- When the ignition is switched ON (engine off or on) the instrument cluster receives (1) the fuel gauge sender unit voltage signal from the rear body control module (RBCM), and the fuel injection amount signal from the PCM.
- The instrument cluster turns the transistor on (2) if the calculated remaining fuel amount based on each signal is approx. 9 L {2 US gal, 2 Imp gal}.

- When the transistor turns on, a ground circuit with the low fuel warning light is established and the low fuel warning light illuminates (3).

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

MASTER WARNING LIGHT

Purpose

With center display

- The master warning light warns the driver that the instrument cluster has received a message from a related unit.

Without center display

- The master warning light warns the driver that any of the following malfunctions is occurring.
  - Brake switch malfunction
  - Engine oil solenoid valve malfunction
  - Global central configuration malfunction
  - Active air shutter system malfunction (with active air shutter system)
  - i-ELOOP system malfunction (with i-ELOOP system)

Function

With center display

- When the instrument cluster receives a message request signal from the related unit, the master warning light illuminates.
- The master warning light is turned on and the displayed messages in the center display are as follows:

NOTE:

- For the warning screen display method, refer to the CENTER DISPLAY. (See **CENTER DISPLAY [WITH CENTER DISPLAY]**.)

×: Applicable—: Not applicable

Center display		Related unit	Reference/function
List title	messages		
i-ELOOP System Malfunction	i-ELOOP system malfunction. Have the vehicle checked by a dealer if this indicator stays on.	PCM	(See **i-ELOOP [i-ELOOP]**.)

Battery Management System Malfunction	Battery management system malfunction. Have the vehicle checked by a dealer.	PCM	(See **CHARGING SYSTEM WARNING LIGHT [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) (See **i-ELOOP [i-ELOOP]**.)
Brake Override System Malfunction	Brake switch malfunction. Have the vehicle checked by a dealer immediately.	PCM	(See **DRIVE-BY-WIRE CONTROL [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)
SCBS Malfunction	Smart city brake support (SCBS) malfunction. Have the vehicle checked by a dealer immediately.	Laser sensor	(See **SMART CITY BRAKE SUPPORT (SCBS)**.)
	Smart city brake support (SCBS) malfunction.Clean the front windshield. Have the vehicle checked by a dealer if this indicator stays on.	Laser sensor	
SCBS Unavailable	Smart city brake support (SCBS) currently unavailable.	Laser sensor	
HBC/LDWS Camera Malfunction	High beam control (HBC)/Lane departure warning system (LDWS) malfunction.Clean the windshield. Have the vehicle checked by a dealer if this indicator stays on.	Forward sensing camera (FSC)	(See **HIGH BEAM CONTROL (HBC) SYSTEM**.) (See **LANE DEPARTURE WARNING SYSTEM (LDWS)**.)
HBC/LDWS System Malfunction	High beam control (HBC)/Lane departure warning system (LDWS) malfunction. Have the vehicle checked by a dealer if this indicator stays on.	FSC	
	High beam control (HBC)/Lane departure warning system (LDWS) malfunction.Defrost the windshield. Have the vehicle checked by a dealer if this indicator stays on.	FSC	
Vehicle System Malfunction	Vehicle system malfunction. Have the vehicle checked by a dealer.	PCM (Global central configuration error or active air shutter system malfunction)	(See **ON-BOARD DIAGNOSTIC SYSTEM TEST MODE [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) (See **ACTIVE AIR SHUTTER CONTROL**.)

- If the cancel procedure for preventing unnecessary operation of the brake override system is implemented, the PCM sends a master warning light flash request signal to the instrument cluster as a CAN signal. The instrument cluster flashes the master warning light based on the master warning light flash request signal sent from the PCM. For the cancel procedure to prevent unnecessary operation of the brake override system, refer to the DRIVE-BY-WIRE CONTROL. (See **DRIVE-BY-WIRE CONTROL [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)
- The master warning light flashing pattern is as indicated in the figure.

Without center display

- The instrument cluster illuminates the master warning light based on the following CAN signals:
    - Brake switch No.1 error signal, brake switch No.2 error signal, engine oil solenoid valve error signal, current sensor error signal, power supply system error signal, global central configuration error signal, active air shutter error signal (with active air shutter system), and i-ELOOP system error signal (with i-ELOOP system) sent from the PCM

NOTE:

- There are warning lights which are illuminated/flashed simultaneously when the master warning light is illuminated. For the warning lights which are illuminated/flashed simultaneously when the master warning light is illuminated, refer to the ON-BOARD DIAGNOSTIC SYSTEM TEST MODE. (See **ON-BOARD DIAGNOSTIC SYSTEM TEST MODE [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)
- If the cancel procedure for preventing unnecessary operation of the brake override system is implemented, the PCM sends a master warning light flash request signal to the instrument cluster as a CAN signal. The instrument cluster flashes the master warning light based on the master warning light flash request signal sent from the PCM. For the cancel procedure to prevent unnecessary operation of the brake override system, refer to the DRIVE-BY-WIRE CONTROL. (See **DRIVE-BY-WIRE CONTROL [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)
- The master warning light flashing pattern is as indicated in the figure.

Construction

- The instrument cluster microcomputer controls the illumination/flashing/turning off of the master warning light based on each error signal sent from the PCM or a message request signal (with center display) from the related system.
- The master warning light is set in the instrument cluster.

Operation

- When the ignition is switched ON (engine off or on), the instrument cluster receives (1) each error signal or a master warning light flash request signal from the PCM, or a message request signal (with center display) from the related unit.
- The instrument cluster turns the transistor on (2) intermittently for flashing and continuously for illumination based on each signal.
- The master warning light flashes (3) when the transistor is turned on intermittently, and it illuminates (3) when the transistor is turned on continuously.

With center display

Without center display

Fail-safe

Function not equipped.

2014 - Mazda3 - Body and Accessories

SPEEDOMETER

Purpose

- The speedometer notifies the driver of the speed at which the vehicle is traveling.

Function

Type A instrument cluster

- The instrument cluster displays the current vehicle speed based on the vehicle speed signal from the PCM.

Type B or type C instrument cluster

- The instrument cluster controls the speedometer needle based on the vehicle speed signal from the PCM and displays the current vehicle speed.

Construction

Type A instrument cluster

- A digital display speedometer has been adopted.
- The current vehicle speed is displayed in the speedometer display and the active driving display.

Type B or type C instrument cluster

- An analog needle display speedometer with a stepping motor mechanism has been adopted.

Operation

Type A instrument cluster

- The instrument cluster receives (1) the vehicle speed signal from the PCM when the ignition is switched ON (engine on).
- The instrument cluster displays (2) the current vehicle speed based on the vehicle speed signal.

Type B or type C instrument cluster

- The instrument cluster receives (1) the vehicle speed signal from the PCM when the ignition is switched ON (engine on).
- The instrument cluster moves the needle based on the vehicle speed signal and displays (2) the current vehicle speed.

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

TACHOMETER

Purpose

- The tachometer notifies the driver of the engine speed. In addition, it warns the driver to change gears using the red zone, which indicates that the engine is running at excess engine speed, and the striped zone, which indicates that the engine is on the verge of running at excess engine speed.

Function

Type A instrument cluster

- The instrument cluster controls the tachometer needle based on the engine speed signal from the PCM and displays the engine speed per minute.

Type B instrument cluster

- The instrument cluster displays the engine speed per minute based on the engine speed signal from the PCM.

Construction

Type A instrument cluster

- An analog needle display tachometer with a stepping motor mechanism has been adopted.
- The striped zone, which indicates that the engine is on the verge of running at excess speed, and the red zone, which indicates the engine is running at excess speed, are printed on the tachometer.

Type B instrument cluster

- A digital display tachometer has been adopted.
- The tachometer displays a striped zone, which indicates that the engine is on the verge of running at excess speed, and the red zone, which indicates the engine is running at excess speed.

Operation

Type A instrument cluster

- The instrument cluster receives (1) the engine speed signal from the PCM when the ignition is switched ON (engine on).
- The instrument cluster moves the needle based on the engine speed signal and displays (2) the current engine speed.

Type B instrument cluster

- The instrument cluster receives (1) the engine speed signal from the PCM when the ignition is switched ON (engine on).
- The instrument cluster displays (2) the current engine speed based on the engine speed signal.

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

FUEL GAUGE

Purpose

- The fuel gauge notifies the user of the amount of remaining fuel.

Function

- The instrument cluster calculates the amount of fuel in the fuel tank based on the following CAN signals and displays the fuel gauge segments.
    - Fuel gauge sender unit voltage signal sent from rear body control module (RBCM)
    - Fuel injection amount signal, vehicle speed signal sent from PCM

Fuel gauge flicker prevention function

- When the instrument cluster determines that the vehicle is being driven, it retards the response with which the calculated amount of fuel is reflected to the fuel gauge. As a result, fuel gauge flicker caused by the variation of fuel surface during driving is prevented.

Refuel determination function

- If the amount of fuel is changed by 5 L {1 US gal, 1 Imp gal}/2 L {0.5 US gal, 0.4 Imp gal}*1 or more while the vehicle is stopped, the instrument cluster determines that the vehicle is refueled and displays the fuel gauge segments based on the fuel gauge sender unit voltage signal from the rear body control module (RBCM).

*1

5 L {1 US gal, 1 Imp gal} when the number of fuel gauge segments is 14 or less/2 L {0.5 US gal, 0.4 Imp gal} when the number of fuel gauge segments is 15 or more.

Construction

- The fuel gauge is displayed in the LCD of the instrument cluster.
- The fuel gauge is consists of 15 segments.

Operation

- When the ignition is switched ON (engine off or on), the rear body control module (RBCM) converts the resistance from the fuel gauge sender unit to voltage and sends it to the instrument cluster as a fuel gauge sender unit voltage signal (1).
- The instrument cluster receives the fuel gauge sender unit voltage signal from the rear body control module (RBCM), and it also receives the fuel injection amount control signal and vehicle speed signal from the PCM (2).
- The instrument cluster calculates the amount of fuel in the fuel tank based on the signals (3).
- The instrument cluster displays/turns off the fuel gauge segments according to the calculation result (4).

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

ODOMETER/TRIPMETER

Purpose

- The odometer/tripmeter notifies the user of the total travel distance or the traveled distance over a specific interval.

Function

- The instrument cluster calculates the traveled distance based on the traveled distance signal from the PCM and displays it.
- The instrument cluster stores the calculated travel distance in the microcomputer of the instrument cluster.

Odometer calculation function

- The instrument cluster calculates the total traveled distance based on the traveled distance signal from the PCM and the stored traveled distance, and displays it.
- The total traveled distance which can be displayed is from 0 to 999,999.

Tripmeter A/B calculation function

- The instrument cluster calculates the traveled distance based on the traveled distance signal from the PCM and the traveled distance from when the tripmeter is reset, and displays it.
- There are A and B tripmeters and the display for each can be switched with each press of the tripmeter switch.
- If the tripmeter switch is continuously pressed for **approx. 1 s or more**, the tripmeter traveled distance is reset (0.0)
- The traveled distance which can be displayed is from 0.0 to 999.9. After 999.9, it returns to 0.

Construction

- The odometer/tripmeter is displayed in the LCD of the instrument cluster.

- The tripmeter switch is installed to the instrument cluster.

- The calculation for the odometer/tripmeter display and the traveled distance is performed by the instrument cluster microcomputer.

Operation

- The instrument cluster receives (1) the traveled distance signal from the PCM when the ignition is switched ON (engine on).
- The instrument cluster calculates the traveled distance (2) in the recorded total traveled distance (odometer) data and the traveled distance over a specific interval (tripmeter) based on the received traveled distance signal.
- The instrument cluster displays (3) the calculated travel distance in the LCD.

Odometer/tripmeter switching operation

- The instrument cluster switches the odometer/tripmeter display when a tripmeter switch ON is detected.
- The instrument cluster returns the traveled distance display to 0.0 when a tripmeter switch ON is detected for 1 s or more while tripmeter A or B is displayed.

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

PANEL LIGHT

Purpose

- The panel light adjusts the instrument cluster and steering switch illumination brightness.

Function

- The instrument cluster adjusts the brightness of the following illumination lights when a TNS illumination signal sent via CAN transmission from the front body control module (FBCM) is received.
    - Instrument cluster
    - Climate control unit
    - Steering switch
    - Cluster switch
    - Hazard warning switch
    - Selector illumination
    - Trunk lid opener switch (4SD)
    - Audio unit (without center display)
    - CD Player (with CD Player)
    - Commander switch (with center display)
- The instrument cluster changes the brightness of the illumination lights according to the rotation signal of the panel light control switch.

Construction

- The panel light control switch is set in the instrument cluster.

Operation

- When the ignition is switched ON (engine off or on), the instrument cluster receives (1) the TNS illumination signal from the front body control module (FBCM).
- The instrument cluster performs the following controls when it receives the TNS illumination signal.

- Changes the brightness of the instrument panel illumination (2).
- Outputs a panel light signal via CAN signal to the climate control unit (with full auto A/C) (2).
- Turns on the panel light circuit transistor (2).

- When the transistor turns on, a ground circuit with the panel light is established and the panel light illuminates.

Panel light control switch operation

- When the ignition is switched ON (engine off or on), the instrument cluster receives (1) the TNS illumination signal from the front body control module (FBCM).
- The instrument cluster changes the brightness of the panel light according to the rotation angle when it receives a panel light control switch rotation signal while receiving the TNS illumination signal (2).
- The instrument cluster outputs a panel light signal to related units (3).

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

TRIP COMPUTER INFORMATION SYSTEM

Outline

- The trip computer system displays the instantaneous fuel economy, average fuel economy, remaining distance to empty, and the average vehicle speed.
- The instrument cluster performs trip computer system fail-safe. (See **INSTRUMENT CLUSTER**.)

Function

- The instrument cluster controls the trip computer system based on the following CAN signals.
  - Vehicle speed signal, fuel injection amount signal, traveled distance signal sent from PCM
  - Fuel gauge sender unit voltage signal sent from rear body control module (RBCM)
  - Steering switch operation signal sent from start stop unit

Remaining travel distance calculation function

- The instrument cluster calculates the remaining travel distance based on the instantaneous fuel economy, cumulative fuel economy and the fuel tank level. In addition, the calculation results are updated every second.

Remaining travel distance formula

A TYPE

$$\text{REMAINING TRAVEL DISTANCE (miles)} = \frac{\text{FUEL TANK LEVEL (L)}}{\text{CUMULATIVE FUEL ECONOMY}^{*1}\text{ (L/mile)} \times (1500-1)/1500 + \text{INSTANTANEOUS FUEL ECONOMY (L/mile) IN PAST 0.06 mile INTERVAL}/1500}$$

B TYPE

$$\text{REMAINING TRAVEL DISTANCE (km)} = \frac{\text{FUEL TANK LEVEL (L)}}{\text{CUMULATIVE FUEL ECONOMY}^{*1}\text{ (L/km)} \times (1500-1)/1500 + \text{INSTANTANEOUS FUEL ECONOMY (L/km) IN PAST 0.1 km INTERVAL}/1500}$$

*1: SUM OF FUEL ECONOMY EVERY 0.1 km {0.06 mile} FROM CONNECTING BATTERY TO PRESENT

- When the fuel tank level reaches 6 L {2 US gal, 1 Imp gal} or less, the instrument cluster displays <0 km> or <0 miles>.

Average fuel economy calculation function

- The instrument cluster calculates the average fuel economy based on the traveled distance and fuel consumption from connecting the battery or resetting the average fuel economy. In addition, the calculation results are updated every minute.

Average fuel economy formula

A TYPE

$$\text{AVERAGE FUEL ECONOMY (mpg)} = \frac{\text{CUMULATIVE TRAVELED DISTANCE}^{*2}\text{ (mile)}}{\text{CUMULATIVE FUEL CONSUMPTION}^{*1}\text{ (gallon)}}$$

B TYPE

$$\text{AVERAGE FUEL ECONOMY (L/100 km)} = \frac{\text{CUMULATIVE FUEL CONSUMPTION}^{*1}\text{ (L)} \times 100}{\text{CUMULATIVE TRAVELED DISTANCE}^{*2}\text{ (km)}}$$

*1: SUM OF FUEL CONSUMPTION FROM CONNECTING BATTERY OR RESETTING AVERAGE FUEL ECONOMY TO PRESENT
*2: SUM OF TRAVELED DISTANCE FROM CONNECTING BATTERY OR RESETTING AVERAGE FUEL ECONOMY TO PRESENT

- If the cumulative traveled distance is 0 km, <99.9 L/100 km> or <0.0 mpg> is displayed.

If the INFO button is pressed for approx. 1.5 s or more while the average fuel economy is displayed, the cumulative fuel economy and cumulative traveled distance data are reset.

- If tripmeter A is reset, the average fuel economy is also reset.
- During the 1 min period after the data has been reset, <--- L/100 km> or <--- mpg> is displayed.

Instantaneous fuel economy calculation function

- The instrument cluster calculates the instantaneous fuel economy based on the fuel consumption and traveled distance over the past 2 s when the vehicle speed is at the set value or more. In addition, the calculation results are updated every 2 s.

Instantaneous fuel economy formula

A TYPE

$$\text{INSTANTANEOUS FUEL ECONOMY (mpg)} = \frac{\text{TRAVELED DISTANCE (mile) OVER PAST 2 s}}{\text{FUEL CONSUMPTION (gallon) OVER PAST 2 s}}$$

B TYPE

$$\text{INSTANTANEOUS FUEL ECONOMY (L/100 km)} = \frac{\text{FUEL CONSUMPTION (L) OVER PAST 2 s} \times 100}{\text{TRAVELED DISTANCE (km) OVER PAST 2 s}}$$

- When there is no fuel consumption, such as during engine braking, <0.0 L/100 km> or <99.9 mpg> is displayed.
- The instantaneous fuel economy is displayed when the vehicle speed is 7.06 km/h {4.39 mph} or more, and <--- L/100 km> or <--- mpg> is displayed when the vehicle speed is 4.24 km/h {2.63 mph} or less.

Average vehicle speed calculation function

- The instrument cluster calculates the average vehicle speed based on the cumulative traveled distance and cumulative traveled time from connecting the battery or resetting the average vehicle speed. In addition, the calculation results are updated every 10 s.

Average vehicle speed formula

A TYPE

$$\text{AVERAGE VEHICLE SPEED (mph)} = \frac{\text{CUMULATIVE TRAVELED DISTANCE (mile)}}{\text{CUMULATIVE TRAVELED TIME (h)}}$$

B TYPE

$$\text{AVERAGE VEHICLE SPEED (km/h)} = \frac{\text{CUMULATIVE TRAVELED DISTANCE (km)}}{\text{CUMULATIVE TRAVELED TIME (h)}}$$

- If the INFO button is pressed for approx.1.5 s or more while the average vehicle speed is displayed, the average vehicle speed (cumulative traveled distance and cumulative traveled time data) is reset.
- During the 1 min period after the data has been reset, <--- km/h> or <--- mph> is displayed.

Structural View

System Wiring Diagram

Operation

- When the ignition is switched ON (engine on), the instrument cluster receives (1) the vehicle speed signal, fuel injection amount signal, traveled distance signal from the PCM, the fuel gauge sender unit voltage signal from the rear body control module (RBCM), and the steering switch operation signal from the start stop unit.
- The instrument cluster microcomputer calculates (2) the instantaneous fuel economy and average fuel economy based on the received data.
- The instrument cluster microcomputer displays (3) the calculated results in the trip computer display screen.

Trip computer display switching operation

- The instrument cluster switches the trip computer display content as follows based on the steering switch operation signal from the start stop unit.

Display screen table

TYPE	REMAINING TRAVEL DISTANCE	AVERAGE FUEL ECONOMY	INSTANTANEOUS FUEL ECONOMY	AVERAGE VEHICLE SPEED
A TYPE	RANGE 100.0 miles	AVG 22.4 mpg	CURRENT 19.7 mpg	AVG 25.0 mph
B TYPE	RANGE 100.0 km	AVG 22.4 L /100km	CURRENT 19.7 L /100km	AVG 25.0 km/h

2014 - Mazda3 - Body and Accessories

ACTIVE DRIVING DISPLAY

Purpose

- The active driving display displays the vehicle information in the set display within the visual range of the driver allowing verification of the vehicle information with only the slightest change in the line of vision.

Function

- The active driving display displays the following vehicle information.
  - Current vehicle speed
  - Cruise control set vehicle speed (with cruise control system)
  - Smart city brake support (SCBS) warning display (with SCBS)
  - Lane departure warning system (LDWS) operation status or warning display (with LDWS)
  - Travel direction (turn by turn (TBT)) display (with car navigation system)
- The active driving display displays the following content based on the following CAN signals when the engine is started. Refer to reference for details on display content.

CAN signal sending module	Signal name	Display content	Display example	Reference
PCM	Vehicle speed signal	Current vehicle speed		(See **SPEEDOMETER**.)

PCM	Cruise control set vehicle speed display signal	Cruise control set vehicle speed		(See **CRUISE CONTROL SYSTEM [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.)
Laser sensor	Warning display request signal	Warning screen		(See **SMART CITY BRAKE SUPPORT (SCBS)**.)
Forward sensing camera (FSC)	Operation display request signal	Vehicle lane display	 OR 	(See **LANE DEPARTURE WARNING SYSTEM (LDWS)**.)
	Warning display request signal	Warning screen	 OR 	

Connectivity master unit (CMU)	Turn-by-turn (TBT) display request signal	Travel direction display		(See **ENTERTAINMENT SYSTEM [WITH CENTER DISPLAY]**.)

Personalization features

- The following items can be set on the active driving display.

Item	Setting contents
Height	The combiner open/close angle can be adjusted.
Brightness Control	The display brightness can be switched between automatic/manual.
Calibration	The automatic dimness adjustment level can be switched. (Can only be changed when Auto is selected in the brightness control)
Brightness	The brightness of the display can be adjusted. (Can only be changed when Manual is selected in the brightness control)
Navigation	The turn-by-turn (TBT) display can be switched on/off.
Active Driving Display	The active driving display can be switched between ON/OFF.
Reset	The active driving display setting can be changed to the initial setting.

Demonstration function

NOTE:

- The demonstration function force-displays the active driving display without the engine being started, such as on an indoor exhibition vehicle, so that customers can verify the display status.
- The demonstration function executes the active driving display with the ignition switched ON (engine off) to display the vehicle information in the display.

Demonstration function on/off setting procedure

- If any door is opened with the odometer/tripmeter switch in the instrument cluster pressed, switch the ignition as follows.
  - Ignition OFF→Ignition ON (engine off)→Ignition OFF→Ignition ON (engine off)
- If “test” is displayed in the instrument cluster, release the odometer/tripmeter switch.

NOTE:

        - With “test” displayed in the instrument cluster, the entire instrument cluster is illuminated when the odometer/tripmeter switch is released.
    - Press the odometer/tripmeter switch and 06 on or 06 off is displayed in the instrument cluster.
        - Select 06 on to turn on the demonstration function.
        - Select 06 off to turn off the demonstration function.
    - Switch the ignition off.

