NOTE: Some vehicles will not receive the TPM Sensor data when the vehicle is stationary. The vehicle may need to be driven at speeds greater than 32 km/h (20 mph) for about five minutes in order to receive TPM Sensor data.

1. Starting with the left front wheel, deflate the tire to 20 PSI, wait two minutes, and check the scan tool for changes to any compensated tire pressure values.
2. Look for a tire location with a non-responsive TPM Sensor ID.
3. Repeat this test on each wheel on the vehicle until the TPM Sensor in question has been identified.

Has the TPM Sensor been located?

Yes

- Replace the Tire Pressure Monitoring (TPM) Sensor in accordance with the Service Information. Refer to **SENSOR, TIRE PRESSURE MONITORING (TPM), REMOVAL** .
- Perform the TPM SENSOR VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Repeat this test until the defective sensor has been located.
- Perform the TPM SENSOR VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

6. **INTERMITTENT TIRE PRESSURE MONITORING (TPM) SENSOR DTC**

1. The conditions necessary to set this DTC are not present at this time.
2. Perform any Technical Service Bulletins that may apply to this condition.
3. With the scan tool, clear DTCs in the Radio Frequency Hub (RF-Hub) Module.
4. Test drive the vehicle for a minimum of 20 minutes with vehicle speed greater than 32 km/h (20 mph).
5. With the scan tool, read active DTCs in the Radio Frequency Hub (RF-Hub) Module.

Does the DTC reset or is the status Active for this DTC?

Yes

- Return to the beginning of this test and perform the diagnostic procedure as necessary.

No

- Test complete.
- Perform the TPM SENSOR VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C1503-07-TIRE PRESSURE SENSOR 3 - MECHANICAL FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

NOTE: Check for and remove any non-FCC compliant components, and verify that the tire pressures are correct, before beginning this diagnostic procedure.

THEORY OF OPERATION

The Tire Pressure Monitoring (TPM) Sensor actively monitors the air pressure, air temperature inside the tire, and the internal battery status. Each sensor has a unique ID code. The TPM Sensor transmits the data at regular intervals via an encoded signal to a receiver circuit located in the Radio Frequency Hub Module (RF-Hub).

WHEN MONITORED

With vehicle speed greater than 32 km/h (20 mph).

SET CONDITION

The RF Hub will monitor the signals from the four active road tire TPM Sensors. This code sets if pressure, temperature, or acceleration data is not received or cannot be accurately decoded for a maximum of 20 minutes.

POSSIBLE CAUSES

Possible Causes
TIRE PRESSURE MONITORING (TPM) SENSOR

DIAGNOSTIC TEST

1. **DTC STATUS IS ACTIVE**

NOTE: Before beginning the diagnostic procedure, verify that the tire pressures are correct, the 9936 TPM-RKE analyzer is up to date and the correct application has been chosen on the tool.

1. Cycle the ignition on.
2. With the scan tool, read and record the RF-Hub Module DTCs.
3. With the scan tool, erase the RF-Hub Module DTCs.
4. Test drive the vehicle at a speed greater than 32 km/h (20 mph) up to 20 minutes in order to receive TPM Sensor data and allow for the system to update.
5. With the scan tool, read the DTCs in the RF-Hub Module.

   Is this DTC status Active at this time?

   Yes

- Go To 2

No

- Go To 5

2. **TIRE PRESSURE MONITORING (TPM) SENSOR INTERNAL FAULT SET USING TPM-RKE ANALYZER**

NOTE: **The following procedure is used to locate the TPM Sensor that is setting the internal fault. If the tires have been rotated, the TPM Sensor is no longer in sequence from the factory. Faults are linked to the TPM Sensor IDs. You MUST locate the TPM Sensor that set the fault before continuing. Use the following method below at every tire location.**

NOTE: **If the TPM Sensor IDs do not match, it may be necessary to move the vehicle to a location away from other TPM Sensors and repeat this step.**

NOTE: **Always be certain to select the proper vehicle line and model year when using this tool, as the tool will automatically use the correct protocol to attempt to read the TPM Sensor. If the incorrect vehicle line and/or model year is selected, the TPM Sensor will not respond to the tool.**

1. Use a TPM-RKE Analyzer (special tool #CH9936, Analyzer, TPM/RKE) to scan each TPM Sensor for a response, and store in the proper location in the TPM-RKE Analyzer. If you receive no response from any of the TPM Sensors, check to make sure that the TPM-RKE Analyzer is set correctly and repeat the process on each non-responsive wheel.
2. Replace the TPM Sensor in accordance with the Service Information. Refer to **SENSOR, TIRE PRESSURE MONITORING (TPM), REMOVAL** . Perform the TPM SENSOR VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
3. With the scan tool, select Data Display for the RF-Hub Module.
4. Check to see if the Sensor IDs match what is programmed into the RF-Hub Module.

   Has the TPM Sensor been located?

   Yes

   - Install the Tire Pressure Monitoring (TPM) Sensor in accordance with the Service Information. Refer to **SENSOR, TIRE PRESSURE MONITORING (TPM), REMOVAL** .
   - Perform the TPM SENSOR VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 3

3. **TIRE PRESSURE MONITORING (TPM) SENSOR INTERNAL FAULT - MISMATCHED ID**

NOTE: If the TPM Sensor IDs do not match, it may be necessary to move the vehicle to a location away from other TPM Sensors and repeat this step.

1. Use a TPM-RKE Analyzer (special tool #CH9936, Analyzer, TPM/RKE) to verify the TPM Sensor IDs match what is programmed into the RF-Hub Module. The TPM Sensor Identifications are located under "Data Display" for the RF-Hub Module.

   Do the TPM Sensor IDs match what is stored in the RF-Hub Module?

