NOTE: **For complete circuit diagrams, refer to SYSTEM WIRING DIAGRAMS . Wiring Information includes wiring diagrams, connector pin-out and location views, details of wire harness routing and retention, splice and ground locations and proper wire and connector repair procedures.**

Before testing any individual components in the heated seat system, check the following:

- Check to see if the concern is isolated to only one seat. Operate the other heated seat.
- Check the fuse in the Power Distribution Center (PDC) and for power at the CSWM. Repair as necessary.
- Using a scan tool, check for any Diagnostic Trouble Codes (DTCs) related to the Comfort Seat and Wheel Module (CSWM) and/or the Radio Receiver Module (RRM). If any DTCs are found, repair as necessary (Refer to **DTC INDEX**).
- Check the vehicles battery open-circuit voltage and charging system performance. If the vehicle's electrical system is defective or weak it may not be suppling sufficient energy to operate the heated seat system.

PAD, HEATER

DESCRIPTION

DESCRIPTION

Fig. 1: Removing/Installing Heated Seat Element
Courtesy of CHRYSLER GROUP, LLC

Vehicles equipped with the optional heated seat system have two heated seats. One heating element (1) is used for each seat bottom cushion and another heating element is used for each seat back cushion.

All of the heated seat elements consist of multiple heating circuits operating in parallel throughout the carbon fiber element and a wire lead and connector (2). The heated seat elements are captured between the seat cover and the seat cushion (3). If a malfunction occurs in one or more of the individual circuits, the remaining operational circuits will continue to provide heat.

OPERATION

OPERATION

Battery current is directed to the heated seat elements by the Comfort Seat and Wheel Module (CSWM). The CSWM will energize the heated seat elements when a heated seat switch is pressed on.

As electrical current passes through each heated seat element, the resistance of the wire used in the element disperse some of the electrical current in the form of heat. The heat produced by the heated seat element then radiates through the seat bottom and seat back covers, warming the seat covers and its occupant.

The heated seat elements cannot be repaired and must be replaced if inoperative or damaged.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - HEATED SEAT ELEMENT

NOTE: **For complete circuit diagrams, SYSTEM WIRING DIAGRAMS . Wiring Information includes wiring diagrams, connector pin-out and location views, details of wire harness routing and retention, splice and ground locations and proper wire and connector repair procedures.**

NOTE: **The wire harness connectors for the heating elements are located under the seat.**

NOTE: **When checking heated seat elements for continuity, be certain to move the heating element being checked. Moving the element, such as sitting in the seat will eliminate the possibility of an intermittent open in the element which would only be evident if the element was in a certain position.**

1. Locate and disconnect the seat heating element electrical connectors as necessary.
2. Check the resistance between the circuits leading in and out of the suspect heated seat element. The resistance should be between the specifications listed in the following Heated Seat Element Resistance table . If OK, refer to **DIAGNOSIS AND TESTING**. If not OK, replace the inoperative heated seat element. Refer to **PAD, HEATER, REMOVAL**.

HEATED SEAT ELEMENT RESISTANCE

Element Location	Acceptable Resistance Value
Driver Seat Bottom Cushion	7.8 - 9.6 ohms
Passenger Seat Bottom Cushion	8.4 - 10.4 ohms
Driver and Passenger Seat Back Cushion	8.5 - 10.6 ohms

REMOVAL

REMOVAL

WARNING: **Disable the airbag system before attempting any component diagnosis or service of the front seats, when equipped with front seat air bags. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.**

NOTE: **Seat bottom cushion shown in illustrations, seat back cushion similar.**

Fig. 2: Removing/Installing Heated Seat Element
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the appropriate seat bottom or seat back cushion and place it on a workbench (Refer to **SEATS, FRONT** or **SEATS, REAR**).
3. Remove the seat bottom or seat back cover from the cushion (1) (Refer to **SEATS, FRONT** or **SEATS, REAR**).
4. Make note of the installed location of the heated seat element on the cushion (3) being serviced.
5. Remove the heated seat element from the foam cushion by peeling the element away from the cushion. Be careful not to remove excessive foam from the cushion.

INSTALLATION

INSTALLATION

CAUTION: During heated seat element replacement, be careful not to fold or crease the new heating element. Folds or creases will cause premature heated seat element failure.

NOTE: Front seat bottom cushion shown, rear seat and seat back cushions similar.

Fig. 3: Identifying Replacement Heating Element And Factory Installed Heating Element
Courtesy of CHRYSLER GROUP, LLC

1. Peel off the adhesive backing from the replacement heated seat element (2).
2. Position the heated seat element to the foam cushion directly where the original heater element was located. There will be adhesive marks on the cushion outlining the factory installed location (1).
3. Firmly press the heated seat element onto the foam cushion. Make sure the adhesive is fully adhered to the cushion.
4. Install the cover onto the seat bottom or seat back cushion (1) (Refer to **SEATS, FRONT** or **SEATS, REAR**).

NOTE: **Make certain the heated seat element and airbag wire harnesses are correctly routed. Any excess wire should be securely placed between the rear of the seat bottom cushion and the rear seat cover flap.**

5. Install the seat bottom or seat back cushion (Refer to **SEATS, FRONT** or **SEATS, REAR**).
6. Install the seat. Refer to **SEAT, INSTALLATION** **SEAT, REAR, INSTALLATION** .
7. Reconnect the negative battery cable.
8. Verify proper heated seat system operation.

SWITCH, HEATED SEAT

DESCRIPTION

DESCRIPTION

Fig. 4: View of Vented Seats U-Connect Touch Screen
Courtesy of CHRYSLER GROUP, LLC

The switches (1) for the optional front heated seat system are located in the U-Connect Touch ™ screen module, at the center of the instrument panel. The heated seat system allows the driver and front seat passenger to select from two different levels of electrical seat heating (HI and LO). When the heated seat switches are pressed on, each heated seat switch illuminates either HI or LO, and an International Standards Organization (ISO) symbol appears at the top of the U-Connect Touch ™ screen module.

OPERATION

OPERATION

When either of the hard or soft front heated seat switches are pressed with the engine running, a signal is sent to the Comfort Seat and Wheel Module (CSWM) over the Controller Area Network (CAN) data bus, signaling the module to energize the heating elements for the selected seat. Indicator lamps illuminate for each heated seat switch and indicate the level of heat in use (HI or LO). Pressing a heated seat switch once will select high-level heating and pressing the same switch a second time will select low-level heating. Pressing the switch a third time will shut the heating elements off.

The CSWM energizes the integral solid-state relays that supply battery current to the heating elements. During high-temperature level operation, the HI indicator illuminates on the U-Connect Touch ™ screen. After 50 minutes of high-temperature level heating, the CSWM automatically lowers the heat level to low. At that time, the LO indicator illuminates on the U-Connect Touch ™ screen. Operation on the low-temperature level setting will automatically turn off after 45 minutes.

The individual front heated seat switches located in the U-Connect Touch ™ screen module cannot be adjusted or repaired. If a front heated seat switch or indicator is inoperative or damaged, the entire U-Connect Touch ™ screen module must be replaced. Refer to **RADIO, REMOVAL** .

2014 ACCESSORIES AND EQUIPMENT

Heated/Cooled Accessories - Service Information - Cherokee

DESCRIPTION

HEATED STEERING WHEEL

0804005802

Fig. 1: View of Vented Seats U-Connect Touch Screen
Courtesy of CHRYSLER GROUP, LLC

The heated steering wheel system is designed to enhance the thermal comfort of the driver by heating the steering wheel, when desired. The steering wheel heating element is made of copper wire and is sandwiched between the leather and the substrate material of the steering wheel. A vehicle with a heated steering wheel can easily be identified by the heated steering wheel switch (3) located in the U-Connect Touch ™ screen module, at the center of the instrument panel. When the heated steering wheel switch is pressed on, the heated steering wheel switch illuminates and an International Standards Organization (ISO) symbol appears in the top corner of the U-Connect Touch ™ screen module.

The heated steering wheel system consists of the following major components

- **Heated Steering Wheel Switch** - Refer to **SWITCH, HEATED STEERING WHEEL, DESCRIPTION**.
- **Comfort Seat and Wheel Module** - Refer to **MODULE, COMFORT SEAT AND WHEEL, DESCRIPTION** .
- **Heated Steering Wheel** - Refer to **OPERATION**.

VENTED SEATS

0804005802

Fig. 2: View of Vented Seats U-Connect Touch Screen
Courtesy of CHRYSLER GROUP, LLC

The vented seat system is designed to enhance the thermal comfort of the driver and front seat occupant, when desired. Occupant comfort is achieved by pulling air from the outside of the seating surfaces into the seat back and cushion of the seat. A vehicle with vented seats can be identified by the vented seat switches (2) located in the Radio Receiver Modules (RRM) U-Connect touch screen.

Each vented seat switch illuminates when the vented seat system is on.

The vented seat system consist of the following major components (there are two different available seat modules, the HSM and the CSWM) :

- **Vented Seat Pads -** Refer to **PAD, VENTED SEAT, DESCRIPTION** for more information.
- **Vented Seat Switches -** Refer to **SWITCH, VENTED SEAT, DESCRIPTION** for more information.
- **Vented Seat Motors -** Refer to **MOTOR, VENTED SEAT, DESCRIPTION** for more information.
- **Custom Seat and Wheel Module -** Refer to **MODULE, COMFORT SEAT AND WHEEL, DESCRIPTION** .

OPERATION

HEATED STEERING WHEEL

Operation of the steering wheel heating element is controlled by the Comfort Seat and Wheel Module (CSWM). The Steering Column Control Module is the interface between the heated steering wheel and the vehicle. The CSWM provides power to the heated steering wheel heating elements in the steering wheel. A temperature sensor is integrated into the steering wheel heating element that sends the temperature of the steering wheel to the steering wheel switch. The steering wheel switch sends this information over the LIN bus to the SCCM. The SCCM then sends this information over the CAN C bus to the Body Control Module (BCM). The BCM sends

this information to the CSWM over the CAN I bus. The normal heating cycle of the steering wheel will last up to 50 minutes on high setting, unless the switch is pressed again. The heated steering wheel system will automatically shut off if the heating element reaches a temperature greater than 46° C (115° F), or if a fault is detected. If for any reason a fault in the heated steering wheel system becomes present, a Diagnostic Trouble Code (DTC) will set.

Auto On Feature

The Auto On feature is a customer configurable feature that when enabled will activate the driver heated seat and heated steering wheel on engine start based on ambient temperature. If Auto On feature is enabled, and the ambient temperature is at or below 40° F the CSWM will activate the driver heated seat and heated steering wheel feature at the high level during engine start. This feature also works with Remote Start.

The heated steering wheel system is diagnosed using a scan tool. Refer to **DIAGNOSIS AND TESTING** .

The steering wheel heating element is not serviced separately from the steering wheel and if inoperative or damaged, the entire steering wheel assembly must be replaced. Refer to **WHEEL, STEERING, REMOVAL** .

VENTED SEATS

The Vented Seat assembly is located internally to the front seats and are intended to enhance the thermal comfort of the seat occupant by ventilating seat to occupant interface. Occupant comfort is achieved by pulling air from the seat surface to the back and underside under side of the seat.

The vented seats are controlled by the heated seat module (HSM also know as the Comfort Seat Wheel Module or CSWM) which provides variable analog voltages driving the 12V vented seat motors in the seats. The vented seats have 2 selectable speeds with a hidden intermediate speed for the fans. For seat venting, each press of the vented seat switch will cause the vented seat to change venting modes. From OFF to HI, from HI to LO and from LO to OFF. The HSM shall turn on the vented seats only with the engine running. Both vented seats operate separately from each other, and will not operate at the same time as the heated seats. To review vented seat switch information, refer to **SWITCH, VENTED SEAT, DESCRIPTION**.

DIAGNOSIS AND TESTING

HEATED STEERING WHEEL

NOTE: **Vehicles equipped with the heated steering wheel option utilize a low voltage cut-off feature. This feature turns off power to the heated steering wheel anytime vehicle voltage is below 9.0 volts or above 16.0 volts. Be certain to check the vehicle electrical system for proper voltage anytime the heated steering wheel appears inoperative.**

NOTE: **If a Diagnostic Trouble Code (DTC) can not be verified, it is a good indication that an INTERMITTENT fault condition may be present. To help find an intermittent problem, move the steering wheel around while testing continuity. Also wiggle the heated steering wheel wire harness and electrical connectors**

while testing continuity.

NOTE: **For complete circuit diagrams, see SYSTEM WIRING DIAGRAMS . Wiring Information includes wiring diagrams, connector pin-out and location views, details of wire harness routing and retention, splice and ground locations and proper wire and connector repair procedures.**

NOTE: **The Auto On feature is designed to function at an ambient temperature of 40° F or below. Make sure this option is enabled the customer programmable interface prior to diagnosis of an inoperative Auto On feature concern.**

Before testing any individual components in the heated steering wheel system, check the following:

- Using a scan tool, check for any Diagnostic Trouble Codes (DTCs) related to the Comfort Seat and Wheel module (CSWM), U-Connect Touch ™ screen module and the Radio Receiver Module (RRM). If any DTCs are found, repair as necessary.
- Check the vehicles battery open-circuit voltage and charging system performance. If the vehicle's electrical system is defective or weak it may not be suppling sufficient energy to operate the heated steering wheel system.
- If there are no DTCs and the heated steering wheel system functions properly, but the heated steering wheel indicator does not illuminate, the entire U-Connect Touch ™ screen module (Integrated Center Stack) must be replaced (Refer to **RADIO**).

VENTILATED SEATS

NOTE: **Vehicles equipped with the ventilated seat option utilize a low voltage cut-off feature. This feature turns off power to the ventilated seat system anytime vehicle voltage is below 11.7 volts or above 15.5 volts. Be certain to check the vehicle electrical system for proper voltage anytime the ventilated seat system appears inoperative.**

NOTE: **If a Diagnostic Trouble Code (DTC) can not be verified, it is a good indication that an INTERMITTENT fault condition may be present. To help find an intermittent problem, sit in the seat in question and move around within the seat while testing continuity. Also wiggle the ventilated seat wire harness and electrical connectors while testing continuity.**

NOTE: **For complete circuit diagrams, see SYSTEM WIRING DIAGRAMS . Wiring Information includes wiring diagrams, connector pin-out and location views, details of wire harness routing and retention, splice and ground locations and proper wire and connector repair procedures.**

Before testing any individual components in the ventilated seat system, check the following:

- Check the ignition fuse in the Power Distribution Center (PDC). Repair as necessary.
- Using a scan tool, check for any Diagnostic Trouble Codes (DTCs) related to the Heated Seat Module (HSM) and the U-Connect Touch ™ screen module. If any DTCs are found, repair as necessary (Refer to **DTC INDEX**).
- Check the vehicles battery open-circuit voltage and charging system performance. If the vehicle's electrical system is defective or weak it may not be suppling sufficient energy to operate the front vented seat system.
- If there are no DTCs and the front vented seat system functions properly, but a vented seat indicator does not illuminate, the entire U-Connect Touch ™ screen module must be replaced (Refer to **RADIO**).

SWITCH, HEATED STEERING WHEEL

DESCRIPTION

DESCRIPTION

Fig. 3: View of Vented Seats U-Connect Touch Screen
Courtesy of CHRYSLER GROUP, LLC

The switch (3) for the optional heated steering wheel is located in the U-Connect Touch ™ screen module, at the center of the instrument panel. When the heated steering wheel switch is pressed on, the heated steering wheel switch illuminates and an International Standards Organization (ISO) symbol appears at the top of the U-Connect Touch ™ screen module.

OPERATION

OPERATION

The heated steering wheel switch allows the driver to turn on and off the heated steering wheel. The heated

steering wheel will remain off until the driver presses the switch. Once the switch is pressed, the switch will illuminate and an International Standards Organization (ISO) symbol appears in to top corner of the U-Connect Touch™ screen module, indicating that the heating element in the steering wheel is operating. Pressing the switch while the heated steering wheel is on, will turn the heating steering wheel off.

The heated steering wheel switch also functions as a visual indicator for a fault with the heated steering wheel system. When the heated steering wheel switch is pressed and a fault is present in the heated steering wheel system, the switch will illuminate for two seconds and then immediately turn off.

The heated steering wheel switch is diagnosed using a scan tool.

The heated steering wheel switch located in the U-Connect Touch™ screen module cannot be adjusted or repaired. If a heated steering wheel switch or indicator lamp is inoperative or damaged, the entire U-Connect Touch™ screen module must be replaced (Refer to **RADIO**).

SWITCH, VENTED SEAT

DESCRIPTION

DESCRIPTION

Fig. 4: View of Vented Seats U-Connect Touch Screen
Courtesy of CHRYSLER GROUP, LLC

The vented seat system is designed to enhance the thermal comfort of the driver and front seat occupant, when desired. Occupant comfort is achieved by pulling air from the outside of the seating surfaces into the seat back and cushion of the seat. A vehicle with vented seats can be identified by the vented seat switches (2) located in the Radio Receiver Modules (RRM) U-Connect touch screen. Each vented seat switch illuminates when the vented seat system is on.

OPERATION

OPERATION

The two vented seat switches are momentary push button type switches that are used to operate the front vented seats. When a vented seat switch is pressed, Light Emitting Diode(s) (LEDs) on the face of that switch will illuminate to indicate the desired mode for that particular vented seat, and a request signal is sent over the Controller Area Network (CAN) bus to the Heated Seat Module (HSM). The HSM provides variable analog voltages that drive the two 12 volt vented seat motors in the seat. There are three settings for each vented seat; off, hi and lo. The vented seat system always starts in the off setting, where none of the LEDs on the switches are illuminated. Pressing a switch once will change the setting for that particular seat from off to hi, and will illuminate both LEDs on the switch. Pressing the same vented seat switch again will change the setting from hi to lo, and only one LED on that switch will illuminate. Pressing the switch once again will change the setting from lo to off again. If for any reason a fault in the vented seat system becomes present, a Diagnostic Trouble Code (DTC) will set and a LED in the vented seat switch will illuminate for two seconds and then go out.

The vented seat switches are diagnosed using a scan tool.

PAD, VENTED SEAT

DESCRIPTION

DESCRIPTION

NOTE: Seat cushion shown, seat back cushion similar.

Fig. 5: Vented Seat Pad, 12 Volt Motor & Heated Seat Pad
Courtesy of CHRYSLER GROUP, LLC

When equipped, each seat bottom and seat back cushion have there own vented seat pad (1) and 12 volt motor (3). The vented seat pad and the heated seat pad (2) are a one piece assembly. The vented and heated pad

assemblies are located between each front seat cushion and cover and are attached to each cushion, by an adhesive.

OPERATION

OPERATION

The vented seat pads provide a path for the air to be pulled away from the seat bottom and seat back surfaces for seat ventilation.

The vented seat pads cannot be repaired and must be replaced if found damaged.

REMOVAL

REMOVAL

WARNING: Disable the airbag system before attempting any component diagnosis or service of the front seats, when equipped with front seat air bags. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.

NOTE: Front seat bottom cushion shown, front seat back cushion similar.

Fig. 6: Front Passenger Seat Bottom Cushion, Occupant Detection Sensor (ODS) & Heater Element
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the appropriate front seat and place it on a workbench. Refer to **SEAT, REMOVAL** .
3. Remove the vented seat motor from the seat cushion being serviced. Refer to **MOTOR, VENTED SEAT, REMOVAL**.
4. Remove the seat bottom or seat back cover from the cushion (1) (Refer to **SEATS, FRONT**).

NOTE: On all models, the front passenger seat contains an Occupant Detection Sensor (ODS) to provide information to the Occupant Restraint Controller (ORC).

5. When servicing the front passenger vented and heated seat pad assembly (2), be sure to replace the Occupant Detection Sensor (ODS) (3). Refer to **SENSOR, OCCUPANT DETECTION, DESCRIPTION** .

Fig. 7: Heated Seat Pad Assembly & Cushion
Courtesy of CHRYSLER GROUP, LLC

NOTE: When servicing the seat back vented and heated pad assembly, carefully guide the vented pad through the opening in the seat back cushion while removing the pad assembly.

6. Remove the vented and heated seat pad assembly (1) by slowly peeling the pad away from the cushion (2). Be careful not to remove excessive foam from the cushion.

INSTALLATION

INSTALLATION

CAUTION: During vented and heated seat pad replacement, be careful not to fold or

crease the new seat pad. Folds or creases will cause premature failure.

NOTE: Front seat bottom cushion shown, front seat back cushion similar.

Fig. 8: Heated Seat Pad Assembly & Cushion
Courtesy of CHRYSLER GROUP, LLC

1. Peel off the adhesive backing from the replacement vented and heated seat pad assembly (1).

NOTE: When servicing the seat back vented and heated pad assembly, carefully guide the vented pad through the opening in the seat back cushion while installing the pad assembly.

2. Position the seat pad to the foam cushion directly where the original seat pad was located. There will be adhesive marks on the cushion outlining the factory installed location.
3. Firmly press the vented and heated pad assembly onto the foam cushion. Make sure the adhesive is fully adhered to the cushion.

Fig. 9: Front Passenger Seat Bottom Cushion, Occupant Detection Sensor (ODS) & Heater Element
Courtesy of CHRYSLER GROUP, LLC

4. When servicing the front passenger bottom vented and heated seat pad assembly (2), install a new Occupant Detection Sensor (ODS) (3). Refer to **SENSOR, OCCUPANT DETECTION, INSTALLATION** .
5. Install the seat bottom or seat back cover onto the cushion (1) (Refer to **SEATS, FRONT**).
6. Install the vented seat motor and cushion. Refer to **MOTOR, VENTED SEAT, INSTALLATION**.
7. Install the seat. Refer to **SEAT, INSTALLATION** .

NOTE: **Make certain the vented and heated seat wire harnesses and ODS harness (when equipped) are correctly routed. Any excess wire for the heated seat element and ODS should be securely placed between the rear of the foam cushion and the rear seat cover flap.**

8. Reconnect the negative battery cable.
9. Verify proper vented and heated seat system operation.

MOTOR, VENTED SEAT

DESCRIPTION

DESCRIPTION

Fig. 10: Vented Seat Motor, Integral Fan Blade, Wire Lead And Connector, Metal Mounting Bracket & Plastic Tabs
Courtesy of CHRYSLER GROUP, LLC

when equipped, each front seat has two vented seat motors (1). One motor is mounted to the seat back frame and the second motor is mounted to the seat bottom pan. Each vented seat motor is attached to a vented pad.

Each vented seat motor consists of a 12 volt motor with a wire lead and connector (4), an integral fan blade (2), a metal mounting bracket (3) and four plastic tabs (5) that secure the motor to the vented pad. The vented seat motors can be seen once the cushions and covers have been removed.

OPERATION

OPERATION

The vented seat motors will only operate with the engine running and will not operate at the same time as the heated seats. The vented seat motors are controlled by the Heated Seat Module (HSM). The HSM provides the vented seat motors with variable analog voltages giving the motors two selectable speeds. These speeds are selected by the driver and/or front passenger by pressing the vented seat switches. Switching the vented seats on while the heated seats are already operating will disable the heating of the seat and start the venting of the seat. Both front vented seats work independently from each other, so that the driver and front passenger can choose there own settings for individual comfort preferences.

The vented seat system is diagnosed using a scan tool. Comfort Seat and Wheel Module. Refer to **DIAGNOSIS AND TESTING** .

The vented seat motors cannot be adjusted or repaired and must be replaced if inoperative or damaged.

REMOVAL

REMOVAL

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

NOTE: LHD passenger seat shown in illustrations, RHD and driver seat similar.

SEAT BOTTOM CUSHION MOTOR

Fig. 11: Heated Seat Pad Electrical Connectors, Seat Cushion Pan & Heated Seat Pad Electrical Connector
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the appropriate seat and place it on a workbench. Refer to **SEAT, REMOVAL** .
3. Disconnect the heated seat pad electrical connectors (2 and 4) located on the seat cushion pan (3).
4. Disengage the heated seat pad electrical connector (1) from the seat cushion pan.

Fig. 12: Two Nuts, Two Push Pin Retainers & Seat Cushion Pan
Courtesy of CHRYSLER GROUP, LLC

5. When servicing the passenger seat, remove the comfort seat and wheel module with bracket. Refer to **MODULE, COMFORT SEAT AND WHEEL, REMOVAL** .
6. Remove the two nuts (1) and disengage the two push pin retainers (2) that secure the vented seat motor to the seat cushion pan (4).
7. Disconnect the vented seat motor electrical connector (3).

Fig. 13: Trim Stick, Vented Seat Motor & Vented Seat Duct
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Illustration shown with seat cover removed. It is not necessary to completely remove the seat bottom cushion cover from the seat bottom cushion to service the vented seat motor.**

8. Remove the seat bottom cushion cover from the seat cushion pan (Refer to **SEATS, FRONT**).

NOTE: On all models, the front passenger seat bottom cushion contains an Occupant Detection Sensor (ODS) to provide information to the Occupant Restraint Controller (ORC). Be sure to disconnect the wire harness connector for the ODS prior to removing the front passenger seat cover and cushion. Refer to SENSOR, OCCUPANT DETECTION, REMOVAL .

9. Remove the seat bottom cushion (3) and cover from the seat cushion pan and place on a workbench (Refer to **SEATS, FRONT**).
10. Using Trim Stick (special tool #C-4755, Trim Stick) or equivalent (4), carefully disengage the four retaining clips that secure the vented seat motor (3) to the vented seat duct (2) and remove the motor.
11. If required, carefully disengage the retaining tab (5) and remove the vented seat duct from the vented seat pad (1).

SEAT BACK CUSHION MOTOR

Fig. 14: Four Nuts, Vented Seat Motor & Seat Back Frame
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the appropriate seat and place it on a workbench. Refer to **SEAT, REMOVAL** .
3. Remove the seat back cover from the seat back frame (Refer to **SEATS, FRONT**).
4. Remove the four nuts (1) that secure the vented seat motor (3) to the seat back frame (2).

Fig. 15: Vented Seat Motor Electrical Harness Retainer, Connector & Seat Back Frame
Courtesy of CHRYSLER GROUP, LLC

5. Move the top of the seat back cushion out of way and disconnect the electrical connector (3) for the vented seat motor.
6. Disengage the vented seat motor electrical harness retainer (1) and the connector (4) from the seat back frame (2).

Fig. 16: Air Bag Electrical Connector, Seat Back Heated Pad Electrical Connector & Seat Cushion Pan

7. Disconnect the air bag electrical connector (1) and seat back heated pad electrical connector (3) located on the seat cushion pan (2).

Fig. 17: Trim Stick, Vented Seat Motor & Vented Seat Pad
Courtesy of CHRYSLER GROUP, LLC

NOTE: It is not necessary to remove the seat back cushion cover from the seat back cushion to replace the seat back vented seat motor. Keep the seat cushion and cover together as an assembly while performing this procedure.

8. Remove the seat back cover and cushion (3) as an assembly and place on a workbench (Refer to **SEATS, FRONT**).
9. Using Trim Stick (special tool #C-4755, Trim Stick) or equivalent (4), carefully disengage the four retaining clips that secure the vented seat motor (2) to the vented seat pad (1) and remove the motor.

INSTALLATION

INSTALLATION

NOTE: LHD passenger seat shown in illustrations, RHD and driver seat similar.

SEAT BOTTOM CUSHION MOTOR

Fig. 18: Vented Seat Duct, Vented Seat Pad, Vented Seat Motor & Retaining Tab
Courtesy of CHRYSLER GROUP, LLC

NOTE: Illustration shown with seat cover removed from cushion.

1. If removed, install the vented seat duct (2) onto the vented seat pad (1). Be sure the retaining tab (4) is fully engaged.
2. Position the vented seat motor (3) to the vented seat duct and carefully engage the four retaining clips that secure the vented seat motor (3) to the duct. Be sure the retaining clips are fully engaged.

NOTE: On all models, the front passenger seat bottom cushion contains an Occupant Detection Sensor (ODS) to provide information to the Occupant Restraint Controller (ORC). Be sure to reconnect the wire harness connector for the ODS once the front passenger seat bottom cushion and cover are installed. Refer to SENSOR, OCCUPANT DETECTION, INSTALLATION .

3. Install the seat bottom cushion (Refer to **SEATS, FRONT**).

Fig. 19: Two Nuts, Two Push Pin Retainers & Seat Cushion Pan
Courtesy of CHRYSLER GROUP, LLC

4. Position the vented seat motor to the seat cushion pan (4), install the two nuts (1) and engage the two push pin retainers (2). Tighten the nuts securely.
5. Connect the vented seat motor electrical connector (3).
6. Install the seat bottom cushion cover (Refer to **SEATS, FRONT**).
7. When servicing the passenger seat, install the Comfort Seat and Wheel Module with bracket. Refer to **MODULE, COMFORT SEAT AND WHEEL, INSTALLATION** .

Fig. 20: Heated Seat Pad Electrical Connectors, Seat Cushion Pan & Heated Seat Pad Electrical Connector
Courtesy of CHRYSLER GROUP, LLC

8. Engage the heated seat pad electrical connector (1) to the seat cushion pan (3).

9. Connect the heated seat pad electrical connectors (2 and 4).

NOTE: **On all models, the front passenger seat bottom cushion contains an Occupant Detection Sensor (ODS) to provide information to the Occupant Restraint Controller (ORC). Be sure to reconnect the wire harness connector for the ODS once the front passenger seat bottom cushion and cover are installed. Refer to SENSOR, OCCUPANT DETECTION, INSTALLATION .**

10. Install the seat. Refer to **SEAT, INSTALLATION** .
11. Reconnect the negative battery cable.
12. Verify proper vented seat system operation.

SEAT BACK CUSHION MOTOR

Fig. 21: Vented Seat Motor & Vented Seat Pad
Courtesy of CHRYSLER GROUP, LLC

1. Position the vented seat motor (2) to the vented seat pad (1) and carefully engage the four retaining clips that secure the motor to the pad. Be sure the retaining clips are fully engaged.

Fig. 22: Vented Seat Motor Electrical Harness Retainer, Connector & Seat Back Frame
Courtesy of CHRYSLER GROUP, LLC

2. Position the seat back cushion and cover onto the seat back frame (2).
3. Engage the vented seat motor electrical harness retainer (1) and the connector (4) to the seat back frame.
4. Connect the vented seat motor electrical connector (3).

Fig. 23: Four Nuts, Vented Seat Motor & Seat Back Frame
Courtesy of CHRYSLER GROUP, LLC

5. Position the vented seat motor (3) to the seat back frame (2) and install the four nuts (1). Tighten the nuts securely.
6. Install the seat back cushion cover onto the seat back frame (Refer to **SEATS, FRONT**).

Fig. 24: Air Bag Electrical Connector, Seat Back Heated Pad Electrical Connector & Seat Cushion Pan
Courtesy of CHRYSLER GROUP, LLC

7. Connect the air bag electrical connector (1) and seat back heated pad electrical connector (3) at the seat cushion pan (2).
8. Install the seat. Refer to **SEAT, INSTALLATION** .
9. Reconnect the negative battery cable.
10. Verify proper vented seat system operation.

2014 ACCESSORIES AND EQUIPMENT

Horn System - Service Information - Cherokee

DESCRIPTION

DESCRIPTION

An electrically-operated horn system is standard factory-installed equipment in this vehicle. Depressing the Driver AirBag (DAB) trim cover in the center of the steering wheel actuates the horn switch contacts, which provides the vehicle operator with a convenient, audible signaling device that can be used to alert pedestrians or the operators of other vehicles in near proximity.

The Body Control Module (BCM) serves as the controller for the horn system, which also allows the BCM to utilize the horn system when providing audible outputs to support other vehicle features such as the horn chirp verification of the Remote Keyless Entry (RKE) and Remote Start systems, as well as the pulsing horn deterrent feature of the optional Vehicle Theft Alarm (VTA) and RKE Panic mode.

The horn system includes the following major components, which are described in further detail elsewhere in this service information:

- **Horn Relay** - The horn relay is soldered onto the Printed Circuit Board (PCB) located within the Body Control Module (BCM) and is not serviceable. The BCM is concealed within the instrument panel behind a fuse access panel outboard of the steering column.
- **Horns** - The standard dual-note horns are located on a bracket secured to the Front End Module (FEM) carrier near the center of the upper radiator cross member, just behind the radiator grille panel. The appearance shield covering the FEM carrier, the cross member and the outboard sides of the cooling module must be removed to gain access to the horns for service.
- **Horn Switch Plate** - The floating horn switch plate is secured to the back of the DAB housing within the steering wheel hub cavity and also serves as the mounting bracket between the DAB and the steering wheel.

Certain functions and features of the horn system rely upon resources shared with other electronic modules in the vehicle over the Local Interface Network (LIN) data bus and the Controller Area Network (CAN) data bus. Other electronic modules in the vehicle that may affect horn system operation are:

- **Body Control Module** - The Body Control Module (BCM) is concealed within the instrument panel outboard of the steering column. The BCM is both a LIN bus master node and a gateway to the CAN data bus. Refer to **MODULE, BODY CONTROL, DESCRIPTION** .
- **Radio Frequency Hub Module** - The Radio Frequency Hub Module (RFHM) (also known as the RF Hub) is located on the upper right D-pillar near the liftgate opening upper header where it is concealed behind the interior trim. Refer to **MODULE, RADIO FREQUENCY (RF HUB), DESCRIPTION** .

The BCM and the RFHM each contain a microcontroller and programming that allow them to communicate with each other and other electronic modules in the vehicle using the Controller Area Network (CAN) data bus. Refer to **COMMUNICATION, DESCRIPTION** .

Hard wired circuitry connects the various horn system components to each other through the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other and to the vehicle electrical system through the use of a combination of soldered splices, splice block connectors and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention as well as pin out and location views for the various wire harness connectors, splices and grounds.

OPERATION

OPERATION

The horn system components operate on battery current received through non-switched fused B(+) circuits so that the system will remain operational, regardless of the status of the ignition switch (also known as the Keyless Ignition Node/KIN or IGnition Node Module/IGNM). The Body Control Module (BCM) controls the output of battery current to the horns through a horn relay soldered to a Printed Circuit Board (PCB) located within the BCM. The BCM controls the relay based upon internal programming, hard wired inputs from the horn switch as well as electronic message inputs received from the Radio Frequency Hub Module (RFHM) (also known as the RF Hub) over the Controller Area Network (CAN) data bus.

The vehicle operator can control typical horn system signaling through the horn switch contacts on the horn switch plate on the back of the Driver AirBag (DAB) within the hub cavity of the steering wheel. When the DAB trim cover in the center of the steering wheel is depressed, the horn switch contacts close, providing a hard wired analog input to the BCM.

In addition, the RFHM sends electronic **horn request** messages to the BCM over the CAN data bus in response to inputs received from the Remote Keyless Entry (RKE) transmitter in vehicles without the optional Passive Entry Keyless Go (PEKG) system, or received from the FOB with Integrated Key (FOBIK) transmitter in vehicles with the PEKG system. Lastly, as the Vehicle Theft Security System (VTSS) controller, the BCM can activate the horn system based upon programming and both hard wired and electronic message inputs from the various VTSS components.

The horns can be activated by the BCM to support each of the following features:

- **Remote Keyless Entry System** - Remote Keyless Entry (RKE) system **Lock** request audible verification.
- **Remote Keyless Entry System** - Remote Keyless Entry (RKE) system **Panic** mode audible alert.
- **Remote Start System** - Remote Start System **Start** request audible verification.
- **Vehicle Theft Alarm** - Vehicle Theft Alarm (VTA) audible alarm.

The RKE system **Lock** request audible verification is a customer programmable feature, which allows the feature to be enabled or disabled to suit individual preferences. Refer to **CENTER, ELECTRONIC VEHICLE INFORMATION, OPERATION** .

The hard wired circuits between components related to the horn system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes

wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the horn system or the electronic controls and communication between modules and other devices that provide some features of the horn system. The most reliable, efficient and accurate means to diagnose the horn system or the electronic controls and communication related to horn system operation requires the use of a diagnostic scan tool.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - HORN SYSTEM

WARNING: **To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.**

NOTE: **A continuously sounding horn is immediately resolved by disconnecting the wiring at the horns.**

HORN SYSTEM DIAGNOSIS		
CONDITION	**POSSIBLE CAUSES**	**CORRECTION**
HORNS SOUND CONTINUOUSLY	1. Ineffective horn feed circuit.	1. Test and repair shorted horn feed circuit if required.
	2. Ineffective horn switch return circuit.	2. Test and repair shorted horn switch return circuit if required.
	3. Ineffective horn relay.	3. Test and replace the horn relay, which is integral to the Body Control Module (BCM), if required.
	4. Ineffective horn switch.	4. Test and replace the shorted horn switch, which is integral to the Driver AirBag (DAB), if required.
	5. Ineffective Body Control Module (BCM) inputs or outputs.	5. Use a diagnostic scan tool to test the BCM inputs and outputs. Refer to the appropriate diagnostic information.
HORNS SOUND INTERMITTENTLY AS THE STEERING WHEEL IS ROTATED	1. Ineffective horn switch return circuit.	1. Test and repair intermittently shorted horn switch return circuit if required.
	2. Ineffective horn switch.	2. Test and replace the intermittently open or shorted horn switch, which is integral to the Driver AirBag (DAB), if required.

HORNS DO NOT SOUND	1. Ineffective horn ground circuit.	1. Test and repair open horn ground circuit if required.
	2. Ineffective horn feed circuit.	2. Test and repair open horn feed circuit if required.
	3. Ineffective horn relay.	3. Test and replace the horn relay, which is integral to the Body Control Module (BCM), if required.
	4. Ineffective horns.	4. Test and replace open horns if required.
	5. Ineffective horn switch feed circuit.	5. Test and repair open horn switch feed circuit if required.
	6. Ineffective horn switch return circuit.	6. Test and repair open horn switch return circuit if required.
	7. Ineffective horn switch.	7. Test and replace the open horn switch, which is integral to the Driver AirBag (DAB), if required.
	8. Ineffective BCM inputs or outputs.	8. Use a diagnostic scan tool to test the BCM inputs and outputs. Refer to the appropriate diagnostic information.

HORN

DESCRIPTION

DESCRIPTION

Fig. 1: Horns, Connector & Bracket
Courtesy of CHRYSLER GROUP, LLC

Dual electromagnetic diaphragm-type horns are standard equipment on this vehicle. A low note (3) and a high note (2) trumpet-style horn are each secured to a mounting bracket (4). The horn and mounting bracket unit is then secured by a single screw to the Front End Module (FEM) carrier atop the upper radiator cross member. The mounting bracket fastening provision is concealed beneath an appearance shield. Internally the two horns are identical in construction and the external horn trumpets are symmetrically opposite.

A short jumper harness connects the horns to each other electrically so they can both be connected through a single connection (1) integral to the left horn. A dedicated take out and connector of the FEM wire harness connects the horns to the vehicle electrical system.

The two horns and the mounting bracket are factory-tuned as a unit and, therefore, are serviced only as a unit. These horns cannot be adjusted or repaired. If either horn or the mounting bracket is ineffective or damaged, the entire unit must be replaced.

OPERATION

OPERATION

Each horn has a path to ground at all times through its wire harness connection to an eyelet terminal secured to the body sheet metal. The horns are completely controlled by a fused B(+) output received through a relay soldered onto the Printed Circuit Board (PCB) within the Body Control Module (BCM).

Within the two halves of the horn housing are a flexible diaphragm, a plunger, an electromagnetic coil and a set of contact points. The diaphragm is secured in suspension around its perimeter by the mating surfaces of the

horn housing. The plunger is secured to the center of the diaphragm and extends into the center of the electromagnetic coil. The contact points control the current flow through the windings of the electromagnetic coil.

When the horn is energized, electrical current flows through the closed contact points to the electromagnetic coil. The resulting electromagnetic field draws the plunger and diaphragm toward it until that movement mechanically opens the contact points. When the contact points open, the electromagnetic field collapses allowing the plunger and diaphragm to return to their relaxed positions and closing the contact points again. This cycle continues repeating at a very rapid rate producing the vibration and movement of air that creates the sound that is directed through the horn trumpet outlet.

The horns as well as the hard wired input circuits for the horns may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - HORNS

Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

1. Disconnect the Front End Module (FEM) wire harness connectors from the pigtail connector on the horn and mounting bracket unit. Check for continuity between the horn ground circuit in the FEM wire harness connector for the horns and a good ground. There should be continuity. If OK, go to Step 2. If not OK, repair the open ground circuit to ground as required.
2. Check for battery voltage at the horn circuit in the FEM wire harness connector for the horns. There should be zero volts. If OK, go to Step 3. If not OK, repair the shorted horn circuit between the horns and the Body Control Module (BCM) as required.
3. Depress the horn switch. There should now be battery voltage at the horn circuit of the FEM wire harness connector for the horns. If OK, replace the ineffective horn and mounting bracket unit. If not OK, use a diagnostic scan tool and the appropriate diagnostic information for further diagnosis of the Body Control Module (BCM) inputs and outputs.

REMOVAL

REMOVAL

Fig. 2: Carrier, Screw, Connector & Bracket
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative cable from the battery.
2. Remove the appearance shield from over the Front End Module (FEM) carrier (1) on the upper radiator cross member.
3. Disconnect the FEM wire harness connector (3) from the pigtail wire connector for the horns.
4. Remove the screw (2) that secures the horn mounting bracket (4) to the top surface of the FEM carrier.
5. Remove both horns and the mounting bracket from the vehicle as a unit.

INSTALLATION

INSTALLATION

Fig. 3: Carrier, Screw, Connector & Bracket
Courtesy of CHRYSLER GROUP, LLC

1. Position the horns and the mounting bracket (4) to the Front End Module (FEM) carrier (1) atop the upper radiator cross member as a unit.
2. Install and tighten the screw (2) that secures the horn mounting bracket to the top surface of the FEM carrier. Tighten the screw to 6 N.m (53 in. lbs.).
3. Reconnect the FEM wire harness connector (3) to the pigtail wire connector for the horns.
4. Reinstall the appearance shield onto the FEM carrier.
5. Reconnect the negative cable to the battery.

RELAY, HORN

DESCRIPTION

DESCRIPTION

The horn relay is a electromechanical device that consists of an electromagnetic coil, a resistor and a pair of normally open electrical contacts. One of the two electrical contacts is fixed, while the other contact is movable. The movable relay contact is held away from the fixed contact by spring pressure. The horn relay for this vehicle is soldered in place on the Printed Circuit Board (PCB) internal to the Body Control Module (BCM), which is located within the instrument panel outboard of the steering column.

The horn relay cannot be repaired or adjusted and, if ineffective or damaged, the entire BCM unit must be replaced.

OPERATION

OPERATION

The horn relay within the Body Control Module (BCM) switches battery current to the horns when the BCM energizes the electromagnetic coil of the relay. When the electromagnetic relay coil is energized, it draws and holds the normally open movable contact of the relay against the fixed relay contact. The closed relay contacts supply fused battery current from the BCM to energize the horns.

When the BCM de-energizes the electromagnetic relay coil, spring pressure returns the movable contact to the normally open position, which de-energizes the horns. The resistor within the relay is connected in parallel with the electromagnetic coil, and helps to dissipate voltage spikes that are produced when the coil is de-energized.

The hard wired output of the horn relay within the BCM may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the BCM or the electronic controls and communication between modules and other devices that provide some features of the BCM controlled horn relay. The most reliable, efficient and accurate means to diagnose the BCM or the electronic controls and communication related to BCM controlled horn relay operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - HORN RELAY

The hard wired output of the horn relay in the Body Control Module (BCM) may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the BCM or the electronic controls and communication between modules and other devices that provide some features of the BCM controlled horn relay. The most reliable, efficient and accurate means to diagnose the BCM or the electronic controls and communication related to BCM controlled horn relay operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

REMOVAL

The horn relay used in this vehicle is soldered onto a Printed Circuit Board (PCB) internal to the Body Control Module located in the instrument panel outboard of the steering column. The horn relay is integral to and serviced only as a unit with the BCM. Refer to **MODULE, BODY CONTROL, REMOVAL** .

INSTALLATION

INSTALLATION

The horn relay used in this vehicle is soldered onto a Printed Circuit Board (PCB) internal to the Body Control Module (BCM) located in the instrument panel outboard of the steering column. The horn relay is integral to

and serviced only as a unit with the BCM. Refer to **MODULE, BODY CONTROL, INSTALLATION** .

SWITCH, HORN

DESCRIPTION

DESCRIPTION

Fig. 4: Horn Switch Plate, Mounting Plate, Horn Switch Contacts & Connector
Courtesy of CHRYSLER GROUP, LLC

The horn switch for this vehicle consists of four individual sets of normally open contacts wired in parallel so that all four sets of contacts operate as one switch. The horn switch contacts (3) are secured to, but insulated from a stamped metal floating horn switch plate (1) that also serves as the mounting plate for the Driver AirBag (DAB) (2). The horn switch plate is over-molded with integral plastic insulators for the horn contacts and routing clips for the contact wiring.

The horn switch plate is secured to but isolated from the DAB housing with four sleeved screws and insulating washers. Each sleeved screw passes through a small coiled spring retained by an interference fit within an isolator on the switch plate. A dedicated take out and connector of the steering wheel wire harness connects the horn switch plate to the vehicle electrical system through a connector (4) on the upper edge of the switch plate. A mounting spring on each outboard side of the horn switch plate is secured within the hub of the steering wheel under a hook formation in the steering wheel hub armature adjacent to each horizontal steering wheel spoke.

The components that make up the horn switch plate cannot be adjusted or repaired. If damaged or ineffective, the entire DAB and horn switch plate must be replaced as a unit.

OPERATION

OPERATION

The floating horn switch plate allows the vehicle operator to actuate the horns by depressing anywhere on the upper surface of the Driver AirBag (DAB) trim cover in the center of the steering wheel. The four sets of horn switch contacts are wired in parallel so they perform as a single switch. One contact from each pair is connected to a path to ground at all times through the steering wheel wire harness and the clockspring.

When the DAB trim cover is depressed, the DAB housing compresses the coil springs isolating the floating horn switch plate causing at least one of the four sets of electrically conductive horn switch contacts to close. When the DAB trim cover is released, the coil springs on the switch plate return the DAB to its at rest position and open the horn switch contacts, which opens the horn switch circuit. The closed horn switch contacts provide a ground signal to the Body Control Module (BCM), which will energize the control coil of the horn relay located within the BCM. The horn relay in the BCM then controls the output to the horns accordingly.

The hard wired circuits between components related to the horn switch plate may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - HORN SWITCH

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

1. Remove the Driver AirBag (DAB) from the steering wheel. Refer to **AIR BAG, DRIVER, REMOVAL** .
2. Disconnect the steering wheel wire harness connector from the horn switch pigtail wire harness connector.
3. With the horn switch contacts released, check for continuity between the two terminals in the horn switch pigtail wire harness connector. There should be no continuity. If OK, go to Step 4. If not OK, replace the ineffective horn switch plate and DAB as a unit.
4. With each of the horn switch contacts compressed one at a time, check for continuity between the two terminals in the horn switch pigtail wire harness connector. There should now be continuity. If OK, go to Step 5. If not OK, replace the ineffective horn switch plate and DAB as a unit.

5. Check the steering wheel wire harness for shorts or opens between the horn switch connector and the clockspring. If OK, go to Step 6. If not OK, repair or replace the steering wheel wire harness as required.
6. Check the clockspring ground circuit between the clockspring and the ground source for continuity. If OK, go to Step 7. If not OK, repair or replace the clockspring or the open ground circuit as required.
7. Check the horn switch output circuit between the clockspring and the horn switch output circuit at the Body Control Module (BCM) for shorts or opens. Repair or replace the clockspring or the shorted or open circuit as required.

REMOVAL

REMOVAL

The horn switch is serviced only as a unit with the Driver AirBag (DAB). Refer to **AIR BAG, DRIVER, REMOVAL** .

INSTALLATION

INSTALLATION

The horn switch is serviced only as a unit with the Driver AirBag (DAB). Refer to **AIR BAG, DRIVER, INSTALLATION** .

DIAGNOSIS AND TESTING

B21DD-84-SYSTEM VOLTAGE - SIGNAL BELOW ALLOWABLE RANGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 1: Instrument Cluster Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

Ignition on.

SET CONDITION

Monitored battery voltage is below 9.0 volts for over 5 seconds.

POSSIBLE CAUSES

Possible Causes
LOW SYSTEM VOLTAGE BATTERY OR CHARGING SYSTEM

DIAGNOSTIC TEST

1. **CHECK POWERTRAIN CONTROL MODULE (PCM) DTCs**
    1. With the scan tool, read PCM DTCs.

       Are there any PCM Charging or Battery DTCs present?

       Yes

       - Refer to the **DTC INDEX** article and perform the appropriate diagnostic procedure.

       No

       - Go To 2
2. **CHECK OTHER MODULES FOR DTCS**
    1. With the scan tool, read DTCs.

       Are there any other modules setting a low system voltage DTC?

       Yes

       - This is either an indication of an overall low system voltage, or depending on the modules affected, it can be one or more power circuits with a high resistance in its output circuit. Using the wiring schematics as a guide, look for a common power circuit between the modules that set a low voltage DTC and repair as necessary. If it seems to be an overall low voltage, check the battery and charging system in accordance with the Service Information.
       - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

       No

       - Go To 3
3. **CHECK FUSED B(+) CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
    1. Turn the ignition off.
    2. Disconnect the Instrument Cluster harness connector.
    3. Using a 12-volt test light connected to ground, check the (A938) Fused B(+) circuit in the Instrument Cluster harness connector.

NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly?

Yes

- Go To 4

No

- Repair the (A938) Fused B(+) circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK IF DTC IS ACTIVE**
   1. Reconnect the Instrument Cluster harness connector.
   2. With the scan tool, erase DTCs.
   3. Cycle the ignition off, then start the engine and allow to idle.
   4. After a couple of minutes, with the scan tool, read Cluster DTCs.

   Does this DTC reset?

   Yes

   - Replace the Instrument Cluster in accordance with the Service Information. Refer to **REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 5

5. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit. Wiggle the wiring and connectors while checking for shorted and open circuits.
   3. Check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Check for Service Information Tune-ups or Service Bulletins for any possible causes that may apply.

   Were there any problems found?

   Yes

- Repair as necessary.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Test complete.

B275B-00-AIRBAG TELLTALE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Ignition on.

SET CONDITION

The Instrument Cluster (IPC) detects an open or short in the Airbag LED circuit.

POSSIBLE CAUSES

Possible Causes
INSTRUMENT CLUSTER

DIAGNOSTIC TEST

CHECK IF THE DTC IS ACTIVE

1. With the scan tool, read Instrument Cluster (IPC) DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - The LED circuit for the Airbag is non-serviceable. Replace the Instrument Cluster in accordance with the Service Information. Refer to **REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U0002-00-CAN C BUS OFF PERFORMANCE

Perform the COMMUNICATION PRE-DIAGNOSTIC PROCEDURE. Refer to **STANDARD PROCEDURE** .

U0010-00-CAN INTERIOR BUS

Perform the COMMUNICATION PRE-DIAGNOSTIC PROCEDURE. Refer to **STANDARD PROCEDURE** .

U0011-00-CAN INTERIOR BUS OFF PERFORMANCE

Perform the COMMUNICATION PRE-DIAGNOSTIC PROCEDURE. Refer to **STANDARD PROCEDURE** .

U0037-00-LIN BUS

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 2: Instrument Cluster Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

Ignition on.

SET CONDITION

The Instrument Cluster (IPC) detects an open/short on the LIN Bus circuit.

POSSIBLE CAUSES

Possible Causes
LIN BUS SHORTED TO GROUND
LIN BUS OPEN
AIRBAG DISABLE LAMP
INSTRUMENT CLUSTER

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, record and erase Instrument Cluster (IPC) DTCs.
    3. Cycle the ignition from off to on.
    4. With the scan tool, read IPC DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Go To 5
2. **CHECK THE (D509) LIN BUS FOR AN OPEN**
    1. Turn the ignition off.
    2. Disconnect the Instrument Cluster harness connector.
    3. Disconnect the Airbag Disable Lamp harness connector.
    4. Measure the resistance of the (D509) LIN Bus circuit between the Instrument Cluster harness connector and the Airbag Disable Lamp harness connector.

    Is the resistance below 5.0 Ohms?

    Yes

    - Go To 3

    No

    - Repair the (D509) LIN Bus circuit for an open or high resistance.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (D509) LIN BUS FOR A SHORT TO GROUND**
   1. Measure the resistance between ground and the (D509) LIN Bus circuit.

      Is the resistance above 100K Ohms?

      Yes

      - Go To 4

      No

      - Repair the (D509) LIN Bus circuit for a short to ground.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
4. **CHECK THE AIRBAG DISABLE LAMP**
   1. Replace the Airbag Disable Lamp module in accordance with the Service Information.
   2. Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      Does the scan tool display this DTC as active?

      Yes

      - Using the schematics as a guide, check the IPC module pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Instrument Cluster in accordance with the Service Information. Refer to **REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Test Complete.
5. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this module. Wiggle the wiring and connectors while checking for shorted and open circuits.
   3. Check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Check Service Bulletins for any possible causes that may apply.

      Were there any problems found?

      Yes

- Repair as necessary.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Test complete.

U0100-00-LOST COMMUNICATION WITH ECM/PCM

Perform the COMMUNICATION PRE-DIAGNOSTIC PROCEDURE. Refer to **STANDARD PROCEDURE** .

U0101-00-LOST COMMUNICATION WITH TCM

Perform the COMMUNICATION PRE-DIAGNOSTIC PROCEDURE. Refer to **STANDARD PROCEDURE** .

U0102-00-LOST COMMUNICATION WITH TRANSFER CASE CONTROL MODULE / AWD

Perform the COMMUNICATION PRE-DIAGNOSTIC PROCEDURE. Refer to **STANDARD PROCEDURE** .

U0129-00-LOST COMMUNICATION WITH BRAKE SYSTEM CONTROL MODULE

Perform the COMMUNICATION PRE-DIAGNOSTIC PROCEDURE. Refer to **STANDARD PROCEDURE** .

U0131-00-LOST COMMUNICATION WITH ELECTRIC POWER STEERING CONTROL MODULE

Perform the COMMUNICATION PRE-DIAGNOSTIC PROCEDURE. Refer to **STANDARD PROCEDURE** .

U0140-00-LOST COMMUNICATION WITH BODY CONTROL MODULE

Perform the COMMUNICATION PRE-DIAGNOSTIC PROCEDURE. Refer to **STANDARD PROCEDURE** .

U0151-00-LOST COMMUNICATION WITH OCCUPANT RESTRAINT CONTROLLER (ORC)

Perform the COMMUNICATION PRE-DIAGNOSTIC PROCEDURE. Refer to **STANDARD PROCEDURE** .

U0159-00-LOST COMMUNICATION WITH PARK ASSIST CONTROL MODULE (PTS)

Perform the COMMUNICATION PRE-DIAGNOSTIC PROCEDURE. Refer to **STANDARD PROCEDURE** .

U0184-00-LOST COMMUNICATION WITH RADIO

Perform the COMMUNICATION PRE-DIAGNOSTIC PROCEDURE. Refer to **STANDARD PROCEDURE** .

U0209-00-LOST COMMUNICATION WITH MEMORY SEAT CONTROL MODULE

Perform the COMMUNICATION PRE-DIAGNOSTIC PROCEDURE. Refer to **STANDARD PROCEDURE** .

U0401-00-IMPLAUSIBLE DATA RECEIVED FROM ECM/PCM

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously with the ignition on.

SET CONDITION

When the Instrument Cluster (IPC) receives an implausible (default/error value, toggle error or parity error) message from the Powertrain Control Module (PCM).

POSSIBLE CAUSES

Possible Causes
BODY CONTROL MODULE (BCM) DTCS PRESENT
POWERTRAIN CONTROL MODULE (PCM) DTCS PRESENT
POWERTRAIN CONTROL MODULE (PCM)
INSTRUMENT CLUSTER

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, record and erase Instrument Cluster (IPC) DTCs.
    3. Cycle the ignition from off to on.
    4. With the scan tool, read IPC DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

No

- Go To 5

2. **CHECK FOR BODY CONTROL MODULE (BCM) DTCS**
   1. With the scan tool, read BCM DTCs.

      Are there any BCM CAN Bus DTCs present?

      Yes

      - Refer to the **BODY CONTROL MODULE (BCM) - DIAGNOSTIC CODE INDEX** article and perform the appropriate diagnostic procedure.

      No

      - Go To 3

3. **CHECK FOR POWERTRAIN CONTROL MODULE (PCM) DTCS**
   1. With the scan tool, read PCM DTCs.

      Are there any PCM DTCs present?

      Yes

      - Refer to the **DTC INDEX** article and perform the appropriate diagnostic procedure.

      No

      - Go To 4

4. **CHECK OTHER MODULES FOR DTCS**
   1. With the scan tool, read DTCs.

      Are there any other modules reporting implausible communication DTCs against the PCM?

      Yes

      - Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Using the schematics as a guide, check the IPC module pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Instrument Cluster in accordance with the Service Information. Refer to **REMOVAL** .

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this module. Wiggle the wiring and connectors while checking for shorted and open circuits.
   3. Check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Check Service Bulletins for any possible causes that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Test complete.

U0402-00-IMPLAUSIBLE DATA RECEIVED FROM TCM

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously with the ignition on.

SET CONDITION

When the Instrument Cluster (IPC) receives an implausible (default/error value, toggle error or parity error) message from the Transmission Control Module (TCM).

POSSIBLE CAUSES

Possible Causes
BODY CONTROL MODULE (BCM) DTCS PRESENT
TRANSMISSION CONTROL MODULE (TCM) DTCS PRESENT
TRANSMISSION CONTROL MODULE (TCM)
INSTRUMENT CLUSTER

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**

1. Turn the ignition on.
2. With the scan tool, record and erase Instrument Cluster (IPC) DTCs.
3. Cycle the ignition from off to on.
4. With the scan tool, read IPC DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Go To 2

   No

   - Go To 5

2. **CHECK FOR BODY CONTROL MODULE (BCM) DTCS**
   1. With the scan tool, read BCM DTCs.

      Are there any BCM CAN Bus DTCs present?

      Yes

      - Refer to the **BODY CONTROL MODULE (BCM) - DIAGNOSTIC CODE INDEX** article and perform the appropriate diagnostic procedure.

      No

      - Go To 3

3. **CHECK FOR TRANSMISSION CONTROL MODULE (TCM) DTCS**
   1. With the scan tool, read TCM DTCs.

      Are there any TCM DTCs present?

      Yes

      - Refer to the **DTC INDEX** article and perform the appropriate diagnostic procedure.

      No

      - Go To 4

4. **CHECK OTHER MODULES FOR DTCS**
   1. With the scan tool, read DTCs.

      Are there any other modules reporting implausible communication DTCs against the TCM?

Yes

- Replace and program the Transmission Control Module (TCM) in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Using the schematics as a guide, check the IPC module pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Instrument Cluster in accordance with the Service Information. Refer to **REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this module. Wiggle the wiring and connectors while checking for shorted and open circuits.
   3. Check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Check Service Bulletins for any possible causes that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Test complete.

U0403-00-IMPLAUSIBLE DATA RECEIVED FROM T-CASE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously with the ignition on.

SET CONDITION

When the Instrument Cluster (IPC) receives an implausible (default/error value, toggle error or parity error) message from the Drive Train Control Module (DTCM).

POSSIBLE CAUSES

Possible Causes
DRIVE TRAIN CONTROL MODULE (DTCM) DTCS PRESENT
BODY CONTROL MODULE (BCM) DTCS PRESENT
DRIVE TRAIN CONTROL MODULE (DTCM)
INSTRUMENT CLUSTER

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, record and erase Instrument Cluster (IPC) DTCs.
    3. Cycle the ignition from off to on.
    4. With the scan tool, read IPC DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Go To 5
2. **CHECK FOR BODY CONTROL MODULE (BCM) DTCS**
    1. With the scan tool, read BCM DTCs.

    Are there any BCM CAN Bus DTCs present?

    Yes

    - Refer to the **BODY CONTROL MODULE (BCM) - DIAGNOSTIC CODE INDEX** article and perform the appropriate diagnostic procedure.

    No

    - Go To 3
3. **CHECK FOR DRIVE TRAIN CONTROL MODULE (DTCM) DTCS**
    1. With the scan tool, read DTCM DTCs.

    Are there any DTCM DTCs present?

    Yes

- Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

No

- Go To 4

4. **CHECK OTHER MODULES FOR DTCS**
   1. With the scan tool, read DTCs.

      Are there any other modules reporting implausible communication DTCs against the DTCM?

      Yes

      - Replace and program the Drive Train Control Module (DTCM) in accordance with the Service Information. Refer to **MODULE, DRIVETRAIN CONTROL, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Using the schematics as a guide, check the IPC pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Instrument Cluster in accordance with the Service Information. Refer to **REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
5. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this module. Wiggle the wiring and connectors while checking for shorted and open circuits.
   3. Check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Check Service Bulletins for any possible causes that may apply.

      Were there any problems found?

      Yes

      - Repair as necessary.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Test complete.

U0418-00-IMPLAUSIBLE DATA RECEIVED FROM BRAKE SYSTEM CONTROL MODULE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously with the ignition on.

SET CONDITION

When the Instrument Cluster (IPC) receives an implausible (default/error value, toggle error or parity error) message from the Antilock Brake System (ABS) Module.

POSSIBLE CAUSES

Possible Causes
ANTILOCK BRAKE SYSTEM (ABS) MODULE DTCS PRESENT
BODY CONTROL MODULE (BCM) DTCS PRESENT
ANTILOCK BRAKE SYSTEM (ABS) MODULE
INSTRUMENT CLUSTER

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, record and erase Instrument Cluster (IPC) DTCs.
    3. Cycle the ignition from off to on.
    4. With the scan tool, read IPC DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Go To 5
2. **CHECK FOR BODY CONTROL MODULE (BCM) DTCS**
    1. With the scan tool, read BCM DTCs.

    Are there any BCM CAN Bus DTCs present?

    Yes

    - Refer to the **BODY CONTROL MODULE (BCM) - DIAGNOSTIC CODE INDEX**

article and perform the appropriate diagnostic procedure.

No

- Go To 3

3. **CHECK FOR ANTILOCK BRAKE SYSTEM (ABS) MODULE DTCS**
   1. With the scan tool, read ABS DTCs.

      Are there any ABS DTCs present?

      Yes

      - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

      No

      - Go To 4

4. **CHECK OTHER MODULES FOR DTCS**
   1. With the scan tool, read DTCs.

      Are there any other modules reporting implausible communication DTCs against the ABS?

      Yes

      - Replace and program the Antilock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Using the schematics as a guide, check the IPC pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Instrument Cluster in accordance with the Service Information. Refer to **REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this module. Wiggle the wiring and connectors while checking for shorted and open circuits.
   3. Check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Check Service Bulletins for any possible causes that may apply.

      Were there any problems found?

Yes

- Repair as necessary.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Test complete.

U0422-00-IMPLAUSABLE DATA RECEIVED FROM BODY CONTROL MODULE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously with the ignition on.

SET CONDITION

When the Instrument Cluster (IPC) receives an implausible (default/error value, toggle error or parity error) message from the Body Control Module (BCM).

POSSIBLE CAUSES

Possible Causes
BODY CONTROL MODULE (BCM) DTCS PRESENT
BODY CONTROL MODULE (BCM)
INSTRUMENT CLUSTER

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, record and erase Instrument Cluster (IPC) DTCs.
    3. Cycle the ignition from off to on.
    4. With the scan tool, read IPC DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

- Go To 4

2. **CHECK FOR BODY CONTROL MODULE (BCM) DTCS**
   1. With the scan tool, read BCM DTCs.

      Are there any BCM CAN Bus DTCs present?

      Yes

      - Refer to the **BODY CONTROL MODULE (BCM) - DIAGNOSTIC CODE INDEX** article and perform the appropriate diagnostic procedure.

      No

      - Go To 3

3. **CHECK OTHER MODULES FOR DTCS**
   1. With the scan tool, read DTCs.

      Are there any other modules reporting implausible communication DTCs against the BCM?

      Yes

      - Replace and program the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Using the schematics as a guide, check the IPC pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Instrument Cluster in accordance with the Service Information. Refer to **REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this module. Wiggle the wiring and connectors while checking for shorted and open circuits.
   3. Check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Check Service Bulletins for any possible causes that may apply.

      Were there any problems found?

      Yes

- Repair as necessary.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Test complete.

U045A-00-IMPLAUSIBLE DATA RECEIVED FROM PARKING ASSIST MODULE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously with the ignition on.

SET CONDITION

When the Instrument Cluster (IPC) receives an implausible (default/error value, toggle error or parity error) message from the Park Assist Module (PAM).

POSSIBLE CAUSES

Possible Causes
PARK ASSIST MODULE (PAM) DTCS PRESENT
BODY CONTROL MODULE (BCM) DTCS PRESENT
PARK ASSIST MODULE (PAM)
INSTRUMENT CLUSTER

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, record and erase Instrument Cluster (IPC) DTCs.
    3. Cycle the ignition from off to on.
    4. With the scan tool, read IPC DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

- Go To 5

2. **CHECK FOR BODY CONTROL MODULE (BCM) DTCS**
   1. With the scan tool, read BCM DTCs.

      Are there any BCM CAN Bus DTCs present?

      Yes

      - Refer to the **BODY CONTROL MODULE (BCM) - DIAGNOSTIC CODE INDEX** article and perform the appropriate diagnostic procedure.

      No

      - Go To 3

3. **CHECK FOR PARKING ASSIST MODULE (PAM) DTCS**
   1. With the scan tool, read PAM DTCs.

      Are there any PAM DTCs present?

      Yes

      - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

      No

      - Go To 4

4. **CHECK OTHER MODULES FOR DTCS**
   1. With the scan tool, read DTCs.

      Are there any other modules reporting implausible communication DTCs against the PAM?

      Yes

      - Replace and program the Park Assist Module (PAM) in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Using the schematics as a guide, check the IPC pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Instrument Cluster in accordance with the Service Information. Refer to **REMOVAL** .

    No

    - Test complete.

U0485-00-IMPLAUSIBLE DATA RECEIVED FROM RADIO

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously with the ignition on.

SET CONDITION

When the Instrument Cluster (IPC) receives an implausible (default/error value, toggle error or parity error) message from the Radio.

POSSIBLE CAUSES

Possible Causes
RADIO DTCS PRESENT
BODY CONTROL MODULE (BCM) DTCS PRESENT
RADIO
INSTRUMENT CLUSTER

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the ignition on.

2. With the scan tool, record and erase Instrument Cluster (IPC) DTCs.
3. Cycle the ignition from off to on.
4. With the scan tool, read IPC DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Go To 2

   No

   - Go To 5

2. **CHECK FOR BODY CONTROL MODULE (BCM) DTCS**
   1. With the scan tool, read BCM DTCs.

      Are there any BCM CAN Bus DTCs present?

      Yes

      - Refer to the **BODY CONTROL MODULE (BCM) - DIAGNOSTIC CODE INDEX** article and perform the appropriate diagnostic procedure.

      No

      - Go To 3

3. **CHECK FOR RADIO DTCS**
   1. With the scan tool, read Radio DTCs.

      Are there any Radio DTCs present?

      Yes

      - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

      No

      - Go To 4

4. **CHECK OTHER MODULES FOR DTCS**
   1. With the scan tool, read DTCs.

      Are there any other modules reporting implausible communication DTCs against the Radio?

      Yes

- Replace and program the Radio in accordance with the Service Information. Refer to **RADIO, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Using the schematics as a guide, check the IPC pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Instrument Cluster in accordance with the Service Information. Refer to **REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this module. Wiggle the wiring and connectors while checking for shorted and open circuits.
   3. Check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Check Service Bulletins for any possible causes that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Test complete.

U050A-00-IMPLAUSIBLE DATA RECEIVED FROM MEMORY SEAT CONTROL MODULE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously with the ignition on.

SET CONDITION

When the Instrument Cluster (IPC) receives an implausible (default/error value, toggle error or parity error) message from the Memory Seat Module (MSMD).

POSSIBLE CAUSES

Possible Causes
MEMORY SEAT MODULE (MSMD) DTCS PRESENT BODY CONTROL MODULE (BCM) DTCS PRESENT MEMORY SEAT MODULE INSTRUMENT CLUSTER

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, record and erase Instrument Cluster (IPC) DTCs.
    3. Cycle the ignition from off to on.
    4. With the scan tool, read IPC DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Go To 5
2. **CHECK FOR BODY CONTROL MODULE (BCM) DTCS**
    1. With the scan tool, read BCM DTCs.

    Are there any BCM CAN Bus DTCs present?

    Yes

    - Refer to the **BODY CONTROL MODULE (BCM) - DIAGNOSTIC CODE INDEX** article and perform the appropriate diagnostic procedure.

    No

    - Go To 3
3. **CHECK FOR MSMD DTCS**
    1. With the scan tool, read Memory Seat Module (MSMD) DTCs.

    Are there any MSMD DTCs present?

    Yes

    - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

No

- Go To 4

4. **CHECK OTHER MODULES FOR DTCS**
   1. With the scan tool, read DTCs.

      Are there any other modules reporting implausible communication DTCs against the MSMD?

      Yes

      - Replace and program the Memory Seat Module (MSMD) in accordance with the Service Information. Refer to **MODULE, MEMORY, SEAT, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Using the schematics as a guide, check the IPC pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Instrument Cluster in accordance with the Service Information. Refer to **REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this module. Wiggle the wiring and connectors while checking for shorted and open circuits.

   4. Check Service Bulletins for any possible causes that may apply.

      Were there any problems found?

      Yes

      - Repair as necessary.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Test complete.

U11B9-00-LOST COMMUNICATION WITH RF HUB

Perform the COMMUNICATION PRE-DIAGNOSTIC PROCEDURE. Refer to **STANDARD PROCEDURE** .

U11FA-00-LOST COMMUNICATION WITH RIGHT BLIND SPOT SENSOR

Perform the COMMUNICATION PRE-DIAGNOSTIC PROCEDURE. Refer to **STANDARD PROCEDURE** .

U11FB-00-LOST COMMUNICATION WITH LEFT BLIND SPOT SENSOR

Perform the COMMUNICATION PRE-DIAGNOSTIC PROCEDURE. Refer to **STANDARD PROCEDURE** .

U1215-00-LOST COMMUNICATION WITH FORWARD FACING CAMERA

Perform the COMMUNICATION PRE-DIAGNOSTIC PROCEDURE. Refer to **STANDARD PROCEDURE** .

U1216-00-LOST COMMUNICATION WITH DASM

Perform the COMMUNICATION PRE-DIAGNOSTIC PROCEDURE. Refer to **STANDARD PROCEDURE** .

NOTE: DASM is also referred to as the Adaptive Cruise Control (ACC) module.

U121F-00-LOST COMMUNICATION WITH SEATBELT REMINDER MODULE

Perform the COMMUNICATION PRE-DIAGNOSTIC PROCEDURE. Refer to **STANDARD PROCEDURE** .

U1464-00-IMPLAUSIBLE DATA RECEIVED FROM EPS STEERING TORQUE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously with the ignition on.

SET CONDITION

When the Instrument Cluster (IPC) receives an implausible (default/error value, toggle error or parity error) message from the Electronic Power Steering (EPS) module.

POSSIBLE CAUSES

Possible Causes
ELECTRONIC POWER STEERING (EPS) MODULE DTCS PRESENT
BODY CONTROL MODULE (BCM) DTCS PRESENT
ELECTRONIC POWER STEERING (EPS) MODULE

INSTRUMENT CLUSTER

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, record and erase Instrument Cluster (IPC) DTCs.
    3. Cycle the ignition from off to on.
    4. With the scan tool, read IPC DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Go To 5
2. **CHECK FOR BODY CONTROL MODULE (BCM) DTCS**
    1. With the scan tool, read BCM DTCs.

    Are there any BCM CAN Bus DTCs present?

    Yes

    - Refer to the **BODY CONTROL MODULE (BCM) - DIAGNOSTIC CODE INDEX** article and perform the appropriate diagnostic procedure.

    No

    - Go To 3
3. **CHECK FOR EPS DTCS**
    1. With the scan tool, read Electronic Power Steering (EPS) DTCs.

    Are there any EPS DTCs present?

    Yes

    - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

    No

    - Go To 4

4. **CHECK OTHER MODULES FOR DTCS**
   1. With the scan tool, read DTCs.

      Are there any other modules reporting implausible communication DTCs against the EPS?

      Yes

      - Replace and program the Electronic Power Steering (EPS) module in accordance with the Service Information. Refer to **GEAR, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Using the schematics as a guide, check the IPC pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Instrument Cluster in accordance with the Service Information. Refer to **REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
5. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this module. Wiggle the wiring and connectors while checking for shorted and open circuits.
   3. Check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Check Service Bulletins for any possible causes that may apply.

      Were there any problems found?

      Yes

      - Repair as necessary.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Test complete.

Possible Causes
RIGHT BLIND SPOT SENSOR (RBSS) MODULE DTCS PRESENT
BODY CONTROL MODULE (BCM) DTCS PRESENT
RIGHT BLIND SPOT SENSOR
INSTRUMENT CLUSTER

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, record and erase Instrument Cluster (IPC) DTCs.
    3. Cycle the ignition from off to on.
    4. With the scan tool, read IPC DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Go To 5
2. **CHECK FOR BODY CONTROL MODULE (BCM) DTCS**
    1. With the scan tool, read BCM DTCs.

    Are there any BCM CAN Bus DTCs present?

    Yes

    - Refer to the **BODY CONTROL MODULE (BCM) - DIAGNOSTIC CODE INDEX** article and perform the appropriate diagnostic procedure.

    No

    - Go To 3
3. **CHECK FOR RBSS DTCS**

1. With the scan tool, read Right Blind Spot Sensor (RBSS) DTCs.

   Are there any RBSS DTCs present?

   Yes

   - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

   No

   - Go To 4

4. **CHECK OTHER MODULES FOR DTCS**
   1. With the scan tool, read DTCs.

      Are there any other modules reporting implausible communication DTCs against the RBSS?

      Yes

      - Replace and program the Right Blind Spot Sensor (RBSS) in accordance with the Service Information. Refer to **SENSOR, BLIND SPOT, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Using the schematics as a guide, check the IPC pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Instrument Cluster in accordance with the Service Information. Refer to **REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this module. Wiggle the wiring and connectors while checking for shorted and open circuits.
   3. Check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Check Service Bulletins for any possible causes that may apply.

      Were there any problems found?

      Yes

      - Repair as necessary.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Test complete.

      - Test complete.

2014 ACCESSORIES AND EQUIPMENT

Instrument Cluster - Service Information - Cherokee

DESCRIPTION

DESCRIPTION

Fig. 1: Base Instrument Cluster with 3.5" EVIC
Courtesy of CHRYSLER GROUP, LLC

Fig. 2: Premium Instrument Cluster with 7" EVIC

Courtesy of CHRYSLER GROUP, LLC

The Instrument Cluster (IC) is also known as the Instrument Panel Cluster (IPC) for this vehicle. There are two distinct versions of the IPC offered in this vehicle: Base with 3.5 inch EVIC and Premium with 7 inch EVIC. The IPC is located in the instrument panel above the steering column opening, directly in front of the driver. The remainder of the IPC, including the mounts and the electrical connections are concealed within the instrument panel behind the cluster bezel. The IPC gauges and indicators are visible through a dedicated opening in the cluster bezel and are protected by a hard plastic cluster lens.

Besides analog gauges and indicators, the IPC incorporates an electronic display unit for displaying odometer/trip odometer information, automatic transmission gear selector position, several warning or reminder indications and certain diagnostic information as well as for the display of the optional Electronic Vehicle Information Center (EVIC) data. There are also unique versions of both the Base and Premium IPC, which accommodate the variations of regulatory requirements for the various markets where the vehicle will be offered.

The rear of the cluster housing and the IPC electronic circuitry are protected by a molded plastic housing and rear cover, which are secured to each other by integral latch features. The rear cover includes an integral lever-type connector receptacle, which is connected to the vehicle electrical system through a dedicated take out and connector from the instrument panel wire harness. The IPC housing also serves as the carrier for the IPC printed circuit board and electronic circuitry, the major and minor analog gauges, a Light Emitting Diode (LED) unit for each indicator, the electronic display unit, an audible tone transducer, several LED units for general illumination lighting and the cluster lens, mask and overlay. The cluster housing also has four integral mounting tabs, one near each upper and lower corner of the housing.

The cluster overlay is a laminated plastic unit. The dark, visible, outer surface of the overlay is marked with all of the analog gauge dial faces and graduations, but this layer is also translucent. The darkness of this outer layer prevents the cluster from appearing cluttered or busy by concealing the cluster indicators that are not illuminated. The translucence of this layer allows those indicators and icons that are illuminated to be readily visible. The underlying layer of the overlay is opaque and allows light from the LED unit for each of the various indicators and illumination lamps behind it to be visible through the outer layer of the overlay through predetermined stencil-like cutouts.

The microcontroller-based IPC utilizes integrated circuitry and digital information carried on the Controller Area Network (CAN) data bus along with hard wired analog inputs to monitor sensors and switches throughout the vehicle. In response to those inputs, the internal circuitry and programming of the IPC allow it to control and integrate many electronic functions and features of the vehicle through both hard wired outputs and the transmission of digital message outputs to other electronic modules in the vehicle over the CAN data bus. Refer to **COMMUNICATION, DESCRIPTION** .

The IPC is serviced only as a complete unit. It cannot be adjusted or repaired. If a gauge, an indicator, a display unit, the electronic printed circuit board, the circuit board hardware, the overlay, the mask, the lens or the housing are damaged or ineffective, the entire IPC must be replaced. The IPC software is flash programmable over the CAN data bus.

ELECTRONIC DISPLAY UNIT

An electronic display unit is a standard factory-installed feature in every IC. The odometer and trip odometer as well as many other indications are displayed in the electronic display unit. This display unit is soldered onto the IC electronic circuit board. There are two distinct versions of the IC offered in this vehicle: Base and Premium. The primary distinction between these two versions lies in the size and type of display used. The Base IC on vehicles with or without the optional EVIC has a monochrome, 4 line, dot matrix display unit. Meanwhile, the Premium IC has a color, 178 millimeter (7 inch) diagonal, Thin Film Transistor (TFT) display unit.

During daylight hours (exterior lamps are OFF) the electronic display unit is illuminated at full brightness for clear visibility. At night (exterior lamps are ON), the electronic display unit lighting level is adjusted with the other cluster general illumination lamps using the panel lamps dimmer thumbwheel of the dimmer module on the instrument panel to the left of the steering column. However, a PARADE mode position of the dimmer thumbwheel allows the display to be illuminated at full brightness if the exterior lamps are turned ON during daylight hours.

VEHICLE SYSTEMS SUPPORT

Besides typical gauge and indicator support, the electronic functions and features that the IC supports or controls include the following:

- **Audible Warnings Support** - The IC electronic circuit board is equipped with an audible tone transducer and programming that allows it to provide various audible alerts to the vehicle operator. These alerts include single chime tones and continuous slow or fast tones. An electromechanical relay is also soldered onto the circuit board to produce audible clicks that are used to emulate the sound of a conventional turn signal or hazard warning flasher. Refer to **DESCRIPTION** .
- **Compass/Temperature Support** - The premium IC provides support for each of the functions and features of the compass/temperature display, as well as for the odometer switch pod in the left horizontal spoke of the steering wheel, which provides user inputs to control the compass/temperature display options.
- **Electronic Vehicle Information Center Support** - On vehicles so equipped, the IC provides support for each of the functions and features of the Electronic Vehicle Information Center (EVIC) display. This includes support for the compass, thermometer and audio system mode, customer programmable features, textual warnings, premium Tire Pressure Monitor (TPM), trip computer, U-Connect™ Hands-Free communication and the switch inputs from the EVIC switch pod located in the left horizontal spoke of the steering wheel, which provides user inputs to control and configure many of the displays. This also includes display arbitrator programming, which controls the priorities, sequences and transition of information that is displayed in the EVIC display, particularly when multiple display requests are received simultaneously. Refer to **CENTER, ELECTRONIC VEHICLE INFORMATION, DESCRIPTION** .
- **Panel Lamps Dimming Control** - The IC monitors electronic **dimming level** messages received from the Body Control Module (BCM) over the CAN data bus, which is based upon a hard wired input to the BCM from the panel lamps dimmer thumbwheel of the dimmer module, then provides both a hard wired 12-volt Pulse-Width Modulated (PWM) output and electronic message outputs over the CAN data bus that synchronize the dimming level of all panel lamps dimmer controlled lamps with that of the IC general illumination lighting.

OPERATION

OPERATION

The Instrument Cluster (IC) (also known as the Instrument Panel Cluster/IPC) is designed to allow the vehicle operator to monitor the conditions of many of the vehicle components and operating systems. The gauges and indicators in the IC provide valuable information about the various standard and optional powertrains, fuel and emissions systems, cooling systems, lighting systems, safety systems and many other convenience items. The IC is installed in the instrument panel so that all of these monitors can be easily viewed by the vehicle operator when driving, while still allowing relative ease of access for service.

The microcontroller-based IC hardware and software uses various inputs to control the gauges and indicators visible on the face of the IC. These inputs are in the form of electronic messages that are transmitted by other electronic modules over the Controller Area Network (CAN) data bus. Refer to **COMMUNICATION, OPERATION** .

The IC microcontroller smooths the input data using algorithms to provide gauge readings that are accurate, stable and responsive to operating conditions. These algorithms are designed to provide gauge readings during normal operation that are consistent with customer expectations. However, when abnormal conditions such as high coolant temperature occur, the algorithm can drive the gauge pointer to an extreme position and the microcontroller can sound an audible alert through the on-board audible tone transducer to provide distinct visual and audible indications of a problem to the vehicle operator. The IC may also produce audible warnings on behalf of other electronic modules in the vehicle based upon electronic **tone request** messages received over the CAN data bus. Each audible warning is intended to provide the vehicle operator with an audible alert to supplement a visual indication.

The IC circuitry operates on battery current received through a fused B(+) fuse on a non-switched fused B(+) circuit, and on battery current received through a fused ignition output (run) fuse on a fused ignition output (run) circuit. This arrangement allows the IC to provide some features regardless of the status of the ignition switch, while other features will operate only when the status of the ignition switch is ON. The IC circuitry has a path to ground at all times through a takeout of the instrument panel wire harness that is secured to the instrument panel support structure.

The Body Control Module (BCM) stores and compares vehicle configuration data with the IC as well as with other Electronic Control Units (ECU) in the vehicle. This process is referred to as Programming Of Configuration of Systems Integrated (PROCSI) (also known as PROXI). If a configuration mismatch is detected, the BCM sets a Diagnostic Trouble Code (DTC). A configuration mismatch will require the performance of a Restore BCM PROXI Configuration routine, or a PROXI Configuration Alignment routine using a diagnostic scan tool.

NOTE: The odometer value on the IC will blink if there is any PROXI mismatch between different modules.

The IC also has a self-diagnostic test capability which will test each of the CAN bus message-controlled functions of the IC by lighting the appropriate indicators, positioning the gauge needles at several predetermined calibration points across the gauge faces and illuminating all segments of the electronic display unit. The electronic display unit will also display the software version used in the IC. Refer to **DIAGNOSIS AND TESTING**.

ELECTRONIC DISPLAY UNIT

When the status of the ignition switch is OFF, the electronic display unit is inactive and the total odometer information is displayed only when the driver side front door is open and is deactivated when the driver side front door is closed. Otherwise, the display unit is only active and the total odometer information is only displayed when the status of the ignition switch is ON/RUN or Accessory (ACC), and is inactive when the status of the ignition switch is OFF.

- **Odometer/Trip Odometer Display Toggling** - Momentarily actuating the appropriate push button within the odometer switch pod (in vehicles equipped with base instrument clusters) or the EVIC switch pod (in vehicles equipped with premium instrument clusters) with the electronic display unit active, will toggle the display between the total odometer and trip odometer information.
- **Trip Odometer Reset** - Actuating the appropriate push button within the odometer switch pod (in vehicles with base cluster) or the EVIC switch pod (in vehicles equipped with premium cluster) for longer than about two seconds while the status of the ignition switch is ON will reset the active trip odometer (A or B) to **0.0** kilometers (miles). Only the trip odometer information being currently displayed (active) will be reset.
- **Communication Error** - If the IC fails to receive an electronic **distance** message during normal operation, it will hold and display the last data received until the status of the ignition switch is OFF. If the IC does not receive a **distance** message within one second after the ignition switch status transitions to ON, it will display the last distance value stored in IC memory. If the IC is unable to display distance information due to an error internal to the IC, the electronic display unit will display **Error** .
- **Self Test** - Each time the IC is put through the self diagnostics test, the electronic display unit will illuminate all of its segments simultaneously to confirm the functionality of the display and the IC control circuitry.

CLUSTER ILLUMINATION

The IC has several Light-Emitting Diode (LED) units that serve as general illumination lighting for the IC. These LED units are illuminated whenever the exterior lighting is turned ON. The illumination intensity of these LED units is adjusted when the panel dimmer thumbwheel on the dimmer module is rotated (down to dim, up to brighten) to one of six available minor detent positions.

The Body Control Module (BCM) monitors a hard wired resistor multiplexed input from the dimmer module on a dimmer input circuit. In response to that input, the BCM sends an electronic **dimming level** message to the IC over the CAN data bus. The electronic circuitry of the IC then converts a fused 12-volt input it receives into a 12-volt Pulse Width Modulated (PWM) output. The IC uses this PWM output to control the illumination intensity of the general illumination of the IC and provides a hard wired PWM output to other components on the instrument panel and within the vehicle interior to control and synchronize their illumination intensity.

In addition, the thumbwheel on the dimmer module has a Parade Mode position to provide a parade or funeral mode. The BCM monitors the request for this mode from the dimmer module, then transmits an electronic **dimming level** message to illuminate all electronic display units in the vehicle at full (daytime) intensity for easier visibility when driving in daylight with the exterior lighting turned ON.

The hard wired headlamp switch and panel lamps dimmer inputs to and outputs from the BCM may be diagnosed using conventional diagnostic methods. However, proper testing of the PWM processing of the IC

and the electronic **dimming level** messages sent by the BCM over the CAN data bus requires the use of a diagnostic scan tool. Refer to **DIAGNOSIS AND TESTING** .

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - INSTRUMENT CLUSTER

If all of the instrument cluster gauges and indicators are inoperative, be certain to check the instrument cluster fused B(+) fuse and the instrument cluster fused B(+) and ground circuits for shorts or opens. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

If an individual hard wired gauge or indicator is inoperative, refer to the diagnosis and testing service information for that specific gauge or indicator. If an individual Controller Area Network (CAN) or Local Interconnect Network (LIN) data bus message-controlled gauge or indicator is inoperative, perform the Actuator Test as follows:

CAUTION: Instrument clusters used in this model automatically configure themselves for compatibility with the features and optional equipment in the vehicle in which they are initially installed. The instrument cluster is programmed to do this by embedding the Vehicle Identification Number (VIN) and other information critical to proper cluster operation into electronic memory. This embedded information is learned through electronic messages received from other electronic modules in the vehicle over the Controller Area Network (CAN) data bus, and through certain hard wired inputs received when the cluster is connected to the vehicle electrically. Once configured, the instrument cluster memory may be irreparably damaged and certain irreversible configuration errors may occur if the cluster is connected electrically to another vehicle; or, if an electronic module from another vehicle is connected that provides data to the instrument cluster (including odometer values) that conflicts with that which was previously learned and stored. Therefore, the practice of exchanging (swapping) instrument clusters and other electronic modules in this vehicle with those removed from another vehicle must always be avoided. Failure to observe this caution may result in instrument cluster damage, which is not reimbursable under the terms of the product warranty. Service replacement instrument clusters are provided with the correct VIN, and the certified odometer and engine hours values embedded into cluster memory, but will otherwise be automatically configured for compatibility with the features and optional equipment in the vehicle in which they are initially installed.

SELF TEST

The self-diagnostic test will put the instrument cluster into its self-diagnostic mode. In this mode the instrument

cluster can perform a self-diagnostic test that will confirm that the circuitry, the gauges and the indicators are capable of operating as designed. During the test the IC circuitry will position each of the gauge needles at various calibration points, illuminate each of the segments in the electronic display unit, and turn all of the indicators ON and OFF again.

Successful completion of the actuator test will confirm that the instrument cluster is operational. However, there may still be a problem with the CAN/LIN data bus, the Powertrain Control Module (PCM), the Body Control Module (BCM), the Transmission Control Module (TCM), the Occupant Restraint Controller (ORC), the Controller Anti-lock Brake (CAB), the compass module, the RF Hub (RFHM) or the hard wired inputs to one of these electronic control modules. Use a diagnostic scan tool to diagnose these components. Refer to the appropriate diagnostic information.

1. Begin the test with the ignition switch in the Off position.
2. Depress the "DOWN" button with a premium cluster or the "RIGHT" button with a base cluster.
3. While still holding the button, position the ignition switch to the Accessory (ACC) position, but do not start the engine.
4. Release the "DOWN" or the "RIGHT" button.
5. The instrument cluster will simultaneously begin to illuminate all of the operational segments in the VFD unit and perform a bulb check of each operational LED indicator. The VFD segments and LED indicators remain illuminated as each gauge needle is swept to several calibration points and back. During this self-diagnostic test, the software level will be displayed. If a VFD segment or an LED indicator fails to illuminate, or if a gauge needle fails to sweep through the calibration points and back during this test, the instrument cluster must be replaced.
6. The actuator test is now completed. The instrument cluster will automatically exit the self-diagnostic mode and return to normal operation at the completion of the test. The actuator test will be aborted if the ignition switch is changed to the Off position, or if a vehicle speed message indicating that the vehicle is moving is received from the PCM over the CAN data bus during the test.

STANDARD PROCEDURE

STANDARD PROCEDURE - ENHANCED SEATBELT REMINDER PROGRAMMING

The seatbelt indicator also includes a programmable enhanced seatbelt reminder or "beltminder" feature that is enabled when the vehicle is shipped from the factory. This beltminder feature provides extended and modified visual seatbelt indicator and audible chime warning responses to an unbuckled driver side or both driver and passenger front seat belts. For further information on the description and operation of the "beltminder" feature, refer to **DESCRIPTION** or **OPERATION** . The beltminder feature may be disabled or enabled by the customer using the programming sequence that follows, or by the dealer using a diagnostic scan tool.

CUSTOMER PROGRAMMING SEQUENCE

NOTE: The following sequence of events must occur within sixty (60) seconds of the ignition switch being placed in the On position in order for the programming to be completed successfully. Even if the vehicle is equipped with both driver and passenger side front seat belt switches, this programming sequence MUST be

performed using the driver side front seat belt. The passenger side front seat belt switch has no programming functionality. Perform the steps again for reactivation.

1. With all doors closed and the ignition switch in the off position, buckle the driver side front seat belt.
2. Turn the ignition switch to the On position and wait for the seat belt indicator reminder function to conclude (about six seconds).
3. Unbuckle and buckle the driver side front seat belt three or more times, ending with the belt buckled.

NOTE: The occupant must be sure to fully retract the seat belt each time during this cycle because the actual switch is located in the seat belt retractor and not the buckle. Each time the seat belt is buckled or unbuckled, and fully retracted, the seat belt indicator will illuminate or turn OFF, depending on switch state.

4. Turn the ignition switch to the off position. A single chime tone will provide an audible confirmation that the programming sequence has been successfully completed.

NOTE: In exclusion mode (Seat belt reminder deactivated) the tell tale works like before but the acoustic portion of the seat belt reminder alert is disabled.

REMOVAL

REMOVAL

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

CLUSTER ASSEMBLY

1. Disconnect and isolate the negative battery cable.

Fig. 3: Instrument Cluster Bezel
Courtesy of CHRYSLER GROUP, LLC

2. Remove the instrument cluster bezel (1). Refer to **BEZEL, INSTRUMENT CLUSTER, REMOVAL** .

Fig. 4: Upper & Lower Fasteners
Courtesy of CHRYSLER GROUP, LLC

3. Remove the two upper (1) and the two lower (2) fasteners securing the instrument cluster to the instrument panel.
4. Pull the top of the instrument cluster back and lift the instrument cluster upward to remove.

Fig. 5: Instrument Cluster Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

5. Disconnect the instrument cluster wire harness connector (1) from the connector receptacles on the back of the cluster housing.

Fig. 6: Instrument Cluster
Courtesy of CHRYSLER GROUP, LLC

6. Remove the instrument cluster (1) from the vehicle.

CLUSTER LENS

1. Disconnect and isolate the negative battery cable.
2. Remove the instrument cluster from the instrument panel .

Fig. 7: Instrument Cluster & Lens
Courtesy of CHRYSLER GROUP, LLC

3. Working around the perimeter of the cluster housing, disengage each of the latches that secure the cluster lens (2), to the instrument cluster housing (1).
4. Remove the lens from the face of the instrument cluster.

INSTALLATION

INSTALLATION

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

NOTE: Certain indicators in this instrument cluster are automatically configured. This feature allows those indicators to be activated or deactivated for compatibility

with certain optional equipment. If a problem is noted that involves improper illumination of an indicator, disconnect and isolate the battery negative cable. After about five minutes, reconnect the battery negative cable and turn the ignition switch to the ON position. The instrument cluster should automatically relearn the equipment in the vehicle and properly configure the configurable indicators accordingly.

CLUSTER ASSEMBLY

1. Make sure the steering column is at its lowest position.

Fig. 8: Instrument Cluster
Courtesy of CHRYSLER GROUP, LLC

2. Position the instrument cluster (1) close enough to the instrument panel to connect the instrument panel wire harness connector to the receptacle on the back of the cluster housing.

Fig. 9: Instrument Cluster Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

3. Connect the instrument cluster wire harness connector (1) to the receptacle on the back of the instrument cluster housing.
4. Position the instrument cluster down into instrument panel bottom end first, aligning the mounting tabs.
5. Tilt the top of the instrument cluster forward until the upper mounting hole align with the upper fastener clip in the instrument panel.

Fig. 10: Upper & Lower Fasteners
Courtesy of CHRYSLER GROUP, LLC

6. Install and tighten the two lower (2) and the two upper (1) fasteners that secure the instrument cluster to the instrument panel.

Fig. 11: Instrument Cluster Bezel
Courtesy of CHRYSLER GROUP, LLC

7. Install the instrument cluster bezel (1). Refer to **BEZEL, INSTRUMENT CLUSTER, INSTALLATION** .
8. Connect the negative battery cable.

NOTE: **If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu. Once the PROXI Configuration has been completed, tire pressure placard values must be programmed in the RF Hub under "Update Front and Rear Axle Nominal Tire Pressure Values". If this routine is not completed, the new Instrument Cluster will display "0 PSI" for tire pressure values as default. (Refer to PROGRAM THE IPC (INSTRUMENT PANEL CLUSTER)).**

CLUSTER LENS

Fig. 12: Instrument Cluster & Lens
Courtesy of CHRYSLER GROUP, LLC

1. Position the cluster lens (2), over the face of the instrument cluster (1).
2. Press firmly and evenly on the lens, until each of the latches are fully engaged around the perimeter of the cluster housing.
3. Install the instrument cluster into the instrument panel .
4. Connect the negative battery cable.

GAUGE PACK, INSTRUMENT CLUSTER

DESCRIPTION

DESCRIPTION

Both the Base and the Premium Instrument Cluster (IC) (also known as the Instrument Panel Cluster/IPC) include analog gauges as well as a digital odometer - trip odometer display, which appears within the electronic display unit for that IC. Textual messages and digital displays, some accompanied by virtual icons may appear in the electronic display unit when appropriate to supplement certain analog gauges in either IC.

Analog gauge illumination is provided by dimmer controlled Light Emitting Diode (LED) units soldered onto the IC electronic circuit board. The analog gauge needles have internal optical illumination. Electronic display unit lighting is also dimmer controlled unless the Parade mode has been selected with the thumbwheel of the dimmer module, or unless certain indicators are active within the display. Whether analog, digital or virtual the gauges are all serviced only as a unit with the IC.

Fig. 13: Tachometer, Engine Temperature Gauge, Fuel Gauge & Speedometer (Base)
Courtesy of CHRYSLER GROUP, LLC

The Base IC for this vehicle includes the following analog gauges:

- **Tachometer (1)**
- **Engine Temperature Gauge (2)**
- **Fuel Gauge (3)**
- **Speedometer (4)**

Fig. 14: Tachometer, Engine Temperature Gauge, Fuel Gauge & Speedometer (Premium)

Courtesy of CHRYSLER GROUP, LLC

The Premium IC for this vehicle includes the following analog gauges:

- **Tachometer (1)**
- **Engine Temperature Gauge (2)**
- **Fuel Gauge (3)**
- **Speedometer (4)**

TACHOMETER

An analog tachometer is standard equipment. The gauge is located at the far left side of the IC overlay. The tachometer in the Base IC consists of a movable gauge needle or pointer controlled by the IC circuitry and a fixed 200 degree scale on the gauge dial face that reads left-to-right from **0** to **7** . On the Premium IC the tachometer consists of a movable gauge needle controlled by the IC circuitry and a fixed 185 degree scale on the gauge dial face that also reads left-to-right from **0** to **7** . The text **RPM X 1000** imprinted on the cluster overlay identifies that each number on the tachometer scale is to be multiplied by 1000 rpm.

SPEEDOMETER

Standard equipment on all instrument clusters, the speedometer is located to the right of center in the instrument cluster. The speedometer consists of a movable gauge needle or pointer controlled by the instrument cluster circuitry and a fixed 210 degree primary scale on the gauge dial face. For all vehicles the speedometer reads left-to-right either from **0** to **120** mph, or from **0** to **220** km/h, depending upon the market for which the vehicle is manufactured. Each version also has a secondary inner scale on the gauge dial face that provides the equivalent opposite units from the primary scale. On all vehicles, text appearing on the cluster overlay above the hub of the speedometer needle abbreviates the unit of measure for the primary scale (either **MPH** or **km/h**), and text inside the low end of the secondary scale indicates the unit of measure for that scale.

ENGINE TEMPERATURE

The standard equipment engine temperature gauge is located in the instrument cluster near center. The gauge consists of a movable gauge needle or pointer controlled by the IC circuitry and a fixed 90 degree gauge scale on the IC overlay that reads from **C** (or Cold) to **H** . An International Control and Display Symbol icon for **Engine Coolant Temperature** is located on the gauge face, near the low end of the scale. For more information, refer to **INTERNATIONAL VEHICLE CONTROL AND DISPLAY SYMBOLS, DESCRIPTION** .

FUEL GAUGE

A fuel gauge is standard equipment on all instrument clusters. This gauge consists of a movable gauge needle or pointer controlled by the instrument cluster circuitry and a fixed 90 degree scale on the cluster overlay that reads left-to-right from **E** (or Empty) to **F** (or Full).

OPERATION

OPERATION

All analog gauges in the Base and the Premium Instrument Cluster (IC) (also known as the Instrument Panel Cluster/IPC) receive battery current on the IC printed circuit board only when the status of the ignition switch is ON. When status of the ignition switch is OFF, battery current is not supplied to any gauges and the IC is programmed to move all of the gauge needles back to the low end of their respective scales. Therefore, the gauges do not accurately indicate any vehicle condition unless the status of the ignition switch is ON.

Each of the analog IC gauges contains an electronically controlled stepper motor unit. The IC circuitry completely controls the activation and deactivation of these stepper motors to position each gauge needle in the appropriate position based upon IC programming and electronic messages received from other electronic modules in the vehicle over the Controller Area Network (CAN) data bus.

The analog gauges are diagnosed using the self-diagnostic IC actuator test. Proper testing of the CAN data bus and the electronic message inputs that the IC uses to control each gauge requires the use of a diagnostic scan tool. Refer to **DIAGNOSIS AND TESTING** .

INDICATORS, INSTRUMENT CLUSTER

DESCRIPTION

BASE

The instrument cluster assembly has provisions for International Control and Display Symbol icon indicators, as well as three analog gauges standard on all models. Refer to **GAUGE PACK, INSTRUMENT CLUSTER, DESCRIPTION**. Some of the indicators are automatically configured when connected to the vehicle electrical system for compatibility with certain optional equipment or equipment required for regulatory purposes in certain markets. While each instrument cluster may have provisions for indicators to support every available option, the configurable indicators will not function in vehicles that do not have the equipment that an indicator supports.

Fig. 15: Instrument Cluster Indicators (Base)
Courtesy of CHRYSLER GROUP, LLC

The instrument cluster includes provisions for the following indicators:

- **Airbag Indicator**
- **Antilock Brake System (ABS) Indicator**
- **Brake Indicator** - may include icon and **LOW BRAKE FLUID LEVEL** textual message in electronic display.
- **Change Oil Indicator** - textual message in electronic display (vehicles manufactured for domestic markets only).
- **Charging Indicator** - icon and textual message in electronic display.
- **Check Gauges Indicator** - textual message in electronic display.
- **Coolant Low Indicator** - icon and textual message in electronic display (diesel only).
- **Cruise Indicator** - icons and textual messages in electronic display.
- **Door Ajar Indicator(s)** - icons and textual messages in electronic display.
- **Electronic Stability Control (ESC) Indicator**
- **Electronic Throttle Control (ETC) Indicator** - icon and textual message in electronic display.
- **Engine Temperature Indicator**
- **ESC Off Indicator** - and textual message in electronic display.
- **Four-Wheel Drive Low Indicator** - may include **CHECK SHIFT PROCEDURE** textual message in electronic display.
- **Front Fog Lamp Indicator**
- **Fuel Saver Indicator - Economizer (ECO)** - icons and textual messages in electronic display.
- **Gas Cap Indicator** - textual message in electronic display.
- **High Beam Indicator**
- **Hill Descent Indicator**
- **Liftgate Ajar Indicator** - icon and textual message in electronic display.
- **Liftgate Flip-Up Glass Ajar Indicator** - icon and textual message in electronic display.
- **Low Fuel Indicator** .
- **Low Oil Pressure Indicator** - icon and textual message in electronic display.
- **Malfunction Indicator Lamp (MIL)**
- **Memory System Indicator** - textual messages in electronic display.
- **No Bus Indicator** - textual message in electronic display.
- **No Fuse Indicator** - textual message in electronic display.
- **Park Assist Disabled Indicator** - textual message in electronic display (if equipped only).
- **Perform Service Indicator** - textual message in electronic display (diesel only).
- **Position Lamp Indicator** - vehicles manufactured for certain export markets only.
- **Power Liftgate Indicator** - textual messages in electronic display (if equipped only).

- **Rear Fog Lamp Indicator** - vehicles manufactured for certain export markets only.
- **Remote Start Indicator** - textual messages in electronic display (if equipped only).
- **Seat Belt Indicator**
- **Security Indicator**
- **Service 4WD Indicator** - textual message in electronic display.
- **Service Column Lock Indicator** - textual messages in electronic display (vehicles manufactured for certain export markets only).
- **Service Exhaust Indicator** - textual messages in electronic display (diesel only).
- **Service Park Assist Indicator** - textual message in electronic display (if equipped only).
- **SmartBeam™ (Auto High Beam) Indicator** - textual message in electronic display (if equipped only).
- **Tire Pressure Monitor (TPM) Indicator** - may also include textual messages in electronic display.
- **Tow / Haul Indicator**
- **Transmission Range Indicator** - textual message in electronic display.
- **Transmission Temperature Indicator** - icon and textual message in electronic display.
- **Turn Signal (Right and Left) Indicators** - may also include icon and **TURN SIGNAL ON** reminder textual message in electronic display (12).
- **Washer Fluid Indicator** - icon and textual message in electronic display.

Each indicator in the instrument cluster, except those located within an electronic display unit, is illuminated by a dedicated Light Emitting Diode (LED) that is soldered onto the electronic circuit board. Cluster illumination is accomplished by several dimmable LED units, which illuminate each of the gauge dial faces for visibility when the exterior lighting is turned ON. These LED units are serviced only as a complete unit with the instrument cluster and, if damaged or ineffective, the entire instrument cluster assembly must be replaced. The cluster lens and the cluster hood and mask unit are the only components of the instrument cluster assembly that can be serviced separately.

PREMIUM

The instrument cluster assembly has provisions for International Control and Display Symbol icon indicators, as well as three analog gauges standard on all models. Refer to **GAUGE PACK, INSTRUMENT CLUSTER, DESCRIPTION**. Some of the indicators are automatically configured when connected to the vehicle electrical system for compatibility with certain optional equipment or equipment required for regulatory purposes in certain markets. While each instrument cluster may have provisions for indicators to support every available option, the configurable indicators will not function in vehicles that do not have the equipment that an indicator supports.

Fig. 16: Instrument Cluster Indicators (Premium)
Courtesy of CHRYSLER GROUP, LLC

The instrument cluster includes provisions for the following indicators:

- **Airbag Indicator**
- **Antilock Brake System (ABS) Indicator**
- **Brake Indicator** - may include icon and **LOW BRAKE FLUID LEVEL** textual message in electronic display.
- **Change Oil Indicator** - textual message in electronic display (vehicles manufactured for domestic markets only).
- **Charging Indicator** - icon and textual message in electronic display.
- **Check Gauges Indicator** - textual message in electronic display.
- **Coolant Low Indicator** - icon and textual message in electronic display (diesel only).
- **Cruise Indicator** - icons and textual messages in electronic display.
- **Door Ajar Indicator(s)** - icons and textual messages in electronic display.
- **Electronic Stability Control (ESC) Indicator**
- **Electronic Throttle Control (ETC) Indicator** - icon and textual message in electronic display (21).
- **Engine Temperature Indicator**
- **ESC Off Indicator** - and textual message in electronic display.
- **Four-Wheel Drive Low Indicator** - may include **CHECK SHIFT PROCEDURE** textual message in electronic display.
- **Front Fog Lamp Indicator**
- **Fuel Saver Indicator - Economizer (ECO)** - icons and textual messages in electronic display (21).
- **Gas Cap Indicator** - textual message in electronic display.

- **High Beam Indicator**
- **Hill Descent Indicator**
- **Liftgate Ajar Indicator** - icon and textual message in electronic display.
- **Liftgate Flip-Up Glass Ajar Indicator** - icon and textual message in electronic display.
- **Low Fuel Indicator** .
- **Low Oil Pressure Indicator** - icon and textual message in electronic display.
- **Malfunction Indicator Lamp (MIL)**
- **Memory System Indicator** - textual messages in electronic display.
- **No Bus Indicator** - textual message in electronic display.
- **No Fuse Indicator** - textual message in electronic display (22).
- **Park Assist Disabled Indicator** - textual message in electronic display (if equipped only).
- **Perform Service Indicator** - textual message in electronic display (diesel only).
- **Position Lamp Indicator** - vehicles manufactured for certain export markets only.
- **Power Liftgate Indicator** - textual messages in electronic display (if equipped only).
- **Rear Fog Lamp Indicator** - vehicles manufactured for certain export markets only.
- **Remote Start Indicator** - textual messages in electronic display (if equipped only).
- **Seat Belt Indicator**
- **Security Indicator**
- **Service 4WD Indicator** - textual message in electronic display.
- **Service Column Lock Indicator** - textual messages in electronic display (vehicles manufactured for certain export markets only).
- **Service Exhaust Indicator** - textual messages in electronic display (diesel only).
- **Service Park Assist Indicator** - textual message in electronic display (if equipped only).
- **SmartBeam™ (Auto High Beam) Indicator** - textual message in electronic display (if equipped only).
- **Tire Pressure Monitor (TPM) Indicator** - may also include textual messages in electronic display.
- **Tow / Haul Indicator**
- **Transmission Range Indicator** - textual message in electronic display.
- **Transmission Temperature Indicator** - icon and textual message in electronic display.
- **Turn Signal (Right and Left) Indicators** - may also include icon and **TURN SIGNAL ON** reminder textual message in electronic display (12).
- **Washer Fluid Indicator** - icon and textual message in electronic display.

Each indicator in the instrument cluster, except those located within an electronic display unit, is illuminated by a dedicated Light Emitting Diode (LED) that is soldered onto the electronic circuit board. Cluster illumination is accomplished by several dimmable LED units, which illuminate each of the gauge dial faces for visibility when the exterior lighting is turned ON. These LED units are serviced only as a complete unit with the instrument cluster and, if damaged or ineffective, the entire instrument cluster assembly must be replaced. The cluster lens and the cluster hood and mask unit are the only components of the instrument cluster assembly that can be serviced separately.

OPERATION

OPERATION

Indicators are located in various positions within the Instrument Cluster (IC) (also known as the Instrument Panel Cluster/IPC) and are all connected to the electronic circuit board of the IC. Some indicators operate based upon hard-wired inputs to the IC, but most are controlled by Controller Area Network (CAN) data bus messages from other electronic modules in the vehicle. If the IC loses CAN data bus communication, the IC circuitry will automatically turn on the Malfunction Indicator Lamp (MIL) until CAN data bus communication is restored.

The various IC indicators are controlled by different strategies; some require fused ignition output to the IC circuitry and have a switched ground, while others are grounded through the IC circuitry and have a switched battery feed. However, all indicators are completely controlled by the IC microprocessor based upon various hard-wired and electronic message inputs. A few, non-critical indicators are dimmable, but most indicators are illuminated at a fixed intensity, which is not affected by the selected illumination intensity of the IC general illumination Light Emitting Diode (LED) units. The illumination intensity of the dimmable indicators is synchronized with that of the general illumination lighting.

In addition, certain indicators in this IC are automatically or self-configured. This feature allows the configurable indicators to be enabled by the IC circuitry for compatibility with certain optional equipment. These indicators are enabled or disabled by an electronic **configuration** message sent to the IC by the Body Control Module (BCM). The defaults for some indicators may be enabled, and these configuration settings must be programmatically disabled in the BCM using a diagnostic scan tool for vehicles that do not have the equipment the indicator supports. The automatically or self-configured indicators remain latent in each IC at all times and will be active only when the IC receives the appropriate CAN bus message inputs for that optional system or equipment.

The hard-wired indicator inputs may be diagnosed using conventional diagnostic tools and procedures. However, the IC circuitry and electronic CAN data bus message controlled indicators are diagnosed using the self-diagnostic test. Proper testing of the CAN data bus and the electronic data bus message inputs to the IC that control each indicator requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information. Specific details of the operation for each indicator may be found elsewhere in this service information.

AIRBAG INDICATOR

The airbag indicator gives an indication to the vehicle operator when the airbag system, or a circuit or component of the system is ineffective. The airbag indicator is controlled by a transistor on the IC circuit board based upon programming and electronic messages received by the IC from the Occupant Restraint Controller (ORC) over the CAN data bus. The IC will illuminate the airbag indicator for about six seconds as a bulb test each time the ignition switch status transitions to ON.

The airbag indicator LED is completely controlled by the IC logic circuit, and that logic will only allow this indicator to operate when the IC receives a battery current input on the fused ignition output (run-start) circuit. Therefore, the LED will always be OFF when the ignition switch status is anything except ON or START. The LED only illuminates when it is provided a path to ground by the IC transistor. The IC will turn ON the airbag indicator for the following reasons:

- **Airbag Indicator Lamp-On Message** - Each time the IC receives an electronic **airbag indicator lamp-on** message from the ORC, the airbag indicator will be illuminated. The indicator remains illuminated for about thirty seconds or until the IC receives a lamp-off message from the ORC, whichever is longer. This indicator will also be extinguished when the ignition switch status transitions to OFF.
- **Communication Error** - If the IC receives no lamp-ON or lamp-OFF messages from the ORC for 10 consecutive message cycles, the airbag indicator is illuminated. The indicator remains illuminated until the IC receives a single lamp-OFF message from the ORC.

The ORC continually monitors the airbag system circuits and sensors to decide whether the system is in good operating condition. The ORC then sends the proper electronic **airbag indicator lamp-on** or **lamp-off** message to the IC. If the ORC sends a lamp-on message after the bulb test, it indicates that the ORC has detected a system malfunction or that the airbags and seat belt tensioners may not deploy when required, or may deploy when not required. The ORC will store a DTC for any malfunction it detects. Each time the airbag indicator fails to illuminate due to an open or short in the IC airbag indicator circuit, the IC sends a message notifying the ORC of the condition, then the IC and the ORC will each store a DTC.

For proper diagnosis of the airbag system, the ORC, the IC, the CAN data bus or the electronic communication related to airbag indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

AJAR INDICATORS

The ajar indicators give an indication to the vehicle operator that one or more of the passenger compartment doors or the deck lid may be open or not completely latched. These indicators are controlled by a transistor on the IC circuit board based upon programming and electronic messages received by the IC from the Body Control Module (BCM) over the CAN data bus. The BCM monitors hard-wired inputs from the door and deck lid ajar switches.

The ajar indicator function of the electronic display unit is completely controlled by the IC logic circuit, and that logic will only allow this indicator to operate when the IC receives a battery current input on the fused B(+) circuit. The ajar indications can occur regardless of the ignition switch position. The IC will turn ON an ajar indicator for the following reasons:

- **Ajar Indicator Lamp-On Message** - Each time the IC receives an electronic **door ajar indicator lamp-on** or **deck lid ajar indicator lamp-on** message from the BCM indicating that a door or the deck lid or a combination of these is open or not completely latched, the appropriate ajar textual message and icons will be illuminated. If the IC detects a vehicle speed input greater than 8 km/h (5 mph) while the ignition switch status is ON or START, the ajar indication will be accompanied by a single chime tone. All door ajar indications will remain on as long as the cluster is awake.

The ajar switches on the door and deck lid latch mechanisms provide hard-wired ground inputs to the BCM circuitry through the ajar switch sense circuits whenever a door or the deck lid is open or not completely latched. The BCM continually monitors the door and deck lid ajar switches to determine the status of the doors and deck lid, then sends the proper electronic **ajar indicator lamp-on** or **lamp-off** message to the IC.

The hard wired ajar switch inputs to the BCM may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. For proper diagnosis of the BCM, the IC, the CAN

data bus or the electronic communication related to ajar indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

ANTILOCK BRAKE SYSTEM INDICATOR

The Antilock Brake System (ABS) indicator gives an indication to the vehicle operator when the ABS system, or a circuit or component of the system is ineffective. This indicator is controlled by a transistor on the IC circuit board based upon programming and electronic messages received by the IC from the Braking System Module (BSM) over the CAN data bus. The IC will illuminate the ABS indicator for about five seconds as a bulb test each time the ignition switch status transitions to ON.

The ABS indicator LED is completely controlled by the IC logic circuit, and that logic will only allow this indicator to operate when the IC receives a battery current input on the fused ignition output (run-start) circuit. Therefore, the LED will always be OFF when the ignition switch status is anything except ON or START. The LED only illuminates when it is provided a path to ground by the IC transistor. The IC will turn ON the ABS indicator for the following reasons:

- **ABS Indicator Lamp-On Message** - Each time the cluster receives an electronic **ABS indicator lamp-on** message from the BSM, the ABS indicator will be illuminated. The indicator remains illuminated until the IC receives a lamp-off message from the BSM, or until the ignition switch status transitions to OFF, whichever occurs first.
- **Communication Error** - If the IC receives no lamp-on or lamp-off messages from the BSM for five consecutive message cycles, the ABS indicator is illuminated. The indicator remains illuminated until the IC receives a valid message from the BSM, or until the ignition switch status transitions to OFF, whichever occurs first.
- **ABS Diagnostic Test** - The ABS indicator is blinked ON and OFF by lamp-on and lamp-off messages from the BSM during the performance of the ABS diagnostic tests.

The BSM continually monitors the ABS circuits and sensors to decide whether the system is in good operating condition. The BSM then sends the proper electronic **ABS indicator lamp-on** or **lamp-off** message to the IC. If the BSM sends a lamp-on message after the bulb test, it indicates that the BSM has detected a system malfunction or that the ABS system has become ineffective. The BSM will store a DTC for any malfunction it detects. Each time the ABS indicator fails to light due to an open or short in the IC ABS indicator circuit, the IC sends a message notifying the BSM of the condition, then the IC and the BSM will each store a DTC and the IC will flash the brake indicator ON and OFF as a backup to notify the vehicle operator.

For proper diagnosis of the anti-lock brake system, the BSM, the IC, the CAN data bus or the electronic communication related to ABS indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

BRAKE/PARK BRAKE INDICATOR

The brake indicator gives an indication to the vehicle operator when the parking brake is applied, when there are certain brake hydraulic system malfunctions as indicated by a low brake hydraulic fluid level condition or when the brake fluid level switch is disconnected. The brake indicator can also give an indication when certain faults are detected in the Antilock Brake System (ABS). This indicator is controlled by the IC logic circuit board based upon programming and electronic messages received by the IC from the CAB or the Body Control

Module (BCM) over the CAN data bus. The IC will illuminate the brake indicator for about three seconds as a bulb test each time the ignition switch status transitions to ON.

The brake indicator is completely controlled by the IC logic circuit, and that logic will only allow this indicator to operate when the IC receives a battery current input on the fused ignition output (run-start) circuit. Therefore, the brake indicator will always be OFF when the ignition switch status is anything except ON or START. The IC will turn ON the brake indicator for the following reasons:

- **Brake Indicator Lamp-On Message** - Each time the IC receives an electronic **brake indicator lamp-on** message from the CAB, the brake indicator will be illuminated. The CAB may also send lamp-on messages as feedback during ABS diagnostic procedures. The indicator remains illuminated until the IC receives a lamp-off message from the CAB or until the ignition switch status transitions to OFF, whichever occurs first.
- **Low Brake Fluid Textual Warning Message** - When the CAB detects a low brake fluid level input from the brake fluid level switch, it will send an electronic **textual warning request** message requesting the IC display a textual warning message. Each time the IC receives this message from the CAB, a **BRAKE FLUID LOW** textual message will appear within the IC electronic display to accompany brake indicator illumination. This message indicates that the CAB has detected a low brake fluid level condition in the brake master cylinder or that there is a problem in the brake fluid level switch or circuits.
- **Park Brake Switch Input** - When the BCM detects an input from the park brake switch while the ignition switch status is ON, it will send electronic **brake indicator lamp-flash** and **textual warning request** messages to the IC. Each time the IC receives these messages from the BCM it will flash the brake indicator ON and OFF and a **PARKING BRAKE ENGAGED** textual message will appear within the IC electronic display to accompany brake indicator illumination. While the ignition switch status is ON, the BCM monitors the park brake switch through the park brake switch sense circuit (park brake switch closed = park brake applied or not fully released). The indicator continues to flash until the park brake switch sense input to the BCM is an open circuit (park brake switch open = park brake fully released), or until the ignition switch status transitions to OFF, whichever occurs first.
- **Antilock Brake System (ABS) Indicator Backup** - If the IC detects a fault in the ABS indicator circuit it will send a message indicating the fault to the CAB, then flash the brake indicator ON and OFF. The IC will continue to flash the brake indicator until the ABS indicator circuit fault is resolved, or until the ignition switch status transitions to OFF, whichever occurs first.

The park brake switch on the park brake lever mechanism provides a hard-wired ground input to the BCM circuitry through the park brake switch sense circuit whenever the park brake is applied or not fully released. The CAB continually monitors the ABS system circuits and sensors, including the brake fluid level switch on the brake master cylinder reservoir, to decide whether the system is in good operating condition. The BCM or the CAB then sends the proper electronic **brake indicator lamp-on** , **lamp-off** or **lamp-flash** messages to the IC. If the CAB sends a lamp-on message after the bulb test, it indicates that the CAB has detected a brake hydraulic system malfunction or that the ABS system has become ineffective. The CAB will store a DTC for any malfunction it detects.

The hard wired inputs to the BCM or the CAB may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. For proper diagnosis of the brake fluid level switch, the ABS, the BCM, the CAB, the IC, the CAN data bus or the electronic communication related to brake indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

CHANGE OIL INDICATOR

The change oil indicator gives an indication to the vehicle operator when a duty-cycle algorithm contained within the software of the PCM determines that a recommended oil change interval has been attained. This indicator is controlled by the IC logic circuit based upon cluster programming and electronic messages received over the CAN data bus from the PCM.

The change oil indicator function of the IC electronic display unit is completely controlled by the IC logic circuit, and that logic will only allow this indicator to operate when the IC receives a battery current input on the fused ignition output (run-start) circuit. Therefore, the change oil indication will always be OFF when the ignition switch status is anything except ON or START. The IC will turn ON the change oil indicator for the following reasons:

- **Change Oil Indicator Lamp-On Message** - Each time the ignition switch status transitions to ON and the IC receives an electronic **change oil indicator lamp-on** message from the PCM indicating that a duty-cycle based recommended oil change interval has been attained, the change oil indicator will be illuminated for about ten seconds, until the IC arbitrator logic determines that another display request has priority, or until the ignition switch status transitions to OFF, whichever occurs first.
- **Change Oil Indicator Reset Procedure** - Once an engine oil change has been completed, the PCM duty cycle counters can be reset using the following procedure. Transition the ignition switch status to ON, but DO NOT start the engine. Slowly depress and release the accelerator pedal fully three times within ten seconds. The IC will display a textual **OIL CHANGE RESET** message. Transition the ignition switch status to OFF. If the change oil indicator illuminates the next time the engine is started, repeat this procedure.

The PCM continually monitors numerous sensor inputs to determine the duty-cycles to which the engine is being subjected. A pre-programmed algorithm within the PCM then determines when to send the proper electronic **change oil indicator lamp-on** or **lamp-off** message to the IC.

For proper diagnosis of the change oil indicator, the PCM, the IC, the CAN data bus or the electronic communication related to change oil indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

CHARGING INDICATOR

The charging indicator gives an indication to the vehicle operator when the electrical system voltage is too low or too high. This indicator is controlled by the IC logic circuit based upon programming and electronic messages received by the IC from the PCM over the CAN data bus. The IC will illuminate the charge indicator for about three seconds as a bulb test each time the ignition switch status transitions to ON.

The charging indicator is completely controlled by the IC logic circuit, and that logic will only allow this indicator to operate when the IC receives a battery current input on the fused ignition output (run-start) circuit. Therefore, the charging indicator will always be OFF when the ignition switch status is anything except ON or START. The IC will turn ON the charging indicator for the following reasons:

- **Voltage Low Message** - Each time the IC receives an electronic **system voltage** message from the PCM indicating the voltage is low (less than about 11.5 volts is a charge fail condition), the charging indicator

will be illuminated. The indicator remains illuminated until the IC receives a message from the PCM indicating the voltage is normal (greater than about 12.0 volts, but less than 16.0 volts), or until the ignition switch status transitions to OFF, whichever occurs first.

- **Voltage High Message** - Each time the IC receives an electronic **system voltage** message from the PCM indicating the voltage is high (greater than about 16.0 volts), the charging indicator will be illuminated. The indicator remains illuminated until the IC receives a message from the PCM indicating the voltage is normal (less than about 15.5 volts, but greater than 11.5 volts), or until the ignition switch status transitions to OFF, whichever occurs first.

The PCM continually monitors the electrical system voltage to control the generator output. The PCM then sends the proper electronic **system voltage** messages to the IC. If the IC turns ON the charging indicator due to a charge fail or voltage high condition, it may indicate that the charging system requires service.

For proper diagnosis of the charging system, the PCM, the IC, the CAN data bus or the electronic communication related to charging indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

CRUISE INDICATOR

The cruise indicator gives two indications to the vehicle operator. When the speed control system is ON, but not engaged, the indicator is illuminated in an amber color. When the speed control system is ON and engaged, the indicator is illuminated in a green color. This indicator is controlled by the IC logic circuit based upon programming and electronic messages received by the IC from the PCM over the CAN data bus.

The cruise indicator is completely controlled by the IC logic circuit, and that logic only allows this indicator to operate when the IC receives a battery current input on the fused ignition output (run-start) circuit. Therefore, the indicator will always be OFF when the ignition switch status is anything except ON or START. The IC will turn ON the cruise indicator for the following reasons:

- **Cruise Ready Lamp-On Message** - Each time the IC receives an electronic **cruise ready lamp-on** message from the PCM indicating the speed control system is ON, but not actively engaged, the cruise indicator is illuminated in an amber color. The indicator remains illuminated in amber until the IC receives a cruise ready lamp-off message from the PCM, a cruise engaged lamp-on message from the PCM or until the ignition switch status transitions to OFF, whichever occurs first.
- **Cruise Engaged Lamp-On Message** - Each time the cluster receives an electronic **cruise engaged lamp-on** message from the PCM indicating the speed control system is actively engaged, the cruise indicator is illuminated in a green color. The indicator remains illuminated in green until the IC receives a cruise engaged lamp-off message from the PCM, a cruise ready lamp-on message from the PCM or until the ignition switch status transitions to OFF, whichever occurs first.

The PCM continually monitors inputs received from the speed control switch pod through the Steering Control Module (SCM) over the CAN data bus to determine the appropriate outputs to control the vehicle speed. The PCM then sends the proper electronic **cruise ready** and **cruise engaged lamp-on** or **lamp-off** messages to the IC.

For proper diagnosis of the speed control switch pod, the SCM, the PCM, the IC, the CAN data bus or the electronic communication related to cruise indicator operation a diagnostic scan tool is required. Refer to the

appropriate diagnostic information.

ELECTRIC POWER STEERING INDICATOR

The Electric Power Steering (EPS) indicator gives an indication to the vehicle operator when the EPS system, or a circuit or component of the system is ineffective. This indicator is controlled by the IC logic circuit based upon programming and electronic messages received by the IC from the EPS Electronic Control Unit (ECU) over the CAN data bus. The IC will illuminate the EPS indicator for about three seconds as a bulb test each time the ignition switch status transitions to ON.

The EPS indicator is completely controlled by the IC logic circuit, and that logic only allows this indicator to operate when the IC receives a battery current input on the fused ignition output (run-start) circuit. Therefore, the indicator will always be OFF when the ignition switch status is anything except ON or START. The IC will turn ON the EPS indicator for the following reasons:

- **EPS Indicator Lamp-On Message** - Each time the cluster receives an electronic **EPS indicator lamp-on** message from the EPS ECU, the EPS indicator will be illuminated. The indicator remains illuminated until the IC receives a lamp-off message from the EPS ECU, or until the ignition switch status transitions to OFF, whichever occurs first.
- **EPS Textual Warning Message** - When the EPS ECU detects that the EPS system has become ineffective, it will send an electronic **textual warning request** message requesting the IC display a textual warning message. Each time the IC receives this message from the EPS ECU, a **SERVICE POWER STEERING** textual message will appear within the IC electronic display to accompany EPS indicator illumination. This message indicates that the EPS ECU has detected a problem in the EPS system components or circuits.
- **Communication Error** - If the IC receives no lamp-on or lamp-off messages from the EPS ECU for five consecutive message cycles, the EPS indicator is illuminated. The indicator remains illuminated until the IC receives a valid message from the EPS ECU, or until the ignition switch status transitions to OFF, whichever occurs first.

The EPS ECU continually monitors the EPS circuits and sensors to decide whether the system is in good operating condition. The EPS ECU then sends the proper electronic **EPS indicator lamp-on** or **lamp-off** message to the IC. If the EPS ECU sends a lamp-on message after the bulb test, it indicates that the ECU has detected a system malfunction or that the EPS system has become ineffective. The ECU will store a DTC for any malfunction it detects.

For proper diagnosis of the EPS system, the EPS ECU, the IC, the CAN data bus or the electronic communication related to EPS indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

ELECTRONIC STABILITY CONTROL INDICATORS

The Electronic Stability Control (ESC) indicators give an indication to the vehicle operator of the ESC system status. These indicators are controlled by transistors on the IC circuit board based upon cluster programming and electronic messages received by the IC from the CAB over the CAN data bus. The IC will illuminate the ESC indicators for about four seconds as a bulb test each time the ignition switch status transitions to ON.

The ESC indicator and the ESC OFF indicator LED units are completely controlled by the IC logic circuit, and that logic will only allow these indicators to operate when the IC receives a battery current input on the fused ignition output (run-start) circuit. Therefore, the ESC and ESC OFF indicator LED units will always be OFF when the ignition switch status is anything except ON or START. The LED units only illuminate when provided a path to ground by the IC transistors. The IC will turn ON the ESC indicators for the following reasons:

- **ESC Indicator Lamp-On Message** - Each time the IC receives an electronic **ESC indicator lamp-on** message from the CAB indicating that the ESC system has been activated, the ESC indicator will be illuminated. The indicator remains illuminated until the IC receives a lamp-off message from the CAB, or until the ignition switch status transitions to OFF, whichever occurs first.
- **ESC Off Indicator Lamp-On Message** - Each time the IC receives an electronic **ESC Off indicator lamp-on** message from the CAB indicating that the ESC system has been manually disabled, the ESC Off indicator will be illuminated. The indicator remains illuminated until the IC receives a lamp-off message from the CAB, or until the ignition switch status transitions to OFF, whichever occurs first.
- **ESC Off Textual Message** - Each time the IC receives an electronic **ESC Off indicator lamp-on** message from the CAB indicating that the ESC system has been manually disabled, a **TRACTION CONTROL OFF** textual message will appear within the IC electronic display unit. The textual message remains displayed until the IC receives a lamp-off message from the CAB, until the IC arbitrator logic determines that another display request has priority, or until the ignition switch status transitions to OFF, whichever occurs first.

The CAB continually monitors the ESC system circuits and sensors to decide whether the system is in good operating condition and the proper outputs to the components of the system. The CAB then sends the proper **ESC indicator** and **ESC Off indicator lamp-ON** or **lamp-OFF** message to the IC.

For proper diagnosis of the ESC system, the CAB, the IC, the CAN data bus or the electronic communication related to the ESC or ESC Off indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

ELECTRONIC THROTTLE CONTROL INDICATOR

The Electronic Throttle Control (ETC) indicator gives an indication to the vehicle operator when the ETC system, or a circuit or component of the system is ineffective. The ETC indicator is controlled by the IC logic circuit based upon programming and electronic messages received by the IC from the Powertrain Control Module (PCM) over the CAN data bus. The IC will illuminate the ETC indicator for about fifteen seconds as a bulb test each time the ignition switch status transitions to ON.

The ETC indicator is completely controlled by the IC logic circuit, and that logic will only allow this indicator to operate when the IC receives a battery current input on the fused ignition output (run-start) circuit. Therefore, the indicator will always be OFF when the ignition switch status is anything except ON or START. The IC will turn ON the ETC indicator for the following reasons:

- **ETC Indicator Lamp-On Message** - Each time the IC receives an electronic **ETC indicator lamp-on** message from the PCM, the ETC indicator will be illuminated. The indicator can be flashed ON and OFF, or illuminated solid, as dictated by the PCM message. The indicator remains illuminated solid or continues to flash for about 12 seconds or until the IC receives a lamp-off message from the PCM,

whichever is longer. If the indicator is illuminated solid with the engine running the vehicle will usually remain drivable. If the indicator is flashing with the engine running the vehicle may require towing. A flashing indicator means the ETC system requires immediate service. The indicator will be extinguished when the ignition switch status transitions to OFF.

- **ETC Indicator Textual Message** - Each time the IC receives an electronic **ETC indicator lamp-on** message from the PCM indicating that the ETC system has become ineffective, a **SERVICE ELECTRONIC THROTTLE CONTROL** textual message will appear within the IC electronic display unit. The textual message remains displayed until the IC receives a lamp-off message from the PCM, until the IC arbitrator logic determines that another display request has priority, or until the ignition switch status transitions to OFF, whichever occurs first.

The PCM continually monitors the ETC system circuits and sensors to decide whether the system is in good operating condition. The PCM then sends the proper electronic **ETC indicator lamp-on** or **lamp-off** message to the IC. If the PCM sends a lamp-on message after the bulb test, it indicates that the PCM has detected an ETC system malfunction or that the ETC system is ineffective. The PCM will store a DTC for any malfunction it detects. Each time the ETC indicator fails to illuminate due to an open or short in the IC ETC indicator circuit, the IC sends a message notifying the PCM of the condition, then the IC and the PCM will each store a DTC.

For proper diagnosis of the ETC system, the PCM, the IC, the CAN data bus or the electronic communication related to the ETC indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

ENGINE TEMPERATURE INDICATOR

The engine temperature indicator gives an indication to the vehicle operator when the engine temperature reflects a condition requiring immediate attention. This indicator is controlled by the IC logic circuit based upon programming and electronic messages received by the IC from the PCM over the CAN data bus. The IC will illuminate the engine temperature indicator for about three seconds as a bulb test each time the ignition switch status transitions to ON.

The engine temperature indicator is completely controlled by the IC logic circuit, and that logic will only allow this indicator to operate when the IC receives a battery current input on the fused ignition output (run-start) circuit. Therefore, the engine temperature indicator will always be OFF when the ignition switch status is anything except ON or START. The IC will turn ON the engine temperature indicator for the following reasons:

- **Engine Temperature High Message** - Each time the IC receives an electronic **engine temperature** message from the PCM indicating the engine coolant temperature is high, the engine temperature indicator will be illuminated and a single chime tone is sounded. The indicator remains illuminated until a message is received from the PCM indicating that the engine coolant temperature is below the high end of normal, or until the ignition switch status transitions to OFF, whichever occurs first. The chime tone feature will only repeat during the same ignition cycle if the engine temperature indicator is cycled off and then on again by the appropriate engine temperature messages from the PCM.
- **Engine Temperature Textual Message** - Each time the IC receives an electronic **engine temperature** message from the PCM indicating the engine coolant temperature is high, a **ENGINE TEMPERATURE HOT** textual message will appear within the IC electronic display unit. The textual message remains displayed until a message is received from the PCM indicating that the engine coolant temperature is

below the high end of normal, until the IC arbitrator logic determines that another display request has priority, or until the ignition switch status transitions to OFF, whichever occurs first.

The PCM continually monitors the engine coolant temperature sensor to determine the engine operating temperature. The PCM then sends the proper electronic **engine temperature** messages to the IC. If the IC turns ON the engine temperature indicator due to a high engine coolant temperature condition, it may indicate that the engine or the engine cooling system requires service.

For proper diagnosis of the engine temperature sensor, the PCM, the IC, the CAN data bus or the electronic communication related to the engine temperature indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

FRONT FOG LAMP INDICATOR

The front fog lamp indicator gives an indication to the vehicle operator whenever the front fog lamps are illuminated. This indicator is controlled by a transistor on the IC circuit board based upon programming and electronic messages received by the IC from the BCM over the CAN data bus.

The front fog lamp indicator LED is completely controlled by the IC logic circuit, and that logic will allow this indicator to operate whenever the IC receives a battery current input on the fused B(+) circuit. Therefore, the LED can be illuminated regardless of the ignition switch status. The LED only illuminates when it is provided a path to ground by the IC transistor. The IC will turn ON the front fog lamp indicator for the following reasons:

- **Front Fog Indicator Lamp-On Message** - Each time the IC receives an electronic **front fog indicator lamp-on** message from the BCM indicating the front fog lamps are turned ON, the front fog lamp indicator will be illuminated. The indicator remains illuminated until the IC receives a lamp-OFF message from the BCM, or until the exterior lamp load shedding (battery saver) timed interval expires, whichever occurs first.

The BCM continually monitors a hard wired input from the exterior lighting switch to determine the appropriate outputs to the front fog lamps. The BCM activates or deactivates the front fog lamps then sends the proper electronic **front fog indicator lamp-on** or **lamp-off** message to the IC to control the front fog lamp indicator.

For proper diagnosis of the front fog lamp system, the BCM, the IC, the CAN data bus or the electronic communication related to front fog lamp indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

HIGH BEAM INDICATOR

The high beam indicator gives an indication to the vehicle operator whenever the headlamp high beams are illuminated. This indicator is controlled by a transistor on the IC circuit board based upon programming and electronic messages received from the BCM over the CAN data bus.

The high beam indicator LED is completely controlled by the IC logic circuit, and that logic will allow this indicator to operate whenever the IC receives a battery current input on the fused B(+) circuit. Therefore, the LED can be illuminated regardless of the ignition switch status. The LED only illuminates when it is provided a path to ground by the IC transistor. The IC will turn ON the high beam indicator for the following reasons:

- **High Beam Indicator Lamp-On Message** - Each time the IC receives an electronic **high beam indicator lamp-on** message from the BCM indicating the high beam lamps are turned ON, the high beam indicator will be illuminated. The indicator remains illuminated until the IC receives a lamp-off message from the BCM, or until the exterior lamp load shedding (battery saver) timed interval expires, whichever occurs first.

The BCM continually monitors electronic **beam select switch status** messages received from the Steering Control Module (SCM) over the CAN data bus as well as messages from the Automatic High Beam Module (AHBM) (also known as SmartBeam® on vehicles so equipped) over the Local Interface Network (LIN) data bus to determine the appropriate outputs to the headlamps. The BCM activates or deactivates the headlamp high beams then sends the proper **high beam indicator lamp-on** or **lamp-off** message to the IC.

For proper diagnosis of the SCM, the AHBM, the BCM, the IC, the CAN data bus, the LIN data bus or the electronic communication related to high beam indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

LOW FUEL INDICATOR

The low fuel indicator gives an indication to the vehicle operator when the level of fuel in the fuel tank becomes low. This indicator is controlled by the IC logic circuit based upon programming and electronic messages received from the PCM over the CAN data bus. The IC will illuminate the low fuel indicator for about three seconds as a bulb test each time the ignition switch status transitions to ON.

The low fuel indicator is completely controlled by the IC logic circuit, and that logic will only allow this indicator to operate when the IC receives a battery current input on the fused ignition output (run-start) circuit. Therefore, the low fuel indicator will always be OFF when the ignition switch status is anything except ON or START. The IC will turn ON the low fuel indicator for the following reasons:

- **Less Than 11 Percent Tank Full Input** - The PCM provides a constant current source to the fuel level sending unit, and monitors a return input on a fuel level sense circuit. The resistance through the fuel level sending unit increases as the fuel level falls, and decreases as the fuel level rises causing changes in the sense input voltage. Each time the fuel level sense input to the PCM indicates the fuel tank is about 11 percent full or less for 10 consecutive seconds and the vehicle speed is zero, or for 60 consecutive seconds and the vehicle speed is greater than zero, the PCM sends an electronic message to the IC. Then the IC moves the gauge needle to the appropriate position on the gauge scale; the low fuel indicator is illuminated and a single chime tone is sounded. The low fuel indicator remains illuminated until the fuel level sense input indicates that the fuel tank is greater than about 14 percent full for 10 consecutive seconds and the vehicle speed is zero, or for 60 consecutive seconds and the vehicle speed is greater than zero, or until the ignition switch transitions to OFF, whichever occurs first. The chime tone feature will only repeat during the same ignition cycle if the low fuel indicator is cycled OFF and then ON again by the appropriate inputs from the fuel level sending unit.
- **Less Than Empty Stop Input** - Each time the IC receives a fuel level message from the PCM that indicates the fuel level in the fuel tank is less than the **E** (or Empty) gauge needle stop position for five consecutive seconds, the gauge needle is moved to the low end of the gauge scale and the low fuel indicator is illuminated immediately. This input would indicate that the fuel level sense input to the PCM is a short circuit.
- **More Than Full Stop Input** - Each time the IC receives a fuel level message from the PCM that

indicates the fuel level in the fuel tank is more than the **F** (or Full) gauge needle stop position for five consecutive seconds, the gauge needle is moved to the low end of the gauge scale and the low fuel indicator is illuminated immediately. This input would indicate that the fuel level sense input to the PCM is an open circuit.

The PCM continually monitors the fuel tank sending unit to determine the level of fuel in the fuel tank. The PCM then sends the proper electronic **fuel level** message to the IC and other electronic modules in the vehicle over the CAN data bus. The PCM will store a DTC for any fault detected in the fuel level sense circuit.

For proper diagnosis of the fuel tank sending unit, the PCM, the IC, the CAN data bus or the electronic communication related to low fuel indicator operation or fuel level data processing, a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

MALFUNCTION INDICATOR LAMP

The Malfunction Indicator Lamp (MIL) gives an indication to the vehicle operator when the PCM has recorded a DTC for an On-Board Diagnostics II (OBDII) emissions-related circuit or component malfunction. The MIL is controlled by a transistor on the IC circuit board based upon programming and electronic messages received by the IC from the PCM over the CAN data bus. The IC will illuminate the MIL indicator for about fifteen seconds as a bulb test each time the ignition switch status transitions to ON.

The MIL LED is completely controlled by the IC logic circuit, and that logic will only allow this indicator to operate when the IC receives a battery current input on the fused ignition output (run-start) circuit. Therefore, the LED will always be OFF when the ignition switch status is anything except ON or START. The LED only illuminates when it is energized by the IC transistor. The IC will turn ON the MIL for the following reasons:

- **MIL Lamp-On Message** - Each time the IC receives an electronic **MIL lamp-on** message from the PCM, the indicator will be illuminated. The indicator can be flashed ON and OFF, or illuminated solid, as dictated by the PCM message. For some DTCs, if a problem does not recur, the PCM will send a lamp-off message automatically. Other DTCs may require that a fault be repaired and the PCM be reset before a lamp-off message will be sent. In the absence of a lamp-off message, the indicator remains illuminated until the ignition switch status transitions to OFF.
- **Communication Error** - If the IC receives no lamp-on or lamp-off messages from the PCM for 10 consecutive message cycles, the MIL is illuminated by the IC to indicate a loss of bus communication. The indicator remains controlled and illuminated by the IC until a valid message is received from the PCM.

The PCM continually monitors the fuel and emissions system circuits and sensors to decide whether the system is in good operating condition. The PCM then sends the proper electronic **MIL lamp-on** or **lamp-off** message to the IC. If the IC turns ON the MIL after the bulb test, it may indicate that a malfunction has occurred and that the fuel and emissions systems require service.

For proper diagnosis of the fuel and emissions systems, the PCM, the IC, the CAN data bus or the electronic communication related to MIL operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

OIL PRESSURE INDICATOR

The low oil pressure indicator gives an indication to the vehicle operator when the engine oil pressure reading reflects a condition requiring immediate attention. This indicator is controlled by the IC logic circuit based upon programming and electronic messages received by the IC from the PCM over the CAN data bus.

The low oil pressure indicator is completely controlled by the IC logic circuit, and that logic will only allow this indicator to operate when the IC receives a battery current input on the fused ignition output (run-start) circuit. Therefore, the low oil pressure indicator will always be OFF when the ignition switch status is anything except ON or START. The IC will turn ON the low oil pressure indicator for the following reasons:

- **Engine Oil Pressure Low Message** - Each time the IC receives an electronic **engine oil pressure** message from the PCM indicating the pressure is about 6.9 kPa (1 psi) or lower, the low oil pressure indicator will be illuminated. The indicator can be flashed ON and OFF, or illuminated solid, as dictated by the PCM message. The indicator remains illuminated solid or flashing until the cluster receives a message from the PCM indicating that the pressure is above about 6.9 kPa (1 psi), or until the ignition switch status transitions to OFF, whichever occurs first. The IC will only turn the indicator ON in response to low engine oil pressure if the engine speed is greater than zero.

The PCM continually monitors the engine oil pressure sensor to determine the engine oil pressure. The PCM then sends the proper electronic **oil pressure** messages to the IC. If the IC turns ON the indicator after the bulb test, it may indicate that the engine or the engine oiling system requires service.

For proper diagnosis of the engine oil pressure sensor, the PCM, the IC, the CAN data bus or the electronic communication related to low oil pressure indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

SEAT BELT INDICATOR

The seatbelt indicator gives an indication to the vehicle operator of the status of the front seat belts. This indicator is controlled by a transistor on the IC circuit board based upon programming and electronic messages received from the ORC over the CAN data bus.

The seatbelt indicator also includes a programmable enhanced seatbelt reminder (also known as Beltminder) feature that is enabled when the vehicle is shipped from the factory. This feature can be disabled and enabled by the customer using a specific programming event sequence, or by the dealer using a diagnostic scan tool.

The seatbelt indicator LED is completely controlled by the IC logic circuit, and that logic will only allow this indicator to operate when the IC receives a battery current input on the fused ignition output (run-start) circuit. Therefore, the LED will always be OFF when the ignition switch status is anything except ON or START. The LED only illuminates when it is provided a path to ground by the IC transistor. The IC will turn ON the seatbelt indicator for the following reasons:

- **Seatbelt Reminder Function** - Each time the IC receives a battery current input on the fused ignition output (run-start) circuit, the indicator will be illuminated as a seatbelt reminder for about six seconds, or until the ignition switch status transitions to OFF, whichever occurs first. This reminder function will occur regardless of the status of the seatbelt switch inputs to the ORC.
- **Front Seat Belt Not Buckled Message - Beltminder Active** - Following the seatbelt reminder function, each time the IC receives an electronic **driver side** or **passenger side front seat belt unbuckled status**

message from the ORC while the ignition switch status is START or ON, the indicator will be illuminated. In addition, if the front seat belt remains unbuckled about 60 seconds after the conclusion of the seatbelt reminder function with the vehicle speed greater than about 8 kilometers-per-hour (5 miles-per-hour), the seat belt indicator will begin to cycle between flashing ON and OFF for 3 seconds, then lighting solid for 2 seconds. The seat belt indicator will continue to cycle between flashing and solid illumination for 13 complete cycles, until the seat belt switch sense inputs to the ORC are closed circuits (seat belt switch closed = seat belt buckled) or until the ignition switch status transitions to OFF, whichever occurs first.

- **Front Seat Belt Not Buckled Message - Beltminder Inactive** - Following the seat belt reminder function, each time the IC receives an electronic **seat belt indicator lamp-on** message from the ORC while the ignition switch status is START or ON, the indicator will be illuminated. The indicator remains illuminated until the IC receives a lamp-off message from the ORC or until the ignition switch status transitions to OFF, whichever occurs first.

Each seat belt switch is connected in series between source current and a sense circuit from the ORC. The ORC continually monitors the seat belt switch circuits then sends the proper electronic **seat belt indicator lamp-on** or **lamp-off** messages to the IC.

The seat belt switch inputs to the ORC may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. For proper diagnosis of the ORC, the IC, the CAN data bus or the electronic communication related to seat belt indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

SECURITY INDICATOR

The security indicator gives an indication to the vehicle operator when the Vehicle Theft Security System (VTSS) is arming or is armed. On vehicles equipped with the Sentry Key Immobilizer System (SKIS), the security indicator also gives an indication to the vehicle operator of the status of the SKIS. On vehicles so equipped, the BCM also monitors electronic messages received from the Radio Frequency Hub Module (RFHM) (also known as the RF Hub) over the CAN data bus for the SKIS status features. The BCM will illuminate the security indicator for about three seconds as a bulb test each time the ignition switch status transitions to ON.

The security indicator LED is completely controlled by the BCM, and that logic will allow this indicator to operate whenever the BCM receives a battery current input on the fused B(+) circuit. Therefore, the LED can be illuminated regardless of the ignition switch status. The LED only illuminates when it is provided a path to ground by the BCM. Depending upon the programmed condition the indicator can be illuminated solid, flashed at a slow rate (0.5 Hertz, 12.5 percent duty cycle), or flashed at a fast rate (1 Hertz, 50 percent duty cycle). The BCM will turn ON the security indicator for the following reasons:

- **VTSS Arming Or Armed** - During the 16 second VTSS arming function, the BCM will flash the security indicator ON and OFF repeatedly at a steady, fast rate to indicate that the VTSS is in the process of arming. Following successful VTSS arming, the BCM will flash the security indicator ON and OFF continuously at a slower rate to indicate that the VTSS is armed. The security indicator continues flashing at the slower rate until the VTSS is disarmed or triggered. If the VTSS has alarmed and rearmed, the BCM will flash the security indicator at a steady, slow rate for about 30 seconds after the VTSS is disarmed.

- **SKIS Indicator Lamp-On Message** - Each time the BCM receives an electronic **SKIS indicator lamp-on** message from the RFHM, the security indicator will be illuminated. The indicator can be flashed ON and OFF, or illuminated solid, as dictated by the RFHM message. The indicator remains illuminated solid or continues to flash until the BCM receives a lamp-off message from the RFHM, or until the ignition switch status transitions to OFF, whichever occurs first. Refer to **OPERATION** .
- **SKIS Textual Message** - When the RFHM detects certain monitored conditions or is placed in the programming mode it will send electronic messages requesting the IC display certain textual messages, and the appropriate textual message or combination of messages is illuminated in the electronic display unit. **PROGRAMMING ACTIVE** , **NEW KEY PROGRAMMED** , **REMOTE KEY BATTERY LOW** and **SERVICE SECURITY KEY** messages appear individually, while a **KEY NOT PROGRAMMED** message is followed by either a **DAMAGED KEY** , **INVALID KEY** or **EXCEEDED KEY PROGRAM LIMIT** message and an **INVALID KEY** message is followed by a **TRY ALTERNATE KEY** message. The textual messages related to key programming are active only on vehicles sold in markets where customer programming is an available feature of the SKIS.
- **Communication Error** - If the BCM receives no lamp-on or lamp-off messages from the RFHM for 10 consecutive message cycles, the security indicator is illuminated. The indicator remains controlled and illuminated by the BCM until a valid lamp-on or lamp-off message is received from the RFHM.

The BCM circuitry controls the security indicator whenever the ignition switch status is OFF and the VTSS is arming, armed or alarming. Whenever the ignition switch status is ON or START, the RFHM performs a self-test to decide whether the SKIS is in good operating condition and whether a valid key is present within the vehicle. The RFHM then sends the proper electronic **security indicator lamp-on** or **lamp-off** message to the BCM. If the BCM flashes the security indicator when the ignition switch transitions to ON, or turns ON the security indicator solid after the bulb test, it indicates that a SKIS malfunction has occurred or that the SKIS is ineffective.

For proper diagnosis of the VTSS, the SKIS, the BCM, the RFHM, the IC, the CAN data bus or the electronic communication related to security indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

TIRE PRESSURE MONITOR INDICATOR

The Tire Pressure Monitor (TPM) indicator gives an indication to the vehicle operator of the status of the TPM system. This indicator is controlled by a transistor on the IC circuit board based upon programming and electronic messages received by the IC from the RFHM over the CAN data bus. The IC will illuminate the TPM indicator for about three seconds as a bulb test each time the ignition switch status transitions to ON.

The TPM indicator LED is completely controlled by the IC logic circuit, and that logic will only allow this indicator to operate when the IC receives a battery current input on the fused ignition output (run-start) circuit. Therefore, the LED will always be OFF when the ignition switch status is anything except ON or START. The LED only illuminates when it is provided a path to ground by the IC transistor. The IC will turn ON the TPM indicator for the following reasons:

- **TPM Indicator Lamp-On Message** - Each time the IC receives an electronic **TPM indicator lamp-on** message from the RFHM, the TPM indicator will be illuminated. The indicator can be flashed ON and OFF, or illuminated solid, as dictated by the RFHM message. The indicator remains illuminated until the IC receives a lamp-off message from the RFHM, or until the ignition switch status transitions to OFF,

whichever occurs first.

- **TPM Low Pressure Message** - Each time the IC receives an electronic **low pressure** message from the RFHM, a vehicle icon with a flashing box containing the pressure value for the identified low tire or tires location or locations will appear within the IC electronic display unit to accompany a solid TPM indicator. This message indicates that the RFHM has received a low tire pressure input from the tire pressure sensor in the identified location on the vehicle.
- **TPM Textual Warning Message** - When the RFHM detects certain monitored fault conditions in the TPM system, it will send electronic messages requesting the IC display a textual warning message. Each time the IC receives an electronic **textual warning request** message from the RFHM, a **SERVICE TIRE PRESSURE MONITORING SYSTEM** textual message will appear within the electronic display unit to accompany a flashing TPM indicator or to replace the TPM **LOW TIRE** icon display. This message indicates that the RFHM has detected a problem in one of the TPM system components.
- **Communication Error** - If the IC receives no TPM lamp-on or lamp-off messages from the RFHM for six consecutive seconds, the TPM indicator is illuminated by the IC. The indicator remains controlled and illuminated by the IC until a valid lamp-on or lamp-off message is received from the RFHM.

The RFHM performs a self-test each time the ignition switch status transitions to ON to decide whether the TPM system is in good operating condition and whether the tire inflation pressures are too high or too low. The RFHM then sends the proper electronic **TPM indicator lamp-on** or **lamp-off** message to the IC. If the IC turns ON the TPM indicator after the bulb test, it indicates that the inflation pressure of a tire is too low or that a malfunction has occurred and the TPM system is ineffective.

For proper diagnosis of the TPM system, the RFHM, the IC, the CAN data bus or the electronic communication related to TPM indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

TRANSMISSION RANGE INDICATOR

The transmission range indicator (also known as the electronic gear selector indicator) gives an indication to the vehicle operator of the transmission gear that has been selected with the automatic transmission gear selector lever. This indicator is controlled by the IC logic circuit based upon programming and electronic messages received over the CAN data bus from the Gear Shift Module (GSM). The IC circuitry automatically configures itself for the proper transmission type based upon an electronic **configuration** message sent to the IC by the BCM.

The transmission range indicator function of the IC electronic display unit is completely controlled by the IC logic circuit, and that logic will only allow this indicator to operate when the IC receives a battery current input on the fused ignition output (run-start) circuit. Therefore, the transmission range indicator will always be OFF when the ignition switch status is anything except ON or START. Each time the IC is disconnected from battery current for more than about five minutes, it must configure itself for the automatic transmission type that is in the vehicle once it is reconnected to battery current. The IC will turn ON the gear selector indicator for the following reasons:

- **Selected Gear Message** - Each time the IC receives an electronic **selected gear** message from the GSM indicating the automatic transmission gear that is currently selected, the appropriate letter, number or word representing the selected gear will be highlighted or displayed in the IC electronic display unit. The indication remains highlighted or displayed until a different electronic **selected gear** message is received,

or until the ignition switch status transitions to OFF, whichever occurs first.

- **Communication Error** - If the IC fails to receive a **selected gear** message from the GSM within three seconds after the ignition switch status transitions to ON, the IC will display all gear positions selected until a valid electronic **selected gear** message is received, or until the ignition switch status transitions to OFF, whichever occurs first.

The GSM continually monitors the gear selector lever position as well as sensor inputs from the automatic transmission that confirm the selected gear is actually engaged. The GSM then sends the proper electronic **gear shift module status** message to the IC.

In vehicles with the premium IC, the way the gear selector indication is displayed is a customer programmable feature. The customer can choose to use the default premium IC indicator, which displays a conventional PRND+/- and highlights only the letter or number that represents the currently selected gear, or they can choose to have only the single letter or number that represents the currently selected gear displayed, which is also the method by which the gear selector indicator is displayed by the base IC. Finally, they can choose to have the one word that represents the currently selected gear spelled out in the premium IC electronic display unit (example:**DRIVE** or **REVERSE**).

For proper diagnosis of the GSM, the IC, the CAN data bus or the electronic communication related to transmission range indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

TURN SIGNAL INDICATORS

The turn signal indicators give an indication to the vehicle operator that the turn signal (left or right indicator flashing) or hazard warning (both left and right indicators flashing) have been selected and are operating. These indicators are controlled by transistors on the IC electronic circuit board based upon programming and electronic messages received from the BCM over the CAN data bus.

Each turn signal indicator LED unit is completely controlled by the IC logic circuit, and that logic will allow this indicator to operate whenever the IC receives a battery current input on the fused B(+) circuit. Therefore, each LED can be illuminated regardless of the ignition switch status. The LED only illuminates when it is provided a path to ground by the IC transistor. The IC will turn ON the turn signal indicators for the following reasons:

- **Turn Signal Indicator Lamp-On Message** - Each time the IC receives an electronic **right** or **left turn signal indicator lamp-on** message from the BCM the appropriate turn signal indicator will be flashed ON and OFF. The BCM also sends the appropriate electronic message to the IC to control the flash rate of the turn signal indicators and the click rate of an electromechanical relay soldered onto the IC electronic circuit board. The relay emulates the sound emitted by a conventional turn signal flasher. The turn signal indicators continue to flash ON and OFF until the IC receives a lamp-off message from the BCM, or until the ignition switch status transitions to OFF, whichever occurs first.
- **Hazard Warning Indicator Lamp-On Message** - Each time the IC receives an electronic **hazard warning indicator lamp-on** message from the BCM both turn signal indicators will be flashed ON and OFF. The BCM also sends the appropriate electronic message to the IC to control the flash rate of the turn signal indicators and the click rate of an electromechanical relay soldered onto the IC electronic circuit board. The relay emulates the sound emitted by a conventional hazard warning flasher. The turn

signal indicators continue to flash ON and OFF until the IC receives a lamp-off message from the BCM.

- **Turn Signal-On Textual Warning Message** - When the BCM detects that a turn signal has been active continuously for 1.6 kilometers (1 mile) with the vehicle speed greater than 22 kilometers-per-hour (15 miles-per hour) a **TURN SIGNAL ON** textual message and flashing right or left turn signal icon will appear within the IC electronic display unit and a chime tone will be sounded.
- **Lamp Out Mode** - If the BCM detects an ineffective turn signal lamp or circuit, it increases the flash rate for the remaining operative turn signals and sends an electronic message to the IC. The IC then increases the flash rate of the turn signal indicators and the click rate of the electromechanical relay to provide an indication of the problem to the vehicle operator.

The BCM continually monitors a hard wired input from the hazard switch and electronic **turn signal switch status** message inputs from the SCM to determine the proper turn signal and hazard warning system operation. The BCM then sends the proper electronic **turn signal indicator** and **hazard warning indicator lamp-on** and **lamp-off** messages to the IC.

For proper diagnosis of the turn signal and hazard warning system, the multi-function switch, the SCM, the BCM, the IC, the CAN data bus or the electronic communication related to turn signal indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

WASHER FLUID INDICATOR

The washer fluid indicator gives an indication to the vehicle operator that the fluid level in the washer reservoir is low. This indicator is controlled by the IC logic circuit based upon programming and electronic messages received from the BCM over the CAN data bus.

The washer fluid indicator function of the electronic display unit is completely controlled by the IC logic circuit, and that logic will only allow this indicator to operate when the IC receives a battery current input on the fused ignition output (run-start) circuit. Therefore, the washer fluid indication will always be OFF when the ignition switch status is anything except ON or START. The IC will turn ON the washer fluid indicator for the following reasons:

- **Washer Fluid Indicator Lamp-On Message** - Each time the IC receives an electronic **washer fluid indicator lamp-on** message from the BCM indicating that a low washer fluid condition has been detected for 60 consecutive seconds, the washer fluid indicator is illuminated and a single chime tone is sounded. The indicator remains illuminated until the IC receives lamp-off messages for 60 consecutive seconds from the BCM, or until the ignition switch status transitions to OFF, whichever occurs first. The chime tone feature will only repeat during the same ignition cycle if the washer fluid indicator is cycled OFF and then ON again by the appropriate lamp-on and lamp-off messages from the BCM.

The BCM continually monitors the washer fluid level switch in the washer reservoir to determine the level of the washer fluid. The BCM then sends the proper **washer fluid indicator lamp-on** or **lamp-off** message to the IC.

For proper diagnosis of the washer fluid level switch, the BCM, the IC, the CAN data bus or the electronic communication related to washer fluid indicator operation a diagnostic scan tool is required. Refer to the appropriate diagnostic information.

POD, SWITCH

DESCRIPTION

DESCRIPTION

The instrument panel switch pod is located just below the heater and air conditioner controls in the center stack area of the instrument panel. This switch is available in multiple configurations, which vary depending upon the equipment in the vehicle. However, every available configuration includes the hazard warning push button switch. The switch pod may include the following switches:

- **Automatic Transmission Tow/Haul Mode Switch**
- **Electronic Stability Control (ESC) Off Switch**
- **Hazard Warning Switch**
- **Headlamp Leveling Switch**
- **Hill Descent Switch**
- **Park Assist Off Switch**

The switch housing and the push buttons are constructed of molded plastic. Each push button has a smooth finish and is clearly identified with the appropriate text and International Control and Display Symbol icons. Refer to **INTERNATIONAL VEHICLE CONTROL AND DISPLAY SYMBOLS, DESCRIPTION** . Several of the push buttons feature Light Emitting Diode (LED) units to give the vehicle operator an indication when the function of that switch is currently active. Only the hazard warning switch push button latches, the manual headlamp leveling switch features a thumbwheel with four detent positions, while the remaining switches feature momentary operation.

Four screws secure the switch to the back of the instrument panel center bezel through integral mounting tabs that are molded onto each end of the switch housing. The back of the switch housing has an integral connector receptacle containing terminal pins that connect the switch to the vehicle electrical system through a dedicated take out and connector of the instrument panel wire harness.

Panel lamps dimmer controlled illumination lamps integral to the circuit board within the switch provide back lighting for visibility at night, but these lamps are not serviceable. The individual switches in the upper instrument panel switch pod cannot be repaired and are not serviced individually. If any component within the switch pod is ineffective or damaged, the entire switch pod must be replaced.

DIAGNOSTIC CODE INDEX

DIAGNOSTIC CODE INDEX

DTC	Description
B157F-2A	INTEGRATED CENTER STACK BUTTON - STUCK
B210D-16	BATTERY VOLTAGE LOW - CIRCUIT BELOW THRESHOLD
B210E-17	BATTERY VOLTAGE HIGH - CIRCUIT VOLTAGE ABOVE THRESHOLD
U0010-00	CAN INTERIOR BUS
U0011-00	CAN INTERIOR BUS OFF PERFORMANCE
U0140-00	LOST COMMUNICATION WITH BODY CONTROL MODULE
U0164	LOST COMMUNICATION WITH HVAC CONTROL
U0184-00	LOST COMMUNICATION WITH RADIO
U0422-00	IMPLAUSIBLE DATA RECEIVED FROM BODY CONTROL MODULE
U0424-00	IMPLAUSIBLE DATA RECEIVED FROM HVAC CONTROL MODULE
U0485-00	IMPLAUSIBLE DATA RECEIVED FROM RADIO

DIAGNOSIS AND TESTING

B157F-2A-INTEGRATED CENTER STACK BUTTON - STUCK

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on. Radio Receiver Module (RRM) and Integrated Center Stack (ICS) active.

SET CONDITION

The Integrated Center Stack (ICS) detects a closed switch for greater than 120 seconds.

POSSIBLE CAUSES

Possible Causes
INTEGRATED CENTER STACK (ICS)

DIAGNOSTIC TEST

VERIFY OPERATION OF THE BUTTON

NOTE: Verify that the ICS buttons are clean and free of debris.

1. With the scan tool, erase DTCs.
2. Press and release the button three times.
3. Wait 120 seconds.
4. With the scan tool, read DTCs.

   Is DTC: B157F-2A-INTEGRATED CENTER STACK BUTTON-STUCK active?

   Yes

   - Replace the Integrated Center Stack (ICS) in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Test complete.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B210D-16-BATTERY VOLTAGE LOW - CIRCUIT BELOW THRESHOLD

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 1: Integrated Center Stack Switch Bank Module Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the ignition on.

SET CONDITION

Vehicle System voltage less than 9.0 volts.

POSSIBLE CAUSES

Possible Causes
VEHICLE CHARGING SYSTEM MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

1. **CHECK FOR POWERTRAIN CONTROL MODULE (PCM) DTCs**

   NOTE: Make sure the battery is fully charged before proceeding.

   1. Using the scan tool, read the active PCM DTCs.

      Are there any battery or charging system DTCs present?

      Yes

      - Refer to the **DTC INDEX** article and perform the appropriate diagnostic procedure.

      No

      - Go To 2
2. **TEST FOR AN INTERMITTENT CONDITION**
   1. Using the scan tool, record and erase the DTCs.
   2. Start the engine.
   3. Allow the engine to idle for two minutes.
   4. Using the scan tool, read the DTCs.

      Does the scan tool display: B210D-16-BATTERY VOLTAGE LOW-CIRCUIT BELOW THRESHOLD?

      Yes

      - Go To 3

      No

      - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
3. **CHECK THE (A937) FUSED B(+) CIRCUIT FOR AN OPEN OR EXCESSIVE RESISTANCE**

NOTE: Check the fuse for an open. If the fuse is open, make sure to check for a short to ground prior to replacing the fuse.

1. Turn the ignition off.
2. Disconnect the INTEGRATED CENTER STACK (ICS) harness connector.
3. Ignition on, engine not running.
4. Using a 12-volt test light connected to ground, check the (A937) Fused B (+) circuit in the INTEGRATED CENTER STACK (ICS) C1 harness connector.
5. The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

   Does the test light illuminate brightly?

   Yes

   - Go To 4

   No

   - Repair the open or excessive resistance in the (A937) Fused B (+) circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK THE (Z914) GROUND CIRCUIT FOR AN OPEN OR EXCESSIVE RESISTANCE**
   1. Using a 12-volt test light connected to 12-volts, check the (Z914) Ground circuit in the INTEGRATED CENTER STACK (ICS harness connector.
   2. The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

      Does the test light illuminate brightly?

      Yes

      - Replace the INTEGRATED CENTER STACK (ICS) in accordance with the Service Information.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Repair the open or excessive resistance in the (Z914) Ground circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B210E-17-BATTERY VOLTAGE HIGH - CIRCUIT VOLTAGE ABOVE THRESHOLD

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 2: Integrated Center Stack Switch Bank Module Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the ignition on.

SET CONDITION

Vehicle System voltage greater than 16.0 volts.

POSSIBLE CAUSES

Possible Causes
VEHICLE CHARGING SYSTEM MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

1. **CHECK FOR POWERTRAIN CONTROL MODULE (PCM) DTCS**
    1. Using the scan tool, read the active PCM DTCs.

       Are there any battery or charging system DTCs?

       Yes

       - Refer to the **DTC INDEX** article and perform the appropriate diagnostic procedure.

       No

       - Go To 2
2. **TEST FOR AN INTERMITTENT CONDITION**
    1. Using the scan tool, record and erase the DTCs.
    2. Start the engine.
    3. Allow the engine to idle for two minutes.
    4. Using the scan tool, read the DTCs.

       Does the scan tool display: B210E-17 BATTERY VOLTAGE HIGH-CIRCUIT VOLTAGE ABOVE THRESHOLD?

       Yes

       - Replace INTEGRATED CENTER STACK (ICS) in accordance with the Service Information.
       - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

       No

       - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
       - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U0010-00-CAN INTERIOR BUS

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

The Integrated Center Stack (ICS) detects that the CAN IHS Bus has been off for more than five seconds when activity was expected.

POSSIBLE CAUSES

Possible Causes
CAN IHS BUS (125K) (+) CIRCUIT SHORTED TO GROUND
CAN IHS BUS (125K) (-) CIRCUIT SHORTED TO VOLTAGE
CAN IHS BUS (125K) (+) CIRCUIT SHORTED TO THE CAN IHS BUS (125K) (-) CIRCUIT
ANY CAN IHS BUS MODULE
INTEGRATED CENTER STACK (ICS)

DIAGNOSTIC TEST

VERIFY IF THE DTC IS ACTIVE

1. Cycle the ignition on.
2. With the scan tool, read the active DTCs.

   Does the scan tool display this DTC as Active?

   Yes

   - Refer to the **BODY CONTROL MODULE (BCM) - DIAGNOSTIC CODE INDEX** article and perform the U0010-00 CAN INTERIOR BUS diagnostic procedure.

   No

   - Refer to **DIAGNOSIS AND TESTING** and perform the STORED LOST COMMUNICATION DTCs diagnostic procedure.

U0011-00-CAN INTERIOR BUS OFF PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The primary communication network between electronic control modules is the Controller Area Network

(CAN) data bus system. The Controller Area Network (CAN) data bus allows all electronic modules connected to the bus to share information with each other. Regardless of whether a message originates from a module on the higher speed CAN C (500K) Bus or on the lower speed bus, CAN Interior High Speed (IHS) (125K) Bus, the message structure and layout is similar, which allows the Body Control Module/Central Gateway (BCM or BCMCGW) to process and transfer messages between the CAN buses. The BCM stores Diagnostic Trouble Codes (DTCs) for certain bus network faults on the CAN C (500K) Bus and CAN IHS (125K) Bus.