    NOTE:

        - If the ignition is switched off with 06 on displayed (demonstration function on) in the instrument cluster, the demonstration function will operate the next time the ignition is switched ON (engine off).
        - If the following is performed with the demonstration function on, the demonstration function turns off.
            - The battery power is interrupted or the room fuse is removed.
            - The vehicle is driven at approx. 20 km/h {12 mph} or more.

Construction

- The active driving display is assembled to the instrument cluster.
- The active driving display consists of a display device which produces the display content and emits the content over a light beam, a reflector which reflects the light beam emitted from the display device, a combiner which reflects the light beam from the reflection and displays the screen, a motor which opens/closes the combiner, and a photo sensor which detects the brightness surrounding the display device.
- The combiner is a processed, clear panel for reflecting the light beam from the display device.
- The combiner opens at the top of the meter hood and displays vehicle information in the forward visual range of the driver. As a result, the time in which the driver's line of vision changes from the view at the front of the vehicle to the view of the vehicle information reflected in the combiner has been shortened.
- By using a concave shaped combiner, the image reflected in the combiner is positioned virtually 1.5 m {4.9 ft} forward of the eye point. As a result, the eye point adjustment time in which the driver's line of vision changes from the view at the front of the vehicle to the view of the vehicle information reflected in the combiner has been reduced.

Operation

- When the ignition is switched ON (engine on), the combiner is opened based on the following CAN signals.
  - ROOM fuse status signal from rear body control module (RBCM)
  - Combiner target angle signal from connectivity master unit (CMU)
- When the combiner opens, the instrument cluster displays the opening screen (vehicle name) for approx. 2 s. In addition, an active driving display execute signal and combiner current position signal (2) are sent to the CMU.

  NOTE:

  - The CMU records the current position of the combiner based on the combiner current position signal from the instrument cluster. When the ignition is switched from OFF to ON (engine running), the target angle signal is sent based on the recorded current position.
  - Even if the battery power is disconnected, the combiner current position recorded by the CMU is not cleared.
  - If the combiner current position is not recorded, the CMU sends the target angle signal of the initial value.
- The instrument cluster displays the current vehicle speed based on the vehicle speed signal (3) from the PCM after opening screen is turned off, and displays warning screens based on request signals (3) from related units.

Fail-safe

- The instrument cluster turns off the active driving display images under the following conditions and stops the display at the current position.
  - Error signal from CMU is received, and CMU malfunction is determined
  - Communication with CMU is interrupted
  - Motor malfunction for combiner operation is detected

2014 - Mazda3 - Body and Accessories

AMBIENT TEMPERATURE DISPLAY

Purpose

- The ambient temperature display notifies the user of the ambient temperature.

Function

- The instrument cluster displays the ambient temperature based on the ambient temperature signal sent from the PCM as a CAN signal.
- The ambient temperature is displayed between -40—70°C {-40—160°F} If the ambient temperature is -40°C {-40°F} or less, -40°C {-40°F} is displayed, and 70°C {160°F} is displayed if the temperature is 70°C {160°F} or more.

Construction

- The ambient temperature is displayed on the LCD in the instrument cluster.

Operation

1. When the ignition is switched ON, the instrument cluster receives an ambient temperature signal from the PCM (1).

2. Based on the ambient temperature signal, the instrument cluster displays the ambient temperature and ice mark on the LCD (2).

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

BLIND SPOT MONITORING (BSM) SYSTEM

Outline

- The blind spot monitoring (BSM) system detects a vehicle in the blind-spot area at the rear of the vehicle to alert the driver of the possible collision with a target vehicle using the BSM indicator light on the outer mirror glass and the blind spot monitoring (BSM) warning alarm.
- The blind spot monitoring (BSM) control module performs the blind spot monitoring (BSM) system fail-safe. (See **BLIND SPOT MONITORING (BSM) CONTROL MODULE**.)

Function

- The blind spot monitoring (BSM) system emits microwaves from the radar of the BSM control module to detect a target vehicle in the blind-spot area at the rear of the vehicle based on the reflected microwaves to alert and inform the driver. For the target vehicle detection method, refer to the blind spot monitoring (BSM) control module. (See **BLIND SPOT MONITORING (BSM) CONTROL MODULE**.)
- The blind spot monitoring (BSM) system has a blind spot monitoring (BSM) function for when the vehicle is moving forward and a rear crossing traffic alert (RCTA) function when the vehicle is reversing.

Blind spot monitoring (BSM) function

- The blind spot monitoring (BSM) control module monitors other vehicles traveling around the detecting vehicle based on the reflected microwaves.
- If a target vehicle enters the following monitored area that has been previously registered, the blind spot monitoring (BSM) control module illuminates the blind spot monitoring (BSM) indicator light.

- If a turn switch signal on the side where a target vehicle has been detected is received during a warning operation (when blind spot monitoring (BSM) indicator light is illuminated), the blind spot monitoring (BSM) control module flashes the blind spot monitoring (BSM) indicator light and sounds the blind spot monitoring (BSM) warning alarm.

Rear crossing traffic alert (RCTA) function

- The blind spot monitoring (BSM) control module determines an object moving at a different speed from the vehicle and approaching the following monitoring line, which has been stored at an angle of approx. 55° or more, 125° or less, as the target vehicle based on the reflected microwaves to calculate the difference in the relative speed between the vehicle and the target vehicle. The blind spot monitoring (BSM) control module estimates the time at which another vehicle will reach the monitoring line based on the calculated relative vehicle speeds and when the estimated reach time decreases below the threshold, the BSM indicator light is flashed and the blind spot monitoring (BSM) warning alarm sounds.

System ON/OFF switching function

- The blind spot monitoring (BSM) system can be turned on (operational) or off (non-operational) by operating the BSM OFF switch.
- If the blind spot monitoring (BSM) system is turned off (non-operational), the BSM OFF indicator light in the instrument cluster is illuminated.
- Because the blind spot monitoring (BSM) control module does not store the system on (operational)/off (non-operational), the BSM system is turned on (operational) if the ignition is switched off or on (engine off or on) from ACC.

Structural View

System wiring diagram

Operation

WARNING:

- Because the BSM system has various restrictions in the operation, the BSM indicator light might not illuminate or it may be delayed even if there is a vehicle traveling around the vehicle.
- Perform radar test for the BSM control module if the rear bumper has received an impact.
- The BSM system may not operate normally under the following conditions:
    - Dirt, ice or snow is adhering to the rear bumper surface.
    - The vehicle is driven in heavy rain or snowfall, or under conditions where water on the road is sprayed by the vehicle.

- The vehicle is towing a trailer.
- The vehicle accelerates from a standing-start with a target vehicle alongside.
- A target vehicle moves laterally from a lane two lanes over to the adjacent lane.
- The difference in vehicle speed between the vehicle and a target vehicle is higher with the target vehicle passing through the detection area in a very short period.
- On a steep incline, or if there is a difference in height between lanes.

- The BSM control module may not detect all types of vehicles. In particular, detection of the following types of vehicles may not occur:
  - A vehicle driving at a low speed
  - Small vehicles such as motorcycles
  - Vehicles with body shapes that may not reflect radar such as unloaded trailers
  - Vehicles with low vehicle height
  - The difference in vehicle speed between the vehicle and a target vehicle is extremely high.
  - A target vehicle accelerates suddenly from the rear of the vehicle and changes to the adjacent lane.
  - A target vehicle is traveling in the vehicle's blind spot at nearly the same speed for long periods
- The BSM indicator light may be difficult to view under the following conditions:
  - Sunlight at sunrise and sunset is reflected in and around the BSM indicator light
  - A lighting device with strong illumination is used in the vehicle
- On a road with a narrower lane width, the system could detect vehicles on a lane next to the adjacent lane and cause the warning light and beep to operate. (Conversely, on a road with a wider lane width, the system may not detect vehicles on the adjacent lane and may not operate the warning light/beep.)

CAUTION:

- If the rear bumper installation position is changed or individual differences (coating film/thickness) occur, the radar angle will deviate and the BSM system may not operate properly. Perform the radar test using the SSTs (Service Special Tools) and Mazda Modular Diagnostic System (M-MDS) when any of the following items have been performed.
  - BSM control module is replaced
  - Rear bumper is repaired or replaced
  - Vehicle’s rear area is repaired due to collision
- Refer to the Workshop Manual for the radar test procedure.

Blind spot monitoring (BSM) operation

Operation condition

- The warning is triggered and the alarm sounds when all of the following conditions are met:
  - BSM OFF indicator light is turned off (system ON)
  - Vehicle speed is approx. **10 km/h {6.2 mph} or more**
  - Selector lever (ATX)/shift position (MTX) is not in R position (ATX)/reverse position (MTX)
  - Vehicle being detected enters the monitored area
  - Turn switch signal on side that blind spot monitoring (BSM) indicator light is illuminated is received (only operations of BSM indicator light flashing and BSM warning alarm sound)
- When the ignition is switched ON (engine off or on) and the BSM OFF indicator light is turned off (system on), the blind spot monitoring (BSM) control module activates the system and when the speed of the detecting vehicle reaches approx. **10 km/h {6.2 mph} or more**, it begins detecting other vehicles.
- When the vehicle speed is **approx. 10 km/h {6.2 mph} or more** and the detected target vehicle enters the monitored area, the blind spot monitoring (BSM) control module illuminates the BSM indicator light on the side the target vehicle is detected.

- When a turn switch signal on the side the target vehicle is detected is received via CAN signal from the start stop unit while the blind spot monitoring (BSM) indicator light is illuminated, the BSM control module flashes the BSM indicator light. In addition, a BSM warning alarm request signal is sent via CAN signal to the instrument cluster.
- The instrument cluster operates the BSM warning alarm based on a request signal from the BSM control module.

Rear crossing traffic alert (RCTA) operation

Operation condition

- The warning is triggered when all of the following conditions are met:
  - BSM OFF indicator light is turned off (system ON)
  - Selector lever (ATX)/shift position (MTX) is in R position (ATX)/reverse position (MTX)
  - Estimated time until detected target vehicle reaches monitoring line decreases below threshold
- When the ignition is switched ON (engine on) and the BSM OFF switch is ON (system ON) and the selector lever (ATX)/shift position (MTX) is in R position (ATX)/reverse position (MTX), the blind spot monitoring (BSM) control module starts detection of a target vehicle.
- If the approach to the monitoring line is from a direction of approx. 55° or more and 125° or less and the estimated reach time decreases below the threshold, the following controls are performed.
  - Flashes blind spot monitoring (BSM) indicator light
  - Sends blind spot monitoring (BSM) warning alarm request signal via CAN signal to instrument cluster
- The instrument cluster operates the BSM warning alarm based on a request signal from the BSM control module.

BLIND SPOT MONITORING (BSM) CONTROL MODULE

Purpose

- The blind spot monitoring (BSM) control module detects a target vehicle in the blind-spot at the rear of the vehicle by emitting microwaves from the radar to control the blind spot monitoring (BSM) system.

Function

- The blind spot monitoring (BSM) control module controls the BSM system based on the following CAN signals:

CAN signal sending module	Signal name
PCM	Vehicle speed signal
EPS control module	Steering angle (estimated absolute angle) signal
Start stop unit	Light switch position signal
	Turn switch signal
Instrument cluster	Ignition switch position signal
	Panel light signal
	BSM OFF switch position signal
	Back-up light illumination request signal

- The blind spot monitoring (BSM) control module (LH) transmits with the related unit using CAN. The BSM control modules (LH) and (RH) transmit via local CAN lines.
- The blind spot monitoring (BSM) control module (LH) transmits the CAN signal received from the related unit to the BSM control module (RH) and sends the CAN signal received from the BSM control module (RH) to the related unit.

Target vehicle detection function

- The blind spot monitoring (BSM) control module emits microwaves to the following area to detect an object in the blind-spot at the rear of the vehicle from the reflected microwaves.

- The blind spot monitoring (BSM) control module calculates the position, direction of vehicle travel, and relative speed of the detected object from the reflected microwaves, vehicle speed, and steering angle (estimated absolute angle) signal to detect an object which approaches the blind-spot at the rear of the vehicle as a target vehicle for monitoring.

Changing function brightness of blind spot monitoring (BSM) indicator light

- When the blind spot monitoring (BSM) control module receives the panel light signal from the instrument cluster, it determines that the vehicle is being driven at night or in a dark place and decreases the brightness of the blind spot monitoring (BSM) indicator light. As a result, visibility of the blind spot monitoring (BSM) indicator light at night has been improved.

On-board diagnostic function

- The blind spot monitoring (BSM) control module detects dirt, transmission errors, and internal malfunctions of the module and stores DTCs. In addition, the BSM off indicator light in the instrument cluster flashes to indicate a system error. For DTC details, refer to ON-BOARD DIAGNOSTIC. (See **ON-BOARD DIAGNOSTIC [BLIND SPOT MONITORING (BSM) SYSTEM]**.)

Construction

The blind spot monitoring (BSM) control modules are positioned on the left and right sides of the body inside the rear bumper.

- The blind spot monitoring (BSM) control module is integrated with the radar, which emits microwaves and receives the reflected waves, and the control module.

Operation

- For the operation of the blind spot monitoring (BSM) control module, refer to the BSM system. (See **BLIND SPOT MONITORING (BSM) SYSTEM**.)

BLIND SPOT MONITORING (BSM) OFF INDICATOR LIGHT

Purpose

- The BSM OFF indicator light informs the driver that the blind spot monitoring (BSM) system is turned off or there is a malfunction in the system.

Function

- If the instrument cluster constantly receives a BSM OFF indicator signal via CAN signal from the blind spot monitoring (BSM) control module (LH), it illuminates the BSM OFF indicator light.
- If the instrument cluster periodically receives a BSM OFF indicator signal via CAN signal from the blind spot monitoring (BSM) control module (LH), it flashes the BSM OFF indicator light.
- The flash pattern of the BSM OFF indicator light is as shown in the figure.

- For vehicles with center display, a warning message in the center display is displayed when the BSM OFF indicator light is flashed. For the message content and verification method, refer to the CENTER DISPLAY. (See **CENTER DISPLAY [WITH CENTER DISPLAY]**.)

Construction

- The BSM OFF indicator light are equipped in the instrument cluster.

- For vehicles with center display, a warning message in the center display is displayed when the BSM OFF indicator

light is flashed. For the message content and verification method, refer to the CENTER DISPLAY. (See **CENTER DISPLAY [WITH CENTER DISPLAY]**.)

Operation

- The instrument cluster receives (1) the BSM OFF indicator signal from the blind spot monitoring (BSM) control module (LH) via the CAN signal.
- The instrument cluster turns the transistor on (2) intermittently when the BSM OFF indicator signal is periodically received and continuously when the signal is constantly received.
- When the transistor turns on intermittently, the BSM OFF indicator light flashes (3) and when it turns on continuously, the BSM OFF indicator light illuminates (3).

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

BLIND SPOT MONITORING (BSM) OFF SWITCH

Purpose

- The blind spot monitoring (BSM) system can be turned on or off optionally by the driver.

Function

- The switch operation signal is sent to the instrument cluster.

Construction

- The BSM OFF switch is built into the cluster switch.
- The resistance is built into each switch.

Operation

- When the BSM OFF switch operates, the BSM OFF switch operation signal is sent to the instrument cluster.
- The instrument cluster sends a BSM OFF switch operation signal to the blind spot monitoring (BSM) control module

(LH) based on the received voltage value (switch operation signal).

- The blind spot monitoring (BSM) control module switches the blind spot monitoring (BSM) system on/off when it receives the BSM OFF switch operation signal from the instrument cluster.

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

BLIND SPOT MONITORING (BSM) WARNING ALARM

Purpose

- The blind spot monitoring (BSM) warning alarm warns the driver of a possible accident.

Function

- If the instrument cluster receives a warning sound request signal from the blind spot monitoring (BSM) control module (LH), it sounds the blind spot monitoring (BSM) warning alarm using the buzzer in the instrument cluster.
- The blind spot monitoring (BSM) warning alarm sound pattern is as shown in the figure.

Construction

- The blind spot monitoring (BSM) warning alarm sounds using the buzzer built into the instrument cluster.

Operation

- The instrument cluster receives (1) the warning sound request signal from the blind spot monitoring (BSM) control module (LH).
- The instrument cluster turns the transistor on (2) based on the warning sound request signal.
- When the transistor turns on, a ground circuit with the alarm is established and the alarm sounds (3).

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

HORN

Purpose

- The horn sounds according to the horn switch operation.

Function

- Sound is harmonized between high and low pitch.

Construction

- Installed to the inside of the front grille.
- The diaphragm is vibrated to apply vibration to the air and produce sound.

Operation

1. When the horn switch turns on (1), the horn relay turns on (2).
2. When the horn relay turns on, the horn sounds.

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

LANE DEPARTURE WARNING SYSTEM (LDWS)

Outline

- The Lane Departure Warning System (LDWS) recognizes vehicle lane lines on a road using the forward sensing camera (FSC) installed to the windshield, and if the vehicle departs from its lane unbeknownst to the driver, the system alerts the driver of the lane departure using a warning indication and warning sound.

WARNING:

- LDWS is only a supplementary system for the prevention of a lane departure, however the LDWS functions have limitations. Relying solely on the LDWS and neglecting prudent steering wheel operation could cause an unexpected accident resulting in death or serious injury. Do not rely solely on the LDWS. Always make lane corrections using the steering wheel and drive safely.
- The LDWS may not operate normally under the following conditions:
    - Poor vehicle lane line visibility due to adverse weather (rain, snow, fog)
    - Poor vehicle lane line visibility due to backlight, snow on the road, water puddles, road ruts
    - Poor vehicle lane line visibility due to cracks and fissures in the vehicle lane
    - Vehicle lane lines intersect with complexity due to additions or reductions of driving lanes
    - Vehicle lane marking is not completely erased after road maintenance, two or more lane lines next to each other
    - Vehicle lane lines not recognized due to vehicle ahead

CAUTION:

- If the FSC aiming for the LDWS is not completed, the camera shot angle for the FSC cannot be recorded and the LDWS may not operate. When performing the following servicing, always perform the FSC aiming. Refer to the FSC aiming procedure in the workshop manual.
    - FSC replacement
    - FSC clip replacement
    - Windshield replacement

Function

- The FSC sets warning-trigger lines based on the vehicle lane lines recognized by the camera, and if the vehicle contacts one of these warning-trigger lines it activates the warning indicator and warning sound. Refer to for FSC and warning-trigger line details. (See **FORWARD SENSING CAMERA (FSC)**.)

Driver operation determination function

- The FSC determines the driver's intentions according to the following driving operations, and controls the warning-trigger operation.
  - After the turn switch is operated and the vehicle lane is changed within 6 s.
  - The steering wheel is turned at a certain angle or more, and the vehicle lane is changed.
  - The accelerator pedal is depressed a certain amount or more, and the vehicle lane is changed.
  - The brake pedal is depressed a certain amount or more and the vehicle departs from its lane.

System status display function

- The FSC displays the system status using the LDWS indicator light (green), LDWS warning light (amber), and the active driving display.

LDWS Switch	Condition	LDWS indicator light (green)	LDWS warning light (amber)	Master warning light	Active driving display
OFF	System is off	Off	Off	Off	No display
ON	Vehicle lanes recognized at vehicle speed of approx. 65 km/h {40 mph} or more	On	Off	Off	
	While warning is triggered	Flash	Off	Off	OR
	Vehicle speed is approx. 60 km/h {37 mph} or less	Off	On	Off	

	Vehicle lanes not recognized	Off	On	Off		FSC detects camera fogging	Off	Off	On	No display
	FSC detects camera dirty	Off	Off	On	No display
	Malfunction in LDWS occurs	Off	Flash	Off	No display
	Malfunction in FSC occurs	Off	Off	On	No display

Operation

Operation conditions

- The warning is triggered when all of the following conditions are met:
  - LDWS switch is on (system on)
  - Vehicle speed signal of approx. 65 km/h {40 mph} or more from PCM is received
  - Vehicle contacts warning-trigger line unbeknownst to driver

Operation

- The warning operation time differs depending on how long the vehicle contacts the warning-trigger line.
  - Vehicle contacts warning-trigger line for less than 1 s: Warning triggers for 1 s
  - Vehicle contacts warning-trigger line for 1 s or more: Warning triggers for 1.5 s
- If the warning is triggered one time, the warning will not trigger again if the vehicle travels within the warning-trigger lines for a period of 2 s.
- The warning operation sound has the following two types:
  - The warning operation sound (beep) is output from the instrument cluster.
  - The warning operation sound (rumble strip sound*1) is output from the tuner and amp unit.

*1

A rumble strip is a series of grooves in the road pavement surface positioned at specific intervals, and when the vehicle passes over it a rumble sound is produced and an uncomfortable vibration can be felt which alerts the driver that the vehicle is departing from the lane lines. The rumble strip sound is a reproduction of the sound which occurs when a vehicle passes over a rumble strip.

Rumble strip sound

- If the FSC determines that the vehicle has contacted a warning-trigger line, it sends a warning indication request signal to the instrument cluster and a warning sound request signal to the connectivity master unit (CMU).
- When the instrument cluster receives the warning indication request signal from the FSC, it flashes the LDWS indicator light (green) and displays the warning screen in the active driving display.
- When the CMU receives the warning sound request signal from the FSC, it sends the warning sound request signal to the tuner and amp unit.
- When the tuner and amp unit receives the warning sound request signal from the CMU, it stops sound output from either the front left or right door speaker according to the request signal and outputs a rumble strip sound.

NOTE:

- If the user is conversing using the HF/TEL, or the voice recognition function is outputting voice, the rumble strip sound is not output.

2014 - Mazda3 - Body and Accessories

FORWARD SENSING CAMERA (FSC)

Purpose

- The camera recognizes light-emitting objects and vehicle lane lines based on the images picked up at the front of the vehicle, and controls the high beam control (HBC) system and lane departure warning system (LDWS).

Function

Light-emitting object (on-coming vehicle, vehicle ahead, street lights) recognition function

- The camera analyzes the light-emitting object it picks up, and recognizes it as an on-coming vehicle, vehicle ahead, or street lights (traveling on town/city streets).

  On-coming vehicle recognition function

- The FSC recognizes a light-emitting object that is within at least approx. 600 m {1,969 ft} from the detecting vehicle as an on-coming vehicle when any of the following conditions are met:
  - Light-emitting object approaches having brightness of specified value or more
  - Light-emitting object approaches having white color and certain level of brightness or more (if it approaches and brightness changes, determination made at point of image capture)

    NOTE:

    - If the on-coming vehicle and the surrounding conditions are as follows, the FSC may require time until it recognizes an on-coming vehicle.
      - Poor visibility due to rain and fog
      - On-coming vehicle is travelling with only TNS or fog lights
      - Brightness of light source, such as vehicle, lowers

Vehicle ahead recognition function

- The FSC recognizes a light-emitting object that is within at least approx. 500 m {1,640 ft} of the detecting vehicle as a vehicle ahead, and when any of the following conditions is met:
    - Red light emitted from light-emitting object is detected
    - Determines that there is a pair of light-emitting objects

    NOTE:

    - Because prevention of dazzling from other vehicles is made a priority, the system could recognize reflecting objects on the road surface or a guard rail as a vehicle ahead (switches to low beams).
    - If visibility is poor due to rain or fog, a vehicle ahead may not be recognized even though one may exist (maintains high beams).