   Yes

   - Replace the Radio Frequency (RF Hub) Module in accordance with the Service Information. Refer to **MODULE, RADIO FREQUENCY (RF HUB), REMOVAL** .
   - Perform the TPM SENSOR VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.
   - Perform the TPM SENSOR VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

4. **TIRE PRESSURE MONITORING (TPM) SENSOR INTERNAL FAULT SET**

NOTE: Some vehicles will not receive the TPM Sensor data when the vehicle is stationary. The vehicle may need to be driven at speeds greater than 32 km/h (20 mph) for about a minute in order to receive TPM Sensor data.

1. Starting with the left front wheel, deflate the tire to 20 PSI, wait two minutes, and check the scan tool for changes to any compensated tire pressure values.
2. Look for a tire location with a non-responsive TPM Sensor ID.
3. Repeat this test on each wheel on the vehicle until the TPM Sensor in question has been identified.

   Has the TPM Sensor been located?

   Yes

   - Install the Tire Pressure Monitoring (TPM) Sensor in accordance with the Service Information. Refer to **SENSOR, TIRE PRESSURE MONITORING (TPM), REMOVAL** .
   - Perform the TPM SENSOR VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

- Perform the TPM SENSOR VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

5. **INTERMITTENT TIRE PRESSURE MONITORING (TPM) SENSOR DTC**
    1. The conditions necessary to set this DTC are not present at this time.
    2. Perform any Technical Service Bulletins that may apply to this condition.
    3. With the scan tool, clear DTCs in the Radio Frequency Hub (RF-Hub) Module.
    4. Test drive the vehicle for a minimum of 20 minutes with vehicle speed greater than 24km/h (20 mph).
    5. With the scan tool, rear the DTCs in the Radio Frequency Hub (RF-Hub) Module.

    Does the DTC reset or is the status Active for this DTC?

    Yes

    - Return to the beginning of this test and perform the diagnostic procedure as necessary.

    No

    - Test complete.
    - Perform the TPM SENSOR VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C1503-31-TIRE PRESSURE SENSOR 3 - NO SIGNAL

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

NOTE: Check for and remove any non-FCC compliant components before beginning this diagnostic procedure.

THEORY OF OPERATION

The Tire Pressure Monitoring (TPM) Sensor actively monitors the air pressure, air temperature inside the tire, and the internal battery status. Each sensor has a unique ID code. The TPM Sensor transmits the data at regular intervals via an encoded signal to a receiver circuit located in the Radio Frequency Hub (RF Hub) Module.

WHEN MONITORED

With vehicle speed greater than 32 km/h (20 mph).

SET CONDITION

The RF Hub Module will monitor the signals from the four active road tire TPM Sensors. This code sets if RF data is not received or cannot be accurately decoded for a maximum of 20 minutes, if localization has completed.

POSSIBLE CAUSES

Possible Causes
NON-FCC COMPLIANT COMPONENTS
AFTERMARKET TIRES/WHEELS
INTERMITTENT TIRE PRESSURE MONITORING (TPM) SENSOR INTERNAL DTC
TIRE PRESSURE MONITORING (TPM) SENSOR
RADIO FREQUENCY HUB (RF-HUB) MODULE

DIAGNOSTIC TEST

1. **DTC STATUS IS ACTIVE**

NOTE: Before beginning the diagnostic procedure, verify that the tire pressures are correct, the 9936 TPM-RKE analyzer is up to date and the correct application has been chosen on the tool.

1. Cycle the ignition on.
2. With the scan tool, read and record RF-Hub Module DTCs.
3. Test drive the vehicle at a speed greater than 32 km/h (20 mph) up to 20 minutes in order to receive TPM Sensor data and allow for the system to update.
4. With the scan tool, read DTCs in the RF-Hub Module.

Is this DTC status Active at this time?

Yes

- Go To 2

No

- Go To 6

2. **TIRE PRESSURE MONITORING (TPM) SENSOR INTERNAL DTC**

NOTE: This fault can be set if the incorrect or no TPM Sensor is installed on the vehicle.

1. Perform a visual inspection to verify that all road wheels are equipped with a TPM Sensor.
2. With the TPM-RKE Analyzer (special tool #CH9936, Analyzer, TPM/RKE) verify the correct TPM Sensor is on the vehicle.

Is the correct TPM Sensor installed on the vehicle?

Yes

- Go To 3

No

- Install the correct Tire Pressure Monitoring (TPM) Sensor in accordance with the Service Information. Refer to **SENSOR, TIRE PRESSURE MONITORING (TPM), REMOVAL** .
- Perform the TPM SENSOR VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

3. **TIRE PRESSURE MONITORING (TPM) SENSOR INTERNAL FAULT SET USING TPM-RKE ANALYZER**

NOTE: The following procedure is used to locate the TPM Sensor that is setting the internal fault. If the tires have been rotated, the TPM Sensor is no longer in sequence from the factory. Faults are linked to the TPM Sensor IDs. You MUST locate the TPM Sensor that set the fault before continuing. Use the following method below at every tire location.

NOTE: If the TPM Sensor IDs do not match, it may be necessary to move the vehicle to a location away from other TPM Sensors and repeat this step.

NOTE: Always be certain to select the proper vehicle line and model year when using this tool, as the tool will automatically use the correct protocol to attempt to read the TPM Sensor. If the incorrect vehicle line and/or model year is selected, the TPM Sensor will not respond to the tool.

1. Use a TPM-RKE Analyzer (special tool #CH9936, Analyzer, TPM/RKE) to scan each TPM Sensor for a response, and store in the proper location in the TPM-RKE Analyzer. If you receive a no response from any of the TPM Sensors, check to make sure that the TPM-RKE Analyzer is set correctly and repeat the process on each non-responsive wheel. If all sensors respond, continue this step.
2. Replace any non-responsive TPM Sensors in accordance with the Service Information. Refer to **SENSOR, TIRE PRESSURE MONITORING (TPM), REMOVAL** . Perform the TPM SENSOR VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
3. With the scan tool, select Data Display for the RF-Hub Module.
4. Check to see if the Sensor IDs match what is programmed into the RF-Hub Module.