All modules transmit and receive messages over one of these buses. Data exchange between the modules is achieved by serial transmission of encoded data messages (a form of transmission in which data bits are sent sequentially, one at a time, over a single line). Each module can both send and receive serial data simultaneously. Each data bit of a CAN Bus message is carried over the bus as a voltage differential between the two bus circuits which, when strung together, form a message. Each module uses arbitration to sort the message priority if two competing messages are attempting to be broadcast at the same time. Corruption of a single bit within a message will corrupt the entire message. Each message contains a Cyclic Redundancy Check (CRC) which specifies the message size exactly. If the message detected conflicts with the CRC the ECU receiving it will determine the message to be an error and consider that communication has not been possible. Diagnosis of this condition using a lab scope may reveal activity that appears to be Bus data messages even if no actual communication is possible. Communication problems that affect the whole bus, as a result of opens and terminal push outs are more likely to occur on data busses that operate at a high speed than a data bus that operates at a lower speed.

When an open circuit or terminal push out occurs one or more modules can become isolated from the remainder of the bus. The isolated module will attempt to communicate, but will not be able to receive messages or determine arbitration from other modules. Each time the isolated module attempts to communicate it alters the bus voltage on the intact bus circuit. Without functioning arbitration the isolated module alters the bus voltage while other bus messages are being sent thereby corrupting the messages on the remainder of the bus.

The CAN bus modules are connected in parallel to the two-wire bus using a twisted pair, where the wires are wrapped around each other to provide shielding from unwanted electromagnetic induction, thus preventing interference with the relatively low voltage signals being carried through them. While the CAN bus is operating (active), one of the bus wires will carry a higher voltage and is referred to as the CAN High or CAN bus (+) wire, while the other bus wire will carry a lower voltage and is referred to as the CAN Low or CAN bus (-) wire.

For additional information on the communication network. Refer to **COMMUNICATION, DESCRIPTION** .

WHEN MONITORED

With the ignition on.

SET CONDITION

The Body Control Module (BCM) detects a short condition in one of the CAN IHS Bus (125K) circuits for less than one second.

POSSIBLE CAUSES

Possible Causes
(D157) CAN IHS BUS (125K) (+) CIRCUIT SHORTED TO GROUND
(D158) CAN IHS BUS (125K) (-) CIRCUIT SHORTED TO VOLTAGE
(D157) CAN IHS BUS (125K) (+) CIRCUIT SHORTED TO THE (D158) CAN IHS BUS (125K) (-) CIRCUIT
ANY CAN IHS BUS MODULE
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Turn the ignition on.
    2. With the scan tool, record and erase DTCs.
    3. Cycle the ignition from on to off three times.
    4. Turn the ignition on and wait 10 seconds.
    5. With the scan tool, read active DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE CAN IHS BUS CIRCUITS FOR A CONCERN WHILE DISCONNECTING THE CAN IHS BUS MODULES**

    NOTE: When performing this step, turn the ignition off (wait one minute) before disconnecting any module. When the module is disconnected turn the ignition on.

    NOTE: The BCM contains pass-through circuits which are used to connect the Front and Rear CAN IHS Star Connectors.

    1. While monitoring the scan tool, disconnect each CAN IHS Bus (125K) module at the CAN IHS Star Connectors (except for the BCM and DLC), one at a time.
    2. Check for this DTC to become stored after disconnecting each CAN IHS Bus (125K) module the vehicle is equipped with.

NOTE: If the DTC becomes stored when a particular module is disconnected, that module or related circuits are causing the DTC to set.

With all the CAN IHS Bus modules disconnected at the Star Connectors (except for BCM and DLC), does the scan tool display this DTC as active?

Yes

- Go To 3

No

- Diagnose the wiring and connectors between the CAN IHS Star Connector and the module that when disconnected caused this DTC to become stored for damage or shorted circuits. If OK, replace the module that when disconnected caused this DTC to become stored in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (D158) CAN IHS BUS (125K) (-) CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 3: Checking CAN IHS BUS (125K) (-) Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the scan tool.
3. Turn the ignition on.
4. Measure the voltage between ground and the (D158) CAN IHS Bus (125K) (-) circuit.

   Is the voltage above 10.0 volts?

   Yes

   - Repair the short to voltage in the (D158) CAN IHS Bus (125K) (-) circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

- Go To 4

4. **CHECK THE (D157) CAN IHS BUS (125K) (+) CIRCUIT FOR A SHORT TO GROUND**

Fig. 4: Checking CAN IHS BUS (125K) (+) Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between ground and the (D157) CAN IHS Bus (125K) (+) circuit.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 5

   No

   - Repair the short to ground in the (D157) CAN IHS Bus (125K) (+) circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **CHECK FOR CORRECT BUS TERMINATION RESISTANCE**

Fig. 5: Checking For Correct BUS Termination Resistance
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect and isolate the negative battery cable.
3. Measure the resistance between the (D157) CAN IHS Bus (125K) (+) circuit and the (D158) CAN IHS Bus (125K) (-) circuit.

   Is the resistance between 53.5 and 67 Ohms?

   Yes

   - Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

- For a resistance measurement above 67 Ohms, an open or high resistance is present in the CAN IHS Bus (125K) (+) circuit or the CAN IHS Bus (125K) (-) circuit between the Star Connectors or one of the termination resistors internal to the Star Connector is damaged. Diagnose and repair as necessary.
- For a resistance measurement below 53.5 Ohms, a short between the CAN IHS Bus (125K) (+) circuit and the CAN IHS Bus (125K) (-) is present. Diagnose the short between the CAN IHS Bus (125K) (+) circuit and the CAN IHS Bus (125K) (-) circuit. Use the Star Connectors to isolate portions of the bus to assist in determining the location of the concern. Diagnose and repair as necessary.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U0140-00-LOST COMMUNICATION WITH BODY CONTROL MODULE

Perform the COMMUNICATION PRE-DIAGNOSTIC PROCEDURE. Refer to **STANDARD PROCEDURE** .

U0164-LOST COMMUNICATION WITH HVAC CONTROL

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously when the ignition is on.

Battery voltage between 10 and 16 volts.

SET CONDITION

Bus messages not received from the HVAC Control Module for approximately 10 seconds.

POSSIBLE CAUSES

Possible Causes
CAN BUS (+) CIRCUIT SHORTED TO VOLTAGE
CAN BUS (-) CIRCUIT SHORTED TO GROUND
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
BODY CONTROL MODULE (BCM) NOT CONFIGURED CORRECTLY
HVAC POWER AND GROUND
HVAC CONTROL MODULE
MODULE THAT SET THE DTC

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE for 2.0L diesel engine, STANDARD PROCEDURE for 2.4L gasoline engine or STANDARD PROCEDURE for 3.2L gasoline engine. .

DIAGNOSTIC TEST

VERIFY DTC IS ACTIVE

1. Turn the ignition on.
2. With the scan tool, read the active DTCs.

   Does the scan tool display; U0164-LOST COMMUNICATION WITH HVAC CONTROL MODULE as Active?

   Yes

   - Refer to the **BODY CONTROL MODULE (BCM) - DIAGNOSTIC CODE INDEX** article and perform the U0164-LOST COMMUNICATION WITH HVAC Control Module.

   No

   - Refer to **DIAGNOSIS AND TESTING** and perform the STORED LOST COMMUNICATION DTCs diagnostic procedure.

U0184-00-LOST COMMUNICATION WITH RADIO

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously when the ignition is on.

The battery voltage is between 10 and 16 volts.

Body Control Module (BCM) is configured correctly.

SET CONDITION

Bus messages not received from the Radio for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
RADIO POWER AND GROUND
BCM NOT CONFIGURED CORRECTLY
RADIO
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

VERIFY THE DIAGNOSTIC TROUBLE CODE (DTC) IS ACTIVE

NOTE: Make sure the battery is fully charged before proceeding.

1. Turn the ignition on.
2. With the scan tool, read the active DTCs.

   Is this DTC active?

   Yes

   - Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM RADIO diagnostic procedure.

   No

   - Refer to **DIAGNOSIS AND TESTING** and perform the STORED LOST COMMUNICATION DTCs diagnostic procedure.

U0422-00- IMPLAUSIBLE DATA RECEIVED FROM BODY CONTROL MODULE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

At all times with Ignition in Run/Start.

SET CONDITION

Incorrect data received from the Body Control Module (BCM).

POSSIBLE CAUSES

Possible Causes
NO COMMUNICATION WITH THE BODY CONTROL MODULE (BCM)
DTCS STORED OR ACTIVE IN THE BCM
INTEGRATED CENTER STACK (ICS)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
   1. Turn the ignition on.
   2. With the scan tool, read the active DTCs.

Does the scan tool display this DTC as active?

Yes

- Go To 2

No

- The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **VERIFY THE BCM IS ACTIVE ON THE CAN BUS**
   1. With the scan tool, select ECU View.
   2. Verify that the BCM is active on the bus.

   Is the BCM active on the bus?

   Yes

   - Replace the Integrated Center Stack (ICS) in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM BCM diagnostic procedure.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U0424-00- IMPLAUSIBLE DATA RECEIVED FROM HVAC CONTROL MODULE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on for at least five seconds.

Battery voltage between 9 and 16 volts.

Body Control Module (BCM) is configured correctly.

SET CONDITION

Whenever the communication data sent over the CAN BUS from the HVAC Control Module is missing part of

the message, the message is corrupted, or the message is an irrational value.

POSSIBLE CAUSES

Possible Causes
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
BCM NOT CONFIGURED CORRECTLY
HVAC POWER AND GROUND
HVAC CONTROL MODULE
MODULE THAT SET THE DTC

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**

   NOTE: Make sure the battery voltage is between 9 and 16 volts before proceeding.

   1. With the scan tool, read active DTCs.

      Is this DTC active?

      Yes

      - Go To 2

      No

      - Refer to **DIAGNOSIS AND TESTING** and perform the STORED LOST COMMUNICATION DTC diagnostic procedure.

2. **CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS**
   1. With the scan tool, read active DTCs from all modules.

      NOTE: Check for BCM configuration, Bus hardware electrical issues, VIN Missing/Mismatch, battery or ignition related DTCs.

      Does the scan tool display any active DTCs to the conditions listed above?

      Yes

      - Go to and perform the appropriate diagnostic procedure.

      No

- Go To 3

3. **VERIFY THE HVAC IS ACTIVE ON THE BUS**
   1. Turn the ignition on.
   2. With the scan tool, verify the HVAC is active on the bus.

      Is the HVAC active on the bus?

      Yes

      - Go To 4

      No

      - Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM HVAC diagnostic procedure.
4. **CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS**
   1. With the scan tool, read all the DTCs.

      Is there more than one module with active DTCs "Logged Against" the HVAC?

      Yes

      - Replace/update the HVAC Module in accordance with the Service Information. Refer to **CONTROL, A/C AND HEATER, REMOVAL** .
      - Perform the appropriate verification test for the module. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 5
5. **CLEAR DTC IN MODULE SETTING FAULT**
   1. With the scan tool, select the module setting the DTC against the HVAC.
   2. Clear active DTCs.

      Is this DTC still active?

      Yes

      - Replace/update the module that set this DTC in accordance with the Service Information.
      - Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module, perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- The condition is not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
- Perform the appropriate verification test for the module. If there is no verification test for the associated module, perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U0485-00- IMPLAUSIBLE DATA RECEIVED FROM RADIO

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

Incorrect data received from the Radio.

POSSIBLE CAUSES

Possible Causes
NO COMMUNICATION WITH THE RADIO
DTCS STORED OR ACTIVE IN THE RADIO
RADIO
MODULE THAT SET THE DTC

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**

NOTE: Diagnose and repair any Radio DTCs before proceeding with this diagnostic procedure.

1. Turn the ignition on.
2. With the scan tool, read active DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Go To 2

No

- The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **VERIFY THE RADIO IS ACTIVE ON THE CAN BUS**
   1. With the scan tool, verify that the Radio is active on the bus.

   Is the Radio active on the bus?

   Yes

   - Replace/update the module that set this DTC in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM RADIO diagnostic procedure.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

Lamps/Lighting - Exterior - Service Information - Cherokee

WARNING

WARNING

WARNING: To avoid serious or fatal injury, eye protection should be used when servicing any glass components.

WARNING: To avoid serious or fatal injury when working on the High Intensity Discharge (HID) headlamp system, be certain to take the proper precautions. The headlamp switch must be in the OFF position. Disconnect and isolate the battery negative cable. There is a risk of fatal injury caused by contact with high voltage used in the HID headlamps. There is a risk of explosion or fire caused by highly flammable materials in the vicinity of damaged HID lighting elements. There is a risk of injury caused by exposure to Ultra Violet (UV) light, a risk of burns caused by high component operating temperatures, a risk of mercury poisoning through glass splinters produced by bursting HID lighting elements. There is also a risk of poisoning caused by inhalation of mercury vapors and by toxic salts and mercury compounds being ingested or coming into contact with the skin. Do not come into contact with parts that are under high voltage. Persons with active electronic implants (e.g. heart pacemakers) must never work on HID headlamps. Wear insulated safety shoes, safety glasses and protective gloves. Remove flammable materials and ensure sufficient ventilation in the working area.

CAUTION: Do not contaminate the glass of halogen bulbs with fingerprints or allow contact with other possibly oily surfaces. Reduced bulb life will result.

CAUTION: Do not use bulbs with higher candle power than indicated in the Bulb Application table. In addition, do not use fuses, circuit breakers or relays having greater amperage value than indicated on the fuse panel or in the Owner's Manual. Damage to lamps, lenses, wiring and other related electrical components can result.

DESCRIPTION

DESCRIPTION

The exterior lighting system for this vehicle includes the following exterior lamp units:

- **Center High Mounted Stop Lamp** - A standard equipment Center High Mounted Stop Lamp (CHMSL) is centered on the liftgate spoiler just above the flip-up glass opening at the rear of the vehicle.
- **Daytime Running Lamps** - The Daytime Running Lamps (DRL) are located in the combination Park/Turn lamp assembly. The DRLs on this vehicle are LED. There is a LED module located on the back of the lamp assembly.
- **Front Fog Cornering Lamps** - Vehicles equipped with this option have a separate fog lamp unit mounted near each outboard end of the front fascia, below each front lamp unit.
- **Front Lamp Units** - A halogen front lamp unit is standard equipment on vehicles manufactured for domestic markets. A High Intensity Discharge (HID) front lamp unit is optional equipment in vehicles manufactured for export markets and optional for domestic market vehicles. The front lamp units are mounted to the front fascia on either side of the mid grille opening.
- **License Plate Lamps** - Two standard equipment rear license plate lamp units are mounted to the underside of the light bar and handle unit, just above the license plate tub formation on the outer liftgate panel.
- **Outside Mirror Signal Lamps** - Vehicles equipped with this option have a signal lamp unit integral to the lower forward facing surface of each outside rear view mirror. These signal lamps are serviced only as a unit with the outside rear view mirror assembly.
- **Rear Lamp Unit** - Full 48-element LED illumination on either side of the vehicle - 24-LED elements are position on either side of the tailgate-to-rear aperture split line. The rear lamp unit combines a three-shot lens that integrates clear, red, and black surround surfacing. Direction signals and braking lamps illuminate on the outside array of the lamp, running lamps illuminate on the full array inside and outside.
- **Rear Fog Lamps** - In certain export markets where they are required, two rectangular fog lamps with red lenses and reflectors are located in the rear bumper fascia, one just inboard and below each rear lamp unit. In domestic market vehicles, a red reflector is installed in the rear fascia in place of a rear fog lamp.

These exterior lighting lamp units and their controls are combined to provide the following exterior lighting features:

- **Automatic Headlamps** - Automatic headlamps are optional equipment on this vehicle. The headlamp switch includes an **A** (Automatic) position and an automatic headlamp sensor senses ambient light levels. The automatic headlamp sensor is integral to the sun load sensor located on the top of the instrument panel. When the **A** position of the headlamp switch is selected, the headlamps are turned ON and OFF automatically as ambient light levels dictate.
- **Automatic High Beam Control** - Vehicles equipped with the optional automatic high beam control system include a unique digital light-sensing imager camera inside the vehicle on the windshield next to the rear view mirror. The conditions that need to be met for Automatic High Beam Control (AHBC) are:
  1. The headlamp switch needs to be sit to AUTO.
  2. Customer preference in the radio options needs to be enable.
  3. The stalk moved to the back/high beam position.
  4. Appropriate light conditions.
- **Backup Lamps** - In domestic market vehicles, the backup (or reverse) lamps include a clear bulb, reflector and clear lens that are integral to each inner and outer rear lamp unit. In export market vehicles, backup lamps are found in only the two inner rear lamp units.

- **Brake Lamps** - The brake (or stop) lamps are LED and are integral to each outer rear lamp unit, and the red lens and multiple Light-Emitting Diode (LED) units of the CHMSL. On vehicles equipped with combined rear lighting, the turn signal and stop lamp use the same LED elements. When combined rear lighting is present, turn signals are allowed to interrupt stop lamp actuation to allow turn signal actuation.
- **Daytime Running Lamps** - Domestic market vehicles with HID front lamp units and DRL illuminate a dedicated DRL bulb in the combination park/turn lamp unit, while export market vehicles illuminate a combination DRL/position lamp bulb in each front lamp unit.
- **Exterior Lamp Fail-Safe Operation** - The ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN) and the Body Control Module (BCM) provide a fail-safe feature which will automatically turn ON the low beam headlamps and all park lamps when the ignition switch is in the ON position and there is no detected input from the headlamp switch, or when there is no communication over the Controller Area Network (CAN) data bus.
- **Exterior Lamp Load Shedding** - The BCM provides a battery saver feature which will automatically turn OFF all exterior lamps that remain ON with the ignition switch in the LOCK position after a timed interval of about eight minutes.
- **Front Fog Cornering Lamps** - The optional front fog lamps include the bulb, reflector and lens of each adjustable front fog lamp unit.
- **Hazard Warning Lamps** - The hazard warning lamps include the bulbs, reflectors and lenses of each lamp in the right and left, front and rear turn signal circuits.
- **Headlamp Delay** - The low or high beam headlamps remain illuminated for 90 seconds after the ignition switch has been turned to the OFF position. If the vehicle is equipped with the optional Electronic Vehicle Information Center (EVIC), the delay interval is customer-programmable for 0, 30, 60 or 90 seconds.
- **Headlamps** - Two headlamp systems are available on this vehicle for domestic markets. The standard halogen headlamp system includes two single filament halogen bulbs in each front lamp unit, one low beam and one high beam. The optional HID headlamp system includes a single HID lighting element/igniter unit for low or high beam headlamps. An electric motor and mechanism internal to the HID lamp unit closes a shutter for low beams and opens the shutter for high beams. The HID front lamp units each include an electronic ballast module, while an Automatic Headlamp Leveling Module (AHLM) that serves both front lamp units levelling motor. Both headlamp systems also include an adjustable reflector and clear lens integral to each front lamp unit.
- **Headlamp Leveling** - On all vehicles equipped with optional HID headlamps, an Automatic Headlamp Leveling Module (AHLM) controls a headlamp leveling actuator motor attached to each front lamp unit to automatically perform headlamp adjustments using inputs from front and rear axle sensors to monitor changes in the vehicle suspension height. On vehicles equipped with manual headlamp levelling, the BCM directly drives both of the headlamp motors.
- **Optical Horn** - Also known as flash-to-pass, the beam selection function of the multi-function switch control stalk has a momentary intermediate position that allows the headlamp high beams to be flashed momentarily, without changing the headlamp beam selection.
- **Park Lamps** - The front park lamps include either the bulbs, the reflectors and the clear lenses of the park lamp compartment in both front combination lamp units. On vehicles not equipped with repeater lamp units, the front lamps also include the front side marker lamp bulbs and reflectors. On vehicles equipped with repeater lamp units, only the side marker reflectors are retained in the front lamp units. The rear park lamps include a clear bulb, a reflector and a red lens integral to each inner and outer rear lamp unit as well as the clear bulbs and lenses of the two license plate lamp units.

- **Rear Fog Lamps** - Rear fog lamps are available only in certain export markets where they are required equipment. The rear fog lamps include a clear bulb and a red lens and reflector that are integral to each rear fog lamp unit located below the outer tail lamps in the rear fascia. On domestic market vehicles, only the red reflector is retained in the rear fascia.
- **Turn Signal Lamps** - The front turn signal lamps include an amber bulb, a reflector, and a clear lens that are integral to each front combination lamp unit. On vehicles equipped with the optional outside mirror signal lamps, there are several amber LED units integral to each mirror signal lamp unit that are also activated by the turn signal circuits for the same side of the vehicle. Depending upon market requirements, the rear turn signal lamps include either a clear bulb and a red lens or an amber lens and a reflector that are integral to each outer rear lamp unit. On vehicles equipped with combined rear lighting, the turn signal and stop lamps use the same bulb filament. When combined rear lighting is preset, turn signals are allowed to interrupt stop lamp actuation to allow turn signal actuation.

Other components of the exterior lighting system for this vehicle include:

- **Automatic Headlamp Leveling Module** - Vehicles equipped with HID headlamps have an AHLM located in the passenger cabin underneath the glove box. The AHLM monitors the vehicle ride height through the front and rear axle sensors, then provides inputs to the headlamp leveling motor on each front lamp unit as appropriate.
- **Axle Sensors** - Vehicles equipped with HID headlamps have an axle sensor for both the front and the rear axles, which monitor the suspension height of the vehicle.
- **Backup Lamp Switch** - A Transmission Range Sensor (TRS) integral to the solenoid pack on the valve body of the electronic automatic transmission performs the backup lamp switch function for this vehicle.
- **Brake Lamp Switch** - A plunger-type brake lamp switch is located on the steering column support bracket under the instrument panel and is actuated by the brake pedal arm when the brake pedal is depressed.
- **Daytime Running Lamp Relays** - All vehicles equipped with optional HID headlamps have two DRL relays located in the Power Distribution Center (PDC).
- **Electronic Ballast Module** - Vehicles equipped with the HID headlamps have an electronic ballast module secured to the underside of each front lamp unit. Each module controls the HID lighting element/igniter within the front lamp unit to which it is mounted.
- **Hazard Switch** - A latching push button-actuated hazard switch is integral to the switch pod located just below the heater and air conditioner controls in the center stack area of the instrument panel.
- **Headlamp Leveling Motor** - A headlamp leveling actuator motor is attached to each front lamp unit housing of vehicles manufactured with HID headlamps.
- **Headlamp Switch** - A headlamp switch is located on the left side of the instrument panel, below the left instrument panel vent outboard of the steering column. The headlamp switch includes a rotary knob to turn the park lamps and headlamps ON or OFF and is pushed inward for selecting the optional front fog lamps on vehicles so equipped. The headlamp switch also features a vertical thumbwheel for selecting the panel lamps dimming level, a PARADE mode to illuminate all Vacuum Fluorescent Display (VFD) units at full brightness for visibility when driving in daylight with the exterior lighting turned ON, and for interior lighting control.
- **Instrument Cluster** - The ElectroMechanical Instrument Cluster (EMIC) is also known as the Cab Compartment Node (CCN) in this vehicle. The EMIC/CCN is located in the instrument panel above the

steering column opening, directly in front of the driver. Refer to **DESCRIPTION** .

- **Multi-Function Switch** - The multi-function switch is integral to the Steering Column Control Module (SCCM) located on the steering column, just below the steering wheel. A control stalk that extends from the left side of the SCM is used to select the turn signal lamps (right or left) and to select the headlamp beam (low, high or optical horn).
- **Park Brake Switch** - A park brake switch is located on the park brake lever mechanism on the cowl side inner panel (Left-Hand Drive/LHD) or the right side of the floor panel transmission tunnel (Right-Hand Drive/RHD) to the left of the steering column.
- **Steering Control Module** - The Steering Control Module (SCM) is located within and integral to the Steering Column Control Module (SCCM) located on the top of the steering column, just below the steering wheel. Refer to **MODULE, STEERING COLUMN, DESCRIPTION** .
- **Body Control Module** - The Body Control Module (BCM) is located beneath the instrument panel on the driver side of the vehicle. Refer to **MODULE, BODY CONTROL, DESCRIPTION** .
- **Trailer Tow Wiring** - Domestic market vehicles with a factory-installed trailer towing package have a trailer tow wire harness with a combination 4-way and heavy duty 7-way trailer tow connector installed in the rear bumper fascia near the trailer hitch receiver. This package also includes an electric trailer brake wiring provision that terminates at a connector located on top of the large body harness connection bracket under the instrument panel to the left of the steering column. An electric trailer brake pigtail harness and an instruction card are available through MOPAR® to ease installation of most aftermarket electric trailer brake controllers.
- **Trailer Tow Relays** - Domestic market vehicles with a factory-installed trailer towing package have two trailer tow relays installed in the TIPM in the engine compartment. One relay is for the trailer right turn and brake lamps, and the other is for the trailer left turn and brake lamps.

Hard wired circuitry connects the exterior lighting system components to the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the exterior lighting components through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

OPERATION

OPERATION

Following are paragraphs that briefly describe the operation of each of the major exterior lighting systems. The lamps and the hard wired circuits between components related to the exterior lighting system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the exterior lighting

system or the electronic controls or communication between modules and other devices that provide some features of the exterior lighting system. The most reliable, efficient and accurate means to diagnose the exterior lighting system or the electronic controls and communication related to exterior lighting system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

AUTOMATIC HEADLAMP

The two optional automatic headlamp systems can include the headlamp switch, the Body Control Module (BCM), the heater and air conditioner control head (also known as the Electronic Climate Control/ECC). The auto headlamp system has two available sensors that give the BCM feedback for lamp control. The light rain sensor and the twilight sensor on the top of the instrument panel are the two available sensors.

If the vehicle is not equipped with a light rain sensor, the twilight sensor provides the ambient light level input to the A/C - heater control whenever the ignition switch status is ON. The A/C - heater control responds to this input by sending the appropriate electronic **light level** messages to the BCM over the Controller Area Network (CAN) data bus. When the **AUTO** (Automatic) position is selected with the headlamp switch, the BCM receives a hard wired multiplex input from the headlamp switch. The BCM also receives electronic messages over the CAN data bus from the Powertrain Control Module (PCM) (also known as the Engine Control Module/ECM) indicating the engine is running. **The twilight sensor is only used for auto headlamp operation when the vehicle is not equipped with an optional light rain sensor.**

If the vehicle is equipped with a light rain sensor, then this rain sensor is what is read by the BCM.

The BCM responds to either input condition by automatically controlling a Pulse-Width Modulated (PWM) voltage output to the selected headlamp bulb filaments through the right and left low or high beam driver circuits to illuminate the headlamps. The BCM also remembers which beams (low or high) were selected when the headlamps were last turned OFF, and energizes those beams and lamps again the next time it turns the headlamps ON.

AUTOMATIC HIGH BEAM CONTROL

The optional auto high beam system **(if equipped with the Forward Facing Camera (FFC))** includes the digital imager Forward Facing (FFC), the BCM, the radio, the IC and the headlamp switch. First, the **Auto High Beams** option must be enabled using the customer programmable features function of the radio. Then the **AUTO** (Automatic) position must be selected using the rotary knob of the headlamp switch, the headlamp beam selector switch must be in the high beam position and the appropriate lighting conditions must be present. Finally, the vehicle speed must be greater than 32 kilometers-per-hour (20 miles-per-hour).

Once all of these prerequisites have been met, the HaLF module (otherwise known as the Forward Facing Camera or FFC) automatically sends the appropriate electronic **headlamp beam select switch status** messages to the BCM over the CAN C data bus. The BCM follows the command from the HaLF and turns on or off the high beams appropriately. The BCM also sends a message to the cluster for "Enabled" and Disabled" display messages. These messages should not display unless under optimal lighting conditions (night, dusk, etc.).

BACKUP LAMPS

The backup (or reverse) lamps have a path to ground at all times through a takeout and eyelet terminal of the

body wire harness that is secured to the body sheet metal within the passenger compartment. On vehicles with a manual transmission, the backup lamp switch provides a hard wired input to the to the PCM through a backup lamp switch signal circuit, and the PCM sends the appropriate electronic **reverse gear status** messages to the BCM over the CAN data bus. The BCM then controls a battery feed to the backup lamps on the backup lamp feed circuit as required whenever the ignition switch status is ON.

On vehicles with an automatic transmission, the PCM continually monitors electronic an hard wired multiplex input from the Transmission Range Sensor (TRS), then sends the appropriate electronic **gear selector status** messages received from the Gear Shift Module (GSM) over the CAN data bus, then relays the appropriate electronic **reverse gear status** messages to the BCM over the CAN data bus.

BRAKE LAMPS

The brake (or stop) lamps and the Center High Mounted Stop Lamp (CHMSL) each have a path to ground at all times through a takeout and eyelet terminal of the body wire harness that is secured to the body sheet metal within the passenger compartment. The brake lamp switch is continually monitored by the BCM. When the normally open circuit of the brake lamp switch is closed by the brake pedal arm, the BCM responds to the brake lamp switch input by providing a control output that energizes or de-energizes the brake lamps.

Some models can be equipped with combined rear lighting. This option allows the brake lamp and the turn signal lamp to use the same single bulb filament. The turn signal operation will take precedence when commanded on.

DAYTIME RUNNING LAMPS

Vehicles equipped with this option or manufactured for sale in Canada illuminate the LED bulbs of both front combination turn/park lamp units when the engine is running, the parking brake is released and the exterior lamps are turned OFF. The BCM must be programmed appropriately for this feature to be enabled. Once enabled, anytime the BCM receives electronic messages over the CAN data bus from the PCM indicating the engine is running, a hard wired multiplex input from the headlamp switch indicating the status of the headlamp switch is OFF and a hard wired input from the park brake switch indicating that the parking brake is released, the BCM provides an output to the proper bulb filaments through the right and left front turn signal feed circuits to produce illumination at the proper intensity.

FRONT FOG AND CORNERING LAMPS

Vehicles equipped with optional front fog lamps include a front fog lamp switch integral to the headlamp switch on the instrument panel. The front fog lamps have a path to ground at all times through their connection to the Front End Module (FEM) wire harness and a takeout with an eyelet terminal that is secured to the body sheet metal.

When the BCM input from the headlamp switch assembly indicates the fog lamps are selected, it controls front fog lamp operation by providing a battery voltage output to the fog lamps through the right and left front fog lamp control circuits. The BCM also sends the appropriate electronic **front fog lamp status** messages to the Instrument Cluster (IC) (also known as the Instrument Panel Cluster/IPC) to illuminate or extinguish the front fog lamp indicator.

Fog Lamp Dropout with High Beam Activation - If the front fog lamps are active and the vehicle's high beams turn ON, then the front fog lamp outputs shall turn OFF and the IPC indicator will also turn off and remain off until the high beams are turned OFF. If vehicle high beams are active and the front fog lamp command is operated, the IPC indicator will remain OFF. The BCM will keep track of a fog lamp request and honor the request when the high beams are turned OFF.

The BCM also provides a battery saver (load shedding) feature for the front fog lamps, which will turn these lamps OFF if they are left ON for more than about eight minutes when the status of the ignition switch is LOCK, if there is a charging system failure or if the electrical system voltage falls below about 11.75 volts for more than about 30 seconds.

Each front fog lamp includes an integral adjustment screw to be used for static aiming of the fog lamp beams.

FRONT FOG CORNERING LAMPS

The Cornering lights function is derived from two different inputs. Steering angle or the activation of the turn signal lamps. Both of those items can induce lamp cornering activation. In the event that both are creating an active request at the same time, the steering angle will be given priority to the expense of the one based on the turn signal lights. In the case of the steering angle sensor, the lamps will activate at the "10 and 2" positions when turning. When neither angle is breached, both of the front fog lamps remain on uninterrupted.

HAZARD WARNING LAMPS

The hazard warning system includes the IC, the BCM and the hazard latching switch in the switch pod bank in the center area of the instrument panel. The hazard switch provides a hard wired input to the BCM. When the BCM receives an input from the hazard switch, it controls hazard warning system operation and flash rate by controlling battery voltage outputs through high side drivers on the front and rear, right and left turn signal control circuits.

The BCM also sends the appropriate electronic **hazard switch status** messages to the IC over the CAN data bus to control the illumination and flash rate of the right and left turn signal indicators, as well as to control the click rate of an electromechanical relay soldered onto the IC electronic circuit board that emulates the sound emitted by a conventional electromechanical hazard warning flasher.

HEADLAMPS

The headlamp system includes the IC, the Steering Control Module (SCM), the BCM, the headlamp switch and the multi-function switch on the steering column. The headlamp bulbs have a path to ground at all times through their connection to the FEM wire harness. The FEM harness has takeouts with eyelet terminals that are secured to the front end sheet metal within the engine compartment. The BCM will store a Diagnostic Trouble Code (DTC) for any shorts or opens in the headlamp circuits.

The BCM monitors a hard wired multiplex input to determine the status of the headlamp switch. The BCM also monitors electronic **headlamp beam select switch status** messages received from the SCM over the CAN data bus. The BCM responds to these inputs by providing a pulse width modulated voltage output to the headlamp bulbs through high side drivers on the right and left headlamp feed circuits to illuminate the headlamps, and controls the high and low beam shutter operation through high side drivers on the right and left high beam feed

circuits. The BCM also sends the appropriate electronic **headlamp beam status** messages to the IC to control the illumination of the high beam indicator.

The BCM also remembers which beams (LOW or HIGH) were selected when the headlamps were last turned OFF, and energizes those beams again the next time the headlamps are turned ON. The BCM provides a battery saver (load shedding) feature for the headlamps, which will turn these lamps OFF if they are left ON for more than about eight minutes when the ignition switch status is LOCK. The SCM and the BCM each provide a fail-safe feature for the headlamps, which will cause the BCM to turn the low beam headlamps ON automatically if there is no input available from the headlamp switch or the multi-function switch. The BCM also provides a fail-safe feature for the headlamps that will turn the headlamps ON automatically whenever a loss of CAN bus communication is detected when the ignition switch status is ON.

Each headlamp includes an integral reflector adjustment screw to be used for static aiming of the headlamps.

HEADLAMP LEVELING

On vehicles with the HID headlamps, an automatic leveling system is used that includes front and rear axle sensors and an Automatic Headlamp Leveling Module (AHLM) located under the dash on the passenger side compartment. A headlamp leveling motor located on the back of each HID lamp unit is mechanically connected through an integral pushrod to the adjustable headlamp reflector.

The automatic headlamp leveling system automatically adjusts the headlamp beam reflectors to compensate for changes in vehicle suspension height regardless of whether caused by the loading of the vehicle suspension or vehicle pitch changes caused by acceleration and deceleration. The actuator motors are automatically adjusted by the AHLM, which reads the front and the rear axle sensors to determine the suspension height changes. The circuitry of the AHLM provides a voltage signal to the electronic circuitry of both leveling actuator motors and the electronic circuitry of these stepper motors responds to the voltage inputs received from the AHLM to move the headlamp reflectors to the selected position.

The headlamp leveling motors have a path to ground at all times. The automatic headlamp leveling components operate on battery current received only when the exterior lighting and the ignition switch are turned ON.

MANUAL HEADLAMP LEVELING

In certain markets where required, a headlamp leveling system is provided on the vehicle. The headlamp leveling system includes unique front headlamp units each connected to a headlamp leveling actuator motor, and a roller-actuated headlamp leveling switch integral to the headlamp switch pod on the instrument panel. The headlamp leveling system allows the headlamp beams to be adjusted to one of four vertical positions to compensate for changes in inclination caused by the loading of the vehicle suspension. The leveling motors are mechanically connected through an integral pushrod to the adjustable headlamp mounting collar.

Each time the headlamp leveling switch is depressed the circuitry of the switch pod provides an electronic **select status up** or **select status down** message input to the BCM over the a data bus. The BCM provides a voltage output to the headlamp leveling motors through high side drivers on the headlamp leveling motor right and left signal circuits to move the headlamp reflectors to the selected position based upon the voltage input received from the BCM. The BCM also sends the appropriate electronic messages back to the switch to control the illumination of the **1** , **2** , or **3** Light Emitting Diode (LED) selected position indicator in the leveling switch

button. BCM logic will only allow the headlamp leveling system to operate while the ignition switch is in the ON position and the exterior lighting is turned ON.

HEADLAMP TIME DELAY

The headlamp delay feature includes the headlamp switch and the BCM. In vehicles with the optional EVIC, this feature is customer programmable using the EVIC switch pod and the EVIC electronic display unit to select delay intervals of 0 seconds (disabled), 30 seconds, 60 seconds and 90 seconds. If the headlamp switch remains in the headlamp **AUTO** (Automatic) position until after the ignition switch status transitions to OFF, then the headlamps will remain illuminated until after the selected delay interval has elapsed. The park lamps will not stay ON during the headlamp time delay interval. The default delay interval is 90 seconds, but can be reprogrammed by the customer using the EVIC switch pod.

PARK LAMPS

The park lamps system includes the headlamp switch on the instrument panel and the BCM. The front park lamps each have a path to ground at all times through their connection to the FEM wire harness. The FEM wire harness has takeouts with eyelet terminals that are secured to the body sheet metal. The rear park/tail lamps and license plate lamp bulb each have a path to ground at all times through a takeout and eyelet terminal of the body wire harness that is also secured to the body sheet metal.

The BCM monitors a hard wired multiplex input from the headlamp switch. The BCM responds to this input by controlling a battery voltage output to the appropriate lamps and bulbs through high side drivers on the front and rear, right and left lamp driver and control circuits. The BCM also sends the appropriate electronic **park lamps status** messages to the IC to control the illumination and lighting level of the panel lamps.

The BCM provides a battery saver (load shedding) feature for the park lamps, which will turn these lamps OFF if they are left ON for more than about eight minutes while the ignition switch status is LOCK. The BCM also provides a fail-safe feature for the park lamps, which will turn the park lamps and low beam headlamps ON automatically if there is no input available from the headlamp switch after the ignition switch status transitions to ON. The BCM also provides a fail-safe feature for the park lamps that will turn the park lamps and low beam headlamps ON automatically whenever a loss of CAN bus communication is detected after the ignition switch status transitions to ON.

TURN SIGNAL LAMPS

The left or right direction signals are activated using the left stalk switch input to the SCCM. These commands are codified using a resistive divider, into the analogical command that is read by the SCCM and then sent to the BCM over CAN-C.

The turn signal lamps system includes the multi-function switch on the steering column, the SCM, the IC and the BCM. The front turn signal lamp bulbs each have a path to ground at all times through their connection to the combination park/turn lamp and dash wire harness. The combination park/turn lamp and dash wire harness has takeouts with eyelet terminals that are secured to the body sheet metal. The rear turn signal lamps are LED elements within the rear outer tail lamp housing.

The SCM monitors a hard wired multiplex input from the multi-function switch to determine the status of the

turn signal switch, then sends the appropriate electronic **turn signal switch status** messages to the BCM over the CAN data bus. The BCM responds to these messages by controlling a battery voltage output and the flash rate for either the right or left turn signal lamps through high side drivers on the appropriate front and rear, right or left turn signal control circuits. The BCM also sends the appropriate electronic messages to the IC to control the illumination and flash rate of the right or left turn signal indicators, as well as to control the click rate of an electromechanical relay soldered onto the IC electronic circuit board that emulates the sound emitted by a conventional electromechanical turn signal flasher.

The BCM also provides a Turn Signal ON warning that will send a **turn signal ON warning** request message to the IC over the CAN bus that causes the IC to generate repetitive chimes to indicate that a turn signal has been active continuously for 1.6 kilometers (1 mile) with the vehicle speed greater than 22 kilometers-per-hour (15 miles-per-hour). The chime will continue until the turn signal input becomes inactive or until the vehicle speed message indicates that the speed is less than 22 kilometers-per-hour (15 miles-per-hour), whichever occurs first.

SNA Definition - Signal Not Acquired. If the SCCM detects an issue (stuck switch, etc) and sets an active fault, the SCCM shall broadcast the SNA state to the BCM. BCM will default to an idle state and keep all turn signal outputs OFF until a valid request is received.

Combined Rear Lighting - Some models will be equipped with combined rear lighting. The stop lamp and the turn signal lamp share the same single bulb filament. When the turn signal is activated, the SCCM recognizes the signal switch request. The SCCM sends this message over the CAN C bus to the BCM for processing. The BCM then actuates the single bulb filament for signal operation only until the stalk is reset back to the neutral position.

Combined Front Park/Turn - When the turn signal function is active, the BCM will apply the normal voltage to the turn signal output. When both the park and the turn functions (or hazards) are active, the BCM will switch between park intensity and turn intensity for the duration of the front left turn or right turn (or hazard) event.

Lane Change Function - If either of the turn signals are actuated for a time equal to or less than 500 ms, the BCM will activate the requested turn signal light and will blink for three blinks. At the same time the signals are switched ON, the BCM will also activate the internal signal corresponding with the selected side. The internal signal will show ON for the entire period of the turn signal even and will not show to be blinking. The internal signal is synchronous with the signal activation and will turn OFF at the end of the vent. After 3 blink cycles, the BCM switches OFF the turn signals, the CAN-B signals, and the internal signals corresponding to the selected side.

Turn Signal Alert Feature - When either the left or right turn signal are activated, the IPC (Cluster) will record the distance travelled using odometer information by way of the CAN-B signal. When one mile (1.6 km) has been traveled, the cluster will assume that the operator has unintentionally left the turn signals activated and two alerts will occur: A slow audible chime will emit from the cluster or an icon and textual message will display on the cluster.

CONTROL MODULE RESPONSIBILITY

- BCM - Turn signal lights request from the SCCM, received from the turn signal multi-function switch.

- BCM - Turn signal lights powering (left and right sides)
- BCM - Turn signal light status transmittal over CAN-B.
- BCM - Combined lighting turn/stop and park/turn lamp management.
- IPC - Obtain turn signal lamp status from CAN-B
- IPC - Turn signal lights signalling management.
- IPC - Turn signal lights fail signalling management.
- SCCM - Turn signal output acquisition from the multi-function switch
- SCCM - Turn signal activation request to BCM over CAN-C

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - EXTERIOR LIGHTING

WARNING: **To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.**

NOTE: **When diagnosing the exterior lighting circuits, remember that high generator output can burn out bulbs rapidly and repeatedly; and, that dim or flickering bulbs can be caused by low generator output or poor battery condition. If one of these symptoms is a problem on the vehicle, be certain to diagnose the battery and charging system, then repair as necessary.**

NOTE: **A good ground is necessary for proper lighting operation. If a lighting problem is being diagnosed that involves multiple symptoms, systems, or components, the problem can often be traced to a loose, corroded, or open ground.**

The lamps and the hard wired circuits between components related to the exterior lighting system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the exterior lighting system or the electronic controls or communication between modules and other devices that provide some features of the exterior lighting system. The most reliable, efficient, and accurate means to diagnose the exterior lighting system or the electronic controls and communication related to exterior lighting system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

AUTOMATIC HEADLAMPS

NOTE: **Be certain that the headlamps can be turned ON and OFF manually before attempting to diagnose and repair the Automatic Headlamps. If not, diagnose and repair those problems before attempting to repair the Automatic Headlamps.**

NOTE: **The Automatic Headlamp switch is integral to the headlamp switch itself, which communicates with the Body Control Module (BCM) over via data bus. Before performing any of the following tests, determine whether the other functions of the headlamp are operational. If the other functions are ineffective, diagnose and repair that problem before attempting to repair the Automatic Headlamps.**

CONDITION	POSSIBLE CAUSES	CORRECTION
AUTO HEADLAMPS INEFFECTIVE	1. Feature not enabled.	1. Enable **Auto Low** or **Auto Low/High** using the customer programmable features function of the Electronic Vehicle Information Center (EVIC).
	2. Ineffective headlamp switch.	2. Test and replace switch if required.
	2. Incorrect BCM configuration.	2. Use a diagnostic scan tool to check and configure BCM if required.
	3. Ineffective circuits between sun load sensor and air conditioner - heater control (except with automatic wipers).	3. Test and repair sun sensor and sun sensor return circuits if required.
	4. Ineffective sun load sensor (except with automatic wipers). If vehicle is export, then LRSM is 100% in control of light identification and not the Sun Sensor.	4. Test and replace sun load sensor if required. Connect the scan tool and monitor the sensor voltage while covering and uncovering the sensor. A covered sensor voltage should read approximately 4.6V and an uncovered sensor should read approximately 2.3V.
	5. Ineffective Light Rain Sensor Module (LRSM) (with automatic wipers).	5. Use a diagnostic scan tool to test and replace the LRSM if required. Refer to the appropriate diagnostic information.
	6. Ineffective BCM inputs or outputs.	6. Use a diagnostic scan tool to test the BCM inputs and outputs. Refer to the appropriate diagnostic information.

AUTO HIGH BEAM HEADLAMP

Please make sure the beauty cover is installed in position while testing the (Forward Facing Camera) FFC and Auto High Beams. Loss of cover creates interference with the imager of the camera.

CONDITION	POSSIBLE CAUSES	CORRECTION
AUTO HIGH BEAM CONTROL SYSTEM IS INOPERATIVE.	1. Feature is not enabled.	1. Enable **Auto Low/High** using the customer programmable features function located within the radio.
	2. Automatic headlamps are not turned **ON** .	2. Turn automatic headlamps ON using the control knob of the headlamp switch.
	3. Headlamp high beams are not selected.	3. Turn high beam headlamps ON using the stalk.
	4. Vehicle speed is below 34 kilometers-per-hour (18 miles-per-hour).	4. Increase vehicle speed. This system not designed to operate at speeds below 34 kilometers-per-hour (18 miles-per-hour).
	5. Incorrect (Body Control Module) BCM configuration.	5. Use a diagnostic scan tool to check and correct the BCM configuration settings if required. Refer to the appropriate diagnostic information.
	6. FFC is inoperative on the bus or a loss of CAN C bus communication.	6. Using the WiTech, confirm the FFC is off-line and to test the CAN C bus system.
	7. Ineffective ground circuit to the FFC.	7. Test and repair open ground circuit to the forward facing camera as required.
	8. Ineffective feed circuit to the FFC.	8. Test and repair open fused run relay output circuit to the forward facing camera if required.
	9. Forward Facing Camera imager lens dirty or obstructed.	9. Clean imager lens and windshield or remove obstructions from the windshield glass if required.
	10. FFC bussed outputs to the BCM.	10. Use a diagnostic scan tool confirm the FFC operation.
	11. FFC is in a limited function mode.	11. Use a diagnostic scan tool and check for DTCs relative to FFC reliant components.

BACKUP LAMPS

CONDITION	POSSIBLE CAUSES	CORRECTION
BACKUP LAMP DOES NOT ILLUMINATE	1. Ineffective or missing bulb.	1. Test and replace backup lamp bulb if required.
	2. Ineffective ground circuit.	2. Test and repair open backup lamp ground circuit if required.
	3. Ineffective feed circuit.	3. Test and repair open backup lamp feed circuit if required.

	4. Ineffective switch.	4. Test and replace backup lamp switch (manual transmission) or TRS (automatic transmission) if required.
	5. Ineffective BCM inputs or outputs.	5. Use a diagnostic scan tool to test the BCM inputs and outputs. Refer to the appropriate diagnostic information.
BACKUP LAMP DOES NOT EXTINGUISH	1. Ineffective feed circuit.	1. Test and repair shorted backup lamp feed circuit if required.
	2. Ineffective switch.	2. Test and replace backup lamp switch (manual transmission) or transmission range sensor (automatic transmission) if required.
	3. Ineffective BCM inputs or outputs.	3. Use a diagnostic scan tool to test the BCM inputs and outputs. Refer to the appropriate diagnostic information.

BRAKE LAMPS

NOTE: **The brake lamps and the Center High Mounted Stop Lamp (CHMSL) are illuminated by several Light-Emitting Diode (LED) units that are soldered to the electronic circuit board within the lamp housing. The CHMSL is hard wired to the output of the brake lamp switch, while the brake lamps are powered by high side drivers within the BCM based upon an input from the brake lamp switch. If the brake lamps and all of the LED units within the CHMSL fail to operate, diagnose and repair the brake lamps before attempting to repair the CHMSL. If the brake lamps operate but none of the CHMSL LED units illuminate, test and repair the CHMSL ground or feed circuit if required. If some of the CHMSL LED units operate and others do not, the CHMSL assembly must be replaced with a new unit.**

CONDITION	POSSIBLE CAUSES	CORRECTION
BRAKE LAMP DOES NOT ILLUMINATE	1. Ineffective ground circuit.	1. Test and repair open brake lamp ground circuit if required.
	2. Ineffective fuse.	2. Test and replace the fuse in the BCM if required.
	3. Ineffective feed circuit.	3. Test and repair open brake lamp switch output circuit or stop lamp output circuit if required.
	4. Ineffective switch.	4. Test and replace brake lamp switch if required.
	5. Ineffective BCM inputs or outputs.	5. Use a diagnostic scan tool to test the BCM inputs and outputs. Refer to the appropriate diagnostic information.
BRAKE LAMP DOES NOT EXTINGUISH	1. Ineffective feed circuit.	1. Test and repair shorted brake lamp switch output circuit or stop lamp output

		circuit if required.
	2. Improperly adjusted switch.	2. Adjust the brake lamp switch if required.
	3. Ineffective switch.	3. Test and replace brake lamp switch if required.
	4. Ineffective BCM inputs or outputs.	4. Use a diagnostic scan tool to test the BCM inputs and outputs. Refer to the appropriate diagnostic information.

DAYTIME RUNNING LAMPS

NOTE: Before performing the following tests, determine whether the turn signals operate. If the turn signals are also ineffective, diagnose and repair that problem before attempting to repair the Daytime Running Lamps.

CONDITION	POSSIBLE CAUSES	CORRECTION
DAYTIME RUNNING LAMPS WILL NOT ILLUMINATE	1. Incorrect BCM programming.	1. Use a diagnostic scan tool to check and configure BCM if required.
	2. Automatic transmission in PARK position.	2. Place the transmission gear selector lever in any position except PARK.
	3. Parking brake applied.	3. Release the parking brake.
	4. Engine not running.	4. Start the engine.
	5. Ineffective LED Module	5. Confirm power and ground at the LED module prior to replacement.
	6. Ineffective BCM inputs or outputs.	6. Use a diagnostic scan tool to test the BCM inputs and outputs. Refer to the appropriate diagnostic information.

FRONT FOG LAMPS

NOTE: The front fog lamp switch is integral to the left multi-function switch/Steering Control Module (SCM), which communicates with the Body Control Module (BCM). The BCM communicates or broadcasts to the ElectroMechanical Instrument Cluster (EMIC)/Cab Compartment Node (CCN) over the CAN-B. Before performing any of the following tests, determine whether the other functions of the left multi-function switch/SCM are operational. If the other left multi-function switch/SCM functions are ineffective, diagnose and repair that problem before attempting to repair the Front Fog Lamps.

If the BCM receives a short or open circuit from the fog lamp switch, the BCM will set a DTC for each present faulted condition. If the BCM received an open or short circuit while the front fog lamps are ON then the BCM will retain the last state of the fog lamp switch until the next engine cycle. After the next ignition cycle if the headlamp switch is still faulted, the BCM will not activate the front fog lamps.

If the front fog lamp switch is active for 20 second or more, the BCM shall activate the front fog lamps and will

set a front fog stick switch fault DTC. If the front fog lamp switch remains faulted, the BCM will continue to drive the front fog lamps in a normal manner until the switch is repaired or replaced. If the front fog switch is no longer stuck, the BCM will clear the related fault DTC.

If the BCM received a front fog command and the PROXI is not correct or set for the vehicle being equipped with fog lamps, the BCM will set a misbuild fault. Run PROXI configuration first.

CONDITION	POSSIBLE CAUSES	CORRECTION
FRONT FOG LAMP DOES NOT ILLUMINATE	1. Ineffective or missing bulb.	1. Test and replace front fog lamp bulb if required.
	2. Ineffective ground circuit.	2. Test and repair open front fog lamp ground circuit if required.
	3. Ineffective feed circuit.	3. Test and repair open front fog lamp feed circuit if required.
	4. Ineffective EMIC (CCN) inputs or outputs.	4. Use a diagnostic scan tool and the appropriate diagnostic information for further EMIC diagnosis.
	5. Ineffective BCM inputs or outputs.	5. Use a diagnostic scan tool to test the BCM inputs and outputs. Refer to the appropriate diagnostic information.
FRONT FOG LAMP DOES NOT EXTINGUISH	1. Ineffective feed circuit.	1. Test and repair shorted front fog lamp feed circuit if required.
	2. Ineffective EMIC (CCN) inputs or outputs.	2. Use a diagnostic scan tool and the appropriate diagnostic information for further EMIC diagnosis.
	3. Ineffective BCM inputs or outputs.	3. Use a diagnostic scan tool to test the BCM inputs and outputs. Refer to the appropriate diagnostic information.

HAZARD WARNING LAMPS

NOTE: **The hazard switch is integral to the instrument panel switch bank, which provides a hard wired output to the BCM. Before performing any of the following tests, confirm whether the left and right turn signals operate satisfactorily. Then determine whether the other functions of the instrument panel switch bank are operational. If the turn signals are ineffective or operate improperly, or if the other instrument panel switch bank functions are ineffective, diagnose and repair those problems before attempting to repair the hazard warning lamps system.**

CONDITION	POSSIBLE CAUSES	CORRECTION
HAZARD WARNING LAMPS DO NOT FLASH	1. Ineffective instrument panel switch bank.	1. Test and replace instrument panel switch bank if required.
	2. Ineffective BCM inputs or	2. Use a diagnostic scan tool to test the BCM inputs and outputs. Refer to the

	outputs.	appropriate diagnostic information.
HAZARD WARNING LAMPS DO NOT STOP FLASHING	1. Ineffective instrument panel switch bank.	1. Test and replace instrument panel switch bank if required.
	2. Ineffective BCM inputs or outputs.	2. Use a diagnostic scan tool to test the BCM inputs and outputs. Refer to the appropriate diagnostic information.

HEADLAMPS

NOTE: **As part of the exterior lighting fail-safe feature, upon ignition ON, all exterior park lamps and the headlamp low beams will illuminate regardless of the left multi-function switch control knob position if the SCM cannot detect an input from the left multi-function switch, or if there is a loss of communication between the left multi-function switch/SCM and the EMIC or between the EMIC and the BCM. Diagnose and repair those problems before attempting to repair the Headlamps. In addition, the BCM will store a Diagnostic Trouble Code (DTC) for an open or shorted headlamp circuit.**

CONDITION	POSSIBLE CAUSES	CORRECTION
HEADLAMP DOES NOT ILLUMINATE	1. Ineffective or missing bulb.	1. Test and replace headlamp bulb if required.
	2. Ineffective ground circuit.	2. Test and repair open headlamp ground circuit if required.
	3. Ineffective feed circuit.	3. Test and repair open headlamp low beam or high beam feed circuit if required.
	4. Ineffective EMIC (CCN) inputs or outputs.	4. Use a diagnostic scan tool and the appropriate diagnostic information for further EMIC diagnosis.
	5. Ineffective BCM inputs or outputs.	5. Use a diagnostic scan tool to test the BCM inputs and outputs. Refer to the appropriate diagnostic information.
HEADLAMP DOES NOT EXTINGUISH	1. Ineffective feed circuit.	1. Test and repair shorted headlamp low beam or high beam feed circuit if required.
	2. Ineffective EMIC (CCN) inputs or outputs.	2. Use a diagnostic scan tool and the appropriate diagnostic information for further EMIC diagnosis.
	3. Ineffective BCM inputs or outputs.	3. Use a diagnostic scan tool to test the BCM inputs and outputs. Refer to the appropriate diagnostic information.
HEADLAMPS ILLUMINATE WITH IGNITION ON AND HEADLAMP SWITCH OFF (FAIL-SAFE OPERATION)	1. Loss of LIN or CAN data bus communication.	1. Test and repair the LIN or CAN data bus if required. Refer to the appropriate diagnostic information.

HEADLAMPS WILL NOT SWITCH FROM HIGH TO LOW BEAMS, OR FROM LOW TO HIGH BEAMS	1. Ineffective EMIC (CCN) inputs or outputs.	1. Use a diagnostic scan tool and the appropriate diagnostic information for further EMIC diagnosis.
	2. Ineffective BCM inputs or outputs.	2. Use a diagnostic scan tool to test the BCM inputs and outputs. Refer to the appropriate diagnostic information.

HEADLAMP LEVELING - AUTOMATIC

NOTE: **Before performing any of the following tests, confirm whether the park lamps operate satisfactorily. If the park lamps are ineffective or operate improperly, diagnose and repair that problem before attempting to repair the automatic headlamp leveling function.**

CONDITION	POSSIBLE CAUSES	CORRECTION
ONE LEVELING MOTOR IS INEFFECTIVE	1. Ineffective ground circuit.	1. Test and repair open leveling motor ground circuit if required.
	2. Ineffective feed circuit.	2. Test and repair open leveling motor feed circuit if required.
	3. Ineffective signal circuit.	3. Test and repair open headlamp adjust signal circuit if required.
	4. Ineffective motor.	4. Test and replace headlamp leveling motor (front lamp unit) if required.
BOTH LEVELING MOTORS ARE INEFFECTIVE	1. Ineffective motor ground circuit.	1. Test and repair open leveling motor ground circuit if required.
	2. Ineffective motor feed circuit.	2. Test and repair open leveling motor feed circuit if required.
	3. Ineffective signal circuit.	3. Test and repair open or shorted leveling motor signal circuit if required.
	4. Ineffective Automatic Headlamp Leveling Module (AHLM) (also known as the High Intensity Discharge Transducer/HIDT) inputs or outputs.	4. Use a diagnostic scan tool to test the AHLM inputs and outputs. Refer to the appropriate diagnostic information.
	5. Ineffective BCM inputs or outputs.	5. Use a diagnostic scan tool to test the BCM inputs and outputs. Refer to the appropriate diagnostic information.
	6. Ineffective motors.	6. Test and replace leveling motors (front lamp units) if required.

HEADLAMP LEVELING - MANUAL

NOTE: **Before performing any of the following tests, confirm whether the park lamps operate satisfactorily. If the park lamps are ineffective or operate improperly, or if the other instrument panel switch pod functions are ineffective, diagnose and repair those problems before attempting to repair the manual headlamp leveling function.**

CONDITION	POSSIBLE CAUSES	CORRECTION
ONE LEVELING MOTOR IS INEFFECTIVE	1. Ineffective ground circuit.	1. Test and repair open leveling motor ground circuit if required.
	2. Ineffective feed circuit.	2. Test and repair open leveling motor feed circuit if required.
	3. Ineffective signal circuit.	3. Test and repair open headlamp leveling motor signal circuit if required.
	4. Ineffective motor.	4. Test and replace headlamp leveling motor if required.
BOTH LEVELING MOTORS ARE INEFFECTIVE	1. Ineffective switch inputs or outputs.	1. Use a diagnostic scan tool and the appropriate diagnostic information for further switch diagnosis.
	2. Ineffective motor ground circuit.	2. Test and repair open leveling motor ground circuit if required.
	3. Ineffective motor feed circuit.	3. Test and repair open leveling motor feed circuit if required.
	4. Ineffective signal circuit.	4. Test and repair open or shorted headlamp leveling motor signal circuit if required.
	5. Ineffective BCM inputs or outputs.	5. Use a diagnostic scan tool to test the BCM inputs and outputs. Refer to the appropriate diagnostic information.
	6. Ineffective motors.	6. Test and replace leveling motors if required.

PARK LAMPS

NOTE: **As part of the exterior lighting fail-safe feature, upon ignition ON, all exterior park lamps and the headlamp low beams will illuminate regardless of the left multi-function switch control knob position if the SCM cannot detect an input from the left multi-function switch, or if there is a loss of communication between the left multi-function switch/SCM and the EMIC or between the EMIC and the BCM. Diagnose and repair those problems before attempting to repair the Park Lamps.**

CONDITION	POSSIBLE CAUSES	CORRECTION
PARK LAMP DOES NOT ILLUMINATE	1. Ineffective or missing bulb.	1. Test and replace park lamp bulb if required.

	2. Ineffective ground circuit.	2. Test and repair open park lamp ground circuit if required.
	3. Ineffective feed circuit.	3. Test and repair open park lamp feed circuit if required.
	4. Ineffective EMIC (CCN) inputs or outputs.	4. Use a diagnostic scan tool and the appropriate diagnostic information for further EMIC diagnosis.
	5. Ineffective BCM inputs or outputs.	5. Use a diagnostic scan tool to test the BCM inputs and outputs. Refer to the appropriate diagnostic information.
PARK LAMP DOES NOT EXTINGUISH	1. Ineffective feed circuit.	1. Test and repair shorted park lamp feed circuit if required.
	2. Ineffective EMIC (CCN) inputs or outputs.	2. Use a diagnostic scan tool and the appropriate diagnostic information for further EMIC diagnosis.
	3. Ineffective BCM inputs or outputs.	3. Use a diagnostic scan tool to test the BCM inputs and outputs. Refer to the appropriate diagnostic information.

TURN SIGNAL LAMPS

NOTE: The turn signal switch is integral to the left multi-function switch/SCM, which communicates with the EMIC/CCN over the LIN data bus. Before performing any of the following tests, determine whether the other functions of the left multi-function switch/SCM are operational. If the other left multi-function switch/SCM functions are ineffective, diagnose and repair that problem before attempting to repair the Turn Signal Lamps.

Turn Lamp Fault Environment - Diagnoses is performed for the front and rear turns signal lamps by the BCM. If Combined Front Park/Turn is present on the vehicle, the BCM will only perform diagnostics when the turn signal is placed into an active state. If a left or right turn signal is requested and a faulted condition is present for either the front or rear turn signals at the time of the activation, the frequency of the CAN-B signals will show doubled corresponding to the side of the fault. If the left or right side has a faulted condition, the cluster will send an internal signal to display to the driver the faulted condition. However, the BCM output frequency to the lamps will not be changed during this faulted state. Even if the CAN-B frequency is doubled, the output from the BCM to the lamps will still be driven at a normal operating frequency.

It is required that, during the same ignition cycle, if a turn signal lamp or bulb is replaced, the system will recover with no intervention by the technician. Starting the vehicle and disconnecting a turn signal bulb or LED will result in an open fault. Replacing the bulb or LED lamp assembly causes the fault to change from active to stored. Normal signalling behavior will returns. This process applies to any of the six exterior lighting turn signal displays in use for this vehicle.

CONDITION	POSSIBLE CAUSES	CORRECTION
ONE TURN SIGNAL LAMP	1. Ineffective or missing	1. Test and replace turn signal bulb if

DOES NOT ILLUMINATE	bulb.	required.
	2. Ineffective ground circuit.	2. Test and repair open ground circuit if required.
	3. Ineffective feed circuit.	3. Test and repair open right or left turn signal feed circuit if required.
	4. Ineffective BCM inputs or outputs.	4. Use a diagnostic scan tool to test the BCM inputs and outputs. Refer to the appropriate diagnostic information.
ALL RIGHT SIDE OR ALL LEFT SIDE TURN SIGNAL LAMPS (OR BOTH SIDES) DO NOT FLASH	1. Ineffective feed circuit.	1. Test and repair open right or left turn signal feed circuit if required.
	2. Ineffective EMIC (CCN) inputs or outputs.	2. Use a diagnostic scan tool and the appropriate diagnostic information for further EMIC diagnosis.
	3. Ineffective BCM inputs or outputs.	3. Use a diagnostic scan tool to test the BCM inputs and outputs. Refer to the appropriate diagnostic information.
ALL RIGHT SIDE OR ALL LEFT SIDE TURN SIGNALS DO NOT FLASH	1. Ineffective or missing bulb.	1. Test and replace turn signal bulb if required.
	2. Ineffective ground circuit.	2. Test and repair open bulb ground circuit if required.
	3. Ineffective feed circuit.	3. Test and repair open right or left turn signal feed circuit if required.
TURN SIGNALS DO NOT AUTOMATICALLY CANCEL	1. Ineffective cancel cam.	1. Inspect and replace the turn signal cancel cam (clockspring) if required.
	2. Ineffective cancel actuator.	2. Inspect and replace the turn signal cancel actuator (left multi-function switch) if required.

STANDARD PROCEDURE

STANDARD PROCEDURE - LAMP ALIGNMENT

VEHICLE PREPARATION FOR LAMP ALIGNMENT

1. Check for and correct any burnt out bulbs.
2. Repair or replace any ineffective, worn or damaged body or suspension components that could hinder proper lamp alignment.
3. Verify the proper tire inflation pressures.
4. Remove any accumulations of mud, snow or ice from the vehicle underbody and clean the front lamp lenses.
5. Verify that there is no load in the vehicle (cargo or passengers), except for the driver.
6. The fuel tank should be FULL. Add 2.94 kilograms (6.5 pounds) of weight over the fuel tank for each estimated gallon of missing fuel.

7. Verify the correct vehicle suspension height.

LAMP ALIGNMENT SCREEN PREPARATION

Fig. 1: Lamp Alignment Screen Preparation
Courtesy of CHRYSLER GROUP, LLC

The procedure that follows will prepare a suitable front lamp alignment screen.

1. Tape a line on a level floor 7.62 meters (25 feet) away from and parallel to the flat wall that will be used as the lamp alignment screen. The level floor will be used as the horizontal zero reference.
2. An adjacent wall or floor member that is perpendicular to the alignment screen can be used as the vertical zero reference. If there is no adjacent wall or floor member that is perpendicular to the screen, tape a second line on the floor perpendicular to both the alignment screen and the first line, and outboard of either side of where the vehicle will be positioned. This will be used as the vertical zero reference.
3. Position the vehicle so that the side of the vehicle is parallel to the vertical zero reference, and so that the front of the lamp lenses are in the vertical plane of the parallel line taped on the floor 7.62 meters (25 feet) away from the screen.
4. Rock the vehicle side-to-side three times to allow the suspension to stabilize.
5. Jounce the front suspension three times by pushing downward on the front bumper and releasing.
6. Measure the distance between the optical center of one of the lamps being aimed (head or fog) and the floor (horizontal zero reference). Transfer this measurement to the alignment screen with a piece of tape placed horizontally to the floor. This line will be used as the lamp horizontal reference.
7. Measure the distance between the vertical zero reference and the optical center of the nearest lamp being aimed (head or fog). Transfer this measurement to the alignment screen with a piece of tape placed vertically across the appropriate (head or fog) lamp horizontal reference. This is the centerline reference for the first lamp.
8. Measure the distance on center between the first and the second lamp being aimed. Transfer this measurement to the alignment screen with a second piece of tape placed vertically across the appropriate (head or fog) lamp horizontal reference. This is the centerline reference for the second lamp.

HEADLAMP ALIGNMENT

NOTE: **Due to the linear nature of the headlamp cutoff, a properly aimed low beam headlamp will project the top edge of the high intensity pattern on the alignment screen from the horizontal line to 50 millimeters (2 inches) below the horizontal line for domestic market vehicles, or to 125 millimeters (5 inches) below the horizontal line for export market vehicles. No horizontal (right/left) adjustment is required for this headlamp beam pattern in domestic market vehicles. Export market vehicles have a second horizontal (right/left) adjustment screw provided. The high beam pattern will be correct when the low beams are properly aimed.**

Fig. 2: Headlamp Vertical Adjustment Screw
Courtesy of CHRYSLER GROUP, LLC

1. Turn the headlamps ON and select the LOW beams for vehicles in all markets.
2. On all vehicles except those with headlamp leveling, use a screwdriver to rotate the headlamp vertical adjustment screw (2) on the back of the front lamp unit just inboard of the fender and forward of the upper radiator crossmember (1) to adjust the beam height as required.
3. For export markets only, use a screwdriver to rotate the headlamp horizontal adjustment screw on each headlamp to adjust the beam right or left as required.

FOG LAMP ALIGNMENT

NOTE: **A properly aimed front fog lamp will project a pattern on the alignment screen 100 millimeters (4 inches) below the fog lamp centerline and straight ahead of the lamp for domestic market vehicles.**

Fig. 3: Vertical Adjustment Screw, Front Fog Lamp & Front Fascia
Courtesy of CHRYSLER GROUP, LLC

1. Turn the fog lamps ON.
2. Insert a screwdriver through the clearance hole in the underside of the front fascia (3) closure panel below each fog lamp (2) to rotate the vertical adjustment screw (1) on each lamp to adjust the beam height as required.

BALLAST, HIGH INTENSITY DISCHARGE (HID)

DESCRIPTION

DESCRIPTION

Fig. 4: Electronic Ballast Module & Screws
Courtesy of CHRYSLER GROUP, LLC

Vehicles equipped with the optional High Intensity Discharge (HID) headlamps have an electronic ballast module (1) mounted to the inboard side of each upper lamp unit. The electronic circuitry of the module is contained within a die cast aluminum module housing, which is secured by four screws through integral mounting tabs to the molded plastic front lamp unit housing.

The sealed connector receptacle of the module is integral located on the side of the housing. The connector receptacle contains terminal pins that connect the module to the vehicle electrical system, to the high tension HID cable and to the front lamp unit through dedicated take outs and connectors of the front lamp unit wire harness.

The electronic ballast module cannot be adjusted or repaired and, if damaged or ineffective, it must be replaced.

OPERATION

OPERATION

The electronic ballast module operates on battery current and ground received directly from the Body Control Module (BCM). Each module controls operation of the High Intensity Discharge (HID) igniter and lighting element for the front lamp unit on which it is installed. The BCM monitors a hard wired input from the headlamp switch to determine the proper control outputs to the electronic ballast module, which then provides a controlled voltage to operate the HID lamp igniter as appropriate.

The BCM also monitors electronic message inputs received from the Steering Control Module (SCM) over the Controller Area Network (CAN) Interior High Speed (IHS) data bus based upon multi-function switch inputs and, if the vehicle is so equipped, from the SmartBeam® (also known as the Automatic High Beam Module/AHBM) and the Light Rain Sensor Module (LRSM) (also known as the Rain Sensor Module/RSM, Light Sensor Module/LSM or Rain/Light Sensor Module/RLSM) to determine the proper lighting outputs to provide to the ballast module.

When a proper 12 volt Direct Current (DC) control output is received from the BCM, the HID electronic ballast module activates the HID igniter integral to the lighting element through a high-tension cable to provide a high voltage (up to about 800 volts Alternating Current/AC) surge. The igniter further steps up this AC voltage to up to about 25, 000 volts, which creates a light arc between the lighting element electrodes. Once the igniter and electronic ballast module detect a suitably stable light arc, they switch over to a power-limiting mode to sustain the light arc, which requires only about 85 volts to sustain proper lighting element output.

The hard wired electronic ballast module circuits may be diagnosed using conventional diagnostic tools and procedures. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the electronic ballast module or the electronic controls and communication that provide some features of the HID lamp system. Proper diagnosis of the electronic ballast module, the BCM, the SCM, the SmartBeam®, the LRSM, the CAN data bus and the electronic communication related to electronic ballast module operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

REMOVAL

Fig. 5: Electronic Ballast Module & Screws
Courtesy of CHRYSLER GROUP, LLC

WARNING: **To avoid serious or fatal injury when working on the High Intensity Discharge (HID) headlamp system, be certain to take the proper precautions. The headlamp switch must be in the OFF position. Disconnect and isolate the battery negative cable. There is a risk of fatal injury caused by contact with high voltage used in the HID headlamps. There is a risk of explosion or fire caused by highly flammable materials in the vicinity of damaged HID lighting elements. There is a risk of injury caused by exposure to Ultra Violet (UV) light, a risk of burns caused by high component operating temperatures, a risk of mercury poisoning through glass splinters produced by bursting HID lighting elements. There is also a risk of poisoning caused by inhalation of mercury vapors and by toxic salts and mercury compounds being ingested or coming into contact with the skin. Do not come into contact with parts that are under high voltage. Persons with active electronic implants (e.g. heart pacemakers) must never work on HID headlamps. Wear insulated safety shoes, safety glasses and protective gloves. Remove flammable materials and ensure sufficient ventilation in the working area.**

1. Disconnect and isolate the battery negative cable.
2. Remove the upper lamp unit from the vehicle. Refer to **UNIT, FRONT LAMP, REMOVAL**.
3. Remove the screws (2) that secure the electronic ballast module (1) to the inboard side of the front lamp unit housing.
4. Pull the ballast module away from the front lamp unit far enough to access and disconnect the wire harness connections within the front lamp unit.
5. Remove the electronic ballast module from the lamp.

INSTALLATION

INSTALLATION

Fig. 6: Electronic Ballast Module & Screws
Courtesy of CHRYSLER GROUP, LLC

1. Position the electronic ballast module (1) to the inboard side of the front lamp unit housing.
2. Reconnect the wire harness connections within the front lamp unit to the module connector receptacles.
3. Install and tighten the screws (2) that secure the module to the housing. Tighten the screws securely.

4. Reinstall the front lamp unit into the vehicle. Refer to **UNIT, FRONT LAMP, INSTALLATION**.
5. Reconnect the battery negative cable.

CAM, TURN SIGNAL CANCEL

DESCRIPTION

DESCRIPTION

The turn signal cancel cam is concealed within the clockspring case on the steering column. The turn signal cancel cam consists of integral eccentrics on the outer circumference of the molded plastic clockspring rotor. The clockspring mechanism provides turn signal cancellation as well as a constant electrical connection between the rotating electrical components on the steering wheel and the instrument panel wire harness on the steering column. The multi-function switch and the housing of the clockspring are secured to the steering column and remain stationary. The rotor of the clockspring, including the turn signal cancel cam lobes, rotate with the steering wheel.

The turn signal cancel cam is serviced as a unit with the clockspring and cannot be repaired. If ineffective or damaged, the entire clockspring unit must be replaced. Refer to **CLOCKSPRING, REMOVAL** .

OPERATION

OPERATION

When the multi-function switch control stalk is moved to a latched turn signal ON position, a turn signal cancel actuator is extended from the inside surface of the switch housing through a small opening on the left side of the Steering Column Control Module (SCCM) mounting housing toward the turn signal cancel cam. As the steering wheel is rotated to complete the turn, one of the cam eccentrics will contact the actuator, automatically cancelling the turn signal event and releasing the latched multi-function switch control stalk to the neutral or OFF position.

LAMP, CENTER HIGH MOUNTED STOP

REMOVAL

REMOVAL

Fig. 7: Center High Mounted Stop Lamp
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the rear spoiler from the vehicle. Refer to **SPOILER, REMOVAL** .
3. Working from the back of the rear spoiler, remove the support bracket (2), the washer nozzle hose from the nozzle and the washer nozzle itself (3).
4. Disconnect the electrical connection (4) from the back of the CHMSL assembly.
5. Remove five screws (5) that secure the CHMSL to the spoiler assembly.
6. Remove the CHMSL assembly from the spoiler.

INSTALLATION

INSTALLATION

Fig. 8: Center High Mounted Stop Lamp
Courtesy of CHRYSLER GROUP, LLC

1. Position the Center High Mounted Stop Lamp (CHMSL) into the rear spoiler for installation.
2. Secure the CHMSL to the rear spoiler using the provided fasteners (1). Secure the center bolts first and then the outer bolts last.
3. Connect the body electrical connector to the receptacle (4) on the back of the CHMSL.
4. Install the bracket (2) to the CHMSL.
5. Install the washer nozzle (3) to the CHMSL.
6. Route the washer fluid tube and seat into position on the CHMSL.
7. Install the rear spoiler to the vehicle. Refer to **SPOILER, INSTALLATION** .
8. Connect the negative battery cable to the proper negative battery terminal.

LAMP, FOG

REMOVAL

BULB

CAUTION: Do not contaminate the bulb glass by touching it with your fingers or by allowing it to contact other oily surfaces. Shortened bulb life will result.

1. Disconnect and isolate the battery negative cable.
2. Raise the vehicle until the wheel well access cover for the fog lamps can be reached comfortably.
3. Twist the top rotational button until the top of the cover releases. Rotate the cover 180° allowing full access to the back of the fog lamp and bulb assembly.

4. Disconnect the harness from the back of the fog lamp assembly.
5. Remove the four fasteners securing the lamp to the lower front fascia.
6. Pull the fog lamp through the access hole.
7. Depress on the two points of the bulb socket to release and remove from the fog lamp assembly.
8. Remove the bulb from the bulb socket.

LAMP

1. Disconnect and isolate the battery negative cable.
2. Raise the vehicle until the wheel well access cover for the fog lamps can be reached comfortably.
3. Twist the top rotational button until the top of the cover releases. Rotate the cover 180° allowing full access to the back of the fog lamp and bulb assembly.
4. Disconnect the harness from the back of the fog lamp assembly.
5. Remove the four fasteners securing the lamp to the lower front fascia.
6. Pull the fog lamp through the access hole.

INSTALLATION

BULB

CAUTION: Always use the correct bulb size and type for replacement. An incorrect bulb size or type may overheat and cause damage to the lamp, the socket or the lamp wiring.

CAUTION: Do not contaminate the bulb glass by touching it with your fingers or by allowing it to contact other oily surfaces. Shortened bulb life will result.

Fig. 9: Fog Lamp, Bulb & Socket

Courtesy of CHRYSLER GROUP, LLC

1. Secure the replacement bulb into the bulb socket (3).
2. Insert the bulb and socket into the back of the fog lamp assembly.
3. Connect the wiring harness connector to the back of the fog lamp socket.
4. Close the access cover in the wheel well area.
5. Connect the negative battery cable to the battery negative post.

LAMP

1. Insert the fog lamp through the access panel in the wheel well.
2. Line up the lamp with the screw holes and secure the lamp using all four fasteners.
3. Attach the harness connector to the back of the lamp assembly.
4. Turn the access cover until the cover is lined up and the button can be turned to secure the cover to the wheel well.
5. Lower the vehicle to access and connect the negative battery cable to the negative battery post.

LAMP, LICENSE PLATE

REMOVAL

BULB

Fig. 10: Bulb & Socket
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the license plate lamp from the rear fascia.
3. Pull the base of the bulb (2) straight out of the socket (1).

LAMP

Fig. 11: Two Screws, License Plate Lamp & Rear Fascia
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the two screws (2) that secure the license plate lamp (3) to the rear fascia (1).
3. Slide the license plate lamp to one side of the fascia opening far enough to lower one end of the lamp through the opening, then lower the opposite end through the opening.

Fig. 12: Bulb Socket & Lamp Housing
Courtesy of CHRYSLER GROUP, LLC

4. Firmly grasp the bulb socket (1) on the top of the lamp housing (2) and rotate it counterclockwise about 30 degrees to unlock it.

5. Pull the socket and bulb straight out of the lamp housing.
6. Remove the lamp lens and housing from the vehicle.

INSTALLATION

BULB

CAUTION: Always use the correct bulb size and type for replacement. An incorrect bulb size or type may overheat and cause damage to the lamp, the socket or the lamp wiring.

Fig. 13: Bulb & Socket
Courtesy of CHRYSLER GROUP, LLC

1. Align the base of the license plate lamp bulb (2) with the socket (1).
2. Push the bulb straight into the socket until the base is firmly seated.
3. Reinstall the license plate lamp into the rear fascia.
4. Reconnect the battery negative cable.

LAMP

Fig. 14: Bulb Socket & Lamp Housing
Courtesy of CHRYSLER GROUP, LLC

1. Position the license plate lamp lens and housing (2) close enough to the rear fascia mounting hole to align the socket (1) and bulb with the keyed opening on the top of the housing.
2. Insert the socket and bulb into the housing until the socket is firmly seated.
3. Rotate the socket clockwise about 30 degrees to lock it into place.

Fig. 15: Two Screws, License Plate Lamp & Rear Fascia
Courtesy of CHRYSLER GROUP, LLC

4. Insert one end of the license plate lamp (3) into one side of the rear fascia (1) mounting hole and slide it to that side far enough to insert the opposite end through the opening.
5. Center the lamp in the opening.
6. Install and tighten the two screws (2) that secure the lamp to the rear fascia. Tighten the screws securely.

7. Reconnect the battery negative cable.

LAMP, MIRROR

REMOVAL

PUDDLE LAMP

Fig. 16: Latch, Puddle Lamp, Mirror Shell & Screw Driver
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.

NOTE: **The graphic shows the puddle lamp latch with the mirror glass and case removed for clarity; however, it is NOT necessary to remove the mirror glass and case to remove or to install the puddle lamp.**

2. Insert a small flat-bladed screw driver (4) between the bottom of the mirror housing bezel and the lower edge of the mirror glass and case to access the puddle lamp (2) latch feature (1).
3. Push the outboard side of the puddle lamp latch feature toward the lamp far enough to release the lamp from the underside of the mirror shell.
4. Disengage the inboard side of the puddle lamp from the inboard side of the lamp opening in the mirror shell.

Fig. 17: Puddle Lamp & Connectors
Courtesy of CHRYSLER GROUP, LLC

5. Pull the puddle lamp (3) away from the mirror shell (1) far enough to access and disconnect the two mirror wire harness connectors (2) from the two terminals of the puddle lamp.
6. Remove the puddle lamp from the mirror.

SIGNAL LAMP

Fig. 18: Outside Rear View Mirror & Signal Lamp
Courtesy of CHRYSLER GROUP, LLC

Vehicles equipped with the optional signal lamps (2) located in the outside rear view mirrors (1) have two Light Emitting Diode (LED) units that illuminate an optic light pipe through a clear lens on the lower, forward and outboard facing surfaces of the mirror shell. Illumination of these lamps is coordinated with the illumination of the turn signals for the same side of the vehicle.

Fig. 19: Mirror Housing, Fasteners & Retaining Tabs
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the mirror glass and case unit from the outside rear view mirror. Refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** and **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL** .
3. Remove the puddle lamp from the outside rear view mirror. Refer to **LAMP, MIRROR, REMOVAL**.
4. Remove the three screws (2) that secure the mirror bezel and housing unit (1) to both the mirror shell and the mirror arm.
5. Insert two flat-bladed screwdrivers into the two holes (3) in the upper inboard corner of the mirror housing and push the screwdriver handles away from each other to pry the two latch features of the housing toward each other far enough to disengage the housing latch features from the mirror shell.
6. Remove the mirror bezel and housing unit from the mirror shell and the mirror arm.

Fig. 20: Mirror Shell, Mirror Arm & Tab

Courtesy of CHRYSLER GROUP, LLC

7. Disengage the tab (3) that secures the inboard end of the mirror shell (1) to the notch in the inboard end of the mirror arm (2).

Fig. 21: Turn Signal Retaining Tabs
Courtesy of CHRYSLER GROUP, LLC

8. From within the outboard end of the mirror shell, carefully pry the mounting tab (3) of the signal lamp (4) housing away from the face of the mounting pocket formation (1) integral to the interior of the mirror shell until it disengages from the locating rib (6) with a light audible snap.
9. Slide the mirror shell mounting pocket formation off of the outboard end of the mirror arm (2).
10. From outside of the mirror shell, press the inboard end of the signal lamp lens into the interior of the shell.
11. Press the outboard end of the signal lamp inboard far enough to disengage the two lamp mounting tabs (5) from the lamp mounting tab receptacle loops integral to the outboard end of the mirror shell interior.
12. Set the mirror shell aside.

Fig. 22: Signal Lamp Housing, Harness Connector, Mirror Arm & Connector Receptacle
Courtesy of CHRYSLER GROUP, LLC

13. Disconnect the mirror wire harness connector (2) from the connector receptacle (4) integral to the signal lamp housing (1).
14. Remove the signal lamp from the mirror arm (3).

INSTALLATION

PUDDLE LAMP

Fig. 23: Puddle Lamp & Connectors
Courtesy of CHRYSLER GROUP, LLC

1. Position the puddle lamp (3) near the lamp opening on the underside of the mirror shell (1).

2. Reconnect the two mirror wire harness connectors (2) to the two terminals of the puddle lamp. Be certain to connect small connector to the small lamp terminal and the large connector to the large lamp terminal.

Fig. 24: Mirror Shell, Puddle Lamp & Latch
Courtesy of CHRYSLER GROUP, LLC

3. Engage the hook features on the inboard side of the puddle lamp (2) into the inboard side of the lamp opening in the mirror shell (1).
4. Using hand pressure, push the outboard side of the lamp up into the opening in the mirror shell until the latch feature (3) snaps into place.
5. Reconnect the battery negative cable.

SIGNAL LAMP

Fig. 25: Outside Rear View Mirror & Signal Lamp

Courtesy of CHRYSLER GROUP, LLC

Vehicles equipped with the optional signal lamps (2) located in the outside rear view mirrors (1) have two Light Emitting Diode (LED) units that illuminate an optic light pipe through a clear lens on the lower, forward and outboard facing surfaces of the mirror shell. Illumination of these lamps is coordinated with the illumination of the turn signals for the same side of the vehicle.

Fig. 26: Signal Lamp Housing, Harness Connector, Mirror Arm & Connector Receptacle
Courtesy of CHRYSLER GROUP, LLC

1. Position the signal lamp (1) to the forward facing surface of the mirror arm (3).
2. Reconnect the mirror wire harness connector (2) to the connector receptacle (4) integral to the signal lamp housing. Be certain the connector is fully engaged and latched.

Fig. 27: Turn Signal Retaining Tabs
Courtesy of CHRYSLER GROUP, LLC

3. Engage the two signal lamp mounting tabs (5) into the lamp mounting tab receptacle loops integral to the outboard end of the mirror shell interior.
4. From within the interior of the mirror shell, press the inboard end of the signal lamp lens (4) into engagement with the mounting hole of the shell.
5. Slide the mounting pocket formation (1) integral to the interior of the mirror shell over the outboard end of the mirror arm (2).
6. From within the outboard end of the mirror shell, press the mounting tab (3) of the signal lamp into position against the locating rib (6) on the face of the mounting pocket until it engages with a light audible snap.

Fig. 28: Mirror Shell, Mirror Arm & Tab
Courtesy of CHRYSLER GROUP, LLC

7. Engage the tab (3) that secures the inboard end of the mirror shell (1) to the notch in the inboard end of the mirror arm (2).

Fig. 29: Mirror Housing, Fasteners & Retaining Tabs
Courtesy of CHRYSLER GROUP, LLC

8. Position the mirror bezel and housing unit (1) over the mirror arm and the mirror shell. Be certain that the mirror wire harness is not pinched between the bezel and the shell, and that the wiring for the puddle lamp is routed through the mounting hole in the underside of the shell.
9. With the bezel aligned with the shell, squeeze the two together until the latch features (3) of the housing engage the receptacle of the shell with a light audible snap.
10. Install and tighten the three screws (2) that secure the mirror bezel and housing unit to both the mirror shell and the mirror arm. Tighten the screws securely.
11. Reinstall the puddle lamp into the outside rear view mirror. Refer to **LAMP, MIRROR, INSTALLATION**.
12. Reinstall the mirror glass and case unit into the outside rear view mirror. Refer to **MIRROR, OUTSIDE REARVIEW, INSTALLATION** and **MIRROR, OUTSIDE REARVIEW, GLASS, INSTALLATION** .
13. Reconnect the battery negative cable.

LAMP, PARK AND TURN SIGNAL

DESCRIPTION

DESCRIPTION

Fig. 30: Park And Turn Signal Lamp
Courtesy of CHRYSLER GROUP, LLC

This vehicle is equipped with a combination Park and Turn signal lamp assembly. The combination lamp includes the following components:

- **Daytime Running Lamp (1):** Domestic market vehicles with HID front lamp units and DRL illuminate a dedicated DRL LED bar in the combination lamp unit. This bar is made up of ten LED points of light.
- **Turn signal lamp (2):**

  The front turn signal indicator integral to the combination lamp uses a single amber bulb.

- **Park lamps (3):** The front park indicator integral to the combination lamp assembly uses a single amber colored bulb.
- **Side marker lamp (3):** The side marker indicator integral to the combination lamp uses a single clear bulb.
- **LED Module:** The LED module is secured to the back of the combination lamp by four fasteners.

REMOVAL

LAMP

Fig. 31: Front Park/Turn Signal Lamp Housing
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the front fascia. Refer to **FASCIA, FRONT, REMOVAL** .
3. Disconnect the wire harness connector from the connector receptacles (3) on the back of the front park/turn signal lamp housing.
4. Remove the fasteners (1) that secure the lamp housing in place.
5. Pull out on the lamp until the alignment pin (2) has been released.

PARK/TURN LAMP BEZEL REMOVAL

Fig. 32: Park/Turn Lamp Assembly
Courtesy of CHRYSLER GROUP, LLC

1. Remove the park/turn lamp assembly. This will involve front fascia removal. Refer to **LAMP, PARK AND TURN SIGNAL, REMOVAL**.
2. Flip the lamp assembly over to access the three fasteners (1) securing the bezel to the bottom of the lamp assembly.
3. Remove the bezel from the lamp assembly.

INSTALLATION

INSTALLATION

Fig. 33: Front Park/Turn Signal Lamp Housing
Courtesy of CHRYSLER GROUP, LLC

1. Position the lamp assembly to the vehicle for installation and insert the alignment pin (2) into position.
2. Install the fasteners (1) that secure the lamp in place.
3. Connect the wire harness connectors to the connector receptacles (3) on the back of the front park/turn signal lamp housing.
4. Install the front fascia to the vehicle. Refer to **FASCIA, FRONT, INSTALLATION** .
5. Connect the negative battery cable to the negative battery terminal.

PARK/TURN LAMP BEZEL REMOVAL

Fig. 34: Park/Turn Lamp Assembly
Courtesy of CHRYSLER GROUP, LLC

1. Position the bezel to the bottom of the lamp assembly for installation.
2. Secure the bezel to the lamp assembly by inserting and tightening the three fasteners (1).
3. Install the front lamp assembly. Refer to **LAMP, PARK AND TURN SIGNAL, INSTALLATION**.

MOTOR, HEADLAMP LEVELING

DESCRIPTION

DESCRIPTION

Fig. 35: Headlamp Leveling Motor, Integral Molded Connector Receptacle & Ball Formation
Courtesy of CHRYSLER GROUP, LLC

The headlamp leveling motor (1) is located on the rear lower surface of each front lamp unit on vehicles equipped with High Intensity Discharge (HID) headlamps and the automatic headlamp leveling system. The motor is encased within a molded plastic housing and is secured by an integral wedge-type mounting flange (3) to a keyed flange on the back of the front lamp unit housing. A rubber seal around the circumference of the mounting flange seals the motor to the lamp housing.

The outside of the motor housing features an integral molded connector receptacle (4) facing rearward on its lower surface, and a plastic pushrod with a ball formation (2) on its free end extends from the motor mounting flange. Within the motor housing is a 12-volt Direct Current (DC) servo motor, an electronic controller board that includes the motor logic circuits, and an integral screw-drive transmission. The headlamp leveling motor is connected to the vehicle electrical system through a dedicated take out and connector of the Front End Module (FEM) wire harness.

The headlamp leveling motor is serviced as a unit with the front lamp unit. The motor cannot be repaired and, if ineffective or damaged, the entire front lamp unit must be replaced.

OPERATION

OPERATION

The controller board and logic circuitry of the headlamp leveling motor controls motor operation based upon a voltage signal input received from the Body Control Module (BCM). On vehicles with High Intensity Discharge (HID) lighting and the automatic headlamp leveling system, the BCM uses electronic messages received over the Controller Area Network (CAN) data bus from the Automatic Headlamp Leveling Module (AHLM) (also known as the High Intensity Discharge Transducer/HIDT) to determine the correct voltage signal to provide the leveling motor.

The headlamp leveling motors have a path to ground at all times. The motors operate on battery voltage received through the headlamp low beam feed circuits so that the system will only operate when the headlamp low beams are turned ON. When the motor is energized it will extend or retract the motor pushrod through an integral screw-drive transmission. The ball on the end of the pushrod is snapped into a socket clip on the back of the reflector within the front lamp unit housing, which will cause the reflector to move as the pushrod is extended or retracted, changing the angle at which the light is projected from the headlamp.

The hard wired circuits for the headlamp leveling motors may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the active electronic elements within the headlamp leveling motors or the electronic controls and communication between other modules and devices that provide some features of the headlamp leveling system. The most reliable, efficient, and accurate means to diagnose the headlamp leveling motor or the electronic controls and communication related to headlamp leveling system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

LAMP, TAIL STOP TURN

REMOVAL

BULB

Each rear lamp unit for this vehicle consists of two pieces. An outer rear lamp unit that is secured at the rear of each quarter panel. An inner rear lamp is secured on each outboard side of the liftgate outer panel adjacent to the outer lamp.

OUTER LAMP

Fig. 36: Outer Rear Lamp Unit & Bulbs
Courtesy of CHRYSLER GROUP, LLC

NOTE: In vehicles manufactured for domestic markets, the outer rear lamp unit (1) contains a bulb (2) for tail/stop/rear side marker/turn signal functions and a second bulb (3) behind a clear lens for an auxiliary backup lamp function. In vehicles manufactured for export markets, the tail/stop/rear side marker functions are performed by one bulb (2) and a separate turn signal bulb (3) behind an amber lens is used in place of the auxiliary backup bulb. The service procedures for each bulb are the same, only the bulb sizes and types may differ.

1. Disconnect and isolate the battery negative cable.
2. Remove the outer rear lamp unit (1) from the end of the quarter panel. Refer to **LAMP, TAIL STOP TURN, REMOVAL**.
3. Firmly grasp the appropriate bulb socket (2 or 3) on the back of the rear lamp unit housing and rotate it counterclockwise about 30 degrees to unlock it.
4. Pull the socket and bulb straight out from the keyed opening in the housing.
5. Pull the base of the bulb straight out of the socket.

INNER LAMP

Fig. 37: Inner Rear Lamp Unit & Bulbs
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The inner rear lamp unit contains two bulbs. The upper socket contains the tail lamp bulb, while the lower socket contains the backup lamp bulb. The service procedures for each bulb are the same, only the bulb sizes and types may differ.**

1. Disconnect and isolate the battery negative cable.
2. Open the liftgate to access and remove the inside trim panel from the lower liftgate. Refer to **PANEL, TRIM, REMOVAL** .
3. Firmly grasp the appropriate bulb socket (2 or 3) on the back of the lamp housing (1) and rotate it counterclockwise about 30 degrees to unlock it.
4. Pull the socket and bulb straight out of the lamp.
5. Pull the base of the bulb straight out of the socket.

LAMP

Each rear lamp unit for this vehicle consists of two pieces. An outer rear lamp unit that is secured at the rear of each quarter panel. An inner rear lamp is secured on each outboard side of the decklid or liftgate (depending on application) adjacent to the outer lamp.

OUTER

091072939

Fig. 38: Outer Rear Tail Lamp Housing, Grommets, Push-Pins & Connectors
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Locate and remove the plastic push-pin fastener that secures the bracket on the bottom of the inboard side of the outer rear tail lamp housing (2) to the upper flange of the rear fascia.
3. Open the liftgate to access and remove the two plastic push-pin fasteners (1) that secure the inboard side of the lamp to the side jamb of the liftgate opening.
4. Pull the outboard side of the lamp rearward far enough to disengage the two ball studs on the back of the lamp housing from the plastic grommets (3) in the lamp opening of the body sheet metal (4).
5. Pull the lamp away from the vehicle far enough to access and disconnect the two body wire harness connectors (5) from the two bulb socket connector receptacles on the back of the lamp housing.
6. Remove the lamp from the vehicle.

INNER

Fig. 39: Inner Rear Tail Lamp Unit, Acorn Nuts & Connectors
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Open the liftgate (2) to access and remove the inside trim panel from the lower liftgate. Refer to **PANEL, TRIM, REMOVAL** .
3. Disconnect the two liftgate wire harness connectors (3) from the bulb socket connector receptacles on the back of the inner rear tail lamp unit (4).
4. Remove the four acorn nuts (1) that secure the four studs on the back of the lamp housing to the lamp opening of the liftgate.
5. Remove the lamp from the vehicle.

INSTALLATION

BULB

Each rear lamp unit for this vehicle consists of two pieces. An outer rear lamp unit that is secured at the rear of each quarter panel. An inner rear lamp is secured on each outboard side of the liftgate outer panel adjacent to the outer lamp.

OUTER LAMP

CAUTION: Always use the correct bulb size and type for replacement. An incorrect bulb size or type may overheat and cause damage to the lamp, the socket or the lamp wiring.

Fig. 40: Outer Rear Lamp Unit & Bulbs
Courtesy of CHRYSLER GROUP, LLC

NOTE: **In vehicles manufactured for domestic markets, the outer rear lamp unit (1) contains a bulb (2) for tail/stop/rear side marker/turn signal functions and a second bulb (3) behind a clear lens for an auxiliary backup lamp function. In vehicles manufactured for export markets, the tail/stop/rear side marker functions are performed by one bulb (2) and a separate turn signal bulb (3) behind an amber lens is used in place of the auxiliary backup bulb. The service procedures for each bulb are the same, only the bulb sizes and types may differ.**

1. Align the base of the bulb with the appropriate bulb socket (2 or 3).
2. Push the bulb straight into the socket until the base is firmly seated.
3. Align the socket and bulb with the keyed opening on the back of the outer rear lamp unit housing (1).
4. Insert the socket and bulb into the housing until the socket is firmly seated.
5. Rotate the socket clockwise about 30 degrees to lock it into place.
6. Reinstall the outer rear lamp unit. Refer to **LAMP, TAIL STOP TURN, INSTALLATION**.
7. Reconnect the battery negative cable.

INNER LAMP

CAUTION: **Always use the correct bulb size and type for replacement. An incorrect bulb size or type may overheat and cause damage to the lamp, the socket or the lamp wiring.**

Fig. 41: Inner Rear Lamp Unit & Bulbs
Courtesy of CHRYSLER GROUP, LLC

NOTE: The inner rear lamp unit contains two bulbs. The upper socket contains the tail lamp bulb, while the lower socket contains the backup lamp bulb. The service procedures for each bulb are the same, only the bulb sizes and types may differ.

1. Align the base of the bulb with the appropriate bulb socket (2 or 3).
2. Push the bulb straight into the socket until the base is firmly seated.
3. Align the socket and bulb with the keyed opening on the back of the inner rear lamp unit housing (1).
4. Insert the socket and bulb into the housing until the socket is firmly seated.
5. Rotate the socket clockwise about 30 degrees to lock it into place.
6. Reinstall the inside trim panel to the lower liftgate. Refer to **PANEL, TRIM, INSTALLATION** .
7. Reconnect the battery negative cable.

LAMP

Each rear lamp unit for this vehicle consists of two pieces. An outer rear lamp unit that is secured at the rear of each quarter panel. An inner rear lamp is secured on each outboard side of the decklid or liftgate (depending on application) adjacent to the outer lamp.

OUTER

Fig. 42: Outer Rear Tail Lamp Housing, Grommets, Push-Pins & Connectors
Courtesy of CHRYSLER GROUP, LLC

1. Check to be certain that the two plastic grommets (3) are in good condition and properly installed in the outboard side of the lamp opening of the body sheet metal (4).
2. Position the outer rear lamp unit (2) to the lamp opening of the body sheet metal.
3. Reconnect the two body wire harness connectors (5) to the two bulb socket connector receptacles on the back of the lamp housing.
4. Align the two ball studs on the back of the lamp housing with the plastic grommets in the lamp opening of the body sheet metal.
5. Using hand pressure, push firmly and evenly on the outboard top and bottom of the lamp until both ball studs snap into the grommets.
6. Reinstall the upper plastic push-pin fastener (1) followed by the lower fastener that secures the inboard side of the outer rear lamp unit to the side jamb of the liftgate opening.
7. Reinstall the plastic push-pin fastener that secures the bracket on the bottom of the inboard side of the outer rear tail lamp housing to the upper flange of the rear fascia.
8. Reconnect the battery negative cable.

INNER

Fig. 43: Inner Rear Tail Lamp Unit, Acorn Nuts & Connectors
Courtesy of CHRYSLER GROUP, LLC

1. Position the inner rear lamp unit (4) to the lamp opening of the liftgate (2).
2. Install and tighten the four acorn nuts (1) that secure the four studs on the back of the lamp housing to the lamp opening of the liftgate in the following sequence: upper outboard, upper inboard, lower outboard then lower inboard. Tighten the nuts securely.
3. Reconnect the two liftgate wire harness connectors (3) to the bulb socket connector receptacles on the back of the lamp housing.
4. Reinstall the inside trim panel to the lower liftgate. Refer to **PANEL, TRIM, INSTALLATION** .
5. Reconnect the battery negative cable.

SWITCH, BACKUP LAMP

DESCRIPTION

DESCRIPTION

Fig. 44: Backup Lamp Switch
Courtesy of CHRYSLER GROUP, LLC

Vehicles equipped with a manual transmission (2) have a normally open, spring-loaded plunger type backup lamp switch (1). Vehicles with an optional electronic automatic transmission have a Gear Shift Module (GSM) that is used to perform several functions, including that of the backup lamp switch. The GSM is described in further detail elsewhere in this service information. Refer to the service and diagnostic information for the automatic transmission type installed in the vehicle.

The backup lamp switch is located in a threaded hole in the manual transmission housing. The switch has a threaded body and a hex formation near the plunger end of the switch. An integral connector receptacle at the end of the switch opposite the plunger connects the switch to the vehicle electrical system through a take out and connector of the engine wire harness. When installed, only the switch connector and the hex formation are visible on the outside of the transmission housing.

The backup lamp switch cannot be adjusted or repaired and, if ineffective or damaged, the entire switch unit must be replaced.

OPERATION

OPERATION

The backup lamp switch controls a path to ground for the Powertrain Control Module (PCM) (also known as the Engine Control Module/ECM) on the reverse switch signal circuit. The PCM reads this input through an internal pull-up, then sends an electronic **reverse switch status** message to the Body Control Module (BCM) over the Controller Area Network (CAN) data bus network. The BCM controls an output through a high side driver that regulates the flow of battery current to the backup lamp bulbs as appropriate on the backup lamp feed circuit.

The backup lamp switch plunger is mechanically actuated by the gearshift mechanism within the transmission, which will depress the switch plunger and close the switch contacts whenever the REVERSE gear has been selected. The switch has a path to ground at all times through a take out and eyelet terminal of the engine wire

harness that is secured to the body sheet metal.

The backup lamp switch as well as the hard wired inputs and outputs of the switch may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the electronic controls or communication between modules and other devices that provide some features of the backup lamp switch input. The most reliable, efficient, and accurate means to diagnose the electronic controls and communication related to backup lamp switch operation requires the use of a diagnostic scan tool.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - BACKUP LAMP SWITCH

1. Disconnect and isolate the battery negative cable.
2. Locate and disconnect the engine wire harness connector from the backup lamp switch connector receptacle.
3. Check for continuity between the two terminal pins in the backup lamp switch connector receptacle.
    a. With the gear selector lever in the REVERSE position, there should be continuity.
    b. With the gear selector lever in any position other than REVERSE, there should be no continuity.
4. If the switch fails either of these two continuity tests, replace the ineffective backup lamp switch.

SWITCH, HAZARD WARNING

DESCRIPTION

DESCRIPTION

Fig. 45: Switch Pod
Courtesy of CHRYSLER GROUP, LLC

The hazard warning flasher switch (4) is located in the switch pod (1) below the radio screen. A red, stencil-like International Control and Display Symbol icon for **Hazard Warning** identifies the hazard warning flasher switch button.

The hazard switch button has panel lamps dimmer controlled illumination for night visibility. The switch button latches to a slightly lowered position when the hazard warning system is activated and the icon on the switch button may illuminate at an increased intensity while the turn signals and turn signal indicators are flashing. The switch button latches to a position flush with the other push buttons in the switch pod when the hazard warning is deactivated.

All of the circuitry and components of the hazard switch are contained within the molded plastic control head or switch bank housing. The switch is connected to the vehicle electrical system through a dedicated take out and connector of the instrument panel wire harness.

The hazard switch cannot be adjusted or repaired and, if ineffective or damaged, the switch pod will need be replaced. Refer to **POD, SWITCH, DESCRIPTION** .

OPERATION

OPERATION

The hazard switch has a path to ground at all times through the instrument panel wire harness. Whenever the hazard switch is in its latched and lowered position, the switch bank circuitry provides a hard wired ground signal output to the Body Control Module (BCM) and the hazard warning system is selected. When the BCM receives a hazard switch input, it then controls hazard warning system operation and flash rate by controlling battery voltage outputs through high side drivers on the right and left, front and rear turn signal feed circuits.

The BCM also sends the appropriate electronic messages to the Instrument Cluster (IC) (also known as the

Instrument Panel Cluster/IPC) over the Controller Area Network (CAN) data bus to control the illumination and flash rate of the right and left turn signal indicators, as well as to control the click rate of an electromechanical relay soldered onto the IC electronic circuit board that emulates the sound emitted by a conventional hazard warning flasher.

The hard wired circuits for the hazard switch may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the electronic controls and communication between other modules and devices that provide some features of the hazard warning system. The most reliable, efficient, and accurate means to diagnose the hazard switch or the electronic controls and communication related to hazard warning system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - HAZARD WARNING SWITCH

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

The hazard switch as well as the hard wired inputs and outputs of the heater or air conditioner and heater control head or the Integrated Center Stack (ICS) switch bank may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information.

1. Remove the control head or switch bank from the instrument panel as a unit, but do not disconnect it from the instrument panel wire harness.
2. Using a multi-meter, test the continuity between the ground terminal and the hazard switch sense terminal of the control head or switch bank. There should be continuity when the hazard switch push button is in its latched (lowered) position, and no continuity when the push button is in its unlatched (flush) position.
3. If the switch fails either of the continuity tests, replace the ineffective control head or switch bank as required.

SWITCH, HEADLAMP

DESCRIPTION

DESCRIPTION

Fig. 46: Headlamp Switch
Courtesy of CHRYSLER GROUP, LLC

The headlamp switch (1) is located on the instrument panel, molded into the steering column opening cover to the left of the steering column. Several different switches are used, depending upon optional equipment requirements. The standard switch features a three-position rotary knob for exterior lighting control. An optional switch has a fourth position added to the rotary knob for automatic headlamps and a momentary PUSH function added to the rotary knob for front fog lamp control.

Each of these switches is constructed of molded plastic. On vehicles with optional fog lamps the rotary knob also has the International Control and Display Symbol icon for **Front Fog Light** applied to it. The switch face plate is also labeled with graphics and icons to clearly identify the many functions of the rotary knob.

The back of the switch housing has an integral connector receptacle containing terminal pins that connect the switch to the vehicle electrical system through a dedicated take out and connector of the instrument panel wire harness. A panel dimmer controlled Light Emitting Diode (LED) unit soldered to the circuit board within the switch provides back lighting for visibility at night, but is not serviceable.

The headlamp switch cannot be repaired and, if ineffective or damaged, it must be replaced.

OPERATION

OPERATION

The headlamp switch uses a single resistor multiplexed output to control the many functions and features it provides. The switch receives a clean ground from the Body Control Module (BCM) on a headlamp switch MUX return circuit. The BCM then reads the switch outputs using an internal pull up on the headlamp/fog lamp switch signal circuit to control the exterior lighting functions.

The switch illumination circuit receives a path to ground at all times through an instrument panel ground circuit. The illumination level is controlled by a Pulse-Width Modulated (PWM) output received from the BCM on a

panel lamps driver circuit. The BCM controls this output based upon the panel lamps dimmer signal circuit input from the interior lighting thumbwheel switch in the dimmer module. Refer to **SWITCH, DIMMER, OPERATION** .

The headlamp switch operates as follows:

- **Front Fog Lamps Control** - For vehicles so equipped, the rotary knob on the headlamp switch is depressed to activate or deactivate the optional front fog lamps. The headlamp switch provides the appropriate resistor multiplexed output to the BCM over the headlamp/fog lamp switch signal circuit, and the BCM reads and responds to this input by energizing or de-energizing the right and left front and rear fog lamp control circuits through internal High Side Drivers (HSD) and by sending an electronic confirmation message to the Instrument Cluster (IC) (also known as the Instrument Panel Cluster/IPC) over the Controller Area Network (CAN) data bus, which controls the front fog lamp indicator as appropriate.
- **Exterior Lighting Control** - The rotary knob on the headlamp switch is rotated to a detent position to activate or deactivate the exterior lighting. The headlamp switch provides the appropriate resistor multiplexed output to the BCM over the headlamp/fog lamp switch signal circuit, and the BCM responds by energizing or de-energizing the right and left park lamp feed circuits and the right and left high or low beam driver circuits through internal HSDs and by sending an electronic confirmation message to the IC over the CAN data bus, which controls the high beam indicator as appropriate. The BCM also remembers which headlamp beams were last selected with the multi-function switch, and energizes those beams by default the next time the headlamps are turned ON. If the vehicle is equipped with optional automatic headlamps and the **AUTO** (Automatic) position is selected, the BCM monitors an electronic **ambient light level** message received over the Local Interface Network (LIN) data bus from the Light Rain Sensor Module (LRSM) (also known as the Rain Light Sensor Module/RLSM, the Rain Sensor Module/RSM or the Light Sensor Module/LSM) from the turn to the exterior lighting ON and OFF automatically while the ignition switch status is ON. If vehicle is not equipped with a RLSM,/LSM/RSM but is equipped with auto head lamps, the BCM also monitors for an electronic **ambient light level** message received over the CAN data bus from the air conditioner - heater control module based upon a hard wired input from the sun sensor

  .

The headlamp switch as well as the hard wired inputs and outputs of the switch may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - HEADLAMP SWITCH

WARNING: **To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to**

disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

Fig. 47: Terminals Of The Switch
Courtesy of CHRYSLER GROUP, LLC

1. Remove the headlamp switch from the instrument panel. Refer to **SWITCH, HEADLAMP, REMOVAL**.
2. Disconnect the instrument panel wire harness connector from the back of the headlamp switch.
3. Using an ohmmeter, test the resistance between the terminals of the switch as shown in the Headlamp Switch Tests table.

HEADLAMP SWITCH TESTS TABLE

HEADLAMP SWITCH TESTS	
SWITCH POSITION (PINS)	***RESISTANCE RANGE (OHMS)**
AUTO (3 and 6)	4028.0 - 4452.0
OFF (3 and 6)	1938.0 - 2142.0
PARK (3 and 6)	1073.5 - 1186.5
HEADLAMP (3 and 6)	627.0 - 693.0
FOG LAMP - AUTO (3 and 6)	347.2 - 383.8
FOG LAMP - OFF (3 and 6)	317.7 - 351.1
FOG LAMP - PARK (3 and 6)	280.6 - 310.1
FOG LAMP - HEADLAMP (3 and 6)	236.6 - 261.5
SWITCH ILLUMINATION (4 and 5)	LEDs - SET MULTIMETER TO DIODE MODE - CONNECT PIN 4 TO PLUS (+), CONNECT PIN 5 TO MINUS (-) - LEDs SHOULD BARELY GLOW
*All resistance values are plus or minus 5%.	

4. If the switch fails any of the tests, replace the ineffective headlamp switch as required.

REMOVAL

REMOVAL

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

Fig. 48: Headlamp Switch Harness Receptacle & Push Down Tabs
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the drivers side lower steering column cover panel. Refer to **COVER, STEERING COLUMN OPENING, REMOVAL** .
3. With the panel loosened, disconnect the wiring connector from the headlamp switch harness receptacle (2).
4. Remove the panel to access the two push down tabs (1). Press down on both tabs to and press the switch outward from the panel.
5. Remove the headlamp switch.

INSTALLATION

INSTALLATION

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

Fig. 49: Headlamp Switch Harness Receptacle & Push Down Tabs
Courtesy of CHRYSLER GROUP, LLC

1. Align the headlamp switch to the mounting location in the instrument panel steering column opening cover.
2. Using hand pressure, push the switch through in order to seat the switch to the housing. Make sure both pawl retainers (1) have cleared the opening and are retaining the switch to the cover.
3. Connect the wiring harness to the headlamp switch harness receptacle (2).
4. Install the lower steering column cover. Refer to **COVER, STEERING COLUMN OPENING, INSTALLATION** .
5. Reconnect the battery negative cable.

SWITCH, MULTIFUNCTION

DESCRIPTION

DESCRIPTION

Fig. 50: Control Knob & Control Stalk
Courtesy of CHRYSLER GROUP, LLC

The multi-function switch is located on the left side of the steering column, just below the steering wheel. This switch is the primary control for the front wiper and washer systems, the turn signals and for headlamp beam selection. The only visible components of the switch are the control stalk (2) and the control knob (1) that extend through the steering column shrouds on the left side of the column. The remainder of the switch including its mounting provisions, its electrical connections and the turn signal cancel actuator are concealed within the Steering Column Control Module (SCCM) mounting housing beneath the shrouds.

The multi-function switch controls as well as the SCCM mounting housing are constructed of molded black plastic. Each of the switch controls has white International Control and Display Symbol graphics applied to it, which clearly identify its many functions. The multi-function switch is integral to the SCCM mounting housing.

The SCCM mounting housing is located near the top of the steering column below the steering wheel. In addition to the integral multi-function switch the SCCM mounting housing incorporates the Steering Control Module (SCM) and has integral features to support the mounting of the clockspring. All of the multi-function switch inputs and outputs are directly connected to the SCM. The SCM is an electronic microcontroller that serves as a Local Interface Network (LIN) master node and also as a gateway to the Controller Area Network (CAN) data bus.

The SCCM mounting housing also features an integral interconnect connector receptacle. This interconnect connects all of the inputs and outputs of the SCM to the vehicle electrical system through several terminal pins of the clockspring interconnect connector and the pass through circuits of the clockspring. The clockspring is connected to the vehicle electrical system through a dedicated take out and connector of the instrument panel wire harness.

The multi-function switch provides the vehicle operator with a control interface for the following exterior lighting functions:

- **Front Washer Control** - The multi-function switch control knob provides a momentary WASH position for washer system operation.

- **Front Wiper Control** - The multi-function switch control knob provides detent switching for two continuous wipe switch positions, low (LO) speed or high (HI) speed and an intermittent wipe mode with four delay interval positions. The four delay positions become four sensitivity positions for vehicles equipped with the optional automatic wiper system. The control knob also has a momentary pulse wipe (MIST) feature switch position.
- **Headlamp Beam Selection** - The multi-function switch control stalk provides detent switching for selection of the headlamp HIGH or LOW beams.
- **Headlamp Optical Horn** - The multi-function switch control stalk includes momentary switching of the headlamp high beam circuits to provide an optical horn feature (sometimes referred to as flash-to-pass), which allows the vehicle operator to momentarily flash the headlamp high beams as an optical signalling device.
- **Turn Signal Control** - The multi-function switch control stalk provides both momentary non-detent (lane change) switching and detent switching with automatic cancellation for both the left and right turn signal.

The multi-function switch cannot be adjusted or repaired. If any function of the switch is ineffective, or if the switch is damaged, the entire SCCM mounting housing, SCM and multi-function switch unit must be replaced. Refer to **MODULE, STEERING COLUMN, REMOVAL** . The clockspring is available for separate service replacement.

OPERATION

OPERATION

The multi-function switch uses resistor multiplexing to control the many functions and features it provides using a minimal number of hard wired circuits. The switch receives clean grounds from the Steering Control Module (SCM), then provides resistor multiplexed return outputs to the SCM to indicate the selected switch positions. The SCM then sends electronic **switch status** messages over the Controller Area Network (CAN) data bus to the Body Control Module (BCM) and other electronic modules in the vehicle.

If the SCM detects no inputs from the multi-function switch, it transmits an electronic **Signal Not Available (SNA)** status message over the CAN data bus. The SNA status signals the other electronic modules to implement a fail-safe or default mode of operation. For the exterior lighting system, the multi-function switch fail-safe mode automatically selects LOW beams when the headlamps are turned ON. For the wiper system, the multi-function switch fail-safe mode will maintain the last selected wiper system mode of operation for the remainder of the current ignition cycle, after which the wiper system will default to OFF.

The hard wired inputs and outputs of the SCM may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the multi-function switch or the electronic controls and communication between other modules and devices that provide some features of the lighting or wiper and washer systems. The most reliable, efficient and accurate means to diagnose the multi-function switch or the electronic controls and communication related to right multi-function switch operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

Following are descriptions of how the multi-function switch is operated to control the functions and features it

provides:

- **Front Washer Control** - The control knob on the end of the multi-function switch control stalk is depressed toward the steering column to the momentary WASH position to activate the washer pump/motor in the FRONT WASH mode. The washer pump/motor will continue to operate for as long as the control knob is held in this position. The SCM reads the resistor multiplexed input from the multi-function switch and sends an electronic **front washer switch status** message over the CAN data bus to the BCM and to other electronic modules in the vehicle.
- **Front Wiper Control** - The control knob on the end of the multi-function switch control stalk is rotated to one of the two continuous wiper detent positions (LO or HI), to one of four intermittent delay or sensitivity wiper detent positions, or to the OFF position to select the FRONT WIPER mode. The SCM reads the resistor multiplexed input from the multi-function switch and sends electronic **front wiper switch status** messages over the CAN data bus to the BCM and to other electronic modules in the vehicle.
- **Front Wiper Mist Mode** - The control knob on the end of the multi-function switch control stalk is rotated to the momentary MIST position to activate the wiper MIST mode. The wiper motor will continue to operate, one complete cycle at a time, for as long as the control knob is held in this position. The SCM reads the resistor multiplexed input from the multi-function switch and sends an electronic **front wiper switch status** message over the CAN data bus to the BCM and to other electronic modules in the vehicle.
- **Headlamp Beam Selection** - The headlamp high beams are selected when the multi-function switch control stalk is pushed forward to the high beam selection detent position. The low beams are selected when the control stalk is pulled rearward to the low beam selection detent position. The SCM reads the resistor multiplexed input from the multi-function switch and sends an electronic **beam select switch status** message over the CAN data bus to the BCM and to other electronic modules in the vehicle.
- **Headlamp Optical Horn** - The headlamp optical horn is selected each time the multi-function switch control stalk is pulled fully rearward to a momentary position. The headlamp HIGH beams will remain illuminated for as long as the control stalk is held in this momentary position and the LOW beams will be restored when the control stalk is released. The SCM reads the resistor multiplexed input from the multi-function switch and sends an electronic **beam select switch status** message over the CAN data bus to the BCM and to other electronic modules in the vehicle.
- **Turn Signal Control** - The turn signals are requested when the multi-function switch control stalk is moved downward (LEFT signal) or upward (RIGHT signal). The control stalk has a detent position in each direction that provides turn signals with automatic cancellation, and an intermediate, momentary position in each direction that automatically provides three turn signal blinks as a LANE CHANGE feature when the control stalk is tapped or will energize the turn signals for as long as the control stalk is held in the momentary position. When the control stalk is moved to a detent turn signal switch position, a cancel actuator extends from the multi-function switch through the Steering Column Control Module (SCCM) mounting housing toward the center of the steering column. A turn signal cancel cam that is integral to the clockspring rotor rotates with the steering wheel and the cam lobes contact the cancel actuator when it is extended from the multi-function switch. When the steering wheel is rotated during a turning maneuver, one of the turn signal cancel cam lobes will contact the turn signal cancel actuator. The cancel actuator latches against the cancel cam rotation in the direction opposite that which is signaled. If the LEFT turn signal detent is selected, the lobes of the cancel cam will ratchet past the cancel actuator when the steering wheel is rotated to the left, but will unlatch the cancel actuator as the steering wheel rotates to the right and returns to center, which will cancel the turn signal event and release the control stalk from the detent so it returns to the neutral OFF position. The SCM reads the resistor multiplexed

input from the multi-function switch and sends an electronic **turn signal switch status** message over the CAN data bus to the BCM and to other electronic modules in the vehicle.

REMOVAL

REMOVAL

The multi-function switch is serviced only as a unit with the Steering Column Control Module (SCCM) mounting housing, the Steering Control Module (SCM) and multi-function switch unit. Refer to **MODULE, STEERING COLUMN, REMOVAL** . The clockspring is available for separate service replacement.

INSTALLATION

INSTALLATION

The multi-function switch is serviced only as a unit with the Steering Column Control Module (SCCM) mounting housing, the Steering Control Module (SCM) and multi-function switch unit. Refer to **MODULE, STEERING COLUMN, INSTALLATION** . The clockspring is available for separate service replacement.

SWITCH, STOP LAMP

DESCRIPTION

DESCRIPTION

Fig. 51: Stop Lamp Switch, Mounting Collar, Switch Plunger & Connector Receptacle
Courtesy of CHRYSLER GROUP, LLC

The brake (or stop) lamp switch (1) is a two-circuit, spring-loaded plunger actuated switch that is secured to the brake pedal support bracket under the instrument panel on the driver side of the vehicle. The molded plastic

switch housing has an integral connector receptacle (4) containing four terminal pins. The switch is connected to the vehicle electrical system through a dedicated take out and connector of the body wire harness.

The switch plunger (3) extends through a mounting collar (2) on one end of the switch housing. The plunger has a telescoping self-adjustment feature that is activated as the switch is being installed by the brake pedal in its normal at-rest position.

This brake lamp switch cannot be repaired. If the switch is damaged or ineffective it must be replaced with a new unit.

OPERATION

OPERATION

The brake (or stop) lamp switch controls two independent circuits. These circuits are described as follows:

- **Normally Closed** - The normally closed circuit provides a hard wired output to the Body Control Module (BCM) indicating the position of the brake pedal, depressed or released. The BCM responds by relaying electronic **brake switch status** messages over the Controller Area Network (CAN) data bus to other electronic modules in the vehicle.
- **Normally Open** - The normally open circuit provides hard wired outputs to the BCM, the Powertrain Control Module (PCM) and the Radio Frequency Hub Module (RFHM) (also known as the RF Hub) whenever the brake pedal is depressed. The BCM responds to the normally open input by providing a control output that energizes or de-energizes the brake lamps. The RFHM responds to the normally open input by providing a control output that energizes or de-energizes the Brake Transmission Shift Interlock (BTSI) solenoid.

The brake lamp switch as well as the hard wired inputs and outputs of the switch may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, the switch can only be tested while installed and, while in the installed position, the switch terminals are inaccessible to test meter probes. The most reliable, efficient and accurate means to diagnose the electronic controls and communication related to brake lamp switch operation requires the use of a diagnostic scan tool to read the switch status through the BCM. Refer to the appropriate diagnostic information.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - STOP LAMP SWITCH

WARNING: **To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.**

Fig. 52: Stop Lamp Switch Connector End View
Courtesy of CHRYSLER GROUP, LLC

The brake lamp switch as well as the hard wired inputs and outputs of the switch may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, the switch can only be tested while installed and, while in the installed position, the switch terminals are inaccessible to test meter probes. The most reliable, efficient and accurate means to diagnose the electronic controls and communication related to brake lamp switch operation requires the use of a diagnostic scan tool to read the switch status through the BCM and the PCM.

1. Using a scan tool, check for Diagnostic Trouble Codes (DTCs) in the BCM and PCM. If no DTCs are found, go to Step 2. If any DTCs are found, refer to **DTC INDEX** to locate the DTC and repair as needed.
2. Monitor the Brake Lamp Switch operation by using the diagnostic scan tool to verify that both switch states in the BCM changes while actuating the brake pedal. If actuation is detected in the BCM, move to the PCM to confirm actuation is detected.

Fig. 53: Identifying Brake Switch Condition
Courtesy of CHRYSLER GROUP, LLC

3. **If damage to the switch is present for any reason the switch is to be replaced. If a switch is removed and the plunger length differs from a new switch, the switch should always be replaced and not reinstalled. The nominal height for a new switch (tip of the plunger to the body of the switch) is 16.90mm.**
   - 1 - Defective brake switch due to the switch tab being sheared off.
   - 2 - Defective brake switch due to the switch tab being offset.
   - 3 - **Normal operational brake lamp switch to be used for installation.**

REMOVAL

REMOVAL

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

CAUTION: Never remove or install the brake lamp switch while the brake pedal arm is disassembled from the brake booster push rod.

CAUTION: Do not depress, lift or move the brake pedal during brake lamp switch

removal to avoid switch damage. Do not depress, lift or move the brake pedal during brake lamp switch installation to avoid improper switch adjustment.

Fig. 54: Stop Lamp Switch & Brake Pedal Support Bracket
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Locate the brake lamp switch (1) on the brake pedal support bracket (2) on the dash panel under the instrument panel.
3. Disconnect the body wire harness connector from the brake lamp switch.

NOTE: **If a click noise is heard during switch removal, the switch may have internal damage and should be replaced.**

4. Press the brake lamp switch against the bracket while rotating the switch housing clockwise about 45 degrees to align the tabs on the switch locking collar with the keyed hole in the brake pedal support bracket.
5. Pull the switch straight away from the keyed hole to remove it from the bracket.
6. Remove the switch from the vehicle.

Fig. 55: Identifying Brake Switch Condition
Courtesy of CHRYSLER GROUP, LLC

7. **If damage to the switch is present for any reason the switch is to be replaced. If a switch is removed and the plunger length differs from a new switch, the switch should always be replaced and not reinstalled. The nominal height for a new switch (tip of the plunger to the body of the switch) is 16.90mm.**
   - 1 - Defective brake switch due to the switch tab being sheared off.
   - 2 - Defective brake switch due to the switch tab being offset.
   - 3 - **Normal operational brake lamp switch to be used for installation.**

INSTALLATION

INSTALLATION

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

CAUTION: Never remove or install the brake lamp switch while the brake pedal arm is disassembled from the brake booster push rod.

CAUTION: Do not depress, lift or move the brake pedal during brake lamp switch

removal to avoid switch damage. Do not depress, lift or move the brake pedal during brake lamp switch installation to avoid improper switch adjustment.

NOTE: Be certain that the brake pedal bracket is not bent or damaged before installing or reinstalling a brake lamp switch. Inspect the brake switch tab location making sure its in the proper location indicating that the switch is not defective.

Fig. 56: Identifying Brake Switch Condition
Courtesy of CHRYSLER GROUP, LLC

NOTE: If damage to the switch is present for any reason the switch is to be replaced. If a switch is removed and the plunger length differs from a new switch, the switch should always be replaced and not reinstalled. The nominal height for a new switch (tip of the plunger to the body of the switch) is 16.90mm.

- 1 - Defective brake switch due to the switch tab being sheared off.
- 2 - Defective brake switch due to the switch tab being offset.
- 3 - **Normal operational brake lamp switch to be used for installation.**

Fig. 57: Stop Lamp Switch & Brake Pedal Support Bracket
Courtesy of CHRYSLER GROUP, LLC

NOTE: Be certain that the brake pedal bracket is not bent before installing or reinstalling a brake lamp switch.

1. Position the brake lamp switch (1) near the brake pedal support bracket (2) on the dash panel under the instrument panel.
2. Align the tabs on the brake lamp switch locking collar with the keyed hole in the brake pedal support bracket.
3. Holding the brake lamp switch perpendicular to the support bracket, insert the tabs on the brake lamp switch locking collar through the keyed hole in the support bracket until the switch housing is firmly seated against the bracket.
4. Rotate the switch housing counterclockwise about 45 degrees to engage the tabs on the locking collar with the support bracket.
5. Reconnect the body wire harness connector to the connector receptacle on the switch.
6. Reconnect the battery negative cable.

UNIT, FRONT LAMP

STANDARD PROCEDURE

STANDARD PROCEDURE - LAMP LENS DEFOGGING

Some customers may report that on occasion, vehicle exterior lamp assemblies are fogged with a light layer of condensation on the inside of the lenses. This may be reported after the lamps have been turned on and brought up to operating temperature, turned off, and then rapidly cooled by cold water (such as rain, or the water from a car wash). Lens fogging can also occur under certain atmospheric conditions after a vehicle has been parked outside overnight (i.e., a warm humid day followed by clear cool night). This will usually clear as atmospheric conditions change to allow the condensation to change back into a vapor. Turning the lamps on will usually

accelerate this process.

A lamp that exhibits condensation/fogging should be evaluated in a service bay environment by first drying all water from the outside surface of the lens and operating the lamp for 20 minutes. If the condensation/fogging has begun to clear from the lamp lens after 20 minutes with the lamps operating, this indicates the lamp sealing has not been breached, and the lamp does not need to be replaced.

If the condensation/fogging has not begun to clear after 20 minutes with the lamps operating, or the lamp has large amounts of water droplets visible on most internal surfaces, this indicates a problem with the lamp sealing that has allowed water to enter the lamp. In this instance, the customer is also likely to report that moisture in the lamp is always present and never disappears. A lamp that exhibits internal moisture permanently should be replaced.

REMOVAL

BULB - HEADLAMP

CAUTION: Do not contaminate the bulb glass by touching it with your fingers or by allowing it to contact other oily surfaces. Shortened bulb life will result.

Fig. 58: Headlamp Bulb Base & Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. For passenger side bulb assembly, position the air cleaner box out of the way. Refer to **AIR CLEANER, REMOVAL** for 2.0L Diesel, **AIR CLEANER, REMOVAL** for 2.4L or **AIR CLEANER, REMOVAL** for 3.2L.
3. Firmly grasp the headlamp bulb access cover on the outboard back of the front lamp unit housing and rotate it counterclockwise about 30 degrees to unlock it.
4. Remove the access cover from the lamp housing.

5. Firmly grasp the headlamp bulb base (1) on the back of the reflector within the front lamp unit housing and rotate it counterclockwise about 30 degrees to unlock it.
6. Pull the bulb and base straight out from the keyed opening in the reflector.

NOTE: Take care to prevent the front lamp unit wire harness and connector from falling back into the lamp housing after disconnecting it from the bulb.

7. Disconnect the front lamp unit wire harness connector (2) from the bulb connector receptacle.
8. Remove the bulb from the back of the front lamp unit.

LAMP

WARNING: To avoid serious or fatal injury when working on the High Intensity Discharge (HID) headlamp system, be certain to take the proper precautions. The headlamp switch must be in the OFF position. Disconnect and isolate the battery negative cable. There is a risk of fatal injury caused by contact with high voltage used in the HID headlamps. There is a risk of explosion or fire caused by highly flammable materials in the vicinity of damaged HID lighting elements. There is a risk of injury caused by exposure to Ultra Violet (UV) light, a risk of burns caused by high component operating temperatures, a risk of mercury poisoning through glass splinters produced by bursting HID lighting elements. There is also a risk of poisoning caused by inhalation of mercury vapors and by toxic salts and mercury compounds being ingested or coming into contact with the skin. Do not come into contact with parts that are under high voltage. Persons with active electronic implants (e.g. heart pacemakers) must never work on HID headlamps. Wear insulated safety shoes, safety glasses and protective gloves. Remove flammable materials and ensure sufficient ventilation in the working area.

3345100

Fig. 59: Front End Module (FEM)
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the fascia from the Front End Module (FEM) (1). Refer to **FASCIA, FRONT, REMOVAL** .
3. Remove the 4 screws (1) that secures the lower front lamp unit to the vehicle.
4. Pull the lamp away from the front of the vehicle far enough to access and disconnect the wire harness connection (2) from the back of the lamp housing.
5. Remove the front lamp unit from the vehicle.

LIGHTING ELEMENT - HIGH INTENSITY DISCHARGE

WARNING: **To avoid serious or fatal injury when working on the High Intensity Discharge (HID) headlamp system, be certain to take the proper precautions. The headlamp switch must be in the OFF position. Disconnect and isolate the battery negative cable. There is a risk of fatal injury caused by contact with high voltage used in the HID headlamps. There is a risk of explosion or fire caused by highly flammable materials in the vicinity of damaged HID lighting elements. There is a risk of injury caused by exposure to Ultra Violet (UV) light, a risk of burns caused by high component operating temperatures, a risk of mercury poisoning through glass splinters produced by bursting HID lighting elements. There is also a risk of poisoning caused by inhalation of mercury vapors and by toxic salts and mercury compounds being ingested or coming into contact with the skin. Do not come into contact with parts that are under high voltage. Persons with active electronic implants (e.g. heart pacemakers) must never work on HID headlamps. Wear insulated safety shoes, safety glasses and protective gloves. Remove flammable materials and ensure sufficient ventilation in the working area.**

CAUTION: **Do not contaminate the lighting element glass by touching it with your fingers or by allowing it to contact other oily surfaces. Shortened lighting element life will result.**

Fig. 60: HID Igniter & High Tension Cable
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the front fascia. Refer to **FASCIA, FRONT, REMOVAL** .
3. Remove the front headlamp assembly. Refer to **UNIT, FRONT LAMP, REMOVAL**.
4. Firmly grasp the headlamp bulb access cover on the outboard back of the front lamp unit housing and rotate it counterclockwise about 30 degrees to unlock it.
5. Remove the access cover from the lamp housing.

NOTE: Take care to prevent the high tension cable from falling back into the lamp housing after disconnecting it from the HID igniter (2).

6. Disconnect the high tension cable (1) from the HID igniter connector receptacle on the back of the reflector within the front lamp unit housing.
7. Firmly grasp the igniter (2) and rotate it counterclockwise about 30 degrees to unlock it.
8. Pull the HID igniter and lighting element straight out from the keyed opening in the reflector.
9. Remove the igniter and lighting element from the back of the front lamp unit.

INSTALLATION

BULB - HEADLAMP

Fig. 61: Headlamp Bulb Base & Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Always use the correct bulb size and type for replacement. An incorrect bulb size or type may overheat and cause damage to the lamp, the socket or the lamp wiring.

CAUTION: Do not contaminate the bulb glass by touching it with your fingers or by allowing it to contact other oily surfaces. Shortened bulb life will result.

1. Position the headlamp bulb close enough to the back of the front lamp unit housing to access and reconnect the lamp wire harness connector (1) to the headlamp bulb connector receptacle.
2. Insert the headlamp bulb into the reflector opening until firmly seated.
3. Rotate the base clockwise about 30 degrees to lock it into place.
4. Position the headlamp bulb access cover onto the outboard back of the front lamp unit housing and rotate it clockwise about 30 degrees to lock it into place.
5. Install the air cleaner assembly (for passenger bulb installations). Refer to **AIR CLEANER, INSTALLATION** for 2.0L Diesel, **AIR CLEANER, INSTALLATION** for 2.4L or **AIR CLEANER, INSTALLATION** for 3.2L.
6. Reconnect the battery negative cable.

LAMP

WARNING: To avoid serious or fatal injury when working on the High Intensity Discharge (HID) headlamp system, be certain to take the proper precautions. The headlamp switch must be in the OFF position. Disconnect and isolate the battery negative cable. There is a risk of fatal injury caused by contact with high voltage used in the HID headlamps. There is a risk of explosion or fire caused by highly flammable materials

in the vicinity of damaged HID lighting elements. There is a risk of injury caused by exposure to Ultra Violet (UV) light, a risk of burns caused by high component operating temperatures, a risk of mercury poisoning through glass splinters produced by bursting HID lighting elements. There is also a risk of poisoning caused by inhalation of mercury vapors and by toxic salts and mercury compounds being ingested or coming into contact with the skin. Do not come into contact with parts that are under high voltage. Persons with active electronic implants (e.g. heart pacemakers) must never work on HID headlamps. Wear insulated safety shoes, safety glasses and protective gloves. Remove flammable materials and ensure sufficient ventilation in the working area.

Fig. 62: Screws & Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

1. Position the front lamp unit close enough to the front of the vehicle to reconnect the headlamp and dash wire harness connections to the front lamp unit wire harness connector (2) on the back of the lamp housing.
2. Install and tighten the four screw (1) to secure the front lamp unit to the mounting bracket.
3. Reinstall the fascia onto the FEM. Refer to **FASCIA, FRONT, INSTALLATION** .
4. Reconnect the battery negative cable.
5. Confirm proper headlamp alignment. Refer to **STANDARD PROCEDURE**.

LIGHTING ELEMENT - HIGH INTENSITY DISCHARGE

WARNING: To avoid serious or fatal injury when working on the High Intensity

Discharge (HID) headlamp system, be certain to take the proper precautions. The headlamp switch must be in the OFF position. Disconnect and isolate the battery negative cable. There is a risk of fatal injury caused by contact with high voltage used in the HID headlamps. There is a risk of explosion or fire caused by highly flammable materials in the vicinity of damaged HID lighting elements. There is a risk of injury caused by exposure to Ultra Violet (UV) light, a risk of burns caused by high component operating temperatures, a risk of mercury poisoning through glass splinters produced by bursting HID lighting elements. There is also a risk of poisoning caused by inhalation of mercury vapors and by toxic salts and mercury compounds being ingested or coming into contact with the skin. Do not come into contact with parts that are under high voltage. Persons with active electronic implants (e.g. heart pacemakers) must never work on HID headlamps. Wear insulated safety shoes, safety glasses and protective gloves. Remove flammable materials and ensure sufficient ventilation in the working area.

CAUTION: Always use the correct lighting element size and type for replacement. An incorrect size or type may overheat and cause damage to the lamp or the lamp wiring.

CAUTION: Do not contaminate the lighting element glass by touching it with your fingers or by allowing it to contact other oily surfaces. Shortened lighting element life will result.

Fig. 63: HID Igniter & High Tension Cable
Courtesy of CHRYSLER GROUP, LLC

1. Align and insert the High Intensity Discharge (HID) igniter and lighting element unit (2) straight into the opening in the front lamp unit reflector as a unit.

2. Press the igniter firmly and evenly toward the reflector until the base is firmly seated.
3. Rotate the igniter clockwise about 30 degrees to lock it into place.
4. Reconnect the high tension cable connector (1) to the connector receptacle integral to the lower edge of the igniter housing.
5. Position the headlamp bulb access cover onto the outboard back of the front lamp unit (2) housing and rotate it clockwise about 30 degrees to lock it into place.
6. Reconnect the battery negative cable.

2014 ACCESSORIES AND EQUIPMENT

Lamps/Lighting - Interior - Service Information - Cherokee

WARNING

WARNING

WARNING: To avoid serious or fatal injury, eye protection should be used when servicing any glass components.

CAUTION: Do not contaminate the glass of halogen bulbs with fingerprints or allow contact with other possibly oily surfaces. Reduced bulb life will result.

CAUTION: Do not use bulbs with higher candle power than indicated in the BULB APPLICATION TABLE . In addition, do not use fuses, circuit breakers or relays having greater amperage value than indicated on the fuse panel or in the Owner's Manual. Damage to lamps, lenses, wiring and other related electrical components can result.

DESCRIPTION

DESCRIPTION

The interior lighting system for this vehicle includes lighting on the dome/courtesy lamp circuit and the non-dimming panel lamps circuit. The lamps on the dome/courtesy circuit include:

- **Cargo Lamp** - An available cargo lamp is located in the left quarter inside panel just forward of the trunk side trim panel at the back of the vehicle and is controlled by the courtesy lamp circuit.
- **Dome/Reading Lamps** - Standard front seat driver side and passenger side dome/reading lamps are located in a mounting bracket on the headliner above the instrument panel near the upper windshield header and are controlled by both the courtesy lamp circuit and by independent push button switches adjacent to each lamp.
- **Vanity Lamps** - An optional single intensity, incandescent vanity lamp is located on each side of a covered mirror on both the right and left sun visors, and is controlled by an integral vanity mirror cover-actuated switch.
- **Glove Box Lamp** - A standard glove box lamp with a single LED unit and an integral switch is located in the glove box housing of the instrument panel and illuminates whenever the glove box is opened.
- **Courtesy Lamps** - Standard incandescent courtesy lamps are located under the right and left ends of the instrument panel, and are controlled by the courtesy lamp circuit.
- **Front Door Map Pocket Lamps** - Front door trim panel map pockets on some models include an LED lamp unit to assist visibility at night. These lamps are controlled by the panel lamps dimmer circuit and illuminate whenever the exterior lighting is turned ON.

- **Center Dome Lamps** - The standard incandescent rear dome/reading lamps are controlled by both the courtesy lamp circuit and independent lens-actuated switches.

Most controls on the instrument panel and elsewhere in the interior of the vehicle are illuminated by Light-Emitting Diode (LED) units on a non-dimming panel lamps circuit for night visibility. These LED units are soldered to internal circuit boards and are not serviceable.

Other components of the interior lighting system for this vehicle include:

- **Body Control Module** - The Body Control Module (BCM) is located under the instrument panel to the left of the steering column in the passenger compartment of the vehicle. Refer to **MODULE, BODY CONTROL, DESCRIPTION** .
- **Door Ajar Switches** - A door ajar switch is integral to the door latch mechanism of each door.
- **Liftgate Ajar Switch** - A liftgate ajar switch is integral to the latch mechanism of the liftgate.
- **Instrument Panel Cluster** - The Instrument Panel Cluster (IPC) is located in the instrument panel above the steering column opening, directly in front of the driver. Refer to **DESCRIPTION** .
- **Headlamp Switch** - A headlamp switch is located on the left side of the instrument panel, below and outboard of the steering column. The headlamp switch includes a thumbwheel for selecting the panel lamps dimming level and for interior lighting control. A PARADE position of the thumbwheel illuminates all display units at full brightness for visibility when driving in daylight with the exterior lighting turned ON. There are also detent positions to turn ON all interior courtesy lighting, and a DEFEAT position that overrides door ajar switch control of interior lighting. Refer to **SWITCH, HEADLAMP, DESCRIPTION** .

Hard wired circuitry connects the interior lighting system components to the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the interior lighting components through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention as well as pin-out and location views for the various wire harness connectors, splices and grounds.

OPERATION

OPERATION

The lamps of the interior lighting system can be divided into two general classifications based upon the circuit that controls their operation: The courtesy lamp circuit, or the non-dimming panel lamps circuit. The following are paragraphs that briefly describe the operation of each of these interior lighting circuits.

The lamps and the hard wired circuits between components related to the interior lighting system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness

connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the interior lighting system or the electronic controls or communication between modules and other devices that provide some features of the interior lighting system. The most reliable, efficient, and accurate means to diagnose the interior lighting system or the electronic controls and communication related to interior lighting system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

COURTESY LAMP CIRCUIT

The courtesy lamp circuit includes the dome/reading lamps located on the headliner near the center of the windshield opening upper header and the cargo (or trunk) lamp located on the rear edge of the left quarter inner trim near the left trunk trim panel at the rear of the vehicle. The lamps in the courtesy lamp circuit are provided with battery voltage and ground by the Body Control Module (BCM) using internal low side drivers through two ground circuits based upon hard wired inputs from the ignition switch and the door ajar switches. Power for the Trunk Lighting Function is sourced via a dedicated high side relay. The BCM also uses electronic message inputs received from other electronic modules in the vehicle over the Controller Area Network (CAN) data bus to control these outputs.

When a door or trunk ajar switch input to the BCM transitions to closed, the BCM will illuminate the courtesy lamps and keep them active for up to about 3 minutes. After all of the ajar switch inputs to the BCM transition to open, the BCM will keep the courtesy lamps illuminated for about 10 seconds. The BCM also provides courtesy lamp operation based upon certain inputs received from the Remote Keyless Entry (RKE) transmitter to provide an Illuminated Entry feature and in response to certain electronic message inputs received from the Occupant Restraint Controller (ORC) or the Powertrain Control Module (PCM) over the CAN data bus.

For those lamps in the courtesy lamp circuit with independent switching such as the dome/reading lamps, the BCM provides a second feed to the switches using another internal low side driver through a separate load shed circuit. The BCM provides a battery saver (load shedding) feature for these lamps, which will automatically turn the lamps OFF if they are left ON for more than about fifteen minutes with the ignition switch in the OFF position.

READING LAMP CIRCUIT

For those lamps on the courtesy lamp circuit with independent switching such as the map or reading lamps, the optional vanity lamps and the glove box lamp, the EMIC also provides a battery voltage output to those switches through a separate reading lamp circuit. The EMIC provides a battery saver (load shedding) feature for the reading lamp circuit as well as the courtesy lamp circuit, which will automatically turn these lamps OFF if they are left ON for more than about 10 minutes after the electronic **ignition switch status** message transitions to OFF. If any reading lamp input is received subsequent to a 10 minute load shed and prior to a new ignition cycle, the reading lamps will turn OFF after 90 seconds.

PANEL LAMPS DIMMER CIRCUIT

The panel lamps dimmer circuit actually includes several circuits. These circuits control the back lighting illumination and dimming level of the headlamp switch, the dimmer module, the automatic transmission gear selector bezel lamp, the front door map pocket lamps, as well as the center floor console cup holder and forward

storage compartment lamps. All lamps in the panel lamps dimmer circuits are provided a path to ground at all times through a hard wired ground circuit. These lamps are illuminated by a 12-volt Pulse Width Modulated (PWM) output of the BCM through several panel lamps dimmer circuits.

This shared PWM output synchronizes the selected illumination intensity level of all the lamps in the panel lamps dimmer circuits. The BCM uses hard wired resistor multiplexed inputs from the rotary exterior lighting control knob of the headlamp switch to determine when the exterior lighting is turned ON and from the thumbwheel of the dimmer module to determine the dimming level selection. Then the BCM provides the appropriate PWM outputs through the panel lamps dimmer circuits as well as electronic **dimming level** messages over the CAN data bus to other electronic modules in the vehicle.

The Instrument Cluster (IC) (also known as the Common Instrument Cluster/CIC) and the Integrated Center Stack (ICS) use the electronic **dimming level** messages to control the illumination intensity of their own back lighting, controls and display units. In addition, when the interior lighting thumbwheel of the dimmer module is moved to the PARADE (or funeral) mode detent position, all of the electronic display units are illuminated at their full intensity levels for increased visibility when the vehicle is driven during daylight hours with the exterior lighting turned ON. The PARADE mode has no effect on the illumination intensity of incandescent panel lamps.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - INTERIOR LIGHTING

WARNING: **To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.**

NOTE: **When diagnosing the interior lighting circuits, remember that high generator output can burn out bulbs rapidly and repeatedly; and, that dim or flickering bulbs can be caused by low generator output or poor battery condition. If one of these symptoms is a problem on the vehicle, be certain to diagnose the battery and charging system, then repair as necessary.**

NOTE: **A good ground is necessary for proper lighting operation. If a lighting problem is being diagnosed that involves multiple symptoms, systems, or components, the problem can often be traced to a loose, corroded, or open ground.**

WARNING: **On vehicles equipped with the high voltage system, disconnecting the 12-volt battery negative cable alone will not power down the 12-volt system. You must perform the 12-volt Power Down procedure before proceeding.**

Failure to follow these instructions may result in possible serious or fatal injury.

The lamps and the hard wired circuits between components related to the interior lighting system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the interior lighting system or the electronic controls or communication between modules and other devices that provide some features of the interior lighting system. The most reliable, efficient, and accurate means to diagnose the interior lighting system or the electronic controls and communication related to interior lighting system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

COURTESY LAMP CIRCUIT

LAMP, READING

REMOVAL

BULB - OVERHEAD CONSOLE

3250466

Fig. 1: Dome/Reading Lamp Socket
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the overhead console (1) from the headliner.
3. Grasp the dome/reading lamp socket (3) firmly and push it to one side far enough to unsnap the socket latch features from the lamp housing (4).
4. Pull the socket and bulb (2) out of the lamp housing.
5. Pull the base of the bulb straight out of the lamp socket.

INSTALLATION

BULB - OVERHEAD CONSOLE

CAUTION: Always use the correct bulb size and type for replacement. An incorrect bulb size or type may overheat and cause damage to the lamp, the socket or the lamp wiring.

Fig. 2: Dome/Reading Lamp Socket
Courtesy of CHRYSLER GROUP, LLC

1. Align the base of the bulb (2) with the overhead console dome/reading lamp socket (3).
2. Push the bulb straight into the socket until the base is fully seated.
3. Align the socket and bulb with the keyed opening in the lamp housing (4).
4. Insert the bulb and socket straight into the hosing until the socket latch features are both fully engaged.
5. Reinstall the overhead console (1) to the headliner.
6. Reconnect the battery negative cable.

LAMP, VANITY

DESCRIPTION

DESCRIPTION

If the overhead visor is equipped with illumination, the lamp and bulb are not serviced. Replacement of the visor is necessary if the bulb is found to be burned out. Refer to **VISOR, REMOVAL** .

SWITCH, DIMMER

DESCRIPTION

DESCRIPTION

This vehicle has a panel dimmer switch (also known as the dimmer module) (1) that is located within the headlamp switch housing on the instrument panel steering column opening cover. The standard dimmer module features a single thumbwheel for panel lamps dimming and interior lighting control. There is also an optional switch with a second thumbwheel. The second thumbwheel is used for ambient (also known as halo) lighting control in vehicles with the ambient lighting option.

The dimmer module is constructed of molded plastic. The thumbwheel is molded plastic and knurled around its circumference to ease operator control. The headlamp switch face plate is labeled with graphics and International Control and Display Symbol icons to clearly identify the functions of the thumbwheel or optional thumbwheels.

The headlamp switch housing is snapped into place within the mounting hole of the steering column opening and held in place by two tension push down to release springs built into the headlamp switch housing itself. The back of the switch housing has an integral connector receptacle containing terminal pins that connect the module to the vehicle electrical system through a dedicated take out and connector of the instrument panel wire harness. Panel dimmer controlled Light Emitting Diode (LED) units soldered to the circuit board within the module provide back lighting for visibility at night, but are not serviceable.

The switch cannot be repaired and, if ineffective or damaged, it must be replaced. Refer to **SWITCH, HEADLAMP, REMOVAL** .

OPERATION

OPERATION

The panel dimmer switch (also known as the dimmer module) uses a single resistor multiplexed output for each switch thumbwheel to control the many functions and features it provides. The switch receives a clean ground from the Body Control Module (BCM) on a multifunction switch MUX return circuit. It then provides outputs to the BCM on a panel lamps dimmer signal circuit to control panel dimmer and interior lighting functions, or on a dimmer environmental lighting circuit to control ambient (halo) lighting functions.

The dimmer module illumination circuit receives a path to ground at all times through an instrument panel ground circuit. The illumination level is controlled by a Pulse-Width Modulated (PWM) output received from the BCM on a panel lamps driver circuit. The BCM controls this output based upon the panel lamps dimmer signal circuit input from the dimmer module.

The dimmer module operates as follows:

- **Ambient (Halo) Lighting Control -** On vehicles so equipped, the right thumbwheel on the dimmer module is rotated to the ambient DEFEAT or one of the six ambient dimmer detent positions to control the ambient (halo) lighting level. The dimmer module provides the appropriate resistor multiplexed

output to the BCM over the dimmer environmental lighting circuit. The BCM reads and responds to this input by providing the appropriate control outputs through internal HSDs over the liftgate courtesy feeds driver circuit.

- **Interior Lighting Control** - The left thumbwheel on the dimmer module is rotated to the dome DEFEAT, dome ON, PARADE mode, or one of the six panel dimmer detent positions to control the interior courtesy/dome and panel lamps. The dimmer module provides the appropriate resistor multiplexed output to the BCM over the panel lamps dimmer signal circuit. The BCM reads and responds to this input by providing the appropriate control outputs through internal HSDs over the courtesy lamps, panel lamps and reading lamps driver circuits, and by sending appropriate electronic **dimming level** messages to other electronic modules over the CAN data bus.

The dimmer module as well as the hard wired inputs and outputs of the module may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information.

SWITCH, DOOR AJAR

DESCRIPTION

DOOR

This vehicle has four door ajar switches, one for each door. Each switch is concealed within and integral to its respective door latch unit. The switches are momentary leaf contact-type micro switch units that are actuated by the mechanisms internal to the door latch. An integral connector receptacle on each door latch connects the door ajar switch and the power lock motor to the vehicle electrical system through its respective door wire harness.

The door ajar switches cannot be adjusted or repaired and, if ineffective or damaged, the door latch unit must be replaced. Refer to **LATCH, DOOR, REMOVAL** or **LATCH, DOOR, REMOVAL** .

LIFTGATE

A liftgate ajar switch is standard equipment on this vehicle. The switch is concealed within and integral to the liftgate latch unit. The switch is a momentary leaf contact-type micro switch unit that is actuated by the liftgate latch mechanism. An integral connector receptacle on the liftgate latch connects the liftgate ajar switch to the vehicle electrical system through the liftgate wire harness.

The liftgate ajar switch cannot be adjusted or repaired and, if ineffective or damaged, the liftgate latch unit must be replaced. Refer to **LATCH, LIFTGATE, REMOVAL** .

OPERATION

DOOR

The door ajar switches are actuated by the mechanisms internal to the door latch. When a door is closed and properly latched, its door ajar switch is an open circuit. When a door is open or only partially latched, the door ajar switch is a closed circuit. The door ajar switches are hard wired in series between a body ground and the Body Control Module (BCM). The BCM reads the hard wired door ajar switch inputs through internal pull-ups, then uses these inputs to control many electronic functions and features of the vehicle. The BCM also sends

electronic **door ajar switch status** messages to other electronic modules in the vehicle over the Controller Area Network (CAN) data bus.

The door ajar switches as well as the hard wired inputs and outputs of the switches may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information.

LIFTGATE

The liftgate ajar switch is actuated by the liftgate latch mechanism. When the liftgate is closed and properly latched, the liftgate ajar switch is an open circuit. When the liftgate is open or only partially latched, the liftgate ajar switch is a closed circuit. The liftgate ajar switch is hard wired in series between a body ground and the Body Control Module (BCM) on vehicles without the power liftgate option, or the Power LiftGate Module (PLGM) on vehicles with the power liftgate option. The BCM or the PLGM reads the hard wired liftgate ajar switch input through an internal pull-up, then uses this input to control many electronic functions and features of the vehicle. The BCM or the PLGM also sends electronic **liftgate ajar switch status** messages to other electronic modules in the vehicle over the Controller Area Network (CAN) data bus.

The liftgate ajar switch as well as the hard wired inputs and outputs of the switch may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information.

LAMP, DOME

REMOVAL

LAMP - CENTER

1. Disconnect and isolate the battery negative cable.
2. To remove and replace a bulb, use a trim stick to pop loose the lens covering the defective bulb. Remove bulb and replace.
3. To remove the entire dome lamp assembly, Insert a trim stick between the lamp housing and the headliner to pry the dome lamp assembly loose.
4. Disconnect the harness from the back of the dome lamp.

INSTALLATION

LAMP - CENTER

1. Position the dome lamp to the mounting hole in the headliner.
2. Reconnect the wire harness connector to the connector on the back of the lamp.
3. Set the lamp into the opening in the headliner.
4. Gently and evenly press the lens lamp into the mounting hole until the bezel of the lamp housing is snapped flush with the headliner.
5. Reconnect the battery negative cable.

LAMP, CARGO

REMOVAL

BULB

Fig. 3: Lamp Hood, Bulb, Lamp Lens & Lamp Socket
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the cargo lamp from the vehicle. Refer to **LAMP, CARGO, REMOVAL**.
3. Disengage the end of the lamp lens (3) with the latch feature from the retention pin on each side of the lamp hood (1).
4. Pivot the lens up from over the hood.
5. Unfold the lamp hood from the lamp socket (4) far enough to access the bulb (2).
6. Pull the base of the bulb straight out of the socket.

LAMP

Fig. 4: Trunk Side Trim Panel, Left Quarter Trim Panel & Cargo Lamp
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Locate the cargo lamp (3) in the rear edge of the left quarter trim panel (2) near the trunk side trim panel (1).
3. Using a trim stick or another suitable wide flat-bladed tool, carefully pry the notched lower end of the cargo lamp lens to disengage the lower end of the lamp housing from the mounting hole in the quarter trim panel.
4. Pull the upper end of the lamp housing out of the mounting hole far enough to access and disconnect the body wire harness connector from the lamp connector receptacle.
5. Remove the cargo lamp from the vehicle.

INSTALLATION

BULB

CAUTION: Always use the correct bulb size and type for replacement. An incorrect bulb size or type may overheat and cause damage to the lamp, the socket or the lamp wiring.

Fig. 5: Lamp Hood, Bulb, Lamp Lens & Lamp Socket
Courtesy of CHRYSLER GROUP, LLC

1. Align the base of the bulb (2) with the cargo lamp socket (4).
2. Push the bulb straight into the socket until the base is firmly seated.
3. Fold the lamp hood (1) back over the bulb until it is parallel to the lamp socket and connector.
4. Pivot the lens down over the hood.
5. Press the end of the lamp lens with the latch feature down firmly and evenly over the hood until the lens snaps into place over the retention pin on each side of the hood.
6. Install the cargo lamp into the vehicle. Refer to **LAMP, CARGO, INSTALLATION**.
7. Reconnect the battery negative cable.

LAMP

Fig. 6: Trunk Side Trim Panel, Left Quarter Trim Panel & Cargo Lamp
Courtesy of CHRYSLER GROUP, LLC

1. Position the cargo lamp (3) close enough to the mounting hole in the rear edge of the left quarter trim panel (2) near the trunk side trim panel (1) to access and reconnect the body wire harness connector to the lamp connector receptacle.
2. Engage the wiring and connector on the upper end of the lamp housing into the upper end of the mounting hole.
3. Using hand pressure, press the notched lower end of the cargo lamp lens firmly and evenly into the mounting hole against the spring pressure of the latch feature until the latch snaps into place.
4. Reconnect the battery negative cable.

2014 ACCESSORIES AND EQUIPMENT

Left Blind Spot Sensor Module (BSM) (LBSS) - Electrical Diagnostics - Cherokee

DIAGNOSTIC CODE INDEX

DIAGNOSTIC CODE INDEX

DTC	Description
B129E-2A	LEFT BLIND SPOT SENSOR - STUCK
B129E-48	LEFT BLIND SPOT SENSOR - SUPERVISION SOFTWARE FAILURE
B129E-98	LEFT BLIND SPOT SENSOR - COMPONENT OR SYSTEM OVER TEMPERATURE
B12A2-00	LBSS RADAR SENSOR ADDRESS FAULT
B2199-16	BATTERY VOLTAGE - CIRCUIT VOLTAGE BELOW THRESHOLD
B2199-17	BATTERY VOLTAGE - CIRCUIT VOLTAGE ABOVE THRESHOLD
B21DD-84	SYSTEM VOLTAGE - SIGNAL BELOW ALLOWABLE RANGE
B21DD-85	SYSTEM VOLTAGE - SIGNAL ABOVE ALLOWABLE RANGE
B223B-00	VEHICLE CONFIGURATION MISMATCH
B2598-00	DOOR MODULE FRONT LEFT
B2204-00	ECU CONFIGURATION MISMATCH
B22A9-04	ECU INTERNAL PERFORMANCE-SYSTEM INTERNAL FAILURES

U0140-00	LOST COMMUNICATION WITH BODY CONTROL MODULE
U0155-00	LOST COMMUNICATION WITH CLUSTER/CCN
U0203-00	LOST COMMUNICATION WITH LEFT FRONT DOOR MODULE
U0204-00	LOST COMMUNICATION WITH RIGHT FRONT DOOR MODULE
U0422-00	IMPLAUSIBLE DATA RECEIVED FROM BODY CONTROL MODULE
U11FA-00	LOST COMMUNICATION WITH RIGHT BLIND SPOT SENSOR
U147D-00	IMPLAUSIBLE DATA RECEIVED FROM RIGHT BLIND SPOT SENSOR

DIAGNOSIS AND TESTING

B129E-2A-LEFT BLIND SPOT SENSOR - STUCK

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

The Blind Spot Sensor detects an internal failure.

POSSIBLE CAUSES

Possible Causes
LEFT BLIND SPOT SENSOR (LBSS)

DIAGNOSTIC TEST

CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)

1. Turn the ignition on.
2. With the scan tool, read DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Replace the Left Blind Spot Sensor in accordance with the Service Information. Refer to **SENSOR, BLIND SPOT, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B129E-48-LEFT BLIND SPOT SENSOR - SUPERVISION SOFTWARE FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

The Blind Spot Sensor detects an internal failure.

POSSIBLE CAUSES

Possible Causes
LEFT BLIND SPOT SENSOR (LBSS)

DIAGNOSTIC TEST

CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)

1. Turn the ignition on.
2. With the scan tool, read DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Replace the Left Blind Spot Sensor in accordance with the Service Information. Refer to **SENSOR, BLIND SPOT, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B129E-98-LEFT BLIND SPOT SENSOR - COMPONENT OR SYSTEM OVER TEMPERATURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Blind Spot Monitor (BSM) system has two primary components; a Left Blind Spot Sensor (LBSS) and Right Blind Spot Sensor (RBSS). Each sensor includes an internal microprocessor that monitors and controls both the sensor and the blind spot indicator. The two sensors are concealed behind the outboard ends of the rear bumper fascia.

The microprocessor analyzes the sensor data to determine whether any detected objects should be reported. When it is determined that an object should be reported, the Sensor controls its respective left or right BSM display directly through a hard wired output to the Outside Rearview Mirrors. The sensor also sends an electronic request message over the CAN IHS Bus to the radio. The Radio then mutes any current output through the speakers and generates a chime as an audible alert.

Each sensor performs a bulb test by illuminating the triangle icon in the Outside Rearview Mirror at each ignition ON cycle.

WHEN MONITORED

With the ignition on.

SET CONDITION

The Blind Spot Sensor detects the internal temperature is too high.

POSSIBLE CAUSES

Possible Causes
BLIND SPOT SENSOR OBSTRUCTED (MUD OR DIRT COVERING INNER FASCIA) BLIND SPOT SENSOR

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**

   NOTE: Before proceeding with this diagnostic procedure, remove any ice mud, dirt, or other obstructions from the underside of the Fascia/Bumper surrounding the sensors.

   1. Turn the ignition on.
   2. With the scan tool, read DTCs.

      Does the scan tool display this DTC as active?

      Yes

      - Go To 2

      No

      - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **BLIND SPOT SENSOR**
   1. Verify that none of the possible causes mentioned above are present. Repair as necessary.

      If none of the possible causes mentioned above are present, view repair.

      Repair

      - Replace the Blind Spot Sensor in accordance with the Service Information. Refer to **SENSOR, BLIND SPOT, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B12A2-00-LBSS RADAR SENSOR ADDRESS FAULT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

This DTC will set if the Blind Spot Sensor detects an extra ground circuit in the harness connector.

POSSIBLE CAUSES

Possible Causes
LEFT BLIND SPOT SENSOR (LBSS)

DIAGNOSTIC TEST

CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)

NOTE: Before proceeding, disconnect the Left Blind Spot Sensor harness connector. Inspect the wiring harness, harness connector and module pins for any damage or corrosion. Repair as necessary.

1. Turn the ignition on.
2. With the scan tool, read DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Replace the Left Blind Spot Sensor in accordance with the Service Information. Refer to **SENSOR, BLIND SPOT, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B2199-16-BATTERY VOLTAGE - CIRCUIT VOLTAGE BELOW THRESHOLD

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 1: Left Blind Spot Sensor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the ignition on.

SET CONDITION

Blind Spot Sensor supply voltage less than 9.5 volts.

POSSIBLE CAUSES

Possible Causes
FUSED IGNITION OUTPUT CIRCUIT EXCESSIVE RESISTANCE
GROUND CIRCUIT EXCESSIVE RESISTANCE
VEHICLE CHARGING SYSTEM
BLIND SPOT SENSOR

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
   1. Turn the ignition on.
   2. With the scan tool, read DTCs.

      Does the scan tool display this DTC as active?

      Yes

      - Go To 2

      No

      - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **VERIFY OPERATION OF THE VEHICLE CHARGING SYSTEM**

   NOTE: Troubleshoot any PCM charging/cranking DTCs before proceeding.

   NOTE: Make sure the battery is fully charged.

   Are any charging system DTCs present?

   Yes

   - Refer to the **DTC INDEX** article and perform the appropriate diagnostic procedure.

   No

   - Go To 3
3. **CHECK THE (F923) FUSED IGNITION OUTPUT (RUN) CIRCUIT FOR EXCESSIVE RESISTANCE**
   1. Turn the ignition off.

2. Disconnect the Left Blind Spot Sensor harness connector.
3. Turn the ignition on.
4. Measure the voltage of the (F923) Fused Ignition Output (RUN) circuit.

   Is the voltage below 9.5 volts?

   Yes

   - Repair the (F923) Fused Ignition Output (RUN) circuit for excessive resistance.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 4

4. **CHECK THE (Z917) GROUND CIRCUIT FOR EXCESSIVE RESISTANCE**
   1. Measure the resistance between ground and the (Z917) Ground circuit.

      Is the resistance above 10.0 Ohms?

      Yes

      - Repair the (Z917) Ground circuit for excessive resistance.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Replace the Blind Spot Sensor in accordance with the Service Information. Refer to **SENSOR, BLIND SPOT, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B2199-17-BATTERY VOLTAGE - CIRCUIT VOLTAGE ABOVE THRESHOLD

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 2: Left Blind Spot Sensor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the ignition on.

SET CONDITION

Blind Spot Sensor supply voltage greater than 16.0 volts.

POSSIBLE CAUSES

Possible Causes
VEHICLE CHARGING SYSTEM BLIND SPOT SENSOR

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
   1. Turn the ignition on.
   2. With the scan tool, read DTCs.

      Does the scan tool display this DTC as active?

      Yes

      - Go To 2

      No

      - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **VERIFY OPERATION OF THE VEHICLE CHARGING SYSTEM**

   NOTE: Troubleshoot any PCM charging/cranking DTCs before proceeding.

   NOTE: Make sure the battery is fully charged.

   Are any charging system DTCs present?

   Yes

   - Refer to the **DTC INDEX** article and perform the appropriate diagnostic procedure.

   No

   - Replace the Blind Spot Sensor in accordance with the Service Information. Refer to **SENSOR, BLIND SPOT, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B21DD-84-SYSTEM VOLTAGE - SIGNAL BELOW ALLOWABLE RANGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 3: Left Blind Spot Sensor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

Ignition on.

SET CONDITION

Monitored battery voltage is below 9.0 volts for over 5 seconds.

POSSIBLE CAUSES

Possible Causes
LOW SYSTEM VOLTAGE BATTERY OR CHARGING SYSTEM

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
   1. Turn the ignition on.
   2. With the scan tool, read DTCs.

      Does the scan tool display this DTC as active?

      Yes

      - Go To 2

      No

      - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **VERIFY OPERATION OF THE VEHICLE CHARGING SYSTEM**

   NOTE: Troubleshoot any PCM charging/cranking DTCs before proceeding.

   NOTE: Make sure the battery is fully charged.

   Are any charging system DTCs present?

   Yes

   - Refer to the **DTC INDEX** article and perform the appropriate diagnostic procedure.

   No

   - Replace the Blind Spot Sensor in accordance with the Service Information. Refer to **SENSOR, BLIND SPOT, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B21DD-85-SYSTEM VOLTAGE - SIGNAL ABOVE ALLOWABLE RANGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 4: Left Blind Spot Sensor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

Ignition on

SET CONDITION

This is a Controller Monitored system voltage was above 16 volts for 5 seconds or more.

POSSIBLE CAUSES

Possible Causes
HIGH BATTERY SYSTEM VOLTAGE CHARGING SYSTEM

DIAGNOSTIC TEST

CHECK ENGINE DTCs

1. With the scan tool, read the Powertrain Control Module (PCM) DTCs.

   Are there any PCM Charging or Battery DTCs present?

   Yes

   - Refer to the **DTC INDEX** article and perform the appropriate diagnostic procedure.

   No

   - This code is a CAN system message for information only. Check the charging system in accordance with the Service Information.

B223B-00-VEHICLE CONFIGURATION MISMATCH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

This DTC will set if the vehicle type is not identified or incorrectly identified.

POSSIBLE CAUSES

Possible Causes
INCORRECT VEHICLE CONFIGURATION IN THE BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)

NOTE: Diagnose and repair any BCM VIN or Communication DTCs before continuing with this test.

1. Turn the ignition on.
2. With the scan tool, select View DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Verify the correct vehicle configuration in the BCM.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Use the scan tool to read DTCs in all other modules. If any communication DTCs are present, perform the appropriate diagnostic procedure. Perform any Technical Service Bulletins that apply. If no problems are found, test is complete.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B2598-00-DOOR MODULE FRONT LEFT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

Vehicle speed greater than 6 mph (9.6 km/h).

SET CONDITION

The door module is reporting a DTC.