Town/city streets recognition function

- Travel on town/city streets is recognized in the following cases:
  - Several light-emitting objects of certain height or more from road surface along same line are detected
  - Camera image gray color is certain level or more

    NOTE:

    - Even during travel other than at night or on town/city streets, if the road surface is bright from moonlight, the system may recognize that the vehicle is traveling on town/city streets (switches to low beams).

Vehicle lane lines and travel lane recognition function

- The FSC recognizes line shapes which are paler than the surrounding color, and white/yellow lines as vehicle lane lines by the contrast (color density) of the camera image.
- If the vehicle lane lines are continuous they are recognized as actual lines, if discontinuous they are recognized as broken lines.
- The travel lanes recognized from the vehicle lane lines on the left and right of the vehicle are used to calculate the width.
- Traveling in a straight line or cornering is determined by the status of the vehicle lane lines.

LDWS warning-trigger line setting function

- The FSC sets the LDWS warning-trigger lines *1 at approx.5 cm {2 in} inside of the recognized vehicle lane lines.

- If there is only one vehicle lane line or only one vehicle lane line can be recognized, the warning-trigger line is set to only the recognized vehicle lane line.
- If the FSC recognizes both broken vehicle lane lines and actual vehicle lane lines, the warning-trigger line is set to the actual vehicle lane line.

*1

The distance between the vehicle lane lines and the warning-trigger lines can be changed using the personalization feature. Refer to INSTRUMENTATION/DRIVER INFO. PERSONALIZATION for details. (See INSTRUMENTATION/DRIVER INFO. PERSONALIZATION.)

LDWS warning-trigger line auto-adjust function

- The FSC automatically adjusts the set warning-trigger lines within the adjustment range in the following cases:

Detection state	Adjustment
Distance of vehicle to vehicle lane line recognized by FSC detected (such as staying to left) continuously as closer than specified value for certain period of	

time.	Recognized travel lane width decreases to certain width or less	Recognized vehicle lane line curves for certain period of time or more and system determines that vehicle is cornering (out-in-out travel)	
Recognized travel lane width is wider than certain width	
Aiming correction function

- The FSC adjusts the camera shot angle by aiming, and stores the vanishing point *1. The stored vanishing point and the current vanishing point are compared and if there is a deviation of a certain value or more in the vanishing point, the current vanishing point is stored as the new vanishing point.

*1

The vehicle lane lines on the road surface are parallel and do not intersect, however, when viewed by the camera image, the lines converge in the distance and eventually cross. The point at which the lines cross is called the vanishing point.

HBC indicator light (green)/HBC warning light (amber) and LDWS indicator light (green)/LDWS warning light (amber) blown fuse check function

- When the ignition is switched ON, the FSC illuminates the HBC warning light (amber)/LDWS warning light (amber) for approx. 3 s and performs a blown fuse check of each indicator light/warning light.

On-board diagnostic function

- The FSC detects dirt and fogging of the camera lens and windshield glass, FSC transmission errors, FSC internal malfunctions, and outputs DTCs. For DTC details, refer to the ON-BOARD DIAGNOSTIC [FSC]. (See **ON-BOARD DIAGNOSTIC [FORWARD SENSING CAMERA (FSC)]**.)

Construction

- Installed to the windshield.
- By integrating a small, color CMOS camera *1 with the control module, lightness and size reduction have been achieved.
- The FSC transmits between other modules using CAN.

*1

Camera with high sensitivity CMOS (Complementary Metal-Oxide Semiconductor) picture element

Operation

Camera range

- The FSC camera shoots in the following range.

NOTE:

- The FSC may be unable to pickup an object within the camera range in front of the vehicle, and not recognize it as a controlled target object depending on the surrounding conditions (ascending roads, winding roads, walls).

Position calculation

- When an object appears on the screen, the FSC determines the position coordinates, and from the coordinates it calculates the distance of the vehicle to the object and the direction.

FORWARD SENSING CAMERA (FSC)

2014 - Mazda3 - Body and Accessories

LDWS SWITCH

Purpose

- The lane departure warning system (LDWS) can be turned on or off optionally by the driver.

Function

- The switch operation signal is sent to the instrument cluster.

Construction

- The LDWS switch is built into the cluster switch.
- The resistance is built into each switch.

Operation

- When the LDWS switch operates, the LDWS switch operation signal is sent to the instrument cluster.
- The instrument cluster determines that the switch has been operated based on the received voltage value (switch operation signal), and the LDWS switch operation signal is sent to the FSC.
- When the FSC receives the LDWS switch operation signal from the instrument cluster, it switches the LDWS on/off.

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

LDWS WARNING ALARM

Purpose

- The LDWS warning alarm warns the user of a possible lane departure.

Function

Beep sound

- If the instrument cluster receives a warning sound request signal from the FSC, is sounds the LDWS warning alarm using the buzzer in the instrument cluster.
- The LDWS warning alarm patterns are as shown in the figure.

Rumble strip sound

- For the LDWS warning alarm on vehicles with the tuner and amp unit, refer to LANE DEPARTURE WARNING SYSTEM (LDWS). (See **LANE DEPARTURE WARNING SYSTEM (LDWS)**.)

Construction

- The LDWS warning alarm sounds using the buzzer built into the instrument cluster.

Operation

Beep sound

1. The instrument cluster receives (1) the warning sound request signal from the FSC.

2. The instrument cluster turns the transistor on (2) based on the warning sound request signal.

3. When the transistor turns on, a ground circuit with the alarm is established and the alarm sounds (3).

Rumble strip sound

- For operation with vehicles having tuner and amp unit, refer to LANE DEPARTURE WARNING SYSTEM (LDWS). (See **LANE DEPARTURE WARNING SYSTEM (LDWS)**.)

Fail-safe

- If the instrument cluster receives the following CAN signals when the LDWS warning alarm is set at rumble, the LDWS warning alarm is sounded using a beep.
    - Communication error signal with tuner and amplifier unit (TAU) from connectivity master unit (CMU)
    - Warning indication request signal from forward sensing camera (FSC)

2014 - Mazda3 - Body and Accessories

LDWS INDICATOR LIGHT (GREEN)/LDWS WARNING LIGHT (AMBER)

Purpose

LDWS indicator light (green)

- The LDWS indicator light (green) notifies the driver of the vehicle lane lines being recognized or that the vehicle may be departing from its lane.

LDWS warning light (amber)

- The LDWS warning light (amber) warns the driver that a malfunction is occurring in the Lane Departure Warning System (LDWS).

Function

LDWS indicator light (green)

- The instrument cluster illuminates the LDWS indicator light (green) based on the system condition display request signal sent via a CAN signal from the FSC.
- The instrument cluster flashes the LDWS indicator light (green) based on the warning indication request signal sent via a CAN signal from the FSC.
- The flash pattern of the LDWS indicator light (green) is as shown in the figure.

LDWS warning light (amber)

- The instrument cluster illuminates the LDWS warning light (amber) based on the system condition display request signal sent via a CAN signal from the FSC.
- The instrument cluster flashes the LDWS warning light (amber) based on the malfunction indication request signal sent via a CAN signal from the FSC.
- The flash pattern of the LDWS warning light (amber) is as shown in the figure.

- For vehicles with center display, a warning message in the center display is displayed when the LDWS warning light (amber) is flashed. For the message content and verification method, refer to the CENTER DISPLAY. (See **CENTER DISPLAY [WITH CENTER DISPLAY]**.)

Construction

- The LDWS indicator light (green) and LDWS warning light (amber) are equipped in the instrument cluster.

Operation

LDWS indicator light (green)

1. The instrument cluster receives (1) the system conditions indication request signal or warning indication request signal from the FSC via the CAN signal.

2. The instrument cluster turns the transistor on (2) intermittently for a warning indication request signal and continuously for a system conditions indication request signal.

3. When the transistor turns on intermittently, the LDWS indicator light (green) flashes (3) and when it turns on continuously, the LDWS indicator light (green) illuminates (3).

LDWS warning light (amber)

1. The instrument cluster receives (1) the system conditions display request signal from the FSC or the system malfunction indication request signal via the CAN signal.

2. The instrument cluster turns the transistor on (2) intermittently for a system malfunction indication request signal and continuously for a system conditions indication request signal.

3. When the transistor turns on intermittently, the LDWS warning light (amber) flashes (3), and the when it turns on continuously, the LDWS warning light (amber) illuminates (3).

Fail-safe

- Function not equipped.

LDWS INDICATOR LIGHT (GREEN)/LDWS WARNING LIGHT (AMBER)

2014 - Mazda3 - Body and Accessories

INDICATOR UNIT

Purpose

- The indicator unit notifies the user of the following conditions.
    - Passenger seat belt status
    - Passenger air bag deactivation (PAD) switch status (with passenger air bag deactivation (PAD) system)
    - Seat warmer operation status (with seat warmer system)

Function

- The indicator unit turns the passenger seat belt warning light on/off based on the request signal sent from the instrument cluster.
- The indicator unit turns the seat warmer switch (with seat warmer system) on/off based on the panel light signal sent from the instrument cluster. For details on the panel light, refer to PANEL LIGHT. (See **PANEL LIGHT**.)

Seat warmer switch function (with seat warmer system)

- The indicator unit switches the temperature level (number of times indicator illuminated) in the order of 3, 2, 1, and OFF according to the seat warmer switch operation and sends the temperature level signal to the seat warmer unit.
- The indicator unit records the temperature level (number of times indicator illuminated) when the ignition is switched from ON (engine off or on) to OFF, and operates the recorded temperature level (number of indicator illumination) when the ignition is switched ON (engine off or on) again.
- If the battery power supply is disconnected, the temperature level recorded by the indicator unit is eliminated.

Construction

- The indicator unit is assembled to the climate control unit.
- The indicator unit consists of the following parts:
    - Display which displays passenger seat belt warning light, passenger air

bag deactivation (PAD) lettering illumination, and PAD OFF indicator light (with passenger air bag deactivation (PAD) system)

- Seat warmer switch (with seat warmer system)

Operation

Seat belt warning light

- When the ignition is switched ON (engine off or on), the indicator unit receives (1) the passenger seat belt warning light illumination request signal from the instrument cluster.
- The indicator unit turns the transistor on (2) based on the request signal from the instrument cluster.
- When the transistor turns on, a ground circuit with passenger seat belt warning light is established, and the passenger seat belt warning light turns on (3).

PAD indicator light (with passenger air bag deactivation (PAD) system)

- When the ignition is switched ON (engine off or on), the instrument cluster turns the PAD indicator light transistor on (1) based on the PAD indicator light illumination request signal from the SAS control module.
- When the transistor in the instrument cluster turns on, the PAD indicator light in the indicator unit turns on (2).

Seat warmer switch (with seat warmer system)

- For details on the seat warmer switch operation, refer to SEAT WARMER SYSTEM. (See **SEAT WARMER SYSTEM**.)

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

ON-BOARD DIAGNOSTIC [INSTRUMENT CLUSTER]

Outline

- The on-board diagnostic function consists of the following functions:
  - A malfunction detection function, which detects overall malfunctions in the instrument cluster-related parts.
  - A memory function, which stores detected DTCs.
  - A display function, which indicates malfunction locations and status via DTC output.
  - A PID/data monitoring function, which reads out specific input/output signals and verifies the input/output condition.
- Using the Mazda Modular Diagnostic System (M-MDS), DTCs can be read out and deleted, and the PID/data monitoring function can be activated.

Malfunction detection function

- Detects malfunctions in input/output signals.
- If a malfunction occurs, the instrument cluster records the malfunction as a DTC. A recorded DTC can be read by the Mazda Modular Diagnostic System (M-MDS).

DTC 7-digit code definition

- When related systems or components have failed, the CM stores the DTC of the malfunctioning part in the CM memory, and allows for the retrieval of the store data using scanning tool when necessary. The DTCs are indicated using seven digits. Each digit indicates the following.

B 1 0 D 5 : 1 3

· Specify the area failure sub type

00: No sub type information
05: System programming malfunctions
13: Open circuit
14: Circuit short to ground or open
16: Circuit voltage below threshold
41: General checksum malfunction
42: General memory malfunction
49: Internal electronic malfunction
51: Not programmed
62: Signal compare malfunction
68: Event information
81: Invalid serial data received
86: Signal invalid
87: Missing message
88: Bus off
92: Performance or incorrect operation
94: Unexpected operation

· Manufacturer controlled

· Indicates subgroup

Powertrain (P code)
0: Fuel and air metering and auxiliary emission controls

Network Electrical (U code)
0: Network Electrical
1: Network communication
2: Network communication
3: Network software
4: Network data
5: Network data

Body (B code)
Manufacturer controlled

Chassis (C code)
Manufacturer controlled

· Indicates who was responsible for DTC definition

0: ISO/SAE controlled
1: Manufacturer controlled
2: There are ISO/SAE controlled just for powertrain, all others are manufacturer controlled.
3: For P3000 to P3399 is manufacturer controlled, all others are ISO/SAE controlled.

· Indicates DTC function

P: Powertrain
B: Body
C: Chassis
U: Network Electrical

Status byte for DTC

- The two digits (two digits after hyphen (-)) after the 7-digit DTC.

7-DIGIT DTC

P 1 2 6 0 : 0 0 − * *

STATUS BYTE

- A code which indicates the pending code, current/past malfunction status, or warning illumination status.
- Can be read by performing a CMDTC self-test using the Mazda Modular Diagnostic System (M-MDS).
- For details on the status byte, refer to the explanation on the Mazda Modular Diagnostic System (M-MDS) when reading the DTC.

Detection condition for the applicable DTC

DTC No.	System malfunction location	Detection condition
B11D4:53*1	Laser sensor malfunction	• Instrument cluster detects the following malfunctions ▪ Laser sensor malfunction ▪ Malfunction in smart city brake support related system (laser sensor, DSC HU/CM, PCM)
U0001:88	Module communication error (HS-CAN)	Instrument cluster detects a CAN bus communication line (HS-CAN) malfunction.
U0010:88	Module communication error (MS-CAN)	Instrument cluster detects a CAN bus communication line (MS-CAN) malfunction.
U0100:00	Communication error with PCM	Instrument cluster cannot receive the CAN signal from the PCM.
U0101:00*2	Communication error with TCM	Instrument cluster cannot receive the CAN signal from the TCM for 1 s or more.
U0121:00	Communication error with DSC HU/CM	Instrument cluster cannot receive the CAN signal from the DSC HU/CM for 1 s or more.
U0131:00	Communication error with EPS control module	Instrument cluster cannot receive the CAN signal from the EPS control module for 1 s or more.
U0140:00	Communication error with front body control module (FBCM)	Instrument cluster cannot receive the CAN signal from the front body control module (FBCM) for 5 s or more.
U0142:00	Communication error with rear body control module (RBCM)	Instrument cluster cannot receive the CAN signal from the rear body control module (RBCM) for 5 s or more.
U0151:00	Communication error with SAS control module	Instrument cluster cannot receive the CAN signal from the SAS control module for 2 s or more.
U0182:00*3	Communication error with AFS control module	Instrument cluster cannot receive the CAN signal from the AFS control module for 5 s or more.

U0214:00	Communication error with start stop unit	Instrument cluster cannot receive the CAN signal from the start stop unit for 5 s or more.
U0232:00*4	Communication error with BSM control module (LH)	Instrument cluster cannot receive the CAN signal from the BSM control module (LH) for 1.5 s or more.
U0235:00*1	Communication error with laser sensor	Instrument cluster cannot receive the CAN signal from the laser sensor for 1 s or more.
U023A:00*5	Communication error with forward sensing camera (FSC)	Instrument cluster cannot receive the CAN signal from the forward sensing camera (FSC) for 1 s or more.
U0300:00	Instrument cluster configuration error	Instrument cluster configuration error (incorrect value write) detected.
U0401:68	Error signal received from PCM	Instrument cluster receives the error signals from the PCM with the ignition switched ON (engine off or on).
U0402:68*2	Error signal received from transmission/transaxle	Instrument cluster received the error signals from the transmission/transaxle for 1 s or more with the ignition switched ON (engine off or on).
U0422:68	Error signal received from front body control module (FBCM)	Instrument cluster receives the error signals from the front body control module (FBCM) for 5 s or more with the ignition switched ON (engine off or on).
U0433:00*1	Error signal received from laser sensor	Instrument cluster detects the following conditions: ▪ The smart city brake support operated normally in the past. ▪ Malfunction of laser sensor or smart city brake support related system (laser sensor, DSC HU/CM, PCM) ▪ Laser sensor control is temporarily inhibited.
U0433:68*1	Error signal received from laser sensor	Instrument cluster detects a malfunction in the laser sensor.
U0515:68	Error signal received from start stop unit	Instrument cluster receives the error signals from the start stop unit with the ignition switched ON (engine off or on).
U053B:00*5	Error signal received from forward sensing camera (FSC)	Instrument cluster receives the error signals from the forward sensing camera (FSC) for 1 s or more with the ignition switched ON (engine off or on).
U2005:86	Error signal received from PCM	Instrument cluster receives the vehicle speed signal error from the PCM for 1 s or more with the ignition switched ON (engine off or on).
U2013:13	Cluster switch circuit malfunction	Instrument cluster detects an open circuit in the cluster switch circuit for 5 s or more with the ignition switched ON (engine off or on).

U2100:00	Instrument cluster configuration error	Instrument cluster configuration error detected as follows: ▪ No configuration of instrument cluster ▪ Instrument cluster configuration has not been correctly performed.
U2300:41	Instrument cluster configuration error	Instrument cluster configuration error (data error) detected.
U2300:51	Instrument cluster configuration error	Instrument cluster configuration error (no configuration) detected.
U2300:56	Instrument cluster configuration error	Instrument cluster configuration error (incorrect value write) detected.
U2300:57	Instrument cluster configuration error	Instrument cluster configuration error (data size error) detected.
U3000:41	Instrument cluster internal malfunction	Instrument cluster detects the internal malfunction.
U3003:16	Low power supply voltage input to instrument cluster	Instrument cluster power supply circuit voltage of less than 10V is detected.

ON-BOARD DIAGNOSTIC [BLIND SPOT MONITORING (BSM) SYSTEM]

Outline

- The on-board diagnostic function consists of the following functions:
  - A malfunction detection function, which detects overall malfunctions in the BSM control module-related parts.
  - A memory function, which stores detected DTCs.
  - A display function, which indicates malfunction locations and status via DTC output.
  - A PID/data monitoring function, which reads out specific input/output signals and verifies the input/output condition.
- Using the Mazda Modular Diagnostic System (M-MDS), DTCs can be read out and deleted, and the PID/data monitoring function can be activated.

Malfunction Detection Function

- Detects malfunctions in input/output signals.
- If a malfunction occurs, the BSM control module (LH) records the malfunction as a DTC. A recorded DTC can be read by the Mazda Modular Diagnostic System (M-MDS).

DTC table

BSM control module (LH) ×: Applicable—: Not applicable

DTC 7-digit code definition

- When related systems or components have failed, the CM stores the DTC of the malfunctioning part in the CM memory, and allows for the retrieval of the store data using scanning tool when necessary. The DTCs are indicated using seven digits. Each digit indicates the following.

B 1 0 D 5 : 1 3

· Specify the area failure sub type

00: No sub type information
01: General electrical failure
05: System programming malfunctions
09: Component failures
13: Open circuit
11: Circuit short to ground
14: Circuit short to ground or open
15: Circuit short to battery or open
16: Circuit voltage below threshold
17: Circuit voltage above threshold
41: General checksum malfunction
42: General memory malfunction
49: Internal electronic malfunction
4A: Incorrect component installed
51: Not programmed
62: Signal compare malfunction
68: Event information
81: Invalid serial data received
86: Signal invalid
87: Missing message
88: Bus off
92: Performance or incorrect operation
94: Unexpected operation
97: Component or system operation obstructed or blocked

· Manufacturer controlled

· Indicates subgroup

Powertrain (P code)
0: Fuel and air metering and auxiliary emission controls

Network Electrical (U code)
0: Network Electrical
1: Network communication
2: Network communication
3: Network software
4: Network data
5: Network data

Body (B code)
Manufacturer controlled

Chassis (C code)
Manufacturer controlled

· Indicates who was responsible for DTC definition

0: ISO/SAE controlled
1: Manufacturer controlled
2: There are ISO/SAE controlled just for powertrain, all others are manufacturer controlled.
3: For P3000 to P3399 is manufacturer controlled, all others are ISO/SAE controlled.

· Indicates DTC function

P: Powertrain
B: Body
C: Chassis
U: Network Electrical

Status byte for DTC

- The two digits (two digits after hyphen (-)) after the 7-digit DTC.

7-DIGIT DTC

P 1 2 6 0 : 0 0 − * *

STATUS BYTE

- A code which indicates the pending code, current/past malfunction status, or warning illumination status.
- Can be read by performing a CMDTC self-test using the Mazda Modular Diagnostic System (M-MDS).
- For details on the status byte, refer to the explanation on the Mazda Modular Diagnostic System (M-MDS) when reading the DTC.

Detection condition for the applicable DTC

BSM control module (LH)

DTC No.	System malfunction location	Detection condition
B118C:11	BSM indicator light (LH) circuit malfunction	BSM control module (LH) performs measurement at 0.01 s intervals and a short to ground in the BSM indicator light (LH) circuit is detected 48 times continuously.
B118C:15	BSM indicator light (LH) circuit malfunction	BSM control module (LH) performs measurement at 0.01 s intervals and a short to power supply in the BSM indicator light (LH) circuit is detected 48 times continuously.
U0001:88	Module communication error (HS-CAN)	BSM control module detected a CAN bus communication line (HS-CAN) malfunction for 0.4 s or more.
U0100:00	Communication error with PCM	BSM control module cannot receive a CAN signal from the PCM for 1.5 s or more.
U0131:00	Communication error with EPS control module	BSM control module cannot receive a CAN signal from the EPS control module for 1.5 s or more.
U0155:00	Communication error with instrument cluster	BSM control module cannot receive a CAN signal from the instrument cluster.
U0214:00	Communication error with start stop unit	BSM control module cannot receive a CAN signal from the start stop unit for 1.5 s or more.
U0233:00	Communication error with BSM control module (RH)	No communication between BSM control module (LH) and (RH) for 1 s or more.
U0401:68	Error signal received from PCM	BSM control module receives the error signal from the PCM for 1 s or more.
U0420:68	Error signal received from EPS control module	BSM control module receives the error signal from the EPS control module for 1 s or more.
U0423:68	Error signal received from instrument cluster	BSM control module receives the error signal from the instrument cluster for 1 s or more.
U0515:68	Error signal received from start stop unit	BSM control module receives the error signal from the start stop unit for 1 s or more.

U2300:54	Configuration signal not received	BSM control module cannot receive the configuration signal it is supposed to receive.
U2300:56	Configuration data unmatched with instrument cluster	Configuration data of the BSM control module and instrument cluster are not matched.
U2300:64	Instrument cluster configuration error	Instrument cluster configuration error (signal error) detected.
U3000:01	Electrical malfunction inside BSM control module	BSM control module is detected an electrical malfunction inside.
U3000:09	BSM control module internal malfunction	BSM control module detected a malfunction inside the voltage control oscillator.
U3000:54	Radar performance malfunction	BSM control module detected malfunction in misalignment.
U3000:97	Radar performance malfunction	• BSM control module internal radar sensor sensitivity is decreased. • BSM control module internal radar sensor axis is deviated.
U3003:04	Instrument cluster configuration error	Instrument cluster configuration error detected.
U3003:16	BSM control module low power supply voltage input (**less than 8.2 V**)	BSM control module power supply voltage of less than 8.2 V is detected for 2 s or more.
U3003:17	BSM control module high power supply voltage input (**16.8 V or more**)	BSM control module power supply voltage of 16.8 V or more is detected for 2 s or more.