Has the TPM Sensor been located?

Yes

- Install the Tire Pressure Monitoring (TPM) Sensor in accordance with the Service Information. Refer to **SENSOR, TIRE PRESSURE MONITORING (TPM), REMOVAL** .
- Perform the TPM SENSOR VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 4

4. **TIRE PRESSURE MONITORING (TPM) SENSOR INTERNAL FAULT - MISMATCHED ID**

NOTE: If the TPM Sensor IDs do not match, it may be necessary to move the vehicle to a location away from other TPM Sensors and repeat this step.

1. Use a TPM-RKE Analyzer (special tool #CH9936, Analyzer, TPM/RKE) to verify the TPM Sensor IDs match what is programmed into the RF-Hub Module. The TPM Sensor Identifications are located under "Data Display" for the RF-Hub Module.

   Do the TPM Sensor IDs match what is stored in the RF-Hub Module?

   Yes

   - Replace the Radio Frequency (RF Hub) Module in accordance with the Service Information. Refer to **MODULE, RADIO FREQUENCY (RF HUB), REMOVAL** .
   - Perform the RADIO FREQUENCY HUB (RF-HUB) VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.
   - Perform the TPM SENSOR VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

5. **TIRE PRESSURE MONITORING (TPM) SENSOR INTERNAL FAULT SET**

NOTE: Some vehicles will not receive the TPM Sensor data when the vehicle is stationary. The vehicle may need to be driven at speeds greater than 32 km/h (20 mph) for about five minutes in order to receive TPM Sensor data.

1. Starting with the left front wheel, deflate the tire to 20 PSI, wait two minutes, and check the scan tool for changes to any compensated tire pressure values.
2. Look for a tire location with a non-responsive TPM Sensor ID.
3. Repeat this test on each wheel on the vehicle until the TPM Sensor in question has been identified.

   Has the TPM Sensor been located?

   Yes

   - Replace the Tire Pressure Monitoring (TPM) Sensor in accordance with the Service Information. Refer to **SENSOR, TIRE PRESSURE MONITORING (TPM), REMOVAL** .
   - Perform the TPM SENSOR VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Repeat this test until the defective sensor has been located.
- Perform the TPM SENSOR VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

6. **INTERMITTENT TIRE PRESSURE MONITORING (TPM) SENSOR DTC**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Perform any Technical Service Bulletins that may apply to this condition.
   3. With the scan tool, clear DTCs in the Radio Frequency Hub (RF-Hub) Module.
   4. Test drive the vehicle for a minimum of 20 minutes with vehicle speed greater than 32 km/h (20 mph).
   5. With the scan tool, read active DTCs in the Radio Frequency Hub (RF-Hub) Module.

   Does the DTC reset or is the status Active for this DTC?

   Yes

   - Return to the beginning of this test and perform the diagnostic procedure as necessary.

   No

   - Test complete.
   - Perform the TPM SENSOR VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C1504-07-TIRE PRESSURE SENSOR 4 - MECHANICAL FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

NOTE: Check for and remove any non-FCC compliant components, and verify that the tire pressures are correct, before beginning this diagnostic procedure.

THEORY OF OPERATION

The Tire Pressure Monitoring (TPM) Sensor actively monitors the air pressure, air temperature inside the tire, and the internal battery status. Each sensor has a unique ID code. The TPM Sensor transmits the data at regular intervals via an encoded signal to a receiver circuit located in the Radio Frequency Hub Module (RF-Hub).

WHEN MONITORED

With vehicle speed greater than 24 km/h (15mph).

SET CONDITION

The RF Hub will monitor the signals from the four active road tire TPM Sensors. This code sets if pressure, temperature, or acceleration data is not received or cannot be accurately decoded for a maximum of 20 minutes.

POSSIBLE CAUSES

Possible Causes
TIRE PRESSURE MONITORING (TPM) SENSOR

DIAGNOSTIC TEST

1. **DTC STATUS IS ACTIVE**

NOTE: **Before beginning the diagnostic procedure, verify that the tire pressures are correct, the 9936 TPM-RKE analyzer is up to date and the correct application has been chosen on the tool.**

1. Cycle the ignition on.
2. With the scan tool, read and record the RF-Hub Module DTCs.
3. With the scan tool, erase the RF-Hub Module DTCs.
4. Test drive the vehicle at a speed greater than 32 km/h (20 mph) up to 20 minutes in order to receive TPM Sensor data and allow for the system to update.
5. With the scan tool, read the DTCs in the RF-Hub Module.

Is this DTC status Active at this time?

Yes

- Go To 2

No

- Go To 5

2. **TIRE PRESSURE MONITORING (TPM) SENSOR INTERNAL FAULT SET USING TPM-RKE ANALYZER**

NOTE: **The following procedure is used to locate the TPM Sensor that is setting the internal fault. If the tires have been rotated, the TPM Sensor is no longer in sequence from the factory. Faults are linked to the TPM Sensor IDs. You MUST locate the TPM Sensor that set the fault before continuing. Use the following method below at every tire location.**

NOTE: **If the TPM Sensor IDs do not match, it may be necessary to move the vehicle to a location away from other TPM Sensors and repeat this step.**

NOTE: **Always be certain to select the proper vehicle line and model year when using this tool, as the tool will automatically use the correct protocol to attempt to read the TPM Sensor. If the incorrect vehicle line and/or model**

year is selected, the TPM Sensor will not respond to the tool.

1. Use a TPM-RKE Analyzer (special tool #CH9936, Analyzer, TPM/RKE) to scan each TPM Sensor for a response, and store in the proper location in the TPM-RKE Analyzer. If you receive no response from any of the TPM Sensors, check to make sure that the TPM-RKE Analyzer is set correctly and repeat the process on each non-responsive wheel.
2. Replace the TPM Sensor in accordance with the Service Information. Refer to **SENSOR, TIRE PRESSURE MONITORING (TPM), REMOVAL** . Perform the TPM SENSOR VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
3. With the scan tool, select Data Display for the RF-Hub Module.
4. Check to see if the Sensor IDs match what is programmed into the RF-Hub Module.