POSSIBLE CAUSES

Possible Causes
DTC IN FRONT LEFT DOOR MODULE

DIAGNOSTIC TEST

CHECK FOR ACTIVE DTC

1. Turn the ignition on.
2. With the scan tool, read DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

   No

   - The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B2204-00-ECU CONFIGURATION MISMATCH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

Each Body Control Module (BCM) is unique to a vehicle and cannot be used with a different vehicle. The configuration information is programmed into the module prior to shipment.

WHEN MONITORED

With the ignition on.

SET CONDITION

The Body Control Module (BCM) is not configured correctly to the vehicle.

POSSIBLE CAUSES

Possible Causes
BCM INSTALLED IN INCORRECT VEHICLE
BCM NOT CONFIGURED CORRECTLY
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR ACTIVE DTC**

1. With the scan tool, read the active DTCs.
2. With the scan tool, clear all the DTCs.
3. Cycle the ignition switch from off to on.
4. Wait 10 seconds.
5. With the scan tool, read the active DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Go To 2

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **VERIFY THE BCM IS INSTALLED IN THE CORRECT VEHICLE**
   1. With the scan tool, read the VIN in the ECU Details.
   2. Compare the VIN in the BCM to the vehicle.

      Do the VINs match?

      Yes

      - Check the repair history for any changes that required a configuration update. Repair as necessary.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - The BCM is installed on the wrong vehicle or the BCM was configured incorrectly. Reinstall the BCM on the correct vehicle or replace the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B22A9-04-ECU INTERNAL PERFORMANCE-SYSTEM INTERNAL FAILURES

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Left Blind Spot Sensor Module (LBSS) performs an internal self test. The repair of this fault condition does not involve any external circuitry and centers on verifying the integrity of the internal circuitry and software

validity.

WHEN MONITORED

Continuously.

SET CONDITION

The Left Blind Spot Sensor Module (LBSS) detects an internal fault.

POSSIBLE CAUSES

Possible Causes
LEFT BLIND SPOT SENSOR MODULE (LBSS)

DIAGNOSTIC TEST

REPLACE THE BLIND SPOT SENSOR MODULE IF THE DTC IS ACTIVE

1. With the scan tool, read the active DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Replace the Blind Spot Sensor Module in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U0020-00-CAN B BUS OFF PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously when the ignition is on.

The battery voltage between 10.0 and 16.0 Volts.

Body Control Module (BCM) is configured correctly.

SET CONDITION

Bus messages not received from the Body Control Module (BCM) for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN IHS BUS (125K) CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
BODY CONTROL MODULE (BCM) POWER AND GROUND
BCM NOT CONFIGURED CORRECTLY
BODY CONTROL MODULE (BCM)
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

VERIFY DTC IS ACTIVE

NOTE: Make sure the battery is fully charged before proceeding.

1. Turn the ignition on.
2. With the scan tool, read the active DTCs.

   Does the scan tool display; U0020-00-CAN B BUS OFF PERFORMANCE as active?

   Yes

   - **For this code, perform the U0011-00-CAN INTERIOR BUS OFF PERFORMANCE diagnostic procedure.** Refer to the **DTC INDEX** article.

   No

   - Refer to **DIAGNOSIS AND TESTING** and perform the STORED LOST COMMUNICATION DTCs diagnostic procedure.

U0140-00-LOST COMMUNICATION WITH BODY CONTROL MODULE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously when the ignition is on.

The battery voltage between 10.0 and 16.0 Volts.

Body Control Module (BCM) is configured correctly.

SET CONDITION

Bus messages not received from the Body Control Module (BCM) for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
BODY CONTROL MODULE POWER AND GROUND
BCM NOT CONFIGURED CORRECTLY
BODY CONTROL MODULE (BCM)
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

VERIFY IF THE DTC IS ACTIVE

NOTE: **Make sure the battery is fully charged before performing any diagnostic procedure.**

With the scan tool, refer to the Network Review Screen to display a high level view of the vehicle communication network. Modules shown in red are problem areas.

Always diagnose any Body Control Module (BCM) DTCs first before proceeding.

1. Turn the ignition on.
2. With the scan tool, read DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM BCM (BODY CONTROL MODULE) diagnostic procedure.

   No

   - Refer to **DIAGNOSIS AND TESTING** and perform the STORED LOST COMMUNICATION DTCs diagnostic procedure.

U0155-00-LOST COMMUNICATION WITH CLUSTER/CCN

Perform the COMMUNICATION PRE-DIAGNOSTIC PROCEDURE. Refer to **STANDARD PROCEDURE** .

WHEN MONITORED

Continuously when the ignition is on.

Battery voltage between 10 and 16 volts.

Body Control Module (BCM) is configured correctly.

SET CONDITION

Bus messages not received from the Instrument Cluster (IC) for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN BUS (+) CIRCUIT SHORTED TO VOLTAGE
CAN BUS (-) CIRCUIT SHORTED TO GROUND
INSTRUMENT CLUSTER (IPC) POWER AND GROUND
BCM NOT CONFIGURED CORRECTLY
INSTRUMENT CLUSTER (IPC)
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

VERIFY DTC IS ACTIVE

NOTE: Make sure the battery is fully charged before proceeding.

1. Turn the ignition on.
2. With the scan tool, read the active DTCs.

   Does the scan tool display: U0155-00-LOST COMMUNICATION WITH CLUSTER/CCN?

   Yes

   - Refer to the **BODY CONTROL MODULE (BCM) - DIAGNOSTIC CODE INDEX** article and perform the U0155-87-LOST COMMUNICATION WITH CLUSTER/CCN diagnostic procedure.

   No

   - Refer to **DIAGNOSIS AND TESTING** and perform the STORED LOST COMMUNICATION DTCs diagnostic procedure.

U0203-00-LOST COMMUNICATION WITH LEFT FRONT DOOR MODULE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

Battery voltage between 10 and 16 volts.

Body Control Module (BCM) is configured correctly.

SET CONDITION

Bus messages not received from the Driver Door Module for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN INTERIOR BUS (+) CIRCUIT SHORTED TO VOLTAGE
CAN INTERIOR BUS (-) CIRCUIT SHORTED TO GROUND
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
DRIVER DOOR MODULE POWER AND GROUND
BCM NOT CONFIGURED CORRECTLY
DRIVER DOOR MODULE
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

VERIFY DTC IS ACTIVE

NOTE: Make sure the fuse is installed and the battery is fully charged before proceeding.

1. Turn the ignition on.
2. With the scan tool, read active DTCs.

   Is this DTC active?

   Yes

   - Refer to the **DTC INDEX** article and perform the U0203-00 LOST COMMUNICATION WITH DOOR MODULE FRONT LEFT diagnostic procedure.

   No

- Refer to **DIAGNOSIS AND TESTING** and perform the STORED LOST COMMUNICATION DTCs diagnostic procedure.

U0204-00-LOST COMMUNICATION WITH RIGHT FRONT DOOR MODULE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

Battery voltage between 10 and 16 volts.

Body Control Module (BCM) is configured correctly.

SET CONDITION

Bus messages not received from the Passenger Door Module for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN INTERIOR BUS (+) CIRCUIT SHORTED TO VOLTAGE
CAN INTERIOR BUS (-) CIRCUIT SHORTED TO GROUND
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
PASSENGER DOOR MODULE POWER AND GROUND
BCM NOT CONFIGURED CORRECTLY
PASSENGER DOOR MODULE
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)

1. Turn the ignition on.
2. With the scan tool, read the active DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Refer to the **BODY CONTROL MODULE (BCM) - DIAGNOSTIC CODE INDEX** article and perform the U0200-00-LOST COMMUNICATION WITH PASSENGER DOOR MODULE diagnostic procedure.

No

- Refer to **DIAGNOSIS AND TESTING** and perform the STORED LOST COMMUNICATION DTCs diagnostic procedure.

U0422-00-IMPLAUSIBLE DATA RECEIVED FROM BODY CONTROL MODULE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

Incorrect data received from the Body Control Module (BCM).

POSSIBLE CAUSES

Possible Causes
NO COMMUNICATION WITH THE BODY CONTROL MODULE (BCM)
DTCS STORED OR ACTIVE IN THE BCM
BLIND SPOT SENSORS

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**

   NOTE: Diagnose and repair any Body Control Module DTCs before proceeding with this diagnostic procedure.

   1. Turn the ignition on.
   2. With the scan tool, read active DTCs.

      Does the scan tool display this DTC as active?

      Yes

      - Go To 2

      No

      - The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **VERIFY THE BCM IS ACTIVE ON THE CAN BUS**
   1. With the scan tool, verify that the BCM is active on the bus.

      Is the BCM active on the bus?

      Yes

      - Replace and program the Blind Spot Sensor in accordance with the Service Information. Refer to **SENSOR, BLIND SPOT, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM BCM diagnostic procedure.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U11FA-00-LOST COMMUNICATION WITH RIGHT BLIND SPOT SENSOR

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 5: Identifying Left/Right Blind Spot Sensor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Blind Spot Monitor (BSM) system has two primary components; a Left Blind Spot Sensor (LBSS) and Right Blind Spot Sensor (RBSS). Each sensor includes an internal microprocessor that monitors and controls both the sensor and the blind spot indicator. The two sensors are concealed behind the outboard ends of the rear bumper fascia.

The microprocessor analyzes the sensor data to determine whether any detected objects should be reported. When it is determined that an object should be reported, the Sensor controls its respective left or right BSM display directly through a hard wired output to the Outside Rearview Mirrors. The sensor also sends an electronic request message over the CAN IHS Bus to the radio. The Radio then mutes any current output through the speakers and generates a chime as an audible alert.

Each sensor performs a bulb test by illuminating the triangle icon in the Outside Rearview Mirror at each ignition ON cycle.

WHEN MONITORED

With the ignition on.

SET CONDITION

The Left Blind Spot Sensor (LBSS) does not receive messages from the Right Blind Spot Sensor (RBSS).

POSSIBLE CAUSES

Possible Causes
FUSED IGNITION OUTPUT (RUN) CIRCUIT OPEN OR SHORTED TO GROUND
GROUND CIRCUIT(S) OPEN
CAN IHS BUS CIRCUIT(S) OPEN
RIGHT BLIND SPOT SENSOR (RBSS)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **(F923) FUSED IGNITION OUTPUT (RUN) CIRCUIT OPEN**

1. Disconnect the Right Blind Spot Sensor (RBSS) harness connector.
2. Turn the ignition on.
3. Using a volt meter, measure the voltage of the (F923) Fused Ignition Output (RUN) circuit.

   Is voltage present?

   Yes

   - Go To 3

   No

   - Repair the (F923) Fused Ignition Switch Output (RUN) circuit for an open or short to ground.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **(Z923) GROUND CIRCUIT(S) OPEN**
   1. Turn the ignition off.
   2. Using an ohm meter, measure the resistance between ground and the (Z923) Ground circuits at the RBSS harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 4

      No

      - Repair the (Z923) Ground circuit(s) for an open.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK THE (D217) AND (D218) CAN IHS BUS CIRCUITS FOR AN OPEN**
   1. Turn the ignition on.
   2. Measure the resistance of the (D217) CAN IHS Bus (-) circuit between the Rear CAN IHS Star Connector C4 harness connector and the RBSS harness connector
   3. Measure the resistance of the (D218) CAN IHS Bus (+) circuit between the Rear CAN IHS Star Connector C4 harness connector and the RBSS harness connector.

      Is resistance below 5.0 Ohms on both circuits?

      Yes

      - Replace the Right Blind Spot Sensor in accordance with the Service Information. Refer to **SENSOR, BLIND SPOT, REMOVAL** .

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Repair the (D218) or (D217) CAN IHS Bus circuit for an open. Inspect the connector for damage.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U147D-00-IMPLAUSIBLE DATA RECEIVED FROM RIGHT BLIND SPOT SENSOR

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 6: Identifying Left/Right Blind Spot Sensor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Blind Spot Monitor (BSM) system has two primary components; a Left Blind Spot Sensor (LBSS) and Right Blind Spot Sensor (RBSS). Each sensor includes an internal microprocessor that monitors and controls both the sensor and the blind spot indicator. The two sensors are concealed behind the outboard ends of the rear bumper fascia.

The microprocessor analyzes the sensor data to determine whether any detected objects should be reported. When it is determined that an object should be reported, the Sensor controls its respective left or right BSM display directly through a hard wired output to the Outside Rearview Mirrors. The sensor also sends an electronic request message over the CAN IHS Bus to the radio. The Radio then mutes any current output through the speakers and generates a chime as an audible alert.

Each sensor performs a bulb test by illuminating the triangle icon in the Outside Rearview Mirror at each ignition ON cycle.

WHEN MONITORED

With the ignition on.

SET CONDITION

Incorrect data received from the Right Blind Spot Sensor (RBSS).

POSSIBLE CAUSES

Possible Causes
NO COMMUNICATION WITH THE RIGHT BLIND SPOT SENSOR (RBSS)
DTCS STORED OR ACTIVE IN THE RBSS
RIGHT BLIND SPOT SENSOR (RBSS)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**

   NOTE: Diagnose and repair any Right Blind Spot Sensor DTCs before proceeding with this diagnostic procedure.

   1. Turn the ignition on.
   2. With the scan tool, read active DTCs.

      Does the scan tool display this DTC as active?

      Yes

      - Go To 2

      No

      - The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **VERIFY THE RBSS IS ACTIVE ON THE CAN BUS**
   1. With the scan tool, verify that the RBSS is active on the bus.

      Is the RBSS active on the bus?

      Yes

      - Replace and program the Blind Spot Sensor in accordance with the Service Information. Refer to **SENSOR, BLIND SPOT, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM RBSS diagnostic procedure.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

DIAGNOSIS AND TESTING

B1D5E-13-POWER SEAT SWITCH - CIRCUIT OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 1: Driver Memory Seat Switch Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Memory System is made up of the Memory Seat Module-Driver (MSMD), Memory Switch, Driver Seat Switch and multiple Seat Motors. The motors each contain a hall-effect position sensor. The hall-effect position sensor provides feedback to the MSMD in relation to the motors position.

The Driver Seat Switch is a Multiplex (Mux) switch which uses set resistance levels for each switch position. These resistances correspond to different voltages which is monitored by the MSMD over two separate circuits. When a voltage change is detected, the MSMD will command the appropriate Seat motor(s) to move the seat in the requested direction as long as the Driver Seat Switch is held in that direction or its stops have been reached.

The Memory Switch is a Mux switch that is used to set and recall the seat positions. When a Memory Switch button is pressed, the Driver Door Module (DDM) detects a voltage change and sends a request over the Controller Area Network (CAN) bus circuit to the MSMD to perform the requested command. If the SET button on the Memory Switch is pressed, followed by the 1 or 2 button, the MSMD will store the seat positions based on the position inputs received from the hall-effect position sensors. If the 1 or 2 button on the Memory Switch is pressed, the MSMD will recall the stored seat positions for that particular selection and return the seat to the stored positions. Memory position may also be recalled using a linked FOBIK transmitter. For driver safety, the MSMD will prevent the memory recall function from being initiated if the transmission gear selector lever is not in the Park position or if the vehicle is moving. For further information, refer to **MODULE, MEMORY, SEAT, OPERATION** .

WHEN MONITORED

Continuously.

SET CONDITION

The MSMD detects an open in either Driver Seat Switch MUX circuit.

POSSIBLE CAUSES

Possible Causes
DRIVER SEAT REAR VERTICAL/HORIZONTAL SWITCH MUX CIRCUIT OPEN
DRIVER SEAT FRONT VERTICAL/RECLINER SWITCH MUX CIRCUIT OPEN
DRIVER SEAT SWITCH MUX RETURN CIRCUIT OPEN
DRIVER SEAT SWITCH
MEMORY SEAT MODULE

Driver Seat Switch Continuity		
Switch Position	**Continuity Between**	**Resistance Value (± 5%)**
Off	10-4	Open
Off	10-11	Open
Off	1-4	47 Ohms
Off	1-11	47 Ohms
Rear Tilt Up	10-11	169 Ohms
Rear Tilt Down	10-11	76 Ohms
Horizontal Forward	10-11	43 Ohms
Horizontal Rearward	10-11	10 Ohms
Recliner Up	10-4	43 Ohms

Recliner Down	10-4	10 Ohms
Front Tilt Up	10-4	169 Ohms
Front Tilt Down	10-4	76 Ohms

DIAGNOSTIC TEST

1. **CHECK IF THE DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. With the scan tool, record and erase Memory Seat Module-Driver (MSMD) DTCs.
    3. Cycle the ignition switch from off to on.
    4. Cycle the Power Seat Switch to all positions.
    5. With the scan tool, read MSMD DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Go To 6
2. **CHECKING THE DRIVER SEAT SWITCH MUX RETURN CIRCUIT**
    1. Turn the ignition off.
    2. Disconnect the Driver Seat Switch harness connector.
    3. Using the DRIVER SEAT SWITCH CONTINUITY CHART, measure the resistance of the Driver Seat Switch in the Off position.

    Is the resistance within specifications?

    Yes

    - Go To 3

    No

    - Replace the Driver Seat Switch in accordance with the Service Information. Refer to **SWITCH, SEAT, REMOVAL** .
    - Perform the POWER SEAT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
3. **CHECK THE (P599) DRIVER SEAT SWITCH MUX RETURN CIRCUIT FOR AN OPEN**
    1. Disconnect the MSMD C7 harness connector.
    2. Measure the resistance of the (P599) Driver Seat Switch Mux Return circuit between the MSMD

C7 harness connector and the Driver Seat Switch harness connector.

Is the resistance below 1.0 Ohm?

Yes

- Go To 4

No

- Repair the (P599) Driver Seat Switch Mux Return circuit for an open or high resistance.
- Perform the POWER SEAT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

4. **CHECK THE (P339) DRIVER SEAT SWITCH FRONT VERTICAL/RECLINER SWITCH MUX CIRCUIT FOR AN OPEN**
   1. Measure the resistance of the (P339) Driver Seat Switch Front Vertical/Recliner Switch Mux circuit between the MSMD C7 harness connector and the Driver Seat Switch harness connector.

      Is the resistance below 1.0 Ohm?

      Yes

      - Go To 5

      No

      - Repair the (P339) Driver Seat Switch Front Vertical/Recliner Switch Mux circuit for an open or high resistance.
      - Perform the POWER SEAT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
5. **CHECK THE (P239) DRIVER SEAT SWITCH REAR VERTICAL/HORIZONTAL SWITCH MUX CIRCUIT FOR AN OPEN**
   1. Measure the resistance of the (P239) Driver Seat Switch Rear Vertical/Horizontal Switch Mux circuit between the MSMD C7 harness connector and the Driver Seat Switch harness connector.

      Is the resistance below 1.0 Ohm?

      Yes

      - Replace the Driver Seat Switch in accordance with the Service Information. Refer to **SWITCH, SEAT, REMOVAL** .
      - Perform the POWER SEAT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

- Repair the (P239) Driver Seat Switch Rear Vertical/Horizontal Switch Mux circuit for an open or high resistance.
- Perform the POWER SEAT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

6. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit. Wiggle the wiring and connectors while checking for shorted and open circuits. Attempt to reproduce the condition by adjusting the seat(s).
   3. Check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Check Service Bulletins for any possible causes that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWER SEAT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

B1D5E-2A-POWER SEAT SWITCH - STUCK

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 2: Driver Memory Seat Switch Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Memory System is made up of the Memory Seat Module-Driver (MSMD), Memory Switch, Driver Seat Switch and multiple Seat Motors. The motors each contain a hall-effect position sensor. The hall-effect position sensor provides feedback to the MSMD in relation to the motors position.

The Driver Seat Switch is a Multiplex (Mux) switch which uses set resistance levels for each switch position. These resistances correspond to different voltages which is monitored by the MSMD over two separate circuits. When a voltage change is detected, the MSMD will command the appropriate Seat motor(s) to move the seat in the requested direction as long as the Driver Seat Switch is held in that direction or its stops have been reached.

The Memory Switch is a Mux switch that is used to set and recall the seat positions. When a Memory Switch button is pressed, the Driver Door Module (DDM) detects a voltage change and sends a request over the Controller Area Network (CAN) bus circuit to the MSMD to perform the requested command. If the SET button on the Memory Switch is pressed, followed by the 1 or 2 button, the MSMD will store the seat positions based on the position inputs received from the hall-effect position sensors. If the 1 or 2 button on the Memory Switch is pressed, the MSMD will recall the stored seat positions for that particular selection and return the seat to the stored positions. Memory position may also be recalled using a linked FOBIK transmitter. For driver safety, the MSMD will prevent the memory recall function from being initiated if the transmission gear selector lever is not in the Park position or if the vehicle is moving. For further information, refer to **MODULE, MEMORY, SEAT, OPERATION** .

WHEN MONITORED

Continuously.

SET CONDITION

The Memory Seat Module-Driver (MSM) detects that the Driver Seat Switch is in an active position for longer than 50 seconds.

POSSIBLE CAUSES

Possible Causes
DRIVER SEAT SWITCH

DIAGNOSTIC TEST

CHECK IF THE DTC IS ACTIVE

1. Ignition on, engine not running.
2. With the scan tool, record and erase Memory Seat Module-Driver (MSMD) DTCs.
3. Cycle the ignition switch from off to on.
4. Cycle the Driver Seat Switch in all directions several times.
5. Wait one minute.
6. With the scan tool, read MSMD DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Replace the Driver Seat Switch in accordance with the Service Information. Refer to **SWITCH, SEAT, REMOVAL** .
   - Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagram as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
- Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

B1D6B-11-SEAT HORIZONTAL POSITION SENSOR - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 3: Driver Memory Seat Module Circuit Diagram

THEORY OF OPERATION

The Memory System is made up of the Memory Seat Module-Driver (MSMD), Memory Switch, Driver Seat Switch and multiple Seat Motors. The motors each contain a hall-effect position sensor. The hall-effect position sensor provides feedback to the MSMD in relation to the motors position.

The Driver Seat Switch is a Multiplex (Mux) switch which uses set resistance levels for each switch position.

These resistances correspond to different voltages which is monitored by the MSMD over two separate circuits. When a voltage change is detected, the MSMD will command the appropriate Seat motor(s) to move the seat in the requested direction as long as the Driver Seat Switch is held in that direction or its stops have been reached.

The Memory Switch is a Mux switch that is used to set and recall the seat positions. When a Memory Switch button is pressed, the Driver Door Module (DDM) detects a voltage change and sends a request over the Controller Area Network (CAN) bus circuit to the MSMD to perform the requested command. If the SET button on the Memory Switch is pressed, followed by the 1 or 2 button, the MSMD will store the seat positions based on the position inputs received from the hall-effect position sensors. If the 1 or 2 button on the Memory Switch is pressed, the MSMD will recall the stored seat positions for that particular selection and return the seat to the stored positions. Memory position may also be recalled using a linked FOBIK transmitter. For driver safety, the MSMD will prevent the memory recall function from being initiated if the transmission gear selector lever is not in the Park position or if the vehicle is moving. For further information, refer to **MODULE, MEMORY, SEAT, OPERATION** .

WHEN MONITORED

The seat motor is activated.

SET CONDITION

If the Memory Seat Module-Driver (MSMD) detects the Driver Seat Horizontal Position Sensor voltage is not within a specified range. The DTC will only set when the seat switch is moved in the same direction three consecutive times.

POSSIBLE CAUSES

Possible Causes
DRIVER SEAT HORIZONTAL POSITION SENSE CIRCUIT SHORTED TO GROUND
DRIVER HORIZONTAL SEAT ADJUSTER MOTOR
MEMORY SEAT MODULE-DRIVER (MSMD)

DIAGNOSTIC TEST

1. **CHECK IF THE DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. With the scan tool, record and erase Memory Seat Module-Driver (MSMD) DTCs.
    3. Cycle the ignition switch from off to on.
    4. Move the Seat Switch in the horizontal position three times.
    5. With the scan tool, read MSMD DTCs.

    Does the scan tool display this DTC as active?

    Yes

- Go To 2

No

- Go To 5

2. **CHECK THE (G401) DRIVER SEAT HORIZONTAL POSITION SENSE CIRCUIT**
   1. Turn the ignition off.
   2. Disconnect the Driver Seat Adjuster Horizontal Motor harness connector.
   3. Ignition on, engine not running.
   4. Measure the voltage of the (G401) Driver Seat Horizontal Position Sense circuit in the Driver Seat Adjuster Horizontal Motor harness connector.

   Is the voltage above 11.0 volts?

   Yes

   - Replace the Power Seat Track in accordance with the Service Information. Refer to **DESCRIPTION** . Refer to **SEAT** .
   - Perform the POWER SEAT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 3

3. **CHECK THE (G401) DRIVER SEAT HORIZONTAL POSITION SENSE CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Disconnect the MSMD C5 harness connector.
   3. Measure the resistance between ground and the (G401) Driver Seat Horizontal Position Sense circuit.

   Is the resistance below 100K Ohms?

   Yes

   - Repair the (G401) Driver Seat Horizontal Position Sense circuit for a short to ground.
   - Perform the POWER SEAT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 4

4. **MEMORY SEAT MODULE (MSMD)**

1. Using the wiring diagram/schematic as a guide, inspect the wiring and harness connectors between the Driver Horizontal Seat Adjuster Motor and the MSMD.
2. Look for any chafed, pierced, pinched, or partially broken wires.
3. Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the Driver Horizontal Seat Adjuster Motor and MSMD harness connectors.
4. Perform any Technical Service Bulletins that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWER SEAT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Replace and program the MSMD in accordance with the Service Information. Refer to **MODULE, MEMORY, SEAT, REMOVAL** .
   - Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

5. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit. Wiggle the wiring and connectors while checking for shorted and open circuits. Attempt to reproduce the condition by adjusting the seat(s).
   3. Check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Check Service Bulletins for any possible causes that may apply.

      Were there any problems found?

      Yes

      - Repair as necessary.
      - Perform the POWER SEAT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Test complete.

B1D6B-12-SEAT HORIZONTAL POSITION SENSOR - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 4: Driver Memory Seat Module Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Memory System is made up of the Memory Seat Module-Driver (MSMD), Memory Switch, Driver Seat Switch and multiple Seat Motors. The motors each contain a hall-effect position sensor. The hall-effect position sensor provides feedback to the MSMD in relation to the motors position.

The Driver Seat Switch is a Multiplex (Mux) switch which uses set resistance levels for each switch position. These resistances correspond to different voltages which is monitored by the MSMD over two separate circuits. When a voltage change is detected, the MSMD will command the appropriate Seat motor(s) to move the seat in the requested direction as long as the Driver Seat Switch is held in that direction or its stops have been reached.

The Memory Switch is a Mux switch that is used to set and recall the seat positions. When a Memory Switch button is pressed, the Driver Door Module (DDM) detects a voltage change and sends a request over the Controller Area Network (CAN) bus circuit to the MSMD to perform the requested command. If the SET button on the Memory Switch is pressed, followed by the 1 or 2 button, the MSMD will store the seat positions based on the position inputs received from the hall-effect position sensors. If the 1 or 2 button on the Memory Switch is pressed, the MSMD will recall the stored seat positions for that particular selection and return the seat to the stored positions. Memory position may also be recalled using a linked FOBIK transmitter. For driver safety, the MSMD will prevent the memory recall function from being initiated if the transmission gear selector lever is not in the Park position or if the vehicle is moving. For further information, refer to **MODULE, MEMORY, SEAT, OPERATION** .

WHEN MONITORED

The seat motor is activated.

SET CONDITION

If the Memory Seat Module-Driver (MSMD) detects the Driver Seat Horizontal Position sensor voltage is not within a specified range. The DTC will only set when the seat switch is moved in the same direction three consecutive times.

POSSIBLE CAUSES

Possible Causes
DRIVER SEAT HORIZONTAL POSITION SENSE CIRCUIT SHORTED TO VOLTAGE
DRIVER HORIZONTAL SEAT ADJUSTER MOTOR
MEMORY SEAT MODULE

DIAGNOSTIC TEST

1. **CHECK IF THE DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. With the scan tool, record and erase Memory Seat Module-Driver (MSMD) DTCs.
    3. Cycle the ignition switch from off to on.
    4. Move the Seat Switch in the horizontal position three times.
    5. With the scan tool, read MSMD DTCs.

    Does the scan tool display this DTC as active?

    Yes

- Go To 2

No

- The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
- Perform the POWER SEAT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

2. **CHECK THE (G401) DRIVER SEAT HORIZONTAL POSITION SENSE CIRCUIT**
   1. Turn the ignition off.
   2. Disconnect the Driver Horizontal Seat Adjuster Motor harness connector.
   3. Ignition on, engine not running.
   4. Measure the voltage between the (G401) Driver Seat Horizontal Position Sense circuit and ground.

   Is the voltage above 11.0 volts?

   Yes

   - Go To 3

   No

   - Replace the Power Seat Track in accordance with the Service Information. Refer to **DESCRIPTION** . Refer to **SEAT** .
   - Perform the POWER SEAT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

3. **CHECK THE (G401) DRIVER SEAT HORIZONTAL POSITION SENSE CIRCUIT FOR A SHORT TO VOLTAGE**
   1. Turn the ignition off.
   2. Disconnect the MSMD C5 harness connector.
   3. Ignition on, engine not running.
   4. Measure the voltage between ground and the (G401) Driver Seat Horizontal Position Sense circuit.

   Is the voltage above 1.0 volt?

   Yes

   - Repair the (G401) Driver Seat Horizontal Position Sense circuit for a short to voltage.
   - Perform the POWER SEAT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

- Go To 4

4. **MEMORY SEAT MODULE (MSMD)**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and harness connectors between the Driver Horizontal Seat Adjuster Motor and the MSMD.
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the Driver Horizontal Seat Adjuster Motor and MSMD harness connectors.
   4. Perform any Technical Service Bulletins that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWER SEAT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Replace the MSMD in accordance with the Service Information. Refer to **MODULE, MEMORY, SEAT, REMOVAL** .
   - Perform the POWER SEAT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

B1D6F-11-SEAT FRONT VERTICAL POSITION SENSOR - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 5: Driver Vertical Seat Motor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Memory System is made up of the Memory Seat Module-Driver (MSMD), Memory Switch, Driver Seat Switch and multiple Seat Motors. The motors each contain a hall-effect position sensor. The hall-effect position sensor provides feedback to the MSMD in relation to the motors position.

The Driver Seat Switch is a Multiplex (Mux) switch which uses set resistance levels for each switch position. These resistances correspond to different voltages which is monitored by the MSMD over two separate circuits. When a voltage change is detected, the MSMD will command the appropriate Seat motor(s) to move the seat in

the requested direction as long as the Driver Seat Switch is held in that direction or its stops have been reached.

The Memory Switch is a Mux switch that is used to set and recall the seat positions. When a Memory Switch button is pressed, the Driver Door Module (DDM) detects a voltage change and sends a request over the Controller Area Network (CAN) bus circuit to the MSMD to perform the requested command. If the SET button on the Memory Switch is pressed, followed by the 1 or 2 button, the MSMD will store the seat positions based on the position inputs received from the hall-effect position sensors. If the 1 or 2 button on the Memory Switch is pressed, the MSMD will recall the stored seat positions for that particular selection and return the seat to the stored positions. Memory position may also be recalled using a linked FOBIK transmitter. For driver safety, the MSMD will prevent the memory recall function from being initiated if the transmission gear selector lever is not in the Park position or if the vehicle is moving. For further information, refer to **MODULE, MEMORY, SEAT, OPERATION** .

WHEN MONITORED

The seat motor is activated.

SET CONDITION

If the Memory Seat Module-Driver (MSMD) detects the Vertical Position sensor voltage is not within a specified range. The DTC will only set when the seat switch is moved in the same direction three consecutive times.

POSSIBLE CAUSES

Possible Causes
DRIVER SEAT FRONT VERTICAL POSITION SENSE CIRCUIT SHORTED TO GROUND
DRIVER FRONT VERTICAL SEAT ADJUSTER MOTOR
MEMORY SEAT MODULE-DRIVER (MSMD)

DIAGNOSTIC TEST

1. **CHECK IF THE DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. With the scan tool, record and erase Memory Seat Module-Driver (MSMD) DTCs.
    3. Cycle the ignition switch from off to on.
    4. Move the Seat Switch in the front vertical position three times.
    5. With the scan tool, read MSMD DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

No

- The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
- Perform the POWER SEAT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

2. **CHECK THE (G404) DRIVER SEAT FRONT VERTICAL POSITION SENSE CIRCUIT**
   1. Turn the ignition off.
   2. Disconnect the Driver Seat Front Vertical Adjuster Motor harness connector.
   3. Ignition on, engine not running.
   4. Measure the voltage between ground and the (G404) Driver Seat Front Vertical Position Sense circuit.

   Is the voltage above 11.0 volts?

   Yes

   - Replace the Power Seat Track in accordance with the Service Information. Refer to **DESCRIPTION** . Refer to **SEAT** .
   - Perform the POWER SEAT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 3

3. **CHECKING THE (G404) DRIVER SEAT FRONT VERTICAL POSITION SENSE CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Disconnect the MSMD C5 harness connector.
   3. Measure the resistance between ground and the (G404) Driver Seat Front Vertical Position Sense circuit.

   Is the resistance below 100K Ohms?

   Yes

   - Repair the (G404) Driver Seat Front Vertical Position Sense circuit for a short to ground.
   - Perform the POWER SEAT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 4

4. **MEMORY SEAT MODULE (MSMD)**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring and harness connectors between the Driver Seat Front Vertical Adjuster Motor and the MSMD.
    2. Look for any chafed, pierced, pinched, or partially broken wires.
    3. Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the Driver Seat Front Vertical Adjuster Motor and MSMD harness connectors.
    4. Perform any Technical Service Bulletins that may apply.

    Were there any problems found?

    Yes

    - Repair as necessary.
    - Perform the POWER SEAT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Replace and program the MSMD in accordance with the Service Information. Refer to **MODULE, MEMORY, SEAT, REMOVAL** .
    - Perform the POWER SEAT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

DIAGNOSTIC TEST

1. **CHECK IF THE DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. With the scan tool, record and erase Memory Seat Module-Driver (MSMD) DTCs.
    3. Cycle the ignition switch from off to on.
    4. Move the Seat Switch in the recliner position three times.
    5. With the scan tool, read MSMD DTCs.

    Does the scan tool display this DTC as active?

    Yes

- Go To 2

No

- The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
- Perform the POWER SEAT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

2. **CHECK THE (G403) DRIVER SEAT RECLINER POSITION SENSE CIRCUIT**
   1. Disconnect the Driver Seat Recliner Adjuster Motor harness connector.
   2. Measure the voltage between the (G403) Driver Seat Recliner Position Sense circuit and ground.

      Is the voltage above 11.0 volts?

      Yes

      - Go To 3

      No

      - Replace the Power Seat Back in accordance with the Service Information. Refer to **DESCRIPTION** . Refer to **SEAT BACK, FRONT** .
      - Perform the POWER SEAT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
3. **CHECK THE (G403) DRIVER SEAT RECLINER POSITION SENSE CIRCUIT FOR A SHORT TO VOLTAGE**
   1. Disconnect the MSMD C4 harness connector.
   2. Measure the voltage between ground and the (G403) Driver Seat Recliner Position Sense circuit.

      Is the voltage above 11.0 volts?

      Yes

      - Repair the (G403) Driver Seat Recliner Position Sense circuit for a short to voltage.
      - Perform the POWER SEAT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Go To 4
4. **MEMORY SEAT MODULE (MSMD)**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and harness connectors between

the Driver Seat Recliner Adjuster Motor and the MSMD.

2. Look for any chafed, pierced, pinched, or partially broken wires.
3. Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the Driver Seat Recliner Adjuster Motor and MSMD harness connectors.
4. Perform any Technical Service Bulletins that may apply.

Were there any problems found?

Yes

- Repair as necessary.
- Perform the POWER SEAT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Replace and program the MSMD in accordance with the Service Information. Refer to **MODULE, MEMORY, SEAT, REMOVAL** .
- Perform the POWER SEAT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

B1D7C-92-SEAT HORIZONTAL MOTOR CONTROL - PERFORMANCE OR INCORRECT OPERATION

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 11: Driver Memory Seat Module Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Memory System is made up of the Memory Seat Module-Driver (MSMD), Memory Switch, Driver Seat Switch and multiple Seat Motors. The motors each contain a hall-effect position sensor. The hall-effect position sensor provides feedback to the MSMD in relation to the motors position.

The Driver Seat Switch is a Multiplex (Mux) switch which uses set resistance levels for each switch position.

These resistances correspond to different voltages which is monitored by the MSMD over two separate circuits. When a voltage change is detected, the MSMD will command the appropriate Seat motor(s) to move the seat in the requested direction as long as the Driver Seat Switch is held in that direction or its stops have been reached.

The Memory Switch is a Mux switch that is used to set and recall the seat positions. When a Memory Switch button is pressed, the Driver Door Module (DDM) detects a voltage change and sends a request over the Controller Area Network (CAN) bus circuit to the MSMD to perform the requested command. If the SET button on the Memory Switch is pressed, followed by the 1 or 2 button, the MSMD will store the seat positions based on the position inputs received from the hall-effect position sensors. If the 1 or 2 button on the Memory Switch is pressed, the MSMD will recall the stored seat positions for that particular selection and return the seat to the stored positions. Memory position may also be recalled using a linked FOBIK transmitter. For driver safety, the MSMD will prevent the memory recall function from being initiated if the transmission gear selector lever is not in the Park position or if the vehicle is moving. For further information, refer to **MODULE, MEMORY, SEAT, OPERATION** .

WHEN MONITORED

The seat motor is activated.

SET CONDITION

The Memory Seat Module-Driver (MSMD) does not detect seat motor activation. The DTC will only set when the seat switch is moved in the same direction three consecutive times.

POSSIBLE CAUSES

Possible Causes
DRIVER SEAT HORIZONTAL POSITION SENSE CIRCUIT OPEN OR EXCESSIVE RESISTANCE
DRIVER SEAT HORIZONTAL SENSOR GROUND CIRCUIT OPEN OR EXCESSIVE RESISTANCE
DRIVER SEAT HORIZONTAL FORWARD DRIVER SHORTED TO VOLTAGE
DRIVER SEAT HORIZONTAL FORWARD DRIVER SHORTED TO GROUND
DRIVER SEAT HORIZONTAL FORWARD DRIVER OPEN OR EXCESSIVE RESISTANCE
DRIVER SEAT HORIZONTAL REARWARD DRIVER SHORTED TO VOLTAGE
DRIVER SEAT HORIZONTAL REARWARD DRIVER SHORTED TO GROUND
DRIVER SEAT HORIZONTAL REARWARD DRIVER OPEN OR EXCESSIVE RESISTANCE
DRIVER HORIZONTAL SEAT ADJUSTER MOTOR
MEMORY SEAT MODULE-DRIVER (MSMD)

DIAGNOSTIC TEST

1. **CHECK FOR RELATED DIAGNOSTIC TROUBLE CODES**
    1. Turn the ignition on.
    2. With the scan tool, read Memory Seat Module-Driver (MSMD) DTCs.

Does the scan tool display any seat position sensor DTCs?

Yes

- Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

No

- Go To 2

2. **CHECK IF THE DTC IS ACTIVE**
   1. Ignition on, engine not running.
   2. With the scan tool, record and erase Memory Seat Module-Driver (MSMD) DTCs.
   3. Cycle the ignition switch from off to on.
   4. Move the Seat Switch in the horizontal position three times.
   5. With the scan tool, read MSMD DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Go To 3

   No

   - The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   - Perform the POWER SEAT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

3. **CHECK THE (G401) DRIVER SEAT HORIZONTAL POSITION SENSE CIRCUIT**
   1. Turn the ignition off.
   2. Disconnect the Driver Horizontal Seat Adjuster Motor harness connector.
   3. Ignition on, engine not running.
   4. Measure the voltage between ground the (G401) Driver Seat Horizontal Position Sense circuit.

   Is the voltage above 11.0 volts?

   Yes

   - Go To 4

   No

- Go To 11

4. **CHECK THE (G491) DRIVER SEAT HORIZONTAL SENSOR GROUND CIRCUIT**
   1. Measure the voltage between the (G401) Driver Seat Horizontal Position Sense circuit and the (G491) Driver Seat Horizontal Sensor Ground circuit.

      Is the voltage above 11.0 volts?

      Yes

      - Go To 5

      No

      - Go To 12
5. **CHECK THE (P115) DRIVER SEAT HORIZONTAL FORWARD DRIVER CIRCUIT**
   1. Measure the voltage between ground and the (P115) Driver Seat Horizontal Forward Driver circuit.

      Is the voltage above 1.0 volt?

      Yes

      - Go To 13

      No

      - Go To 6
6. **CHECK THE (P117) DRIVER SEAT HORIZONTAL REARWARD DRIVER CIRCUIT**
   1. Measure the voltage between ground and the (P117) Driver Seat Horizontal Rearward Driver circuit.

      Is the voltage above 1.0 volt?

      Yes

      - Go To 14

      No

      - Go To 7
7. **CHECK THE (P115) DRIVER SEAT HORIZONTAL FORWARD DRIVER CIRCUIT**
   1. Connect a 12-volt test light between ground and the (P115) Driver Seat Horizontal Forward Driver circuit.
   2. While observing the test light, move the Driver Seat Horizontal Switch in the forward position.

NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly?

Yes

- Go To 8

No

- Go To 15

8. **CHECK THE (P117) DRIVER SEAT HORIZONTAL REARWARD DRIVER CIRCUIT**
   1. Connect a 12-volt test light between ground and the (P117) Driver Seat Horizontal Rearward Driver circuit.
   2. While observing the test light, move the Driver Seat Horizontal Switch in the rearward position.

   Does the test light illuminate brightly?

   Yes

   - Go To 9

   No

   - Go To 17

9. **CHECK THE DRIVER SEAT HORIZONTAL REARWARD DRIVER**
   1. Connect a 12-volt test light between the (P115) Driver Seat Horizontal Forward Driver circuit and the (P117) Driver Seat Horizontal Rearward Driver circuit.
   2. While observing the test light, move the Driver Seat Horizontal Switch in the forward position.

   Does the test light illuminate brightly?

   Yes

   - Go To 10

   No

   - Go To 19

10. **CHECK THE DRIVER SEAT HORIZONTAL FORWARD DRIVER**
    1. While observing the test light, move the Driver Seat Horizontal Switch in the rearward position.

    Does the test light illuminate brightly?

Yes

- Replace the Power Seat Track in accordance with the Service Information. Refer to **DESCRIPTION** . Refer to **SEAT** .
- Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 19

11. **CHECK THE (G401) DRIVER SEAT HORIZONTAL POSITION SENSE CIRCUIT FOR AN OPEN OR EXCESSIVE RESISTANCE**
    1. Turn the ignition off.
    2. Disconnect the MSMD C5 harness connector.
    3. Measure the resistance of the (G401) Driver Seat Horizontal Position Sense circuit between the Driver Seat Horizontal Adjuster Motor harness connector and the MSMD C5 harness connector.

    Is the resistance above 5.0 Ohms?

    Yes

    - Repair the (G401) Driver Seat Horizontal Position Sense circuit for and open or excessive resistance.
    - Perform the POWER SEAT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Go To 19

12. **CHECK THE (G491) DRIVER SEAT HORIZONTAL SENSOR GROUND CIRCUIT FOR AN OPEN OR EXCESSIVE RESISTANCE**
    1. Turn the ignition off.
    2. Disconnect the MSMD C5 harness connector.
    3. Measure the resistance of the (G491) Driver Seat Horizontal Sensor Ground circuit between the Driver Seat Horizontal Adjuster Motor harness connector and the MSMD C5 harness connector.

    Is the resistance above 5.0 Ohms.

    Yes

    - Repair the (G491) Driver Seat Horizontal Sensor Ground circuit for an open or excessive resistance.
    - Perform the POWER SEAT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 19

13. **CHECK THE (P115) DRIVER SEAT HORIZONTAL FORWARD DRIVER CIRCUIT FOR A SHORT TO VOLTAGE**
    1. Disconnect the MSMD C5 harness connector.
    2. Measure the voltage between ground and the (P115) Driver Seat Horizontal Forward Driver circuit.

    Is the voltage above 1.0 volt?

    Yes

    - Repair the (P115) Driver Seat Horizontal Forward Driver circuit for a short to voltage.
    - Perform the POWER SEAT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Go To 19

14. **CHECK THE (P117) DRIVER SEAT HORIZONTAL REARWARD DRIVER CIRCUIT FOR A SHORT TO VOLTAGE**
    1. Disconnect the MSMD C5 harness connector.
    2. Measure the voltage between ground and the (P117) Driver Seat Horizontal Rearward Driver circuit.

    Is the voltage above 1.0 volt?

    Yes

    - Repair the (P117) Driver Seat Horizontal Rearward Driver circuit for a short to voltage.
    - Perform the POWER SEAT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Go To 19

15. **CHECK THE (P115) DRIVER SEAT HORIZONTAL FORWARD DRIVER CIRCUIT FOR A SHORT TO GROUND**
    1. Turn the ignition off.
    2. Disconnect the MSMD C5 harness connector.
    3. Measure the resistance between ground and the (P115) Driver Seat Horizontal Forward Driver circuit.

Is the resistance below 100K Ohms?

Yes

- Repair the (P115) Driver Seat Horizontal Forward Driver circuit for a short to ground.
- Perform the POWER SEAT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 16

16. **CHECK THE (P115) DRIVER SEAT HORIZONTAL FORWARD DRIVER CIRCUIT FOR AN OPEN OR EXCESSIVE RESISTANCE**
    1. Measure the resistance of the (P115) Driver Seat Horizontal Forward Driver circuit between the Driver Seat Horizontal Adjuster Motor harness connector and the MSMD C5 harness connector.

    Is the resistance above 5.0 Ohms?

    Yes

    - Repair the (P115) Driver Seat Horizontal Forward Driver circuit for an open or excessive resistance.
    - Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Go To 19

17. **CHECK THE (P117) DRIVER SEAT HORIZONTAL REARWARD DRIVER CIRCUIT FOR A SHORT TO GROUND**
    1. Turn the ignition off.
    2. Disconnect the MSMD C5 harness connector.
    3. Measure the resistance between ground and the (P117) Driver Seat Horizontal Rearward Driver circuit.

    Is the resistance below 100K Ohms?

    Yes

    - Repair the (P117) Driver Seat Horizontal Rearward Driver circuit for a short to ground.
    - Perform the POWER SEAT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

- Go To 18

18. **CHECK THE (P117) DRIVER SEAT HORIZONTAL REARWARD DRIVER CIRCUIT FOR AN OPEN OR EXCESSIVE RESISTANCE**
    1. Measure the resistance of the (P117) Driver Seat Horizontal Rearward Driver circuit between the Driver Seat Horizontal Adjuster Motor harness connector and the MSMD C5 harness connector.

       Is the resistance above 10 Ohms?

       Yes

       - Repair the (P117) Driver Seat Horizontal Rearward Driver circuit for an open or excessive resistance.
       - Perform the POWER SEAT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

       No

       - Go To 19

19. **MEMORY SEAT MODULE (MSMD)**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring and harness connectors between the Driver Seat Horizontal Adjuster Motor and the MSMD.
    2. Look for any chafed, pierced, pinched, or partially broken wires.
    3. Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the Driver Seat Horizontal Adjuster Motor and MSMD harness connectors.
    4. Perform any Technical Service Bulletins that may apply.

       Were there any problems found?

       Yes

       - Repair as necessary.
       - Perform the POWER SEAT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

       No

       - Replace and program the MSMD in accordance with the Service Information. Refer to **MODULE, MEMORY, SEAT, REMOVAL** .
       - Perform the POWER SEAT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

B1D7F-00-SEAT FRONT VERTICAL MOTOR CONTROL CIRCUIT PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 12: Driver Vertical Seat Motor Circuit Diagram

THEORY OF OPERATION

The Memory System is made up of the Memory Seat Module-Driver (MSMD), Memory Switch, Driver Seat Switch and multiple Seat Motors. The motors each contain a hall-effect position sensor. The hall-effect position sensor provides feedback to the MSMD in relation to the motors position.

The Driver Seat Switch is a Multiplex (Mux) switch which uses set resistance levels for each switch position. These resistances correspond to different voltages which is monitored by the MSMD over two separate circuits. When a voltage change is detected, the MSMD will command the appropriate Seat motor(s) to move the seat in

the requested direction as long as the Driver Seat Switch is held in that direction or its stops have been reached.

The Memory Switch is a Mux switch that is used to set and recall the seat positions. When a Memory Switch button is pressed, the Driver Door Module (DDM) detects a voltage change and sends a request over the Controller Area Network (CAN) bus circuit to the MSMD to perform the requested command. If the SET button on the Memory Switch is pressed, followed by the 1 or 2 button, the MSMD will store the seat positions based on the position inputs received from the hall-effect position sensors. If the 1 or 2 button on the Memory Switch is pressed, the MSMD will recall the stored seat positions for that particular selection and return the seat to the stored positions. Memory position may also be recalled using a linked FOBIK transmitter. For driver safety, the MSMD will prevent the memory recall function from being initiated if the transmission gear selector lever is not in the Park position or if the vehicle is moving. For further information, refer to **MODULE, MEMORY, SEAT, OPERATION** .

WHEN MONITORED

The seat motor is activated.

SET CONDITION

The Memory Seat Module-Driver (MSMD) does not detect seat motor activation. The DTC will only set when the seat switch is moved in the same direction three consecutive times.

POSSIBLE CAUSES

Possible Causes
DRIVER SEAT FRONT VERTICAL POSITION SENSE CIRCUIT OPEN OR EXCESSIVE RESISTANCE
DRIVER SEAT FRONT VERTICAL SENSOR GROUND CIRCUIT OPEN OR EXCESSIVE RESISTANCE
DRIVER SEAT FRONT VERTICAL UP DRIVER CIRCUIT SHORTED TO VOLTAGE
DRIVER SEAT FRONT VERTICAL UP DRIVER CIRCUIT SHORTED TO GROUND
DRIVER SEAT FRONT VERTICAL UP DRIVER CIRCUIT OPEN OR EXCESSIVE RESISTANCE
DRIVER SEAT FRONT VERTICAL DOWN DRIVER CIRCUIT SHORTED TO VOLTAGE
DRIVER SEAT FRONT VERTICAL DOWN DRIVER CIRCUIT SHORTED TO GROUND
DRIVER SEAT FRONT VERTICAL DOWN DRIVER CIRCUIT OPEN OR EXCESSIVE RESISTANCE

MEMORY SEAT MODULE-DRIVER (MSMD)

DIAGNOSTIC TEST

1. **CHECK FOR RELATED DIAGNOSTIC TROUBLE CODES**
    1. Turn the ignition on.
    2. With the scan tool, read Memory Seat Module-Driver (MSMD) DTCs.

Does the scan tool display any seat position sensor DTCs?

Yes

- Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

No

- Go To 2

2. **CHECK IF THE DTC IS ACTIVE**
   1. Ignition on, engine not running.
   2. With the scan tool, record and erase MSMD DTCs.
   3. Cycle the ignition switch from off to on.
   4. Move the Seat Switch in the front vertical position three times.
   5. With the scan tool, read MSMD DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Go To 3

   No

   - The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   - Perform the POWER SEAT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

3. **CHECK THE (G404) DRIVER SEAT FRONT VERTICAL POSITION SENSE CIRCUIT**
   1. Turn the ignition off.
   2. Disconnect the Driver Front Vertical Seat Adjuster Motor harness connector.
   3. Ignition on, engine not running.
   4. Measure the voltage between ground and the (G404) Driver Seat Front Vertical Position Sense circuit in the Driver Front Vertical Seat Adjuster Motor harness connector.

   Is the voltage above 11.0 volts?

   Yes

   - Go To 4

   No

- Go To 11

4. **CHECK THE (G494) DRIVER SEAT FRONT VERTICAL SENSOR GROUND CIRCUIT**
   1. Measure the voltage between the (G404) Driver Seat Front Vertical Position Sense circuit and the (G494) Driver Seat Front Vertical Sensor Ground circuit.

      Is the voltage above 11.0 volts?

      Yes

      - Go To 5

      No

      - Go To 12
5. **CHECK THE (P119) DRIVER SEAT FRONT VERTICAL UP DRIVER CIRCUIT**
   1. Measure the voltage between ground and the (P119) Driver Seat Front Vertical Up Driver circuit.

      Is the voltage above 1.0 volt?

      Yes

      - Go To 13

      No

      - Go To 6
6. **CHECK THE (P121) DRIVER SEAT FRONT VERTICAL DOWN DRIVER CIRCUIT**
   1. Measure the voltage between ground and the (P121) Driver Seat Front Vertical Down Driver circuit.

      Is the voltage above 1.0 volt?

      Yes

      - Go To 14

      No

      - Go To 7
7. **CHECK THE (P119) DRIVER SEAT FRONT VERTICAL UP DRIVER CIRCUIT**
   1. Connect a 12-volt test light between ground and the (P119) Driver Seat Front Vertical Up Driver circuit.
   2. While observing the test light, move the Driver Seat Front Vertical Switch in the up position.

NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test lamp illuminate brightly?

Yes

- Go To 8

No

- Go To 15

8. **CHECK THE (P121) DRIVER SEAT FRONT VERTICAL DOWN DRIVER CIRCUIT**
   1. Connect a 12-volt test light between ground and the (P121) Driver Seat Front Vertical Down Driver circuit.
   2. While observing the test light, move the Driver Seat Front Vertical Switch in the down position.

   Does the test light illuminate brightly?

   Yes

   - Go To 9

   No

   - Go To 17

9. **CHECK THE DRIVER SEAT FRONT VERTICAL DOWN DRIVER**
   1. Connect a 12-volt test light between the (P119) Driver Seat Front Vertical Up Driver circuit and the (P121) Driver Seat Front Vertical Down Driver circuit.
   2. While observing the test light, move the Driver Seat Front Vertical Switch in the up position.

   Does the test light illuminate brightly?

   Yes

   - Go To 10

   No

   - Go To 19

10. **CHECK THE DRIVER SEAT FRONT VERTICAL UP DRIVER**
    1. While observing the test light, move the Driver Seat Front Vertical Switch in the down position.

    Does the test light illuminate brightly?

Yes

- Replace the Power Seat Track in accordance with the Service Information. Refer to **DESCRIPTION** . Refer to **SEAT** .
- Perform the POWER SEAT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 19

11. **CHECK THE (G404) DRIVER SEAT FRONT VERTICAL POSITION SENSE CIRCUIT FOR AN OPEN OR EXCESSIVE RESISTANCE**
    1. Turn the ignition off.
    2. Disconnect the MSMD C5 harness connector.
    3. Measure the resistance of the (G404) Driver Seat Front Vertical Position Sense circuit between the Driver Seat Front Vertical Adjuster Motor harness connector and the MSMD C5 harness connector.

    Is the resistance above 5.0 Ohms?

    Yes

    - Repair the (G404) Driver Seat Front Vertical Position Sense circuit for an open or excessive resistance.
    - Perform the POWER SEAT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Go To 19

12. **CHECK THE (G494) DRIVER SEAT FRONT VERTICAL SENSOR GROUND CIRCUIT FOR AN OPEN OR EXCESSIVE RESISTANCE**
    1. Turn the ignition off.
    2. Disconnect the MSMD C5 harness connector.
    3. Measure the resistance of the (G494) Driver Seat Front Vertical Sensor Ground circuit between the Driver Seat Front Vertical Adjuster Motor harness connector and the MSMD C5 harness connector.

    Is the resistance above 5.0 Ohms?

    Yes

    - Repair the (G494) Driver Seat Front Vertical Sensor Ground circuit for an open or excessive resistance.
    - Perform the POWER SEAT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 19

13. **CHECK THE (P119) DRIVER SEAT FRONT VERTICAL UP DRIVER CIRCUIT FOR A SHORT TO VOLTAGE**
    1. Disconnect the MSMD C5 harness connector.
    2. Measure the voltage between ground the (P119) Driver Seat Front Vertical Up Driver circuit.

    Is the voltage above 1.0 volt?

    Yes

    - Repair the (P119) Driver Seat Front Vertical Up Driver circuit for a short to voltage.
    - Perform the POWER SEAT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Go To 19

14. **CHECK THE (P121) DRIVER SEAT FRONT VERTICAL DOWN DRIVER CIRCUIT FOR A SHORT TO VOLTAGE**
    1. Disconnect the MSMD C5 harness connector.
    2. Measure the voltage between ground and the (P121) Driver Seat Front Vertical Down Driver circuit.

    Is the voltage above 1.0 volt?

    Yes

    - Repair the (P121) Driver Seat Front Vertical Down Driver circuit for a short to voltage.
    - Perform the POWER SEAT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Go To 19

15. **CHECK THE (P119) DRIVER SEAT FRONT VERTICAL UP DRIVER CIRCUIT FOR A SHORT TO GROUND**
    1. Turn the ignition off.
    2. Disconnect the MSMD C5 harness connector.
    3. Measure the resistance between ground and the (P119) Driver Seat Front Vertical Up Driver circuit.

Is the resistance below 100K Ohms?

Yes

- Repair the (P119) Driver Seat Front Vertical Up Driver circuit for a short to ground.
- Perform the POWER SEAT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 16

16. **CHECKING THE (P119) DRIVER SEAT FRONT VERTICAL UP DRIVER CIRCUIT FOR AN OPEN OR EXCESSIVE RESISTANCE**
    1. Measure the resistance of the (P119) Driver Seat Front Vertical Up Driver circuit between the Driver Seat Front Vertical Adjuster Motor harness connector and the MSMD C5 harness connector.

    Is the resistance above 5.0 Ohms?

    Yes

    - Repair the (P119) Driver Seat Front Vertical Up Driver circuit for an open or excessive resistance.
    - Perform the POWER SEAT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Go To 19

17. **CHECK THE (P121) DRIVER SEAT FRONT VERTICAL DOWN DRIVER CIRCUIT FOR A SHORT TO GROUND**
    1. Turn the ignition off.
    2. Disconnect the MSMD C5 harness connector.
    3. Measure the resistance between ground and the (P121) Driver Seat Front Vertical Down Driver circuit.

    Is the resistance below 100K Ohms?

    Yes

    - Repair the (P121) Driver Seat Front Vertical Down Driver circuit for an open.
    - Perform the POWER SEAT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

- Go To 18

18. **CHECK THE (P121) DRIVER SEAT FRONT VERTICAL DOWN DRIVER CIRCUIT FOR AN OPEN OR EXCESSIVE RESISTANCE**
    1. Measure the resistance of the (P121) Driver Seat Front Vertical Down Driver circuit between the Driver Seat Front Vertical Adjuster Motor harness connector and the MSMD C5 harness connector.

       Is the resistance above 5.0 Ohms?

       Yes

       - Repair the (P121) Driver Seat Front Vertical Down Driver circuit for an open or excessive resistance.
       - Perform the POWER SEAT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

       No

       - Go To 19

19. **MEMORY SEAT MODULE (MSMD)**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring and harness connectors between the Driver Seat Front Vertical Adjuster Motor and the MSMD.
    2. Look for any chafed, pierced, pinched, or partially broken wires.
    3. Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the Driver Seat Front Vertical Adjuster Motor and MSMD harness connectors.
    4. Perform any Technical Service Bulletins that may apply.

       Were there any problems found?

       Yes

       - Repair as necessary.
       - Perform the POWER SEAT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

       No

       - Replace and program the MSMD in accordance with the Service Information. Refer to **MODULE, MEMORY, SEAT, REMOVAL** .
       - Perform the POWER SEAT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

B1D84-92-SEAT REAR VERTICAL MOTOR CONTROL - PERFORMANCE OR INCORRECT OPERATION

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 13: Driver Vertical Seat Motor Circuit Diagram

THEORY OF OPERATION

The Memory System is made up of the Memory Seat Module-Driver (MSMD), Memory Switch, Driver Seat Switch and multiple Seat Motors. The motors each contain a hall-effect position sensor. The hall-effect position sensor provides feedback to the MSMD in relation to the motors position.

The Driver Seat Switch is a Multiplex (Mux) switch which uses set resistance levels for each switch position.

These resistances correspond to different voltages which is monitored by the MSMD over two separate circuits. When a voltage change is detected, the MSMD will command the appropriate Seat motor(s) to move the seat in the requested direction as long as the Driver Seat Switch is held in that direction or its stops have been reached.

The Memory Switch is a Mux switch that is used to set and recall the seat positions. When a Memory Switch button is pressed, the Driver Door Module (DDM) detects a voltage change and sends a request over the Controller Area Network (CAN) bus circuit to the MSMD to perform the requested command. If the SET button on the Memory Switch is pressed, followed by the 1 or 2 button, the MSMD will store the seat positions based on the position inputs received from the hall-effect position sensors. If the 1 or 2 button on the Memory Switch is pressed, the MSMD will recall the stored seat positions for that particular selection and return the seat to the stored positions. Memory position may also be recalled using a linked FOBIK transmitter. For driver safety, the MSMD will prevent the memory recall function from being initiated if the transmission gear selector lever is not in the Park position or if the vehicle is moving. For further information, refer to **MODULE, MEMORY, SEAT, OPERATION** .

WHEN MONITORED

The seat motor is activated.

SET CONDITION

The Memory Seat Module-Driver (MSMD) does not detect seat motor activation. The DTC will only set when the seat switch is moved in the same direction three consecutive times.

POSSIBLE CAUSES

Possible Causes
DRIVER SEAT REAR VERTICAL POSITION SENSE CIRCUIT OPEN OR EXCESSIVE RESISTANCE
DRIVER SEAT REAR VERTICAL SENSOR GROUND CIRCUIT OPEN OR EXCESSIVE RESISTANCE
DRIVER SEAT REAR VERTICAL DOWN DRIVER CIRCUIT SHORTED TO VOLTAGE
DRIVER SEAT REAR VERTICAL DOWN DRIVER CIRCUIT SHORTED TO GROUND
DRIVER SEAT REAR VERTICAL DOWN DRIVER CIRCUIT OPEN OR EXCESSIVE RESISTANCE
DRIVER SEAT REAR VERTICAL UP DRIVER CIRCUIT SHORTED TO VOLTAGE
DRIVER SEAT REAR VERTICAL UP DRIVER CIRCUIT SHORTED TO GROUND
DRIVER SEAT REAR VERTICAL UP DRIVER CIRCUIT OPEN OR EXCESSIVE RESISTANCE
DRIVER REAR VERTICAL SEAT ADJUSTER MOTOR
MEMORY SEAT MODULE-DRIVER (MSMD)

DIAGNOSTIC TEST

1. **CHECK FOR RELATED DIAGNOSTIC TROUBLE CODES**
    1. Turn the ignition on.

2. With the scan tool, read Memory Seat Module-Driver (MSMD) DTCs.

   Does the scan tool display any seat position sensor DTCs?

   Yes

   - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

   No

   - Go To 2

2. **CHECK IF THE DTC IS ACTIVE**
   1. Ignition on, engine not running.
   2. With the scan tool, record and erase MSMD DTCs.
   3. Cycle the ignition switch from off to on.
   4. Move the Seat Switch in the rear vertical position three times.
   5. With the scan tool, read MSMD DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Go To 3

   No

   - The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   - Perform the POWER SEAT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

3. **CHECK THE (G402) DRIVER SEAT REAR VERTICAL POSITION SENSE CIRCUIT**
   1. Disconnect the Driver Rear Vertical Seat Adjuster Motor harness connector.
   2. Measure the voltage between ground and the (G402) Driver Seat Rear Vertical Position Sense circuit.

   Is the voltage above 11.0 volts?

   Yes

   - Go To 4

   No

- Go To 11

4. **CHECK THE (G492) DRIVER SEAT REAR VERTICAL SENSOR GROUND CIRCUIT**
   1. Measure the voltage between the (G402) Driver Seat Rear Vertical Position Sense circuit and the (G492) Driver Seat Rear Vertical Sensor Ground circuit.

      Is the voltage above 11.0 volts?

      Yes

      - Go To 5

      No

      - Go To 12
5. **CHECK THE (P111) DRIVER SEAT REAR VERTICAL DOWN DRIVER CIRCUIT**
   1. Measure the voltage between ground and the (P111) Driver Seat Rear Vertical Down Driver circuit.

      Is the voltage above 1.0 volt?

      Yes

      - Go To 13

      No

      - Go To 6
6. **CHECK THE (P113) DRIVER SEAT REAR VERTICAL UP DRIVER CIRCUIT**
   1. Measure the voltage between ground and the (P113) Driver Seat Rear Vertical Up Driver circuit.

      Is the voltage above 1.0 volt?

      Yes

      - Go To 14

      No

      - Go To 7
7. **CHECK THE (P111) DRIVER SEAT REAR VERTICAL DOWN DRIVER CIRCUIT**
   1. Connect a 12-volt test light between ground and the (P111) Driver Seat Rear Vertical Down Driver circuit.
   2. While observing the test light, move the Driver Seat Rear Vertical Switch in the down position.

NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly?

Yes

- Go To 8

No

- Go To 15

8. **CHECK THE (P113) DRIVER SEAT REAR VERTICAL UP DRIVER CIRCUIT**
   1. Connect a 12-volt test light between ground and the (P113) Driver Seat Rear Vertical Up Driver circuit.
   2. While observing the test light, move the Driver Seat Rear Vertical Switch in the up position.

   Does the test light illuminate brightly?

   Yes

   - Go To 9

   No

   - Go To 17

9. **CHECK THE DRIVER SEAT REAR VERTICAL DOWN DRIVER**
   1. Connect a 12-volt test light between the (P111) Driver Seat Rear Vertical Down Driver circuit and the (P113) Driver Seat Rear Vertical Up Driver circuit.
   2. While observing the test light, move the Driver Seat Rear Vertical Switch in the down position.

   Does the test light illuminate brightly?

   Yes

   - Go To 10

   No

   - Go To 19

10. **CHECK THE DRIVER SEAT REAR VERTICAL UP DRIVER**
    1. While observing the test light, move the Driver Seat Rear Vertical Switch in the up position.

    Does the test light illuminate brightly?

Yes

- Replace the Power Seat Track in accordance with the Service Information. Refer to **DESCRIPTION** . Refer to **SEAT** .
- Perform the POWER SEAT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 19

11. **CHECK THE (G402) DRIVER SEAT REAR VERTICAL POSITION SENSE CIRCUIT FOR AN OPEN OR EXCESSIVE RESISTANCE**
    1. Turn the ignition off.
    2. Disconnect the MSMD C5 harness connector.
    3. Measure the resistance of the (G402) Driver Seat Rear Vertical Position Sense circuit between the Driver Seat Rear Vertical Adjuster Motor harness connector and the MSMD C5 harness connector.

    Is the resistance above 5.0 Ohms?

    Yes

    - Repair the (G402) Driver Seat Rear Vertical Position Sense circuit for an open or excessive resistance.
    - Perform the POWER SEAT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Go To 19

12. **CHECK THE (G492) DRIVER SEAT REAR VERTICAL SENSOR GROUND CIRCUIT FOR AN OPEN OR EXCESSIVE RESISTANCE**
    1. Turn the ignition off.
    2. Disconnect the MSMD C5 harness connector.
    3. Measure the resistance of the (G492) Driver Seat Rear Vertical Sensor Ground circuit between the Driver Seat Rear Vertical Adjuster Motor harness connector and the MSMD C5 harness connector.

    Is the resistance above 5.0 Ohms?

    Yes

    - Repair the (G492) Driver Seat Rear Vertical Sensor Ground circuit for an open or excessive resistance.
    - Perform the POWER SEAT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 19

13. **CHECK THE (P111) DRIVER SEAT REAR VERTICAL DOWN DRIVER CIRCUIT FOR A SHORT TO VOLTAGE**
    1. Disconnect the MSMD C5 harness connector.
    2. Measure the voltage between ground and the (P111) Driver Seat Rear Vertical Down Driver circuit.

    Is the voltage above 1 volt?

    Yes

    - Repair the (P111) Driver Seat Rear Vertical Down Driver circuit for a short to voltage.
    - Perform the POWER SEAT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Go To 19

14. **CHECK THE (P113) DRIVER SEAT REAR VERTICAL UP DRIVER CIRCUIT FOR A SHORT TO VOLTAGE**
    1. Disconnect the MSMD C5 harness connector.
    2. Measure the voltage between ground and the (P113) Driver Seat Rear Vertical Up Driver circuit.

    Is the voltage above 1.0 volt?

    Yes

    - Repair the (P113) Driver Seat Rear Vertical Up Driver circuit for a short to voltage.
    - Perform the POWER SEAT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Go To 19

15. **CHECK THE (P111) DRIVER SEAT REAR VERTICAL DOWN DRIVER CIRCUIT FOR A SHORT TO GROUND**
    1. Turn the ignition off.
    2. Disconnect the MSMD C5 harness connector.
    3. Measure the resistance between ground and the (P111) Driver Seat Rear Vertical Down Driver circuit.

    Is the resistance below 100K Ohms?

Yes

- Repair the (P111) Driver Seat Rear Vertical Down Driver circuit for a short to ground.
- Perform the POWER SEAT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 16

16. **CHECK THE (P111) DRIVER SEAT REAR VERTICAL DOWN DRIVER CIRCUIT FOR AN OPEN OR EXCESSIVE RESISTANCE**
    1. Measure the resistance of the (P111) Driver Seat Rear Vertical Down Driver circuit between the Driver Seat Rear Vertical Adjuster Motor harness connector and the MSMD C5 harness connector.

    Is the resistance above 5.0 Ohms?

    Yes

    - Repair the (P111) Driver Seat Rear Vertical Down Driver circuit for an open or excessive resistance.
    - Perform the POWER SEAT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Go To 19

17. **CHECK THE (P113) DRIVER SEAT REAR VERTICAL UP DRIVER CIRCUIT FOR A SHORT TO GROUND**
    1. Turn the ignition off.
    2. Disconnect the MSMD C5 harness connector.
    3. Measure the resistance between ground and the (P113) Driver Seat Rear Vertical Up Driver circuit.

    Is the resistance below 100K Ohms?

    Yes

    - Repair the (P113) Driver Seat Rear Vertical Up Driver circuit for a short to ground.
    - Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Go To 18

18. **CHECK THE (P113) DRIVER SEAT REAR VERTICAL UP DRIVER CIRCUIT FOR AN OPEN**

OR EXCESSIVE RESISTANCE

1. Measure the resistance of the (P113) Driver Seat Rear Vertical Up Driver circuit between the Driver Seat Rear Vertical Adjuster Motor harness connector and the MSMD C5 harness connector.

   Is the resistance above 5.0 Ohms?

   Yes

   - Repair the (P113) Driver Seat Rear Vertical Up Driver circuit for an open or excessive resistance.
   - Perform the POWER SEAT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 19

19. **MEMORY SEAT MODULE (MSMD)**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring and harness connectors between the Driver Seat Rear Vertical Adjuster Motor and the MSMD.
    2. Look for any chafed, pierced, pinched, or partially broken wires.
    3. Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the Driver Seat Rear Vertical Adjuster Motor and MSMD harness connectors.
    4. Perform any Technical Service Bulletins that may apply.

       Were there any problems found?

       Yes

       - Repair as necessary.
       - Perform the POWER SEAT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

       No

       - Replace and program the Memory Seat Module (MSMD) in accordance with the Service Information. Refer to **MODULE, MEMORY, SEAT, REMOVAL** .
       - Perform the POWER SEAT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

B1D87-00-SEAT BACKREST MOTOR CONTROL - CIRCUIT PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 14: Driver Memory Seat Module Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Memory System is made up of the Memory Seat Module-Driver (MSMD), Memory Switch, Driver Seat Switch and multiple Seat Motors. The motors each contain a hall-effect position sensor. The hall-effect position sensor provides feedback to the MSMD in relation to the motors position.

The Driver Seat Switch is a Multiplex (Mux) switch which uses set resistance levels for each switch position.

These resistances correspond to different voltages which is monitored by the MSMD over two separate circuits. When a voltage change is detected, the MSMD will command the appropriate Seat motor(s) to move the seat in the requested direction as long as the Driver Seat Switch is held in that direction or its stops have been reached.

The Memory Switch is a Mux switch that is used to set and recall the seat positions. When a Memory Switch button is pressed, the Driver Door Module (DDM) detects a voltage change and sends a request over the Controller Area Network (CAN) bus circuit to the MSMD to perform the requested command. If the SET button on the Memory Switch is pressed, followed by the 1 or 2 button, the MSMD will store the seat positions based on the position inputs received from the hall-effect position sensors. If the 1 or 2 button on the Memory Switch is pressed, the MSMD will recall the stored seat positions for that particular selection and return the seat to the stored positions. Memory position may also be recalled using a linked FOBIK transmitter. For driver safety, the MSMD will prevent the memory recall function from being initiated if the transmission gear selector lever is not in the Park position or if the vehicle is moving. For further information, refer to **MODULE, MEMORY, SEAT, OPERATION** .

WHEN MONITORED

The seat motor is activated.

SET CONDITION

The Memory Seat Module-Driver (MSMD) does not detect seat motor activation. The DTC will only set when the seat switch is moved in the same direction three consecutive times.

POSSIBLE CAUSES

Possible Causes
DRIVER SEAT RECLINER POSITION SENSE CIRCUIT OPEN OR EXCESSIVE RESISTANCE
DRIVER SEAT RECLINER POSITION SENSOR GROUND CIRCUIT OPEN OR EXCESSIVE RESISTANCE
DRIVER SEAT RECLINER UP DRIVER CIRCUIT SHORTED TO VOLTAGE
DRIVER SEAT RECLINER UP DRIVER CIRCUIT SHORTED TO GROUND
DRIVER SEAT RECLINER UP DRIVER CIRCUIT OPEN OR EXCESSIVE RESISTANCE
DRIVER SEAT RECLINER DOWN DRIVER CIRCUIT SHORTED TO VOLTAGE
DRIVER SEAT RECLINER DOWN DRIVER CIRCUIT SHORTED TO GROUND
DRIVER SEAT RECLINER DOWN DRIVER CIRCUIT OPEN OR EXCESSIVE RESISTANCE
DRIVER RECLINER SEAT ADJUSTER MOTOR
MEMORY SEAT MODULE-DRIVER (MSMD)

DIAGNOSTIC TEST

1. **CHECK FOR RELATED DIAGNOSTIC TROUBLE CODES**
    1. Turn the ignition on.
    2. With the scan tool, read Memory Seat Module-Driver (MSMD) DTCs.

Does the scan tool display any seat position sensor DTCs?

Yes

- Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

No

- Go To 2

2. **CHECK IF THE DTC IS ACTIVE**
   1. Ignition on, engine not running.
   2. With the scan tool, record and erase MSMD DTCs.
   3. Cycle the ignition switch from off to on.
   4. Move the Seat Switch in the recline position three times.
   5. With the scan tool, read MSMD DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Go To 3

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   - Perform the POWER SEAT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

3. **CHECK THE (G403) DRIVER SEAT RECLINER POSITION SENSE CIRCUIT**
   1. Turn the ignition off.
   2. Disconnect the Driver Recliner Seat Adjuster Motor harness connector.
   3. Ignition on, engine not running.
   4. Measure the voltage between ground and the (G403) Driver Seat Recliner Position Sense circuit.

   Is the voltage above 11.0 volts?

   Yes

   - Go To 4

   No

- Go To 11

4. **CHECK THE (G493) DRIVER SEAT RECLINER POSITION SENSOR GROUND CIRCUIT**
   1. Measure the voltage between the (G403) Driver Seat Recliner Position Sense circuit and the (G493) Driver Seat Recliner Position Sensor Ground circuit.

      Is the voltage above 11.0 volts?

      Yes

      - Go To 5

      No

      - Go To 12
5. **CHECK THE (P141) DRIVER SEAT RECLINER UP DRIVER CIRCUIT**
   1. Measure the voltage between ground and the (P141) Driver Seat Recliner Up Driver circuit.

      Is the voltage above 1.0 volt?

      Yes

      - Go To 13

      No

      - Go To 6
6. **CHECK THE (P143) DRIVER SEAT RECLINER DOWN DRIVER CIRCUIT**
   1. Measure the voltage between the ground and the (P143) Driver Seat Recliner Down Driver circuit.

      Is the voltage above 1.0 volt?

      Yes

      - Go To 14

      No

      - Go To 7
7. **CHECK THE (P141) DRIVER SEAT RECLINER UP DRIVER CIRCUIT**
   1. Connect a 12-volt test light between ground and the (P141) Driver Seat Recliner Up Driver circuit.
   2. While observing the test light, move the Driver Seat Recliner Switch in the up position.

NOTE: The test light must illuminate brightly. Compare the brightness to

that of a direct connection to the battery.

Does the test light illuminate brightly?

Yes

- Go To 8

No

- Go To 15

8. **CHECK THE (P143) DRIVER SEAT RECLINER DOWN DRIVER CIRCUIT**
   1. Connect a 12-volt test light between ground and the (P143) Driver Seat Recliner Down Driver circuit.
   2. While observing the test light, move the Driver Seat Recliner Switch in the down position.

   Does the test light illuminate brightly?

   Yes

   - Go To 9

   No

   - Go To 17

9. **CHECK THE DRIVER SEAT RECLINER DOWN DRIVER**
   1. Connect a 12-volt test light between the (P141) Driver Seat Recliner Up Driver circuit and the (P143) Driver Seat Recliner Down Driver circuit.
   2. While observing the test light, move the Driver Seat Recliner Switch in the up position.

   Does the test light illuminate brightly?

   Yes

   - Go To 10

   No

   - Go To 19

10. **CHECK THE DRIVER SEAT RECLINER UP DRIVER**
    1. While observing the test light, move the Driver Seat Recliner Switch in the down position.

    Does the test light illuminate brightly?

Yes

- Replace the Power Seat Track in accordance with the Service Information. Refer to **DESCRIPTION** . Refer to **SEAT** .
- Perform the POWER SEAT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 19

11. **CHECK THE (G403) DRIVER SEAT RECLINER POSITION SENSE CIRCUIT FOR AN OPEN OR EXCESSIVE RESISTANCE**
    1. Turn the ignition off.
    2. Disconnect the MSMD C4 harness connector.
    3. Measure the resistance of the (G403) Driver Seat Recliner Position Sense circuit between the Driver Seat Recliner Adjuster Motor harness connector and the MSMD C4 harness connector.

    Is the resistance above 5.0 Ohms?

    Yes

    - Repair the (G403) Driver Seat Recliner Position Sense circuit for an open or excessive resistance.
    - Perform the POWER SEAT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Go To 19

12. **CHECK THE (G493) DRIVER SEAT RECLINER POSITION SENSOR GROUND CIRCUIT FOR AN OPEN OR EXCESSIVE RESISTANCE**
    1. Turn the ignition off.
    2. Disconnect the MSMD C4 harness connector.
    3. Measure the resistance of the (G493) Driver Seat Recliner Position Sensor Ground circuit between the Driver Seat Recliner Adjuster Motor harness connector and the MSMD C4 harness connector.

    Is the resistance above 5.0 Ohms?

    Yes

    - Repair the (G493) Driver Seat Recliner Position Sensor Ground circuit for an open or excessive resistance.
    - Perform the POWER SEAT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 19

13. **CHECK THE (P141) DRIVER SEAT RECLINER UP DRIVER CIRCUIT FOR A SHORT TO VOLTAGE**
    1. Turn the ignition off.
    2. Disconnect the MSMD C4 harness connector.
    3. Ignition on, engine not running.
    4. Measure the voltage between ground and the (P141) Driver Seat Recliner Up Driver circuit.

    Is the voltage above 1.0 volt?

    Yes

    - Repair the (P141) Driver Seat Recliner Up Driver circuit for a short to voltage.
    - Perform the POWER SEAT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Go To 19

14. **CHECK THE (P143) DRIVER SEAT RECLINER DOWN DRIVER CIRCUIT FOR A SHORT TO VOLTAGE**
    1. Turn the ignition off.
    2. Disconnect the MSMD C4 harness connector.
    3. Ignition on, engine not running.
    4. Measure the voltage between ground and the (P143) Driver Seat Recliner Down Driver circuit.

    Is the voltage above 1.0 volt?

    Yes

    - Repair the (P143) Driver Seat Recliner Down Driver circuit for a short to voltage.
    - Perform the POWER SEAT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Go To 19

15. **CHECK THE (P141) DRIVER SEAT RECLINER UP DRIVER CIRCUIT FOR A SHORT TO GROUND**
    1. Turn the ignition off.
    2. Disconnect the MSMD C4 harness connector.

3. Measure the resistance between ground and the (P141) Driver Seat Recliner Up Driver circuit.

   Is the resistance below 100K Ohms?

   Yes

   - Repair the short to ground in the (P141) Driver Seat Recliner Up Driver circuit.
   - Perform the POWER SEAT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 16

16. **CHECK THE (P141) DRIVER SEAT RECLINER UP DRIVER CIRCUIT FOR AN OPEN OR EXCESSIVE RESISTANCE**
    1. Measure the resistance of the (P141) Driver Seat Recliner Up Driver circuit between the Driver Seat Recliner Adjuster Motor harness connector and the MSMD C4 harness connector.

       Is the resistance above 5.0 Ohms?

       Yes

       - Repair the (P141) Driver Seat Recliner Up Driver circuit for an open or excessive resistance.
       - Perform the POWER SEAT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

       No

       - Go To 19

17. **CHECK THE (P143) DRIVER SEAT RECLINER DOWN DRIVER CIRCUIT FOR A SHORT TO GROUND**
    1. Turn the ignition off.
    2. Disconnect the MSMD C4 harness connector.
    3. Measure the resistance between ground and the (P143) Driver Seat Recliner Down Driver circuit.

       Is the resistance below 100K Ohms?

       Yes

       - Repair the (P143) Driver Seat Recliner Down Driver circuit for a short to ground.
       - Perform the POWER SEAT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

       No

- Go To 18

18. **CHECK THE (P143) DRIVER SEAT RECLINER DOWN DRIVER CIRCUIT FOR AN OPEN OR EXCESSIVE RESISTANCE**
    1. Measure the resistance of the (P143) Driver Seat Recliner Down Driver circuit between the Driver Seat Recliner Adjuster Motor harness connector and the MSMD C4 harness connector.

       Is the resistance above 5.0 Ohms?

       Yes

       - Repair the (P143) Driver Seat Recliner Down Driver circuit for an open or excessive resistance.
       - Perform the POWER SEAT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

       No

       - Go To 19

19. **MEMORY SEAT MODULE (MSMD)**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring and harness connectors between the Driver Seat Recliner Adjuster Motor and the MSMD.
    2. Look for any chafed, pierced, pinched, or partially broken wires.
    3. Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the Driver Seat Recliner Adjuster Motor and MSMD harness connectors.
    4. Perform any Technical Service Bulletins that may apply.

       Were there any problems found?

       Yes

       - Repair as necessary.
       - Perform the POWER SEAT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

       No

       - Replace and program the MSMD in accordance with the Service Information. Refer to **MODULE, MEMORY, SEAT, REMOVAL** .
       - Perform the POWER SEAT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

B1D9B-00-SEAT HORIZONTAL FRONT STOP NOT LEARNED

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 15: Driver Memory Seat Module Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Memory System is made up of the Memory Seat Module-Driver (MSMD), Memory Switch, Driver Seat Switch and multiple Seat Motors. The motors each contain a hall-effect position sensor. The hall-effect position sensor provides feedback to the MSMD in relation to the motors position.

The Driver Seat Switch is a Multiplex (Mux) switch which uses set resistance levels for each switch position.

These resistances correspond to different voltages which is monitored by the MSMD over two separate circuits. When a voltage change is detected, the MSMD will command the appropriate Seat motor(s) to move the seat in the requested direction as long as the Driver Seat Switch is held in that direction or its stops have been reached.

The Memory Switch is a Mux switch that is used to set and recall the seat positions. When a Memory Switch button is pressed, the Driver Door Module (DDM) detects a voltage change and sends a request over the Controller Area Network (CAN) bus circuit to the MSMD to perform the requested command. If the SET button on the Memory Switch is pressed, followed by the 1 or 2 button, the MSMD will store the seat positions based on the position inputs received from the hall-effect position sensors. If the 1 or 2 button on the Memory Switch is pressed, the MSMD will recall the stored seat positions for that particular selection and return the seat to the stored positions. Memory position may also be recalled using a linked FOBIK transmitter. For driver safety, the MSMD will prevent the memory recall function from being initiated if the transmission gear selector lever is not in the Park position or if the vehicle is moving. For further information, refer to **MODULE, MEMORY, SEAT, OPERATION** .

WHEN MONITORED

The seat motor is activated.

SET CONDITION

Seat becomes de-standardized. The seat horizontal motor is 5% past the expected soft stop position.

POSSIBLE CAUSES

Possible Causes
OTHER DTCS SET IN THE MEMORY SEAT MODULE
SEAT STANDARDIZATION ROUTINE NOT PERFORMED
MEMORY SEAT MODULE-DRIVER (MSMD)

DIAGNOSTIC TEST

1. **CHECK FOR RELATED DTCS**
    1. Turn the ignition on.
    2. With the scan tool, read Memory Seat Module-Driver (MSMD) DTCs.

    Does the scan tool display any seat position sensor or circuit performance DTCs?

    Yes

    - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

    No

    - Go To 2
2. **CHECK IF THE DTC IS ACTIVE**

1. Ignition on, engine not running.
2. With the scan tool, record and erase MSMD DTCs.
3. Cycle the ignition switch from off to on.
4. Move the seat in the full forward horizontal position.
5. With the scan tool, read MSMD DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - With the scan tool, perform the MSMD Standardization Routine.
   - Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   - Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

B2199-16-BATTERY VOLTAGE - CIRCUIT VOLTAGE BELOW THRESHOLD

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 16: MSDM CAN IHS, Fused B+ & Ground Circuit Diagram

THEORY OF OPERATION

The Memory System is made up of the Memory Seat Module-Driver (MSMD), Memory Switch, Driver Seat Switch and multiple Seat Motors. The motors each contain a hall-effect position sensor. The hall-effect position sensor provides feedback to the MSMD in relation to the motors position.

The Driver Seat Switch is a Multiplex (Mux) switch which uses set resistance levels for each switch position. These resistances correspond to different voltages which is monitored by the MSMD over two separate circuits. When a voltage change is detected, the MSMD will command the appropriate Seat motor(s) to move the seat in the requested direction as long as the Driver Seat Switch is held in that direction or its stops have been reached.

The Memory Switch is a Mux switch that is used to set and recall the seat positions. When a Memory Switch button is pressed, the Driver Door Module (DDM) detects a voltage change and sends a request over the Controller Area Network (CAN) bus circuit to the MSMD to perform the requested command. If the SET button on the Memory Switch is pressed, followed by the 1 or 2 button, the MSMD will store the seat positions based on the position inputs received from the hall-effect position sensors. If the 1 or 2 button on the Memory Switch is pressed, the MSMD will recall the stored seat positions for that particular selection and return the seat to the stored positions. Memory position may also be recalled using a linked FOBIK transmitter. For driver safety, the MSMD will prevent the memory recall function from being initiated if the transmission gear selector lever is not in the Park position or if the vehicle is moving. For further information, refer to **MODULE, MEMORY, SEAT, OPERATION** .

WHEN MONITORED

Engine running, during seat motor operation.

SET CONDITION

The Memory Seat Module-Driver (MSMD) detects a voltage under 9.5 volts on the Fused B(+) circuit.

POSSIBLE CAUSES

Possible Causes
CHARGING SYSTEM VOLTAGE LOW FUSED B(+) CIRCUIT MEMORY SEAT MODULE-DRIVER (MSMD)

DIAGNOSTIC TEST

1. **CHECK PCM FOR CHARGING SYSTEM DTC**
    1. With the scan tool, read the PCM DTCs.

       Are there any Charging System DTCs set in the PCM?

       Yes

       - Refer to the **DTC INDEX** article and perform the appropriate diagnostic procedure.

       No

       - Go To 2
2. **CHECK IF THE DTC IS ACTIVE**

1. Ignition on, engine not running.
2. With the scan tool, record and erase Memory Seat Module-Driver (MSMD) DTCs.
3. Cycle the ignition switch from off to on.
4. Start the engine and operate the driver power seat.
5. With the scan tool, read MSMD DTCs.

Does the scan tool display this DTC as active?

Yes

- Go To 3

No

- The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
- Perform the POWER SEAT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

3. **CHECK THE (A942) FUSED B(+) CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Disconnect the MSMD C1 harness connector.
   3. Ignition on, engine running.
   4. Using a 12-volt test light connected to ground, check the (A942) Fused B(+) circuit in the MSMD C1 harness connector.

NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly?

Yes

- Replace and program the Memory Seat Module (MSMD) in accordance with the Service Information. Refer to **MODULE, MEMORY, SEAT, REMOVAL** .
- Perform the POWER SEAT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Repair the (A942) Fused B(+) circuit for an open or high resistance.
- Perform the POWER SEAT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

B2199-17-BATTERY VOLTAGE-CIRCUIT VOLTAGE ABOVE THRESHOLD

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 17: MSDM CAN IHS, Fused B+ & Ground Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Memory System is made up of the Memory Seat Module-Driver (MSMD), Memory Switch, Driver Seat Switch and multiple Seat Motors. The motors each contain a hall-effect position sensor. The hall-effect position sensor provides feedback to the MSMD in relation to the motors position.

The Driver Seat Switch is a Multiplex (Mux) switch which uses set resistance levels for each switch position. These resistances correspond to different voltages which is monitored by the MSMD over two separate circuits. When a voltage change is detected, the MSMD will command the appropriate Seat motor(s) to move the seat in the requested direction as long as the Driver Seat Switch is held in that direction or its stops have been reached.

The Memory Switch is a Mux switch that is used to set and recall the seat positions. When a Memory Switch button is pressed, the Driver Door Module (DDM) detects a voltage change and sends a request over the Controller Area Network (CAN) bus circuit to the MSMD to perform the requested command. If the SET button on the Memory Switch is pressed, followed by the 1 or 2 button, the MSMD will store the seat positions based on the position inputs received from the hall-effect position sensors. If the 1 or 2 button on the Memory Switch is pressed, the MSMD will recall the stored seat positions for that particular selection and return the seat to the stored positions. Memory position may also be recalled using a linked FOBIK transmitter. For driver safety, the MSMD will prevent the memory recall function from being initiated if the transmission gear selector lever is not in the Park position or if the vehicle is moving. For further information, refer to **MODULE, MEMORY, SEAT, OPERATION** .

WHEN MONITORED

Engine running, during seat motor operation.

SET CONDITION

The Memory Seat Module-Driver (MSMD) detects a voltage over 16.5 volts on the Fused B(+) circuit.

POSSIBLE CAUSES

Possible Causes
CHARGING SYSTEM VOLTAGE HIGH MEMORY SEAT MODULE-DRIVER (MSMD)

DIAGNOSTIC TEST

1. **CHECK PCM FOR CHARGING SYSTEM DTC**
    1. With the scan tool, read the PCM DTCs.

       Are there any Charging System DTCs set in the PCM?

       Yes

       - Refer to the **DTC INDEX** article and perform the appropriate diagnostic procedure.

       No

- Go To 2

2. **CHECK IF THE DTC IS ACTIVE**
   1. Ignition on, engine not running.
   2. With the scan tool, record and erase Memory Seat Module-Driver (MSMD) DTCs.
   3. Cycle the ignition switch from off to on.
   4. Start the engine and operate the driver power seat.
   5. With the scan tool, read MSMD DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Replace and program the Memory Seat Module (MSMD) in accordance with the Service Information. Refer to **MODULE, MEMORY, SEAT, REMOVAL** .
   - Perform the POWER SEAT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
   - Perform the POWER SEAT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

B221C-00-(MSM) MEMORY SEAT MODULE INTERNAL

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 18: MSDM CAN IHS, Fused B+ & Ground Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

Ignition on.

SET CONDITION

The Memory Seat Module-Driver (MSMD) internal self test has failed.

POSSIBLE CAUSES

Possible Causes
MEMORY SEAT MODULE-DRIVER (MSMD)

DIAGNOSTIC TEST

CHECK IF THE DTC IS ACTIVE

1. Ignition on, engine not running.
2. With the scan tool, record and erase Memory Seat Module-Driver (MSMD) DTCs.
3. Cycle the ignition switch from off to on.
4. With the scan tool, read MSMD DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Attempt to update (flash) the MSMD. If you are unable to update the controller, or if this DTC continues to reset after updating, replace and program the Memory Seat Module (MSMD) in accordance with the Service Information. Refer to **MODULE, MEMORY, SEAT, REMOVAL** .
   - Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   - Perform POWER SEAT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

U0011-00-CAN INTERIOR BUS OFF PERFORMANCE

Perform the COMMUNICATION PRE-DIAGNOSTIC PROCEDURE. Refer to **STANDARD PROCEDURE** .

U0013-00-CAN INTERIOR BUS (+) CIRCUIT LOW

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously when the ignition is on.

The battery voltage between 10 volts and 16 volts.

Body Control Module (BCM) is configured correctly.

SET CONDITION

A short to ground is detected on the CAN Interior Bus (125K) (+) circuit.

POSSIBLE CAUSES

Possible Causes
CAN BUS CIRCUITS OPEN OR SHORTED DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES BCM NOT CONFIGURED CORRECTLY BODY CONTROL MODULE (BCM) CONTROL MODULE THAT SET THE DTC

DIAGNOSTIC TEST

VERIFY IF THE DTC IS ACTIVE

1. Turn the ignition on.
2. With the scan tool, read DTCs.

   Is this DTC active?

   Yes

   - Refer to the **BODY CONTROL MODULE (BCM) - DIAGNOSTIC CODE INDEX** article and perform the diagnostic test procedure for CAN INTERIOR BUS.

   No

   - Refer to **DIAGNOSIS AND TESTING** and perform the STORED LOST COMMUNICATION DTCs diagnostic procedure.

U0014-00-CAN INTERIOR BUS (+) CIRCUIT HIGH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously when the ignition is on.

The battery voltage between 10 volts and 16 volts.

Body Control Module (BCM) is configured correctly.

SET CONDITION

A short to voltage is detected on the CAN Interior Bus (+) circuit.

POSSIBLE CAUSES

Possible Causes
CAN BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
BCM NOT CONFIGURED CORRECTLY
BODY CONTROL MODULE (BCM)
CONTROL MODULE THAT SET THE DTC

DIAGNOSTIC TEST

VERIFY IF THE DTC IS ACTIVE

1. Turn the ignition on.
2. With the scan tool, read DTCs.

   Is this DTC active?

   Yes

   - Refer to the **BODY CONTROL MODULE (BCM) - DIAGNOSTIC CODE INDEX** article and perform the diagnostic test procedure for CAN INTERIOR BUS.

   No

   - Refer to **DIAGNOSIS AND TESTING** and perform the STORED LOST COMMUNICATION DTCs diagnostic procedure.

U0016-00-CAN INTERIOR BUS (-) CIRCUIT LOW

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously when the ignition is on.

The battery voltage between 10 volts and 16 volts.

Body Control Module (BCM) is configured correctly.

SET CONDITION

A short to ground is detected on the CAN Interior Bus (125K) (-) circuit.

POSSIBLE CAUSES

Possible Causes
CAN BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
BCM NOT CONFIGURED CORRECTLY
BODY CONTROL MODULE (BCM)
CONTROL MODULE THAT SET THE DTC

DIAGNOSTIC TEST

VERIFY IF THE DTC IS ACTIVE

1. Turn the ignition on.
2. With the scan tool, read DTCs.

   Is this DTC active?

   Yes

   - Refer to the **BODY CONTROL MODULE (BCM) - DIAGNOSTIC CODE INDEX** article and perform the diagnostic test procedure for CAN INTERIOR BUS.

   No

   - Refer to **DIAGNOSIS AND TESTING** and perform the STORED LOST COMMUNICATION DTCs diagnostic procedure.

U0017-00-CAN INTERIOR BUS (-) CIRCUIT HIGH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously when the ignition is on.

The battery voltage between 10 volts and 16 volts.

Body Control Module (BCM) is configured correctly.

SET CONDITION

A short to voltage is detected on the CAN Interior Bus (125K) (-) circuit.

POSSIBLE CAUSES

Possible Causes
CAN BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
BCM NOT CONFIGURED CORRECTLY
BODY CONTROL MODULE (BCM)
CONTROL MODULE THAT SET THE DTC

DIAGNOSTIC TEST

VERIFY IF THE DTC IS ACTIVE

1. Turn the ignition on.
2. With the scan tool, read DTCs.

   Is this DTC active?

   Yes

   - Refer to the **BODY CONTROL MODULE (BCM) - DIAGNOSTIC CODE INDEX** article and perform the diagnostic test procedure for CAN INTERIOR BUS.

   No

   - Refer to **DIAGNOSIS AND TESTING** and perform the STORED LOST COMMUNICATION DTCs diagnostic procedure.

U0140-00-LOST COMMUNICATION WITH BODY CONTROL MODULE

Perform the COMMUNICATION PRE-DIAGNOSTIC PROCEDURE. Refer to **STANDARD PROCEDURE** .

U0199-00-LOST COMMUNICATION WITH DRIVER DOOR MODULE

Perform the COMMUNICATION PRE-DIAGNOSTIC PROCEDURE. Refer to **STANDARD PROCEDURE** .

U0422-00-IMPLAUSIBLE DATA RECEIVED FROM BODY CONTROL MODULE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on and the vehicle in reverse.

SET CONDITION

When the Memory Seat Module-Driver (MSMD) receives communication data sent over the CAN Bus from the Body Control Module (BCM) that is missing part of the message, the message is corrupted, or the message is an irrational value.

POSSIBLE CAUSES

Possible Causes
COMMUNICATION WITH THE BODY CONTROL MODULE (BCM)
DTCS STORED OR ACTIVE IN THE BCM
BODY CONTROL MODULE (BCM)
MEMORY SEAT MODULE-DRIVER (MSMD)

DIAGNOSTIC TEST

1. **CHECK IF THE DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, read Memory Seat Module (MSMD) DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - The condition that caused this DTC to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.
    - Perform the POWER SEAT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
2. **VERIFY BCM IS ACTIVE ON THE CAN BUS**
    1. With the scan tool, select ECU View.
    2. Verify that the BCM is active on the bus.

    Is the BCM active on the bus?

    Yes

- Go To 3

No

- Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM BCM diagnostic procedure.
- Perform the POWER SEAT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

3. **DTCS STORED OR ACTIVE IN THE BCM**
   1. With the scan tool, read BCM DTCs.

      Are any DTCs active or stored in the BCM?

      Yes

      - Refer to the **BODY CONTROL MODULE (BCM) - DIAGNOSTIC CODE INDEX** article and perform the appropriate diagnostic procedure.

      No

      - Go To 4
      - Perform the POWER SEAT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
4. **DTCS STORED OR ACTIVE AGAINST THE BCM**
   1. With the scan tool, read DTCs.

      Are any other Modules reporting a implausible DTC against the BCM?

      Yes

      - Replace and program the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .

      No

      - Replace and program the Memory Seat Module (MSMD) in accordance with the Service Information. Refer to **MODULE, MEMORY, SEAT, REMOVAL** .
      - Perform the POWER SEAT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

STANDARD PROCEDURE

POWER SEAT SYSTEM VERIFICATION TEST

DIAGNOSTIC TEST

PERFORM POWER SEAT SYSTEM VERIFICATION TEST

1. Disconnect all jumper wires and reconnect all previously disconnected components and connectors.
2. Make sure that all accessories are turned off.
3. Make sure that the battery is fully charged.
4. Turn the ignition on.
5. If either the Memory Seat Module (MSM) or the Driver Horizontal Seat Adjuster Motor/Seat Track was replaced, then the MSM Standard Routine must be performed using a scan tool.
6. Using a scan tool, record and erase Diagnostic Trouble Codes (DTCs) from all modules.
7. Operate the driver seat in all positions.
8. Using the Memory Switch on the driver's door, program the driver's seat number 1 Button to a desired position and the driver's seat number 2 Button to a different position.
9. Verify both Memory positions can be recalled with the Remote Keyless Entry (RKE) transmitter and with the Memory Switch on the driver's door.
10. Turn the ignition off, wait 10 seconds, then turn the ignition on.
11. Using a scan tool, select ECU View.
12. Check for DTCs in the modules.

    Are DTCs present in any of the modules or is the original condition still present?

    Yes

    - The repair is not complete. Perform the appropriate diagnostic procedure for the DTC or symptom that is still present.

    No

    - The repair is complete.

2014 ACCESSORIES AND EQUIPMENT

Message Center - Service Information - Cherokee

CENTER, ELECTRONIC VEHICLE INFORMATION

DESCRIPTION

DESCRIPTION

Fig. 1: Electronic Vehicle Information Center (EVIC) Driver-Interactive Display
Courtesy of CHRYSLER GROUP, LLC

The Electronic Vehicle Information Center (EVIC) features a driver-interactive display. The display is located in the middle of the instrument cluster between the speedometer and tachometer. This system conveniently allows the driver to select a variety of useful information by pressing the switches mounted on the steering wheel. The EVIC displays information related to the following:

- Audio mode display
- Compass display
- Fuel saver indicator, Economizer (ECO) display
- Navigation system screens - If Equipped
- Outside temperature display
- Park Assist System - If Equipped
- Personal Settings (customer programmable features)
- System Status

- Tire Pressure Monitor System - If Equipped
- Trip computer functions
- U-Connect™ hands-free communication system displays - If Equipped
- Vehicle information warning message displays

The EVIC system is comprised of several different components. Those components are:

- Instrument Cluster
- Steering Wheel Switches
- Ambient Temperature Sensor
- Controller Area Network (CAN) Data Bus
- Local Interface Network (LIN) Data Bus

The EVIC display is part of the Instrument Cluster assembly and is not serviced as a separate component. If the display is inoperative the complete Instrument Cluster assembly must be replaced. Refer to **REMOVAL** . If the EVIC function buttons are inoperative and require replacement, refer to **SWITCH, EVIC CONTROL, REMOVAL** for the appropriate procedure.

OPERATION

EVIC SWITCHES

Fig. 2: EVIC Function Buttons
Courtesy of CHRYSLER GROUP, LLC

The EVIC function buttons are used to operate the different functions of the EVIC system. Pressing and releasing the **Arrow** buttons allows the driver to scroll though and select the Compass/Temperature, Trip Computer, Personal Settings or System Status functions. The **OK** button allows the selection of setting or resetting of the function currently displayed at that time.

EVIC DISPLAY MODES

SYSTEM STATUS

Displays warnings and user interaction messages. Initial warnings will be displayed accompanied by a series of audible beeps. Critical text warnings will be displayed until the failure is corrected. Non-critical text warnings will be displayed for 60 seconds. The driver can scroll to view multiple messages by using the menu buttons.

When the appropriate conditions exist, the EVIC displays the following messages:

- Turn signal on
- Perform service
- Key not programmed - damaged key
- Key not programmed - invalid key
- Key not programmed - exceeded key program limit
- Programming active - new key programmed
- Service security key
- Invalid key - try alternate key
- Driver/passenger door open (with graphic)
- Left/right rear door open (with graphic)
- Doors open (with graphic)
- Liftgate open (with graphic)
- Liftgate/door open (with graphic)
- Liftgate/doors open (with graphic)
- Liftglass open (with graphic)
- Hood open (with graphic)
- Hood/door open (with graphic)
- Hood/doors open (with graphic)
- Liftgate/hood open (with graphic)
- Hood/glass/door open (with graphic)
- Hood/glass/doors open (with graphic)
- Hood/gate/door open (with graphic)
- Hood/gate/doors open (with graphic)
- Liftglass/door open (with graphic)
- Liftglass/doors open (with graphic)
- Liftglass/hood open (with graphic)
- Washer fluid low (with graphic)
- Coolant low (with graphic)
- Oil change required
- Oil change reset
- Check gauges
- Auto highbeam on
- Auto highbeam off

- Park assist disabled
- Service suspension
- Service park assist system
- Transmission over temp
- Check shift procedure
- Service 4wd system
- 4wd system in neutral
- Low brake fluid level
- Warning! Limit speed
- Check gas cap
- ESC off
- Hill descent control
- Memory #1 positions set
- Memory #2 positions set
- Memory system disabled - seatbelt fastened (with graphic)
- Memory system disabled - vehicle not in park
- Driver 1 memory
- Driver 2 memory
- Adj. Pedals disabled - cruise control set
- Adj. Pedals disabled - shifter in reverse
- Tire low pressure
- Check TPM system
- Exhaust Service Required - See Dealer Now (diesel models only)
- Exhaust System - Regeneration Required Now (diesel models only)
- Left front low pressure (premium TPM system only)
- Right front low pressure (premium TPM system only)
- Left rear low pressure (premium TPM system only)
- Right rear low pressure (premium TPM system only)
- Spare low pressure (premium TPM system only)
- Water in fuel (diesel models only)
- Service blind spot system
- Blind spot system unavailable
- Blind spot system off

TRIP COMPUTER

Press and release the **MENU** buttons until one of the following Trip Functions displays in the EVIC:

- Average Fuel Economy
- Distance To Empty
- Elapsed Time
- Display Units of Measure in

Press the **STEP** button to cycle through all the Trip Computer functions.

The Trip Functions mode displays the following information:

- **Average Fuel Economy** Shows the average fuel economy since the last reset. When the fuel economy is reset, the display will read "RESET" or show dashes for two seconds. Then, the history information will be erased, and the averaging will continue from the last fuel average reading before the reset.
- **Distance To Empty (DTE)** Shows the estimated distance that can be traveled with the fuel remaining in the tank. This estimated distance is determined by a weighted average of the instantaneous and average fuel economy, according to the current fuel tank level. DTE cannot be reset through the **RESET** button. When the DTE value is less than 30 miles (48 km) estimated driving distance, the DTE display will change to a text display of "LOW FUEL." This display will continue until the vehicle runs out of fuel. Adding a significant amount of fuel to the vehicle will turn off the "LOW FUEL" text and a new DTE value will display.
- **Elapsed Time** Shows the total elapsed time of travel since the last reset when the ignition switch is in the ACC position. Elapsed time will increment when the ignition switch is in the ON or START position.
- **Display Units of Measure in:** To make your selection, press and release the **RESET** button until "US" or "METRIC" appears.

To Reset The Display Reset will only occur while a reset function is being displayed. Press and release the **RESET** button once to clear the reset function being displayed. To reset all reset functions, press and release the **RESET** button a second time within 3 seconds of resetting the currently displayed function (>Reset ALL will display during this 3 second window).

HANDS FREE TELEPHONE - IF EQUIPPED

Provides the following information and features for the optional hands-free communications system:

- Phone status: idle, voice mail, roaming, battery strength and signal strength in increments of 20 percent
- Call status: Incoming call, connecting, connected, air time in minutes and seconds, call ended, busy, call failed, roaming and no phone connection
- UConnect Active
- Caller ID phone number display

NAVIGATION - IF EQUIPPED

Navigation Display Control Press and release the MENU button until Navigation displays in the EVIC. When the Navigation System is On, the steering wheel buttons can be used to select the Map or Menu display on the Navigation Unit. When the Menu display is active, the STEP button can be used to scroll through the list, the RESET button can be used to select an item, and the AUDIO MODE button can be used to return to the

previous menu. When the Map display is active, pressing the RESET button will change the Navigation Unit Display to the Menu.

Turn-By-Turn Directions The EVIC displays turn-by-turn directions to a programmed destination when Turn-By-Turn Navigation is enabled through Personal Settings. When enabled, the EVIC displays the name of the approaching road at the top of the screen, followed by an arrow to indicate the direction to turn the vehicle, and a count down to indicate the distance to the turn.

PERSONAL SETTINGS MODE (CUSTOMER PROGRAMMABLE FEATURES)

Allows the driver to set and recall features when the transmission is in Park by pressing and releasing the **MENU** button until Personal Settings is displayed in the EVIC. Pressing and releasing the **STEP** button will scroll through the following personal settings choices:

- **Language** When in this display you may select one of five languages for all display nomenclature, including the trip functions and the navigation system (if equipped). Press the **RESET** button while in this display to select English, Espanol, or Francais. Then, as you continue, the information will display in the selected language.

NOTE: The EVIC will not change the UConnect™ language selection.

- **Lock Doors Automatically at 15 mph (24 km/h)** When ON is selected, all doors will lock automatically when the vehicle reaches a speed of 15 mph (24 km/h). To make your selection, press and release the **RESET** button until "ON" or "OFF" appears.
- **Unlock Doors Automatically on Exit** When ON is selected, all doors will unlock when the vehicle is stopped and the transmission is in the P (Park) or N (Neutral) position and the driver's door is opened. To make your selection, press and release the **RESET** button until "ON" or "OFF" appears.
- **Remote Key Unlock** When DRIVER DOOR 1ST PRESS is selected, only the driver's door will unlock on the first press of the remote keyless entry unlock button. When Driver Door 1st Press is selected, you must press of the remote keyless entry unlock button twice to unlock the passenger's doors. When ALL DOORS 1ST PRESS is selected, all of the doors will unlock on the first press of the remote keyless entry unlock button. To make your selection, press and release the **RESET** button until "Driver Door 1st Press" or "All Doors 1st Press" appears.
- **Sound Horn with Remote Key Lock** When ON is selected, a short horn sound will occur when the remote keyless entry "Lock" button is pressed. This feature may be selected with or without the flash lights on lock/unlock feature. To make your selection, press and release the **RESET** button until "ON" or "OFF" appears.
- **Flash Lights with Remote Key Lock** When ON is selected, the front and rear turn signals will flash when the doors are locked or unlocked with the remote keyless entry transmitter. This feature may be selected with or without the sound horn on lock feature selected. To make your selection, press and release the **RESET** button until "ON" or "OFF" appears.
- **Delay Turning Headlights Off** When this feature is selected, the driver can choose to have the headlights remain on for 0, 30, 60, or 90 seconds when exiting the vehicle. To make your selection, press and release the **RESET** button until "0," "30," "60," or "90" appears.
- **Turn Headlights On with Remote Key Unlock** When this feature is selected, the headlights will

activate and remain on for up to 90 seconds when the doors are unlocked with the remote keyless entry transmitter. To make your selection, press and release the **RESET** button until "OFF," "30 sec.," "60 sec.," or "90 sec." appears.

- **Headlights On with Wipers (Available with Auto Headlights Only)** When this feature is selected and the headlight switch is in the AUTO position, the headlights will activate approximately 10 seconds after the wipers are turned on. To make your selection, press and release the **RESET** button until "ON" or "OFF" appears.
- **Delay Power Off to Accessories Until Exit** When this feature is selected, the power window switches, radio, hands-free system (if equipped), DVD video system (if equipped), power sunroof (if equipped), and power outlets will remain active for up to 10 minutes after the ignition switch is turned off. Opening a vehicle door will cancel this feature. To make your selection, press and release the **RESET** button until "Off," "45 sec.," "5 min.," or "10 min." appears.
- **Confirmation of Voice Commands - If Equipped** When ON is selected, all voice commands from the UConnect™ system are confirmed. To make your selection, press and release the **RESET** button until "ON" or "OFF" appears.
- **Display Units of Measure in** The EVIC, odometer, and navigation system (if equipped) can be changed between English and Metric units of measure. To make your selection, press and release the **RESET** button until "US" or "METRIC" appears.

COMPASS/TEMPERATURE

Compass heading and outside temperature are displayed on the EVIC display screen. One of eight compass headings to indicate the direction the vehicle is facing (N, S, E, W, NE, NW, SE, SW) and one of 15 compass variance settings can be programmed. Outside temperature is displayed in °C (degrees Celsius) or °F (degrees Fahrenheit).

For additional information regarding the compass, refer to Personal Settings (Customer Programmable Features) in this article .

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - ELECTRONIC VEHICLE INFORMATION CENTER

The Electronic Vehicle Information Center (EVIC) data is obtained from several components on the Controller Area Network (CAN) Data Bus circuit. The EVIC will not function properly if the bus messages from any of these components is not received. If no EVIC data is displayed, check the CAN Data Bus circuit communications, the Instrument Cluster functions and the Body Control Module (BCM).

The use of a scan tool and the proper diagnostic procedures information are recommended for further testing of the EVIC and the CAN Data Bus circuit. Refer to the appropriate wiring information for complete circuit schematic or connector pin-out information.

SENSOR, AMBIENT TEMPERATURE

DESCRIPTION

DESCRIPTION

Fig. 3: Identifying Ambient Air Temperature Sensor
Courtesy of CHRYSLER GROUP, LLC

The ambient air temperature sensor is a variable resistor that monitors the air temperature outside of the vehicle. The Automatic Temperature Control (ATC) heating and A/C system uses the ambient air temperature sensor data to help maintain optimum passenger compartment temperature levels. The ambient air temperature sensor is mounted behind the front fascia.

OPERATION

OPERATION

The ambient air temperature sensor is a variable resistor that operates on a 5 volt Direct Current (DC) reference signal sent by the Body Control Module (BCM). The ambient air temperature sensor is connected to the BCM through a two-wire lead and connector of the vehicle wire harness. The ambient air temperature sensor changes its internal resistance in response to changes in the outside air temperature, which either increases or decreases the reference signal voltage read by the BCM. The BCM converts and broadcasts the sensor data over the Controller Area Network (CAN) data bus, where it is read by the A/C-heater control, Powertrain Control Module (PCM) and other vehicle control modules.

The ambient air temperature sensor is diagnosed using a scan tool. Refer to the appropriate Diagnostic Information .

The ambient air temperature sensor cannot be adjusted or repaired and must be replaced if inoperative or damaged. Refer to **SENSOR, AMBIENT TEMPERATURE, REMOVAL**.

REMOVAL

REMOVAL

Fig. 4: Ambient Temperature Sensor, Connector & Push Pin
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Disconnect the wire harness connector (3) from the ambient air temperature sensor (2).
3. Remove the push pin (1) that secures the ambient air temperature sensor and remove the sensor.

INSTALLATION

INSTALLATION

Fig. 5: Ambient Temperature Sensor, Connector & Push Pin
Courtesy of CHRYSLER GROUP, LLC

1. Install the push pin (2) that secures the ambient air temperature sensor to the vehicle.
2. Connect the wire harness connector (3) to the ambient air temperature sensor (2).
3. Connect the negative battery cable.

SWITCH, EVIC CONTROL

DESCRIPTION

DESCRIPTION

Fig. 6: EVIC Function Buttons
Courtesy of CHRYSLER GROUP, LLC

The Electronic Vehicle Information Center (EVIC) control switch pod is located in the left spoke of the steering wheel spoke bezel. This switch has up to eight push buttons. Five of the push buttons are used on all vehicles equipped with the EVIC. Three additional push buttons are found on vehicles equipped with the optional Uconnect™ Hands-Free Communication System. The only visible components of the switch pod are the switch push buttons and a decorative bezel around the push buttons, which stands slightly proud of the steering wheel spoke bezel. The remainder of the switch pod including its mounting provisions and its electrical connection are concealed beneath the spoke bezel.

The switch pod housing and push buttons are constructed of molded plastic. Each of the push buttons has white International Control and Display Symbol graphics or text applied to it, which clearly identify the function of each push button. The switch pod is secured through three integral mounting tabs to mounting bosses on the back of the spoke bezel by three screws. A connector receptacle integral to the inboard end of the switch pod housing connects the EVIC control switch pod to the vehicle electrical system through a dedicated take out and connector of the steering wheel wire harness.

The EVIC control switch pod cannot be adjusted or repaired. If any function of the switch is ineffective or damaged, the entire switch pod unit must be replaced.

OPERATION

OPERATION

The Electronic Vehicle Information Center (EVIC) control switch pod is a resistor multiplexed unit that receives source current from and provides hard wired inputs to the Local Interface Network (LIN) slave node circuitry of the LIN module or integral to the cruise control switch pod in the right spoke of the steering wheel spoke bezel. The LIN slave node circuitry communicates the switch states of the EVIC control switch pod, the remote radio switches, the horn switch and the heated steering wheel sensor (if equipped) over the LIN data bus to the LIN master node integral to the Steering Column Module (SCM) integral to the Steering Column Control Module (SCCM) mounting housing located on the top of the steering column below the clockspring. The SCM is also a gateway to the Controller Area Network (CAN) data bus.

The EVIC control switch pod contains four push buttons whose functions are:

- **Down Arrow** - Pressing and releasing the Down Arrow push button allows the operator to scroll downward through the various EVIC main menus and sub menus.
- **Left Arrow** - Pressing and releasing the Left Arrow push button returns you to the previous sub menu or main menu.
- **Right Arrow** - Pressing and releasing the Right Arrow (Select) push button allows the operator to navigate, select and reset items or settings in the currently displayed EVIC main menu or sub menu. Pressing and holding the Right Arrow (Select) push button for two seconds provides a global reset of all of those EVIC features that can be reset, whether currently displayed or not.
- **Up Arrow** - Pressing and releasing the Up Arrow push button allows the operator to scroll upward through the various EVIC main menus and sub menus.

For vehicles equipped with the Uconnect® Hands-Free Communication System, the EVIC control switch pod contains two additional switch push buttons whose functions are:

- **VR (Voice Recognition)** - This switch button activates the Uconnect® Voice Command system.
- **Phone** - This switch push button activates the Uconnect® Hands-Free Phone system.

The LIN slave node circuitry of the LIN module or the cruise control switch pod provides current for all of the switches and sensors on the rotating steering wheel as well as for the Light Emitting Diode (LED) back lighting of both the cruise control and the EVIC control switch pods. The SCM continually monitors all of the hard wired speed control switch circuits as well as the LIN bus data. The SCM will store a Signal Not Available (SNA) code for any LIN bus input errors. The SCM also communicates with other electronic modules over the CAN data bus. Therefore, any SCM DTC information can be retrieved using a diagnostic scan tool connected to the Data Link Connector (DLC).

The analog resistor multiplexed circuits of the EVIC control switch pod as well as the hard wired circuits between the switch pod and the speed control switch pod may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the LIN slave or master nodes, the SCM or the electronic controls and communication between modules and other devices that provide some features of the EVIC system. The most reliable, efficient, and accurate means to diagnose the EVIC control switch pod, the LIN slave or master nodes, the SCM or the electronic controls and

communication related to EVIC system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

REMOVAL

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

1. Disconnect and isolate the battery negative cable.
2. Remove the remote radio switch. Refer to **SWITCH, REMOTE RADIO, REMOVAL** .

0806007482

Fig. 7: Steering Wheel Front Bezel & Screws
Courtesy of CHRYSLER GROUP, LLC

3. From the back of the steering wheel front bezel (2), remove the two screws (1) that secure the EVIC switch pod to the bezel.
4. Remove the switch from the bezel.

INSTALLATION

INSTALLATION

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

0806007482

Fig. 8: Steering Wheel Front Bezel & Screws
Courtesy of CHRYSLER GROUP, LLC

1. Position the Electronic Vehicle Information center (EVIC) switch pod to the back of the steering wheel front bezel (2).
2. Install and tighten the two screws (1) that secure the switch to the bezel. Tighten the screws securely.
3. Install the remote radio switch. Refer to **SWITCH, REMOTE RADIO, INSTALLATION** .
4. Connect the negative battery cable.

2014 ACCESSORIES AND EQUIPMENT

Navigation/Telecommunication - Service Information - Cherokee

DESCRIPTION

HANDS FREE PHONE

A Uconnect™ Hands Free Phone system is factory-installed optional equipment. This system allows hands free use of compatible mobile phones for sending and receiving phone calls and text messages as well as for streaming audio from those devices through the audio system in the vehicle. The Hands Free Phone system includes the following major components, which are described in further detail elsewhere in this service information:

- **Bluetooth™ Antenna** - A Bluetooth™ antenna is internal and integral to the Radio Receiver Module (RRM) (also known as the radio or the head unit).
- **Bluetooth™ Phone** - A customer-supplied and paired Bluetooth™ phone is a required component of the hands free phone system.
- **Body Control Module** - The Body Control Module (BCM) (also known as the Common Body Controller/CBC) is located on the right cowl side inner panel within the passenger compartment, where it is concealed behind the cowl side kick panel to the right of the instrument panel. The BCM is the configuration master node for the vehicle. Refer to **MODULE, BODY CONTROL, DESCRIPTION** .
- **Electronic Vehicle Information Center Switch Pod** - The Electronic Vehicle Information Center (EVIC) switch pod is located in the left horizontal spoke of the steering wheel. In addition to the EVIC switch buttons this switch pod contains the Uconnect™ Voice Recognition (VR) (also known as Voice Command) switch button and the Uconnect™ Phone switch button of the Hands Free Phone system. Refer to **SWITCH, EVIC CONTROL, DESCRIPTION** .
- **Microphones** - Stereo microphones are integral to the inside rear view mirror in vehicles equipped with the Uconnect™ Hands Free Phone system. These microphones are located on the top surface of the mirror housing, one to each side of center. Refer to **MICROPHONE, DESCRIPTION**.
- **Radio Receiver Module** - The Radio Receiver Module (RRM) (also known as the radio or the head unit) is located near the top of the instrument panel center stack area and is the primary component of the phone system in this vehicle. In addition to a 213 millimeter (8.4 inch) color electronic touchscreen display, a microcontroller, a Bluetooth™ transceiver, a navigation module, flash memory and sophisticated Advanced Speech Recognition (ASR) input capability through Voice Recognition (VR) software. The ASR software includes many different available languages. Each vehicle is equipped with a list of available languages, which are made available from the factory based upon languages most commonly used for the market destination. Refer to **RADIO, DESCRIPTION** .

The RRM also contains a microcontroller and programming that allows it to communicate with other electronic modules in the vehicle over the Controller Area Network - Interior High Speed (CAN-IHS) data bus. Refer to **COMMUNICATION, DESCRIPTION** .

The Uconnect™ Hands Free Phone system components cannot be adjusted or repaired. If any Hands Free Phone system component is damaged or ineffective, that component must be replaced. The Hands Free Phone

system software is flash programmable through the Universal Serial Bus (USB) port.

NAVIGATION

A factory-installed satellite navigation system based upon the Global Positioning System (GPS) is an available option on this vehicle. Depending upon the optional touchscreen Radio Receiver Module (RRM) (also known as the radio or the head unit) selected for the vehicle, there are some variations in navigation system features available. Each system provides the vehicle operator with both visual and audible guidance to a chosen destination. An available premium navigation system includes such features as one-shot Voice Recognition (VR) destination entry, three dimensional city models and landmarks, digital terrain modeling, SiriusXM™ Travel Link and SiriusXM™ Traffic.

A color touchscreen electronic display provides a graphical interface for programming, searching for and selecting destinations. In vehicles also equipped with a Uconnect™ Hands-Free telecommunication option, the available navigation systems are also equipped with Advanced Speech Recognition (ASR) input capability allowing hands-free operation. Each system provides visual guidance through dynamic maps with a turn-by-turn feature that can be enabled or disabled by the vehicle operator, while voice prompts through the audio system of the vehicle provide the vehicle operator with audible alerts and directions coordinated with the visual displays. The system also displays and logs valuable trip information such as speed, posted speed limit, distance and Estimated Time of Arrival (ETA).

The premium navigation system is activated when the vehicle is shipped from the factory, while another available system is shipped from the factory as Navigation Ready. The Navigation Ready system allows the customer to choose whether to have the dealer activate the embedded navigation module after the vehicle has been delivered.

The navigation system includes the following major components, which are described in further detail elsewhere in this service information:

- **Body Control Module** - The Body Control Module (BCM) (also known as the Common Body Controller/CBC) is located on the right cowl side inner panel within the passenger compartment, where it is concealed behind the cowl side kick panel to the right of the instrument panel. The BCM is the configuration master node for the vehicle. Refer to **MODULE, BODY CONTROL, DESCRIPTION** .
- **Combination Antenna** - The navigation module acquires GPS position data through a roof-mounted combination antenna that also receives satellite audio and cellular signals. Refer to **ANTENNA, SATELLITE, AUDIO, DESCRIPTION** .
- **Electronic Vehicle Information Center** - The Electronic Vehicle Information Center (EVIC) is an electronic display within the Instrument Cluster (IC) (also known as the Common Instrument Cluster/CIC). When Turn-By-Turn navigation is enabled through the EVIC Personal Settings menu, the EVIC displays turn-by-turn directions to the chosen destination supplemental to the navigation display within the RRM touchscreen unit. Refer to **CENTER, ELECTRONIC VEHICLE INFORMATION, DESCRIPTION** .
- **Electronic Vehicle Information Center Switch Pod** - The Electronic Vehicle Information Center (EVIC) switch pod is located in the left horizontal spoke of the steering wheel. In addition to the EVIC switch buttons this switch pod contains the Uconnect™ Voice Recognition (VR) (also known as Voice Command) switch button and the Uconnect™ Phone switch button of the Uconnect™ Hands-Free Phone

system. Refer to **SWITCH, EVIC CONTROL, DESCRIPTION** .

- **Microphones** - Stereo microphones are integral to the inside rear view mirror in vehicles equipped with the Uconnect™ Hands-Free Phone system. These microphones are located on the top surface of the mirror housing, one to each side of center. Refer to **MICROPHONE, DESCRIPTION**.
- **Radio Receiver Module** - The Radio Receiver Module (RRM) (also known as the radio or the head unit) contains the central components of the navigation system. In addition to a 213 millimeter (8.4 inch) color electronic touchscreen display, a navigation module is internal and integral to each RRM that is equipped with navigation capability. The navigation module contains all of the navigation system hardware and software. Hardware includes the GPS receiver, an electronic gyroscope, a microcontroller and flash memory for system software and map data storage. Refer to **RADIO, DESCRIPTION** .

The IC and the RRM each contain a microcontroller and programming that allow them to communicate with each other and other electronic modules in the vehicle using the Controller Area Network - Interior High Speed (CAN - IHS) data bus. Refer to **COMMUNICATION, DESCRIPTION** .

The navigation system components cannot be adjusted or repaired. If any of the navigation system components is damaged or ineffective, that component must be replaced. The external combination antenna can be repaired separately from the RRM. The navigation system software as well as the map data is flash programmable through the Universal Serial Bus (USB) port.

UCONNECT ACCESS

A Uconnect™ Access system is factory-installed optional equipment. The Uconnect™ Access system uses an embedded cellular connection and available subscription service packages to enable several mobile connectivity features. Vehicles equipped with the Uconnect™ Access system can be readily identified by two switch buttons on the inside rear view mirror identified with **ASSIST** and **9-1-1** labels.

To fully enable the Uconnect™ Access system, a Uconnect™ Access account must first be established by following the steps described in the Uconnect™ Access registration process at **www.MoparOwnerConnect.com** . Next, one of two optional subscription service packages must be selected. The two packages are:

- **Uconnect™ Access Assist Package** - This package provides one touch 9-1-1 calling and roadside assistance calling features.
- **Uconnect™ Access Advantage Package** - This package also includes the one touch 9-1-1 calling and roadside assistance calling features found in the Assist Package. In addition, this package provides features such as Bing™ hands-free search and voice-to-text hands-free text message dictation, both through the user's compatible, paired and enabled Bluetooth™ phone. Another feature of this package is remote vehicle services like remote **Lock** , **Unlock** and **Start** . The remote vehicle services can be activated through the user's compatible smart phone after the **Uconnect™ Access Mobile** smart phone app is installed on the smart phone. Download and installation of the **Uconnect™ Access Mobile** smart phone app can be done during the Uconnect™ Access registration process at **www.MoparOwnerConnect.com** or from the user's smart phone App storefront. The user can also activate the remote vehicle services feature from the Uconnect™ Access web portal.

NOTE: A free trial period of the Uconnect™ Access Assist or Advantage subscription

packages may be offered after successful completion of the Uconnect™ Access registration process.

The Uconnect™ Store Front is accessible from the appropriate Radio Receiver Module (RRM) (also known as the radio or the head unit) touch screen menu once the Uconnect™ Access registration process has been successfully completed. In the future, additional Uconnect™ Access compatible applications (also known as RRM apps) will be made available for purchase and download from the Uconnect™ Store Front.

The Uconnect™ Access system includes the following major components, which are described in further detail elsewhere in this service information:

- **Access Switches** - In vehicles equipped with Uconnect™ Access, the inside rear view mirror also contains two integral push button switches and a Light Emitting Diode (LED) indicator located on the rearward-facing housing just below the center of the mirror glass for activation of the **ASSIST** and **9-1-1** features.
- **Bluetooth™ Antennas** - Bluetooth™ antennas are internal and integral to the RRM.
- **Bluetooth™ Phone** - A customer-supplied and paired Bluetooth™ smart phone is a required component of the Uconnect™ Access system to enable remote services.
- **Body Control Module** - The Body Control Module (BCM) (also known as the Common Body Controller/CBC) is located on the right cowl side inner panel within the passenger compartment, where it is concealed behind the cowl side kick panel to the right of the instrument panel. The BCM is the configuration master node for the vehicle. Refer to **MODULE, BODY CONTROL, DESCRIPTION** .
- **Combination Antenna** - The Radio Receiver Module (RRM) (also known as the radio or the head unit) sends and receives cellular data through a roof-mounted combination antenna that also receives satellite audio and Global Positioning System (GPS) navigation signals. Refer to **ANTENNA, SATELLITE, AUDIO, DESCRIPTION** .
- **Electronic Vehicle Information Center Switch Pod** - The Electronic Vehicle Information Center (EVIC) switch pod is located in the left horizontal spoke of the steering wheel. In addition to the EVIC switch buttons this switch pod contains the Voice Recognition (VR) switch button and the Phone switch button of the hands-free phone system. Refer to **SWITCH, EVIC CONTROL, DESCRIPTION** .
- **Microphones** - Stereo microphones are integral to the inside rear view mirror in vehicles equipped with the hands-free phone system. These microphones are located on the top surface of the mirror housing, one to each side of center. Refer to **MICROPHONE, DESCRIPTION**.
- **Radio Frequency Hub Module** - The Radio Frequency Hub Module (RFHM) (also known as the RF Hub) is a key component of the Uconnect™ Access remote vehicle services feature. The RFHM is located on the left rear quarter inner panel in the cargo area within the passenger compartment and concealed behind the quarter trim panel. Refer to **MODULE, RADIO FREQUENCY (RF HUB), DESCRIPTION** .
- **Radio Receiver Module** - The Radio Receiver Module (RRM) (also known as the radio or the head unit) is located near the top of the instrument panel center stack area and is the primary component of the Uconnect™ Access system in this vehicle. The RRM includes a 213 millimeter (8.4 inch) color electronic touchscreen display, a microcontroller, a Bluetooth™ transceiver, a navigation module, flash memory and sophisticated Advanced Speech Recognition (ASR) input capability through Voice Recognition (VR) software. The ASR software includes many different available languages. Each vehicle is equipped with a list of available languages, which are made available from the factory based upon languages most

commonly used for the market destination. Refer to **RADIO, DESCRIPTION** .

- **Uconnect™ Access Registration And Applications** - Uconnect™ Access registration must be completed before individual RRM apps or Uconnect™ Access subscription packages can be purchased from the Uconnect™ Store Front. The Uconnect™ Access Mobile smart phone app must also be installed on the user's compatible smart phone for the remote vehicle services features to operate. Many additional Uconnect™ Access apps are under development for later release.

The RRM contains a microcontroller and programming that allows it to communicate with other electronic modules in the vehicle over the Controller Area Network - Interior High Speed (CAN-IHS) data bus. In vehicles equipped with Uconnect™ Access, the RRM also uses electronic message communication with other electronic modules in the vehicle over the CAN-C data bus. Refer to **COMMUNICATION, DESCRIPTION** .

The Uconnect™ Access system components cannot be adjusted or repaired. If any Uconnect™ Access system component is damaged or ineffective, that component must be replaced. The external combination antenna can be repaired separately from the RRM. The Uconnect™ Access system software is flash programmable through the Universal Serial Bus (USB) port.

WI-FI HOT SPOT

Vehicles equipped with the Uconnect™ Access system can become a Wi-Fi hot spot with payment of a daily, weekly or monthly subscription option. This system allows the use of the vehicle as a Wi-Fi hot spot for connecting consumer Wi-Fi devices to the Internet through a Wi-Fi antenna and an embedded cellular connection that are internal and integral to the Radio Receiver Module (RRM) (also known as the radio or the head unit), and the external cellular combination antenna.

The Wi-Fi Hot Spot system includes the following major components, which are described in further detail elsewhere in this service information:

- **Wi-Fi Antenna** - The Wireless Local Area Network (WLAN) (also known as Wi-Fi) antenna is internal and integral to the RRM.
- **Wi-Fi Device** - A customer-supplied Wi-Fi capable device is a required component of the Wi-Fi Hot Spot system.
- **Combination Antenna** - The RRM sends and receives cellular data through a roof-mounted combination antenna that also receives satellite audio and Global Positioning System (GPS) navigation signals. Refer to **ANTENNA, SATELLITE, AUDIO, DESCRIPTION** .
- **Radio Receiver Module** - The Radio Receiver Module (RRM) (also known as the radio or the head unit) is located near the top of the instrument panel center stack area and is the primary component of the telecommunication system in this vehicle. The RRM includes a 213 millimeter (8.4 inch) color electronic touchscreen display, a microcontroller, a Bluetooth™ transceiver, a navigation module, flash memory and sophisticated Advanced Speech Recognition (ASR) input capability through Voice Recognition (VR) software. The ASR software includes many different available languages. Each vehicle is equipped with a list of available languages, which are made available from the factory based upon languages most commonly used for the market destination. Refer to **RADIO, DESCRIPTION** .

The Uconnect™ Access Wi-Fi Hot Spot system components cannot be adjusted or repaired. If any Wi-Fi Hot Spot system component is damaged or ineffective, that component must be replaced. The external combination

antenna can be repaired separately from the RRM. The Wi-Fi Hot Spot system software is flash programmable through the Universal Serial Bus (USB) port.

OPERATION

HANDS FREE PHONE

The Uconnect™ Hands Free Phone system relies upon Bluetooth™ technology to enable wireless connectivity between Bluetooth™ compatible, paired and turned On mobile devices and the on-board entertainment system components. This system also relies upon Advanced Speech Recognition (ASR) software to enable Voice Commands to control the mobile device as well as the components and features of some other on-board systems.

The system will recognize up to ten Bluetooth™ compatible devices, each of which is identified within the system by the name acquired from the device during the pairing process. The Hands Free Phone system will communicate with a paired device that is anywhere within the vehicle. However, covering the paired device with a metal object may block the signal.

The Hands Free Phone system is operated in one of two ways: actively or passively. Active operation begins with the vehicle operator depressing a push button in the Electronic Vehicle Information Center (EVIC) switch pod on the face of the left horizontal spoke of the steering wheel. The Uconnect™ Voice Recognition (**VR**) (also known as Voice Command) button is depressed for hands free Voice Command access to available features other than the phone, or the Uconnect™ Phone (**Phone** is identified by a phone handset icon) button is depressed for hands free phone access.

The **VR** or **Phone** button press provides a resistor multiplexed input to the Local Interface Network (LIN) slave node integral to the EVIC switch pod. The LIN slave node sends an electronic **switch press** message to the LIN master node integral to the Body Control Module (BCM) (also known as the Common Body Controller/CBC). The BCM is also a gateway to the CAN - Interior High Speed (CAN-IHS) data bus and relays the message over CAN-IHS data bus to the Radio Receiver Module (RRM) (also known as the radio or the head unit).

When the RRM receives the electronic **switch press** message, the RRM suppresses any current audio output and issues an audible **beep** to indicate that the VR hardware is prepared to receive a Voice Command. Part of the Uconnect™ Hands Free Phone system hardware includes the VR stereo microphones integral to the top surface of the inside rear view mirror. The microphones provide a hard wired input of Voice Commands to the VR engine within the RRM, and the ASR software converts that input into an electronic instruction message broadcast over the CAN-IHS data bus to invoke the appropriate system response. If no appropriate Voice Command is received within a few seconds following the audible **beep** , the system will provide an audible verbal output listing a menu of the available Voice Command options.

Passive operation begins when an incoming cellular call is received. If the Bluetooth™ phone is Short Message Service (SMS) text message capable and compatible with the Uconnect™ system (see the Uconnect™ web site), passive operation will also begin when an SMS text message is received. The call or SMS text message is relayed to the Bluetooth™ transceiver embedded within the RRM. The Bluetooth™ transceiver then instructs the RRM to announce the incoming call or message. The vehicle operator presses the Uconnect™ **Phone** button in the EVIC switch pod or the soft button that will appear in the RRM display to accept the call, or the soft button that will appear in the RRM display to accept the message.

The Bluetooth™ transceiver connects the voices of the two phone parties using outputs through the audio system speakers and inputs through the Uconnect™ hands free microphones. In the case of a text message, the Bluetooth™ transceiver sends the message to the VR hardware and the ASR software converts the message from text to voice and plays it through the audio system speakers.

If the RRM has the optional 213 millimeter (8.4 inch) electronic touchscreen display, the text message can then be replied to by depressing the Uconnect™ **VR** button and giving an **SMS** Voice Command to select from several predetermined short text phrase responses. If the RRM has the 127 millimeter (5 inch) display, it can receive and display SMS text messages, but it is not equipped to reply to text messages.

The Hands Free Phone system operates on battery current received through a fused B(+) circuit, but also monitors the ignition switch (also known as the Keyless Ignition Node/KIN or IGnition Node Module/IGNM) status through electronic messages received over the CAN-IHS data bus. If a call is in progress when the status of the ignition switch transitions to Off, the system will continue to operate until the call has been completed.

The RRM receives electronic message inputs over the CAN-IHS data bus related to the Hands Free Phone system. The RRM is also connected to the CAN-C data bus; however, the RRM is not a CAN gateway. All electronic message outputs of the RRM are carried over the CAN-IHS data bus. When the RRM monitors a problem in any of the audio system circuits and components, or in any of the Bluetooth™ transceiver circuits, it stores a fault code or Diagnostic Trouble Code (DTC) in its memory circuit.

The hard wired circuits between components related to the RRM and the Hands Free Phone system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the RRM or the electronic controls and communication between modules and other devices that provide some features of the Hands Free Phone system. The most reliable, efficient and accurate means to diagnose the RRM or the electronic controls and communication related to Hands Free Phone system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

NAVIGATION

The optional navigation system is active whenever the Radio Receiver Module (RRM) (also known as the radio or the head unit) electronic display is powered On. In vehicles equipped with a navigation system that allows activation after the vehicle has been delivered, all post delivery activations must be performed by the dealer.

If a navigation system menu or map isn't being actively displayed, the system is still operating in the background. The menu, map or route that was active when the RRM electronic display was powered Off along with all other user-relevant information is saved in nonvolatile memory by the navigation module for display again the next time the RRM electronic display is powered On and the navigation system is selected.

Once a destination is selected, the navigation system uses information from stored map data to quickly calculate a route. As the vehicle is driven along that route, the vehicle operator is guided with visual displays and voice prompts. Any variances from that route will cause the navigation system to automatically recalculate and

deliver a revised route to the chosen destination.

When Turn-By-Turn Navigation is enabled through the Personal Settings menu of the Electronic Vehicle Information Center (EVIC), the EVIC supplements the RRM display with a more focused turn-by-turn display which includes: the name of the approaching crossroad, an arrow indicating the upcoming turn direction and a countdown to indicate the distance to that turn.

All vehicles have their original map and Points-Of-Interest (POI) data stored in nonvolatile flash memory integral to the navigation module integral and internal to the RRM. Updated map and POI data as well as updated navigation software for these vehicles can be uploaded to the system using Universal Serial Bus (USB) media. The originally installed data is based upon the market for which the vehicle was manufactured. Navigation software updates are also uploaded to the system using USB media.

The Global Positioning System (GPS) receiver of the navigation module is capable of acquiring and tracking GPS signal inputs through the roof-mounted combination antenna from numerous satellites simultaneously to calculate and display the position and direction of the vehicle. However, when access to satellite signals is blocked by bridges, tunnels or other obstacles, the navigation module relies upon Dead Reckoning (DR) to aid in calculating vehicle position and direction. The navigation module uses pulse signals from the wheel speed sensors, a Reverse gear indicator input and an internal electronic gyroscope sensor to provide DR vehicle position and direction calculations to supplement GPS satellite signals.

User input mechanisms for the navigation system include the RRM touchscreen and the Uconnect™ Hands-Free Voice Recognition (VR) (also known as Voice Command) verbal commands. The VR function uses Advanced Speech Recognition (ASR) software. Master control of the VR function is handled by the VR engine internal and integral to the RRM. The VR recognizes and responds to certain global commands, while other commands are specific to the RRM or the navigation system.

For safety reasons some input, editing and setting features of the navigation system are restricted when the vehicle is in motion or when a hands-free phone call is active. This includes many features that require touchscreen inputs. However, many of those same features disabled for touchscreen inputs remain enabled for Uconnect™ Hands-Free VR inputs.

The navigation module receives electronic message inputs within the RRM over the Controller Area Network - Interior High Speed (CAN-IHS) data bus; however, the RRM is not a CAN gateway. All electronic message outputs of the navigation module and the RRM are carried over the CAN-IHS data bus. When the RRM monitors a problem in any of the audio system circuits and components, or in any of the navigation system antenna circuits, it stores a fault code or Diagnostic Trouble Code (DTC) in its memory circuit. The external combination antenna may be diagnosed separately from the RRM.

The hard wired circuits between components related to the RRM and the navigation system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the RRM or the electronic controls and communication between modules and other devices that provide some features of the

navigation system. The most reliable, efficient and accurate means to diagnose the RRM or the electronic controls and communication related to navigation system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

UCONNECT ACCESS

The two switch buttons on the inside rear view mirror identified with **ASSIST** and **9-1-1** labels in vehicles equipped with the optional Uconnect™ Access system provide active control of the one-touch 9-1-1 calling and roadside assistance calling features. The **ASSIST** button behavior is dependent upon the Uconnect™ Assist or Advantage subscription status. If either subscription is active, pressing the **ASSIST** allows the user to contact the Chrysler Customer Care Center, the Uconnect™ Customer Care Center for Uconnect™ Access related issues or the Roadside Assistance Call Center. If both subscriptions are inactive, only the Chrysler Customer Care Center or the Roadside Assistance Call Center may be contacted. The **9-1-1** button is enabled with or without a subscription. These switches provide a resistor multiplexed input to the Local Interface Network (LIN) slave node integral to the inside rear view mirror.

The LIN slave node sends an electronic **switch press** message to the LIN master node integral to the Body Control Module (BCM) (also known as the Common Body Controller/CBC). The BCM relays the message over the Controller Area Network - Interior High Speed (CAN-IHS) data bus, where it is retrieved by the Radio Receiver Module (RRM) (also known as the radio or the head unit). There is also an **ASSIST** soft button available in a menu of the RRM that provides a direct input to the Uconnect™ Access system.

The Light Emitting Diode (LED) indicator between the push buttons provides an indication of the status of the Uconnect™ Access embedded cellular device. Any fault indication is accompanied by a pop up screen in the RRM (also known as the radio or the head unit) electronic display. The following indications are provided whenever the status of the ignition switch is On or Accessory:

- **Solid Green** - No active call.
- **Flashing Green** - A call is active.
- **Solid Red** - A CAN, embedded cellular device or cellular antenna fault has been detected.
- **Off** - No power supply to the rear view mirror.

If a Bluetooth™ phone is Short Message Service (SMS) text message capable and compatible with the Uconnect™ Access system (see the Uconnect™ web site for a phone compatibility list), a Uconnect™ Advantage subscription provides an enhanced SMS text message free form dictation feature to compose a response when a text message is received. The call or SMS text message is relayed to the Bluetooth™ transceiver embedded within the RRM. The Bluetooth™ transceiver then instructs the RRM to announce the incoming call or message. The vehicle operator presses the Uconnect™ **Phone** button in the EVIC switch pod or the soft button that will appear in the RRM display to accept the message and dictate a response.

If the vehicle has had the optional Uconnect™ Mobile application (also known as app) downloaded, installed and enabled on their smart phone the Uconnect™ Advantage subscription can provide remote door locking and unlocking, remote starting and remote horn and lights features. In the Uconnect™ Access system the Mobile app on the smart phone calls the RRM in the vehicle, the RRM communicates through electronic messages over the Controller Area Network - C (CAN-C) data bus with the Radio Frequency Hub Module (RFHM) (also known as the RF Hub) and the RFHM communicates over the CAN-C bus with the Body Control Module

(BCM) (also known as the Common Body Controller/CBC) to achieve the requested remote features. While the RRM uses electronic message communication over the CAN-C data bus and the CAN - Interior High Speed (CAN-IHS) data bus, the RRM is not a CAN gateway.

The Uconnect™ Advantage subscription also enables hands-free mobile Bing™ local search and navigation capabilities.

The hard wired circuits between components related to the RRM and the Uconnect™ Access system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the RRM or the electronic controls and communication between modules and other devices that provide some features of the Uconnect™ Access system. The most reliable, efficient and accurate means to diagnose the RRM or the electronic controls and communication related to Uconnect™ Access system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

WI-FI HOT SPOT

Vehicles equipped with the optional Uconnect™ Access system are capable of becoming Wi-Fi hot spots with the Wi-Fi Hot Spot system. The Radio Receiver Module (RRM) (also known as the radio or the head unit) includes both an integral internal Wireless Local Area Network (WLAN) (also known as Wi-Fi) antenna and an embedded cellular connection. Along with a paid daily, weekly or monthly subscription service these features allow the vehicle to become a Wireless Access Point (WAP) for access to the Internet through Wi-Fi capable and enabled devices.

An Application Settings menu of the RRM allows the adjustment of the WAP password and security settings. The external combination antenna can be diagnosed and repaired separately from the RRM.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - HANDS-FREE PHONE

WARNING: **To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.**

The hard wired circuits between components related to the Radio Receiver Module (RRM) (also known as the radio or the head unit) and the Uconnect™ Hands-Free Phone system may be diagnosed using conventional

diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the RRM or the electronic controls and communication between modules and other devices that provide some features of the Uconnect™ Hands-Free Phone system. The most reliable, efficient and accurate means to diagnose the RRM or the electronic controls and communication related to Uconnect™ Hands-Free Phone system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

NOTE: **Validation and diagnosis of many of the conditions listed below will require access to both the paired Bluetooth™ device and the PIN required for that device.**

HANDS-FREE PHONE DIAGNOSIS		
CONDITION	**POSSIBLE CAUSES**	**CORRECTION**
PHONE NOT AVAILABLE	1. Bluetooth phone not paired to the RRM.	1. Be certain that the phone is Bluetooth compatible and is paired to the RRM.
	2. Bluetooth phone not present or turned Off.	2. Be certain that the paired phone is present, turned On and that the Bluetooth option is enabled in the phone.
	3. Bluetooth phone has low battery.	3. At low battery levels, some phones will turn Off Bluetooth functionality. Be certain that the phone battery is charged to an adequate level.
	4. The boot procedure for the RRM, the phone or both did not complete successfully.	4. Cycle both the RRM and the phone Off, then On again in an attempt to complete a successful boot procedure.
	5. A phone freeze has occurred.	5. Power cycle the phone. Refer to the operator's manual for the phone.
	1. The phone is not Bluetooth enabled.	1. The Bluetooth transceiver requires that the cellular phone be Bluetooth enabled. The phone must be upgraded to one that is Bluetooth enabled. A list of suggested phones is available at: **http://www.chrysler.com/uconnect**
	2. The phone does not support the Bluetooth Hands-Free Profile.	2. The Bluetooth transceiver requires that the cellular phone support the Hands-Free Profile. The phone must be upgraded to one that supports the Hands-Free Profile. A list of suggested phones is available at: **http://www.chrysler.com/uconnect**
	3. Incorrect discovered Bluetooth device selected in phone.	3. Be certain to select Uconnect in the discovered Bluetooth™ devices in the phone for pairing.
	4. The PIN of the phone is not the same as the PIN	4. The PIN assigned by the RRM during pairing

PHONE PAIRING FAILED	assigned by the RRM during pairing. 5. Phone pairing is locked (password protected). 6. The RRM has reached the maximum number of allowed devices paired. 7. The phone has reached the maximum number of allowed devices paired. 8. The boot procedure for the RRM, the phone or both did not complete successfully. 9. A phone freeze has occurred.	must match the PIN of the phone. 5. To unlock phone pairing in the phone, be certain that password protection is turned Off. 6. Remove one of the previously paired devices from the paired list of the RRM. 7. Remove one of the previously paired devices from the paired list of the phone, or delete the pairing history from the phone. Refer to the operator's manual for the phone. 8. Cycle both the RRM and the phone Off, then On again in an attempt to complete a successful boot procedure. 9. Perform a hard reset (power cycle) to the phone. Refer to the operator's manual for the phone.
PHONE WILL NOT RECONNECT AFTER PAIRING	1. Bluetooth settings in phone are incorrect. 2. Phone pairing is locked (password protected). 3. The boot procedure for the RRM, the phone or both did not complete successfully. 4. A phone freeze has occurred.	1. Bluetooth settings in phone should be set to auto-connect or select Uconnect™ as a trusted device in phone. 2. To unlock phone pairing in the phone, be certain that password protection is turned Off. 3. Cycle both the RRM and the phone Off, then On again in an attempt to complete a successful boot procedure. 4. Perform a hard reset (power cycle) to the phone. Refer to the operator's manual for the phone.
	1. User is not waiting for the **beep** tone acknowledgement before issuing Voice Commands. 2. User is not issuing Voice Commands in a smooth and consistent speaking voice. 3. User is not using proper Voice Command syntax. 4. High noise levels within the passenger	1. Be certain the user knows to wait for the acknowledgement **beep** tone prior to issuing Voice Commands. 2. Be certain the user is issuing Voice Commands in a normal, smooth and consistent speaking voice. The Advanced Speech Recognition (ASR) engine is designed to recognize normal speech patterns and at a normal tone. Some users tend to speak to a computer loud and slow, which results in reduced performance. 3. User must speak using proper Voice Command syntax. 4. ASR engine performance is increased when noise conditions in the passenger compartment are lowered. Ideal conditions include having the

	compartment.	windows closed and the blower fan set to Low or Off.
	5. Passengers are talking while the user is attempting to issue a Voice Command.	5. Although designed to focus on sounds from the driver's seated position, the directional microphones will pick up sounds from any seating position in the vehicle. ASR engine performance is increased in low noise environments.
POOR VOICE RECOGNITION	6. Foreign objects interfering with microphone input.	6. Verify that there are no foreign objects hanging from the inside rear view mirror that could be interfering with microphone reception.
	7. The inside rear view mirror is not properly attached to the mount.	7. The inside rear view mirror must be firmly mounted to the mounting location. Be certain the mirror is properly installed.
	8. The incorrect Uconnect switch button is being depressed.	8. Phone features are accessed using the Uconnect **Phone** button on the steering wheel or the **Phone** soft key in the RRM display. Other Uconnect Voice Command features are accessed using the Uconnect **VR** button or soft key.
	9. Microphone failure.	9. Use a diagnostic scan tool and the appropriate diagnostic procedures for further diagnosis of the microphone.
PHONE BOOK DOES NOT DOWNLOAD	1. Phone does not support the Phone Book Access Profile (PBAP).	1. The Uconnect system requires that the cellular phone support the PBAP profile. To enable the Uconnect phone book download feature, the phone must be upgraded to one that is PBAP enabled. A list of suggested phones is available at: **http://www.chrysler.com/uconnect**
	2. Phone book transfer not enabled in phone during pairing.	2. Be certain that phone book transfer is accepted or enabled in the phone during pairing to enable the Uconnect phone book download feature.
	3. Missing contacts from downloaded phone book.	3. Only contacts with a phone number are downloaded from phone and the number of contacts downloaded is limited to 1000.
	1. User is not waiting for the **beep** tone acknowledgement before issuing Voice Commands.	1. Be certain the user knows to wait for the acknowledgement **beep** tone prior to issuing Voice Commands.
	2. User is not issuing Voice Commands in a smooth and consistent speaking voice.	2. Be certain the user is issuing Voice Commands in a normal, smooth and consistent speaking voice. The Advanced Speech Recognition (ASR) engine is designed to recognize normal speech patterns and at a normal tone. Some users tend to speak to a computer loud and slow, which results in reduced performance.
	3. User is not using proper	3. User must speak using proper Voice Command

	Voice Command syntax.	syntax (i.e.: say **Call** - then name, or say **Dial** - then number).
	4. Phone book names too short.	4. For increased performance, it is recommended to use both first and last names for phone book entries. Example: **Daniel Johnson** as opposed to **Dan** .
	5. Name not spoken by user as it appears in the phone book.	5. Speak the full contact name as it appears in the phone book. Do not use nicknames.
	6. Multiple similar sounding names in the phone book.	6. For increased performance it is recommended that the user do not enter similar sounding names in the phone book.
	7. Phone book download not yet completed.	7. Depending upon the size of the contact list on the phone, the download may not have had time to complete. If the Phone Book button on the RRM phone screen appears grayed out, the contact list download is still in progress. Wait until download completes.
PHONE BOOK NAMES NOT RECOGNIZED CONSISTENTLY	8. High noise levels within the passenger compartment.	8. ASR engine performance is increased when noise conditions in the passenger compartment are lowered. Ideal conditions include having the windows closed and the blower fan set to Low or Off.
	9. Passengers are talking while the user is attempting to issue a Voice Command.	9. Although designed to focus on sounds from the driver's seated position, the directional microphones will pick up sounds from any seating position in the vehicle. ASR engine performance is increased in low noise environments.
	10. Foreign objects interfering with microphone input.	10. Verify that there are no foreign objects hanging from the inside rear view mirror that could be interfering with microphone reception.
	11. The inside rear view mirror is not properly attached to the mount.	11. The inside rear view mirror must be firmly mounted to the mounting location. Be certain the mirror is properly installed.
	12. The incorrect Uconnect switch button is being depressed.	12. Phone features are accessed using the Uconnect **Phone** button on the steering wheel or the **Phone** soft key in the RRM display. Other Uconnect Voice Command features are accessed using the Uconnect **VR** button or soft key.
	13. Microphone failure.	13. Use a diagnostic scan tool and the appropriate diagnostic procedures for further diagnosis of the microphone.
	1. High noise levels within the passenger	1. ASR engine performance is increased when noise conditions in the passenger compartment are lowered. Ideal conditions include having the

POOR PHONE AUDIO QUALITY	compartment. 2. Passengers are talking while the user is attempting to issue a Voice Command. 3. Foreign objects interfering with microphone input. 4. The inside rear view mirror is not properly attached to the mount. 5. Microphone failure.	windows closed and the blower fan set to Low or Off. 2. Although designed to focus on sounds from the driver's seated position, the directional microphones will pick up sounds from any seating position in the vehicle. ASR engine performance is increased in low noise environments. 3. Verify that there are no foreign objects hanging from the inside rear view mirror that could be interfering with microphone reception. 4. The inside rear view mirror must be firmly mounted to the mounting location. Be certain the mirror is properly installed. 5. Use a diagnostic scan tool and the appropriate diagnostic procedures for further diagnosis of the microphone.
NO PHONE AUDIO	1. The settings in the phone cause the phone audio to be routed to a handset.	1. Route the phone audio to the hands-free device.
CALL LOG INOPERATIVE OR INACCURATE	1. Call log not supported by phone. 2. The phone is not providing accurate call log data.	1. The Uconnect system requires that the cellular phone support the call log feature. To enable the Uconnect call log feature, the phone must be upgraded to one that is call log enabled. A list of suggested phones is available at: **http://www.chrysler.com/uconnect** 2. Refer to the operator's manual for the phone.
AUDIO OUTPUT TOO LOW	1. Volume setting on the Bluetooth device set too low. 2. Volume setting on the RRM set too low.	1. Set the volume of the phone or other Bluetooth device to about three quarters (3/4) of full or maximum volume. 2. Set the volume of the RRM to the desired level during an active Uconnect Hands-Free Phone call session.

DIAGNOSIS AND TESTING - NAVIGATION

WARNING: **To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper**

precautions could result in accidental airbag deployment.

The hard wired circuits between components related to the Radio Receiver Module (RRM) (also known as the radio or the head unit) and the Uconnect™ Navigation system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the RRM or the electronic controls and communication between modules and other devices that provide some features of the Uconnect™ Navigation system. The most reliable, efficient and accurate means to diagnose the RRM or the electronic controls and communication related to Uconnect™ Navigation system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

DIAGNOSIS AND TESTING - UCONNECT ACCESS

WARNING: **To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.**

The hard wired circuits between components related to the Radio Receiver Module (RRM) (also known as the radio or the head unit) and the Uconnect™ Access system may be diagnosed using conventional diagnostic tools and procedures. NOTE: **Validation and diagnosis of many of the conditions listed below will require access to both the paired Bluetooth™ device and the PIN required for that device.**

UCONNECT ACCESS DIAGNOSIS		
CONDITION	POSSIBLE CAUSES	CORRECTION
	1. User is not waiting for the **beep** tone	1. Be certain the user knows to wait for the acknowledgement **beep** tone prior to issuing

POOR VOICE RECOGNITION	acknowledgement before issuing Voice Commands.	Voice Commands.
	2. User is not issuing Voice Commands in a smooth and consistent speaking voice.	2. Be certain the user is issuing Voice Commands in a normal, smooth and consistent speaking voice. The Advanced Speech Recognition (ASR) engine is designed to recognize normal speech patterns and at a normal tone. Some users tend to speak to a computer loud and slow, which results in reduced performance.
	3. User is not using proper Voice Command syntax.	3. User must speak using proper Voice Command syntax.
	4. High noise levels within the passenger compartment.	4. ASR engine performance is increased when noise conditions in the passenger compartment are lowered. Ideal conditions include having the windows closed and the blower fan set to Low or Off.
	5. Passengers are talking while the user is attempting to issue a Voice Command.	5. Although designed to focus on sounds from the driver's seated position, the directional microphones will pick up sounds from any seating position in the vehicle. ASR engine performance is increased in low noise environments.
	6. Foreign objects interfering with microphone input.	6. Verify that there are no foreign objects hanging from the inside rear view mirror that could be interfering with microphone reception.
	7. The inside rear view mirror is not properly attached to the mount.	7. The inside rear view mirror must be firmly mounted to the mounting location. Be certain the mirror is properly installed.
	8. The incorrect Uconnect switch button is being depressed.	8. Phone features are accessed using the Uconnect **Phone** button on the steering wheel or the **Phone** soft key in the RRM (also known as the radio or head unit) display. Other Uconnect Voice Command features are accessed using the Uconnect **VR** button or soft key.
	9. Microphone failure.	9. Use a diagnostic scan tool and the appropriate diagnostic procedures for further diagnosis of the microphone.
TEXT MESSAGING INOPERATIVE	1. The Bluetooth Message Access Profile (MAP) is not supported by the phone.	1. The Uconnect system requires that the cellular phone support the Bluetooth MAP for the text messaging feature. To enable the Uconnect text messaging feature, the phone must be upgraded to one that supports Bluetooth MAP. A list of suggested phones is available at: **http://www.chrysler.com/uconnect**
	2. The Connect-To-Your-Messages setting has not	2. Accept the Connect-To-Your-Messages setting on the phone. Refer to the operator's manual for

	been accepted on the phone.	the phone.
ENHANCED VOICE-TO-TEXT (DICTATED) MESSAGING RESPONSE FEATURE INOPERATIVE	1. Uconnect registration incomplete. 2. Uconnect Access Advantage subscription service is inactive or not installed in the RRM (also known as the radio or head unit). 3. The Bluetooth Message Access Profile (MAP) is not supported by the phone. 4. The Connect-To-Your-Messages setting has not been accepted on the phone.	1. Select the **Apps** soft key in the RRM (also known as the radio or head unit) display, then select the **Uconnect Registration App** soft key from the **Apps** list. For further assistance press the **ASSIST** button on the inside rear view mirror to contact Uconnect Customer Care. 2. This feature is only available with the Uconnect Access Advantage subscription service. Be certain that the subscription service account is active and installed in the RRM (also known as the radio or head unit). 3. The Uconnect system requires that the cellular phone support the Bluetooth MAP for the text messaging feature. To enable the Uconnect text messaging feature, the phone must be upgraded to one that supports Bluetooth MAP. A list of suggested phones is available at: **http://www.chrysler.com/uconnect** 4. Accept the Connect-To-Your-Messages setting on the phone. Refer to the operator's manual for the phone.
UNABLE TO DOWNLOAD APPLICATIONS FROM UCONNECT STORE FRONT	1. Uconnect registration incomplete. 2. Cellular antenna issue.	1. Select the **Apps** soft key in the RRM (also known as the radio or head unit) display, then select the **Uconnect Registration App** soft key from the **Apps** list. For further assistance press the **ASSIST** button on the inside rear view mirror to contact Uconnect Customer Care. 2. Refer to the Audio And Video System service information for further diagnosis of the cellular (combination) antenna.
	1. Uconnect registration incomplete. 2. Uconnect Access Mobile application (app) not downloaded or not fully installed to smart	1. Select the **Apps** soft key in the RRM (also known as the radio or head unit) display, then select the **Uconnect Registration App** soft key from the **Apps** list. For further assistance press the **ASSIST** button on the inside rear view mirror to contact Uconnect Customer Care. 2. Download the Uconnect Access Mobile app to the user's smart phone from **www.MoparOwnerConnect.com** . Allow sufficient time for the Uconnect Access Mobile application (app) download to smart phone to complete. Download times will vary widely with

REMOTE SERVICES INOPERATIVE	phone. 3. Uconnect Access Advantage subscription service is inactive or not installed in the RRM (also known as the radio or head unit). 4. Cellular antenna issue. 5. Radio Frequency Hub Module (RFHM) issue.	the throughput performance of the user's smart phone and the accessibility of the user's cellular network services. 3. This feature is only available with the Uconnect Access Advantage subscription service. Be certain that the subscription service account is active and installed in the RRM (also known as the radio or head unit). 4. Refer to the Audio And Video System service information for further diagnosis of the cellular (combination) antenna. 5. Further diagnosis of the RFHM requires the use of a diagnostic scan tool and the appropriate diagnostic procedures.
AUDIO OUTPUT TOO LOW	1. Volume setting on Bluetooth device set too low. 2. Volume setting on the RRM (also known as the radio or head unit) set too low.	1. Set the volume of the phone or other Bluetooth device to about three quarters (3/4) of full or maximum volume. 2. Set the volume of the RRM (also known as the radio or head unit) to the desired level during an active Uconnect Access feature session.
UCONNECT ACCESS INOPERATIVE - NO GREEN OR RED LED INDICATOR	1. Status of ignition switch is Off. 2. Inside rear view mirror wiring not connected. 3. Ineffective ground circuit. 4. Ineffective feed circuit.	1. Ignition switch status must be On or Accessory during Uconnect Access operation. 2. Be certain the wire harness for the inside rear view mirror is connected and fully engaged. 3. Test and repair the open inside rear view mirror ground circuit if required. 4. Test and repair the open inside rear view mirror feed circuit if required.
UCONNECT ACCESS INOPERATIVE - GREEN LED INDICATOR	1. Uconnect registration incomplete. 2. Uconnect Access Assist or Advantage subscription service is inactive or not installed in the RRM (also known as the radio or head unit). 3. Uconnect Access application (app) corrupt or improperly installed.	1. Select the **Apps** soft key in the RRM (also known as the radio or head unit) display, then select the **Uconnect Registration App** soft key from the **Apps** list. For further assistance press the **ASSIST** button on the inside rear view mirror to contact Uconnect Customer Care. 2. Many Uconnect Access features are only available with the Uconnect Access Assist or Advantage subscription service. Be certain that the subscription service account is active and installed in the RRM (also known as the radio or head unit). 3. Perform the Uconnect Access System Reinstall Applications Standard Procedure. Refer to **STANDARD PROCEDURE**.
	1. Loss of Controller Area	1. Further diagnosis of CAN-IHS or CAN-C

UCONNECT ACCESS INOPERATIVE - RED LED INDICATOR	Network (CAN) - Interior High Speed (IHS) or CAN-C communication. 2. Cellular antenna issue. 3. Ineffective embedded cellular device.	communication requires the use of a diagnostic scan tool and the appropriate diagnostic procedures. 2. Refer to the Audio And Video System service information for further diagnosis of the cellular (combination) antenna. 3. Test and replace the RRM (also known as the radio or head unit) if required.

DIAGNOSIS AND TESTING - WI-FI HOT SPOT

WARNING: **To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.**

The hard wired circuits between components related to the Radio Receiver Module (RRM) (also known as the radio or the head unit) and the Uconnect™ Wi-Fi Hot Spot system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the RRM or the electronic controls and communication between modules and other devices that provide some features of the Uconnect™ Wi-Fi Hot Spot system. The most reliable, efficient and accurate means to diagnose the RRM or the electronic controls and communication related to Uconnect™ Wi-Fi Hot Spot system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

NOTE: **Validation and diagnosis of many of the conditions listed below will require access to both the paired Bluetooth™ device and the PIN required for that device.**

WI-FI HOT SPOT DIAGNOSIS		
CONDITION	**POSSIBLE CAUSES**	**CORRECTION**
	1. Uconnect registration incomplete. 2. Uconnect Wi-Fi	1. Select the **Apps** soft key in the RRM display, then select the **Uconnect Registration App** soft key from the **Apps** list. For further assistance press the **ASSIST** button on the inside rear view mirror to contact Uconnect Customer Care. 2. This feature is only available with the

WI-FI HOT SPOT INOPERATIVE	subscription service is inactive, expired or not installed in the RRM. 3. Wi-Fi capability is not enabled in user's Bluetooth device. 4. Selected Wireless Access Point (WAP) is incorrect. 5. Wireless Access Point (WAP) password or security settings incorrect. 6. Cellular antenna issue.	Uconnect Wi-Fi subscription service. Be certain that the subscription service account is active and installed in the RRM. 3. Confirm Wi-Fi setting in user's Bluetooth device is enabled. Refer to the user's manual for that device. 4. Confirm that correct WAP is selected in user's Bluetooth device. Refer to the user's manual for that device. 5. Use the Application Settings menu of the RRM to confirm or adjust the WAP password and security settings. 6. Refer to the Audio And Video System service information for further diagnosis of the cellular antenna.

STANDARD PROCEDURE

NAVIGATION SYSTEM - ACTIVATION

In vehicles equipped with the optional Navigation Ready version of the Radio Receiver Module (RRM) (also known as the radio or the head unit), if the customer chooses to have the navigation system activated, the vehicle must be returned to the dealer for system activation. The dealer activates the navigation system as follows:

NOTE: Once a Radio Receiver Module (RRM) (also known as the radio or the head unit) with the Navigation Ready feature has had the Navigation feature activated, any factory replacement RRM for the same vehicle will be provided with the Navigation system already activated.

1. Place the RRM into Dealer Mode using a simultaneous 3 button press of the driver side Temperature Up, driver side Temperature Down and Front Defrost push buttons.
2. The Dealer Mode screen will appear in the RRM display showing the System Information menu. Select the **VP3 Navigation Activation** menu item.
3. A Navigation Activation screen appears advising that an Activation Code needs to be purchased and referencing Technical Service Bulletin (TSB) 08-031-12. A 16 digit alpha numeric Request Code appears just below the displayed text.
4. With the Request Code and the Vehicle Identification Number (VIN), log onto the DealerConnect web site (**https://dealerconnect.chrysler.com/**). Locate the Navigation Activation link on the web site, enter the Request Code and VIN as appropriate. The web site will respond with an alpha numeric Activation Code.

NOTE: During the initial launch of this product, the dealer will be provided with a Navigation Activation phone number (Nokia Location And Content Call Center) to use in order to obtain an Activation Code rather than the

DealerConnect link mentioned in Step 4.

5. With the Activation Code, go back to the RRM and press the **OK** button on the Navigation Activation screen. A Data Entry screen will appear. Enter the Activation Code, then press the **OK** button on the Data Entry screen.
6. The navigation system has now been activated using the hardware and software that was installed in the RRM at the time that it was manufactured. If the customer wishes to update the factory installed map and Points-Of-Interest (POI) software, it may be purchased at the customer's expense and downloaded from the Navteq Maps web site (**www.navigation.com**). See Navigation System - Restore Or Update. Refer to **STANDARD PROCEDURE**.