BSM Control Module (RH)

DTC No.	Description	Detection condition
B118D:11	BSM indicator light (RH) circuit malfunction	BSM control module (RH) performs measurement at 0.01 s intervals and a short to ground in the BSM indicator light (RH) circuit is detected 48 times continuously.
B118D:15	BSM indicator light (RH) circuit malfunction	BSM control module (RH) performs measurement at 0.01 s intervals and a short circuit to power supply in the BSM indicator light (RH) circuit is detected 48 times continuously.
U0001:88	Module communication error (HS-CAN)	BSM control module detected a CAN bus communication line (HS-CAN) malfunction for 0.4 s or more.
U0100:00	Communication error with PCM	BSM control module cannot receive a CAN signal from the PCM for 1.5 s or more.
U0131:00	Communication error with EPS control module	BSM control module cannot receive a CAN signal from the EPS control module for 1.5 s or more.

U0155:00	Communication error with instrument cluster	BSM control module cannot receive a CAN signal from the instrument cluster.
U0214:00	Communication error with start stop unit	BSM control module cannot receive a CAN signal from the start stop unit for 1.5 s or more.
U0232:00	Communication error with BSM control module (LH)	No communication between BSM control module (LH) and (RH) for 1 s or more.
U0401:68	Error signal received from PCM	BSM control module receives the error signal from the PCM for 1 s or more.
U0420:68	Error signal received from EPS control module	BSM control module receives the error signal from the EPS control module for 1 s or more.
U0423:68	Error signal received from instrument cluster	BSM control module receives the error signal from the instrument cluster for 1 s or more.
U0515:68	Error signal received from start stop unit	BSM control module receives the error signal from the start stop unit for 1 s or more.
U2300:54	Configuration signal not received	BSM control module cannot receive the configuration signal it is supposed to receive.
U2300:56	Configuration data unmatched with instrument cluster	Configuration data of the BSM control module and instrument cluster are not matched.
U2300:64	Instrument cluster configuration error	Instrument cluster configuration error (signal error) detected.
U3000:01	Electrical malfunction inside BSM control module	BSM control module is detected an electrical malfunction inside.
U3000:09	BSM control module internal malfunction	BSM control module detected a malfunction inside the voltage control oscillator.
U3000:54	Radar performance malfunction	BSM control module detected malfunction in misalignment.
U3000:97	Radar performance malfunction	Instrument cluster configuration error detected.
U3003:04	Instrument cluster configuration error	• BSM control module internal radar sensor sensitivity is decreased. • BSM control module internal radar sensor axis is deviated.
U3003:16	BSM control module low power supply voltage input (**less than 8.2 V**)	BSM control module power supply voltage of less than 8.2 V is detected for 2 s or more.
	BSM control module high power supply	

U3003:17	voltage input (**16.8 V or more**)	BSM control module power supply voltage of 16.8 V or more is detected for 2 s or more.

Snap shot data

- The data for all DTCs currently detected is stored.

—: Not applicable

Snapshot data item	Unit		Data contents	Data read/use method	Corresponding data monitor items
AAT	°C	°F	Ambient temperature	—	—
APP_STATUS	Accelerator Pedal Off/Under20%/Over20%/FAIL		Accelerator pedal position status	—	—
CFG_STATUS	Config Complete/Not Configured/Config Error		Instrument cluster configuration status	—	—
ECT_STATUS	Under 0 degrees C/0 - Under 80 degrees C/Over 80 degrees C/FAIL		Engine coolant temperature status	—	—
IC_VPWR	V		Instrument cluster power supply voltage	• The BSM control module (LH) or (RH) constantly receives the power supply voltage value of the instrument cluster sent via CAN signal from the instrument cluster. • If a DTC is detected, the BSM control module (LH) or (RH) records the power supply voltage of the instrument cluster when the DTC was detected, and it is displayed in the Mazda Modular Diagnostic System (M-MDS).	VPWR*1
			Elapsed time since ignition was switched ON (engine off or on) **NOTE:** • The instrument	• The BSM control module (LH) or (RH) constantly receives the elapsed time since the ignition was switched ON (engine off or on) sent via CAN signal from the instrument cluster.	

IG-ON_TIMER	hh:mm:ss*2	cluster records the elapsed time since the ignition was switched ON (engine off or on).	• If a DTC is detected, the BSM control module (LH) or (RH) records the elapsed time since the ignition was switched ON (engine off or on) when the DTC was detected, and it is displayed in the Mazda Modular Diagnostic System (M-MDS).	—
PWR_MODE_KEY	Key Out/Key Recently Out (Position 0)/Accessory (Position 1)/Post Ignition (Position 2)/Ignition On (Position 2)/Running (Position 2)/Running - Starting	• Key Out: Ignition switched off • Key Recently Out (Position 0): Elapsed time **within 3 s** since ignition was switched off • Accessory (Position 1): Ignition is switched to ACC • Post Ignition (Position 2): Elapsed time **within 3 s** since ignition was switched ON (engine off or on) • Ignition On (Position 2): Ignition switched ON (engine off) • Running (Position 2): Ignition switched ON (engine on) • Running - Starting: Cranking condition	• The BSM control module (LH) or (RH) constantly receives the ignition switch status sent via CAN signal from the instrument cluster. • If a DTC is detected, the BSM control module (LH) or (RH) records the ignition switch status when the DTC was detected, and it is displayed in the Mazda Modular Diagnostic System (M-MDS).	—

RPM_STATUS	Engine Stop/Under1500rpm/Over1500rpm/FAIL		Engine speed status	• The BSM control module (LH) or (RH) constantly receives the engine speed sent via CAN signal from the instrument cluster. • If a DTC is detected, the BSM control module (LH) or (RH) records the engine speed when the DTC was detected, and it is displayed in the Mazda Modular Diagnostic System (M-MDS).	TACHOMTR*1
SHIFT_STATUS	P/N/D/R/FAIL		Selector lever position status	• The BSM control module (LH) or (RH) constantly receives the selector lever position sent via CAN signal from the instrument cluster. • If a DTC is detected, the BSM control module (LH) or (RH) records the selector lever position when the DTC was detected, and it is displayed in the Mazda Modular Diagnostic System (M-MDS).	—
TOTAL_DIST	km	Miles	Accumulated total traveled distance from completion of vehicle until BSM control module (LH) or (RH) detects DTC (Odometer value in instrument cluster)	The total traveled distance from which the BSM control module (LH) or (RH) detects DTCs to the present can be calculated by performing the following procedure. • Verify the odometer value in the instrument cluster. • Verify the snapshot data item TOTAL_DIST. • Subtract 2 from 1.	—
TOTAL_TIME	hh:mm:ss*2		Accumulated total elapsed time since vehicle completion until BSM control module (LH) or (RH) detects a DTC **NOTE:** • When the ROOM fuse is removed, and the ignition is switched off,	The elapsed time from which the BSM control module (LH) or (RH) detects DTCs to the present can be calculated by performing the following procedure. • Verify the instrument cluster PID item TOTAL_TIME. • Verify the snapshot data item TOTAL_TIME.	TOTAL_TIME*1

		the time is not included in the elapsed time.	• Subtract 2 from 1.	
VPWR	V	BSM control module (LH) or (RH) power supply voltage	—	VPWR_IG1
VSPD_STATUS	Stop/0-10km/h/Over10km/h/FAIL	Vehicle speed status	• The BSM control module (LH) or (RH) constantly receives the vehicle speed sent via CAN signal from the instrument cluster. • If a DTC is detected, the BSM control module (LH) or (RH) records the vehicle speed when the DTC was detected, and it is displayed in the Mazda Modular Diagnostic System (M-MDS).	SPEEDOMTR*1

*1

Instrument cluster PID (See ON-BOARD DIAGNOSTIC [INSTRUMENT CLUSTER].)

*2

The seconds may be indicated after the decimal point.

Data Monitor Function

- With the PID/data monitor function, input/output signal monitor items set in the BSM control module can be selected and read out in real-time.

PID/data monitor table

BSM Control Module (LH)—: Not applicable

PID	Unit/Operation	Data contents	Module control terminal
DTC_CNT	—	Displays number of DTCs stored in the BSM control module (LH)	—
IL_MODE	Off/On	• Off: BSM OFF indicator light is illuminated in night mode. • On: BSM OFF indicator light is illuminated in daytime mode.	C, D (CAN)
RCTA_BUZZER	Off/On	• Off: RCTA warning alarm does not sound.	C, D (CAN)

		On: RCTA warning alarm sounds.

		• Off: Turns off BSM indicator light (RH).	BSM indicator light (RH) (Power outer mirror

WRN_IND_R	Off/On	• On: Illuminates BSM indicator light (RH).	(RH))

2014 - Mazda3 - Body and Accessories

ON-BOARD DIAGNOSTIC [FORWARD SENSING CAMERA (FSC)]

Outline

- The on-board diagnostic function consists of the following functions:
  - A malfunction detection function, which detects overall malfunctions in the forward sensing camera (FSC)-related parts.
  - A memory function, which stores detected DTCs.
  - A display function, which indicates malfunction locations and status via DTC output.
  - A PID/data monitoring function, which reads out specific input/output signals and verifies the input/output condition.
- Using the Mazda Modular Diagnostic System (M-MDS), DTCs can be read out and deleted, and the PID/data monitoring function can be activated.

Malfunction detection function

- Detects malfunctions in input/output signals.
- If a malfunction occurs, the FSC records the malfunction as a DTC. A recorded DTC can be read by the Mazda Modular Diagnostic System (M-MDS).

DTC 7-digit code definition

- When related systems or components have failed, the CM stores the DTC of the malfunctioning part in the CM memory, and allows for the retrieval of the store data using scanning tool when necessary. The DTCs are indicated using seven digits. Each digit indicates the following.

B 1 0 D 5 : 1 3

· Specify the area failure sub type

00: No sub type information
05: System programming malfunctions
11: Circuit short to ground
13: Open circuit
14: Circuit short to ground or open
16: Circuit voltage below threshold
41: General checksum malfunction
09: Component failures
17: Circuit voltage above threshold
42: General memory malfunction
49: Internal electronic malfunction
51: Not programmed
62: Signal compare malfunction
68: Event information
81: Invalid serial data received
04: System internal failures
86: Signal invalid
87: Missing message
88: Bus off
92: Performance or incorrect operation
94: Unexpected operation
97: Component or system operation obstructed or blocked

· Manufacturer controlled

· Indicates subgroup

Powertrain (P code)	Network Electrical (U code)	Body (B code)	Chassis (C code)
0: Fuel and air metering and auxiliary emission controls	0: Network Electrical	Manufacturer controlled	Manufacturer controlled
	1: Network communication		
	2: Network communication		
	3: Network software		
	4: Network data		
	5: Network data		

· Indicates who was responsible for DTC definition

0: ISO/SAE controlled
1: Manufacturer controlled
2: There are ISO/SAE controlled just for powertrain, all others are manufacturer controlled.
3: For P3000 to P3399 is manufacturer controlled, all others are ISO/SAE controlled.

· Indicates DTC function

P: Powertrain
B: Body
C: Chassis
U: Network Electrical

Status byte for DTC

- The two digits (two digits after hyphen (-)) after the 7-digit DTC.

7-DIGIT DTC

P 1 2 6 0 : 0 0 − * *

STATUS BYTE

- A code which indicates the pending code, current/past malfunction status, or warning illumination status.
- Can be read by performing a CMDTC self-test using the Mazda Modular Diagnostic System (M-MDS).
- For details on the status byte, refer to the explanation on the Mazda Modular Diagnostic System (M-MDS) when reading the DTC.

Detection condition for the applicable DTC

DTC No.	Description	Detection condition
B115E:54	Forward sensing camera (FSC) aiming not completed	Forward sensing camera (FSC) aiming not completed is detected.
B13A6:11	LDWS switch circuit malfunction	Forward sensing camera (FSC) detects that LDWS switch is held pressed for 10 s or more.
C1001:92	Poor functioning of forward sensing camera (FSC)	With the LDWS switch on or the high beam control (HBC) system operating, it is detected that the area around the forward sensing camera (FSC) is excessively bright, and the system is inoperable for 10 min.
C1001:97	Forward sensing camera (FSC) poor visibility	With the LDWS switch on or the high beam control (HBC) system operating, it is detected that the forward sensing camera (FSC) field of view is obstructed for 10 min.
U0001:88	Module communication error (HS-CAN)	• Forward sensing camera (FSC) cannot receive the CAN bus communication signal (HS-CAN) for 1 s or more. • Forward sensing camera (FSC) detects the CAN bus communication line (HS-CAN) malfunction 10 times continuously.
U0100:00	Communication error with PCM	Forward sensing camera (FSC) cannot receive the CAN signal from the PCM for 1 s or more.
U0121:00	Communication error with DSC HU/CM	Forward sensing camera (FSC) cannot receive the CAN signal from the DSC HU/CM for 1 s or more.
U0131:00	Communication error with EPS control module	Forward sensing camera (FSC) cannot receive the CAN signal from the EPS control module for 1 s or more.
U0140:00	Communication error with front body control module (FBCM)	Forward sensing camera (FSC) cannot receive the CAN signal from the front body control module (FBCM) for 5 s or more.
U0155:00	Communication error with instrument cluster	Forward sensing camera (FSC) cannot receive the CAN signal from the instrument cluster for 5 s or more.
	Communication error with start	

U0214:00	stop unit	Forward sensing camera (FSC) cannot receive the CAN signal from the start stop unit for 1 s or more.
U0401:68	Error signal received from PCM	Forward sensing camera (FSC) receives the error signal from the PCM for 1 s or more.
U0415:68	Error signal received from DSC HU/CM	Forward sensing camera (FSC) receives the error signal from the DSC HU/CM for 1 s or more.
U0420:68	Error signal received from EPS control module	Forward sensing camera (FSC) receives the error signal from the EPS control module for 1 s or more.
U0423:68	Error signal received from instrument cluster	Forward sensing camera (FSC) receives the error signal from the instrument cluster for 5 s or more.
U0515:68	Error signal received from start stop unit	Forward sensing camera (FSC) receives the error signal from the start stop unit for 1 s or more.
U2005:86	Error signal received from PCM	Forward sensing camera (FSC) receives the vehicle speed signal error from the PCM for 1 s or more.
U2100:00	Forward sensing camera (FSC) configuration error	Forward sensing camera (FSC) configuration not completed is detected.
U2101:00	Forward sensing camera (FSC) configuration error	Detects that forward sensing camera (FSC) has unsupported configuration data.
U3000:04	Forward sensing camera (FSC) internal malfunction	Forward sensing camera (FSC) detects an error in the image-related circuit in the forward sensing camera (FSC) with the ignition switched ON (engine off or on).
U3000:09	Forward sensing camera (FSC) internal malfunction	Forward sensing camera (FSC) detects an internal temperature sensor malfunction in the forward sensing camera (FSC) with the ignition switched ON (engine off or on).
U3000:42	Forward sensing camera (FSC) internal malfunction	Forward sensing camera (FSC) detects a NVRAM error in the forward sensing camera (FSC) with the ignition switched ON (engine off or on).
U3000:49	Forward sensing camera (FSC) internal malfunction	Forward sensing camera (FSC) detects a malfunction in the forward sensing camera (FSC) with the ignition switched ON (engine off or on).
U3003:16	Forward sensing camera (FSC) low power supply voltage input	Forward sensing camera (FSC) power supply circuit voltage of 8.0 Å} 0.8 V or less is detected for 5 s or more with the ignition switched ON (engine off or on).
U3003:17	Forward sensing camera (FSC) high power supply voltage input	Forward sensing camera (FSC) power supply circuit voltage of 16.0 Å} 0.8 V or more is detected for 5 s or more with the ignition switched ON (engine off or on).

Snap shot data

- The data for all DTCs currently detected is stored.

—: Not applicable

Snapshot data item	Unit		Data contents	Data read/use method	Corresponding data monitor items
ECU_IN_TMP	°C	°F	ECU Internal Temperature	—	—
IG-ON_TIMER	hh:mm:ss*1		Elapsed time since ignition was switched ON (engine off or on) **NOTE:** • The instrument cluster records the elapsed time since the ignition was switched ON (engine off or on).	• The forward sensing camera (FSC) constantly receives the elapsed time since the ignition was switched ON (engine off or on) sent via CAN signal from the instrument cluster. • If a DTC is detected, the forward sensing camera (FSC) records the elapsed time since the ignition was switched ON (engine off or on) when the DTC was detected, and it is displayed in the Mazda Modular Diagnostic System (M-MDS).	—
OPE_MODE	Normal/CALIBRATION/EMERGENCY		Operation Mode	—	—
VSPD	KPH	MPH	Vehicle speed	—	—

*1

The seconds may be indicated after the decimal point.

Data Monitor Function

- The PID/data monitor function performs reading in real time of optionally selected input/output signal monitor items that are set in the FSC.

PID/data monitor table

			Module

PID	Unit/Operation	Data contents	control terminal
A_ANG_PITCH	° (deg)	Displays forward sensing camera (FSC) aiming angle (pitch)	C, E (CAN)
A_ANG_ROLL	° (deg)	Displays forward sensing camera (FSC) aiming angle (roll)	C, E (CAN)
A_ANG_YAW	° (deg)	Displays forward sensing camera (FSC) aiming angle (yaw)	C, E (CAN)
BRAKE_SW	Off/On	• Off: Brake switch (No. 2 signal) is off. (Brake pedal is depressed.) • On: Brake switch (No. 2 signal) is on. (Brake pedal is not depressed.)	C, E (CAN)
DSP_LANE_ST	Off/Dash_Lane/Solid_Lane	• Off: Off: Vehicle lanes not displayed in the active driving display (ADD) • Dash_Lane: Displays broken lines in the active driving display (ADD) • Solid_Lane: Displays actual lanes in the active driving display (ADD)	C, E (CAN)
		• Off: Warning not displayed in the center display • LDWS_Left: Warning related to lane departure on vehicle left side is displayed in the center display. • LDWS_Right: Warning related to lane departure on vehicle right side is displayed in the center display. • LDWS_Fail: Warning related to malfunction in lane departure warning	

DSP_WRN_ST	Off/LDWS_Left/LDWS_Right/LDWS_Fail/HBC_Fail/Camera_BLK/FSC_Fail/Camera_DRDT	system (LDWS) is displayed in the center display. • HBC_Fail: Warning related to malfunction in high beam control (HBC) system is displayed in the center display. • Camera_BLK: Warning related to dirt of the forward sensing camera (FSC) is displayed in the center display. • FSC_Fail: Warning related to malfunction in forward sensing camera (FSC) is displayed in the center display. • Camera_DRDT: Warning related to fogging of the forward sensing camera (FSC) is displayed in the center display.	C, E (CAN)
HBC_H/L_CS	Hi_Request/Low_Request/Invalid	• Hi_Request: HI beam switch signal received • Low_Request: LO beam switch signal received • Invalid: Error in HI/LO beam switch request signal	C, E (CAN)
IL_ST_HBC	Off/Green_On/Green_Flash/Amber_On/Amber_Flash	• Off: HBC system indicator light (green) and HBC system warning indicator light (amber) turned off • Green_On: HBC system indicator light (green) is illuminated. • Green_Flash: HBC system indicator light (green) is flashing. • Amber_On: HBC system warning light (amber) is illuminated.	C, E (CAN)

		• Amber_Flash: HBC system warning light (amber) is flashing.	
IL_ST_LDWS	Off/Green_On/Green_Flash/Amber_On/Amber_Flash	• Off: LDWS indicator light (green) and LDWS warning light (amber) turned off • Green_On: LDWS indicator light (green) illuminated • Green_Flash: LDWS indicator light (green) is flashing. • Amber_On: LDWS warning light (amber) is illuminated. • Amber_Flash: LDWS warning light (amber) is flashing.	C, E (CAN)
LDWS_BUZZER	Off/On	• Off: LDWS warning alarm does not sound. • On: LDWS warning alarm sounds.	C, E (CAN)
LDWS_SW	Off/On	• Off: LDWS switch is off. • On: LDWS switch is on.	C, E (CAN)
RS_SOUND_CS	Off/Left/Right	• Off: Rumble strip sound is not heard. • Left: Left side rumble strip sound heard. • Right: Right side rumble strip sound heard.	C, E (CAN)
VPWR_IG1	V	Displays forward sensing camera (FSC) power supply voltage	I (Power supply)
VSPD	KPH, MPH	Displays vehicle speed	C, E (CAN)

2014 - Mazda3 - Body and Accessories

INSTRUMENT CLUSTER OPERATION RECORD

Purpose

- The instrument cluster operation record stores the record of the illumination or flashing of the warning light.

Function

- The operation record is stored by the instrument cluster and displayed using the Mazda Modular Diagnostic System (M-MDS).
- The instrument cluster stores the following when any of the warning lights illuminates or flashes.
    - Time and date
    - Control module which sent warning light illumination/flash request
    - Battery voltage

Construction

- Based on the stored record, the instrument cluster displays the following operation record on the M-MDS screen.

MAZDA MODULAR DIAGNOSTIC SYSTEM (M-MDS) SCREEN

Operation

- When the instrument cluster receives a CAN signal or a warning light illumination/flash request signal sent from each switch, it controls the warning light to illuminate/flash and stores the operation record at the same time.

Fail-safe

- Function not equipped.

2014 - Mazda3 - Body and Accessories

ACTIVE AIR SHUTTER SYSTEM

Outline

- The active air shutter system controlled by the PCM reduces turbulent air*1 occurring around the vehicle which reduces air resistance. It does this by closing the active air shutter behind the front bumper mesh while the vehicle is being driven to control the air flowing into the engine compartment. In addition, by closing the shutter and blocking the air flow while the vehicle is driven during cold temperatures, the engine warms up more efficiently. By reducing the air resistance and improving the engine warm-up efficiency, the fuel economy has been improved.

*1

Air flowing into the engine compartment from the front bumper mesh while the vehicle is driven flows underneath the floor and the tire housings and collides with the air flowing around the vehicle, creating turbulence.

Structural View

Component parts	Function
PCM	The PCM controls the actuator of the active air shutter according to the driving and engine conditions.
Active air shutter	The active air shutter opens/closes the shutter according to the request signal from the PCM.
DSC HU/CM	The DSC HU/CM sends the vehicle speed signal to the PCM.
TCM	The TCM sends the cooling fan operation request signal to the PCM.

Climate control unit	The climate control unit sends the A/C operation signal to the PCM.
Intake air temperature sensor No.1	Intake air temperature sensor No.1 detects the intake air temperature before it passes through the throttle body.
Engine coolant temperature sensor No.1	Engine coolant temperature sensor No.1 detects the engine coolant temperature.
Refrigerant pressure sensor	The refrigerant pressure sensor detects the refrigerant pressure.
Instrument cluster	The instrument cluster turns on the master warning light when a system malfunction occurs.
Connectivity master unit (with center display)	The connectivity master unit displays the warning screen in the center display based on the warning display request signal from the PCM.
Center display (with center display)	The center display displays the warning screen when a system malfunction occurs.