   Has the TPM Sensor been located?

   Yes

   - Install the Tire Pressure Monitoring (TPM) Sensor in accordance with the Service Information. Refer to **SENSOR, TIRE PRESSURE MONITORING (TPM), REMOVAL** .
   - Perform the TPM SENSOR VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 3

3. **TIRE PRESSURE MONITORING (TPM) SENSOR INTERNAL FAULT - MISMATCHED ID**

NOTE: **If the TPM Sensor IDs do not match, it may be necessary to move the vehicle to a location away from other TPM Sensors and repeat this step.**

1. Use a TPM-RKE Analyzer (special tool #CH9936, Analyzer, TPM/RKE) to verify the TPM Sensor IDs match what is programmed into the RF-Hub Module. The TPM Sensor Identifications are located under "Data Display" for the RF-Hub Module.

   Do the TPM Sensor IDs match what is stored in the RF-Hub Module?

   Yes

   - Replace the Radio Frequency (RF Hub) Module in accordance with the Service Information. Refer to **MODULE, RADIO FREQUENCY (RF HUB), REMOVAL** .
   - Perform the TPM SENSOR VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

- Perform the TPM SENSOR VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

4. **TIRE PRESSURE MONITORING (TPM) SENSOR INTERNAL FAULT SET**

NOTE: Some vehicles will not receive the TPM Sensor data when the vehicle is stationary. The vehicle may need to be driven at speeds greater than 32 km/h (20 mph) for about a minute in order to receive TPM Sensor data.

1. Starting with the left front wheel, deflate the tire to 20 PSI, wait two minutes, and check the scan tool for changes to any compensated tire pressure values.
2. Look for a tire location with a non-responsive TPM Sensor ID.
3. Repeat this test on each wheel on the vehicle until the TPM Sensor in question has been identified.

Has the TPM Sensor been located?

Yes

- Install the Tire Pressure Monitoring (TPM) Sensor in accordance with the Service Information. Refer to **SENSOR, TIRE PRESSURE MONITORING (TPM), REMOVAL** .
- Perform the TPM SENSOR VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete.
- Perform the TPM SENSOR VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

5. **INTERMITTENT TIRE PRESSURE MONITORING (TPM) SENSOR DTC**

1. The conditions necessary to set this DTC are not present at this time.
2. Perform any Technical Service Bulletins that may apply to this condition.
3. With the scan tool, clear DTCs in the Radio Frequency Hub (RF-Hub) Module.
4. Test drive the vehicle for a minimum of 20 minutes with vehicle speed greater than 24km/h (20 mph).
5. With the scan tool, rear the DTCs in the Radio Frequency Hub (RF-Hub) Module.

Does the DTC reset or is the status Active for this DTC?

Yes

- Return to the beginning of this test and perform the diagnostic procedure as necessary.

No

- Test complete.
- Perform the TPM SENSOR VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C1504-31-TIRE PRESSURE SENSOR 4 - NO SIGNAL

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

NOTE: Check for and remove any non-FCC compliant components before beginning this diagnostic procedure.

THEORY OF OPERATION

The Tire Pressure Monitoring (TPM) Sensor actively monitors the air pressure, air temperature inside the tire, and the internal battery status. Each sensor has a unique ID code. The TPM Sensor transmits the data at regular intervals via an encoded signal to a receiver circuit located in the Radio Frequency Hub (RF Hub) Module.

WHEN MONITORED

With vehicle speed greater than 32 km/h (20 mph).

SET CONDITION

The RF Hub Module will monitor the signals from the four active road tire TPM Sensors. This code sets if RF data is not received or cannot be accurately decoded for a maximum of 20 minutes, if localization has completed.

POSSIBLE CAUSES

Possible Causes
NON-FCC COMPLIANT COMPONENTS
AFTERMARKET TIRES/WHEELS
INTERMITTENT TIRE PRESSURE MONITORING (TPM) SENSOR INTERNAL DTC
TIRE PRESSURE MONITORING (TPM) SENSOR
RADIO FREQUENCY HUB (RF-HUB) MODULE

DIAGNOSTIC TEST

1. **DTC STATUS IS ACTIVE**

NOTE: Before beginning the diagnostic procedure, verify that the tire pressures are correct, the 9936 TPM-RKE analyzer is up to date and the correct application has been chosen on the tool.

1. Cycle the ignition on.
2. With the scan tool, read and record RF-Hub Module DTCs.
3. Test drive the vehicle at a speed greater than 32 km/h (20 mph) up to 20 minutes in order to receive TPM Sensor data and allow for the system to update.
4. With the scan tool, read DTCs in the RF-Hub Module.

Is this DTC status Active at this time?

Yes

- Go To 2

No

- Go To 6

2. **TIRE PRESSURE MONITORING (TPM) SENSOR INTERNAL DTC**

NOTE: This fault can be set if the incorrect or no TPM Sensor is installed on the vehicle.

1. Perform a visual inspection to verify that all road wheels are equipped with a TPM Sensor.
2. With the TPM-RKE Analyzer (special tool #CH9936, Analyzer, TPM/RKE) verify the correct TPM Sensor is on the vehicle.

Is the correct TPM Sensor installed on the vehicle?

Yes

- Go To 3

No

- Install the correct Tire Pressure Monitoring (TPM) Sensor in accordance with the Service Information. Refer to **SENSOR, TIRE PRESSURE MONITORING (TPM), REMOVAL** .
- Perform the TPM SENSOR VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

3. **TIRE PRESSURE MONITORING (TPM) SENSOR INTERNAL FAULT SET USING TPM-RKE ANALYZER**

NOTE: The following procedure is used to locate the TPM Sensor that is setting the internal fault. If the tires have been rotated, the TPM Sensor is no longer in sequence from the factory. Faults are linked to the TPM Sensor IDs. You MUST locate the TPM Sensor that set the fault before continuing. Use the following method below at every tire location.