NAVIGATION SYSTEM - RESTORE OR UPDATE

Navigation System map and Point-Of-Interest (POI) data updates may become available occasionally through the Navteq Maps web site (www.navigation.com). The updated information as well as some additional feature applications can be downloaded and copied to Universal Serial Bus (USB) media for transfer and installation to the navigation module within the Radio Receiver Module (RRM) (also known as the radio or the head unit) in the vehicle. These are fee-based applications and updates, which are made at the option and expense of the customer.

However, a new RRM is equipped with only a standard base version of the map and POI data. Before an original RRM is replaced by the dealer with a new unit, the version of the map and POI data on the original RRM must be noted. If the version of the map and POI data found on the new RRM is not equal to or newer than the version that was found on the replaced RRM, updated data will have to be downloaded and installed to the new RRM at the expense of the dealer.

UCONNECT ACCESS SYSTEM - REINSTALL APPLICATIONS

NOTE: The following procedure may assist the dealer technician in diagnosis by reloading the applications for which the vehicle owner or operator has valid subscriptions. This is primarily used to troubleshoot any application provisioning or data corruption issues. The reinstallation process may take up to 30 minutes, depending upon the number of apps and the cellular signal strength seen on the Apps orb of the Radio Receiver Module (RRM).

The Reinstall Applications procedure can only be initiated from the touchscreen of the Radio Receiver Module (RRM) (also known as the radio or the head unit).

During this procedure, the subscribed applications are removed from the RRM and reinstalled based upon data found on the cloud server. The applications reinstalled onto the RRM will be based upon valid subscriptions and is referred to as Digital Rights.

1. Navigate through the **Apps > Uconnect Store > My Apps > Settings** on the RRM touchscreen.
2. Select **Reinstall Apps** .
3. Press the **Continue** soft key to initiate the Reinstall Applications procedure, or press the **Help** soft key for

more information.

4. When the **Apps reinstalled. Radio will restart shortly.** screen appears, press the **OK** soft key.
5. Once the request is processed, a screen will appear alerting the customer with the message, **Important: Application Data Reset Initiated. After Radio Resets, all application data will be lost. Please Wait.** After the radio reset occurs, the apps will begin to be reinstalled. The reinstallation process may take up to 30 minutes, depending upon the number of apps and the cellular signal strength seen on the Apps orb of the RRM.

NOTE: One or two ignition cycles (including bus time-outs) may speed the reloading process following the radio reset.

UCONNECT ACCESS SYSTEM - REMOVE ACCOUNTS

NOTE: The following procedure is provided to the dealer technician as INFORMATION ONLY. This procedure is intended for use by the vehicle owner or operator. This procedure is used when selling the vehicle or cancelling the Uconnect Access account. Removing the account will disassociate the Vehicle Identification Number (VIN) from the account and remove Uconnect Access features from the vehicle. The Uconnect Access features can be reinstated by repeating the registration process through the Radio Receiver Module (RRM) (also known as the radio or the head unit) and following the directions associated with registering for Uconnect Access.

The Remove Accounts procedure can be initiated by one of three methods:

- Through the touchscreen of the RRM.
- Through the Uconnect™ Call Center (**ASSIST** button on inside rear view mirror) or under **Uconnect™ Apps** selection of the RRM display.
- Through the Uconnect™ Owners information accessed through the Mopar Owner Connect web site (www.moparownerconnect.com).

The following describes the Remove Accounts procedure accomplished through the RRM touchscreen:

1. Navigate through **Apps > Uconnect Store > My Apps > Settings** on the RRM touchscreen.
2. Select **Remove Uconnect Account** .
3. Press the **Continue** soft key after each of the two **Warning** screens, or press the **Cancel** soft key to abort the procedure.
4. When the **Authentication** screen is reached, enter the 4 digit **Uconnect Access ID** .
5. Press the **Continue** soft key to continue the Remove Accounts procedure, the **Help** soft key for additional information or the **Cancel** soft key to abort the Remove Accounts procedure.
6. When the **This vehicle has been removed from your account.** screen appears, press the **OK** soft key. Once the request is processed, a screen will appear alerting the customer with the message, **Important: Application Data Reset Initiated. After Radio Resets, all application data will be lost. Please Wait.**
7. After the radio reset occurs, Uconnect Access applications will no longer be available and the **Uconnect**

Registration screen will appear each time the **Apps** soft key is selected until a new valid registration has been successfully completed.

ANTENNA, NAVIGATION

DESCRIPTION

DESCRIPTION

The navigation antenna is integrated into a roof-mounted combination antenna that also receives satellite audio and cellular signals. Refer to **ANTENNA, SATELLITE, AUDIO, DESCRIPTION** .

OPERATION

OPERATION

The navigation module acquires Global Positioning System (GPS) position data through a roof-mounted combination antenna that also receives satellite audio and cellular signals. Refer to **ANTENNA, SATELLITE, AUDIO, DESCRIPTION** .

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - NAVIGATION ANTENNA

Refer to **DIAGNOSIS AND TESTING** .

REMOVAL

REMOVAL

The navigation antenna is serviced as a unit with the combination antenna located on the roof panel. Refer to **ANTENNA, SATELLITE, AUDIO, REMOVAL** .

INSTALLATION

INSTALLATION

The navigation antenna is serviced as a unit with the combination antenna located on the roof panel. Refer to **ANTENNA, SATELLITE, AUDIO, INSTALLATION** .

DESCRIPTION

DESCRIPTION

Fig. 1: Inside Rear View Mirror Housing
Courtesy of CHRYSLER GROUP, LLC

Vehicles equipped with the optional hands-free system have two stereo microphones (2) mounted in the top surface of the inside rear view mirror housing (1), one to each side of center. The two microphones are individually powered by and provide hard wired inputs to the Radio Receiver Module (RRM) (also known as the radio or the head unit) in the instrument panel whenever the Voice Recognition (VR) feature of the hands-free system is active. These two microphones are connected to the vehicle electrical system through a connector receptacle integral to the forward-facing surface of the inside rear view mirror housing by a dedicated take out and connector of the overhead wire harness.

In vehicles equipped with the optional Uconnect™ Access system, the inside rear view mirror system also houses both a **9-1-1** push button (3) and a **Assist** push button (5).

The microphones cannot be adjusted or repaired and, if damaged or ineffective, they must be replaced as a unit with the inside rear view mirror assembly.

OPERATION

OPERATION

When the hands-free Voice Recognition (VR) control circuitry integral and internal to the Radio Receiver Module (RRM) (also known as the radio or the head unit) detects the appropriate inputs or requests, it energizes the circuitry of the two stereo microphones within the inside rear view mirror housing. The microphones remain active until they are deactivated by the hands-free VR control circuitry, or until the status of the ignition switch (also known as the Keyless Ignition Node/KIN or IGnition Node Module/IGNM) transitions to Off, whichever occurs first.

The inputs from the microphones is processed, filtered and redirected by the VR control circuitry and logic as appropriate. Those inputs can be redirected to the Advanced Speech Recognition (ASR) engine or to the audio send circuitry of the Bluetooth™ transceiver. Each of these electronic modules is also integral and internal to the RRM.

The status of the Uconnect™ Access **Assist** and **9-1-1** push buttons is relayed by the Local Interface Network (LIN) slave node integral to the inside rear view mirror over the LIN data bus to the Body Control Module (BCM) (also known as the Common Body Controller/CBC), which is a LIN master node. The BCM is also a Controller Area Network (CAN) data bus gateway and relays the push button status information to the RRM over the CAN - Interior High Speed (CAN-IHS) data bus.

The hard wired inputs and outputs of the microphones in the inside rear view mirror may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the microphone or the electronic controls and communication between modules and other devices that provide some features of the RRM controlled microphones. The most reliable, efficient and accurate means to diagnose the RRM or the electronic controls and communication related to RRM-controlled microphone operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - MICROPHONE

WARNING: **To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.**

The hard wired inputs and outputs of the microphones in the inside rear view mirror may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the microphone or the electronic controls and communication between modules and other devices that provide some features of the Radio Receiver Module (RRM) (also known as the radio or the head unit) controlled microphones. The most reliable, efficient and accurate means to diagnose the RRM or the electronic controls and communication related to RRM-controlled microphone operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

REMOVAL

The inside rear view mirror mounted microphones used in this vehicle are integral to and serviced only as a unit with the inside rear view mirror. Refer to **MIRROR, REARVIEW, REMOVAL** .

INSTALLATION

INSTALLATION

The inside rear view mirror mounted microphones used in this vehicle are integral to and serviced only as a unit with the inside rear view mirror. Refer to **MIRROR, REARVIEW, INSTALLATION** .

2014 ACCESSORIES AND EQUIPMENT

Occupant Classification Module (OCM) - Electrical Diagnostics - Cherokee

DIAGNOSTIC CODE INDEX

DIAGNOSTIC CODE INDEX

DTC	Description
B1B9D-00	PASSENGER BLADDER FLUID LEVEL LOW
B1BA8-00	OCM SYSTEM OUT OF CALIBRATION/NOT CALIBRATED
B210A-00	SYSTEM VOLTAGE LOW
B210B-00	SYSTEM VOLTAGE HIGH
B2206-00	CURRENT VIN MISSING-MISMATCH
B2212-00	OCCUPANT CLASSIFICATION MODULE -INTERNAL
B222D-00	ECU UNABLE TO CONFIGURE/CONFIGURATION NOT LEARNED
B222A-00	VEHICLE LINE MISMATCH
U0002-00	CAN-C-BUS-OFF-PERFORMANCE
U0140-00	LOST COMMUNICATION WITH BODY CONTROL MODULE

DIAGNOSIS AND TESTING

B1B9D-00-PASSENGER BLADDER FLUID LEVEL LOW

THEORY OF OPERATION

The OCM monitors the bladder fluid pressure to determine the occupied or empty state of the passenger seat and verify the operational status of the bladder. To determine the operational status of the bladder the OCM monitors the bladder fluid pressure and temperature. The bladder fluid pressure and temperature are analog measurements and converted to digital counts.

WHEN MONITORED

Monitored continuous when the ignition is on and temperature is above 32 F.

SET CONDITION

This DTC will set if the Occupant Classification Module (OCM) detects raw pressure less than 28 counts for more than 60 seconds with temperature above 32F.

POSSIBLE CAUSES

Possible Causes
OCCUPANT CLASSIFICATION MODULE (OCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

Replace the Occupant Classification Module (OCM)

1. Make sure the battery is fully charged.
2. Perform the OCCUPANT CLASSIFICATION MODULE (OCM) VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
3. With the scan tool, read the OCM DTC's.

   Did the scan tool display active or stored B1B9D-00-PASSENGER BLADDER FLUID LEVEL LOW DTC?

   Yes

   - Replace the OCCUPANT CLASSIFICATION MODULE (OCM)
   - Perform the OCCUPANT CLASSIFICATION MODULE (OCM) VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Perform the OCCUPANT CLASSIFICATION MODULE (OCM) VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

B1BA8-00-OCM SYSTEM OUT OF CALIBRATION/NOT CALIBRATED

THEORY OF OPERATION

The Occupant Classification Module (OCM), seat cushion and bladder are calibrated as one unit in the assembly plant. The OCM will automatically re-calibrate the assembly from time to time to retain the calibrated relationship between the seat, bladder and module as the seat and bladder change due to age and wear. The re-zero Occupant Classification Module Test uses a scan tool process called the Occupant Classification System Verification Test to force the OCM to re-calibrate or re-zero. To ensure the up to date calibration and functional performance the scan tool Occupant Classification System Verification Test is performed during and after servicing the system.

WHEN MONITORED

While the CAN bus ignition status is IGN_RUN or signal not available.

SET CONDITION

This DTC will set if the OCM or the scan tool initiated re-zero failed, the system verification routine was aborted or a update option table from the flash routine was incomplete or missing.

POSSIBLE CAUSES

Possible Causes
OCCUPANT CLASSIFICATION MODULE (OCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

VERIFY ACTIVE DTC

NOTE: **Make sure the battery is fully charged.**

NOTE: **Follow the ignition off warning, due to any special tools or body harness connectors that may need to be reconnected reintroducing voltage to a wire harness and component area.**

WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

1. Remove any special tools or jumper wires and reconnect all previously disconnected components - except the battery.
2. Make sure the passenger seat is empty.
3. If equipped with the standard key ignition, use this ignition on warning.

WARNING: **Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

4. If equipped with the keyless ignition, use this ignition on warning.

WARNING: **Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

NOTE: **Failure to follow the test instructions or aborting the test causes faults to set when performing the Scan tool Occupant Classification Module System Verification Test. To prevent faults due to process errors: verify that all tests steps that led you here were performed as directed, verify**

that the ignition is in run position. Only press scan tool buttons when directed to do so and perform the scan tool Occupant Classification Module System Verification Test to completion.

5. With the scan tool in OCM, select the Miscellaneous Functions tab on the scan tool, select Empty Seat Value Relearn. Run the test by following the instructions displayed on the scan tool. When the test completes, wait two minutes and then proceed as follows.
6. With the scan tool, read active DTCs.

   Does the scan tool display active or stored B1BA8-00-OCM SYSTEM OUT OF CALIBRATION/NOT CALIBRATED active DTCs?

   Yes

   - Replace the OCCUPANT CLASSIFICATION MODULE (OCM)
   - Perform the OCCUPANT CLASSIFICATION MODULE (OCM) VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - OCM re-zero procedure complete. Perform the Standard Procedure OCCUPANT CLASSIFICATION MODULE (OCM) VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

B210A-00-SYSTEM VOLTAGE LOW

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 1: Battery Voltage Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

When powered, the Occupant Classification Module (OCM) on board diagnostics monitors the CAN Bus messages from the Body Control Module (BCM) to determine the minimum and maximum system voltage.

WHEN MONITORED

With the ignition on. The Occupant Classification Module (OCM) on board diagnostics continuously monitors the CAN Bus messages.

SET CONDITION

The code will set when the Occupant Classification Module (OCM) receives the Body Control Module (BCM) Can Bus message containing the system voltage below 10.0 volts.

Refer to the **BODY CONTROL MODULE (BCM) - DIAGNOSTIC CODE INDEX** article and perform **B2199-16-BATTERY VOLTAGE-CIRCUIT VOLTAGE BELOW THRESHOLD** diagnostic procedure.

B210B-00-SYSTEM VOLTAGE HIGH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 2: Battery Voltage Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

When powered, the Occupant Classification Module (OCM) on board diagnostics monitors the CAN Bus messages from the Body Control Module (BCM) to determine the minimum and maximum system voltage.

WHEN MONITORED

With the ignition on. The Occupant Classification Module (OCM) on board diagnostics continuously monitors the CAN Bus messages.

SET CONDITION

The code will set when the Occupant Classification Module (OCM) receives the Body Control Module (BCM) Can Bus message containing the system voltage above 16.0 volts.

Refer to the **BODY CONTROL MODULE (BCM) - DIAGNOSTIC CODE INDEX** article and perform the **B2199-17-BATTERY VOLTAGE-CIRCUIT VOLTAGE ABOVE THRESHOLD** diagnostic procedure.

B2206-00-CURRENT VIN MISSING-MISMATCH

Fig. 3: Battery Voltage Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

Ignition on.

SET CONDITION

The VIN received via CAN message does not match the VIN stored in the TCM.

POSSIBLE CAUSES

Possible Causes
TRANSMISSION CONTROL MODULE (TCM) IS NOT PROGRAMMED PROPERLY TRANSMISSION CONTROL MODULE (TCM) INSTALLED FROM ANOTHER VEHICLE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

Replace the Occupant Classification Module (OCM)

1. Make sure the battery is fully charged.
2. Turn the ignition off, wait ten seconds and turn ignition on.
3. With the scan tool, read the OCM DTC.

   Did the scan tool display active or stored B2206-00-CURRENT VIN MISSING-MISMATCH DTC?

   Yes

   - Replace the OCCUPANT CLASSIFICATION MODULE (OCM)

     .

   - Perform the OCCUPANT CLASSIFICATION MODULE (OCM) VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Perform the OCCUPANT CLASSIFICATION MODULE (OCM) VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

B2212-00-OCCUPANT CLASSIFICATION MODULE -INTERNAL

WHEN MONITORED

While the IGN status is in the RUN position or the signal is not available, while the CAN bus system voltage is between 10 and 16 volts.

SET CONDITION

This DTC will set if the Occupant Classification Module (OCM) detects an internal failure.

POSSIBLE CAUSES

Possible Causes

OCCUPANT CLASSIFICATION MODULE (OCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

Replace the Occupant Classification Module (OCM)

1. Make sure the battery is fully charged.
2. Turn the ignition off, wait ten seconds and turn ignition on.
3. With the scan tool, read the OCM DTC.

   Did the scan tool display active or stored B2212-00-OCCUPANT CLASSIFICATION MODULE INTERNAL DTC?

   Yes

   - Replace the OCCUPANT CLASSIFICATION MODULE (OCM)

     .

   - Perform the OCCUPANT CLASSIFICATION MODULE (OCM) VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Perform the OCCUPANT CLASSIFICATION MODULE (OCM) VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

B222D-00-ECU UNABLE TO CONFIGURE/CONFIGURATION NOT LEARNED

WHEN MONITORED

At ignition on the Occupant Classification Module verifies the configuration parameters.

SET CONDITION

This DTC will set if the OCM configuration parameters do not match expected values.

POSSIBLE CAUSES

Possible Causes
PROXI OCM OCCUPANT CLASSIFICATION MODULE (OCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

   Does the scan tool display active B222D-00-ECU UNABLE TO CONFIGURE/CONFIGURATION NOT LEARNED DTC?

   OCM - ACTIVE DTC

   WARNING: **If the Occupant Classification Module (OCM) is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and may result in possible serious or fatal injury.**

   WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

   - Using scan tool PROXI OCM, clear code and retest. If code is still active, replace the OCM in accordance with Service Information. Refer to **MODULE, OCCUPANT CLASSIFICATION, REMOVAL** .
   - Perform the OCCUPANT CLASSIFICATION MODULE (OCM) VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   OCM - STORED DTC

   - Go To 2

2. **STORED OCM DTC**
   1. With the scan tool, record and erase all OCM DTC's.
   2. If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

      WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

   3. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
   4. Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.
   5. The following additional checks may assist you in identifying a possible intermittent problem.
   6. Reconnect any disconnected components and harness connector.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

7. With the scan tool monitor active codes as you work through the following steps.

WARNING: Maintain a safe distance from all airbags while performing the following steps. Failure to follow these instructions may result in possible serious or fatal injury.

8. Wiggle the wiring harness and connectors of the related OCM circuits or component.
9. If only stored codes return continue the test until the problem area has been isolated.
10. In the previous steps you have attempted to recreate the conditions responsible for setting active DTC in question.

    Are any ACTIVE DTC's present?

    Yes

    - Select the appropriate diagnostic procedure in this service information. Refer to the **DIAGNOSTIC CODE INDEX**.

    No

    - No problem found at this time. Erase all codes before returning vehicle to customer.

B222A-00-VEHICLE LINE MISMATCH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article**

Fig. 4: Battery Voltage Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

During power-up, the Occupant Classification Module (OCM) monitors the CAN bus for the VIN message. The bus message must match the OCM vehicle line configuration stored in the OCM.

WHEN MONITORED

During power-up.

SET CONDITION

This DTC will set if the Vehicle Line information received from the Body Control Module (BCM) is different from the Occupant Classification Module (OCM) stored Vehicle Line Information.

POSSIBLE CAUSES

Possible Causes
INCORRECT VIN PROGRAMMED INTO THE BCM OCCUPANT CLASSIFICATION MODULE (OCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**
    1. Make sure the battery is fully charged.
    2. Turn the ignition on.
    3. Wait 12 seconds, then with the scan tool, read all active OCM DTCs.

    Is the DIAGNOSTIC TROUBLE CODE (DTC) active or stored?

    OCM - ACTIVE DTC

    - Go To 2

    OCM - STORED DTC

    - Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE**.
2. **CHECK BCM VEHICLE INFORMATION**
    1. Using the scan tool, check for the correct Country Code, Vehicle Line, and Body Style.

    Does the Vehicle Configuration in the BCM match the Vehicle Configuration in the OCM?

    Repair

    WARNING: **If the Occupant Classification Module (OCM) is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and may result in possible serious or fatal injury.**

    WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait**

two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

- Replace the OCM in accordance with Service Information. Refer to **MODULE, OCCUPANT CLASSIFICATION, REMOVAL** .
- Perform the OCCUPANT CLASSIFICATION MODULE (OCM) VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 3

3. **STORED OCM DTC**
   1. With the scan tool, record and erase all OCM DTC's.
   2. If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

      WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

   3. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
   4. Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.
   5. The following additional checks may assist you in identifying a possible intermittent problem.
   6. Reconnect any disconnected components and harness connector.

      WARNING: **Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

   7. With the scan tool monitor active codes as you work through the following steps.

      WARNING: **Maintain a safe distance from all airbags while performing the following steps. Failure to follow these instructions may result in possible serious or fatal injury.**

   8. Wiggle the wiring harness and connectors of the related OCM circuits or component.
   9. If only stored codes return continue the test until the problem area has been isolated.
   10. In the previous steps you have attempted to recreate the conditions responsible for setting active DTC in question.

       Are any ACTIVE DTC's present?

       Yes

- Select the appropriate diagnostic procedure in this service information. Refer to the **DIAGNOSTIC CODE INDEX** .

No

- No problem found at this time. Erase all codes before returning vehicle to customer.

U0002-00-CAN-C-BUS-OFF-PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 5: Battery Voltage Circuit Diagram

Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

The OCM checks for serial data message traffic at power up during the initialization process, and continuously through the ignition cycle.

SET CONDITION

This DTC sets when the OCM fails to detect serial data message traffic for more than 5 seconds. In the event the OCM detects serial data message traffic, this DTC will immediately transition to stored status.

POSSIBLE CAUSES

Possible Causes
OCCUPANT CLASSIFICATION MODULE (OCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

   Is the DTC active or stored?

   OCM - ACTIVE DTC

   - Go To 2

   OCM - STORED DTC

   - Go To 3
2. **REPLACE OCCUPANT CLASSIFICATION MODULE**

   When this code is set, view repair.

   Repair

   WARNING: **If the Occupant Classification Module (OCM) is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and may result in possible serious or fatal injury.**

   WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two**

minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

- Replace the OCM in accordance with Service Information. Refer to **MODULE, OCCUPANT CLASSIFICATION, REMOVAL** .
- Perform the OCCUPANT CLASSIFICATION MODULE (OCM) VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

3. **STORED OCM DTC**
   1. With the scan tool, record and erase all DTC's from all Airbag System Modules.
   2. If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

      WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

   3. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
   4. Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.
   5. The following additional checks may assist you in identifying a possible intermittent problem.
   6. Reconnect any disconnected components and harness connector.

      WARNING: **Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

   7. With the scan tool monitor active codes as you work through the following steps.

      WARNING: **Maintain a safe distance from all airbags while performing the following steps. Failure to follow these instructions may result in possible serious or fatal injury.**

   8. Wiggle the wiring harness and connectors of the related Can C Bus circuits or component.
   9. If only stored codes return continue the test until the problem area has been isolated.
   10. In the previous steps you have attempted to recreate the conditions responsible for setting active DTC in question.

       Are any ACTIVE DTC's present?

       Yes

       - Select the appropriate diagnostic procedure in this service information. Refer to the **DIAGNOSTIC CODE INDEX** .

No

- No problem found at this time. Erase all codes before returning vehicle to customer.

U0140-00-LOST COMMUNICATION WITH BODY CONTROL MODULE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 6: Battery Voltage Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

Continuously when the ignition is on.

The battery voltage between 10.0 and 16.0 Volts.

Body Control Module (BCM) is configured correctly.

SET CONDITION

Bus messages not received from the Body Control Module (BCM) for 2.5 seconds.

POSSIBLE CAUSES

Possible Causes
CAN BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
BODY CONTROL MODULE POWER AND GROUND
BCM NOT CONFIGURED CORRECTLY
BODY CONTROL MODULE (BCM)
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

VERIFY DTC IS ACTIVE

1. Turn the ignition on.
2. With the scan tool, read the active DTCs.

   Does the scan tool display; U0140-00-LOST COMMUNICATION WITH BODY CONTROL MODULE as active?

   Yes

   - Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM BCM (BODY CONTROL MODULE) diagnostic procedure.

   No

   - Refer to **DIAGNOSIS AND TESTING** and perform the STORED LOST COMMUNICATION DTC diagnostic procedure.

STANDARD PROCEDURE

OCCUPAANT-CLASSIFICATION MODULE INTERMITTENT TEST

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

DIAGNOSTIC INTERMITTENT TEST

1. **RECORD AND ERASE ALL RESTRAINT SYSTEM DTCS**
    1. With the scan tool, record and erase all DTCs from all restraints system modules. Monitor for any active codes as you work through the following steps.
        - Review the code monitored and set conditions for any DTCs that are stored and attempt to reproduce the conditions listed.
        - Wiggle the wiring harness and connectors of the related airbag circuit, sensor, or component.

        WARNING: **Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

        - Disconnect components and inspect the harness and connectors for damage.
        - Reconnect components and ensure they are properly seated.

        If equipped with the keyless ignition, use this ignition on warning.

        WARNING: **Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

        If equipped with the standard key ignition, use this ignition on warning.

        WARNING: **Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

        - Turn the ignition off.
        - Perform any Technical Service Bulletins (TSBs) that may apply.

        Was the source of the customer complaint found or did any DTCs appear and stay active?

        Yes

        - Make the appropriate repairs and either perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** or **DIAGNOSIS AND TESTING** for the appropriate diagnostic procedure.

No

- Go To 2

2. **ATTEMPT TO REPRODUCE THE CONDITION**
   1. In the event the customer complaint cannot be duplicated due to an intermittent condition in the restraints system, the following may aid in attempting to reproduce the condition.

      WARNING: **Turn the ignition off, disconnect the battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

      - Using the wiring diagram/schematic as a guide, inspect the wiring and connectors related to the stored code or component in question.
      - Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.
      - Reconnect any disconnected components and harness connectors and ensure they are properly seated.

        If equipped with the keyless ignition, use this ignition on warning.

        WARNING: **Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

        If equipped with the standard key ignition, use this ignition on warning.

        WARNING: **Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

      - If numerous trouble codes were set, use a schematic and inspect any common ground or supply circuits.

      Was the source of the intermittent condition located?

      Yes

      - Make the appropriate repairs and perform the RESTRAINTS SYSTEM VERIFICATION PROCEDURE. Refer to **STANDARD PROCEDURE** .

No

- The problem cannot be found at this time.

RESTRAINTS-SYSTEM-PRE-DIAGNOSTIC-PROCEDURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

DIAGNOSTIC PRE-TEST

1. Before attempting to repair any restraint system, technicians should be familiar with and fully understand the system operation. Refer to **RESTRAINTS - SERVICE INFORMATION** DESCRIPTION and OPERATION for complete details. The following should be used as a checklist to be completed in its entirety prior to referencing specific Restraints Diagnostic Procedures.
2. **FOLLOW THE BASIC OUTLINE SET FORTH IN THE SIX-STEP TROUBLESHOOTING PROCEDURE**
   1. Verification of complaint.
   2. Verification of any related symptoms.
   3. Symptom analysis.
   4. Problem isolation.
   5. Repair of isolated problem.
   6. Verification of proper operation.
3. **TAKE INTO ACCOUNT CURRENT VEHICLE CONDITION, REPAIR HISTORY, AND TECHNICAL SERVICE BULLETINS (TSBs)**
   - Verify that there are no outward signs of vehicle damage or effects from a collision that could impact the proper operation of the Restraints system.
   - Check for aftermarket vehicle accessories that may have been installed improperly or could interfere with the system.
   - Check the vehicle repair history for repairs that may relate to the current condition.
   - Check for current Technical Service Bulletins (TSBs) for the Restraints system related to the customer concern. If a TSB applies, follow the procedure outlined in the TSB.
4. **DIAGNOSE ONLY THOSE FAILURES THAT ARE ACTIVE AND CAN BE REPRODUCED**
   - Check the control module central to the subsystem that is exhibiting the condition for active DTCs.
   - For an intermittent failure that is not active at the time of vehicle inspection, perform the OCCUPANT CLASSIFICATION MODULE (OCM) INTERMITTENT TEST diagnostic procedure and document the event on the repair order. Refer to **STANDARD PROCEDURE**.
5. **ADDRESS ACTIVE DIAGNOSTIC TROUBLE CODES (DTCs) IN THE CORRECT ORDER**
   1. Low/High Voltage and Serial Data Loss of Communication Codes.
   2. Module Internal Failure and Configuration Mismatch Codes.
   3. Circuit specific DTC failures.
6. Should the malfunction still be present after conducting this Pre-diagnostic Procedure, technicians should continue to the appropriate DTC procedure. Refer to **STANDARD PROCEDURE**.

Was the Pre-Test reviewed and is the DTC still present?

Yes

- Perform the appropriate DTC procedure. Refer to **DIAGNOSIS AND TESTING**.

No

- Test Complete.

RE-ZERO OCCUPANT CLASSIFICATION MODULE

OCM RE-ZERO TEST

VERIFY ACTIVE DTC

NOTE: Make sure the battery is fully charged.

NOTE: Follow the ignition off warning, due to any special tools or body harness connectors that may need to be reconnected reintroducing voltage to a wire harness and component area.

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Remove any special tools or jumper wires and reconnect all previously disconnected components - except the battery.
2. Make sure the passenger seat is empty.
3. If equipped with the standard key ignition, use this ignition on warning.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

4. If equipped with the keyless ignition, use this ignition on warning.

WARNING: Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

NOTE: **Failure to follow the test instructions or aborting the test causes faults to set when performing the Scan tool Occupant Classification Module System Verification Test. To prevent faults due to process errors: verify that all tests steps that led you here were performed as directed, verify that the ignition is in run position. Only press scan tool buttons when directed to do so and perform the scan tool Occupant Classification Module System Verification Test to completion.**

5. With the scan tool in OCM, select the Miscellaneous Functions tab on the scan tool, select Empty Seat Value Relearn. Run the test by following the instructions displayed on the scan tool. When the test completes, wait two minutes and then proceed as follows.
6. With the scan tool, read active DTCs.

   Does the scan tool display any OCM active DTCs?

   Yes

   - Follow the appropriate diagnostics. Refer to **DIAGNOSIS AND TESTING**.

   No

   - OCM Re-zero procedure complete. Perform the Standard Procedure OCCUPANT CLASSIFICATION MODULE (OCM) VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

OCCUPANT CLASSIFICATION MODULE (OCM) VERIFICATION TEST

DIAGNOSTIC VERIFICATION TEST

NOTE: **Follow the ignition off warning, due to any special tools or body harness connectors that may need to be reconnected reintroducing voltage to a wire harness and component area.**

WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

VERIFICATION TEST

1. Remove any special tools or jumper wires and reconnect all previously disconnected components - except the battery.
2. If equipped with the standard key ignition, use this ignition on warning.

WARNING: **Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may**

result in possible serious or fatal injury.

3. If equipped with the keyless ignition, use this ignition on warning.

   WARNING: **Disconnect the 12-volt battery wait two minutes before proceeding, remove the OCM fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the OCM fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

4. Connect the scan tool to the Data Link Connector - use the most current software available.
5. With the scan tool erase stored DTCs in the Restraint System or whichever subsystem DTCs set.
6. Turn the ignition off, and wait 15 seconds, then turn the ignition on.
7. Wait one minute, using the scan tool read active subsystem DTCs and if there are none present read the stored codes.
8. If the scan tool shows any active or stored codes, follow path specified for that trouble code. If no active or stored codes are present, the repair is complete.

   Are any DTCs present or is the original condition still present?

   Yes

   - Repair is not complete, whichever subsystem DTC or DTCs set and perform the appropriate diagnostic procedure. Refer to **DIAGNOSIS AND TESTING**.

   No

   WARNING: **Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

   - If equipped with the standard key ignition, use this ignition on warning.

     WARNING: **Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

     If equipped with the keyless ignition, use this ignition on warning.

     WARNING: **Disconnect the 12-volt battery wait two minutes before proceeding, remove the OCM fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the OCM fuses. Wait two**

minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

- Perform the OCCUPANT CLASSIFICATION MODULE VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

DIAGNOSIS AND TESTING

B128E-11-PTS SENSOR 1 - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 1: Identifying Front Park Assist Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Park Assist Sensors are ultrasonic transceivers that are completely controlled by the Park Assist Module. The sensors transmit and receive ultrasonic signals. Each sensor has a voltage, signal, and return circuit to the module. The sensors communicate with the Park Assist Module using a dedicated serial bus communication circuit.

NOTE: The numbering system for the park assist sensors allows for up to twelve sensors on the vehicle, six front and six rear. The sensors are numbered in a clockwise manner starting at the left front bumper. The left front sensor (if equipped with front park assist) is the number 1 sensor. The numbering continues in a clockwise direction around the vehicle.

WHEN MONITORED

Vehicle in reverse and during the self-test while vehicle is in drive between 18 km/h (11 mph) and 40 km/h (25 mph).

SET CONDITION

The Park Assist Module detects a short to ground on the Park Assist Sensor Signal circuit.

POSSIBLE CAUSES

Possible Causes
PARK ASSIST SENSOR DISCONNECTED
(D702) PARK ASSIST SENSOR 1 SIGNAL CIRCUIT SHORTED TO GROUND
(D702) PARK ASSIST SENSOR 1 SIGNAL CIRCUIT SHORTED TO THE (X751) FRONT PARK ASSIST SENSOR GROUND CIRCUIT
(D702) PARK ASSIST SENSOR 1 SIGNAL CIRCUIT OPEN
(X702) FRONT PARK ASSIST SENSOR SUPPLY CIRCUIT OPEN
PARK ASSIST SENSOR
PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**

NOTE: A disconnected sensor will set this DTC. Verify the Park Assist Sensor is connected before proceeding with this diagnostic procedure.

1. Turn the ignition on.

2. With the scan tool, read DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Go To 2

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK THE VOLTAGE OF THE (X702) FRONT PARK ASSIST SENSOR SUPPLY CIRCUIT**
   1. Turn the ignition off.
   2. Disconnect the Park Assist Sensor harness connector.
   3. Turn the ignition on.
   4. Measure the voltage of the (X702) Front Park Assist Sensor Supply circuit.

      Is the voltage above 8.0 volts?

      Yes

      - Go To 4

      No

      - Go To 3

3. **CHECK THE (X702) FRONT PARK ASSIST SENSOR SUPPLY CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Disconnect the Park Assist Module C3 harness connector.
   3. Measure the resistance of the (X751) Front Park Assist Sensor Supply circuit.

      Is the resistance below 5.0 Ohms?

      Yes

      - Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Repair the open or high resistance in the (X702) Front Park Assist Sensor Supply circuit.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK THE (D702) PARK ASSIST SENSOR 1 SIGNAL CIRCUIT FOR A SHORT TO GROUND WITH THE PARK ASSIST MODULE CONNECTED**

NOTE: Perform this step with the Park Assist Module harness connected.

1. Measure the resistance between ground and the (D702) Park Assist Sensor 1 Signal circuit.

   Is the resistance below 10K Ohms?

   Yes

   - Go To 5

   No

   - Go To 7

5. **CHECK THE (D702) PARK ASSIST SENSOR 1 SIGNAL CIRCUIT FOR A SHORT TO GROUND WITH THE PARK ASSIST MODULE DISCONNECTED**
   1. Disconnect the Park Assist Module C3 harness connector.
   2. Measure the resistance between ground and the (D702) Park Assist Sensor 1 Signal circuit.

      Is the resistance below 10K Ohms?

      Yes

      - Repair the short to ground in the (D702) Park Assist Sensor 1 Signal circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 6

6. **CHECK THE (D702) PARK ASSIST SENSOR 1 SIGNAL CIRCUIT FOR A SHORT TO THE (X751) FRONT PARK ASSIST SENSOR GROUND CIRCUIT**
   1. Measure the resistance between the (D702) Park Assist Sensor 1 Signal circuit and the (X751) Front Park Assist Sensor Ground circuit.

      Is the resistance below 10K Ohms?

      Yes

- Repair the short between the (D702) Park Assist Sensor 1 Signal circuit and the (X702) Front Park Assist Sensor Ground circuit.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

7. **CHECK THE (D702) PARK ASSIST SENSOR 1 SIGNAL CIRCUIT FOR AN OPEN**
   1. Disconnect the Park Assist Module C3 harness connector.
   2. Measure the resistance of the (D702) Park Assist Sensor 1 Signal circuit.

   Is the resistance above 5.0 Ohms?

   Yes

   - Repair the open in the (D702) Park Assist Sensor 1 Signal circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 8

8. **PARK ASSIST SENSOR**
   1. Turn the ignition on.
   2. Reconnect the Park Assist Module C3 harness connector.
   3. Connect a jumper wire across the (X702) Front Park Assist Sensor Supply and (D702) Park Assist Sensor 1 Signal circuits.
   4. Turn the ignition on.
   5. With the scan tool, read DTCs.

   Does the scan tool display DTC: B128E-12-PTS SENSOR 1 - CIRCUIT SHORT TO BATTERY as active?

   Yes

   - Replace the Park Assist Sensor in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the Park Assist Module in accordance with the Service Information. Refer to

MODULE, PARK ASSIST, REMOVAL .

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B128E-12-PTS-SENSOR 1 - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 2: Identifying Front Park Assist Circuit Diagram

THEORY OF OPERATION

The Park Assist Sensors are ultrasonic transceivers that are completely controlled by the Park Assist Module. The sensors transmit and receive ultrasonic signals. Each sensor has a voltage, signal, and return circuit to the module. The sensors communicate with the Park Assist Module using a dedicated serial bus communication circuit.

NOTE: The numbering system for the park assist sensors allows for up to twelve sensors on the vehicle, six front and six rear. The sensors are numbered in a clockwise manner starting at the left front bumper. The left front sensor (if equipped with front park assist) is the number 1 sensor. The numbering continues in a clockwise direction around the vehicle.

WHEN MONITORED

Vehicle in reverse and during the self-test while vehicle is in drive between 18 km/h (11 mph) and 40 km/h (25 mph).

SET CONDITION

The Park Assist Module detects an open or short to voltage on the Park Assist Sensor Signal circuit.

POSSIBLE CAUSES

Possible Causes
(D702) PARK ASSIST SENSOR 1 SIGNAL CIRCUIT SHORTED TO VOLTAGE
(D702) PARK ASSIST SENSOR 1 SIGNAL CIRCUIT SHORTED TO THE (X702) FRONT PARK ASSIST SENSOR SUPPLY CIRCUIT
(X751) FRONT PARK ASSIST SENSOR GROUND CIRCUIT OPEN
PARK ASSIST SENSOR
PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this

time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **(D702) PARK ASSIST SENSOR 1 SIGNAL CIRCUIT SHORTED TO BATTERY**
   1. Turn the ignition off.
   2. Disconnect the Park Assist Module C3 harness connector.
   3. Disconnect the Park Assist Sensor harness connector.
   4. Turn the ignition on.
   5. Measure the voltage of the (D702) Park Assist Sensor 1 Signal circuit.

   Is the voltage above 10.0 volts?

   Yes

   - Repair the (D702) Park Assist Sensor 1 Signal circuit for a short to battery.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 3

3. **(D702) PARK ASSIST SENSOR 1 SIGNAL CIRCUIT SHORTED TO THE (X702) FRONT PARK ASSIST SENSOR SUPPLY CIRCUIT**
   1. Turn the ignition off.
   2. Measure the resistance between the (D702) Park Assist Sensor 1 Signal circuit and the (X702) Front Park Assist Sensor Supply circuit.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the (D702) Park Assist Sensor 1 Signal circuit for a short to the (X702) Front Park Assist Sensor Supply circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 4

4. **(X751) FRONT PARK ASSIST SENSOR GROUND CIRCUIT OPEN**
   1. Reconnect the Park Assist Module C3 harness connector.
   2. Measure the resistance between ground and the (X751) Front Park Assist Sensor Ground circuit.

   Is the resistance above 20.0 Ohms?

Yes

- Go To 5

No

- Replace the Park Assist Sensor in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **(X751) FRONT PARK ASSIST SENSOR GROUND CIRCUIT OPEN BETWEEN PARK ASSIST MODULE AND SENSOR**
   1. Disconnect the Park Assist Module C3 harness connector.
   2. Measure the resistance of the (X751) Front Park Assist Sensor Ground circuit.

   Is the resistance above 5.0 Ohms?

   Yes

   - Repair the open in the (X751) Front Park Assist Sensor Ground circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B128E-25-PTS SENSOR 1 - SIGNAL SHAPE / WAVEFORM FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 3: Identifying Front Park Assist Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Park Assist Sensors are ultrasonic transceivers that are completely controlled by the Park Assist Module. The sensors transmit and receive ultrasonic signals. Each sensor has a voltage, signal, and return circuit to the module. The sensors communicate with the Park Assist Module using a dedicated serial bus communication circuit.

WHEN MONITORED

Vehicle in reverse.

During the self-test while vehicle is in drive between 11 mph (18 km/h) and 25 mph (40 km/h).

SET CONDITION

The Park Assist Module detects an internal Sensor error.

POSSIBLE CAUSES

Possible Causes
PARK ASSIST SENSOR MEMBRANE OBSTRUCTION (ICE, SNOW, MUD, DIRT COVERING FASCIA)
PARK ASSIST SENSOR CONNECTOR OBSTRUCTION (ICE, SNOW, MUD, DIRT)
DECOUPLING RING MISSING/MOUNTED WRONG
OBJECTS - SUCH AS LICENSE PLATES - IN CLOSE RANGE TO THE SENSOR
PARK ASSIST SENSOR

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**

   NOTE: Before proceeding with this diagnostic procedure, remove any ice, snow, mud, dirt, or other obstructions from the front/rear fascia/bumper. Also remove any ice, snow, dirt, mud, or other obstructions from the underside of the Fascia/Bumper surrounding the sensors.

   1. Turn the ignition on.
   2. With the scan tool, read Park Assist Module DTCs.

      Does the scan tool display this DTC as active?

      Yes

      - Go To 2

      No

      - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **PARK ASSIST SENSOR**
   1. Verify that none of the possible causes mentioned above are present. Repair as necessary.

If none of the possible causes mentioned above are present, view repair.

Repair

- Replace the Park Assist Sensor that caused this DTC to change from active to stored after disconnecting it in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B128E-92-PTS SENSOR 1 - PERFORMANCE OR INCORRECT OPERATION

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 4: Identifying Front Park Assist Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Park Assist Sensors are ultrasonic transceivers that are completely controlled by the Park Assist Module. The sensors transmit and receive ultrasonic signals. Each sensor has a voltage, signal, and return circuit to the module. The sensors communicate with the Park Assist Module using a dedicated serial bus communication circuit.

NOTE: The numbering system for the park assist sensors allows for up to twelve

sensors on the vehicle, six front and six rear. The sensors are numbered in a clockwise manner starting at the left front bumper. The left front sensor (if equipped with front park assist) is the number 1 sensor. The numbering continues in a clockwise direction around the vehicle.

WHEN MONITORED

Vehicle in reverse and during the self-test while vehicle is in drive between 18 km/h (11 mph) and 40 km/h (25 mph).

SET CONDITION

If the system detects data corruption in the transmission in the internal communication line between the module and sensors, this code will set.

POSSIBLE CAUSES

Possible Causes
(D702) PARK ASSIST SENSOR 1 SIGNAL CIRCUIT SHORTED TO GROUND
(D702) PARK ASSIST SENSOR 1 SIGNAL CIRCUIT SHORTED TO BATTERY
(D702) PARK ASSIST SENSOR 1 SIGNAL CIRCUIT OPEN
PARK ASSIST SENSOR
PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE PARK ASSIST SENSOR FOR AN INTERNAL SHORT**
    1. Disconnect the Park Assist Sensor harness connector.

2. With the scan tool, read DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Go To 3

   No

   - Replace Park Assist Sensor 1 in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (D702) PARK ASSIST SENSOR 1 SIGNAL CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Disconnect the Park Assist Module C3 harness connector.
   3. Measure the resistance between ground and the (D702) Park Assist Sensor 1 Signal circuit.

      Is the resistance below 10K Ohms?

      Yes

      - Repair the (D702) Park Assist Sensor 1 Signal circuit for a short to ground.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 4

4. **CHECK THE (D702) PARK ASSIST SENSOR 1 SIGNAL CIRCUIT FOR A SHORT TO BATTERY**
   1. Turn the ignition on.
   2. Measure the voltage of the (D702) Park Assist Sensor 1 Signal circuit.

      Is voltage present?

      Yes

      - Repair the (D702) Park Assist Sensor 1 Signal circuit for a short to battery.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

- Go To 5

5. **CHECK THE (D702) PARK ASSIST SENSOR 1 SIGNAL CIRCUIT FOR AN OPEN**
   1. Measure the resistance of the (D702) Park Assist Sensor 1 Signal circuit.

      Is the resistance above 5.0 Ohms?

      Yes

      - Repair the (D702) Park Assist Sensor 1 Signal circuit for an open.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Replace the Park Assist Module in accordance with Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B128F-11-PTS SENSOR 2 - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 5: Identifying Front Park Assist Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Park Assist Sensors are ultrasonic transceivers that are completely controlled by the Park Assist Module. The sensors transmit and receive ultrasonic signals. Each sensor has a voltage, signal, and return circuit to the module. The sensors communicate with the Park Assist Module using a dedicated serial bus communication circuit.

NOTE: The numbering system for the park assist sensors allows for up to twelve

sensors on the vehicle, six front and six rear. The sensors are numbered in a clockwise manner starting at the left front bumper. The left front sensor (if equipped with front park assist) is the number 1 sensor. The numbering continues in a clockwise direction around the vehicle.

WHEN MONITORED

Vehicle in reverse and during the self-test while vehicle is in drive between 18 km/h (11 mph) and 40 km/h (25 mph).

SET CONDITION

The Park Assist Module detects a short to ground on the Park Assist Sensor Signal circuit.

POSSIBLE CAUSES

Possible Causes
PARK ASSIST SENSOR DISCONNECTED
(D705) PARK ASSIST SENSOR 2 SIGNAL CIRCUIT SHORTED TO GROUND
(D705) PARK ASSIST SENSOR 2 SIGNAL CIRCUIT SHORTED TO THE (X751) FRONT PARK ASSIST SENSOR GROUND CIRCUIT
(D705) PARK ASSIST SENSOR 2 SIGNAL CIRCUIT OPEN
(X702) FRONT PARK ASSIST SENSOR SUPPLY CIRCUIT OPEN
PARK ASSIST SENSOR
PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**

NOTE: **A disconnected sensor will set this DTC. Verify the Park Assist Sensor is connected before proceeding with this diagnostic procedure.**

1. Turn the ignition on.
2. With the scan tool, read DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Go To 2

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this

time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK THE VOLTAGE OF THE (X702) FRONT PARK ASSIST SENSOR SUPPLY CIRCUIT**
   1. Turn the ignition off.
   2. Disconnect the Park Assist Sensor harness connector.
   3. Turn the ignition on.
   4. Measure the voltage of the (X702) Front Park Assist Sensor Supply circuit.

   Is the voltage above 8.0 volts?

   Yes

   - Go To 4

   No

   - Go To 3

3. **CHECK THE (X702) FRONT PARK ASSIST SENSOR SUPPLY CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Disconnect the Park Assist Module C3 harness connector.
   3. Measure the resistance of the (X702) Front Park Assist Sensor Supply circuit.

   Is the resistance below 5.0 Ohms?

   Yes

   - Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Repair the open or high resistance in the (X702) Front Park Assist Sensor Supply circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK THE (D705) PARK ASSIST SENSOR 2 SIGNAL CIRCUIT FOR A SHORT TO GROUND WITH THE PARK ASSIST MODULE CONNECTED**

   NOTE: Perform this step with the Park Assist Module connected.

   1. Measure the resistance between ground and the (D705) Park Assist Sensor 2 Signal circuit.

Is the resistance below 10K Ohms?

Yes

- Go To 5

No

- Go To 7

5. **CHECK THE (D705) PARK ASSIST SENSOR 2 SIGNAL CIRCUIT FOR A SHORT TO GROUND WITH THE PARK ASSIST MODULE DISCONNECTED**
   1. Disconnect the Park Assist Module C3 harness connector.
   2. Measure the resistance between ground and the (D705) Park Assist Sensor 2 Signal circuit.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the short to ground in the (D705) Park Assist Sensor 2 Signal circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 6

6. **CHECK THE (D705) PARK ASSIST SENSOR 2 SIGNAL CIRCUIT FOR A SHORT TO THE (X751) FRONT PARK ASSIST SENSOR GROUND CIRCUIT**
   1. Measure the resistance between the (D705) Park Assist Sensor 2 Signal circuit and the (X751) Front Park Assist Sensor Ground circuit.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the short between the (D705) Park Assist Sensor 2 Signal circuit and the (X751) Front Park Assist Sensor Ground circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

7. **CHECK THE (D705) PARK ASSIST SENSOR 2 SIGNAL CIRCUIT FOR AN OPEN**
   1. Disconnect the Park Assist Module C3 harness connector.

2. Measure the resistance of the (D705) Park Assist Sensor 2 Signal circuit.

   Is the resistance above 5.0 Ohms?

   Yes

   - Repair the open in the (D705) Park Assist Sensor 2 Signal circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 8

8. **PARK ASSIST SENSOR**
   1. Turn the ignition on.
   2. Reconnect the Park Assist Module C3 harness connector.
   3. Connect a jumper wire across the (X702) Front Park Assist Sensor Supply and (D705) Park Assist Sensor 2 Signal circuits.
   4. Turn the ignition on.
   5. With the scan tool, read DTCs.

      Does the scan tool display DTC: B128F-12-PTS SENSOR 2 - CIRCUIT SHORT TO BATTERY as active?

      Yes

      - Replace the Park Assist Sensor in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B128F-25-PTS SENSOR 2 - SIGNAL SHAPE / WAVEFORM FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 6: Identifying Front Park Assist Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Park Assist Sensors are ultrasonic transceivers that are completely controlled by the Park Assist Module. The sensors transmit and receive ultrasonic signals. Each sensor has a voltage, signal, and return circuit to the module. The sensors communicate with the Park Assist Module using a dedicated serial bus communication circuit.

WHEN MONITORED

Vehicle in reverse.

During the self-test while vehicle is in drive between 11 mph (18 km/h) and 25 mph (40 km/h).

SET CONDITION

The Park Assist Module detects an internal Sensor error.

POSSIBLE CAUSES

Possible Causes
PARK ASSIST SENSOR MEMBRANE OBSTRUCTION (ICE, SNOW, MUD, DIRT COVERING FASCIA)
PARK ASSIST SENSOR CONNECTOR OBSTRUCTION (ICE, SNOW, MUD, DIRT)
DECOUPLING RING MISSING/MOUNTED WRONG
OBJECTS - SUCH AS LICENSE PLATES - IN CLOSE RANGE TO THE SENSOR
PARK ASSIST SENSOR

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**

   NOTE: Before proceeding with this diagnostic procedure, remove any ice, snow, mud, dirt, or other obstructions from the front/rear fascia/bumper. Also remove any ice, snow, dirt, mud, or other obstructions from the underside of the Fascia/Bumper surrounding the sensors.

   1. Turn the ignition on.
   2. With the scan tool, read Park Assist Module DTCs.

      Does the scan tool display this DTC as active?

      Yes

      - Go To 2

      No

      - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **PARK ASSIST SENSOR**
   1. Verify that none of the possible causes mentioned above are present. Repair as necessary.

If none of the possible causes mentioned above are present, view repair.

Repair

- Replace the Park Assist Sensor that caused this DTC to change from active to stored after disconnecting it in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B128F-92-PTS SENSOR 2-PERFORMANCE OR INCORRECT OPERATION

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 7: Identifying Front Park Assist Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Park Assist Sensors are ultrasonic transceivers that are completely controlled by the Park Assist Module. The sensors transmit and receive ultrasonic signals. Each sensor has a voltage, signal, and return circuit to the module. The sensors communicate with the Park Assist Module using a dedicated serial bus communication circuit.

NOTE: The numbering system for the park assist sensors allows for up to twelve

sensors on the vehicle, six front and six rear. The sensors are numbered in a clockwise manner starting at the left front bumper. The left front sensor (if equipped with front park assist) is the number 1 sensor. The numbering continues in a clockwise direction around the vehicle.

WHEN MONITORED

Vehicle in reverse and during the self-test while vehicle is in drive between 18 km/h (11 mph) and 40 km/h (25 mph).

SET CONDITION

If the system detects data corruption in the transmission in the internal communication line between the module and sensors, this code will set.

POSSIBLE CAUSES

Possible Causes
(D705) PARK ASSIST SENSOR 2 SIGNAL CIRCUIT SHORTED TO GROUND
(D705) PARK ASSIST SENSOR 2 SIGNAL CIRCUIT SHORTED TO BATTERY
(D705) PARK ASSIST SENSOR 2 SIGNAL CIRCUIT OPEN
PARK ASSIST SENSOR
PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE PARK ASSIST SENSOR FOR AN INTERNAL SHORT**
    1. Disconnect the Park Assist Sensor harness connector.

2. With the scan tool, read DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Go To 3

   No

   - Replace Park Assist Sensor 2 in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (D705) PARK ASSIST SENSOR 2 SIGNAL CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Disconnect the Park Assist Module C3 harness connector.
   3. Measure the resistance between ground and the (D705) Park Assist Sensor 2 Signal circuit.

      Is the resistance below 10K Ohms?

      Yes

      - Repair the (D705) Park Assist Sensor 2 Signal circuit for a short to ground.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 4

4. **CHECK THE (D705) PARK ASSIST SENSOR 2 SIGNAL CIRCUIT FOR A SHORT TO BATTERY**
   1. Turn the ignition on.
   2. Measure the voltage of the (D705) Park Assist Sensor 2 Signal circuit.

      Is voltage present?

      Yes

      - Repair the (D705) Park Assist Sensor 2 Signal circuit for a short to battery.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

- Go To 5

5. **CHECK THE (D705) PARK ASSIST SENSOR 2 SIGNAL CIRCUIT FOR AN OPEN**
   1. Measure the resistance of the (D705) Park Assist Sensor 2 Signal circuit.

      Is the resistance above 5.0 Ohms?

      Yes

      - Repair the (D705) Park Assist Sensor 2 Signal circuit for an open.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Replace the Park Assist Module in accordance with Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1290-11-PTS SENSOR 3-CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 8: Identifying Front Park Assist Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Park Assist Sensors are ultrasonic transceivers that are completely controlled by the Park Assist Module. The sensors transmit and receive ultrasonic signals. Each sensor has a voltage, signal, and return circuit to the module. The sensors communicate with the Park Assist Module using a dedicated serial bus communication circuit.

NOTE: The numbering system for the park assist sensors allows for up to twelve

sensors on the vehicle, six front and six rear. The sensors are numbered in a clockwise manner starting at the left front bumper. The left front sensor (if equipped with front park assist) is the number 1 sensor. The numbering continues in a clockwise direction around the vehicle.

WHEN MONITORED

Vehicle in reverse and during the self-test while vehicle is in drive between 18 km/h (11 mph) and 40 km/h (25 mph).

SET CONDITION

The Park Assist Module detects a short to ground on the Park Assist Sensor Signal circuit.

POSSIBLE CAUSES

Possible Causes
PARK ASSIST SENSOR DISCONNECTED
(D706) PARK ASSIST SENSOR 3 SIGNAL CIRCUIT SHORTED TO GROUND
(D706) PARK ASSIST SENSOR 3 SIGNAL CIRCUIT SHORTED TO THE (X751) FRONT PARK ASSIST SENSOR GROUND CIRCUIT
(D706) PARK ASSIST SENSOR 3 SIGNAL CIRCUIT OPEN
(X702) FRONT PARK ASSIST SENSOR SUPPLY CIRCUIT OPEN
PARK ASSIST SENSOR
PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**

NOTE: **A disconnected sensor will set this DTC. Verify the Park Assist Sensor is connected before proceeding with this diagnostic procedure.**

1. Turn the ignition on.
2. With the scan tool, read DTCs.

Does the scan tool display this DTC as active?

Yes

- Go To 2

No

- Test complete, the condition or conditions that originally set this DTC are not present at this

time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK THE VOLTAGE OF THE (X702) FRONT PARK ASSIST SENSOR SUPPLY CIRCUIT**
   1. Turn the ignition off.
   2. Disconnect the Park Assist Sensor harness connector.
   3. Turn the ignition on.
   4. Measure the voltage of the (X702) Front Park Assist Sensor Supply circuit.

   Is the voltage above 8.0 volts?

   Yes

   - Go To 4

   No

   - Go To 3

3. **CHECK THE (X702) FRONT PARK ASSIST SENSOR SUPPLY CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Disconnect the Park Assist Module C3 harness connector.
   3. Measure the resistance of the (X702) Front Park Assist Sensor Supply circuit.

   Is the resistance below 5.0 Ohms?

   Yes

   - Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Repair the open or high resistance in the (X702) Front Park Assist Sensor Supply circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK THE (D706) PARK ASSIST SENSOR 3 SIGNAL CIRCUIT FOR A SHORT TO GROUND WITH THE PARK ASSIST MODULE CONNECTED**

   NOTE: Perform this step with the Park Assist Module connected.

   1. Measure the resistance between ground and the (D706) Park Assist Sensor 3 Signal circuit.

Is the resistance below 10K Ohms?

Yes

- Go To 5

No

- Go To 7

5. **CHECK THE (D706) PARK ASSIST SENSOR 3 SIGNAL CIRCUIT FOR A SHORT TO GROUND WITH THE PARK ASSIST MODULE DISCONNECTED**

Fig. 9: Measuring Resistance Between Ground & Park Assist Sensor Signal Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Park Assist Module C3 harness connector.
2. Measure the resistance between ground and the (D706) Park Assist Sensor 3 Signal circuit.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the short to ground in the (D706) Park Assist Sensor 3 Signal circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 6

6. **CHECK THE (D706) PARK ASSIST SENSOR 3 SIGNAL CIRCUIT FOR A SHORT TO THE (X751) FRONT PARK ASSIST SENSOR GROUND CIRCUIT**

Fig. 10: Measuring Resistance Between Park Assist Sensor Signal Circuit & Park Assist Sensor Ground Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (D706) Park Assist Sensor 3 Signal circuit and the (X751) Front Park Assist Sensor Ground circuit.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the short between the (D706) Park Assist Sensor 3 Signal circuit and the (X751) Front Park Assist Sensor Ground circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

7. **CHECK THE (D706) PARK ASSIST SENSOR 3 SIGNAL CIRCUIT FOR AN OPEN**

Fig. 11: Checking Park Assist Sensor 3 Signal Circuit For Open
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Park Assist Module C3 harness connector.
2. Measure the resistance of the (D706) Park Assist Sensor 3 Signal circuit.

   Is the resistance above 5.0 Ohms?

   Yes

   - Repair the open in the (D706) Park Assist Sensor 3 Signal circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 8

8. **PARK ASSIST SENSOR**

Fig. 12: Checking Park Assist Sensor
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition on.
2. Reconnect the Park Assist Module C3 harness connector.
3. Connect a jumper wire across the (X702) Front Park Assist Sensor Supply and (D706) Park Assist Sensor 3 Signal circuits.

4. Turn the ignition on.
5. With the scan tool, read DTCs.

   Does the scan tool display DTC: B1290-12-PTS SENSOR 3 - CIRCUIT SHORT TO BATTERY as active?

   Yes

   - Replace the Park Assist Sensor in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1290-12-PTS SENSOR 3-CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 13: Identifying Front Park Assist Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Park Assist Sensors are ultrasonic transceivers that are completely controlled by the Park Assist Module. The sensors transmit and receive ultrasonic signals. Each sensor has a voltage, signal, and return circuit to the module. The sensors communicate with the Park Assist Module using a dedicated serial bus communication circuit.

NOTE: The numbering system for the park assist sensors allows for up to twelve

sensors on the vehicle, six front and six rear. The sensors are numbered in a clockwise manner starting at the left front bumper. The left front sensor (if equipped with front park assist) is the number 1 sensor. The numbering continues in a clockwise direction around the vehicle.

WHEN MONITORED

Vehicle in reverse and during the self-test while vehicle is in drive between 18 km/h (11 mph) and 40 km/h (25 mph).

SET CONDITION

The Park Assist Module detects an open or short to voltage on the Park Assist Sensor Signal circuit.

POSSIBLE CAUSES

Possible Causes
(D706) PARK ASSIST SENSOR 3 SIGNAL CIRCUIT SHORTED TO VOLTAGE
(D706) PARK ASSIST SENSOR 3 SIGNAL CIRCUIT SHORTED TO THE (X702) FRONT PARK ASSIST SENSOR SUPPLY CIRCUIT
(X751) FRONT PARK ASSIST SENSOR GROUND CIRCUIT OPEN
PARK ASSIST SENSOR
PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
   1. Turn the ignition on.
   2. With the scan tool, read DTCs.

      Does the scan tool display this DTC as active?

      Yes

      - Go To 2

      No

      - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **(D706) PARK ASSIST SENSOR 3 SIGNAL CIRCUIT SHORTED TO BATTERY**
   1. Turn the ignition off.

2. Disconnect the Park Assist Module C3 harness connector.
3. Disconnect the Park Assist Sensor harness connector.
4. Turn the ignition on.
5. Measure the voltage of the (D706) Park Assist Sensor 3 Signal circuit.

   Is the voltage above 10.0 volts?

   Yes

   - Repair the (D706) Park Assist Sensor 3 Signal circuit for a short to battery.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 3

3. **(D706) PARK ASSIST SENSOR 3 SIGNAL CIRCUIT SHORTED TO THE (X702) FRONT PARK ASSIST SENSOR SUPPLY CIRCUIT**
   1. Turn the ignition off.
   2. Measure the resistance between the (D706) Park Assist Sensor 3 Signal circuit and the (X702) Front Park Assist Sensor Supply circuit.

      Is the resistance below 10K Ohms?

      Yes

      - Repair the (D706) Park Assist Sensor 3 Signal circuit for a short to the (X702) Front Park Assist Sensor Supply circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 4

4. **(X751) FRONT PARK ASSIST SENSOR GROUND CIRCUIT OPEN**
   1. Reconnect the Park Assist Module C3 harness connector.
   2. Measure the resistance between ground and the (X751) Front Park Assist Sensor Ground circuit.

      Is the resistance above 20.0 Ohms?

      Yes

      - Go To 5

      No

- Replace the Park Assist Sensor in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **(X751) FRONT PARK ASSIST SENSOR GROUND CIRCUIT OPEN BETWEEN PARK ASSIST MODULE AND SENSOR**
   1. Disconnect the Park Assist Module C3 harness connector.
   2. Measure the resistance of the (X751) Front Park Assist Sensor Ground circuit.

      Is the resistance above 5.0 Ohms?

      Yes

      - Repair the open in the (X751) Front Park Assist Sensor Ground circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1290-25-PTS SENSOR 3-SIGNAL SHAPE / WAVEFORM FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 14: Identifying Front Park Assist Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Park Assist Sensors are ultrasonic transceivers that are completely controlled by the Park Assist Module. The sensors transmit and receive ultrasonic signals. Each sensor has a voltage, signal, and return circuit to the module. The sensors communicate with the Park Assist Module using a dedicated serial bus communication circuit.

WHEN MONITORED

Vehicle in reverse.

During the self-test while vehicle is in drive between 11 mph (18 km/h) and 25 mph (40 km/h).

SET CONDITION

The Park Assist Module detects an internal Sensor error.

POSSIBLE CAUSES

Possible Causes
PARK ASSIST SENSOR MEMBRANE OBSTRUCTION (ICE, SNOW, MUD, DIRT COVERING FASCIA)
PARK ASSIST SENSOR CONNECTOR OBSTRUCTION (ICE, SNOW, MUD, DIRT)
DECOUPLING RING MISSING/MOUNTED WRONG
OBJECTS - SUCH AS LICENSE PLATES - IN CLOSE RANGE TO THE SENSOR
PARK ASSIST SENSOR

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**

   NOTE: Before proceeding with this diagnostic procedure, remove any ice, snow, mud, dirt, or other obstructions from the front/rear fascia/bumper. Also remove any ice, snow, dirt, mud, or other obstructions from the underside of the Fascia/Bumper surrounding the sensors.

   1. Turn the ignition on.
   2. With the scan tool, read Park Assist Module DTCs.

      Does the scan tool display this DTC as active?

      Yes

      - Go To 2

      No

      - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **PARK ASSIST SENSOR**
   1. Verify that none of the possible causes mentioned above are present. Repair as necessary.

If none of the possible causes mentioned above are present, view repair.

Repair

- Replace the Park Assist Sensor that caused this DTC to change from active to stored after disconnecting it in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1290-92-PTS SENSOR 3-PERFORMANCE OR INCORRECT OPERATION

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 15: Identifying Front Park Assist Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Park Assist Sensors are ultrasonic transceivers that are completely controlled by the Park Assist Module. The sensors transmit and receive ultrasonic signals. Each sensor has a voltage, signal, and return circuit to the module. The sensors communicate with the Park Assist Module using a dedicated serial bus communication circuit.

NOTE: The numbering system for the park assist sensors allows for up to twelve

sensors on the vehicle, six front and six rear. The sensors are numbered in a clockwise manner starting at the left front bumper. The left front sensor (if equipped with front park assist) is the number 1 sensor. The numbering continues in a clockwise direction around the vehicle.

WHEN MONITORED

Vehicle in reverse and during the self-test while vehicle is in drive between 18 km/h (11 mph) and 40 km/h (25 mph).

SET CONDITION

If the system detects data corruption in the transmission in the internal communication line between the module and sensors, this code will set.

POSSIBLE CAUSES

Possible Causes
(D706) PARK ASSIST SENSOR 3 SIGNAL CIRCUIT SHORTED TO GROUND
(D706) PARK ASSIST SENSOR 3 SIGNAL CIRCUIT SHORTED TO BATTERY
(D706) PARK ASSIST SENSOR 3 SIGNAL CIRCUIT OPEN
PARK ASSIST SENSOR
PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE PARK ASSIST SENSOR FOR AN INTERNAL SHORT**
    1. Disconnect the Park Assist Sensor harness connector.

2. With the scan tool, read DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Go To 3

   No

   - Replace Park Assist Sensor 3 in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (D706) PARK ASSIST SENSOR 3 SIGNAL CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Disconnect the Park Assist Module C3 harness connector.
   3. Measure the resistance between ground and the (D706) Park Assist Sensor 3 Signal circuit.

      Is the resistance below 10K Ohms?

      Yes

      - Repair the (D706) Park Assist Sensor 3 Signal circuit for a short to ground.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 4

4. **CHECK THE (D706) PARK ASSIST SENSOR 3 SIGNAL CIRCUIT FOR A SHORT TO BATTERY**
   1. Turn the ignition on.
   2. Measure the voltage of the (D706) Park Assist Sensor 3 Signal circuit.

      Is voltage present?

      Yes

      - Repair the (D706) Park Assist Sensor 3 Signal circuit for a short to battery.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

- Go To 5

5. **CHECK THE (D706) PARK ASSIST SENSOR 3 SIGNAL CIRCUIT FOR AN OPEN**
   1. Measure the resistance of the (D706) Park Assist Sensor 3 Signal circuit.

      Is the resistance above 5.0 Ohms?

      Yes

      - Repair the (D706) Park Assist Sensor 3 Signal circuit for an open.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Replace the Park Assist Module in accordance with Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1291-11-PTS SENSOR 4-CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 16: Identifying Front Park Assist Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Park Assist Sensors are ultrasonic transceivers that are completely controlled by the Park Assist Module. The sensors transmit and receive ultrasonic signals. Each sensor has a voltage, signal, and return circuit to the module. The sensors communicate with the Park Assist Module using a dedicated serial bus communication circuit.

NOTE: The numbering system for the park assist sensors allows for up to twelve sensors on the vehicle, six front and six rear. The sensors are numbered in a clockwise manner starting at the left front bumper. The left front sensor (if equipped with front park assist) is the number 1 sensor. The numbering continues in a clockwise direction around the vehicle.

WHEN MONITORED

Vehicle in reverse and during the self-test while vehicle is in drive between 18 km/h (11 mph) and 40 km/h (25 mph).

SET CONDITION

The Park Assist Module detects a short to ground on the Park Assist Sensor Signal circuit.

POSSIBLE CAUSES

Possible Causes
PARK ASSIST SENSOR DISCONNECTED
(D707) PARK ASSIST SENSOR 4 SIGNAL CIRCUIT SHORTED TO GROUND
(D707) PARK ASSIST SENSOR 4 SIGNAL CIRCUIT SHORTED TO THE (X751) FRONT PARK ASSIST SENSOR GROUND CIRCUIT
(D707) PARK ASSIST SENSOR 4 SIGNAL CIRCUIT OPEN
(X702) FRONT PARK ASSIST SENSOR SUPPLY CIRCUIT OPEN
PARK ASSIST SENSOR
PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**

   NOTE: A disconnected sensor will set this DTC. Verify the Park Assist Sensor is connected before proceeding with this diagnostic procedure.

   1. Turn the ignition on.
   2. With the scan tool, read DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Go To 2

   No

- Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK THE VOLTAGE OF THE (X702) FRONT PARK ASSIST SENSOR SUPPLY CIRCUIT**
   1. Turn the ignition off.
   2. Disconnect the Park Assist Sensor harness connector.
   3. Turn the ignition on.
   4. Measure the voltage of the (X702) Front Park Assist Sensor Supply circuit.

   Is the voltage above 8.0 volts?

   Yes

   - Go To 4

   No

   - Go To 3

3. **CHECK THE (X702) FRONT PARK ASSIST SENSOR SUPPLY CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Disconnect the Park Assist Module C3 harness connector.
   3. Measure the resistance of the (X702) Front Park Assist Sensor Supply circuit.

   Is the resistance below 5.0 Ohms?

   Yes

   - Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Repair the open or high resistance in the (X702) Front Park Assist Sensor Supply circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK THE (D707) PARK ASSIST SENSOR 4 SIGNAL CIRCUIT FOR A SHORT TO GROUND WITH THE PARK ASSIST MODULE CONNECTED**

   NOTE: Perform this step with the Park Assist Module connected.

   1. Measure the resistance between ground and the (D707) Park Assist Sensor 4 Signal circuit.

Is the resistance below 10K Ohms?

Yes

- Go To 5

No

- Go To 7

5. **CHECK THE (D707) PARK ASSIST SENSOR 4 SIGNAL CIRCUIT FOR A SHORT TO GROUND WITH THE PARK ASSIST MODULE DISCONNECTED**
   1. Disconnect the Park Assist Module C3 harness connector.
   2. Measure the resistance between ground and the (D707) Park Assist Sensor 4 Signal circuit.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the short to ground in the (D707) Park Assist Sensor 4 Signal circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 6

6. **CHECK THE (D707) PARK ASSIST SENSOR 4 SIGNAL CIRCUIT FOR A SHORT TO THE (X751) FRONT PARK ASSIST SENSOR GROUND CIRCUIT**
   1. Measure the resistance between the (D707) Park Assist Sensor 4 Signal circuit and the (X751) Front Park Assist Sensor Ground circuit.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the short between the (D707) Park Assist Sensor 4 Signal circuit and the (X751) Front Park Assist Sensor Ground circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

7. **CHECK THE (D707) PARK ASSIST SENSOR 4 SIGNAL CIRCUIT FOR AN OPEN**
   1. Disconnect the Park Assist Module C3 harness connector.

2. Measure the resistance of the (D707) Park Assist Sensor 4 Signal circuit.

   Is the resistance above 5.0 Ohms?

   Yes

   - Repair the open in the (D707) Park Assist Sensor 4 Signal circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 8

8. **PARK ASSIST SENSOR**
   1. Turn the ignition on.
   2. Reconnect the Park Assist Module C3 harness connector.
   3. Connect a jumper wire across the (X702) Front Park Assist Sensor Supply and (D707) Park Assist Sensor 4 Signal circuits.
   4. Turn the ignition on.
   5. With the scan tool, read DTCs.

      Does the scan tool display DTC: B1291-12-PTS SENSOR 4 - CIRCUIT SHORT TO BATTERY as active?

      Yes

      - Replace the Park Assist Sensor in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B128F-12-PTS SENSOR 2 - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 17: Identifying Front Park Assist Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Park Assist Sensors are ultrasonic transceivers that are completely controlled by the Park Assist Module. The sensors transmit and receive ultrasonic signals. Each sensor has a voltage, signal and return circuit to the module. The sensors communicate with the Park Assist Module using a dedicated serial bus communication circuit.

NOTE: The numbering system for the park assist sensors allows for up to twelve

sensors on the vehicle, six front and six rear. The sensors are numbered in a clockwise manner starting at the left front bumper. The left front sensor (if equipped with front park assist) is the number 1 sensor. The numbering continues in a clockwise direction around the vehicle.

WHEN MONITORED

Vehicle in reverse and during the self-test while vehicle is in drive between 18 km/h (11 mph) and 40 km/h (25 mph).

SET CONDITION

The Park Assist Module detects an open or short to voltage on the Park Assist Sensor Signal circuit.

POSSIBLE CAUSES

Possible Causes
(D705) PARK ASSIST SENSOR 2 SIGNAL CIRCUIT SHORTED TO VOLTAGE
(D705) PARK ASSIST SENSOR 2 SIGNAL CIRCUIT SHORTED TO THE (X702) FRONT PARK ASSIST SENSOR SUPPLY CIRCUIT
(X751) FRONT PARK ASSIST SENSOR GROUND CIRCUIT OPEN
PARK ASSIST SENSOR
PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
   1. Turn the ignition on.
   2. With the scan tool, read DTCs.

      Does the scan tool display this DTC as active?

      Yes

      - Go To 2

      No

      - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **(D705) PARK ASSIST SENSOR 2 SIGNAL CIRCUIT SHORTED TO BATTERY**
   1. Turn the ignition off.

2. Disconnect the Park Assist Module C3 harness connector.
3. Disconnect the Park Assist Sensor harness connector.
4. Turn the ignition on.
5. Measure the voltage of the (D705) Park Assist Sensor 2 Signal circuit.

   Is the voltage above 10.0 volts?

   Yes

   - Repair the (D705) Park Assist Sensor 2 Signal circuit for a short to battery.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 3

3. **(D705) PARK ASSIST SENSOR 2 SIGNAL CIRCUIT SHORTED TO THE (X702) FRONT PARK ASSIST SENSOR SUPPLY CIRCUIT**
   1. Turn the ignition off.
   2. Measure the resistance between the (D705) Park Assist Sensor 2 Signal circuit and the (X702) Front Park Assist Sensor Supply circuit.

      Is the resistance below 10K Ohms?

      Yes

      - Repair the (D705) Park Assist Sensor 2 Signal circuit for a short to the (X702) Front Park Assist Sensor Supply circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 4

4. **(X751) FRONT PARK ASSIST SENSOR GROUND CIRCUIT OPEN**
   1. Reconnect the Park Assist Module C3 harness connector.
   2. Measure the resistance between ground and the (X751) Front Park Assist Sensor Ground circuit.

      Is the resistance above 20.0 Ohms?

      Yes

      - Go To 5

      No

- Replace the Park Assist Sensor in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **(X751) FRONT PARK ASSIST SENSOR GROUND CIRCUIT OPEN BETWEEN PARK ASSIST MODULE AND SENSOR**
   1. Disconnect the Park Assist Module C3 harness connector.
   2. Measure the resistance of the (X751) Front Park Assist Sensor Ground circuit.

      Is the resistance above 5.0 Ohms?

      Yes

      - Repair the open in the (X751) Front Park Assist Sensor Ground circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1291-12-PTS SENSOR 4 - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 18: Identifying Front Park Assist Circuit Diagram

THEORY OF OPERATION

The Park Assist Sensors are ultrasonic transceivers that are completely controlled by the Park Assist Module. The sensors transmit and receive ultrasonic signals. Each sensor has a voltage, signal, and return circuit to the module. The sensors communicate with the Park Assist Module using a dedicated serial bus communication circuit.

NOTE: **The numbering system for the park assist sensors allows for up to twelve sensors on the vehicle, six front and six rear. The sensors are numbered in a clockwise manner starting at the left front bumper. The left front sensor (if equipped with front park assist) is the number 1 sensor. The numbering continues in a clockwise direction around the vehicle.**

WHEN MONITORED

Vehicle in reverse and during the self-test while vehicle is in drive between 18 km/h (11 mph) and 40 km/h (25 mph).

SET CONDITION

The Park Assist Module detects an open or short to voltage on the Park Assist Sensor Signal circuit.

POSSIBLE CAUSES

Possible Causes
(D707) PARK ASSIST SENSOR 4 SIGNAL CIRCUIT SHORTED TO VOLTAGE
(D707) PARK ASSIST SENSOR 4 SIGNAL CIRCUIT SHORTED TO THE (X702) FRONT PARK ASSIST SENSOR SUPPLY CIRCUIT
(X751) FRONT PARK ASSIST SENSOR GROUND CIRCUIT OPEN
PARK ASSIST SENSOR
PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **(D707) PARK ASSIST SENSOR 4 SIGNAL CIRCUIT SHORTED TO BATTERY**

1. Turn the ignition off.
2. Disconnect the Park Assist Module C3 harness connector.
3. Disconnect the Park Assist Sensor harness connector.
4. Turn the ignition on.
5. Measure the voltage of the (D707) Park Assist Sensor 4 Signal circuit.

   Is the voltage above 10.0 volts?

   Yes

   - Repair the (D707) Park Assist Sensor 4 Signal circuit for a short to battery.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 3

3. **(D707) PARK ASSIST SENSOR 4 SIGNAL CIRCUIT SHORTED TO THE (X702) FRONT PARK ASSIST SENSOR SUPPLY CIRCUIT**
   1. Turn the ignition off.
   2. Measure the resistance between the (D707) Park Assist Sensor 4 Signal circuit and the (X702) Front Park Assist Sensor Supply circuit.

      Is the resistance below 10K Ohms?

      Yes

      - Repair the (D707) Park Assist Sensor 4 Signal circuit for a short to the (X702) Front Park Assist Sensor Supply circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 4

4. **(X751) FRONT PARK ASSIST SENSOR GROUND CIRCUIT OPEN**
   1. Reconnect the Park Assist Module C3 harness connector.
   2. Measure the resistance between ground and the (X751) Front Park Assist Sensor Ground circuit.

      Is the resistance above 20.0 Ohms?

      Yes

      - Go To 5

No

- Replace the Park Assist Sensor in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **(X751) FRONT PARK ASSIST SENSOR GROUND CIRCUIT OPEN BETWEEN PARK ASSIST MODULE AND SENSOR**
   1. Disconnect the Park Assist Module C3 harness connector.
   2. Measure the resistance of the (X751) Front Park Assist Sensor Ground circuit.

      Is the resistance above 5.0 Ohms?

      Yes

      - Repair the open in the (X751) Front Park Assist Sensor Ground circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1291-25-PTS SENSOR 4 - SIGNAL SHAPE / WAVEFORM FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 19: Identifying Front Park Assist Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Park Assist Sensors are ultrasonic transceivers that are completely controlled by the Park Assist Module. The sensors transmit and receive ultrasonic signals. Each sensor has a voltage, signal, and return circuit to the module. The sensors communicate with the Park Assist Module using a dedicated serial bus communication circuit.

WHEN MONITORED

Vehicle in reverse.

During the self-test while vehicle is in drive between 11 mph (18 km/h) and 25 mph (40 km/h).

SET CONDITION

The Park Assist Module detects an internal Sensor error.

POSSIBLE CAUSES

Possible Causes
PARK ASSIST SENSOR MEMBRANE OBSTRUCTION (ICE, SNOW, MUD, DIRT COVERING FASCIA)
PARK ASSIST SENSOR CONNECTOR OBSTRUCTION (ICE, SNOW, MUD, DIRT)
DECOUPLING RING MISSING/MOUNTED WRONG
OBJECTS - SUCH AS LICENSE PLATES - IN CLOSE RANGE TO THE SENSOR
PARK ASSIST SENSOR

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**

   NOTE: Before proceeding with this diagnostic procedure, remove any ice, snow, mud, dirt, or other obstructions from the front/rear fascia/bumper. Also remove any ice, snow, dirt, mud, or other obstructions from the underside of the Fascia/Bumper surrounding the sensors.

   1. Turn the ignition on.
   2. With the scan tool, read Park Assist Module DTCs.

      Does the scan tool display this DTC as active?

      Yes

      - Go To 2

      No

      - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **PARK ASSIST SENSOR**

1. Verify that none of the possible causes mentioned above are present. Repair as necessary.

   If none of the possible causes mentioned above are present, view repair.

   Repair

   - Replace the Park Assist Sensor that caused this DTC to change from active to stored after disconnecting it in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1291-92-PTS SENSOR 4 - PERFORMANCE OR INCORRECT OPERATION

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 20: Identifying Front Park Assist Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Park Assist Sensors are ultrasonic transceivers that are completely controlled by the Park Assist Module. The sensors transmit and receive ultrasonic signals. Each sensor has a voltage, signal, and return circuit to the module. The sensors communicate with the Park Assist Module using a dedicated serial bus communication circuit.

NOTE: **The numbering system for the park assist sensors allows for up to twelve sensors on the vehicle, six front and six rear. The sensors are numbered in a clockwise manner starting at the left front bumper. The left front sensor (if equipped with front park assist) is the number 1 sensor. The numbering continues in a clockwise direction around the vehicle.**

WHEN MONITORED

Vehicle in reverse and during the self-test while vehicle is in drive between 18 km/h (11 mph) and 40 km/h (25 mph).

SET CONDITION

If the system detects data corruption in the transmission in the internal communication line between the module and sensors, this code will set.

POSSIBLE CAUSES

Possible Causes
(D707) PARK ASSIST SENSOR 4 SIGNAL CIRCUIT SHORTED TO GROUND
(D707) PARK ASSIST SENSOR 4 SIGNAL CIRCUIT SHORTED TO BATTERY
(D707) PARK ASSIST SENSOR 4 SIGNAL CIRCUIT OPEN
PARK ASSIST SENSOR
PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE PARK ASSIST SENSOR FOR AN INTERNAL SHORT**

1. Disconnect the Park Assist Sensor harness connector.
2. With the scan tool, read DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Go To 3

   No

   - Replace Park Assist Sensor 4 in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (D707) PARK ASSIST SENSOR 4 SIGNAL CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Disconnect the Park Assist Module C3 harness connector.
   3. Measure the resistance between ground and the (D707) Park Assist Sensor 4 Signal circuit.

      Is the resistance below 10K Ohms?

      Yes

      - Repair the (D707) Park Assist Sensor 4 Signal circuit for a short to ground.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 4

4. **CHECK THE (D707) PARK ASSIST SENSOR 4 SIGNAL CIRCUIT FOR A SHORT TO BATTERY**
   1. Turn the ignition on.
   2. Measure the voltage of the (D707) Park Assist Sensor 4 Signal circuit.

      Is voltage present?

      Yes

      - Repair the (D707) Park Assist Sensor 4 Signal circuit for a short to battery.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

- Go To 5

5. **CHECK THE (D707) PARK ASSIST SENSOR 4 SIGNAL CIRCUIT FOR AN OPEN**
   1. Measure the resistance of the (D707) Park Assist Sensor 4 Signal circuit.

      Is the resistance above 5.0 Ohms?

      Yes

      - Repair the (D707) Park Assist Sensor 4 Signal circuit for an open.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Replace the Park Assist Module in accordance with Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1292-11-PTS SENSOR 5 - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 21: Identifying Front Park Assist Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Park Assist Sensors are ultrasonic transceivers that are completely controlled by the Park Assist Module. The sensors transmit and receive ultrasonic signals. Each sensor has a voltage, signal, and return circuit to the module. The sensors communicate with the Park Assist Module using a dedicated serial bus communication circuit.

NOTE: The numbering system for the park assist sensors allows for up to twelve sensors on the vehicle, six front and six rear. The sensors are numbered in a clockwise manner starting at the left front bumper. The left front sensor (if equipped with front park assist) is the number 1 sensor. The numbering continues in a clockwise direction around the vehicle.

WHEN MONITORED

Vehicle in reverse and during the self-test while vehicle is in drive between 18 km/h (11 mph) and 40 km/h (25 mph).

SET CONDITION

The Park Assist Module detects a short to ground on the Park Assist Sensor Signal circuit.

POSSIBLE CAUSES

Possible Causes
PARK ASSIST SENSOR DISCONNECTED
(D708) PARK ASSIST SENSOR 5 SIGNAL CIRCUIT SHORTED TO GROUND
(D708) PARK ASSIST SENSOR 5 SIGNAL CIRCUIT SHORTED TO THE (X751) FRONT PARK ASSIST SENSOR GROUND CIRCUIT
(D708) PARK ASSIST SENSOR 5 SIGNAL CIRCUIT OPEN
(X702) FRONT PARK ASSIST SENSOR SUPPLY CIRCUIT OPEN
PARK ASSIST SENSOR
PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**

   NOTE: A disconnected sensor will set this DTC. Verify the Park Assist Sensor is connected before proceeding with this diagnostic procedure.

   1. Turn the ignition on.
   2. With the scan tool, read DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Go To 2

   No

- Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK THE VOLTAGE OF THE (X702) FRONT PARK ASSIST SENSOR SUPPLY CIRCUIT**
   1. Turn the ignition off.
   2. Disconnect the Park Assist Sensor harness connector.
   3. Turn the ignition on.
   4. Measure the voltage of the (X702) Front Park Assist Sensor Supply circuit.

   Is the voltage above 8.0 volts?

   Yes

   - Go To 4

   No

   - Go To 3

3. **CHECK THE (X702) FRONT PARK ASSIST SENSOR SUPPLY CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Disconnect the Park Assist Module C3 harness connector.
   3. Measure the resistance of the (X702) Front Park Assist Sensor Supply circuit.

   Is the resistance below 5.0 Ohms?

   Yes

   - Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Repair the open or high resistance in the (X702) Front Park Assist Sensor Supply circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK THE (D708) PARK ASSIST SENSOR 5 SIGNAL CIRCUIT FOR A SHORT TO GROUND WITH THE PARK ASSIST MODULE CONNECTED**

   NOTE: Perform this step with the Park Assist Module connected.

   1. Measure the resistance between ground and the (D708) Park Assist Sensor 5 Signal circuit.

Is the resistance below 10K Ohms?

Yes

- Go To 5

No

- Go To 7

5. **CHECK THE (D708) PARK ASSIST SENSOR 5 SIGNAL CIRCUIT FOR A SHORT TO GROUND WITH THE PARK ASSIST MODULE DISCONNECTED**
   1. Disconnect the Park Assist Module C3 harness connector.
   2. Measure the resistance between ground and the (D708) Park Assist Sensor 5 Signal circuit.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the short to ground in the (D708) Park Assist Sensor 5 Signal circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 6

6. **CHECK THE (D708) PARK ASSIST SENSOR 5 SIGNAL CIRCUIT FOR A SHORT TO THE (X751) FRONT PARK ASSIST SENSOR GROUND CIRCUIT**
   1. Measure the resistance between the (D708) Park Assist Sensor 5 Signal circuit and the (X751) Front Park Assist Sensor Ground circuit.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the short between the (D708) Park Assist Sensor 5 Signal circuit and the (X751) Front Park Assist Sensor Ground circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

7. **CHECK THE (D708) PARK ASSIST SENSOR 5 SIGNAL CIRCUIT FOR AN OPEN**
   1. Disconnect the Park Assist Module C3 harness connector.

2. Measure the resistance of the (D708) Park Assist Sensor 5 Signal circuit.

   Is the resistance above 5.0 Ohms?

   Yes

   - Repair the open in the (D708) Park Assist Sensor 5 Signal circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 8

8. **PARK ASSIST SENSOR**
   1. Turn the ignition on.
   2. Reconnect the Park Assist Module C3 harness connector.
   3. Connect a jumper wire across the (X702) Front Park Assist Sensor Supply and (D708) Park Assist Sensor 5 Signal circuits.
   4. Turn the ignition on.
   5. With the scan tool, read DTCs.

      Does the scan tool display DTC: B1292-12-PTS SENSOR 5 - CIRCUIT SHORT TO BATTERY as active?

      Yes

      - Replace the Park Assist Sensor in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1292-12-PTS SENSOR 5 - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 22: Identifying Front Park Assist Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Park Assist Sensors are ultrasonic transceivers that are completely controlled by the Park Assist Module. The sensors transmit and receive ultrasonic signals. Each sensor has a voltage, signal, and return circuit to the module. The sensors communicate with the Park Assist Module using a dedicated serial bus communication circuit.

NOTE: **The numbering system for the park assist sensors allows for up to twelve sensors on the vehicle, six front and six rear. The sensors are numbered in a clockwise manner starting at the left front bumper. The left front sensor (if equipped with front park assist) is the number 1 sensor. The numbering continues in a clockwise direction around the vehicle. Since Chrysler Group vehicles use only four rear sensors, sensor numbers 7 and 12 are omitted, so the left rear sensor is the number 11 sensor.**

WHEN MONITORED

Vehicle in reverse and during the self-test while vehicle is in drive between 18 km/h (11 mph) and 40 km/h (25 mph).

SET CONDITION

The Park Assist Module detects an open or short to voltage on the Park Assist Sensor Signal circuit.

POSSIBLE CAUSES

Possible Causes
(D708) PARK ASSIST SENSOR 5 SIGNAL CIRCUIT SHORTED TO VOLTAGE
(D708) PARK ASSIST SENSOR 5 SIGNAL CIRCUIT SHORTED TO THE (X702) FRONT PARK ASSIST SENSOR SUPPLY CIRCUIT
(X751) FRONT PARK ASSIST SENSOR GROUND CIRCUIT OPEN
PARK ASSIST SENSOR
PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **(D708) PARK ASSIST SENSOR 5 SIGNAL CIRCUIT SHORTED TO BATTERY**
   1. Turn the ignition off.
   2. Disconnect the Park Assist Module C3 harness connector.
   3. Disconnect the Park Assist Sensor harness connector.
   4. Turn the ignition on.
   5. Measure the voltage of the (D708) Park Assist Sensor 5 Signal circuit.

      Is the voltage above 10.0 volts?

      Yes

      - Repair the (D708) Park Assist Sensor 5 Signal circuit for a short to battery.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 3
3. **(D708) PARK ASSIST SENSOR 5 SIGNAL CIRCUIT SHORTED TO THE (X702) FRONT PARK ASSIST SENSOR SUPPLY CIRCUIT**
   1. Turn the ignition off.
   2. Measure the resistance between the (D708) Park Assist Sensor 5 Signal circuit and the (X702) Front Park Assist Sensor Supply circuit.

      Is the resistance below 10K Ohms?

      Yes

      - Repair the (D708) Park Assist Sensor 5 Signal circuit for a short to the (X702) Front Park Assist Sensor Supply circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 4
4. **(X751) FRONT PARK ASSIST SENSOR GROUND CIRCUIT OPEN**
   1. Reconnect the Park Assist Module C3 harness connector.
   2. Measure the resistance between ground and the (X751) Front Park Assist Sensor Ground circuit.

      Is the resistance above 20.0 Ohms?

      Yes

      - Go To 5

No

- Replace the Park Assist Sensor in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **(X751) FRONT PARK ASSIST SENSOR GROUND CIRCUIT OPEN BETWEEN PARK ASSIST MODULE AND SENSOR**
   1. Disconnect the Park Assist Module C3 harness connector.
   2. Measure the resistance of the (X751) Front Park Assist Sensor Ground circuit.

   Is the resistance above 5.0 Ohms?

   Yes

   - Repair the open in the (X751) Front Park Assist Sensor Ground circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1292-25-PTS SENSOR 5 - SIGNAL SHAPE / WAVEFORM FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 23: Identifying Front Park Assist Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Park Assist Sensors are ultrasonic transceivers that are completely controlled by the Park Assist Module. The sensors transmit and receive ultrasonic signals. Each sensor has a voltage, signal, and return circuit to the module. The sensors communicate with the Park Assist Module using a dedicated serial bus communication circuit.

WHEN MONITORED

Vehicle in reverse.

During the self-test while vehicle is in drive between 11 mph (18 km/h) and 25 mph (40 km/h).

SET CONDITION

The Park Assist Module detects an internal Sensor error.

POSSIBLE CAUSES

Possible Causes
PARK ASSIST SENSOR MEMBRANE OBSTRUCTION (ICE, SNOW, MUD, DIRT COVERING FASCIA)
PARK ASSIST SENSOR CONNECTOR OBSTRUCTION (ICE, SNOW, MUD, DIRT)
DECOUPLING RING MISSING/MOUNTED WRONG
OBJECTS - SUCH AS LICENSE PLATES - IN CLOSE RANGE TO THE SENSOR
PARK ASSIST SENSOR

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**

   NOTE: Before proceeding with this diagnostic procedure, remove any ice, snow, mud, dirt, or other obstructions from the front/rear fascia/bumper. Also remove any ice, snow, dirt, mud, or other obstructions from the underside of the Fascia/Bumper surrounding the sensors.

   1. Turn the ignition on.
   2. With the scan tool, read Park Assist Module DTCs.

      Does the scan tool display this DTC as active?

      Yes

      - Go To 2

      No

      - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **PARK ASSIST SENSOR**

1. Verify that none of the possible causes mentioned above are present. Repair as necessary.

   If none of the possible causes mentioned above are present, view repair.

   Repair

   - Replace the Park Assist Sensor that caused this DTC to change from active to stored after disconnecting it in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1292-92-PTS SENSOR 5 - PERFORMANCE OR INCORRECT OPERATION

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 24: Identifying Front Park Assist Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Park Assist Sensors are ultrasonic transceivers that are completely controlled by the Park Assist Module. The sensors transmit and receive ultrasonic signals. Each sensor has a voltage, signal, and return circuit to the module. The sensors communicate with the Park Assist Module using a dedicated serial bus communication circuit.

NOTE: **The numbering system for the park assist sensors allows for up to twelve sensors on the vehicle, six front and six rear. The sensors are numbered in a clockwise manner starting at the left front bumper. The left front sensor (if equipped with front park assist) is the number 1 sensor. The numbering continues in a clockwise direction around the vehicle.**

WHEN MONITORED

Vehicle in reverse and during the self-test while vehicle is in drive between 18 km/h (11 mph) and 40 km/h (25 mph).

SET CONDITION

If the system detects data corruption in the transmission in the internal communication line between the module and sensors, this code will set.

POSSIBLE CAUSES

Possible Causes
(D708) PARK ASSIST SENSOR 5 SIGNAL CIRCUIT SHORTED TO GROUND
(D708) PARK ASSIST SENSOR 5 SIGNAL CIRCUIT SHORTED TO BATTERY
(D708) PARK ASSIST SENSOR 5 SIGNAL CIRCUIT OPEN
PARK ASSIST SENSOR
PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE PARK ASSIST SENSOR FOR AN INTERNAL SHORT**

1. Disconnect the Park Assist Sensor harness connector.
2. With the scan tool, read DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Go To 3

   No

   - Replace Park Assist Sensor 5 in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (D708) PARK ASSIST SENSOR 5 SIGNAL CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Disconnect the Park Assist Module C3 harness connector.
   3. Measure the resistance between ground and the (D708) Park Assist Sensor 5 Signal circuit.

      Is the resistance below 10K Ohms?

      Yes

      - Repair the (D708) Park Assist Sensor 5 Signal circuit for a short to ground.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 4

4. **CHECK THE (D708) PARK ASSIST SENSOR 5 SIGNAL CIRCUIT FOR A SHORT TO BATTERY**
   1. Turn the ignition on.
   2. Measure the voltage of the (D708) Park Assist Sensor 5 Signal circuit.

      Is voltage present?

      Yes

      - Repair the (D708) Park Assist Sensor 5 Signal circuit for a short to battery.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

- Go To 5

5. **CHECK THE (D708) PARK ASSIST SENSOR 5 SIGNAL CIRCUIT FOR AN OPEN**
   1. Measure the resistance of the (D708) Park Assist Sensor 5 Signal circuit.

      Is the resistance above 5.0 Ohms?

      Yes

      - Repair the (D708) Park Assist Sensor 5 Signal circuit for an open.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Replace the Park Assist Module in accordance with Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1293-11-PTS SENSOR 6 - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 25: Identifying Front Park Assist Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Park Assist Sensors are ultrasonic transceivers that are completely controlled by the Park Assist Module. The sensors transmit and receive ultrasonic signals. Each sensor has a voltage, signal, and return circuit to the module. The sensors communicate with the Park Assist Module using a dedicated serial bus communication circuit.

NOTE: The numbering system for the park assist sensors allows for up to twelve sensors on the vehicle, six front and six rear. The sensors are numbered in a clockwise manner starting at the left front bumper. The left front sensor (if equipped with front park assist) is the number 1 sensor. The numbering continues in a clockwise direction around the vehicle.

WHEN MONITORED

Vehicle in reverse and during the self-test while vehicle is in drive between 18 km/h (11 mph) and 40 km/h (25 mph).

SET CONDITION

The Park Assist Module detects a short to ground on the Park Assist Sensor Signal circuit.

POSSIBLE CAUSES

Possible Causes
PARK ASSIST SENSOR DISCONNECTED
(D709) PARK ASSIST SENSOR 6 SIGNAL CIRCUIT SHORTED TO GROUND
(D709) PARK ASSIST SENSOR 6 SIGNAL CIRCUIT SHORTED TO THE (X751) FRONT PARK ASSIST SENSOR GROUND CIRCUIT
(D709) PARK ASSIST SENSOR 6 SIGNAL CIRCUIT OPEN
(X702) FRONT PARK ASSIST SENSOR SUPPLY CIRCUIT OPEN
PARK ASSIST SENSOR
PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**

   NOTE: A disconnected sensor will set this DTC. Verify the Park Assist Sensor is connected before proceeding with this diagnostic procedure.

   1. Turn the ignition on.
   2. With the scan tool, read DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Go To 2

   No

- Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK THE VOLTAGE OF THE (X702) FRONT PARK ASSIST SENSOR SUPPLY CIRCUIT**
   1. Turn the ignition off.
   2. Disconnect the Park Assist Sensor harness connector.
   3. Turn the ignition on.
   4. Measure the voltage of the (X702) Front Park Assist Sensor Supply circuit.

   Is the voltage above 8.0 volts?

   Yes

   - Go To 4

   No

   - Go To 3

3. **CHECK THE (X702) FRONT PARK ASSIST SENSOR SUPPLY CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Disconnect the Park Assist Module C3 harness connector.
   3. Measure the resistance of the (X702) Front Park Assist Sensor Supply circuit.

   Is the resistance below 5.0 Ohms?

   Yes

   - Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Repair the open or high resistance in the (X702) Front Park Assist Sensor Supply circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK THE (D709) PARK ASSIST SENSOR 6 SIGNAL CIRCUIT FOR A SHORT TO GROUND WITH THE PARK ASSIST MODULE CONNECTED**

   NOTE: Perform this step with the Park Assist Module connected.

   1. Measure the resistance between ground and the (D709) Park Assist Sensor 6 Signal circuit.

Is the resistance below 10K Ohms?

Yes

- Go To 5

No

- Go To 7

5. **CHECK THE (D709) PARK ASSIST SENSOR 6 SIGNAL CIRCUIT FOR A SHORT TO GROUND WITH THE PARK ASSIST MODULE DISCONNECTED**
   1. Disconnect the Park Assist Module C3 harness connector.
   2. Measure the resistance between ground and the (D709) Park Assist Sensor 6 Signal circuit.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the short to ground in the (D709) Park Assist Sensor 6 Signal circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 6

6. **CHECK THE (D709) PARK ASSIST SENSOR 6 SIGNAL CIRCUIT FOR A SHORT TO THE (X751) FRONT PARK ASSIST SENSOR GROUND CIRCUIT**
   1. Measure the resistance between the (D709) Park Assist Sensor 6 Signal circuit and the (X751) Front Park Assist Sensor Ground circuit.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the short between the (D709) Park Assist Sensor 6 Signal circuit and the (X751) Front Park Assist Sensor Ground circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

7. **CHECK THE (D709) PARK ASSIST SENSOR 6 SIGNAL CIRCUIT FOR AN OPEN**
   1. Disconnect the Park Assist Module C3 harness connector.

2. Measure the resistance of the (D709) Park Assist Sensor 6 Signal circuit.

   Is the resistance above 5.0 Ohms?

   Yes

   - Repair the open in the (D709) Park Assist Sensor 6 Signal circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 8

8. **PARK ASSIST SENSOR**
   1. Turn the ignition on.
   2. Reconnect the Park Assist Module C3 harness connector.
   3. Connect a jumper wire across the (X702) Front Park Assist Sensor Supply and (D709) Park Assist Sensor 6 Signal circuits.
   4. Turn the ignition on.
   5. With the scan tool, read DTCs.

      Does the scan tool display DTC: B1291-12-PTS SENSOR 6 - CIRCUIT SHORT TO BATTERY as active?

      Yes

      - Replace the Park Assist Sensor in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1293-12-PTS SENSOR 6 - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 26: Identifying Front Park Assist Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Park Assist Sensors are ultrasonic transceivers that are completely controlled by the Park Assist Module. The sensors transmit and receive ultrasonic signals. Each sensor has a voltage, signal, and return circuit to the module. The sensors communicate with the Park Assist Module using a dedicated serial bus communication circuit.

NOTE: **The numbering system for the park assist sensors allows for up to twelve sensors on the vehicle, six front and six rear. The sensors are numbered in a clockwise manner starting at the left front bumper. The left front sensor (if equipped with front park assist) is the number 1 sensor. The numbering continues in a clockwise direction around the vehicle.**

WHEN MONITORED

Vehicle in reverse and during the self-test while vehicle is in drive between 18 km/h (11 mph) and 40 km/h (25 mph).

SET CONDITION

The Park Assist Module detects an open or short to voltage on the Park Assist Sensor Signal circuit.

POSSIBLE CAUSES

Possible Causes
(D709) PARK ASSIST SENSOR 6 SIGNAL CIRCUIT SHORTED TO VOLTAGE
(D709) PARK ASSIST SENSOR 6 SIGNAL CIRCUIT SHORTED TO THE (X702) FRONT PARK ASSIST SENSOR SUPPLY CIRCUIT
(X751) FRONT PARK ASSIST SENSOR GROUND CIRCUIT OPEN
PARK ASSIST SENSOR
PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
   1. Turn the ignition on.
   2. With the scan tool, read DTCs.

      Does the scan tool display this DTC as active?

      Yes

      - Go To 2

      No

      - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **(D709) PARK ASSIST SENSOR 6 SIGNAL CIRCUIT SHORTED TO BATTERY**

1. Turn the ignition off.
2. Disconnect the Park Assist Module C3 harness connector.
3. Disconnect the Park Assist Sensor harness connector.
4. Turn the ignition on.
5. Measure the voltage of the (D709) Park Assist Sensor 6 Signal circuit.

   Is the voltage above 10.0 volts?

   Yes

   - Repair the (D709) Park Assist Sensor 6 Signal circuit for a short to battery.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 3

3. **(D709) PARK ASSIST SENSOR 6 SIGNAL CIRCUIT SHORTED TO THE (X702) FRONT PARK ASSIST SENSOR SUPPLY CIRCUIT**
   1. Turn the ignition off.
   2. Measure the resistance between the (D709) Park Assist Sensor 6 Signal circuit and the (X702) Front Park Assist Sensor Supply circuit.

      Is the resistance below 10K Ohms?

      Yes

      - Repair the (D709) Park Assist Sensor 6 Signal circuit for a short to the (X702) Front Park Assist Sensor Supply circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 4

4. **(X751) FRONT PARK ASSIST SENSOR GROUND CIRCUIT OPEN**
   1. Reconnect the Park Assist Module C3 harness connector.
   2. Measure the resistance between ground and the (X751) Front Park Assist Sensor Ground circuit.

      Is the resistance above 20.0 Ohms?

      Yes

      - Go To 5

No

- Replace the Park Assist Sensor in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **(X751) FRONT PARK ASSIST SENSOR GROUND CIRCUIT OPEN BETWEEN PARK ASSIST MODULE AND SENSOR**
   1. Disconnect the Park Assist Module C3 harness connector.
   2. Measure the resistance of the (X751) Front Park Assist Sensor Ground circuit.

   Is the resistance above 5.0 Ohms?

   Yes

   - Repair the open in the (X751) Front Park Assist Sensor Ground circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the Park Assist Module in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1293-25-PTS SENSOR 6 - SIGNAL SHAPE / WAVEFORM FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 27: Identifying Front Park Assist Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Park Assist Sensors are ultrasonic transceivers that are completely controlled by the Park Assist Module. The sensors transmit and receive ultrasonic signals. Each sensor has a voltage, signal, and return circuit to the module. The sensors communicate with the Park Assist Module using a dedicated serial bus communication circuit.

WHEN MONITORED

Vehicle in reverse.

During the self-test while vehicle is in drive between 11 mph (18 km/h) and 25 mph (40 km/h).

SET CONDITION

The Park Assist Module detects an internal Sensor error.

POSSIBLE CAUSES

Possible Causes
PARK ASSIST SENSOR MEMBRANE OBSTRUCTION (ICE, SNOW, MUD, DIRT COVERING FASCIA)
PARK ASSIST SENSOR CONNECTOR OBSTRUCTION (ICE, SNOW, MUD, DIRT)
DECOUPLING RING MISSING/MOUNTED WRONG
OBJECTS - SUCH AS LICENSE PLATES - IN CLOSE RANGE TO THE SENSOR
PARK ASSIST SENSOR

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**

   NOTE: Before proceeding with this diagnostic procedure, remove any ice, snow, mud, dirt, or other obstructions from the front/rear fascia/bumper. Also remove any ice, snow, dirt, mud, or other obstructions from the underside of the Fascia/Bumper surrounding the sensors.

   1. Turn the ignition on.
   2. With the scan tool, read Park Assist Module DTCs.

      Does the scan tool display this DTC as active?

      Yes

      - Go To 2

      No

      - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **PARK ASSIST SENSOR**

1. Verify that none of the possible causes mentioned above are present. Repair as necessary.

   If none of the possible causes mentioned above are present, view repair.

   Repair

   - Replace the Park Assist Sensor that caused this DTC to change from active to stored after disconnecting it in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1293-92-PTS SENSOR 6 - PERFORMANCE OR INCORRECT OPERATION

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 28: Identifying Front Park Assist Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Park Assist Sensors are ultrasonic transceivers that are completely controlled by the Park Assist Module. The sensors transmit and receive ultrasonic signals. Each sensor has a voltage, signal, and return circuit to the module. The sensors communicate with the Park Assist Module using a dedicated serial bus communication circuit.

NOTE: **The numbering system for the park assist sensors allows for up to twelve sensors on the vehicle, six front and six rear. The sensors are numbered in a clockwise manner starting at the left front bumper. The left front sensor (if equipped with front park assist) is the number 1 sensor. The numbering continues in a clockwise direction around the vehicle.**

WHEN MONITORED

Vehicle in reverse and during the self-test while vehicle is in drive between 18 km/h (11 mph) and 40 km/h (25 mph).

SET CONDITION

If the system detects data corruption in the transmission in the internal communication line between the module and sensors, this code will set.

POSSIBLE CAUSES

Possible Causes
(D709) PARK ASSIST SENSOR 6 SIGNAL CIRCUIT SHORTED TO GROUND
(D709) PARK ASSIST SENSOR 6 SIGNAL CIRCUIT SHORTED TO BATTERY
(D709) PARK ASSIST SENSOR 6 SIGNAL CIRCUIT OPEN
PARK ASSIST SENSOR
PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE PARK ASSIST SENSOR FOR AN INTERNAL SHORT**

1. Disconnect the Park Assist Sensor harness connector.
2. With the scan tool, read DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Go To 3

   No

   - Replace Park Assist Sensor 6 in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (D709) PARK ASSIST SENSOR 6 SIGNAL CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Disconnect the Park Assist Module C3 harness connector.
   3. Measure the resistance between ground and the (D709) Park Assist Sensor 6 Signal circuit.

      Is the resistance below 10K Ohms?

      Yes

      - Repair the (D709) Park Assist Sensor 6 Signal circuit for a short to ground.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 4

4. **CHECK THE (D709) PARK ASSIST SENSOR 6 SIGNAL CIRCUIT FOR A SHORT TO BATTERY**
   1. Turn the ignition on.
   2. Measure the voltage of the (D709) Park Assist Sensor 6 Signal circuit.

      Is voltage present?

      Yes

      - Repair the (D709) Park Assist Sensor 6 Signal circuit for a short to battery.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

- Go To 5

5. **CHECK THE (D709) PARK ASSIST SENSOR 6 SIGNAL CIRCUIT FOR AN OPEN**
   1. Measure the resistance of the (D709) Park Assist Sensor 6 Signal circuit.

      Is the resistance above 5.0 Ohms?

      Yes

      - Repair the (D709) Park Assist Sensor 6 Signal circuit for an open.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Replace the Park Assist Module in accordance with Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1294-11-PTS SENSOR 7 - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 29: Identifying Rear Park Assist Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Park Assist Sensors are ultrasonic transceivers that are completely controlled by the Park Assist Module. The sensors transmit and receive ultrasonic signals. Each sensor has a voltage, signal, and return circuit to the module. The sensors communicate with the Park Assist Module using a dedicated serial bus communication circuit.

NOTE: The numbering system for the park assist sensors allows for up to twelve sensors on the vehicle, six front and six rear. The sensors are numbered in a clockwise manner starting at the left front bumper. The left front sensor (if equipped with front park assist) is the number 1 sensor. The numbering continues in a clockwise direction around the vehicle.

WHEN MONITORED

Vehicle in reverse and during the self-test while vehicle is in drive between 17 km/h (11 mph) and 40 km/h (25 mph).

SET CONDITION

The Park Assist Module detects a short to ground on the Park Assist Sensor Signal circuit.

POSSIBLE CAUSES

Possible Causes
PARK ASSIST SENSOR DISCONNECTED
(D700) PARK ASSIST SENSOR 7 SIGNAL CIRCUIT SHORTED TO GROUND
(D700) PARK ASSIST SENSOR 7 SIGNAL CIRCUIT SHORTED TO THE (X750) PARK ASSIST SENSOR GROUND CIRCUIT
(D700) PARK ASSIST SENSOR 7 SIGNAL CIRCUIT OPEN
(X700) PARK ASSIST SENSOR SUPPLY CIRCUIT OPEN
PARK ASSIST SENSOR
PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**

   NOTE: A disconnected sensor will set this DTC. Verify the Park Assist Sensor is connected before proceeding with this diagnostic procedure.

   1. Turn the ignition on.
   2. With the scan tool, read DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Go To 2

   No

- Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK THE VOLTAGE OF THE (X700) PARK ASSIST SENSOR SUPPLY CIRCUIT**
   1. Turn the ignition off.
   2. Disconnect the Park Assist Sensor harness connector.
   3. Turn the ignition on.
   4. Measure the voltage of the (X700) Park Assist Sensor Supply circuit.

   Is the voltage above 8.0 volts?

   Yes

   - Go To 4

   No

   - Go To 3

3. **CHECK THE (X700) PARK ASSIST SENSOR SUPPLY CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Disconnect the Park Assist Module C2 harness connector.
   3. Measure the resistance of the (X700) Park Assist Sensor Supply circuit.

   Is the resistance below 5.0 Ohms?

   Yes

   - Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Repair the open or high resistance in the (X700) Park Assist Sensor Supply circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK THE (D700) PARK ASSIST SENSOR 7 SIGNAL CIRCUIT FOR A SHORT TO GROUND WITH THE PARK ASSIST MODULE CONNECTED**

   NOTE: Perform this step with the Park Assist Module connected.

   1. Measure the resistance between ground and the (D700) Park Assist Sensor 7 Signal circuit.

Is the resistance below 10K Ohms?

Yes

- Go To 5

No

- Go To 7

5. **CHECK THE (D700) PARK ASSIST SENSOR 7 SIGNAL CIRCUIT FOR A SHORT TO GROUND WITH THE PARK ASSIST MODULE DISCONNECTED**
   1. Disconnect the Park Assist Module C2 harness connector.
   2. Measure the resistance between ground and the (D700) Park Assist Sensor 7 Signal circuit.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the short to ground in the (D700) Park Assist Sensor 7 Signal circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 6

6. **CHECK THE (D700) PARK ASSIST SENSOR 7 SIGNAL CIRCUIT FOR A SHORT TO THE (X750) PARK ASSIST SENSOR GROUND CIRCUIT**
   1. Measure the resistance between the (D700) Park Assist Sensor 7 Signal circuit and the (X750) Park Assist Sensor Ground circuit.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the short between the (D700) Park Assist Sensor 7 Signal circuit and the (X750) Park Assist Sensor Ground circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

7. **CHECK THE (D700) PARK ASSIST SENSOR 7 SIGNAL CIRCUIT FOR AN OPEN**
   1. Disconnect the Park Assist Module C2 harness connector.

2. Measure the resistance of the (D700) Park Assist Sensor 7 Signal circuit.

   Is the resistance above 5.0 Ohms?

   Yes

   - Repair the open in the (D700) Park Assist Sensor 7 Signal circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 8

8. **PARK ASSIST SENSOR**
   1. Turn the ignition on.
   2. Reconnect the Park Assist Module C2 harness connector.
   3. Connect a jumper wire across the (X700) Park Assist Sensor Supply and (D700) Park Assist Sensor 7 Signal circuits.
   4. Turn the ignition on.
   5. With the scan tool, read DTCs.

      Does the scan tool display DTC: B1294-12-PTS SENSOR 7-CIRCUIT SHORT TO BATTERY as active?

      Yes

      - Replace the Park Assist Sensor in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1294-12-PTS SENSOR 7 - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 30: Identifying Rear Park Assist Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Park Assist Sensors are ultrasonic transceivers that are completely controlled by the Park Assist Module. The sensors transmit and receive ultrasonic signals. Each sensor has a voltage, signal, and return circuit to the module. The sensors communicate with the Park Assist Module using a dedicated serial bus communication circuit.

NOTE: **The numbering system for the park assist sensors allows for up to twelve sensors on the vehicle, six front and six rear. The sensors are numbered in a clockwise manner starting at the left front bumper. The left front sensor (if equipped with front park assist) is the number 1 sensor. The numbering continues in a clockwise direction around the vehicle.**

WHEN MONITORED

Vehicle in reverse and during the self-test while vehicle is in drive between 18 km/h (11 mph) and 40 km/h (25 mph).

SET CONDITION

The Park Assist Module detects an open or short to voltage on the Park Assist Sensor Signal circuit.

POSSIBLE CAUSES

Possible Causes
(D700) PARK ASSIST SENSOR 7 SIGNAL CIRCUIT SHORTED TO VOLTAGE
(D700) PARK ASSIST SENSOR 7 SIGNAL CIRCUIT SHORTED TO THE (X700) PARK ASSIST SENSOR SUPPLY CIRCUIT
(X750) PARK ASSIST SENSOR GROUND CIRCUIT OPEN
PARK ASSIST SENSOR
PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **(D700) PARK ASSIST SENSOR 7 SIGNAL CIRCUIT SHORTED TO BATTERY**

1. Turn the ignition off.
2. Disconnect the Park Assist Module C2 harness connector.
3. Disconnect the Park Assist Sensor harness connector.
4. Turn the ignition on.
5. Measure the voltage of the (D700) Park Assist Sensor 7 Signal circuit.

   Is the voltage above 10.0 volts?

   Yes

   - Repair the (D700) Park Assist Sensor 7 Signal circuit for a short to battery.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 3

3. **(D700) PARK ASSIST SENSOR 7 SIGNAL CIRCUIT SHORTED TO THE (X700) PARK ASSIST SENSOR SUPPLY CIRCUIT**
   1. Turn the ignition off.
   2. Measure the resistance between the (D700) Park Assist Sensor 7 Signal circuit and the (X700) Park Assist Sensor Supply circuit.

      Is the resistance below 10K Ohms?

      Yes

      - Repair the (D700) Park Assist Sensor 7 Signal circuit for a short to the (X700) Park Assist Sensor Supply circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 4

4. **(X750) PARK ASSIST SENSOR GROUND CIRCUIT OPEN**
   1. Reconnect the Park Assist Module C2 harness connector.
   2. Measure the resistance between ground and the (X750) Park Assist Sensor Ground circuit.

      Is the resistance above 20.0 Ohms?

      Yes

      - Go To 5

No

- Replace the Park Assist Sensor in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **(X750) PARK ASSIST SENSOR GROUND CIRCUIT OPEN BETWEEN PARK ASSIST MODULE AND SENSOR**
   1. Disconnect the Park Assist Module C2 harness connector.
   2. Measure the resistance of the (X750) Park Assist Sensor Ground circuit.

   Is the resistance above 5.0 Ohms?

   Yes

   - Repair the open in the (X750) Park Assist Sensor Ground circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1294-25-PTS SENSOR 7 - SIGNAL SHAPE / WAVEFORM FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 31: Identifying Rear Park Assist Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

Vehicle in reverse.

During the self-test while vehicle is in drive between 11 mph (18 km/h) and 25 mph (40 km/h).

SET CONDITION

The Park Assist Module detects an internal Sensor error.

POSSIBLE CAUSES

Possible Causes
PARK ASSIST SENSOR MEMBRANE OBSTRUCTION (ICE, SNOW, MUD, DIRT COVERING FASCIA)
PARK ASSIST SENSOR CONNECTOR OBSTRUCTION (ICE, SNOW, MUD, DIRT)
DECOUPLING RING MISSING/MOUNTED WRONG
OBJECTS - SUCH AS LICENSE PLATES - IN CLOSE RANGE TO THE SENSOR
PARK ASSIST SENSOR

THEORY OF OPERATION

The Park Assist Sensors are ultrasonic transceivers that are completely controlled by the Park Assist Module. The sensors transmit and receive ultrasonic signals. Each sensor has a voltage, signal, and return circuit to the module. The sensors communicate with the Park Assist Module using a dedicated serial bus communication circuit.

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**

   NOTE: Before proceeding with this diagnostic procedure, remove any ice, snow, mud, dirt, or other obstructions from the front/rear fascia/bumper. Also remove any ice, snow, dirt, mud, or other obstructions from the underside of the Fascia/Bumper surrounding the sensors.

   1. Turn the ignition on.
   2. With the scan tool, read Park Assist Module DTCs.

      Does the scan tool display this DTC as active?

      Yes

      - Go To 2

      No

      - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **PARK ASSIST SENSOR**
   1. Verify that none of the possible causes mentioned above are present. Repair as necessary.

If none of the possible causes mentioned above are present, view repair.

Repair

- Replace the Park Assist Sensor that caused this DTC to change from active to stored after disconnecting it in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1294-92-PTS SENSOR 7 - PERFORMANCE OR INCORRECT OPERATION

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 32: Identifying Rear Park Assist Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Park Assist Sensors are ultrasonic transceivers that are completely controlled by the Park Assist Module. The sensors transmit and receive ultrasonic signals. Each sensor has a voltage, signal, and return circuit to the module. The sensors communicate with the Park Assist Module using a dedicated serial bus communication circuit.

NOTE: **The numbering system for the park assist sensors allows for up to twelve sensors on the vehicle, six front and six rear. The sensors are numbered in a clockwise manner starting at the left front bumper. The left front sensor (if equipped with front park assist) is the number 1 sensor. The numbering continues in a clockwise direction around the vehicle.**

WHEN MONITORED

Vehicle in reverse and during the self-test while vehicle is in drive between 18 km/h (11 mph) and 40 km/h (25 mph).

SET CONDITION

If the system detects data corruption in the transmission in the internal communication line between the module and sensors, this code will set.

POSSIBLE CAUSES

Possible Causes
(D700) PARK ASSIST SENSOR 7 SIGNAL CIRCUIT SHORTED TO GROUND
(D700) PARK ASSIST SENSOR 7 SIGNAL CIRCUIT SHORTED TO BATTERY
(D700) PARK ASSIST SENSOR 7 SIGNAL CIRCUIT OPEN
PARK ASSIST SENSOR 7
PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
    1. Turn the ignition on.
    2. With the scan tool, read Park Assist Module DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK PARK ASSIST SENSOR 7 FOR INTERNAL SHORT**

1. Disconnect Park Assist Sensor 7.
2. With the scan tool, read Park Assist Module DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Go To 3

   No

   - Replace Park Assist Sensor 7 in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (D700) PARK ASSIST SENSOR 7 SIGNAL CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Disconnect the Park Assist Module C2 harness connector.
   3. Using a 12-volt test light connected to 12-volts check the (D700) Park Assist Sensor 7 Signal circuit at the Park Assist Module C2 harness connector.

      Does the test light illuminate brightly?

      Yes

      - Repair the (D700) Park Assist Sensor 7 Signal circuit for a short to ground.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 4

4. **CHECK THE (D700) PARK ASSIST SENSOR 7 SIGNAL CIRCUIT FOR A SHORT TO BATTERY**
   1. Turn the ignition on.
   2. Using a 12-volt test light connected to ground check the (D700) Park Assist Sensor 7 Signal circuit at the Park Assist Module C2 harness connector for a short to battery.

      Does the test light illuminate brightly?

      Yes

      - Repair the (D700) Park Assist Sensor 7 Signal circuit for a short to battery.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 5

5. **CHECK THE (D700) PARK ASSIST SENSOR 7 SIGNAL CIRCUIT FOR AN OPEN**
   1. Measure the resistance of the (D700) Park Assist Sensor 7 Signal circuit between the Park Assist Module C2 harness connector and the Park Assist Sensor 7 harness connector.

      Is the resistance below 5.0 Ohms?

      No

      - Repair the (D700) Park Assist Sensor 7 Signal circuit for an open.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      Yes

      - Replace the Park Assist Module in accordance with Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1295-11-PTS SENSOR 8 - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 33: Identifying Rear Park Assist Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Park Assist Sensors are ultrasonic transceivers that are completely controlled by the Park Assist Module. The sensors transmit and receive ultrasonic signals. Each sensor has a voltage, signal, and return circuit to the module. The sensors communicate with the Park Assist Module using a dedicated serial bus communication circuit.

NOTE: The numbering system for the park assist sensors allows for up to twelve sensors on the vehicle, six front and six rear. The sensors are numbered in a clockwise manner starting at the left front bumper. The left front sensor (if equipped with front park assist) is the number 1 sensor. The numbering continues in a clockwise direction around the vehicle.

WHEN MONITORED

Vehicle in reverse and during the self-test while vehicle is in drive between 18 km/h (11 mph) and 40 km/h (25 mph).

SET CONDITION

The Park Assist Module detects a short to ground on the Park Assist Sensor Signal circuit.

POSSIBLE CAUSES

Possible Causes
PARK ASSIST SENSOR DISCONNECTED
(D701) PARK ASSIST SENSOR 8 SIGNAL CIRCUIT SHORTED TO GROUND
(D701) PARK ASSIST SENSOR 8 SIGNAL CIRCUIT SHORTED TO THE (X750) PARK ASSIST SENSOR GROUND CIRCUIT
(D701) PARK ASSIST SENSOR 8 SIGNAL CIRCUIT OPEN
(X700) PARK ASSIST SENSOR SUPPLY CIRCUIT OPEN
PARK ASSIST SENSOR
PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**

   NOTE: A disconnected sensor will set this DTC. Verify the Park Assist Sensor is connected before proceeding with this diagnostic procedure.

   1. Turn the ignition on.
   2. With the scan tool, read DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Go To 2

   No

- Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK THE VOLTAGE OF THE (X700) PARK ASSIST SENSOR SUPPLY CIRCUIT**
   1. Turn the ignition off.
   2. Disconnect the Park Assist Sensor harness connector.
   3. Turn the ignition on.
   4. Measure the voltage of the (X700) Park Assist Sensor Supply circuit.

   Is the voltage above 8.0 volts?

   Yes

   - Go To 4

   No

   - Go To 3

3. **CHECK THE (X700) PARK ASSIST SENSOR SUPPLY CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Disconnect the Park Assist Module C2 harness connector.
   3. Measure the resistance of the (X700) Park Assist Sensor Supply circuit.

   Is the resistance below 5.0 Ohms?

   Yes

   - Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Repair the open or high resistance in the (X700) Park Assist Sensor Supply circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK THE (D701) PARK ASSIST SENSOR 8 SIGNAL CIRCUIT FOR A SHORT TO GROUND WITH THE PARK ASSIST MODULE CONNECTED**

   NOTE: Perform this step with the Park Assist Module connected.

   1. Measure the resistance between ground and the (D701) Park Assist Sensor 8 Signal circuit.

Is the resistance below 10K Ohms?

Yes

- Go To 5

No

- Go To 7

5. **CHECK THE (D701) PARK ASSIST SENSOR 8 SIGNAL CIRCUIT FOR A SHORT TO GROUND WITH THE PARK ASSIST MODULE DISCONNECTED**
   1. Disconnect the Park Assist Module C2 harness connector.
   2. Measure the resistance between ground and the (D701) Park Assist Sensor 8 Signal circuit.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the short to ground in the (D701) Park Assist Sensor 8 Signal circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 6

6. **CHECK THE (D701) PARK ASSIST SENSOR 8 SIGNAL CIRCUIT FOR A SHORT TO THE (X750) PARK ASSIST SENSOR GROUND CIRCUIT**
   1. Measure the resistance between the (D701) Park Assist Sensor 8 Signal circuit and the (X750) Park Assist Sensor Ground circuit.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the short between the (D701) Park Assist Sensor 8 Signal circuit and the (X750) Park Assist Sensor Ground circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

7. **CHECK THE (D701) PARK ASSIST SENSOR 8 SIGNAL CIRCUIT FOR AN OPEN**
   1. Disconnect the Park Assist Module C2 harness connector.

2. Measure the resistance of the (D701) Park Assist Sensor 8 Signal circuit.

   Is the resistance above 5.0 Ohms?

   Yes

   - Repair the open in the (D701) Park Assist Sensor 8 Signal circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 8

8. **PARK ASSIST SENSOR**
   1. Turn the ignition on.
   2. Reconnect the Park Assist Module C2 harness connector.
   3. Connect a jumper wire across the (X700) Park Assist Sensor Supply and (D701) Park Assist Sensor 8 Signal circuits.
   4. Turn the ignition on.
   5. With the scan tool, read DTCs.

      Does the scan tool display DTC: B1295-12-PTS SENSOR 8 - CIRCUIT SHORT TO BATTERY as active?

      Yes

      - Replace the Park Assist Sensor in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1295-12-PTS SENSOR 8 - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 34: Identifying Rear Park Assist Circuit Diagram

THEORY OF OPERATION

The Park Assist Sensors are ultrasonic transceivers that are completely controlled by the Park Assist Module. The sensors transmit and receive ultrasonic signals. Each sensor has a voltage, signal, and return circuit to the module. The sensors communicate with the Park Assist Module using a dedicated serial bus communication circuit.

NOTE: **The numbering system for the park assist sensors allows for up to twelve sensors on the vehicle, six front and six rear. The sensors are numbered in a clockwise manner starting at the left front bumper. The left front sensor (if equipped with front park assist) is the number 1 sensor. The numbering continues in a clockwise direction around the vehicle.**

WHEN MONITORED

Vehicle in reverse and during the self-test while vehicle is in drive between 18 km/h (11 mph) and 40 km/h (25 mph).

SET CONDITION

The Park Assist Module detects an open or short to voltage on the Park Assist Sensor Signal circuit.

POSSIBLE CAUSES

Possible Causes
(D701) PARK ASSIST SENSOR 8 SIGNAL CIRCUIT SHORTED TO VOLTAGE
(D701) PARK ASSIST SENSOR 8 SIGNAL CIRCUIT SHORTED TO THE (X700) PARK ASSIST SENSOR SUPPLY CIRCUIT
(X750) PARK ASSIST SENSOR GROUND CIRCUIT OPEN
PARK ASSIST SENSOR
PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
   1. Turn the ignition on.
   2. With the scan tool, read DTCs.

      Does the scan tool display this DTC as active?

      Yes

      - Go To 2

      No

      - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **(D701) PARK ASSIST SENSOR 8 SIGNAL CIRCUIT SHORTED TO BATTERY**

1. Turn the ignition off.
2. Disconnect the Park Assist Module C2 harness connector.
3. Disconnect the Park Assist Sensor harness connector.
4. Turn the ignition on.
5. Measure the voltage of the (D701) Park Assist Sensor 8 Signal circuit.

   Is the voltage above 10.0 volts?

   Yes

   - Repair the (D701) Park Assist Sensor 8 Signal circuit for a short to battery.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 3

3. **(D701) PARK ASSIST SENSOR 8 SIGNAL CIRCUIT SHORTED TO THE (X700) PARK ASSIST SENSOR SUPPLY CIRCUIT**
   1. Turn the ignition off.
   2. Measure the resistance between the (D701) Park Assist Sensor 8 Signal circuit and the (X700) Park Assist Sensor Supply circuit.

      Is the resistance below 10K Ohms?

      Yes

      - Repair the (D701) Park Assist Sensor 8 Signal circuit for a short to the (X700) Park Assist Sensor Supply circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 4

4. **(X750) PARK ASSIST SENSOR GROUND CIRCUIT OPEN**
   1. Reconnect the Park Assist Module C2 harness connector.
   2. Measure the resistance between ground and the (X750) Park Assist Sensor Ground circuit.

      Is the resistance above 20.0 Ohms?

      Yes

      - Go To 5

No

- Replace the Park Assist Sensor in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **(X750) PARK ASSIST SENSOR GROUND CIRCUIT OPEN BETWEEN PARK ASSIST MODULE AND SENSOR**
   1. Disconnect the Park Assist Module C2 harness connector.
   2. Measure the resistance of the (X750) Park Assist Sensor Ground circuit.

   Is the resistance above 5.0 Ohms?

   Yes

   - Repair the open in the (X750) Park Assist Sensor Ground circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1295-25-PTS SENSOR 8 - SIGNAL SHAPE / WAVEFORM FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 35: Identifying Rear Park Assist Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Park Assist Sensors are ultrasonic transceivers that are completely controlled by the Park Assist Module. The sensors transmit and receive ultrasonic signals. Each sensor has a voltage, signal, and return circuit to the module. The sensors communicate with the Park Assist Module using a dedicated serial bus communication circuit.

WHEN MONITORED

Vehicle in reverse.

During the self-test while vehicle is in drive between 11 mph (18 km/h) and 25 mph (40 km/h).

SET CONDITION

The Park Assist Module detects an internal Sensor error.

POSSIBLE CAUSES

Possible Causes
PARK ASSIST SENSOR MEMBRANE OBSTRUCTION (ICE, SNOW, MUD, DIRT COVERING FASCIA)
PARK ASSIST SENSOR CONNECTOR OBSTRUCTION (ICE, SNOW, MUD, DIRT)
DECOUPLING RING MISSING/MOUNTED WRONG
OBJECTS - SUCH AS LICENSE PLATES - IN CLOSE RANGE TO THE SENSOR
PARK ASSIST SENSOR

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**

   NOTE: Before proceeding with this diagnostic procedure, remove any ice, snow, mud, dirt, or other obstructions from the front/rear fascia/bumper. Also remove any ice, snow, dirt, mud, or other obstructions from the underside of the Fascia/Bumper surrounding the sensors.

   1. Turn the ignition on.
   2. With the scan tool, read Park Assist Module DTCs.

      Does the scan tool display this DTC as active?

      Yes

      - Go To 2

      No

      - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **PARK ASSIST SENSOR**

1. Verify that none of the possible causes mentioned above are present. Repair as necessary.

   If none of the possible causes mentioned above are present, view repair.

   Repair

   - Replace the Park Assist Sensor that caused this DTC to change from active to stored after disconnecting it in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1295-92-PTS SENSOR 8 - PERFORMANCE OR INCORRECT OPERATION

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 36: Identifying Rear Park Assist Circuit Diagram

THEORY OF OPERATION

The Park Assist Sensors are ultrasonic transceivers that are completely controlled by the Park Assist Module. The sensors transmit and receive ultrasonic signals. Each sensor has a voltage, signal, and return circuit to the module. The sensors communicate with the Park Assist Module using a dedicated serial bus communication circuit.

NOTE: **The numbering system for the park assist sensors allows for up to twelve sensors on the vehicle, six front and six rear. The sensors are numbered in a clockwise manner starting at the left front bumper. The left front sensor (if equipped with front park assist) is the number 1 sensor. The numbering continues in a clockwise direction around the vehicle.**

WHEN MONITORED

Vehicle in reverse and during the self-test while vehicle is in drive between 18 km/h (11 mph) and 40 km/h (25 mph).

SET CONDITION

If the system detects data corruption in the transmission in the internal communication line between the module and sensors, this code will set.

POSSIBLE CAUSES

Possible Causes
(D701) PARK ASSIST SENSOR 8 SIGNAL CIRCUIT SHORTED TO GROUND
(D701) PARK ASSIST SENSOR 8 SIGNAL CIRCUIT SHORTED TO BATTERY
(D701) PARK ASSIST SENSOR 8 SIGNAL CIRCUIT OPEN
PARK ASSIST SENSOR 8
PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
    1. Turn the ignition on.
    2. With the scan tool, read Park Assist Module DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK PARK ASSIST SENSOR 8 FOR INTERNAL SHORT**

1. Disconnect Park Assist Sensor 8.
2. With the scan tool, read Park Assist Module DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Go To 3

   No

   - Replace Park Assist Sensor 8 in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (D701) PARK ASSIST SENSOR 8 SIGNAL CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Disconnect the Park Assist Module C2 harness connector.
   3. Using a 12-volt test light connected to 12-volts check the (D701) Park Assist Sensor 8 Signal circuit at the Park Assist Module C2 harness connector.

      Does the test light illuminate brightly?

      Yes

      - Repair the (D701) Park Assist Sensor 8 Signal circuit for a short to ground.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 4

4. **CHECK THE (D701) PARK ASSIST SENSOR 8 SIGNAL CIRCUIT FOR A SHORT TO BATTERY**
   1. Turn the ignition on.
   2. Using a 12-volt test light connected to ground check the (D701) Park Assist Sensor 8 Signal circuit at the Park Assist Module C2 harness connector for a short to battery.

      Does the test light illuminate brightly?

      Yes

      - Repair the (D701) Park Assist Sensor 8 Signal circuit for a short to battery.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 5

5. **CHECK THE (D701) PARK ASSIST SENSOR 8 SIGNAL CIRCUIT FOR AN OPEN**
   1. Measure the resistance of the (D701) Park Assist Sensor 8 Signal circuit between the Park Assist Module C2 harness connector and the Park Assist Sensor 8 harness connector.

      Is the resistance below 5.0 Ohms?

      No

      - Repair the (D701) Park Assist Sensor 8 Signal circuit for an open.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      Yes

      - Replace the Park Assist Module in accordance with Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1296-11-PTS SENSOR 9 - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 37: Identifying Rear Park Assist Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Park Assist Sensors are ultrasonic transceivers that are completely controlled by the Park Assist Module. The sensors transmit and receive ultrasonic signals. Each sensor has a voltage, signal, and return circuit to the module. The sensors communicate with the Park Assist Module using a dedicated serial bus communication circuit.

NOTE: The numbering system for the park assist sensors allows for up to twelve sensors on the vehicle, six front and six rear. The sensors are numbered in a clockwise manner starting at the left front bumper. The left front sensor (if equipped with front park assist) is the number 1 sensor. The numbering continues in a clockwise direction around the vehicle.

WHEN MONITORED

Vehicle in reverse and during the self-test while vehicle is in drive between 18 km/h (11 mph) and 40 km/h (25 mph).

SET CONDITION

The Park Assist Module detects a short to ground on the Park Assist Sensor Signal circuit.

POSSIBLE CAUSES

Possible Causes
PARK ASSIST SENSOR DISCONNECTED
(D703) PARK ASSIST SENSOR 9 SIGNAL CIRCUIT SHORTED TO GROUND
(D703) PARK ASSIST SENSOR 9 SIGNAL CIRCUIT SHORTED TO THE (X750) PARK ASSIST SENSOR GROUND CIRCUIT
(D703) PARK ASSIST SENSOR 9 SIGNAL CIRCUIT OPEN
(X700) PARK ASSIST SENSOR SUPPLY CIRCUIT OPEN
PARK ASSIST SENSOR
PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**

   NOTE: A disconnected sensor will set this DTC. Verify the Park Assist Sensor is connected before proceeding with this diagnostic procedure.

   1. Turn the ignition on.
   2. With the scan tool, read DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Go To 2

   No

- Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK THE VOLTAGE OF THE (X700) PARK ASSIST SENSOR SUPPLY CIRCUIT**
   1. Turn the ignition off.
   2. Disconnect the Park Assist Sensor.
   3. Turn the ignition on.
   4. Measure the voltage of the (X700) Park Assist Sensor Supply circuit.

   Is the voltage above 8.0 volts?

   Yes

   - Go To 4

   No

   - Go To 3

3. **CHECK THE (X700) PARK ASSIST SENSOR SUPPLY CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Disconnect the Park Assist Module C2 harness connector.
   3. Measure the resistance of the (X700) Park Assist Sensor Supply circuit.

   Is the resistance below 5.0 Ohms?

   Yes

   - Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Repair the open or high resistance in the (X700) Park Assist Sensor Supply circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK THE (D703) PARK ASSIST SENSOR 9 SIGNAL CIRCUIT FOR A SHORT TO GROUND WITH THE PARK ASSIST MODULE CONNECTED**

   NOTE: Perform this step with the Park Assist Module connected.

   1. Measure the resistance between ground and the (D703) Park Assist Sensor 9 Signal circuit.

Is the resistance below 10K Ohms?

Yes

- Go To 5

No

- Go To 7

5. **CHECK THE (D703) PARK ASSIST SENSOR 9 SIGNAL CIRCUIT FOR A SHORT TO GROUND WITH THE PARK ASSIST MODULE DISCONNECTED**
   1. Disconnect the Park Assist Module C2 harness connector.
   2. Measure the resistance between ground and the (D703) Park Assist Sensor 9 Signal circuit.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the short to ground in the (D703) Park Assist Sensor 9 Signal circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 6

6. **CHECK THE (D703) PARK ASSIST SENSOR 9 SIGNAL CIRCUIT FOR A SHORT TO THE (X750) PARK ASSIST SENSOR GROUND CIRCUIT**
   1. Measure the resistance between the (D703) Park Assist Sensor 9 Signal circuit and the (X750) Park Assist Sensor Ground circuit.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the short between the (D703) Park Assist Sensor 9 Signal circuit and the (X750) Park Assist Sensor Ground circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

7. **CHECK THE (D703) PARK ASSIST SENSOR 9 SIGNAL CIRCUIT FOR AN OPEN**
   1. Disconnect the Park Assist Module C2 harness connector.

2. Measure the resistance of the (D703) Park Assist Sensor 9 Signal circuit.

   Is the resistance above 5.0 Ohms?

   Yes

   - Repair the open in the (D703) Park Assist Sensor 9 Signal circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 8

8. **PARK ASSIST SENSOR**
   1. Turn the ignition on.
   2. Reconnect the Park Assist Module C2 harness connector.
   3. Connect a jumper wire across the (X700) Park Assist Sensor Supply and (D703) Park Assist Sensor 9 Signal circuits.
   4. Turn the ignition on.
   5. With the scan tool, read DTCs.

      Does the scan tool display DTC: B1296-12-PTS SENSOR 9-CIRCUIT SHORT TO BATTERY as active?

      Yes

      - Replace the Park Assist Sensor in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1296-12-PTS SENSOR 9 - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 38: Identifying Rear Park Assist Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Park Assist Sensors are ultrasonic transceivers that are completely controlled by the Park Assist Module. The sensors transmit and receive ultrasonic signals. Each sensor has a voltage, signal, and return circuit to the module. The sensors communicate with the Park Assist Module using a dedicated serial bus communication circuit.

NOTE: **The numbering system for the park assist sensors allows for up to twelve sensors on the vehicle, six front and six rear. The sensors are numbered in a clockwise manner starting at the left front bumper. The left front sensor (if equipped with front park assist) is the number 1 sensor. The numbering continues in a clockwise direction around the vehicle.**

WHEN MONITORED

Vehicle in reverse and during the self-test while vehicle is in drive between 18 km/h (11 mph) and 40 km/h (25 mph).

SET CONDITION

The Park Assist Module detects an open or short to voltage on the Park Assist Sensor Signal circuit.

POSSIBLE CAUSES

Possible Causes
(D703) PARK ASSIST SENSOR 9 SIGNAL CIRCUIT SHORTED TO VOLTAGE
(D703) PARK ASSIST SENSOR 9 SIGNAL CIRCUIT SHORTED TO THE (X700) PARK ASSIST SENSOR SUPPLY CIRCUIT
(X750) PARK ASSIST SENSOR GROUND CIRCUIT OPEN
PARK ASSIST SENSOR
PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **(D703) PARK ASSIST SENSOR 9 SIGNAL CIRCUIT SHORTED TO BATTERY**

1. Turn the ignition off.
2. Disconnect the Park Assist Module C2 harness connector.
3. Disconnect the Park Assist Sensor harness connector.
4. Turn the ignition on.
5. Measure the voltage of the (D703) Park Assist Sensor 9 Signal circuit.

   Is the voltage above 10.0 volts?

   Yes

   - Repair the (D703) Park Assist Sensor 9 Signal circuit for a short to battery.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 3

3. **(D703) PARK ASSIST SENSOR 9 SIGNAL CIRCUIT SHORTED TO THE (X700) PARK ASSIST SENSOR SUPPLY CIRCUIT**
   1. Turn the ignition off.
   2. Measure the resistance between the (D703) Park Assist Sensor 9 Signal circuit and the (X700) Park Assist Sensor Supply circuit.

      Is the resistance below 10K Ohms?

      Yes

      - Repair the (D703) Park Assist Sensor 9 Signal circuit for a short to the (X700) Park Assist Sensor Supply circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 4

4. **(X750) PARK ASSIST SENSOR GROUND CIRCUIT OPEN**
   1. Reconnect the Park Assist Module C2 harness connector.
   2. Measure the resistance between ground and the (X750) Park Assist Sensor Ground circuit.

      Is the resistance above 20.0 Ohms?

      Yes

      - Go To 5

No

- Replace the Park Assist Sensor that caused this DTC to change from active to stored after disconnecting it in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **(X750) PARK ASSIST SENSOR GROUND CIRCUIT OPEN BETWEEN PARK ASSIST MODULE AND SENSOR**
   1. Disconnect the Park Assist Module C2 harness connector.
   2. Measure the resistance of the (X750) Park Assist Sensor Ground circuit.

   Is the resistance above 5.0 Ohms?

   Yes

   - Repair the open in the (X750) Park Assist Sensor Ground circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1296-25-PTS SENSOR 9 - SIGNAL SHAPE / WAVEFORM FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 39: Identifying Rear Park Assist Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Park Assist Sensors are ultrasonic transceivers that are completely controlled by the Park Assist Module. The sensors transmit and receive ultrasonic signals. Each sensor has a voltage, signal, and return circuit to the module. The sensors communicate with the Park Assist Module using a dedicated serial bus communication circuit.

WHEN MONITORED

Vehicle in reverse.

During the self-test while vehicle is in drive between 11 mph (18 km/h) and 25 mph (40 km/h).

SET CONDITION

The Park Assist Module detects an internal Sensor error.

POSSIBLE CAUSES

Possible Causes
PARK ASSIST SENSOR MEMBRANE OBSTRUCTION (ICE, SNOW, MUD, DIRT COVERING FASCIA)
PARK ASSIST SENSOR CONNECTOR OBSTRUCTION (ICE, SNOW, MUD, DIRT)
DECOUPLING RING MISSING/MOUNTED WRONG
OBJECTS - SUCH AS LICENSE PLATES - IN CLOSE RANGE TO THE SENSOR
PARK ASSIST SENSOR

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**

   NOTE: Before proceeding with this diagnostic procedure, remove any ice, snow, mud, dirt, or other obstructions from the front/rear fascia/bumper. Also remove any ice, snow, dirt, mud, or other obstructions from the underside of the Fascia/Bumper surrounding the sensors.

   1. Turn the ignition on.
   2. With the scan tool, read Park Assist Module DTCs.

      Does the scan tool display this DTC as active?

      Yes

      - Go To 2

      No

      - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **PARK ASSIST SENSOR**

1. Verify that none of the possible causes mentioned above are present. Repair as necessary.

   If none of the possible causes mentioned above are present, view repair.

   Repair

   - Replace the Park Assist Sensor that caused this DTC to change from active to stored after disconnecting it in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1296-92-PTS SENSOR 9 - PERFORMANCE OR INCORRECT OPERATION

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 40: Identifying Rear Park Assist Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Park Assist Sensors are ultrasonic transceivers that are completely controlled by the Park Assist Module. The sensors transmit and receive ultrasonic signals. Each sensor has a voltage, signal, and return circuit to the module. The sensors communicate with the Park Assist Module using a dedicated serial bus communication circuit.

NOTE: **The numbering system for the park assist sensors allows for up to twelve sensors on the vehicle, six front and six rear. The sensors are numbered in a clockwise manner starting at the left front bumper. The left front sensor (if equipped with front park assist) is the number 1 sensor. The numbering continues in a clockwise direction around the vehicle.**

WHEN MONITORED

Vehicle in reverse and during the self-test while vehicle is in drive between 18 km/h (11 mph) and 40 km/h (25 mph).

SET CONDITION

If the system detects data corruption in the transmission in the internal communication line between the module and sensors, this code will set.

POSSIBLE CAUSES

Possible Causes
(D703) PARK ASSIST SENSOR 9 SIGNAL CIRCUIT SHORTED TO GROUND
(D703) PARK ASSIST SENSOR 9 SIGNAL CIRCUIT SHORTED TO BATTERY
(D703) PARK ASSIST SENSOR 9 SIGNAL CIRCUIT OPEN
PARK ASSIST SENSOR 9
PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
    1. Turn the ignition on.
    2. With the scan tool, read Park Assist Module DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK PARK ASSIST SENSOR 9 FOR INTERNAL SHORT**

1. Disconnect Park Assist Sensor 9.
2. With the scan tool, read Park Assist Module DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Go To 3

   No

   - Replace Park Assist Sensor 9 in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (D703) PARK ASSIST SENSOR 9 SIGNAL CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Disconnect the Park Assist Module C2 harness connector.
   3. Using a 12-volt test light connected to 12-volts check the (D703) Park Assist Sensor 9 Signal circuit for a short to ground at the Park Assist Module C2 harness connector.

      Does the test light illuminate brightly?

      Yes

      - Repair the (D703) Park Assist Sensor 9 Signal circuit for a short to ground.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 4

4. **CHECK THE (D703) PARK ASSIST SENSOR 9 SIGNAL CIRCUIT FOR A SHORT TO BATTERY**
   1. Turn the ignition on.
   2. Using a 12-volt test light connected to ground check the (D703) Park Assist Sensor 9 Signal circuit at the Park Assist Module C2 harness connector for a short to battery.

      Does the test light illuminate brightly?

      Yes

      - Repair the (D703) Park Assist Sensor 9 Signal circuit for a short to battery.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 5

5. **CHECK THE (D703) PARK ASSIST SENSOR 9 SIGNAL CIRCUIT FOR AN OPEN**
   1. Measure the resistance of the (D703) Park Assist Sensor 9 Signal circuit between the Park Assist Module C2 harness connector and the Park Assist Sensor 9 harness connector.

      Is the resistance below 5.0 Ohms?

      No

      - Repair the (D703) Park Assist Sensor 9 Signal circuit for an open.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      Yes

      - Replace the Park Assist Module in accordance with Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1297-11-PTS SENSOR 10 - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 41: Identifying Rear Park Assist Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Park Assist Sensors are ultrasonic transceivers that are completely controlled by the Park Assist Module. The sensors transmit and receive ultrasonic signals. Each sensor has a voltage, signal and return circuit to the module. The sensors communicate with the Park Assist Module using a dedicated serial bus communication circuit.

NOTE: The numbering system for the park assist sensors allows for up to twelve sensors on the vehicle, six front and six rear. The sensors are numbered in a clockwise manner starting at the left front bumper. The left front sensor (if equipped with front park assist) is the number 1 sensor. The numbering continues in a clockwise direction around the vehicle.

WHEN MONITORED

Vehicle in reverse and during the self-test while vehicle is in drive between 18 km/h (11 mph) and 40 km/h (25 mph).

SET CONDITION

The Park Assist Module detects a short to ground on the Park Assist Sensor Signal circuit.

POSSIBLE CAUSES

Possible Causes
PARK ASSIST SENSOR DISCONNECTED
(D704) PARK ASSIST SENSOR 10 SIGNAL CIRCUIT SHORTED TO GROUND
(D704) PARK ASSIST SENSOR 10 SIGNAL CIRCUIT SHORTED TO THE (X750) PARK ASSIST SENSOR GROUND CIRCUIT
(D704) PARK ASSIST SENSOR 10 SIGNAL CIRCUIT OPEN
(X700) PARK ASSIST SENSOR SUPPLY CIRCUIT OPEN
PARK ASSIST SENSOR
PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**

   NOTE: A disconnected sensor will set this DTC. Verify the Park Assist Sensor is connected before proceeding with this diagnostic procedure.

   1. Turn the ignition on.
   2. With the scan tool, read DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Go To 2

   No

- Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK THE VOLTAGE OF THE (X700) PARK ASSIST SENSOR SUPPLY CIRCUIT**
   1. Turn the ignition off.
   2. Disconnect the Park Assist Sensor harness connector.
   3. Turn the ignition on.
   4. Measure the voltage of the (X700) Park Assist Sensor Supply circuit.

   Is the voltage above 8.0 volts?

   Yes

   - Go To 4

   No

   - Go To 3

3. **CHECK THE (X700) PARK ASSIST SENSOR SUPPLY CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Disconnect the Park Assist Module C2 harness connector.
   3. Measure the resistance of the (X700) Park Assist Sensor Supply circuit.

   Is the resistance below 5.0 Ohms?

   Yes

   - Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Repair the open or high resistance in the (X700) Park Assist Sensor Supply circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK THE (D704) PARK ASSIST SENSOR 10 SIGNAL CIRCUIT FOR A SHORT TO GROUND WITH THE PARK ASSIST MODULE CONNECTED**

   NOTE: Perform this step with the Park Assist Module connected.

   1. Measure the resistance between ground and the (D704) Park Assist Sensor 10 Signal circuit.

Is the resistance below 10K Ohms?

Yes

- Go To 5

No

- Go To 7

5. **CHECK THE (D704) PARK ASSIST SENSOR 10 SIGNAL CIRCUIT FOR A SHORT TO GROUND WITH THE PARK ASSIST MODULE DISCONNECTED**
   1. Disconnect the Park Assist Module C2 harness connector.
   2. Measure the resistance between ground and the (D704) Park Assist Sensor 10 Signal circuit.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the short to ground in the (D704) Park Assist Sensor 10 Signal circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 6

6. **CHECK THE (D704) PARK ASSIST SENSOR 10 SIGNAL CIRCUIT FOR A SHORT TO THE (X750) PARK ASSIST SENSOR GROUND CIRCUIT**
   1. Measure the resistance between the (D704) Park Assist Sensor 10 Signal circuit and the (X750) Park Assist Sensor Ground circuit.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the short between the (D704) Park Assist Sensor 10 Signal circuit and the (X750) Park Assist Sensor Ground circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

7. **CHECK THE (D704) PARK ASSIST SENSOR 10 SIGNAL CIRCUIT FOR AN OPEN**
   1. Disconnect the Park Assist Module C2 harness connector.

2. Measure the resistance of the (D704) Park Assist Sensor 10 Signal circuit.

   Is the resistance above 5.0 Ohms?

   Yes

   - Repair the open in the (D704) Park Assist Sensor 10 Signal circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 8

8. **PARK ASSIST SENSOR**
   1. Turn the ignition on.
   2. Reconnect the Park Assist Module C2 harness connector.
   3. Connect a jumper wire across the (X700) Park Assist Sensor Supply and (D704) Park Assist Sensor 10 Signal circuits.
   4. Turn the ignition on.
   5. With the scan tool, read DTCs.

      Does the scan tool display DTC: B1297-12-PTS SENSOR 10 - CIRCUIT SHORT TO BATTERY as active?

      Yes

      - Replace the Park Assist Sensor in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1297-12-PTS SENSOR 10 - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 42: Identifying Rear Park Assist Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Park Assist Sensors are ultrasonic transceivers that are completely controlled by the Park Assist Module. The sensors transmit and receive ultrasonic signals. Each sensor has a voltage, signal, and return circuit to the module. The sensors communicate with the Park Assist Module using a dedicated serial bus communication circuit.

NOTE: **The numbering system for the park assist sensors allows for up to twelve sensors on the vehicle, six front and six rear. The sensors are numbered in a clockwise manner starting at the left front bumper. The left front sensor (if equipped with front park assist) is the number 1 sensor. The numbering continues in a clockwise direction around the vehicle.**

WHEN MONITORED

Vehicle in reverse and during the self-test while vehicle is in drive between 18 km/h (11 mph) and 40 km/h (25 mph).

SET CONDITION

The Park Assist Module detects an open or short to voltage on the Park Assist Sensor Signal circuit.

POSSIBLE CAUSES

Possible Causes
(D704) PARK ASSIST SENSOR 10 SIGNAL CIRCUIT SHORTED TO VOLTAGE
(D704) PARK ASSIST SENSOR 10 SIGNAL CIRCUIT SHORTED TO THE (X700) PARK ASSIST SENSOR SUPPLY CIRCUIT
(X750) PARK ASSIST SENSOR GROUND CIRCUIT OPEN
PARK ASSIST SENSOR
PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **(D704) PARK ASSIST SENSOR 10 SIGNAL CIRCUIT SHORTED TO BATTERY**

1. Turn the ignition off.
2. Disconnect the Park Assist Module C2 harness connector.
3. Disconnect the Park Assist Sensor harness connector.
4. Turn the ignition on.
5. Measure the voltage of the (D704) Park Assist Sensor 10 Signal circuit.

   Is the voltage above 10.0 volts?

   Yes

   - Repair the (D704) Park Assist Sensor 10 Signal circuit for a short to battery.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 3

3. **(D704) PARK ASSIST SENSOR 10 SIGNAL CIRCUIT SHORTED TO THE (X700) PARK ASSIST SENSOR SUPPLY CIRCUIT**
   1. Turn the ignition off.
   2. Measure the resistance between the (D704) Park Assist Sensor 10 Signal circuit and the (X700) Park Assist Sensor Supply circuit.

      Is the resistance below 10K Ohms?

      Yes

      - Repair the (D704) Park Assist Sensor 10 Signal circuit for a short to the (X700) Park Assist Sensor Supply circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 4

4. **(X750) PARK ASSIST SENSOR GROUND CIRCUIT OPEN**
   1. Reconnect the Park Assist Module C2 harness connector.
   2. Measure the resistance between ground and the (X750) Park Assist Sensor Ground circuit.

      Is the resistance above 20.0 Ohms?

      Yes

      - Go To 5

No

- Replace the Park Assist Sensor in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **(X750) PARK ASSIST SENSOR GROUND CIRCUIT OPEN BETWEEN PARK ASSIST MODULE AND SENSOR**
   1. Disconnect the Park Assist Module C2 harness connector.
   2. Measure the resistance of the (X750) Park Assist Sensor Ground circuit.

   Is the resistance above 5.0 Ohms?

   Yes

   - Repair the open in the (X750) Park Assist Sensor Ground circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1297-25-PTS SENSOR 10 - SIGNAL SHAPE / WAVEFORM FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 43: Identifying Rear Park Assist Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Park Assist Sensors are ultrasonic transceivers that are completely controlled by the Park Assist Module. The sensors transmit and receive ultrasonic signals. Each sensor has a voltage, signal, and return circuit to the module. The sensors communicate with the Park Assist Module using a dedicated serial bus communication circuit.

WHEN MONITORED

Vehicle in reverse.

During the self-test while vehicle is in drive between 11 mph (18 km/h) and 25 mph (40 km/h).

SET CONDITION

The Park Assist Module detects an internal Sensor error.

POSSIBLE CAUSES

Possible Causes
PARK ASSIST SENSOR MEMBRANE OBSTRUCTION (ICE, SNOW, MUD, DIRT COVERING FASCIA)
PARK ASSIST SENSOR CONNECTOR OBSTRUCTION (ICE, SNOW, MUD, DIRT)
DECOUPLING RING MISSING/MOUNTED WRONG
OBJECTS - SUCH AS LICENSE PLATES - IN CLOSE RANGE TO THE SENSOR
PARK ASSIST SENSOR

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**

   NOTE: Before proceeding with this diagnostic procedure, remove any ice, snow, mud, dirt, or other obstructions from the front/rear fascia/bumper. Also remove any ice, snow, dirt, mud, or other obstructions from the underside of the Fascia/Bumper surrounding the sensors.

   1. Turn the ignition on.
   2. With the scan tool, read Park Assist Module DTCs.

      Does the scan tool display this DTC as active?

      Yes

      - Go To 2

      No

      - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **PARK ASSIST SENSOR**

1. Verify that none of the possible causes mentioned above are present. Repair as necessary.

   If none of the possible causes mentioned above are present, view repair.

   Repair

   - Replace the Park Assist Sensor in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1297-92-PTS SENSOR 10 - PERFORMANCE OR INCORRECT OPERATION

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 44: Identifying Rear Park Assist Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Park Assist Sensors are ultrasonic transceivers that are completely controlled by the Park Assist Module. The sensors transmit and receive ultrasonic signals. Each sensor has a voltage, signal, and return circuit to the module. The sensors communicate with the Park Assist Module using a dedicated serial bus communication circuit.

NOTE: **The numbering system for the park assist sensors allows for up to twelve sensors on the vehicle, six front and six rear. The sensors are numbered in a clockwise manner starting at the left front bumper. The left front sensor (if equipped with front park assist) is the number 1 sensor. The numbering continues in a clockwise direction around the vehicle.**

WHEN MONITORED

Vehicle in reverse and during the self-test while vehicle is in drive between 18 km/h (11 mph) and 40 km/h (25 mph).

SET CONDITION

If the system detects data corruption in the transmission in the internal communication line between the module and sensors, this code will set.

POSSIBLE CAUSES

Possible Causes
(D704) PARK ASSIST SENSOR 10 SIGNAL CIRCUIT SHORTED TO GROUND
(D704) PARK ASSIST SENSOR 10 SIGNAL CIRCUIT SHORTED TO BATTERY
(D704) PARK ASSIST SENSOR 10 SIGNAL CIRCUIT OPEN
PARK ASSIST SENSOR 10
PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
    1. Turn the ignition on.
    2. With the scan tool, read Park Assist Module DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK PARK ASSIST SENSOR 10 FOR INTERNAL SHORT**

1. Disconnect Park Assist Sensor 10.
2. With the scan tool, read Park Assist Module DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Go To 3

   No

   - Replace Park Assist Sensor 10 in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (D704) PARK ASSIST SENSOR 10 SIGNAL CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Disconnect the Park Assist Module C2 harness connector.
   3. Using a 12-volt test light connected to 12-volts check the (D704) Park Assist Sensor 10 Signal circuit at the Park Assist Module C2 harness connector.

      Does the test light illuminate brightly?

      Yes

      - Repair the (D704) Park Assist Sensor 10 Signal circuit for a short to ground.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 4

4. **CHECK THE (D704) PARK ASSIST SENSOR 10 SIGNAL CIRCUIT FOR A SHORT TO BATTERY**
   1. Turn the ignition on.
   2. Using a 12-volt test light connected to ground check the (D704) Park Assist Sensor 10 Signal circuit at the Park Assist Module C2 harness connector for a short to battery.

      Does the test light illuminate brightly?

      Yes

      - Repair the (D704) Park Assist Sensor 10 Signal circuit for a short to battery.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 5

5. **CHECK THE (D704) PARK ASSIST SENSOR 10 SIGNAL CIRCUIT FOR AN OPEN**
   1. Turn the ignition off.
   2. Measure the resistance of the (D704) Park Assist Sensor 10 Signal circuit between the Park Assist Module C2 harness connector and the Park Assist Sensor 10 harness connector.

      Is the resistance below 5.0 Ohms?

      No

      - Repair the (D704) Park Assist Sensor 10 Signal circuit for an open.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      Yes

      - Replace the Park Assist Module in accordance with Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1298-11-PTS SENSOR 11 - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 45: Identifying Rear Park Assist Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Park Assist Sensors are ultrasonic transceivers that are completely controlled by the Park Assist Module. The sensors transmit and receive ultrasonic signals. Each sensor has a voltage, signal, and return circuit to the module. The sensors communicate with the Park Assist Module using a dedicated serial bus communication circuit.

NOTE: The numbering system for the park assist sensors allows for up to twelve sensors on the vehicle, six front and six rear. The sensors are numbered in a clockwise manner starting at the left front bumper. The left front sensor (if equipped with front park assist) is the number 1 sensor. The numbering continues in a clockwise direction around the vehicle.

WHEN MONITORED

Vehicle in reverse and during the self-test while vehicle is in drive between 18 km/h (11 mph) and 40 km/h (25 mph).

SET CONDITION

The Park Assist Module detects a short to ground on the Park Assist Sensor Signal circuit.

POSSIBLE CAUSES

Possible Causes
PARK ASSIST SENSOR DISCONNECTED
(D710) PARK ASSIST SENSOR 11 SIGNAL CIRCUIT SHORTED TO GROUND
(D710) PARK ASSIST SENSOR 11 SIGNAL CIRCUIT SHORTED TO THE (X750) PARK ASSIST SENSOR GROUND CIRCUIT
(D710) PARK ASSIST SENSOR 11 SIGNAL CIRCUIT OPEN
(X700) PARK ASSIST SENSOR SUPPLY CIRCUIT OPEN
PARK ASSIST SENSOR
PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**

   NOTE: A disconnected sensor will set this DTC. Verify the Park Assist Sensor is connected before proceeding with this diagnostic procedure.

   1. Turn the ignition on.
   2. With the scan tool, read DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Go To 2

   No

- Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK THE VOLTAGE OF THE (X700) PARK ASSIST SENSOR SUPPLY CIRCUIT**
   1. Turn the ignition off.
   2. Disconnect the Park Assist Sensor 11 harness connector.
   3. Turn the ignition on.
   4. Measure the voltage of the (X700) Park Assist Sensor Supply circuit.

   Is the voltage above 8.0 volts?

   Yes

   - Go To 4

   No

   - Go To 3

3. **CHECK THE (X700) PARK ASSIST SENSOR SUPPLY CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Disconnect the Park Assist Module C2 harness connector.
   3. Measure the resistance of the (X700) Park Assist Sensor Supply circuit.

   Is the resistance below 5.0 Ohms?

   Yes

   - Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Repair the open or high resistance in the (X700) Park Assist Sensor Supply circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK THE (D711) PARK ASSIST SENSOR 11 SIGNAL CIRCUIT FOR A SHORT TO GROUND WITH THE PARK ASSIST MODULE CONNECTED**

   NOTE: Perform this step with the Park Assist Module connected.

   1. Measure the resistance between ground and the (D711) Park Assist Sensor 11 Signal circuit.

Is the resistance below 10K Ohms?

Yes

- Go To 5

No

- Go To 7

5. **CHECK THE (D711) PARK ASSIST SENSOR 11 SIGNAL CIRCUIT FOR A SHORT TO GROUND WITH THE PARK ASSIST MODULE DISCONNECTED**
   1. Disconnect the Park Assist Module C2 harness connector.
   2. Measure the resistance between ground and the (D711) Park Assist Sensor 11 Signal circuit.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the short to ground in the (D711) Park Assist Sensor 11 Signal circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 6

6. **CHECK THE (D711) PARK ASSIST SENSOR 11 SIGNAL CIRCUIT FOR A SHORT TO THE (X750) PARK ASSIST SENSOR GROUND CIRCUIT**
   1. Measure the resistance between the (D711) Park Assist Sensor 11 Signal circuit and the (X750) Park Assist Sensor Ground circuit.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the short between the (D711) Park Assist Sensor 11 Signal circuit and the (X750) Park Assist Sensor Ground circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

7. **CHECK THE (D711) PARK ASSIST SENSOR 11 SIGNAL CIRCUIT FOR AN OPEN**
   1. Disconnect the Park Assist Module C2 harness connector.

2. Measure the resistance of the (D711) Park Assist Sensor 11 Signal circuit.

   Is the resistance above 5.0 Ohms?

   Yes

   - Repair the open in the (D711) Park Assist Sensor 11 Signal circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 8

8. **PARK ASSIST SENSOR**
   1. Turn the ignition on.
   2. Reconnect the Park Assist Module C2 harness connector.
   3. Connect a jumper wire across the (X700) Park Assist Sensor Supply and (D711) Park Assist Sensor 11 Signal circuits.
   4. Turn the ignition on.
   5. With the scan tool, read DTCs.

      Does the scan tool display DTC: B1298-12 PTS SENSOR 11-CIRCUIT SHORT TO BATTERY as active?

      Yes

      - Replace the Park Assist Sensor in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1298-12-PTS SENSOR 11 - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 46: Identifying Rear Park Assist Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Park Assist Sensors are ultrasonic transceivers that are completely controlled by the Park Assist Module. The sensors transmit and receive ultrasonic signals. Each sensor has a voltage, signal, and return circuit to the module. The sensors communicate with the Park Assist Module using a dedicated serial bus communication circuit.

NOTE: **The numbering system for the park assist sensors allows for up to twelve sensors on the vehicle, six front and six rear. The sensors are numbered in a clockwise manner starting at the left front bumper. The left front sensor (if equipped with front park assist) is the number 1 sensor. The numbering continues in a clockwise direction around the vehicle.**

WHEN MONITORED

Vehicle in reverse and during the self-test while vehicle is in drive between 18 km/h (11 mph) and 40 km/h (25 mph).

SET CONDITION

The Park Assist Module detects an open or short to voltage on the Park Assist Sensor Signal circuit.

POSSIBLE CAUSES

Possible Causes
(D710) PARK ASSIST SENSOR 11 SIGNAL CIRCUIT SHORTED TO VOLTAGE
(D710) PARK ASSIST SENSOR 11 SIGNAL CIRCUIT SHORTED TO THE (X700) PARK ASSIST SENSOR SUPPLY CIRCUIT
(X750) PARK ASSIST SENSOR GROUND CIRCUIT OPEN
PARK ASSIST SENSOR
PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **(D710) PARK ASSIST SENSOR 11 SIGNAL CIRCUIT SHORTED TO BATTERY**

1. Turn the ignition off.
2. Disconnect the Park Assist Module C2 harness connector.
3. Disconnect the Park Assist Sensor 11 harness connector.
4. Turn the ignition on.
5. Measure the voltage of the (D710) Park Assist Sensor 11 Signal circuit.

   Is the voltage above 10.0 volts?

   Yes

   - Repair the (D710) Park Assist Sensor 11 Signal circuit for a short to battery.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 3

3. **(D710) PARK ASSIST SENSOR 11 SIGNAL CIRCUIT SHORTED TO THE (X700) PARK ASSIST SENSOR SUPPLY CIRCUIT**
   1. Turn the ignition off.
   2. Measure the resistance between the (D710) Park Assist Sensor 11 Signal circuit and the (X700) Park Assist Sensor Supply circuit.

      Is the resistance below 10K Ohms?

      Yes

      - Repair the (D710) Park Assist Sensor 11 Signal circuit for a short to the (X700) Park Assist Sensor Supply circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 4

4. **(X750) PARK ASSIST SENSOR GROUND CIRCUIT OPEN**
   1. Reconnect the Park Assist Module C2 harness connector.
   2. Measure the resistance between ground and the (X750) Park Assist Sensor Ground circuit.

      Is the resistance above 20.0 Ohms?

      Yes

      - Go To 5

No

- Replace the Park Assist Sensor in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **(X750) PARK ASSIST SENSOR GROUND CIRCUIT OPEN BETWEEN PARK ASSIST MODULE AND SENSOR**
   1. Disconnect the Park Assist Module C2 harness connector.
   2. Measure the resistance of the (X750) Park Assist Sensor Ground circuit.