- For the active air shutter system control, refer to ACTIVE AIR SHUTTER SYSTEM CONTROL. (See **ACTIVE AIR SHUTTER CONTROL**.)
- For details on the active air shutter, refer to ACTIVE AIR SHUTTER. (See **ACTIVE AIR SHUTTER**.)

2014 - Mazda3 - Body and Accessories

ACTIVE AIR SHUTTER CONTROL

Outline

- In the active air shutter control, the PCM controls the active air shutter actuator to open/close the shutter.
- The controlled functions are as follows:

Control Table

Control	Function	Content
Basic control	1. Basic function (See **1. Basic function**.)	• Opens/closes the shutter according to the vehicle speed, engine coolant temperature, or the load condition due to A/C operation.
	2. Shutter fully open/closed position learning function (See **2. Shutter fully open/closed position learning function**.)	• Learns the shutter fully open/closed positions by opening/closing the shutter.
Protection control	1. Engine protection function (See **1. Engine protection function**.)	• Opens the shutter to protect the engine if it is estimated that the engine coolant temperature is high or the engine oil temperature increases excessively.
	2. ATX protection function (See **2. ATX protection function**.)	• Opens the shutter to protect the ATX if the ATF temperature is high.
	3. Throttle valve protection function (See **3. Throttle valve protection function**.)	• Opens the shutter to prevent the engine oil temperature from increasing rapidly when the intake air temperature is low.
Fail-safe (See **Fail-safe**.)		• Opens the shutter if the active air shutter control has a malfunction.

Block Diagram

Operation

- The shutter is fully open when the ignition is switched off.
- The shutter is controlled in three positions; 0 ° (fully closed), 66 ° (66 ° open from fully closed position), and 90 ° (fully open).

NOTE:

- With the shutter opened to the 66 ° position, more air flows to the radiator and condenser while driving than with the shutter fully open.

SHUTTER OPEN/CLOSED POSITION

- The PCM opens/closes the active air shutter depending on the conditions after the shutter fully open/closed position learning is completed.
- The PCM opens/closes the shutter in the following control sections.

Basic Control

1. Basic function

- The PCM fully closes the shutter when all the following conditions are met.
  - Vehicle speed: less than 140 km/h {87.0 mph}
  - Engine coolant temperature: less than 100 °C {212 °F}
  - Load condition due to A/C operation: vehicle speed and refrigerant pressure during A/C operation are the specified values or less
  - Protection control is not operating
- If any of the following conditions is met, the PCM opens the shutter to the 66 ° position.
  - Vehicle speed: 140 km/h {87.0 mph} or more
  - Engine coolant temperature: 100 °C {212 °F} or more
  - A/C operation is in the following range (to cool the condenser)

2. Shutter fully open/closed position learning function

NOTE:

- After the main relay turns off (specified time has elapsed since ignition is switched off), the shutter fully open/closed positions recorded in the active air shutter actuator are cleared.

Shutter fully open/closed position learning function flow

- After the ignition is switched ON, the PCM moves the shutter to the 90 ° (fully open) position when the vehicle speed is 10 km/h {6.2 mph} or more.
- After the shutter reaches the 90 ° (fully open) position, the PCM moves the shutter to the 0 ° (fully closed) position.
- When the shutter reaches the 0 ° (fully closed) position, the shutter fully open/closed position learning function is completed.

- If an error occurs during the shutter fully open/closed position learning and the learning is not completed, the PCM performs the learning again (to maximum 3 times).

Protection Control

1. Engine protection function

- If any of the following conditions is met, the PCM opens the shutter to the 66 ° position to protect the engine until the ignition is switched off.
  - Engine coolant temperature: 116 °C {241 °F} or more
  - Engine oil temperature control of drive-by-wire control is operating*
  - *: This function is synchronized with the engine oil temperature control of the drive-by-wire control. For details on the engine oil temperature control, refer to the DRIVE-BY-WIRE CONTROL. (See **DRIVE-BY-WIRE CONTROL [SKYACTIV-G 2.0, SKYACTIV-G 2.5]**.) In addition, when this function operates, the PCM sends a master warning light on request to the instrument cluster. (See **MASTER WARNING LIGHT**.)

2. ATX protection function

- For ATX protection, when the PCM receives a cooling fan operation request signal from the TCM, the PCM opens the shutter to the 66 ° position until the ignition is switched off to prevent the ATF temperature from being excessively high, and also to lower the frequency of fail-safe operations which operate when the ATF temperature is high.

3. Throttle valve protection function

- When the intake air temperature is -5 °C {23 °F} or less, the PCM opens the shutter to the 66 ° position to prevent the engine oil temperature from increasing rapidly.
- By opening the shutter, a rapid increase in engine oil temperature is suppressed to prevent the blow-by gas from freezing and adhering to the throttle valve.

NOTE:

- If the flow amount exceeds the allowable flow amount of the PCV valve, the blow-by gas flows inside the air hose via the ventilation hose.

The blow-by gas is cooled by the cool intake air and condenses to water, and the water freezes by being cooled furthermore. If this ice adheres to the throttle valve, it may affect the throttle valve operation. In addition, if the engine oil temperature increases rapidly, fluid in the engine oil in the crank case evaporates and mixes with the blow-by gas. To prevent this, the shutter is opened when the intake air temperature is low to suppress rapid increase in the engine oil temperature.

Fail-safe

- If any of the following DTCs is stored, the PCM opens the shutter to the 66 ° position.
  - Intake air temperature sensor No.1 malfunction (P0112:00, P0113:00)
  - Engine coolant temperature sensor malfunction (P0117:00, P0118:00)
  - Vehicle speed signal error (P0500:00)
  - Active air shutter malfunction (P059F:00, P05A0:00)

2014 - Mazda3 - Body and Accessories

ACTIVE AIR SHUTTER

Purpose, Function

- The active air shutter opens/closes the shutter based on the open/close signal from the PCM. In addition, the active air shutter sends the current position of the shutter to the PCM.

Construction

CAUTION:

- The active air shutter cannot be disassembled. If the active air shutter is disassembled, the active air shutter system will not operate correctly. Therefore do not disassemble.
- The active air shutter consists of the following parts.
    - Shutter (9)
    - Shaft-integrated shutter (1)
    - Link connecting individual shutters
    - Actuator which drives shaft-integrated shutter
    - Frame assembling shutter and actuator together
    - Cover
    - Bracket
- A Hall sensor, which detects the current position, and the LIN driver, which performs communication with the PCM, are built into the actuator.

Operation

- When the open/close signal from the PCM is received, the active air shutter operates the actuator (1).
- When the actuator operates, the shaft-integrated shutter rotates (2).
- When the shaft- integrated shutter rotates, the link activates to rotate the remaining shutters simultaneously (3).
- The actuator detects the opening angle of the shutter using the Hall sensor and sends the current position signal of the shutter to the PCM (4).

- The shutter fully opens when the ignition is switched off.
- The shutter fully closes when the ignition is switched ON (engine running) and a shutter close signal is received.
- When the ignition is switched ON (engine on) and a shutter open signal is received, the shutter opens to the position 66° from the fully closed position to facilitate air flow to the radiator and condenser.

Fail-safe

- If communication with the PCM is interrupted, the active air shutter operates the actuator to open the shutter to the fully open position.

NOTE:

- If the vehicle continues to be driven with the active air shutter in a fully closed condition, air will not contact the radiator and condenser, and the engine coolant temperature and ATF temperature will increase. To prevent overheating from an excessive rise in temperatures, the active air shutter opens the shutter to the fully open position if communication with the PCM is interrupted.

CONTROL SYSTEM

Outline

- A front body control module (FBCM) has been adopted for the vehicle front which controls systems such as the headlights, windshield wipers, and turn lights.
- A rear body control module (RBCM) has been adopted for the vehicle rear which controls systems such as the power door lock, rear wiper, and interior light.

2014 - Mazda3 - Body and Accessories

FRONT BODY CONTROL MODULE (FBCM)

Outline

- Located at the front of the vehicle, the front body control module (FBCM) performs numerous system controls for functions at the front of the vehicle.

Function

- The front body control module (FBCM) controls the system based on the input/output signals.
- The functions which are controlled are as follows:

Control table

Control	Content	Reference
Front combination light control	Each light illuminates or flashes in conjunction with the operation of the light switch, turn switch and hazard warning switch.	(See **FRONT COMBINATION LIGHT**.)
Horn control	Sound is harmonized between high and low pitch.	(See **HORN**.)
Rear defroster system control	Warms the rear window glass and the outer mirror glass using heat filaments to defog the glass surface.	(See **REAR WINDOW DEFROSTER/OUTER MIRROR HEATER**.)
Front fog light control	By shining light in a wider area in front of the vehicle than the light from the headlights, visibility during poor weather conditions, such as rain and fog, has been improved. In addition, the visibility of the vehicle from on-coming vehicles, pedestrians, has been improved.	(See **FRONT FOG LIGHT**.)
Front wiper system control	Equipped with continuous (low/high), auto-stop, one-touch wiper, intermittent wiper, and synchronized washer and wiper operation.	(See **WINDSHIELD WIPER/WASHER SYSTEM**.)
CAN (Controller Area Network)	Sends and receives signals between CAN system-related modules using CAN system.	(See **MULTIPLEX COMMUNICATION SYSTEM**.)
ON-BOARD DIAGNOSTIC SYSTEM	The front body control module (FBCM) is equipped with an on-board diagnosis function which records DTCs in the event of a malfunction.	(See **ON-BOARD DIAGNOSTIC SYSTEM [FRONT BODY CONTROL MODULE (FBCM)]**.)

Structural view

System wiring diagram

Rear defroster, blower motor

Headlights, turn lights, front fog lights

FRONT BODY CONTROL MODULE (FBCM)

Windshield wipers, front washer

Theft-deterrent system, horn, sensors

CAN system

Battery Discharge Suppression Function

- The front body control module (FBCM) monitors the battery charge condition and, according to the condition, it stops the seat warmer and rear window defroster functions to prevent a battery discharge or battery life deterioration.

Fail-safe

Exterior lighting system

- If the CAN signal cannot be received normally, the front body control module (FBCM) performs the following controls:
    - Light is illuminated: Continues to illuminate until the ignition is switched off.
    - Light is turned off: Turns on/off according to the light switch operation. If the light switch is off, the TNS is forced on. When the ignition is switched off, the light turns off.

Auto light system

- If there is a communication error in the rain sensor while the light is illuminated, the front body control module (FBCM) continues to illuminate the light until the ignition is switched off or the light switch is operated to the position other than AUTO.

DRL system

- Function not equipped.

Turn light system

- If the CAN signal cannot be received normally, the front body control module (FBCM) controls the turn light system based on the signal last received. If the CAN signal cannot be received normally for 5 s or more, the front body control module (FBCM) stops the turn light system control.

Rear defroster system control

- Function not equipped.

Horn control

- Function not equipped.

Windshield wiper and washer system

- If the front body control module (FBCM) detects a malfunction in the internal CPU, it controls as follows:
    - When the wiper and washer switch is in the LO or HI position: LO operation control is performed.
    - When the wiper and washer switch is in the OFF position: Windshield wiper operation is stopped.
- If the front body control module (FBCM) cannot receive a windshield wiper switch position signal because of a malfunction in the start stop unit or a CAN communication error between the start stop unit, or if it detects an error in the windshield wiper switch position signal, it continues the control before detecting the malfunction. However, if the driver operates the wiper and washer switch, it controls as follows:
    - When the front body control module (FBCM) detects LO/HI ON using the LO/HI detection function: The windshield wipers are operated at low speed.
    - When the front body control module (FBCM) detects LO/HI OFF using the LO/HI detection function: The windshield wipers are stopped at the park position.
- If the windshield wiper switch position, which is monitored by the LO/HI detection function of the front body control module (FBCM), does not match the one sent from the start stop unit as a CAN signal, the windshield wipers are controlled according to the CAN signal for a certain period of time. After the certain period of time has elapsed, they are controlled as follows:
    - When the front body control module (FBCM) detects LO/HI ON using the LO/HI detection function: The windshield wipers are operated at low speed.

    - When the front body control module (FBCM) detects LO/HI OFF using the LO/HI detection function: The windshield wipers are stopped at the park position.

- If the front body control module (FBCM) detects a malfunction in the auto stop switch circuit while the windshield wipers are operating, it allows the windshield wipers to operate for a certain period of time and then stops the operation. However, if the driver operates the wiper and washer switch, or if the ignition is switched off and switched ON (engine off or on) again, it operates the windshield wipers again.
- If the front body control module (FBCM) cannot receive an INT volume signal because of a CAN communication error between the start stop unit or a malfunction in the start stop unit, it continues the operation at a certain intermittent timing.
- If the front body control module (FBCM) detects an error in the INT volume signal from the start stop unit, it continues the operation according to the INT volume signal before detecting the malfunction.
- If the front body control module (FBCM) cannot receive a windshield washer operation request signal because of a CAN communication error between the start stop unit or a malfunction in the start stop unit, it controls as follows:
    - When the windshield washer is operated: The washer operation is continued for a certain period of time and then stopped.
    - When the windshield washer is not operated: The washer is not operated.
- If the windshield washer is continuously operated for a long period (**1 min. or more**), the operation is stopped temporarily to prevent the windshield washer relay from overheating.

Auto wiper system

- If the front body control module (FBCM) cannot receive a CAN signal (vehicle speed signal) from the PCM normally, it continues the control using the vehicle speed signal before detecting the malfunction.
- If there is a malfunction in the rain sensor or a communication error between the rain sensor and front body control module (FBCM), and if the front body control module (FBCM) detects a signal error ten times in a series, the operation before the malfunction was detected is continued.
- If the rain sensor detects rainfall and then detects no change in the detected amount after the wipers have been operated approx. 2 times, the windshield is determined to be dirty and windshield wiper operation is stopped.
    - If the windshield is dirty, set the wiper and washer switch to LO or HI position to operate the windshield wiper. Or, remove the dirt from the windshield, then operate the auto wiper.
- If the temperature sensor in the rain sensor detects **-10 °C {14 °F}** or less when the ignition is switched ON (engine off or on), the windshield wipers do not operate even though it may be snowing.

2014 - Mazda3 - Body and Accessories

ON-BOARD DIAGNOSTIC SYSTEM [FRONT BODY CONTROL MODULE (FBCM)]

Outline

- The on-board diagnostic function consists of the following functions:
  - A malfunction detection function, which detects overall malfunctions in the front body control module (FBCM)-related parts.
  - A memory function, which stores detected DTCs.
  - A display function, which indicates malfunction locations and status via DTC output.
  - A PID/data monitoring function, which reads out specific input/output signals and verifies the input/output condition.
- Using the Mazda Modular Diagnostic System (M-MDS), DTCs can be read out and deleted, and the PID/data monitoring function can be activated.

Malfunction detection function

- Detects malfunctions in input/output signals.
- If a malfunction occurs, the front body control module (FBCM) records the malfunction as a DTC. A recorded DTC can be read by the Mazda Modular Diagnostic System (M-MDS).

DTC 7-digit code definition

- When related systems or components have failed, the CM stores the DTC of the malfunctioning part in the CM memory, and allows for the retrieval of the stored data using the scanning tool when necessary. The DTCs are indicated using seven digits. Each digit indicates the following.

B 1 0 D 5 : 1 3

· Specify the area failure sub type

00: No sub type information
02: General signal failure
09: Component failures
11: Circuit short to ground
12: Circuit short to battery
13: Open circuit
14: Circuit short to ground or open
16: Circuit voltage below threshold
17: Circuit voltage above threshold
19: Circuit current above threshold
49: Internal electronic failure
56: ISO/SAE reserved
62: Signal compare malfunction
64: Signal plausibility failure
68: Event information
7B: Low fluid level
72: Actuator stuck open
73: Actuator stuck closed
86: Signal invalid
88: Bus off
97: Component or system operation obstructed or blocked

· Manufacturer controlled

· Indicates subgroup

Powertrain (P code)	Network Electrical (U code)	Body (B code)	Chassis (C code)
1: Fuel and air metering	0: Network Electrical 1: Network communication	Manufacturer controlled	Manufacturer controlled

· Indicates who was responsible for DTC definition

0: ISO/SAE controlled
1: Manufacturer controlled
2: There are ISO/SAE controlled just for powertrain, all others are manufacturer controlled.
3: For P3000 to P3399 is manufacturer controlled, all others are ISO/SAE controlled.

· Indicates DTC function

P: Powertrain
B: Body
U: Network Electrical

Status byte for DTC

- The two digits (two digits after hyphen (-)) after the 7-digit DTC.

- A code which indicates the pending code, current/past malfunction status, or warning illumination status.
- Can be read by performing a CMDTC self-test using the Mazda Modular Diagnostic System (M-MDS).
- For details on the status byte, refer to the explanation on the Mazda Modular Diagnostic System (M-MDS) when reading the DTC.

Detection condition for the applicable DTC

DTC	System malfunction location	Detection condition
B1008:02	Windshield wiper control signal mismatch	Front body control module (FBCM) receives the error signals from the start stop unit with the ignition switched ON (engine off or on).
B1008:62	Windshield wiper LO switch signal mismatch	The condition in which the CAN and module signals are compared and no match is detected between the signals for 5 s or more with the ignition switched ON (engine off or on).
B1048:7B	Brake fluid level sensor circuit malfunction	Front body control module (FBCM) detected that the brake fluid level is less than MIN with the ignition switched ON (engine off or on).
B1087:88	LIN communication error	LIN bus communication line malfunction detected for 1 s or more
B1088:88	LIN communication error	LIN bus communication line malfunction detected for 1 s or more
B1092:11*1	DRL relay circuit malfunction	Front body control module (FBCM) detects a short to ground in the DRL relay circuit with the ignition switched ON (engine off or on).
B109A:12	Headlight HI relay circuit malfunction	Front body control module (FBCM) detects a short to power supply in the headlight HI relay circuit with the ignition switched ON (engine off or on).
B109A:14	Headlight HI relay circuit malfunction	Front body control module (FBCM) detects an open circuit or short to ground in the headlight HI relay circuit with the ignition switched ON (engine off or on).
B10A6:64*2	Light switch error signal received	Front body control module (FBCM) receives the error signals from the start stop unit for 5 s or more with the ignition switched ON (engine off or on).

B10A8:12*1	Headlight LO relay circuit malfunction	Front body control module (FBCM) detects a short to power supply in the headlight LO relay circuit with the ignition switched ON (engine off or on).
B10AD:86*3	Error signal received from auto light sensor/rain sensor	Front body control module (FBCM) receives the error signals from the auto light sensor/rain sensor 10 times continuously with the ignition switched ON (engine off or on).
B10AF:12	Blower relay circuit malfunction	Front body control module (FBCM) detects a short to power supply in the blower relay circuit with the ignition switched ON (engine off or on).
B1142:13	IG1 relay circuit malfunction	Front body control module (FBCM) detects an open circuit in the IG1 relay circuit for 2 s or more with the ignition switched ON (engine off or on).
B1143:13	IG2 relay control circuit malfunction	Front body control module (FBCM) detects an open circuit in the IG2 relay control circuit for 2 s or more with the ignition switched ON (engine off or on).
B11DB:86*4	Error signal received from current sensor	Front body control module (FBCM) receives the error signals from the current sensor for 5 s or more with the ignition switched ON (engine off or on).
B1314:11	Illumination output circuit malfunction	Front body control module (FBCM) detects a short to ground in the illumination output circuit with the ignition switched ON (engine off or on).
B134D:02	Headlight control signal error	Front body control module (FBCM) receives the error signal from the start stop unit for 5 s or more with the ignition switched ON (engine off or on).
B13CF:19	IG2 power supply output circuit malfunction	Front body control module (FBCM) detects over-current in the IG2 power supply output circuit with the ignition switched ON (engine off or on).
B13D0:11	TNS circuit malfunction	Front body control module (FBCM) detects a short to ground in the TNS relay circuit with the ignition switched ON (engine off or on).
B13D2:12*5	Front fog light relay circuit malfunction	Front body control module (FBCM) detects a short to power supply in the front fog light relay circuit with the ignition switched ON (engine off or on).
B13FE:12*6	Headlight LO relay (RH) circuit malfunction	Front body control module (FBCM) detects a short to power supply in the headlight LO relay (RH) circuit with the ignition switched ON (engine off or on).
B13FE:14*6	Headlight LO relay (RH) circuit malfunction	Front body control module (FBCM) detects an open circuit or short to ground in the headlight LO relay (RH) circuit with the ignition switched ON (engine off or on).
B141E:12*6	Headlight LO relay (LH) circuit malfunction	Front body control module (FBCM) detects a short to power supply in the headlight LO relay (LH) circuit with the ignition switched ON (engine off or on).
B1C84:12	Rear window defroster relay circuit	Front body control module (FBCM) detects a short to power supply in the rear window defroster

	malfunction	relay circuit with the ignition switched ON (engine off or on).
B1C84:14	Rear window defroster relay circuit malfunction	Front body control module (FBCM) detects an open circuit or short to ground in the rear window defroster relay circuit with the ignition switched ON (engine off or on).
B1D06:11	Turn light (LH) circuit malfunction	Front body control module (FBCM) detects a short to ground in the turn light (LH) circuit with the ignition switched ON (engine off or on).
B1D06:13	Turn light (LH) circuit malfunction	Front body control module (FBCM) detects an open circuit or short to power supply in the turn light (LH) circuit with the ignition switched ON (engine off or on).
B1D07:11	Turn light (RH) circuit malfunction	Front body control module (FBCM) detects a short to ground in the turn light (RH) circuit with the ignition switched ON (engine off or on).
B1D07:13	Turn light (RH) circuit malfunction	Front body control module (FBCM) detects an open circuit or short to power supply in the turn light (RH) circuit with the ignition switched ON (engine off or on).
U0001:88	Module communication error (HS-CAN)	Front body control module (FBCM) detects a CAN bus communication line (HS-CAN) malfunction 10 times continuously.
U0100:00	Communication error with PCM	Front body control module (FBCM) could not receive the CAN signal from the PCM for 5 s or more.
U0101:00 *7	Communication error with TCM	Front body control module (FBCM) could not receive the CAN signal from the TCM for 5 s or more.
U0151:00	Communication error with SAS control module	Front body control module (FBCM) could not receive the CAN signal from the SAS control module for 5 s or more.
U0155:00	Communication error with instrument cluster	Front body control module (FBCM) could not receive the CAN signal from the instrument cluster for 5 s or more.
U0164:68 *8	Communication error with climate control unit	Front body control module (FBCM) could not receive signals from the climate control unit for 5 s or more with the ignition switched ON (engine off or on).
U0214:00	Communication error with start stop unit	Front body control module (FBCM) could not receive the CAN signal from the start stop unit for 5 s or more.
U0231:68 *3	Communication error with auto light sensor/rain sensor	Front body control module (FBCM) could not receive the signals from the auto light sensor/rain sensor for 5 s or more with the ignition switched ON (engine off or on).
U023A:00 *9	Communication error with forward sensing camera (FSC)	Front body control module (FBCM) could not receive the CAN signal from the forward sensing camera (FSC) for 5 s or more.
U0338:09	Error light switch signal received from	Front body control module (FBCM) receives the CAN error signals from the start stop unit 3 times

	start stop unit	with the ignition switched ON (engine off or on).
U0401:68	Error signal received from PCM	Front body control module (FBCM) receives the error ECT sensor or ambient temperature sensor signals from the PCM for 5 s or more with the ignition switched ON (engine off or on).
U053B:68 *9	Error signal received from forward sensing camera (FSC)	Front body control module (FBCM) receives the error signals from the forward sensing camera (FSC) for 5 s or more with the ignition switched ON (engine off or on).
U1007:68 *4	Communication error with current sensor	Front body control module (FBCM) could not receive signals from the current sensor for 5 s or more with the ignition switched ON (engine off or on).
U2005:68	Error vehicle speed signal received from PCM	Front body control module (FBCM) receives the vehicle speed signal error from the PCM for 5 s or more with the ignition switched ON (engine off or on).
U2100:00	Front body control module (FBCM) configuration error	Front body control module (FBCM) configuration error (no configuration) detected.
U2101:00	Front body control module (FBCM) configuration error	Front body control module (FBCM) configuration error detected.
U3000:49	Front body control module (FBCM) internal malfunction	Front body control module (FBCM) detects the internal malfunction.
U3000:56	Front body control module (FBCM) configuration error	Front body control module (FBCM) configuration error detected.
U3003:16	Front body control module (FBCM) power supply voltage (+B power supply) low input	Front body control module (FBCM) power supply circuit voltage of 8.8 V or less is detected for 10 s or more with the ignition switched ON (engine off or on).
U3003:17	Front body control module (FBCM) power supply voltage high input	Front body control module (FBCM) power supply circuit voltage of 14.2 V or more is detected for 10 s or more with the ignition switched ON (engine off or on).
U3006:62	Front body control module (FBCM) power supply voltage mismatch	Front body control module (FBCM) terminal 1A, 1B, 3K, and 3L voltages of 2 V or more lower than the voltage of terminal 2A are detected for 5 s or more with the ignition switched ON (engine off or on).