NOTE: If the TPM Sensor IDs do not match, it may be necessary to move the vehicle to a location away from other TPM Sensors and repeat this step.

NOTE: Always be certain to select the proper vehicle line and model year when using this tool, as the tool will automatically use the correct protocol to

attempt to read the TPM Sensor. If the incorrect vehicle line and/or model year is selected, the TPM Sensor will not respond to the tool.

1. Use a TPM-RKE Analyzer (special tool #CH9936, Analyzer, TPM/RKE) to scan each TPM Sensor for a response, and store in the proper location in the TPM-RKE Analyzer. If you receive a no response from any of the TPM Sensors, check to make sure that the TPM-RKE Analyzer is set correctly and repeat the process on each non-responsive wheel. If all sensors respond, continue this step.
2. Replace any non-responsive TPM Sensors in accordance with the Service Information. Refer to **SENSOR, TIRE PRESSURE MONITORING (TPM), REMOVAL** . Perform the TPM SENSOR VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
3. With the scan tool, select Data Display for the RF-Hub Module.
4. Check to see if the Sensor IDs match what is programmed into the RF-Hub Module.

   Has the TPM Sensor been located?

   Yes

   - Install the Tire Pressure Monitoring (TPM) Sensor in accordance with the Service Information. Refer to **SENSOR, TIRE PRESSURE MONITORING (TPM), REMOVAL** .
   - Perform the TPM SENSOR VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 4

4. **TIRE PRESSURE MONITORING (TPM) SENSOR INTERNAL FAULT - MISMATCHED ID**

NOTE: **If the TPM Sensor IDs do not match, it may be necessary to move the vehicle to a location away from other TPM Sensors and repeat this step.**

1. Use a TPM-RKE Analyzer (special tool #CH9936, Analyzer, TPM/RKE) to verify the TPM Sensor IDs match what is programmed into the RF-Hub Module. The TPM Sensor Identifications are located under "Data Display" for the RF-Hub Module.

   Do the TPM Sensor IDs match what is stored in the RF-Hub Module?

   Yes

   - Replace the Radio Frequency (RF Hub) Module in accordance with the Service Information. Refer to **MODULE, RADIO FREQUENCY (RF HUB), REMOVAL** .
   - Perform the RADIO FREQUENCY HUB (RF-HUB) VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete.
- Perform the TPM SENSOR VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

5. **TIRE PRESSURE MONITORING (TPM) SENSOR INTERNAL FAULT SET**

NOTE: Some vehicles will not receive the TPM Sensor data when the vehicle is stationary. The vehicle may need to be driven at speeds greater than 32 km/h (20 mph) for about five minutes in order to receive TPM Sensor data.

1. Starting with the left front wheel, deflate the tire to 20 PSI, wait two minutes, and check the scan tool for changes to any compensated tire pressure values.
2. Look for a tire location with a non-responsive TPM Sensor ID.
3. Repeat this test on each wheel on the vehicle until the TPM Sensor in question has been identified.

Has the TPM Sensor been located?

Yes

- Replace the Tire Pressure Monitoring (TPM) Sensor in accordance with the Service Information. Refer to **SENSOR, TIRE PRESSURE MONITORING (TPM), REMOVAL** .
- Perform the TPM SENSOR VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Repeat this test until the defective sensor has been located.
- Perform the TPM SENSOR VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

6. **INTERMITTENT TIRE PRESSURE MONITORING (TPM) SENSOR DTC**

1. The conditions necessary to set this DTC are not present at this time.
2. Perform any Technical Service Bulletins that may apply to this condition.
3. With the scan tool, clear DTCs in the Radio Frequency Hub (RF-Hub) Module.
4. Test drive the vehicle for a minimum of 20 minutes with vehicle speed greater than 32 km/h (20 mph).
5. With the scan tool, read active DTCs in the Radio Frequency Hub (RF-Hub) Module.

Does the DTC reset or is the status Active for this DTC?

Yes

- Return to the beginning of this test and perform the diagnostic procedure as necessary.

No

- Test complete.
- Perform the TPM SENSOR VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C151C-51-TIRE PRESSURE SENSOR ID MISSING - NOT PROGRAMMED

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

NOTE: FF is the default value. If this value is found, the RF-Hub has not been programmed.

NOTE: Check for and remove any non-FCC compliant components before beginning this diagnostic procedure.

THEORY OF OPERATION

When installing a new Radio Frequency Hub (RF-Hub) Module, the module is programed with universal IDs for the Tire Pressure Monitoring (TPM) Sensors. The RF-Hub Module must be programmed with the correct TPM Sensor IDs or drive the vehicle for a minimum of 20 minutes with vehicle speed greater than 32 km/h (20 mph).

WHEN MONITORED

During vehicle TPM Sensor ID locate process.

SET CONDITION

At least one or more wheel unit IDs have not been programmed.

POSSIBLE CAUSES

Possible Causes
NON-FCC COMPLIANT COMPONENTS
SENSOR IDS NOT DOWNLOADED INTO RADIO FREQUENCY HUB (RF-HUB) MODULE
INCORRECT TIRE PRESSURE MONITORING (TPM) SENSOR IDS
TIRE PRESSURE MONITORING (TPM) SENSOR

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**

NOTE: Before beginning the diagnostic procedure, verify that the tire pressures are correct, the 9936 TPM-RKE analyzer is up to date and the correct application has been chosen on the tool.

1. Cycle the ignition on.
2. With the scan tool, read and record RF-Hub Module DTCs.
3. Test drive the vehicle at a speed greater than 32 km/r (20 mph) for 20 minutes in order to receive TPM data and allow for the system to update.
4. With the scan tool, read DTCs in the Radio Frequency Hub (RF-Hub) Module.