   Is the resistance above 5.0 Ohms?

   Yes

   - Repair the open in the (X750) Park Assist Sensor Ground circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1298-25-PTS SENSOR 11-SIGNAL SHAPE / WAVEFORM FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 47: Identifying Rear Park Assist Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Park Assist Sensors are ultrasonic transceivers that are completely controlled by the Park Assist Module. The sensors transmit and receive ultrasonic signals. Each sensor has a voltage, signal, and return circuit to the module. The sensors communicate with the Park Assist Module using a dedicated serial bus communication circuit.

WHEN MONITORED

Vehicle in reverse.

During the self-test while vehicle is in drive between 11 mph (18 km/h) and 25 mph (40 km/h).

SET CONDITION

The Park Assist Module detects an internal Sensor error.

POSSIBLE CAUSES

Possible Causes
PARK ASSIST SENSOR MEMBRANE OBSTRUCTION (ICE, SNOW, MUD, DIRT COVERING FASCIA)
PARK ASSIST SENSOR CONNECTOR OBSTRUCTION (ICE, SNOW, MUD, DIRT)
DECOUPLING RING MISSING/MOUNTED WRONG
OBJECTS - SUCH AS LICENSE PLATES - IN CLOSE RANGE TO THE SENSOR
PARK ASSIST SENSOR

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**

   NOTE: Before proceeding with this diagnostic procedure, remove any ice, snow, mud, dirt, or other obstructions from the front/rear fascia/bumper. Also remove any ice, snow, dirt, mud, or other obstructions from the underside of the Fascia/Bumper surrounding the sensors.

   1. Turn the ignition on.
   2. With the scan tool, read Park Assist Module DTCs.

      Does the scan tool display this DTC as active?

      Yes

      - Go To 2

      No

      - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **PARK ASSIST SENSOR**

1. Verify that none of the possible causes mentioned above are present. Repair as necessary.

   If none of the possible causes mentioned above are present, view repair.

   Repair

   - Replace the Park Assist Sensor in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1298-92-PTS SENSOR 11-PERFORMANCE OR INCORRECT OPERATION

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 48: Identifying Rear Park Assist Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Park Assist Sensors are ultrasonic transceivers that are completely controlled by the Park Assist Module. The sensors transmit and receive ultrasonic signals. Each sensor has a voltage, signal, and return circuit to the module. The sensors communicate with the Park Assist Module using a dedicated serial bus communication circuit.

NOTE: **The numbering system for the park assist sensors allows for up to twelve sensors on the vehicle, six front and six rear. The sensors are numbered in a clockwise manner starting at the left front bumper. The left front sensor (if equipped with front park assist) is the number 1 sensor. The numbering continues in a clockwise direction around the vehicle.**

WHEN MONITORED

Vehicle in reverse and during the self-test while vehicle is in drive between 18 km/h (11 mph) and 40 km/h (25 mph).

SET CONDITION

If the system detects data corruption in the transmission in the internal communication line between the module and sensors, this code will set.

POSSIBLE CAUSES

Possible Causes
(D710) PARK ASSIST SENSOR 11 SIGNAL CIRCUIT SHORTED TO GROUND
(D710) PARK ASSIST SENSOR 11 SIGNAL CIRCUIT SHORTED TO BATTERY
(D710) PARK ASSIST SENSOR 11 SIGNAL CIRCUIT OPEN
PARK ASSIST SENSOR 11
PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
    1. Turn the ignition on.
    2. With the scan tool, read Park Assist Module DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK PARK ASSIST SENSOR 11 FOR INTERNAL SHORT**

1. Disconnect Park Assist Sensor 11 harness connector.
2. With the scan tool, read Park Assist Module DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Go To 3

   No

   - Replace Park Assist Sensor 11 in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (D710) PARK ASSIST SENSOR 11 SIGNAL CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Disconnect the Park Assist Module C2 harness connector.
   3. Using a 11-volt test light connected to 11-volts check the (D710) Park Assist Sensor 11 Signal circuit at the Park Assist Module C2 harness connector.

      Does the test light illuminate brightly?

      Yes

      - Repair the (D710) Park Assist Sensor 11 Signal circuit for a short to ground.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 4

4. **CHECK THE (D710) PARK ASSIST SENSOR 11 SIGNAL CIRCUIT FOR A SHORT TO BATTERY**
   1. Turn the ignition on.
   2. Using a 11-volt test light connected to ground check the (D710) Park Assist Sensor 11 Signal circuit at the Park Assist Module C2 harness connector for a short to battery.

      Does the test light illuminate brightly?

      Yes

      - Repair the (D710) Park Assist Sensor 11 Signal circuit for a short to battery.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 5

5. **CHECK THE (D710) PARK ASSIST SENSOR 11 SIGNAL CIRCUIT FOR AN OPEN**
   1. Measure the resistance of the (D710) Park Assist Sensor 11 Signal circuit between the Park Assist Module C2 harness connector and the Park Assist Sensor 11 harness connector.

      Is the resistance below 5.0 Ohms?

      No

      - Repair the (D710) Park Assist Sensor 11 Signal circuit for an open.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      Yes

      - Replace the Park Assist Module in accordance with Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1299-11-PTS SENSOR 12 - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 49: Identifying Rear Park Assist Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Park Assist Sensors are ultrasonic transceivers that are completely controlled by the Park Assist Module. The sensors transmit and receive ultrasonic signals. Each sensor has a voltage, signal, and return circuit to the module. The sensors communicate with the Park Assist Module using a dedicated serial bus communication circuit.

NOTE: The numbering system for the park assist sensors allows for up to twelve sensors on the vehicle, six front and six rear. The sensors are numbered in a clockwise manner starting at the left front bumper. The left front sensor (if equipped with front park assist) is the number 1 sensor. The numbering continues in a clockwise direction around the vehicle.

WHEN MONITORED

Vehicle in reverse and during the self-test while vehicle is in drive between 18 km/h (11 mph) and 40 km/h (25 mph).

SET CONDITION

The Park Assist Module detects a short to ground on the Park Assist Sensor Signal circuit.

POSSIBLE CAUSES

Possible Causes
PARK ASSIST SENSOR DISCONNECTED
(D712) PARK ASSIST SENSOR 12 SIGNAL CIRCUIT SHORTED TO GROUND
(D712) PARK ASSIST SENSOR 12 SIGNAL CIRCUIT SHORTED TO THE (X750) PARK ASSIST SENSOR GROUND CIRCUIT
(D712) PARK ASSIST SENSOR 12 SIGNAL CIRCUIT OPEN
(X700) PARK ASSIST SENSOR SUPPLY CIRCUIT OPEN
PARK ASSIST SENSOR
PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**

   NOTE: A disconnected sensor will set this DTC. Verify the Park Assist Sensor is connected before proceeding with this diagnostic procedure.

   1. Turn the ignition on.
   2. With the scan tool, read DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Go To 2

   No

- Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK THE VOLTAGE OF THE (X700) PARK ASSIST SENSOR SUPPLY CIRCUIT**
   1. Turn the ignition off.
   2. Disconnect the Park Assist Sensor 12 harness connector.
   3. Turn the ignition on.
   4. Measure the voltage of the (X700) Park Assist Sensor Supply circuit.

   Is the voltage above 8.0 volts?

   Yes

   - Go To 4

   No

   - Go To 3

3. **CHECK THE (X700) PARK ASSIST SENSOR SUPPLY CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Disconnect the Park Assist Module C2 harness connector.
   3. Measure the resistance of the (X700) Park Assist Sensor Supply circuit.

   Is the resistance below 5.0 Ohms?

   Yes

   - Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Repair the open or high resistance in the (X700) Park Assist Sensor Supply circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK THE (D712) PARK ASSIST SENSOR 12 SIGNAL CIRCUIT FOR A SHORT TO GROUND WITH THE PARK ASSIST MODULE CONNECTED**

   NOTE: Perform this step with the Park Assist Module connected.

   1. Measure the resistance between ground and the (D712) Park Assist Sensor 12 Signal circuit.

Is the resistance below 10K Ohms?

Yes

- Go To 5

No

- Go To 7

5. **CHECK THE (D712) PARK ASSIST SENSOR 12 SIGNAL CIRCUIT FOR A SHORT TO GROUND WITH THE PARK ASSIST MODULE DISCONNECTED**
   1. Disconnect the Park Assist Module C2 harness connector.
   2. Measure the resistance between ground and the (D712) Park Assist Sensor 12 Signal circuit.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the short to ground in the (D712) Park Assist Sensor 12 Signal circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 6

6. **CHECK THE (D712) PARK ASSIST SENSOR 12 SIGNAL CIRCUIT FOR A SHORT TO THE (X750) PARK ASSIST SENSOR GROUND CIRCUIT**
   1. Measure the resistance between the (D712) Park Assist Sensor 12 Signal circuit and the (X750) Park Assist Sensor Ground circuit.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the short between the (D712) Park Assist Sensor 12 Signal circuit and the (X750) Park Assist Sensor Ground circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

7. **CHECK THE (D712) PARK ASSIST SENSOR 12 SIGNAL CIRCUIT FOR AN OPEN**
   1. Disconnect the Park Assist Module C2 harness connector.

2. Measure the resistance of the (D712) Park Assist Sensor 12 Signal circuit.

   Is the resistance above 5.0 Ohms?

   Yes

   - Repair the open in the (D712) Park Assist Sensor 12 Signal circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 8

8. **PARK ASSIST SENSOR**
   1. Turn the ignition on.
   2. Reconnect the Park Assist Module C2 harness connector.
   3. Connect a jumper wire across the (X700) Park Assist Sensor Supply and (D712) Park Assist Sensor 12 Signal circuits.
   4. Turn the ignition on.
   5. With the scan tool, read DTCs.

      Does the scan tool display DTC: B1299-12-PTS SENSOR 12 CIRCUIT SHORT TO BATTERY as active?

      Yes

      - Replace the Park Assist Sensor in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1299-12-PTS SENSOR 12-CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 50: Identifying Rear Park Assist Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Park Assist Sensors are ultrasonic transceivers that are completely controlled by the Park Assist Module. The sensors transmit and receive ultrasonic signals. Each sensor has a voltage, signal, and return circuit to the module. The sensors communicate with the Park Assist Module using a dedicated serial bus communication circuit.

NOTE: **The numbering system for the park assist sensors allows for up to twelve sensors on the vehicle, six front and six rear. The sensors are numbered in a clockwise manner starting at the left front bumper. The left front sensor (if equipped with front park assist) is the number 1 sensor. The numbering continues in a clockwise direction around the vehicle.**

WHEN MONITORED

Vehicle in reverse and during the self-test while vehicle is in drive between 18 km/h (11 mph) and 40 km/h (25 mph).

SET CONDITION

The Park Assist Module detects an open or short to voltage on the Park Assist Sensor Signal circuit.

POSSIBLE CAUSES

Possible Causes
(D712) PARK ASSIST SENSOR 12 SIGNAL CIRCUIT SHORTED TO VOLTAGE
(D712) PARK ASSIST SENSOR 12 SIGNAL CIRCUIT SHORTED TO THE (X700) PARK ASSIST SENSOR SUPPLY CIRCUIT
(X750) PARK ASSIST SENSOR GROUND CIRCUIT OPEN
PARK ASSIST SENSOR
PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
    1. Turn the ignition on.
    2. With the scan tool, read Park Assist Module DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK PARK ASSIST SENSOR 12 FOR INTERNAL SHORT**

1. Disconnect Park Assist Sensor 12 harness connector.
2. With the scan tool, read Park Assist Module DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Go To 3

   No

   - Replace Park Assist Sensor 12 in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (D712) PARK ASSIST SENSOR 12 SIGNAL CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Disconnect the Park Assist Module C2 harness connector.
   3. Using a 12-volt test light connected to 12-volts check the (D712) Park Assist Sensor 12 Signal circuit at the Park Assist Module C2 harness connector.

      Does the test light illuminate brightly?

      Yes

      - Repair the (D712) Park Assist Sensor 12 Signal circuit for a short to ground.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 4

4. **CHECK THE (D712) PARK ASSIST SENSOR 12 SIGNAL CIRCUIT FOR A SHORT TO BATTERY**
   1. Turn the ignition on.
   2. Using a 12-volt test light connected to ground check the (D712) Park Assist Sensor 12 Signal circuit at the Park Assist Module C2 harness connector for a short to battery.

      Does the test light illuminate brightly?

      Yes

      - Repair the (D712) Park Assist Sensor 12 Signal circuit for a short to battery.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 5

5. **CHECK THE (D712) PARK ASSIST SENSOR 12 SIGNAL CIRCUIT FOR AN OPEN**
   1. Measure the resistance of the (D712) Park Assist Sensor 12 Signal circuit between the Park Assist Module C2 harness connector and the Park Assist Sensor 12 harness connector.

      Is the resistance below 5.0 Ohms?

      No

      - Repair the (D712) Park Assist Sensor 12 Signal circuit for an open.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      Yes

      - Replace the Park Assist Module in accordance with Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1299-25-PTS SENSOR 12 - SIGNAL SHAPE / WAVEFORM FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 51: Identifying Rear Park Assist Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Park Assist Sensors are ultrasonic transceivers that are completely controlled by the Park Assist Module. The sensors transmit and receive ultrasonic signals. Each sensor has a voltage, signal, and return circuit to the module. The sensors communicate with the Park Assist Module using a dedicated serial bus communication circuit.

WHEN MONITORED

Vehicle in reverse.

During the self-test while vehicle is in drive between 11 mph (18 km/h) and 25 mph (40 km/h).

SET CONDITION

The Park Assist Module detects an internal Sensor error.

POSSIBLE CAUSES

Possible Causes
PARK ASSIST SENSOR MEMBRANE OBSTRUCTION (ICE, SNOW, MUD, DIRT COVERING FASCIA)
PARK ASSIST SENSOR CONNECTOR OBSTRUCTION (ICE, SNOW, MUD, DIRT)
DECOUPLING RING MISSING/MOUNTED WRONG
OBJECTS - SUCH AS LICENSE PLATES - IN CLOSE RANGE TO THE SENSOR
PARK ASSIST SENSOR

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**

   NOTE: Before proceeding with this diagnostic procedure, remove any ice, snow, mud, dirt, or other obstructions from the front/rear fascia/bumper. Also remove any ice, snow, dirt, mud, or other obstructions from the underside of the Fascia/Bumper surrounding the sensors.

   1. Turn the ignition on.
   2. With the scan tool, read Park Assist Module DTCs.

      Does the scan tool display this DTC as active?

      Yes

      - Go To 2

      No

      - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **PARK ASSIST SENSOR**

1. Verify that none of the possible causes mentioned above are present. Repair as necessary.

   If none of the possible causes mentioned above are present, view repair.

   Repair

   - Replace the Park Assist Sensor in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1299-92 PTS SENSOR 12-PERFORMANCE OR INCORRECT OPERATION

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 52: Identifying Rear Park Assist Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Park Assist Sensors are ultrasonic transceivers that are completely controlled by the Park Assist Module. The sensors transmit and receive ultrasonic signals. Each sensor has a voltage, signal, and return circuit to the module. The sensors communicate with the Park Assist Module using a dedicated serial bus communication circuit.

NOTE: **The numbering system for the park assist sensors allows for up to twelve sensors on the vehicle, six front and six rear. The sensors are numbered in a clockwise manner starting at the left front bumper. The left front sensor (if equipped with front park assist) is the number 1 sensor. The numbering continues in a clockwise direction around the vehicle.**

WHEN MONITORED

Vehicle in reverse and during the self-test while vehicle is in drive between 18 km/h (11 mph) and 40 km/h (25 mph).

SET CONDITION

If the system detects data corruption in the transmission in the internal communication line between the module and sensors, this code will set.

POSSIBLE CAUSES

Possible Causes
(D712) PARK ASSIST SENSOR 12 SIGNAL CIRCUIT SHORTED TO GROUND
(D712) PARK ASSIST SENSOR 12 SIGNAL CIRCUIT SHORTED TO BATTERY
(D712) PARK ASSIST SENSOR 12 SIGNAL CIRCUIT OPEN
PARK ASSIST SENSOR 12
PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
    1. Turn the ignition on.
    2. With the scan tool, read Park Assist Module DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK PARK ASSIST SENSOR 12 FOR INTERNAL SHORT**

1. Disconnect Park Assist Sensor 12 harness connector.
2. With the scan tool, read Park Assist Module DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Go To 3

   No

   - Replace Park Assist Sensor 12 in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (D712) PARK ASSIST SENSOR 12 SIGNAL CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Disconnect the Park Assist Module C2 harness connector.
   3. Using a 12-volt test light connected to 12-volts check the (D712) Park Assist Sensor 12 Signal circuit at the Park Assist Module C2 harness connector.

      Does the test light illuminate brightly?

      Yes

      - Repair the (D712) Park Assist Sensor 12 Signal circuit for a short to ground.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 4

4. **CHECK THE (D712) PARK ASSIST SENSOR 12 SIGNAL CIRCUIT FOR A SHORT TO BATTERY**
   1. Turn the ignition on.
   2. Using a 12-volt test light connected to ground check the (D712) Park Assist Sensor 12 Signal circuit at the Park Assist Module C2 harness connector for a short to battery.

      Does the test light illuminate brightly?

      Yes

      - Repair the (D712) Park Assist Sensor 12 Signal circuit for a short to battery.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 5

5. **CHECK THE (D712) PARK ASSIST SENSOR 12 SIGNAL CIRCUIT FOR AN OPEN**
   1. Measure the resistance of the (D712) Park Assist Sensor 12 Signal circuit between the Park Assist Module C2 harness connector and the Park Assist Sensor 12 harness connector.

      Is the resistance below 5.0 Ohms?

      No

      - Repair the (D712) Park Assist Sensor 12 Signal circuit for an open.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      Yes

      - Replace the Park Assist Module in accordance with Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B210C-16-BATTERY VOLTAGE INPUT - CIRCUIT VOLTAGE BELOW THRESHOLD

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 53: PAM CAN C, Run Relay Control & Ground Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

Vehicle in reverse and during the self-test while vehicle is in drive between 18 km/h (11 mph) and 40 km/h (25 mph).

SET CONDITION

Park Assist Module supply voltage less than 6.5 volts.

POSSIBLE CAUSES

Possible Causes
VEHICLE CHARGING SYSTEM PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
   1. Turn the ignition on.
   2. With the scan tool, read Park Assist Module DTCs.

      Does the scan tool display this DTC as active?

      Yes

      - Go To 2

      No

      - The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **VERIFY OPERATION OF THE VEHICLE CHARGING SYSTEM**

   NOTE: Troubleshoot any PCM charging/cranking DTCs before proceeding.

   NOTE: Make sure the battery is fully charged.

   Are any charging system DTCs present?

   Yes

   - Refer to the **DTC INDEX** article and perform the appropriate diagnostic procedure.

   No

   - Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B210C-17-BATTERY VOLTAGE INPUT - CIRCUIT VOLTAGE ABOVE THRESHOLD

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 54: PAM CAN C, Run Relay Control & Ground Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

Vehicle in reverse and during the self-test while vehicle is in drive between 18 km/h (11 mph) and 40 km/h (25 mph).

SET CONDITION

Park Assist Module supply voltage greater than 16.0 volts.

POSSIBLE CAUSES

Possible Causes
VEHICLE CHARGING SYSTEM PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
   1. Turn the ignition on.
   2. With the scan tool, read Park Assist Module DTCs.

      Does the scan tool display this DTC as active?

      Yes

      - Go To 2

      No

      - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **VERIFY OPERATION OF THE VEHICLE CHARGING SYSTEM**

   NOTE: Troubleshoot any PCM charging/cranking DTCs before proceeding.

   NOTE: Make sure the battery is fully charged.

   Are any charging system DTCs present?

   Yes

   - Refer to the **DTC INDEX** article and perform the appropriate diagnostic procedure.

   No

   - Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B2128-16-SENSOR SUPPLY VOLTAGE - CIRCUIT VOLTAGE BELOW THRESHOLD

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Park Assist Sensors are ultrasonic transceivers that are completely controlled by the Park Assist Module. The sensors transmit and receive ultrasonic signals. Each sensor has a voltage, signal, and return circuit to the module. The sensors communicate with the Park Assist Module using a dedicated serial bus communication circuit.

WHEN MONITORED

Vehicle in reverse and during the self-test while vehicle is in drive between 18 km/h (11 mph) and 40 km/h (25 mph).

SET CONDITION

Park Assist Sensor supply voltage less than 7.2 volts.

POSSIBLE CAUSES

Possible Causes
FRONT PARK ASSIST SENSOR SUPPLY CIRCUIT SHORTED TO GROUND (IF EQUIPPED)
PARK ASSIST SENSOR SUPPLY CIRCUIT SHORTED TO GROUND
PARK ASSIST SENSOR
PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK EACH PARK ASSIST SENSOR FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Disconnect one Park Assist Sensor.
   3. Turn the ignition on.
   4. With the scan tool, read Park Assist Module DTCs. If this DTC is still active, repeat this procedure by disconnecting another Park Assist Sensor. However, if this DTC changes from active to stored, or if all sensors have been disconnected, proceed as follows:

      Does the scan tool still display this DTC as active?

      Yes

      - Go To 3

      No

      - Replace the Park Assist Sensor that caused this DTC to change from active to stored after disconnecting it in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (X702) FRONT PARK ASSIST SENSOR SUPPLY CIRCUIT SHORTED TO GROUND (IF EQUIPPED)**

   NOTE: If vehicle is not equipped with Front Park Assist, proceed to next test step.

   NOTE: Perform this test with all Front Park Assist Sensors disconnected.

   1. Disconnect the Park Assist Module C3 harness connector.
   2. Measure the resistance between ground and the (X702) Front Park Assist Sensor Supply circuit.

      Is the resistance below 10K Ohms?

      Yes

      - Repair the short to ground in the (X702) Front Park Assist Sensor Supply circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 4

4. **CHECK THE (X700) PARK ASSIST SENSOR SUPPLY CIRCUIT FOR A SHORT TO GROUND**

NOTE: Perform this test with all Rear Park Assist Sensors disconnected.

1. Disconnect the Park Assist Module C2 harness connector.
2. Measure the resistance between ground and the (X700) Park Assist Sensor Supply circuit.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the (X700) Park Assist Sensor Supply circuit for a short to ground.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B2128-17-SENSOR SUPPLY VOLTAGE - CIRCUIT VOLTAGE ABOVE THRESHOLD

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Park Assist Sensors are ultrasonic transceivers that are completely controlled by the Park Assist Module. The sensors transmit and receive ultrasonic signals. Each sensor has a voltage, signal, and return circuit to the module. The sensors communicate with the Park Assist Module using a dedicated serial bus communication circuit.

WHEN MONITORED

Vehicle in reverse and during the self-test while vehicle is in drive between 18 km/h (11 mph) and 40 km/h (25 mph).

SET CONDITION

Park Assist Sensor supply voltage greater than 9.2 volts.

POSSIBLE CAUSES

Possible Causes
FRONT PARK ASSIST SENSOR SUPPLY CIRCUIT SHORTED TO VOLTAGE (IF EQUIPPED)
PARK ASSIST SENSOR SUPPLY CIRCUIT SHORTED TO VOLTAGE
PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **CHECK FOR ACTIVE DTC**
   1. Turn the ignition on.
   2. With the scan tool, read Park Assist Module DTCs.

      Does the scan tool display this DTC as active?

      Yes

      - Go To 2

      No

      - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE (X702) FRONT PARK ASSIST SENSOR SUPPLY CIRCUIT FOR A SHORT TO VOLTAGE (IF EQUIPPED)**

   NOTE: If vehicle is not equipped with Front Park Assist, proceed to next test step.

   1. Turn the ignition off.
   2. Disconnect the Park Assist Module C3 harness connector.
   3. Turn the ignition on.
   4. Measure the voltage on the (X702) Front Park Assist Sensor Supply circuit.

      Is the voltage above 9.2 volts?

      Yes

      - Repair the (X702) Front Park Assist Sensor Supply circuit for a short to voltage.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 3
3. **CHECK THE (X700) PARK ASSIST SENSOR SUPPLY CIRCUIT FOR A SHORT TO VOLTAGE**
   1. Turn the ignition off.
   2. Disconnect the Park Assist Module C2 harness connector.
   3. Turn the ignition on.

4. Measure the voltage on the (X700) Park Assist Sensor Supply circuit.

   Is the voltage above 9.2 volts?

   Yes

   - Repair the (X700) Park Assist Sensor Supply circuit for a short to voltage.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B21DD-16-SYSTEM VOLTAGE - CIRCUIT VOLTAGE BELOW THRESHOLD

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

   NOTE: Make sure the battery is fully charged.

   Are any charging system DTCs present?

   Yes

   - Refer to the **DTC INDEX** article and perform the appropriate diagnostic procedure.

   No

   - Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U0002-00-CAN C BUS OFF PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Ignition run time is greater than one second.

Battery voltage between 9 and 16 volts.

Engine run time greater than three seconds.

SET CONDITION

The Steering Column Control Module (SCCM) detects a short condition on one of the CAN C Bus circuits.

POSSIBLE CAUSES

Possible Causes
CAN C BUS (+) CIRCUIT SHORTED TO GROUND
CAN C BUS (-) CIRCUIT SHORTED TO VOLTAGE
CAN C BUS (+) CIRCUIT SHORTED TO THE CAN C BUS (-) CIRCUIT
STAR CONNECTOR
ANY MODULE CONNECTED TO THE CAN C BUS

DIAGNOSTIC TEST

CHECK FOR AN ACTIVE DTC

1. Ignition on, engine not running.
2. With the scan tool, select view DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Refer to the **DTC INDEX** article and perform the U0002-00-CAN C BUS OFF PERFORMANCE diagnostic procedure.

   No

   - Refer to **DIAGNOSIS AND TESTING** and perform the STORED LOST COMMUNICATION DTCs diagnostic procedure.

B222A-00-VEHICLE LINE MISMATCH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

If the Vehicle Line data transmitted on the CAN C Interior bus doesn't correspond with the data stored in the Park Assist Module.

POSSIBLE CAUSES

Possible Causes
PARK ASSIST MODULE

DIAGNOSTIC TEST

CHECK VEHICLE LINE IN THE BCM

1. With the scan tool, compare the vehicle line that is programmed in to the BCM to the vehicle line of the vehicle.

   Does the vehicle line programmed into the BCM match the vehicle?

   Yes

   - Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Use the scan tool to read DTCs in all other modules. If any communication DTCs are present, perform the appropriate diagnostic procedure. Perform any Technical Service Bulletins that apply. If no problems are found, test is complete.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B223B-00-VEHICLE CONFIGURATION MISMATCH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

This DTC will set if the vehicle type is not identified or incorrectly identified.

POSSIBLE CAUSES

Possible Causes
INCORRECT VEHICLE CONFIGURATION IN THE BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)

NOTE: Diagnose and repair any BCM VIN or Communication DTCs before continuing with this test.

1. Turn the ignition on.
2. With the scan tool, select View DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Verify the correct vehicle configuration in the BCM.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Use the scan tool to read DTCs in all other modules. If any communication DTCs are present, perform the appropriate diagnostic procedure. Perform any Technical Service Bulletins that apply. If no problems are found, test is complete.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B2232-00-(PTS) PARKTRONICS INTERNAL

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

The Park Assist Module detects an internal failure.

POSSIBLE CAUSES

Possible Causes
PARK ASSIST MODULE

DIAGNOSTIC TEST

REPLACE THE PARK ASSIST MODULE

View Repair

Repair

- Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U0100-00-LOST COMMUNICATION WITH ECM/PCM

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously when the ignition is on.

The battery voltage between 10 and 16 Volts.

Body Control Module (BCM) is configured correctly.

SET CONDITION

Bus messages not received from the Powertrain Control Module (PCM) for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN C BUS CIRCUITS OPEN OR SHORTED DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES POWERTRAIN CONTROL MODULES POWER AND GROUND BCM NOT CONFIGURED CORRECTLY POWERTRAIN CONTROL MODULE (PCM) ANY MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

VERIFY IF THE DTC IS ACTIVE

NOTE: **Make sure the battery is fully charged before performing any diagnostic procedure.**

With the scan tool, refer to the Network Review Screen to display a high level view of the vehicle communication network. Modules shown in red are problem areas.

Always diagnose any Body Control Module (BCM) DTCs first before proceeding.

1. Turn the ignition on.
2. Using the scan tool, read DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Refer to the **BODY CONTROL MODULE (BCM) - DIAGNOSTIC CODE INDEX** article and perform the U0100 LOST COMMUNICATION WITH PCM diagnostic procedure.

   No

   - Refer to **DIAGNOSIS AND TESTING** and perform the STORED LOST COMMUNICATION DTCs diagnostic procedure.

U0102-00-LOST COMMUNICATION WITH TRANSFER CASE CONTROL MODULE / AWD

Perform the COMMUNICATION PRE-DIAGNOSTIC PROCEDURE. Refer to **STANDARD PROCEDURE** .

U0121-00-LOST COMMUNICATION WITH ANTI-LOCK BRAKE SYSTEM (ABS) CONTROL MODULE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously when the ignition is on.

The battery voltage between 10 and 16 volts.

Body Control Module (BCM) is configured correctly.

SET CONDITION

Bus messages not received from the Anti-lock Brake System (ABS) Module for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN C BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
ANTI LOCK BRAKE MODULE (ABS) POWER AND GROUND
BCM NOT CONFIGURED CORRECTLY
ANTI LOCK BRAKE MODULE (ABS)
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

VERIFY DTC IS ACTIVE

NOTE: Make sure the battery is fully charged before proceeding.

1. Cycle the ignition on.
2. With the scan tool, read the active DTCs.

   Does the scan tool display: U0121-00-LOST COMMUNICATION WITH ANTI-LOCK BRAKE SYSTEM (ABS) CONTROL MODULE?

   Yes

   - Refer to the **BODY CONTROL MODULE (BCM) - DIAGNOSTIC CODE INDEX** article and perform the U0121-00 LOST COMMUNICATION WITH ANTI-LOCK BRAKE SYSTEM (ABS) CONTROL MODULE diagnostic procedure.

   No

   - Refer to **DIAGNOSIS AND TESTING** and perform the STORED LOST COMMUNICATION DTCs diagnostic procedure.

U0129-00-LOST COMMUNICATION WITH BRAKE SYSTEM CONTROL MODULE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

The battery voltage between 10 and 16 volts.

Body Control Module (BCM) is configured correctly.

SET CONDITION

Bus messages not received from the Anti-lock Brake System (ABS) Module.

POSSIBLE CAUSES

Possible Causes
CAN C BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
ANTI LOCK BRAKE MODULE (ABS) POWER AND GROUND
BCM NOT CONFIGURED CORRECTLY
ANTI LOCK BRAKE MODULE (ABS)
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

VERIFY DTC IS ACTIVE

NOTE: Make sure the battery is fully charged before proceeding.

1. Turn the ignition on.
2. With the scan tool, read the active DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Refer to the **BODY CONTROL MODULE (BCM) - DIAGNOSTIC CODE INDEX** article and perform the U0121-87-LOST COMMUNICATION WITH ANTI-LOCK BRAKE SYSTEM (ABS) CONTROL MODULE diagnostic procedure.

   No

   - Refer to **DIAGNOSIS AND TESTING** and perform the STORED LOST COMMUNICATION DTCs diagnostic procedure.

U0140-00-LOST COMMUNICATION WITH BODY CONTROL MODULE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously when the ignition is on.

The battery voltage between 10.0 and 16.0 Volts.

Body Control Module (BCM) is configured correctly.

SET CONDITION

Bus messages not received from the Body Control Module (BCM) for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
BODY CONTROL MODULE POWER AND GROUND
BCM NOT CONFIGURED CORRECTLY
BODY CONTROL MODULE (BCM)
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

VERIFY IF THE DTC IS ACTIVE

NOTE: **Make sure the battery is fully charged before performing any diagnostic procedure.**

With the scan tool, refer to the Network Review Screen to display a high level view of the vehicle communication network. Modules shown in red are problem areas.

Always diagnose any Body Control Module (BCM) DTCs first before proceeding.

1. Turn the ignition on.
2. With the scan tool, read DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM BCM (BODY CONTROL MODULE) diagnostic procedure.

   No

   - Refer to **DIAGNOSIS AND TESTING** and perform the STORED LOST COMMUNICATION DTCs diagnostic procedure.

U0151-00-LOST COMMUNICATION WITH OCCUPANT RESTRAINT CONTROLLER (ORC)

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously when the ignition is on.

The battery voltage between 10 and 16 volts.

Body Control Module (BCM) is configured correctly.

SET CONDITION

Bus messages not received from the Occupant Restraint Controller (ORC) for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
OCCUPANT RESTRAINT CONTROLLER (ORC) POWER AND GROUND
BCM NOT CONFIGURED CORRECTLY
OCCUPANT RESTRAINT CONTROLLER (ORC)
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

VERIFY IF THE DTC IS ACTIVE

NOTE: **Make sure the battery is fully charged before performing any diagnostic procedure.**

With the scan tool, refer to the Network Review Screen to display a high level view of the vehicle communication network. Modules shown in red are problem areas.

Always diagnose any Body Control Module (BCM) DTCs first before proceeding.

1. Turn the ignition on.
2. With the scan tool, read DTCs.

   Does the scan tool display this DTC as active?

Yes

- Refer to the **BODY CONTROL MODULE (BCM) - DIAGNOSTIC CODE INDEX** article and perform the U0151-00 LOST COMMUNICATION WITH OCCUPANT RESTRAINT CONTROLLER (ORC) diagnostic procedure.

No

- Refer to **DIAGNOSIS AND TESTING** and perform the STORED LOST COMMUNICATION DTCs diagnostic procedure.

U0155-00-LOST COMMUNICATION WITH CLUSTER/CCN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously when the ignition is on.

Battery voltage between 10 and 16 volts.

Body Control Module (BCM) is configured correctly.

SET CONDITION

Bus messages not received from the Instrument Cluster (IC) for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN C BUS (+) CIRCUIT SHORTED TO VOLTAGE
CAN C BUS (-) CIRCUIT SHORTED TO GROUND
INSTRUMENT CLUSTER (IC) POWER AND GROUND
BCM NOT CONFIGURED CORRECTLY
INSTRUMENT CLUSTER (IC)
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

VERIFY IF THE DTC IS ACTIVE

NOTE: Make sure the battery is fully charged before proceeding.

1. Turn the ignition on.
2. With the scan tool, read active DTCs.

Does the scan tool display this DTC as active?

Yes

- Refer to the **BODY CONTROL MODULE (BCM) - DIAGNOSTIC CODE INDEX** article and perform the U0155-LOST COMMUNICATION WITH CLUSTER/CCN diagnostic procedure.

No

- Refer to **DIAGNOSIS AND TESTING** and perform the STORED LOST COMMUNICATION DTCs diagnostic procedure.

U0212-00-LOST COMMUNICATION WITH SCM

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on for at least five seconds.

Battery voltage between 10 and 16 volts.

SET CONDITION

Bus messages not received from the Steering Column Control Module (SCM) for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
STEERING COLUMN CONTROL MODULE (SCM) POWERS AND GROUNDS
STEERING COLUMN CONTROL MODULE (SCM)
CAN C BUS (+) CIRCUIT OPEN
CAN C BUS (-) CIRCUIT OPEN
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

CHECK FOR AN ACTIVE DTC

NOTE: If DTC U0010-00-CAN INTERIOR BUS or U0011-00-CAN INTERIOR BUS OFF PERFORMANCE is set in the Body Control Module (BCM), diagnose this DTC before continuing with this diagnostic procedure.

1. Turn the ignition on.

2. With the scan tool, read active DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM SCM (STEERING COLUMN CONTROL MODULE) diagnostic procedure.

   No

   - Refer to **DIAGNOSIS AND TESTING** and perform the STORED LOST COMMUNICATION DTCS diagnostic procedure.

U0401-00- IMPLAUSIBLE DATA RECEIVED FROM ECM/PCM

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on and the vehicle in reverse.

SET CONDITION

VIN data not received from Powertrain Control Module (PCM).

POSSIBLE CAUSES

Possible Causes
NO COMMUNICATION WITH POWERTRAIN CONTROL MODULE (PCM)
DTCS STORED OR ACTIVE IN THE PCM
ACTIVE COMMUNICATION DTCS IN THE BCM
PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
   1. Turn the ignition on.
   2. With the scan tool, read Park Assist Module DTCs.

      Does the scan tool display this DTC as active?

      Yes

      - Go To 2

No

- The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **VERIFY PCM IS ACTIVE ON THE CAN BUS**
   1. With the scan tool, select ECU View.
   2. Verify that the PCM is active on the bus.

   Is the PCM active on the bus?

   Yes

   - Go To 3

   No

   - Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM PCM diagnostic procedure.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **DTCS STORED OR ACTIVE IN THE PCM**
   1. With the scan tool, read PCM DTCs.

   Are any DTCs active or stored in the PCM?

   Yes

   - Refer to the **DTC INDEX** article and perform the appropriate diagnostic procedure.

   No

   - Go To 4

4. **ACTIVE COMMUNICATION DTCS IN THE BCM**
   1. With the scan tool, select ECU View and select BCM.
   2. With the scan tool, read active DTCs.

   Are any Communication DTCs active in the BCM?

   Yes

   - Refer to the **BODY CONTROL MODULE (BCM) - DIAGNOSTIC CODE INDEX** article and perform the appropriate diagnostic procedure.

No

- Replace and program the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U0403-00- IMPLAUSIBLE DATA RECEIVED FROM T-CASE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously with the ignition on.

SET CONDITION

When the Park Assist Module (PAM) receives an implausible (default/error value, toggle error or parity error) message from the Drive Train Control Module (DTCM).

POSSIBLE CAUSES

Possible Causes
DRIVE TRAIN CONTROL MODULE (DTCM) DTCS PRESENT
BODY CONTROL MODULE (BCM) DTCS PRESENT
DRIVE TRAIN CONTROL MODULE (DTCM)
PARK ASSIST MODULE (PAM)

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, record and erase DTCs.
    3. Cycle the ignition from off to on.
    4. With the scan tool, read DTCs.

    Is the DTC active at this time?

    Yes

    - Go To 2

    No

    - Go To 5

2. **CHECK FOR BODY CONTROL MODULE (BCM) DTCS**
   1. With the scan tool, read BCM DTCs.

      Are there any BCM CAN Bus DTCs present?

      Yes

      - Perform the appropriate diagnostic procedure. Refer to the **BODY CONTROL MODULE (BCM) - DIAGNOSTIC CODE INDEX** article .

      No

      - Go To 3
3. **CHECK FOR DRIVE TRAIN CONTROL MODULE (DTCM) DTCS**
   1. With the scan tool, read DTCM DTCs.

      Are there any DTCM DTCs present?

      Yes

      - Perform the appropriate diagnostic procedure. Refer to **DIAGNOSIS AND TESTING** .

      No

      - Go To 4
4. **CHECK OTHER MODULES FOR DTCS**
   1. With the scan tool, read DTCs.

      Are there any other modules reporting implausible communication DTCs against the DTCM?

      Yes

      - Replace the Drive Train Control Module (DTCM) in accordance with the Service Information. Refer to **MODULE, DRIVETRAIN CONTROL, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Using the schematics as a guide, check the Park Assist Module (PAM) pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Park Assist Module (PAM) in accordance with the Service Information.

        Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **CHECK THE WIRING AND CONNECTORS**
    1. The conditions necessary to set the DTC are not present at this time.
    2. Using the schematics as a guide, inspect the wiring and connectors specific to this module. Wiggle the wiring and connectors while checking for shorted and open circuits.
    3. Check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    4. Check Service Bulletins for any possible causes that may apply.

    Were there any problems found?

    Yes

    - Repair as necessary.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

    No

    - Test complete.

U0402-00- IMPLAUSIBLE DATA RECEIVED FROM TCM

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on and the vehicle in reverse.

SET CONDITION

Shift Lever data not received from the Transmission Control Module (TCM).

POSSIBLE CAUSES

Possible Causes
NO COMMUNICATION WITH THE TRANSMISSION CONTROL MODULE (TCM)
DTCS STORED OR ACTIVE IN THE TCM
PARK ASSIST MODULE (PAM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
    1. Turn the ignition on.
    2. With the scan tool, read Park Assist Module DTCs.

Does the scan tool display this DTC as active?

Yes

- Go To 2

No

- The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **VERIFY TCM IS ACTIVE ON THE CAN BUS**
   1. With the scan tool, select ECU View.
   2. Verify that the TCM is active on the bus.

   Is the TCM active on the bus?

   Yes

   - Go To 3

   No

   - Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM TCM diagnostic procedure.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **DTCS STORED OR ACTIVE IN THE TCM**
   1. With the scan tool, read TCM DTCs.

   Are any DTCs active or stored in the TCM?

   Yes

   - Perform the appropriate diagnostic procedure.

   No

   - Go To 4

4. **ACTIVE COMMUNICATION DTCS IN THE BCM**
   1. With the scan tool, select ECU View and select BCM.
   2. With the scan tool, read active DTCs.

Are any Communication DTCs active in the BCM?

Yes

- Refer to the **BODY CONTROL MODULE (BCM) - DIAGNOSTIC CODE INDEX** article and perform the appropriate diagnostic procedure.

No

- Replace and program the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U0418-00-IMPLAUSIBLE DATA RECEIVED FROM BRAKE SYSTEM CONTROL MODULE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on and the vehicle in reverse.

SET CONDITION

Vehicle speed data not received from Antilock Brake Module (ABS).

POSSIBLE CAUSES

Possible Causes
NO COMMUNICATION WITH ANTILOCK BRAKE MODULE (ABS)
DTCS STORED OR ACTIVE IN THE ANTILOCK BRAKE MODULE (ABS)
ACTIVE COMMUNICATION DTCS IN THE BCM
PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
    1. Turn the ignition on.
    2. With the scan tool, read Park Assist Module DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

No

- The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **VERIFY ABS IS ACTIVE ON THE CAN BUS**
   1. With the scan tool, select ECU View.
   2. Verify that the ABS is active on the bus.

   Is the ABS active on the bus?

   Yes

   - Go To 3

   No

   - Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM ABS diagnostic procedure.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **DTCS STORED OR ACTIVE IN THE ANTILOCK BRAKE MODULE (ABS)**
   1. With the scan tool, read ABS DTCs.

   Are any DTCs active or stored in the ABS?

   Yes

   - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

   No

   - Go To 4

4. **ACTIVE COMMUNICATION DTCS IN THE BCM**
   1. With the scan tool, select ECU View and select BCM.
   2. With the scan tool, read active DTCs.

   Are any Communication DTCs active in the BCM?

   Yes

   - Refer to the **BODY CONTROL MODULE (BCM) - DIAGNOSTIC CODE INDEX** article and perform the appropriate diagnostic procedure.

No

- Replace and program the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U0422-00-IMPLAUSIBLE DATA RECEIVED FROM BODY CONTROL MODULE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on and the vehicle in reverse.

SET CONDITION

Data not received from the Body Control Module (BCM).

POSSIBLE CAUSES

Possible Causes
NO COMMUNICATION WITH THE BODY CONTROL MODULE (BCM)
DTCS STORED OR ACTIVE IN THE BCM
PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
   1. Turn the ignition on.
   2. With the scan tool, read Park Assist Module DTCs.

      Does the scan tool display this DTC as active?

      Yes

      - Go To 2

      No

      - The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **VERIFY BCM IS ACTIVE ON THE CAN BUS**

1. With the scan tool, select ECU View.
2. Verify that the BCM is active on the bus.

   Is the BCM active on the bus?

   Yes

   - Go To 3

   No

   - Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM BCM diagnostic procedure.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **DTCS STORED OR ACTIVE IN THE BCM**
   1. With the scan tool, read BCM DTCs.

      Are any DTCs active or stored in the BCM?

      Yes

      - Refer to the **BODY CONTROL MODULE (BCM) - DIAGNOSTIC CODE INDEX** article and perform the appropriate diagnostic procedure.

      No

      - Replace and program the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U0423-00-IMPLAUSIBLE DATA RECEIVED FROM CLUSTER/CCN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Park Assist Module supply voltage between 9-16 volts. Ignition in Run/Start.

SET CONDITION

Incorrect ignition status received from the Cluster

POSSIBLE CAUSES

Possible Causes

NO COMMUNICATION WITH CLUSTER
DTCS STORED OR ACTIVE IN THE CLUSTER
ACTIVE COMMUNICATION DTCS IN THE BODY CONTROL MODULE (BCM)
PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
    1. Turn the ignition on.
    2. With the scan tool, read Park Assist Module DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **VERIFY CLUSTER IS ACTIVE ON THE CAN BUS**
    1. With the scan tool, select ECU View.
    2. Verify that the Cluster is active on the bus.

    Is the Cluster active on the bus?

    Yes

    - Go To 3

    No

    - Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM CLUSTER/CCN diagnostic procedure.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
3. **DTCS STORED OR ACTIVE IN THE CLUSTER**
    1. Check for active DTCs in the Cluster.

    Are any DTCs active or stored in the Cluster?

Yes

- Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

No

- Go To 4

4. **ACTIVE COMMUNICATION DTCS IN THE BCM**
   1. With the scan tool, select ECU View and select BCM.
   2. With the scan tool, read active DTCs.

   Are any Communication DTCs active in the BCM?

   Yes

   - Refer to the **BODY CONTROL MODULE (BCM) - DIAGNOSTIC CODE INDEX** article and perform the appropriate diagnostic procedure.

   No

   - Replace and program the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U0452-00-IMPLAUSIBLE DATA RECEIVED FROM RESTRAINTS CONTROL MODULE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on for at least five seconds.

Battery voltage between 10 and 16 volts.

Body Control Module (BCM) is configured correctly.

SET CONDITION

Whenever the communication data sent over the CAN BUS from the Occupant Restraint Controller (ORC) is missing part of the message, the message is corrupted, or the message is an irrational value.

POSSIBLE CAUSES

Possible Causes
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES

BCM NOT CONFIGURED CORRECTLY
ORC POWER AND GROUND
OCCUPANT RESTRAINT CONTROLLER (ORC)
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**

   NOTE: Make sure the battery voltage is between 10 and 16 volts before proceeding.

   1. With the scan tool, read active DTCs.

      Is this DTC active?

      Yes

      - Go To 2

      No

      - Refer to **DIAGNOSIS AND TESTING** and perform the STORED LOST COMMUNICATION DTCS diagnostic procedure.
2. **CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS**
   1. With the scan tool, read all active DTCs from all modules.

      NOTE: Check for BCM configuration, CAN Bus hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

      Does the scan tool display any active DTCs to the conditions listed above?

      Yes

      - Refer to the **DTC INDEX** article and perform the appropriate diagnostic procedure.

      No

      - Go To 3
3. **VERIFY THE ORC IS ACTIVE ON THE BUS**
   1. Turn the ignition on.
   2. With the scan tool, verify the ORC is active on the bus.

      Is the ORC active on the bus?

Yes

- Go To 4

No

- Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM ORC diagnostic procedure.

4. **CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS**
   1. With the scan tool, read all the DTCs.

   Is there more than one module with active DTCs "Logged Against" the ORC?

   Yes

   - Replace/update the ORC in accordance with the Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 5

5. **CLEAR DTC IN MODULE SETTING FAULT**
   1. With the scan tool, select the module setting the DTC against the ORC.
   2. Clear active DTCs.

   Is this DTC still active?

   Yes

   - Replace/update the module that set this DTC in accordance with the Service Information.
   - Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module, perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - The condition is not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   - Perform the appropriate verification test for the module. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2014 ACCESSORIES AND EQUIPMENT

Passenger Door Module (PDM) (DMFL/R) - Electrical Diagnostics - Cherokee

DIAGNOSTIC CODE INDEX

DIAGNOSTIC CODE INDEX

DTC	Description
B173D-11	MIRROR SIGNAL LAMP CONTROL - CIRCUIT SHORT TO GROUND
B173D-12	MIRROR SIGNAL LAMP CONTROL - CIRCUIT SHORT TO BATTERY
B173D-13	MIRROR SIGNAL LAMP CONTROL - CIRCUIT OPEN
B18BA-11	WINDOW CONTROL - CIRCUIT SHORT TO GROUND
B18BA-12	WINDOW CONTROL - CIRCUIT SHORT TO BATTERY
B18BA-13	WINDOW CONTROL - CIRCUIT OPEN
B18BA-4B	WINDOW CONTROL-OVER TEMPERATURE
B1DD0-11	MIRROR HEATER CONTROL - CIRCUIT SHORT TO GROUND
B1DD0-15	MIRROR HEATER CONTROL - CIRCUIT SHORT TO BATTERY OR OPEN
B1F02-11	MIRROR VERTICAL MOTOR CONTROL - CIRCUIT SHORT TO GROUND
B1F02-12	MIRROR VERTICAL MOTOR CONTROL - CIRCUIT SHORT TO BATTERY
B1F02-13	MIRROR VERTICAL MOTOR CONTROL - CIRCUIT OPEN

DIAGNOSIS AND TESTING

B173D-11-MIRROR SIGNAL LAMP CONTROL - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 1: Passenger Mirror Assembly - Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

Continuously.

SET CONDITION

The Door Module senses a short low on the Mirror Turn Signal Driver circuit for more than two seconds with the turn signal switched on.

POSSIBLE CAUSES

Possible Causes
OUTSIDE REARVIEW MIRROR DOOR MODULE

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Cycle the ignition on.
    2. With the scan tool, record and erase the DTCs.
    3. Turn the passenger side turn signal on.
    4. Turn the park lamps on.
    5. Turn the rear defogger on, if equipped with heated mirror.
    6. Press and release the Mirror Select switch to select the Passenger Outside Rearview Mirror.
    7. Operate the Mirror Adjust switch in all directions several times while monitoring the scan tool for DTCs.

    NOTE: After adjusting the mirror in one direction wait at least two seconds before adjusting the mirror in the opposite direction, as this will allow time for an active fault to set if present.

    8. With the scan tool, read the DTCs.

    Does the scan tool display: B173D-11-MIRROR SIGNAL LAMP CONTROL - CIRCUIT SHORT TO GROUND?

    Yes

    - Go To 2

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. For vehicle's equipped with folding outside rearview mirrors, repeat the above test with the mirror folded. If this DTC is now active, Go To 2. Otherwise, using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **INSPECT MIRROR CONNECTIONS**
    1. Cycle the ignition off.
    2. Disconnect the Passenger Outside Rearview Mirror C1 and C2 connectors at the Passengers Door Module.

3. Inspect the wiring harness, connectors and the Passengers Door Module.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 3

3. **MIRROR OR MODULE**
   1. Cycle the ignition on.
   2. With the scan tool, record and erase DTCs.
   3. Turn the passengers side turn signal on.
   4. Operate the Fold and Unfold switch several time, if equipped with folding mirrors.
   5. Turn the rear defogger on, if equipped with heated mirror.
   6. Turn the park lamps on.
   7. Press and release the Mirror Select switch to select the Passenger Outside Rearview Mirror.
   8. Operate the Mirror Adjust switch in all directions several times while monitoring the scan tool for DTCs.

      NOTE: After adjusting the mirror in one direction wait at least two seconds before adjusting the mirror in the opposite direction, as this will allow time for an active fault to set if present.

   9. With the scan tool, read DTCs.

      NOTE: Check for a change in DTCs.

      Does the scan tool display: B173D-13-MIRROR SIGNAL LAMP CONTROL - CIRCUIT OPEN as active?

      Yes

      - With the circuit now OPEN that indicates the short is NOT in the Module. Replace the mirror in accordance with the Service Information. Refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** and **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

- Replace the Door Module in accordance with the Service Information. Refer to **MODULE, DOOR, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B173D-12-MIRROR SIGNAL LAMP CONTROL - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 2: Passenger Mirror Assembly - Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

Continuously.

SET CONDITION

The Door Module senses a short high on the Mirror Turn Signal Driver circuit for more than two seconds with the turn signal switched on.

POSSIBLE CAUSES

Possible Causes
MIRROR TURN SIGNAL DRIVER CIRCUIT FOR A SHORT TO ANY SIGNAL OR DRIVER CIRCUIT
OUTSIDE REARVIEW MIRROR
DOOR MODULE

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**

NOTE: Check the turn signals to be sure they are flashing properly before proceeding.

1. Cycle the ignition on.
2. With the scan tool, record and erase DTCs.
3. Turn the passenger side turn signal on.
4. Turn the park lamps on.
5. Turn the rear defogger on, if equipped with heated mirror.
6. Press and release the Mirror Select switch to select the Passenger Outside Rearview Mirror.
7. Operate the Mirror Adjust switch in all directions several times while monitoring the scan tool for DTCs.

NOTE: After adjusting the mirror in one direction wait at least two seconds before adjusting the mirror in the opposite direction, as this will allow time for an active fault to set if present.

8. With the scan tool, read the active DTCs.

   Does the scan tool display: B173D-12-MIRROR SIGNAL LAMP CONTROL - CIRCUIT SHORT TO BATTERY as active?

   Yes

- Go To2

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time. For vehicle's equipped with folding outside rearview mirrors, repeat the above test with the mirror folded. If this DTC is now active, Go To 2. For others, using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK (P502) PASSENGER MIRROR TURN SIGNAL DRIVER CIRCUIT FOR A SHORT TO ANY SIGNAL OR DRIVER CIRCUIT**

Fig. 3: Checking Passenger Mirror Turn Signal Driver Circuit For Short To Any Signal Or Driver Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Cycle the ignition off.
2. Turn all accessories off.
3. Disconnect the Passenger Outside Rearview Mirror C1 (Component Side) and C2 (Component Side) harness connectors from the Door Module.
4. Measure the resistance between the (P502) Passenger Mirror Turn Signal Driver circuit (C2-9) and each designated Signal or Driver circuit in the Passenger Outside Rearview Mirror C1 and C2 (Component Side) harness connectors.

   Is the resistance below 10K Ohms for any measurement?

   Yes

   - Repair the (P502) Passenger Mirror Turn Signal Driver circuit for a short to a Signal or Driver circuit. If the wiring harness and harness connectors are okay, replace the Passenger Outside Rearview Mirror in accordance with the Service Information. Refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** and **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Inspect the wiring harness and harness connectors for damage and repair as necessary. If the wiring harness and harness connectors are okay, replace the Door Module in accordance with the Service Information. Refer to **MODULE, DOOR, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B173D-13-MIRROR SIGNAL LAMP CONTROL - CIRCUIT OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 4: Passenger Mirror Assembly - Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

Continuously.

SET CONDITION

The Door Module senses an open between the Mirror Turn Signal Driver circuit and the Mirror Turn Signal Return circuit for more than two seconds with the turn signal switched on.

POSSIBLE CAUSES

Possible Causes
MIRROR TURN SIGNAL DRIVER CIRCUIT OPEN TO THE MIRROR TURN SIGNAL LAMP RETURN CIRCUIT
OUTSIDE REARVIEW MIRROR
DOOR MODULE

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Cycle the ignition on.
    2. With the scan tool, record and erase DTCs.
    3. Turn the passenger side turn signal on.
    4. Press and release the Mirror Select switch to select the Passenger Outside Rearview Mirror.
    5. With the scan tool, read the active DTCs.

    Does the scan tool display: B173D-13-MIRROR SIGNAL LAMP CONTROL - CIRCUIT OPEN?

    Yes

    - Go To 2

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK (P502) PASSENGER MIRROR TURN SIGNAL DRIVER CIRCUIT FOR AN OPEN TO THE (P595) PASSENGER MIRROR TURN SIGNAL RETURN CIRCUIT**

Fig. 5: Checking Passenger Mirror Turn Signal Driver Circuit For Open To Passenger Mirror Turn Signal Return Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (P502) Passenger Mirror Turn Signal Driver circuit and the (P595) Passenger Mirror Turn Signal Return circuit in the Passenger Outside Rearview Mirror C2 (Component Side) harness connector.

   Is the resistance below 30.0 Ohms?

   Yes

   - Replace the Door Module in accordance with the Service Information. Refer to **MODULE, DOOR, REMOVAL** .

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Repair the open in the (P502) Passenger Mirror Turn Signal Driver circuit. If the wiring harness and harness connectors are okay, replace the Passenger Outside Rearview Mirror in accordance with the Service Information. Refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** and **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B18BA-11-WINDOW CONTROL - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 6: Window Motor - Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

Whenever the module is awake.

SET CONDITION

When both Window Driver circuits (Up and Down) are grounded during a window movement command, this code will set.

POSSIBLE CAUSES

Possible Causes
WINDOW DRIVER DOWN CIRCUIT SHORTED TO GROUND
WINDOW DRIVER UP CIRCUIT SHORTED TO GROUND
WINDOW DRIVER DOWN CIRCUIT SHORTED TO THE WINDOW DRIVER UP CIRCUIT
WINDOW MOTOR
DOOR MODULE

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Cycle the ignition on.
    2. With the scan tool, record and erase DTCs.
    3. Try to operate the Passenger Window up and down several times.
    4. Wait 30 seconds.
    5. With the scan tool, read DTCs.

    Does the scan tool display; B18BA-11-WINDOW CONTROL - CIRCUIT SHORT TO GROUND?

    Yes

    - Go To 2

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **WINDOW MOTOR SHORTED**

Fig. 7: View Of Passenger Window Motor Connector
Courtesy of CHRYSLER GROUP, LLC

1. With the scan tool, erase the DTCs.
2. Cycle the ignition off.
3. Disconnect the Passenger Window Motor connector.
4. Cycle the ignition on.
5. Operate the passenger window switch up and down several times.

6. Wait 30 seconds.
7. With the scan tool, read the active DTCs.

   Does the scan tool display; B18BA-11-WINDOW CONTROL - CIRCUIT SHORT TO GROUND?

   Yes

   - Go To 3

   No

   - Replace the Window Motor in accordance with the Service Information. Refer to **MOTOR, WINDOW REGULATOR, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **(Q22) PASSENGER WINDOW DRIVER DOWN CIRCUIT SHORTED TO GROUND**

Fig. 8: Checking Passenger Window Driver (Down) Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Cycle the ignition off.
2. Disconnect the Passenger Door Module C4 harness connector.
3. Measure the resistance between Ground and the (Q22) Passenger Window Driver Down circuit.

   Is the resistance below 10k Ohms?

   Yes

   - Repair the short to ground in the (Q22) Passenger Window Driver Down circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 4

4. **(Q12) PASSENGER WINDOW DRIVER UP CIRCUIT SHORTED TO GROUND**

Fig. 9: Checking Passenger Window Driver (Up) Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between Ground and the (Q12) Passenger Window Driver Up circuit.

   Is the resistance below 10k Ohms?

   Yes

   - Repair the short to ground in the (Q12) Passenger Window Driver Up circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 5

5. **(Q22) PASSENGER WINDOW DRIVER DOWN CIRCUIT SHORTED TO (Q12) PASSENGER WINDOW DRIVER UP CIRCUIT**

Fig. 10: Checking Passenger Window Driver Down Circuit For Short To Passenger Window Driver Up Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (Q22) Passenger Window Driver Down circuit and the (Q12) Passenger Window Driver Up circuit.

   Is the resistance below 10k Ohms?

Yes

- Repair the short between the (Q22) Passenger Window Driver Down circuit and the (Q12) Passenger Window Driver Up circuit.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace the Passenger Door Module in accordance with the Service Information. Refer to **MODULE, DOOR, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B18BA-12-WINDOW CONTROL - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 11: Window Motor - Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

Whenever the module is awake.

SET CONDITION

When both Window Driver circuits (Up and Down) are supplied with voltage during a window movement command for more than five ms., this code will set.

POSSIBLE CAUSES

Possible Causes
WINDOW DRIVER DOWN CIRCUIT SHORTED TO VOLTAGE
WINDOW DRIVER UP CIRCUIT SHORTED TO VOLTAGE
WINDOW MOTOR
DOOR MODULE

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Cycle the ignition on.
    2. With the scan tool, record and erase the DTCs.
    3. Try to operate the Passenger Window up and down several times.
    4. Wait 30 seconds.
    5. With the scan tool, read the DTCs.

    Does the scan tool display; B18BA-12-WINDOW CONTROL - CIRCUIT SHORT TO BATTERY?

    Yes

    - Go To 2

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **WINDOW MOTOR SHORTED**
    1. With the scan tool, erase the DTCs.
    2. Cycle the ignition off.
    3. Disconnect the Passenger Window Motor harness connector.
    4. Cycle the ignition on.
    5. Operate the Passenger window switch up and down several times.

6. Wait 30 seconds.
7. With the scan tool, read the DTCs.

   Does the scan tool display; B18BA-12-WINDOW CONTROL - CIRCUIT SHORT TO BATTERY?

   Yes

   - Go To 3

   No

   - Replace the Passenger Window Motor in accordance with service information.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **(Q22) PASSENGER WINDOW DRIVER DOWN CIRCUIT SHORTED TO VOLTAGE**

Fig. 12: Measuring Voltage Between Ground & Passenger Window Driver Down Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Cycle the ignition off.
2. Disconnect the Passenger Door Module C4 harness connector.
3. Cycle the ignition on.
4. Measure the voltage between ground and the (Q22) Passenger Window Driver Down circuit.

   Is there any voltage present?

   Yes

   - Repair the (Q22) Passenger Window Driver Down circuit for a short to voltage.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 4

4. **(Q12) PASSENGER WINDOW DRIVER UP CIRCUIT SHORTED TO VOLTAGE**

Fig. 13: Measuring Voltage Between Passenger Window Driver Up Circuit & Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the voltage between the (Q12) Passenger Window Driver Up circuit and Ground.

   Is there any voltage present?

   Yes

   - Repair the (Q12) Passenger Window Driver Up circuit for a short to voltage.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace the Passenger Door Module in accordance with the Service Information. Refer to **MODULE, DOOR, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B18BA-13-WINDOW CONTROL - CIRCUIT OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 14: Window Motor - Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

Whenever the module is awake.

SET CONDITION

When one or both Window circuits (Up and Down) are not supplied with voltage, when they should be, during a window movement command for more than five ms., this code will set.

POSSIBLE CAUSES

Possible Causes
WINDOW DOWN CIRCUIT OPEN
WINDOW UP CIRCUIT OPEN
WINDOW MOTOR
DOOR MODULE

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Cycle the ignition on.
    2. With the scan tool, record and erase the DTCs.
    3. Try to operate the Passenger Window up and down several times.
    4. Wait 30 seconds.
    5. With the scan tool, read the DTCs.

    Does the scan tool display; B18BA-13-WINDOW CONTROL - CIRCUIT OPEN?

    Yes

    - Go To 2

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **WINDOW MOTOR OR CIRCUIT OPEN**
    1. Cycle the ignition off.
    2. Disconnect the Passenger Window Motor harness connector.
    3. Connect a test light between the (Q12) Passenger Window Driver Up circuit and the (Q22) Passenger Window Driver Down circuit.
    4. Cycle the ignition on.
    5. Operate the passenger window switch up and down several times while observing the test light.

Does the test light illuminate brightly when the switch is pressed in both directions? With the express up window, the test light will only flash momentarily each time the switch is actuated.

Yes

- Replace the Passenger Window Motor in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 3

3. **(Q22) PASSENGER WINDOW DRIVER DOWN CIRCUIT OPEN**
   1. Cycle the ignition off.
   2. Disconnect the Passenger Door Module C4 harness connector.
   3. Measure the resistance of the (Q22) Passenger Window Driver Down circuit between the C4 module connector and the motor connector.

   Is the resistance below 2.0 Ohms?

   Yes

   - Go To 4

   No

   - Repair the open in the (Q22) Passenger Window Driver Down circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **(Q12) PASSENGER WINDOW DRIVER UP CIRCUIT OPEN**
   1. Measure the resistance of the (Q12) Passenger Window Driver Up circuit between the C4 module connector and the motor connector.

   Is the resistance below 2.0 Ohms?

   No

   - Repair the open in the (Q12) Passenger Window Driver Up circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   Yes

   - Replace the Passenger Door Module in accordance with the Service Information. Refer to **MODULE, DOOR, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B18BA-4B WINDOW CONTROL-OVER TEMPERATURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 15: Window Motor - Circuit Diagram

Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

Continuously.

SET CONDITION

This DTC sets when the window motor is continuously requested to move repeatedly without a sufficient cooling time (1-2 seconds). The Driver Door Module logic has determined the temperature has exceeded 80°C (176°F) and inhibits window operation.

POSSIBLE CAUSES

Possible Causes
HIGH TEMPERATURE FAILURE
PASSENGER DOOR WINDOW MOTOR
PASSENGER DOOR MODULE

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
   1. Cycle the ignition on.
   2. With the scan tool, read and record the DTCs.

      Does the scan tool display; B18BA-4B WINDOW CONTROL-OVER TEMPERATURE as **ACTIVE** ?

      Yes

      - Go To 2

      No

      - Test complete, the conditions that caused this code to set is not present at this time.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CONFIRM WINDOW OPERATION**

   NOTE: This step is being performed only when DTC B18BA-4B is ACTIVE.

   1. Run the window to the full up position and continue to hold the switch for an additional two

seconds.

2. Run the window to the full down position and continue to hold the switch for an additional two seconds.
3. Again run the window to the full up position and continue to hold the switch for an additional two seconds.
4. Lower the window to the full down position then press and release the switch to the express up position.

   Did the window move to the full up position?

   Yes

   - Replace the Passenger Door Module in accordance with the Service Information. Refer to **MODULE, DOOR, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 3

3. **CHECKING THE (Q12) PASSENGER WINDOW PASSENGER UP CIRCUIT AND THE (Q22) PASSENGER WINDOW PASSENGER DOWN CIRCUIT FOR VOLTAGE**

NOTE: This step is being performed only when DTC B18BA-4B is ACTIVE.

1. Cycle the ignition off.
2. Disconnect the Passenger Window Motor harness connector.
3. Connect a test light between the (Q12) Passenger Window Passenger Up circuit and the (Q22) Passenger Window Passenger Down circuit.
4. Cycle the ignition on.
5. Trip the Passenger door latch to the closed position.
6. Operate the Passenger window switch up and down several times while observing the test light.

   Does the test light illuminate brightly when the switch is pressed in both directions? With the express up window, the test light will only flash momentarily each time the switch is activated.

   Yes

   - Replace the Passenger Window Motor in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace the Passenger Door Module in accordance with the Service Information. Refer to **MODULE, DOOR, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1DD0-11-MIRROR HEATER CONTROL - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 16: Passenger Mirror Assembly - Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

Continuously.

SET CONDITION

The Door Module senses a short low on the Mirror Heater Driver circuit for more than two seconds with the heater switched on.

POSSIBLE CAUSES

Possible Causes
MIRROR HEATER DRIVER CIRCUIT SHORTED TO GROUND
MIRROR HEATER DRIVER CIRCUIT SHORTED TO ANY DRIVER MIRROR DRIVER CIRCUIT
MIRROR HEATER DRIVER CIRCUIT SHORTED TO THE MIRROR HEATER RETURN CIRCUIT
MIRROR HEATER DRIVER CIRCUIT SHORTED TO ANY SENSOR GROUND OR RETURN CIRCUIT
OUTSIDE REARVIEW MIRROR
DOOR MODULE

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Cycle the ignition on.
    2. With the scan tool, record and erase the Diagnostic Trouble Codes (DTCs).
    3. Turn the rear defogger ON.
    4. Press and release the Mirror Select switch to select the Passenger Outside Rearview Mirror.
    5. Operate the Mirror Adjust switch in all directions several times.
    6. With the scan tool, read the active DTCs.

    Does the scan tool display; B1DD0-11-MIRROR HEATER CONTROL - CIRCUIT SHORT TO GROUND as active?

    Yes

    - Go To 2

    No

    - The conditions that caused this code to set are not present at this time. For vehicle's equipped with folding outside rearview mirrors, repeat test with mirror folded. If DTC is now active,

Go To 2. Otherwise, use the wiring diagram/schematic as a guide and inspect the wiring and connectors.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK (C17) PASSENGER MIRROR HEATER DRIVER CIRCUIT FOR A SHORT TO GROUND OR TO THE (C170) PASSENGER MIRROR HEATER RETURN CIRCUIT**

Fig. 17: Passenger Outside Rearview Mirror Connector End View
Courtesy of CHRYSLER GROUP, LLC

1. Cycle the ignition off.
2. Disconnect the Passenger Outside Rearview Mirror (Component Side) connector from the PDM C2 harness connector.

3. Cycle the ignition on.
4. With the scan tool, erase the DTCs.
5. Turn the rear defogger ON.
6. Press and release the Mirror Select switch to select the Passenger Outside Rearview Mirror.
7. Operate the Mirror Adjust switch in all directions several times.
8. With the scan tool, read the active DTCs.

   Does the scan tool display; B1DD0-11-MIRROR HEATER CONTROL - CIRCUIT SHORT TO GROUND as active?

   Yes

   - Replace the Passenger Door Module (PDM) in accordance with the Service Information. Refer to **MODULE, DOOR, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Repair the (C17) Passenger Mirror Heater Driver circuit for a short to ground or to the (C170) Passenger Mirror Heater Return circuit. If the wiring harness and connector are okay, replace the Passenger Outside Rearview Mirror in accordance with the Service Information. Refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** and **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1DD0-15-MIRROR HEATER CONTROL - CIRCUIT SHORT TO BATTERY OR OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 18: Passenger Mirror Assembly - Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

Continuously.

SET CONDITION

The Door Module senses an open or a short high on the Mirror Heater Driver circuit for more than two seconds.

POSSIBLE CAUSES

Possible Causes
MIRROR HEATER DRIVER CIRCUIT SHORTED TO VOLTAGE
MIRROR HEATER DRIVER CIRCUIT OPEN
MIRROR HEATER RETURN CIRCUIT OPEN
MIRROR HEATER DRIVER CIRCUIT SHORTED TO THE MIRROR HEATER RETURN CIRCUIT
MIRROR HEATER DRIVER CIRCUIT SHORTED TO ANOTHER DRIVER CIRCUIT
OUTSIDE REARVIEW MIRROR
DOOR MODULE

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Cycle the ignition on.
    2. With the scan tool, record and erase the Diagnostic Trouble Codes (DTCs).
    3. Turn the rear defogger OFF.
    4. Press and release the Mirror Select switch to select the Passenger Outside Rearview Mirror.
    5. Operate the Mirror Adjust switch in all directions several times.
    6. With the scan tool, read the active DTCs.

    Does the scan tool display; B1DD0-15-MIRROR HEATER CONTROL - CIRCUIT SHORT TO BATTERY OR OPEN as active?

    Yes

    - Go To 2

    No

    - The conditions that caused this code to set are not present at this time. For vehicle's equipped with folding outside rearview mirrors, repeat test with mirror folded. If DTC is now active, Go To 2. Otherwise, use the wiring diagram/schematic as a guide and inspect the wiring and connectors.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK (C17) PASSENGER MIRROR HEATER DRIVER CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 19: Checking Passenger Mirror Heater Driver Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Cycle the ignition off.
2. Disconnect the Passenger Outside Rearview Mirror (Component Side) connector from the PDM C2 harness connector.
3. Cycle the ignition on.
4. Measure the voltage of the (C17) Passenger Mirror Heater Driver circuit between the Passenger Outside Rearview Mirror (Component Side) connector and ground.

   Is there any voltage present?

   Yes

   - Repair the (C17) Passenger Mirror Heater Driver circuit for a short to voltage. If the wiring

harness and connector are okay, replace the Passenger Outside Rearview Mirror in accordance with the Service Information. Refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** and **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL** .

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 3

3. **CHECK (C17) PASSENGER MIRROR HEATER DRIVER CIRCUIT AND (C170) PASSENGER MIRROR HEATER RETURN CIRCUIT FOR AN OPEN**

Fig. 20: Checking Passenger Mirror Heater Driver Circuit Or Passenger Mirror Heater Return Circuit For Open
Courtesy of CHRYSLER GROUP, LLC

1. Cycle the ignition off.
2. Measure the resistance between the (C17) Passenger Mirror Heater Driver circuit and the (C170) Passenger Mirror Heater Return circuit at the Passenger Outside Rearview Mirror (Component Side) connector.

   Is the resistance approximately 10.0 Ohms?

   Yes

   - Replace the Passenger Door Module (PDM) in accordance with the Service Information. Refer to **MODULE, DOOR, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Repair the (C17) Passenger Mirror Heater Driver circuit or the (C170) Passenger Mirror Heater Return circuit for an open. If the wiring harness and connector are okay, replace the Passenger Outside Rearview Mirror in accordance with the Service Information. Refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** and **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1F02-11-MIRROR VERTICAL MOTOR CONTROL - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 21: Passenger Mirror Assembly - Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Mirror Vertical Driver circuit supplies battery voltage for the mirror up position and ground for the mirror down position. The Mirror Common Driver supplies battery voltage for the mirror Down position and ground for the mirror up position.

WHEN MONITORED

Continuously.

SET CONDITION

The Door Module senses a short low on the Mirror Vertical Driver circuit for more than 10 ms.

POSSIBLE CAUSES

Possible Causes
MIRROR VERTICAL DRIVER CIRCUIT SHORTED TO GROUND
MIRROR VERTICAL DRIVER CIRCUIT SHORTED TO THE MIRROR HEATER RETURN CIRCUIT
OUTSIDE REARVIEW MIRROR
DOOR MODULE

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Cycle the ignition on.
    2. With the scan tool, record and erase Diagnostic Trouble Codes (DTCs).
    3. Press and release the Mirror Select switch to select the Passenger Outside Rearview Mirror.
    4. Turn the hazard lamps on.
    5. Turn on the park lamps (if equipped with auto dimming mirrors).
    6. Turn the rear defogger on, if equipped with heated mirror.
    7. Operate the Mirror Adjust switch in all directions several times while monitoring the scan tool for DTCs.

    NOTE: After adjusting the mirror in one direction wait at least two seconds before adjusting the mirror in the opposite direction, as this will allow time for an active fault to set if present.

    Does the scan tool display; B1F02-11-MIRROR VERTICAL MOTOR CONTROL - CIRCUIT SHORT TO GROUND?

    Yes

    - Go To 2

    No

    - The conditions that caused this code to set are not present at this time. For vehicle's equipped with folding outside rearview mirrors, repeat test with mirror folded. If DTC is now active, Go To 2. Otherwise, use the wiring diagram/schematic as a guide and inspect the wiring and connectors.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **INSPECT MIRROR CONNECTIONS**
   1. Cycle the ignition off.
   2. Disconnect the Passenger Outside Rearview Mirror C1 and C2 connectors at the Passengers Door Module.
   3. Inspect the wiring harness, connectors and the Passengers Door Module.

      Were there any problems found?

      Yes

      - Repair as necessary.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 3

3. **MIRROR OR MODULE**
   1. Cycle the ignition on.
   2. With the scan tool, record and erase DTCs.
   3. Press and release the Mirror Select switch to select the Passenger Outside Rearview Mirror.
   4. Operate the Mirror Adjust switch in all directions several times while monitoring the scan tool for DTCs.

      NOTE: After adjusting the mirror in one direction wait at least two seconds before adjusting the mirror in the opposite direction, as this will allow time for an active fault to set if present.

   5. With the scan tool, read DTCs.

      NOTE: Check for a change in DTCs.

      Does the scan tool display: B1F02-13-MIRROR VERTICAL MOTOR CONTROL - CIRCUIT OPEN as active?

      Yes

      - With the circuit now OPEN that indicates the short is NOT in the Module. Replace the mirror in accordance with the Service Information. Refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** and **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

- Replace the Door Module in accordance with the Service Information. Refer to **MODULE, DOOR, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1F02-12-MIRROR VERTICAL MOTOR CONTROL - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 22: Passenger Mirror Assembly - Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Mirror Vertical Driver circuit supplies battery voltage for the mirror up position and ground for the mirror down position. The Mirror Common Driver supplies battery voltage for the mirror Down position and ground for the mirror up position.

WHEN MONITORED

Continuously.

SET CONDITION

The Door Module senses a short to voltage on the Mirror Vertical Driver circuit during a mirror movement for more than 10 ms.

POSSIBLE CAUSES

Possible Causes
OUTSIDE REARVIEW MIRROR
DOOR MODULE

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Cycle the ignition on.
    2. With the scan tool, record and erase the Diagnostic Trouble Codes (DTCs).
    3. Press and release the Mirror Select switch to select the Passenger Outside Rearview Mirror.
    4. Operate the Mirror Adjust switch in all directions several times.
    5. Cycle the ignition from on to off three times.
    6. Cycle the ignition on.
    7. With the scan tool, read the DTCs.

    Does the scan tool display; B1F02-12-MIRROR VERTICAL MOTOR CONTROL - CIRCUIT SHORT TO BATTERY?

    Yes

    - Go To 2

    No

    - The conditions that caused this code to set are not present at this time. For vehicles equipped with folding outside rearview mirrors, repeat test with mirror folded. If DTC is now active, Go To 2. Otherwise, use the wiring diagram/schematic as a guide and inspect the wiring and connectors.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK (P695) PASSENGER MIRROR FOLD DRIVER CIRCUIT AND (P692) PASSENGER MIRROR UNFOLD DRIVER CIRCUIT FOR A SHORT TO (P72) PASSENGER MIRROR VERTICAL DRIVER CIRCUIT**

Fig. 23: Checking Passenger Mirror Fold Driver Circuit & Passenger Mirror Unfold Driver Circuit For A Short To Passenger Mirror Vertical Driver Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Cycle the ignition off.
2. Disconnect the Passenger Outside Rearview Mirror (Component Side) C2 harness connector from the PDM.
3. Measure the resistance between the (P72) Passenger Mirror Vertical Driver circuit and the (P695) Passenger Mirror Fold Driver circuitat the Passenger Outside Rearview Mirror (Component Side) connector.

4. Measure the resistance between the (P72) Passenger Mirror Vertical Driver circuit and the (P692) Passenger Mirror Unfold Driver circuit at the Passenger Outside Rearview Mirror (Component Side) connector.

   Is the resistance below 10k Ohms for either measurement?

   Yes

   - Repair all circuits with a resistance below 10k Ohms for a short to the (P72) Passenger Mirror Vertical Driver circuit. If the wiring harness and connector are okay, replace the Passenger Outside Rearview Mirror in accordance with the Service Information. Refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** and **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 3

3. **CHECK (P72) PASSENGER MIRROR VERTICAL DRIVER CIRCUIT FOR A SHORT TO THE (C17) PASSENGER MIRROR HEATER DRIVER CIRCUIT**

Fig. 24: Checking Passenger Mirror Vertical Driver Circuit For A Short To Passenger Mirror Heater Driver Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (P72) Passenger Mirror Vertical Driver circuit and the (C17) Passenger Mirror Heater Driver circuit at the Passenger Outside Rearview Mirror (Component Side) connector.

   Is the resistance below 10k Ohms?

   Yes

   - Repair the (P72) Passenger Mirror Vertical Driver circuit for a short to the (C17) Passenger Mirror Heater Driver circuit. If the wiring harness and connector are okay, replace the Passenger Outside Rearview Mirror in accordance with the Service Information. Refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** and **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL** .

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace the Passenger Door Module (PDM) in accordance with the Service Information. Refer to **MODULE, DOOR, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1F02-13-MIRROR VERTICAL MOTOR CONTROL - CIRCUIT OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 25: Passenger Mirror Assembly - Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Mirror Vertical Driver circuit supplies battery voltage for the mirror up position and ground for the mirror down position. The Mirror Common Driver supplies battery voltage for the mirror Down position and ground for the mirror up position.

WHEN MONITORED

Continuously.

SET CONDITION

When the Door Module senses a short high on the Mirror Vertical Driver circuit for more than 10 ms.

POSSIBLE CAUSES

Possible Causes
MIRROR VERTICAL DRIVER CIRCUIT OPEN
MIRROR COMMON DRIVER CIRCUIT OPEN
OUTSIDE REARVIEW MIRROR
DOOR MODULE

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Cycle the ignition on.
    2. With the scan tool, record and erase the Diagnostic Trouble Codes (DTCs).
    3. Press and release the Mirror Select switch to select the Passenger Outside Rearview Mirror.
    4. Operate the Mirror Adjust switch in all directions several times.
    5. Cycle the ignition from on to off three times.
    6. Cycle the ignition on.
    7. With the scan tool, read the active DTCs.

    Does the scan tool display; B1F02-13-MIRROR VERTICAL MOTOR CONTROL - CIRCUIT OPEN as active?

    Yes

    - Go To 2

    No

    - The conditions that caused this code to set are not present at this time. For vehicles equipped with folding outside rearview mirrors, repeat the test with the mirror folded. If the DTC is now active, Go To 2. Otherwise, use the wiring diagram/schematic as a guide and inspect the wiring and connectors.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK MIRROR AND HARNESS FOR AN OPEN**

Fig. 26: Checking Mirror & Harness For Open
Courtesy of CHRYSLER GROUP, LLC

1. Gain access to the Passenger Door Module but do not disconnect the Mirror (PDM) C2 harness connector.

   NOTE: The graphic shows the terminal side of the connector. Back probe the wire side.

2. Using a 12 volt test light, back probe and connect one lead to the (P72) Passenger Mirror Vertical Driver circuit and the other lead to the (P70) Passenger Mirror Common Driver circuit in the Passenger Outside Rearview Mirror (Component Side) C2 connector in the PDM.
3. Operate the Mirror Adjust Switch up and down and observe the test light.

   Does the test light illuminate brightly when the switch is moved in either direction?

Yes

- Examine and repair the mirror harness for any breaks or damage. If the wiring harness and connector are okay, replace the Passenger Outside Rearview Mirror in accordance with the Service Information. Refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** and **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace the Passenger Door Module (PDM) in accordance with the Service Information. Refer to **MODULE, DOOR, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1F03-11-MIRROR HORIZONTAL MOTOR CONTROL - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 27: Passenger Mirror Assembly - Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Mirror Horizontal Driver circuit supplies battery voltage for the mirror left position and ground for the mirror right position. The Mirror Common Driver supplies battery voltage for the mirror right position and ground for the mirror left.

WHEN MONITORED

Continuously.

SET CONDITION

The Door Module senses a short low on the Mirror Horizontal Driver circuit for more than two seconds.

POSSIBLE CAUSES

Possible Causes
MIRROR HORIZONTAL DRIVER CIRCUIT SHORTED TO GROUND
MIRROR HORIZONTAL DRIVER CIRCUIT SHORTED TO ANOTHER DRIVER MIRROR DRIVER CIRCUIT
MIRROR HORIZONTAL DRIVER CIRCUIT FOR A SHORT TO ANY RETURN OR GROUND CIRCUITS
OUTSIDE REARVIEW MIRROR
DOOR MODULE

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Cycle the ignition on.
    2. With the scan tool, record and erase Diagnostic Trouble Codes (DTCs).
    3. Press and release the Mirror Select switch to select the Driver Outside Rearview Mirror.
    4. Operate the Mirror Adjust switch in all directions several times while monitoring the scan tool for DTCs.

    NOTE: After adjusting the mirror in one direction wait at least two seconds before adjusting the mirror in the opposite direction, as this will allow time for an active fault to set if present.

    Does the scan tool display; B1F03-11-MIRROR HORIZONTAL MOTOR CONTROL - CIRCUIT SHORT TO GROUND?

    Yes

    - Go To 2

    No

    - The conditions that caused this code to set are not present at this time. Use the wiring diagram/schematic as a guide and inspect the wiring and connectors.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **INSPECT MIRROR CONNECTIONS**
    1. Cycle the ignition off.

2. Disconnect the Passenger Outside Rearview Mirror C2 connector at the Passenger Door Module.
3. Inspect the wiring harness, connectors and the Passenger Door Module for any pin problems, shorted or broken wiring.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 3

3. **MIRROR OR MODULE**
   1. Cycle the ignition on.
   2. With the scan tool, record and erase DTCs.
   3. Press and release the Mirror Select switch to select the Passenger Outside Rearview Mirror.
   4. Operate the Mirror Adjust switch in all directions several times while monitoring the scan tool for DTCs.

      NOTE: After adjusting the mirror in one direction wait at least two seconds before adjusting the mirror in the opposite direction, as this will allow time for an active fault to set if present.

   5. With the scan tool, read DTCs.

      NOTE: Check for a change in DTCs.

      Does the scan tool display: B1F03-13-MIRROR HORIZONTAL MOTOR CONTROL - CIRCUIT OPEN as active?

      Yes

      - With the circuit now OPEN that indicates the short is NOT in the Module. Replace the mirror in accordance with the Service Information. Refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** and **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Replace the Door Module in accordance with the Service Information. Refer to **MODULE, DOOR, REMOVAL** .

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1F03-12-MIRROR HORIZONTAL MOTOR CONTROL - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 28: Passenger Mirror Assembly - Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Mirror Horizontal Driver circuit supplies battery voltage for the mirror left position and ground for the mirror right position. The Mirror Common Driver supplies battery voltage for the mirror right position and ground for the mirror left.

WHEN MONITORED

Continuously.

SET CONDITION

When the Door Module (DDM) senses a short high on the Mirror Horizontal Driver circuit for more than 10 ms.

POSSIBLE CAUSES

Possible Causes
MIRROR HORIZONTAL DRIVER CIRCUIT SHORTED TO THE MIRROR FOLD DRIVER CIRCUIT
MIRROR HORIZONTAL DRIVER CIRCUIT SHORTED TO THE MIRROR UNFOLD DRIVER CIRCUIT
MIRROR HORIZONTAL DRIVER CIRCUIT SHORTED TO THE MIRROR HEATER DRIVER CIRCUIT
OUTSIDE REARVIEW MIRROR
DOOR MODULE

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Cycle the ignition on.
    2. With the scan tool, record and erase the Diagnostic Trouble Codes (DTCs).
    3. Press and release the Mirror Select switch to select the Passenger Outside Rearview Mirror.
    4. Operate the Mirror Adjust switch in all directions several times.
    5. Cycle the ignition from on to off three times.
    6. Cycle the ignition on.
    7. With the scan tool, read the active DTCs.

    Does the scan tool display; B1F03-12-MIRROR HORIZONTAL MOTOR CONTROL - CIRCUIT SHORT TO BATTERY as active?

    Yes

    - Go To 2

    No

- The conditions that caused this code to set are not present at this time. For vehicles equipped with folding outside rearview mirrors, repeat test with mirror folded. If DTC is now active, Go To 2. Otherwise, use the wiring diagram/schematic as a guide and inspect the wiring and connectors.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK (P695) PASSENGER MIRROR FOLD DRIVER CIRCUIT AND (P692) PASSENGER MIRROR UNFOLD DRIVER CIRCUIT FOR A SHORT TO (P74) PASSENGER MIRROR HORIZONTAL DRIVER CIRCUIT**

Fig. 29: Checking Passenger Mirror Fold Driver Circuit & Passenger Mirror Unfold Driver Circuit For Short To Passenger Mirror Horizontal Driver Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Cycle the ignition off.
2. Disconnect the Passenger Outside Rearview Mirror (Component Side) C2 connector from the

PDM.

3. Measure the resistance between the (P74) Passenger Mirror Horizontal Driver circuit and the (P695) Passenger Mirror Fold Driver circuit at the Passenger Outside Rearview Mirror (Component Side) connector.
4. Measure the resistance between the (P74) Passenger Mirror Horizontal Driver circuit and the (P692) Passenger Mirror Unfold Driver circuit at the Passenger Outside Rearview Mirror (Component Side) connector.

Is the resistance below 10k Ohms for either measurement?

Yes

- Repair all circuits with a resistance below 10k Ohms for a short to the (P74) Passenger Mirror Horizontal Driver circuit. If the wiring harness and connector are okay, replace the Passenger Outside Rearview Mirror in accordance with the Service Information. Refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** and **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 3

3. **CHECK (P74) PASSENGER MIRROR HORIZONTAL DRIVER CIRCUIT FOR A SHORT TO THE (C17) PASSENGER MIRROR HEATER DRIVER CIRCUIT**

Fig. 30: Checking Passenger Mirror Horizontal Driver Circuit For Short To Passenger Mirror Heater Driver Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (P74) Passenger Mirror Horizontal Driver circuit and the (C17) Passenger Mirror Heater Driver circuit at the Passenger Outside Rearview Mirror (Component Side) connector.

   Is the resistance below 10k Ohms?

   Yes

   - Repair the short between the (P74) Passenger Mirror Horizontal Driver circuit and the (C17) Passenger Mirror Heater Driver circuit. If the wiring harness and connector are okay, replace the Passenger Outside Rearview Mirror in accordance with the Service Information. Refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** and **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL** .

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace the Passenger Door Module (PDM) in accordance with the Service Information. Refer to **MODULE, DOOR, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1F03-13-MIRROR HORIZONTAL MOTOR CONTROL - CIRCUIT OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 31: Passenger Mirror Assembly - Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Mirror Horizontal Driver circuit supplies battery voltage for the mirror left position and ground for the mirror right position. The Mirror Common Driver supplies battery voltage for the mirror right position and ground for the mirror left.

WHEN MONITORED

Continuously.

SET CONDITION

When the Door Module senses a short high on the Mirror Horizontal Driver circuit for more than 10 ms.

POSSIBLE CAUSES

Possible Causes
MIRROR HORIZONTAL DRIVER CIRCUIT OPEN
MIRROR COMMON DRIVER CIRCUIT OPEN
OUTSIDE REARVIEW MIRROR
DOOR MODULE

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Cycle the ignition on.
    2. With the scan tool, record and erase the Diagnostic Trouble Codes (DTCs).
    3. Press and release the Mirror Select switch to select the Passenger Outside Rearview Mirror.
    4. Operate the Mirror Adjust switch in all directions several times.
    5. Cycle the ignition from on to off three times.
    6. Cycle the ignition on.
    7. With the scan tool, read the active DTCs.

    Does the scan tool display; B1F03-13-MIRROR HORIZONTAL MOTOR CONTROL - CIRCUIT OPEN as active?

    Yes

    - Go To 2

    No

    - The conditions that caused this code to set are not present at this time. For vehicle's equipped with folding outside rearview mirrors, repeat test with mirror folded. If DTC is now active, Go To 2. Otherwise, use the wiring diagram/schematic as a guide and inspect the wiring and connectors.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK MIRROR AND HARNESS FOR AN OPEN**

Fig. 32: Checking Mirror & Harness For Open
Courtesy of CHRYSLER GROUP, LLC

1. Gain access to the Passenger Door Module but do not disconnect the Mirror C2 connector.

   NOTE: The graphic shows the terminal side of the connector. Back probe the wire side.

2. Using a 12 volt test light, back probe and connect one lead to the (P74) Passenger Mirror Horizontal Driver circuit and the other lead to the (P70) Passenger Mirror Common Driver circuit in the Passenger Outside Rearview Mirror (Component Side) connector (PDM C2).
3. While moving the mirror adjust switch left and right, observe the test light.

   Does the test light illuminate brightly when the switch is moved in either direction?

   Yes

- Examine and repair the mirror harness for any breaks or damage. If the wiring harness and connector are okay, replace the Passenger Outside Rearview Mirror in accordance with the Service Information. Refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** and **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace the Passenger Door Module (PDM) in accordance with the Service Information. Refer to **MODULE, DOOR, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1F04-11-MIRROR FOLD CONTROL - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 33: Passenger Mirror Assembly - Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

Continuously.

SET CONDITION

When the Door Module senses a short low on the Mirror Fold Driver circuit or the Mirror Unfold Driver circuit for more than 10 ms.

POSSIBLE CAUSES

Possible Causes
MIRROR FOLD DRIVER CIRCUIT SHORTED TO GROUND
MIRROR UNFOLD DRIVER CIRCUIT SHORTED TO GROUND
MIRROR FOLD DRIVER CIRCUIT SHORTED TO THE MIRROR HEATER RETURN CIRCUIT
MIRROR UNFOLD DRIVER CIRCUIT SHORTED TO THE MIRROR HEATER RETURN CIRCUIT
OUTSIDE REARVIEW MIRROR
DOOR MODULE

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Turn the ignition on.
    2. With the scan tool, record and erase the Diagnostic Trouble Codes (DTCs).
    3. Operate the Mirror Fold switch several times.
    4. Cycle the ignition from on to off three times.
    5. Turn the ignition on.
    6. With the scan tool, read the active DTCs.

    Does the scan tool display; B1F04-11-MIRROR FOLD CONTROL - CIRCUIT SHORT TO GROUND as active?

    Yes

    - Go To 2

    No

    - The conditions that caused this code to set are not present at this time. Repeat the test with the mirror adjusted in several different positions. If the DTC is now active, Go To 2. Otherwise, use the wiring diagram/schematic as a guide and inspect the wiring and connectors.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK (P695) PASSENGER MIRROR FOLD DRIVER CIRCUIT AND (P692) PASSENGER MIRROR UNFOLD DRIVER CIRCUIT FOR A SHORT TO GROUND**

Fig. 34: Checking Passenger Mirror Fold Driver Circuit & Passenger Mirror Unfold Driver Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Passenger Outside Rearview Mirror (Component Side) connector from the PDM C2 harness connector.
3. Measure the resistance of the (P695) Passenger Mirror Fold Driver circuit between ground and the Passenger Outside Rearview Mirror (Component Side) connector.
4. Measure the resistance of the (P692) Passenger Mirror Unfold Driver circuit between ground and the Passenger Outside Rearview Mirror (Component Side) connector.

   Is the resistance below 10k Ohms for either measurement?

Yes

- Repair all circuits with a resistance below 10k ohms for a short to ground. If the wiring harness and connector are okay, replace the Passenger Outside Rearview Mirror in accordance with the Service Information. Refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** and **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 3

3. **CHECK (P695) PASSENGER MIRROR FOLD DRIVER CIRCUIT AND (P692) PASSENGER MIRROR UNFOLD DRIVER CIRCUIT FOR A SHORT TO THE (C170) PASSENGER MIRROR HEATER RETURN CIRCUIT**

Fig. 35: Checking Passenger Mirror Fold/Unfold Driver Circuit For Short To Passenger Mirror Heater Return Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (P695) Passenger Mirror Fold Driver circuit and the (C170) Passenger Mirror Heater Return circuit at the Passenger Outside Rearview Mirror (Component Side) connector.
2. Measure the resistance between the (P692) Passenger Mirror Unfold Driver circuit and the (C170) Passenger Mirror Heater Return circuit at the Passenger Outside Rearview Mirror (Component Side) connector.

Is the resistance below 10k Ohms for either measurement?

Yes

- Repair all circuits with a resistance below 10k ohms for a short to the (C170) Passenger Mirror Heater Return circuit. If the wiring harness and connector are okay, replace the Passenger Outside Rearview Mirror in accordance with the Service Information. Refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** and **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 4.

4. **MODULE OR MIRROR**
   1. Turn the ignition on.
   2. With the scan tool, record and erase the Diagnostic Trouble Codes (DTCs).
   3. Operate the Mirror Fold switch several times.
   4. Operate the mirror switch in all directions.
   5. Cycle the ignition from on to off three times.
   6. Turn the ignition on.
   7. Wait 30 seconds.
   8. With the scan tool, read the active DTCs.

NOTE: Check for a CHANGE in the DTCs.

Does the scan tool display; B1F04-15-MIRROR FOLD CONTROL - CIRCUIT SHORT TO BATTERY OR OPEN as active?

Yes

- Check and repair any damaged wiring in the C2 harness. If the wiring harness and connectors are okay, replace the Outside Rearview Mirror in accordance with the Service Information.

Refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** and **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL** .

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace the Passenger Door Module (PDM) in accordance with the Service Information. Refer to **MODULE, DOOR, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1F04-15-MIRROR FOLD CONTROL - CIRCUIT SHORT TO BATTERY OR OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 36: Passenger Mirror Assembly - Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

Continuously.

SET CONDITION

When the Door Module senses voltage on the Mirror Fold Driver circuit or the Mirror Unfold Driver circuit for more than 10 ms when no voltage should be present or the Fold or Unfold Driver circuit is open.

POSSIBLE CAUSES

Possible Causes
MIRROR FOLD DRIVER CIRCUIT SHORTED TO THE MIRROR HEATER DRIVER CIRCUIT
MIRROR UNFOLD DRIVER CIRCUIT SHORTED TO THE MIRROR HEATER DRIVER CIRCUIT
MIRROR FOLD DRIVER CIRCUIT SHORTED TO VOLTAGE
MIRROR UNFOLD DRIVER CIRCUIT SHORTED TO VOLTAGE
MIRROR FOLD DRIVER CIRCUIT OPEN
MIRROR UNFOLD DRIVER CIRCUIT OPEN
OUTSIDE REARVIEW MIRROR SHORTED
DOOR MODULE

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Cycle the ignition on.
    2. With the scan tool, record and erase the Diagnostic Trouble Codes (DTCs).
    3. For vehicles equipped with heated mirrors, turn the rear defogger ON.
    4. Operate the Mirror Fold switch several times.
    5. With the scan tool, read the DTCs.

    Does the scan tool display; B1F04-15-MIRROR FOLD CONTROL - CIRCUIT SHORT TO BATTERY OR OPEN?

    Yes

    - Go To 2

    No

    - The conditions that caused this code to set are not present at this time. Repeat the test with the mirror adjusted in several different positions. If the DTC is now active, Go To2 Otherwise, use the wiring diagram/schematic as a guide and inspect the wiring and connectors.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE (P695) PASSENGER MIRROR FOLD DRIVER CIRCUIT AND THE (P692) PASSENGER MIRROR UNFOLD DRIVER CIRCUIT FOR A SHORT TO THE (C17) PASSENGER MIRROR HEATER DRIVER CIRCUIT**

Fig. 37: Checking Passenger Mirror Fold/Unfold Driver Circuit For Short To Passenger Mirror Heater Driver Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Cycle the ignition off.
2. Disconnect the Passenger Outside Rearview Mirror (Component Side) connector from the PDM C2 harness connector.
3. Measure the resistance between the (P695) Passenger Mirror Fold Driver circuit and the (C17) Passenger Mirror Heater Driver circuit at the Passenger Outside Rearview Mirror (Component Side) connector.
4. Measure the resistance between the (P692) Passenger Mirror Unfold Driver circuit and the (C17) Passenger Mirror Heater Driver circuit at the Passenger Outside Rearview Mirror (Component Side) connector.

   Is the resistance below 10k Ohms for either measurement?

Yes

- Repair all circuits with a resistance below 10k Ohms for a short to the (C17) Passenger Mirror Heater Driver circuit. If the wiring harness and connector are okay, replace the Passenger Outside Rearview Mirror in accordance with the Service Information. Refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** and **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 3

3. **CHECK THE (P695) PASSENGER MIRROR FOLD DRIVER CIRCUIT AND THE (P692) PASSENGER MIRROR UNFOLD DRIVER CIRCUIT FOR AN OPEN**

Fig. 38: Checking Passenger Mirror Fold Driver Circuit & Passenger Mirror Unfold Driver Circuit

For Open
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (P695) Passenger Mirror Fold Driver circuit and the (P692) Passenger Mirror Unfold Driver circuit at the Passenger Outside Rearview Mirror C2 (Component Side) connector.

   Is the resistance below 9.0 Ohms?

   Yes

   - Go To 4

   No

   - Replace the Passenger Power Folding Mirror Assembly in accordance with the Service Information. Refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** and **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK THE (P695) PASSENGER MIRROR FOLD DRIVER CIRCUIT AND THE (P692) PASSENGER MIRROR UNFOLD DRIVER CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 39: Checking Passenger Mirror Fold Driver Circuit & Passenger Mirror Unfold Driver Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Cycle the ignition on.
2. Measure the voltage between ground and the (P695) Passenger Mirror Fold Driver circuit in the Passenger Outside Rearview Mirror C2 (Component Side) connector.
3. Measure the voltage between ground and the (P692) Passenger Mirror Unfold Driver circuit in the Passenger Outside Rearview Mirror C2 (Component Side) connector.

   Is there any voltage present in either terminal?

   Yes

   - Replace the Passenger Outside Rearview Folding Mirror in accordance with the Service

Information. Refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** and **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL** .

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace the Passenger Door Module (PDM) in accordance with the Service Information. Refer to **MODULE, DOOR, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1F06-12-MIRROR CONTROL SENSOR POSITION CIRCUIT - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 40: Passenger Mirror Assembly - Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

Continuously with ignition on.

SET CONDITION

When the Door Module senses a short to battery on either the 5-volt supply, the mirror horizontal signal or the mirror vertical position signal circuit for more than two seconds, this code will set.

POSSIBLE CAUSES

Possible Causes
MIRROR VERTICAL POSITION SIGNAL CIRCUIT SHORTED TO VOLTAGE
MIRROR VERTICAL POSITION SIGNAL CIRCUIT SHORTED TO ANY DRIVER OR SIGNAL CIRCUIT
MIRROR HORIZONTAL POSITION SIGNAL CIRCUIT SHORTED TO VOLTAGE
MIRROR HORIZONTAL POSITION SIGNAL CIRCUIT SHORTED TO ANY DRIVER OR SIGNAL CIRCUIT
5 VOLT SUPPLY CIRCUIT SHORTED TO ANY CIRCUIT DRIVER CIRCUIT
5 VOLT SUPPLY CIRCUIT SHORTED TO BATTERY
OUTSIDE REARVIEW MIRROR
DOOR MODULE

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**

NOTE: Before proceeding be sure this vehicle is equipped with Memory Mirrors and the configuration is set to = True.

1. Cycle the ignition on.
2. Using a scan tool, record and erase the Diagnostic Trouble Codes (DTCs).
3. Turn the passenger side turn signal on.
4. Turn the approach lamps on, if equipped.
5. Turn the rear defogger on, if equipped with heated mirror.
6. Press and release the Mirror Select switch to select the Passenger Outside Rearview Mirror.
7. Operate the Mirror Adjust Switch in all directions several times while monitoring the scan tool for DTCs.

NOTE: After adjusting the mirror in one direction wait at least two seconds before adjusting the mirror in the opposite direction, as this will allow time for an active DTC to set, if present.

Does the scan tool display: B1F06-12-MIRROR CONTROL SENSOR POSITION CIRCUIT - CIRCUIT SHORT TO BATTERY as active?

Yes

- Go To 2

No

- The conditions that caused this code to set are not present at this time. For vehicle's equipped with folding outside rearview mirrors, repeat this test with the mirror folded. If this DTC is now active, Go To 2. Otherwise, using the wiring diagrams as a guide, check all related connectors for signs of water intrusion, corrosion, pushed out or bent terminals and poor pin fit.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK (A857) 5-VOLT SUPPLY CIRCUIT IN THE MODULE FOR A SHORT TO BATTERY**

NOTE: In this step we are measuring the 5-Volt Supply voltage at the Door Module. It should not be over 5.5 volts.

1. Cycle the ignition off.
2. Disconnect the Passenger Outside Rearview Mirror C1 and C2 (Component Side) harness connectors from the Door Module C1 and C2 sockets.
3. Cycle the ignition on.
4. Measure the voltage between Ground and the (A857) 5-volt Supply circuit at the Door Module (C1-Pin 10) (Module Side) socket.

   Is the Voltage above 5.5 Volts?

   Yes

   - Replace the Door Module in accordance with the Service Information. Refer to **MODULE, DOOR, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 3

3. **CHECK (A857) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO ANY OF THE CIRCUIT DRIVER OR SIGNAL CIRCUITS**

NOTE: We are now checking the wiring and the mirror for any crossed circuits.

2. Measure the resistance between the (A857) 5-Volt Supply circuit (C1-Cavity 10) and all designated circuit Driver or Signal circuits in the Passenger Outside Rearview Mirror C1 and C2 (Component Side) harness connectors.

   Is the resistance below 20K Ohms between the (A857) 5-Volt Supply and any of the designated Driver circuits?

   Yes

   - Repair all circuits with a resistance below 20K Ohms for a short to the (A857) 5-Volt Supply circuit. If the wiring harness and connectors are okay, replace the Passenger Outside Rearview Mirror in accordance with the Service Information. Refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** and **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

1. Measure the resistance between the (P68) Passenger Mirror Horizontal Position Signal circuit (C1-Cavity 9) and all the designated circuit Driver or Signal circuits in the Passenger Outside Rearview Mirror C1 and C2 (Component Side) harness connectors.

   Is the resistance below 20K Ohms between the (P68) circuit and any of the designated circuit Driver or Signal circuits?

   Yes

   - Repair all circuits with a resistance below 20K Ohms for a short to the (P68) Passenger Mirror Horizontal Position Signal circuit. If the wiring harness and connectors are okay, replace the Passenger Outside Rearview Mirror in accordance with the Service Information. Refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** and **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Inspect the wiring and connectors for damage and repair as necessary. If the wiring and connectors are okay, replace the Passenger Door Module in accordance with the Service Information. Refer to **MODULE, DOOR, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1F06-14-MIRROR CONTROL SENSOR POSITION CIRCUIT - CIRCUIT SHORT TO GROUND OR OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 44: Passenger Mirror Assembly - Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

Continuously with ignition on.

SET CONDITION

When the Door Module senses an open or short to ground on either the 5-volt supply, the mirror horizontal signal or the mirror vertical position signal circuit for more than two seconds, this code will set.

POSSIBLE CAUSES

Possible Causes
MIRROR VERTICAL POSITION SIGNAL CIRCUIT SHORTED TO GROUND
MIRROR VERTICAL POSITION SIGNAL CIRCUIT SHORTED TO ANY SENSOR GROUND OR RETURN CIRCUIT
MIRROR HORIZONTAL POSITION SIGNAL CIRCUIT SHORTED TO GROUND
MIRROR HORIZONTAL POSITION SIGNAL CIRCUIT SHORTED TO ANY SENSOR GROUND OR RETURN CIRCUIT
5 VOLT SUPPLY CIRCUIT SHORTED TO ANY SENSOR GROUND OR RETURN CIRCUIT

5-VOLT SUPPLY CIRCUIT OPEN AT THE MODULE
MIRROR VERTICAL POSITION SIGNAL CIRCUIT OPEN
MIRROR HORIZONTAL POSITION SIGNAL CIRCUIT OPEN
5-VOLT SUPPLY CIRCUIT OPEN
OUTSIDE REARVIEW MIRROR
DOOR MODULE

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Cycle the ignition on.
    2. Using a scan tool, record and erase the Diagnostic Trouble Codes (DTCs).
    3. Turn the passenger side turn signal on.
    4. Turn the approach lamps on, if equipped.
    5. Turn the rear defogger on, if equipped with heated mirror.
    6. Press and release the Mirror Select switch to select the Passenger Outside Rearview Mirror.
    7. Operate the Mirror Adjust Switch in all directions several times while monitoring the scan tool for DTCs.

    NOTE: After adjusting the mirror in one direction wait at least two seconds before adjusting the mirror in the opposite direction, as this will allow time for an active DTC to set, if present.

    Does the scan tool display: B1F06-14-MIRROR CONTROL SENSOR POSITION CIRCUIT - CIRCUIT SHORT TO GROUND OR OPEN as active?

    Yes

    - Go To 2

    No

- The conditions that caused this code to set are not present at this time. For vehicle's equipped with folding outside rearview mirrors, repeat this test with the mirror folded. If this DTC is now active, Go To 2. Otherwise, using the wiring diagrams as a guide, check all related connectors for signs of water intrusion, corrosion, pushed out or bent terminals and poor pin fit.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK (A857) 5-VOLT SUPPLY CIRCUIT FOR AN OPEN AT THE MODULE**

NOTE: In this step we are measuring the 5-Volt Supply voltage at the Door Module. It should be over 4.5 volts.

1. Cycle the ignition off.
2. Disconnect the Passenger Outside Rearview Mirror C1 and C2 (Component Side) harness connectors from the Door Module C1 and C2 sockets.
3. Cycle the ignition on.
4. Measure the voltage between Ground and the (A857) 5-volt Supply circuit at the Door Module (C1-Pin 10) (Module Side) socket.

   Is the Voltage above 4.5 Volts?

   Yes

   - Go To 3

   No

   - Replace the Door Module in accordance with the Service Information. Refer to **MODULE, DOOR, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK (A857) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO GROUND**

Fig. 45: Checking 5-Volt Supply Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Cycle the ignition off.
2. Measure the resistance between Ground and the (A857) 5-Volt Supply circuit in the Passenger Outside Rearview Mirror C1 connector.

   Is the resistance below 10K Ohms

   Yes

   - Repair the short to ground in the (A857) 5-Volt Supply circuit. If the wiring harness and connector is okay, replace the Passenger Outside Rearview Mirror in accordance with the Service Information. Refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** and

MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL .

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 4

4. **CHECK (P64) PASSENGER MIRROR VERTICAL POSITION SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Fig. 46: Checking Passenger Mirror Vertical Position Signal Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between Ground and the (P64) Passenger Mirror Vertical Position Signal circuit in the Passenger Outside Rearview Mirror C1 harness connector.

Is the resistance below 10K Ohms?

Yes

- Repair the (P64) Passenger Mirror Vertical Position Signal circuit for a short to ground. If the wiring harness and connector are okay, replace the Passenger Outside Rearview Mirror in accordance with the Service Information. Refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** and **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 5

5. **CHECK (P68) PASSENGER MIRROR HORIZONTAL POSITION SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Fig. 47: Checking Passenger Mirror Horizontal Position Signal Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between Ground and the (P68) Passenger Mirror Horizontal Position Signal circuit in the Passenger Outside Rearview Mirror C1 harness connector.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the (P68) Passenger Mirror Horizontal Position Signal circuit for a short to ground. If the wiring harness and connector are okay, replace the Passenger Outside Rearview Mirror in accordance with the Service Information. Refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** and **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 6

6. **CHECK (P64) PASSENGER MIRROR VERTICAL POSITION SIGNAL CIRCUIT FOR AN OPEN**

Fig. 48: Checking Passenger Mirror Vertical Position Signal Circuit For Open
Courtesy of CHRYSLER GROUP, LLC

1. Connect an ohmmeter between the (P64) Passenger Mirror Vertical Position Signal circuit and the (P69) Passenger Mirror Sensor Ground circuit in the Passenger Outside Rearview Mirror C1 (Component Side) harness connector.
2. Manually move the mirror Up and Down while observing the ohmmeter.

Does the resistance measure between approximately 1.2K Ohms and 2.4K Ohms as you move the mirror from Up to Down?

Yes

- Go To 7

No

- Replace the Passenger Outside Rearview Mirror in accordance with the Service Information. Refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** and **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

7. **CHECK (P68) PASSENGER MIRROR HORIZONTAL POSITION SIGNAL CIRCUIT FOR AN OPEN**

Fig. 49: Checking Passenger Mirror Horizontal Position Signal Circuit For Open
Courtesy of CHRYSLER GROUP, LLC

1. Connect an ohmmeter between the (P68) Passenger Mirror Horizontal Position Signal circuit and the (P69) Passenger Mirror Sensor Ground circuit in the Passenger Outside Rearview Mirror C1 (Component Side) harness connector.
2. Manually move the mirror Left to Right while observing the ohmmeter.

   Does the resistance measure between approximately 1.5K Ohms and 2.4K Ohms as you move the mirror from Left to Right?

   Yes

   - Go To 8

   No

   - Replace the Passenger Outside Rearview Mirror in accordance with the Service Information. Refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** and **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

8. **CHECK (A857) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO ANY GROUND OR RETURN CIRCUIT**

   Is the resistance below 20K Ohms between the (P68) circuit and any of the designated circuit Ground or Return circuits?

   Yes

   - Repair all circuits with a resistance below 20K Ohms for a short to the (P68) Passenger Mirror Horizontal Position Signal circuit. If the wiring harness and connectors are okay, replace the Passenger Outside Rearview Mirror in accordance with the Service Information. Refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** and **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Inspect the wiring and connectors for damage and repair as necessary. If the wiring and connectors are okay, replace the Passenger Door Module in accordance with the Service Information. Refer to **MODULE, DOOR, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B210C-16-BATTERY VOLTAGE INPUT - CIRCUIT VOLTAGE BELOW THRESHOLD

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 54: PDM CAN IHS, Fused B+ & Ground Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

At all times.

SET CONDITION

Anytime the module senses a voltage input below 9.0 volts, this code will set.

POSSIBLE CAUSES

POSSIBLE CAUSES
LOW VOLTAGE ENGINE DTC
FUSED B (+) CIRCUIT HAS HIGH RESISTANCE
GROUND CIRCUIT HAS HIGH RESISTANCE
DOOR MODULE

DIAGNOSTIC TEST

1. **CHECK POWERTRAIN CONTROL MODULE (PCM) DTCs**
   1. With the scan tool, read PCM DTCs

      Are there any PCM Charging or Battery DTCs present?

      Yes

      - Refer to **DTC INDEX** and perform the appropriate diagnostic procedures.

      No

      - Go To 2
2. **TEST FOR INTERMITTENT CONDITION**
   1. With the scan tool, record and erase the DTCs.
   2. Start the engine and run for two minutes.
   3. With the scan tool, read the DTCs in the Door Module.

      Does the scan tool display; B210C-16-BATTERY VOLTAGE INPUT - CIRCUIT VOLTAGE BELOW THRESHOLD?

      Yes

      - Go To 3

      No

      - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
3. **(A925) FUSED B(+) OR GROUND CIRCUITS RESISTED**

Fig. 55: Checking Fused B(+) Or Ground Circuits For Resistance
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Passenger Door Module C3 harness connector.
3. Test the circuits by connecting a 12-volt test light between the (A925) Fused B(+) circuit and the Ground circuits in the door module C3 harness connector. The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

   Does the test light illuminate brightly?

   Yes

   - Replace the Passenger Door Module in accordance with Service Information. Refer to **MODULE, DOOR, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

- Test the Fused B(+) and the Ground circuits to determine which one has the high resistance. Repair the circuit for high resistance.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B210C-17-BATTERY VOLTAGE INPUT - CIRCUIT VOLTAGE ABOVE THRESHOLD

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 56: PDM CAN IHS, Fused B+ & Ground Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

At all times.

SET CONDITION

Anytime the module senses voltage input above 15.9 volts, this code will set.

POSSIBLE CAUSES

POSSIBLE CAUSES
HIGH VOLTAGE POWERTRAIN CONTROL MODULE (PCM) DTC DOOR MODULE

DIAGNOSTIC TEST

1. **CHECK PCM DTCs**
    1. With the scan tool, read PCM DTCs.

       Are there any PCM Charging or Battery DTCs present?

       Yes

       - Refer to **DTC INDEX** and perform the appropriate diagnostic procedure.

       No

       - Go To 2
2. **TEST FOR INTERMITTENT CONDITION**
    1. With the scan tool, record and erase the DTCs.
    2. Start the engine and run for two minutes.
    3. With the scan tool, read the Door Module DTCs.

       Does the scan tool display; B210C-17-BATTERY VOLTAGE INPUT - CIRCUIT VOLAGE ABOVE THRESHOLD?

       Yes

       - Replace the Passenger Door Module in accordance with the Service Information. Refer to **MODULE, DOOR, REMOVAL** .
       - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

       No

       - Test complete, the condition or conditions that originally set this DTC are not present at this

time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B21DD-84-SYSTEM VOLTAGE - SIGNAL BELOW ALLOWABLE RANGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

At all times.

SET CONDITION

This is a Controller Area Network (CAN) message that the battery voltage was below 7.3 volts for over 10 seconds.

POSSIBLE CAUSES

POSSIBLE CAUSES
LOW SYSTEM VOLTAGE BATTERY OR CHARGING SYSTEM

DIAGNOSTIC TEST

CHECK ENGINE DTCs

1. With the scan tool, read Powertrain Control Module (PCM) DTCs.

   Are there any PCM Charging or Battery DTCs present?

   Yes

   - Refer to **DTC INDEX** and perform the appropriate diagnostic procedure.

   No

   - This code is for information only. At some time there was a low battery system voltage. Check the battery and charging system in accordance with the Service Information.

B21DD-85-SYSTEM VOLTAGE - SIGNAL ABOVE ALLOWABLE RANGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

At all times.

SET CONDITION

This is a CAN message that the system voltage was above 18.4 volts for over 10 seconds.

POSSIBLE CAUSES

POSSIBLE CAUSES
HIGH BATTERY SYSTEM VOLTAGE CHARGING SYSTEM

DIAGNOSTIC TEST

CHECK ENGINE DTCs

1. With the scan tool, read the Powertrain Control Module (PCM) DTCs.

   Are there any PCM Charging or Battery DTCs present?

   Yes

   - Refer to **DTC INDEX** and perform the appropriate diagnostic procedure.

   No

   - This code is a CAN system message for information only. Check the charging system in accordance with the Service Information.

B224F-54-DOOR MODULE INTERNAL - MISSING CALIBRATION

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Whenever the window motor is operating.

SET CONDITION

When the Door Module has lost the parameters for window travel, this code will set.

POSSIBLE CAUSES

Possible Causes
MODULE NOT CALIBRATED
EXPRESS WINDOW SWITCH

DOOR MODULE

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Cycle the ignition on.
    2. With the scan tool, record and erase the DTCs.
    3. Operate the Passenger Window up and down several times.
    4. Wait 30 seconds.
    5. With the scan tool, read the active DTCs.

    Does the scan tool display; B224F-54 DOOR MODULE INTERNAL - MISSING CALIBRATION?

    Yes

    - Go To 2

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and poor pin fit.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **DENORMALIZE THE WINDOW MODULE**
    1. With the scan tool in Passenger Door Module, select "Miscellaneous Functions" and perform the "Denormalize Window/Reset ECU" routine.
    2. Start the engine or connect a battery charger and set at charging voltage.
    3. Sit in the driver seat.
    4. Using the window switch, move the passenger window part way down.
    5. Using the window switch, raise the window to the full up position and continue to hold the switch for an additional two seconds.
    6. Lower the window to the full down position by pushing down on the window switch to its second detent and continue to hold the switch for an additional two seconds.
    7. Lift the window switch to the express up position and release.

    Did the window move to the full up position?

    Yes

    - Test complete.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 3

3. **EXPRESS SWITCH**

   Is the express feature inoperative from both front door switches?

   Yes

   - Replace the Passenger Door Module in accordance with the Service Information. Refer to **MODULE, DOOR, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the defective Express Window Switch assembly. Refer to **SWITCH, POWER WINDOW, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B224F-96-DOOR MODULE INTERNAL - COMPONENT INTERNAL FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

At all times.

SET CONDITION

Whenever the module detects an EEPROM failure.

POSSIBLE CAUSES

POSSIBLE CAUSES
DOOR MODULE

DIAGNOSTIC TEST

Replace the Passenger Door Module

NOTE: Anytime this code is logged (active or stored), the module must be replaced.

Repair

- Replace the Passenger Door Module in accordance with the Service Information. Refer to **MODULE,**

DOOR, REMOVAL .

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B25AF-2A-DOOR LOCK/UNLOCK SWITCH - STUCK

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously whenever the door module is awake.

SET CONDITION

When the Door Lock Switch Mux circuit is shorted low for over five seconds.

POSSIBLE CAUSES

Possible Causes
PASSENGER DOOR LOCK SWITCH MUX CIRCUIT SHORTED TO GROUND
PASSENGER DOOR LOCK SWITCH MUX CIRCUIT SHORT TO THE PASSENGER WINDOW EXPRESS SWITCH RETURN CIRCUIT
DOOR LOCK SWITCH
DOOR MODULE

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. With the scan tool, record and erase the DTCs.
    2. Operate the Passenger Door Lock Switch in all positions several times.
    3. Cycle the ignition on and wait 30 seconds.
    4. With the scan tool, read the DTCs.

    Does the scan tool display; B25AF-2A-DOOR LOCK/UNLOCK SWITCH - STUCK?

    Yes

    - Go To 2

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **DOOR LOCK SWITCH SHORTED**

Fig. 57: Passenger Window/Door Lock Switch Connector End View
Courtesy of CHRYSLER GROUP, LLC

1. With the scan tool, erase the DTCs.
2. Disconnect the Passenger Window/Door Lock Switch harness connector.
3. With the scan tool, read the DTCs.

Does the scan tool display; B25AF-2A- DOOR LOCK/UNLOCK SWITCH - STUCK?

Yes

- Go To 3

No

- Replace the Passenger Window/Door Lock Switch in accordance with the Service Information. Refer to **SWITCH, POWER WINDOW, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **(G160) PASSENGER DOOR LOCK SWITCH MUX CIRCUIT SHORTED TO GROUND**

Fig. 58: Checking Passenger Door Lock Switch MUX Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Cycle the ignition off.
2. Disconnect the Passenger Door Module C5 harness connector.
3. Measure the resistance between ground and the (G160) Passenger Door Lock Switch Mux circuit in the Passenger Window/Door Lock Switch harness connector.

   Is the resistance below 10k Ohms?

Yes

- Repair the (G160) Passenger Door Lock Switch Mux circuit for a short to ground.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 4

4. **(G160) PASSENGER DOOR LOCK SWITCH MUX CIRCUIT SHORT TO THE (Q936) PASSENGER WINDOW EXPRESS SWITCH RETURN CIRCUIT**

Fig. 59: Checking Passenger Door Lock Switch MUX Circuit For Short To Passenger Window Express Switch Return Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (G160) Passenger Door Lock Switch Mux circuit and the (Q936) Passenger Window Express Switch Return circuit.

   Is the resistance below 10k Ohms?

   Yes

   - Repair the (G160) Passenger Door Lock Switch Mux circuit for a short to the (Q936) Passenger Window Express Switch Return circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the Passenger Door Module in accordance with the Service Information. Refer to **MODULE, DOOR, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B25B0-31-WINDOW POSITION SENSOR - NO SIGNAL

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 60: Window Position Sensor - Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The window motor contains a hall effect sensor to detect the window position. A hall effect sensor is a transducer that varies its output voltage in response to changes in magnetic field. If the motor loses its counts, it may perform erratically or in very short movements.

WHEN MONITORED

Whenever the module is awake.

SET CONDITION

When the window motor hall sensor does not generate a signal during a window movement.

POSSIBLE CAUSES

Possible Causes
WINDOW HALL SENSOR SUPPLY CIRCUIT SHORTED TO VOLTAGE
WINDOW HALL SENSOR A SIGNAL CIRCUIT SHORTED TO GROUND
WINDOW HALL SENSOR RETURN CIRCUIT OPEN
WINDOW HALL SENSOR A SIGNAL CIRCUIT SHORTED TO THE WINDOW HALL SENSOR RETURN CIRCUIT
WINDOW HALL SENSOR A SIGNAL CIRCUIT OPEN
WINDOW HALL SENSOR SUPPLY CIRCUIT OPEN
WINDOW HALL SENSOR RETURN CIRCUIT OPEN
WINDOW MOTOR

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Cycle the ignition on.
    2. With the scan tool, record and erase the DTCs.
    3. Operate the Passenger Window up and down several times.
    4. Wait 30 seconds.
    5. With the scan tool, read the DTCs.

    Does the scan tool display; B25B0-31-WINDOW POSITION SENSOR - NO SIGNAL?

    Yes

    - Go To 2

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **(Q306) PASSENGER WINDOW HALL SENSOR SUPPLY CIRCUIT SHORTED TO VOLTAGE**

Fig. 61: Checking Passenger Window Hall Sensor Supply Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Cycle the ignition off.
2. Disconnect the Passenger Door Module C4 harness connector.
3. Cycle the ignition on.
4. Measure the voltage between ground and the (Q306) Passenger Window Hall Sensor Supply circuit.

   Is there any voltage present?

   Yes

   - Repair the short to voltage in the (Q306) Passenger Window Hall Sensor Supply circuit.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 3

3. **(Q302) PASSENGER WINDOW HALL SENSOR A SIGNAL SHORTED TO GROUND**
   1. Cycle the ignition off.
   2. Disconnect the Passenger Window Motor harness connector.
   3. Measure the resistance between ground and the (Q302) Passenger Window Hall Sensor A Signal circuit in the Passenger Window Motor harness connector.

      Is the resistance below 10K Ohms?

      Yes

      - Repair the short to ground in the Passenger Window Hall Sensor A signal circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 4

4. **(Q306) PASSENGER WINDOW HALL SENSOR SUPPLY CIRCUIT OPEN**
   1. Measure the resistance of the (Q306) Passenger Window Hall Sensor Supply circuit between the Passenger Door Module C4 harness connector and the Passenger Window Motor harness connector.

      Is the resistance above 2.0 Ohms?

      Yes

      - Repair the open in the (Q306) Passenger Window Hall Sensor Supply circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 5

5. **(Q990) PASSENGER WINDOW HALL SENSOR RETURN CIRCUIT OPEN**
   1. Measure the resistance of the (Q990) Passenger Window Hall Sensor Return circuit between the Passenger Door Module C4 harness connector and the Passenger Window Motor harness connector.

      Is the resistance above 2.0 Ohms?

      Yes

- Repair the open in the (Q990) Passenger Window Hall Sensor Return circuit.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 6

6. **(Q302) DRIVER WINDOW HALL SENSOR A SIGNAL CIRCUIT OPEN**
   1. Measure the resistance of the (Q302) Passenger Window Hall Sensor A Signal circuit between the Passenger Door Module C4 harness connector and the Passenger Window Motor harness connector.

      Is the resistance above 2.0 Ohms?

      Yes

      - Repair the open in the (Q302) Passenger Window Hall Sensor A Signal circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 7

7. **(Q302) PASSENGER WINDOW HALL SENSOR A SIGNAL CIRCUIT SHORTED TO THE (Q990) PASSENGER WINDOW HALL SENSOR RETURN CIRCUIT**
   1. Measure the resistance between the (Q302) Passenger Window Hall Sensor A Signal circuit and the (Q990) Passenger Window Hall Sensor Return circuit in the Passenger Window Motor harness connector.

      Is the resistance below 10K Ohms?

      Yes

      - Repair the (Q302) Passenger Window Hall Sensor A Signal circuit for a short to the (Q990) Passenger Window Hall Sensor Return circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Replace the Window Motor in accordance with the Service Information.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B25B1-11-WINDOW POSITION SENSOR POWER SUPPLY - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 62: Window Position Sensor - Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The window motor contains a hall effect sensor to detect the window position. A hall effect sensor is a transducer that varies its output voltage in response to changes in magnetic field. If the motor loses its counts, it may perform erratically or in very short movements.

WHEN MONITORED

Whenever the module is awake.

SET CONDITION

When the Window Hall Sensor Supply circuit falls below 0.8 of a volt for over 480 ms., this code will set.

POSSIBLE CAUSES

Possible Causes
WINDOW HALL SENSOR SUPPLY CIRCUIT SHORTED TO GROUND
WINDOW MOTOR
DOOR MODULE

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Cycle the ignition on.
    2. With the scan tool, record and erase the DTCs.
    3. Operate the Passenger Window up and down several times.
    4. Wait 30 seconds.
    5. With the scan tool, read the DTCs.

    Does the scan tool display; B25B1-11-WINDOW POSITION SENSOR POWER SUPPLY - CIRCUIT SHORT TO GROUND?

    Yes

    - Go To 2

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **WINDOW MOTOR SHORTED**
    1. With the scan tool, erase the DTCs.
    2. Cycle the ignition off.
    3. Disconnect the Passenger Window Motor connector.
    4. Cycle the ignition on.
    5. Operate the passenger window switch up and down several times.
    6. With the scan tool, read the DTCs.

    Does the scan tool display; B25B1-11-WINDOW POSITION SENSOR POWER SUPPLY - CIRCUIT SHORT TO GROUND?

Yes

- Go To 3

No

- Replace the Window Motor in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **(Q306) PASSENGER WINDOW HALL SENSOR SUPPLY CIRCUIT SHORTED TO GROUND**

Fig. 63: Checking Passenger Window Hall Sensor Supply Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Cycle the ignition off.

2. Disconnect the Passenger Door Module C4 harness connector.
3. Measure the resistance between Ground and the (Q306) Passenger Window Hall Sensor Supply circuit.

   Is the resistance below 10k Ohms?

   Yes

   - Repair the short to ground in the (Q306) Passenger Window Hall Sensor Supply circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the Passenger Door Module in accordance with the Service Information. Refer to **MODULE, DOOR, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B285F-11-BLIND SPOT WARNING LIGHT CONTROL - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously with the ignition in the run position.

SET CONDITION

When the Blind Spot Indicator circuit senses that the voltage is below 4.0 volts for over 155 ms., this code will set.

POSSIBLE CAUSES

Possible Causes
MIRROR ASSEMBLY
PASSENGER DOOR MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
   1. Cycle the ignition on.
   2. With the scan tool, erase all DTCs.
   3. Cycle the ignition from on to off three times.

4. Cycle the ignition on.
5. With the scan tool, read the active DTCs.

   Does the scan tool display: B285F-11-BLIND SPOT WARNING LIGHT CONTROL - CIRCUIT SHORT TO GROUND as Active?

   Yes

   - Go To 2

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all relate splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension. Repair as necessary.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **INSPECT MIRROR CONNECTIONS**
   1. Cycle the ignition off.
   2. Disconnect the Passenger Door Module C1 harness connector.
   3. Inspect the wiring and connectors between the mirror and the Passenger Door Module.

      Were there any problems found?

      Yes

      - Repair as necessary.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 3

3. **MIRROR ASSEMBLY**
   1. Cycle the ignition on
   2. With the scan tool, erase the DTCs.
   3. Cycle the ignition from on to off three times.
   4. Cycle the ignition on.
   5. Make sure the PDM C1 harness connector is still disconnected.
   6. With the scan tool, read the active DTCs.
   7. Look for a change in DTCs.

      Does the scan tool display: B285F-15-BLIND SPOT WARNING LIGHT CONTROL - CIRCUIT

SHORT TO BATTERY OR OPEN as Active?

Yes

- Replace the Passenger Mirror Assembly in accordance with the Service Information. Refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** and **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace the Passenger Door Module in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B285F-15-BLIND SPOT WARNING LIGHT CONTROL - CIRCUIT SHORT TO BATTERY OR OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously.

SET CONDITION

When the Blind Spot Indicator circuit senses high voltage or an open circuit for over 55 ms., this code will set.

POSSIBLE CAUSES

Possible Causes
MIRROR ASSEMBLY
PASSENGER DOOR MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Cycle the ignition on.
    2. With the scan tool, erase all DTCs.
    3. Cycle the ignition from on to off three times.
    4. Cycle the ignition on.
    5. With the scan tool, read the DTCs.

Does the scan tool display active: B285F-15-BLIND SPOT WARNING LIGHT CONTROL - CIRCUIT SHORT TO BATTERY OR OPEN?

Yes

- Go To 2

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension. Repair as necessary.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **INSPECT MIRROR CONNECTIONS**
   1. Cycle the ignition off.
   2. Disconnect the Passengers Door Module C1 harness connector.
   3. Inspect the wiring and connectors between the mirror and the Passengers Door Module.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 3

3. **MIRROR ASSEMBLY**
   1. Measure the resistance between the (P554) Passenger Blind Spot/Approach Return circuit and the (P712) Passenger Blind Spot Signal Driver circuit in the PDM C1 harness connector.

   Is the resistance between 550.0 and 650.0 Ohms?

   Yes

   - Replace the Passenger Door Module in accordance with the Service Information. Refer to **MODULE, DOOR, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the Passenger Mirror Assembly in accordance with the Service Information. Refer to

MIRROR, OUTSIDE REARVIEW, REMOVAL and **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL** .

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B2860-11-DOOR AMBIENT LIGHT CONTROL - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

An ambient lamp can be a: map pocket, door handle, halo ring, cup holder, etc. It is a LED with a built in circuit board.

WHEN MONITORED

Whenever the ambient lamp is commanded to be on.

SET CONDITION

When the Door Ambient Lamp Driver circuit falls below 3.0 volts for over 2000 ms. and the above conditions are met, this code will set.

POSSIBLE CAUSES

Possible Causes
DOOR AMBIENT LAMP DRIVER CIRCUIT SHORTED TO GROUND
DOOR AMBIENT LAMP DRIVER CIRCUIT SHORTED TO THE DOOR LIGHTING RETURN CIRCUIT
MAP POCKET LAMP
DOOR MODULE

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**

NOTE: It is recommended that a battery charger be connected and set on low during this test.

NOTE: Be sure the thumbwheels on the Dimmer Module are turned fully on during this test.

1. Turn the ignition on.
2. With the scan tool, record and erase the DTCs.
3. Cycle the ignition on to off three times.

4. Turn the park lamps on.
5. Wait 30 seconds.
6. With the scan tool, read the active DTCs.

   Does the scan tool display: B2860-11-DOOR AMBIENT LAMP CONTROL - CIRCUIT SHORT TO GROUND?

   Yes

   - Go To 2

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **PASSENGER DOOR AMBIENT LAMP SHORTED**

Fig. 64: Passenger Map Pocket Lamp Connector End View
Courtesy of CHRYSLER GROUP, LLC

1. With the scan tool, erase the DTCs.
2. Turn the ignition off.
3. Remove the inner door panel trim in accordance with the Service Information. Refer to **PANEL, DOOR TRIM, REMOVAL** .
4. Ensure the Passenger Door Map Pocket/Courtesy Lamp connector is disconnected.

5. Turn the ignition on.
6. Be sure the park lamps are still on.
7. Wait one minute.
8. With the scan tool, read the active DTCs.

   Does the scan tool display: B2860-11-DOOR AMBIENT LAMP - CONTROL CIRCUIT SHORT TO GROUND as Active?

   Yes

   - Go To 3

   No

   - Replace the Passenger Door Ambient Lamp Assembly.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **(M35) PASSENGER DOOR AMBIENT LAMP DRIVER CIRCUIT SHORTED TO GROUND**

Fig. 65: Checking Passenger Door Ambient Lamp Driver Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Turn the park lamps off.
3. Disconnect the Passenger Door Module C5 harness connector.
4. Measure the resistance between Ground and the (M35) Passenger Door Ambient Lamp Driver circuit in the PDM C5 harness connector.

   Is the resistance below 20K Ohms?

   Yes

   - Repair the short to ground in the (M35) Passenger Door Ambient Lamp Driver circuit.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 4

4. **(M35) PASSENGER DOOR AMBIENT LAMP DRIVER CIRCUIT SHORTED TO THE (M36) PASSENGER DOOR LIGHTING RETURN CIRCUIT**

Fig. 66: Measuring Resistance Between Passenger Door Ambient Lamp Driver Circuit & Passenger Door Lighting Return Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (M35) Passenger Door Ambient Lamp Driver circuit and the (M36) Passenger Door Lighting Return circuit in the PDM C5 harness connector.

   Is the resistance below 20K Ohms?

Yes

- Repair the short between the (M35) Passenger Door Ambient Lamp Driver circuit and the (M36) Passenger Door Lighting Return circuit.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace the Passenger Door Module in accordance with the Service Information. Refer to **MODULE, DOOR, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B2860-15-DOOR AMBIENT LIGHT CONTROL-CIRCUIT SHORT TO BATTERY OR OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

An ambient lamp can be a: map pocket, door handle, halo ring, cup holder, etc. It is a LED with a built in circuit board.

WHEN MONITORED

Whenever the ambient lamp is commanded to be on.

SET CONDITION

When the Door Ambient Lamp Driver circuit is on when it should be off or off when it should be on, for over 2000 ms. and the above conditions are met, this code will set.

POSSIBLE CAUSES

Possible Causes
DOOR AMBIENT LAMP DRIVER CIRCUIT SHORTED TO BATTERY VOLTAGE
DOOR AMBIENT LAMP DRIVER CIRCUIT OPEN
DOOR MAP POCKET LAMP
DOOR MODULE

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**

NOTE: **Be sure the thumbwheels on the Dimmer Module are turned fully on until instructed to turn them off.**

1. Turn the ignition on.
2. With the scan tool, record and erase the DTCs.
3. Cycle the ignition on to off three times.
4. Turn the park lamps on.
5. Wait 30 seconds then turn the ignition on.
6. With the scan tool, read the active DTCs.

   Does the scan tool display: B2860-15-DOOR AMBIENT LAMP CONTROL - CIRCUIT SHORT TO BATTERY OR OPEN?

   Yes

   - Go To 2

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **(M35) PASSENGER DOOR AMBIENT LAMP DRIVER CIRCUIT SHORTED TO VOLTAGE**

Fig. 67: Checking Passenger Door Ambient Lamp Driver Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Remove the inner door panel trim in accordance with the Service Information. Refer to **PANEL, DOOR TRIM, REMOVAL** .
3. Leave the Passenger Door Map Pocket/Courtesy Lamp connector connected.
4. Disconnect the Passenger Door Module C5 harness connector.
5. Turn the ignition on.
6. Measure the voltage between ground and the (M35) Passenger Door Ambient Lamp Driver circuit in the Passenger Door Module C5 harness connector.

   Is there any voltage present?

   Yes

- Repair the (M35) Passenger Door Ambient Lamp Driver circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 3

3. **(M35) PASSENGER DOOR AMBIENT LAMP DRIVER CIRCUIT OPEN**

Fig. 68: Passenger Door Module Connector End View
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.

2. Be sure the Passenger Door Map Pocket/Courtesy Lamp connector is still connected.
3. Turn the ignition on.
4. Connect a fused jumper wire to the (M35) Passenger Door Ambient Lamp Driver circuit in the PDM C5 harness connector.
5. Connect a jumper wire to the (M36) Passenger Door Lighting Return circuit in the PDM C5 harness connector.

   Does the Passenger Door Ambient Lamp illuminate brightly?

   Yes

   - Replace the Passenger Door Module in accordance with the Service Information. Refer to **MODULE, DOOR, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 4

4. **(M35) PASSENGER DOOR AMBIENT LAMP DRIVER CIRCUIT OPEN**

Fig. 69: Checking Passenger Door Ambient Lamp Driver Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Passenger Door Map Pocket/Courtesy Lamp harness connector.
2. Measure the resistance of the (M35) Passenger Door Ambient Lamp Driver circuit between the PDM C5 harness connector and the Passenger Door Map Pocket/Courtesy Lamp harness connector.

   Is the resistance below 2.0 Ohms?

   Yes

   - Go To 5

   No

   - Repair the open in the (M35) Passenger Door Courtesy Lamp Driver circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **(M36) PASSENGER DOOR LIGHTING RETURN CIRCUIT OPEN**

Fig. 70: Checking Passenger Door Lighting Return Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (M36) Passenger Door Lighting Return circuit between the PDM C5 harness connector and the Passenger Door Map Pocket/Courtesy Lamp harness connector.

   Is the resistance below 2.0 Ohms?

Yes

- Replace the Passenger Door Ambient Lamp.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Repair the open in the (M36) Passenger Door Lighting Return circuit.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B2861-11-MIRROR APPROACH LIGHT CONTROL - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously.

SET CONDITION

The Door Module senses a short low on the Approach Lamp Driver circuit for more than two seconds with the approach lights switched on.

POSSIBLE CAUSES

Possible Causes
MIRROR APPROACH LAMP DRIVER CIRCUIT SHORTED TO GROUND
MIRROR APPROACH LAMP DRIVER CIRCUIT SHORTED TO THE APPROACH LAMP RETURN CIRCUIT
MIRROR APPROACH LAMP DRIVER CIRCUIT SHORTED TO ANY SENSOR GROUND OR RETURN CIRCUIT
OUTSIDE REARVIEW MIRROR
DOOR MODULE

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Cycle the ignition on.
    2. Using a scan tool, record and erase Diagnostic Trouble Codes (DTCs).
    3. Cycle the ignition off then on.
    4. Press and release the Mirror Select switch to select the Passenger Outside Rearview Mirror.
    5. Open the passenger door to turn the approach lights on.
    6. Turn the passenger side turn signal on.
    7. Fold and unfold the mirrors (if equipped).

8. Turn the rear defogger on (if equipped with heated mirrors).
9. Operate the Mirror Adjust switch in all directions several times while monitoring the scan tool for DTCs.

NOTE: After adjusting the mirror in one direction wait at least two seconds before adjusting the mirror in the opposite direction, as this will allow time for an active fault to set if present.

10. With the scan tool, read the DTCs.

    Does the scan tool display: B2861-11-MIRROR APPROACH LAMP CONTROL - CIRCUIT SHORT TO GROUND?

    Yes

    - Go To 2

    No

    - The conditions that caused this code to set are not present at this time. Repeat this test again. If this DTC is now present, Go To 2. Otherwise, use the wiring diagram/schematic as a guide and inspect the wiring and connectors.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK (P553) PASSENGER MIRROR APPROACH LAMP DRIVER CIRCUIT FOR A SHORT TO GROUND**

Fig. 71: Checking Passenger Mirror Approach Lamp Driver Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Cycle the ignition off.
2. Disconnect the Passenger Outside Rearview Mirror C1 and C2 (Component Side) harness connectors from the Door Module.
3. Measure the resistance between ground and the (P553) Passenger Approach Lamp Driver circuit at the Passenger Outside Rearview Mirror C1 (Component Side) connector.

   Is the resistance below 10k Ohms?

   Yes

   - Repair the (P553) Passenger Approach Lamp Driver circuit for a short to ground. If the

wiring harness and connector are okay, replace the Passenger Outside Rearview Mirror in accordance with the Service Information. Refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** and **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL** .

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 3

3. **CHECK (P553) PASSENGER MIRROR APPROACH LAMP DRIVER CIRCUIT FOR A SHORT TO THE (P554) PASSENGER APPROACH LAMP RETURN CIRCUIT**

Fig. 72: Checking Passenger Mirror Approach Lamp Driver Circuit For Short To Passenger Blind Spot/Approach Return Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (P553) Passenger Approach Lamp Driver circuit and the (P554) Passenger Blind Spot/Approach Return circuit at the Passenger Outside Rearview Mirror C1 (Component Side) harness connector.

   Is the resistance below 2.0 Ohm?

   Yes

   - Repair the (P553) Passenger Approach Lamp Driver circuit for a short to the (P554) Passenger Approach Lamp Return circuit. If the wiring harness and connector are okay, replace the Passenger Outside Rearview Mirror in accordance with the Service Information. Refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** and **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 4

4. **CHECK (P553) PASSENGER MIRROR APPROACH LAMP DRIVER CIRCUIT FOR A SHORT TO ANY PASSENGER MIRROR GROUND OR RETURN CIRCUIT**

Fig. 73: Checking Passenger Mirror Approach Lamp Driver Circuit For Short To Any Passenger Mirror Ground Or Return Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (P553) Passenger Approach Lamp Driver circuit (C1-1) and each of the Passenger Mirror Ground and Return circuits in the Passenger Outside Rearview Mirror C1 and C2 (Component Side) connectors.

   Is the resistance below 10k Ohms for any measurement?

   Yes

   - Repair all circuits with a resistance below 10k Ohms for a short to the (P553) Passenger Approach Lamp Driver circuit. If the wiring harness and connector are okay, replace the Passenger Outside Rearview Mirror in accordance with the Service Information. Refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** and **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Inspect the wiring and connectors for damage and repair as necessary. If the wiring and connectors are okay, replace the Door Module in accordance with the Service Information. Refer to **MODULE, DOOR, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B2861-15-MIRROR APPROACH LIGHT CONTROL - CIRCUIT SHORT TO BATTERY OR OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously.

SET CONDITION

The Door Module senses an open or a short high on the Mirror Approach Lamp Driver circuit for more than two seconds.

POSSIBLE CAUSES

Possible Causes
MIRROR APPROACH LAMP DRIVER CIRCUIT SHORTED TO VOLTAGE
MIRROR APPROACH LAMP DRIVER CIRCUIT OPEN
MIRROR APPROACH LAMP RETURN CIRCUIT OPEN

MIRROR APPROACH LAMP DRIVER CIRCUIT OPEN TO THE APPROACH LAMP RETURN CIRCUIT
MIRROR APPROACH LAMP DRIVER CIRCUIT SHORTED TO ANOTHER DRIVER OR SIGNAL CIRCUIT
OUTSIDE REARVIEW MIRROR
DOOR MODULE

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
   1. Cycle the ignition on.
   2. Using a scan tool, record and erase Diagnostic Trouble Codes (DTCs).
   3. Cycle the ignition off then back to on.
   4. Open the passenger door to turn the approach lights on.
   5. Turn the passenger side turn signal on.
   6. Fold and unfold the mirrors (if equipped).
   7. Turn the rear defogger on (if equipped with heated mirrors).
   8. Operate the Mirror Adjust switch in all directions several times while monitoring the scan tool for DTCs.

      NOTE: After adjusting the mirror in one direction wait at least two seconds before adjusting the mirror in the opposite direction, as this will allow time for an active fault to set if present.

   9. With the scan tool, read the DTCs.

      Does the scan tool display: B2861-15-MIRROR APPROACH LIGHT CONTROL - CIRCUIT SHORT TO BATTERY OR OPEN as active?

      Yes

      - Go To 2

      No

      - The conditions that caused this code to set are not present at this time. Repeat this test again. If this DTC is now present, Go To 2. Otherwise, use the wiring diagram/schematic as a guide and inspect the wiring and connectors.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK (P553) PASSENGER MIRROR APPROACH LAMP DRIVER CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 74: Checking Passenger Mirror Approach Lamp Driver Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Cycle the ignition off.
2. Disconnect the Passenger Outside Rearview Mirror C1 and C2 (Component Side) harness connectors from the Door Module.
3. Cycle the ignition on.
4. Measure the voltage between ground and the (P553) Passenger Mirror Approach Lamp Driver circuit in the Passenger Outside Rearview Mirror C1 (Component Side) harness connector.

   Is there any voltage present?

   Yes

- Repair the (P553) Passenger Mirror Approach Lamp Driver circuit for a short to voltage. If the wiring harness and connector are okay, replace the Passenger Outside Rearview Mirror in accordance with the Service Information. Refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** and **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 3

3. **CHECK (P553) PASSENGER MIRROR APPROACH LAMP DRIVER CIRCUIT AND (P554) PASSENGER APPROACH LAMP RETURN CIRCUIT FOR AN OPEN**

Fig. 75: Checking Passenger Mirror Approach Lamp Driver Circuit For Short To Passenger Blind

Spot/Approach Return Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Cycle the ignition off.
2. Measure the resistance between the (P553) Passenger Mirror Approach Lamp Driver circuit and the (P554) Passenger Blind Spot/Approach Return circuit at the Passenger Outside Rearview Mirror C1 (Component Side) connector.

   Is the resistance below 10.0 Ohms?

   Yes

   - Go To 4

   No

   - Repair the (P553) Passenger Mirror Approach Lamp Driver circuit or the (P554) Passenger Blind Spot/Approach Return circuit for an open. If the wiring harness and connector are okay, replace the Passenger Outside Rearview Mirror in accordance with the Service Information. Refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** and **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK (P553) PASSENGER MIRROR APPROACH LAMP DRIVER CIRCUIT FOR A SHORT TO ANOTHER MIRROR DRIVER OR SIGNAL CIRCUIT**

Fig. 76: Checking Passenger Mirror Approach Lamp Driver Circuit For Short To Another Mirror Driver Or Signal Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (P553) Passenger Mirror Approach Lamp Driver circuit (C1-1) and each of the designated Mirror Driver and Signal circuits in the Passenger Outside Rearview Mirror C1 and C2 (Component Side) connectors.

   Is the resistance below 10k Ohms for any measurement?

   Yes

   - Repair all circuits with a resistance below 10k Ohms for a short to the (P553) Passenger Mirror Approach Lamp Driver circuit. If the wiring harness and connector are okay, replace the Passenger Outside Rearview Mirror in accordance with the Service Information. Refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** and **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Inspect the wiring and connectors for damage and repair as necessary. If the wiring and connectors are okay, replace the Door Module in accordance with the Service Information. Refer to **MODULE, DOOR, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U0010-00-CAN INTERIOR BUS

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously when the ignition is on.

Battery voltage between 10 and 16 volts.

SET CONDITION

The Body Control Module (BCM) detects a short to ground on the CAN Interior Bus (+) circuit or a short to voltage on the CAN Interior Bus (-) circuit.

POSSIBLE CAUSES

Possible Causes
CAN INTERIOR BUS (+) CIRCUIT SHORTED TO GROUND
CAN INTERIOR BUS (-) CIRCUIT SHORTED TO VOLTAGE

ANY CAN INTERIOR BUS MODULE
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

VERIFY IF THE DTC IS ACTIVE

1. Cycle the ignition on.
2. With the scan tool, read the active DTCs.

   Does the scan tool display this DTC as Active?

   Yes

   - Refer to **DTC INDEX** and perform the U0010-00 CAN Interior Bus diagnostic procedure.

   No

   - Refer to **DIAGNOSIS AND TESTING** and perform the Stored Lost Communication DTCs diagnostic procedure.

U0011-00-CAN INTERIOR BUS OFF PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

The Body Control Module (BCM) detects a short condition in one of the CAN IHS Bus (125K) circuits for less than one second.

POSSIBLE CAUSES

Possible Causes
CAN IHS BUS (125K) (+) CIRCUIT SHORTED TO GROUND
CAN IHS BUS (125K) (-) CIRCUIT SHORTED TO VOLTAGE
CAN IHS BUS (125K) (+) CIRCUIT SHORTED TO THE CAN IHS BUS (125K) (-) CIRCUIT
ANY CAN IHS BUS MODULE
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
   1. Turn the ignition on.
   2. With the scan tool, record and erase DTCs.
   3. Cycle the ignition from on to off three times.
   4. Turn the ignition on and wait 10 seconds.
   5. With the scan tool, read active DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Go To 2

   No

   - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE CAN IHS BUS CIRCUITS FOR THE CAN IHS BUS (125K) MODULES**

   NOTE: When performing this step, turn the ignition off (wait one minute) before disconnecting any module. When the module is disconnected turn the ignition on.

   NOTE: This step is to determine if the fault is a module or the circuits between the module and the Star Connector.

   1. While monitoring the scan tool, disconnect each CAN IHS Bus (125K) module at the Front CAN IHS Star Connector (except for the BCM and DLC), one at a time.
   2. Check for this DTC to become stored after disconnecting each CAN IHS Bus (125K) module the vehicle is equipped with.

      NOTE: If the DTC becomes stored when a particular module is disconnected, that module or related circuits are causing the DTC to set.

      With all the CAN IHS Bus modules disconnected at the Star Connector (except for BCM and DLC), does the scan tool display this DTC as active?

      Yes

      - Go To 3

No

- Diagnose the wiring and connectors between the Front CAN IHS Star Connector and the module that when disconnected caused this DTC to become stored for damage or shorted circuits. If OK, replace the module that when disconnected caused this DTC to become stored in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE CAN IHS BUS (125K) (-) CIRCUIT FOR A SHORT TO VOLTAGE**
   1. Turn the ignition off.
   2. Disconnect the scan tool.
   3. Disconnect the Front CAN IHS Star Connector for the DLC.
   4. Turn the ignition on.
   5. Measure the voltage between ground and the CAN IHS Bus (125K) (-) circuit.

   Is there any voltage present?

   Yes

   - Repair the short to voltage in the CAN IHS Bus (-) circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 4

4. **CHECK THE CAN IHS BUS (125K) (+) CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Measure the resistance between ground and the CAN IHS Bus (125K) (+) circuit.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 5

   No

   - Repair the short to ground in the CAN IHS Bus (125K) (+) circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **CHECK FOR A SHORT BETWEEN THE CAN IHS BUS (125K) (+) CIRCUIT AND CAN IHS BUS (125K) (-) CIRCUIT**
   1. Measure the resistance between the CAN IHS Bus (125K) (-) and the CAN IHS Bus (125K) (+) circuits.

Is the resistance above 10k Ohms?

Yes

- Go To 6

No

- Repair the short between the CAN IHS Bus (125K) (+) circuit and the CAN IHS Bus (125K) (-) circuit.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

6. **CHECK THE CAN IHS BUS CIRCUITS FOR A BCM CONCERN**
   1. Disconnect the Front CAN IHS Star Connector for the BCM.
   2. Reconnect all other connectors.
   3. Cycle the ignition from on to off three times.
   4. Turn the ignition on and wait 10 seconds.
   5. With the scan tool, read all DTCs.

   Do any modules on the CAN IHS BUS (125K) display this DTC or U0010-00-CAN INTERIOR BUS as active?

   Yes

   - Reconnect all the connectors and retest. If the concern is still present, replace the Star Connector.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Diagnose the wiring and connectors between the Front CAN IHS Star Connector and the BCM. If OK, replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U0140-00-LOST COMMUNICATION WITH BODY CONTROL MODULE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously when the ignition is on.

The battery voltage between 10.0 and 16.0 Volts.

Body Control Module (BCM) is configured correctly.

SET CONDITION

Bus messages not received from the Body Control Module (BCM) for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
BODY CONTROL MODULE POWER AND GROUND
BCM NOT CONFIGURED CORRECTLY
BODY CONTROL MODULE (BCM)
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

VERIFY IF THE DTC IS ACTIVE

NOTE: **Make sure the battery is fully charged before performing any diagnostic procedure.**

With the scan tool, refer to the Network Review Screen to display a high level view of the vehicle communication network. Modules shown in red are problem areas.

Always diagnose any Body Control Module (BCM) DTCs first before proceeding.

1. Turn the ignition on.
2. With the scan tool, read DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Refer to **DIAGNOSIS AND TESTING** and perform the No Response from BCM (Body Control Module) diagnostic procedure.

   No

   - Refer to **DIAGNOSIS AND TESTING** and perform the Stored Lost Communication DTC diagnostic procedure.

U0164-00-LOST COMMUNICATION WITH HVAC CONTROL MODULE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously when the ignition is on.

Battery voltage between 9 and 16 volts.

SET CONDITION

Bus messages not received from the HVAC Control Module for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN BUS (+) CIRCUIT SHORTED TO VOLTAGE
CAN BUS (-) CIRCUIT SHORTED TO GROUND
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
BODY CONTROL MODULE (BCM) NOT CONFIGURED CORRECTLY
HVAC POWER AND GROUND
HVAC CONTROL MODULE
MODULE THAT SET THE DTC

DIAGNOSTIC TEST

VERIFY DTC IS ACTIVE

1. Cycle the ignition on.
2. With the scan tool, read the active DTCs.

   Does the scan tool display; U0164-00-LOST COMMUNICATION WITH HVAC CONTROL MODULE as Active?

   Yes

   - **Refer to DTC INDEX** and perform the U0164-00-Lost Communication with HVAC Control Module.

   No

   - **Refer to DIAGNOSIS AND TESTING** and perform the Stored Lost Communication DTCs diagnostic procedure.

U0199-00-LOST COMMUNICATION WITH DRIVER DOOR MODULE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

Battery voltage between 10 and 16 volts.

Body Control Module (BCM) is configured correctly.

SET CONDITION

Bus messages not received from the Driver Door Module for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN BUS (+) CIRCUIT SHORTED TO VOLTAGE
CAN BUS (-) CIRCUIT SHORTED TO GROUND
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
DRIVER DOOR MODULE POWER AND GROUND
BCM NOT CONFIGURED CORRECTLY
DRIVER DOOR MODULE
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

VERIFY DTC IS ACTIVE

1. Cycle the ignition on.
2. With the scan tool, read the active DTCs.

   Does the scan tool display; U0199-00-LOST COMMUNICATION WITH DRIVER DOOR MODULE as active?

   Yes

   - Refer to **DTC INDEX** and perform the U0199-00-Lost Communication with Driver Door Module diagnostic procedure.

   No

   - Refer to **DIAGNOSIS AND TESTING** and perform the Stored Lost Communication DTCs diagnostic procedure.

U0209-00-LOST COMMUNICATION WITH MEMORY SEAT CONTROL MODULE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously when the ignition is on.

Battery voltage between 9 and 16 volts.

Ignition Off Draw (IOD) fuse installed.

Body Control Module (BCM) is configured correctly.

SET CONDITION

Bus messages not received from the Memory Seat Module for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN INTERIOR BUS(+) (125k) CIRCUIT SHORTED TO VOLTAGE
CAN INTERIOR BUS(-) (125k) CIRCUIT SHORTED TO GROUND
MEMORY SEAT MODULE POWER AND GROUND
BCM NOT CONFIGURED CORRECTLY
MEMORY SEAT MODULE
MODULE THAT SET THIS DTC

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.

DIAGNOSTIC TEST

VERIFY DTC IS ACTIVE

NOTE: Make sure the IOD fuse is installed and the battery is fully charged before proceeding.

1. Turn the ignition on.
2. With the scan tool, read active DTCs.

   Is this DTC active?

   Yes

   - **Refer to DTC INDEX** and perform the U0209-Lost Communication with Memory Seat Control

Module diagnostic procedure.

No

- **Refer to DIAGNOSIS AND TESTING** and perform the Stored Lost Communication DTCs diagnostic procedure.

U0422-00-IMPAUSIBLE DATA RECEIVED FROM BODY CONTROL MODULE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on and the vehicle in reverse.

SET CONDITION

Ambient Temperature data not received from the Body Control Module (BCM).

POSSIBLE CAUSES

Possible Causes
NO COMMUNICATION WITH THE BODY CONTROL MODULE (BCM)
DTCS STORED OR ACTIVE IN THE BCM
DRIVER DOOR MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
   1. Turn the ignition on.
   2. With the scan tool, read Drivers Door Module DTCs.

      Does the scan tool display this DTC as active?

      Yes

      - Go To 2

      No

      - The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread,

corroded, or contaminated terminals.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **VERIFY BCM IS ACTIVE ON THE CAN BUS**
   1. With the scan tool, select ECU View.
   2. Verify that the BCM is active on the bus.

   Is the BCM active on the bus?

   Yes

   - Go To 3

   No

   - Refer to **DIAGNOSIS AND TESTING** and perform the No Response from BCM diagnostic procedure.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **DTCS STORED OR ACTIVE IN THE BCM**
   1. With the scan tool, read BCM DTCs.

   Are any DTCs active or stored in the BCM?

   Yes

   - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

   No

   - Replace and program the Driver Door Module in accordance with the Service Information. Refer to **MODULE, DOOR, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U050A-00-IMPLAUSIBLE DATA RECEIVED FROM MEMORY SEAT CONTROL MODULE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on for at least five seconds.

Battery voltage between 9 and 16 volts.

Body Control Module (BCM) is configured correctly.

SET CONDITION

Whenever the communication data sent over the CAN BUS from the Memory Seat (MSMD) Module is missing part of the message, the message is corrupted, or the message is an irrational value.

POSSIBLE CAUSES

Possible Causes
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
BCM NOT CONFIGURED CORRECTLY
MEMORY SEAT MODULE POWER AND GROUND
MEMORY SEAT MODULE
MODULE THAT SET THE DTC

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**

   NOTE: Make sure the battery voltage is between 9 and 16 volts before proceeding.

   1. With the scan tool, read active DTCs.

      Is this DTC active?

      Yes

      - Go To 2

      No

      - Refer to **DIAGNOSIS AND TESTING** and perform the Stored Lost Communication DTC diagnostic procedure.

2. **CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS**
   1. With the scan tool, read active DTCs from all modules.

      NOTE: Check for BCM configuration, Bus hardware electrical issues, VIN Missing/Mismatch, battery or ignition related DTCs.

      Does the scan tool display any active DTCs to the conditions listed above?

      Yes

- Refer to **DTC INDEX** and perform the appropriate diagnostic procedure.

No

- Go To 3

3. **VERIFY THE MSMD IS ACTIVE ON THE BUS**
   1. Turn the ignition on.
   2. With the scan tool, verify the MSMD is active on the bus.

   Is the MSMD active on the bus?

   Yes

   - Go To 4

   No

   - Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM MSMD diagnostic procedure.

4. **CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS**
   1. With the scan tool, read all the DTCs.

   Is there more than one module with active DTCs "Logged Against" the MSMD?

   Yes

   - Replace/update the MSMD Module in accordance with the Service Information. Refer to **MODULE, MEMORY, SEAT, REMOVAL** .
   - Perform the appropriate verification test for the module. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 5

5. **CLEAR DTC IN MODULE SETTING FAULT**
   1. With the scan tool, select the module setting the DTC against the MSMD.
   2. Clear active DTCs.

   Is this DTC still active?

   Yes

   - Replace/update the module that set this DTC in accordance with the Service Information.

- Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- The condition is not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
- Perform the appropriate verification test for the module. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U11FA-00-LOST COMMUNICATION WITH RIGHT BLIND SPOT SENSOR

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 77: Identifying Left/Right Blind Spot Sensor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Blind Spot Monitor (BSM) system has two primary components; a Left Blind Spot Sensor (LBSS) and Right Blind Spot Sensor (RBSS). Each sensor includes an internal microprocessor that monitors and controls both the sensor and the blind spot indicator. The two sensors are concealed behind the outboard ends of the rear bumper fascia.

The microprocessor analyzes the sensor data to determine whether any detected objects should be reported. When it is determined that an object should be reported, the Sensor controls its respective left or right BSM display directly through a hard wired output to the Outside Rearview Mirrors. The sensor also sends an electronic request message over the CAN IHS Bus to the radio. The Radio then mutes any current output through the speakers and generates a chime as an audible alert.

Each sensor performs a bulb test by illuminating the triangle icon in the Outside Rearview Mirror at each ignition ON cycle.

WHEN MONITORED

With the ignition on.

SET CONDITION

The Left Blind Spot Sensor (LBSS) does not receive messages from the Right Blind Spot Sensor (RBSS).

POSSIBLE CAUSES

Possible Causes
FUSED IGNITION OUTPUT (RUN) CIRCUIT OPEN OR SHORTED TO GROUND
GROUND CIRCUIT(S) OPEN
CAN IHS BUS CIRCUIT(S) OPEN
RIGHT BLIND SPOT SENSOR (RBSS)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **(F923) FUSED IGNITION OUTPUT (RUN) CIRCUIT OPEN**

1. Disconnect the Right Blind Spot Sensor (RBSS) harness connector.
2. Turn the ignition on.
3. Using a volt meter, measure the voltage of the (F923) Fused Ignition Output (RUN) circuit.

   Is voltage present?

   Yes

   - Go To 3

   No

   - Repair the (F923) Fused Ignition Switch Output (RUN) circuit for an open or short to ground.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **(Z923) GROUND CIRCUIT(S) OPEN**
   1. Turn the ignition off.
   2. Using an ohm meter, measure the resistance between ground and the (Z923) Ground circuits at the RBSS harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 4

      No

      - Repair the (Z923) Ground circuit(s) for an open.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK THE (D217) AND (D218) CAN IHS BUS CIRCUITS FOR AN OPEN**
   1. Turn the ignition on.
   2. Measure the resistance of the (D217) CAN IHS Bus (-) circuit between the Rear CAN IHS Star Connector C4 harness connector and the RBSS harness connector
   3. Measure the resistance of the (D218) CAN IHS Bus (+) circuit between the Rear CAN IHS Star Connector C4 harness connector and the RBSS harness connector.

      Is resistance below 5.0 Ohms on both circuits?

      Yes

      - Replace the Right Blind Spot Sensor in accordance with the Service Information. Refer to **SENSOR, BLIND SPOT, REMOVAL** .

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Repair the (D218) or (D217) CAN IHS Bus circuit for an open. Inspect the connector for damage.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U11FB-00-LOST COMMUNICATION WITH LEFT BLIND SPOT SENSOR

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 78: Identifying Left/Right Blind Spot Sensor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Blind Spot Monitor (BSM) system has two primary components; a Left Blind Spot Sensor (LBSS) and Right Blind Spot Sensor (RBSS). Each sensor includes an internal microprocessor that monitors and controls both the sensor and the blind spot indicator. The two sensors are concealed behind the outboard ends of the rear bumper fascia.

The microprocessor analyzes the sensor data to determine whether any detected objects should be reported. When it is determined that an object should be reported, the Sensor controls its respective left or right BSM display directly through a hard wired output to the Outside Rearview Mirrors. The sensor also sends an electronic request message over the CAN IHS Bus to the radio. The Radio then mutes any current output through the speakers and generates a chime as an audible alert.

Each sensor performs a bulb test by illuminating the triangle icon in the Outside Rearview Mirror at each ignition ON cycle.

WHEN MONITORED

With the ignition on.

SET CONDITION

The Right Blind Spot Sensor (LBSS) does not receive messages from the Left Blind Spot Sensor (RBSS).

POSSIBLE CAUSES

Possible Causes
FUSED IGNITION OUTPUT (RUN) CIRCUIT OPEN OR SHORTED TO GROUND
GROUND CIRCUIT(S) OPEN
CAN IHS BUS CIRCUIT(S) OPEN
LEFT BLIND SPOT SENSOR (RBSS)

DIAGNOSTIC TEST

VERIFY DTC IS ACTIVE

1. Cycle the ignition on.
2. With the scan tool, read the active DTCs.

   Does the scan tool display; U11FB-00- LOST COMMUNICATION WITH LEFT BLIND SPOT SENSOR as Active?

   Yes

   - **Refer to DTC INDEX** and perform the U11FB-00- LOST COMMUNICATION WITH LEFT BLIND SPOT SENSOR.

   No

   - **Refer to DIAGNOSIS AND TESTING** and perform the Stored Lost Communication DTCs diagnostic procedure.

U147D-00-IMPLAUSIBLE DATA RECEIVED FROM RIGHT BLIND SPOT SENSOR

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

Incorrect data received from the Right Blind Spot Sensor (RBSS).

POSSIBLE CAUSES

Possible Causes
NO COMMUNICATION WITH THE RIGHT BLIND SPOT SENSOR (RBSS)
DTCS STORED OR ACTIVE IN THE RBSS
RIGHT BLIND SPOT SENSOR (RBSS)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**

   NOTE: Diagnose and repair any Right Blind Spot Sensor DTCs before proceeding with this diagnostic procedure.

   1. Turn the ignition on.
   2. With the scan tool, read active DTCs.

      Does the scan tool display this DTC as active?

      Yes

      - Go To 2

      No

      - The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **VERIFY THE RBSS IS ACTIVE ON THE CAN BUS**
   1. With the scan tool, verify that the RBSS is active on the bus.

      Is the RBSS active on the bus?

Yes

- Replace and program the Blind Spot Sensor in accordance with the Service Information. Refer to **SENSOR, BLIND SPOT, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Refer to **DIAGNOSIS AND TESTING** and perform the No Response from RBSS diagnostic procedure.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U147E-00-IMPLAUSIBLE DATA RECEIVED FROM LEFT BLIND SPOT SENSOR

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

Incorrect data received from the Left Blind Spot Sensor (LBSS).

POSSIBLE CAUSES

Possible Causes
NO COMMUNICATION WITH THE LEFT BLIND SPOT SENSOR (LBSS)
DTCS STORED OR ACTIVE IN THE LBSS
LEFT BLIND SPOT SENSOR (LBSS)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**

NOTE: Diagnose and repair any Left Blind Spot Sensor DTCs before proceeding with this diagnostic procedure.

1. Turn the ignition on.
2. With the scan tool, read active DTCs.

Does the scan tool display this DTC as active?

Yes

- Go To 2

No

- The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **VERIFY THE LBSS IS ACTIVE ON THE CAN IHS BUS**
   1. With the scan tool, verify that the LBSS is active on the bus.

      Is the LBSS active on the bus?

      Yes

      - Replace and program the Blind Spot Sensor in accordance with the Service Information. Refer to **SENSOR, BLIND SPOT, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Refer to **DIAGNOSIS AND TESTING** and perform the No Response from LBSS diagnostic procedure.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2014 ACCESSORIES AND EQUIPMENT

Power Liftgate - Service Information - Cherokee

WARNING

WARNING

WARNING: There is a small area located on each side of the liftgate from about the belt line down to the sill which is not protected by the power liftgate system pinch sensors. Extreme caution must be taken to prevent body extremities or other objects from entering this area once the liftgate reaches the secondary latch contact position, which is about 13 millimeters (1/2 inch) before the liftgate is fully closed. Failure to observe this warning may result in serious or fatal injury.

WARNING: Never attempt to enter, exit or reach through the liftgate opening with the power liftgate in motion. You could cause damage to the power liftgate system or components, and serious or fatal injuries may result.

CAUTION: Never attempt to operate the power liftgate system while the Power Drive Unit (PDU) or a gas-charged hydraulic strut or prop is removed or disconnected. Damage to the power liftgate system or components may result.