Snapshot data

- The front body control module (FBCM) stores the following two types of snapshot data (vehicle information) when a DTC is detected and displays them in the Mazda Modular Diagnostic System (M-MDS).
  - Vehicle information detected by front body control module (FBCM)
  - Vehicle information detected by instrument cluster and received by front body control module (FBCM) via CAN signal

Snapshot data table—: Not applicable

Snapshot data item	Unit		Data contents	Data read/use method	Corresponding data monitor items
AAT	°C	°F	Ambient temperature	—	—
APP_STATUS	Accelerator Pedal Off/Under20%/Over20%/FAIL		Accelerator pedal position status	—	—
CFG_STATUS	Config Complete/Not Configured/Config Error		Instrument cluster configuration status	—	—
ECT_STATUS	Under 0 degrees C/0 - Under 80 degrees C/Over 80 degrees C/FAIL		Engine coolant temperature status	—	—
IC_VPWR	V		Instrument cluster power supply voltage	• The front body control module (FBCM) constantly receives the power supply voltage value of the instrument cluster sent via CAN signal from the instrument cluster. • If a DTC is detected, the front body control module (FBCM)	VPWR*1

			records the power supply voltage of the instrument cluster when the DTC was detected, and it is displayed in the Mazda Modular Diagnostic System (M-MDS).	
IG-ON_TIMER	hh:mm:ss*2	Elapsed time since ignition was switched ON (engine off or on) **NOTE:** • The instrument cluster records the elapsed time since the ignition was switched ON (engine off or on).	• The front body control module (FBCM) constantly receives the elapsed time since the ignition was switched ON (engine off or on) sent via CAN signal from the instrument cluster. • If a DTC is detected, the front body control module (FBCM) records the elapsed time since the ignition was switched ON (engine off or on) when the DTC was detected, and it is displayed in the Mazda Modular Diagnostic System (M-MDS).	—
PWR_MODE_KEY	Key Out/Key Recently Out (Position 0)/Accessory (Position 1)/Post Ignition (Position 2)/Ignition On (Position 2)/Running (Position 2)/Running - Starting	• Key Out: Ignition switched off • Key Recently Out (Position 0): Elapsed time **within 3 s** since ignition was switched off • Accessory (Position 1): Ignition is switched to ACC • Post Ignition (Position 2): Elapsed time **within 3 s** since ignition was switched ON (engine off or on) • Ignition On (Position 2): Ignition	• The front body control module (FBCM) constantly receives the ignition switch status sent via CAN signal from the instrument cluster. • If a DTC is detected, the front body control module (FBCM) records the ignition switch status when the DTC was detected, and it is displayed in the Mazda Modular Diagnostic System (M-MDS).	—

			switched ON (engine off) • Running (Position 2): Ignition switched ON (engine on) • Running - Starting: Cranking condition		
RPM_STATUS	Engine Stop/Under1500rpm/Over1500rpm/FAIL		Engine speed status	• The front body control module (FBCM) constantly receives the engine speed sent via CAN signal from the instrument cluster. • If a DTC is detected, the front body control module (FBCM) records the engine speed when the DTC was detected, and it is displayed in the Mazda Modular Diagnostic System (M-MDS).	TACHOMTR*1
SHIFT_STATUS	P/N/D/R/FAIL		Selector lever position status	• The front body control module (FBCM) constantly receives the selector lever position sent via CAN signal from the instrument cluster. • If a DTC is detected, the front body control module (FBCM) records the selector lever position when the DTC was detected, and it is displayed in the Mazda Modular Diagnostic System (M-MDS).	—
TOTAL_DIST	km	Miles	Accumulated total traveled distance from completion of vehicle until front body control module (FBCM) detects DTC (Odometer value in instrument cluster)	The total traveled distance from which the front body control module (FBCM) detects DTCs to the present can be calculated by performing the following procedure. • Verify the odometer value in the instrument cluster. • Verify the snapshot data item TOTAL_DIST. • Subtract 2 from 1.	—

TOTAL_TIME	hh:mm:ss*2	Accumulated total elapsed time since vehicle completion until front body control module (FBCM) detects a DTC **NOTE:** • When the ROOM fuse is removed, and the ignition is switched off, the time is not included in the elapsed time.	The elapsed time from which the front body control module (FBCM) detects DTCs to the present can be calculated by performing the following procedure. • Verify the instrument cluster PID item TOTAL_TIME. • Verify the snapshot data item TOTAL_TIME. • Subtract 2 from 1.	TOTAL_TIME*1
VPWR	V	Front body control module (FBCM) power supply voltage	—	VPWR_B
VSPD_STATUS	Stop/0-10km/h/Over10km/h/FAIL	Vehicle speed status	• The front body control module (FBCM) constantly receives the vehicle speed sent via CAN signal from the instrument cluster. • If a DTC is detected, the front body control module (FBCM) records the vehicle speed when the DTC was detected, and it is displayed in the Mazda Modular Diagnostic System (M-MDS).	SPEEDOMTR*1

*1 **Instrument cluster PID (See ON-BOARD DIAGNOSTIC [INSTRUMENT CLUSTER].)**

*2 **The seconds may be indicated after the decimal point.**

Data monitor function

- With the PID/data monitor function, input/output signal monitor items set in the front body control module (FBCM) can be selected and read out in real-time.

PID/data monitor table

—: Not applicable

PID	Unit/Operation	Data contents	Data read/use method	Module control terminal
ABK_CS_BG*1	Off/On	Theft-deterrent system answer-back signal input status • Off: Theft-deterrent system answer-back signal is not received. • On: Theft-deterrent system answer-back signal is received.	Theft-deterrent system answer-back request signal input from rear body control module (RBCM) **NOTE:** • Operates only if the ignition is switched off.	2I, 2K (CAN)
ABK_CS_KEY	Off/On	Keyless entry system answer-back signal input status • Off: Keyless entry system answer-back signal is not received. • On: Keyless entry system answer-back signal is received.	Answer-back request signal input for keyless entry system from rear body control module (RBCM)	2I, 2K (CAN)
ABK_HD_CS_R	Off/On	**NOTE:** • It is displayed, however, if an accessory part is installed, it cannot be used.	—	—
ABK_HN_CS_R	Off/On	**NOTE:** • It is displayed, however, if an accessory part	—	—

		is installed, it cannot be used.		
ABK_HN_KEY	Off/On	Keyless entry system horn answer-back signal input status • Off: Keyless entry system horn answer-back signal is not received. • On: Keyless entry system horn answer-back signal is received.	Keyless entry system horn answer-back request signal input from rear body control module (RBCM)	2I, 2K (CAN)
BAT_TMP	°C, °F	Displays battery temperature (estimated).	Estimated battery temperature transmitted by LIN communication from current sensor	2E (LIN)
BG_ALARM_CS*1	Off/On	Theft-deterrent system alarm signal input status • Off: Hazard warning light flashing request signal is not received • On: Hazard warning light flashing request signal is received	Theft-deterrent system alarm request signal input from rear body control module (RBCM) **NOTE:** • Operates only if the ignition is switched off.	2I, 2K (CAN)
BLWR_MT_RY	Off/On	Blower motor relay output signal status • Off: Blower relay is off. • On: Blower relay is on.	—	2Z (Blower motor relay control)
		Brake switch operation status • Off: Brake switch (No. 2 signal) is off.		

BRAKE_SW	Off/On	(Brake pedal is depressed.) • On: Brake switch (No. 2 signal) is on. (Brake pedal is not depressed.)	Brake switch signal status detected by PCM	2N, 2P (CAN)
BRK_F_L_SW	Normal/Low/Unknown	Brake fluid level condition • Normal: Brake fluid level is between MAX and MIN. • Low: Brake fluid level is lower than MIN. • Unknown: Brake fluid level is not determined.	—	2Q (Brake fluid level switch signal)
DCDC_CVT_ST	**NOTE:** • Displays in the Mazda Modular Diagnostic System (M-MDS) but it does not operate.			
DCDC_VLT_I	**NOTE:** • Displays in the Mazda Modular Diagnostic System (M-MDS) but it does not operate.			
DCDC_VLT_O	**NOTE:** • Displays in the Mazda Modular Diagnostic System (M-MDS) but it does not operate.			
DEFOG_F_CS	Off/On	**NOTE:** • It is displayed, however, if an accessory part is installed, it cannot be used.	—	—
		Rear defroster operation request signal from heater		

DEFOG_R_CS	Off/On	control unit • Off: Rear window defroster control signal is not received. • On: Rear window defroster control signal is received.	For manual A/C vehicles, request signal transmission is via LIN communication.	2I, 2K (CAN)
ENG_C_TMP	°C, °F	Displays the engine coolant temperature value from the PCM.	—	2N, 2P (CAN)
ESS_ST	**NOTE:** • Displays in the Mazda Modular Diagnostic System (M-MDS) but it does not operate.			
F_FOG_LMP*2	Off/On	Front fog light control signal • Off: Front fog light is turned off. • On: Front fog light is turned on.	—	—
F_FOG_SW*2	Off/On	Front fog light switch input signal from start stop unit • Off: Front fog light switch F.FOG signal is not received. • On: Front fog light switch F.FOG signal is received.	—	2I, 2K (CAN)
		Headlight control signal • OFF: Headlight is turned off. • DRL: DRL is		

H/L	OFF/DRL/TNS/H/L_LOW/H/L_HI	turned on. • TNS: TNS is turned on. • H/L_LOW: Headlight (LO) is turned on. • H/L_HI: Headlight (HI) is turned on.	—	—
H/L_CLN_RY	**NOTE:** • Displays in the Mazda Modular Diagnostic System (M-MDS) but it does not operate.			
H/L_CS_RLS*3	Off/TNS_On/TNS+H/L_On	Headlight control input signal from auto light sensor/rain sensor • Off: TNS and headlight on request signal is not received from auto light sensor. • TNS_On: TNS on signal is received from auto light sensor. • TNS+H/L_On: TNS and headlight LO on signal is received from auto light sensor.	—	2G (LIN)
H/L_HI	Off/On	Headlight HI beams • Off: Headlight HI is turned off. • On: Headlight HI is turned on.	—	—

H/L_SW_HI	Off/On	Light switch position (HI) condition via CAN signal from start stop unit • Off: Light switch HI signal is not received. • On: Light switch HI signal is received.	—	2I, 2K (CAN)
H/L_SW_LOW1	Off/On	Displays dimmer switch position of light switch sent from start stop unit via CAN signal • Off: Other than dimmer switch LO position of light switch is received • On: Dimmer switch LO position of light switch is received	Verify if the monitor value switches when the dimmer switch of the light switch is switched between LO and HI positions. If the dimmer switch operation and monitor values do not match, inspect the start stop unit or CAN communication. **NOTE:** • If PID items H/L_SW_LOW1 and H/L_SW_LOW2 do not match, the front body control module (FBCM) detects a DTC. Also, the headlight (low) may be constantly illuminated.	2I, 2K (CAN)
H/L_SW_LOW2	Off/On	Displays dimmer switch position of light switch connected to front body control module (FBCM) terminal 2W • Off: Other than dimmer switch LO position of light switch is received • On: Dimmer switch LO position of light switch is received	Verify if the monitor value switches when the dimmer switch of the light switch is switched between LO and HI positions. If the dimmer switch operation and monitor values do not match, inspect the light switch or related wiring harness. **NOTE:** • If PID items H/L_SW_LOW1 and H/L_SW_LOW2 do not match, the front body control module (FBCM) detects a DTC. Also, the headlight (low) may be constantly illuminated.	2W (Headlight (LO) switch signal)
		Light switch position (OFF) condition via CAN signal from		

H/L_SW_OFF	Off/On	start stop unit • Off: Light switch OFF signal is not received. • On: Light switch OFF signal is received.	—	2I, 2K (CAN)
H/L_SW_PASS	Off/On	Light switch position (PASS) condition via CAN signal from start stop unit • Off: Light switch FLASH-TO-PASS signal is not received. • On: Light switch FLASH-TO-PASS signal is received.	—	2I, 2K (CAN)
H/L_SW_TNS	Off/On	Light switch position (TNS) status via CAN signal from start stop unit • Off: Light switch TNS signal is not received. • On: Light switch TNS signal is received.	—	2I, 2K (CAN)
H/L_TNS	Off/On	Light switch (TNS) output signal • Off: TNS is turned off. • On: TNS is turned on.	—	—
		Hazard light output signal		

HAZARD_LMP	Off/On	• Off: Hazard light is turned off. • On: Hazard light is turned on.	—	—
HAZARD_SW	Off/On/Unknown	Hazard switch input signal from start stop unit • Off: Hazard warning switch is not pressed. • On: Hazard warning switch is pressed. • Unknown: Hazard warning switch on/off is not determined.	—	2I, 2K (CAN)
HBC_CS*4	Off/On/Invalid	High beam control (HBC) system control signal input from forward sensing camera (FSC) • Off: High beam control (HBC) system signal is not received. • On: High beam control (HBC) system signal is received. • Invalid: High beam control (HBC) system signal has error.	—	2I, 2K (CAN)
HBC_ST*4	Off/On	Operation status of high beam control (HBC) system • Off: High beam control (HBC) system is not	Control status of high beam control (HBC) system of front body control module	2I, 2K

		operated. • On: High beam control (HBC) system is operated.	(FBCM) by signal from forward sensing camera (FSC)	(CAN)
HEAT_CS_R	**NOTE:** • Displays in the Mazda Modular Diagnostic System (M-MDS) but it does not operate.			
IG_ST	Off/On	Ignition switch status • Off: IG1 is off. • On: IG1 is on.	—	2I, 2K (CAN)
L_OFF_AUTO	Off/On	Operation status of lights off function by auto-light function • Off: TNS or headlight off control by auto light off system is not operated. • On: TNS or headlight off control by auto light off system is operated.	If the lights are turned off by the auto-light function (ignition is switched off), the value becomes On.	—
L_OFF_BS	**NOTE:** • Displays in the Mazda Modular Diagnostic System (M-MDS) but it does not operate.			
OIL_P_SW	**NOTE:** • Displays in the Mazda Modular Diagnostic System (M-MDS) but it does not operate.			
OUT_CAR_TMP	°C, °F	Displays the ambient temperature value input from the PCM.	—	2N, 2P (CAN)
		Parking brake switch status having input from instrument cluster		

P_BRAKE_SW	Off/On	• Off: Parking brake switch is off. (Parking brake lever is not pulled.) • On: Parking brake switch is on. (Parking brake lever is pulled.)	—	2I, 2K (CAN)
PNC_CS	Off/On	Panic signal input from rear body control module (RBCM) • Off: Panic control signal is not received. • On: Panic control signal is received.	—	2I, 2K (CAN)
PNC_HD_CS_R	Off/On	**NOTE:** • It is displayed, however, if an accessory part is installed, it cannot be used.	—	—
PNC_HN_CS_R	Off/On	**NOTE:** • It is displayed, however, if an accessory part is installed, it cannot be used.	—	—
PTC_HEAT_CS	**NOTE:** • Displays in the Mazda Modular Diagnostic System (M-MDS) but it does not operate.			
R_FOG_LMP	**NOTE:** • Displays in the Mazda Modular Diagnostic System (M-MDS) but it does not operate.			
	NOTE:			

R_FOG_SW	• Displays in the Mazda Modular Diagnostic System (M-MDS) but it does not operate.			
RES_CS	Off/On	**NOTE:** • It is displayed, however, if an accessory part is installed, it cannot be used.	—	—
RLS_FLT*3	O.K./FAULT	Fail determination signal of auto light sensor/rain sensor • O.K.: Rain sensor is normal. • FAULT: Rain sensor has a malfunction.	If normal, the value is O.K.. If abnormal, FAULT.	2G (LIN)
S_HT_CUT*5	No_Request/Cut	Seat warmer cut status • No_Request: Except below • Cut: Seat warmer is turned off or lowered.	—	—
SHIFT_L_POS*7	Between/P/R/N/D/S(2)/L(1)	Selector lever position signal from TCM • Between: Selector lever is between two positions. • P: Selector lever is in P position. • R: Selector lever is in R position. • N: Selector lever is in N position.	—	2I, 2K (CAN)

		• D: Selector lever is in D position. • S(2): Selector lever is in D position 2nd gear. • L(1): Selector lever is in D position 1st gear.		
TURN_L_L	Off/On	Turn light (LH) output signal • Off: Turn light (LH) is turned off. • On: Turn light (LH) is turned on.	—	—
TURN_L_R	Off/On	Turn light (RH) output signal • Off: Turn light (RH) is turned off. • On: Turn light (RH) is turned on.	—	—
TURN_SW	Off/Turn_R_On/Turn_L_On/Unknown	Turn switch signal input from start stop unit • Off: Turn switch is in OFF position. • Turn_R_On: Turn switch is in RH position. • Turn_L_On: Turn switch is in LH position. • Unknown: Turn switch position is not	—	2I, 2K (CAN)

		determined.		
VPWR_B	V	Displays front body control module (FBCM) power supply voltage	—	2A, 3K, 3L (Power supply)
VSPD	KPH, MPH	Displays the vehicle speed signal from the PCM.	—	2N, 2P (CAN)
WAS_FLUID_L*6	Normal/Low/Unknown	Washer fluid level • Normal: Washer fluid level is normal. • Low: Washer fluid level is low. • Unknown: Washer fluid level is not determined.	—	2S (Washer level switch signal)
WAS_MT_RY_F	Off/On	Windshield washer motor relay operation signal • Off: Windshield washer motor relay is off. • On: Windshield washer motor relay is on.	—	3F (Windshield washer motor control)
WAS_MT_RY_R*8	Off/On	Rear washer motor relay operation signal • Off: Rear washer motor relay is off. • On: Rear washer motor relay is on.	—	3H (Rear window washer motor control)
		Windshield washer switch input signal from start stop unit • Off: Windshield		

WASHER_F	Off/On	washer switch is off. • On: Windshield washer switch is on.	—	2I, 2K (CAN)
WASHER_R*8	Off/On	Rear washer switch input signal from start stop unit • Off: Rear wiper and washer switch is not in rear washer position. • On: Rear wiper and washer switch is in rear washer position.	—	2I, 2K (CAN)
WIP_CS_RLS*3	Off/Single_Wipe/F_Wiper_LOW/F_Wiper_HI/Failure	Auto wiper input signal from auto light sensor/rain sensor • Off: Wiper operation signal is not received from rain sensor. • Single_Wipe: Signal to operate wiper once is received from rain sensor. • F_Wiper_LOW: Signal to operate wiper at low speed is received from rain sensor. • F_Wiper_HI: Signal to operate wiper at high speed is received from rain sensor.	—	2G (LIN)

		• Failure: Communication with rain sensor is failed.		
WIP_F	OFF/LOW/HI/INT / AUTO	Windshield wiper switch input signal from start stop unit • OFF: Windshield wiper switch is in OFF position. • LOW: Windshield wiper switch is in LO position. • HI: Windshield wiper switch is in HI position. • INT / AUTO: Windshield wiper switch is in INT or AUTO position.	—	2I, 2K (CAN)
WIP_F_INT_L	%	Displays the windshield wiper intermittent interval time input signal from start stop unit.	—	2I, 2K (CAN)
WIP_F_LOW	Off/On	Windshield wiper LO switch input status • Off: Windshield wiper switch is not in LO position. • On: Windshield wiper switch is in LO position.	—	2Y (Windshield wiper (LO) switch signal)
		Windshield wiper stop position signal input • Stop: Windshield		

WIP_F_MST	Stop/Move	wipers stop at normal position • Move: Windshield wipers do not stop at normal position	If windshield wipers are operating, Move-Stop is repeated.	2AA (Autostop switch signal)
WIP_F_RY_HI	Off/On	Windshield wiper HI relay output signal • Off: Windshield wiper HI relay is off. • On: Windshield wiper HI relay is on.	—	3C, 3E (Windshield wiper motor (HI) control)
WIP_F_RY_LO	Off/On	Windshield wiper relay LO output signal • Off: Windshield wiper LO relay is off. • On: Windshield wiper LO relay is on.	—	3G, 3I (Windshield wiper motor (LOW) control)
WIP_R*8	OFF/LOW/INT	Rear wiper operation condition input signal from start stop unit • OFF: Rear wiper switch is in OFF position. • LOW: Rear wiper switch is in ON position. • INT: Rear wiper switch is in INT position.	—	2I, 2K (CAN)
		Rear wiper relay drive signal • Off: Rear wiper motor is not		

WIP_R_RY*8	Off/On	operated. • On: Rear wiper motor is operated.	—	2I, 2K (CAN)

Active Command Modes Function

- The output parts set in the front body control module (FBCM) can be operated regardless of the FBCM control condition.
- Items which can be operated are as follows:

Simulation item	Unit/Operation	Data contents	Output part name
DEFOG_F_ST	**NOTE:** • Displays in the Mazda Modular Diagnostic System (M-MDS) but it does not operate.		
DEFOG_R_ST	Off/On	• Off: Stops rear window defroster. • On: Operates rear window defroster.	Filament
ESS_ST	**NOTE:** • Displays in the Mazda Modular Diagnostic System (M-MDS) but it does not operate.		