   Is the DTC status Active at this time?

   Yes

   - Go To 2

   No

   - Test complete.
   - Perform the TPM SENSOR VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

2. **TPM-RKE ANALYZER CH9936**

   Is there a TPM-RKE Analyzer CH9936 available?

   Yes

   - Go To 3

   No

   - Go To 4

3. **WITH TPM-RKE TOOL CHECK TIRE PRESSURE MONITORING (TPM) SENSOR IDS**

   NOTE: Always be certain to select the proper vehicle line and model year when using this tool, as the tool will automatically use the correct protocol to attempt to read the Sensor. If the incorrect vehicle line and/or model year is selected, the Sensor will not respond to the tool.

   NOTE: If you receive no response from any of the tire pressure sensors, check to make sure that the TPM-RKE Analyzer is set correctly, and repeat the process on each of the non-responsive wheel(s)

   1. Use a TPM-RKE Analyzer (special tool #CH9936, Analyzer, TPM/RKE) to scan each TPM Sensor for an ID, store in the proper location in the TPM-RKE Analyzer.
   2. Use a TPM-RKE Analyzer to upload the correct IDs and proper locations in the scan tool.
   3. With the scan tool, select the RF-Hub Module under "Miscellaneous Functions", follow the procedure for uploading TPM Sensor IDs.

4. With the scan tool, erase RF-Hub Module DTCs.
5. Test drive the vehicle at a speed greater than 32 km/r (20 mph) for 20 minutes in order to receive TPM data and allow for the system to update.
6. With the scan tool, check to see if the TPM sensor IDs match what is programmed into the RF-Hub Module.

   Do the TPM IDs match?

   Yes

   - Test complete.
   - Perform the TPM SENSOR VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - With the scan tool, read RF-Hub DTCs. If any displayed, perform the appropriate diagnostic procedure. If there are none, repeat this test. A bad RF-Hub will have other DTCs set.
   - Perform the TPM SENSOR VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

4. **WITHOUT TPM-RKE TOOL CHECK TIRE PRESSURE MONITORING (TPM) SENSOR IDS**
   1. Cycle the ignition on.
   2. Starting with the left front wheel, deflate the tire to 20 PSI, wait two minutes, and check the scan tool for changes to any compensated tire pressure values.
   3. Repeat the above step on each wheel of the vehicle.
   4. With the scan tool, erase RF-Hub Module DTCs.
   5. Test drive the vehicle at a speed greater than 32 km/r (20 mph) for 20 minutes in order to receive TPM data and allow for the system to update.
   6. With the scan tool, check to see if the TPM sensor IDs are programmed into the RF-Hub Module.

      Are the TPM Sensor IDs in the RF-Hub Module?

      Yes

      - Test complete.
      - Perform the TPM SENSOR VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - With the scan tool, read RF-Hub DTCs. If any displayed, perform the appropriate diagnostic procedure. If there are none, repeat this test. A bad RF-Hub will have other DTCs set.
      - Perform the TPM SENSOR VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C151D-00-TIRE PRESSURE SENSOR LOCATION UNDETERMINED

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

NOTE: Check for and remove any non-FCC compliant components before beginning this diagnostic procedure.

THEORY OF OPERATION

The vehicle Tire Pressure Monitoring (TPM) Sensor locate process occurs after the vehicle is stationary for more than 20 min. The TPM system will determine the sensor positions while driving at speeds above 32 km/h (20 mph). This process can take up to 20 min to determine TPM Sensor positions.

WHEN MONITORED

During vehicle TPM Sensor locate process.

SET CONDITION

When the localization sequence is not completed successfully. Must fail multiple vehicle TPM Sensor locate processes if localization fails due to Left/Right fail or Front/Rear fail or if the Radio Frequency Hub (RF-Hub) Module is new and has never attempted localization. If missing TPM Sensors are present on first drive, this DTC will set to show that the TPM Sensor location cannot be determined/guaranteed (cannot revert to last known good locations).

POSSIBLE CAUSES

Possible Causes
NON-FCC COMPLIANT COMPONENTS
TPM SENSOR ID AUTO LEARNING NOT COMPLETED
ANTILOCK BRAKE SYSTEM DTC
TIRE PRESSURE MONITORING (TPM) SENSOR
RADIO FREQUENCY HUB (RF-HUB) MODULE

DIAGNOSTIC TEST

1. **ANTILOCK BRAKE (ABS) DTC**
    1. Cycle the ignition on.
    2. With the scan tool, read Antilock Brake System (ABS) DTCs.

       Does the scan tool display any ABS DTCs?

       Yes

       - Repair all Antilock Brake System DTCs. Refer to **DIAGNOSIS AND TESTING** .

       No

- Go To 2

2. **VERIFY DTC IS ACTIVE**

NOTE: If a new RF-Hub Module was replaced, the vehicle must remain stationary for 20 minutes before proceeding with this diagnostic procedure.

1. Cycle the ignition on.
2. With the scan tool, read and record RF-Hub Module DTCs.
3. Test drive the vehicle at a speed greater than 32 km/h (20 mph) for 20 minutes in order to receive TPM Sensor data and allow for the system to update.
4. With the scan tool, read the active DTCs in the RF-Hub Module.

Does the scan tool display: C151D-00 Active at this time?

Yes

- Replace the Radio Frequency (RF Hub) Module in accordance with the Service Information. Refer to **MODULE, RADIO FREQUENCY (RF HUB), REMOVAL** .
- Perform the RADIO FREQUENCY HUB (RF-HUB) VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
- Perform the TPM SENSOR VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C1570-00-DUPLICATE TIRE PRESSURE SENSOR IDS

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

NOTE: FF is the default value. If this value is found, the RF-Hub has not been programmed.

NOTE: Check for and remove any non-FCC compliant components before beginning this diagnostic procedure.