DESCRIPTION

DESCRIPTION

A power operated liftgate system is an available option on this vehicle. The power liftgate system includes the following major components, which are described in further detail elsewhere in this service information:

- **Chime** - An electronic power liftgate chime tone generator is located on the inside of the left inner D-pillar just below the belt line, where it is concealed behind the interior D-pillar trim.
- **D-Pillar Switch** - A power liftgate D-pillar switch (also known as the rear zone switch) is located in a bezel near the back of the left quarter inside trim panel near the D-pillar.
- **Exterior Latch Handle Switch** - A power liftgate exterior latch handle switch (also known as the outside handle switch) is integral to the unique power liftgate exterior latch handle.
- **Latch** - A unique, electrically actuated power liftgate latch and latch cinching mechanism is installed in place of the latch used on vehicles without the power liftgate system option.
- **Overhead Console Switch** - A power liftgate overhead console switch (also known as the front zone switch) is located between the two front reading lamp switches in the overhead console.
- **Pinch Sensors** - A power liftgate pinch sensor is located on each side shut face of the liftgate and extends from about the belt line to just below the liftgate opening header. The right side pinch sensor includes an

integral thermistor.

- **Power Drive Unit** - An electrically operated Power Drive Unit (PDU) is installed on the left side of the liftgate between the liftgate and the liftgate opening trough. It is secured to the same ball studs that are used for the conventional gas-charged hydraulic strut or prop that the PDU replaces.
- **Power Liftgate Module** - The Power LiftGate Module (PLGM) (also known as the Power Liftgate/PLG control module) is concealed behind the liftgate sill scuff plate and trim, on the inside of the back rear cargo area. The PLGM is secured by two integral mounting tabs and an integral latch tab to slots in the sheet metal. Refer to **MODULE, POWER LIFTGATE CONTROL, DESCRIPTION** .
- **Thermistor** - A thermistor is internal and integral to the right side pinch sensor.

Hard wired circuitry connects the power liftgate system components to the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the power liftgate components through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin out and location views for the various wire harness connectors, splices and grounds.

OPERATION

OPERATION

The components and features of the power liftgate system are designed to provide the vehicle operator with convenient and safe access to the cargo area of the vehicle. The power liftgate components convert electrical energy produced by the electrical system of the vehicle into the mechanical action necessary to latch, unlatch, raise and lower the liftgate with the simple touch of a button or the slight pull of the exterior liftgate latch handle.

Battery voltage is supplied to the Power LiftGate Module (PLGM) through a fused B(+) fuse in the Power Distribution Center (PDC) so the PLGM can operate regardless of the ignition switch status. The PLGM monitors many hard wired switch and sensor inputs from the liftgate latch and cinch mechanisms, the Power Drive Unit (PDU), the D-pillar power liftgate switch, the exterior latch handle power liftgate switch, the overhead console power liftgate switch, both pinch sensors and the thermistor in the right pinch sensor.

The PLGM also monitors many electronic message inputs received over the Controller Area Network (CAN) data bus network. Electronic message inputs include: ignition switch status, Transmission Range Sensor (TRS) status, vehicle speed, Remote Keyless Entry (RKE) commands, vehicle theft alarm status, power lock system status and (if equipped) liftgate flip-up glass ajar switch status. In response to those many inputs, the PLGM logic allows it to properly control numerous hard wired outputs that operate the power liftgate latch and cinch mechanisms and the PDU that opens and closes the liftgate as well as the chime tone generator that provides audible indications of the power liftgate status. The PLGM will also place electronic messages on the CAN data bus indicating the liftgate status and many of the hard wired sensor inputs it receives for use by other electronic modules in the vehicle.

Operation of the power liftgate requires the transmission be in the Park or Neutral positions, the vehicle speed

not be greater than zero and that the liftgate flip-up glass is closed. When the vehicle is also unlocked, the power liftgate can be opened by lifting the exterior liftgate latch handle. If the vehicle is locked, a single press of the overhead console power liftgate button or two presses within five seconds of the RKE Liftgate button on the FOB with Integrated Key (FOBIK) will unlock and open the liftgate. The fully open liftgate can be closed automatically by depressing the D-Pillar switch or the overhead console switch one time or by depressing the RKE Liftgate button on the FOBIK twice within five seconds. The fully open liftgate can also be closed manually by pulling it down in the same manner as a non-power liftgate.

The PLGM also confirms safety requirements are met before supplying power to the PDU to begin any power cycle. The PLGM software detects obstructions through inputs from the two pinch sensors as well as by monitoring the resistance to travel of the PDU. When a sufficient obstruction is detected, the PLGM will reverse the direction of the liftgate. Also, an exterior liftgate handle pull during an automatic **Close** cycle will reverse the power liftgate operation to **Open** , while an exterior liftgate handle pull during an automatic **Open** cycle will cancel the cycle and put the power liftgate into full manual operation. In addition to the Electronic Vehicle Information Center (EVIC) customer programmable audible power liftgate chime alerts, when a customer programmable feature is set to **Flash Lamps With Lock** , two flashes of the exterior signal lamps will occur at the beginning of each power liftgate **Open** or **Close** cycle.

The PLGM continually monitors all of the power liftgate system circuits and components, and will store a Diagnostic Trouble Code (DTC) for any problem it detects. The PLGM uses an adaptive memory which allows it to relearn and adapt to changes in the system that might occur due to component wear or ambient conditions. If a power liftgate system component is replaced or a liftgate adjustment is made, the PLGM is required to relearn the effort and time required to open or close the liftgate. This learn cycle can be initiated with a diagnostic scan tool. Refer to **MODULE, POWER LIFTGATE CONTROL, STANDARD PROCEDURE** .

The hard wired circuits and components of the power liftgate system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the power liftgate system or the electronic controls or communication between other modules and devices that provide some features of the system. The most reliable, efficient, and accurate means to diagnose the power liftgate system or the electronic controls and communication related to system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - POWER LIFTGATE SYSTEM

NOTE: Before any testing of the power liftgate system is attempted, the battery should be fully-charged.

The latch, the sensors, the switches and the hard wired circuits between components related to the power liftgate system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the electronic controls or communication between modules and other devices that provide some features of the power liftgate system. The most reliable, efficient, and accurate means to diagnose the power liftgate system or the electronic controls and communication related to power liftgate system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

Following are quick reference diagnostic tables to help when diagnosing and testing the power liftgate system.

SYMPTOM DRIVEN POWER LIFTGATE SYSTEM DIAGNOSIS

CONDITION	POSSIBLE CAUSES	CORRECTION
LIFTGATE WILL NOT INITIATE POWER OPEN/POWER CLOSE WITH EITHER FOBIK OR OVERHEAD CONSOLE SWITCH	1. Power Liftgate System Inhibitors preventing operation.	1. Check Inhibit Monitors using a diagnostic scan tool. Refer to **POWER LIFTGATE SYSTEM INHIBIT MONITORS** . Repair if required.
	2. Power Liftgate Input/Output status incorrect.	2. Check power liftgate input - output status using a diagnostic scan tool. Refer to **POWER LIFTGATE INPUT - OUTPUT TABLE** . Repair if required.
	3. Binding or sticking of components.	3. Establish location of binding or sticking components. Repair or replace if required.
	4, Wiring problems (system or vehicle).	4. Refer to the appropriate wiring information. Repair if required.
	5. Ineffective Power LiftGate Module (PLGM).	5. Test the PLGM using a diagnostic scan tool. Replace if required.
	6. Ineffective power liftgate latch assembly.	6. Check for foreign matter or damaged components preventing proper latch operation. Use diagnostic scan tool to cycle the latch. Replace if required.
	7. Ineffective liftgate Power Drive Unit (PDU).	7. Use a diagnostic scan tool to cycle the PDU. Replace if required.
FOBIK DOES NOT OPERATE POWER LIFTGATE, BUT OVERHEAD CONSOLE SWITCH DOES	1. Power Liftgate System Inhibitors preventing operation.	1. Check Inhibit Monitors using a diagnostic scan tool. Refer to **POWER LIFTGATE SYSTEM INHIBIT MONITORS** . Repair if required.
	2. Power Liftgate Input/Output status incorrect.	2. Check power liftgate input - output status using a diagnostic scan tool. Refer to **POWER LIFTGATE INPUT - OUTPUT TABLE** . Repair if required.
	3. Key in ignition.	3. FOB with Integrated Key (FOBIK) buttons do not function while key is in ignition by design. Remove key from ignition and retry.
	4. Ineffective FOBIK.	4. Reprogram FOBIK and retry. Replace if required.

	5. Ineffective Keyless Ignition Node (KIN).	5. Test the KIN using a diagnostic scan tool. Replace if required.
	6. Wiring problems (system or vehicle).	6. Refer to the appropriate wiring information. Repair if required.
	7 Ineffective Controller Area Network (CAN) data bus.	7. Test the CAN data bus using a diagnostic scan tool. Repair if required.
	8. Ineffective PLGM.	8. Test the PLGM using a diagnostic scan tool. Replace if required.
OVERHEAD CONSOLE SWITCH DOES NOT OPERATE POWER LIFTGATE - BUT FOBIK DOES	1. Power Liftgate System Inhibitors preventing operation.	1. Check Inhibit Monitors using a diagnostic scan tool. Refer to **POWER LIFTGATE SYSTEM INHIBIT MONITORS** . Repair if required.
	2. Power Liftgate Input/Output status incorrect.	2. Check power liftgate input - output status using a diagnostic scan tool. Refer to **POWER LIFTGATE INPUT - OUTPUT TABLE** . Repair if required.
	3. Ineffective power liftgate overhead console switch.	3. Test the overhead console switch. Replace if required.
	4. Wiring problems (system or vehicle).	4. Refer to the appropriate wiring information. Repair if required.
	5. Ineffective PLGM.	5. Test the PLGM using a diagnostic scan tool. Replace if required.
LATCH WILL NOT RELEASE WITH EXTERIOR HANDLE, POWER-OPEN CYCLE MAY OR MAY NOT INITIATE	1. Power Liftgate System Inhibitors preventing operation.	1. Check Inhibit Monitors using a diagnostic scan tool. Refer to **POWER LIFTGATE SYSTEM INHIBIT MONITORS** . Repair if required.
	2. Power Liftgate Input/Output status incorrect.	2. Check power liftgate input - output status using a diagnostic scan tool. Refer to **POWER LIFTGATE INPUT - OUTPUT TABLE** . Repair if required.
	3. Ineffective power liftgate exterior handle switch.	3. Test the exterior handle switch. Replace if required.
	4. Ineffective power liftgate latch assembly.	4. Check for foreign matter or damaged components preventing proper latch operation. Use diagnostic scan tool to cycle the latch. Replace if required.
	5. Wiring problems (system or vehicle).	5. Refer to the appropriate wiring information. Repair if required.
	6. Binding or sticking of components.	6. Establish location of binding or sticking components. Repair or replace if required.
		7. Test the PLGM using a diagnostic scan

	7. Ineffective PLGM.	tool. Replace if required.
LIFTGATE REVERSES DIRECTION DURING POWER OPEN - POWER CLOSE CYCLE	1. FOBIK button being hit more than the two times, or overhead console switch being hit more than once.	1. By design, the liftgate will reverse direction if the FOBIK button is depressed more than twice or the overhead console switch button is depressed more than once.
	2. Power Liftgate System Inhibitors preventing operation.	2. Check Inhibit Monitors using a diagnostic scan tool. Refer to **POWER LIFTGATE SYSTEM INHIBIT MONITORS** . Repair if required.
	3. Power Liftgate Input/Output status incorrect.	3. Check power liftgate input - output status using a diagnostic scan tool. Refer to **POWER LIFTGATE INPUT - OUTPUT TABLE** . Repair if required.
	4. Binding or sticking of components.	4. Establish location of binding or sticking components. Repair or replace if required.
	5. Wiring problems (system or vehicle).	5. Refer to the appropriate wiring information. Repair if required.
	6. Ineffective liftgate PDU.	6. Use a diagnostic scan tool to cycle the PDU. Replace if required.
	7. Ineffective PLGM.	7. Test the PLGM using a diagnostic scan tool. Replace if required.
LATCH WILL NOT POWER-CINCH TO PRIMARY POSITION DURING MANUAL OR POWER OPERATION	1. Power Liftgate System Inhibitors preventing operation.	1. Check Inhibit Monitors using a diagnostic scan tool. Refer to **POWER LIFTGATE SYSTEM INHIBIT MONITORS** . Repair if required.
	2. Pinch sensor activated or opened shorted circuit.	2. Check pinch sensor status using a diagnostic scan tool. Repair or replace if required.
	3. Power Liftgate Input/Output status incorrect.	3. Check power liftgate input - output status using a diagnostic scan tool. Refer to **POWER LIFTGATE INPUT - OUTPUT TABLE** . Repair if required.
	4. Binding or sticking of components.	4. Establish location of binding or sticking components. Repair or replace if required.
	5. Liftgate weather seal force too high.	5. Inspect weather seals for damage, improper installation, foreign matter or other possible obstructions. Repair if required.
	6. Wiring problems (system or vehicle).	6. Refer to the appropriate wiring information. Repair if required.
	7. Ineffective power liftgate latch assembly.	7. Check for foreign matter or damaged components preventing proper latch operation. Use diagnostic scan tool to cycle the latch. Replace if required.
		8. Test the PLGM using a diagnostic scan

	8. Ineffective PLGM.	tool. Replace if required.
LIFTGATE SAGS AFTER COMPLETION OF POWER OPEN CYCLE OR MANUAL OPENING	1. Loose or damaged PDU or strut mounts.	1. Check for loose or broken PDU (left side) or strut (right side) ball stud attachments. Repair or replace if required.
	2. Ineffective liftgate gas-charged strut (prop rod).	2. Check gas-charged strut (prop rod) on right side of liftgate. Replace if required.
HIGH OPENING EFFORT - LIFTGATE OPENS VERY SLOWLY DURING MANUAL OR POWER OPERATION	1. Power Liftgate System Inhibitors preventing operation.	1. Check Inhibit Monitors using a diagnostic scan tool. Refer to **POWER LIFTGATE SYSTEM INHIBIT MONITORS** . Repair if required.
	2. Loose or damaged PDU or strut mounts.	2. Check for loose or broken PDU (left side) or strut (right side) ball stud attachments. Repair or replace if required.
	3. Ineffective liftgate gas-charged strut (prop rod).	3. Check gas-charged strut (prop rod) on right side of liftgate. Replace if required.
	4. Binding or sticking of components.	4. Establish location of binding or sticking components. Repair or replace if required.
	5. Wiring problems (system or vehicle).	5. Refer to the appropriate wiring information. Repair if required.
	6. Vehicle located on too steep of a grade for power liftgate operation.	6. Operate liftgate manually.
	7. Ineffective liftgate PDU.	7. Use a diagnostic scan tool to cycle the PDU. Replace if required.
LIFTGATE CONTINUES TO POWER-CLOSE AFTER REACHING FULL-CLOSED POSITION	1. Power Liftgate Input/Output status incorrect.	1. Check power liftgate input - output status using a diagnostic scan tool. Refer to **POWER LIFTGATE INPUT - OUTPUT TABLE** . Repair if required.
	2. Wiring problems (system or vehicle).	2. Refer to the appropriate wiring information. Repair if required.
	3. Binding or sticking of components.	3. Establish location of binding or sticking components. Repair or replace if required.
	4. Ineffective power liftgate latch assembly.	4. Check for foreign matter or damaged components preventing proper latch operation. Use diagnostic scan tool to cycle the latch. Replace if required.
	5. Ineffective PLGM.	5. Test the PLGM using a diagnostic scan tool. Replace if required.
LIFTGATE CONTINUES TO POWER-OPEN AFTER REACHING FULL-OPEN POSITION - MAY PULSE SEVERAL TIMES	1. Power Liftgate Input/Output status incorrect.	1. Check power liftgate input - output status using a diagnostic scan tool. Refer to **POWER LIFTGATE INPUT - OUTPUT TABLE** . Repair if required.

	2. Wiring problems (system or vehicle).	2. Refer to the appropriate wiring information. Repair if required.
	3. Ineffective full open switch (liftgate PDU).	3. Use a diagnostic scan tool to check the switch status and cycle the PDU. Replace if required.
	4. Ineffective PLGM.	4. Test the PLGM using a diagnostic scan tool. Replace if required.
SQUEAKS, NOISES AND RATTLES	1. Foreign material within liftgate panel.	1. Remove foreign material from within liftgate if required.
	2. Worn or loose liftgate components.	2. Inspect and tighten or replace loose liftgate components if required.
LIFTGATE UNLATCHES OR INITIATES POWER OPEN OR POWER CLOSE CYCLE UNEXPECTEDLY	1. Inadvertent power liftgate activation.	1. Use a diagnostic scan tool to read and record PLGM activation history.
	2. Power Liftgate System Inhibitors preventing operation.	2. Check Inhibit Monitors using a diagnostic scan tool. Refer to **POWER LIFTGATE SYSTEM INHIBIT MONITORS** . Repair if required.
	3. Power Liftgate Input/Output status incorrect.	3. Check power liftgate input - output status using a diagnostic scan tool. Refer to **POWER LIFTGATE INPUT - OUTPUT TABLE** . Repair if required.
	4. Wiring problems (system or vehicle).	4. Refer to the appropriate wiring information. Repair if required.
	5. Ineffective power liftgate overhead console switch.	5. Test the overhead console switch. Replace if required.
	6. Ineffective FOBIK.	6. Reprogram FOBIK and retry. Replace if required.
	7. Ineffective power liftgate latch assembly.	7. Check for foreign matter or damaged components preventing proper latch operation. Use diagnostic scan tool to cycle the latch. Replace if required.
	8. Ineffective PLGM.	8. Test the PLGM using a diagnostic scan tool. Replace if required.

POWER LIFTGATE SYSTEM CONTROL PARAMETERS

The power liftgate system is designed with a number of control parameters, which are conditions that must be fulfilled to allow operation. These control parameters are listed below:

- The Power LiftGate Module (PLGM) will inhibit operation of the power liftgate in extreme ambient temperatures. These temperatures are at or below about -30° C (-22° F) and at or above about 65° C (149° F). The pinch sensor/thermistor assembly on the right side of the liftgate monitors the ambient temperature.

- The transmission must be in the **Park** (P) or **Neutral** (N) positions for the power liftgate system to operate.
- The vehicle speed input must be zero (0) for the power liftgate system to operate.
- The electrical system voltage must be within minimum and maximum specifications for the power liftgate system to operate. A low-voltage cut off is built into the power liftgate system to prevent the battery from discharging to the point where the vehicle cannot be operated.
- If the ignition switch is in the **Start** position, the power liftgate system will not initiate a power cycle.
- If the ignition switch is moved to the **Start** position during a power cycle, the power liftgate will pause.
- If the vehicle is locked, the exterior liftgate handle will not release the latch. The FOB with Integrated Key (FOBIK) and the overhead console switch will work for power open or close cycles.
- If the vehicle theft alarm is armed, the overhead console switch will not open the liftgate; however, the FOBIK will.
- If a liftgate pinch sensor is activated during a power close, the liftgate will reverse direction. If a pinch sensor is already active, the power liftgate system will not initiate a power close. A pinch activation during latch cinch will stop the cinch operation.
- If something sufficiently impedes liftgate travel, the power liftgate will detect an obstacle and reverse direction, traveling to full open or full closed.
- If multiple obstacles are detected during the same power open or close cycle, the liftgate will abort that power cycle and go into full manual operation.
- The power liftgate components are protected by the power liftgate system fuse. If the fuse is ineffective, the power liftgate system will not function.
- Some Diagnostic Trouble Codes (DTC) stored in the PLGM may cause the power liftgate system not to operate. Always use a diagnostic scan tool to check and clear DTCs from the PLGM before and after servicing any power liftgate system components.

POWER LIFTGATE INPUT - OUTPUT TABLE

POWER LIFTGATE INPUT - OUTPUT TABLE

INPUT	NORMAL READINGS			
	FULLY CLOSED AND LATCHED	FULLY OPEN	BETWEEN FULLY OPEN AND CLOSED	DESCRIPTION
PRIMARY RATCHET - AJAR SWITCH CLOSED	FALSE	TRUE	TRUE	Primary/Ajar switch, internal to the liftgate latch. **Open** when latch is in primary. **Closed** when latch is out of primary.
SECONDARY RATCHET SWITCH CLOSED	FALSE	TRUE	TRUE	Internal to the liftgate latch. Indicates when the latch is in secondary position. **Open** when in secondary position. **Closed** when out of secondary

				position.
SECTOR GEAR SWITCH CLOSED	FALSE	FALSE	FALSE	Internal to the liftgate latch. Essentially a park switch for the latch. When latch is running a cinch or release, this switch is **Closed** . After cinch or release is complete, the Power LiftGate Module (PLGM) will reverse direction of the latch until the switch is **Open** .
FULL OPEN SWITCH CLOSED	FALSE	TRUE	FALSE	Internal to the Power Drive Unit (PDU). Indicates when the liftgate is a few degrees from full open. **Closed** when full open. **Open** when not full open.
POSITION SENSOR NUMBER 1 AND NUMBER 2 CLOSED	FALSE OR TRUE	FALSE OR TRUE	FALSE OR TRUE	When in motion, these signals will toggle between **Open** and **Closed** . The two signals together tell the PLGM the speed and distance of liftgate travel. These inputs are also used by the PLGM to sense obstacles encountered by the liftgate.
POSITION SENSOR PULSE COUNTS	100	1600 TO 1800	100 TO 1600	This is a counter derived from the pulses coming from Position Sensors number 1 and 2. This count represents total travel of the liftgate (to mechanical end of travel).
GATE FULL OPEN SWITCH POSITION COUNTS	ABOUT 1600	ABOUT 1600	ABOUT 1600	This is a counter derived from the pulses coming from Position Sensors number 1 and 2. This count represents the position of the full open switch in the PDU.

INPUT	NORMAL (NOT PRESSED)	PRESSED	DESCRIPTION
LEFT PINCH SENSOR	About 4.1 Volts (10 Kilohms)	Less than 1 Volt	Pinch sensor reads 10 kilohms when not pinched. When pinched, shorts out the 10 kilohm resistor and should read from 0 to about 200 ohms.
			Right pinch sensor has a 10 kilohm at room

RIGHT PINCH SENSOR	About 1.7 Volts at 21° C (70° F)	Less than 1 Volt	temperature thermistor in place of the resistor. When not pinched, resistance is proportional to the ambient temperature. When pinched, shorts out the thermistor and should read from 0 to about 200 ohms.
EXTERIOR HANDLE SWITCH	5 Volts (Normally Open)	About 3.4 Volts (4.7 Kilohms)	Located in the liftgate latch. Open circuit when not active. 4.7 kilohms to ground when handle is activated.
OVERHEAD CONSOLE SWITCH	About 4.7 Volts	About 3.4 Volts	When not pressed, should read about 810 kilohms. When pressed, should read about 4.7 kilohms.
D-PILLAR (REAR ZONE) SWITCH	About 4.7 Volts	About 3.4 Volts	When not pressed, should read about 810 kilohms. When pressed, should read about 4.7 kilohms.

OUTPUT	DESCRIPTION	DIAGNOSE
HALL EFFECT POWER	Provides +5 Volts to the Hall sensors in the PDU	As long as the PLGM is awake it should read approximately +5 volts.
LATCH MOTOR	Provides +/- 12 Volts to latch motor for cinch and release	Actuate with diagnostic scan tool. Should see positive voltage on the cinch wiring connector terminal for cinch direction. Should see positive voltage on the release wiring connector terminal for release direction. Refer to the appropriate wiring information for specific harness and connector pinout information.
DRIVE MOTOR	Provides +/- 12 Volts to PDU for power Open or Close	Actuate with diagnostic scan tool. Should see positive voltage on the open wiring connector terminal for open direction. Should see positive voltage on the close wiring connector terminal for close direction. Refer to the appropriate wiring information for specific harness and connector pinout information.
CHIME	Provides signal to output sound	Actuate with diagnostic scan tool. While monitoring with a digital multimeter some activity should be present, but not much voltage.

POWER LIFTGATE SYSTEM INHIBIT MONITORS

The following is a list of inhibit monitors that may be observed using an appropriate diagnostic scan tool.

INHIBIT MONITOR	POSSIBLE CAUSES	CORRECTION
$80 OPEN INHIBIT - VOLTAGE TOO LOW	1. Low or dead battery.	1. Test and charge battery. Replace if required.
	2. Ineffective power or ground circuits to the Power LiftGate Module (PLGM).	2. Check the power and ground circuits for the PLGM. Repair if required.

$82 CLOSE INHIBIT - VOLTAGE TOO LOW	3. Inaccurate voltage reading from the PLGM.	3. Compare the PLGM battery reading using a diagnostic scan tool with a voltmeter reading at the PLGM wiring connections. If a voltage difference of 0.5 Volt or greater is obtained, replace the PLGM.
$81 OPEN INHIBIT - VOLTAGE TOO HIGH	1. Charging system over voltage.	1. Test the charging system. Repair if required.
$83 CLOSE INHIBIT - VOLTAGE TOO HIGH	2. Inaccurate voltage reading from the PLGM.	2. Compare the PLGM battery reading using a diagnostic scan tool with a voltmeter reading at the PLGM wiring connections. If a voltage difference of 0.5 Volt or greater is obtained, replace the PLGM.
$84 OPEN INHIBIT - TEMPERATURE TOO LOW	1. Temperature was below -30° C (-22° F) when the operation was attempted.	1. Inform customer of power liftgate system temperature operating range.
$86 CLOSE INHIBIT - TEMPERATURE TOO LOW	2. Open or high resistance to right pinch sensor thermistor through signal or ground circuit.	2. Check the signal and ground circuits between the pinch sensor and the PLGM including the in-line connectors. Repair if required.
	3. Ineffective right pinch sensor or thermistor.	3. Allow vehicle to sit in a constant temperature environment for one hour with the liftgate open. Test the resistance of the right pinch sensor and thermistor compared to specification. Replace if required.
	4. Inaccurate temperature reading from the PLGM.	4. Allow vehicle to sit in a constant temperature environment for one hour with the liftgate open. Compare the PLGM temperature reading using a diagnostic scan tool with the temperature indicated by the resistance specification of the right pinch sensor and thermistor. If the right pinch sensor and thermistor are within range of specification and the temperature difference at the PLGM is greater than 4.5° C (8° F), replace the PLGM.
$85 OPEN INHIBIT - TEMPERATURE TOO HIGH	1. Temperature was above 65° C (149° F) when the operation was attempted.	1. Inform customer of power liftgate system temperature operating range.
	2. Shorted or partially shorted right pinch sensor thermistor through signal or ground circuit.	2. Check the signal and ground circuits between the pinch sensor and the PLGM including the in-line connectors. Repair if required.
	3. Ineffective right pinch sensor or thermistor.	3. Allow vehicle to sit in a constant temperature environment for one hour with the liftgate open. Test the resistance of the right pinch sensor and thermistor compared to

		specification. Replace if required.
$87 CLOSE INHIBIT - TEMPERATURE TOO HIGH	4. Inaccurate temperature reading from the PLGM.	4. Allow vehicle to sit in a constant temperature environment for one hour with the liftgate open. Compare the PLGM temperature reading using a diagnostic scan tool with the temperature indicated by the resistance specification of the right pinch sensor and thermistor. If the right pinch sensor and thermistor are within range of specification and the temperature difference at the PLGM is greater than 4.5° C (8° F), replace the PLGM.
$88 CLOSE INHIBIT - LEFT PINCH SENSOR ACTIVE	1. Left pinch sensor was activated prior to activation of power close cycle.	1. Check for obstructions causing pinch sensor activation. Repair if required. If no obstructions found, inform customer of pinch sensor operation.
	2. Short to ground on left pinch sensor signal circuit.	2. Check the signal circuit between the pinch sensor and the PLGM including the in-line connectors. Repair if required.
	3. Ineffective left pinch sensor.	3. Test the resistance of the left pinch sensor in an unpinched state. If the resistance is less than 9 kilohms, replace the left pinch sensor.
	4. Ineffective PLGM.	4. Use a diagnostic scan tool to observe the voltage of the left pinch sensor input. With the sensor disconnected the reading should be approximately 5 volts. Short the pinch sensor circuit to ground and the reading should be approximately 0 volts. If the readings are not okay, replace the PLGM.
$89 CLOSE INHIBIT - RIGHT PINCH SENSOR ACTIVE	1. Right pinch sensor was activated prior to activation of power close cycle.	1. Check for obstructions causing pinch sensor activation. Repair if required. If no obstructions found, inform customer of pinch sensor operation.
	2. Short to ground on right pinch sensor signal circuit.	2. Check the signal circuit between the pinch sensor and the PLGM including the in-line connectors. Repair if required.
	3. Ineffective right pinch sensor.	3. Test the resistance of the right pinch sensor in an unpinched state. If the resistance is less than 9 kilohms, replace the right pinch sensor.
	4. Ineffective PLGM.	4. Use a diagnostic scan tool to observe the voltage of the right pinch sensor input. With the sensor disconnected the reading should be approximately 5 volts. Short the pinch sensor circuit to ground and the reading should be approximately 0 volts. If the readings are not

		okay, replace the PLGM.
$8A OPEN INHIBIT - NOT IN PARK OR NEUTRAL	1. Operator attempted power open cycle when vehicle was not in Park or Neutral.	1. Inform customer of power liftgate system operating restrictions.
	2. Operator attempted manual latch release with exterior handle when vehicle was not in Park or Neutral.	2. Inform customer of power liftgate system operating restrictions.
	3. Ignition switch status problem.	3. Use a diagnostic scan tool to observe the electronic message inputs received by the PLGM over the CAN data bus. Verify the ignition switch status reads correctly. Repair if required.
	4. Transmission Range Sensor (TRS) problem.	4. Use a diagnostic scan tool to observe the electronic message inputs received by the PLGM over the CAN data bus. Verify PRNDL status reads correctly. If not okay, repair or replace the TRS if required.
	5. Overhead console power liftgate switch problem.	5. Use a diagnostic scan tool to observe the overhead console liftgate switch inputs to the PLGM. Verify the inputs are correct under different voltage and driving conditions. If not okay, repair or replace the switch if required.
	6. FOB with Integrated Key (FOBIK) or Keyless Ignition Node (KIN) (also known as Wireless Control Module/WCM) problem.	6. Verify proper operation of the FOBIK and the Remote Keyless Entry (RKE) system. Repair or replace if required.
	7. Exterior liftgate latch handle switch problem.	7. Use a diagnostic scan tool to observe the exterior liftgate latch handle switch inputs to the PLGM. Verify the inputs are correct under different voltage and driving conditions. If not okay, repair or replace the switch if required.
$8B CLOSE INHIBIT -	1. Operator attempted power close cycle when vehicle was not in Park or Neutral.	1. Inform customer of power liftgate system operating restrictions.
	2. Ignition switch status problem.	2. Use a diagnostic scan tool to observe the electronic message inputs received by the PLGM over the CAN data bus. Verify the ignition switch status reads correctly. Repair if required.
	3. TRS problem.	3. Use a diagnostic scan tool to observe the electronic message inputs received by the PLGM over the CAN data bus. Verify

NOT IN PARK OR NEUTRAL		PRNDL status reads correctly. If not okay, repair or replace the TRS if required.
	4. Overhead console power liftgate switch problem.	4. Use a diagnostic scan tool to observe the overhead console liftgate switch inputs to the PLGM. Verify the inputs are correct under different voltage and driving conditions. If not okay, repair or replace the switch if required.
	5. FOBIK or KIN problem.	5. Verify proper operation of the FOBIK and the RKE system. Repair or replace if required.
$8C OPEN INHIBIT - NON-ZERO VEHICLE SPEED	1. Operator attempted power open cycle when vehicle is in Neutral and rolling.	1. Inform customer of power liftgate system operating restrictions.
	2. Ignition switch status problem.	2. Use a diagnostic scan tool to observe the electronic message inputs received by the PLGM over the CAN data bus. Verify the ignition switch status reads correctly. Repair if required.
	3. Vehicle Speed Sensor (VSS) problem.	3. Use a diagnostic scan tool to observe the electronic message inputs received by the PLGM over the CAN data bus. Verify the vehicle speed status reads correctly. If not okay, repair or replace the VSS if required.
	4. Overhead console power liftgate switch problem.	4. Use a diagnostic scan tool to observe the overhead console liftgate switch inputs to the PLGM. Verify the inputs are correct under different voltage and driving conditions. If not okay, repair or replace the switch if required.
	5. FOBIK or KIN problem.	5. Verify proper operation of the FOBIK and the RKE system. Repair or replace if required.
	6. Exterior liftgate latch handle switch problem.	6. Use a diagnostic scan tool to observe the exterior liftgate latch handle switch inputs to the PLGM. Verify the inputs are correct under different voltage and driving conditions. If not okay, repair or replace the switch if required.
	1. Operator attempted power close cycle when vehicle is in Neutral and rolling.	1. Inform customer of power liftgate system operating restrictions.
	2. Ignition switch status problem.	2. Use a diagnostic scan tool to observe the electronic message inputs received by the PLGM over the CAN data bus. Verify the ignition switch status reads correctly. Repair

		if required.
$8D CLOSE INHIBIT - NON-ZERO VEHICLE SPEED	3. VSS problem.	3. Use a diagnostic scan tool to observe the electronic message inputs received by the PLGM over the CAN data bus. Verify the vehicle speed status reads correctly. If not okay, repair or replace the VSS if required.
	4. Overhead console power liftgate switch problem.	4. Use a diagnostic scan tool to observe the overhead console liftgate switch inputs to the PLGM. Verify the inputs are correct under different voltage and driving conditions. If not okay, repair or replace the switch if required.
	5. FOBIK or KIN problem.	5. Verify proper operation of the FOBIK and the RKE system. Repair or replace if required.
$8E OPEN INHIBIT - IGNITION IN START POSITION	1. Operator attempted power open cycle with the ignition switch in the Start position.	1. Inform customer of power liftgate system operating restrictions.
	2. Ignition switch status problem.	2. Use a diagnostic scan tool to observe the electronic message inputs received by the PLGM over the CAN data bus. Verify the ignition switch status reads correctly. Repair if required.
	3. Overhead console power liftgate switch problem.	3. Use a diagnostic scan tool to observe the overhead console liftgate switch inputs to the PLGM. Verify the inputs are correct under different voltage and driving conditions. If not okay, repair or replace the switch if required.
	4. FOBIK or KIN problem.	4. Verify proper operation of the FOBIK and the RKE system. Repair or replace if required.
$8F CLOSE INHIBIT - IGNITION IN START POSITION	1. Operator attempted power close cycle with the ignition switch in the Start position.	1. Inform customer of power liftgate system operating restrictions.
	2. Ignition switch status problem.	2. Use a diagnostic scan tool to observe the electronic message inputs received by the PLGM over the CAN data bus. Verify the ignition switch status reads correctly. Repair if required.
	3. Overhead console power liftgate switch problem.	3. Use a diagnostic scan tool to observe the overhead console liftgate switch inputs to the PLGM. Verify the inputs are correct under different voltage and driving conditions. If not okay, repair or replace the switch if required.

	4. FOBIK or KIN problem.	4. Verify proper operation of the FOBIK and the RKE system. Repair or replace if required.
$90 OPEN INHIBIT - IN-PLANT MODE	1. Power open cycle will not function because the PLGM is in the in-plant mode.	1. Use a diagnostic scan tool to perform the PLGM learn cycle. Refer to **MODULE, POWER LIFTGATE CONTROL, STANDARD PROCEDURE** . If learn cycle does not correct the problem, replace the PLGM if required.
$91 CLOSE INHIBIT - IN-PLANT MODE	1. Power close cycle will not function because the PLGM is in the in-plant mode.	1. Use a diagnostic scan tool to perform the PLGM learn cycle. Refer to **MODULE, POWER LIFTGATE CONTROL, STANDARD PROCEDURE** . If learn cycle does not correct the problem, replace the PLGM if required.
$92 OPEN INHIBIT - GEAR/SPEED MISMATCH	1. Power open cycle will not function because of a conflict between the TRS and VSS inputs.	1. Use a diagnostic scan tool to observe the electronic message inputs to the PLGM over the CAN data bus. Verify the vehicle speed and the PRNDL status read correctly. If not okay, repair or replace the TRS or VSS if required. **NOTE:** This inhibitor could also have been operator induced by placing the transmission in Park when the vehicle is still rolling and immediately attempting a power open cycle command.
	2. Ignition switch status problem.	2. Use a diagnostic scan tool to observe the electronic message inputs received by the PLGM over the CAN data bus. Verify the ignition switch status reads correctly. Repair if required.
$93 CLOSE INHIBIT - GEAR/SPEED MISMATCH	1. Power close cycle will not function because of a conflict between the TRS and VSS inputs.	1. Use a diagnostic scan tool to observe the electronic message inputs to the PLGM over the CAN data bus. Verify the vehicle speed and the PRNDL status read correctly. If not okay, repair or replace the TRS or VSS if required. **NOTE:** This inhibitor could also have been operator induced by placing the transmission in Park when the vehicle is still rolling and immediately attempting a power close cycle command.
	2. Ignition switch status problem.	2. Use a diagnostic scan tool to observe the electronic message inputs received by the PLGM over the CAN data bus. Verify the ignition switch status reads correctly. Repair if required.
	1. Operator induced by	

$94 OPEN INHIBIT - NOT FULLY OPEN OR FULLY CLOSED	placing the liftgate latch in the primary or secondary latch position while the liftgate was open.	1. Inform customer of proper power liftgate and latch operation.
	2. Conflict between power liftgate latch switches and PDU full open switch inputs to the PLGM.	2. Use a diagnostic scan tool to observe the liftgate latch full open, primary, secondary, sector and pawl switch readings with the liftgate in the fully open position. Verify that the full open, primary, secondary and pawl switch readings are all **Closed** and the sector switch reading is **Open** . Then, with the liftgate in the fully closed position, verify that the full open, primary, secondary and pawl switch readings are all **Open** and the sector switch reading is **Closed** . Repair if required.
	3. PDU full open switch problem.	3. Use a diagnostic scan tool to verify proper operation of the full open switch during a power liftgate cycle. Repeat during a manual liftgate cycle. In each case the switch reading should be **Closed** with the liftgate a few degrees below fully opened and **Open** in all other positions. Repair if required.
$95 LATCH RELEASE INHIBIT - LOCK ENGAGED	1. Vehicle was locked when the operator attempted to release the power liftgate latch using the exterior latch handle.	1. Inform customer of proper power liftgate and latch operation.
	2. Invalid lock status received by the PLGM.	2. Use a diagnostic scan tool to observe the electronic message inputs to the PLGM over the CAN data bus. Cycle the power door locks using the FOBIK, the interior lock switches and the automatic (or rolling) lock feature. Verify that the lock status reads correctly. Repair if required.
$96 LATCH CINCH ABORTED - LEFT PINCH SENSOR ACTIVE	1. Left pinch sensor was activated when power liftgate latch was cinching.	1. Check for obstructions causing pinch sensor activation. Check the pinch sensor for areas that may be coming into contact with other parts of the vehicle. Ensure the pinch sensor is properly secured to the liftgate. Repair if required. If no obstructions found, inform customer of pinch sensor operation.
	2. Short to ground on left pinch sensor signal circuit.	2. Check the signal circuit between the pinch sensor and the PLGM including the in-line connectors. Repair if required.
	3. Ineffective left pinch sensor.	3. Test the resistance of the left pinch sensor in an unpinched state. If the resistance is less

		than 9 kilohms, replace the left pinch sensor.
	4. Ineffective PLGM.	4. Use a diagnostic scan tool to observe the voltage of the left pinch sensor input. With the sensor disconnected the reading should be approximately 5 volts. Short the pinch sensor circuit to ground and the reading should be approximately 0 volts. If the readings are not okay, replace the PLGM.
$97 LATCH CINCH ABORTED - RIGHT PINCH SENSOR ACTIVE	1. Right pinch sensor was activated when power liftgate latch was cinching.	1. Check for obstructions causing pinch sensor activation. Check the pinch sensor for areas that may be coming into contact with other parts of the vehicle. Ensure the pinch sensor is properly secured to the liftgate. Repair if required. If no obstructions found, inform customer of pinch sensor operation.
	2. Short to ground on right pinch sensor signal circuit.	2. Check the signal circuit between the pinch sensor and the PLGM including the in-line connectors. Repair if required.
	3. Ineffective right pinch sensor.	3. Test the resistance of the right pinch sensor in an unpinched state. If the resistance is less than 9 kilohms, replace the right pinch sensor.
	4. Ineffective PLGM.	4. Use a diagnostic scan tool to observe the voltage of the right pinch sensor input. With the sensor disconnected the reading should be approximately 5 volts. Short the pinch sensor circuit to ground and the reading should be approximately 0 volts. If the readings are not okay, replace the PLGM.
$98 OPEN CANCELLED - HANDLE ACTIVE	1. Operator induced by grabbing the exterior handle while a power open cycle was taking place.	1. Inform customer of power liftgate system operating restrictions.
	2. Exterior liftgate latch handle switch problem.	2. Use a diagnostic scan tool to observe the exterior liftgate latch handle switch inputs to the PLGM. Verify the liftgate latch handle switch (located in the exterior latch handle assembly) reading is approximately 2.4 volts with handle activated and greater than 4.6 volts when released. Using a digital multimeter, measure the resistance of the liftgate latch handle switch. The multimeter should read approximately 4.7 kilohms activated, and open with the handle released. If not okay, repair or replace the switch if required.

$99 OPEN CANCELLED - RKE ACTIVE	1. A power open cycle was cancelled during the first two seconds (while chiming) by an RKE signal.	1. Inform customer of power liftgate system operating restrictions. FOBIK buttons may get inadvertently pressed when in a pocket or purse. Rapid pressing of the buttons may also be the cause.
	2. FOBIK or KIN problem.	2. Verify proper operation of the FOBIK and the RKE system. Repair or replace if required.
$9A OPEN CANCELLED - OVERHEAD/IP ACTIVE	1. A power open cycle was cancelled during the first two seconds (while chiming) by an overhead console power liftgate switch signal.	1. Inform customer of power liftgate system operating restrictions. The overhead console power liftgate switch may have been double pressed.
	2. Overhead console power liftgate switch problem.	2. Use a diagnostic scan tool to observe the overhead console liftgate switch inputs to the PLGM. Verify the inputs are correct under different voltage and driving conditions. If not okay, repair or replace the switch if required.
$9B CLOSE CANCELLED - HANDLE ACTIVE	1. Operator induced by grabbing the exterior handle while a power close cycle was taking place.	1. Inform customer of power liftgate system operating restrictions.
	2. Exterior liftgate latch handle switch problem.	2. Use a diagnostic scan tool to observe the exterior liftgate latch handle switch inputs to the PLGM. Verify the liftgate latch handle switch (located in the exterior latch handle assembly) reading is approximately 2.4 volts with handle activated and greater than 4.6 volts when released. Using a digital multimeter, measure the resistance of the liftgate latch handle switch. The multimeter should read approximately 4.7 kilohms activated, and open with the handle released. If not okay, repair or replace the switch if required.
$9C CLOSE CANCELLED - RKE ACTIVE	1. A power close cycle was cancelled during the first two seconds (while chiming) by an RKE signal.	1. Inform customer of power liftgate system operating restrictions. FOBIK buttons may get inadvertently pressed when in a pocket or purse. Rapid pressing of the buttons may also be the cause.
	2. FOBIK or KIN problem.	2. Verify proper operation of the FOBIK and the RKE system. Repair or replace if required.
	1. A power close cycle was cancelled during the first two	1. Inform customer of power liftgate system

$9D CLOSE CANCELLED - OVERHEAD/IP ACTIVE	seconds (while chiming) by an overhead console power liftgate switch signal.	operating restrictions. The overhead console power liftgate switch may have been double pressed.
	2. Overhead console power liftgate switch problem.	2. Use a diagnostic scan tool to observe the overhead console liftgate switch inputs to the PLGM. Verify the inputs are correct under different voltage and driving conditions. If not okay, repair or replace the switch if required.
$9E CLOSE CANCELLED - LEFT PINCH SENSOR DETECTED	1. A power close cycle was cancelled during the first two seconds (while chiming) by a left pinch sensor signal.	1. Check for obstructions causing pinch sensor activation. Check the pinch sensor for areas that may be coming into contact with other parts of the vehicle. Ensure the pinch sensor is properly secured to the liftgate. Repair if required. If no obstructions found, inform customer of pinch sensor operation.
	2. Short to ground on left pinch sensor signal circuit.	2. Check the signal circuit between the pinch sensor and the PLGM including the in-line connectors. Repair if required.
	3. Ineffective left pinch sensor.	3. Test the resistance of the left pinch sensor in an unpinched state. If the resistance is less than 9 kilohms, replace the left pinch sensor.
	4. Ineffective PLGM.	4. Use a diagnostic scan tool to observe the voltage of the left pinch sensor input. With the sensor disconnected the reading should be approximately 5 volts. Short the pinch sensor circuit to ground and the reading should be approximately 0 volts. If the readings are not okay, replace the PLGM.
$9F CLOSE CANCELLED - RIGHT PINCH SENSOR DETECTED	1. A power close cycle was cancelled during the first two seconds (while chiming) by a right pinch sensor signal.	1. Check for obstructions causing pinch sensor activation. Check the pinch sensor for areas that may be coming into contact with other parts of the vehicle. Ensure the pinch sensor is properly secured to the liftgate. Repair if required. If no obstructions found, inform customer of pinch sensor operation.
	2. Short to ground on right pinch sensor signal circuit.	2. Check the signal circuit between the pinch sensor and the PLGM including the in-line connectors. Repair if required.
	3. Ineffective right pinch sensor.	3. Test the resistance of the right pinch sensor in an unpinched state. If the resistance is less than 9 kilohms, replace the right pinch sensor.
		4. Use a diagnostic scan tool to observe the voltage of the right pinch sensor input. With the sensor disconnected the reading should be

	4. Ineffective PLGM.	approximately 5 volts. Short the pinch sensor circuit to ground and the reading should be approximately 0 volts. If the readings are not okay, replace the PLGM.
$A0 OPEN REVERSAL - GEAR OR SPEED STATE CHANGE	1. Operator shifted vehicle out of Park or Neutral while a power open cycle was in progress.	1. Inform customer of power liftgate system operating restrictions.
	2. VSS problem.	2. Use a diagnostic scan tool to observe the electronic message inputs received by the PLGM over the CAN data bus. Verify the vehicle speed status reads correctly. If not okay, repair or replace the VSS if required.
	3. TRS problem.	3. Use a diagnostic scan tool to observe the electronic message inputs received by the PLGM over the CAN data bus. Verify PRNDL status reads correctly. If not okay, repair or replace the TRS if required.
$A1 OPEN REVERSAL - USER INPUT	1. Operator activated either a FOBIK button or the overhead console power liftgate switch while a power open or power close cycle was in progress	1. Inform customer of power liftgate system operating restrictions. The overhead console power liftgate switch may have been double pressed or the FOBIK buttons may get inadvertently pressed when in a pocket or purse. Rapid pressing of the buttons may also be the cause.
	2. Overhead console power liftgate switch problem.	2. Use a diagnostic scan tool to observe the overhead console liftgate switch inputs to the PLGM. Verify the inputs are correct under different voltage and driving conditions. If not okay, repair or replace the switch if required.
	3. FOBIK or KIN problem.	3. Verify proper operation of the FOBIK and the RKE system. Repair or replace if required.
$A2 CLOSE REVERSAL - USER INPUT	1. Operator activated either a FOBIK button or the overhead console power liftgate switch while a power open or power close cycle was in progress.	1. Inform customer of power liftgate system operating restrictions. The overhead console power liftgate switch may have been double pressed or the FOBIK buttons may get inadvertently pressed when in a pocket or purse. Rapid pressing of the buttons may also be the cause.
	2. Overhead console power liftgate switch problem.	2. Use a diagnostic scan tool to observe the overhead console liftgate switch inputs to the PLGM. Verify the inputs are correct under different voltage and driving conditions. If not okay, repair or replace the switch if

		required.
	3. FOBIK or KIN problem.	3. Verify proper operation of the FOBIK and the RKE system. Repair or replace if required.
$A3 CLOSE REVERSAL - LEFT PINCH SENSOR DETECTED	1. A power close cycle reversed direction due to a left pinch sensor signal.	1. Check for obstructions causing pinch sensor activation. Check the pinch sensor for areas that may be coming into contact with other parts of the vehicle. Ensure the pinch sensor is properly secured to the liftgate. Repair if required. If no obstructions found, inform customer of pinch sensor operation.
	2. Short to ground on left pinch sensor signal circuit.	2. Check the signal circuit between the pinch sensor and the PLGM including the in-line connectors. Repair if required.
	3. Ineffective left pinch sensor.	3. Test the resistance of the left pinch sensor in an unpinched state. If the resistance is less than 9 kilohms, replace the left pinch sensor.
	4. Ineffective PLGM.	4. Use a diagnostic scan tool to observe the voltage of the left pinch sensor input. With the sensor disconnected the reading should be approximately 5 volts. Short the pinch sensor circuit to ground and the reading should be approximately 0 volts. If the readings are not okay, replace the PLGM.
$A4 CLOSE REVERSAL - RIGHT PINCH SENSOR DETECTED	1. A power close cycle reversed direction due to a right pinch sensor signal.	1. Check for obstructions causing pinch sensor activation. Check the pinch sensor for areas that may be coming into contact with other parts of the vehicle. Ensure the pinch sensor is properly secured to the liftgate. Repair if required. If no obstructions found, inform customer of pinch sensor operation.
	2. Short to ground on right pinch sensor signal circuit.	2. Check the signal circuit between the pinch sensor and the PLGM including the in-line connectors. Repair if required.
	3. Ineffective right pinch sensor.	3. Test the resistance of the right pinch sensor in an unpinched state. If the resistance is less than 9 kilohms, replace the right pinch sensor.
	4. Ineffective PLGM.	4. Use a diagnostic scan tool to observe the voltage of the right pinch sensor input. With the sensor disconnected the reading should be approximately 5 volts. Short the pinch sensor circuit to ground and the reading should be approximately 0 volts. If the readings are not okay, replace the PLGM.
	1. A power close cycle	

$A5 CLOSE REVERSAL - HANDLE ACTIVE	reversed direction due to the operator grabbing the exterior handle while the cycle was taking place.	1. Inform customer of power liftgate system operating restrictions.
	2. Exterior liftgate latch handle switch problem.	2. Use a diagnostic scan tool to observe the exterior liftgate latch handle switch inputs to the PLGM. Verify the liftgate latch handle switch (located in the exterior latch handle assembly) reading is approximately 2.4 volts with handle activated and greater than 4.6 volts when released. Using a digital multimeter, measure the resistance of the liftgate latch handle switch. The multimeter should read approximately 4.7 kilohms activated, and open with the handle released. If not okay, repair or replace the switch if required.
$A6 OPEN ABORTED - HANDLE ACTIVE	1. A power open cycle was aborted due to the operator grabbing the exterior handle while the cycle was taking place.	1. Inform customer of power liftgate system operating restrictions.
	2. Exterior liftgate latch handle switch problem.	2. Use a diagnostic scan tool to observe the exterior liftgate latch handle switch inputs to the PLGM. Verify the liftgate latch handle switch (located in the exterior latch handle assembly) reading is approximately 2.4 volts with handle activated and greater than 4.6 volts when released. Using a digital multimeter, measure the resistance of the liftgate latch handle switch. The multimeter should read approximately 4.7 kilohms activated, and open with the handle released. If not okay, repair or replace the switch if required.
$A7 OPEN OBSTACLE	1. A power open cycle reversed direction due to an obstacle detected while the cycle was taking place.	1. Normal operation. Inform customer of power liftgate system operating restrictions.
	2. Binding or sticking of components.	2. Use a diagnostic scan tool to determine the Gate Position indicated in the Inhibit Monitor record. Move the liftgate manually to that location and note the components involved in the obstruction or binding. Repair or replace the components if required.
		3. Use a diagnostic scan tool to perform the

	3. The PLGM is not properly calibrated.	PLGM learn cycle. Refer to **MODULE, POWER LIFTGATE CONTROL, STANDARD PROCEDURE** . If learn cycle does not correct the problem, replace the PLGM if required.
$A8 CLOSE OBSTACLE	1. A power close cycle reversed direction due to an obstacle detected while the cycle was taking place.	1. Normal operation. Inform customer of power liftgate system operating restrictions.
	2. Binding or sticking of components.	2. Use a diagnostic scan tool to determine the Gate Position indicated in the Inhibit Monitor record. Move the liftgate manually to that location and note the components involved in the obstruction or binding. Repair or replace the components if required.
	3. The PLGM is not properly calibrated.	3. Use a diagnostic scan tool to perform the PLGM learn cycle. Refer to **MODULE, POWER LIFTGATE CONTROL, STANDARD PROCEDURE** . If learn cycle does not correct the problem, replace the PLGM if required.
$AA LATCH IS NOT NEAR SECONDARY STATE	1. Operator induced by placing the liftgate latch in the primary or secondary latch position while the liftgate was open.	1. Inform customer of proper power liftgate and latch operation.
	2. Wiring problem.	Use a diagnostic scan tool to observe and verify that the position sensor 1 and 2 in the PDU toggle between **Open** and **Closed** . If readings are inaccurate, diagnose the wiring for possible opens or shorts to ground or voltage. Refer to the appropriate wiring information. Repair if required.
	3. PDU position sensor problem.	3. Manually open the liftgate to the fully open position. Bring the liftgate down to just before the latch contacts the striker. Using a diagnostic scan tool observe the Gate Position counts. If the count is greater than 20, replace the ineffective PDU.
	4. PLGM problem.	Use a diagnostic scan tool to observe the position sensor 1 and 2 status. Disconnect the PDU electrical connector. Apply opens and grounds to the position sensor signal circuits. Verify that the PLGM reads the correct **Open** and **Closed** status. If not okay, replace the PLGM if required.

$AB OPEN INHIBIT - VTA ARMED	1. The overhead console power liftgate switch would not initiate a power open cycle because the Vehicle Theft Alarm (VTA) was armed.	1. Normal operation. Inform customer of power liftgate system operating restrictions.
	2. Invalid VTA status.	2. Use a diagnostic scan tool to observe and verify that electronic messages from the instrument cluster (also known as the Cab Compartment Node/CCN) over the CAN data bus indicate proper operation of the VTA system. If not okay, repair or replace components if required.
$AC OPEN INHIBIT - INVALID INPUT	1. The power liftgate D-pillar switch would not initiate a power open cycle because a power open is not allowed from that input.	1. Normal operation. Inform customer of power liftgate system operating restrictions.
$AD OPEN INHIBIT - FLIPPER GLASS AJAR	1. Operator attempted a power open cycle while the liftgate flip-up glass was ajar.	1. Normal operation. Inform customer of power liftgate system operating restrictions.
	2. Liftgate flip-up glass ajar switch problem.	2. Use a diagnostic scan tool to observe and verify that electronic messages from the Body Control Module (BCM) over the CAN data bus indicate the proper status of the liftgate flip-up glass. If not okay, repair or replace flip-up glass ajar switch if required.
$AE CLOSE INHIBIT - FLIPPER GLASS AJAR	1. Operator attempted a power close cycle while the liftgate flip-up glass was ajar.	1. Normal operation. Inform customer of power liftgate system operating restrictions.
	2. Liftgate flip-up glass ajar switch problem.	2. Use a diagnostic scan tool to observe and verify that electronic messages from the Body Control Module (BCM) over the CAN data bus indicate the proper status of the liftgate flip-up glass. If not okay, repair or replace flip-up glass ajar switch if required.

STANDARD PROCEDURE

STANDARD PROCEDURE - LIFTGATE OPERATION

The liftgate must open and close freely and smoothly in order for the power liftgate system to function properly. The power liftgate system is designed to compensate for some minor changes in opening and closing effort caused by moderate changes in temperature or vehicle attitude. However, if there are extreme deficiencies in the alignment of the liftgate to the liftgate opening causing mechanical interference, or if there is extreme binding in a liftgate hinge or liftgate prop rod, appropriate adjustments or mechanical repairs may be required.

Manually operate the liftgate of another vehicle of the same model that is known to be in good condition for a comparison of liftgate opening and closing effort. Liftgate adjustment procedures and specifications are the same for vehicles with or without the optional power liftgate system. Refer to **LIFTGATE, ADJUSTMENTS** .

CHIME

DESCRIPTION

DESCRIPTION

Fig. 1: Power Liftgate, Chime, Retainer & Connector
Courtesy of CHRYSLER GROUP, LLC

Vehicles equipped with an optional power operated liftgate have a power liftgate chime (1). The chime is concealed behind the left quarter inner trim panel. The chime is contained within small cylindrically-shaped molded plastic housing that is secured to the left inner D-pillar sheet metal by an integral molded plastic retainer (2).

The chime has a pigtail wire and connector (3) that connects it to the vehicle electrical system through a

dedicated take out and connector of the body wire harness.

The chime cannot be adjusted or repaired and, if damaged or ineffective, the entire chime unit must be replaced.

OPERATION

OPERATION

The power liftgate chime can produce either single or repetitive, audible chime tones as an alert heard at the rear of the vehicle at the start of any power liftgate opening or closing cycle. The chime is completely controlled by and receives both a path to ground and current through hard wired circuits from the Power LiftGate Module (PLGM) (also known as the Power LiftGate/PLG control module). The PLGM outputs a Pulse Width Modulated (PWM) signal to drive the chime. When activated in the repetitive mode the chime is pulsed ON and OFF in 0.5 second intervals.

If the power liftgate chime is enabled through the Electronic Vehicle Information Center (EVIC) customer programmable features, there are four chime tones generated at the beginning of a power **Close** cycle. There are also four chime tones generated in response to a power **Open** cycle from all operator inputs except the exterior liftgate handle switch, which is associated with three chime tones only. Any reversal during a power cycle operation will result in two chime tones being generated.

The power liftgate chime as well as the hard wired circuits to the chime unit may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information.

REMOVAL

REMOVAL

Fig. 2: Sill, D-Pillar, Power Liftgate, Chime & Harness Connector

Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the scuff plate from the liftgate opening sill (2). Refer to **PLATE, SCUFF, DOOR SILL, REMOVAL** .
3. Move the quarter trim panel away from the lower left inner D-pillar (1) far enough to access the power liftgate chime (3). Refer to **PANEL, QUARTER TRIM, REMOVAL** .
4. Disconnect the body wire harness connector (4) from the chime pigtail wire connector.
5. Disengage the retainer integral to the chime pigtail wire connector from the body sheet metal.
6. Disengage the retainer integral to the chime housing from the body sheet metal.
7. Remove the chime from the vehicle.

INSTALLATION

INSTALLATION

Courtesy of CHRYSLER GROUP, LLC

1. Position the power liftgate chime (3) to the left inner D-pillar (1) in the vehicle.
2. Engage the retainer integral to the chime housing into the hole in the inner D-pillar.
3. Reconnect the chime pigtail wire connector to the body wire harness connector (4) for the chime.
4. Engage the retainer integral to the chime pigtail wire connector with the hole in the inner D-pillar.
5. Reinstall the quarter trim panel to the lower left inner D-pillar. Refer to **PANEL, QUARTER TRIM, INSTALLATION** .
6. Reinstall the scuff plat onto the liftgate opening sill (2). Refer to **PLATE, SCUFF, DOOR SILL,**

INSTALLATION .

7. Reconnect the battery negative cable.

DRIVE UNIT, POWER

DESCRIPTION

DESCRIPTION

Fig. 4: Socket-Type Pivot End & Connector
Courtesy of CHRYSLER GROUP, LLC

Vehicles equipped with an optional power liftgate system, are equipped with a single Power Drive Unit (PDU) mounted in place of the standard equipment gas-charged lift strut on the left side of the liftgate. The PDU is equipped with a socket-type pivot end (3) with spring clip retainer at both the top and bottom and is mounted using the same ball studs at the top of the left liftgate opening side trough and near the belt line of the left liftgate shut face as are used for securing a conventional gas-charged lift strut.

The PDU appears similar in construction to a conventional gas-charged lift strut, but has both upper and lower cylinders or tubes that are noticeably larger in diameter than the cylinder and rod found on most conventional gas-charged lift struts. This larger diameter accommodates a small, but powerful reversible electric motor, a small planetary gear set transmission, a full-open switch, a screw-type drive unit and two Hall effect sensors. There are also two coil-type springs within the PDU; one long spring with large diameter coils, and one short spring with smaller diameter coils.

The PDU has a pigtail wire harness and connector (2) that exits the top of the larger upper cylinder. The pigtail harness is equipped with a large rubber grommet where the harness passes through the sheet metal of the left liftgate opening side trough. The PDU wiring is connected to the vehicle electrical system through a dedicated

takeout and connector of the body wire harness near the top of the inner D-pillar.

The PDU cannot be adjusted or repaired and, if damaged or inoperative, it must be replaced with a new unit.

OPERATION

OPERATION

The motor, transmission and screw-drive portions of the power liftgate Power Drive Unit (PDU) provide the power and torque required to open or close the liftgate under most conditions. The Hall effect sensors provide the Power LiftGate Module (PLGM) (also known as the Power LiftGate/PLG control module) with both a speed signal and a direction signal. These Hall effect inputs allow the PLGM to monitor and respond appropriately to any irregularities in liftgate travel and or operation. The full-open switch is used to let the PLGM know when the liftgate is approaching the full open position.

The long, large diameter coil spring within the PDU is strong enough to assist in opening and, in combination with the gas-charged lift cylinder on the right side of the liftgate, will support the liftgate in any open position. The short, small-diameter spring provides an initial lift-off that moves the liftgate latch away from the latch striker after the power liftgate latch is initially released.

The hard wired input and output circuits of the PDU may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the electronic controls that provide many features of the power liftgate system. The most reliable, efficient and accurate means to diagnose the PDU or the electronic controls related to operation of the power liftgate system requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

REMOVAL

WARNING: **To avoid serious or fatal injury, during service lift the ball socket end retaining clip only far enough to release the socket from the ball stud. Excessive prying or removal of the clip may result in improper clip spring tension. Improper clip tension may result in the support cylinder separating from the ball stud causing sudden, unexpected loss of liftgate support.**

Fig. 5: Pigtail Wire Connector & Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Open and support the liftgate with a suitable prop.
3. Remove the trim from the inside of the rear quarter trim panel (3). Refer to **PANEL, QUARTER TRIM, REMOVAL** .
4. Disconnect the power liftgate Power Drive Unit (PDU) pigtail wire connector (1) from the body wire harness connector (2) on the inside of the trim panel.

Fig. 6: Grommet & PDU
Courtesy of CHRYSLER GROUP, LLC

5. Unseat the grommet (3) of the PDU (2) pigtail wire from the clearance hole in the upper left liftgate opening trough and pull the connector through the clearance hole.

Fig. 7: Removing PDU Ball Socket From Ball Stud
Courtesy of CHRYSLER GROUP, LLC

6. Insert a small flat-bladed tool (3) into the notch on the outer face of the ball socket end (1) on the lower end of the PDU and carefully pry the retaining clip (2) outward while pulling the ball socket away from the ball stud (4) on the liftgate.
7. Release the retaining clip to its installed position.
8. Repeat Step 6 and Step 7 for the ball socket on the upper end of the PDU at the left liftgate opening trough.
9. Remove the PDU from the vehicle as a unit.

INSTALLATION

INSTALLATION

Fig. 8: Grommet & PDU
Courtesy of CHRYSLER GROUP, LLC

1. Check to be certain that the ball studs (1) on the liftgate trough and the liftgate are both in good condition and properly tightened. Tighten the ball studs to 30 N.m (22 ft. lbs.).
2. Position the ball socket on the upper end of the power liftgate Power Drive Unit (PDU) (2) to the ball stud on the left liftgate opening trough.
3. Using hand pressure, press the ball socket onto the ball stud until the retainer clip snaps into place.
4. Repeat Step 2 and Step 3 for the ball socket on the lower end of the PDU at the ball stud on the liftgate (4).
5. Inspect to be certain that the retaining clip on each of the PDU ball socket ends is fully seated.
6. Insert the PDU pigtail wire and connector through the clearance hole in the upper left liftgate opening trough and seat the grommet (3).

Fig. 9: Pigtail Wire Connector & Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

7. Reconnect the PDU pigtail wire connector (1) to the body wire harness connector (2) on the inside of the trim panel.
8. Install the trim onto the inside of the left quarter trim pillar/panel (3). Refer to **PANEL, QUARTER TRIM, INSTALLATION** .
9. Remove the service support prop from the liftgate.
10. Reconnect the battery negative cable.
11. Perform the Power Liftgate Learn/Relearn Cycle standard procedure. Refer to **STANDARD PROCEDURE**.

LATCH, LIFTGATE

DESCRIPTION

DESCRIPTION

Fig. 10: Latch Assembly, Actuator Motor & Connector
Courtesy of CHRYSLER GROUP, LLC

Vehicles equipped with an optional power liftgate are equipped with a unique latch assembly (3) that performs the same function as a manual liftgate latch, but includes a Direct Current (DC) electric cinch and release actuator motor (1). This latch also includes three integral switches: a sector switch, a secondary ratchet switch and a primary ratchet switch. The primary ratchet switch also provides the liftgate ajar signal from the power liftgate latch.

Only the lower latch housing is visible on the lower center of the liftgate shut face, where the latch is secured with three screws. The remainder of the latch mechanism extends upward into the interior of the liftgate shell, where it is concealed between the liftgate outer panel and the lower liftgate trim panel. An integral pigtail wire harness and connector (2) connects the latch to the vehicle electrical system through a dedicated take out and connector of the liftgate wire harness.

The power liftgate latch cannot be repaired. If the latch mechanism, the actuator motor or any one of the three latch switches is damaged or ineffective, the entire power liftgate latch unit must be replaced.

OPERATION

OPERATION

The power cinching liftgate latch actuator motor (cinch/release motor) provides the torque required to close the liftgate from the secondary to the primary closed and latched position. The actuator also releases the liftgate from the primary closed and latched position to the fully unlatched and movable position. The actuator motor includes a small drive gear that meshes with the internal gear mechanism of the latch assembly to drive the latch and perform the power cinch and release functions.

The latch actuator is controlled by the Power LiftGate Module (PLGM) (also known as the Power LiftGate/PLG

control module), which controls the cinch and release functions and limits actuator current draw to protect the assembly. The PLGM also monitors the latch and latch pawl positions through hard wired inputs from the sector, primary ratchet and secondary ratchet switches integral to the latch. If the power liftgate pinch sensors are damaged or ineffective, the PLGM will disable the cinching function of the latch.

Following every cinch or release sequence, the power liftgate latch will return to a **home** or neutral position. If for any reason the latch is unable to return to the **home** position, the PLGM will sense this through the integral latch switch inputs and prevent the latch from releasing. If this condition exists, activation of the power liftgate using the front or rear switches, the exterior handle, Passive Entry or the Remote Keyless Entry (RKE) FOB with Integrated Key (FOBIK) will result in a short, audible beep tone being issued from the power liftgate chime. This indicates that the Power Liftgate Latch Homing standard procedure must be performed. Refer to **LATCH, LIFTGATE, STANDARD PROCEDURE**.

The hard wired input and output circuits of the power liftgate latch may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the electronic controls that provide some features of the power liftgate system. The most reliable, efficient and accurate means to diagnose the power liftgate latch or the electronic controls related to operation of the power liftgate system requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

STANDARD PROCEDURE

POWER LIFTGATE LATCH HOMING

Following every power liftgate cinch or release sequence, the latch returns to a **home** or neutral position. If for any reason the latch is unable to return to the **home** position, the Power LiftGate Module (PLGM) (also known as the Power LiftGate/PLG control module) will sense this through hard wired inputs from the sector, primary ratchet and secondary ratchet switches integral to the latch and prevent the latch from releasing. If this condition exists, activation of the power liftgate using the front or rear switches, or the Remote Keyless Entry (RKE) FOB with Integrated Key (FOBIK) will result in a short, audible beep tone being issued from the power liftgate chime. This indicates that it is necessary to perform a latch homing routine. Latch homing in many cases can be initiated by pulling on the exterior liftgate handle. If unsuccessful, then a diagnostic scan tool must be used to run a routine that allows the latch to be returned to the **home** position as follows:

1. Connect a diagnostic scan tool to the Data Link Connector (DLC).
2. Follow the programming steps outlined in the diagnostic scan tool for **Latch Home Position Test** under the **PLGM/Power LiftGate Module** menu item.
3. If the **Latch Home Position Test** is unsuccessful, disconnect the battery for 60 seconds. Reconnect the battery, then lift the outside liftgate handle and hold it for at least 20 seconds to actuate the handle switch.
4. If the liftgate latch still does not release, use the diagnostic scan tool to select **Actuators** and **Latch Motor Release Direction** . This will drive the latch motor for longer than actuating the outside handle switch.
5. If driving the latch motor using the **Latch Motor Release Direction** works to release the latch, perform the **Latch Home Position Test** again before returning the vehicle to the owner. If driving the latch motor using the **Latch Motor Release Direction** does not work to release the latch, use the Power Liftgate Latch Manual Override standard procedure to open the liftgate and continue the diagnosis as required.

Refer to **LATCH, LIFTGATE, STANDARD PROCEDURE**.

POWER LIFTGATE LATCH MANUAL OVERRIDE

Fig. 11: View Of Power Liftgate Latch Assembly
Courtesy of CHRYSLER GROUP, LLC

NOTE: **If the power liftgate latch (1) latch release function becomes inoperative, it may be released manually by operating the manual latch release lever (3). If the power liftgate latch cinch release function becomes inoperative, it may be overridden by pushing downward on the manual cinch override lever (2).**

1. Remove the access cover from the center of the lower liftgate trim panel.
2. Reach around to the rearward face of the latch assembly to access and manually actuate the appropriate release lever for the current latch condition.

REMOVAL

REMOVAL

Fig. 12: Liftgate, Screws & Liftgate Latch, Connector, Wire Harness
Courtesy of CHRYSLER GROUP, LLC

1. Open the liftgate.
2. Disconnect and isolate the battery negative cable.
3. Remove the lower trim panel from the inside of the liftgate (2). Refer to **PANEL, TRIM, REMOVAL** .
4. Remove the three screws (5) that secure the power liftgate latch (1) to the lower shut face of the liftgate.
5. Disconnect the connector (4) of the liftgate wire harness (3) from the pigtail wire connector of the latch.
6. Remove the latch from the inside of the liftgate.

INSTALLATION

INSTALLATION

Fig. 13: Liftgate, Screws & Liftgate Latch, Connector, Wire Harness

Courtesy of CHRYSLER GROUP, LLC

1. Position the power liftgate latch (1) into the inside of the liftgate (2).
2. Reconnect the connector (4) of the liftgate wire harness (3) to the pigtail wire connector of the latch.
3. Loosely install the screw (5) into the right rear mounting hole that secures the latch to the lower shut face of the liftgate.
4. Install and tighten the two screws into the front mounting holes that secure the latch to the liftgate. Tighten the screws to 12 N.m (106 in. lbs.).
5. Tighten the left rear latch mounting screw to 12 N.m (106 in. lbs.).
6. Reinstall the lower trim panel onto the inside of the liftgate. Refer to **PANEL, TRIM, INSTALLATION** .
7. Reconnect the battery negative cable.
8. Perform the Power Liftgate Learn/Relearn Cycle standard procedure. Refer to **STANDARD PROCEDURE**.

SENSOR, PINCH

DESCRIPTION

DESCRIPTION

Fig. 14: Two Pinch Sensors, Five Plastic Clips, Wire And Connector & Grommet
Courtesy of CHRYSLER GROUP, LLC

Vehicles equipped with an optional power operated liftgate system use two pinch sensors (1) (also known as anti-pinch sensors). One sensor is located on each side jamb of the liftgate, extending from the belt line to just below the liftgate header. Externally, these pinch sensors appear very similar to a synthetic rubber weather strip

that is secured by five plastic clips (2) to the side jamb of the liftgate. However, internally each pinch sensor has two electrically conductive membranes (also known as tape switches), a diagnostic resistor and a plastic carrier. The right side pinch sensor also contains a thermistor.

Each pinch sensor has a short pigtail wire and connector (4) that exits through a grommet (3) on the lower end of the inboard side of each unit and passes through a dedicated hole in the side jamb of the liftgate near the belt line into the interior of the liftgate. Concealed within the liftgate each sensor is connected to the vehicle electrical system through a dedicated take out and connector of the liftgate wire harness.

A pinch sensor cannot be adjusted or repaired. If damaged or ineffective, the entire sensor unit must be replaced.

OPERATION

OPERATION

The two pinch sensors (also known as anti-pinch sensors) are tactile sensors that are able to react to the slightest pressure. They are used to provide additional protection against vehicle damage or personal injury caused by obstructions between the liftgate and the liftgate opening of the vehicle. The interior of each sensor contains two electrically conductive polymer material membranes that will close a circuit when the sensor is contacted.

During a **close** cycle of the power liftgate, if either of the two pinch sensors come in contact with an obstacle, the pinch sensor circuit is closed. The closed sensor circuit provides a sense input to the Power LiftGate Module (PLGM) (also known as the Power LiftGate/PLG control module) indicating there is an obstruction in the path of the closing liftgate. The PLGM will then stop the liftgate **close** cycle immediately and return the liftgate to the full open position.

The thermistor integral to the right pinch sensor provides a temperature sense input that allows the PLGM to monitor and compensate for extreme temperature conditions and provide proper power liftgate operation. This temperature sense input is only provided when the pinch sensor is an open circuit because, when the sensor is a closed circuit, the thermistor is shorted. As the outside temperature increases, the resistance reading decreases. As temperature decreases, the resistance reading increases.

The pinch sensors are wired in series with the PLGM, so if either pinch sensor becomes a closed or shorted circuit the module will act as though both sensors are closed circuits. Each sensor also contains a diagnostic resistor, which allows the PLGM to diagnose a problem in the pinch sensor circuits and store a Diagnostic Trouble Code (DTC) for any problem it detects.

The hard wired input and output circuits of the power liftgate pinch sensors may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the electronic controls and communication that provide some features of the power liftgate system. The most reliable, efficient and accurate means to diagnose the power liftgate pinch sensors or the electronic controls and communication related to operation of the power liftgate system requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - PINCH SENSOR

SENSOR

WARNING: To avoid serious or fatal injury during testing of pinch sensor operation, use extreme caution to keep away from the closing liftgate.

To verify power liftgate system pinch sensor operation:

1. Remove the liftgate trim panel to access and disconnect the inoperable pinch sensor's electrical connector. Using an ohmmeter, check for continuity on the two wires leading from the pinch sensor. While depressing either pinch sensor, continuity should be less than 400 ohms. While NOT depressing the left pinch sensor, continuity should be 10, 000 ohms ± 500 ohms. While NOT depressing the right pinch sensor, continuity will vary with ambient temperature (see table below), but should always be greater than 4000 ohms. If the measured pinch sensor meets the stated continuity, then it is OK at this time. If the measured continuity is outside of the stated ranges, replace the pinch sensor.
2. Remove the lower trim from the inside of the liftgate to access and disconnect the pinch sensor pigtail wire connectors from the liftgate wire harness. Using an ohmmeter, check the resistance between the two pins of each pinch sensor pigtail wire connector. When the sensor is depressed (contacts are closed), the resistance should be 300 ohms maximum. When the pinch sensor is released (contacts are open) the resistance should be 10, 000 ohms minimum. If not OK, replace the ineffective pinch sensor.

THERMISTOR

The thermistor portion of the right pinch sensor provides a temperature sense input to the Power LiftGate Module (PLGM) (also known as the Power LiftGate/PLG control module). The temperature input is only provided when the pinch sensor is in a non-pinched (contacts are open) condition. When the pinch sensor contacts are closed (sensor is pinched) this input is unavailable because the thermistor is shorted. Remove the lower trim from the inside of the liftgate to access and disconnect the right pinch sensor pigtail wire connector from the liftgate wire harness. Refer to the **Right Pinch Sensor Thermistor Resistance** table and check between the two terminals of the sensor connector for the proper thermistor resistance at the listed temperatures. If the sensor fails this test, replace the right pinch sensor unit.

RIGHT PINCH SENSOR THERMISTOR RESISTANCE TABLE

RIGHT PINCH SENSOR THERMISTOR RESISTANCE	
TEMPERATURE	**RESISTANCE**
0°C (32°F)	29330 - 35990 Ohms
25°C (77°F)	9120 - 10880 Ohms
40°C (104°F)	4900 - 5750 Ohms

REMOVAL

REMOVAL

Fig. 15: Liftgate, Pigtail Wire Connector, Harness Connector & Pinch Sensor
Courtesy of CHRYSLER GROUP, LLC

1. Open the liftgate (2).
2. Disconnect and isolate the battery negative cable.
3. Remove the lower trim from the liftgate inner panel. Refer to **PANEL, TRIM, REMOVAL** .
4. Reach through the access hole in the liftgate inner panel to access and disconnect the pinch sensor pigtail wire connector (4) from the liftgate wire harness connector (3).
5. Disengage the five plastic retainers of the pinch sensor (1) from the liftgate shut face.
6. Disengage the pigtail wire grommet on the lower end of the pinch sensor from the clearance hole in the liftgate shut face.
7. While guiding the pigtail wire out through the clearance hole, remove the pinch sensor from the liftgate.

INSTALLATION

INSTALLATION

Fig. 16: Liftgate, Pigtail Wire Connector, Harness Connector & Pinch Sensor
Courtesy of CHRYSLER GROUP, LLC

1. While guiding the pinch sensor pigtail wire and connector (4) through the clearance hole in the liftgate (2) shut face, position the sensor to the liftgate.
2. Engage the pigtail wire grommet on the lower end of the pinch sensor into the clearance hole in the liftgate shut face.
3. Engage the five plastic retainers of the pinch sensor (1) to the holes in the liftgate shut face.
4. Reach through the access hole in the liftgate inner panel to access and reconnect the pinch sensor pigtail wire connector to the liftgate wire harness connector (3).
5. Reinstall the lower trim onto the liftgate inner panel. Refer to **PANEL, TRIM, INSTALLATION** .
6. Reconnect the battery negative cable.

DESCRIPTION

DESCRIPTION

Fig. 17: Power Liftgate Switch, Push Button, Snap Features & Connector Receptacle
Courtesy of CHRYSLER GROUP, LLC

The rear power liftgate switch (1) (also known as the D-pillar switch) is located on the left quarter trim panel, in a mounting hole bezel located between the left rear inner wheel housing and the D-pillar. This switch has a single momentary push button (2) and is used to provide a **Close** request to the Power LiftGate Module (PLGM).

The switch is constructed of molded plastic and the push button has a smooth, concave face with an International Control and Display Symbol icon for **Liftgate Release** or **Liftgate Open** applied to it. The switch housing is secured within the receptacle on the back of the switch mounting bezel by two snap features (4) integral to each side of the switch housing. The top of the switch housing has an integral spline (3) that ensures proper switch orientation when it engages a keyway integral to the switch bezel receptacle.

The bottom of the switch housing has an integral connector receptacle (5) containing terminal pins that connect the switch to the vehicle electrical system through a dedicated take out and connector of the body wire harness.

The rear power liftgate switch cannot be repaired and, if ineffective or damaged, it must be replaced.

OPERATION

OPERATION

The rear power liftgate switch (also known as the D-pillar switch) is a momentary, push button actuated, resistor multiplexed switch. The switch receives source voltage from the Power LiftGate Module (PLGM) through an internal pull up on a power liftgate logic return circuit. The switch then provides a multiplexed output to the PLGM on a liftgate switch rear signal circuit. The output to the PLGM indicates whether the switch push button is depressed or released.

When the switch push button is depressed, it provides a **Close** request to the PLGM. If the push button is depressed a second time, while the PLGM is in the process of closing the liftgate, the PLGM will automatically

reverse the liftgate to the full open position. This switch will NOT open the liftgate if it is already closed.

The rear power liftgate switch as well as the hard wired inputs and outputs of the switch may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the power liftgate system or the electronic controls and communication between other modules and devices that provide some features of the power liftgate system. The most reliable, efficient, and accurate means to diagnose the power liftgate system or the electronic controls and communication related to rear power liftgate switch operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

REMOVAL

Fig. 18: Power Liftgate Switch, Bezel & Quarter Trim Panel
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Using a trim stick or another suitable wide flat-bladed tool, carefully pry the edges of the rear power liftgate switch (2) bezel (3) away from the left quarter trim panel (1) far enough to disengage the two integral latch features of the bezel from the quarter trim panel bezel opening.
3. Pull the switch and bezel unit away from the quarter trim panel far enough to access and disconnect the body wire harness connector from the connector receptacle on the bottom of the switch.

Fig. 19: Bezel, Switch & Two Snap Features
Courtesy of CHRYSLER GROUP, LLC

4. Using a trim stick or another suitable wide flat-bladed tool, carefully pry the sides of the switch receptacle on the back of the bezel (1) away from the switch (2) far enough to release the two snap features (3) on each side of the switch housing.
5. Remove the rear power liftgate switch from the receptacle on the back of the switch bezel.

INSTALLATION

INSTALLATION

Fig. 20: Bezel, Switch & Two Snap Features
Courtesy of CHRYSLER GROUP, LLC

1. Position the rear power liftgate switch (2) to the receptacle on the back of the switch bezel (1) being

certain to align the spline on the top of the switch housing with the keyway at the top of the receptacle.

2. Using hand pressure, press the switch firmly and evenly into the receptacle until the two snap features (3) on each side of the switch housing snap into place and the switch is fully engaged in the receptacle.

Fig. 21: Power Liftgate Switch, Bezel & Quarter Trim Panel
Courtesy of CHRYSLER GROUP, LLC

3. Position the switch (2) and switch bezel (3) unit close enough to the bezel opening in the left quarter trim panel (1) to access and connect the body wire harness connector to the connector receptacle on the bottom of the switch housing.
4. Align the switch bezel to the quarter trim panel bezel opening and, using hand pressure, press the bezel firmly and evenly into the opening until the two latch features integral to the back of the bezel are fully engaged.
5. Reconnect the battery negative cable.

SWITCH, EXTERIOR HANDLE

DESCRIPTION

DESCRIPTION

Fig. 22: Power Liftgate Exterior Handle Switch, Latch Handle Assembly & Wire
Courtesy of CHRYSLER GROUP, LLC

The power liftgate exterior handle switch (2) is integral to a unique liftgate exterior latch handle assembly (3). Externally the latch handle and the handle bezel or housing appear identical to the latch handle used without a power liftgate option. However, within the liftgate the power liftgate handle includes the dedicated exterior handle switch and it has no mechanical cables or linkage connecting it to the liftgate latch. The exterior handle switch is mechanically actuated by the exterior latch handle, and is used to provide an **Open** request to the Power LiftGate Module (PLGM).

The exterior handle switch is a micro switch. The switch housing is constructed of molded plastic and includes a short pigtail wire (1) and connector. The switch housing is secured to one of the pivot stanchions on the back of the handle bezel or housing. The switch pigtail wire and connector connect the switch to the vehicle electrical system through a dedicated take out and connector of the liftgate wire harness.

The power liftgate exterior handle switch cannot be repaired or adjusted. If the switch is ineffective or damaged, the entire liftgate exterior latch handle unit must be replaced.

OPERATION

OPERATION

The power liftgate exterior handle switch is a momentary, plunger actuated, resistor multiplexed micro switch. The switch receives source voltage from the Power LiftGate Module (PLGM) through an internal pull up on a power liftgate logic return circuit. The switch then provides a multiplexed output to the PLGM on a liftgate switch MUX input 2 circuit. The output to the PLGM indicates whether the switch plunger is depressed or extended. When the switch plunger is extended, it provides an **Open** request to the PLGM.

An exterior handle switch input to the PLGM will begin a power **Open** cycle of the liftgate if the liftgate is fully

closed when it occurs, will cancel a power **Open** cycle and put the power liftgate in manual operating mode if the liftgate is already in a power **Open** cycle when it occurs, will reverse the liftgate to open if it occurs during a power **Close** cycle, or may be used to home the latch as described in the Power Liftgate Latch Homing standard procedure. Refer to **LATCH, LIFTGATE, STANDARD PROCEDURE**.

The power liftgate exterior handle switch as well as the hard wired inputs and outputs of the switch may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the power liftgate system or the electronic controls and communication between other modules and devices that provide some features of the power liftgate system. The most reliable, efficient, and accurate means to diagnose the power liftgate system or the electronic controls and communication related to power liftgate exterior handle switch operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

REMOVAL

Fig. 23: Liftgate, Exterior Handle, Two Nuts & Wire Connector
Courtesy of CHRYSLER GROUP, LLC

1. Open the liftgate.
2. Disconnect and isolate the battery negative cable.
3. Remove the power liftgate latch from the liftgate (1) inner panel. Refer to **LATCH, LIFTGATE, REMOVAL**.
4. Disconnect the power liftgate exterior handle (3) switch pigtail wire connector (4) from the liftgate wire harness connector.
5. Remove the two nuts (2) that secure the two studs on the back of the handle housing to the inside of the liftgate outer panel.
6. From the outside of the liftgate, remove the power liftgate exterior handle and switch through the liftgate outer panel latch handle pocket as a unit.

INSTALLATION

INSTALLATION

2815379

Fig. 24: Liftgate, Exterior Handle, Two Nuts & Wire Connector
Courtesy of CHRYSLER GROUP, LLC

1. Position the power liftgate exterior handle (3) and switch into the liftgate outer panel (1) latch handle pocket as a unit. Be certain not to pinch the exterior handle switch pigtail wire (4) between the handle housing and the liftgate outer panel.
2. Install and tighten the two nuts (2) that secure the two studs on the back of the handle housing to the inside of the liftgate outer panel. Tighten the nuts securely.
3. Reconnect the power liftgate exterior handle switch pigtail wire connector to the liftgate wire harness connector.
4. Reinstall the power liftgate latch onto the liftgate. Refer to **LATCH, LIFTGATE, INSTALLATION**.
5. Reconnect the battery negative cable.

SWITCH, OVERHEAD CONSOLE

DESCRIPTION

DESCRIPTION

Fig. 25: Front Power Liftgate Switch
Courtesy of CHRYSLER GROUP, LLC

The front power liftgate switch (2) (also known as the overhead console switch) is located in the forward switch pod of the overhead console (1), between the two reading lamp switches. This switch has a single momentary push button and is used to provide a toggling **Open** or **Close** request to the Power LiftGate Module (PLGM).

The switch is constructed of molded plastic and the push button has a smooth face with an International Control and Display Symbol icon for **Liftgate Release** or **Liftgate Open** applied to it. The switch button has instrument panel dimmer controlled Light Emitting Diode (LED) back lighting for night visibility.

The front power liftgate switch is integral to the overhead console switch pod assembly on the printed circuit board for the overhead console. The switch cannot be repaired or adjusted and, if ineffective or damaged, the entire overhead console unit must be replaced. Refer to **CONSOLE, OVERHEAD, FRONT, REMOVAL** .

OPERATION

OPERATION

The front power liftgate switch (also known as the overhead console switch) is a momentary, push button actuated, resistor multiplexed switch. The switch has a path to ground at all times through an eyelet terminal secured by a screw to the body sheet metal within the passenger compartment. The switch provides a multiplexed output to the PLGM on a liftgate switch front signal circuit. The PLGM reads the switch output through an internal pull up. The output to the PLGM indicates whether the switch push button is depressed or released.

When the switch push button is depressed, it provides an **Open** or a **Close** request to the PLGM. The PLGM interprets the request based upon the present status of the liftgate. If the monitored status of the liftgate is not closed, the front switch input is interpreted as a **Close** request. If the status of the liftgate is not opened, the front switch input is interpreted as an **Open** request. If the switch button is depressed a second time, while the PLGM is in the process of opening or closing the liftgate, the PLGM will automatically reverse the liftgate to the full open position.

The front power liftgate switch as well as the hard wired inputs and outputs of the switch may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the power liftgate system or the electronic controls and communication between other modules and devices that provide some features of the power liftgate system. The most reliable, efficient, and accurate means to diagnose the power liftgate system or the electronic controls and communication related to front power liftgate switch operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

DIAGNOSIS AND TESTING

B1882-92-LIFTGATE POSITION SENSOR - PERFORMANCE OR INCORRECT OPERATION

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 1: Power Liftgate Position Sensor Signal, Supply, Liftgate Drive & Ground Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

Whenever the Power Liftgate Module is power opening or closing.

SET CONDITION

When the Power Liftgate Module senses the (Q204) Position Sensor Signal 1 circuit not pulsing during motor operation, this code will set.

POSSIBLE CAUSES

Possible Causes
(Q204) POSITION SENSOR SIGNAL 1 CIRCUIT SHORTED TO GROUND

(Q204) POSITION SENSOR SIGNAL 1 CIRCUIT OPEN
(Q204) POSITION SENSOR SIGNAL 1 CIRCUIT SHORTED TO VOLTAGE
(Q204) POSITION SENSOR SIGNAL 1 CIRCUIT SHORTED TO (Q205) POSITION SENSOR SIGNAL 2 CIRCUIT
(Q901) LOGIC GROUND CIRCUIT OPEN
(Q203) POSITION SENSOR SUPPLY CIRCUIT OPEN
(Q203) POSITION SENSOR SUPPLY CIRCUIT SHORTED TO GROUND
POWER LIFTGATE DRIVE UNIT
POWER LIFTGATE MODULE

DIAGNOSTIC TEST

1. **CHECK FOR DTCS**
    1. With the scan tool, record and erase the DTCs.
    2. Turn the ignition off, wait 10 seconds, then turn the ignition on.
    3. If possible, operate the liftgate several times.
    4. With the scan tool, read the Active DTCs.

    Does the scan tool display; B1882-92-LIFTGATE POSITION SENSOR - PERFORMANCE OR INCORRECT OPERATION?

    Yes

    - Go To 2.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and poor pin fit.
    - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
2. **(Q901) LOGIC GROUND OPEN**
    1. Turn the ignition off.
    2. Turn all lights off.
    3. Disconnect the Power Liftgate Drive Unit harness connector.
    4. Disconnect the Power Liftgate Module C2 harness connector.
    5. Measure the resistance of the (Q901) Logic Ground circuit between the Power Liftgate Drive Unit harness connector and the Power Liftgate Module C2 harness connector.

    Is the resistance below 5.0 Ohms between the (Q901) Logic Ground circuit?

    Yes

- Go To 3.

No

- Repair the (Q901) Logic Ground circuit for an open.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

3. **(Q204) POSITION SENSOR SIGNAL 1 CIRCUIT SHORTED TO GROUND**
   1. Disconnect the Power Liftgate Module C1 harness connector.
   2. Measure the resistance between ground and the (Q204) Position Sensor Signal 1 circuit.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the (Q204) Position Sensor Signal 1 circuit for a short to ground.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Go To 4.

4. **(Q204) POSITION SENSOR SIGNAL 1 CIRCUIT SHORTED TO VOLTAGE**
   1. Turn the ignition on.
   2. Measure the voltage between ground and the (Q204) Position Sensor Signal 1 circuit.

   Is there any voltage present?

   Yes

   - Repair the (204) Position Sensor Signal 1 circuit for a short to voltage.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Go To 5.

5. **(Q204) POSITION SENSOR SIGNAL 1 CIRCUIT OPEN**
   1. Turn the ignition off.
   2. Measure the resistance of the (Q204) Position Sensor Signal 1 circuit between the PLG C1 connector and the Drive Unit connector.

   Is the resistance below 5.0 Ohms?

   Yes

- Go To 6.

No

- Repair the (Q204) Position Sensor Signal 1 circuit for an open.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

6. **(Q203) POSITION SENSOR SUPPLY CIRCUIT OPEN**

Fig. 2: Checking Position Sensor Supply Circuit For Open
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (Q203) Position Sensor Supply circuit between the Power Liftgate Module C1 connector and the Power Liftgate Drive Unit connector.

   Is the resistance below 2.0 Ohms?

   Yes

   - Go To 7.

   No

   - Repair the (Q203) Position Sensor Supply circuit for an open.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

7. **(Q203) POSITION SENSOR SUPPLY CIRCUIT SHORTED TO GROUND**

Fig. 3: Checking Position Sensor Supply Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (Q203) Position Sensor Supply circuit.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the (Q203) Position Sensor Supply circuit for a short to ground.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Go To 8.

8. **(Q204) POSITION SENSOR SIGNAL 1 CIRCUIT SHORTED TO THE (Q205) POSITION SENSOR SIGNAL 2 CIRCUIT**
    1. Measure the resistance between the (Q204) Position Sensor Signal 1 circuit and the (Q205) Position Sensor Signal 2 circuit.

       Is the resistance below 10K Ohms?

       Yes

       - Repair the (Q204) Position Sensor Signal 1 circuit for a short to the (Q205) Position Sensor Signal 2 circuit.
       - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

       No

       - Go To 9.
9. **POWER LIFTGATE MODULE**

Fig. 4: Checking Power Liftgate Module Supply Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Reconnect the Power Liftgate Module C1 harness connector.
2. Reconnect the Power Liftgate Module C2 harness connector.
3. Reconnect the Power Liftgate Drive Unit harness connector.
4. Turn the ignition on.
5. While back probing, measure the voltage between ground and the (Q203) Position Sensor Supply circuit in the Power Liftgate Drive Unit harness connector.

NOTE: **The graphic shows the terminal end of the connector, back probe the wire end.**

Is the voltage approximately 5.0 volts?

Yes

- Go To 10.

No

- Replace the Power Liftgate Module in accordance with the Service Information. Refer to **MODULE, POWER LIFTGATE CONTROL, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

10. **POWER LIFTGATE MODULE**

Fig. 5: Checking The Voltage Between Ground And The Position Sensor Signal 1 Circuit In The Power Liftgate Drive Unit Harness Connector
Courtesy of CHRYSLER GROUP, LLC

1. While back probing, measure the voltage between ground and the (Q204) Position Sensor Signal 1 circuit in the Power Liftgate Drive Unit harness connector.

   NOTE: The graphic shows the terminal end of the connector, back probe the wire end.

2. Slowly lower and raise the liftgate while observing the voltmeter.

   Does the voltage change from approximately 0.0 volts to 4.7 volts as the liftgate is moved?

   Yes

   - Test complete.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Replace the Power Liftgate Drive Unit in accordance with the Service Information. Refer to **DRIVE UNIT, POWER, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

B1886-11-LIFTGATE PINCH SENSOR - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 6: Power Liftgate Module Pinch Sensor & Liftgate Switch Signal, Release Switch Sense & Ground Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

Whenever the Power Liftgate Module is awake.

SET CONDITION

The Power Liftgate Module has detected the Right Liftgate Pinch Sensor circuit voltage is under 0.5 of a volt

for over 15 seconds.

POSSIBLE CAUSES

Possible Causes
(Q78) RIGHT PINCH SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
(Q78) RIGHT PINCH SENSOR SIGNAL CIRCUIT SHORTED TO THE (Q901) LOGIC GROUND CIRCUIT
RIGHT LIFTGATE PINCH SENSOR
POWER LIFTGATE MODULE

DIAGNOSTIC TEST

1. **DTC PRESENT**

   NOTE: The vehicle should be at room temperature when this test is performed.

   1. With the scan tool, record and erase the DTCs and any liftgate inhibitors.
   2. Cycle the ignition off, wait 20 seconds, then cycle the ignition on.
   3. Be sure the liftgate is closed.
   4. Open and close the liftgate several times.
   5. With the scan tool, read the Active DTCs.

   Does the scan tool display; B1886-11-LIFTGATE PINCH SENSOR - CIRCUIT SHORT TO GROUND?

   Yes

   - Go To 2

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **RIGHT LIFTGATE PINCH SENSOR SHORTED**

Fig. 7: Right Liftgate Pinch Sensor Harness Connector
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Right Liftgate Pinch Sensor harness connector.
2. Erase the DTCs.
3. Cycle the ignition off, wait 10 seconds, then cycle the ignition on.
4. With the scan tool, read the Active DTCs.

   Does the scan tool display; B1886-11-LIFTGATE PINCH SENSOR - CIRCUIT SHORT TO GROUND?

Yes

- Go To3

No

- Replace the Right Liftgate Pinch Sensor in accordance with the service information. Refer to **SENSOR, PINCH, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **(Q78) RIGHT PINCH SENSOR SIGNAL CIRCUIT SHORTED TO GROUND**

Fig. 8: Checking Right Pinch Sensor Signal Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Cycle the ignition off.
2. Disconnect the Power Liftgate Module C2 harness connector.

3. Measure the resistance between ground and the (Q78) Right Pinch Sensor Signal circuit.

   Is the resistance below 20K Ohms?

   Yes

   - Repair the (Q78) Right Pinch Sensor Signal circuit for a short to ground.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 4

4. **(Q78) RIGHT PINCH SENSOR SIGNAL CIRCUIT SHORTED TO THE (Q901) LOGIC GROUND CIRCUIT**

Fig. 9: Checking Right Pinch Sensor Signal Circuit For Short To Logic Ground Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (Q78) Right Pinch Sensor Signal circuit and the (Q901) Logic Ground circuit.

   Is the resistance below 20K Ohms?

   Yes

   - Repair the (Q78) Right Pinch Sensor Signal circuit for a short to the (Q901) Logic ground.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the Power Liftgate Module in accordance with the Service Information. Refer to **MODULE, POWER LIFTGATE CONTROL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

DIAGNOSTIC TEST

1. **DTC PRESENT**

   NOTE: The vehicle should be at room temperature when this test is performed.

   1. With the scan tool, record and erase the DTCs and any liftgate inhibitors.
   2. Cycle the ignition off, wait 10 seconds, then cycle the ignition on.
   3. Open and close the liftgate several times.
   4. With the scan tool, read the Active DTCs.

   Does the scan tool display; B1886-12-LIFTGATE PINCH SENSOR - CIRCUIT SHORT TO BATTERY?

   Yes

   - Go To 2

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **(Q901) LOGIC GROUND OPEN**

Fig. 11: Checking Logic Ground Circuit For Open
Courtesy of CHRYSLER GROUP, LLC

1. Cycle the ignition off.
2. Disconnect the Right Liftgate Pinch Sensor connector.
3. Measure the resistance between ground and the (Q901) Logic Ground circuit in the Right Pinch Sensor harness connector.

   Is the resistance below 9.5 Ohms?

   Yes

   - Go To 3

   No

   - Repair the (Q901) Logic Ground circuit for an open.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE RIGHT LIFTGATE PINCH SENSOR**

Fig. 12: Checking Right Liftgate Pinch Sensor
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (Q901) Logic Ground circuit and the (Q78) Right Pinch Sensor Signal circuit in the Right Liftgate Pinch/Temp Sensor (Component Side) connector.

NOTE: **The graphic shows the harness side - the component side is the male connector.**

NOTE: **The vehicle should be at room temperature when this test is performed. At 50 °F the reading should be between 18K and 22K. At 77 ° F the reading should be between 9.12K and 10.88K. At 104 ° F the reading should be between 4.90K and 5.75K.**

Is the resistance between 4.9K and 22K Ohms depending on the temperature?

Yes

- Go To 4

No

- Replace the Right Liftgate Pinch/Temp Sensor in accordance with the service information. Refer to **SENSOR, PINCH, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **(Q78) RIGHT PINCH SENSOR SIGNAL CIRCUIT OPEN**

Fig. 13: Checking Right Pinch Sensor Signal Circuit For Open

Courtesy of CHRYSLER GROUP, LLC

1. Cycle the ignition on.
2. Measure the voltage between the (Q901) Logic Ground circuit and the (Q78) Right Pinch Sensor Signal circuit in the Right Pinch Sensor harness connector.

   Is the voltage below 4.5 volts?

   Yes

   - Go To 5

   No

   - Go To 6

5. **CHECK THE (Q78) RIGHT PINCH SENSOR SIGNAL CIRCUIT FOR AN OPEN**

Fig. 14: Checking Right Pinch Sensor Signal Circuit For Open

Courtesy of CHRYSLER GROUP, LLC

1. Cycle the ignition off.
2. Disconnect the Power Liftgate Module C2 harness connector.
3. Measure the resistance of the (Q78) Right Pinch Sensor Signal circuit between the Power Liftgate Module C2 harness connector and the Right Liftgate Pinch Sensor harness connector.

   Is the resistance below 2.0 Ohms?

   Yes

   - Replace the Power Liftgate Module in accordance with the service information. Refer to **MODULE, POWER LIFTGATE CONTROL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Repair the (Q78) Right Pinch Sensor Signal circuit for an open.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

6. **(Q78) RIGHT PINCH SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE**

Fig. 15: Checking Right Pinch Sensor Signal Circuit For Open
Courtesy of CHRYSLER GROUP, LLC

1. Measure the voltage between the (Q901) Logic Ground circuit and the (Q78) Right Pinch Sensor Signal circuit in the Right Pinch Sensor harness connector.

   Is the voltage above 5.0 volts?

   Yes

   - Go To 7

   No

   - Replace the Right Liftgate Pinch Sensor in accordance with the Service Information. Refer to

SENSOR, PINCH, REMOVAL .

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

7. **(Q78) RIGHT PINCH SENSOR SIGNAL WIRE SHORTED TO VOLTAGE**

Fig. 16: Checking Right Pinch Sensor Signal Wire Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Power Liftgate Module C2 harness connector.
2. Measure the voltage between ground and the (Q78) Right Pinch Sensor Signal circuit in the Right Pinch Sensor harness connector.

   Is there any voltage present?

   Yes

- Repair the (Q78) Right Pinch Sensor Signal circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace the Power Liftgate Module in accordance with the service information. Refer to **MODULE, POWER LIFTGATE CONTROL, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B188C-11-LIFTGATE CONTROL CIRCUIT 1 - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 17: Power Liftgate Position Sensor Signal, Supply, Liftgate Drive & Ground Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

Whenever the Power Liftgate is power opening or closing.

SET CONDITION

When the Power Liftgate Module senses voltage less than 1.5 volts on the (Q88) Liftgate Open Driver circuit, prior to starting a power cycle, this code will set.

POSSIBLE CAUSES

Possible Causes
(Q88) LIFTGATE OPEN DRIVER CIRCUIT SHORTED TO GROUND
(Q88) LIFTGATE OPEN DRIVER CIRCUIT SHORTED TO THE (Q89) LIFTGATE CLOSE DRIVER CIRCUIT
(Q89) LIFTGATE CLOSE DRIVER CIRCUIT SHORTED TO GROUND
POWER LIFTGATE DRIVE UNIT SHORTED
POWER LIFTGATE MODULE

DIAGNOSTIC TEST

1. **DTC PRESENT**
    1. With the scan tool, record and erase the DTCs.
    2. Cycle the ignition off, wait 10 seconds, then cycle the ignition on.
    3. If possible, operate the liftgate several times.
    4. With the scan tool, read the Active DTCs.

    Does the scan tool display; B188C-11-LIFTGATE CONTROL CIRCUIT 1 - CIRCUIT SHORT TO GROUND?

    Yes

    - Go To 2.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
2. **(Q88) LIFTGATE OPEN DRIVER CIRCUIT SHORTED TO GROUND**

Fig. 18: Checking Liftgate Open Driver Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Cycle the ignition off.
2. Disconnect the Power Liftgate Module C1 harness connector.
3. Measure the resistance between ground and the (Q88) Liftgate Open Driver circuit.

   Is the resistance below 10K Ohms?

   Yes

   - Go To 4.

   No

   - Go To 3.

3. **(Q88) LIFTGATE OPEN DRIVER CIRCUIT SHORTED TO THE (Q89) LIFTGATE CLOSE DRIVER CIRCUIT**

Fig. 19: Checking Liftgate Open Driver Circuit For Short To Liftgate Close Driver Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance (with the Power Liftgate Drive Unit still connected) between the (Q88) Liftgate Open Driver circuit and the (Q89) Liftgate Close Driver circuit.

NOTE: **Be sure to use an accurate DVOM in the following step. Zero the meter before beginning.**

Is the resistance below 0.5 Ohms?

Yes

- Go To 6.

No

- Replace the Power Liftgate Module in accordance with service information. Refer to **MODULE, POWER LIFTGATE CONTROL, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

4. **(Q88) LIFTGATE OPEN DRIVER WIRE SHORTED TO GROUND**

Fig. 20: Checking Liftgate Open Driver Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Power Liftgate Drive Unit connector.
2. Measure the resistance between ground and the (Q88) Liftgate Open Driver circuit.

   Is the resistance below 10K Ohms?

   Yes

- Repair the (Q88) Liftgate Open Driver circuit for a short to ground.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To 5.

5. **(Q89) LIFTGATE CLOSE DRIVER WIRE SHORTED TO GROUND**

Fig. 21: Checking Liftgate Close Driver Wire For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (Q89) Liftgate Close Driver circuit in the Power Liftgate Module C1 connector.

   Is the resistance below 10K Ohms?

   Yes

- Repair the (Q89) Liftgate Close Driver circuit for a short to ground.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Replace the Power Liftgate Drive Unit in accordance with the Service Information. Refer to **DRIVE UNIT, POWER, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

6. **(Q88) LIFTGATE OPEN DRIVER WIRE SHORTED TO THE (Q89) LIFTGATE CLOSE DRIVER WIRE**

Fig. 22: Checking Liftgate Open Driver Wire For Short To Liftgate Close Driver Wire
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Power Liftgate Drive Unit harness connector.
2. Measure the resistance between the (Q88) Liftgate Open Driver circuit and the (Q89) Liftgate Close Driver circuit.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the (Q88) Liftgate Open Driver circuit for a short to the (Q89) Liftgate Close Driver circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Replace the Power Liftgate Drive Unit in accordance with the Service Information. Refer to **DRIVE UNIT, POWER, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

B188C-12-LIFTGATE CONTROL CIRCUIT 1 - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 23: Power Liftgate Position Sensor Signal, Supply, Liftgate Drive & Ground Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

Whenever the Power Liftgate is power opening or closing.

SET CONDITION

When the Power Liftgate Module senses voltage more than 9.5 volts on the (Q88) Liftgate Open Driver circuit prior to starting a liftgate power cycle, this code will set.

POSSIBLE CAUSES

Possible Causes
(Q88) LIFTGATE OPEN DRIVER CIRCUIT SHORTED TO VOLTAGE

(Q89) LIFTGATE CLOSE DRIVER CIRCUIT SHORTED TO VOLTAGE
(Q88) LIFTGATE OPEN DRIVER CIRCUIT SHORT TO THE (Q89) LIFTGATE CLOSE DRIVER CIRCUIT
POWER LIFTGATE MODULE

DIAGNOSTIC TEST

1. **DTC PRESENT**
    1. With the scan tool, record and erase the DTCs.
    2. Cycle the ignition off, wait 10 seconds, then cycle the ignition on.
    3. If possible, operate the liftgate several times.
    4. With the scan tool, read the Active DTCs.

    Does the scan tool display; B188C-12-LIFTGATE CONTROL CIRCUIT 1 - CIRCUIT SHORT TO BATTERY?

    Yes

    - Go To 2.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

1. Cycle the ignition off.
2. Disconnect the Power Liftgate Module C1 harness connector.
3. Disconnect the Power Liftgate Drive Unit harness connector.
4. Cycle the ignition on.
5. Measure the voltage between ground and the (Q88) Liftgate Open Driver circuit in the PLGM C1 harness connector.

   Is there any voltage present?

   Yes

   - Repair the (Q88) Liftgate Open Driver circuit for a short to voltage.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Go To 3.

3. **(Q89) LIFTGATE CLOSE DRIVER CIRCUIT SHORTED TO VOLTAGE**

Fig. 25: Checking Liftgate Close Driver Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Measure the voltage between the (Q89) Liftgate Close Driver circuit and ground.

   Is there any voltage present?

   Yes

   - Repair the (Q89) Liftgate Close Driver circuit for a short to voltage.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Go To 4.

4. **(Q88) LIFTGATE OPEN DRIVER CIRCUIT SHORTED TO THE (Q89) LIFTGATE CLOSE**

DRIVER CIRCUIT

Fig. 26: Checking Liftgate Open Driver Circuit For Short To Liftgate Close Driver Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Cycle the ignition off.
2. Measure the resistance between the (Q88) Liftgate Open Driver circuit and the (Q89) Liftgate Close Driver circuit.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the (Q88) Liftgate Open Driver circuit for a short to the (Q89) Liftgate Close Driver circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Replace the Power Liftgate Module in accordance with the Service Information. Refer to **MODULE, POWER LIFTGATE CONTROL, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

B188C-13-LIFTGATE CONTROL CIRCUIT 1 - CIRCUIT OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 27: Power Liftgate Position Sensor Signal, Supply, Liftgate Drive & Ground Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

Whenever the Power Liftgate is power opening or power closing.

SET CONDITION

When the Power Liftgate Module senses no current on the (Q88) Liftgate Open Driver circuit and no liftgate movement, this code will set. It is also possible for this code to set if the liftgate has been run several times and the internal circuit breaker (Thermo Protection Device) has opened up.

POSSIBLE CAUSES

Possible Causes
(Q88) LIFTGATE OPEN DRIVER CIRCUIT OPEN
(Q89) LIFTGATE CLOSE DRIVER CIRCUIT OPEN
POWER LIFTGATE DRIVE UNIT
POWER LIFTGATE MODULE

DIAGNOSTIC TEST

1. **DTC PRESENT**
    1. With the scan tool, record and erase the DTCs.
    2. Cycle the ignition off, wait 10 seconds, then cycle the ignition on.
    3. If possible, operate the liftgate several times.
    4. With the scan tool, read the Active DTCs.

    Does the scan tool display; B188C-13-LIFTGATE CONTROL CIRCUIT 1 - CIRCUIT OPEN?

    Yes

    - Go To 2

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and poor pin fit.
    - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
2. **POWER LIFTGATE MODULE**

Fig. 28: Checking Liftgate Open Driver Circuit For Short To Liftgate Close Driver Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Cycle the ignition off.
2. Disconnect the Power Liftgate Module C1 harness connector.
3. Measure the resistance between the (Q88) Liftgate Open Driver circuit and the (Q89) Liftgate Close Driver circuit.

NOTE: **Be sure to use an accurate DVOM in the following step. Zero the meter before beginning.**

Is the resistance approximately 0.5 of an Ohm?

Yes

- Replace the Power Liftgate Module in accordance with the service information. Refer to **MODULE, POWER LIFTGATE CONTROL, REMOVAL** .

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

B18E1-12-POWER LIFTGATE FRONT ZONE SWITCH - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 31: Power Liftgate Module Pinch Sensor & Liftgate Switch Signal, Release Switch Sense & Ground Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

Whenever the Power Liftgate Module is awake.

SET CONDITION

When the Power Liftgate Module senses a voltage over 4.7 volts on the (G25) Liftgate Release Switch Sense

circuit for longer than 15 seconds, this code will set.

POSSIBLE CAUSES

Possible Causes
(G25) LIFTGATE RELEASE SWITCH SENSE CIRCUIT SHORTED TO VOLTAGE
(G25) LIFTGATE SWITCH SENSE CIRCUIT OPEN
FRONT POWER LIFTGATE SWITCH
POWER LIFTGATE MODULE

DIAGNOSTIC TEST

1. **DTC PRESENT**
    1. With the scan tool, record the DTCs.
    2. Erase the DTCs.
    3. Turn the ignition off, wait 10 seconds, then turn the ignition on.
    4. Operate the liftgate several times from the front switch.
    5. With the scan tool, read the Active DTCs.

    Does the scan tool display; B18E1-12-POWER LIFTGATE FRONT ZONE SWITCH - CIRCUIT SHORT TO BATTERY?

    Yes

    - Go To 2.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **FRONT POWER LIFTGATE SWITCH SHORTED**
    1. Disconnect the Front Power Liftgate Switch harness connector in the overhead console.
    2. Erase the DTCs.
    3. Turn the ignition off, wait 15 seconds, then turn the ignition on.
    4. With the scan tool, read the DTCs.

    Does the scan tool display; B18E1-12-POWER LIFTGATE FRONT ZONE SWITCH - CIRCUIT SHORT TO BATTERY?

    Yes

- Go To3.

No

- Replace the Front Power Liftgate Switch (Overhead Console) in accordance with the Service Information. Refer to **CONSOLE, OVERHEAD, FRONT, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **(G25) LIFTGATE RELEASE SWITCH SENSE CIRCUIT SHORTED TO VOLTAGE**
   1. Disconnect the Power Liftgate Module C2 harness connector.
   2. Measure the voltage between ground and the (G25) Liftgate Release Switch Sense circuit.

   Is there any voltage present?

   Yes

   - Repair the (G25) Liftgate Release Switch Sense circuit for a short to voltage.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 4.
4. **(G25) LIFTGATE RELEASE SWITCH SENSE CIRCUIT OPEN**
   1. Turn the ignition off.
   2. Measure the resistance of the (G25) Liftgate Release Switch Sense circuit between the Switch connector and the Power Liftgate C2 harness connector.

   Is the resistance below 2.0 Ohms?

   Yes

   - Replace the Power Liftgate Module in accordance with the Service Information. Refer to **MODULE, POWER LIFTGATE CONTROL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Repair the (G25) Liftgate Release Switch Sense circuit for an open.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B18E1-2A-POWER LIFTGATE FRONT ZONE SWITCH - STUCK

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 32: Power Liftgate Module Pinch Sensor & Liftgate Switch Signal, Release Switch Sense & Ground Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

Whenever the Power Liftgate Module is awake.

SET CONDITION

When the Power Liftgate Module senses the (G25) Liftgate Switch Sense circuit active (2.0 to 3.5 volts) for

longer than 15 seconds, this code will set.

POSSIBLE CAUSES

Possible Causes
(G25) LIFTGATE RELEASE SWITCH SENSE CIRCUIT PARTIALLY SHORTED TO GROUND
FRONT POWER LIFTGATE SWITCH STUCK
POWER LIFTGATE MODULE

DIAGNOSTIC TEST

1. **DTC PRESENT**
    1. With the scan tool, record the DTCs.
    2. Erase the DTCs.
    3. Cycle the ignition off, wait 15 seconds, then cycle the ignition on.
    4. Operate the liftgate several times from the overhead switch.
    5. With the scan tool, read the DTCs.

    Does the scan tool display; B18E1-2A-POWER LIFTGATE FRONT ZONE SWITCH - STUCK?

    Yes

    - Go To 2.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **FRONT POWER LIFTGATE SWITCH STUCK**
    1. Disconnect the Front Power Liftgate Switch harness connector.
    2. Erase the DTCs.
    3. Cycle the ignition off, wait 15 seconds, then cycle the ignition on.
    4. With the scan tool, read the Active DTCs.

    Does the scan tool display; B18E1-2A-POWER LIFTGATE FRONT ZONE SWITCH - STUCK?

    Yes

    - Go To 3.

    No

- Replace the Front Power Liftgate Switch (Overhead Console) in accordance with the Service Information. Refer to **CONSOLE, OVERHEAD, FRONT, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **(G25) LIFTGATE RELEASE SWITCH SENSE CIRCUIT SHORTED TO GROUND**

Fig. 33: Checking Liftgate Switch Sense Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Cycle the ignition off.
2. Disconnect the Power Liftgate Module C2 harness connector.
3. Measure the resistance between ground and the (G25) Liftgate Release Switch Sense circuit.

   Is the resistance below 10K Ohms?

Yes

- Repair the (G25) Liftgate Release Switch Sense circuit for a partial short to ground.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace the Power Liftgate Module in accordance with the Service Information. Refer to **MODULE, POWER LIFTGATE CONTROL, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1941-92-POWER LIFTGATE POSITION SENSOR 2 - PERFORMANCE OR INCORRECT OPERATION

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 34: Power Liftgate Position Sensor Signal, Supply, Liftgate Drive & Ground Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

Whenever the Power Liftgate is power opening or closing.

SET CONDITION

When the Power Liftgate Module senses the (Q205) Position Sensor Signal 2 circuit not pulsing during motor operation, this code will set.

POSSIBLE CAUSES

Possible Causes
(Q901) LOGIC GROUND OPEN

(Q205) POSITION SENSOR SIGNAL 2 CIRCUIT SHORTED TO GROUND
(Q205) POSITION SENSOR SIGNAL 2 CIRCUIT OPEN
Q205) POSITION SENSOR SIGNAL 2 CIRCUIT SHORTED TO VOLTAGE
(Q203) POSITION SENSOR SUPPLY CIRCUIT OPEN
(Q203) POSITION SENSOR SUPPLY CIRCUIT SHORTED TO GROUND
Q205) POSITION SENSOR SIGNAL 2 CIRCUIT SHORTED TO THE (Q204) POSITION SENSOR SIGNAL 1 CIRCUIT
POWER LIFTGATE DRIVE UNIT
POWER LIFTGATE MODULE

DIAGNOSTIC TEST

1. **DTC PRESENT**
    1. With the scan tool, record the DTCs.
    2. Erase the DTCs.
    3. Turn the ignition off, wait 10 seconds, then turn the ignition on.
    4. If possible, operate the liftgate several times.
    5. With the scan tool, read the Active DTCs.

    Does the scan tool display; B1941-92-POWER LIFTGATE POSITION SENSOR 2 - PERFORMANCE OR INCORRECT OPERATION?

    Yes

    - Go To 2.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **(Q901) LOGIC GROUND OPEN**
    1. Turn the ignition off.
    2. Disconnect the Power Liftgate Drive Unit harness connector.
    3. Disconnect the Power Liftgate Module C2 harness connector.
    4. Measure the resistance of (Q901) Logic Ground circuit between the Power Liftgate Drive Unit harness connector and the Power Liftgate Module C2 harness connector.

    Is the resistance below 1.0 Ohm?

    Yes

- Go To 3.

No

- Repair the (Q901) Logic Ground circuit for an open.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **(Q205) POSITION SENSOR SIGNAL 2 CIRCUIT SHORTED TO GROUND**

Fig. 35: Checking Position Sensor Signal 2 Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Power Liftgate Module C1 harness connector.
2. Measure the resistance between ground and the (Q205) Position Sensor Signal 2 circuit.

   Is the resistance below 10K Ohms?

Yes

- Repair the (Q205) Position Sensor Signal 2 circuit for a short to ground.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To4

4. **(Q205) POSITION SENSOR SIGNAL 2 CIRCUIT SHORTED TO VOLTAGE**

Fig. 36: Checking Position Sensor Signal 2 Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition on.
2. Measure the voltage between ground and the (Q205) Position Sensor Signal 2 circuit.

Is there any voltage present?

Yes

- Repair the (204) Position Sensor Signal 2 circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 5.

1. While back probing, measure the voltage between ground and the (Q205) Liftgate Position Sensor 2 Signal circuit in the Power Liftgate Drive Unit harness connector.

NOTE: The graphic shows the terminal end of the connector, back probe the

wire end.

2. Slowly lower and raise the liftgate while observing the voltmeter.

   Does the voltage change from approximately 0.0 volts to 4.7 volts as the liftgate is moved?

   Yes

   - Test Complete.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the Power Liftgate Drive Unit in accordance with the Service Information. Refer to **DRIVE UNIT, POWER, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1945-11-POWER LIFTGATE PINCH SENSOR 2 - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 43: Power Liftgate Module Pinch Sensor & Liftgate Switch Signal, Release Switch Sense & Ground Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

Whenever the Power Liftgate Module is awake.

SET CONDITION

The Power Liftgate Module has detected the Left Liftgate Pinch Sensor circuit voltage is under 0.5 of a volt for

over 15 seconds.

POSSIBLE CAUSES

Possible Causes
(Q75) LEFT PINCH SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
(Q75) LEFT PINCH SENSOR SIGNAL CIRCUIT SHORTED TO THE (Q901) LOGIC GROUND CIRCUIT
LEFT LIFTGATE PINCH SENSOR
POWER LIFTGATE MODULE

DIAGNOSTIC TEST

1. **DTC PRESENT**
    1. With the scan tool, record and erase the DTCs and any liftgate inhibitors.
    2. Cycle the ignition off, wait 10 seconds, then cycle the ignition on.
    3. Operate the liftgate several times.
    4. With the scan tool, read the Active DTCs.

    Does the scan tool display; B1945-11-POWER LIFTGATE PINCH SENSOR 2 - CIRCUIT SHORT TO GROUND?

    Yes

    - Go To 2

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
2. **LEFT PINCH SENSOR SHORTED**

Fig. 44: Left Pinch Sensor Harness Connector End View
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Left Liftgate Pinch Sensor harness connector.
2. Erase the DTCs.
3. Cycle the ignition off, wait 20 seconds, then cycle the ignition on.
4. With the scan tool, read the Active DTCs.

   Does the scan tool display; B1945-11-POWER LIFTGATE PINCH SENSOR 2 - CIRCUIT SHORT TO GROUND?

   Yes

- Go To 3

No

- Replace the Left Liftgate Pinch Sensor in accordance with the Service Information. Refer to **SENSOR, PINCH, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

3. **CHECK THE (Q75) LEFT PINCH SENSOR SIGNAL FOR A SHORT TO GROUND**

Fig. 45: Checking Left Pinch Sensor Signal For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Cycle the ignition off.
2. Disconnect the Power Liftgate Module C2 harness connector.

3. Measure the resistance between ground and the (Q75) Left Pinch Sensor Signal harness circuit.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the (Q75) Left Pinch Sensor Signal circuit for a short to ground.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Go To 4

4. **CHECK THE (Q75) LEFT PINCH SENSOR SIGNAL FOR A SHORT TO THE (Q901) LOGIC GROUND CIRCUIT**

Fig. 46: Checking Left Pinch Sensor Signal For A Short To Logic Ground Circuit

Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (Q75) Left Pinch Sensor Signal circuit and the (Q901) Logic Ground circuit.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the (Q75) Left Pinch Sensor Signal circuit for a short to the (Q901) Logic Ground circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Replace the Power Liftgate Module in accordance with the Service Information. Refer to **MODULE, POWER LIFTGATE CONTROL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

B1945-12-POWER LIFTGATE PINCH SENSOR 2 - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 47: Power Liftgate Module Pinch Sensor & Liftgate Switch Signal, Release Switch Sense & Ground Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

Whenever the Power Liftgate Module is awake.

SET CONDITION

The Power Liftgate Module has detected the Left Power Liftgate Pinch Sensor circuit voltage is above 4.6 volts

for over 15 seconds.

POSSIBLE CAUSES

Possible Causes
(Q901) LOGIC GROUND CIRCUIT OPEN
(Q75) LEFT PINCH SENSOR SIGNAL CIRCUIT OPEN
(Q75) LEFT PINCH SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
LEFT LIFTGATE PINCH SENSOR
POWER LIFTGATE MODULE

DIAGNOSTIC TEST

1. **DTC PRESENT**
    1. With the scan tool, record and erase the DTCs and any liftgate inhibitors.
    2. Cycle the ignition off, wait 10 seconds, then cycle the ignition on.
    3. Operate the liftgate several times.
    4. With the scan tool, read the Active DTCs.

    Does the scan tool display; B1945-12-POWER LIFTGATE PINCH SENSOR 2 - CIRCUIT SHORT TO BATTERY?

    Yes

    - Go To 2

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .
2. **(Q901) LOGIC GROUND OPEN**

Fig. 48: Checking Logic Ground Circuit For Open
Courtesy of CHRYSLER GROUP, LLC

1. Cycle the ignition off.
2. Disconnect the Left Liftgate Pinch Sensor harness connector.
3. Measure the resistance of the (Q901) Logic Ground circuit in the Left Pinch Sensor harness connector.

   Is the resistance below 5 Ohms?

   Yes

   - Go To 3

   No

- Repair the (Q901) Logic Ground circuit for an open.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

3. **LEFT PINCH SENSOR OPEN**

Fig. 49: Checking Left Pinch Sensor For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the Left Pinch Sensor in the Component Side connector.

NOTE: **The graphic shows the harness side - component side is the mate connector of the pinch sensor.**

Is the resistance between 9K and 11K Ohms?

Yes

- Go To 4

No

- Replace the Left Pinch Sensor in accordance with the Service Information. Refer to **SENSOR, PINCH, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

4. **(Q75) LEFT PINCH SENSOR SIGNAL CIRCUIT OPEN**

Fig. 50: Checking Left Pinch Sensor Signal Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Cycle the ignition on.
2. Measure the voltage between the (Q901) Logic Ground circuit and the (Q75) Left Pinch Sensor Signal circuit in the Left Pinch Sensor harness connector.

Is the voltage below 4.5 volts?

Yes

- Go To 5

No

- Go To 6

5. **(Q75) LEFT PINCH SENSOR SIGNAL CIRCUIT OPEN**

Fig. 51: Checking Left Pinch Sensor Signal Circuit For Open
Courtesy of CHRYSLER GROUP, LLC

1. Cycle the ignition off.

2. Disconnect the Power Liftgate Module C2 harness connector.
3. Measure the resistance of the (Q75) Left Pinch Sensor Signal circuit between the Power Liftgate Module C2 connector and the Left Liftgate Pinch Sensor connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Replace the Power Liftgate Module in accordance with the Service Information. Refer to **MODULE, POWER LIFTGATE CONTROL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Repair the (Q75) Left Pinch Sensor Signal circuit for an open.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

6. **(Q75) LEFT PINCH SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE**

Fig. 52: Checking Left Pinch Sensor Signal Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Measure the voltage between the (Q901) Logic Ground circuit and the (Q75) Left Pinch Sensor Signal circuit.

   Is the voltage above 4.5 volts?

   Yes

   - Go To 7

   No

   - Replace the Left Liftgate Pinch Sensor in accordance with the Service Information. Refer to **SENSOR, PINCH, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

7. **(Q75) LEFT PINCH SENSOR SIGNAL WIRE SHORTED TO VOLTAGE**

Fig. 53: Checking Left Pinch Sensor Signal Wire For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Power Liftgate Module C2 harness connector.
2. Measure the voltage between ground and the (Q75) Left Pinch Sensor Signal circuit.

   Is there any voltage present?

   Yes

   - Repair the (Q75) Left Pinch Sensor Signal circuit for a short to voltage.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Replace the Power Liftgate Module in accordance with the Service Information. Refer to

MODULE, POWER LIFTGATE CONTROL, REMOVAL .

- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

B1949-12-POWER LIFTGATE REAR ZONE SWITCH - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 54: Power Liftgate Module Pinch Sensor & Liftgate Switch Signal, Release Switch Sense & Ground Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

Whenever the Power Liftgate Module is awake.

SET CONDITION

When the Power Liftgate Module senses a voltage over 4.7 volts on the (G29) Liftgate Switch Signal circuit for longer than 15 seconds, this code will set.

POSSIBLE CAUSES

Possible Causes
(G29) LIFTGATE SWITCH SIGNAL CIRCUIT SHORTED TO VOLTAGE
LIFTGATE SWITCH
POWER LIFTGATE MODULE

DIAGNOSTIC TEST

1. **DTC PRESENT**
    1. With the scan tool, record and erase the DTCs.
    2. Cycle the ignition off, wait 10 seconds, then cycle the ignition on.
    3. Operate the liftgate several times from the rear switch.
    4. With the scan tool, read the Active DTCs.

    Does the scan tool display; B1949-12-POWER LIFTGATE REAR ZONE SWITCH - CIRCUIT SHORT TO BATTERY?

    Yes

    - Go To 2

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and poor pin fit.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **LIFTGATE REAR SWITCH SHORTED**

Fig. 55: Power Liftgate Rear Switch Connector End View
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Power Liftgate Rear Switch connector.
2. Erase the DTCs.
3. Cycle the ignition off, wait 15 seconds, then cycle the ignition on.
4. With the scan tool, read the DTCs.

   Does the scan tool display; B1949-12-POWER LIFTGATE REAR ZONE SWITCH - CIRCUIT SHORT TO BATTERY?

   Yes

- Go To 3

No

- Replace the Power Liftgate Rear Switch in accordance with the Service Information. Refer to **SWITCH, D-PILLAR, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **(G29) LIFTGATE SWITCH SIGNAL CIRCUIT SHORTED TO VOLTAGE**

Fig. 56: Checking Liftgate Switch Signal Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Cycle the ignition off.
2. Disconnect the Power Liftgate Module C2 harness connector.
3. Cycle the ignition on.

4. Measure the voltage between ground and the (G29) Liftgate Switch Signal circuit.

   Is there any voltage present?

   Yes

   - Repair the (G29) Liftgate Switch Signal circuit for a short to voltage.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the Power Liftgate Module in accordance with the Service Information. Refer to **MODULE, POWER LIFTGATE CONTROL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1949-2A-POWER LIFTGATE REAR ZONE SWITCH - STUCK

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 57: Power Liftgate Module Pinch Sensor & Liftgate Switch Signal, Release Switch Sense & Ground Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

Whenever the Power Liftgate Module is awake.

SET CONDITION

When the Power Liftgate Module senses a voltage between 2.0 volts and 3.5 volts on the (G29) Liftgate Switch

Signal circuit for longer than 15 seconds, this code will set.

POSSIBLE CAUSES

Possible Causes
(G29) LIFTGATE SWITCH SIGNAL CIRCUIT PARTIAL SHORTED TO GROUND
LIFTGATE SWITCH
POWER LIFTGATE MODULE

DIAGNOSTIC TEST

1. **DTC PRESENT**
    1. With the scan tool, record and erase the DTCs.
    2. Cycle the ignition off, wait 10 seconds, then cycle the ignition on.
    3. Operate the liftgate several times from the rear switch.
    4. With the scan tool, read the Active DTCs.

    Does the scan tool display; B1949-2A-POWER LIFTGATE REAR ZONE SWITCH - STUCK?

    Yes

    - Go To 2.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and poor pin fit.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **LIFTGATE REAR SWITCH SHORTED**

Fig. 58: Power Liftgate Rear Switch Connector End View
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Power Liftgate Rear Switch connector.
2. Erase the DTCs.
3. Cycle the ignition off, wait 15 seconds, then cycle the ignition on.
4. With the scan tool, read the Active DTCs.

   Does the scan tool display; B1949-2A-POWER LIFTGATE REAR ZONE SWITCH - STUCK?

   Yes

- Go To 3.

No

- Replace the Liftgate Rear Switch in accordance with the Service Information. Refer to **SWITCH, D-PILLAR, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **(G29 LIFTGATE SWITCH SIGNAL CIRCUIT SHORTED TO GROUND**

Fig. 59: Checking Liftgate Switch Signal Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Cycle the ignition off.
2. Disconnect the Power Liftgate Module C2 harness connector.
3. Measure the resistance between ground and the (G29) Liftgate Switch Signal circuit.

Is the resistance below 10K Ohms?

Yes

- Repair the (G29) Liftgate Switch Signal circuit for a short to ground.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace the Power Liftgate Module in accordance with the Service Information. Refer to **MODULE, POWER LIFTGATE CONTROL, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1952-00-POWER LIFTGATE DRIVE MOTOR - INCORRECT DIRECTION

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 60: Power Liftgate Position Sensor Signal, Supply, Liftgate Drive & Ground Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

Whenever the Power Liftgate Motor is in operation.

SET CONDITION

When the Power Liftgate Module senses the direction of the drive motor is in opposition to the direction it is trying to drive the liftgate, this code will set.

POSSIBLE CAUSES

Possible Causes
(Q88) LIFTGATE OPEN DRIVER CIRCUIT AND THE (Q89) LIFTGATE CLOSE DRIVER

CIRCUITS ARE CROSSED
(Q204) LIFTGATE POSITION SENSOR 1 SIGNAL AND THE (Q205) LIFTGATE POSITION SENSOR 2 SIGNAL CIRCUITS ARE CROSSED
POWER LIFTGATE DRIVE UNIT
POWER LIFTGATE MODULE

DIAGNOSTIC TEST

1. **DTC PRESENT**
    1. With the scan tool, record the DTCs.
    2. Erase the DTCs.
    3. Cycle the ignition off, wait 10 seconds, then cycle the ignition on.
    4. If possible, operate the liftgate several times.
    5. With the scan tool, read the Active DTCs.

    Does the scan tool display; B1952-00-POWER LIFTGATE DRIVE MOTOR - INCORRECT DIRECTION?

    Yes

    - Go To 2

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and poor pin fit.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

1. Inspect the Power Liftgate Drive Unit and Power Liftgate Module connectors, terminals and harness for damaged or pushed out terminals, or pinched/broken wires. Repair any obvious problems.
2. Trace the (Q204) Liftgate Position Sensor 1 Signal circuit and the (Q205) Liftgate Position Sensor 2 Signal circuits between the Power Liftgate Module C1 harness connector and the Power Liftgate Drive Unit harness connector.

NOTE: In the graphic, the Sensor 1 Signal is shown as (+) and the Sensor 2 Signal is shown as (-).

Are the circuits crossed at either connector?

Yes

- Correct the wiring as necessary.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace the Power Liftgate Drive Unit in accordance with the Service Information. Refer to **DRIVE UNIT, POWER, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B195F-11-POWER LIFTGATE CHIME CONTROL - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Whenever the Power Liftgate Module is activating the chime.

SET CONDITION

The power liftgate module has detected the internal chime circuit voltage is low.

POSSIBLE CAUSES

Possible Causes
POWER LIFTGATE MODULE

DIAGNOSTIC TEST

DTC PRESENT

1. With the scan tool, record the DTCs.
2. Erase the DTCs.
3. Turn the ignition off, wait 10 seconds, then turn the ignition on.
4. Operate the liftgate several times.
5. With the scan tool, read the Active DTCs.

   Does the scan tool display; B195F-11-POWER LIFTGATE CHIME CONTROL - CIRCUIT SHORT TO GROUND?

   Yes

   - Replace the Power Liftgate Module in accordance with the Service Information. Refer to **MODULE, POWER LIFTGATE CONTROL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B195F-12-POWER LIFTGATE CHIME CONTROL - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Whenever the Power Liftgate Module is awake.

SET CONDITION

The latch release operation is longer than 4 seconds and/or the power liftgate module has detected the internal chime circuit voltage is over 4.0 volts during operation or over 1.5 volts when not operating

POSSIBLE CAUSES

Possible Causes
POWER LIFTGATE MODULE (PLGM)

DIAGNOSTIC TEST

DTC PRESENT

1. With the scan tool, record the DTCs.
2. Erase the DTCs.
3. Turn the ignition off, wait 10 seconds, then turn the ignition on.
4. Operate the liftgate several times.
5. With the scan tool, read the Active DTCs.

   Does the scan tool display; B195F-12-POWER LIFTGATE CHIME CONTROL - CIRCUIT SHORT TO BATTERY?

   Yes

   - Replace the Power Liftgate Module in accordance with the Service Information. Refer to **MODULE, POWER LIFTGATE CONTROL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1963-00-POWER LIFTGATE STRUT PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 63: Power Liftgate Position Sensor Signal, Supply, Liftgate Drive & Ground Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

This DTC is designed to detect a failed gas prop which will cause the liftgate to free fall at the top of an open cycle. This is accomplished by the liftgate position sensors 1 and 2 transmitting that information to the power liftgate module. This DTC can also be set by the operator pulling on the opened liftgate and closing it down to quickly (less than one second).

WHEN MONITORED

One second after the liftgate completes a power opening operation.

SET CONDITION

The PLGM has detected that the gate does not remain open (25 pulses in 1 second) after disengaging the drive unit. If the liftgate starts to drop after a complete opening operation, the Power Liftgate Module will set this code.

POSSIBLE CAUSES

Possible Causes
WEAK STRUT
COLD WEATHER CONDITION

DIAGNOSTIC TEST

1. **DTC PRESENT**
    1. With the scan tool, record the PLG DTCs and any liftgate inhibitors.
    2. Erase the DTCs.
    3. Turn the ignition off, wait 10 seconds, then turn the ignition on.
    4. Operate the liftgate to the full up position and wait 30 seconds.
    5. Close the liftgate and repeat the previous step.
    6. With the scan tool, read the Active DTCs.

    Does the scan tool display; B1963-00-POWER LIFTGATE STRUT PERFORMANCE?

    Yes

    - Go To 2.

    No

    - Make sure there is no intermittent binding or cold weather condition which may have caused this code to set.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **WEAK STRUT**
    1. Manually open the liftgate to approximately 1/4 open position.
    2. Let go of the liftgate and see if it will slam shut.
    3. If necessary, compare the effort to open and close the liftgate with a known good vehicle.

    NOTE: At this point the liftgate should hold in this position but it may slip down very slowly which is passable.

    Does the liftgate hold in position or lower very slowly?

    Yes

- Go To 3.

No

- Replace the Liftgate Gas Prop (strut) in accordance with the Service Information. Refer to **PROP ASSEMBLY, POWER, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **WEAK STRUT**
   1. Manually open the liftgate to the full open position.
   2. Leave go of the liftgate and see if it will stay in the full up position.

   Does the liftgate stay in the full up position as it should?

   Yes

   - No trouble found at this time. If this vehicle continues to set this DTC, replace the Liftgate Gas Prop (strut) in accordance with the Service Information. Refer to **PROP ASSEMBLY, POWER, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the Liftgate Gas Prop (strut) in accordance with the Service Information. Refer to **PROP ASSEMBLY, POWER, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1964-11-POWER LIFTGATE SENSOR SUPPLY - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 64: Power Liftgate Position Sensor Signal, Supply, Liftgate Drive & Ground Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

Whenever the Power Liftgate Module is awake.

SET CONDITION

The Power Liftgate Module has detected the sensor supply circuit voltage is under 4.0 volts.

POSSIBLE CAUSES

Possible Causes
(Q203) POSITION SENSOR SUPPLY CIRCUIT SHORTED TO GROUND

POWER LIFTGATE DRIVE UNIT
POWER LIFTGATE MODULE

DIAGNOSTIC TEST

1. **DTC PRESENT**
    1. With the scan tool, record the DTCs and any liftgate inhibitors.
    2. Erase the DTCs.
    3. Cycle the ignition off, wait 10 seconds, then cycle the ignition on.
    4. Operate the liftgate several times.
    5. With the scan tool, read the Active DTCs.

    Does the scan tool display; B1964-11-POWER LIFTGATE SENSOR SUPPLY - CIRCUIT SHORT TO GROUND?

    Yes

    - Go To 2

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and poor pin fit.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **POWER LIFTGATE DRIVE UNIT**

Fig. 65: Power Liftgate Drive Unit Connector End View
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and inspect the Power Liftgate Drive Unit harness connector. Clean and repair if necessary and repeat step 1. If the connector is okay, continue testing.
2. Erase the DTCs.
3. Cycle the ignition off, wait 10 seconds, then cycle the ignition on.
4. With the scan tool, read the Active DTCs.

   Does the scan tool display; B1964-11-POWER LIFTGATE SENSOR SUPPLY - CIRCUIT SHORT TO GROUND?

   Yes

   - Go To 3

   No

   - Replace the Power Liftgate Drive Unit in accordance with the service information.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **(Q203) POSITION SENSOR SUPPLY CIRCUIT SHORTED TO GROUND**

Fig. 66: Checking Position Sensor Supply Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Cycle the ignition off.
2. Disconnect the Power Liftgate Module C1 harness connector.
3. Measure the resistance between ground and the (Q203) Position Sensor Supply circuit.

   Is the resistance below 10K Ohms?

   Yes

   - Replace the Power Liftgate Module in accordance with service information. Refer to **MODULE, POWER LIFTGATE CONTROL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Repair the (Q203) Position Sensor Supply circuit for a short to ground.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1964-12-POWER LIFTGATE SENSOR SUPPLY - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 67: Power Liftgate Position Sensor Signal, Supply, Liftgate Drive & Ground Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

Whenever the Power Liftgate Module is awake.

SET CONDITION

The Power Liftgate Module has detected the Position Sensor Supply voltage is above 5.5 volts.

POSSIBLE CAUSES

Possible Causes
(Q901) LOGIC GROUND OPEN

(Q203) POSITION SENSOR SUPPLY CIRCUIT OPEN
(Q203) POSITION SENSOR SUPPLY CIRCUIT SHORTED TO BATTERY
POWER LIFTGATE DRIVE UNIT
POWER LIFTGATE MODULE

DIAGNOSTIC TEST

1. **DTC PRESENT**
    1. With the scan tool, record the DTCs and any liftgate inhibitors.
    2. Erase the DTCs.
    3. Turn the ignition off, wait 10 seconds, then turn the ignition on.
    4. Operate the liftgate several times.
    5. With the scan tool, read the Active DTCs.

    Does the scan tool display; B1964-12-POWER LIFTGATE SENSOR SUPPLY - CIRCUIT SHORT TO BATTERY?

    Yes

    - Go To 2

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and poor pin fit.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **(Q901) LOGIC GROUND CIRCUIT OPEN**
    1. Turn the ignition off.
    2. Disconnect the Power Liftgate Module C2 harness connector.
    3. Disconnect the Power Liftgate Drive Unit harness connector.
    4. Measure the resistance of the (Q901) Logic Ground circuit between the Power Liftgate Module C2 harness connector and the Power Liftgate Drive Unit connector.

    Is the resistance below 1.0 Ohm on both?

    Yes

    - Go To 3

    No

    - Repair the (Q901) Logic Ground circuit for an open.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **(Q203) POSITION SENSOR SUPPLY CIRCUIT SHORTED TO VOLTAGE**

Fig. 68: Checking Position Sensor Supply Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Connect the Power Liftgate Module C2 harness connector.
2. Turn the ignition on.
3. Measure the voltage between the (Q901) Logic Ground circuit and the (Q203) Position Sensor Supply circuit in the Power Liftgate Drive Unit connector.

   Is the voltage above 5.5 volts?

Yes

- Repair the (Q203) Position Sensor Supply circuit for a short to voltage. If the power liftgate is inoperative after repairing the (Q203) Position Sensor Supply circuit, replace the Power Liftgate Drive Unit in accordance with the service information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 4

4. **(Q203) POSITION SENSOR SUPPLY CIRCUIT OPEN**

1. Turn the ignition off.
2. Disconnect the Power Liftgate Module C1 harness connector.
3. Measure the resistance of the (Q203) Position Sensor Supply circuit between the Power Liftgate Module C1 harness connector and the Power Liftgate Drive Unit harness connector.

   Is the resistance below 1.0 Ohm?

   Yes

   - Replace the Power Liftgate Module in accordance with the Service Information. Refer to **MODULE, POWER LIFTGATE CONTROL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Repair the (Q203) Position Sensor Supply circuit for an open.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1967-00-POWER LIFTGATE OPEN DIRECTION OVERCURRENT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 70: Power Liftgate Position Sensor Signal, Supply, Liftgate Drive & Ground Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

Anytime the Power Liftgate is in a power open operation.

SET CONDITION

The drive motor stall current of over 24 amps has been detected for over 500 ms. during the power opening operation.

POSSIBLE CAUSES

Possible Causes
BINDING LIFTGATE OR OVERLOADING

(Q88) LIFTGATE OPEN DRIVER CIRCUIT SHORTED TO THE (Q89) LIFTGATE CLOSE DRIVER CIRCUIT
(Q89) LIFTGATE CLOSE DRIVER CIRCUIT SHORTED TO VOLTAGE
(Q76) LATCH SECONDARY POSITION SENSE CIRCUIT SHORTED TO GROUND
(Q76) LATCH SECONDARY POSITION SENSE CIRCUIT OPEN
(Q76) LATCH SECONDARY POSITION SENSE WIRE SHORTED TO VOLTAGE
WEAK STRUT
LATCH ASSEMBLY
POWER LIFTGATE MODULE
POWER LIFTGATE DRIVE UNIT

DIAGNOSTIC TEST

1. **DTC PRESENT**
    1. With the scan tool, record and erase the DTCs.
    2. Turn the ignition off, wait 10 seconds, then turn the ignition on.
    3. Operate the power liftgate several times if possible.
    4. With the scan tool, read the Active DTCs.

    Does the scan tool display; B1967-00-POWER LIFTGATE OPEN DIRECTION OVERCURRENT?

    Yes

    - Go To 2

    No

    - Using the wiring diagram/schematic as a guide, inspect the wiring and connectors for an intermittent condition. Operate the liftgate several times and check for any binding conditions.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **BINDING LIFTGATE**
    1. Examine the liftgate for proper alignment, worn or binding hinges, weak liftgate prop assembly, or loose/hard weatherstrip for wear or anything that would cause an obstruction to proper operation. Check for the possibility of the liftgate having been overloaded due to ice or heavy snow.
    2. Raise the liftgate and check the struts for proper operation.
    3. If necessary manually operate the liftgate of a known good vehicle and notice the effort needed.
    4. Compare the effort needed on the disabled vehicle.

    Were there any mechanical problems found?

    Yes

- Refer to **STANDARD PROCEDURE** for the related symptom(s).
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 3

3. **CHECK THE SECONDARY RATCHET SWITCH**
   1. Open the liftgate to the middle position.
   2. With the scan tool, monitor the Secondary Ratchet Switch.
   3. Using a screwdriver, click the latch to the fully closed position while observing the scan tool.
   4. Unlatch the latch by pressing the handle switch and observe the scan tool for a change of state.
   5. Repeat this step several times while moving the liftgate in different positions and wiggling the harness to check for an intermittent shorted circuit.

   Did the scan tool show the switch state changing correctly every time?

   Yes

   - Go To 4

   No

   - Go To 8

4. **(Q89) LIFTGATE CLOSE DRIVER CIRCUIT SHORTED TO VOLTAGE**

Fig. 71: Checking Liftgate Close Driver Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Power Liftgate Module C1 connector.
3. Turn the ignition on.
4. Measure the voltage between the (Q89) Liftgate Close Driver circuit and ground.

   Is there any voltage present?

   Yes

   - Repair the (Q89) Liftgate Close Driver circuit for a short to voltage.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

- Go To 5

5. **(Q88) LIFTGATE OPEN DRIVER CIRCUIT SHORTED TO THE (Q89) LIFTGATE CLOSE DRIVER CIRCUIT**

Fig. 72: Checking Liftgate Open Driver Circuit For Short To Liftgate Close Driver Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between the (Q88) Liftgate Open Driver circuit and the (Q89) Liftgate Close Driver circuit.

NOTE: **Be sure to use an accurate DVOM in the following step. Zero the meter before beginning.**

Is the resistance below 0.5 of an Ohm?

Yes

- Go To 6

No

- Go To 7

6. **(Q88) LIFTGATE OPEN DRIVER CIRCUIT SHORTED TO THE (Q89) LIFTGATE CLOSE DRIVER CIRCUIT**

Fig. 73: Checking Liftgate Open Driver Circuit For Short To Liftgate Close Driver Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Power Liftgate Drive Unit connector.
2. Measure the resistance between the (Q88) Liftgate Open Driver circuit and the (Q89) Liftgate Close Driver circuit.

   Is the resistance below 10K Ohms?

Yes

- Repair the (Q88) Liftgate Open Driver circuit for a short to the (Q89) Liftgate Close Driver circuit.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace the Power Liftgate Drive Unit in accordance with service information. Refer to **DRIVE UNIT, POWER, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

7. **POWER LIFTGATE DRIVE UNIT**
   1. Reconnect the Power Liftgate Module C1 connector.
   2. Operate the Power Liftgate in both directions if possible.

   Does the motor start to lift the liftgate but is very slow and labors extensively?

   Yes

   - Replace the Power Liftgate Drive Unit assembly in accordance with the service information. Refer to **DRIVE UNIT, POWER, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the Power Liftgate Module in accordance with the Service Information. Refer to **MODULE, POWER LIFTGATE CONTROL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
8. **CHECK THE (Q76) LATCH SECONDARY POSITION SENSE CIRCUIT FOR A SHORT TO GROUND**

Fig. 74: Checking Latch Secondary Position Sense Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Power Liftgate Latch connector.
3. Measure the resistance between ground and the (Q76) Latch Secondary Position Sense circuit.
4. Wiggle the harness while observing the Ohmmeter.

   Is the resistance below 1K Ohms?

   Yes

   - Repair the (Q76) Latch Secondary Position Sense circuit for a short to ground.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

- Go To 9

9. **CHECK THE (Q76) LATCH SECONDARY POSITION SENSE CIRCUIT FOR AN OPEN**

3. Wiggle the harness while observing the Ohmmeter.

   Is the resistance below 1.0 Ohm?

   Yes

   - Go To 10

   No

   - Repair the (Q76) Latch Secondary Position Sense circuit for an open.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

10. **(Q76) LATCH SECONDARY POSITION SENSE WIRE SHORTED TO VOLTAGE**

Fig. 76: Checking Latch Secondary Position Sense Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition on.
2. Measure the voltage between ground and the (Q76) Latch Secondary Position Sense circuit.
3. Wiggle the harness while observing the voltmeter.

   Is there any voltage present?

   Yes

   - Repair the (Q76) Latch Secondary Position Sense circuit for a short to voltage.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

- Replace the Power Liftgate Latch in accordance with the Service Information. Refer to **LATCH, LIFTGATE, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1968-00-POWER LIFTGATE OPEN DIRECTION - EXCESSIVE TIME

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 77: Power Liftgate Position Sensor Signal, Supply, Liftgate Drive & Ground Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

Anytime the Power Liftgate is in a power open operation.

SET CONDITION

The drive motor has taken longer than 15 seconds to complete an open command.

POSSIBLE CAUSES

Possible Causes
BINDING LIFTGATE
EXCESSIVE CIRCUIT RESISTANCE ON THE (A111) POWER LIFTGATE MODULE FUSED B(+) CIRCUIT, THE Q88 LIFTGATE OPEN DRIVER CIRCUIT, OR THE Q89 LIFTGATE CLOSE DRIVER CIRCUIT
POWER LIFTGATE DRIVE UNIT
INCORRECT POWER LIFTGATE MODULE IS INSTALLED IN THE VEHICLE

DIAGNOSTIC TEST

1. **DTC PRESENT**
    1. With the scan tool, record and erase the DTCs.
    2. Cycle the ignition off, wait 10 seconds, then cycle the ignition on.
    3. Operate the power liftgate several times if possible.
    4. With the scan tool, read the Active DTCs.

    Does the scan tool display; B1968-00-POWER LIFTGATE OPEN DIRECTION - EXCESSIVE TIME?

    Yes

    - Go To 2

    No

    - Using the wiring diagram/schematic as a guide, inspect the wiring and connectors for an intermittent condition. Operate the liftgate several times and check for any binding conditions.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **BINDING LIFTGATE**
    1. Examine the liftgate for proper alignment, worn or binding hinges, weak liftgate prop assembly, or loose/hard weatherstrip or anything that would cause an obstruction to proper operation.
    2. If necessary manually operate the liftgate of a known good vehicle and notice the effort needed.
    3. Compare the effort needed on the disabled vehicle.

    Were there any mechanical problems found?

    Yes

- Refer to **STANDARD PROCEDURE** for the related symptom(s).
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 3

3. **CHECK FOR EXCESSIVE CIRCUIT RESISTANCE**
   1. Disconnect all Power Liftgate Module harness connectors.
   2. Disconnect the Power Liftgate Drive Unit harness connector.
   3. Check all connectors and terminals for corrosion.

   Do any connectors or terminals need repairing?

   Yes

   - Clean and repair wiring as necessary.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the Power Liftgate Drive Unit in accordance with the Service Information. Refer to **DRIVE UNIT, POWER, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1969-00-POWER LIFTGATE OPEN DIRECTION EXCESSIVE POSITION SENSOR COUNTS

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 78: Power Liftgate Position Sensor Signal, Supply, Liftgate Drive & Ground Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

During Power Liftgate opening cycle.

SET CONDITION

If the Power Liftgate (PLG) Module detects that the Power Liftgate Drive Unit has generated excessive pulses during a full power cycle, this code will set.

POSSIBLE CAUSES

Possible Causes
BINDING LIFTGATE

(Q901) LOGIC GROUND OPEN
POWER LIFTGATE DRIVE UNIT
POWER LIFTGATE MODULE

DIAGNOSTIC TEST

1. **DTC PRESENT**
    1. With the scan tool, record and erase DTCs.
    2. Turn the ignition off, wait 10 seconds, then turn the ignition on.
    3. Operate the Power Liftgate several times from stop to stop if possible.
    4. With the scan tool, read the Active DTCs.

    Does the scan tool display; B1969-00-POWER LIFTGATE OPEN DIRECTION EXCESSIVE POSITION SENSOR COUNTS?

    Yes

    - Go To 2

    No

    - Using the wiring diagram/schematic as a guide, inspect the wiring and connectors for an intermittent condition. Operate the liftgate several times and check for any binding conditions.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **BINDING LIFTGATE**
    1. Examine the liftgate for proper alignment, worn or binding hinges, weak liftgate prop assembly, loose/hard weatherstrip, for wear or anything that would cause an obstruction to proper operation.
    2. If necessary manually operate the power liftgate on a known good vehicle and notice the effort needed to open and close for comparison.

    Were there any mechanical problems found?

    Yes

    - Refer to **STANDARD PROCEDURE** for the related symptom(s).
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

    No

    - Go To 3
3. **POWER LIFTGATE MODULE - POSITION SENSE OPEN**
    1. Operate the liftgate from the full closed position and put an obstacle in its path to make it reverse.

Did the liftgate reverse back to the closed position?

Yes

- Go To 4

No

- Check to see if there is an updated flash for this module. If there is not an updated flash available, replace the Power Liftgate Module in accordance with the service information. Refer to **MODULE, POWER LIFTGATE CONTROL, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **(Q901) LOGIC GROUND OPEN**
   1. Turn the ignition off.
   2. Disconnect the Power Liftgate Drive Unit harness connector.
   3. Disconnect the Power Liftgate Module C2 harness connector.
   4. Measure and note the resistance of the (Q901) Logic Ground circuit between the Power Liftgate Drive Unit harness connector and the Power Liftgate Module C2 harness connector.
   5. Connect a jumper between the (Q901) Logic Ground circuit and ground in the Power Liftgate Drive Unit harness connector.
   6. Using a 12-volt test light connected to 12 volts, check the (Q901) Logic Ground circuit at the Power Liftgate Module C2 harness connector.

   Is the resistance below 1.0 Ohm and does the test light illuminate as bright when compared to that of a direct connection to the battery?

   Yes

   - Replace the Power Liftgate Drive Unit in accordance with Service Information. Refer to **DRIVE UNIT, POWER, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Repair the (Q901) Logic Ground circuit for an open / excessive resistance.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B196A-00-POWER LIFTGATE CLOSE DIRECTION OVERCURRENT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 79: Power Liftgate Right Pinch Sensor Signal, Sector Switch Sense, Secondary Position Latch Sense, Driver & Ground Circuit Diagram

WHEN MONITORED

Anytime the Power Liftgate is in a power closing operation.

SET CONDITION

The drive motor stall current of over 20 amps has been detected for over 500 ms. during a power closing operation.

POSSIBLE CAUSES

Possible Causes
BINDING LIFTGATE
STRUT BINDING
(Q88) LIFTGATE OPEN DRIVER CIRCUIT SHORTED TO THE (Q89) LIFTGATE CLOSE DRIVER CIRCUIT
(Q88) LIFTGATE OPEN DRIVER CIRCUIT SHORT TO VOLTAGE
(Q76) LATCH SECONDARY POSITION SENSE CIRCUIT SHORTED TO GROUND
(Q76) LATCH SECONDARY POSITION SENSE CIRCUIT OPEN
(Q76) LATCH SECONDARY POSITION SENSE WIRE SHORTED TO VOLTAGE
POWER LIFTGATE MODULE
LIFTGATE LATCH
POWER LIFTGATE DRIVE UNIT

DIAGNOSTIC TEST

1. **DTC PRESENT**
    1. With the scan tool, record and erase the DTCs.
    2. Cycle the ignition off, wait 10 seconds, then cycle the ignition on.
    3. Operate the power liftgate several times if possible.
    4. With the scan tool, read the Active DTCs.

    Does the scan tool display; B196A-00-POWER LIFTGATE CLOSE DIRECTION OVERCURRENT?

    Yes

    - Go To 2

    No

    - Using the wiring diagram/schematic as a guide, inspect the wiring and connectors for an intermittent condition. Operate the liftgate several times and check for any binding conditions.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **BINDING LIFTGATE**
    1. Examine the liftgate for proper alignment, worn or binding hinges, weak liftgate prop assembly, or loose/hard weatherstrip for wear or anything that would cause an obstruction to proper operation.
    2. Check the struts to be sure they are not binding when the liftgate is closing.
    3. If necessary manually operate the liftgate of a known good vehicle and notice the effort needed.
    4. Compare the effort needed on the disabled vehicle.

    Were there any mechanical problems found?

Yes

- Refer to **STANDARD PROCEDURE** for the related symptom(s).
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 3

3. **CHECK THE SECONDARY RATCHET SWITCH**
   1. With the scan tool, monitor the Secondary Ratchet Switch.
   2. Using a screwdriver, click the latch to the fully closed position while observing the scan tool.
   3. Unlatch the latch by pressing the handle switch and observe the scan tool for a change of state.
   4. Repeat this step several times while moving the liftgate in different positions and wiggling the harness to check for an intermittent shorted circuit.

   Did the scan tool show the switch state changing correctly every time?

   Yes

   - Go To 4

   No

   - Go To 8

4. **CHECK THE (Q88) LIFTGATE OPEN DRIVER CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 80: Checking Liftgate Open Driver Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Cycle the ignition off.
2. Disconnect the Power Liftgate Module C1 connector.
3. Cycle the ignition on.
4. Measure the voltage between ground and the (Q88) Liftgate Open Driver circuit.

   Is there any voltage present?

   Yes

   - Repair the (Q88) Liftgate Open Driver circuit for a short to voltage.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 5

5. **(Q88) LIFTGATE OPEN DRIVER CIRCUIT SHORTED TO THE (Q89) LIFTGATE CLOSE DRIVER CIRCUIT**

Fig. 81: Checking Liftgate Open Driver Circuit For Short To Liftgate Close Driver Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Cycle the ignition off.
2. Measure the resistance between the (Q88) Liftgate Open Driver circuit and the (Q89) Liftgate Close Driver circuit.
3. Wiggle the harness and check for an intermittent shorted condition.

NOTE: **Be sure to use an accurate DVOM in the following step. Zero the meter before beginning.**

Is the resistance below 0.35 of an Ohm (should be approximately 0.5 of an Ohm)?

Yes

- Go To 6

No

- Go To 7

6. **(Q88) LIFTGATE OPEN DRIVER WIRE SHORTED TO THE (Q89) LIFTGATE CLOSE DRIVER WIRE**

Fig. 82: Checking Liftgate Open Driver Circuit For Short To Liftgate Close Driver Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Power Liftgate Drive Unit connector.
2. Measure the resistance between the (Q88) Liftgate Open Driver circuit and the (Q89) Liftgate

Close Driver circuit.

3. Wiggle the harness and check for an intermittent short circuit condition.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the (Q88) Liftgate Open Driver circuit for a short to the (Q89) Liftgate Close Driver circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the Power Liftgate Drive Unit in accordance with service information. Refer to **DRIVE UNIT, POWER, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

7. **POWER LIFTGATE DRIVE UNIT**
   1. Reconnect all connectors.
   2. Operate the Power Liftgate in both directions if possible.

      Does the motor start to lift or lower the liftgate but moves very slow and labors extensively?

      Yes

      - Replace the Power Liftgate Drive Unit assembly in accordance with the service information. Refer to **DRIVE UNIT, POWER, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Replace the Power Liftgate Module in accordance with the Service Information. Refer to **MODULE, POWER LIFTGATE CONTROL, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

8. **CHECK THE (Q76) LATCH SECONDARY POSITION SENSE CIRCUIT FOR A SHORT TO GROUND**

Fig. 83: Checking Latch Secondary Position Sense Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Cycle the ignition off.
2. Disconnect the Power Liftgate Latch connector.
3. Measure the resistance between ground and the (Q76) Latch Secondary Position Sense circuit.
4. Wiggle the harness while observing the Ohmmeter.

   Is the resistance below 1, 000 Ohms?

   Yes

   - Repair the (Q76) Latch Secondary Position Sense circuit for a short to ground.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

- Go To 9

3. Wiggle the harness while observing the Ohmmeter.

   Is the resistance below 2.0 Ohms?

   Yes

   - Go To 10

   No

   - Repair the (Q76) Latch Secondary Position Sense circuit for an open.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

10. **(Q76) LATCH SECONDARY POSITION SENSE WIRE SHORTED TO VOLTAGE**

Fig. 85: Checking Latch Secondary Position Sense Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Cycle the ignition on.
2. Measure the voltage of the (Q76) Latch Secondary Position Sense circuit in accordance with the service information.
3. Wiggle the harness while observing the voltmeter.

   Is there any voltage present?

   Yes

   - Repair the (Q76) Latch Secondary Position Sense circuit for a short to voltage.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

- Replace the Power Liftgate Latch in accordance with Service Information. Refer to **LATCH, LIFTGATE, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B196B-00-POWER LIFTGATE CLOSE DIRECTION - EXCESSIVE TIME

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 86: Power Liftgate Right Pinch Sensor Signal, Sector Switch Sense, Secondary Position Latch Sense, Driver & Ground Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

Anytime the Power Liftgate is in a power close operation.

SET CONDITION

The drive motor has taken longer than 15 seconds to complete a close command or 20 seconds with the engine cranking.

POSSIBLE CAUSES

Possible Causes
BINDING LIFTGATE
EXCESSIVE CIRCUIT RESISTANCE ON THE (A111) POWER LIFTGATE MODULE FUSED B(+) CIRCUIT, THE Q88 LIFTGATE OPEN DRIVER CIRCUIT, OR THE Q89 LIFTGATE CLOSE DRIVER CIRCUIT
POWER LIFTGATE DRIVE UNIT
INCORRECT POWER LIFTGATE MODULE WAS INSTALLED

DIAGNOSTIC TEST

1. **DTC PRESENT**
    1. With the scan tool, record and erase the DTCs.
    2. Cycle the ignition off, wait 10 seconds, then cycle the ignition on.
    3. Operate the power liftgate several times if possible.
    4. With the scan tool, read the Active DTCs.

    Does the scan tool display; B196B-00-POWER LIFTGATE CLOSE DIRECTION - EXCESSIVE TIME?

    Yes

    - Go To 2

    No

    - Using the wiring diagram/schematic as a guide, inspect the wiring and connectors for an intermittent condition. Operate the liftgate several times and check for any binding conditions.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **BINDING LIFTGATE**
    1. Examine the liftgate for proper alignment, worn or binding hinges, stiff liftgate prop assembly, or loose/hard weatherstrip or anything that would cause an obstruction to proper operation.
    2. If necessary manually operate the liftgate of a known good vehicle and notice the effort needed.
    3. Compare the effort needed on the disabled vehicle.

Were there any mechanical problems found?

Yes

- Refer to **STANDARD PROCEDURE** for the related symptom(s).
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 3

3. **CHECK POWER LIFTGATE CONNECTORS FOR EXCESSIVE CIRCUIT RESISTANCE**
   1. Disconnect all Power Liftgate Module harness connectors.
   2. Disconnect the Power Liftgate Drive Unit harness connector.
   3. Check all connectors for damage or corroded/pushed out terminals.

   Do any connectors or terminals need repairing?

   Yes

   - Repair as necessary.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the Power Liftgate Drive Unit in accordance with the Service Information. Refer to **DRIVE UNIT, POWER, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B196C-00-POWER LIFTGATE CLOSE DIRECTION EXCESSIVE POSITION SENSOR COUNTS

SET CONDITION

If the Power Liftgate (PLG) Module detects that the Power Liftgate Drive Unit has generated excessive pulses during a full power cycle, this code will set.

POSSIBLE CAUSES

Possible Causes
BINDING LIFTGATE
(Q76) LATCH SECONDARY POSITION SENSE CIRCUIT SHORTED TO GROUND
LATCH ASSEMBLY
POWER LIFTGATE DRIVE UNIT
POWER LIFTGATE MODULE

DIAGNOSTIC TEST

1. **DTC PRESENT**
    1. With the scan tool, record and erase DTCs.
    2. Cycle the ignition off, wait 10 seconds, then cycle the ignition on.
    3. Operate the Power Liftgate several times from stop to stop if possible.
    4. With the scan tool, read ACTIVE DTCs.

    Does the scan tool display; B196C-00-POWER LIFTGATE CLOSE DIRECTION EXCESSIVE POSITION SENSOR COUNTS?

    Yes

    - Go To 2

    No

    - Using the wiring diagram/schematic as a guide, inspect the wiring and connectors for an intermittent condition. Operate the liftgate several times and check for any binding conditions.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **BINDING LIFTGATE**
    1. Examine the liftgate for proper alignment, worn or binding hinges, weak liftgate prop assembly, loose/hard weatherstrip seal, for wear or anything that would cause an obstruction to proper operation.
    2. If necessary manually operate the power liftgate on a known good vehicle and notice the effort needed to open and close for comparison.

    Were there any mechanical problems found?

    Yes

    - Refer to **STANDARD PROCEDURE** .
    - Perform the BODY VERIFICATION TEST. for the related symptom(s). Refer to **STANDARD PROCEDURE** .

No

- Go To 3

3. **POWER LIFTGATE LATCH**
   1. With the scan tool, monitor the SECONDARY RATCHET SWITCH CLOSED.
   2. Using a screwdriver, click the latch to the closed position while observing the scan tool.
   3. Unlatch the latch by pressing the handle switch and observe the scan tool for a change of state.
   4. Repeat this step several times while moving the liftgate in different positions and wiggling the harness to check for an intermittent open or shorted circuit.

   Did the scan tool show the switch state changing correctly every time?

   Yes

   - Go To 5

   No

   - Go To 4
4. **CHECK THE (Q76) LATCH SECONDARY POSITION SENSE CIRCUIT FOR A SHORT TO GROUND**

Fig. 88: Checking Latch Secondary Position Sense Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Cycle the ignition off.
2. Disconnect the Power Liftgate Latch harness connector.
3. Measure the resistance between ground and the (Q76) Latch Secondary Position Sense circuit.
4. Wiggle the harness while observing the Ohmmeter.

   Is the resistance below 1K Ohm?

   Yes

   - Repair the (Q76) Latch Secondary Position Sense circuit for a short to ground.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

- Replace the Power Liftgate Latch assembly in accordance with the Service Information. Refer to **LATCH, LIFTGATE, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **POWER LIFTGATE MODULE - POSITION SENSE OPEN**
   1. Operate the liftgate from the full closed position and put an obstacle in its path to make it reverse.

      Did the liftgate reverse back to the closed position?

      Yes

      - Replace the Power Liftgate Drive Unit in accordance with the service information. Refer to **DRIVE UNIT, POWER, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Replace the Power Liftgate Module in accordance with the Service Information. Refer to **MODULE, POWER LIFTGATE CONTROL, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B197F-11-POWER LIFTGATE LATCH CONTROL 1 - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 89: Power Liftgate Right Pinch Sensor Signal, Sector Switch Sense, Secondary Position Latch Sense, Driver & Ground Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

Anytime the Power Liftgate is in a latch cinch or release operation.

SET CONDITION

When the liftgate latch motor cinch or release output is pulled low prior to or during a latch cinch or release operation, this code will set.

POSSIBLE CAUSES

Possible Causes
BINDING LATCH
LOW BATTERY VOLTAGE
(Q84) LIFTGATE LATCH CINCH DRIVER CIRCUIT SHORTED TO GROUND
(Q85) LIFTGATE LATCH RELEASE DRIVER CIRCUIT SHORTED TO GROUND
(Q84) LIFTGATE LATCH CINCH DRIVER CIRCUIT SHORTED TO THE (Q85) LIFTGATE LATCH RELEASE DRIVER CIRCUIT
LATCH ASSEMBLY
POWER LIFTGATE MODULE

DIAGNOSTIC TEST

1. **DTC PRESENT**
    1. With the scan tool, record and erase DTCs.
    2. Cycle the ignition off, wait 10 seconds, then cycle the ignition on.
    3. Operate the power liftgate several times if possible.
    4. With the scan tool, read DTCs.
    5. If the B2199-16-BATTERY VOLTAGE LOW DTC is present, repair that code before proceeding.

    Does the scan tool display; B197F-11-POWER LIFTGATE LATCH CONTROL 1 - CIRCUIT SHORT TO GROUND?