F_FOG_LMP*1	Off/On	• Off: Turns off front fog light. • On: Illuminates front fog light.	Front fog light
H/L	OFF/DRL/TNS/H/L_LOW/H/L_HI	• Off: Turns off headlight. • DRL: Illuminates DRL. • TNS: Illuminates TNS. • H/L_LOW: Illuminates headlight LO. • H/L_HI: Illuminates headlight HI.	• Headlight LO/HI • Parking light • Taillight • License plate light • DRL
H/L_CLN_RY	**NOTE:** • Displays in the Mazda Modular Diagnostic System (M-MDS) but it does not operate.		
HAZARD_LMP	Off/On	• Off: Turns off hazard warning light. • On: Flashes hazard warning light.	• Front turn light • Side turn light*3 • Rear turn light
PTC_HEAT_ST	**NOTE:** • Displays in the Mazda Modular Diagnostic System (M-MDS) but it does not operate.		
WAS_MT_RY_F	Off/On	• Off: Turns front washer motor relay off. • On: Turns front washer motor relay on.	Front body control module (FBCM)
WAS_MT_RY_R*2	Off/On	• Off: Turns rear washer motor relay off. • On: Turns rear washer motor relay on.	Front body control module (FBCM)

*1 **With front fog light**

*2 **With rear wiper and washer**

*3 **With side turn light**

REAR BODY CONTROL MODULE (RBCM)

Outline

- Positioned at the rear of the vehicle, the rear body control module (RBCM) performs numerous system controls for functions at the vehicle rear.

Function

- The rear body control module (RBCM) controls the system based on the input/output signals.
- The functions which are controlled are as follows:

Control table

Control	Content	Reference
Interior light control system control	The rear body control module (RBCM) changes the illumination condition and illumination level of the interior light (door position) according to whether the doors are opened/closed.	(See **INTERIOR LIGHTING SYSTEM**.)
Back-up light control	The back-up light illuminates in conjunction with the shift operation.	(See **REAR COMBINATION LIGHT**.)
Power door lock system control	A power door lock system has been adopted in which all doors and the liftgate are locked/unlocked when the driver's door is locked/unlocked using the driver's door lock knob, or the door key cylinder is operated.	(See **POWER DOOR LOCK SYSTEM**.)
Trunk lid opener system control	A trunk lid opener system has been adopted in which the trunk lid can be opened just by pressing the trunk lid opener switch.	(See **TRUNK LID OPENER SYSTEM**.)
CAN (Controller Area Network)	Sends and receives signals between CAN system-related modules using the CAN system.	(See **MULTIPLEX COMMUNICATION SYSTEM**.)
ON-BOARD DIAGNOSTIC SYSTEM	The rear body control module (RBCM) is equipped with an on-board diagnosis function which records DTCs in the event of a malfunction.	(See **ON-BOARD DIAGNOSTIC SYSTEM [REAR BODY CONTROL MODULE (RBCM)]**.)

System wiring diagram

Power window system, auto dimming mirror

Power door lock system, theft-deterrent system

Room lights, brake light system

Rear wiper system

Fuel-level sensor, rear seat belt reminder system

CAN system

Fail-safe

Room light control system

- If an error is detected in a combination of the door lock-link switch signals, the rear body control module (RBCM) controls the interior light based on the signal before the error occurred.
- If the CAN signal cannot be received normally, the rear body control module (RBCM) controls the interior light based on the signal last received. If the CAN signal cannot be received normally for 5 s or more, the rear body control module (RBCM) stops the interior light control.

Back-up light

- Function not equipped.

Power door lock system

- Function not equipped.

Theft-deterrent system

- Function not equipped.

ON-BOARD DIAGNOSTIC SYSTEM [REAR BODY CONTROL MODULE (RBCM)]

Outline

- The on-board diagnostic function consists of the following functions:
  - A malfunction detection function, which detects overall malfunctions in the rear body control module (RBCM)-related parts.
  - A memory function, which stores detected DTCs.
  - A display function, which indicates malfunction locations and status via DTC output.
  - A PID/data monitoring function, which reads out specific input/output signals and verifies the input/output condition.
- Using the Mazda Modular Diagnostic System (M-MDS), DTCs can be read out and deleted, and the PID/data monitoring function can be activated.

Malfunction detection function

- Detects malfunctions in input/output signals.
- If a malfunction occurs, the rear body control module (RBCM) records the malfunction as a DTC. A recorded DTC can be read by the Mazda Modular Diagnostic System (M-MDS).

DTC 7-digit code definition

- When related systems or components have failed, the CM stores the DTC of the malfunctioning part in the CM memory, and allows for the retrieval of the stored data using the scanning tool when necessary. The DTCs are indicated using seven digits. Each digit indicates the following.

Status byte for DTC

- The two digits (two digits after hyphen (-)) after the 7-digit DTC.

- A code which indicates the pending code, current/past malfunction status, or warning illumination status.
- Can be read by performing a CMDTC self-test using the Mazda Modular Diagnostic System (M-MDS).
- For details on the status byte, refer to the explanation on the Mazda Modular Diagnostic System (M-MDS) when reading the DTC.

Detection condition for the applicable DTC

×: Applicable—: Not applicable

DTC	System malfunction location	Detection condition
B1079:13*1	Hood latch switch circuit malfunction	Rear body control module (RBCM) detects an open circuit in hood latch switch circuit.
B108F:16	Door lock switch circuit malfunction	With the door lock switch off, the rear body control module (RBCM) detects door lock switch circuit voltage of 4 V or less.
B109E:87	Communication error with start stop unit	Rear body control module (RBCM) detects a communication error with the start stop unit for 10 times continuously.
	4SD	

B113E:11 *2, *3	• Trunk lid opener switch (exterior) circuit malfunction **5HB** • Liftgate opener switch circuit malfunction	Rear body control module (RBCM) detects a short to ground in the trunk lid opener switch (exterior) (4SD)/liftgate opener switch (5HB) circuit
B1172:11	Front door lock-link switch (LH) unlock circuit malfunction	Rear body control module (RBCM) detects a short to ground in the front door lock-link switch (LH) unlock circuit with the front door lock-link switch (LH) locked.
B1172:13	Front door lock-link switch (LH) unlock circuit malfunction	Rear body control module (RBCM) detects an open circuit in the front door lock-link switch (LH) unlock circuit with the front door lock-link switch (LH) unlocked.
B1174:11	**Without theft-deterrent system** • Front door lock-link switch (RH) unlock circuit malfunction **With theft-deterrent system** • Door lock-link switch unlock circuit malfunction	**Without Theft-Deterrent System** • Rear body control module (RBCM) detects a short to ground in the front door lock-link switch (RH) unlock circuit with the front door lock-link switch (RH) not unlocked. **With Theft-Deterrent System** • Rear body control module (RBCM) detects a short to ground in the door lock-link switch unlock circuit with the front door lock-link switch (RH)/rear door lock-link switch (LH)/(RH) not unlocked.
B1174:13	**Without theft-deterrent system** • Front door lock-link switch (RH) unlock circuit malfunction **With theft-deterrent system** • Door lock-link switch unlock circuit malfunction	**Without Theft-Deterrent System** • Rear body control module (RBCM) detects an open circuit in the front door lock-link switch (RH) unlock circuit with the front door lock-link switch (RH) unlocked. **With Theft-Deterrent System** • Rear body control module (RBCM) detects an open circuit in the door lock-link switch unlock circuit with the front door lock-link switch (RH)/rear door lock-link switch (LH)/(RH) unlocked.
B1175:11	Front door latch switch (LH) circuit malfunction	Rear body control module (RBCM) detects a short to ground in the front door latch switch (LH) circuit with the front door (LH) closed (front door latch switch (LH) off).
B1176:11	Front door latch switch (RH) circuit malfunction	Rear body control module (RBCM) detects a short to ground in the front door latch switch (RH) circuit with the front door (RH) closed (front door latch switch (RH) off).
B1178:11	**4SD** • Trunk lid latch switch circuit malfunction **5HB** • Liftgate latch switch circuit malfunction	**4SD** • Rear body control module (RBCM) detects short to ground in trunk lid latch switch circuit with the trunk closed (trunk lid latch switch off). **5HB** • Rear body control module (RBCM) detects short to ground in liftgate latch switch circuit with the liftgate closed (liftgate latch switch off).
B11DA:16	Front door key cylinder switch (LH) circuit malfunction	Rear body control module (RBCM) detects the front door key cylinder switch (LH) circuit voltage of 4 V or less with the front door key cylinder switch (LH) off.
B11E9:11	Rear door latch switch (LH) circuit malfunction	Rear body control module (RBCM) detects a short to ground in the rear door latch switch (LH) circuit with the rear door (LH) closed (rear door latch switch (LH) off).
B11EA:11	Rear door latch switch (RH) circuit malfunction	Rear body control module (RBCM) detects a short to ground in the rear door latch switch (RH) circuit with the rear door (RH) closed (rear door latch switch (RH) off).

B1219:11*4	Trunk lid opener switch (interior) circuit malfunction	Rear body control module (RBCM) detects a short to ground in trunk lid opener switch (interior) circuit
B126A:11	Front door lock-link switch (LH) lock circuit malfunction	Rear body control module (RBCM) detects a short to ground in the front door lock-link switch (LH) lock circuit with the front door lock-link switch (LH) unlocked.
B126A:13	Front door lock-link switch (LH) lock circuit malfunction	Rear body control module (RBCM) detects an open circuit in the front door lock-link switch (LH) lock circuit with the front door lock-link switch (LH) locked.
C0023:14*5	Brake light circuit malfunction	• Rear body control module (RBCM) detects any of the following conditions: ▪ Brake lights/high-mount brake light illuminated even though driver or system does not illuminate brake lights/high-mount brake lights. ▪ Brake lights/high-mount brake light not illuminated even though driver depresses brake pedal. ▪ Brake lights/high-mount brake light not illuminated even though system illuminates brake lights/high-mount brake light.
U0010:88	Unit communication error (MS-CAN)	Rear body control module (RBCM) detects a CAN communication line (MS-CAN) error with the ignition switched ON (engine off or on).
U0155:00	Communication error with instrument cluster	Rear body control module (RBCM) cannot receive the CAN signals from the instrument cluster for 5 s or more with the ignition switched ON (engine off or on).
U2100:00	Rear body control module (RBCM) configuration error	Rear body control module (RBCM) configuration error (no configuration) detected.
U3000:49	Rear body control module (RBCM) internal malfunction	Rear body control module (RBCM) detects the internal malfunction.
U3003:16	Rear body control module (RBCM) power supply voltage low input	Rear body control module (RBCM) power supply circuit voltage of 5 V or more, less than 9 V is detected for 10 s or more.

*1 **With hood latch switch**

*2 **5HB**

*3 **With trunk lid opener switch (exterior)**

*4 **With trunk lid opener switch (interior)**

*5 **With smart city brake support (SCBS)**

Snapshot data

- The rear body control module (RBCM) stores the following two types of snapshot data (vehicle information) when a DTC is detected and displays them in the Mazda Modular Diagnostic System (M-MDS).
  - Vehicle information detected by rear body control module (RBCM)
  - Vehicle information detected by instrument cluster and received by rear body control module (RBCM) via CAN signal

Snapshot data table—: Not applicable

Snapshot data item	Unit		Data contents	Data read/use method	Corresponding data monitor items
AAT	°C	°F	Ambient temperature	—	—
APP_STATUS	Accelerator Pedal Off/Under20%/Over20%/FAIL		Accelerator pedal position status	—	—

CFG_STATUS	Config Complete/Not Configured/Config Error	Instrument cluster configuration status	—	—
ECT_STATUS	Under 0 degrees C/0 - Under 80 degrees C/Over 80 degrees C/FAIL	Engine coolant temperature status	—	—
IC_VPWR	V	Instrument cluster power supply voltage	• The rear body control module (RBCM) constantly receives the power supply voltage value of the instrument cluster sent via CAN signal from the instrument cluster. • If a DTC is detected, the rear body control module (RBCM) records the power supply voltage of the instrument cluster when the DTC was detected, and it is displayed in the Mazda Modular Diagnostic System (M-MDS).	VPWR*1
IG-ON_TIMER	hh:mm:ss*2	Elapsed time since ignition was switched ON (engine off or on) **NOTE:** • The instrument cluster records the elapsed time since the ignition was switched ON (engine off or on).	• The rear body control module (RBCM) constantly receives the elapsed time since the ignition was switched ON (engine off or on) sent via CAN signal from the instrument cluster. • If a DTC is detected, the rear body control module (RBCM) records the elapsed time since the ignition was switched ON (engine off or on) when the DTC was detected, and it is displayed in the Mazda Modular Diagnostic System (M-MDS).	—
PWR_MODE_KEY	Key Out/Key Recently Out (Position 0)/Accessory (Position 1)/Post Ignition (Position 2)/Ignition On (Position 2)/Running (Position 2)/Running - Starting	• Key Out: Ignition switched off • Key Recently Out (Position 0): Elapsed time **within 3 s** since ignition was switched off • Accessory (Position 1): Ignition is switched to ACC • Post Ignition (Position 2): Elapsed time **within 3 s** since ignition was switched ON (engine off or on) • Ignition On (Position 2):	• The rear body control module (RBCM) constantly receives the ignition switch status sent via CAN signal from the instrument cluster. • If a DTC is detected, the rear body control module (RBCM) records the ignition switch status when the DTC was detected, and it is displayed in the Mazda Modular Diagnostic System (M-MDS).	—

			Ignition switched ON (engine off) • Running (Position 2): Ignition switched ON (engine on) • Running - Starting: Cranking condition		
RPM_STATUS	Engine Stop/Under1500rpm/Over1500rpm/FAIL		Engine speed status	• The rear body control module (RBCM) constantly receives the engine speed sent via CAN signal from the instrument cluster. • If a DTC is detected, the rear body control module (RBCM) records the engine speed when the DTC was detected, and it is displayed in the Mazda Modular Diagnostic System (M-MDS).	TACHOMTR*1
SHIFT_STATUS	P/N/D/R/FAIL		Selector lever position status	• The rear body control module (RBCM) constantly receives the selector lever position sent via CAN signal from the instrument cluster. • If a DTC is detected, the rear body control module (RBCM) records the selector lever position when the DTC was detected, and it is displayed in the Mazda Modular Diagnostic System (M-MDS).	—
TOTAL_DIST	km	Miles	Accumulated total traveled distance from completion of vehicle until rear body control module (RBCM) detects DTC (Odometer value in instrument cluster)	The total traveled distance from which the rear body control module (RBCM) detects DTCs to the present can be calculated by performing the following procedure. • Verify the odometer value in the instrument cluster. • Verify the snapshot data item TOTAL_DIST. • Subtract 2 from 1.	—
TOTAL_TIME	hh:mm:ss*2		Accumulated total elapsed time since vehicle completion until rear body control module (RBCM) detects a DTC **NOTE:** • When the ROOM fuse is removed, and the ignition is switched off, the time is not included	The elapsed time from which the rear body control module (RBCM) detects DTCs to the present can be calculated by performing the following procedure. • Verify the instrument cluster PID item TOTAL_TIME. • Verify the snapshot data item TOTAL_TIME. • Subtract 2 from 1.	TOTAL_TIME*1

		in the elapsed time.		
VPWR	V	Rear body control module (RBCM) power supply voltage	—	VPWR_IG1
VSPD_STATUS	Stop/0-10km/h/Over10km/h/FAIL	Vehicle speed status	• The rear body control module (RBCM) constantly receives the vehicle speed sent via CAN signal from the instrument cluster. • If a DTC is detected, the rear body control module (RBCM) records the vehicle speed when the DTC was detected, and it is displayed in the Mazda Modular Diagnostic System (M-MDS).	SPEEDOMTR*1

*1
Instrument cluster PID (See ON-BOARD DIAGNOSTIC [INSTRUMENT CLUSTER].)

*2
The seconds may be indicated after the decimal point.

Data monitor function

- With the PID/data monitor function, input/output signal monitor items set in the rear body control module (RBCM) can be selected and read out in real-time.

PID/data monitor table

—: Not applicable

PID	Unit/Operation	Data contents	Data read/use method	Module control terminal
AT_DL_IG	Off/On	Auto door lock function (IG) • Off: Door lock actuator does not operate to unlock in conjunction with ignition off. • On: Door lock actuator operates to unlock in conjunction with ignition off.	If the personalization features setting for the auto door lock is set to auto door lock in conjunction with the ignition, displays if the auto door lock set in conjunction with the ignition being switched off is applicable. Operates when the ignition is switched from ON to OFF.	—
AT_DL_SHIFT	Off/On	Auto door lock function (shift) • Off: Door lock actuator does not operate to lock or unlock in conjunction with shifting. • On: Door lock actuator operate to lock or unlock in conjunction with shifting.	If the personalization features setting for the auto door lock is set to auto door lock in conjunction with the AT shifting, displays if the auto door lock set in conjunction with gear shifting is applicable. Operates when the gear is shifted.	—
		Auto door lock function (vehicle speed)		

AT_DL_VSPD	Off/On	• Off: Door lock actuator does not operate to lock in conjunction with vehicle speed. • On: Door lock actuator operates to lock in conjunction with vehicle speed.	If the personalization features setting for the auto door lock is set in conjunction with the vehicle speed, displays if the auto door lock set in conjunction with the vehicle speed is applicable. Operates at a vehicle speed of **20 km/h {12 mph} or more**.	—
BG_HORN_RLY*1	Off/On	Theft-deterrent horn relay operation output • Off: Theft-deterrent horn relay is off. • On: Theft-deterrent horn relay is on.	—	2F (Theft-deterrent horn relay control)
BRAKE_SW*2	Off/On	Brake switch input signal • Off: Brake switch (No.1 signal) is off (brake pedal is not depressed). • On: Brake switch (No.1 signal) is on (brake pedal is depressed).	—	2J (Brake switch signal)
C_DL_SW_LK	Off/On	Door lock switch (lock side) input signal • Off: Door lock switch is not in lock. • On: Door lock switch is in lock.	—	3F (Door lock switch signal)
C_DL_SW_UNL	Off/On	Door lock switch (unlock side) input signal • Off: Door lock switch is not in unlock. • On: Door lock switch is in unlock.	—	3F (Door lock switch signal)
CNT_S_COMM	—	The rear body control module (RBCM) counts the lock/unlock request signal (serial transmission) received from the start stop unit. **NOTE:** • If number of times **exceeds 15**, display returns to 0.	If the lock/unlock operation is performed by the remote transmitter or request switch, the start stop unit sends the lock/unlock request signal to the rear body control module (RBCM). If the lock/unlock request signal is received normally, the rear body control module (RBCM) increases the counter by one for the PID. When monitoring PID item CNT_S_COMM, switch the ignition off because the start stop unit does not output the lock/unlock signal when the ignition is switched ON.	3B (Serial communication)
DL_MT_A_LK	Off/On	All-door lock motor lock output • Off: All door lock actuators are not operated to lock. • On: All door lock actuators are operated to lock.	—	—
		All-door lock motor unlock output • Off: All door lock actuators are not		

DL_MT_A_UNL	Off/On	operated to unlock. • On: All door lock actuators are operated to unlock.	—	—
DL_MT_D_UNL	Off/On	Driver's door lock motor unlock output • Off: Front door lock actuator (LH) is not operated to unlock. • On: Front door lock actuator (LH) is operated to unlock.	—	—
DL_MT_S-LK	**NOTE:** • Displays in the Mazda Modular Diagnostic System (M-MDS) but it does not operate.			
DOOR_ALL	Close/OPEN	Open/closed condition of all doors • Close: All doors are closed. • OPEN: Any door is open.	If all doors (including trunk (4SD)/liftgate (5HB)) are closed, Close, or if not, OPEN	—
DOOR_D	Close/OPEN	Door switch input on driver's door • Close: Front door (LH) is closed. • OPEN: Front door (LH) is open.	—	3W (Front door switch (driver's door) signal)
ELAT_MT_RLY	Off/On	Electric latch motor relay operation output • Off: Trunk lid latch (4SD)/liftgate latch (5HB) is not operated to unlock. • On: Trunk lid latch (4SD)/liftgate latch (5HB) is operated to unlock.	—	4C (Trunk lid release/Liftgate lock actuator control)
ELAT_UNL	Off/On	Electric latch motor (unlock) operation output • Off: Trunk lid latch (4SD)/liftgate latch (5HB) is not operated to unlock. • On: Trunk lid latch (4SD)/liftgate latch (5HB) is operated to unlock.	—	—
FUEL_SEN_M	V	Displays input voltage of fuel gauge sender unit input from rear body control module (RBCM)	If the fuel tank level is low, the rear body control module (RBCM) input voltage increases because the fuel gauge sender unit resistance decreases.	3I (Fuel sensor signal)
FUEL_SEN_S	V	Displays fuel gauge sender unit (SUB) input voltage input from rear body control module (RBCM)	If there is no fuel gauge sender unit (SUB), a constant **5 V** is output.	—
		Displays power voltage supplied to fuel gauge sender unit from rear body control module (RBCM)		

FUEL_SEN_SV	V	**CAUTION:** • The battery voltage is supplied to the fuel gauge sender unit from the rear body control module (RBCM), however display of the PID item is controlled by the microcomputer and therefore **5 V** is displayed. Accordingly, even if the actual terminal voltage differs from the PID item display, this does not indicate an abnormality.	After switching the ignition off, supply of the battery voltage to the fuel gauge sender unit from the rear body control module (RBCM) continues until the CAN communication is in the sleep mode.	2P (Power supply)
HOOD*1	Close/OPEN	Hood latch switch condition • Close: Hood is closed. • OPEN: Hood is open.	—	3L (Hood latch switch signal)
IG1_SW	Off/On	Displays power input condition of rear body control module (RBCM) • Off: IG1 power is not input to rear body control module (RBCM) • On: IG1 power is input to rear body control module (RBCM)	If there is a malfunction in the IG1 power supply input to the rear body control module (RBCM), the door lock and interior light controls, which the rear body control module (RBCM) controls, do not operate normally because PID item IG1_SW is used for determining ignition on/off for the rear body control module (RBCM).	2I (Ignition power supply)
KC_SW_D_LK	Off/On	Driver's key cylinder switch (lock side) operation condition • Off: Front door key cylinder switch is not in lock. • On: Front door key cylinder switch is in lock.	—	3H (Driver's door key cylinder switch signal)
KC_SW_D_UNL	Off/On	Driver's key cylinder switch (unlock side) operation condition • Off: Front door key cylinder switch is not in unlock. • On: Front door key cylinder switch is in unlock.	—	3H (Driver's door key cylinder switch signal)
LL_P/R*1	Unlock/Other	Passenger/rear door lock link operation condition • Unlock: Front door lock-link switch (RH), rear door lock-link switch (LH), rear door lock-link switch (RH) are in unlock. • Other: Front door lock-link switch (RH), rear door lock-link switch (LH), rear door	—	3J (Lock input (lock-link switch (passenger, rear door)))

		lock-link switch (RH) are in other than unlock.		
LL_SW_D_LK	Off/On	Driver's door lock link switch (lock side) operation condition • Off: Front door lock-link switch (LH) is in unlock. • On: Front door lock-link switch (LH) is in lock.	—	3O (Lock input (front door lock-link switch (driver's door)))
LL_SW_D_UNL	Off/On	Driver's door lock link switch (unlock side) operation condition • Off: Front door lock-link switch (LH) is in lock. • On: Front door lock-link switch (LH) is in unlock.	—	3M (Unlock input (front door lock-link switch (driver's door)))

Active Command Modes Function

- The output parts set in the rear body control module (RBCM) can be operated regardless of the RBCM control condition.
- Items which can be operated are as follows:

Simulation item	Unit/Operation	Data contents	Output part name

BG_HORN_RLY*1	Off/On	• Off: Stops theft-deterrent horn. • On: Sounds the theft-deterrent horn.	Rear body control module (RBCM)
DL_MT_A	Lock/Unlock	• Lock: Locks all of the doors. • Unlock: Unlocks all of the doors.	Door lock actuator
ELAT_MT_RLY	Off/On	• Off: Stops the trunk lid latch (4SD)/liftgate latch (5HB) release operation. • On: Releases the trunk lid latch (4SD)/liftgate latch (5HB).	**4SD** • Trunk lid latch and release actuator **5HB** • Liftgate latch and lock actuator
ELAT_UNL	Off/On	• Off: Stops the trunk lid latch (4SD)/liftgate latch (5HB) release operation. • On: Releases the trunk lid latch (4SD)/liftgate latch (5HB).	**4SD** • Trunk lid latch and release actuator **5HB** • Liftgate latch and lock actuator
R_FOG_LMP	**NOTE:** • Displays in the Mazda Modular Diagnostic System (M-MDS) but it does not operate.		
R_LMP	Off/On	• Off: Turns off back-up light. • On: Illuminates back-up light.	Back-up light
R_WIP_MT_LO*2	Off/On	• Off: Stops rear wiper motor. • On: Operates rear wiper motor.	Rear wiper motor
STOP_LMP_CS*3	Off/On	• Off: Turns off brake light. • On: Illuminates brake light.	• Brake light • High-mount brake light

2014 - Mazda3 - Multiplex Communication System

MULTIPLEX COMMUNICATION SYSTEM

Outline

- A controller area network (CAN) system has been adopted in which multiplex communication is performed using a single communication path.
- For individual communication between the control modules, a local CAN, ISO communication, and LIN communication have been adopted in consideration of the required communication speed and cost.