THEORY OF OPERATION

When installing a new Tire Pressure Monitoring (TPM) Module, the module is programed with universal IDs for the Tire Pressure Monitoring (TPM) Sensors. The TPM Module must be programmed with the correct TPM Sensor IDs or drive the vehicle for a minimum of 20 minutes with vehicle speed greater than 32 km/h (20 mph).

WHEN MONITORED

During vehicle TPM Sensor ID locate process.

SET CONDITION

At least one or more wheel unit IDs are duplicated.

POSSIBLE CAUSES

Possible Causes
NON-FCC COMPLIANT COMPONENTS
SENSOR IDS NOT DOWNLOADED INTO RADIO FREQUENCY HUB (RF-HUB) MODULE
INCORRECT TIRE PRESSURE MONITORING (TPM) SENSOR IDS
TIRE PRESSURE MONITORING (TPM) SENSOR

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**

   NOTE: Before beginning the diagnostic procedure, verify that the tire pressures are correct, the 9936 TPM-RKE analyzer is up to date and the correct application has been chosen on the tool.

   1. Cycle the ignition on.
   2. With the scan tool, read and record RF-Hub Module DTCs.
   3. Test drive the vehicle at a speed greater than 32 km/r (20 mph) for 20 minutes in order to receive TPM data and allow for the system to update.
   4. With the scan tool, read DTCs in the Radio Frequency Hub (RF-Hub) Module.

      Is the DTC status Active at this time?

      Yes

      - Go To 2

      No

      - Test complete.
      - Perform the TPM SENSOR VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

2. **WITH TPM-RKE TOOL CHECK TIRE PRESSURE MONITORING (TPM) SENSOR IDS**

   NOTE: Always be certain to select the proper vehicle line and model year when using this tool, as the tool will automatically use the correct protocol to

attempt to read the Sensor. If the incorrect vehicle line and/or model year is selected, the Sensor will not respond to the tool.

NOTE: If you receive no response from any of the tire pressure sensors, check to make sure that the TPM-RKE Analyzer is set correctly, and repeat the process on each of the non-responsive wheel(s)

1. Use a TPM-RKE Analyzer (special tool #CH9936, Analyzer, TPM/RKE) to scan each TPM Sensor for an ID, store in the proper location in the TPM-RKE Analyzer.
2. Use a TPM-RKE Analyzer to upload the correct IDs and proper locations in the scan tool.
3. With the scan tool, select the RF-Hub Module under "Miscellaneous Functions", follow the procedure for uploading TPM Sensor IDs.
4. With the scan tool, erase RF-Hub Module DTCs.
5. Test drive the vehicle at a speed greater than 32 km/r (20 mph) for 20 minutes in order to receive TPM data and allow for the system to update.
6. With the scan tool, check to see if the TPM sensor IDs match what is programmed into the RF-Hub Module.

   Do the TPM IDs match?

   Yes

   - Test complete.
   - Perform the TPM SENSOR VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - With the scan tool, read RF-Hub DTCs. If any displayed, perform the appropriate diagnostic procedure. If there are none, repeat this test. A bad RF-Hub will have other DTCs set.
   - Perform the TPM SENSOR VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

3. **WITHOUT TPM-RKE TOOL CHECK TIRE PRESSURE MONITORING (TPM) SENSOR IDS**
   1. Cycle the ignition on.
   2. Starting with the left front wheel, deflate the tire to 20 PSI, wait two minutes, and check the scan tool for changes to any compensated tire pressure values.
   3. Repeat the above step on each wheel of the vehicle.
   4. With the scan tool, erase RF-Hub Module DTCs.
   5. Test drive the vehicle at a speed greater than 32 km/r (20 mph) for 20 minutes in order to receive TPM data and allow for the system to update.
   6. With the scan tool, check to see if the TPM sensor IDs are programmed into the RF-Hub Module.

      Are the TPM Sensor IDs in the RF-Hub Module?

Yes

- Test complete.
- Perform the TPM SENSOR VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- With the scan tool, read RF-Hub DTCs. If any displayed, perform the appropriate diagnostic procedure. If there are none, repeat this test. A bad RF-Hub will have other DTCs set.
- Perform the TPM SENSOR VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C1597-00-TPM SYSTEM DEACTIVATED-WINTER MODE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

NOTE: Check for and remove any non-FCC compliant components before beginning this diagnostic procedure.

THEORY OF OPERATION

NOTE: When this DTC is active the TPM Module will enter a deactivation mode (Winter Mode) and the TPM system becomes deactivated. If winter tires and wheel assemblies are installed no repair is required.

The Tire Pressure Monitor (TPM) Module determines the TPM Sensor positions by performing the vehicle Tire Pressure Monitoring (TPM) Sensor locate procedure. This procedure is run after the vehicle has been stationary for 20 minutes. After driving the vehicle at speeds greater than 32 km/h (20 mph) for a minimum of 10 minutes without the TPM Sensor installed, the TPM Module sends a bus message commanding the TPM telltale lamp to flash for 75 seconds. After the 75 seconds of flashing, the lamp will remain on solid and a chime will be heard. The message center will display SERVICE TPM SYSTEM for five seconds and shut off, all while the tire pressure values will be displayed as dashes. After the ignition has been cycled off and on the TPM telltail lamp will remain off, the message center will no longer display SERVICE TPM SYSTEM, and the tire pressures continue to be displayed as dashes.

WHEN MONITORED

During vehicle TPM Sensor locate process.

SET CONDITION

For BUX/Canada vehicles only where all four TPM Sensors fail the locate processes at the same time because the TPM sensors are not installed on winter tire and wheel assemblies.