    Yes

    - Go To 2

    No

    - Using the wiring diagram/schematic as a guide, inspect the wiring and connectors for an intermittent condition. Operate the liftgate several times and check for any binding conditions in the latch assembly.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **BINDING LIFTGATE LATCH**
    1. Examine the liftgate for proper alignment, worn or binding hinges, latch alignment or anything that would cause an obstruction to proper operation.
    2. With an open liftgate, manually close the latch and open it with the handle switch several times.

    Were there any mechanical problems found?

    Yes

    - Refer to the Service information for the related symptom(s). Refer to **STANDARD PROCEDURE** .

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 3

3. **CHECK THE (Q84) LIFTGATE LATCH CINCH DRIVER CIRCUIT FOR A SHORT TO THE (Q901) LOGIC GROUND**

Fig. 90: Checking Liftgate Latch Cinch Driver Circuit For A Short To Logic Ground
Courtesy of CHRYSLER GROUP, LLC

1. Cycle the ignition off.
2. Disconnect the Power Liftgate Latch connector.
3. Measure the resistance between the (Q901) Logic Ground circuit and the (Q84) Liftgate Latch

Cinch Driver circuit in the latch connector.

4. Wiggle the harness and check for an intermittent short circuit condition.

   Is the resistance below 100.0 Ohms?

   Yes

   - Go To 6

   No

   - Go To 4

4. **CHECK THE (Q85) LIFTGATE LATCH RELEASE DRIVER CIRCUIT FOR A SHORT TO THE (Q901) LOGIC GROUND**

Fig. 91: Checking Liftgate Latch Release Driver Circuit For A Short To Logic Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (Q901) Logic Ground circuit and the (Q85) Liftgate Latch Release Driver circuit in the latch connector.
2. Wiggle the harness and check for an intermittent short circuit condition.

   Is the resistance below 100.0 Ohms?

   Yes

   - Go To 6

   No

   - Go To 5

5. **CHECK THE (Q84) LIFTGATE LATCH CINCH DRIVER CIRCUIT FOR A SHORT TO THE (Q85) LIFTGATE LATCH RELEASE DRIVER CIRCUIT**

Fig. 92: Measuring Resistance Between Liftgate Latch Cinch Driver Circuit & Liftgate Latch Release Driver
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Power Liftgate Module C2 harness connector.
2. Measure the resistance between the (Q84) Liftgate Latch Cinch Driver circuit and the (Q85) Liftgate Latch Release Driver circuit.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the (Q84) Liftgate Latch Cinch Driver circuit for a short to the (Q85) Liftgate Latch Release Driver Circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace the Power Liftgate Latch assembly in accordance with the Service Information and using the scan tool, run the "Latch Home Sector Test". Refer to **LATCH, LIFTGATE, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

6. **CHECK THE (Q85) LIFTGATE LATCH RELEASE DRIVER CIRCUIT FOR A SHORT TO GROUND**

Fig. 93: Checking Liftgate Latch Release Driver Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Power Liftgate Module C2 harness connector.
2. Measure the resistance between ground and the (Q85) Liftgate Latch Release Driver circuit.
3. Wiggle the harness and check for an intermittent short circuit condition.

Is the resistance below 10K Ohms?

Yes

- Repair the (Q85) Liftgate Latch Release Driver circuit for a short to ground.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 7

7. **CHECK THE (Q84) LIFTGATE LATCH CINCH DRIVER CIRCUIT FOR A SHORT TO GROUND**

Fig. 94: Checking Liftgate Latch Cinch Driver Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (Q84) Liftgate Latch Cinch Driver circuit.

2. Wiggle the harness and check for an intermittent short circuit condition.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the (Q84) Liftgate Latch Cinch Driver circuit for a short to ground.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the Power Liftgate Module in accordance with service information. Refer to **MODULE, POWER LIFTGATE CONTROL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B197F-12-POWER LIFTGATE LATCH CONTROL 1 - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 95: Power Liftgate Right Pinch Sensor Signal, Sector Switch Sense, Secondary Position Latch Sense, Driver & Ground Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

Anytime the Power Liftgate is in a latch cinch or release operation.

SET CONDITION

When the liftgate latch motor cinch or release output is pulled high prior to or during a latch cinch or release operation, this code will set.

POSSIBLE CAUSES

Possible Causes
HIGH BATTERY VOLTAGE
(Q84) LIFTGATE LATCH CINCH DRIVER CIRCUIT SHORTED TO VOLTAGE
(Q85) LIFTGATE LATCH RELEASE DRIVER CIRCUIT SHORTED TO VOLTAGE
POWER LIFTGATE MODULE

DIAGNOSTIC TEST

1. **DTC PRESENT**
    1. With the scan tool, record and erase DTCs.
    2. Cycle the ignition off, wait 10 seconds, then cycle the ignition on.
    3. Operate the power liftgate several times if possible.
    4. With the scan tool, read DTCs.
    5. If the B2199-17-BATTERY VOLTAGE - CIRCUIT VOLTAGE ABOVE THRESHOLD DTC is present, repair that code before proceeding.

    Does the scan tool display; B197F-12-POWER LIFTGATE LATCH CONTROL 1 - CIRCUIT SHORT TO BATTERY?

    Yes

    - Go To 2

    No

    - Using the wiring diagram/schematic as a guide, inspect the wiring and connectors for an intermittent condition. Operate the liftgate several times and check for any binding conditions in the latch assembly.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **POWER LIFTGATE MODULE**

Fig. 96: Checking Power Liftgate Module
Courtesy of CHRYSLER GROUP, LLC

1. Cycle the ignition off.
2. Disconnect the Power Liftgate Module C2 harness connector.
3. Cycle the ignition on.
4. Measure the voltage of the (Q84) Liftgate Latch Cinch Driver circuit.

   Is there any voltage present?

   Yes

   - Go To 3

   No

- Replace the Power Liftgate Module in accordance with the service information. Refer to **MODULE, POWER LIFTGATE CONTROL, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **(Q84) LIFTGATE LATCH CINCH DRIVER CIRCUIT SHORTED TO VOLTAGE**

Fig. 97: Checking Power Liftgate Module
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Power Liftgate Latch harness connector.
2. Measure the voltage of the (Q84) Liftgate Latch Cinch Driver circuit.

   Is there any voltage present?

   Yes

   - Repair the (Q84) Liftgate Latch Cinch Driver circuit for a short to voltage.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Repair the (Q85) Liftgate Latch Release Driver circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B197F-13-POWER LIFTGATE LATCH CONTROL 1 - CIRCUIT OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 98: Power Liftgate Right Pinch Sensor Signal, Sector Switch Sense, Secondary Position Latch Sense, Driver & Ground Circuit Diagram

Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

Anytime the Power Liftgate is performing a power cinching or releasing operation.

SET CONDITION

When the power liftgate latch motor control circuit voltage is below the low voltage threshold.

POSSIBLE CAUSES

Possible Causes
(Q84) LIFTGATE LATCH CINCH DRIVER CIRCUIT OPEN
(Q85) LIFTGATE LATCH RELEASE DRIVER CIRCUIT OPEN
POWER LIFTGATE LATCH
POWER LIFTGATE MODULE

DIAGNOSTIC TEST

1. **DTC PRESENT**
    1. With the scan tool, record and erase DTCs.
    2. Cycle the ignition off, wait 10 seconds, then cycle the ignition on.
    3. Operate the power liftgate several times if possible.
    4. With the scan tool, read the active DTCs.

    Does the scan tool display; B197F-13-POWER LIFTGATE LATCH CONTROL 1 - CIRCUIT OPEN?

    Yes

    - Go To 2

    No

    - Using the wiring diagram/schematic as a guide, inspect the wiring and connectors for an intermittent condition. Operate the liftgate several times and check for any binding conditions in the latch assembly.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **LIFTGATE LATCH CIRCUIT OPEN**

Fig. 99: Checking Liftgate Latch Circuit For Open
Courtesy of CHRYSLER GROUP, LLC

1. Cycle the ignition off.
2. Disconnect the Power Liftgate Module C2 harness connector.
3. Measure the resistance between the (Q84) Liftgate Latch Cinch Driver circuit and the (Q85) Liftgate Latch Release Driver circuit.

   Is the resistance approximately 4.0 Ohms?

   Yes

   - Replace the Power Liftgate Module in accordance with the service information. Refer to **MODULE, POWER LIFTGATE CONTROL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

- Go To 3

3. **(Q84) LIFTGATE LATCH CINCH DRIVER CIRCUIT OPEN**

LATCH-
DOOR-
LIFTGATE
(POWER LIFTGATE)

MODULE-
POWER
LIFTGATE C2

Fig. 100: Checking Liftgate Latch Cinch Driver Circuit For Open
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Power Liftgate Latch harness connector.
2. Measure the resistance of the (Q84) Liftgate Latch Cinch Driver circuit between the Power Liftgate Module C2 harness connector and the Power Liftgate Latch harness connector.

   Is the resistance below 2.0 Ohms?

   Yes

   - Go To 4

   No

   - Repair the (Q84) Liftgate Latch Cinch Driver circuit for an open.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **(Q85) LIFTGATE LATCH RELEASE DRIVER CIRCUIT OPEN**

LATCH-
DOOR-
LIFTGATE
(POWER LIFTGATE)

MODULE-
POWER
LIFTGATE C2

Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (Q85) Liftgate Latch Release Driver circuit between the Power Liftgate Module C2 harness connector and the Power Liftgate Latch harness connector.

   Is the resistance below 2.0 Ohms?

   Yes

   - Replace the Power Liftgate Latch assembly in accordance with the Service Information and using the scan tool, run the "Latch Home Sector Test". Refer to **LATCH, LIFTGATE, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Repair the (Q85) Liftgate Latch Release Driver circuit for an open.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B2199-16-BATTERY VOLTAGE CIRCUIT VOLTAGE BELOW THRESHOLD

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 102: PLGM CAN IHS, Fused B+ & Ground Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

At all times.

SET CONDITION

Whenever the liftgate is activated, if the voltage is below 10.5 volts, within 15 seconds prior to power operation, this code will set.

POSSIBLE CAUSES

POSSIBLE CAUSES
PCM LOW VOLTAGE DTC (A111) FUSED B+ CIRCUIT OPEN OR HIGH RESISTANCE (Z923) GROUND CIRCUIT OPEN OR HIGH RESISTANCE POWER LIFTGATE MODULE

DIAGNOSTIC TEST

1. **CHECK FOR PCM DTCS**

   NOTE: Make sure the battery is fully charged and serviceable before proceeding.

   1. With the scan tool, read the PCM DTCs

      Are there any PCM Battery or Charging System DTCs present?

      Yes

      - Refer to the appropriate Testing & Diagnostics article under ENGINE PERFORMANCE and perform the appropriate Diagnostic Procedure. Also refer to the **DTC INDEX** article.

      No

      - Go To 2.
2. **TEST FOR INTERMITTENT CONDITION**
   1. With the scan tool, record and erase the DTCs.
   2. Start the engine and run for two minutes.
   3. With the scan tool, read Power Liftgate Module Active DTCs.

      Does the scan tool display; B2199-16-BATTERY VOLTAGE - CIRCUIT VOLTAGE BELOW THRESHOLD?

      Yes

      - Go To 3

      No

      - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and poor pin fit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
3. **CHECK THE (A111) FUSED B(+) CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**

Fig. 103: Checking Fused B(+) Circuit For An Open Or High Resistance
Courtesy of CHRYSLER GROUP, LLC

1. Cycle the ignition off.
2. Disconnect the Power Liftgate Module C2 harness connector.
3. Start the engine.
4. Measure the voltage between ground and the (A111) Fused B(+) circuit in the Power Liftgate C2 connector.
5. Compare the voltage read at the PLG C2 connector with a direct connection at the battery.

   Is the voltage at the PLG C2 connector within 0.5 of a volt of the battery voltage?

   Yes

   - Go To 4

No

- Repair the (A111) Fused B(+) circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK THE (Z923) GROUND CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**

Fig. 104: Checking Ground Circuit For An Open Or High Resistance
Courtesy of CHRYSLER GROUP, LLC

1. Cycle the ignition off.
2. Using a 12 volt test light, connect one end to the (A111) Fused B(+) circuit and the other end to the (Z923) Ground in the Liftgate C2 harness connector.

NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery

Does the test tight illuminate brightly?

Yes

- Replace the Power Liftgate Module in accordance with the Service Information. Refer to **MODULE, POWER LIFTGATE CONTROL, REMOVAL** .
- Perform BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Repair the (Z923) Ground circuit for an open or high resistance.
- Perform BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B2199-17-BATTERY VOLTAGE - CIRCUIT VOLTAGE ABOVE THRESHOLD

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 105: PLGM CAN IHS, Fused B+ & Ground Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

At all times.

SET CONDITION

Anytime the Power Liftgate is activated and the module senses voltage input above 16.0 volts, this code will set.

POSSIBLE CAUSES

POSSIBLE CAUSES
HIGH VOLTAGE POWERTRAIN CONTROL MODULE DTC POWER LIFTGATE MODULE

DIAGNOSTIC TEST

1. **CHECK ENGINE DTCs**
   1. With the scan tool, read PCM DTCs.

      Are there any Battery or Charging System DTCs present?

      Yes

      - Refer to the appropriate Testing & Diagnostics article under ENGINE PERFORMANCE and perform the applicable Diagnostic Procedure. Also refer to the **DTC INDEX** article.

      No

      - Go To 2
2. **TEST FOR INTERMITTENT CONDITION**
   1. With the scan tool, record and erase the DTCs.
   2. Start the engine and run for two minutes.
   3. With the scan tool, read the Active PLG DTCs.

      Does the scan tool display; B2199-17-BATTERY VOLTAGE - CIRCUIT VOLTAGE ABOVE THRESHOLD?

      Yes

      - Replace the Power Liftgate Module in accordance with service information. Refer to **MODULE, POWER LIFTGATE CONTROL, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B21DD-16-SYSTEM VOLTAGE - CIRCUIT VOLTAGE BELOW THRESHOLD

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 106: PLGM CAN IHS, Fused B+ & Ground Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

Anytime the power liftgate module is awake

SET CONDITION

The Power Liftgate Module senses the input voltage is below 10.5 volts.

POSSIBLE CAUSES

Possible Causes

BATTERY OR VEHICLE CHARGING SYSTEM
LOW SYSTEM VOLTAGE

DIAGNOSTIC TEST

CHECK FOR ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)

1. Check the ignition on.
2. With the scan tool, read the ENGINE DTCs.

   Are there any ENGINE Charging or Battery DTCs present?

   Yes

   - Perform the appropriate charging system or battery diagnostic procedure. Refer to the appropriate Testing & Diagnostics article under ENGINE PERFORMANCE. Also refer to the **DTC INDEX** article.

   No

   - This code is for information only. At some time there was a low battery system voltage. Check the battery and charging system in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B21DD-17-SYSTEM VOLTAGE - CIRCUIT VOLTAGE ABOVE THRESHOLD

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 107: PLGM CAN IHS, Fused B+ & Ground Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

Anytime the Power Liftgate Module is awake.

SET CONDITION

The Power Liftgate Module senses that the system voltage was above 16 volts.

POSSIBLE CAUSES

Possible Causes

VEHICLE CHARGING SYSTEM HIGH BATTERY SYSTEM VOLTAGE

DIAGNOSTIC TEST

CHECK FOR ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)

1. Cycle the ignition on.
2. Using the scan tool, read the Engine DTCs.

   Are there any ENGINE Charging or Battery DTCs present?

   Yes

   - Refer to the appropriate Testing & Diagnostics article under ENGINE PERFORMANCE and perform the appropriate diagnostic procedure. Also refer to the **DTC INDEX** article.

   No

   - This code is a CAN system message for information only. At some time the battery system was over 18.4 volts. Check the charging system and system grounds in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B224E-00-POWER LIFTGATE MODULE INTERNAL

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Whenever the battery is connected.

SET CONDITION

When the module senses an internal problem, this code will set.

POSSIBLE CAUSES

Possible Causes
TROUBLE CODE PRESENT POWER LIFTGATE MODULE

DIAGNOSTIC TEST

DTC PRESENT

1. With the scan tool, record and erase the DTCs.
2. Cycle the ignition switch from On to Off.
3. Wait 30 seconds.
4. Turn the ignition on.
5. With the scan tool, read the Active DTCs.

   Does the scan tool display; B224E-00 POWER LIFTGATE MODULE INTERNAL?

   No

   - Operate the power liftgate open and closed several times. With the scan tool, read the DTCs. If this code appears, replace the Power Liftgate Module in accordance with the Service Information. Refer to **MODULE, POWER LIFTGATE CONTROL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   Yes

   - Replace the Power Liftgate Module in accordance with the Service Information. Refer to **MODULE, POWER LIFTGATE CONTROL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B25B7-00-POWER LIFTGATE CLOSE DIRECTION - RATCHET PRIMARY SWITCH INVALID STATE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Whenever the power liftgate in performing a power close operation.

SET CONDITION

The ratchet primary (Ajar) switch is detected as open before the power cinching operation is started.

POSSIBLE CAUSES

Possible Causes
BINDING LIFTGATE
(Q901) LOGIC GROUND CIRCUIT OPEN
(G78) LIFTGATE AJAR SWITCH SENSE CIRCUIT OPEN
POWER LIFTGATE LATCH
POWER LIFTGATE MODULE

DIAGNOSTIC TEST

1. **DTC PRESENT**

NOTE: This DTC will only set during the cinching operation after the four second time out. This may make it difficult to reproduce.

1. With the scan tool, record and erase the DTCs.
2. Turn the ignition off, wait 10 seconds, then turn the ignition on.
3. Operate the power liftgate several times if possible.
4. With the scan tool, read the Active DTCs.

Does the scan tool display; B25B7-00 - POWER LIFTGATE CLOSE DIRECTION - RATCHET PRIMARY SWITCH INVALID STATE?

Yes

- Go To 2

No

- Using the wiring diagram/schematic as a guide, inspect the wiring and connectors for an intermittent condition. Operate the door several times and check for any binding or other obstructions.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **BINDING LIFTGATE**

1. Examine the liftgate for proper fit and alignment, loose/hard or torn seals, misaligned latch striker or anything that would cause an obstruction to proper operation.
2. Manually operate the liftgate of a known good vehicle and notice the effort needed to open and close.
3. Compare the effort needed on the disabled liftgate.
4. Especially notice the effort needed to unlatch and close the liftgate.

Does it take more effort to operate the liftgate than it should?

Yes

- Refer to the Service information for the related symptom(s). Refer to **STANDARD PROCEDURE** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 3

3. **POWER LIFTGATE MODULE**

1. With the scan tool, monitor the PRIMARY RATCHET SWITCH.
2. Using a screwdriver, click the latch to the second detent while observing the scan tool.
3. Unlatch the latch by pressing the handle switch and observe the scan tool for a change of state.
4. Repeat this step several times while moving the liftgate in different positions and wiggling the harness to check for an intermittent open or shorted circuit.

   Did the scan tool show the switch state changing correctly every time?

   Yes

   - Go To 4

   No

   - Replace the Power Liftgate Module in accordance with the service information. Refer to **MODULE, POWER LIFTGATE CONTROL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK THE (Q901) LOGIC GROUND CIRCUIT FOR AN OPEN**

Fig. 108: Checking Logic Ground Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Power Liftgate Latch harness connector.
3. Measure the resistance between ground and the (Q901) Logic Ground circuit.
4. Wiggle the harness while observing the ohmmeter.

   Is the resistance below 9.5 Ohms?

   Yes

   - Go To 5

No

- Repair the (Q901) Logic Ground circuit for an open.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **(G78) LIFTGATE AJAR SWITCH SENSE CIRCUIT OPEN**

LIFTGATE C2

Fig. 109: Checking Liftgate Ajar Switch Sense Circuit For An Open Or High Resistance
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Power Liftgate Module C2 harness connector.
2. Measure the resistance of the (G78) Liftgate Ajar Switch Sense circuit between the Power Liftgate C2 connector and the Power Liftgate Latch connector.
3. Wiggle the harness while observing the ohmmeter.

   Is the resistance below 1.0 Ohms?

   Yes

   - Replace the Power Liftgate Latch assembly in accordance with the Service Information and using the scan tool, run the "Latch Home Sector Test". Refer to **LATCH, LIFTGATE, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Repair the (G78) Liftgate Ajar Switch Sense circuit for an open.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B25B8-00-POWER LIFTGATE OPEN DIRECTION - RATCHET SECONDARY SWITCH INVALID STATE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Whenever the power liftgate is performing an opening operation.

SET CONDITION

The ratchet secondary switch is still detected as open after 10% of liftgate travel during an opening operation.

POSSIBLE CAUSES

Possible Causes
BINDING LIFTGATE
(Q901) LOGIC GROUND CIRCUIT OPEN
(Q76) LATCH SECONDARY POSITION SENSE CIRCUIT OPEN
(Q76) LATCH SECONDARY POSITION SENSE CIRCUIT SHORTED TO VOLTAGE
POWER LIFTGATE LATCH
POWER LIFTGATE MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to COMMUNICATION PRE-DIAGNOSTIC PROCEDURE .

DIAGNOSTIC TEST

1. **DTC PRESENT**

   NOTE: This DTC will only set during the releasing operation after the four second time out. This may make it difficult to reproduce.

   1. With the scan tool, record and erase DTCs.
   2. Turn the ignition off, wait 10 seconds, then turn the ignition on.
   3. Operate the power liftgate several times if possible.
   4. With the scan tool, read ACTIVE DTCs.

      Does the scan tool display; B25B8-00 - POWER LIFTGATE OPEN DIRECTION - RATCHET SECONDARY SWITCH INVALID STATE?

      Yes

      - Go To 2

      No

      - Using the wiring diagram/schematic as a guide, inspect the wiring and connectors for an intermittent condition. Operate the door several times and check for any binding or other obstructions.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **BINDING LIFTGATE**
   1. Examine the liftgate for proper fit and alignment, loose/hard or torn seals, misaligned latch striker or anything that would cause an obstruction to proper operation.
   2. Manually operate the liftgate of a known good vehicle and notice the effort needed to open and close.
   3. Compare the effort needed on the disabled liftgate.
   4. Especially notice the effort needed to unlatch and close the liftgate.

      Does it take more effort to operate the liftgate than it should?

      Yes

      - Refer to the Service information for the related symptom(s). Refer to **STANDARD PROCEDURE** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 3

3. **POWER LIFTGATE MODULE**
   1. With the scan tool, monitor the SECONDARY RATCHET SWITCH CLOSED.
   2. Using a screwdriver, click the latch to the first detent while observing the scan tool.
   3. Unlatch the latch by pressing the handle switch and observe the scan tool for a change of state.
   4. Repeat this step several times while moving the liftgate in different positions and wiggling the harness to check for an intermittent open or shorted circuit.

   Did the scan tool show the switch state changing correctly every time?

   No

   - Go To 4

   Yes

   - Replace the Power Liftgate Module in accordance with the service information. Refer to **MODULE, POWER LIFTGATE CONTROL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
4. **CHECK THE (Q901) LOGIC GROUND CIRCUIT FOR AN OPEN**

Fig. 110: Checking Logic Ground Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Power Liftgate Latch harness connector.
3. Measure the resistance between ground and the (Q901) Logic Ground circuit.
4. Wiggle the harness while observing the ohmmeter.

   Is the resistance below 9.5 Ohms?

   Yes

   - Go To 5

No

- Repair the (Q901) Logic Ground circuit for an open.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **CHECK THE (Q76) LATCH SECONDARY POSITION SENSE CIRCUIT OPEN**

Fig. 111: Checking Latch Secondary Position Sense Circuit For Open
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Power Liftgate Module C2 harness connector.
2. Measure the resistance of the (Q76) Latch Secondary Position Sense between the Power Liftgate Module C2 connector and the Power Liftgate Latch connector.
3. Wiggle the harness while observing the ohmmeter.

   Is the resistance below 1.0 Ohm?

   No

   - Repair the (Q76) Latch Secondary Position Sense circuit for an open.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   Yes

   - Go To 6

6. **(Q76) LATCH SECONDARY POSITION SENSE CIRCUIT SHORTED TO VOLTAGE**

Fig. 112: Checking Latch Secondary Position Sense Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition on.
2. Measure the voltage of the (Q76) Latch Secondary Position Sense circuit.
3. Wiggle the harness while observing the voltmeter.

   Is there any voltage present?

   No

   - Replace the Power Liftgate Latch assembly in accordance with the Service Information and using the scan tool, run the "Latch Home Sector Test". Refer to **LATCH, LIFTGATE, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

Yes

- Repair the (Q76) Latch Secondary Position Sense circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B25B9-00-POWER LIFTGATE CLOSE DIRECTION - RATCHET SECONDARY SWITCH INVALID STATE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Whenever the power liftgate is performing a closing operation.

SET CONDITION

The ratchet secondary switch is detected as open to early in the power close operation.

POSSIBLE CAUSES

Possible Causes
BINDING LIFTGATE
(Q901) LOGIC GROUND CIRCUIT OPEN
(Q76) LATCH SECONDARY POSITION SENSE CIRCUIT OPEN
(Q76) LATCH SECONDARY POSITION SENSE CIRCUIT SHORTED TO VOLTAGE
POWER LIFTGATE LATCH
POWER LIFTGATE MODULE

DIAGNOSTIC TEST

1. **DTC PRESENT**

NOTE: This DTC will only set during the releasing operation after the four second time out. This may make it difficult to reproduce.

1. With the scan tool, record and erase DTCs.
2. Turn the ignition off, wait 10 seconds, then turn the ignition on.
3. Operate the power liftgate several times if possible.
4. With the scan tool, read ACTIVE DTCs.

   Does the scan tool display; B25B9-00 POWER LIFTGATE CLOSE DIRECTION - RATCHET SECONDARY SWITCH INVALID STATE?

   Yes

- Go To 2

No

- Using the wiring diagram/schematic as a guide, inspect the wiring and connectors for an intermittent condition. Operate the door several times and check for any binding or other obstructions.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **BINDING LIFTGATE**
   1. Examine the liftgate for proper fit and alignment, loose/hard or torn seals, misaligned latch striker or anything that would cause an obstruction to proper operation.
   2. Manually operate the liftgate of a known good vehicle and notice the effort needed to open and close.
   3. Compare the effort needed on the disabled liftgate.
   4. Especially notice the effort needed to unlatch and close the liftgate.

   Does it take more effort to operate the liftgate than it should?

   Yes

   - Refer to the Service information for the related symptom(s). Refer to **STANDARD PROCEDURE** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 3
3. **POWER LIFTGATE MODULE**
   1. With the scan tool, monitor the SECONDARY RATCHET SWITCH CLOSED.
   2. Using a screwdriver, click the latch to the first detent while observing the scan tool.
   3. Unlatch the latch by pressing the handle switch and observe the scan tool for a change of state.
   4. Repeat this step several times while moving the liftgate in different positions and wiggling the harness to check for an intermittent open or shorted circuit.

   Did the scan tool show the switch state changing correctly every time?

   No

   - Go To 4

   Yes

   - Replace the Power Liftgate Module in accordance with the service information.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK THE (Q901) LOGIC GROUND CIRCUIT FOR AN OPEN**

Fig. 113: Checking Logic Ground Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Power Liftgate Latch harness connector.
3. Measure the resistance between ground and the (Q901) Logic Ground circuit.
4. Wiggle the harness while observing the ohmmeter.

   Is the resistance below 9.5 Ohms?

   Yes

- Go To 5

No

- Repair the (Q901) Logic Ground circuit for an open.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **CHECK THE (Q76) LATCH SECONDARY POSITION SENSE CIRCUIT FOR AN OPEN**

Fig. 114: Checking Latch Secondary Position Sense Circuit For Open
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Power Liftgate Module C2 harness connector.
2. Measure the resistance of the (Q76) Latch Secondary Position Sense between the Power Liftgate Module C2 connector and the Power Liftgate Latch connector.
3. Wiggle the harness while observing the ohmmeter.

   Is the resistance below 1.0 Ohm?

   No

   - Repair the (Q76) Latch Secondary Position Sense circuit for an open.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   Yes

   - Go To 6

6. **CHECK THE (Q76) LATCH SECONDARY POSITION SENSE CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 115: Checking Latch Secondary Position Sense Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition on.
2. Measure the voltage of the (Q76) Latch Secondary Position Sense circuit.
3. Wiggle the harness while observing the voltmeter.

   Is there any voltage present?

   No

   - Replace the Power Liftgate Latch assembly in accordance with the Service Information and using the scan tool, run the "Latch Home Sector Test".
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   Yes

- Repair the (Q76) Latch Secondary Position Sense circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B25BA-00-POWER LIFTGATE OPEN DIRECTION - SECTOR SWITCH INVALID STATE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Whenever the power liftgate is performing a power open operation.

SET CONDITION

The Sector switch was NOT detected in the home / normal position, prior to an opening operation.

POSSIBLE CAUSES

Possible Causes
BINDING LIFTGATE
LATCH NOT IN HOME POSITION
(Q901) LOGIC GROUND CIRCUIT OPEN
(Q79) SECTOR SWITCH SENSE CIRCUIT OPEN
(Q79) SECTOR SWITCH SENSE CIRCUIT SHORTED TO VOLTAGE
(Q79) SECTOR SWITCH SENSE CIRCUIT SHORTED TO GROUND
POWER LIFTGATE LATCH
POWER LIFTGATE MODULE

DIAGNOSTIC TEST

1. **CHECK FOR DTCS**

NOTE: This DTC will only set during the power open operation.

1. With the scan tool, record and erase DTCs.
2. Turn the ignition off, wait 10 seconds, then turn the ignition on.
3. Operate the power liftgate several times if possible.
4. With the scan tool, read Active DTCs.

Does the scan tool display; B25BA-00 - POWER LIFTGATE OPEN DIRECTION - SECTOR SWITCH INVALID STATE?

Yes

- Go To 2

No

- Using the wiring diagram/schematic as a guide, inspect the wiring and connectors for an intermittent condition. Operate the door several times and check for any binding or other obstructions.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **BINDING LIFTGATE**
   1. Examine the liftgate for proper fit and alignment, loose/hard or torn seals, misaligned latch striker or anything that would cause an obstruction to proper operation.
   2. Manually operate the liftgate of a known good vehicle and notice the effort needed to open and close.
   3. Compare the effort needed on the disabled liftgate.
   4. Especially notice the effort needed to unlatch and close the liftgate.

   Does it take more effort to operate the liftgate than it should?

   Yes

   - Refer to the Service information for the related symptom(s). Refer to **STANDARD PROCEDURE** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 3

3. **LATCH HOME POSITION**
   1. With the scan tool in Inputs/Outputs, read the "Sector Gear Switch Closed" state.

   Does the scan tool display; YES?

   Yes

   - Go To 9

   No

   - Go To 4

4. **POWER LIFTGATE LATCH**

Fig. 116: Power Liftgate Latch Connector End View
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Power Liftgate Latch harness connector.
2. With the scan tool, monitor the Sector Gear Switch Closed state.
3. Connect a jumper wire between the (Q79) Sector Switch Sense circuit and the (Q901) Sensor Ground circuit.
4. Repeat the previous step several times by disconnecting and connecting the jumper while observing the scan tool.

   Did the scan tool show the switch state changing correctly every time the jumper was connected and disconnected?

Yes

- Replace the Power Liftgate Latch in accordance with the service information and using the scan tool, run the "Latch Home Sector Test". Refer to **LATCH, LIFTGATE, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 5

5. **CHECK THE (Q901) LOGIC GROUND CIRCUIT FOR AN OPEN**

Fig. 117: Checking Logic Ground Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.

2. Turn all lights off.
3. Measure the resistance between ground and the (Q901) Logic Ground circuit.
4. Wiggle the harness while observing the ohmmeter.

   Is the resistance below 9.5 Ohms?

   Yes

   - Go To 6

   No

   - Repair the (Q901) Logic Ground circuit for an open.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

6. **CHECK THE (Q79) SECTOR SWITCH SENSE CIRCUIT FOR A SHORT TO GROUND**

Fig. 118: Checking Sector Switch Sense Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (Q901) Logic Ground circuit and the (Q79) Sector Switch Sense circuit.
2. Wiggle the harness while observing the ohmmeter.

   Is the resistance below 100.0 Ohms?

   Yes

   - Go To 11

   No

- Go To7

7. **CHECK THE (Q79) SECTOR SWITCH SENSE CIRCUIT FOR AN OPEN**

LIFTGATE C2

Fig. 119: Checking Sector Switch Sense Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Power Liftgate Module C2 harness connector.
2. Measure the resistance of the (Q79) Sector Switch Sense circuit between the Power Liftgate C2 harness connector and the Power Liftgate Latch harness connector.
3. Wiggle the harness while observing the ohmmeter.

   Is the resistance below 1.0 Ohm?

   No

   - Repair the (Q79) Sector Switch Sense circuit for an open.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   Yes

   - Go To 8

8. **CHECK THE (Q79) SECTOR SWITCH SENSE CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 120: Checking Sector Switch Sense Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition on.
2. Measure the voltage of the (Q79) Sector Switch Sense circuit.
3. Wiggle the harness while observing the voltmeter.

   Is there any voltage present?

   No

   - Replace the Power Liftgate Module in accordance with the service information. Refer to **MODULE, POWER LIFTGATE CONTROL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

Yes

- Repair the (Q79) Sector Switch Sense circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

9. **ADJUST LATCH TO HOME POSITION**
   1. With the scan tool run the "Latch Home Sector Test".

      NOTE: This test will try to adjust the sector gear to the Home Position.

   2. With the scan tool in Inputs/Outputs, read the "Sector Gear Switch Closed" state.

      Does the scan tool display: NO?

      Yes

      - Repair is complete. The latch was not in the Home position.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 10

10. **CHECK THE (Q79) SECTOR SWITCH SENSE CIRCUIT FOR A SHORT TO THE (Q901) LOGIC GROUND CIRCUIT**

Fig. 121: Checking Sector Switch Sense Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Power Liftgate Latch harness connector.
2. Measure the resistance between the (Q901) Logic Ground circuit and the (Q79) Sector Switch Sense circuit.
3. Wiggle the harness while observing the ohmmeter.

   Is the resistance below 1, 000 Ohms?

   Yes

   - Go To 11

   No

- Replace the Power Liftgate Latch assembly in accordance with the Service Information and using the scan tool, run the "Latch Home Sector Test". Refer to **LATCH, LIFTGATE, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

11. **CHECK THE (Q79) SECTOR SWITCH SENSE CIRCUIT FOR A SHORT TO GROUND**

Fig. 122: Checking Sector Switch Sense Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Power Liftgate Module C2 harness connector.
2. Measure the resistance between ground and the (Q79) Sector Switch Sense circuit.

3. Wiggle the harness while observing the ohmmeter.

   Is the resistance below 1, 000 Ohms?

   Yes

   - Repair the (Q79) Sector Switch Sense circuit for a short to ground.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the Power Liftgate Module in accordance with the service information. Refer to **MODULE, POWER LIFTGATE CONTROL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B25BB-00-POWER LIFTGATE CLOSE DIRECTION - SECTOR SWITCH INVALID STATE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Whenever the Power Liftgate is performing a closing operation.

SET CONDITION

The Sector switch was NOT detected in the home / normal - Full OPEN position, prior to a closing operation.

POSSIBLE CAUSES

Possible Causes
BINDING LIFTGATE
LATCH NOT IN HOME POSITION
(Q901) LOGIC GROUND CIRCUIT OPEN
(Q79) SECTOR SWITCH SENSE CIRCUIT OPEN
(Q79) SECTOR SWITCH SENSE CIRCUIT SHORTED TO VOLTAGE
(Q79) SECTOR SWITCH SENSE CIRCUIT SHORTED TO GROUND
POWER LIFTGATE LATCH
POWER LIFTGATE MODULE

DIAGNOSTIC TEST

1. **DTC PRESENT**
   1. With the scan tool, record and erase DTCs.
   2. Turn the ignition off, wait 10 seconds, then turn the ignition on.

3. Operate the power liftgate several times if possible.
4. With the scan tool, read the Active DTCs.

   Does the scan tool display; B1978-00-POWER LIFTGATE CLOSING OPERATION - SECTOR SWITCH PERFORMANCE?

   Yes

   - Go To 2

   No

   - Using the wiring diagram/schematic as a guide, inspect the wiring and connectors for an intermittent condition. Operate the door several times and check for any binding or other obstructions.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **BINDING LIFTGATE**
   1. Examine the liftgate for proper fit and alignment, loose/hard or torn seals, misaligned latch striker or anything that would cause an obstruction to proper operation.
   2. Manually operate the liftgate of a known good vehicle and notice the effort needed to open and close.
   3. Compare the effort needed on the disabled liftgate.
   4. Especially notice the effort needed to unlatch and close the liftgate.

      Does it take more effort to operate the liftgate than it should?

      Yes

      - Refer to the Service information for the related symptom(s). Refer to **STANDARD PROCEDURE** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 3

3. **LATCH HOME POSITION**
   1. Make sure the liftgate is closed.
   2. With the scan tool in Inputs/Outputs, read the "Sector Gear Switch Closed" state.

      Does the scan tool display; YES?

      Yes

- Go To 9

No

- Go To 4

4. **POWER LIFTGATE LATCH**

Fig. 123: Power Liftgate Latch Connector End View
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Power Liftgate Latch harness connector.
2. With the scan tool, monitor the Sector Gear Switch Closed.

3. Connect a jumper wire between the (Q79) Sector Switch Sense circuit and the (Q901) Logic Ground circuit.
4. Repeat the previous step several times by disconnecting and connecting the jumper while observing the scan tool.

   Did the scan tool show the switch state changing correctly every time the jumper was connected and disconnected?

   Yes

   - Replace the Power Liftgate Latch in accordance with the service information and using the scan tool, run the power liftgate "Latch Home Sector Test" procedure. Refer to **LATCH, LIFTGATE, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 5

5. **CHECK THE (Q901) LOGIC GROUND CIRCUIT FOR AN OPEN**

Fig. 124: Checking Logic Ground Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Turn all lights off.
3. Measure the resistance between ground and the (Q901) Logic Ground circuit.
4. Wiggle the harness while observing the ohmmeter.

   Is the resistance below 9.5 Ohms?

   Yes

   - Go To 5

No

- Repair the (Q901) Logic Ground circuit for an open.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

6. **CHECK THE (Q79) SECTOR SWITCH SENSE CIRCUIT FOR A SHORT TO GROUND**

Fig. 125: Checking Sector Switch Sense Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (Q901) Sensor Ground circuit and the (Q79) Sector Switch Sense circuit in the Liftgate Latch connector.
2. Wiggle the harness while observing the ohmmeter.

   Is the resistance below 100.0 Ohms?

Yes

- Go To 7

No

- Go To 11

7. **CHECK THE (Q79) SECTOR SWITCH SENSE CIRCUIT FOR AN OPEN**

1. Disconnect the Power Liftgate Module C2 harness connector.
2. Measure the resistance of the (Q79) Sector Switch Sense circuit between the Power Liftgate C2 harness connector and the Power Liftgate Latch harness connector.
3. Wiggle the harness while observing the ohmmeter.

   Is the resistance below 1.0 Ohm?

   Yes

   - Go To 8

   No

   - Repair the (Q79) Sector Switch Sense circuit for an open.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

8. **CHECK THE (Q79) SECTOR SWITCH SENSE CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 127: Checking Sector Switch Sense Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition on.
2. Measure the voltage of the (Q79) Sector Switch Sense circuit.
3. Wiggle the harness while observing the voltmeter.

   Is there any voltage present?

   Yes

   - Repair the (Q79) Sector Switch Sense circuit for a short to voltage.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

- Replace the Power Liftgate Module in accordance with service information. Refer to **MODULE, POWER LIFTGATE CONTROL, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

9. **ADJUST LATCH TO HOME POSITION**
   1. With the scan tool run the "Latch Home Sector Test".

      NOTE: This test will try to adjust the sector gear to the Home Position.

   2. With the scan tool in Inputs/Outputs, read the "Sector Gear Switch Closed" state.

      Does the scan tool display: NO?

      Yes

      - Repair complete. The latch was not in the Home position.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 10

10. **CHECK THE (Q79) SECTOR SWITCH SENSE CIRCUIT FOR A SHORT TO THE (Q901) LOGIC GROUND CIRCUIT**

Fig. 128: Checking Sector Switch Sense Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Power Liftgate Latch harness connector.
2. Measure the resistance between the (Q901) Logic Ground circuit and the (Q79) Sector Switch Sense circuit in the Power Liftgate Latch connector.
3. Wiggle the harness while observing the ohmmeter.

   Is the resistance below 1000.0 Ohms?

   Yes

   - Go To 11

   No

- Replace the Power Liftgate Latch assembly in accordance with the Service Information and using the scan tool, run the power liftgate "Latch Home Sector Test" procedure. Refer to **LATCH, LIFTGATE, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

11. **CHECK THE (Q79) SECTOR SWITCH SENSE CIRCUIT FOR A SHORT TO GROUND**

Fig. 129: Checking Sector Switch Sense Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Power Liftgate Module C2 harness connector.
2. Measure the resistance between ground and the (Q79) Sector Switch Sense circuit.

3. Wiggle the harness while observing the ohmmeter.

   Is the resistance below 1K Ohms?

   Yes

   - Repair the (Q79) Sector Switch Sense wire for a short to ground.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the Power Liftgate Module in accordance with service information. Refer to **MODULE, POWER LIFTGATE CONTROL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U0010-00-CAN INTERIOR BUS

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

The Integrated Center Stack (ICS) detects that the CAN IHS Bus has been off for more than five seconds when activity was expected.

POSSIBLE CAUSES

Possible Causes
CAN IHS BUS (125K) (+) CIRCUIT SHORTED TO GROUND
CAN IHS BUS (125K) (-) CIRCUIT SHORTED TO VOLTAGE
CAN IHS BUS (125K) (+) CIRCUIT SHORTED TO THE CAN IHS BUS (125K) (-) CIRCUIT
ANY CAN IHS BUS MODULE
INTEGRATED CENTER STACK (ICS)

DIAGNOSTIC TEST

VERIFY IF THE DTC IS ACTIVE

1. Cycle the ignition on.
2. With the scan tool, read the active DTCs.

   Does the scan tool display this DTC as Active?

Yes

- Refer to the **DTC INDEX** article and perform the U0010-00 CAN INTERIOR BUS diagnostic procedure.

No

- Refer to **DIAGNOSIS AND TESTING** and perform the STORED LOST COMMUNICATION DTCs diagnostic procedure.

U0011-00-CAN INTERIOR BUS OFF PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

The Body Control Module (BCM) detects a short condition in one of the CAN IHS Bus (125K) circuits for less than one second.

POSSIBLE CAUSES

Possible Causes
CAN IHS BUS (125K) (+) CIRCUIT SHORTED TO GROUND
CAN IHS BUS (125K) (-) CIRCUIT SHORTED TO VOLTAGE
CAN IHS BUS (125K) (+) CIRCUIT SHORTED TO THE CAN IHS BUS (125K) (-) CIRCUIT
ANY CAN IHS BUS MODULE
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Turn the ignition on.
    2. With the scan tool, record and erase DTCs.
    3. Cycle the ignition from on to off three times.
    4. Turn the ignition on and wait 10 seconds.
    5. With the scan tool, read active DTCs.

    Does the scan tool display this DTC as active?

    Yes

- Go To 2

No

- Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK THE CAN IHS BUS CIRCUITS FOR THE CAN IHS BUS (125K) MODULES**

NOTE: When performing this step, turn the ignition off (wait one minute) before disconnecting any module. When the module is disconnected turn the ignition on.

NOTE: This step is to determine if the fault is a module or the circuits between the module and the Star Connector.

1. While monitoring the scan tool, disconnect each CAN IHS Bus (125K) module at the Front CAN IHS Star Connector (except for the BCM and DLC), one at a time.
2. Check for this DTC to become stored after disconnecting each CAN IHS Bus (125K) module the vehicle is equipped with.

NOTE: If the DTC becomes stored when a particular module is disconnected, that module or related circuits are causing the DTC to set.

With all the CAN IHS Bus modules disconnected at the Star Connector (except for BCM and DLC), does the scan tool display this DTC as active?

Yes

- Go To 3

No

- Diagnose the wiring and connectors between the Front CAN IHS Star Connector and the module that when disconnected caused this DTC to become stored for damage or shorted circuits. If OK, replace the module that when disconnected caused this DTC to become stored in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE CAN IHS BUS (125K) (-) CIRCUIT FOR A SHORT TO VOLTAGE**
   1. Turn the ignition off.
   2. Disconnect the scan tool.
   3. Disconnect the Front CAN IHS Star Connector for the DLC.

4. Turn the ignition on.
5. Measure the voltage between ground and the CAN IHS Bus (125K) (-) circuit.

   Is there any voltage present?

   Yes

   - Repair the short to voltage in the CAN IHS Bus (-) circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 4

4. **CHECK THE CAN IHS BUS (125K) (+) CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Measure the resistance between ground and the CAN IHS Bus (125K) (+) circuit.

      Is the resistance above 10k Ohms?

      Yes

      - Go To 5

      No

      - Repair the short to ground in the CAN IHS Bus (125K) (+) circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **CHECK FOR A SHORT BETWEEN THE CAN IHS BUS (125K) (+) CIRCUIT AND CAN IHS BUS (125K) (-) CIRCUIT**
   1. Measure the resistance between the CAN IHS Bus (125K) (-) and the CAN IHS Bus (125K) (+) circuits.

      Is the resistance above 10k Ohms?

      Yes

      - Go To 6

      No

      - Repair the short between the CAN IHS Bus (125K) (+) circuit and the CAN IHS Bus (125K) (-) circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

6. **CHECK THE CAN IHS BUS CIRCUITS FOR A BCM CONCERN**
    1. Disconnect the Front CAN IHS Star Connector for the BCM.
    2. Reconnect all other connectors.
    3. Cycle the ignition from on to off three times.
    4. Turn the ignition on and wait 10 seconds.
    5. With the scan tool, read all DTCs.

    Do any modules on the CAN IHS BUS (125K) display this DTC or U0010-00-CAN INTERIOR BUS as active?

    Yes

    - Reconnect all the connectors and retest. If the concern is still present, replace the Star Connector.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

    No

    - Diagnose the wiring and connectors between the Front CAN IHS Star Connector and the BCM. If OK, replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U0140-00-LOST COMMUNICATION WITH BODY CONTROL MODULE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously when the ignition is on.

The battery voltage between 10.0 and 16.0 Volts.

Body Control Module (BCM) is configured correctly.

SET CONDITION

Bus messages not received from the Body Control Module (BCM) for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES

BODY CONTROL MODULE POWER AND GROUND
BCM NOT CONFIGURED CORRECTLY
BODY CONTROL MODULE (BCM)
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

VERIFY DTC IS ACTIVE

1. Cycle the ignition on.
2. With the scan tool, read the active DTCs.

   Does the scan tool display; U0140-00-LOST COMMUNICATION WITH BODY CONTROL MODULE as active?

   Yes

   - Refer to the **DTC INDEX** article and perform the U0140-LOST COMMUNICATION WITH BODY CONTROL MODULE diagnostic procedure.

   No

   - Refer to **DIAGNOSIS AND TESTING** and perform the STORED LOST COMMUNICATION DTCs diagnostic procedure.

U0422-00-IMPLAUSIBLE DATA RECEIVED FROM BODY CONTROL MODULE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on and the vehicle in reverse.

SET CONDITION

Ambient Temperature data not received from the Body Control Module (BCM).

POSSIBLE CAUSES

Possible Causes
NO COMMUNICATION WITH THE BODY CONTROL MODULE (BCM)
DTCS STORED OR ACTIVE IN THE BCM
POWER LIFTGATE MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to

COMMUNICATION PRE-DIAGNOSTIC PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
    1. Cycle the ignition on.
    2. With the scan tool, read Power Liftgate Module DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **VERIFY BCM IS ACTIVE ON THE CAN BUS**
    1. With the scan tool, select ECU View.
    2. Verify that the BCM is active on the bus.

    Is the BCM active on the bus?

    Yes

    - Go To 3

    No

    - Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM BCM diagnostic procedure.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
3. **DTCS STORED OR ACTIVE IN THE BCM**
    1. With the scan tool, read BCM DTCs.

    Are any DTCs active or stored in the BCM?

    Yes

    - Refer to the **DTC INDEX** article and perform the appropriate diagnostic procedure.

No

- Replace and program the Power Liftgate Module in accordance with the Service Information. Refer to **MODULE, POWER LIFTGATE CONTROL, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2014 ACCESSORIES AND EQUIPMENT

Power Locks - Service Information - Cherokee

DESCRIPTION

DESCRIPTION

A power operated door lock system is available factory-installed equipment on this vehicle. The power lock system allows all of the doors to be locked or unlocked electrically. Locking or unlocking the vehicle using the power lock system can be accomplished by up to three different methods:

- **Power Lock System** - Operating a power lock system switch on either front door inside trim panel will lock or unlock the latches of all four doors. Operating the power liftgate switch on the front overhead console will unlatch and open the liftgate. Operating a fuel door release switch on the driver side front door trim panel will unlatch the fuel filler door in the right quarter outside panel.
- **Remote Keyless Entry System** - Depressing the **Lock** or **Unlock** button of the optional Remote Keyless Entry (RKE) system transmitter (also known as the FOB with Integrated Key/FOBIK) can also be used to lock or unlock the latches of the doors. Depressing the **Liftgate Release** button of the RKE transmitter two times will unlatch the liftgate. The specific locks operated and the number of FOBIK button presses required varies depending upon the Customer Programmable settings chosen by the vehicle operator.
- **Passive Entry System** - On vehicles with the optional Passive Entry Keyless Go (PEKG) system, contacting the capacitive **Unlock** switch on the inside of either exterior front door Smart handle pull or depressing the tactile **Lock** button of either front door Smart handle while a valid FOBIK is identified in that same zone can be used to lock or unlock the doors. Also depressing the tactile electronic liftgate handle while a valid FOBIK is identified in that same zone can be used to unlatch the deck lid. The specific locks operated varies depending upon the Customer Programmable settings chosen by the vehicle operator.

Additional details of each of these subsystems and their components can be found in the subheadings and paragraphs that follow.

PASSIVE ENTRY SYSTEM

A Passive Entry Keyless Go (PEKG) system is available factory-installed equipment for this vehicle. The PEKG system allows the vehicle to be unlocked without the use of a mechanical key, as long as an authorized FOB with Integrated Key (FOBIK) is in the possession of the individual or in close proximity to the aperture of the vehicle that is to be unlocked. All other features and Customer Programmable feature settings of the power lock system and the Remote Keyless Entry (RKE) system function the same as they would on vehicles without the PEKG system option.

The PE system includes the following major components, which are described in further detail elsewhere in this service information:

- **Electronic Liftgate Latch Release Switch** - A tactile liftgate release switch is located where you normally would find a mechanical latch mechanism.

- **Door Handle Switches** - Each PE door outside handle (also known as a Smart handle) is equipped with three switches and an Integrated Circuit (IC). A tactile **Lock** switch is located on the outer horizontal surface of each door handle pull, a capacitive **Unlock** switch membrane is located on the inner vertical surface of the handle pull, while a Hall effect switch and an IC are concealed within the handle pull unit.
- **Low Frequency Antennas** - The PE system includes four Low Frequency (LF) antennas, one mounted beneath the front of the center floor console, one on each rear door hardware module carrier concealed behind the inside trim panel, one in front of the left rear seat floor and one concealed behind the rear fascia at the rear of the vehicle.
- **Radio Frequency Hub Module** - The Radio Frequency Hub Module (RFHM) (also known as the RF Hub) is the Passive Entry Keyless Go (PEKG) system control module and RF receiver located in the rear cargo area headliner. Refer to **MODULE, RADIO FREQUENCY (RF HUB), DESCRIPTION** .

Hard wired circuitry connects many of the PE system components to the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the PE system components through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

POWER LOCK SYSTEM

The power lock system includes the following major components, which are described in further detail elsewhere in this service information:

- **Body Control Module** - The Body Control Module (BCM) is located beneath the instrument panel on the driver side of the vehicle. Refer to **MODULE, BODY CONTROL, DESCRIPTION** .
- **Electronic Vehicle Information Center** - The Electronic Vehicle Information Center (EVIC) includes the EVIC switches and the U-Connect Touch™ screen module in the Integrated Center Stack (ICS) located in the center stack area of the instrument panel. Refer to **CENTER, ELECTRONIC VEHICLE INFORMATION, DESCRIPTION** .
- **Fuel Door Release Switch** - A switch in the map pocket on the driver side front door inside trim panel will unlatch the fuel filler door in the right outside quarter panel.
- **Power Lock Motors** - A reversible electric power lock motor is integral to the latch of each front and rear door and the liftgate.
- **Power Lock Switches** - A power lock switch is integral to the switch module located on the forward end of the arm rest of each front door inside trim panel.

These components and their controls are combined to provide the following power lock system central locking and unlocking features:

- **Automatic Door Locking** - Automatic door locking (also known as rolling door locks) automatically locks any unlocked door when the vehicle speed exceeds about 25.7 kilometers per hour (15 miles per hour). This is a Customer Programmable feature.

- **Automatic Door Unlocking** - Automatic door unlocking (also known as automatic unlock doors on exit) automatically unlocks the doors after they were automatically locked when the vehicle speed exceeded about 25.7 kilometers per hour (15 miles per hour), the vehicle speed has returned to zero, the transmission shift lever is in the **Neutral** or **Park** positions and the driver side front door is opened. This is a Customer Programmable feature.
- **Customer Programmable Features** - The vehicle operator interfaces with the BCM, which is the power lock system controller, using the EVIC. EVIC switches allow the vehicle operator to set or change the power lock system Customer Programmable Features through the EVIC display.
- **Door Lock Inhibit** - Prevents locking the doors using a power door lock switch or the **Lock** button of the Remote Keyless Entry (RKE) system transmitter (also known as the FOB with Integrated Key/FOBIK) if the key is in the ignition and the driver side front door is open.
- **Enhanced Accident Response System** - In the event of a vehicle impact that causes airbag deployment but leaves vehicle electrical power intact, the Enhanced Accident Response System (EARS) automatically turns OFF the supply of fuel to the engine, turns ON the interior courtesy lamps, turns ON the hazard warning flashers and unlocks the doors after the vehicle speed has returned to zero. This helps emergency responders in their efforts to render the appropriate assistance. The courtesy lamps and hazard flashers remain ON as long as the battery has power or until the key is removed from the ignition.
- **Illuminated Entry** - Automatic illumination of the interior courtesy lamps when the vehicle is unlocked using the power lock system.

Hard wired circuitry connects the power lock system components to the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the power lock system components through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

REMOTE KEYLESS ENTRY SYSTEM

The Remote Keyless Entry (RKE) system is available factory-installed equipment on this vehicle. The RKE system includes the following major components, which are described in further detail elsewhere in this service information:

- **Electronic Vehicle Information Center** - The Electronic Vehicle Information Center (EVIC) is a digital display integral to the Instrument Cluster (IC) (also known as the Instrument Panel Cluster/IPC). The EVIC includes the EVIC switch pod in the right horizontal spoke of the steering wheel. Refer to **CENTER, ELECTRONIC VEHICLE INFORMATION, DESCRIPTION** .
- **Radio Frequency Hub Module** - The Radio Frequency Hub Module (RFHM) (also known as the RF Hub) is the RKE system control module and RF receiver located up in the rear cargo headliner. Refer to **MODULE, RADIO FREQUENCY (RF HUB), DESCRIPTION** .
- **Remote Keyless Entry System Transmitter** - The RKE system transmitter (also known as the FOB with Integrated Key/FOBIK) is the battery powered, wireless and portable Radio Frequency (RF) user controller for all of the features of the RKE system.

These components and their controls are combined to provide the following RKE system features:

- **Customer Programmable Features** - The vehicle operator interfaces with the RFHM, which is the RKE system controller, using the EVIC. EVIC switches allow the vehicle operator to set or change the RKE system Customer Programmable Features through the EVIC display.
- **Flash Lights With Lock And Unlock** - This is a Customer Programmable feature of the RKE system. The first option has the park lamps flash as an optical verification that the RKE system has received a valid **Lock** or **Unlock** request from the FOBIK. The second option disables the optical verification feature.
- **Panic Feature** - In certain markets the FOBIK may also be equipped with a red **Panic** button. Depressing the **Panic** button of the FOBIK while within transmitter range will sound the vehicle signal horn and flash the exterior lighting of the vehicle for about three minutes or until the **Panic** button is depressed a second time, whichever occurs first. Attaining a vehicle speed of about 25.7 kilometers per hour (15 miles per hour) will also cancel the Panic event.
- **Programming Additional Transmitters** - Two RKE transmitters are shipped with the vehicle from the factory, but the RKE system can retain the vehicle access codes of up to a total of eight transmitters. The transmitter codes are retained in the RKE system controller memory, even if the battery is disconnected. If a FOBIK is ineffective, lost or an additional FOBIK is desired, new transmitter vehicle access codes can be programmed into the system using a diagnostic scan tool.
- **Remote Liftgate Unlatching** - Depressing the **Liftgate Release** button of the FOBIK twice within 5 seconds while within transmitter range will unlatch and open the liftgate of the vehicle.
- **Remote Engine Start** - On vehicles equipped with the optional Remote Starting System, depressing the **Remote Start** button of the FOBIK twice while within transmitter range will lock all of the vehicle doors and start the engine of the vehicle.
- **Remote Locking** - Depressing the **Lock** button of the FOBIK while within transmitter range will lock all of the vehicle doors.
- **Remote Unlocking** - Depressing the **Unlock** button of the FOBIK while within transmitter range will unlock the vehicle and activate the Illuminated Entry System. The specific locks operated and the number of FOBIK button presses required varies depending upon the Customer Programmable settings chosen by the vehicle operator.
- **Remote Unlock Sequence** - This is a Customer Programmable feature of the RKE system. There are two options available. The first option allows only the driver side front door to unlock when the FOBIK **Unlock** button is depressed one time, and the remaining doors unlock when the button is depressed a second time within 5 seconds of the first press. The second option allows all doors to unlock upon a single press of the FOBIK **Unlock** button.
- **Sound Horn On Lock** - This is a Customer Programmable feature of the RKE system. There are two options available. The first option has the signal horn of the vehicle sound a short chirp as an audible verification that the RKE system received a valid **Lock** request from the FOBIK. The second option disables the audible verification feature.
- **Vehicle Theft Alarm Arming** - If the vehicle is equipped with the optional Vehicle Theft Alarm (VTA), depressing the **Lock** button of the FOBIK while within transmitter range will arm the VTA in addition to activating the remote locking feature.
- **Vehicle Theft Alarm Disarming** - If the vehicle is equipped with the optional Vehicle Theft Alarm (VTA), depressing the **Unlock** button of the FOBIK while within transmitter range will disarm the VTA in addition to activating the remote unlocking feature.

Hard wired circuitry connects many of the RKE system components to the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the RKE system components through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

OPERATION

OPERATION

PASSIVE ENTRY SYSTEM

In the Passive Entry Keyless Go (PEKG) system the doors are unlocked passively; however, they must still be locked actively after exiting the vehicle using the tactile **Lock** button on either front door Smart handle. When the system senses a hand approaching the capacitive switch in the door Smart handle pull or detects a button press of the liftgate release switch, it sends out challenge messages through the Low Frequency (LF) antennas to authenticate the presence and location of a valid FOB with Integrated Key (FOBIK).

The FOBIK responds by sending a Very High Frequency (VHF) message back to the receiver within the Radio Frequency Hub Module (RFHM) (also known as the RF Hub). If the RFHM determines the FOBIK is valid and that it is located outside the vehicle in the same zone or vicinity as the door handle or liftgate switch being activated, it sends an electronic **Unlock Request** message over the Controller Area Network (CAN) data bus to the Body Control Module (BCM) to automatically unlock and allow entry to that aperture.

The PEKG system circuits and FOBIK inputs are continually monitored by the microprocessor and software contained within the RFHM. When the RFHM monitors a problem in any of the PEKG system circuits or FOBIK inputs, it stores a Diagnostic Trouble Code (DTC) in its memory circuit. The hard wired circuits between components related to the PEKG system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the PEKG system or the electronic controls or communication between other modules and devices that provide features of the PEKG system. The most reliable, efficient, and accurate means to diagnose the PEKG system or the electronic controls and communication related to PEKG system operation, as well as the retrieval or erasure of a DTC requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

POWER LOCK SYSTEM

The power lock system uses non-switched battery current received through a fused B(+) fuse in the Body Control Module (BCM) so that the system remains operational regardless of the status of the ignition switch. The BCM is the primary power lock system controller. On vehicles equipped with a Drivers Door Module (DDM), the power lock switches are hard wired direct to the DDM. The DDM then sends the switch status via

CAN to the BCM. For those vehicles equipped with a Smart Motor instead of the DDM, the power door lock switches are hardwired directly to the BCM. The BCM, DDM and PDM all communicate with each other and with other electronic modules in the vehicle over the Controller Area Network (CAN) data bus.

When the BCM receives an input from a door module or from a switch on a Smart motor system, it responds to these request messages by providing the appropriate outputs to each of the power lock motors to lock or unlock each of the door latches. The BCM also monitors a hard wired input from the power liftgate module and electronic message inputs indicating automatic transmission gear selector position and vehicle speed. The BCM uses all of these inputs and internal programming to determine whether or not to provide the output necessary to operate the liftgate latch release motor.

The BCM also stores the power lock system Customer Programmable feature settings received over the CAN data bus from the Electronic Vehicle Information Center (EVIC). The BCM uses these settings and internal programming along with hard wired and electronic message inputs to determine the proper outputs needed to produce each of the appropriate power lock system features.

The power lock system circuits are continually monitored and controlled by the microprocessor and software contained within the BCM. When the BCM monitors a problem in any of the power lock system circuits or components, it stores a fault code or Diagnostic Trouble Code (DTC) in its memory circuit. The hard wired circuits between components related to the power lock system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the power lock system or the electronic controls or communication between other modules and devices that provide features of the power lock system. The most reliable, efficient, and accurate means to diagnose the power lock system or the electronic controls and communication related to power lock system operation, as well as the retrieval or erasure of a DTC requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOTE KEYLESS ENTRY SYSTEM

The Remote Keyless Entry (RKE) system uses non-switched battery current received through a fused B(+) fuse in the Body Control Module (BCM) so that the system remains operational regardless of the ignition switch position. The Radio Frequency Hub Module (RFHM) (also known as the RF Hub) is the primary RKE system controller as well as the Radio Frequency (RF) RKE receiver. The RFHM validates the vehicle access code of each RKE transmitter (also known as FOB with Integrated Key/FOBIK) from which it receives RF signal inputs. It ignores requests from any transmitter for which it has no stored vehicle access code.

The RFHM communicates and shares resources with the BCM and many other electronic modules in the vehicle over the CAN data bus. The RFHM also stores the RKE system Customer Programmable feature settings received over the CAN data bus from the Electronic Vehicle Information Center (EVIC). When the RFHM receives an input from a valid transmitter source, it uses these settings and internal programming to send the appropriate electronic request messages to the BCM and other electronic modules over the CAN data bus to invoke the proper RKE system features and responses.

The RKE system circuits and transmitter inputs are continually monitored by the microprocessor and software

contained within the RFHM. When the RFHM monitors a problem in any of the RKE system circuits or transmitters, it stores a Diagnostic Trouble Code (DTC) in its memory circuit. The hard wired circuits between components related to the RKE system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the RKE system or the electronic controls or communication between other modules and devices that provide features of the RKE system. The most reliable, efficient, and accurate means to diagnose the RKE system or the electronic controls and communication related to RKE system operation, as well as the retrieval or erasure of a DTC requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - POWER LOCK SYSTEMS

PASSIVE ENTRY SYSTEM

As a preliminary diagnosis for the Passive Entry Keyless Go (PEKG) system, first check using the Electronic Vehicle Information Center (EVIC) or with a diagnostic scan tool to be certain that this Customer Programmable feature is enabled. Next, confirm that the power lock system and the RKE system operate satisfactorily. If the power lock system or the RKE system fails to operate correctly, repair that problem before attempting to diagnose the PEKG system.

The most reliable, efficient, and accurate means to diagnose the PEKG system requires the use of a diagnostic scan tool and the appropriate diagnostic information. The diagnostic scan tool can provide confirmation that the CAN data bus is functional, that all of the proper electronic modules are sending and receiving the proper electronic messages over the CAN data bus, and that the Radio Frequency Hub Module (RFHM) (also known as the RF Hub) is sending the proper Radio Frequency (RF) signals to and receiving the proper RF signals from the RKE transmitters (also known as FOB with Integrated Key/FOBIK) to perform its PEKG system functions.

Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

POWER LOCK SYSTEM

Following are tests that may help to diagnose the hard wired components and circuits of the power lock system. However, these tests may not prove conclusive in the diagnosis of this system. In order to obtain conclusive testing of the power lock system, the Controller Area Network (CAN) data bus and all of the electronic modules that provide inputs to, or receive outputs from the power lock system components must also be tested.

The most reliable, efficient, and accurate means to diagnose the power lock system requires the use of a diagnostic scan tool and the appropriate diagnostic information. The diagnostic scan tool can provide confirmation that the CAN data bus is functional, that all of the proper electronic modules are sending and receiving the proper electronic messages over the CAN data bus, and that the power lock motors are receiving

the proper hard wired outputs from the Body Control Module (BCM) (also known as the Common Body Controller/CBC) for them to perform their power lock system functions.

Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

PRELIMINARY DIAGNOSIS

As a preliminary diagnosis for the power lock system, note the system operation while you actuate both the **Lock** and **Unlock** functions with the power lock switches and with the Remote Keyless Entry (RKE) transmitter (also known as the FOB with Integrated Key/FOBIK). Then, proceed as follows:

1. If the entire power lock system fails to function with either the power lock switches or the FOBIK, check the fused B(+) fuse for the power lock system.
2. If the power lock system functions with both power lock switches, but not with the FOBIK, proceed to diagnosis of the RKE system.
3. If the power lock system functions with the FOBIK, but not with one or both power lock switches, proceed to diagnosis of the door lock switches.
4. If only one power lock motor fails to operate with both power lock switches and the RKE transmitter, proceed to diagnosis of the power lock motor.

REMOTE KEYLESS ENTRY SYSTEM

Following are tests that may help to diagnose the Remote Keyless Entry (RKE) system. However, these tests may not prove conclusive in the diagnosis of this system. In order to obtain conclusive testing of the RKE system, the Controller Area Network (CAN) data bus network and all of the electronic modules that provide inputs to, or receive outputs from the RKE system components must also be tested.

The most reliable, efficient, and accurate means to diagnose the RKE system requires the use of a diagnostic scan tool and the appropriate diagnostic information. The diagnostic scan tool can provide confirmation that the CAN data bus is functional, that all of the proper electronic modules are sending and receiving the proper electronic messages over the CAN data bus, and that the Radio Frequency Hub Module (RFHM) (also known as the RF Hub) is being sent the proper Radio Frequency (RF) signals by the RKE transmitters (also known as FOB with Integrated Key/FOBIK) to perform its RKE system functions.

Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

PRELIMINARY DIAGNOSIS

As a preliminary diagnosis for the RKE system, first confirm that the power lock system operates satisfactorily. If the power lock system fails to operate correctly, repair that problem before attempting to diagnose the RKE system. If the problem being diagnosed involves only one or more Customer Programmable features, check using the Electronic Vehicle Information Center (EVIC) or with a diagnostic scan tool to be certain that these programmable features are enabled. If the features are enabled and still fail to operate, the RFHM and the CAN

data bus must be tested. Next, note the RKE system operation while you perform both the **Lock** and **Unlock** functions with the FOBIK. Then, proceed as follows:

1. If the power lock system functions with both power lock switches, but not with the FOBIK, proceed to diagnosis of the FOBIK.
2. If the FOBIK checks okay, proceed to diagnosis of the RFHM or the CAN data bus. The use of a diagnostic scan tool and the appropriate diagnostic information are required.

ACTUATOR, FUEL DOOR

DESCRIPTION

DESCRIPTION

Fig. 1: Mechanical Emergency Release Cable & Actuator Mechanism
Courtesy of CHRYSLER GROUP, LLC

An electronically actuated fuel door release mechanism is standard equipment in this vehicle. A striker on the fuel door is engaged by a latch and actuator mechanism (2) integral to the fuel filler housing located behind the fuel door opening of the outer quarter panel. The actuator mechanism is operated by an electronic solenoid that is also integral to the fuel filler housing. A short wire harness connected to the solenoid passes through a rubber grommet and a hole in the body sheet metal into the trunk compartment along with a mechanical emergency release cable (1). The solenoid is connected to the vehicle electrical system through a dedicated take out and connector of the body wire harness located on the right side of the trunk.

OPERATION

OPERATION

The fuel filler door actuator solenoid is energized by fused battery feed received from the fuel filler door switch located within the map pocket of the driver side front door inside trim panel whenever the momentary switch button is depressed. The solenoid is connected to a path to ground at all times through a take out of the body wire harness that is secured to the body sheet metal. These connections allow the solenoid to operate regardless of the ignition switch status.

If the vehicle electrical system, the fuel filler release solenoid, the switch or the release solenoid electrical circuits are damaged or ineffective, pulling the mechanical emergency release cable located within the trunk compartment will manually release the fuel filler door.

REMOVAL

REMOVAL

Fuel Door Actuator Removal.

Fig. 2: Lock Tabs & Fuel Door Actuator
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Open the fuel door using the push button switch within the map pocket of the drivers door panel. If unable to actuate the fuel door with the switch then open the trunk and pull the mechanical emergency release cable to release the fuel door manually. The mechanical emergency release cable is located on the right side within the trunk compartment.
3. Once the fuel door is open you can access the fuel door actuator (2). There are two lock tabs (1) holding

the actuator in place. Use a screw driver or like object to pop the fuel door actuator out from underneath the tabs.

Fig. 3: Mechanical Emergency Release Cable & Actuator Mechanism
Courtesy of CHRYSLER GROUP, LLC

4. Once the fuel door actuator is free of the tabs, remove the rubber grommet and maneuver the actuator through the opening that the actuator is fed through so that you are feeding the actuator back into the trunk.
5. Disconnect the fuel door actuator harness from the solenoid assembly.
6. Disconnect the mechanical emergency fuel door release cable from the interior wall of the trunk and pull the actuator and cable out from the trunk, fully removing the actuator and cable from the vehicle.

INSTALLATION

INSTALLATION

Fuel Door Actuator Installation.

Fig. 4: Mechanical Emergency Release Cable & Actuator Mechanism
Courtesy of CHRYSLER GROUP, LLC

1. The fuel door actuator is routed through the passenger side interior of the trunk through the opening in the body sheet metal that allows the actuator to pass through and reside within filler housing. Feed the actuator through this opening while maneuvering the actuator.

Fig. 5: Lock Tabs & Fuel Door Actuator

Courtesy of CHRYSLER GROUP, LLC

2. Once the actuator is inserted through the hole and into the housing area, position the actuator so that the lock tabs on the housing will mesh with the tabs on the actuator. Snap/secure the actuator into place.
3. Connect the fuel door actuator harness connector to the solenoid assembly.
4. Connect the mechanical emergency release cable into position on the passenger side of the trunk compartment.
5. Reconnect the battery negative cable and test for proper fuel door actuation.

ANTENNA, PASSIVE ENTRY

DESCRIPTION

DESCRIPTION

Fig. 6: Integral Connector Receptacle, Ferrite Antenna Units & Flanges
Courtesy of CHRYSLER GROUP, LLC

Vehicles equipped with the Passive Entry (PE) and Keyless Go (KG) systems have several Low Frequency (LF), ferrite antenna units (2) located within the vehicle. Each ferrite PE antenna unit is contained within a molded black plastic housing with an integral connector receptacle (3) molded into one end. The connector receptacle contains terminal pins that connect the antenna to the vehicle electrical system through a twisted pair of conductors and a connector that are part of the adjacent wire harness.

Each antenna housing also includes an integral mounting flange or flanges (1) which can be used to mount the unit with screws. However, in some applications the antenna mounting flanges are snapped into a spring steel adapter or retainer, which allows the antenna unit to be securely clipped in place over a body flange rather than being secured with screws. This vehicle platform uses five PE antenna units. One is secured to the underside of the center floor console, one is secured to each rear door hardware module carrier concealed behind the inside door trim panels, one is secured in front of the rear seat to the floor and one is concealed behind the rear fascia

to the bracket.

The antennas are each connected to the Radio Frequency Hub Module (RFHM) (also known as the RF Hub) on dedicated and sequentially numbered circuits. The left rear door antenna is connected through the antenna 1 circuits, the right rear door antenna is connected through the antenna 2 circuits, the trunk antenna is connected through the antenna 3 circuits, the center floor console is connected through the antenna 4 circuits and the rear fascia bracket antenna is connected through the antenna 5 circuits.

PASSIVE ENTRY LOW FREQUENCY ANTENNA AND CIRCUIT NUMBERING	
Location	**Antenna And Circuit Number**
Left Rear Door	1
Right Rear Door	2
Center Floor Console	3
Left Rear Floor	4
Rear Fascia Bracket	5

An LF antenna unit cannot be adjusted or repaired. If ineffective or damaged, it must be replaced with a new unit. For applications where it is used, the antenna unit adapter or retainer may be serviced only as a unit with the LF antenna.

OPERATION

OPERATION

The Passive Entry (PE) antenna units allow the transmitter within the Radio Frequency Hub Module (RFHM) (also known as the RF Hub) to communicate via Low Frequency (LF) radio transmission with a FOB with Integrated Key (FOBIK) that is located inside the vehicle or, at most, about 0.7 meters (2.5 feet) horizontally in all directions around the outside of the vehicle. The RFHM uses communication through the antenna units to wake up and challenge a FOBIK that is within range in order to authenticate whether that FOBIK is valid (programmed) to the vehicle. The RFHM communication with the FOBIK is on 125 kilohertz using Frequency-Shift Keying (FSK) modulation.

Each antenna unit has two dedicated connections to the RFHM. One connection is the LF antenna output circuit, while the other connection Is the LF antenna return circuit. These circuits to each antenna unit are a twisted pair to help reduce the potential for induced electrical interference. The RFHM microprocessor continuously monitors all of the antenna units and will store a Diagnostic Trouble Code (DTC) for any fault that it detects.

The hard wired inputs and outputs of the LF antenna units may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, the most reliable, efficient, and accurate means to diagnose the LF antenna units requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

CENTER FLOOR CONSOLE

Fig. 7: Low Frequency (LF) Antenna
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the center floor console from the vehicle. Refer to **CONSOLE, FLOOR, REMOVAL** .
3. Disconnect the wire harness connector from the connector receptacle for the Low Frequency (LF) antenna (1) beneath the front of the console.
4. Remove the two screws that secure the antenna to the bracket beneath the front of the console.
5. Remove the antenna from the console.

REAR DOOR

Fig. 8: Antenna, Connector & Screws
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the trim panel from the inside of the rear door. Refer to **PANEL, REAR DOOR TRIM, REMOVAL** .
3. Disconnect the door wire harness connector (3) from the Low Frequency (LF) antenna connector receptacle.
4. Remove the two screws that secure the antenna (2) to the inside of the rear door hardware module carrier.
5. Remove the antenna (1) from the carrier.

REAR FASCIA BRACKET

Fig. 9: Low Frequency Antenna & Connector
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the rear fascia from the vehicle. Refer to **FASCIA, REAR, REMOVAL** .
3. Disconnect the wire harness connector (1) from the connector receptacle for the Low Frequency (LF) antenna (2) located in a pocket near the center of the rear fascia bracket.
4. Unsnap the antenna from the retainer integral to the rear fascia bracket.
5. Remove the LF antenna from the vehicle.

TRUNK

Fig. 10: LF Antenna, Connector & Cover
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Fold and move forward the drivers side second row set. Next to the left side of the right side seat track (3) is a cover cut into the carpet. Fold this cover up to expose the LF antenna (1).
3. Disconnect the body wire harness connector from the Low Frequency (LF) antenna connector receptacle (2).
4. Remove the fasteners that secure the antenna in position.
5. Remove the LF antenna.

INSTALLATION

CENTER FLOOR CONSOLE

Fig. 11: Low Frequency (LF) Antenna
Courtesy of CHRYSLER GROUP, LLC

1. Position the Low Frequency (LF) antenna (1) to the bracket beneath the front of the center floor console.
2. Install and tighten the two screws that secure the antenna to the bracket beneath the front of the console. Tighten the screws securely.
3. Reconnect the wire harness connector to the antenna connector receptacle.
4. Reinstall the console into the vehicle. Refer to **CONSOLE, FLOOR, INSTALLATION** .
5. Reconnect the battery negative cable.

REAR DOOR

Fig. 12: Antenna, Connector & Screws
Courtesy of CHRYSLER GROUP, LLC

1. Position the Low Frequency (LF) antenna (1) to the rear door hardware module carrier.
2. Install and tighten the two screws (2) that secure the antenna to the carrier. Tighten the screws securely.
3. Reconnect the door wire harness connector (3) to the antenna connector receptacle.
4. Reinstall the trim panel onto the inside of the rear door. Refer to **PANEL, REAR DOOR TRIM, INSTALLATION** .
5. Reconnect the battery negative cable.

REAR FASCIA BRACKET

Fig. 13: Low Frequency Antenna & Connector
Courtesy of CHRYSLER GROUP, LLC

1. Position the Low Frequency (LF) antenna (2) in the pocket near the center of the rear fascia bracket.
2. Reconnect the wire harness connector (1) to the connector receptacle for the antenna.
3. Align the antenna with the retainers integral to the rear fascia bracket, then slide it downward until it snaps into place.
4. Reinstall the rear fascia onto the vehicle. Refer to **FASCIA, REAR, INSTALLATION** .
5. Reconnect the battery negative cable.

FORWARD CARGO FLOOR

Fig. 14: LF Antenna, Connector & Cover
Courtesy of CHRYSLER GROUP, LLC

1. Position the Low Frequency (LF) antenna (1) into position in the opening on the floor behind the drivers second row seat, to the left of the right side seat track (3).
2. Install the fasteners that secure the antenna to the floor.
3. Reconnect the body wire harness connector to the antenna connector receptacle (2).
4. Reconnect the battery negative cable.

MOTOR, DOOR LOCK

DESCRIPTION

DESCRIPTION

Power operated door locking and liftgate latching mechanisms are available equipment in this vehicle. The lock mechanisms of each door and the liftgate latch of vehicles with the power lock system are actuated by a reversible electric motor integral to each latch unit. A connector receptacle integral to each latch connects the power lock motor and the integral door or liftgate ajar micro switch to the vehicle electrical system through a dedicated take out and connector of the door or body wire harness.

The power lock motors cannot be adjusted or repaired and, if ineffective or damaged, the entire door or liftgate latch unit must be replaced.

OPERATION

OPERATION

The power lock motors are controlled by outputs received from the Body Control Module (BCM). The BCM acts upon programming, hard wired inputs from the driver or passenger door lock switches as well as electronic **lock** or **unlock** command message inputs received over the Controller Area Network (CAN) data bus from the Radio Frequency Hub Module (RFHM) (also known as the RF Hub) based upon inputs from the Remote Keyless Entry (RKE) or FOB with Integrated Key (FOBIK) transmitters.

A positive and negative battery connection to the two lock motor terminals will cause the motor to move in one direction, locking or unlocking the latch. Reversing the current will cause the motor to move in the opposite direction.

The power lock motors and the hard wired circuits between the motors and the BCM may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the power lock system or the electronic controls or communication between other modules and devices that provide some features of the power lock system. The most reliable, efficient, and accurate means to diagnose the power lock motors or the electronic controls and communication related to power lock motor operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - POWER LOCK MOTOR

Remember, the Body Control Module (BCM) circuitry controls the outputs to the power lock motors. If both the power lock motors and the circuits between the motors and the BCM test okay, the use of a diagnostic scan tool is required for further power lock system diagnosis. Refer to the appropriate diagnostic information.

Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

1. Check the power lock motor for correct operation while moving a power lock switch to both the **Lock** and **Unlock** positions.

2. Disconnect the door or body wire harness connector from the inoperative power lock motor.
3. Apply 12 volts to the lock and unlock driver circuit cavities of the power lock motor connector to check its operation in one direction.
4. Reverse the connection polarity to check the motor operation in the opposite direction.
5. If motor operation is okay in both directions, check both the lock and unlock circuits between the lock motor and the BCM and repair if required. If motor operation is not okay in both directions, replace the latch unit containing the ineffective power lock motor.

SWITCH, DOOR HANDLE

DESCRIPTION

DESCRIPTION

Fig. 15: Front Door Handle Components
Courtesy of CHRYSLER GROUP, LLC

Vehicles equipped with the optional Passive Entry (PE) system have unique outside front door handles that incorporate three switches and a logic circuit. These unique PE door handles are sometimes referred to as smart handles. The handle itself is very similar in appearance to those used in conventional non-PE applications, consisting primarily of a grip (4) and a base (1).

The PE door handles can be readily identified by a tactile, resistive membrane lock switch (5) located on the outward facing vertical surface at the rearward end of the handle grip, and by a capacitive sensor or switch membrane patch on the inside surface (2) of the grip. A third, Hall-effect type switch as well as an Integrated Circuit (IC) chip are concealed within the grip near the handle base.

The mechanical functions and mounting provisions of the PE handle are identical to those of a conventional outside door handle. However, an integral connector receptacle (3) is located at the forward end of the handle grip where it is concealed within the door interior. The PE handle is connected to the vehicle electrical system through a dedicated take out and connector of the door wire harness.

The individual switches of the PE outside front door handles cannot be adjusted or repaired. If any one of the switches, the IC or any of the mechanical handle components is damaged or ineffective, the entire handle unit must be replaced. Refer to **HANDLE, EXTERIOR, REMOVAL** and **HANDLE, INTERIOR, REMOVAL** .

OPERATION

OPERATION

The three switches of each Passive Entry (PE) outside front door handles are each powered by and provide a direct input to the Integrated Circuit (IC) of that door handle. The IC of each PE outside front door handle receives power from the Radio Frequency Hub Module (RFHM) (also known as the RF Hub) on a signal circuit, and a clean ground from the RFHM on a return circuit. The PE handle IC and the RFHM communicate with each other by modulating the current in the signal circuit.

Each PE outside front door handle has three switches. The inputs from those three switches and the handle logic circuit allow each handle to send the RFHM up to four different signals: Unlock Request, Hall, Lock Request and Error. The RFHM determines the system response based upon the inputs it receives from each handle as well as the inputs it receives through the authentication process with each detected FOB with Integrated Key (FOBIK).

The tactile, mechanical, resistive membrane lock switch allows the user to actively lock the vehicle. The capacitive switch senses a hand approaching the handle grip to passively unlock the vehicle. The Hall-effect switch senses handle grip movement. An adaptation algorithm in the logic circuit of each handle can modify the sensitivity of the capacitive switches as well as system responses to the Hall-effect switch inputs to compensate for sensed repeated or continuous actuations such as might be caused by the switch membrane being wetted, but restores normal sensitivity about one minute after the repeated or continuous actuation input ceases.

The hard wired inputs and outputs of the PE outside front door handle may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, the most reliable, efficient and accurate means to diagnose this component requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

SWITCH, FUEL DOOR

DESCRIPTION

DESCRIPTION

Fig. 16: Switch, Latch Features, Receptacle & Alignment Spline
Courtesy of CHRYSLER GROUP, LLC

The fuel door release switch (1) is mounted in the map pocket of the driver side front door inside trim panel. Only the switch button is visible on the outer surface of the trim panel. The black plastic switch button has a white International Control and Display Symbol icon applied to it, which clearly identifies its function. A Light Emitting Diode (LED) unit within the switch illuminates the icon on the switch button for improved visibility.

The black, molded plastic switch housing encloses the switch button mechanism and the switch circuitry including the switch contacts. A connector receptacle (3) is integral to the back of the switch housing, while integral latch features (2) and an alignment spline (4) on the sides of the housing are used to secure and locate the switch within a mounting receptacle integral to a reinforcement on the back side of the door trim panel. The fuel door release switch is connected to the vehicle electrical system through a dedicated take out and connector of the door wire harness.

The fuel door release switch cannot be adjusted or repaired and, if ineffective or damaged, the unit must be replaced.

OPERATION

OPERATION

The fuel door release switch is a normally open, momentary switch that is connected to fused battery feed at all times. When the switch button is depressed, it provides a battery feed signal to the fuel door release actuator solenoid on the fuel filler housing through a fuel door control circuit.

The hard wired circuit between the fuel door release switch and the fuel door release actuator solenoid may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information.

REMOVAL

REMOVAL

Fig. 17: Latch Tabs & Release Switch
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the trim panel from the inside of the driver side front door. Refer to **PANEL, DOOR TRIM, REMOVAL** .
3. Working from the back side of the door trim panel, disengage the latch tabs (1 and 3) that secure the fuel door release switch (2) to the receptacle integral to the trim panel reinforcement.
4. Remove the switch from the door trim panel.

INSTALLATION

INSTALLATION

Fig. 18: Latch Tabs & Release Switch

Courtesy of CHRYSLER GROUP, LLC

1. Align the fuel door release switch (2) with the receptacle integral to the reinforcement on the back side of the driver side front door trim panel.
2. Using hand pressure, push the switch into the receptacle until each of the switch latch tabs (1 and 3) are fully engaged.
3. Reinstall the trim panel onto the inside of the driver side front door. Refer to **PANEL, DOOR TRIM, INSTALLATION** .
4. Reconnect the battery negative cable.

SWITCH, LOCK

DESCRIPTION

DESCRIPTION

Fig. 19: Driver Side & Passenger Side Front Door Power Switch Module & Bezel Unit
Courtesy of CHRYSLER GROUP, LLC

A front door power switch module and bezel unit is located near the forward end of the arm rest of each front door trim panel. Separate modules are used for the driver side (1) and the passenger side (2) front doors. In addition, there are three versions of each module to accommodate power window and power mirror options. Each switch button in both modules is identified with either an International Control and Display Symbol icon or text that clearly identifies the switch function, and each switch button has a Light Emitting Diode (LED) unit soldered to the switch circuit board that provides back lighting of the icon or text for night visibility.

The Driver Door Switch Assembly contains window lift switches for front windows (driver and passenger) including auto-down or an auto-down and auto-up (also known as one-touch down or up and express down or up) features for both front door windows, window lift switches for rear windows (as equipped), window lockout switch (as equipped), power mirror switch with mirror select (as equipped), and a power fold button (as

equipped - LIN & Hybrid only). The passenger side power door switch module may combine power lock switches with a passenger side front door power window switch with the auto-down or the auto down and auto-up features. Each power switch module housing is secured within the trim panel armrest by four spring clip retainers (3), two on each side of the module housing. A connector receptacle (4) integral to each module housing connects the switches to the vehicle electrical system through dedicated take outs and connectors of the door wire harnesses.

Each front door power switch module may include the following switches:

- **Power Lock Switch** - A momentary switch button to control the **Lock** function of the power lock system is standard equipment in each front door power switch module in vehicles equipped with the optional power lock system.
- **Power Unlock Switch** - A momentary switch button to control the **Unlock** function of the power lock system is standard equipment in each front door power switch module in vehicles equipped with the optional power lock system.
- **Power Mirror Selector Switch (Driver Side Switch Only)** - In vehicles equipped with the power outside rear view mirror option, two latching mirror selector switch buttons choose the power mirror to be adjusted, **R** (right) or **L** (left).
- **Power Mirror Control Switch (Driver Side Switch Only)** - In vehicles equipped with the power outside rear view mirror option, after a power mirror is selected, pressing down on one of the four arrowheads on the circular, concave momentary mirror control switch pad will move the selected mirror in that direction for as long as the pad is held down or until the limit of the mirror travel is reached.
- **Power Window Lockout Switch (Driver Side Switch Only)** - In vehicles equipped with the power window option, a latching push-button power window lockout switch allows the vehicle operator to lock out the power window switches on each front and rear passenger door so that those windows may be operated only from the driver side front door master switches. When the lockout switch is engaged, the LED back lighting for each front and rear passenger door power window switch is extinguished.
- **Power Window Switches** - In vehicles equipped with the power window option, a single two-way, momentary power window switch with a push-to-open and a lift-to-close tab is provide for each front and rear passenger door window. The driver side switch module contains four of these power window switches, one switch dedicated to each door window. In vehicles with the base power window system, all power window switches are of a high current design and the switch tabs for the driver and passenger side front door power windows have an intermediate detent in the down direction which is used to activate the **Auto-Down** (also known as express down or one-touch down) feature. In vehicles equipped with the premium power window system, the front door power window switches are a low current design and a time based (less than 800 milliseconds) activation in the up or down direction on either front door power window switch activates the **Auto-Down** or **Auto-Up** (also known as express up and down, or one-touch up and down) feature.

The front door power switch modules cannot be adjusted or repaired. If damaged or ineffective, the entire driver side or passenger side front door power switch module must be replaced as a unit.

OPERATION

OPERATION

The Main function of the this switch assembly is to control the opening or closing of the Power windows and power locks based on the manual input given. The Driver Door Switch Assemblies are classified as high current, low current (LIN) or "hybrid." High current Door Switch Assemblies directly control windows and mirrors through high current switched contacts within the switch assembly. Low current (LIN) Door Switch Assemblies control windows and mirrors via messages sent over the LIN bus to a module which directly controls the windows and mirrors. Hybrid Door Switch Assemblies control front windows and mirrors via LIN messages, while controlling rear windows through high current switched contacts. In all cases, Door Locks are controlled by an RMUX signal to the module which directly controls the door lock solenoids.

The front door power switch module provides resistor multiplexed outputs to the Body Control Module (BCM) indicating the power lock switch selection, and the BCM operates the lock motors accordingly. On vehicles with the power outside rear view mirror option, the driver side front door power switch module also provides hard wired analog outputs directly from the power mirror selector and control switches to the power mirrors.

On vehicles with a base power window system option, the driver side front door power switch module provides high current hard wired analog outputs directly to the driver side front power window motor, or to the front and rear passenger door power window motors through the power window switch for that door. In the base power window system, an integrated circuit within each front door power switch module monitors inputs from the auto-down detent of the front door power window switches to invoke that feature.

On vehicles with a premium power window system option, the driver and passenger side front door power switch modules provide low current hard wired outputs to the driver or passenger side front r window motors, while the rear passenger power window motors still rely upon high current hard wired outputs from the switches. In the premium power window system, the BCM monitors the front door power window switches to invoke the auto-down and auto-up features through the smart power window motors.

The hard wired inputs and outputs of the driver and passenger side front door power switch modules may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the electronic controls of the power switch modules or in the diagnosis of the other modules and electronic controls that provide some features of the power lock, power mirror or power window systems. The most reliable, efficient, and accurate means to diagnose the driver side power switch module or the electronic controls and communication related to power lock, power mirror or power window system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - POWER FRONT DOOR SWITCH MODULES

Fig. 20: Driver Front Door Switch Module Connector Receptacle
Courtesy of CHRYSLER GROUP, LLC

Fig. 21: Passenger Front Door Switch Module Connector Receptacle
Courtesy of CHRYSLER GROUP, LLC

1. Remove the power switch module and bezel unit from the front door trim panel. Refer to **SWITCH, LOCK, REMOVAL**.
2. Disconnect the door wire harness connector from the power switch module.
3. Using an ohmmeter, test the resistance between the terminals of the front door power lock or power window switch as shown in the Power Lock or Power Window Switch Tests chart .

NOTE: **The switches in the driver front door switch module not listed in the Switch Test Tables provide inputs to the Driver Door Module (DDM) over a Local Interface Network (LIN) data bus and cannot be resistance tested.**

The use of a diagnostic scan tool and the appropriate diagnostic information is required for further testing of those switches.

POWER LOCK SWITCH TESTS - PASSENGER DOOR	
SWITCH POSITION (PINS)	**RESISTANCE RANGE (OHMS)**
LOCK (4 and 8)	326 - 341
UNLOCK (4 and 8)	99 - 103
NEUTRAL (4 and 8)	>1 megohm

POWER WINDOW SWITCH TESTS - DRIVER DOOR	
SWITCH POSITION (PINS)	**RESISTANCE (OHMS)**
MASTER LEFT REAR WINDOW	
UP SWITCH - NEUTRAL (2 and 5)	>1 megohm
UP SWITCH - UP (2 and 5)	<2
DOWN SWITCH - NEUTRAL (2 and 7)	>1 megohm
DOWN SWITCH - DOWN (2 and 7)	<2
MASTER RIGHT REAR WINDOW	
UP SWITCH - NEUTRAL (2 and 12)	>1 megohm
UP SWITCH - UP (2 and 12)	<2
DOWN SWITCH - NEUTRAL (2 and 14)	>1 megohm
DOWN SWITCH - DOWN (2 and 14)	<2

POWER WINDOW SWITCH TESTS - PASSENGER DOOR	
SWITCH POSITION (PINS)	**RESISTANCE RANGE (OHMS)**
UP (4 and 8)	990 - 1022
AUTO UP (4 and 8)	329 - 349
DOWN (4 and 8)	2970 - 3042
AUTO DOWN (4 and 8)	0 - 12
NEUTRAL (4 and 8)	>1 megohm

4. If a switch fails any of the tests, replace the ineffective front door power switch module and bezel unit as required.

REMOVAL

REMOVAL

Fig. 22: Front Door Switch Module & Door Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Using (special tool #C-4755, Trim Stick), pry the bezel of the front door switch module (1) up and away from the front door trim panel arm rest far enough to disengage the four spring steel retainers of the switch from the arm rest opening.
3. Pull the switch module away from the mounting hole of the arm rest far enough to access and disconnect the door wire harness connector (2) from the switch connector receptacle.
4. Remove the switch module from the vehicle.

INSTALLATION

INSTALLATION

Fig. 23: Front Door Switch Module & Door Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

1. Position the front door switch module (1) close enough to the mounting hole in the arm rest of the front door trim panel to access and reconnect the front door wire harness connector (2) to the switch connector receptacle.
2. Align the switch module to the arm rest mounting hole.
3. Using hand pressure, press the switch module firmly and evenly into the mounting hole until the four spring steel retainers of the switch are fully engaged and the switch bezel is fully seated against the arm rest.
4. Reconnect the battery negative cable.

TRANSMITTER, INTEGRATED KEY FOB

DESCRIPTION

DESCRIPTION

Fig. 24: FOBIK Transmitter - Without Passive Entry Keyless Go System
Courtesy of CHRYSLER GROUP, LLC

Fig. 25: FOBIK Transmitter - With Passive Entry Keyless Go System
Courtesy of CHRYSLER GROUP, LLC

Vehicles equipped with the power lock system may also have the optional Remote Keyless Entry (RKE) or the optional Passive Entry Keyless Go (PEKG) system. These vehicles are each shipped from the factory with two FOB with Integrated Key (FOBIK) Remote Keyless Entry (RKE) transmitters programmed to the vehicle as standard equipment. Although either type of transmitter can be programmed for compatibility with the power lock, Vehicle Theft Alarm (VTA) and remote start system features of the other, the FOBIK for vehicles without the PEKG system will not operate the passive entry system features, and neither FOBIK is compatible with the ignition switch design of the other.

The transmitter circuitry of both FOBIK types is contained and protected within a molded black plastic case with a black soft rubber touch pad on the face divided into six sections. The rearward end of the FOBIK case has a key ring and houses a mechanically coded, metal emergency key (5) that is released by sliding a latch button on the FOBIK case.

Depending upon vehicle equipment, each FOBIK has at least three and no more than five functional resistive membrane switches located beneath the six touch pad sections. Each functional touch pad section is clearly identified by white icons or white text and icons identifying the specific function obtained by pushing that button. Domestic market vehicles also include either a hard red plastic button with the white text **PANIC** , or a touch pad section on the FOBIK with the red text **PANIC** applied to it. Not counting the **PANIC** button or touch pad (4), the available switches include:

- **Unlock (1)** - Standard Equipment.
- **Lock (2)** - Standard equipment.
- **Remote Start (3)** - Only for vehicles equipped with the factory-installed remote start system.
- **Trunk (6)** - Standard equipment.

The FOBIK RKE transmitter is the primary customer active interface for remotely operating the power lock system, the RKE system, the VTA system and the remote start system components and features. However, the FOBIK also has an important passive role in each of the following vehicle systems:

- **Keyless Go System** - Refer to **DESCRIPTION** .
- **Passive Entry System** - Refer to **DESCRIPTION**.
- **Sentry Key® Theft Deterrent System** - Refer to **DESCRIPTION** .
- **Vehicle Theft Security System (VTSS)** - Refer to **DESCRIPTION** .

Other than battery replacement, the FOBIK cannot be adjusted or repaired. Once a FOBIK has been programmed to a vehicle, it cannot be reprogrammed for use on any other vehicle. If damaged or ineffective, the FOBIK must be replaced with a new unit. A new and unused FOBIK unit must be properly programmed in order to function properly with the systems of the vehicle. The mechanical emergency key of the new FOBIK must also be cut to match the coding of the lock cylinders in the vehicle.

OPERATION

OPERATION

The FOB with Integrated Key (FOBIK) incorporates many useful functions into a single, compact unit. The transducer on the internal circuit board of the FOBIK uses low frequency Radio Frequency (RF) communication to ensure vehicle security through an electronic validation or handshake process that is performed with the Radio Frequency Hub Module (RFHM) (also known as the RF Hub) each time the engine is started.

When any one of the Remote Keyless Entry (RKE) buttons of the FOBIK is depressed, the on-board transmitter of the FOBIK generates a high frequency RF request signal that is received and validated by the RFHM. If the RFHM determines that the RF signal was generated by a FOBIK that is valid for the vehicle, the RFHM relays

electronic request messages to the appropriate electronic modules in the vehicle over the Controller Area Network (CAN) data bus to invoke the functions or features associated with the request.

The integrated mechanical emergency key of the FOBIK provides emergency access to the vehicle in case the battery in the vehicle or the transmitter becomes discharged. The emergency key can also be retained to keep any locked on-board vehicle storage compartments such as the glove box secured, for example: While the vehicle is being attended to by a parking valet.

Each vehicle owner is provided with a four-digit Personal Identification Number (PIN) by the dealer at the time of vehicle purchase. This number is required along with a diagnostic scan tool for the dealer to program an additional or replacement FOBIK into the electronics of the vehicle. The emergency key included with a new additional or replacement blank FOBIK must also be cut to match the coding of the lock cylinders in the vehicle.

Diagnosis of a FOBIK transmitter requires the use of a Radio Frequency Detector such as special tool (special tool #9001, RF Detector). Refer to the appropriate diagnostic information.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - FOBIK TRANSMITTER

Fig. 26: Radio Frequency Detector #9001
Courtesy of CHRYSLER GROUP, LLC

Use a Radio Frequency Detector such as special tool (special tool #9001, RF Detector) to confirm that the Remote Keyless Entry (RKE) transmitter is functioning. Typical testing distance is 2.5 centimeters (1 inch) for the transmitters of vehicles manufactured for Asian markets, and 30.5 centimeters (12 inches) for all others.

1. Position the transmitter the appropriate distance from the special tool.

2. Depress any transmitter button, then test each button individually. The special tool will issue an audible beep tone if a satisfactory radio signal strength that lights five or more Signal Strength Light Emitting Diode (LED) units is detected.
3. Repeat Step 2 three times. If the transmitter fails any of the signal strength tests, use a diagnostic scan tool and the appropriate diagnostic information to complete further diagnosis.

STANDARD PROCEDURE

STANDARD PROCEDURE - FOBIK TRANSMITTER BATTERY REPLACEMENT

WITHOUT PASSIVE ENTRY KEYLESS GO SYSTEM

Fig. 27: Case, Notch, Emergency Key & Storage Slot
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not touch or disturb the metal contacts for the battery. Avoid touching the new battery. Battery contamination from oils on your skin may result in shortened battery life. If the battery or contacts are contaminated, clean them thoroughly with rubbing alcohol.

1. Unlatch and remove the emergency key (3) from the storage slot (4) of the FOB with Integrated Key (FOBIK) case (1).
2. With the back of the FOBIK case facing upward, insert the tip of the emergency key into the notch (2) between the case halves and twist the key to unsnap and separate the front case half from the back case half.

Fig. 28: Back Half Of FOBIK Case, Front Half Of FOBIK Case & Battery
Courtesy of CHRYSLER GROUP, LLC

3. Lift the battery (3) out of the receptacle in the back half of the FOBIK case (1).
4. Replace the battery with a recommended replacement battery. Refer to **TRANSMITTER, INTEGRATED KEY FOB, SPECIFICATIONS**.
5. Install the new battery into the receptacle in the back half of the FOBIK case with the negative terminal facing upward.
6. Align the front half of the FOBIK case (2) with the back half.
7. Using hand pressure, squeeze the two FOBIK case halves around their perimeters until they snap back together.
8. Reinsert the emergency key into the storage slot of the FOBIK case.
9. Test the FOBIK operation.

WITH PASSIVE ENTRY KEYLESS GO SYSTEM

Fig. 29: Emergency Key, Storage Slot & Integrated Key (FOBIK) Case
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not touch or disturb the metal contacts for the battery. Avoid touching the new battery. Battery contamination from oils on your skin may result in shortened battery life. If the battery or contacts are contaminated, clean them thoroughly with rubbing alcohol.

1. Unlatch and remove the emergency key (3) from the storage slot (4) of the FOB with Integrated Key (FOBIK) case (1).
2. With the front of the FOBIK case facing upward, insert the tip of the emergency key into the notch (2) between the case halves and twist the key to unsnap and separate the front case half from the back case half.

Fig. 30: FOBIK Case & Battery

Courtesy of CHRYSLER GROUP, LLC

3. Lift the battery (3) out of the receptacle in the back half of the FOBIK case (2).
4. Replace the battery with a recommended replacement battery. Refer to **TRANSMITTER, INTEGRATED KEY FOB, SPECIFICATIONS**.
5. Install the new battery into the receptacle in the back half of the FOBIK case with the negative terminal facing upward.
6. Align the front half of the FOBIK case (1) with the back half.
7. Using hand pressure, squeeze the two FOBIK case halves around their perimeters until they snap back together.
8. Reinsert the emergency key into the storage slot of the FOBIK case.
9. Test the FOBIK operation.

STANDARD PROCEDURE - FOBIK TRANSMITTER PROGRAMMING

FOB with Integrated Key (FOBIK) transmitter programming may require the use of the Personal Identification Number PIN) for the vehicle, a diagnostic scan tool and the appropriate diagnostic information. Also be certain that the FOBIK and any replaced electronic modules are programmed in the proper sequence. Refer to **STANDARD PROCEDURE** .

SPECIFICATIONS

SPECIFICATIONS - FOBIK TRANSMITTER

BATTERY

The FOB with Integrated Key (FOBIK) transmitter is powered by a single 3-volt lithium and manganese dioxide button cell battery, which can be removed and replaced without special tools. Refer to **TRANSMITTER, INTEGRATED KEY FOB, STANDARD PROCEDURE**. The international standard battery type designation is: **CR2032** . This battery type is available at many local retail stores. Typical battery life is approximately three years.

CAUTION: Do not handle the batteries any more than necessary. Hands must be clean and dry.

RANGE

Normal FOBIK Remote Keyless Entry (RKE) transmitter operation range for vehicles manufactured for domestic markets is up to 20 meters (66 feet) away from the vehicle. On vehicles manufactured for export markets, normal FOBIK transmitter operation range is up to 10 meters (33 feet) away from the vehicle. If a domestic market vehicle is equipped with the optional factory-installed Remote Start System, the normal FOBIK transmitter operation range is increased to up to 91 meters (300 feet). Please note that the actual FOBIK transmitter range values may be better or worse than specified above, depending upon many possible variables in the environment at the specific time and location that any FOBIK transmission is attempted.

SWITCH, LIFTGATE RELEASE

DESCRIPTION

DESCRIPTION

2810385

Fig. 31: Liftgate Handle And Light Bar Unit, PE Liftgate Lock And Unlock Switch And Push Button
Courtesy of CHRYSLER GROUP, LLC

Vehicles equipped with the optional Passive Entry (PE) system have a unique liftgate handle and light bar unit (1) that incorporates a PE liftgate lock and unlock switch (3) and push button (4). This tactile switch is secured to the back of the right side of the handle and light bar unit by three latch features integral to the back of the handle housing. The switch button extends through a clearance hole in the handle housing so that it can be accessed on the outer surface of the handle to the right side of center.

The switch is soldered to the handle and light bar unit wire harness secured to the back of the handle housing that connects the switch along with the liftgate flip-up glass latch release switch, the two license plate lamps and, if the vehicle is so equipped, the rear view camera to the vehicle electrical system through a dedicated take out and connector of the liftgate wire harness.

The PE liftgate lock and unlock switch cannot be adjusted or repaired. If the switch is damaged or ineffective, the entire liftgate handle and light bar unit wire harness must be replaced.

OPERATION

OPERATION

The Passive Entry (PE) liftgate lock and unlock switch is a normally open switch that is hard wired to the Remote Frequency Hub (RFHUB) through a signal circuit and a return circuit. The RFHUB continually monitors the condition of the PE liftgate lock and unlock switch and circuits, and will store a Diagnostic Trouble Code (DTC) for any fault that is detected in these circuits.

When the switch button is depressed, it provides a signal to the RFHUB. The RFHUB determines the system response based upon the inputs it receives through the authentication process with each detected FOB with Integrated Key (FOBIK). If the authentication process is successful, the RFHUB sends an electronic **lock request** or **unlock request** message to the Body Control Module (BCM) over the Controller Area Network (CAN) data bus, and the BCM energizes the liftgate lock and unlock relay accordingly.

The hard wired circuits between the PE liftgate lock and unlock switch and the RFHUB may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the switch or the electronic controls and communication between other modules and devices that provide some features of the PE system. The most reliable, efficient, and accurate means to diagnose the PE system or the electronic controls and communication related to liftgate lock and unlock switch operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

2014 ACCESSORIES AND EQUIPMENT

Power Mirrors - Service Information - Cherokee

DESCRIPTION

AUTOMATIC DIMMING INSIDE REAR VIEW MIRROR SYSTEM

The automatic dimming inside rear view mirror is available factory-installed equipment on this vehicle. This mirror is also known as the ElectroChromic Mirror Module (ECMM). This mirror system uses an ElectroChromic (EC) material and will automatically adjust the reflectance of the mirror glass to reduce glare from the headlamps of following vehicles during dark or night time driving conditions. Reducing glare will improve driver comfort and vision under these driving conditions. The components of the automatic dimming inside rear view mirror system are completely self-contained within the inside rear view mirror. Refer to **MIRROR, AUTOMATIC DAY AND NIGHT, DESCRIPTION**.

Certain functions and features of the EC mirror system may rely upon resources shared by other electronic modules in the vehicle over a Local Interface Network (LIN) data bus as well as over the Controller Area Network (CAN) data bus. Other electronic modules in the vehicle that may affect EC mirror operation are:

- **Body Control Module** - The Body Control Module (BCM) is located beneath the instrument panel on the driver side of the vehicle. The BCM controls many of the body electrical system components. The BCM is both a LIN master node and a gateway to the CAN data bus. Refer to **MODULE, BODY CONTROL, DESCRIPTION** .
- **Powertrain Control Module** - The Powertrain Control Module (PCM) (also known as the Engine Control Module/ECM) is located beneath the hood in the engine compartment of the vehicle. The PCM controls many of the powertrain electrical system components. The PCM communicates on the CAN data bus. Refer to **MODULE, POWERTRAIN CONTROL, DESCRIPTION** .
- **Transmission Control Module** - On vehicles with an automatic transmission, the Transmission Control Module (TCM) (also known as the Engine Control Module/ECM) is located beneath the hood in the engine compartment of the vehicle. The TCM controls many of the automatic transmission electrical system components. The TCM communicates on the CAN data bus. Refer to **MODULE, TRANSMISSION CONTROL, OPERATION** .

These components and their controls are combined to provide the following EC mirror system feature:

- **Dimming Disabled In Reverse** - The automatic dimming feature of the EC mirrors is disabled anytime the Reverse position of the transmission is selected.

POWER OPERATED OUTSIDE REAR VIEW MIRROR SYSTEM

The power operated outside rear view mirror system is available factory-installed equipment on this vehicle. This system allows the driver to adjust both the driver and passenger side outside rear view mirrors electrically from the driver seat by operating switches on the arm rest of the driver side front door inside trim panel. These switches allow the vehicle operator a convenient means of adjusting the mirrors to optimize peripheral vision to include the areas at the sides and rear corners of the vehicle, those blind spot areas that are generally blocked

from the view of the vehicle operator by the vehicle structure.

The power operated outside rear view mirror system includes the following major components, which are described in further detail elsewhere in this service information:

- **Power Mirror** - Vehicles equipped with the power operated outside rear mirror system have a power operated mirror secured to the mirror flag area at the front of each front door glass opening. Refer to **MIRROR, OUTSIDE REARVIEW, DESCRIPTION**.
- **Power Mirror Switch** - Vehicles equipped with the power operated outside rear view mirror system have a power mirror selector switch, a power mirror control switch, and a power folding mirror switch integral to the power switch module located near the front of the arm rest on the driver side front door interior trim panel. Refer to **SWITCH, LOCK, DESCRIPTION** .

Certain functions and features of the power operated outside rear view mirror system may rely upon resources shared by other electronic modules in the vehicle over a Local Interface Network (LIN) data bus as well as over the Controller Area Network (CAN) data bus. Other electronic modules in the vehicle that may affect power operated outside rear view mirror operation are:

- **Blind Spot Sensors** - Vehicles equipped with the BSM system have both a Left Blind Spot Sensor (LBSS) and a Right Blind Spot Sensor (RBSS). The LBSS and the RBSS each include a RAdio Detection And Ranging (RADAR) sensor and an integral electronic control unit. Each of the two control units is independent, communicates on the Controller Area Network (CAN) data bus and is hard wired to its respective right or left blind spot display. The LBSS and the RBSS are concealed behind their respective right and left outboard ends of the rear bumper fascia, just behind the rear wheel openings.
- **Body Control Module** - The Body Control Module (BCM) is located beneath the instrument panel on the driver side of the vehicle. The BCM controls many of the body electrical system components. The BCM is both a LIN master node and a gateway to the CAN data bus. Refer to **MODULE, BODY CONTROL, DESCRIPTION** .
- **Radio Frequency Hub Module** - The Radio Frequency Hub Module (RFHM) (also known as the RF Hub) is the RKE system control module and RF receiver located in the rear cargo area headliner. Refer to **MODULE, RADIO FREQUENCY (RF HUB), DESCRIPTION** .

These components and their controls are combined to provide the following power operated outside rear view mirror system features:

- **Blind Spot Monitor Display** - In vehicles also equipped with the optional Blind Spot Monitor (BSM) system, an amber Light Emitting Diode (LED) unit behind a small, triangular translucent icon in each outside rear view mirror glass is illuminated each time the right or left blind spot sensor detects an object of interest in one of the monitored vehicle blind spots. Refer to **DISPLAY, BLIND SPOT, DESCRIPTION** .
- **Heated Mirrors** - The heated mirror option includes an electric heating grid behind the mirror glass in each outside rear view mirror, which can clear the mirror glass of ice, snow, or fog. Refer to **DESCRIPTION** .
- **Puddle Lamps** - In vehicles equipped with this option, white Light Emitting Diode (LED) units behind a small round lens on the underside of each outside rear view mirror illuminate the ground outside each front door when a door is opened. Refer to **DESCRIPTION** .

- **Signal Lamps** - In vehicles equipped with this option, two amber Light Emitting Diode (LED) units illuminate a light pipe behind a clear lens that wraps around the lower outward and forward-facing surfaces of each mirror shell in concert with the turn signals. Refer to **DESCRIPTION** .

OPERATION

OPERATION

AUTOMATIC DIMMING INSIDE REAR VIEW MIRROR SYSTEM

The ElectroChromic Mirror Module (ECMM) of the automatic dimming inside rear view mirror system receives battery current on a fused ignition output (run) circuit from a fuse in the Junction Block (JB) (also known as the interior Power Distribution Center/PDC). The ECCM has a path to ground at all times through a take out and eyelet terminal of the body wire harness that is secured to the body sheet metal. These connections allow the automatic dimming inside rear view mirror system to operate. When the automatic dimming mirror system is on, a green power indicator within the mirror housing is illuminated by an integral Light-Emitting Diode (LED) unit.

POWER OPERATED OUTSIDE REAR VIEW MIRRORS

The power operated outside rear view mirrors are connected to battery current at all times. Each mirror head contains two electric motors, two drive mechanisms, an electric heating element and the mirror glass. First, a mirror selector switch button is depressed in the driver door power switch module to determine whether the mirror adjuster switch will have control over the right or left mirror. If the vehicle is equipped with the high current door power switch module configuration, hard wired ground and battery current outputs to each power mirror motor determine whether the horizontal or the vertical motor will be operated and the polarity of those outputs control the direction in which the motor will move the drive unit and mirror glass.

Power mirror and mirror switch functionality is the same with the low current configuration; however, the driver door power switch module sends power mirror switch status messages over the Local Interface Network (LIN) data bus to the driver front door control module. The driver front door control module then controls the high current outputs to the driver door mirror motors or sends electronic request messages over the Controller Area Network (CAN) Interior High Speed (IHS) data bus to the passenger front door control module to control high current outputs to the passenger door mirror motors.

The power mirror switch is diagnosed using a scan tool, refer to **DIAGNOSIS AND TESTING** for the appropriate information.

MIRROR, AUTOMATIC DAY AND NIGHT

DESCRIPTION

DESCRIPTION

INSIDE MIRROR - An automatic dimming inside rear view mirror is an available factory-installed option on this vehicle. This mirror features a thin layer of ElectroChromic (EC) material sandwiched between two pieces

of conductive glass to make up the face of the mirror. The EC material explains how this mirror also became known as the ElectroChromic Mirror Module (ECMM). The ECMM will automatically change the reflectance of the inside rear view mirror glass to reduce the glare of headlamps approaching the vehicle from the rear while driving during dark or night time conditions. The ability to turn this option ON or OFF will be found in the U-Connect touch screen as a soft button select switch.

The ECMM is a completely self-contained unit that replaces the standard equipment prismatic inside rear view mirror. Besides the mirror glass, the ECMM includes two photocell sensors, the electronic mirror control circuitry and the hardware necessary to communicate as a Local Interface Network (LIN) slave node on the LIN data bus.

Hard wired circuitry connects the ECMM to the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the ECMM through the use of a combination of soldered splices, splice block connectors and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention as well as pin-out and location views for the various wire harness connectors, splices and grounds.

The ECMM cannot be repaired or adjusted. If any component of this unit is ineffective or damaged, the entire ECMM unit must be replaced.

OUTSIDE MIRROR - The automatic dimming driver side outside rear view mirror is able to automatically change its reflectance. The automatic dimming outside rear view mirror replaces the standard equipment outside rear view mirror. The two layers of conductive mirror glass with a thin layer of electrochromic material between them is contained within the outside rear view mirror glass case. However, this mirror relies upon the photocells and mirror control circuitry of the automatic dimming inside rear view mirror to control its reflectance.

The automatic dimming outside rear view mirror is secured to the same mounting flag on the front door panel and in the same manner that is used to mount the standard equipment outside rear view mirrors. The mirror is connected to the vehicle electrical system through a dedicated take out and connector of the front door wire harness. The automatic dimming circuitry of the outside rear view mirror receives current through auto day/night mirror feed (+) and return (-) circuits from the inside rear view mirror, and will only operate when the ignition switch is in the ON or START positions.

The automatic dimming outside rear view mirror sensitivity cannot be repaired or adjusted. If any component of this unit is ineffective or damaged, the entire outside rear view mirror unit must be replaced. For service procedures, refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** , **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL** , **MIRROR, OUTSIDE REARVIEW, INSTALLATION** and **MIRROR, OUTSIDE REARVIEW, GLASS, INSTALLATION** .

OPERATION

OPERATION

Both the inside and outside automatic dimming mirrors receive battery current through a fused ignition switch output (run/start) circuit and fuse in the Body Control Module (BCM), and will only operate when the ignition

switch is in the ON or START positions.

INSIDE

The soft switch located in the U-Connect touch screen provides the vehicle operator with a manual control of whether the automatic dimming feature is operational. If the dimming is turned to the off position, the mirror will always turn back ON by default at the onset of a new ignition ON cycle. The automatic dimming mirror circuitry also senses the backup lamp circuit, and will automatically disable its self-dimming feature whenever the transmission gear selector is in the REVERSE position.

The ambient photocell sensor of the mirror faces forward, to detect the outside light levels through the windshield glass. A second headlamp photocell sensor is located in the upper right quadrant of the mirror face, to detect the light level received at the rear window side of the mirror. When the mirror control circuitry detects that the difference between the two sensed light levels has become too great (the light level received at the rear of the mirror is much higher than that at the front of the mirror) the mirror begins to darken. A thin layer of electrochromic material between two pieces of conductive glass make up the face of the mirror.

On vehicles equipped with an optional driver side automatic dimming outside rear view mirror, the signal to control the dimming of that mirror is generated by the automatic dimming inside rear view mirror circuitry. That signal is then delivered to the driver side outside rear view mirror on two hard wired circuits.

The BCM determines the ignition status and the gear status. Once determined, the BCM sends an enable/disable signal over the LIN bus to the electrochromic mirror. The electrochromic mirror reads the internal message for the sensor value and determines the ratio between forward/backward light intensity, along with the enable signal coming from the BCM, to determine the reflecting mode to be used.

OUTSIDE

The driver side automatic dimming outside mirror is operated by the same controls and circuitry as the automatic inside rear view mirror. When the automatic inside rear view mirror is switched ON or OFF, the automatic dimming outside mirror is likewise switched ON or OFF. Just as in the automatic inside rear view mirror, a thin layer of electrochromic material between two pieces of conductive glass make up the face of the automatic dimming outside mirror. However, the signal to control the dimming of the outside mirror is generated by the automatic dimming inside rear view mirror control circuitry based upon the inputs from the two photocell sensors integral to the inside mirror. That signal is then delivered to the driver side outside rear view mirror on two hard wired circuits.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - AUTOMATIC DIMMING INSIDE REAR VIEW MIRROR

For complete circuit diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

1. With the status of the ignition switch Of, disconnect and isolate the battery negative cable. Unplug the wire harness connector from the ElectroChromic Mirror Module (ECMM). Reconnect the battery negative cable, then transition the status of the ignition switch to On. Check for battery voltage at the fused ignition output (run) circuit cavity of the wire harness connector for the ECMM. If OK, go to step

2. If not OK, repair the open circuit as required.

2. Transition the status of the ignition switch to Off. Disconnect and isolate the battery negative cable. Check for continuity between the ground circuit cavity of the wire harness connector for the ECMM and a good ground. There should be continuity. If OK, go to step 3. If not OK, repair the open circuit to ground as required.
3. Reconnect the wire harness connector for the ECMM. Reconnect the battery negative cable. Cover the forward facing ambient photocell sensor to keep out any ambient light. Transition the status of the ignition switch to On. Place the transmission gear selector lever in the Neutral position.

NOTE: The ambient photocell sensor must be covered completely, so that no light reaches the sensor. Use a finger pressed tightly against the sensor, or cover the sensor completely with electrical tape.

4. Shine a light into the rearward facing headlamp photocell sensor. The mirror glass should darken. Turn the light Off. The mirror glass should return to normal reflectance. If OK, go to step 5. If not OK, replace the ineffective ECMM unit.
5. Use a diagnostic scan tool and the appropriate diagnostic procedure to perform further ECMM diagnosis.

MIRROR, OUTSIDE REARVIEW

DESCRIPTION

DESCRIPTION

Fig. 1: Signal Lamps & Puddle Lamps
Courtesy of CHRYSLER GROUP, LLC

Vehicles equipped with the optional power operated outside rear view mirror system are equipped with a power mirror head unit located on the outside of each front door. Each power mirror has a molded plastic housing and bezel that faces rearward and a molded plastic decorative cover or shell that faces forward. The shell may also

include openings to accommodate Light Emitting Diode (LED) signal lamps (1) and puddle lamps (2) on vehicles equipped with those optional features.

The housing and shell are secured to a molded plastic arm with an integral, hollow pivot pin that is secured to the mirror mounting bracket. This pivot pin features a spring-loaded detent mechanism that allows the mirror to be manually folded toward the door glass for additional clearance during vehicle shipping or storage. The mirror mounting bracket has three threaded studs that are used to secure the mirror assembly to the flag area at the front of each front door glass opening.

Fig. 2: Blind Spot Monitor (BSM) LED Indicator Lamp Unit
Courtesy of CHRYSLER GROUP, LLC

The open rearward-facing side of the housing and bezel unit serves as a seat within which the mirror glass is exposed to the view of the vehicle operator. The mirror glass is mounted within a molded plastic case. In vehicles with the heated mirror option, a glass heating grid locked within a plastic membrane is sandwiched between the back of the mirror glass and the case. A Blind Spot Monitor (BSM) LED indicator lamp unit (1) is also integral to the case in vehicles with that option.

The mirror glass case snaps onto a swivel assembly integral to the mirror articulation mechanism on the arm within the mirror housing. The mirror articulation mechanism includes two small Direct Current (DC) electric motors with gear drives and clutch units that connect them to the swivel assembly. A mirror wire harness is connected to each of the electrical elements within the mirror housing and is routed through the hollow pivot pin and the mounting bracket to the interior of the front door, where it connects the mirror to the vehicle electrical system through a dedicated take out and connector of the door wire harness.

The power operated outside rear view mirror housing and bezel, mounting bracket, arm and articulation mechanism cannot be adjusted or repaired. If damaged or ineffective, the entire mirror unit must be replaced. Refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** and **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL** . The puddle lamp and the signal lamp are available for separate service replacement. Refer to **LAMP, MIRROR, REMOVAL** . The mirror shell as well as a mirror glass and case unit with an integral heating grid and BSM indicator lamp are available for separate service replacement. Refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** and **MIRROR, OUTSIDE REARVIEW, GLASS,**

REMOVAL .

OPERATION

OPERATION

Each power mirror articulation mechanism is driven by two individual Direct Current (DC) reversible electric motors. Each motor also features Positive Temperature Coefficient (PTC) protection. One motor in each mirror controls horizontal (left and right) movement, while the second motor controls vertical (up and down) movement. The power mirror selector switch setting determines which mirror is to receive the output from the power mirror control switch.

The power mirror control switch determines which motor will be energized and the direction in which the motor will be driven. When battery current and ground are output from the control switch to the two motor terminals, the motor rotates in one direction. When the switch output polarity to the motor connections is reversed, the motor rotates in the opposite direction. The mirror articulation mechanism also incorporates clutches that protect the mechanism by disengaging the drive whenever the travel limits of the articulation swivel have been reached.

The power mirrors as well as the hard wired input circuits for the mirrors may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - POWER OUTSIDE REAR VIEW MIRROR

The following tests will confirm whether the power mirror horizontal and vertical motors and articulation mechanisms are functional in either a driver or passenger outside rear view mirror. If the mirror motors and mechanisms pass the following tests, but a mirror fails to operate using the power mirror switch integral to the power lock and power window switch pod on the driver side front door, be certain to test the switch and the wiring between the switch and the mirror before considering component replacement.

Refer to **SWITCH, LOCK, DIAGNOSIS AND TESTING** and refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

1. Disconnect and isolate the battery negative cable.
2. Remove the trim panel from the inside of the door to which the ineffective power mirror is secured. Refer to **PANEL, DOOR TRIM, REMOVAL** .
3. Disconnect the door wire harness connector from the connector for the mirror to bet tested.
4. Reconnect the battery negative cable.
5. Connect a jumper wire to a good body ground.
6. Connect a second jumper wire to a source of fused 12-volt battery current.
7. See the Power Mirror Motor Test table below for the correct jumper wire connections to the power mirror wire harness connector.

Fig. 3: Passenger Front Door Switch Module Connector Terminal Identification
Courtesy of CHRYSLER GROUP, LLC

POWER MIRROR MOTOR TEST TABLE

POWER MIRROR MOTOR TEST			
MIRROR CONNECTOR PINS		MIRROR REACTION	
12 VOLTS	GROUND	RIGHT MIRROR	LEFT MIRROR
Pin 1	Pin 2	-	Up
Pin 6	Pin 2	-	Left
Pin 2	Pin 1	-	Down
Pin 2	Pin 6	-	Right
Pin 7	Pin 2	Up	-
Pin 4	Pin 2	Left	-
Pin 2	Pin 7	Down	-
Pin 2	Pin 4	Right	-

NOTE: **If either the horizontal or the vertical power mirror motor and articulation mechanism do not respond as indicated in the table, replace the ineffective power mirror assembly. If both power mirror motors and mechanisms respond as indicated in the table, test the power mirror switch. If the switch tests okay, test and repair the wiring between the power mirror switch and the power mirror for a short or open circuit as required.**

SWITCH, MIRROR

DESCRIPTION

DESCRIPTION

Fig. 4: Driver Front Door Power Switch Module
Courtesy of CHRYSLER GROUP, LLC

The power mirror switch includes the mirror selector switch (2) and the mirror control switch (3), which are both integral to the driver side front door power switch module (1) located near the forward end of the arm rest on the driver side front door inside trim panel. The mirror selector switch includes two momentary push buttons marked **R** (Right) and **L** (Left). The mirror control switch includes a momentary selector disc marked with four directional arrow heads.

There are two unique versions of the driver side front door power switch module. One version is for use in vehicles equipped with the base power window system and is a high current design. The other version is for use in vehicles equipped with the premium power window system and is a low current design. Either version will operate the power mirror system correctly, but an incorrect version will not be compatible with the front door power window system components.

The power mirror switch is serviced only as a unit with the driver side front door power switch module (1). If any part of this switch module is ineffective or damaged, the entire module must be replaced with a new unit. Refer to **SWITCH, LOCK, REMOVAL** .

OPERATION

OPERATION

The power mirror switch circuitry within the driver side front door power switch module is connected to battery current through a non-switched fused B(+) circuit received from a fused B(+) fuse in the underhood Power Distribution Center (PDC). The power mirror switch circuitry also has a path to ground at all times through a take out and eyelet terminal of the body wire harness that is secured to the body sheet metal. These connections allow the power mirror switch to remain operational regardless of the status of the ignition switch.

A latching push button power mirror selector switch has three positions, **L** (left), **R** (right) and **N** (neutral). After the right or left mirror is selected, one of the four directional arrows on the momentary power mirror control switch disc is depressed to move the selected mirror up, down, right or left. The power mirror control

switch directs the appropriate battery current and ground feeds to the proper horizontal or vertical motor within the mirror articulating mechanism of the selected power mirror.

The power mirror switches as well as the hard wired input and output circuits of the switches may be diagnosed using conventional diagnostic tools and procedures. Refer to **SWITCH, LOCK, DIAGNOSIS AND TESTING** .

2014 ACCESSORIES AND EQUIPMENT

Power Seats - Service Information - Cherokee

DESCRIPTION

DESCRIPTION

Fig. 1: Seat Position Switch & Lumbar Switch
Courtesy of CHRYSLER GROUP, LLC

A driver side six-way power seat is available on this vehicle. The power seat system allows the driver to electrically adjust the seating position using the power seat switch (1) located on the outboard seat cushion side shield. This graphic also shows the available lumbar option if equipped (2).

The six-way power seat can be adjusted forward, rearward, front up and front down. This power seat system may also be equipped with heated seats.

Fig. 2: Reversible Motor, Up/Down Seat Motor & Forward/Rearward Seat Motor
Courtesy of CHRYSLER GROUP, LLC

The power seat adjuster assembly is made up of an upper and a lower power seat adjuster. The upper power seat adjuster contains one reversible motor (1) that is connected to a gearbox that tilts the front of the seat cushion up and down. The lower power seat adjusted contains two reversible motors connected to gearboxes. One motor (2) tilts the rear of the seat up and down and the other motor (3) moves the seat assembly forward and rearward. When the rear and front tilt motors are activated together, the height of the driver seat raises and lowers. Each motor contains a self-resetting circuit breaker to protect it from overload. Consecutive or frequent resetting of the circuit breakers may damage the motors.

The power seat motors cannot be adjusted or repaired and if inoperative or damaged, the entire power seat adjuster assembly must be replaced.

Fig. 3: Heated & Vented Seat System (HVS Equipped) Lumbar System & Heated Only Or Non Heated Or Non Vented Seat (non-HVS) Lumbar System
Courtesy of CHRYSLER GROUP, LLC

There are two possible lumbar systems available for this vehicle.

- **HEATED AND VENTED SEAT SYSTEM (HVS equipped) LUMBAR SYSTEM (1)**
- **HEATED ONLY OR NON HEATED OR NON VENTED SEAT (non-HVS) LUMBAR SYSTEM (2).**

OPERATION

OPERATION

The power seat system receives battery current through a fuse in the Power Distribution Center (PDC) and remains operational, regardless of ignition position.

When a power seat switch is actuated, a battery feed and a ground path are applied through the power seat switch contacts to the appropriate motor or motors. The motor and drive unit operate to move the seat in the selected direction until the switch is released, or until the travel limit of the gearbox and linkage is reached. When the switch is moved in the opposite direction, the battery feed and ground path to the motor is reversed through the switch contacts. This causes the motor to run in the opposite direction.

The power seat motors, gearboxes and linkage cannot be adjusted or repaired and if inoperative or damaged, the entire power seat adjuster and seat cushion pan, or the power reclining seat back must be replaced as an assembly.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - POWER SEAT SYSTEM

NOTE: For complete circuit diagrams, refer to SYSTEM WIRING DIAGRAMS . Wiring Information includes wiring diagrams, connector pin-out and location views, details of wire harness routing and retention, splice and ground locations and proper wire and connector repair procedures.

Operate the power seat switches and power lumbar support switch. Move the seat, seat back and power lumbar support in all directions. The seat and lumbar support should move in each of the selected directions. If any of the power seat and/or lumbar support motors fail to operate in more than one direction, proceed as follows:

1. Inspect the power seat and power lumbar pneumatic motor to ensure the electrical connectors are fully connected to the motor. If OK, go to Step 2. If not OK, reconnect the electrical connector(s).
2. Check the power seat fuse in the Power Distribution Center (PDC). If OK, go to Step 3. If not OK, replace the fuse.
3. Remove the power seat switch and/or power lumbar switch from the seat cushion side panel. Check for

battery voltage at the fused B(+) circuit cavity of the switch wire harness connector. If OK, go to Step 4. If not OK, repair the open circuit as required.

4. Check for continuity between the ground circuit cavity of the power seat switch and/or power lumbar switch wire harness connector and a good ground. There should be continuity. If OK, go to Step 5. If not OK, repair the open circuit to ground as required.
5. Test the power seat switch and/or power lumbar switch. Refer to **SWITCH, SEAT, DIAGNOSIS AND TESTING** and **SWITCH, LUMBAR CONTROL, DIAGNOSIS AND TESTING**. If the switch tests OK, check the wire harness between the switch and the motor(s) (refer to **SYSTEM WIRING DIAGRAMS**). If the circuits check OK, replace the inoperative power seat track or the seat back assembly (Refer to **SEATS, FRONT** or **SEATS, REAR**). If the circuits are not OK, repair the wire harness as required.

SWITCH, MEMORY

DESCRIPTION

DESCRIPTION

Fig. 4: Memory Switch & Driver Door Trim Panel
Courtesy of CHRYSLER GROUP, LLC

When equipped, the memory seat switch (2) is located on the driver door trim panel (1). The driver seating position can be automatically adjusted for two different driver preference settings using the memory seat switch. The memory seat system is able to store and recall all driver power seat positions (fore/aft, up/down, tilt and recline), driver side power rear view mirror position and the power adjustable steering column position, when equipped. The memory system is also able to store and recall up to twenty radio station presets for two drivers (ten AM and ten FM). The memory system also will store and recall the last station listened to for each driver, even if it is not one of the twenty preset stations.

OPERATION

OPERATION

When one of the two driver memory seat switches is pressed, a resistance signal is sent to the Memory Seat Module (MSM) over the Controller Area Network (CAN) data bus. The MSM is responsible for the 12 volt Direct Current (DC) feed and ground path to the power seat motors.

The MSM receives the memory seat switch set and selection inputs through the CAN bus circuit, along with input signals from the hall effect sensors in the driver side mirror and power adjustable steering column (when equipped), and hardwired input signals from the hall effect sensors mounted in each of the driver power seat motors. The programmed software in the module allow it to know where the driver seat, driver side mirror and power adjustable steering column (when equipped) are located in their designed travel, by the pulse count generated from each hall effect sensor. This way, when a memory switch is pressed, the MSM powers the driver seat, driver side mirror and power adjustable steering column (when equipped), until each correct preset location is achieved. The MSM will prevent seat memory recall function from being initiated if the transmission gear selector lever is not in the Park position or if the driver seat belt is latched. These inputs are monitored by the MSM over the CAN bus.

- A memory setting is saved by pressing the "set" button, then pressing either the memory "1" or "2" button within five seconds of pressing the "set" button.
- A memory setting is recalled by pressing either the memory "1" or "2" button, or by pressing the unlock button on a "linked" Remote Keyless Entry (RKE) transmitter.

The memory seat switch is diagnosed using a scan tool. Refer to **DIAGNOSIS AND TESTING** .

The memory seat switch cannot be adjusted or repaired and must be replaced if damaged or inoperative.

REMOVAL

REMOVAL

NOTE: Take the proper precautions to protect the door handle and bezel from cosmetic damage while performing this procedure.

Fig. 5: Memory Seat Switch & Retaining Tabs
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the driver door handle and place it on a workbench. Refer to **PANEL, DOOR TRIM, REMOVAL** .
3. Using an appropriate flat bladed tool, gently disengage the four retaining tabs (2 and 4) that secure the memory seat switch (1) to the back of the driver door handle bezel (3).
4. Remove the memory seat switch from the driver door handle bezel.

INSTALLATION

INSTALLATION

NOTE: Take the proper precautions to protect the door handle and bezel from cosmetic damage while performing this procedure.

Fig. 6: Memory Seat Switch & Retaining Tabs
Courtesy of CHRYSLER GROUP, LLC

1. Install the memory seat switch (1) into the driver door handle bezel (3). Push the switch firmly into the bezel until the retaining tabs (2 and 4) are fully engaged.
2. Install the driver door handle and bezel. Refer to **PANEL, DOOR TRIM, INSTALLATION** .
3. Reconnect the negative battery cable.
4. Using a scan tool, perform the Power Seat System Verification test. Refer to **STANDARD PROCEDURE** .
5. Verify proper memory seat system operation.

MOTOR, SEAT

REMOVAL

REMOVAL- SEAT HEIGHT ADJUSTMENT MOTOR

WARNING: Disable the airbag system before attempting any component diagnosis or service of the front seats, when equipped with front seat air bags. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.

WARNING: Use caution when removing the height adjust motor and gearbox assembly (2) if the motor is inoperative, and the power seat is not in the full up position. The seat adjuster assembly is under load from the height adjust assist spring and may cause the motor to rotate under pressure

when the fasteners are removed. The seat adjuster assembly also may spring upward when the motor is removed. If the height adjust motor is operative, move the power seat to the full up position prior to disconnecting the battery.

Fig. 7: Height Adjust Motor And Gearbox Assembly
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the inoperative front seat. Refer to **SEAT, REMOVAL** .
3. Disconnect the height adjust motor electrical connector.
4. Remove the height adjust motor gearbox spindle (1) retaining screw (4).
5. Remove the motor retaining screws (3).
6. Remove the height adjust motor and gearbox assembly (2) from the seat track.

REMOVAL- SEAT FORWARD/AFT MOTOR

WARNING: **Disable the airbag system before attempting any component diagnosis or service of the front seats, when equipped with front seat air bags. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.**

Fig. 8: Identifying Power Seat Fore/Aft Motor
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the inoperative front seat. Refer to **SEAT, REMOVAL** .
3. Remove the flex drive cable cover (2).
   a. Using a small flat bladed tool, release the mounting strap (1) that secures the flex drive cable cover (2) to the fore/aft motor (5).
   b. Pivot the cover away from the cable and pull it away from the seat frame (4) to disengage the cover slot from the mounting tab (3).

Fig. 9: Flex Drive Cable
Courtesy of CHRYSLER GROUP, LLC

4. Remove the flex drive cable.

a. Carefully bend the flex drive cable at the center and pull the motor end (3) away from the fore/aft motor (1) to disengage.
b. Pull the cable out of the screw drive assembly (2) and remove from seat track.

Fig. 10: Seat Frame Assembly
Courtesy of CHRYSLER GROUP, LLC

5. Disconnect the fore aft motor electrical connector.
6. Remove the fore/aft motor to mounting bracket retaining screws (1).
7. Remove the fore/aft motor (3).
8. Remove the short flex drive cable (2) from the seat frame assembly (4).

INSTALLATION

INSTALLATION - SEAT FORWARD/AFT MOTOR

WARNING: Disable the airbag system before attempting any component diagnosis or service of the front seats, when equipped with front seat air bags. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions may result in accidental airbag deployment and possible serious or fatal injury.

CAUTION: Seat track side to side timing may be off if the fore aft motor was completely inoperative prior to removal. In the event the track timing is in question, proceed to for track timing procedure. If track timing is not in question proceed to.

1. Using the square drive end of the old flex drive cable and a variable speed drill motor, drive the seat track screw drive assemblies reward until they reach the rear stops.
   a. Clamp one end of the old cable into the drill motor chuck.
   b. Put the other cable end into the seat track screw drive cable slot and slowly drive the seat track assembly reward until it reaches the rear stops. Take care not to bind the cable when the drive reaches the stop.
   c. Repeat this procedure for the other seat track.

81cff6eb

Fig. 11: Removing/Installing Short Flex Drive Cable & Fore/Aft Motor
Courtesy of CHRYSLER GROUP, LLC

2. Install the short flex drive cable (2) into the seat frame assembly (4). Ensure the square cable end is properly aligned and fully inserted into the square drive slot of the screw drive assembly.
3. Install the fore/aft motor (3) ensuring the square cable end is properly aligned and fully inserted into the square drive slot of the motor.
4. Install the motor retaining screws (1). Tighten the screws to 5 N.m (45 in. lbs.).

Fig. 12: Flex Drive Cable
Courtesy of CHRYSLER GROUP, LLC

5. Install the flex drive cable.
   a. Install the flex drive cable into the seat frame assembly (2). Ensure the square cable end is properly aligned and fully inserted into the square drive slot of the screw drive assembly.
   b. Install the flex drive cable into the fore/aft motor (1). Ensure the square cable end is properly aligned and fully inserted into the square drive slot of the motor assembly (3).

Fig. 13: Identifying Power Seat Fore/Aft Motor
Courtesy of CHRYSLER GROUP, LLC

6. Position the flex drive cable cover (2) onto the seat track assembly (4). Ensure the cover slots are properly aligned and fully inserted onto the mounting tabs (3).
7. Pivot the cable cover towards the cable and onto the fore/aft motor (5).

8. Secure the cover to the motor with the retaining strap (1).
9. Connect the fore/aft motor electrical connector.
10. Install the power seat. Refer to **SEAT, INSTALLATION** .
11. Verify proper power seat operation.

INSTALLATION

Fig. 14: Height Adjust Motor And Gearbox Assembly
Courtesy of CHRYSLER GROUP, LLC

1. Screw the height adjust motor gearbox spindle (1) in or out as necessary until the motor retaining screws (3) and spindle screw (4) holes are aligned and all fasteners can be installed.
2. Position the height adjust motor and gearbox assembly (2) onto the seat track.
3. Install the motor retaining screws (3). Tighten the screws to 12 N.m (106 in. lbs.).
4. Install the height adjust motor gearbox spindle (1) retaining screw (4). Tighten the screw to 17 N.m (150 in. lbs.).
5. Connect the motor electrical connector.
6. Install the seat. Refer to **SEAT, INSTALLATION** .
7. Reconnect the negative battery cable.
8. Verify proper power seat operation.

SWITCH, SEAT

DESCRIPTION

DESCRIPTION

Fig. 15: Seat Position Switch & Power Seat Recliner Switch
Courtesy of CHRYSLER GROUP, LLC

NOTE: Driver power seat switch shown.

The standard driver power seat and available power front passenger seats can be adjusted using the power seat switch located on the outboard seat cushion side shield.

The power seat adjuster switch assembly is used for adjusting the front seats (both driver and passenger) position, it could have one or two knobs depending on the different versions (4-way, 6-way, 8-way).

Both the high current and low current versions of the power seat adjuster switch assemblies is to provide a means to electrically adjust the position of the front driver and passenger seats, high current switch feeds the Seat motors directly whilst low current is used in vehicles with Memory Recall feature so the signal travel to an ECU which controls the motors.

OPERATION

OPERATION

When a power seat switch is actuated, a battery feed and a ground path are applied through the switch contacts to the power seat track adjuster motor. The selected adjuster motor operates to move the seat through its drive unit in the selected direction until the switch is released, or until the travel limit of the adjuster is reached. When the switch is moved in the opposite direction, the battery feed and ground path to the motor are reversed through the switch contacts. This causes the adjuster motor to run in the opposite direction.

On vehicles equipped with the memory seat system, the driver memory seat switch provides a resistive signal/input to the Memory Seat Module (MSM). The MSM is responsible for the 12 volt battery feed and ground path to the power seat adjuster motors.

No power seat switch should be held applied in any direction after the adjuster has reached its travel limit. The

power seat adjuster motors each contain a self-resetting circuit breaker to protect them from overload. However, consecutive or frequent resetting of the circuit breaker may result in motor damage.

The individual switches in the power seat switch cannot be adjusted or repaired. If a switch is damaged or inoperative, the entire power seat switch must be replaced.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - POWER SEAT SWITCH

Fig. 16: Power Seat Switch Terminals
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the power seat switch from the power seat. Refer to **SWITCH, SEAT, REMOVAL**.
3. Use an ohmmeter to test the continuity of the power seat switch. If not OK, replace the faulty power seat switch. If switch tests OK, refer to **DIAGNOSIS AND TESTING**.

POWER SEAT SWITCH CONTINUITY

SWITCH POSITION	CONTINUITY BETWEEN
OFF	7-1, 7-3, 7-4, 7-5, 7-8, 7-9, 7-10, 7-11
RECLINER UP	6-3, 7-1, 7-4, 7-5, 7-8, 7-9, 7-10, 7-11
RECLINER DOWN	6-1, 7-3, 7-4, 7-5, 7-8, 7-9, 7-10, 7-11
HORIZONTAL FORWARD	6-8, 7-1, 7-3, 7-4, 7-5, 7-9, 7-10, 7-11
HORIZONTAL REARWARD	6-4, 7-1, 7-3, 7-5, 7-8, 7-9, 7-10, 7-11

REMOVAL

REMOVAL

WARNING: Disable the airbag system before attempting any front seat diagnosis or

service. Disconnect and isolate the negative battery (ground) cable and wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.

Fig. 17: Electrical Connector, Power Seat Switch, Seat Cushion Side Trim Panel & Four Retaining Tabs
Courtesy of CHRYSLER GROUP, LLC

1. Position the seat being serviced all the way forward.
2. Disconnect and isolate the negative battery cable.

NOTE: It is not necessary to remove the seat belt anchor from the seat when servicing the power seat switch.

3. Remove the outboard seat cushion side trim panel (5) from the seat. Refer to **SIDE SHIELDS, SEAT CUSHION, FRONT, REMOVAL** .
4. Using Trim Stick (special tool #C-4755, Trim Stick) or equivalent, carefully disengage the four tabs (2 and 4) that secure the power seat switch (1) to the seat cushion side trim panel.
5. Disconnect the electric connector (3) from the power seat switch and remove the switch.

INSTALLATION

INSTALLATION

Fig. 18: Electrical Connector, Power Seat Switch, Seat Cushion Side Trim Panel & Four Retaining Tabs
Courtesy of CHRYSLER GROUP, LLC

1. Connect the electrical connector (3) to the power seat switch (1). Make sure the connector is fully engaged to the switch.
2. Position the power seat switch to the seat cushion side trim panel (5) and engage the four retaining tabs (2 and 4) that secure the switch to the trim panel. Make sure the retaining tabs are fully engaged.
3. Install the outboard seat cushion side trim panel. Refer to **SIDE SHIELDS, SEAT CUSHION, FRONT, INSTALLATION** .
4. Connect the negative battery cable.
5. Verify proper power seat operation.

SWITCH, LUMBAR CONTROL

DESCRIPTION

DESCRIPTION

2733809

Fig. 19: Power Lumbar Switch
Courtesy of CHRYSLER GROUP, LLC

The Power Lumbar Switch which is located at the side bottom of both driver and front passenger seat. It is used to provide a means to electrically adjust the position of the front driver and passenger seats to make it more comfortable. It is able to adjust the Seat Back Rest Lumbar support forward and Rearward. It is also able to adjust the Lumbar Support position upward and downward. It's a high current switch driving the seat motors directly from battery feed.

There are two available lumbar systems available for this model. Vehicles with Heated and Vented Seats (HVS) receive a motor and cable driver lumbar system. Vehicle with heated seat or no heating or cooled accessories will receive a non-HVS system which involves a pneumatic pump and bladder.

OPERATION

OPERATION

HEATED ONLY OR NON HEATED OR NON VENTED SEAT (non-HVS) LUMBAR SYSTEM - When a power lumbar support switch is actuated, a battery feed and a ground path are applied through the switch contacts to the power lumbar pneumatic pump. The pneumatic pump operates the lumbar support bladder in the selected direction until the switch is released, or until the fill limit of the bladder is reached. When the switch is moved in the opposite direction, the battery feed and ground path to the motor are reversed through the switch contacts. This causes the pneumatic pump motor to run in the opposite direction.

The power lumbar support switch should not be held applied in any direction after the bladder has reached its travel limit. The power lumbar support pneumatic motor contains a self-resetting circuit breaker to protect from overload. However, consecutive or frequent resetting of the circuit breaker may result in motor damage.

The power lumbar switch cannot be adjusted or repaired and must be replaced if damaged or inoperative.

HEATED AND VENTED SEAT SYSTEM (HVS equipped) LUMBAR SYSTEM - When a power lumbar

support switch is actuated, a battery feed and a ground path are applied through the switch contacts to the power lumbar support adjuster. The selected lumbar support adjuster motor operates the lumbar support adjuster mechanism through its drive unit in the selected direction until the switch is released, or until the travel limit of the adjuster is reached. When the switch is moved in the opposite direction, the battery feed and ground path to the motor are reversed through the switch contacts. This causes the selected power lumbar support adjuster motor to run in the opposite direction.

No power lumbar support switch should be held applied in any direction after the adjuster has reached its travel limit. The power lumbar support adjuster motors each contain a self-resetting circuit breaker to protect them from overload. However, consecutive or frequent resetting of the circuit breaker may result in motor damage.

The power lumbar switch cannot be adjusted or repaired and must be replaced if damaged or inoperative.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - POWER LUMBAR SWITCH

NOTE: For complete circuit diagrams, refer to SYSTEM WIRING DIAGRAMS . Wiring Information includes wiring diagrams, connector pin-out and location views, details of wire harness routing and retention, splice and ground locations and proper wire and connector repair procedures.

2834249

Fig. 20: Power Lumbar Switch Connector Terminals
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the power lumbar support switch from the seat. Refer to **SWITCH, LUMBAR CONTROL, REMOVAL**.
3. Use an ohmmeter to test the continuity of the power lumbar support switch using the following table. If not OK, replace the inoperative power lumbar support switch. If switch tests OK, check for an open or short in the power lumbar support circuit wiring. If no open or short is found, replace the power lumbar

support adjuster motor(s) as required.

LUMBAR SWITCH CONTINUITY

SWITCH POSITION	CONTINUITY BETWEEN
OFF	1-2, 1-3, 1-4, 1-5, 2-3, 2-4, 2-5, 3-4, 3-5, 4-5
UP	1-2, 1-3, 1-4, 2-3, 2-4, 3-4, 5-6
DOWN	1-3, 1-4, 1-5, 2-3, 2-4, 2-5, 3-4, 3-5, 4-5
IN	1-2, 1-4, 1-5, 2-6, 3-4, 3-5, 4-5
OUT	2-4, 2-5, 3-6, 4-5

REMOVAL

REMOVAL

WARNING: Disable the airbag system before attempting any front seat diagnosis or service. Disconnect and isolate the negative battery (ground) cable and wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.

Fig. 21: Electrical Connector, Power Lumbar Control Switch, Seat Cushion Side Trim Panel & Four Retaining Tabs
Courtesy of CHRYSLER GROUP, LLC

1. Position the seat being serviced all the way forward.
2. Disconnect and isolate the negative battery cable.

NOTE: It is not necessary to remove the seat belt anchor from the seat when

servicing the power lumbar control switch.

3. Remove the outboard seat cushion side trim panel (5) from the seat. Refer to **SIDE SHIELDS, SEAT CUSHION, FRONT, REMOVAL** .
4. Using Trim Stick (special tool #C-4755, Trim Stick) or equivalent, carefully disengage the four tabs (2 and 4) that secure the lumbar control switch (1) to the seat cushion side trim panel.
5. Disconnect the electric connector (3) from the lumbar control switch and remove the switch.

INSTALLATION

INSTALLATION

Fig. 22: Electrical Connector, Power Lumbar Control Switch, Seat Cushion Side Trim Panel & Four Retaining Tabs
Courtesy of CHRYSLER GROUP, LLC

1. Connect the electrical connector (3) to the power lumbar control switch (1). Make sure the connector is fully engaged to the switch.
2. Position the lumbar control switch to the seat cushion side trim panel (5) and engage the four retaining tabs (2 and 4) that secure the switch to the trim panel. Make sure the retaining tabs are fully engaged.
3. Install the outboard seat cushion side trim panel. Refer to **SIDE SHIELDS, SEAT CUSHION, FRONT, INSTALLATION** .
4. Connect the negative battery cable.
5. Verify proper power lumbar support operation.

2014 ACCESSORIES AND EQUIPMENT

Power Top/Sunroof - Service Information - Cherokee

DESCRIPTION

DUAL PANE SUNROOF

The optional dual pane (also known as the CommandView®) sunroof has one movable deep tinted glass pane over the front row seating and one fixed deep tinted glass pane over the second row seating. This unit also features a power operated sunshade that extends over both the front and rear glass panes when closed. If one of the switch push buttons for the movable pane is actuated while the sunshade is extended over the front glass opening, the system will automatically retract the sunshade to behind the front glass opening before moving the sunroof glass pane. Therefore, the sunshade can never cover the movable glass pane opening unless the pane is in the fully closed position.

The dual pane power sunroof system allows the sliding glass sunroof panel to be opened, closed or placed in a ventilation position electrically by actuating one of three switch push buttons located in the overhead console. The electronic controls integral to the sunroof motor and module unit provide an express (also known as one-touch) feature to simplify sunroof opening and closing while driving. The electronics also provide an Excess Force Limitation (EFL) feature, which detects obstacles trapped between the glass and the opening in the vehicle roof panel during closing.

A second two push button switch in the overhead console provides separate express features for opening and closing the sunshade. The power operated sunshade electronics also provide an EFL feature, which detects obstacles trapped between the sunshade and the opening in the vehicle roof panel during closing.

The sliding sunroof glass panel tilts upward at the rear for the ventilation position, or slides downward and rearward beneath the fixed glass panel for the open position. The sliding glass panel seals flush with the roof in the closed position to eliminate wind noise, and an integrated mesh wind deflector reduces wind buffeting at low speeds with the sunroof open.

The major components of the dual pane power sunroof system include:

- **Fixed Glass Panel** - Refer to **SUNROOF, DUAL PANE, DESCRIPTION** .
- **Frame and Mechanism** - Refer to **SUNROOF, DUAL PANE, DESCRIPTION** .
- **Motor And Electronic Module Units** - The dual pane power sunroof and power sunshade motor and electronic module units are secured to each side of center on the front frame member of the sunroof, between the outer roof panel and the headliner.
- **Power Sunshade** - Refer to **SUNROOF, DUAL PANE, DESCRIPTION** .
- **Sliding Glass Panel** - Refer to **SUNROOF, DUAL PANE, DESCRIPTION** .
- **Switches** - The dual pane power sunroof and power sunshade switches are integral to the overhead console centered in the headliner between the windshield upper header and the front of the sunroof opening.
- **Wind Deflector** - Refer to **SUNROOF, DUAL PANE, DESCRIPTION** .

Hard wired circuitry connects the dual pane power sunroof system components to the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the dual pane power sunroof system components through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

OPERATION

DUAL PANE SUNROOF AND SUNSHADE

The dual pane power sunroof sliding glass panel and power sunshade motors both receive battery feed through a fused B(+) circuit from the Power Distribution Center (PDC). However, the on-board electronic module of each sunroof or sunshade motor monitors an input on a fused ignition (run - accessory) circuit and is configured to only allow the power sunroof and the power sunshade to be operated with the switches in the overhead console when the ignition switch is in the ON or ACCESSORY positions, or using the accessory delay feature for a timed interval after the ignition is turned to the OFF position as long as neither front door has been opened.

The electric motor and electronic module unit of the sunroof or sunshade moves the sliding glass panel or the sunshade through the use of mechanical drive cables as well as mechanical linkages and guides. Refer to **SUNROOF, DUAL PANE, DESCRIPTION** for additional information on these components..

The on-board electronic modules integral to the power sunroof and sunshade motors provide both express (also known as one-touch) and manual opening and closing for their respective motors based upon module programming and the inputs received from the sunroof and sunshade switches integral to the overhead console. The electronic modules store and recall a sliding glass panel or a power sunshade hard stop position, then counts the direction and number of motor rotations from that hard stop to enable the express open and close features. These hard stops must be learned by a service replacement motor and electronic module unit during an initialization procedure.

In addition, the electronic modules are programmed to move only one motor at a time. The two motors communicate switch input information as well as sunroof and sunshade position information with each other through a serial bus circuit, but do not communicate with any other electronic modules in the vehicle. The electronic modules are programmed to move the sunshade out of the way into a safe mid-open position automatically before allowing the sliding glass panel to move. Likewise, if the sunshade switch is depressed to close the sunshade while the sliding glass panel is in an open position, the electronic modules are programmed to automatically close the glass panel before closing the sunshade.

The electronic modules also provide an obstacle detection (also known as Excess Force Limitation/EFL) feature for both the sliding glass panel and the sunshade. The modules each monitor motor closing load through motor speed. When an obstacle is detected due to a significant decrease in motor speed, the module will stop the motor closing motion while limiting the forces applied to the obstacle, then reverse the motor direction to allow the obstacle to be removed.

The electronic modules provide a thermal protection feature to protect the motors from abuse or overheating. If

the motor is cycled enough to cause overheating, the software will allow one final closing cycle before it stops responding to further switch inputs. Once a motor has cooled sufficiently, normal operation will be automatically restored. However, the ignition switch must remain in the ON or ACCESSORY positions so that the module remains awake long enough to monitor the cool down of the motor.

The power sunroof and sunshade circuits and switches may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the on-board electronic modules or the power sunroof and power sunshade motors. If there are no issues with the power sunroof and sunshade mechanisms and the power sunroof or power sunshade switches and circuitry test okay, but the motor and express or EFL features are still ineffective following the initialization procedure, the motor and electronic module unit must be replaced.

STANDARD PROCEDURE

STANDARD PROCEDURE - DRIVE MOTOR TEACH PROCEDURE

REPLACEMENT DRIVE MOTOR

1. Operate the sunroof manually and continuously through one full Vent and Slide cycle.
2. After completion of complete cycle, release sunroof switch. Sunroof will now operate normally.
3. Verify sunroof express function operation.

ORIGINAL DRIVE MOTOR

1. Press and hold sunroof Vent switch until the sunroof glass vents and stops.
2. Release sunroof switch.
3. Press and hold sunroof Vent switch once again for at least 15 seconds. After 15 seconds of pressing the Vent switch, the sunroof glass will automatically move and stop at a new location.
4. Release sunroof switch.
5. Operate the sunroof manually and continuously through one full Vent and Slide cycle.
6. After completion of complete cycle, release sunroof switch. Sunroof will now operate normally.
7. Verify sunroof express function operation.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - POWER SUNROOF SYSTEM

The hard wired circuits between components related to the operation of the single pane power sunroof system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the electronic module

integral to the power sunroof motor. If the power sunroof switches, motors and circuitry test okay, but the express or Excess Force Limitation (EFL) features are still ineffective following the calibration and initialization procedures, the motor and module unit must be replaced.

NOTE: **If there is no sliding sunroof panel movement when the power sunroof switch OPEN or CLOSE push button is depressed, but there is movement when the VENT push button is depressed, the sunroof module requires calibration. Complete the Single Pane Sunroof Motor And Module Initialization procedure prior to performing any further sunroof diagnosis. Refer to MOTOR, SUNROOF, STANDARD PROCEDURE.**

CONDITION	POSSIBLE CAUSES	CORRECTION
POWER SUNROOF COMPLETELY INOPERATIVE	1. Ineffective ground circuit.	1. Test and repair the open sunroof motor ground circuit if required.
	2. Ineffective feed circuit.	2. Test and repair the open sunroof motor feed circuit if required.
	3. Ineffective sunroof switch.	3. Test and replace the sunroof switch (overhead console assembly) if required.
	4. Ineffective sunroof motor and module unit.	4. Replace the sunroof motor and module unit if required.
AUDIBLE WHINE WHEN POWER SUNROOF SWITCH IS ACTUATED	1. Binding drive cable.	1. Replace the binding drive cable if required.
	2. Ineffective sunroof motor and module unit.	2. Replace the sunroof motor and module unit if required.
AUDIBLE CLICKING OR RATCHETING WHEN POWER SUNROOF SWITCH IS ACTUATED	1. Improperly adjusted sliding glass panel.	1. Adjust the sunroof glass panel if required. Refer to **ADJUSTMENTS** or **ADJUSTMENTS** .
	2. Damaged or worn drive cable.	2. Replace the broken or worn drive cable if required.
	3. Damaged or worn motor drive gear.	3. Replace the sunroof motor and module unit if required.
POWER SUNROOF VENTS AND OPENS BUT DOES NOT CLOSE	1. Damaged or disengaged trough guide.	1. Replace or reinstall trough guide if required.
	2. Binding drive cable.	2. Replace the binding drive cable if required.
	3. Ineffective CLOSE circuit.	3. Repair the sunroof CLOSE circuit between the switch and the motor if required.
	4. Ineffective sunroof switch.	4. Test and replace the sunroof switch (overhead console assembly) if required.
	5. Ineffective sunroof motor and module unit.	5. Replace the sunroof motor and module unit if required.
	1. Binding drive cable.	1. Replace the binding drive cable if required.

POWER SUNROOF VENTS AND CLOSES BUT DOES NOT OPEN	2. Ineffective OPEN circuit.	2. Repair the sunroof OPEN circuit between the switch and the motor if required.
	3. Ineffective sunroof switch.	3. Test and replace the sunroof switch (overhead console assembly) if required.
	4. Ineffective sunroof motor and module unit.	4. Replace the sunroof motor and module unit if required.
POWER SUNROOF DOES NOT VENT	1. Binding drive cable.	1. Replace the binding drive cable if required.
	2. Ineffective VENT circuit.	2. Repair the sunroof VENT circuit between the switch and the motor if required.
	3. Ineffective sunroof switch.	3. Test and replace the sunroof switch (overhead console assembly) if required.
	4. Ineffective sunroof motor and module unit.	4. Replace the sunroof motor and module unit if required.
POWER SUNROOF GLASS MOVEMENT INCONSISTENT - NOT SMOOTH AND UNIFORM	1. Improperly adjusted sliding glass panel.	1. Adjust the sunroof glass panel if required. Refer to **ADJUSTMENTS** or **ADJUSTMENTS** .

MOTOR, SUNROOF

DESCRIPTION

DESCRIPTION

Fig. 1: Single Pane Sunroof Motor
Courtesy of CHRYSLER GROUP, LLC

Fig. 2: Dual Pane Sunroof Or Sunshade Motor
Courtesy of CHRYSLER GROUP, LLC

The motor and electronic module units for both the single pane sunroof and the dual pane sunroof or sunshade are quite similar, but are not interchangeable. However, the dual pane sunroof and sunshade motor and module units are interchangeable and configure themselves to either sunroof or sunshade operation through a configuration pin in the sunshade connector of the sunroof wire harness. Each sunroof motor (5) is a reversible, 12-volt Direct Current (DC), permanent magnet motor with internal thermal protection.

The single panel sunroof has a single motor and electronic module unit secured by three screws near the center of the underside of the front sunroof frame member where it is concealed above the headliner. The dual pane sunroof has two motor and electronic modules, each secured by three screws to the underside of the front sunroof frame member and concealed above the headliner. The motor to the left of center operates the sliding

glass mechanism, while the motor to the right of center operates the power sunshade mechanism.

Each motor is connected mechanically to the sunroof or sunshade drive gear (4) through a right angle drive, gear reduction transmission (3). Each motor also is connected electrically to an on-board electronic control unit (2) that has an integral connector receptacle (1) that connects the unit to the vehicle electrical system through a dedicated take out and connector of the sunroof wire harness.

The sunroof motor or sunshade motor and electronic module units cannot be repaired. If ineffective or damaged, the entire motor and module unit must be replaced.

OPERATION

OPERATION

The single pane and dual pane power sunroof and power sunshade motors are each completely controlled by the circuitry of their respective on-board electronic module. The module receives battery current on a fused B(+) circuit from the Power Distribution Center (PDC) and has a path to ground at all times through a take out and eyelet terminal connector secured by a ground screw to the body sheet metal. These connections allow the module to function regardless of the ignition switch position.

However, the modules both monitor an input on a fused ignition switch output (run - accessory) circuit, and provide a source current to the sunroof and sunshade switches in the overhead console only when the ignition switch is in the ON or ACCESSORY positions, or while the accessory delay feature is active. The modules then monitor a separate input circuit for each switch position, which it uses to determine the proper outputs to the power sunroof or power sunshade motor. A positive and negative battery connection to the two motor brushes will cause the power sunroof or sunshade motor to rotate in one direction. Reversing the current through these same two brushes will cause the motor to rotate in the opposite direction.

The hard wired circuits of the power sunroof and power sunshade motors as well as those between the electronic modules and switches may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the electronic module integral to the power sunroof and power sunshade motors. If the power sunroof or power sunshade switches and the hard wired circuitry test okay, but the motor or the express or Excess Force Limitation (EFL) features are still ineffective following the calibration and initialization procedures, the motor and module must be replaced as a unit.

STANDARD PROCEDURE

DUAL PANE SUNROOF OR SUNSHADE OVERRIDE POSITION CALIBRATION

SLIDING GLASS

The sliding glass panel motor stalls when the glass reaches the fully vented position and the electronic motor module learns that position (hard stop), then counts the number of motor rotations to know where the fully closed and fully open positions of the glass are located. The following procedure causes a previously calibrated and properly operating electronic motor module to relearn the fully vented motor stall position.

1. Be certain electrical system voltage is at or above 12.5 volts.
2. Be certain the key is in the ignition switch and the switch is in the ON position.
3. Be certain the power sunshade is open at least beyond the back of the sliding glass panel opening.
4. Depress and hold the VENT push button of the sunroof switch until the sliding glass panel is in the fully vented position or until the motor will not drive the glass any further towards the fully vented position.
5. Open the driver side front door.
6. Turn the ignition switch to the OFF position.
7. Within 2 seconds, turn the ignition switch back to the ON position.
8. Within 2 seconds, depress and hold the VENT push button of the sunroof switch for about ten seconds. At the end of ten seconds, the motor will try to drive the sliding glass panel to the fully vented position. Once motor stall is detected the electronic module will write that stall position to memory as the new glass position.
9. Verify sliding glass panel motor operation by cycling the glass to fully opened, fully closed, fully vented, then fully closed again.

SUNSHADE

The sunshade motor stalls when the shade reaches the fully closed position and the electronic motor module learns that position (hard stop), then counts the number of motor rotations to know where the mid-opened and fully opened positions of the shade are located. The following procedure causes a previously calibrated and properly operating electronic motor module to relearn the fully closed motor stall position.

1. Be certain electrical system voltage is at or above 12.5 volts.
2. Be certain the key is in the ignition switch and the switch is in the ON position.
3. Be certain the sliding glass panel is in the fully closed position.
4. Depress and hold the CLOSE push button of the sunshade switch until the shade is in the fully closed position or until the motor will not drive the shade any further towards the fully closed position.
5. Open the driver side front door.
6. Turn the ignition switch to the OFF position.
7. Within 2 seconds, turn the ignition switch back to the ON position.
8. Within 2 seconds, depress and hold the CLOSE push button of the sunshade switch for about ten seconds. At the end of ten seconds, the motor will try to drive the shade to the fully closed position. Once motor stall is detected, the electronic module will write that stall position to memory as the new shade position.
9. Verify sunshade motor operation by cycling the shade to mid-opened, fully opened, then fully closed again.

DUAL PANE SUNROOF OR SUNSHADE OBSTACLE DETECTION UPDATE

The obstacle detection function (also known as Excessive Force Limitation/EFL) updates the sunroof sliding glass panel and sunshade closing profiles after each successful CLOSE event as long as temperature and voltage are within a normal range. Being certain that these parameters are within range and cycling the sliding glass panel and sunshade will update the obstacle detection settings in the electronic module software.

- Be certain electrical system voltage is at or above 12.5 volts.
- Be certain vehicle is in an area that is near room temperature - 20 to 25° C (68 to 77° F).
- Be certain the key is in the ignition switch and the switch is in the ON position.
- Be certain there are no physical binds or blockages to sliding glass panel or sunshade travel.

SLIDING GLASS

1. Be certain the power sunshade is in the fully open position.
2. Depress the VENT push button of the sunroof switch so that the sliding glass panel travels to the fully vented position.
3. Depress the CLOSE push button of the sunroof switch so that the sliding glass panel travels to the fully closed position.
4. Depress the OPEN push button of the sunroof switch so that the sliding glass panel travels to the fully opened position.
5. Depress the CLOSE push button of the sunroof switch so that the sliding glass panel travels to the fully closed position.
6. Repeat Steps 2 through 5 for at least 5 complete sliding glass panel cycles (VENT, CLOSE, OPEN, CLOSE).

SUNSHADE

1. Be certain the sunroof sliding glass is in the fully closed position.
2. Depress the OPEN push button of the sunshade switch so that the shade travels to the mid-open position.
3. Depress the OPEN push button of the sunshade switch again so that the shade travels to the fully opened position.
4. Depress the CLOSE push button of the sunshade switch so that the shade travels to the fully closed position.
5. Repeat Steps 2 through 4 for at least 5 complete sunshade panel cycles (MID-OPEN, FULL-OPEN, CLOSE).

SUNROOF MOTOR AND MODULE INITIALIZATION

SINGLE PANE SUNROOF

INITIALIZATION

A new motor is shipped uncalibrated with no vehicle cycles having been run. After installation and connection of the wire harness, the following steps must be taken to initialize the new motor and module unit.

NOTE: **Verify that the battery is in good condition prior to performing this procedure. Do not leave the vehicle on a battery charger while performing this procedure. If the voltage at the sunroof motor and module unit drops below 11 volts or exceeds 15 volts at anytime while this procedure is being performed, the motor and module initialization procedure will not be properly completed.**

NOTE: If at any point during the following procedure the sunroof does not respond as expected, restart the procedure at Step 1.

1. Depress and hold the CLOSE push button of the sunroof switch until the sunroof sliding glass panel moves to the fully closed hard stop and then back to the tilt (VENT) position.
2. Release the CLOSE push button of the sunroof switch, then depress and hold the CLOSE push button again within 5 seconds.
3. As the CLOSE push button of the sunroof switch is held, the sunroof sliding glass panel will move to the fully closed position, then to the fully opened position and then fully closed again.
4. Initialization is complete. Release the sunroof switch push button.

REINITIALIZATION

The following procedure causes a previously calibrated and properly operating electronic motor module to relearn and update motor stall position and obstacle detection.