Function

CAN (controller area network) system

- HS-CAN (high-speed controller area network) is used for communication between the following modules:
  - PCM
  - DSC HU/CM
  - Front body control module (FBCM)
  - TCM (ATX)
  - DC-DC converter (With i-ELOOP system)
  - AFS control module (with AFS)
  - Laser sensor (with smart city brake support)
  - Forward sensing camera (FSC) (with forward sensing camera)
  - Start stop unit
  - EPS control module
  - SAS control module
  - Connectivity master unit (with center display)
  - Audio amplifier (with Bose®)
  - Instrument cluster
- MS-CAN (mid-speed controller area network) is used for communication between the following modules:
  - Instrument cluster
  - Climate control unit (full-auto air conditioner)
  - BSM control module (LH) (with BSM system)
  - Rear body control module (RBCM)
- Signals transmitted using the CAN system are as follows:

HS-CAN communication tableOUT: Output (sends signal)IN: Input (receives signal)

Signal	CAN system related module

Malfunction diagnosis procedure

- If a vehicle with a malfunction in a system controlled by a CAN system related module is brought in, verify the repair order form and the malfunctioning symptom first, then perform CAN malfunction diagnosis to determine if the malfunction cause is in the CAN system or not.
- For CAN malfunction diagnosis, the voltage at the CAN connection terminal on the DLC-2 is measured, and based on the measured value, the CAN circuit can be examined or the malfunction symptom can be determined.
- If the malfunction symptom is not an open circuit, inspect the voltage or continuity at the CAN circuit and determine the malfunctioning location.
- If the malfunction symptom is an open circuit, determine the area of the open circuit by using the displayed communication error DTC and the module in which communication has failed.

Ex.) Open circuit location determination procedure

1. Verify the CAN system-related module DTCs and the failed module using the Mazda Modular Diagnostic System (M-MDS).

DTC output module	Mazda Modular Diagnostic System (M-MDS) display	Output DTC
PCM	PCM	U0121:00
Front body control module (FBCM)	F_BCM	U0121:00
TCM	TCM	U0121:00
Laser sensor	SCBS	U0121:00
Forward sensing camera (FSC)	FSC	U0121:00
Start stop unit	SSU	U0121:00
Start stop unit	SSU	U0121:87
EPS control module	EPS	U0121:00
Connectivity master unit	CMU	U0121:00
Instrument cluster	IC	U0121:00

Module	Fail display
DSC HU/CM	×

2. Although communication between the PCM and instrument cluster is normal, DTCs indicating communication error between the DSC HU/CM and PCM/front body control module (FBCM)/TCM/laser sensor/forward sensing camera (FSC)/start stop unit/EPS control module/connectivity master unit/instrument cluster are displayed, in addition, DSC HU/CM is displayed as failed. Therefore, there may be a malfunction in the wiring harness between the DSC HU/CM and front body control module (FBCM), or in the DSC HU/CM itself.

Local CAN

- Local CAN is used for communication between the following modules:
  - Between PCM and TCM
  - Between DSC HU/CM and SAS control module
  - Between connectivity master unit, CD unit, and tuner and amp unit (with center display)
  - Between audio unit, Bluetooth® unit, and CD unit (without center display)
  - Between BSM control module (LH) and BSM control module (RH)

LIN communication

- LIN communication is used for communication between the following modules:
  - Between front body control module (FBCM) and rain sensor
  - Between front body control module (FBCM) and current sensor
  - Between front body control module (FBCM) and climate control unit (manual air conditioner)
  - Between AFS control module and swivel actuator (front combination light)
  - Between PCM and active air shutter actuator
  - Between connectivity master unit and commander switch (without center display)

ISO communication

- ISO communication is used for communication between the following modules:
  - Between rear body control module (RBCM) and start stop unit

Construction

CAN

- The HS-CAN has terminator resistors built into the following units which form the CAN lines.
  - Between PCM terminals 2AK (CAN_H) and 2AL (CAN_L), resistance value: **124 ohms**
  - Between instrument cluster terminals B (CAN_H) and D (CAN_L), resistance value: **120 ohms**
- The MS-CAN has terminal resistors built into the following units which form the CAN lines.
  - Between rear body control module (RBCM) terminals 4G (CAN_H) and 4J (CAN_L), resistance value: **120 ohms**
  - Between instrument cluster terminals 2C (CAN_H) and 2E (CAN_L), resistance value: **120 ohms**

Local CAN

- The local CAN has terminator resistors built into the following units which form the CAN lines.
    - Between connectivity master unit terminals 2AK (CAN_H) and 2AL (CAN_L), resistance value: **124 ohms** (with center display)
    - Between tuner and amp unit terminals B (CAN_H) and D (CAN_L), resistance value: **120 ohms** (with center display)
    - Between CD unit terminals G (CAN_H) and H (CAN_L), resistance value: **120 ohms** (without center display)
    - Between audio unit terminals 1O (CAN_H) and 1Q (CAN_L), resistance value: **120 ohms** (without center display)
    - Between BSM control module (LH) terminals A (CAN_H) and B (CAN_L), resistance value: **120 ohms**
    - Between BSM control module (RH) terminals A (CAN_H) and B (CAN_L), resistance value: **120 ohms**
    - Between PCM terminals 1A (CAN_H) and 1B (CAN_L), resistance value: **120 ohms**
    - Between TCM terminals G (CAN_H) and H (CAN_L), resistance value: **120 ohms**

LIN communication

- The LIN communication has drivers built into the following units which form the LIN communication lines.
    - PCM
    - AFS control module
    - Front body control module (FBCM)
    - Rain sensor
    - Current sensor
    - Climate control unit (manual air conditioner)
    - Swivel actuator (front combination light)
    - Active air shutter actuator

ISO communication

- The ISO communication has drivers built into the following units which form the ISO communication lines.
    - Start stop unit
    - Rear body control module (RBCM)

2014 - Mazda3 - I-ELOOP

i-ELOOP [i-ELOOP]

Outline

- For improved fuel economy, electrical power is generated using kinetic energy during deceleration and retrieved as electrical energy, which decreases the amount of fuel used for supplying power.
- i-ELOOP is a Mazda-unique regenerative braking system* that generates and stores electrical energy during deceleration. Through efficient energy regeneration, storage, and usage, fuel economy improvement is achieved while driving.

* **The regenerative braking system is a mechanism for converting kinetic energy during deceleration to electrical energy and storing it for reuse. The electricity stored from the regenerative braking is re-used as power for electrical devices such as the A/C and audio, which decreases the fuel consumption amount required by the engine to supply power.**

Structural View

- i-ELOOP consists mainly of the following parts.

Capacitor (i-ELOOP)	(See **CAPACITOR (i-ELOOP) [i-ELOOP]**.)
DC-DC converter	(See **DC-DC CONVERTER [i-ELOOP]**.)
Generator	(See **GENERATOR [i-ELOOP]**.)

System Wiring Diagram

Operation

- The operation aspect of i-ELOOP is as follows.

- The i-ELOOP operation mode varies depending on the vehicle driving conditions and the conditions of i-ELOOP-related parts.

Condition	Operation mode	Reference
Regeneration, storage	1.Regenerative braking mode	(See **1. Regenerative braking mode**.)
	2. Conventional power generation mode (no regenerative braking)	(See **2. Conventional power generation mode (no regenerative braking)**.)
Use	3. Capacitor (i-ELOOP) power supply mode	(See **3. Capacitor (i-ELOOP) power supply mode**.)
	4. Battery power supply mode	(See **4. Battery power supply mode**.)
	5. By-pass mode	(See **5. By-pass mode**.)
Other mode	6. Pre-charge mode	(See **6. Pre-charge mode**.)
	7. Capacitor (i-ELOOP) power generation mode	(See **7. Capacitor (i-ELOOP) power generation mode**.)

1. Regenerative braking mode

Purpose

- During deceleration, fuel economy is improved by the generator producing electricity.

Operation condition

- During fuel-cut by release of accelerator pedal and TCC engagement

Operation content

- Generator operates at full capacity and stores electricity in the Capacitor (i-ELOOP). The voltage stored in the Capacitor (i-ELOOP) is lowered by the DC-DC converter and electrical power is supplied to the vehicle electrical devices.

2. Conventional power generation mode (no regenerative braking)

Purpose

- During constant/acceleration travel, battery stability is maintained by the power generated by the generator.

Operation condition

- During engine rotation, battery voltage is certain value or less

Operation content

- Generator operates and 12 to 25 V of electrical power is stored in the Capacitor (i-ELOOP). The voltage stored in the Capacitor (i-ELOOP) is lowered by the DC-DC converter and electrical power is supplied to the vehicle electrical devices. (Compared to regenerative braking mode, amount of power generated by generator is low.)

3. Capacitor (i-ELOOP) power supply mode

Purpose

- Electrical power is supplied to vehicle electrical devices from the Capacitor (i-ELOOP).

Operation condition

- Capacitor (i-ELOOP) voltage exceeds battery voltage.

Operation content

- The voltage stored in the Capacitor (i-ELOOP) is lowered by the DC-DC converter and electrical power is supplied to vehicle electrical devices.

4. Battery power supply mode

Purpose

- Electrical power is supplied to vehicle electrical devices from the battery.

Operation condition

- Capacitor (i-ELOOP) voltage certain value or less, or during cranking.

Operation content

- The same as on contemporary vehicles, electrical power is supplied to vehicle electrical devices from the battery.

5. By-pass mode

NOTE:

- During by-pass mode, verification is not possible using the instrument cluster indication.
- If high-capacity audio or additional electrical devices are connected, the by-pass mode may operate frequently due to the increase in the vehicle electrical load.

Purpose

- If vehicle electrical load (consumption current) exceeds 50A or more, a bypass relay within the DC-DC converter is energized to supply power generated by the generator directly to the vehicle electrical devices.

Operation condition

- Bypass mode is operating due to the following conditions:
  - Vehicle electric load (current consumption) is 50 A or more
  - Voltage reduction circuit in DC-DC converter is malfunctioning
  - Ambient temperature is less than 0 °C {32 °F}
  - Battery charge condition is less than 65%

Operation content

- Turns the bypass relay in the DC-DC converter on and the power generated by the generator is also supplied directly to the vehicle's electrical devices.At this time, the amount of power generated by the generator is suppressed so that power can be supplied directly to the vehicle's electrical devices.

6. Pre-charge mode

NOTE:

- If the Capacitor (i-ELOOP) continues to self-discharge (vehicle left for long periods with engine not started)/excess back-up current consumption, the pre-charge mode may operate due to the decrease in Capacitor (i-ELOOP) voltage.
- If the vehicle is jump started, leave the jumper connected until the warning message is no longer displayed.
- If vehicle is driven while the warning is displayed, a warning sound will be heard and power steering assist will be limited.

Purpose

- The Capacitor (i-ELOOP) charges for the following two reasons.
  - If the Capacitor (i-ELOOP) voltage is low, the excitation current to the generator lowers and the generator may not be able to generate power.
  - To supply power to the battery from the Capacitor (i-ELOOP), a higher electrical load than the battery is required.

Operation condition

- If the Capacitor (i-ELOOP) voltage is a certain value or less (stops operation when Capacitor (i-ELOOP) voltage reaches certain value or more.)

Operation content

- Depending on each type of condition, the method for charging the Capacitor (i-ELOOP) varies.

Condition	Power supply method	Instrument cluster display
Negative battery cable is connected	Power supplied from battery to Capacitor (i-ELOOP)	Not applicable
Ignition switched ON (engine off) while engine is stopped	Power supplied from battery to Capacitor (i-ELOOP)	Not applicable
Engine is started	Power supplied from generator to Capacitor (i-ELOOP)	Applicable

- The PCM sends an i-ELOOP indicator light flash request to the instrument cluster during capacitor pre-charge when the engine is started.
- If the vehicle is driven with the i-ELOOP indicator light flashing, the PCM sends an i-ELOOP warning alarm operation request to the instrument cluster.
- For details on the i-ELOOP warning alarm, refer to i-ELOOP warning alarm. (See **i-ELOOP WARNING ALARM [i-ELOOP]**.)

With center display

- The PCM sends a message display request signal to the CMU during capacitor (i-ELOOP) pre-charge when the engine is started.

7. Capacitor (i-ELOOP) power generation mode

Purpose

- Surplus power stored in the Capacitor (i-ELOOP) charges the battery.

Operation condition

- With ignition switched off and hood closed, Capacitor (i-ELOOP) voltage is certain voltage or more.

Operation content

- During normal operation, extra voltage from the capacitor is used to charge the battery. If the battery voltage is high and power cannot be supplied from the capacitor to the battery, capacitor voltage flows to the ground side.

Normal operation

When power cannot be supplied to battery

- The following are examples of the i-ELOOP operation in each mode.

RUN PATTERN	VEHICLE CONDITION				
	NORMAL	HIGH ELECTRICAL LOAD	LOW CAPACITOR (i-ELOOP) VOLTAGE	LOW BATTERY VOLTAGE	i-ELOOP MALFUNCTION
IGNITION SWITCH: OFF	CAPACITOR (i-ELOOP) ⑦ POWER GENERATION MODE	—	⑥ PRE-CHARGE MODE	CAPACITOR (i-ELOOP) ⑦ POWER GENERATION MODE	④ BATTERY POWER SUPPLY MODE
IGNITION SWITCH: ACC	④ BATTERY POWER SUPPLY MODE			④ BATTERY POWER SUPPLY MODE	
IGNITION SWITCH: ON (ENGINE OFF)					
CRANKING	④ BATTERY POWER SUPPLY MODE				
ENGINE ON (IDLE)	③ CAPACITOR (i-ELOOP) POWER SUPPLY MODE	⑤ BY-PASS MODE	⑥ PRE-CHARGE MODE	⑤ BY-PASS MODE	
ENGINE ON (ACCELERATION/CRUISE)			② CONVENTIONAL POWER GENERATION MODE (NO REGENERATIVE BRAKING)		
ENGINE ON (DECELERATION)	① REGENERATIVE BRAKING MODE		① REGENERATIVE BRAKING MODE		

i-ELOOP operation status

Without center display

- The i-ELOOP operation status can be determined by the illumination/flashing of the i-ELOOP indicator light.
- For details on the i-ELOOP indicator light, refer to i-ELOOP indicator light. (See **i-ELOOP INDICATOR LIGHT [i-ELOOP]**.)

With center display

- The i-ELOOP operation status can be determined using the center display.
- For details on the center display, refer to center display. (See **CENTER DISPLAY [WITH CENTER DISPLAY]**.)

2014 - Mazda3 - I-ELOOP

i-ELOOP WARNING ALARM [i-ELOOP]

Purpose

- The i-ELOOP warning alarm is a function which warns the driver if the vehicle is driven before pre-charging is completed and while “i-ELOOP charging” is displayed in the LCD.

Function

- The i-ELOOP warning alarm sound pattern is as shown in the figure.

Construction

- The i-ELOOP warning alarm sounds using the buzzer built into the instrument cluster.

Operation

1. The instrument cluster receives (1) the i-ELOOP warning alarm request signal from the PCM.

2. The instrument cluster microcomputer turns the transistor on (2) based on the i-ELOOP warning alarm request signal.

3. When the transistor turns on, a ground circuit with the alarm is established and the alarm sounds (3).

Fail-safe

- Function not equipped.

2014 - Mazda3 - I-ELOOP

i-ELOOP INDICATOR LIGHT [i-ELOOP]

Purpose, Function

- The i-ELOOP indicator light turns on/flashes according to the i-ELOOP control status to notify the driver of the i-ELOOP control status.

Construction

- The i-ELOOP indicator light is built into the instrument cluster. (See **INSTRUMENT CLUSTER**.)

Operation

- The i-ELOOP indicator light illumination conditions are as follows:

  i-ELOOP indicator light illumination conditions

  - i-ELOOP control is in regenerative braking mode

  i-ELOOP indicator light flashing conditions

  - i-ELOOP control is in pre-charge mode
- The PCM sends a i-ELOOP indicator light illumination request to the instrument cluster via CAN communication.

2014 - Mazda3 - I-ELOOP

GENERATOR [i-ELOOP]

Purpose, Function

- With the adoption of i-ELOOP, a variable voltage type generator has been adopted which generates 12 to 25 V.
- 12 to 25 V is generated according to the vehicle conditions to charge the capacitor (i-ELOOP).

Construction

- The generator is installed on the engine left front side.
- The generator consists of the following parts:

- To handle a maximum of 25 V, the voltage resistance performance of the diode has been improved.
- With the adoption of i-ELOOP, an IC regulator with the following protection functions has been adopted.

  Excess temperature protection function

  - If the IC regulator reaches the specified temperature, the generator output current is restricted to suppress a rise in the temperature of the generator.

  Excess voltage protection function

  - If an excess excitation current control signal from the PCM is input, the generator output voltage is restricted to suppress application of excess voltage to the capacitor (i-ELOOP).

  Excess-current protection function

  - If the excitation current reaches the specified value, the excitation current is interrupted to restrict power generation by the generator.
- The initial excitation current to the rotors is supplied from the capacitor (i-ELOOP). When excitation current is supplied from the capacitor (i-ELOOP) and the generator begins generating electricity, the excitation current from the capacitor (i-ELOOP) is interrupted. After the generator begins generating electricity, the power generated by the generator is used for excitation current.

Fail-safe

DTC	Fail-safe
P2502:00	• Generator switch to default mode requested (14.5 V constant voltage power generation).
P2503:00	• Generator switch to default mode requested (14.5 V constant voltage power generation).
P2504:00	• Generator switch to default mode requested (14.5 V constant voltage power generation).

2014 - Mazda3 - I-ELOOP

CAPACITOR (i-ELOOP) [i-ELOOP]

Purpose, Function

- The capacitor (i-ELOOP) is a storage battery which can be charged with/discharge large amounts of current instantaneously. In conjunction with the variable voltage type generator which can generate a maximum of 25 V, the capacitor (i-ELOOP) can also be charged efficiently with the generated power in a short period of time.

Construction

- The capacitor (i-ELOOP) is installed directly below the front combination light (LH).
- The capacitor (i-ELOOP) is equipped with service plug. A short circuit can be prevented by pulling out the service plug because 25 V related power is interrupted.
- A thermistor type temperature sensor is equipped inside the capacitor (i-ELOOP). The temperature sensor detects the temperature of the capacitor (i-ELOOP) and inputs the signal to the DC-DC converter.
- A discharge box is equipped in the capacitor (i-ELOOP). The discharge box serves the purpose of assuring safety when the capacitor (i-ELOOP) is discarded. By forcing the capacitor (i-ELOOP) to discharge using the resistor, the capacitor (i-ELOOP) will not ignite even when pressed.

- The capacitor (i-ELOOP) has the following input/outputs.

Terminal signal	Input/output
2A	Power input from generator.
3A	Power output to DC-DC converter.
1A	Temperature sensor signal output to DC-DC converter.
1B	GND

- Although the battery generates chemical reactions to charge/discharge electricity, the capacitor (i-ELOOP) does not; instead, it charges/discharges physically. As a result, the capacitor (i-ELOOP) is able to charge/discharge large amounts of electricity more rapidly than the battery, and deterioration of the electrodes is gradual with a long service life.

  Charging

  - Electrical charge adheres to surface of electrodes.

Discharging

- Electrical charge separates and moves from surface of electrodes.

Fail-safe

DTC	Fail-safe
P1794:00	• Inhibits the i-ELOOP function.

DC-DC CONVERTER [i-ELOOP]

Purpose, Function

- The DC-DC converter supplies the electricity supplied from the capacitor (i-ELOOP) to the vehicle's electrical devices.
- If the electricity supplied from the capacitor (i-ELOOP) exceeds the rated voltage of an electrical device, the DC-DC converter lowers the voltage to 12 V and then supplies the electricity to the electrical devices.

Construction

- The DC-DC converter is installed directly under the front seat (LH).
- The DC-DC converter has the following inputs/outputs.

Terminal signal	Input/output
3A	Power is input from capacitor (i-ELOOP). Power is output to capacitor (i-ELOOP). (Pre-charge)

4A	Power is output to battery and electrical device. Power is input from battery. (Pre-charge)
1A	CAN communication
1B	GND
1C	CAN communication
1D	GND
1E	Temperature sensor signal input from capacitor (i-ELOOP).
1G	The by-pass relay on signal from the PCM is input.
1H	Battery power via IG1 relay is input.
1I	The by-pass relay on signal from the PCM is input.

- The DC-DC converter switches the operation content according to the vehicle conditions. Refer to “i-ELOOP” for details. (See **i-ELOOP [i-ELOOP]**.)

Fail-safe

DTC	Fail-safe
P0A12:00	• Depending on the type of malfunction, any of the following controls may be implemented. ▪ Transition to i-ELOOP bypass mode. ▪ i-ELOOP bypass mode inhibited.
P0A94:00	• The following fail-safe differ depending on the type of malfunction ▪ Transition to i-ELOOP bypass mode. ▪ i-ELOOP bypass mode inhibited.