NOTE: If at any point during the following procedure the sunroof does not respond as expected, restart the procedure at Step 1.

1. Depress and hold the CLOSE push button of the sunroof switch until the sliding glass panel is fully closed.
2. Continue to hold the CLOSE push button of the sunroof switch. It will take at least 10 seconds for the initialization process to begin.
3. The sunroof sliding glass panel will move to the hard stop and then back to the tilt (VENT) position.
4. Release the CLOSE push button of the sunroof switch, then depress and hold the CLOSE push button again within 5 seconds.
5. As the CLOSE push button of the sunroof switch is held, the sunroof sliding glass panel will move to the fully closed position, then to the fully opened position and then fully closed again.
6. Initialization is complete. Release the sunroof switch push button.

DUAL PANE SUNROOF

A new motor is shipped uncalibrated with no vehicle cycles having been run. After installation and connection of the wire harness, the following steps must be taken to initialize the new motor and module unit.

NOTE: Verify that the battery is in good condition prior to performing this procedure. Do not leave the vehicle on a battery charger while performing this procedure. If the voltage at the sunroof motor and module unit drops below 11 volts or exceeds 15 volts at anytime while this procedure is being performed, the motor and module initialization procedure will not be properly completed.

SUNROOF

1. Turn the ignition switch to the ON position.

2. Depress and hold the VENT push button of the sunroof switch until the sliding glass panel has moved to the fully vented position.
3. Be certain that the sunshade has opened to at least beyond the back of the sliding glass panel opening before finishing the sunroof motor and module initialization.
4. Depress the VENT push button of the sunroof switch and release. The sliding glass panel should travel to the fully vented position.
5. Depress the CLOSE push button of the sunroof switch and release. The sliding glass panel should travel past the fully closed position, then reverse direction back to fully closed to set the sunroof seal.
6. Depress the OPEN push button of the sunroof switch and release. The sliding glass panel should travel to the fully opened position.
7. Depress the CLOSE push button of the sunroof switch and release. The sliding glass panel should travel to the fully closed position.
8. Repeat Steps 4 through 7 for at least 5 complete sliding glass panel cycles (VENT, CLOSE, OPEN, CLOSE).

SUNSHADE

1. Turn the ignition switch to the ON position.
2. Depress and hold the CLOSE push button of the sunroof switch until the sliding sunshade panel has moved to the fully closed position.
3. Be certain that the sunroof sliding glass panel is in the fully closed position before finishing the sunshade motor and module initialization.
4. Depress the OPEN push button of the sunshade switch and release. The sunshade panel should travel to the mid-open position at least beyond the back of the sliding glass panel opening.
5. Depress the OPEN push button of the sunshade switch again and release. The sunshade panel should travel to the fully opened position.
6. Depress the CLOSE push button of the sunshade switch and release. The sunshade panel should travel to the fully closed position.
7. Repeat Steps 4 through 6 for at least 5 complete sunshade panel cycles (MID-OPEN, FULL-OPEN, CLOSE).

SUNROOF OR SUNSHADE OBSTACLE DETECTION REVERSAL OVERRIDE

SINGLE PANE

There are two methods for overriding the obstacle detection feature if the single pane sunroof sliding glass is unable to close due to a known blockage condition (ice, leaves, debris in track).

OVERRIDE - METHOD 1

Depress and hold the CLOSE push button of the sunroof switch during the close. The sunroof will be in override mode during the close.

OVERRIDE - METHOD 2

Once the sunroof encounters and reverses on an obstacle during express (one touch) closing three consecutive times, the sunroof will be in override mode. All push button commands will be in manual mode (no one-touch or express mode) while the obstacle detection feature is in override mode.

EXITING OVERRIDE MODE

Any sunroof obstacle detection override mode is exited by reaching the close position. Once the override has been exited, all normal operations will resume including the obstacle detection feature.

DUAL PANE

There are two methods for overriding the obstacle detection feature if the dual pane sunroof sliding glass panel or sunshade is unable to close due to a known blockage condition (ice, leaves, debris in track).

OVERRIDE - METHOD 1

Depress and hold the CLOSE push button of the sunroof or sunshade switch during the initial close, during the reversal and for 2 seconds after the reversal stops. If the CLOSE push button is released at any time between the initial close and the end of the 2 seconds after the reversal stops, the sunroof or sunshade will not enter override mode. Once the CLOSE push button has been held through these events, the sunroof or sunshade will be in primary override mode. All CLOSE push button commands will be in manual mode (no one-touch or express mode) while the obstacle detection feature is in primary override mode.

OVERRIDE - METHOD 2

Once the sunroof or sunshade encounters and reverses on an obstacle during closing three consecutive times with no other sunroof or sunshade push button switches being depressed, the fourth time the CLOSE push button is depressed, the sunroof or sunshade will be in override mode. All push button commands will be in manual mode (no one-touch or express mode) while the obstacle detection feature is in override mode.

EXITING OVERRIDE MODE

Any sunroof or sunshade obstacle detection override mode is exited by either reaching the close position or by depressing any sunroof or sunshade switch push button except CLOSE to remove the obstacle. Once the override has been exited, all normal operations will resume including the obstacle detection feature.

REMOVAL

REMOVAL

WARNING: **Do not attempt to move or reposition the sunroof glass panel or drive cables with the sunroof motor and module unit removed. Damage to the vehicle, to the sunroof or personal injuries may result.**

WARNING: **The Sunroof Motor And Module Initialization procedure must be completed any time a sunroof motor and module unit is replaced with a new component. Failure to perform this procedure may result in damage**

to the vehicle, to the sunroof or in serious or fatal injuries.

Fig. 3: Headliner, Bracket, Module Unit, Screws & Module Connector Receptacle
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Lower the headliner (1) from the inner roof panel. Refer to **HEADLINER, REMOVAL** .
3. Remove the three screws (2) that secure the motor and module to the sunroof frame.
4. Lower the motor and module unit far enough to access and disconnect the sunroof wire harness connector from the motor and module connector receptacle (3).
5. Remove the sunroof motor and module unit from the vehicle.

INSTALLATION

INSTALLATION

WARNING: **Do not attempt to move or reposition the sunroof glass panel or drive cables with the sunroof motor and module unit removed. Damage to the vehicle, to the sunroof or personal injuries may result.**

WARNING: **The Sunroof Motor And Module Initialization procedure must be completed any time a sunroof motor and module unit is replaced with a new component. Failure to perform this procedure may result in damage to the vehicle, to the sunroof or in serious or fatal injuries.**

Fig. 4: Headliner, Bracket, Module Unit, Screws & Module Connector Receptacle
Courtesy of CHRYSLER GROUP, LLC

1. Position the sunroof motor and module unit (4) close enough to the sunroof frame to access and reconnect the sunroof wire harness connector to the motor and module connector receptacle (3).
2. Position the motor and module through the headliner bracket opening and onto the sunroof frame.
3. Install and tighten the three screws (2) that secure the motor and module to the sunroof frame. Tighten the screws to 4 N.m (35 in. lbs.).
4. Reinstall the headliner (1) to the inner roof panel. Refer to **HEADLINER, INSTALLATION** .
5. Reconnect the battery negative cable.
6. Perform the Sunroof Motor And Module Initialization standard procedure. Refer to **MOTOR, SUNROOF, STANDARD PROCEDURE**.

SWITCH, SUNROOF

DESCRIPTION

DESCRIPTION

Fig. 5: Overhead Console Components
Courtesy of CHRYSLER GROUP, LLC

Vehicles equipped with a power sunroof have a power sunroof switch (3) integral to the overhead console (1) located in the headliner just forward of the sunroof opening. The switch buttons are centered between the two map/reading lamps (4), forward of the sunglasses storage bin (5) and, if equipped, rearward of the universal transmitter (Homelink®) push buttons (2). This switch has three momentary push buttons clearly identified by either text or icons indicating their functions. The three functions are from front-to-back: AUTO (CLOSE), VENT and AUTO (OPEN). The switch push buttons also have instrument panel dimmer controlled Light Emitting Diode (LED) units that provide back lighting for visibility at night.

The power sunroof switch is connected to the vehicle electrical system through the printed circuit board of the overhead console, which is connected to a dedicated take out and connector of the overhead wire harness. If the switch is ineffective or damaged, the entire overhead console must be replaced.

OPERATION

OPERATION

The power sunroof switch is hard wired to the electronic module integral to the power sunroof motor. The electronic module provides the switch with a source current whenever the status of the ignition switch is ON or ACCESSORY. When one of the switch push buttons is depressed, it sends a signal back to the electronic module and the electronic module controls the motor to move the sunroof panel to the appropriate position.

A short duration (less than 800 milliseconds) press of the switch push button is interpreted by the electronic module as an AUTO (also known as express or one touch) command, where the motor will automatically move the glass panel to the fully open, fully closed or the ventilation position. A long duration (greater than 800 milliseconds) press of the push button is interpreted by the electronic module as a manual command, where the motor moves only as long as the push button is held in the depressed position. During an AUTO event, any new switch input will immediately stop the event in progress which, as in the manual mode, allows the customer to stop the sliding glass panel at any desired location.

The power sunroof switch may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - POWER SUNROOF SWITCH

Fig. 6: Overhead Console Wire Harness Connector End View
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the overhead console from the headliner. Refer to **CONSOLE, OVERHEAD, FRONT, REMOVAL** .
3. Disconnect the overhead wire harness connector from the overhead console connector receptacle.
4. Using a multimeter, test the continuity between the terminals of the overhead console connector receptacle while actuating the power sunroof switch as shown in the Sunroof Switch Tests chart .

SUNROOF SWITCH TESTS	
SWITCH POSITION	**CONTINUITY BETWEEN PINS**
NO BUTTONS PRESSED (OFF)	NO CONTINUITY BETWEEN PINS 7, 8 or 9 and PIN 10
AUTO (OPEN)	7 and 10
AUTO (CLOSE)	9 and 10
VENT	8 and 10

5. If the switch fails any of the tests, replace the overhead console and the switch as a unit.

REMOVAL

REMOVAL

The power sunroof switch is serviced only as a unit with the overhead console. Refer to **CONSOLE, OVERHEAD, FRONT, REMOVAL** .

INSTALLATION

INSTALLATION

The power sunroof switch is serviced only as a unit with the overhead console. Refer to **CONSOLE, OVERHEAD, FRONT, INSTALLATION** .

2014 ACCESSORIES AND EQUIPMENT

Power Windows - Service Information - Cherokee

DESCRIPTION

DESCRIPTION

The power window system allows each of the door windows to be raised and lowered electrically by actuating a switch on the trim panel of each respective door. A master switch on the driver side front door trim panel allows the driver to raise or lower each of the passenger door windows, and to lock out the individual switches on the passenger doors from operation. The power window system receives battery feed only when the ignition switch is in the RUN or ACCESSORY position. The power window system will also operate when in power accessory delay

Vehicles equipped with Express Up Windows are equipped with a door module. Refer to **OPERATION** for further information.

Vehicle equipped with One Touch Down (OTD) employ a Smart Window Motor. Refer to **OPERATION** for further information.

For service of mechanical components, such as the regulator, lift plate, window tracks, or glass refer to **BODY - INTERIOR & EXTERIOR** .

OPERATION

OPERATION

Power Window Switch - The power windows are controlled by a window/lock switch on the trim panel of each front door. Switches in the driver door window/lock switch allows the driver to control the passenger windows. The power window switch for the driver side front door window has a second detent position beyond the normal Down position, that provides an automatic one-touch window down feature. Some vehicles may be equipped with an express closing feature (front windows only). During an express closing, anytime an obstacle is detected in the way of the glass, the motor will stop and reverses travel to avoid pinching an occupant fingers. Modules in the doors are programmed to compare the position of the glass to the amount of current being used to drive up the glass. The system also includes various features to manage the perceived forces on the glass as it travels up. If the express closing calibration is lost, the system will self-calibrate itself after the windows are moved up and down two cycles. The power window switches control the battery and ground feeds to the power window motors. All passenger door power window switches receive their battery and ground feeds through the circuitry of the window/lock switch. When the power window lockout switch is in the Lock position, the battery feed for the individual passenger door power window switches is interrupted. Please review the power window switch service information for further operation detail. Refer to **SWITCH, POWER WINDOW, DESCRIPTION**.

Door Control Modules (DCM) - The (Driver Door Module (DDM) and Passenger Door Module (PDM)) opens or closes the windows when a actuation input signal from the window switch is received. This is only

powered when the ignition switch is in the RUN or ACCESSORY position. Power is supplied to the modules through the Power Distribution Center (PDC). For further DCM/DDM/PDM operation, refer to **MODULE, DOOR, DESCRIPTION** .

Power Window Motor - A permanent magnet reversible motor moves the window regulator through an integral gearbox mechanism. A positive and negative battery connection to the two motor terminals will cause the motor to rotate in one direction. Reversing the current through these same two connections will cause the motor to rotate in the opposite direction. Each individual motor is grounded through the master switch. In addition, each power window motor is equipped with an integral self-resetting circuit breaker to protect the motor from overloads. The power window motor and gearbox assembly cannot be adjusted or repaired. If damaged or ineffective, the entire unit must be replaced. Refer to **MOTOR, WINDOW REGULATOR, REMOVAL**.

EXPRESS UP/DOWN WINDOW FEATURE

Express operation is time-driven. If the window button is pressed for more than 50 milliseconds but less than 800 milliseconds, the window motor activates express operation. The smart motors will ignore any switch input lasting longer than 15 seconds. Vehicles may be equipped with either express down or express up and down.

EXPRESS AUTO-UP FEATURE WITH ANTI-PINCH PROTECTION

AUTO-Up Feature With Anti-Pinch Protection - If Equipped Lift the window switch to the second detent, release, and the window will go up automatically. To stop the window from going all the way up during the AUTO-up operation, push down on the switch briefly. To close the window part way, lift the window switch to the first detent and release it when you want the window to stop.

Anti-Pinch Functionality - The Anti-Pinch strategy is only active after the system has been initialized. This function will work during manual and express window functions. If the window runs into any obstacle during auto-closure, it will reverse direction and then go back down. Remove the obstacle and use the window switch again to close the window. Any impact due to rough road conditions may trigger the auto-reverse function unexpectedly during auto-closure. If this happens, pull the switch lightly to the first detent and hold to close the window manually.

EXPRESS DOWN WINDOW FEATURE

This feature allows the driver or front passenger to lower the door glass to its full-down position without holding the switch while the glass is in motion. To activate the Expess-down feature depress the window switch to its second detent and release, the door glass will lower automatically. This feature may also be controlled and allows you to remotely lower both front door windows at the same time. To use this feature, press and release the UNLOCK button on the Remote Keyless Entry (RKE) transmitter and then immediately press and hold the UNLOCK button until the windows lower to the desired level or until they lower completely.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - POWER WINDOWS

For complete circuit diagrams, refer to SYSTEM WIRING DIAGRAMS .

ALL WINDOWS INOPERATIVE

1. Check the circuit breaker. If OK, go to Step 2. If not OK, replace the inoperative circuit breaker.
2. Disconnect and isolate the battery negative cable. Remove the window/lock switch from the driver side front door trim panel. Unplug the wire harness connector.
3. Check for continuity between the ground circuit cavity of the door module wire harness connector and a good ground. If OK, go to Step 4. If not OK, repair the circuit to ground as required.
4. Connect the battery negative cable. Turn the ignition switch to the On position. Check for battery voltage at the fused ignition switch output (run) circuit cavity of the window/lock switch wire harness connector. If OK, refer to **SWITCH, LOCK, DIAGNOSIS AND TESTING** . If not OK, repair the circuit as required.

ONE WINDOW INOPERATIVE

The window glass must be free to slide up and down for the power window motor to function properly. If the glass is not free to move up and down, the motor will overload and trip the integral circuit breaker. To determine if the glass is free, disconnect the regulator from the glass. Then slide the window up and down by hand.

There is an alternate method to check if the glass is free. Position the glass between the up and down stops. Then, shake the glass in the door. Check that the glass can be moved slightly from side to side, front to rear, and up and down. Then check that the glass is not bound tight in the tracks. If the glass is free, proceed with the diagnosis that follows. If the glass is not free, determine the cause of the condition.

If the only inoperative window is in the driver or passenger side front door and the preceding checks have not identified a problem. Refer to **MOTOR, WINDOW REGULATOR, DIAGNOSIS AND TESTING**. If the problem being diagnosed involves only the Auto-down feature for the driver side front door window, but all of the power windows are operational, replace the driver's side window/lock switch. For diagnosis of the window/lock switch, refer to **SWITCH, LOCK, DIAGNOSIS AND TESTING** . For a rear power window problem, proceed with the following:

1. Disconnect and isolate the battery negative cable. Unplug the wire harness connector from the power window switch unit on the door with the inoperative power window. Check for continuity between the ground circuit cavity of the power window switch wire harness connector and a good ground. There should be continuity. If OK, go to Step 2. If not OK, repair the open circuit to the power window and door lock master switch as required.
2. Connect the battery negative cable. Turn the ignition switch to the On position. Check for battery voltage at the fused ignition switch output (run) circuit cavity in the body half of the power window switch unit wire harness connector. If OK, go to Step 3. If not OK, repair the open circuit to the power window and door lock master switch as required.
3. Test the power window switch continuity. Refer to **SWITCH, POWER WINDOW, DIAGNOSIS AND TESTING**. If OK, go to Step 4. If not OK, replace the power window switch.
4. Check the continuity in each circuit between the inoperative power window switch wire harness connector cavities and the corresponding power window motor wire harness connector cavities. If OK, refer to **MOTOR, WINDOW REGULATOR, DIAGNOSIS AND TESTING**. If not OK, repair the open circuit(s) as required.

NOTE: **All passenger door power window switches receive their battery and ground feed for operating the passenger door power window motors through the driver side power window and lock master switch and wire harness connector.**

STANDARD PROCEDURE

DOOR MODULE LEARN PROCEDURES

NOTE:

- **This procedure must be performed anytime the power window system has been serviced in either front door or when there is a possible concern with a door module calibration.**
- **The battery must be fully charged or the vehicle running before proceeding with the learn procedure.**
- **All doors must be completely closed before proceeding.**
- **It is suggested to sit inside the vehicle in the drivers seat and close the door.**

Express-up / Express-down possible concerns.

- Glass will not lower all the way down flush to the belt-line.
- Glass will not raise fully; wind noise / water leak.
- Glass will not raise automatically (Expess-up) after lifting the switch to the second detent and releasing.

To relearn the door module memory after module replacement, perform the following procedure:

1. Check and repair any door module Diagnostic Trouble Code (DTC) (s) unrelated to missing calibration before proceeding.
2. Using the window switch, lower the door glass to the full-down position by pushing down (depress) the window switch to its second detent and hold the switch until the door glass is fully open. Continue to hold the window switch down for two seconds after the door glass is fully open.
3. Raise the door glass to the full-up position by pulling up on the window switch and hold the switch until the door glass is fully closed. Continue to hold the window switch up for two seconds after the door glass is full closed.
4. Code should now be stored. Clear code and test window operations.

To relearn the door module memory after window/regulator replacement, perform the following procedure:

1. Using the scan tool, go to the network topology screen.
2. Click on the Diagnostic Procedures tab at the lower portion of the screen.
3. Run ECU Reset for DDM/PDM.
4. DDM/PDM calibration missing DTC will now set.

5. Using the window switch, lower the door glass to the full-down position by pushing down (depress) the window switch to its second detent and hold the switch until the door glass is fully open. Continue to hold the window switch down for two seconds after the door glass is fully open.
6. Raise the door glass to the full-up position by pulling up on the window switch and hold the switch until the door glass is fully closed. Continue to hold the window switch up for two seconds after the door glass is full closed.
7. DTC will now be stored. Clear code and test window operations.

MOTOR, WINDOW REGULATOR

DESCRIPTION

DESCRIPTION

The power window system allows each of the door windows to be raised and lowered electrically by actuating a switch on the trim panel of each respective door. A master switch on the driver side front door trim panel allows the driver to raise or lower each of the passenger door windows, and to lock out the individual switches on the passenger doors from operation. The power window system receives battery feed only when the ignition switch is in the RUN or ACCESSORY position. The power window system will also operate when in power accessory delay

Vehicles equipped with Express Up Windows are equipped with a door module. Refer to **OPERATION** for further information.

Vehicle equipped with One Touch Down (OTD) employ a Smart Window Motor. Refer to **OPERATION** for further information.

For service of mechanical components, such as the regulator, lift plate, window tracks, or glass refer to **BODY - INTERIOR & EXTERIOR** .

OPERATION

POWER WINDOW MOTOR - STANDARD

A positive and negative battery connection to the two motor terminals will cause the power window motor to rotate in one direction. Reversing the current through these same two connections will cause the motor to rotate in the opposite direction.

Because the Drivers Door Module (DDM) drives the window, it can sense when the top and bottom travel has been reached and stop driving the window regardless of the window switch position (no hall pulses within 50 ms). The DDM considers the Hall Effect faulted if no pulses are sensed when the window is driven up and down. When this condition is detected, the DDM will activate the motor until the switch is released or a stuck fault is set (10 seconds). In addition, each power window motor is equipped with an integral self-resetting circuit breaker to protect the motor from overloads.

The driver side motor is controlled directly by the DDM. The passenger side motor receives current through a

window up relay and a window down relay. The up and down window relays are controlled by the DDM.

There is also a fuse in the Power Distribution Center (PDC) to protect the passenger window circuits and a fuse in the PDC to protect the drivers window circuits.

POWER WINDOW MOTOR - SMART

Vehicles equipped with the One Touch Down (OTD) option use a "smart" window motor assembly. The smart window motors contain the electronics required to provide express up or down operation without the use of separate door modules.

The smart window motor will enter sleep mode after 20 seconds if ALL of the following conditions are true:

- No motor movement (stall condition previously detected)
- No switch input is active or the stuck switch condition has not been detected
- No stuck relay condition has been detected
- Window thermal protection is not in severe or activated mode

The smart window motor wakes up based on the following inputs:

- Any switch input becomes active
- Hardware reset
- Voltage is detected in any output from the relay to the motor terminals

The smart window motor does not communicate with the other modules on the vehicle. The rear windows on vehicles equipped with one-touch power front windows operate in the same manner used for the standard power window system. The one tough feature is not available for the rear windows.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - WINDOW SMART MOTOR

When a window motor is installed, it must be initialized to program the up and down stops. The initialization procedure is to manually drive the window motor to both the top and bottom of the window travel. Initialization is performed by holding the switch for two seconds after the window reaches the full up position.

Diagnosing a motor concern requires the technician to diagnose by the process of elimination. If a window motor is inoperative, verify that all switch signals to the motor are correct. Verify power and ground at the window motor. If the switch signals, power and ground are okay and there are no obstructions, attempt to initialize the motor prior to replacement.

DIAGNOSIS AND TESTING - WINDOW MOTOR

1. Remove door trim panel. Refer to **PANEL, DOOR TRIM, REMOVAL** .
2. Connect positive (+) lead from a test battery to either of the two motor terminals.

3. Connect negative (-) lead from test battery to remaining motor terminal.
4. The motor should now rotate in one direction to either move window up or down.
   a. If window happens to already be in full UP position and motor is connected so as to move it in UP direction no movement will be observed.
   b. Likewise, motor connected to move window in DOWN direction no movement will be observed if window is already in full DOWN position.
   c. Reverse battery leads in Step 2 and Step 3 and window should now move. If window does not move, replace motor.
5. If window moved completely up or down, the test leads should be reversed one more time to complete a full window travel inspection.
6. If window does not move, check to make sure that it is free.
7. It is necessary that the window be free to slide up and down in the glass channels. If the window is not free to move up and down, the window lift motor will not be able to move the glass.
8. To determine if the glass is free, disconnect the regulator from the glass lift plate. Remove the two attaching screws, and slide the window up and down by hand.

REMOVAL

REMOVAL

Fig. 1: Interior Trim panel
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the door interior trim panel (2). Refer to **PANEL, DOOR TRIM, REMOVAL** or **PANEL, REAR DOOR TRIM, REMOVAL** for the appropriate procedure.

Fig. 2: Power Window Motor Electrical Connector, Three Fasteners, Power Window Motor And Gear Assembly
Courtesy of CHRYSLER GROUP, LLC

3. Disconnect the power window motor electrical connector (3).
4. Remove the three fasteners (2) that secure the power window motor and gear assembly (1) to the carrier plate and remove the motor and gear assembly.

INSTALLATION

INSTALLATION

Fig. 3: Power Window Motor Electrical Connector, Three Fasteners, Power Window Motor And Gear Assembly
Courtesy of CHRYSLER GROUP, LLC

NOTE: The power window motor may need to actuated momentarily to line up the gear in the drive assembly with the regulator.

1. Connect the power window motor electrical connector to the motor electrical connector receptacle (3).
2. Position the power window motor and gear assembly (2) on the carrier plate (1) aligning the drive gear with the regulator.
3. If necessary, temporarily connect the window switch assembly and battery to actuate the motor.
4. Install and tighten the three fasteners (4) that secure the power window motor and gear assembly to the carrier plate.

Fig. 4: Interior Trim panel
Courtesy of CHRYSLER GROUP, LLC

5. Reinstall the door interior trim panel (2). Refer to **PANEL, DOOR TRIM, INSTALLATION** or **PANEL, REAR DOOR TRIM, INSTALLATION** for the appropriate procedure.
6. Connect the negative battery cable.

SWITCH, POWER WINDOW

DESCRIPTION

DESCRIPTION

Fig. 5: Driver Side Module, Passenger Side Module, Four Spring Clip Retainers & Connector Receptacle
Courtesy of CHRYSLER GROUP, LLC

A front door power switch module and bezel unit is located near the forward end of the arm rest of each front door trim panel. Two different modules are used: a driver side module (1), and a passenger side module (2). Each switch button in both modules is identified with either an International Control and Display Symbol icon or text that clearly identifies the switch function, and each switch button has a Light Emitting Diode (LED) unit soldered to the switch circuit board that provides back lighting of the icon or text for night visibility.

Each switch module housing is secured within the trim panel armrest by four spring clip retainers (3), two on each side of the switch module housing. The passenger side switch module includes a small cubby bin. A connector receptacle (4) integral to the switch module housing connect the switches to the vehicle electrical system through dedicated take outs and connectors of the door wire harness.

The front door power switch modules include the following switches:

- **Power Lock Switch** - A momentary switch button to control the **Lock** function of the power lock system.
- **Power Unlock Switch** - A momentary switch button to control the **Unlock** function of the power lock system.
- **Power Mirror Selector Switch (Driver Side Switch Only)** - Three mirror selector switch buttons choose the power mirror to be adjusted, **R** (right), **L** (left) or a power fold position (both mirrors).
- **Power Mirror Direction Control Switch (Driver Side Switch Only)** - After a power mirror is selected, pressing down on one of the arrows on the momentary mirror direction switch will move the selected mirror in that direction for as long as it is held down until the limit of the mirror travel is reached.
- **Power Window Lockout Switch (Driver Side Switch Only)** - A latching push-button power window lockout switch allows the vehicle operator to lock out the power window switches on each front and rear passenger door so that those windows may be operated only from the driver side front door master switches. When the lockout switch is engaged, the LED back lighting for each front and rear passenger

door power window switch is extinguished.

- **Power Window Switches** - A single two-way, momentary power window switch with a push-to-open and a lift-to-close tab is provide for each passenger door window while the driver side switch module contains four of these power window switches, one switch dedicated to each door window. The switch tab for the driver side front door power window has a second detent in the down direction which is used to activate the **Auto-Down** (also known as express down or one-touch down) feature. A second detent in the up direction on both front door power window switches activates the **Express-Up** feature.

The front door power switch modules cannot be adjusted or repaired. If damaged or ineffective, the entire driver side or passenger side front door switch module must be replaced as a unit.

There are 3 available driver door switch assemblies :

- 1-touch up and down driver window control
- 1-touch down only driver window control
- 1-touch down only driver window control and manual door locks and mirrors

There are 3 available passenger door switch assemblies:

- 1-touch up and down passenger window control
- Manual passenger window control
- Manual passenger window control and manual door locks.

OPERATION

OPERATION

WITH SMART MOTOR

Fig. 6: Driver Side Module, Passenger Side Module, Four Spring Clip Retainers & Connector Receptacle
Courtesy of CHRYSLER GROUP, LLC

The driver side front door power switch module combines a power lock switch, a power window switch for each of the four door windows including auto-down (also known as one-touch down or express down) and express up features for both front door windows, a power window lockout switch, a power mirror selector switch, and a power mirror adjustment switch in a single unit. The passenger side power door switch module combines a power lock switch and a passenger side front door power window switch with the auto-down and express up features.

The driver side front door power switch module provides resistor multiplexed outputs to the driver smart motor indicating the power lock switch selection, hard wired analog outputs indicating the power mirror selector switch and adjustment switch selections, and electronic message outputs over a Local Interface Network (LIN) data bus connection indicating the power window switch selections. The passenger side front door power switch module provides resistor multiplexed outputs to the passenger door module indicating both the power lock and power window switch selections.

The hard-wired circuits between the driver side front door power switch module and the driver side door smart motor or the rear door power window switches may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the electronic controls and communication between the switch module and the smart motor. **The smart window motor does not communicate with other modules on the vehicle** . The most reliable, efficient, and accurate means to diagnose the driver side power switch module or the electronic controls and communication related to power lock, power mirror or power window system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

The hard-wired circuits between the passenger side front door power switch module and the passenger side smart motor may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The most reliable, efficient, and accurate means to diagnose the power switch module or the

electronic controls and communication related to power lock or power window system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

WITH DOOR MODULE

2824067

Fig. 7: Driver Side Module, Passenger Side Module, Four Spring Clip Retainers & Connector Receptacle
Courtesy of CHRYSLER GROUP, LLC

The driver side front door power switch module combines a power lock switch, a power window switch for each of the four door windows including auto-down (also known as one-touch down or express down) and express up features for both front door windows, a power window lockout switch, a power mirror selector switch, and a power mirror adjustment switch in a single unit. The passenger side power door switch module combines a power lock switch and a passenger side front door power window switch with the auto-down and express up features.

The driver side front door power switch module provides resistor multiplexed outputs to the driver door module indicating the power lock switch selection, hard wired analog outputs indicating the power mirror selector switch and adjustment switch selections, and electronic message outputs over a Local Interface Network (LIN) data bus connection indicating the power window switch selections. The passenger side front door power switch module provides resistor multiplexed outputs to the passenger door module indicating both the power lock and power window switch selections.

The hard-wired circuits between the driver side front door power switch module and the driver side door module or the rear door power window switches may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the electronic controls and communication between the switch module and the door module or in the diagnosis of the electronic controls and communication between other modules and the door module that provide some features of the power lock, power mirror or power window systems. The most reliable, efficient, and accurate means to diagnose the driver side power switch module or the electronic

controls and communication related to power lock, power mirror or power window system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - POWER WINDOW SWITCHES

The master window switch has an Auto-Down feature. Actuation of the master switch to the second down position will move the drivers side window completely down. The electronic switch will automatically disconnect the motor approximately one second after the window bottoms out. Failure of the electronic switch to detect stall current, will cause the switch to disconnect after approximately 13 seconds. The auto down function can be canceled by any movement of that switch.

FRONT DOOR - DRIVER SIDE

Any diagnosis of the power window system should begin with the use of the scan tool. For information on the use of the scan tool, refer to the appropriate Diagnostic Service Information .

The diagnosis found here applies to the passenger power window switches. If the problem being diagnosed is an inoperative power window switch illumination lamp, but the power window switch operates as designed, replace the faulty door power window switch.

For complete circuit diagrams, refer to **SYSTEM WIRING DIAGRAMS** .

1. Disconnect and isolate the battery negative cable.
2. Remove the power window switch from the door trim panel. Refer to **SWITCH, POWER WINDOW, REMOVAL**.
3. Check the door power window switch continuity as shown in the power window switch test table below.

REAR DOOR

3835039

Fig. 13: Rear Power Window Switch Connector End View
Courtesy of CHRYSLER GROUP, LLC

The following test procedure applies to the rear door power window switches on all vehicles equipped with power windows, with or without power locks.

1. Remove the power window switch from the rear door trim panel. Refer to **SWITCH, POWER WINDOW, REMOVAL**.
2. Using an ohmmeter, test the continuity between the terminals of the rear door power window switch as shown in the Rear Door Power Window Switch Tests table.

REAR DOOR POWER WINDOW SWITCH TESTS TABLE

REAR DOOR POWER WINDOW SWITCH TESTS	
SWITCH POSITION	**CONTINUITY BETWEEN (PINS)**
NEUTRAL	1 and 4, 3 and 6
UP	2 and 4, 3 and 5
DOWN	2 and 3, 4 and 5
SWITCH ILLUMINATION	LEDs - SET MULTIMETER TO DIODE MODE - CONNECT PIN 2 TO PLUS (+), CONNECT PIN 5 TO MINUS (-) - LEDs SHOULD BARELY GLOW

3. If a switch fails any of the tests, replace the ineffective rear door power window switch as required.

REMOVAL

REMOVAL

FRONT DOOR

Fig. 14: Power Window Switch
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Remove door trim panel. Refer to **PANEL, DOOR TRIM, REMOVAL** .
3. Disconnect switch wire connector.
4. Remove switch assembly (1).

REAR DOOR

1. Disconnect and isolate the negative battery cable.
2. Remove the interior handle. Refer to **HANDLE, EXTERIOR, REMOVAL** .
3. Disconnect the electrical connector.
4. Remove the switch from the handle.

INSTALLATION

INSTALLATION

FRONT DOOR

Fig. 15: Power Window Switch
Courtesy of CHRYSLER GROUP, LLC

1. Install the switch (1) by snapping into place.
2. Connect switch wire connector.
3. Install the door trim panel. Refer to **PANEL, DOOR TRIM, INSTALLATION** .
4. Connect the negative battery cable.

REAR DOOR

1. Install the switch to the handle.
2. Connect the electrical connector.
3. Install the interior door handle. Refer to **HANDLE, EXTERIOR, INSTALLATION** .
4. Connect the negative battery cable.

DIAGNOSIS AND TESTING

B1A08-00-RKE FOB 1 PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

At every RKE message reception.

SET CONDITION

Upon detection of an out of sync condition between the Radio Frequency (RF Hub) and the FOBIK transceiver.

NOTE: **The most probable cause that sets this code is the RKE transceiver (FOBIK) being pressed over 1024 times when it is out of range of the RF Hub and it loses synchronization with the rolling code. Re-syncing automatically takes place in the background after the vehicle has been started and driven above 5 mph. This happens once per ignition cycle above 5 mph to all FOBIKs located inside the vehicle, just in case one of the FOBIKs was de-activated during a FOBIK safe lock procedure.**

POSSIBLE CAUSES

Possible Causes
EXCESSIVE PRESSES FROM TRANSMITTER WHEN OUT OF RANGE
FOBIK TRANSCEIVER

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**

NOTE: **All FOBIKs used with this vehicle should be present during this test.**

NOTE: **Verify that the battery is fully charged with a DVOM and use the scan tool to compare the Battery Voltage listed under "Data" in the RFH View to that of the BCM. If the battery is not fully charged, correct this condition before proceeding.**

1. Use the alleged inoperative FOBIK, cycle/press (if equipped with Keyless Go, the KIN button) the ignition on.

NOTE: **On the Passive Entry Keyless Go (PEKG)/Keyless Ignition Node (KIN) system, using the rounded end of the FOBIK to press the Stop/Start button can cycle the ignition even if the battery in the FOBIK is inop.**

2. With the scan tool, record and erase the DTCs.
3. Press the lock/unlock button of the alleged inoperative FOBIK several times.
4. With the scan tool, read the DTCs.

Does the scan tool display this DTC as active?

Yes

- Go To 2

No

- The conditions that caused this code to set are not present at this time. The FOBIK may have already been re-synchronized by being in the vehicle while it was being driven. Inform the owner of the most probable cause for this code to set and therefore causing the FOBIK to be inoperative.

2. **CYCLE THE IGNITION**
   1. With the scan tool, erase the DTCs.
   2. Cycle the ignition off.
   3. Put the inoperative FOBIK in the vehicle.
   4. With the good FOBIK, start and drive the vehicle above five miles per hour for one mile.
   5. Cycle the ignition off.
   6. Operate the inoperative FOBIK in all positions several times.
   7. With the scan tool, read the DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Replace the FOBIK and program using the scan tool.

   No

   - Test complete.

B1A09-00-RKE FOB 2 PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

At every RKE message reception.

SET CONDITION

Upon detection of an out of sync condition between the Radio Frequency (RF Hub) and the FOBIK transceiver.

NOTE: **The most probable cause that sets this code is the RKE transceiver (FOBIK) being pressed over 1024 times when it is out of range of the RF Hub and it loses synchronization with the rolling code. Re-syncing automatically takes place in the background after the vehicle has been started and driven above 5 mph. This happens once per ignition cycle above 5 mph to all FOBIKs located inside the**

vehicle, just in case one of the FOBIKs was de-activated during a FOBIK safe lock procedure.

POSSIBLE CAUSES

Possible Causes
EXCESSIVE PRESSES FROM TRANSMITTER WHEN OUT OF RANGE
FOBIK TRANSCEIVER

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**

NOTE: **All FOBIKs used with this vehicle should be present during this test.**

NOTE: **Verify that the battery is fully charged with a DVOM and use the scan tool to compare the Battery Voltage listed under "Data" in the RFH View to that of the BCM. If the battery is not fully charged, correct this condition before proceeding.**

1. Use the alleged inoperative FOBIK, cycle/press (if equipped with Keyless Go, the KIN button) the ignition on.

NOTE: **On the Passive Entry Keyless Go (PEKG)/Keyless Ignition Node (KIN) system, using the rounded end of the FOBIK to press the Stop/Start button can cycle the ignition even if the battery in the FOBIK is inop.**

2. With the scan tool, record and erase the DTCs.
3. Press the lock/unlock button of the alleged inoperative FOBIK several times.
4. With the scan tool, read the DTCs.

Does the scan tool display this DTC as active?

Yes

- Go To 2

No

- The conditions that caused this code to set are not present at this time. The FOBIK may have already been re-syncronized by being in the vehicle while it was being driven. Inform the owner of the most probable cause for this code to set and therefore causing the FOBIK to be inoperative.

2. **CYCLE THE IGNITION**

1. With the scan tool, erase the DTCs.
2. Cycle the ignition off.
3. Put the inoperative FOBIK in the vehicle.
4. With the good FOBIK, start and drive the vehicle above five miles per hour for one mile.
5. Cycle the ignition off.
6. Operate the inoperative FOBIK in all positions several times.
7. With the scan tool, read the DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Replace the FOBIK and program using the scan tool.

   No

   - Test complete.

5. Cycle the ignition on.
6. Using the scan tool, read the active DTCs.

   Does the scan tool display: B1A15-00-RKE FOB 6 BATTERY LOW as active?

   Yes

   - Replace the FOBIK battery. Test the FOBIK using the (special tool #9001, Rf Detector). If the Strength Display does not display "Strong", replace and program the FOBIK using the scan tool.

   No

   - Test complete. The conditions that caused this code to set are not present at this time.

B1A16-00-RKE FOB 7 BATTERY LOW

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

At every RKE message reception (Lock, Unlock and Keyless Go).

SET CONDITION

If the battery in the Fob-Integrated-Key (FOBIK) is low during key interrogation, with a valid key, this code will set. It may also set during a valid RKE button press.

POSSIBLE CAUSES

Possible Causes
LOW BATTERY
FOBIK TRANSCEIVER

DIAGNOSTIC TEST

TEST FOR INTERMITTENT CONDITION

NOTE: Verify that the vehicle's battery is fully charged with a DVOM and use the scan tool to compare the Battery Voltage listed under "Data" in the RFH View to that of the BCM. If the vehicle's battery is not fully charged, correct this condition before proceeding.

NOTE: Verify that the FOBIK in use is the FOBIK causing the DTC to set.

NOTE: All FOBIKs used with this vehicle should be present during this test.

1. With one of the owners known good FOBIKs in the vehicle, cycle (or press the KIN button with Keyless Go) the ignition on.
2. Using the scan tool, record and erase the DTCs.
3. Cycle the ignition off.
4. From inside the vehicle, operate the alleged inoperative FOBIK in all positions several times.
5. Cycle the ignition on.
6. Using the scan tool, read the active DTCs.

   Does the scan tool display: B1A16-00-RKE FOB 7 BATTERY LOW as active?

   Yes

- Replace the FOBIK battery. Test the FOBIK using the (special tool #9001, Rf Detector). If the Strength Display does not display "Strong", replace and program the FOBIK using the scan tool.

No

- Test complete. The conditions that caused this code to set are not present at this time.

B1A17-00-RKE FOB 8 BATTERY LOW

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

At every RKE message reception (Lock, Unlock and Keyless Go).

SET CONDITION

If the battery in the Fob-Integrated-Key (FOBIK) is low during key interrogation, with a valid key, this code will set. It may also set during a valid RKE button press.

POSSIBLE CAUSES

Possible Causes
LOW BATTERY
FOBIK TRANSCEIVER

DIAGNOSTIC TEST

TEST FOR INTERMITTENT CONDITION

NOTE: Verify that the vehicle's battery is fully charged with a DVOM and use the scan tool to compare the Battery Voltage listed under "Data" in the RFH View to that of the BCM. If the vehicle's battery is not fully charged, correct this condition before proceeding.

NOTE: Verify that the FOBIK in use is the FOBIK causing the DTC to set.

NOTE: All FOBIKs used with this vehicle should be present during this test.

1. With one of the owners known good FOBIKs in the vehicle, cycle (or press the KIN button with Keyless Go) the ignition on.
2. Using the scan tool, record and erase the DTCs.
3. Cycle the ignition off.
4. From inside the vehicle, operate the alleged inoperative FOBIK in all positions several times.

5. Cycle the ignition on.
6. Using the scan tool, read the active DTCs.

   Does the scan tool display: B1A17-00-RKE FOB 8 BATTERY LOW as active?

   Yes

   - Replace the FOBIK battery. Test the FOBIK using the (special tool #9001, Rf Detector). If the Strength Display does not display "Strong", replace and program the FOBIK using the scan tool.

   No

   - Test complete. The conditions that caused this code to set are not present at this time.

B1A24-00-KEY NOT PROGRAMMED

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

Whenever a Fob-Integrated-Key (FOBIK) is inserted in the Ignition Node Module (IGNM); or the Keyless Ignition Node (KIN) push button is pressed with the key inside the vehicle, the Radio Frequency Hub (RF-Hub) performs a self test and resynchronization routine. During the routine, the RF-Hub interrogates the FOBIK, performing various validity and performance tests. The repair of this fault condition relies on the programmed status of the FOBIK.

WHEN MONITORED

Interrogation of the FOBIK is completed in two ways, the IGnition Node Module or Keyless Ignition Node. The IGNM, uses low frequency communication between the FOBIK and RFHM through the LIN to the IGNM coil. The KIN, on the passive entry keyless go system uses low frequency communication between the LF antennas, FOBIK and Radio Frequency Hub Module. It will also use radio frequency communication between the FOBIK and RFHM.

SET CONDITION

This DTC sets if the RF-Hub receives the default, secret key status from a FOBIK. Once set, this DTC will remain active until two valid FOBIKs are recognized by the RF-Hub.

POSSIBLE CAUSES

Possible Causes
NO FOBIK PROGRAMMED
RADIO FREQUENCY HUB
REPLACEMENT RADIO FREQUENCY HUB

DIAGNOSTIC TEST

PROGRAM ALL FOBIKS

NOTE: All FOBIKs that are to be used in this vehicle must remain on the front seat near the console during programming.

NOTE: The RF-Hub

must have a minimum of two

programmed FOBIKs for this DTC to be stored.

1. With the scan tool, select "Misc. Functions", "Program Ignition FOBIKs" and follow the instructions on the screen.
2. Program all FOBIKs that are used with this vehicle.
3. Try each FOBIK that was programmed.

   Do all FOBIKs operate properly?

   Yes

   - Test complete.

   No

   - With the scan tool perform the "RFH", "Reset ECU" and repeat this test from the beginning.

B1A25-00-INVALID KEY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

At ignition on and during FOBIK programming mode.

SET CONDITION

When the RF Hub (RFHM) does not receive a valid FOBIK response from the IGnition Node Module (IGNM), or the key that is being used is programmed for a different vehicle.

POSSIBLE CAUSES

Possible Causes
PREVIOUSLY PROGRAMMED FOBIK TO A DIFFERENT VEHICLE

FOBIK
IGNITION NODE MODULE (IGNM)
RADIO FREQUENCY HUB MODULE (RF HUB)

DIAGNOSTIC TEST

1. **DETERMINING IF DIAGNOSTIC TROUBLE CODE (DTC) IS CURRENT**

   NOTE: Verify the FOBIK being used is correct for this vehicle and unprogrammed. If the FOBIK being programmed is not blank (already programmed to another vehicle) this fault will set.

   NOTE: Verify that the battery is fully charged with a DVOM and use the scan tool to compare the Battery Voltage listed under "Data" in the RFH View to that of the BCM. If the battery is not fully charged, correct this condition before proceeding.

   1. With the scan tool, read and record the RFH DTCs.
   2. With the scan tool, erase the RFH DTCs.

      NOTE: Perform the following test several times to make sure the DTC is current.

   3. Use the alleged FOBIK and try to cycle the ignition.
   4. Wait 10 seconds.
   5. With the scan tool, read the RFH DTCs.

      Does the scan tool display the DTC that was previously erased?

      Yes

      - Go To 2

      No

      - Test complete.

2. **CHECKING FOR MULTIPLE KEYS**

   Are there multiple vehicle FOBIK's available?

   Yes

   - Go To 3

No

- Go To 4

3. **MULTIPLE KEY OPERATION**

NOTE: Perform the following steps using one of the vehicles FOBIK's. When finished, repeat the procedure using each of the other FOBIK's, one at a time.

1. With the scan tool, erase the RFH DTCs.
2. Cycle the ignition off.
3. Wait 10 seconds.
4. Cycle the ignition on.
5. With the scan tool, read the RFH DTCs.

Is the DTC present for **all** ignition keys?

Yes

- Go To 5

No

- Replace the FOBIK that caused the RFH DTC.
- Perform the RFH VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

4. **REPROGRAM KEY**

1. With the scan tool, attempt to reprogram the FOBIK to the RFH.
2. With the scan tool, erase the RFH DTCs.
3. Wait 10 seconds.
4. Cycle the ignition on.
5. With the scan tool, read the RFH DTCs.

Does the DTC set again?

Yes

- Go To 5

No

- Test complete.

5. **REPLACE FOBIK**

1. Replace the FOBIK that caused the RFH DTC.
2. With the scan tool, erase the RFH DTCs.
3. Wait 10 seconds.
4. Cycle the ignition on.
5. With the scan tool, read the RFH DTCs.

   Does the DTC set again?

   Yes

   - Go To 6

   No

   - Test complete.

6. **REPLACE THE IGNM**
   1. Replace the IGNM in accordance with Service Information.
   2. With the scan tool, erase the RFH DTCs.
   3. Wait 10 seconds.
   4. Cycle the ignition on.
   5. With the scan tool, read the RFH DTCs.

      Does the DTC set again?

      Yes

      - Replace and program the Radio Frequency Hub Module in accordance with the Service Information.
      - Perform the RFH VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Test complete.

B1A35-00-UNIDENTIFIED KEY COMMUNICATION ERROR

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition state in Off, the IGNM is rotated or KIN button is pressed, LF authentication is attempted but no valid RF response is received from a key.

SET CONDITION

This Diagnostic Trouble Code (DTC) sets when the Operator rotates/presses the IGNM/KIN button to start the vehicle. Depending upon the ignition type (KIN or IGNM) the Cluster/EVIC message "Fob not Detected" or "Damaged Key" will display.

POSSIBLE CAUSES

Possible Causes
FOBIK
IGNITION NODE MODULE (IGNM) OR KEYLESS IGNITION NODE (KIN)

DIAGNOSTIC TEST

1. **CHECK FOR AN INTERMITTENT CONDITION**

NOTE: **Verify that the battery is fully charged with a DVOM and use the scan tool to compare the Battery Voltage listed under "Data" in the RFH View to that of the BCM. If the battery is not fully charged, correct this condition before proceeding.**

NOTE: **An external Radio-Frequency Identification (RFID) key (and/or pass/radio key), such as one used to gain access to a 24 hour gym, can cause this DTC to set and create a no start condition. Inspect the customer's key chain for any type of RFID key. If one is not found, question the customer to see if a spare key chain has this RFID key on it or if it was removed from the original key chain before the vehicle was released for service. If a RFID key is present, remove the ignition key from the vehicle and remove the RFID key from the key chain. For GPEC equipped vehicles, disconnect the battery and wait a minimum of five minutes, reconnect and attempt to start the vehicle.**

NOTE: **Verify the FOBIK in use is the FOBIK causing this DTC to set.**

1. Cycle the ignition on.
2. With the scan tool, record and erase the RFH DTCs.
3. Cycle the ignition switch from on to off, wait five seconds and then crank the engine.
4. Cycle the engine off, key on.
5. With the scan tool, read the active RFH DTCs.

   Does the scan tool display: B1A35-00 UNIDENTIFIED KEY COMMUNICATION ERROR as Active?

   Yes

- Go To 2

No

- Perform the RFH VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

2. **TEST LF COMMUNICATION**
   1. With the scan tool, in the RFH menu, go to Data Display, Bussed Outputs and check the status for the current FOBIK that is being used and record that status.
   2. Cycle the ignition off.
   3. Use the other known good FOBIKs programmed with this vehicle,

      NOTE: If another FOBIK is not available, insert a new FOBIK (Do not program) to test the RF Hub modules LF communication.

   4. Check the status of the current FOBIK being used and verify that the status changed from the first FOBIK

      Does the status change ?

      Yes

      - Replace and program the FOBIK in accordance with the Service Information.
      - Perform the RFH VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Replace the IGNM/KIN in accordance with Service Information.
      - Perform the RFH VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

B1A71-11-PASSIVE ENTRY ANTENNA 1 - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 1: Passive Entry Antenna 1 & 2 - Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Passive Entry (PE) antenna units allow the transmitter within the Radio Frequency Hub (also known as the RF Hub) to communicate via Low Frequency (LF) radio transmission with a FOB with Integrated Key (FOBIK) that is located inside the vehicle or, at most, about 2 meters (6.5 feet) horizontally in all directions around the outside of the vehicle. The RF Hub uses communication through the antenna units to wake up and challenge a FOBIK that is within range in order to authenticate whether that FOBIK is valid (programmed) to the vehicle. The RF Hub communicates with the FOBIK using Frequency-Shift Keying (FSK) modulation.

Each antenna unit has two dedicated connections to the RF Hub. One connection is the LF antenna output circuit, while the other connection Is the LF antenna return circuit. These circuits to each antenna unit are a twisted pair to help reduce the potential for induced electrical interference. The RF Hub microcontroller

monitors all of the antenna units and will store a Diagnostic Trouble Code (DTC) for any fault that it detects.

The hard wired inputs and outputs of the antenna units may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, the most reliable, efficient, and accurate means to diagnose the antenna units requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

WHEN MONITORED

At every Passive Entry or Keyless Go action.

SET CONDITION

When Antenna 1 Signal circuit is shorted to ground. If another Antenna Signal circuit is Open and there are no other Antennas that have a Short to Battery DTC, both Antennas will set this Short to Ground DTC.

POSSIBLE CAUSES

Possible Causes
ANOTHER ANTENNA SIGNAL CIRCUIT MAY BE SETTING AN OPEN DTC
(D920) PASSIVE ENTRY ANTENNA 1 SIGNAL CIRCUIT SHORTED TO GROUND
(D921) PASSIVE ENTRY ANTENNA 1 RETURN CIRCUIT SHORTED TO GROUND
PASSIVE ENTRY ANTENNA
RADIO FREQUENCY HUB (RF HUB) MODULE

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**

NOTE: **Verify that the vehicle's battery is fully charged with a DVOM and use the scan tool to compare the Battery Voltage listed under "Data" in the RFH View to that of the BCM. If the vehicle's battery is not fully charged, correct this condition before proceeding.**

1. Cycle the ignition on.
2. Using the scan tool, record and erase the DTCs.
3. With the scan tool, select: RF Hub, More Options and System Tests.
4. Perform the RF Hub LF Antenna Verification Tests. Refer to **STANDARD PROCEDURE**.
5. With the scan tool, read the Active DTCs.

   Does the scan tool display: B1A71-11-PASSIVE ENTRY ANTENNA 1 - CIRCUIT SHORT TO GROUND as active?

   Yes

- Go To 2

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **(D920) PASSIVE ENTRY ANTENNA SHORTED**
   1. Cycle the ignition off.
   2. Disconnect the Passive Entry Antenna 1 harness connector.

      NOTE: Antenna 1 is located in the Left Rear Door. Refer to ANTENNA, PASSIVE ENTRY, REMOVAL .

   3. Cycle the ignition on.
   4. Using the scan tool, record and erase the DTCs.
   5. With the scan tool, select: RF Hub, More Options and System Tests.
   6. Perform the RF Hub LF Antenna Verification Tests. Refer to **STANDARD PROCEDURE**.
   7. With the scan tool, read the Active DTCs.

      Does the scan tool display: B1A71-11-PASSIVE ENTRY ANTENNA 1 - CIRCUIT SHORT TO GROUND as active?

      Yes

      - Go To 3

      No

      - Replace the Antenna in accordance with the service information. Refer to **ANTENNA, PASSIVE ENTRY, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **(D920) PASSIVE ENTRY ANTENNA 1 SIGNAL CIRCUIT SHORTED TO GROUND**

Fig. 2: Checking Passive Entry Antenna 1 Signal Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Cycle the ignition off.
2. Disconnect the RF Hub Module C2 harness connector.
3. Measure the resistance between ground and the (D920) Passive Entry Antenna 1 Signal circuit.

   Is the resistance below 30K Ohms?

   Yes

   - Repair the short to ground in the (D920) Passive Entry Antenna 1 Signal circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 4

4. **(D921) PASSIVE ENTRY ANTENNA 1 RECycle CIRCUIT SHORTED TO GROUND**

Fig. 3: Measuring Resistance Between Ground & Passive Entry Antenna 1 Return Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (D921) Passive Entry Antenna 1 ReCycle circuit.

   Is the resistance below 30K Ohms?

   Yes

   - Repair the short to ground in the (D921) Passive Entry Antenna 1 ReCycle circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

- Replace the appropriate Passive Entry antenna in accordance with Service Information. Perform the RADIO FREQUENCY HUB (RF HUB) VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
- If replacing the Passive Entry antenna for this DTC did not repair the concern, replace the RF Hub in accordance with the Service Information. Refer to **MODULE, RADIO FREQUENCY (RF HUB), REMOVAL** .
- Perform the RADIO FREQUENCY HUB (RF HUB) VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

B1A71-12-PASSIVE ENTRY ANTENNA 1 - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 4: Passive Entry Antenna 1 & 2 - Circuit Diagram

Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Passive Entry (PE) antenna units allow the transmitter within the Radio Frequency Hub (also known as the RF Hub) to communicate via Low Frequency (LF) radio transmission with a FOB with Integrated Key (FOBIK) that is located inside the vehicle or, at most, about 2 meters (6.5 feet) horizontally in all directions around the outside of the vehicle. The RF Hub uses communication through the antenna units to wake up and challenge a FOBIK that is within range in order to authenticate whether that FOBIK is valid (programmed) to the vehicle. The RF Hub communicates with the FOBIK using Frequency-Shift Keying (FSK) modulation.

Each antenna unit has two dedicated connections to the RF Hub. One connection is the LF antenna output circuit, while the other connection Is the LF antenna return circuit. These circuits to each antenna unit are a twisted pair to help reduce the potential for induced electrical interference. The RF Hub microcontroller monitors all of the antenna units and will store a Diagnostic Trouble Code (DTC) for any fault that it detects.

The hard wired inputs and outputs of the antenna units may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, the most reliable, efficient, and accurate means to diagnose the antenna units requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

WHEN MONITORED

At every Passive Entry or Keyless Go action.

SET CONDITION

When the Antenna 1 Signal Circuit is shorted to Battery. If another Antenna has a Short to Ground, a General Electrical Failure or Open DTC, both Antennas will set this Short to Battery DTC.

POSSIBLE CAUSES

Possible Causes
ANOTHER ANTENNA SIGNAL CIRCUIT MAY BE SHORTED TO GROUND, GENERAL FAILURE OR OPEN DTC
(D920) PASSIVE ENTRY ANTENNA 1 SIGNAL CIRCUIT SHORTED TO VOLTAGE
(D921) PASSIVE ENTRY ANTENNA 1 RETURN CIRCUIT SHORT TO VOLTAGE
RADIO FREQUENCY HUB (RF HUB) MODULE

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**

NOTE: **Verify that the vehicle's battery is fully charged with a DVOM and use the scan tool to compare the Battery Voltage listed under "Data" in the RFH View to that of the BCM. If the vehicle's battery is not fully charged, correct**

this condition before proceeding.

NOTE: If another antenna has a Short to Ground, General Electrical Failure or Open DTC, both antennas will set this Short to Voltage DTC.

1. Cycle the ignition on.
2. Using the scan tool, record and erase the DTCs.
3. With the scan tool, select: RF Hub, More Options and System Tests.
4. Perform the RF Hub LF Antenna Verification Tests. Refer to **STANDARD PROCEDURE**.
5. With the scan tool, read the Active DTCs.

   Does the scan tool display: B1A71-12-PASSIVE ENTRY ANTENNA 1 - CIRCUIT SHORT TO BATTERY as active?

   Yes

   - Go To 2

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.

2. **(D920) PASSIVE ENTRY ANTENNA 1 SIGNAL CIRCUIT SHORTED TO VOLTAGE**

Fig. 5: Measuring Voltage Between Ground & Passive Entry Antenna 1 Signal Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Cycle the ignition off.
2. Disconnect the Radio Frequency Hub C2 harness connector.
3. Cycle the ignition on.
4. Measure the voltage between ground and the (D920) Passive Entry Antenna 1 Signal circuit.

   Is there any voltage present?

   Yes

   - Repair the short to voltage in the (D920) Passive Entry Antenna 1 Signal circuit.

   No

- Go To 3

3. **(D921) PASSIVE ENTRY ANTENNA 1 RETURN CIRCUIT SHORT TO VOLTAGE**
   1. Be sure the ignition is still on.
   2. Measure the voltage between ground and the (D921) Passive Entry Antenna 1 Return circuit (Cavity 15 in the C2 connector).

      Is there any voltage present?

      Yes

      - Repair the short to voltage in the (D921) Passive Entry Antenna 1 Return circuit.

      No

      - Replace the RF HUB in accordance with the Service Information. Refer to **MODULE, RADIO FREQUENCY (RF HUB), REMOVAL** .
      - Perform the RADIO FREQUENCY HUB (RF HUB) VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

Measure the resistance between the (D920) Passive Entry Antenna 1 Signal circuit and the (D921) Passive Entry Antenna 1 Return circuit in the RF Hub C2 harness connector.

Is the resistance below 30K Ohms?

Yes

- Repair the short between the (D920) Passive Entry Antenna 1 Signal circuit and the (D921) Passive Entry Antenna 1 Return circuit.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace the Antenna in accordance with the Service Information. Refer to **ANTENNA, PASSIVE ENTRY, INSTALLATION** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1A72-11-PASSIVE ENTRY ANTENNA 2 - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 11: Passive Entry Antenna 1 & 2 - Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Passive Entry (PE) antenna units allow the transmitter within the Radio Frequency Hub (also known as the

RF Hub) to communicate via Low Frequency (LF) radio transmission with a FOB with Integrated Key (FOBIK) that is located inside the vehicle or, at most, about 2 meters (6.5 feet) horizontally in all directions around the outside of the vehicle. The RF Hub uses communication through the antenna units to wake up and challenge a FOBIK that is within range in order to authenticate whether that FOBIK is valid (programmed) to the vehicle. The RF Hub communicates with the FOBIK using Frequency-Shift Keying (FSK) modulation.

Each antenna unit has two dedicated connections to the RF Hub. One connection is the LF antenna output circuit, while the other connection Is the LF antenna return circuit. These circuits to each antenna unit are a twisted pair to help reduce the potential for induced electrical interference. The RF Hub microcontroller monitors all of the antenna units and will store a Diagnostic Trouble Code (DTC) for any fault that it detects.

The hard wired inputs and outputs of the antenna units may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, the most reliable, efficient, and accurate means to diagnose the antenna units requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

WHEN MONITORED

At every Passive Entry or Keyless Go action.

SET CONDITION

When Antenna 2 Signal circuit is shorted to ground. If another Antenna Signal circuit is Open and there are no other Antennas that have a Short to Battery DTC, both Antennas will set this Short to Ground DTC.

POSSIBLE CAUSES

Possible Causes
ANOTHER ANTENNA SIGNAL CIRCUIT MAY BE SETTING AN OPEN DTC
(D922) PASSIVE ENTRY ANTENNA 2 SIGNAL CIRCUIT SHORTED TO GROUND
(D923) PASSIVE ENTRY ANTENNA 2 RETURN CIRCUIT SHORTED TO GROUND
PASSIVE ENTRY ANTENNA
RADIO FREQUENCY HUB (RF HUB) MODULE

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**

NOTE: **Verify that the vehicle's battery is fully charged with a DVOM and use the scan tool to compare the Battery Voltage listed under "Data" in the RFH View to that of the BCM. If the vehicle's battery is not fully charged, correct this condition before proceeding.**

1. Cycle the ignition on.
2. Using the scan tool, record and erase the DTCs.

3. With the scan tool, select: RF Hub, More Options and System Tests.
4. Perform the RF Hub LF Antenna Verification Tests. Refer to **STANDARD PROCEDURE**.
5. With the scan tool, read the Active DTCs.

   Does the scan tool display: B1A72-11-PASSIVE ENTRY ANTENNA 2 - CIRCUIT SHORT TO GROUND as active?

   Yes

   - Go To 2

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **(D922) PASSIVE ENTRY ANTENNA SHORTED**
   1. Cycle the ignition off.
   2. Disconnect the Passive Entry Antenna 2 connector.

      NOTE: Antenna 2 is located in the Right Rear Door. Refer to ANTENNA, PASSIVE ENTRY, REMOVAL .

   3. Cycle the ignition on.
   4. Using the scan tool, record and erase the DTCs.
   5. With the scan tool, select: RF Hub, More Options and System Tests.
   6. Perform the RF Hub LF Antenna Verification Tests. Refer to **STANDARD PROCEDURE**.
   7. With the scan tool, read the Active DTCs.

      Does the scan tool display: B1A72-11-PASSIVE ENTRY ANTENNA 2 - CIRCUIT SHORT TO GROUND as active?

      Yes

      - Go To 3

      No

      - Replace the Antenna in accordance with the service information. Refer to **ANTENNA, PASSIVE ENTRY, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **(D922) PASSIVE ENTRY ANTENNA 2 SIGNAL CIRCUIT SHORTED TO GROUND**

Fig. 12: Measuring Resistance Between Ground & Passive Entry Antenna 2 Signal Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Cycle the ignition off.
2. Disconnect the RF Hub Module C2 harness connector.
3. Measure the resistance between ground and the (D922) Passive Entry Antenna 2 Signal circuit.

   Is the resistance below 30K Ohms?

   Yes

   - Repair the short to ground in the (D922) Passive Entry Antenna 2 Signal circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

- Go To 4

4. **(D923) PASSIVE ENTRY ANTENNA 2 RETURN CIRCUIT SHORTED TO GROUND**

Fig. 13: Measuring Resistance Between Ground & Passive Entry Antenna 2 Return Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (D923) Passive Entry Antenna 2 Return circuit.

   Is the resistance below 30K Ohms?

   Yes

   - Repair the short to ground in the (D923) Passive Entry Antenna 2 Return circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

- Replace the appropriate Passive Entry antenna in accordance with Service Information. Perform the RADIO FREQUENCY HUB (RF HUB) VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
- If replacing the Passive Entry antenna for this DTC did not repair the concern, replace the RF Hub in accordance with the Service Information. Refer to **MODULE, RADIO FREQUENCY (RF HUB), REMOVAL** .
- Perform the RADIO FREQUENCY HUB (RF HUB) VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

B1A72-12-PASSIVE ENTRY ANTENNA 2 - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 14: Passive Entry Antenna 1 & 2 - Circuit Diagram

Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Passive Entry (PE) antenna units allow the transmitter within the Radio Frequency Hub (also known as the RF Hub) to communicate via Low Frequency (LF) radio transmission with a FOB with Integrated Key (FOBIK) that is located inside the vehicle or, at most, about 2 meters (6.5 feet) horizontally in all directions around the outside of the vehicle. The RF Hub uses communication through the antenna units to wake up and challenge a FOBIK that is within range in order to authenticate whether that FOBIK is valid (programmed) to the vehicle. The RF Hub communicates with the FOBIK using Frequency-Shift Keying (FSK) modulation.

Each antenna unit has two dedicated connections to the RF Hub. One connection is the LF antenna output circuit, while the other connection Is the LF antenna return circuit. These circuits to each antenna unit are a twisted pair to help reduce the potential for induced electrical interference. The RF Hub microcontroller monitors all of the antenna units and will store a Diagnostic Trouble Code (DTC) for any fault that it detects.

The hard wired inputs and outputs of the antenna units may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, the most reliable, efficient, and accurate means to diagnose the antenna units requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

WHEN MONITORED

At every Passive Entry or Keyless Go action.

SET CONDITION

When the Antenna 2 Signal Circuit is shorted to Battery. If another Antenna has a Short to Ground, a General Electrical Failure or Open DTC, both Antennas will set this Short to Battery DTC.

POSSIBLE CAUSES

Possible Causes
ANOTHER ANTENNA SIGNAL CIRCUIT MAY BE SHORTED TO GROUND, GENERAL FAILURE OR OPEN DTC
(D922) PASSIVE ENTRY ANTENNA 2 SIGNAL CIRCUIT SHORTED TO VOLTAGE
(D923) PASSIVE ENTRY ANTENNA 2 RETURN CIRCUIT SHORTED TO VOLTAGE
RADIO FREQUENCY HUB (RF HUB) MODULE

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**

NOTE: **Verify that the vehicle's battery is fully charged with a DVOM and use the scan tool to compare the Battery Voltage listed under "Data" in the RFH View to that of the BCM. If the vehicle's battery is not fully charged, correct**

this condition before proceeding.

NOTE: If another antenna has a Short to Ground, General Electrical Failure or Open DTC, both antennas will set this Short to Voltage DTC.

1. Cycle the ignition on.
2. Using the scan tool, record and erase the DTCs.
3. With the scan tool, select: RF Hub, More Options and System Tests.
4. Perform the RF Hub LF Antenna Verification Tests. Refer to **STANDARD PROCEDURE**.
5. With the scan tool, read the Active DTCs.

   Does the scan tool display: B1A72-12-PASSIVE ENTRY ANTENNA 2 - CIRCUIT SHORT TO BATTERY as active?

   Yes

   - Go To 2

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.

2. **(D922) PASSIVE ENTRY ANTENNA 2 SIGNAL CIRCUIT SHORTED TO VOLTAGE**

Fig. 15: Measuring Voltage Between Ground & Passive Entry Antenna 2 Signal Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Cycle the ignition off.
2. Disconnect the RF Hub C2 harness connector.
3. Cycle the ignition on.
4. Measure the voltage between ground and the (D922) Passive Entry Antenna 2 Signal circuit.

   Is there any voltage present?

   Yes

   - Repair the short to voltage in the (D922) Passive Entry Antenna 2 Signal circuit.

   No

   - Go To 3

3. **(D923) PASSIVE ENTRY ANTENNA 2 RETURN CIRCUIT SHORTED TO VOLTAGE**
    1. Be sure the ignition is still on.
    2. Measure the voltage between ground and the (D923) Passive Entry Antenna 2 Return circuit (cavity 14 in the C2 connector).

       Is there any voltage present?

       Yes

       - Repair the short to voltage in the (D923) Passive Entry Antenna 2 Return circuit.

       No

       - Replace the RF HUB in accordance with the Service Information. Refer to **MODULE, RADIO FREQUENCY (RF HUB), REMOVAL** .
       - Perform the RADIO FREQUENCY HUB (RF HUB) VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

B1A74-11-PASSIVE ENTRY ANTENNA 4 - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 31: Passive Entry Antenna 3 & 4 - Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Passive Entry (PE) antenna units allow the transmitter within the Radio Frequency Hub (also known as the RF Hub) to communicate via Low Frequency (LF) radio transmission with a FOB with Integrated Key (FOBIK) that is located inside the vehicle or, at most, about 2 meters (6.5 feet) horizontally in all directions around the outside of the vehicle. The RF Hub uses communication through the antenna units to wake up and challenge a FOBIK that is within range in order to authenticate whether that FOBIK is valid (programmed) to the vehicle. The RF Hub communicates with the FOBIK using Frequency-Shift Keying (FSK) modulation.

Each antenna unit has two dedicated connections to the RF Hub. One connection is the LF antenna output circuit, while the other connection Is the LF antenna return circuit. These circuits to each antenna unit are a twisted pair to help reduce the potential for induced electrical interference. The RF Hub microcontroller monitors all of the antenna units and will store a Diagnostic Trouble Code (DTC) for any fault that it detects.

The hard wired inputs and outputs of the antenna units may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, the most reliable, efficient, and accurate means to diagnose the antenna units requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

WHEN MONITORED

At every Passive Entry or Keyless Go action.

SET CONDITION

When Antenna 4 Signal circuit is shorted to ground. If another Antenna Signal circuit is Open and there are no other Antennas that have a Short to Battery DTC, both Antennas will set this Short to Ground DTC.

POSSIBLE CAUSES

Possible Causes
ANOTHER ANTENNA SIGNAL CIRCUIT MAY BE SETTING AN OPEN DTC
(D926) PASSIVE ENTRY ANTENNA 4 SIGNAL CIRCUIT SHORTED TO GROUND
(D927) PASSIVE ENTRY ANTENNA 4 RETURN CIRCUIT SHORTED TO GROUND
PASSIVE ENTRY ANTENNA
RADIO FREQUENCY HUB (RF HUB) MODULE

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**

NOTE: **Verify that the vehicle's battery is fully charged with a DVOM and use the scan tool to compare the Battery Voltage listed under "Data" in the RFH View to that of the BCM. If the vehicle's battery is not fully charged, correct this condition before proceeding.**

1. Cycle the ignition on.
2. Using the scan tool, record and erase the DTCs.
3. With the scan tool, select: RF Hub, More Options and System Tests.
4. Perform the RF Hub LF Antenna Verification Tests. Refer to **STANDARD PROCEDURE**.
5. With the scan tool, read the Active DTCs.

Does the scan tool display: B1A74-11-PASSIVE ENTRY ANTENNA 4- CIRCUIT SHORT TO GROUND as active?

Yes

- Go To 2

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **(D926) PASSIVE ENTRY ANTENNA SHORTED**
   1. Cycle the ignition off.
   2. Disconnect the Passive Entry Antenna 4 harness connector.

      NOTE: For antenna locations, refer to ANTENNA, PASSIVE ENTRY, DESCRIPTION .

   3. Cycle the ignition on.
   4. Using the scan tool, record and erase the DTCs.
   5. With the scan tool, select: RF Hub, More Options and System Tests.
   6. Perform the RF Hub LF Antenna Verification Tests. Refer to **STANDARD PROCEDURE**.
   7. With the scan tool, read the Active DTCs.

      Does the scan tool display: B1A74-11-PASSIVE ENTRY ANTENNA 4 - CIRCUIT SHORT TO GROUND as active?

      Yes

      - Go To 3

      No

      - Replace the Antenna in accordance with the service information. Refer to **ANTENNA, PASSIVE ENTRY, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **(D926) PASSIVE ENTRY ANTENNA 4 SIGNAL CIRCUIT SHORTED TO GROUND**

Fig. 32: Measuring Resistance Between Ground & Passive Entry Antenna 4 Signal Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Cycle the ignition off.
2. Disconnect the RF Hub Module C2 harness connector.
3. Measure the resistance between ground and the (D926) Passive Entry Antenna 4 Signal circuit.

   Is the resistance below 30K Ohms?

   Yes

   - Repair the short to ground in the (D926) Passive Entry Antenna 4 Signal circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 4

4. **(D927) PASSIVE ENTRY ANTENNA 4 RETURN CIRCUIT SHORTED TO GROUND**

(D928) PASSIVE ENTRY ANTENNA 5 SIGNAL CIRCUIT OPEN
(D929) PASSIVE ENTRY ANTENNA 5 RETURN CIRCUIT OPEN
(D928) PASSIVE ENTRY ANTENNA 5 SIGNAL CIRCUIT SHORTED TO THE (D929) PASSIVE ENTRY ANTENNA 5 RETURN CIRCUIT
PASSIVE ENTRY ANTENNA
RADIO FREQUENCY HUB (RF HUB) MODULE

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**

NOTE: **Verify that the vehicle's battery is fully charged with a DVOM and use the scan tool to compare the Battery Voltage listed under "Data" in the RFH View to that of the BCM. If the vehicle's battery is not fully charged, correct this condition before proceeding.**

1. Cycle the ignition on.
2. Using the scan tool, record and erase the DTCs.
3. With the scan tool, select: RF Hub, More Options and System Tests.
4. Perform the RF Hub LF Antenna Verification Tests. Refer to **STANDARD PROCEDURE**.
5. With the scan tool, read the Active DTCs.

   Does the scan tool display: B1A75-13-PASSIVE ENTRY ANTENNA 5 - CIRCUIT OPEN as active?

Yes

- Go To 2

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **(D928) PASSIVE ENTRY ANTENNA 5 CIRCUIT OPEN**

Fig. 47: Checking Passive Entry Antenna 5 Circuit For Open
Courtesy of CHRYSLER GROUP, LLC

1. Cycle the ignition off.
2. Disconnect the Radio frequency Hub (RF HUB) C2 connector.
3. Measure the resistance between the (D928) Passive Entry Antenna 5 Signal circuit and the (D929) Passive Entry Antenna 5 Return circuit.

   Is the resistance between 1.5 and 3.5 Ohms?

   Yes

   - Replace the RF Hub in accordance with the Service Information. Refer to **MODULE, RADIO FREQUENCY (RF HUB), REMOVAL** .
   - Perform the RADIO FREQUENCY HUB (RF HUB) VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 3

Fig. 48: Checking Passive Entry Antenna 5 Signal Circuit For Open
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Passive Entry Antenna 5 harness connector.

   NOTE: For antenna locations, refer to ANTENNA, PASSIVE ENTRY, DESCRIPTION .

2. Measure the resistance of the (D928) Passive Entry Antenna 5 Signal circuit between the RF HUB C2 connector and the Passive Entry Antenna 5 harness connector.

   Is the resistance below 2.0 Ohms?

   Yes

   - Go To 4

   No

   - Repair the open in the (D928) Passive Entry Antenna 5 Signal circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **(D929) PASSIVE ENTRY ANTENNA 5 RETURN CIRCUIT OPEN**

Fig. 49: Checking Passive Entry Antenna 5 Return Circuit For Open

Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance of the (D929) Passive Entry Antenna 5 Return circuit between the RF HUB C2 connector and the Passive Entry Antenna 5 harness connector.

   Is the resistance below 2.0 Ohms?

   Yes

   - Go To 5

   No

   - Repair the open in the (D929) Passive Entry Antenna 5 Return circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **(D928) PASSIVE ENTRY ANTENNA 5 SIGNAL CIRCUIT SHORTED TO THE (D929) PASSIVE ENTRY ANTENNA 5 RETURN CIRCUIT**

Fig. 50: Measuring Resistance Between Passive Entry Antenna 5 Signal Circuit & Passive Entry Antenna 5 Return Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (D928) Passive Entry Antenna 5 Signal circuit and the (D929) Passive Entry Antenna 5 Return circuit.

   Is the resistance below 30K Ohms?

   Yes

   - Repair the short between the (D928) Passive Entry Antenna 5 Signal circuit and the (D929) Passive Entry Antenna 5 Return circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace the Antenna in accordance with the service information. Refer to **ANTENNA, PASSIVE ENTRY, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1A76-11-REMOTE START ANTENNA CIRCUIT - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously.

SET CONDITION

The Antenna Test Circuit is driven high but the feedback from the test circuit is low (less than 3.67 volts) 3 consecutive times. Each test sequence takes 95ms.

POSSIBLE CAUSES

POSSIBLE CAUSES
REMOTE START ANTENNA RADIO FREQUENCY HUB (RF HUB)

DIAGNOSTIC TEST

1. **CHECK THE REMOTE START ANTENNA CONNECTION**

NOTE: **Verify that the battery is fully charged with a DVOM and use the scan tool to compare the Battery Voltage listed under "Data" in the RFH View to that of the BCM. If the battery is not fully charged, correct this condition before proceeding.**

1. Gain access to the RF Hub connectors (under the rear shelf cover).
2. Disconnect and reconnect the Remote Start Antenna at the RF Hub module.
3. Using the scan tool, record and erase the DTCs.
4. Turn the ignition to the Lock position.
5. Start the engine and allow to run for 30 seconds.
6. Using the scan tool, read the active DTCs.

   Does the scan tool display; B1A76-11-REMOTE START ANTENNA CIRCUIT - CIRCUIT SHORT TO GROUND?

Yes

- Go To 2

No

- Test complete.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK THE REMOTE START ANTENNA CONNECTION**
   1. Disconnect the Remote Start Antenna.
   2. Replace the antenna with a known good antenna.
   3. Turn the ignition to the Lock position.
   4. Start the engine and allow to run for 30 seconds.
   5. Using the scan tool, read the active DTCs.

   Does the scan tool display; B1A76-11-REMOTE START ANTENNA CIRCUIT - CIRCUIT SHORT TO GROUND?

   Yes

   - Replace the Radio Frequency Hub in accordance with the Service Information. Refer to **MODULE, RADIO FREQUENCY (RF HUB), REMOVAL** .
   - Perform the RADIO FREQUENCY HUB VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Replace the Remote Start Antenna in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1A76-13-REMOTE START ANTENNA CIRCUIT - CIRCUIT OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously.

SET CONDITION

The Antenna Test Circuit is driven high but the feedback from the test circuit is low (less than 0.85 volts for 3 consecutive times). Each test sequence takes 95ms.

POSSIBLE CAUSES

POSSIBLE CAUSES
ANTENNA DISCONNECTED REMOTE START ANTENNA RADIO FREQUENCY HUB (RF HUB)

DIAGNOSTIC TEST

1. **CHECK THE REMOTE START ANTENNA CONNECTION**
    1. Gain access to the RF Hub connectors (under the rear shelf cover).
    2. Disconnect and reconnect the Remote Start Antenna at the RF Hub module.
    3. Using the scan tool, record and erase the DTCs.
    4. Turn the ignition to the Lock position.
    5. Start the engine and allow to run for 30 seconds.
    6. Using the scan tool, read the active DTCs.

    Does the scan tool display; B1A76-13-REMOTE START ANTENNA CIRCUIT - CIRCUIT OPEN?

    Yes

    - Go To 2

    No

    - Test complete.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE REMOTE START ANTENNA CONNECTION**
    1. Disconnect the Remote Start Antenna.
    2. Replace the antenna with a known good antenna.
    3. Turn the ignition to the Lock position.
    4. Start the engine and allow to run for 30 seconds.
    5. Using the scan tool, read the active DTCs.

    Does the scan tool display; B1A76-13-REMOTE START ANTENNA CIRCUIT - CIRCUIT OPEN?

    Yes

    - Replace the Radio Frequency Hub in accordance with the Service Information. Refer to **MODULE, RADIO FREQUENCY (RF HUB), REMOVAL** .
    - Perform the RADIO FREQUENCY HUB VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Replace the Remote Start Antenna in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1A7B-00-IMMOBILIZER ANTENNA (IGNM)

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously

SET CONDITION

The IGNM uses a motor to prevent the driver removing the FOBIK from the IGNM. If the motor is driven and the motor driver IC reports a fault or over-current condition, then this condition is relayed to the RFHM. The fault shall mature if the RFHM sees this condition for 3 times in a row.

POSSIBLE CAUSES

Possible Causes
IGNITION NODE MODULE (IGNM)

DIAGNOSTIC TEST

REPLACE THE IGNM IF THE DTC IS ACTIVE

1. Turn the ignition on.
2. With the scan tool, record and erase the RF-Hub DTCs.
3. Turn the ignition off.
4. Turn the ignition on and wait 30 seconds.
5. With the scan tool, read the active DTCs.

   Does the scan tool display: B1A7B-00-IMMOBILIZER ANTENNA (IGNM) as ACTIVE?

   Yes

   - Replace the Ignition Node Module (IGNM) in accordance with the Service Information. Refer to **MODULE, IGNITION NODE, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time.

Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1A7B-01-IMMOBILIZER ANTENNA (KIN/IGNM) - GENERAL ELECTRICAL FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Whenever the ignition is put in the start position or the Loop test for the immobilizer is run.

SET CONDITION

If the internal antenna is shorted to ground, open, shorted to battery or the internal terminals are shorted together, this code will set.

POSSIBLE CAUSES

POSSIBLE CAUSES
KEYLESS IGNITION NODE (KIN) OR IGNITION MODULE (IGNM)

DIAGNOSTIC TEST

CHECK INTERMITTENT CONDITION

NOTE: Verify that the battery is fully charged with a DVOM and use the scan tool to compare the Battery Voltage listed under "Data" in the RFH View to that of the BCM. If the battery is not fully charged, correct this condition before proceeding.

1. Cycle the ignition on.
2. Using the scan tool, record and erase the DTCs.
3. Cycle the ignition off and wait 30 seconds.
4. Cycle the ignition on and attempt to start the engine.
5. If the engine started, wait 10 seconds then cycle the ignition off.
6. Cycle the ignition on.
7. Using the scan tool, read the active DTCs.

   Does the scan tool display; B1A7B-01-IMMOBILIZER ANTENNA (KIN/IGNM) - GENERAL ELECTRICAL FAILURE?

   Yes

- If equipped with a Keyless Ignition Node (KIN), replace it in accordance with Service Information. Refer to **MODULE, KEYLESS IGNITION NODE, REMOVAL** .
- If equipped with an Ignition Node Module (IGNM), replace it in accordance with Service Information. Refer to **MODULE, IGNITION NODE, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Test complete. If the DTC ever repeats, replace the Keyless Ignition Node (KIN) or the Ignition Module (IGNM) in accordance with the Service Information. Refer to **MODULE, KEYLESS IGNITION NODE, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1A7B-62-IMMOBILIZER ANTENNA (KIN/IGNM)-SIGNAL COMPARE FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 51: Security K Line Communication Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

Whenever the ignition is put in the start position or the Loop test for the immobilizer is run.

SET CONDITION

When the hard-wired ignition run/start line between the KIN / IGNM and RFH indicates a different ignition

position from the received signal of the LIN bus between the KIN / IGNM and the RFH.

POSSIBLE CAUSES

POSSIBLE CAUSES
KEYLESS IGNITION NODE (KIN) OR IGNITION MODULE (IGNM)
RADIO FREQUENCY HUB (RFH) MODULE
IGNITION RUN / START SWITCH SENSE CIRCUIT
LIN BUS CIRCUIT

DIAGNOSTIC TEST

1. **CHECK INTERMITTENT CONDITION**

NOTE: **Verify that the battery is fully charged with a DVOM and use the scan tool to compare the Battery Voltage listed under "Data" in the RFH View to that of the BCM. If the battery is not fully charged, correct this condition before proceeding.**

NOTE: **Perform any Radio Frequency Hub (RFH) Module LIN bus communication DTC's before continuing.**

1. Turn the ignition on.
2. Using the scan tool, record and erase the DTCs.
3. Turn the ignition off and wait 30 seconds.
4. Turn the ignition on and attempt to start the engine.
5. If the engine started, wait 10 seconds then turn the ignition off.
6. Turn the ignition on.
7. Using the scan tool, read the active DTCs.

Does the scan tool display the B1A7B-62-IMMOBILIZER ANTENNA (KIN/IGNM)-SIGNAL COMPARE FAILURE as an ACTIVE fault?

Yes

- Go to 2

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **(G20) IGNITION RUN / START SWITCH SENSE CIRCUIT SHORTED TO VOLTAGE**
   1. Turn the ignition off.
   2. Disconnect the Ignition Node Module (IGNM) connector.
   3. Check the G20 Ignition Run / Start Switch Sense circuit for a short to voltage.

      Is there any voltage present?

      Yes

      - Repair the (G20) Ignition Run / Start Switch Sense circuit for a short to voltage.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go to 3
3. **(G20) IGNITION RUN / START SWITCH SENSE CIRCUIT SHORTED TO GROUND**
   1. Measure the resistance between ground and the (G20) Ignition Run / Start Switch Sense circuit.

      Is the resistance below 10K Ohms?

      Yes

      - Repair the (G20) Ignition Run / Start Switch Sense circuit for a short to ground.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go to 4
4. **CHECK THE (G20) IGNITION RUN / START SWITCH SENSE CIRCUIT**
   1. If equipped with a Keyless Ignition Node (KIN), replace it in accordance with Service Information. Refer to **MODULE, KEYLESS IGNITION NODE, REMOVAL** .
   2. If equipped with an Ignition Node Module (IGNM), replace it in accordance with Service Information.
   3. Turn the ignition on and attempt to start the engine.
   4. If the engine started, wait 10 seconds then turn the ignition off.
   5. Turn the ignition on.
   6. Using the scan tool, read the active DTCs.

      Does the scan tool display the B1A7B-62-IMMOBILIZER ANTENNA (KIN/IGNM)-SIGNAL COMPARE FAILURE as an ACTIVE fault?

      Yes

- Replace the RF Hub in accordance with the Service Information. Refer to **MODULE, RADIO FREQUENCY (RF HUB), REMOVAL** .
- Perform the RADIO FREQUENCY HUB (RF HUB) VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete. If the DTC ever repeats, replace the Keyless Ignition Node (KIN) or the Ignition Module (IGNM) in accordance with the Service Information. Refer to **MODULE, KEYLESS IGNITION NODE, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1A7D-2A-START BUTTON - STUCK

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Each time the Start/Stop Button is pressed.

SET CONDITION

If the (D122) Security K Line Communication circuit and the (G20) Ignition Switch Sense circuit match, during a button press, but are On for longer than 25 seconds, this code will set.

POSSIBLE CAUSES

POSSIBLE CAUSES
FOREIGN OBJECT STUCK IN SWITCH KEYLESS IGNITION NODE (KIN)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
   1. Using the scan tool, record and erase the DTCs.
   2. Cycle the ignition to the Lock position.

      NOTE: Do not apply the brake or the clutch in the next step.

   3. Press the KIN in all positions several times.
   4. Cycle the ignition off and then back on.
   5. Using the scan tool, read the active DTCs.

      Does the scan tool display; B1A7D-2A-START BUTTON - STUCK?

Yes

- Go To 2

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and poor pin fit.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **EXAMINE THE KEYLESS IGNITION NODE**
   1. Check for anything that could cause the button to stick.

      Could you find anything that would cause a sticking condition?

      Yes

      - Repair as necessary.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Replace the Keyless Ignition Node (KIN) in accordance with the Service Information. Refer to **MODULE, KEYLESS IGNITION NODE, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1A8F-00-IGNM PHOTO POSITION FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously.

SET CONDITION

The Radio Frequency Hub (RF-Hub) detects an internal fault in the Ignition Node Module (IGNM).

POSSIBLE CAUSES

Possible Causes
IGNITION NODE MODULE (IGNM) RADIO FREQUENCY HUB MODULE (RF HUB)

DIAGNOSTIC TEST

1. **CHECK FOR ACTIVE DTC**
    1. Cycle the ignition on.
    2. With the scan tool, record and erase the RF-Hub DTCs.
    3. Cycle the ignition off then back on.
    4. Wait 30 seconds.
    5. With the scan tool, read the active DTCs.

    Does the scan tool display: B1A8F-00 IGNM PHOTO SENSOR FAILURE as active?

    Yes

    - Go To 2

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension. If this DTC ever reCycles, replace the Ignition Node Module in accordance with the Service Information.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **REPLACE THE IGNM IF THE DTC IS ACTIVE**
    1. Replace the Ignition Node Module in accordance with Service Information.
    2. With the scan tool, record and erase the RF-Hub DTCs.
    3. Cycle the ignition off then back on.
    4. Wait 30 seconds.
    5. With the scan tool, read the active DTCs.

    Does the scan tool display: B1A8F-00 IGNM PHOTO SENSOR FAILURE as active?

    Yes

    - Replace the Radio Frequency Hub Module (RFHM) in accordance with the Service Information. Refer to **MODULE, RADIO FREQUENCY (RF HUB), REMOVAL** .
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension. If this DTC ever reCycles, replace the Ignition Node Module in accordance with the Service Information.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B18A9-00-TRUNK/GATE LOCK CONTROL CIRCUIT 1

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 52: Exterior Liftgate Handle Switch - Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

Continuously

SET CONDITION

When the Exterior Liftgate Handle Switch Signal/Return circuit(s) are shorted to ground/together; or the Exterior Liftgate Handle Switch is stuck, this DTC will set.

POSSIBLE CAUSES

Possible Causes
POWER LIFTGATE HANDLE SWITCH (P30) EXTERIOR LIFTGATE HANDLE SWITCH SIGNAL CIRCUIT SHORTED TO GROUND (P39) EXTERIOR LIFTGATE HANDLE SWITCH RETURN CIRCUIT SHORTED TO GROUND (P30) EXTERIOR LIFTGATE HANDLE SWITCH SIGNAL CIRCUIT SHORTED TO (P39) EXTERIOR LIFTGATE HANDLE SWITCH RETURN CIRCUIT

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Cycle the ignition on.
    2. Using the scan tool, record and erase the DTCs.
    3. With the scan tool, read the Active DTCs.

    Does the scan tool display: B18A9-00-TRUNK/GATE LOCK CONTROL CIRCUIT 1 as active?

    Yes

    - Go To 3

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
2. **CHECKING THE EXTERIOR LIFTGATE HANDLE SWITCH**
    1. Cycle the ignition off.
    2. Disconnect the Exterior Liftgate Handle Switch.
    3. Cycle the ignition on.
    4. Using the scan tool, record and erase the DTCs.
    5. With the scan tool, read the Active DTCs.

    Does the scan tool display: B18A9-00-TRUNK/GATE LOCK CONTROL CIRCUIT 1 as active?

    Yes

    - Go to 3

No

- Check the connection at the Exterior Liftgate Handle Switch for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
- If no problem found with the connection, replace the Exterior Liftgate Handle Switch in accordance with Service Information. Refer to **SWITCH, EXTERIOR HANDLE, REMOVAL** .

3. **CHECKING THE EXTERIOR LIFTGATE HANDLE SWITCH SIGNAL CIRCUIT FOR A SHORT TO GROUND**
   1. Cycle the ignition off.
   2. Disconnect the RF Hub Module C2 harness connector.
   3. Measure the resistance between ground and the (P30) Exterior Liftgate Handle Switch Signal circuit.

      Is the resistance below 30K Ohms?

      Yes

      - Repair the short to ground in the (P30) Exterior Liftgate Handle Switch Signal circuit.

      No

      - Go To 4
4. **CHECKING THE EXTERIOR LIFTGATE HANDLE SWITCH RETURN CIRCUIT FOR A SHORT TO GROUND**
   1. Measure the resistance between ground and the (P39) Exterior Liftgate Handle Switch Return circuit.

      Is the resistance below 30K Ohms?

      Yes

      - Repair the short to ground in the (P39) Exterior Liftgate Handle Switch Return circuit.

      No

      - Go To 5
5. **CHECKING THE EXTERIOR LIFTGATE HANDLE SWITCH SIGNAL CIRCUIT BEING SHORTED TO THE EXTERIOR LIFTGATE HANDLE SWITCH RETURN CIRCUIT**

NOTE: **The RF Hub Module C2 harness connector and the Exterior Liftgate Handle Switch**

should still be disconnected

when performing this test.

1. Measure the resistance between the (P30) Exterior Liftgate Handle Switch Signal circuit and the (P39) Exterior Liftgate Handle Switch Return circuit at the RF Hub C2 harness connector.

   Is the resistance below 30K Ohms?

   Yes

   - Repair the short between the (P30) Exterior Liftgate Handle Switch Signal circuit and the (P39) Exterior Liftgate Handle Switch Return circuit.

   No

   - Check the connection at the RF Hub Module for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
   - If no problem found at the connection, replace the RF Hub in accordance with the Service Information. Refer to **MODULE, RADIO FREQUENCY (RF HUB), REMOVAL** .

B215B-11-IGNITION RUN/START 2 CONTROL-CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 53: Ignition Run/Start Output Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

During a Passive Entry or Keyless Go event.

SET CONDITION

Whenever the Radio Frequency Hub (RF Hub) senses a short to ground on the F20 Ignition Run/Start Output circuit, this code will set.

NOTE: This F20 circuit is a sense circuit from the Radio Frequency Hub to the Body Control Module. It has a maximum draw of 10mA.

POSSIBLE CAUSES

Possible Causes
(F20) IGNITION SWITCH OUTPUT CIRCUIT SHORTED TO GROUND
RADIO FREQUENCY HUB (RF HUB)

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**

NOTE: Verify that the battery is fully charged with a DVOM and use the scan tool to compare the Battery Voltage listed under "Data" in the RFH View to that of the BCM. If the battery is not fully charged, correct this condition before proceeding.

1. Turn the ignition on.
2. Using the scan tool, record and erase the DTCs.
3. Try to start the engine.
4. With the scan tool, read the Active DTCs and wait one minute.

   Does the scan tool display: B215B-11-IGNITION RUN/START 2 CONTROL - CIRCUIT SHORT TO GROUND as active?

   Yes

   - Go To 2

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **(F20) IGNITION SWITCH OUTPUT CIRCUIT SHORT TO GROUND**

Fig. 54: Measuring Resistance Between Ground & Ignition Switch Output Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Radio Frequency Hub (RF Hub) C1 harness connector.
3. Measure the resistance between ground and the (F20) Ignition Switch Output circuit.

   Is the resistance below 30k Ohms?

   Yes

   - Repair the short to ground in the (F20) Ignition Switch Output circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

- Replace the Radio Frequency Hub (RF Hub) Module in accordance with the Service Information. Refer to **MODULE, RADIO FREQUENCY (RF HUB), REMOVAL** .
- Perform the Radio Frequency Hub Verification test. Refer to **STANDARD PROCEDURE**.

B215B-12-IGNITION RUN/START 2 CONTROL - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 55: Ignition Run/Start Output Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

During a Passive Entry or Keyless Go event.

SET CONDITION

Whenever the Radio Frequency Hub (RF Hub) senses a short to battery on the F20 Ignition Run/Start Output circuit, this code will set.

NOTE: The F20 circuit is a sense circuit from the Radio Frequency Hub to the Body Control Module. It has a maximum draw of 100mA.

POSSIBLE CAUSES

Possible Causes
(F20) IGNITION SWITCH OUTPUT CIRCUIT SHORTED TO VOLTAGE
BODY CONTROL MODULE (BCM)
RADIO FREQUENCY HUB (RF HUB)

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**

   NOTE: Verify that the battery is fully charged with a DVOM and use the scan tool to compare the Battery Voltage listed under "Data" in the RFH View to that of the BCM. If the battery is not fully charged, correct this condition before proceeding.

   1. Cycle the ignition on.
   2. Using the scan tool, record and erase the DTCs.
   3. Try to start the engine.
   4. With the scan tool, read the Active DTCs and wait one minute.

      Does the scan tool display: B215B-12-IGNITION RUN/START 2 CONTROL - CIRCUIT SHORT TO BATTERY as active?

      Yes

      - Go To 2

      No

      - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **(F20) IGNITION SWITCH OUTPUT CIRCUIT SHORT TO VOLTAGE**
   1. Cycle the ignition off.
   2. Disconnect the Body Control Module C8 harness connector.
   3. Leave the ignition off.
   4. Cycle the park lamps on.
   5. Measure the voltage between ground and the (F20) Ignition Switch Output circuit in the Body Control Module E harness connector.

      Is there any voltage present?

Yes

- Go To 3

No

- Replace the Body Control Module in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **(F20) IGNITION SWITCH OUTPUT WIRE SHORTED TO VOLTAGE**
   1. Disconnect the Radio Frequency Hub (RF Hub) C1 harness connector.
   2. Measure the voltage between ground and the (F20) Ignition Switch Output circuit.

   Is there any voltage present?

   Yes

   - Repair the short to voltage in the (F20) Ignition Switch Output circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the Radio Frequency Hub (RF Hub) Module in accordance with the Service Information. Refer to **MODULE, RADIO FREQUENCY (RF HUB), REMOVAL** .
   - Perform the RADIO FREQUENCY HUB VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

B215B-13-IGNITION RUN/START 2 CONTROL-CIRCUIT OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 56: Ignition Run/Start Output Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

During a Passive Entry or Keyless Go event.

SET CONDITION

Whenever the Radio Frequency Hub (RF Hub) senses an open on the F20 Ignition Run/Start Output circuit, this code will set.

NOTE: This F20 circuit is a sense circuit from the Radio Frequency Hub to the Body Control Module. It has a maximum draw of 10mA.

POSSIBLE CAUSES

Possible Causes
(F20) IGNITION SWITCH OUTPUT CIRCUIT OPEN
RADIO FREQUENCY HUB (RF HUB)

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**

NOTE: Verify that the battery is fully charged with a DVOM and use the scan tool to compare the Battery Voltage listed under "Data" in the RFH View to that of the BCM. If the battery is not fully charged, correct this condition before proceeding.

1. Turn the ignition on.
2. Using the scan tool, record and erase the DTCs.
3. Try to start the engine.
4. With the scan tool, read the Active DTCs and wait one minute.

   Does the scan tool display: B215B-13-IGNITION RUN/START 2 CONTROL - CIRCUIT OPEN as active?

   Yes

   - Go To 2

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **(F20) IGNITION SWITCH OUTPUT CIRCUIT WIRE OPEN**

1.
2. Turn the ignition off.
3. Disconnect the Radio Frequency Hub (RF Hub) C1 harness connector.
4. Disconnect the Body Control Module C8 harness connector.
5. Measure the resistance of the (F20) Ignition Switch Output wire between the Body Control Module C8 harness connector and the RF Hub C1 harness connector.

   Is the resistance below 2.0 Ohms?

   Yes

   - Replace the Radio Frequency Hub (RF Hub) Module in accordance with the Service Information. Refer to **MODULE, RADIO FREQUENCY (RF HUB), REMOVAL** .
   - Perform the RADIO FREQUENCY HUB VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

- Repair the open in the (F20) Ignition Switch Output wire.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B2199-16-BATTERY VOLTAGE - CIRCUIT VOLTAGE BELOW THRESHOLD

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 57: RF Hub Supply Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

At all times.

SET CONDITION

Anytime the module senses voltage input below 8.0 Volts for over two seconds, this code will set.

POSSIBLE CAUSES

POSSIBLE CAUSES
LOW VOLTAGE ENGINE DTC (A910A) FUSED B(+) OR (Z924) GROUND CIRCUIT HAS HIGH RESISTANCE RADIO FREQUENCY HUB (RF HUB) MODULE

DIAGNOSTIC TEST

1. **CHECK POWERTRAIN DTCs**

   NOTE: Verify that the battery is fully charged with a DVOM and use the scan tool to compare the Battery Voltage listed under "Data" in the RFH View to that of the BCM. If the battery is not fully charged, correct this condition before proceeding.

   1. Using the scan tool, read the active PCM DTCs.

      Are there any Battery or Charging System DTCs?

      Yes

      - Refer to **DTC INDEX** and perform the appropriate diagnostic procedure for the charging system DTCs.

      No

      - Go To 2

2. **TEST FOR INTERMITTENT CONDITION**
   1. Using the scan tool, record and erase the DTCs.
   2. Start the engine and run for two minutes.
   3. Using the scan tool, read the Active DTCs.

      Does the scan tool display B2199-16-BATTERY VOLTAGE - CIRCUIT VOLTAGE BELOW THRESHOLD as active?

      Yes

      - Go To 3

      No

      - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **(A910A) FUSED B(+) OR (Z924) GROUND CIRCUIT RESISTED**

Fig. 58: Checking Fused B(+) Circuit For High Resistance
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Radio Frequency Hub (RF Hub) Module C1 harness connector.
2. Test the (A910A) Fused B(+) circuit for high resistance by connecting a 12-volt test light between the (A910) Fused B(+) circuit and the (Z924) Ground circuit in the RF Hub C1 harness connector. The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

   Does the test light illuminate brightly?

   Yes

- Replace the Radio Frequency Hub (RF Hub) module in accordance with the Service Information. Refer to **MODULE, RADIO FREQUENCY (RF HUB), REMOVAL** .
- Perform the RADIO FREQUENCY HUB VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test the (A910A) Fused B(+) and the (Z924) Ground circuits to determine which one has the high resistance. Repair the (A910A) Fused B(+) circuit or the (Z924) Ground circuit for high resistance.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B2199-17-BATTERY VOLTAGE - CIRCUIT VOLTAGE ABOVE THRESHOLD

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 59: RF Hub Supply Circuit Diagram

Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

At all times.

SET CONDITION

Anytime the module senses voltage input above 16.0 Volts for over two seconds, this code will set.

POSSIBLE CAUSES

POSSIBLE CAUSES
HIGH VOLTAGE PCM DTC RADIO FREQUENCY HUB (RF HUB)

DIAGNOSTIC TEST

1. **CHECK PCM DTCs**

   NOTE: Verify that the battery is fully charged with a DVOM and use the scan tool to compare the Battery Voltage listed under "Data" in the RFH View to that of the BCM. If the battery is not fully charged, correct this condition before proceeding.

   1. Using the scan tool, read the active Powertrain DTCs.

      Are there any active Battery or Charging system DTCs present?

      Yes

      - Refer to **DTC INDEX** and perform the diagnostic procedure for the battery or charging system DTCs.

      No

      - Go To 2

2. **TEST FOR INTERMITTENT CONDITION**
   1. Using the scan tool, record and erase the DTCs.
   2. Start the engine and run for two minutes.
   3. Using the scan tool, read the active DTCs.

      Does the scan tool display; B2199-17-BATTERY VOLTAGE - CIRCUIT VOLTAGE ABOVE THRESHOLD as active?

Yes

- Replace the Radio Frequency Hub (RF Hub) in accordance with the Service Information. Refer to **MODULE, RADIO FREQUENCY (RF HUB), REMOVAL** .
- Perform the RADIO FREQUENCY HUB VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B21DD-84-SYSTEM VOLTAGE - SIGNAL BELOW ALLOWABLE RANGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

The first 10 seconds after the ignition is turned to run.

SET CONDITION

When the Body Control Module (BCM) sends a message that the system voltage is below 10.0 volts for over 15 seconds, this code will set.

POSSIBLE CAUSES

POSSIBLE CAUSES
LOW SYSTEM VOLTAGE
BATTERY OR CHARGING SYSTEM

DIAGNOSTIC TEST

CHECK POWERTRAIN CONTROL MODULE (PCM) DTCs

NOTE: Verify that the battery is fully charged with a DVOM and use the scan tool to compare the Battery Voltage listed under "Data" in the RFH View to that of the BCM. If the battery is not fully charged, correct this condition before proceeding.

1. With the scan tool, read PCM DTCs.

   Are there any PCM Charging or Battery DTCs present?

Yes

- Refer to **DTC INDEX** and perform the appropriate diagnostic procedure.

No

- This code is for information only. At some time there was a low battery system voltage. Check the battery and charging system for an intermittent failure.

B21DD-85-SYSTEM VOLTAGE - SIGNAL ABOVE ALLOWABLE RANGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

The first 10 seconds after the ignition is turned to run.

SET CONDITION

When the Body Control Module (BCM) sends a message that the system voltage is above 16.0 volts for over 15 seconds, this code will set.

POSSIBLE CAUSES

POSSIBLE CAUSES
HIGH SYSTEM VOLTAGE BATTERY OR CHARGING SYSTEM

DIAGNOSTIC TEST

CHECK POWERTRAIN CONTROL MODULE (PCM) DTCs

NOTE: Verify that the battery is fully charged with a DVOM and use the scan tool to compare the Battery Voltage listed under "Data" in the RFH View to that of the BCM. If the battery is not fully charged, correct this condition before proceeding.

1. With the scan tool, read PCM DTCs.

   Are there any PCM Charging or Battery DTCs present?

   Yes

   - Refer to **DTC INDEX** and perform the appropriate diagnostic procedure.

   No

- This code is for information only. At some time there was a high battery system voltage. Check the battery and charging system for an intermittent failure.

B222C-00-VEHICLE CONFIGURATION NOT PROGRAMMED

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously in all ignition modes.

SET CONDITION

When the RFHM has not learned proxi at least once. This can take place at end of the assembly line or at dealership when the RF-Hub module is replaced and the proxi is not performed or not accepted.

POSSIBLE CAUSES

Possible Causes
PROXI NOT PERFORMED ON THE RF HUB

DIAGNOSTIC TEST

1. **CHECK FOR ACTIVE DTC**
    1. Cycle the ignition on.
    2. With the scan tool, record and erase the RF-Hub Module DTCs.
    3. Cycle the ignition switch from on to off, wait five seconds and then back to on.
    4. With the scan tool, read the active RF-Hub Module DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
2. **PROGRAM THE RF HUB MODULE**
    1. With the scan tool, reprogram and proxi the RF-Hub Module in accordance with Service Information. Refer to **MODULE, RADIO FREQUENCY (RF HUB), REMOVAL** .
    2. With the scan tool, record and erase the RF-Hub Module DTCs.

3. Cycle the ignition switch from on to off, wait five seconds and then back to on.
4. With the scan tool, read the active RF-Hub Module DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Replace the RF-Hub Module in accordance with the Service Information. Refer to **MODULE, RADIO FREQUENCY (RF HUB), REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B2205-00-ORIGINAL VIN MISSING/MISMATCH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

During a Passive Entry or Keyless Go event.

SET CONDITION

The Radio Frequency Hub (RF Hub) will receive and monitor the VIN message from the PCM and record the VIN if different from the last VIN. If the module was used on a previous vehicle, the VIN will be set to that vehicle and the module will have to be replaced.

NOTE: Do not attempt to swap RF Hub modules. If a RF Hub module has been used on one vehicle, it cannot be used on another vehicle.

POSSIBLE CAUSES

Possible Causes
RF HUB RECEIVED INVALID VIN
RADIO FREQUENCY HUB (RF HUB) NOT PROGRAMMED
RADIO FREQUENCY HUB (RF HUB)

DIAGNOSTIC TEST

1. **CHECK THE VEHICLE VIN**
   1. Cycle the ignition on.

2. With the scan tool, select: RF Hub, "REPORTS", "ECU Details Report".
3. Scroll down to "RF Hub", read the "VIN Original" and compare it to the actual vehicle VIN.

   Does the RF Hub VIN Original match the vehicle VIN?

   Yes

   - Go To 2

   No

   - Go To 3

2. **CHECK FOR ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
   1. With the scan tool, record and erase the DTCs.
   2. With the scan tool, select: RF Hub, "System Tests".
   3. Perform the "RF Hub LF Antennas Verification Test".
   4. With the scan tool, read the Active DTCs.

   Does the scan tool display: B2205-00-ORIGINAL VIN MISSING/MISMATCH as active?

   Yes

   - Replace the RF Hub module in accordance with the Service Information. Refer to **MODULE, RADIO FREQUENCY (RF HUB), REMOVAL** .
   - Perform the RADIO FREQUENCY HUB (RF HUB) VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **RESET ECU**
   1. With the scan tool, select "Misc Functions"
   2. With the scan tool, perform the "Reset ECU" routine.
   3. Cycle the ignition off and wait 30 seconds.
   4. Try to start the engine three times.

   Did the engine start?

   Yes

- Test complete.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace the Radio Frequency Hub module in accordance with the Service Information. Refer to **MODULE, RADIO FREQUENCY (RF HUB), REMOVAL** .
- Perform the RADIO FREQUENCY HUB VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

B22A9-00-ECU INTERNAL PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The RADIO FREQUENCY HUB (RF-HUB) performs an internal self test. The repair of this fault condition does not involve any external circuitry and centers on verifying the integrity of the internal circuitry and software validity.

WHEN MONITORED

Continuously.

SET CONDITION

The RADIO FREQUENCY HUB (RF-HUB) detects an internal fault.

POSSIBLE CAUSES

Possible Causes
RADIO FREQUENCY HUB (RF-HUB)

DIAGNOSTIC TEST

REPLACE THE RF-HUB IF THE DTC IS ACTIVE

NOTE: **Verify that the battery is fully charged with a DVOM and use the scan tool to compare the Battery Voltage listed under "Data" in the RFH View to that of the BCM. If the battery is not fully charged, correct this condition before proceeding.**

1. Cycle the ignition on.
2. With the scan tool, record and erase the RF-Hub DTCs.
3. Cycle the ignition off.

4. Cycle the ignition on and wait 30 seconds.
5. With the scan tool, read the active DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Replace the Radio Frequency Hub (RF-Hub) in accordance with the Service Information. Refer to **MODULE, RADIO FREQUENCY (RF HUB), REMOVAL** .
   - Perform the RADIO FREQUENCY HUB (RF-HUB) VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

B25A9-00-FRONT DRIVER DOOR HANDLE SENSE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 60: Front Driver & Passenger Door Handle Sense - Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

During the Passive Entry or Keyless Go event.

SET CONDITION

When the RF Hub module senses a door handle hall sensor, a lock switch failure or a continuous activation for over four (4) minutes, this code will set.

POSSIBLE CAUSES

Possible Causes
DOOR HANDLE CAP
DRIVER EXTERIOR DOOR HANDLE (PASSIVE ENTRY)
RADIO FREQUENCY HUB (RF- HUB)

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**

NOTE: **Verify that the vehicle's battery is fully charged with a DVOM and use the scan tool to compare the Battery Voltage listed under "Data" in the RFH View to that of the BCM. If the vehicle's battery is not fully charged, correct this condition before proceeding.**

NOTE: **Before proceeding, check the handle for any foreign material, or binding, that could cause a sticking situation to the handle or switch.**

NOTE: **If there are any other active RF Hub DTCs, perform the diagnostic procedure for them before proceeding.**

1. Cycle the ignition on.
2. Using the scan tool, record and erase the DTCs.
3. Make sure that the door handle is in the home position (not pulled).
4. With the scan tool, select "Diagnostic Procedures", "Reset ECU" and "RFH" and perform the routine.
5. With the scan tool, select "RFH", "Data" and scroll to "Last Message: Left Front Door Handle Hall Signal".
6. Observe the value field.

Does the scan tool display: YES?

Yes

NOTE: **Verify that the magnet is present in the Door Handle Cap. If the magnet is present, then continue with the diagnostic procedure. If the magnet is NOT present, replace the Door Handle Cap first.**

- Replace the Left Front Exterior Door Handle in accordance with the Service Information. Refer to **HANDLE, EXTERIOR, REMOVAL** and **HANDLE, INTERIOR, REMOVAL** .
- With the scan tool, select "Diagnostic Procedures", "Reset ECU" and "RFH" and perform the routine.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 2

2. **TEST FOR STUCK LOCK SWITCH**
   1. With the scan tool, select "RFH", "Data" and scroll to "Last Message: Left Front Door Handle Lock".
   2. Observe the value field.

      Does the scan tool display: YES?

      Yes

      - Replace the Left Front Exterior Door Handle in accordance with the Service Information. Refer to **HANDLE, EXTERIOR, REMOVAL** and **HANDLE, INTERIOR, REMOVAL** .
      - With the scan tool, select "Diagnostic Procedures", "Reset ECU" and "RFH" and perform the routine.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 3

3. **DOOR HANDLE OPERATION**
   1. Open the Left Front Door window.
   2. Cycle the ignition off, remove the FOBIK and close all doors.
   3. Have the FOBIK outside and within 10 cm. and 1.5 m. (4 in. and 5 ft.) of the Left Front door handle.

      NOTE: In the next step, wait two (2) seconds between each Lock and Unlock activation as there is a two second delay after each Lock action.

   4. Lock and Unlock the Left Front Door by the outside handle four (4) times.
   5. Open the Left Front Door by pulling the handle.

      Did the Door Handle Lock and Unlock the door as it should?

      Yes

      - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension. Record the findings on the work order.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 4

4. **DOOR HANDLE OR RF HUB**
   1. Cycle the ignition on and open the Right Front window.
   2. Cycle the ignition off, remove the FOBIK and close all doors.
   3. Have the FOBIK outside the car and within 10cm. and 1.5 m. (4 in. and 5 ft.) from the Right Front door handle.

      NOTE: In the next steps, wait two (2) seconds between each Lock and Unlock activation as there is a two second delay after each Lock action.

   4. Lock and Unlock the Right Front Door by the outside handle four (4) times.
   5. Using the handle lock switch, lock the doors.
   6. Open the Right Front Door by pulling the handle.

      Did the Right Front Door Handle Lock and Unlock the door as it should?

      Yes

      - Replace the Left Front Exterior Door Handle in accordance with the Service Information. Refer to **HANDLE, EXTERIOR, REMOVAL** and **HANDLE, INTERIOR, REMOVAL** .
      - With the scan tool, select "Diagnostic Procedures", "Reset ECU" and "RFH" and perform the routine.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Replace the RF-HUB in accordance with the Service Information. Refer to **MODULE, RADIO FREQUENCY (RF HUB), REMOVAL** .
      - Perform the RADIO FREQUENCY HUB VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

B25A9-01-FRONT DRIVER DOOR HANDLE SENSE - GENERAL ELECTRICAL FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 61: Door Handle Sense Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

During the Passive Entry or Keyless Go event.

SET CONDITION

Whenever the Radio Frequency Hub (RF Hub) senses an open, a short to ground or a short to battery on the Passive Handle Switch Sense circuit for over one (1) minute, this code will set.

POSSIBLE CAUSES

Possible Causes
(P125) DRIVER PASSIVE ENTRY HANDLE SWITCH SENSE CIRCUIT SHORTED TO GROUND
(P124) DRIVER PASSIVE ENTRY HANDLE SWITCH RETURN CIRCUIT OPEN
(P125) DRIVER PASSIVE ENTRY HANDLE SWITCH SENSE CIRCUIT SHORTED TO BATTERY
(P125) DRIVER PASSIVE ENTRY HANDLE SWITCH SENSE CIRCUIT OPEN
(P125) DRIVER PASSIVE ENTRY HANDLE SWITCH SENSE CIRCUIT SHORTED TO THE (P124) DRIVER PASSIVE ENTRY HANDLE SWITCH RETURN CIRCUIT
DRIVER EXTERIOR DOOR HANDLE (PASSIVE ENTRY)

RADIO FREQUENCY HUB (RF HUB)
DOOR HANDLE CAP

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**

NOTE: **Verify that the vehicle's battery is fully charged with a DVOM and use the scan tool to compare the Battery Voltage listed under "Data" in the RFH View to that of the BCM. If the vehicle's battery is not fully charged, correct this condition before proceeding.**

NOTE: **Before proceeding, check the handle for any foreign material, or binding, that could cause a sticking situation to the handle or switch.**

1. Cycle the ignition on and leave on until instructed to "Cycle the ignition off".
2. Using the scan tool, record and erase the DTCs.
3. With the scan tool, select: "RFH" and "System Tests".
4. Perform the Door Handle Verification Test. This will activate the module to retest for DTCs.
5. With the scan tool, read the Active DTCs and wait one (1) minute.

Does the scan tool display: B25A9-01-FRONT DRIVER DOOR HANDLE SENSE - GENERAL ELECTRICAL FAILURE as active?

Yes

NOTE: **Verify that the magnet is present in the Door Handle Cap. If the magnet is present, then continue with the diagnostic procedure. If the magnet is NOT present, replace the Door Handle Cap first.**

- Go To 2

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **(P125) DRIVER PASSIVE ENTRY HANDLE SWITCH SENSE CIRCUIT**
   1. With the scan tool, select "RFH", "Data" and scroll to "Left Front Door Handle Power".
   2. Observe the Value field.

What does the Value field display?

OFF

- Go To 3

ON

- Go To 8

3. **(P125) DRIVER PASSIVE ENTRY HANDLE SWITCH SENSE CIRCUIT OPEN OR SHORTED**
   1. With the scan tool, select "Diagnostic Procedures", "Reset ECU" and "RFH" and perform the routine.
   2. With the scan tool, select "RFH", "Data" and scroll to "Left Front Door Handle Power".
   3. Double click on the Value field to start the graph.
   4. Observe the graph for a pulsating line.

   Is the graph pulsating between high and low on the screen?

   Yes

   - Go To 4

   No

   - Go To 7

4. **DRIVER EXTERIOR DOOR HANDLE (PASSIVE ENTRY)**
   1. Cycle the ignition off.
   2. Disconnect the Driver Exterior Door Handle Switch harness connector. Refer to **HANDLE, EXTERIOR, REMOVAL** and **HANDLE, INTERIOR, REMOVAL** .
   3. Cycle the ignition on.
   4. With the scan tool, select "Diagnostic Procedures", "Reset ECU" and "RFH" and perform the routine.
   5. With the scan tool, select "RFH", "Data" and scroll to "Left Front Door Handle Power".
   6. Double click on the Value field to start the graph.
   7. Observe the graph for a pulsating line.

   Is the graph pulsating between high and low on the screen?

   Yes

   - Go To 5

   No

   - Replace the Driver External Door Handle. Refer to **HANDLE, EXTERIOR,**

INSTALLATION and **HANDLE, INTERIOR, INSTALLATION** .

- With the scan tool, select "Diagnostic Procedures", "Reset ECU" and "RFH" and perform the routine.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **(P125) DRIVER PASSIVE HANDLE SWITCH SENSE WIRE SHORTED TO GROUND**

Fig. 62: Checking Driver Passive Handle Switch Sense Wire For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Cycle the ignition off.
2. Disconnect the Radio Frequency Hub (RF Hub) Module C2 harness connector.
3. Check the connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension. Repair as necessary. If repairs were made, return to Step 1.
4. Measure the resistance between ground and the (P125) Driver Passive Handle Switch Sense wire in

the Handle Switch harness connector.

Is the resistance below 30K Ohms?

Yes

- Repair the short to ground in the (P125) Driver Passive Handle Switch Sense circuit.
- With the scan tool, select "Diagnostic Procedures", "Reset ECU" and "RFH" and perform the routine.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 6

6. **(P125) DRIVER PASSIVE HANDLE SWITCH SENSE CIRCUIT SHORTED TO THE (P124) DRIVER PASSIVE HANDLE SWITCH RETURN CIRCUIT**

Fig. 63: Measuring Resistance Between Driver Passive Handle Switch Sense Circuit & Driver Passive Handle Switch Return Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (P125) Driver Passive Handle Switch Sense circuit and the (P124) Driver Passive Handle Switch Return circuit.

   Is the resistance below 30K Ohms?

   Yes

   - Repair the short between the (P125) Driver Passive Handle Switch Sense circuit and the (P124) Driver Passive Handle Switch Return circuit.
   - With the scan tool, select "Diagnostic Procedures", "Reset ECU" and "RFH" and perform the routine.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace the Radio Frequency Hub (RF Hub) Module in accordance with the Service Information. Refer to **MODULE, RADIO FREQUENCY (RF HUB), REMOVAL** .
- Perform the RADIO FREQUENCY HUB VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

7. **(P125) DRIVER PASSIVE ENTRY HANDLE SWITCH SENSE CIRCUIT**
   1. Continue with the scan tool still on "Left Front Door Handle Power".
   2. Observe the Value field.

   What does the Value field display?

   OFF

   - Replace the Radio Frequency Hub (RF Hub) Module in accordance with the Service Information. Refer to **MODULE, RADIO FREQUENCY (RF HUB), REMOVAL** .
   - Perform the RADIO FREQUENCY HUB VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   ON

   - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
8. **DRIVER PASSIVE ENTRY HANDLE SWITCH SENSE OR RETURN CIRCUIT OPEN**
   1. Continue with the scan tool still on "Left Front Door Handle Power".
   2. Double click on the Value field to start the graph.
   3. Observe the graph for a pulsating line.

   Is the graph pulsating between high and low on the screen?

   Yes

   - Go To 4

   No

   - Go To 9
9. **TEST HANDLE FUNCTIONS**
   1. Stop the graph.
   2. Lower the driver door window.
   3. Cycle the ignition off, remove the FOBIK and close all doors.

4. With the scan tool, select "RFH", "Data" and scroll to "Passive Entry Function Carried Out".
5. Have the FOBIK within 1.5 m (5 ft.) of the driver door handle.

NOTE: In the next steps, wait two (2) seconds between each Lock and Unlock activation as there is a two second delay after each Lock action.

6. Press the Lock button on the handle and observe the screen for "Passive lock at left front door".
7. Grab the door handle and observe the screen for "Passive entry at left front door".
8. Repeat steps 6 and 7 two more times.

Is the module receiving the inputs on the screen as you do them?

Yes

- Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 10

10. **HANDLE OR CIRCUIT PROBLEM**

Fig. 64: Measuring Voltage Between Passenger Passive Handle Switch Return & Passenger Passive Handle Sense Circuits
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Driver Exterior Door Handle Switch harness connector. Refer to **HANDLE, EXTERIOR, REMOVAL** and **HANDLE, INTERIOR, REMOVAL** .
2. Measure the voltage between the (P124) Driver Passive Handle Switch Return and the (P125) Driver Passive Handle Sense circuits in the Driver Exterior Door Handle Switch connector.

   Is the voltage above 11.8 volts?

   Yes

   - Replace the Driver External Door Handle in accordance with the Service Information. Refer

to **HANDLE, EXTERIOR, INSTALLATION** and **HANDLE, INTERIOR, INSTALLATION** .

- With the scan tool, select "Diagnostic Procedures", "Reset ECU" and "RFH" and perform the routine.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 11

11. **(P124) DRIVER PASSIVE HANDLE SWITCH RETURN CIRCUIT OPEN**

Fig. 65: Measuring Resistance Between Ground Driver Passive Handle Switch Return Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (P124) Driver Passive Handle Switch Return circuit

in the Driver Exterior Door Handle Switch harness connector.

Is the resistance below 12.0 Ohms?

Yes

- Go To 14

No

- Go To 12

12. **(P124) DRIVER PASSIVE HANDLE SWITCH RETURN WIRE OPEN**

Fig. 66: Checking Driver Passive Handle Switch Return Wire For Open

Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Radio Frequency Hub (RF Hub) Module C2 harness connector.
2. Check the connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension. Repair as necessary. If repairs were made, return to Step 1.
3. Measure the resistance of the (P124) Driver Passive Handle Switch Return circuit between the RF Hub Module C2 harness connector and the Driver Exterior Door Handle Switch harness connector.

   Is the resistance below 2.0 Ohms?

   Yes

   - Go To 13

   No

   - Repair the open in the (P124) Driver Passive Handle Switch Return wire.
   - With the scan tool, select "Diagnostic Procedures", "Reset ECU" and "RFH" and perform the routine.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

13. **GROUND WIRE OPEN**

Fig. 67: Checking Ground Wire For Open
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Radio Frequency Hub (RF Hub) Module C1 harness connector.
2. Check the connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension. Repair as necessary. If repairs were made, return to Step 1.
3. Using a 12-volt test light connected to 12-volts, check the RF-Hub Ground circuit in the C1 harness connector.

NOTE: **The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.**

Does the test light illuminate brightly?

Yes

- Replace the Radio Frequency Hub (RF Hub) Module in accordance with the Service Information. Refer to **MODULE, RADIO FREQUENCY (RF HUB), REMOVAL** .
- Perform the RADIO FREQUENCY HUB VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Repair the open in the RF-Hub Ground circuit.
- With the scan tool, select "Diagnostic Procedures", "Reset ECU" and "RFH" and perform the routine.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

14. **(P125) DRIVER PASSIVE HANDLE SWITCH SENSE WIRE OPEN**

Fig. 68: Checking Driver Passive Handle Switch Sense Wire For Open
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the RF Hub Module C2 harness connector.

2. Check the connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension. Repair as necessary. If repairs were made, return to Step 1.
3. Measure the resistance of the (P125) Driver Passive Handle Switch Sense wire between the RF Hub C2 harness connector and the Driver Exterior Door Handle Switch harness connector.

   Is the resistance below 2.0 Ohms?

   Yes

   - Go To 15

   No

   - Repair the open in the (P125) Driver Passive Handle Sense wire.
   - With the scan tool, select "Diagnostic Procedures", "Reset ECU" and "RFH" and perform the routine.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

15. **(P125) DRIVER PASSIVE HANDLE SWITCH SENSE WIRE SHORT TO VOLTAGE**

Fig. 69: Checking Driver Passive Handle Switch Sense Wire For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Measure the voltage between ground and the (P125) Driver Passive Handle Switch Sense circuit in the C2 harness connector.

   Is there any voltage present?

   Yes

   - Repair the short to voltage in the (P125) Driver Passive Handle Sense circuit.
   - With the scan tool, select "Diagnostic Procedures", "Reset ECU" and "RFH" and perform the routine.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace the Radio Frequency Hub (RF Hub) Module in accordance with the Service Information. Refer to **MODULE, RADIO FREQUENCY (RF HUB), REMOVAL** .
- Perform the RADIO FREQUENCY HUB VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

B25AA-00-FRONT PASSENGER DOOR HANDLE SENSE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 70: Door Handle Sense Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

During a Passive Entry or Keyless Go event.

SET CONDITION

When the RF Hub module senses a door handle hall sensor, a lock switch failure or a continuous activation for over four (4) minutes, this code will set.

POSSIBLE CAUSES

Possible Causes
DOOR HANDLE CAP
PASSENGER EXTERIOR DOOR HANDLE (PASSIVE ENTRY)
RADIO FREQUENCY HUB (RF HUB)

DIAGNOSTIC TEST

1. **TEST HANDLE HALL SENSOR**

NOTE: **Verify that the vehicle's battery is fully charged with a DVOM and use the scan tool to compare the Battery Voltage listed under "Data" in the RFH View to that of the BCM. If the vehicle's battery is not fully charged, correct this condition before proceeding.**

NOTE: **Before proceeding, check the handle for any foreign material, or binding, that could cause a sticking situation to the handle or switch.**

NOTE: **If there are any other active RF Hub DTCs, perform the diagnostic procedure for them before proceeding.**

1. Cycle the ignition on.
2. Using the scan tool, record and erase the DTCs.
3. Make sure that the door handle is in the home position (not pulled).
4. With the scan tool, select "Diagnostic Procedures", "Reset ECU" and "RFH" and perform the routine.
5. With the scan tool, select "RFH", "Data" and scroll to "Last Message: Passenger Door Handle Hall Signal".
6. Observe the value field.

Does the scan tool display: YES?

Yes

NOTE: **Verify that the magnet is present in the Door Handle Cap. If the magnet is present, then continue with the diagnostic procedure. If the magnet is NOT present, replace the Door Handle Cap first.**

- Replace the Passenger Exterior Door Handle in accordance with the Service Information. Refer to **HANDLE, EXTERIOR, REMOVAL** and **HANDLE, INTERIOR, REMOVAL** .
- With the scan tool, select "Diagnostic Procedures", "Reset ECU" and "RFH" and perform the routine.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 2

2. **TEST FOR STUCK LOCK SWITCH**
   1. With the scan tool, select "RFH", "Data" and scroll to "Last Message: Passenger Door Handle Lock Signal".
   2. Observe the value field.

      Does the scan tool display: YES?

      Yes

      - Replace the Passenger Exterior Door Handle in accordance with the Service Information. Refer to **HANDLE, EXTERIOR, REMOVAL** and **HANDLE, INTERIOR, REMOVAL** .
      - With the scan tool, select "Diagnostic Procedures", "Reset ECU" and "RFH" and perform the routine.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 3

3. **DOOR HANDLE OPERATION**
   1. Open the Passenger door window.
   2. Cycle the ignition off, remove the FOBIK and close all doors.
   3. Have the FOBIK outside the car and within 10 cm. and 1.5 m. (4 in. and 5 ft.) of the Passenger door handle.

      NOTE: In the next steps, wait two (2) seconds between each Lock and Unlock activation as there is a two second delay after each Lock action.

   4. Lock and Unlock the Passenger Door by the outside handle four (4) times.
   5. Open the Passenger Door by pulling the handle.

      Did the Door Handle Lock and Unlock the door as it should?

      Yes

      - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 4

4. **DOOR HANDLE OR RF HUB**
   1. Cycle the ignition on and open the Driver door window.
   2. Cycle the ignition off, remove the FOBIK and close all doors.
   3. Have the FOBIK outside the car and within 10cm. and 1.5 m. (4 in. and 5 ft.) from the Driver door handle.

      NOTE: In the next steps, wait two (2) seconds between each Lock and Unlock activation as there is a two second delay after each Lock action.

   4. Lock and Unlock the Driver Door by the outside handle four (4) times.
   5. Using the handle lock switch, lock the doors.
   6. Open the Driver Door by pulling the handle.

   Did the Driver Door Handle Lock and Unlock the door as it should?

   Yes

   - Replace the Passenger Exterior Door Handle in accordance with the Service Information. Refer to **HANDLE, EXTERIOR, REMOVAL** and **HANDLE, INTERIOR, REMOVAL** .
   - With the scan tool, select "Diagnostic Procedures", "Reset ECU" and "RFH" and perform the routine.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the RF HUB Module in accordance with the Service Information. Refer to **MODULE, RADIO FREQUENCY (RF HUB), REMOVAL** .
   - Perform the RADIO FREQUENCY HUB VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

B25AA-01-FRONT PASSENGER DOOR HANDLE SENSE-GENERAL ELECTRICAL FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 71: Door Handle Sense Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

During a Passive Entry or Keyless Go Event.

SET CONDITION

Whenever the Radio Frequency Hub (RF Hub) senses an open, a short to ground or a short to battery on the Passive Handle Switch Sense circuit for over one (1) minute, this code will set.

POSSIBLE CAUSES

Possible Causes
(P400) PASSENGER PASSIVE HANDLE SWITCH SENSE CIRCUIT SHORTED TO VOLTAGE
(P400) PASSENGER PASSIVE HANDLE SWITCH SENSE CIRCUIT SHORTED TO GROUND
(P401) PASSENGER PASSIVE HANDLE SWITCH RETURN CIRCUIT OPEN
(P400) PASSENGER PASSIVE HANDLE SWITCH SENSE CIRCUIT OPEN
(P400) PASSENGER PASSIVE HANDLE SWITCH SENSE CIRCUIT SHORTED TO THE (P401) PASSENGER PASSIVE HANDLE SWITCH RETURN CIRCUIT
PASSENGER EXTERIOR DOOR HANDLE (PASSIVE ENTRY)

RADIO FREQUENCY HUB (RF HUB)
DOOR HANDLE CAP

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**

NOTE: **Verify that the vehicle's battery is fully charged with a DVOM and use the scan tool to compare the Battery Voltage listed under "Data" in the RFH View to that of the BCM. If the vehicle's battery is not fully charged, correct this condition before proceeding.**

NOTE: **Before proceeding, check the handle for any foreign material, or binding that could cause a sticking situation to the handle or switch.**

1. Cycle the ignition on and leave on until instructed to "Cycle the ignition off".
2. Using the scan tool, record and erase the DTCs.
3. With the scan tool, select: "RFH" and "System Tests".
4. Perform the Door Handle Verification Test. This will activate the module to retest for DTCs.
5. With the scan tool, read the Active DTCs and wait one (1) minute.

Does the scan tool display: B25AA-01-FRONT PASSENGER DOOR HANDLE SENSE - GENERAL ELECTRICAL FAILURE as active?

Yes

NOTE: **Verify that the magnet is present in the Door Handle Cap. If the magnet is present, then continue with the diagnostic procedure. If the magnet is NOT present, replace the Door Handle Cap first.**

- Go To 2

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **(P400) PASSENGER PASSIVE ENTRY HANDLE SWITCH SENSE CIRCUIT**
   1. With the scan tool, select "RFH", "Data" and scroll to "Right Front Door Handle Power".
   2. Observe the Value field.

What does the value field display?

OFF

- Go To 3

ON

- Go To 8

3. **(P400) PASSENGER PASSIVE ENTRY HANDLE SWITCH SENSE CIRCUIT OPEN OR SHORTED**
   1. With the scan tool, select "Diagnostic Procedures", "Reset ECU" and "RFH" and perform the routine.
   2. With the scan tool, select "RFH", "Data" and scroll to "Right Front Door Handle Power".
   3. Double click on the Value field to start the graph.
   4. Observe the graph for a pulsating line.

   Is the graph pulsating between high and low on the screen?

   Yes

   - Go To 4

   No

   - Go To 7

4. **PASSENGER EXTERIOR DOOR HANDLE (PASSIVE ENTRY)**
   1. Cycle the ignition off.
   2. Disconnect the Passenger Exterior Door Handle Switch harness connector. Refer to **HANDLE, EXTERIOR, REMOVAL** and **HANDLE, INTERIOR, REMOVAL** .
   3. Cycle the ignition on.
   4. With the scan tool, select "Diagnostic Procedures", "Reset ECU" and "RFH" and perform the routine.
   5. With the scan tool, select "RFH", "Data" and scroll to "Right Front Door Handle Power".
   6. Double click on the Value field to start the graph.
   7. Observe the graph for a pulsating line.

   Is the graph pulsating between high and low on the screen?

   Yes

   - Go To 5

   No

- Replace the Passenger External Door Handle. Refer to **HANDLE, EXTERIOR, INSTALLATION** and **HANDLE, INTERIOR, INSTALLATION** .
- With the scan tool, select "Diagnostic Procedures", "Reset ECU" and "RFH" and perform the routine.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **(P400) PASSENGER PASSIVE HANDLE SWITCH SENSE WIRE SHORTED TO GROUND**

Fig. 72: Checking Passenger Passive Handle Switch Sense Wire For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Cycle the ignition off.
2. Disconnect the Radio Frequency Hub (RF Hub) Module C2 harness connector.
3. Check the connectors for signs of water intrusion, corrosion, pushed out or bent terminals and

correct pin tension. Repair as necessary. If repairs were made, return to Step 1.

4. Measure the resistance between ground and the (P400) Passenger Passive Handle Switch Sense wire in the Handle Switch harness connector.

   Is the resistance below 30K Ohms?

   Yes

   - Repair the short to ground in the (P400) Passenger Passive Handle Switch Sense circuit.
   - With the scan tool, select "Diagnostic Procedures", "Reset ECU" and "RFH" and perform the routine.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 6

6. **(P400) PASSENGER PASSIVE HANDLE SWITCH SENSE CIRCUIT SHORTED TO THE (P401) PASSENGER PASSIVE HANDLE SWITCH RETURN CIRCUIT**

Fig. 73: Measuring Resistance Between Passenger Passive Handle Switch Sense Circuit & Passenger Passive Handle Switch Return Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (P400) Passenger Passive Handle Switch Sense circuit and the (P401) Passenger Passive Handle Switch Return circuit.

   Is the resistance below 30K Ohms?

   Yes

   - Repair the short between the (P400) Passenger Passive Handle Switch Sense circuit and the (P401) Passenger Passive Handle Switch Return circuit.
   - With the scan tool, select "Diagnostic Procedures", "Reset ECU" and "RFH" and perform the routine.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace the Radio Frequency Hub (RF Hub) Module in accordance with the Service Information. Refer to **MODULE, RADIO FREQUENCY (RF HUB), REMOVAL** .
- Perform the RADIO FREQUENCY HUB VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

7. **(P400) PASSENGER PASSIVE ENTRY HANDLE SWITCH SENSE CIRCUIT**
   1. Continue with the scan tool still on "Right Front Door Handle Power".
   2. Observe the Value field.

   What does the Value field display?

   OFF

   - Replace the Radio Frequency Hub (RF Hub) Module in accordance with the Service Information. Refer to **MODULE, RADIO FREQUENCY (RF HUB), REMOVAL** .
   - Perform the RADIO FREQUENCY HUB VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   ON

   - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
8. **PASSENGER PASSIVE ENTRY HANDLE SWITCH SENSE OR RETURN CIRCUIT OPEN**
   1. Continue with the scan tool still on "Right Front Door Handle Power".
   2. Double click on the Value field to start the graph.
   3. Observe the graph for a pulsating line.

   Is the graph pulsating between high and low on the screen?

   Yes

   - Go To 4

   No

   - Go To 9
9. **TEST HANDLE FUNCTIONS**
   1. Stop the graph.
   2. Lower the passenger door window.
   3. Cycle the ignition off, remove the FOBIK and close all doors.

4. With the scan tool, select "RFH", "Data" and scroll to "Passive Entry Function Carried Out".
5. Have the FOBIK within 1.5 m (5 ft.) of the passenger door handle.

NOTE: In the next steps, wait two (2) seconds between each Lock and Unlock activation as there is a two second delay after each Lock action.

6. Press the Lock button on the handle and observe "Passive lock at right front door".
7. Grab the door handle and observe "Passive entry at right front door".
8. Repeat steps 6 and 7 two more times.

Is the module receiving the inputs on the screen as you do them?

Yes

- Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 10

10. **HANDLE OR CIRCUIT PROBLEM**

Fig. 74: Measuring Voltage Between Passenger Passive Handle Switch Return And Passenger Passive Handle Sense Circuits
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Passenger Exterior Door Handle Switch harness connector. Refer to **HANDLE, EXTERIOR, REMOVAL** and **HANDLE, INTERIOR, REMOVAL** .
2. Measure the voltage between the (P401) Passenger Passive Handle Switch Return and the (P400) Passenger Passive Handle Sense circuits in the Passenger Exterior Door Handle Switch connector.

   Is the voltage above 11.8 volts?

   Yes

   - Replace the Passenger External Door Handle in accordance with the Service Information.

Refer to **HANDLE, EXTERIOR, INSTALLATION** and **HANDLE, INTERIOR, INSTALLATION** .

- With the scan tool, select "Diagnostic Procedures", "Reset ECU" and "RFH" and perform the routine.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 11

11. **(P401) PASSENGER PASSIVE HANDLE SWITCH RETURN CIRCUIT OPEN**

Fig. 75: Measuring Resistance Between Ground Passenger Passive Handle Switch Return Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between ground and the (P401) Passenger Passive Handle Switch Return circuit.

Is the resistance below 12.0 Ohms?

Yes

- Go To 14

No

- Go To 12

3. Measure the resistance of the (P401) Passenger Passive Handle Switch Return circuit between the RF Hub Module C2 harness connector and the Passenger Exterior Door Handle Switch harness connector.

   Is the resistance below 2.0 Ohms?

   Yes

   - Go To 13

   No

   - Repair the open in the (P401) Passenger Passive Handle Switch Return wire.
   - With the scan tool, select "Diagnostic Procedures", "Reset ECU" and "RFH" and perform the routine.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

13. **GROUND WIRE OPEN**

Fig. 77: Checking Ground Wire For Open
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the Radio Frequency Hub (RF Hub) Module C1 harness connector.
2. Check the connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension. Repair as necessary. If repairs were made, return to Step 1.
3. Using a 12-volt test light connected to 12-volts, check the RF-Hub Ground circuit in the C1 harness connector.

NOTE: **The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.**

Does the test light illuminate brightly?

Yes

- Replace the Radio Frequency Hub (RF Hub) Module in accordance with the Service Information. Refer to **MODULE, RADIO FREQUENCY (RF HUB), REMOVAL** .
- Perform the RADIO FREQUENCY HUB VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Repair the open in the RF-Hub Ground circuit.
- With the scan tool, select "Diagnostic Procedures", "Reset ECU" and "RFH" and perform the routine.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. Measure the resistance of the (P400) Passenger Passive Handle Switch Sense wire between the RF Hub C2 harness connector and the Passenger Exterior Door Handle Switch harness connector.

   Is the resistance below 2.0 Ohms?

   Yes

   - Go To 15

   No

   - Repair the open in the (P400) Passenger Passive Handle Sense wire.
   - With the scan tool, select "Diagnostic Procedures", "Reset ECU" and "RFH" and perform the routine.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

15. **(P400) PASSENGER PASSIVE HANDLE SWITCH SENSE WIRE SHORTED TO VOLTAGE**

Fig. 79: Checking Passenger Passive Handle Switch Sense Wire For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Measure the voltage between ground and the (P400) Passenger Passive Handle Switch Sense circuit in the C2 harness connector.

   Is there any voltage present?

   Yes

   - Repair the short to voltage in the (P400) Passenger Passive Handle Sense circuit.
   - With the scan tool, select "Diagnostic Procedures", "Reset ECU" and "RFH" and perform the routine.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace the Radio Frequency Hub (RF Hub) Module in accordance with the Service Information. Refer to **MODULE, RADIO FREQUENCY (RF HUB), REMOVAL** .
- Perform the RADIO FREQUENCY HUB VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

B285F-11-BLIND SPOT WARNING LIGHT CONTROL - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

When the Driver Door Module (DDM) turns the Blind Spot Indicator on.

SET CONDITION

When the Driver Door Module (DDM) detects a short to ground on the Blind Spot Indicator circuit, this code will set.

POSSIBLE CAUSES

Possible Causes
MIRROR ASSEMBLY
DOOR MODULE

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Turn the ignition on.
    2. With the scan tool, erase all DTCs.
    3. Cycle the ignition from on to off three times.
    4. Turn the ignition on.
    5. Wait one minute.
    6. With the scan tool, read the active DTCs.

    Does the scan tool display: B285F-11-BLIND SPOT WARNING LIGHT CONTROL - CIRCUIT SHORT TO GROUND as Active?

    Yes

    - Go To 2

    No

- Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all relate splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension. Repair as necessary.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **INSPECT MIRROR CONNECTIONS**
   1. Turn the ignition off.
   2. Disconnect the Driver Door Module C1 harness connector.
   3. Inspect the wiring and connectors between the mirror and the Drivers Door Module.

      Were there any problems found?

      Yes

      - Repair as necessary.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 3

3. **MIRROR ASSEMBLY**
   1. Turn the ignition on
   2. With the scan tool, erase the DTCs.
   3. Cycle the ignition from on to off three times.
   4. Turn the ignition on.
   5. Make sure the DDM C1 harness connector is still disconnected.
   6. Wait one minute.

      NOTE: Look for a change in DTCs.

   7. With the scan tool, read the active DTCs.

      Does the scan tool display: B285F-15-BLIND SPOT WARNING LIGHT CONTROL - CIRCUIT SHORT TO BATTERY OR OPEN as Active?

      Yes

      - Replace the Driver Mirror Assembly in accordance with the Service Information. Refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** and **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace the Driver Door Module in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B285F-15-BLIND SPOT WARNING LIGHT CONTROL - CIRCUIT SHORT TO BATTERY OR OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously.

SET CONDITION

When the Blind Spot Indicator circuit senses high voltage or an open circuit for over 55 ms., this code will set.

POSSIBLE CAUSES

Possible Causes
MIRROR ASSEMBLY
DOOR MODULE

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Cycle the ignition on.
    2. With the scan tool, erase all DTCs.
    3. Cycle the ignition from on to off three times.
    4. Cycle the ignition on.
    5. Wait one minute.
    6. With the scan tool, read the DTCs.

    Does the scan tool display active: B285F-15-BLIND SPOT WARNING LIGHT CONTROL - CIRCUIT SHORT TO BATTERY OR OPEN?

    Yes

    - Go To 2

    No

- Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension. Repair as necessary.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **INSPECT MIRROR CONNECTIONS**
   1. Cycle the ignition off.
   2. Disconnect the Drivers Door Module C1 harness connector.
   3. Inspect the wiring and connectors between the mirror and the Drivers Door Module.

      Were there any problems found?

      Yes

      - Repair as necessary.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 3
3. **MIRROR ASSEMBLY**
   1. Measure the resistance between the (P552) Driver Blind Spot/Approach Return circuit and the (P711) Driver Blind Spot Signal Driver circuit in the DDM C1 harness connector.

      Is the resistance between 550.0 and 650.0 Ohms?

      Yes

      - Replace the Driver Door Module in accordance with the Service Information. Refer to **MODULE, DOOR, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Replace the Driver Mirror Assembly in accordance with the Service Information. Refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** and **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

C1501-07-TIRE PRESSURE SENSOR 1 - MECHANICAL FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

NOTE: Check for and remove any non-FCC compliant components, and verify that the tire pressures are correct, before beginning this diagnostic procedure.

THEORY OF OPERATION

The Tire Pressure Monitoring (TPM) Sensor actively monitors the air pressure, air temperature inside the tire, and the internal battery status. Each sensor has a unique ID code. The TPM Sensor transmits the data at regular intervals via an encoded signal to a receiver circuit located in the Radio Frequency Hub Module (RF-Hub).

WHEN MONITORED

With vehicle speed greater than 32 km/h (20 mph).

SET CONDITION

The RF Hub will monitor the signals from the active road tire TPM Sensors. This code sets if pressure, temperature, or acceleration data is not received or cannot be accurately decoded for a maximum of 20 minutes.

POSSIBLE CAUSES

Possible Causes
TIRE PRESSURE MONITORING (TPM) SENSOR

DIAGNOSTIC TEST

1. **DTC STATUS IS ACTIVE**

NOTE: Before beginning the diagnostic procedure, verify that the tire pressures are correct, the 9936 TPM-RKE analyzer is up to date and the correct application has been chosen on the tool.

1. Cycle the ignition on.
2. With the scan tool, read and record the RF-Hub Module DTCs.
3. With the scan tool, erase the RF-Hub Module DTCs.
4. Test drive the vehicle at a speed greater than 32 km/h (20 mph) up to 20 minutes in order to receive TPM Sensor data and allow for the system to update.
5. With the scan tool, read the DTCs in the RF-Hub Module.

Is this DTC status Active at this time?

Yes

- Go To 2

No

- Go To 5

2. **TIRE PRESSURE MONITORING (TPM) SENSOR INTERNAL FAULT SET USING TPM-RKE ANALYZER**

NOTE: **The following procedure is used to locate the TPM Sensor that is setting the internal fault. If the tires have been rotated, the TPM Sensor is no longer in sequence from the factory. Faults are linked to the TPM Sensor IDs. You MUST locate the TPM Sensor that set the fault before continuing. Use the following method below at every tire location.**

NOTE: **If the TPM Sensor IDs do not match, it may be necessary to move the vehicle to a location away from other TPM Sensors and repeat this step.**

NOTE: **Always be certain to select the proper vehicle line and model year when using this tool, as the tool will automatically use the correct protocol to attempt to read the TPM Sensor. If the incorrect vehicle line and/or model year is selected, the TPM Sensor will not respond to the tool.**

1. Use a TPM-RKE Analyzer (special tool #CH9936, Analyzer, TPM/RKE) to scan each TPM Sensor for a response, and store in the proper location in the TPM-RKE Analyzer. If you receive no response from any of the TPM Sensors, check to make sure that the TPM-RKE Analyzer is set correctly and repeat the process on each non-responsive wheel.
2. Replace the TPM Sensor in accordance with the Service Information. Refer to **SENSOR, TIRE PRESSURE MONITORING (TPM), REMOVAL** . Perform the TPM SENSOR VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
3. With the scan tool, select Data Display for the RF-Hub Module.
4. Check to see if the Sensor IDs match what is programmed into the RF-Hub Module.

   Has the TPM Sensor been located?

   Yes

   - Install the Tire Pressure Monitoring (TPM) Sensor in accordance with the Service Information. Refer to **SENSOR, TIRE PRESSURE MONITORING (TPM), REMOVAL** .
   - Perform the TPM SENSOR VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 3

3. **TIRE PRESSURE MONITORING (TPM) SENSOR INTERNAL FAULT - MISMATCHED ID**

NOTE: **If the TPM Sensor IDs do not match, it may be necessary to move the vehicle to a location away from other TPM Sensors and repeat this step.**

1. Use a TPM-RKE Analyzer (special tool #CH9936, Analyzer, TPM/RKE) to verify the TPM Sensor IDs match what is programmed into the RF-Hub Module. The TPM Sensor Identifications are located under "Data Display" for the RF-Hub Module.

   Do the TPM Sensor IDs match what is stored in the RF-Hub Module?

   Yes

   - Replace the Radio Frequency (RF Hub) Module in accordance with the Service Information. Refer to **MODULE, RADIO FREQUENCY (RF HUB), REMOVAL** .
   - Perform the TPM SENSOR VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.
   - Perform the TPM SENSOR VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

4. **TIRE PRESSURE MONITORING (TPM) SENSOR INTERNAL FAULT SET**

   NOTE: Some vehicles will not receive the TPM Sensor data when the vehicle is stationary. The vehicle may need to be driven at speeds greater than 32 km/h (20 mph) for about a minute in order to receive TPM Sensor data.

   1. Starting with the left front wheel, deflate the tire to 20 PSI, wait two minutes, and check the scan tool for changes to any compensated tire pressure values.
   2. Look for a tire location with a non-responsive TPM Sensor ID.
   3. Repeat this test on each wheel on the vehicle until the TPM Sensor in question has been identified.

      Has the TPM Sensor been located?

      Yes

      - Install the Tire Pressure Monitoring (TPM) Sensor in accordance with the Service Information. Refer to **SENSOR, TIRE PRESSURE MONITORING (TPM), REMOVAL** .
      - Perform the TPM SENSOR VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Test complete.
      - Perform the TPM SENSOR VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

5. **INTERMITTENT TIRE PRESSURE MONITORING (TPM) SENSOR DTC**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Perform any Technical Service Bulletins that may apply to this condition.

3. With the scan tool, clear DTCs in the Radio Frequency Hub (RF-Hub) Module.
4. Test drive the vehicle for a minimum of 20 minutes with vehicle speed greater than 32 km/h (20 mph).
5. With the scan tool, rear the DTCs in the Radio Frequency Hub (RF-Hub) Module.

   Does the DTC reset or is the status Active for this DTC?

   Yes

   - Return to the beginning of this test and perform the diagnostic procedure as necessary.

   No

   - Test complete.
   - Perform the TPM SENSOR VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C1501-31-TIRE PRESSURE SENSOR 1 - NO SIGNAL

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

NOTE: Check for and remove any non-FCC compliant components before beginning this diagnostic procedure.

THEORY OF OPERATION

The Tire Pressure Monitoring (TPM) Sensor actively monitors the air pressure, air temperature inside the tire, and the internal battery status. Each sensor has a unique ID code. The TPM Sensor transmits the data at regular intervals via an encoded signal to a receiver circuit located in the Radio Frequency Hub (RF Hub) Module.

WHEN MONITORED

With vehicle speed greater than 32 km/h (20 mph).

SET CONDITION

The RF Hub Module will monitor the signals from the four active road tire TPM Sensors. This code sets if RF data is not received or cannot be accurately decoded for a maximum of 20 minutes, if localization has completed.

POSSIBLE CAUSES

Possible Causes
NON-FCC COMPLIANT COMPONENTS
AFTERMARKET TIRES/WHEELS
INTERMITTENT TIRE PRESSURE MONITORING (TPM) SENSOR INTERNAL DTC

TIRE PRESSURE MONITORING (TPM) SENSOR
RADIO FREQUENCY HUB (RF-HUB) MODULE

DIAGNOSTIC TEST

1. **DTC STATUS IS ACTIVE**

NOTE: **Before beginning the diagnostic procedure, verify that the tire pressures are correct, the 9936 TPM-RKE analyzer is up to date and the correct application has been chosen on the tool.**

1. Cycle the ignition on.
2. With the scan tool, read and record RF-Hub Module DTCs.
3. Test drive the vehicle at a speed greater than 32 km/h (20 mph) up to 20 minutes in order to receive TPM Sensor data and allow for the system to update.
4. With the scan tool, read DTCs in the RF-Hub Module.

Is this DTC status Active at this time?

Yes

- Go To 2

No

- Go To 6

2. **TIRE PRESSURE MONITORING (TPM) SENSOR INTERNAL DTC**

NOTE: **This fault can be set if the incorrect or no TPM Sensor is installed on the vehicle.**

1. Perform a visual inspection to verify that all road wheels are equipped with a TPM Sensor.
2. With the TPM-RKE Analyzer (special tool #CH9936, Analyzer, TPM/RKE) verify the correct TPM Sensor is on the vehicle.

Is the correct TPM Sensor installed on the vehicle?

Yes

- Go To 3

No

- Install the correct Tire Pressure Monitoring (TPM) Sensor in accordance with the Service

Information. Refer to **SENSOR, TIRE PRESSURE MONITORING (TPM), REMOVAL** .

- Perform the TPM SENSOR VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

3. **TIRE PRESSURE MONITORING (TPM) SENSOR INTERNAL FAULT SET USING TPM-RKE ANALYZER**

NOTE: The following procedure is used to locate the TPM Sensor that is setting the internal fault. If the tires have been rotated, the TPM Sensor is no longer in sequence from the factory. Faults are linked to the TPM Sensor IDs. You MUST locate the TPM Sensor that set the fault before continuing. Use the following method below at every tire location.

NOTE: If the TPM Sensor IDs do not match, it may be necessary to move the vehicle to a location away from other TPM Sensors and repeat this step.

NOTE: Always be certain to select the proper vehicle line and model year when using this tool, as the tool will automatically use the correct protocol to attempt to read the TPM Sensor. If the incorrect vehicle line and/or model year is selected, the TPM Sensor will not respond to the tool.

1. Use a TPM-RKE Analyzer (special tool #CH9936, Analyzer, TPM/RKE) to scan each TPM Sensor for a response, and store in the proper location in the TPM-RKE Analyzer. If you receive a no response from any of the TPM Sensors, check to make sure that the TPM-RKE Analyzer is set correctly and repeat the process on each non-responsive wheel. If all sensors respond, continue this step.
2. Replace any non-responsive TPM Sensors in accordance with the Service Information. Refer to **SENSOR, TIRE PRESSURE MONITORING (TPM), REMOVAL** . Perform the TPM SENSOR VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
3. With the scan tool, select Data Display for the RF-Hub Module.
4. Check to see if the Sensor IDs match what is programmed into the RF-Hub Module.

Has the TPM Sensor been located?

Yes

- Install the Tire Pressure Monitoring (TPM) Sensor in accordance with the Service Information. Refer to **SENSOR, TIRE PRESSURE MONITORING (TPM), REMOVAL** .
- Perform the TPM SENSOR VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 4

4. **TIRE PRESSURE MONITORING (TPM) SENSOR INTERNAL FAULT - MISMATCHED ID**

NOTE: If the TPM Sensor IDs do not match, it may be necessary to move the vehicle to a location away from other TPM Sensors and repeat this step.

1. Use a TPM-RKE Analyzer (special tool #CH9936, Analyzer, TPM/RKE) to verify the TPM Sensor IDs match what is programmed into the RF-Hub Module. The TPM Sensor Identifications are located under "Data Display" for the RF-Hub Module.

   Do the TPM Sensor IDs match what is stored in the RF-Hub Module?

   Yes

   - Replace the Radio Frequency (RF Hub) Module in accordance with the Service Information. Refer to **MODULE, RADIO FREQUENCY (RF HUB), REMOVAL** .
   - Perform the RADIO FREQUENCY HUB (RF-HUB) VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.
   - Perform the TPM SENSOR VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

5. **TIRE PRESSURE MONITORING (TPM) SENSOR INTERNAL FAULT SET**

NOTE: Some vehicles will not receive the TPM Sensor data when the vehicle is stationary. The vehicle may need to be driven at speeds greater than 32 km/h (20 mph) for about five minutes in order to receive TPM Sensor data.

1. Starting with the left front wheel, deflate the tire to 20 PSI, wait two minutes, and check the scan tool for changes to any compensated tire pressure values.
2. Look for a tire location with a non-responsive TPM Sensor ID.
3. Repeat this test on each wheel on the vehicle until the TPM Sensor in question has been identified.

   Has the TPM Sensor been located?

   Yes

   - Replace the Tire Pressure Monitoring (TPM) Sensor in accordance with the Service Information. Refer to **SENSOR, TIRE PRESSURE MONITORING (TPM), REMOVAL** .
   - Perform the TPM SENSOR VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Repeat this test until the defective sensor has been located.
   - Perform the TPM SENSOR VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

6. **INTERMITTENT TIRE PRESSURE MONITORING (TPM) SENSOR DTC**
    1. The conditions necessary to set this DTC are not present at this time.
    2. Perform any Technical Service Bulletins that may apply to this condition.
    3. With the scan tool, clear DTCs in the Radio Frequency Hub (RF-Hub) Module.
    4. Test drive the vehicle for a minimum of 20 minutes with vehicle speed greater than 32 km/h (20 mph).
    5. With the scan tool, read active DTCs in the Radio Frequency Hub (RF-Hub) Module.

    Does the DTC reset or is the status Active for this DTC?

    Yes

    - Return to the beginning of this test and perform the diagnostic procedure as necessary.

    No

    - Test complete.
    - Perform the TPM SENSOR VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C1502-07-TIRE PRESSURE SENSOR 2 - MECHANICAL FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

NOTE: Check for and remove any non-FCC compliant components, and verify that the tire pressures are correct, before beginning this diagnostic procedure.

THEORY OF OPERATION

The Tire Pressure Monitoring (TPM) Sensor actively monitors the air pressure, air temperature inside the tire, and the internal battery status. Each sensor has a unique ID code. The TPM Sensor transmits the data at regular intervals via an encoded signal to a receiver circuit located in the Radio Frequency Hub Module (RF-Hub).

WHEN MONITORED

With vehicle speed greater than 32 km/h (20 mph).

SET CONDITION

The RF Hub will monitor the signals from the four active road tire TPM Sensors. This code sets if pressure, temperature, or acceleration data is not received or cannot be accurately decoded for a maximum of 20 minutes.

POSSIBLE CAUSES

Possible Causes

TIRE PRESSURE MONITORING (TPM) SENSOR

DIAGNOSTIC TEST

1. **DTC STATUS IS ACTIVE**

NOTE: **Before beginning the diagnostic procedure, verify that the tire pressures are correct, the 9936 TPM-RKE analyzer is up to date and the correct application has been chosen on the tool.**

1. Cycle the ignition on.
2. With the scan tool, read and record the RF-Hub Module DTCs.
3. With the scan tool, erase the RF-Hub Module DTCs.
4. Test drive the vehicle at a speed greater than 32 km/h (20 mph) up to 20 minutes in order to receive TPM Sensor data and allow for the system to update.
5. With the scan tool, read the DTCs in the RF-Hub Module.

Is this DTC status Active at this time?

Yes

- Go To 2

No

- Go To 5

2. **TIRE PRESSURE MONITORING (TPM) SENSOR INTERNAL FAULT SET USING TPM-RKE ANALYZER**

NOTE: **The following procedure is used to locate the TPM Sensor that is setting the internal fault. If the tires have been rotated, the TPM Sensor is no longer in sequence from the factory. Faults are linked to the TPM Sensor IDs. You MUST locate the TPM Sensor that set the fault before continuing. Use the following method below at every tire location.**

NOTE: **If the TPM Sensor IDs do not match, it may be necessary to move the vehicle to a location away from other TPM Sensors and repeat this step.**

NOTE: **Always be certain to select the proper vehicle line and model year when using this tool, as the tool will automatically use the correct protocol to attempt to read the TPM Sensor. If the incorrect vehicle line and/or model year is selected, the TPM Sensor will not respond to the tool.**

1. Use a TPM-RKE Analyzer (special tool #CH9936, Analyzer, TPM/RKE) to scan each TPM Sensor

for a response, and store in the proper location in the TPM-RKE Analyzer. If you receive no response from any of the TPM Sensors, check to make sure that the TPM-RKE Analyzer is set correctly and repeat the process on each non-responsive wheel.

2. Replace the TPM Sensor in accordance with the Service Information. Refer to **SENSOR, TIRE PRESSURE MONITORING (TPM), REMOVAL** . Perform the TPM SENSOR VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
3. With the scan tool, select Data Display for the RF-Hub Module.
4. Check to see if the Sensor IDs match what is programmed into the RF-Hub Module.

   Has the TPM Sensor been located?

   Yes

   - Install the Tire Pressure Monitoring (TPM) Sensor in accordance with the Service Information. Refer to **SENSOR, TIRE PRESSURE MONITORING (TPM), REMOVAL** .
   - Perform the TPM SENSOR VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 3

3. **TIRE PRESSURE MONITORING (TPM) SENSOR INTERNAL FAULT - MISMATCHED ID**

   NOTE: If the TPM Sensor IDs do not match, it may be necessary to move the vehicle to a location away from other TPM Sensors and repeat this step.

   1. Use a TPM-RKE Analyzer (special tool #CH9936, Analyzer, TPM/RKE) to verify the TPM Sensor IDs match what is programmed into the RF-Hub Module. The TPM Sensor Identifications are located under "Data Display" for the RF-Hub Module.

      Do the TPM Sensor IDs match what is stored in the RF-Hub Module?

      Yes

      - Replace the Radio Frequency (RF Hub) Module in accordance with the Service Information. Refer to **MODULE, RADIO FREQUENCY (RF HUB), REMOVAL** .
      - Perform the TPM SENSOR VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Test complete.
      - Perform the TPM SENSOR VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

4. **TIRE PRESSURE MONITORING (TPM) SENSOR INTERNAL FAULT SET**

NOTE: Some vehicles will not receive the TPM Sensor data when the vehicle is stationary. The vehicle may need to be driven at speeds greater than 32 km/h (20 mph) for about a minute in order to receive TPM Sensor data.

1. Starting with the left front wheel, deflate the tire to 20 PSI, wait two minutes, and check the scan tool for changes to any compensated tire pressure values.
2. Look for a tire location with a non-responsive TPM Sensor ID.
3. Repeat this test on each wheel on the vehicle until the TPM Sensor in question has been identified.

   Has the TPM Sensor been located?

   Yes

   - Install the Tire Pressure Monitoring (TPM) Sensor in accordance with the Service Information. Refer to **SENSOR, TIRE PRESSURE MONITORING (TPM), REMOVAL** .
   - Perform the TPM SENSOR VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.
   - Perform the TPM SENSOR VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

5. **INTERMITTENT TIRE PRESSURE MONITORING (TPM) SENSOR DTC**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Perform any Technical Service Bulletins that may apply to this condition.
   3. With the scan tool, clear DTCs in the Radio Frequency Hub (RF-Hub) Module.
   4. Test drive the vehicle for a minimum of 20 minutes with vehicle speed greater than 24km/h (20 mph).
   5. With the scan tool, rear the DTCs in the Radio Frequency Hub (RF-Hub) Module.

      Does the DTC reset or is the status Active for this DTC?

      Yes

      - Return to the beginning of this test and perform the diagnostic procedure as necessary.

      No

      - Test complete.
      - Perform the TPM SENSOR VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C1502-31-TIRE PRESSURE SENSOR 2 - NO SIGNAL

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

NOTE: Check for and remove any non-FCC compliant components before beginning this diagnostic procedure.

THEORY OF OPERATION

The Tire Pressure Monitoring (TPM) Sensor actively monitors the air pressure, air temperature inside the tire, and the internal battery status. Each sensor has a unique ID code. The TPM Sensor transmits the data at regular intervals via an encoded signal to a receiver circuit located in the Radio Frequency Hub (RF Hub) Module.

WHEN MONITORED

With vehicle speed greater than 32 km/h (20 mph).

SET CONDITION

The RF Hub Module will monitor the signals from the four active road tire TPM Sensors. This code sets if RF data is not received or cannot be accurately decoded for a maximum of 20 minutes, if localization has completed.

POSSIBLE CAUSES

Possible Causes
NON-FCC COMPLIANT COMPONENTS
AFTERMARKET TIRES/WHEELS
INTERMITTENT TIRE PRESSURE MONITORING (TPM) SENSOR INTERNAL DTC
TIRE PRESSURE MONITORING (TPM) SENSOR
RADIO FREQUENCY HUB (RF-HUB) MODULE

DIAGNOSTIC TEST

1. **DTC STATUS IS ACTIVE**

NOTE: Before beginning the diagnostic procedure, verify that the tire pressures are correct, the 9936 TPM-RKE analyzer is up to date and the correct application has been chosen on the tool.

1. Turn the ignition on.
2. With the scan tool, read and record RF-Hub Module DTCs.
3. Test drive the vehicle at a speed greater than 32 km/h (20 mph) up to 20 minutes in order to receive TPM Sensor data and allow for the system to update.
4. With the scan tool, read DTCs in the RF-Hub Module.

Is this DTC status Active at this time?

Yes

- Go To 2

No

- Go To 6

2. **TIRE PRESSURE MONITORING (TPM) SENSOR INTERNAL DTC**

NOTE: This fault can be set if the incorrect or no TPM Sensor is installed on the vehicle.

1. Perform a visual inspection to verify that all road wheels are equipped with a TPM Sensor.
2. With the TPM-RKE Analyzer (special tool #CH9936, Analyzer, TPM/RKE) verify the correct TPM Sensor is on the vehicle.

Is the correct TPM Sensor installed on the vehicle?

Yes

- Go To 3

No

- Install the correct Tire Pressure Monitoring (TPM) Sensor in accordance with the Service Information. Refer to **SENSOR, TIRE PRESSURE MONITORING (TPM), REMOVAL** .
- Perform the TPM SENSOR VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

3. **TIRE PRESSURE MONITORING (TPM) SENSOR INTERNAL FAULT SET USING TPM-RKE ANALYZER**

NOTE: The following procedure is used to locate the TPM Sensor that is setting the internal fault. If the tires have been rotated, the TPM Sensor is no longer in sequence from the factory. Faults are linked to the TPM Sensor IDs. You MUST locate the TPM Sensor that set the fault before continuing. Use the following method below at every tire location.

NOTE: If the TPM Sensor IDs do not match, it may be necessary to move the vehicle to a location away from other TPM Sensors and repeat this step.

NOTE: Always be certain to select the proper vehicle line and model year when using this tool, as the tool will automatically use the correct protocol to attempt to read the TPM Sensor. If the incorrect vehicle line and/or model year is selected, the TPM Sensor will not respond to the tool.

1. Use a TPM-RKE Analyzer (special tool #CH9936, Analyzer, TPM/RKE) to scan each TPM Sensor for a response, and store in the proper location in the TPM-RKE Analyzer. If you receive a no response from any of the TPM Sensors, check to make sure that the TPM-RKE Analyzer is set correctly and repeat the process on each non-responsive wheel. If all sensors respond, continue this step.
2. Replace any non-responsive TPM Sensors in accordance with the Service Information. Refer to **SENSOR, TIRE PRESSURE MONITORING (TPM), REMOVAL** . Perform the TPM SENSOR VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
3. With the scan tool, select Data Display for the RF-Hub Module.
4. Check to see if the Sensor IDs match what is programmed into the RF-Hub Module.

   Has the TPM Sensor been located?

   Yes

   - Install the Tire Pressure Monitoring (TPM) Sensor in accordance with the Service Information. Refer to **SENSOR, TIRE PRESSURE MONITORING (TPM), REMOVAL** .
   - Perform the TPM SENSOR VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 4

4. **TIRE PRESSURE MONITORING (TPM) SENSOR INTERNAL FAULT - MISMATCHED ID**

NOTE: **If the TPM Sensor IDs do not match, it may be necessary to move the vehicle to a location away from other TPM Sensors and repeat this step.**

1. Use a TPM-RKE Analyzer (special tool #CH9936, Analyzer, TPM/RKE) to verify the TPM Sensor IDs match what is programmed into the RF-Hub Module. The TPM Sensor Identifications are located under "Data Display" for the RF-Hub Module.

   Do the TPM Sensor IDs match what is stored in the RF-Hub Module?

   Yes

   - Replace the Radio Frequency (RF Hub) Module in accordance with the Service Information. Refer to **MODULE, RADIO FREQUENCY (RF HUB), REMOVAL** .
   - Perform the RADIO FREQUENCY HUB (RF-HUB) VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

- Perform the TPM SENSOR VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