POSSIBLE CAUSES

Possible Causes
NON-FCC COMPLIANT COMPONENTS
TIRE PRESSURE MONITORING (TPM) SENSORS NOT PRESENT
TIRE PRESSURE MONITORING (TPM) SENSORS
RADIO FREQUENCY HUB (RF-HUB) MODULE

DIAGNOSTIC TEST

1. **DTC STATUS IS ACTIVE**

NOTE: **Before beginning the diagnostic procedure, verify that the tire pressures are correct, the 9936 TPM-RKE analyzer is up to date and the correct application has been chosen on the tool.**

1. Cycle the ignition on.
2. With the scan tool, read and record the RF-Hub Module DTCs.
3. With the scan tool, erase stored RF-Hub Module DTCs.
4. Drive the vehicle at speeds greater than 32 km/h (20 mph) for 10 minutes.
5. With the scan tool, read DTCs in the RF-Hub Module.

Is this DTC Active at this time?

Yes

- Go To 2

No

- Go To 4

2. **TIRE PRESSURE MONITORING (TPM) WINTER MODE**

NOTE: **Repair all other RF -Hub Module DTCs before continuing with this test procedure.**

1. Cycle the ignition off.
2. Cycle the ignition from off to on.
3. Check for the following conditions:
   - The telltale lamp is off.
   - The tire pressure values in the Instrument Cluster are displayed as dashes.
   - The message center **is not** displaying "SERVICE TPM SYSTEM".

Are all of the above conditions correct?

Yes

- The Tire Pressure Monitoring (TPM) Module is now in deactivation mode (Winter Mode). This DTC will remain active until the correct tire and wheel assemblies are installed back on the vehicle. Once one of the correct tire and wheel assemblies are reinstalled, the other three must also be reinstalled prior to turning the ignition on.

No

- Go To 3

3. **TIRE PRESSURE MONITORING (TPM) SENSORS**
   1. Cycle the ignition off.
   2. Verify the correct TPM Sensors are installed in all of the tire and wheel assemblies.

   Are the correct TPM Sensors installed?

   Yes

   - Replace the Radio Frequency (RF Hub) Module in accordance with the Service Information. Refer to **MODULE, RADIO FREQUENCY (RF HUB), REMOVAL** .
   - Perform the RADIO FREQUENCY HUB (RF HUB) VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Install all new Tire Pressure Monitoring (TPM) Sensors in accordance with the Service Information. Refer to **SENSOR, TIRE PRESSURE MONITORING (TPM), REMOVAL** .
   - Perform the TPM SENSOR VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
4. **INTERMITTENT TIRE PRESSURE MONITORING (TPM) SENSOR DTC**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Perform any Technical Service Bulletins that may apply to this condition.
   3. With the scan tool, clear DTCs in the Radio Frequency Hub (RF-Hub) Module.
   4. Test drive the vehicle for a minimum of 10 minutes with vehicle speed greater than 32 km/h (20 mph).
   5. With the scan tool, read DTCs in the Radio Frequency Hub (RF-Hub) Module.

   Does the DTC reset or is the status Active for this DTC?

   Yes

   - With the scan tool, read RF-Hub DTCs. If any displayed, perform the appropriate diagnostic procedure. If there are none, repeat this test. A bad RF-Hub will have other DTCs set.
   - Perform the TPM SENSOR VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete.
- Perform the TPM SENSOR VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C15CB-00-FRONT AXLE TIRE PRESSURE PLACARD VALUE IMPLAUSIBLE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously while driving.

SET CONDITION

Placard values not programmed into the Radio Frequency Hub (RF Hub) Module.

POSSIBLE CAUSES

Possible Causes
MISSING PLACARD VALUES IN THE RADIO FREQUENCY HUB (RF HUB) MODULE

DIAGNOSTIC TEST

TIRE PRESSURE VALUES

NOTE: Before beginning the diagnostic procedure, verify that the tire pressures are correct, the 9936 TPM-RKE analyzer is up to date and the correct application has been chosen on the tool.

1. With the scan tool, select "RFH", "Data Display", "Tire Placard Pressure - Front" under each of the TPM Sensor Identification locations.
2. Compare the pressure values with the "Tire Inflation Pressure (Placard) Label located on the driver's side B-Pillar.
3. With the scan tool, select "RFH", "Miscellaneous Functions", "Update Pressure Threshold" and follow the instructions on the scan tool.
4. Enter the front and rear placard pressure values as seen on the Tire Inflation Pressure (Placard) Label.

   Do the tire pressure values match the Placard Values?

   Yes

   - Test complete.
   - Perform the TPM SENSOR VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Repeat this test.
- Perform the TPM SENSOR VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C15CC-00-REAR AXLE TIRE PRESSURE PLACARD VALUE IMPLAUSIBLE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously while driving.

SET CONDITION

Placard values not programmed into the Radio Frequency Hub (RF Hub) Module.

POSSIBLE CAUSES

Possible Causes
MISSING PLACARD VALUES IN THE RADIO FREQUENCY HUB (RF HUB) MODULE

DIAGNOSTIC TEST

TIRE PRESSURE VALUES

NOTE: Before beginning the diagnostic procedure, verify that the tire pressures are correct, the 9936 TPM-RKE analyzer is up to date and the correct application has been chosen on the tool.

1. With the scan tool, select "RFH", "Data Display", "Tire Placard Pressure - Rear" under each of the TPM Sensor Identification locations.
2. Compare the pressure values with the "Tire Inflation Pressure (Placard) Label located on the driver's side B-Pillar.
3. With the scan tool, select "RFH", "Miscellaneous Functions", "Update Pressure Threshold" and follow the instructions on the scan tool.
4. Enter the front and rear placard pressure values as seen on the Tire Inflation Pressure (Placard) Label.

   Do the tire pressure values match the Placard Values?

   Yes

   - Test complete.
   - Perform the TPM SENSOR VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Repeat this test.
- Perform the TPM SENSOR VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

P0704-2A-CLUTCH SWITCH INPUT CIRCUIT-STUCK

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 80: Clutch Position Signal - Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

Cycling the ignition to start.

SET CONDITION

This DTC applies to manual transmission only, when the KIN button is pushed to START, the vehicle will crank without the driver pressing the clutch pedal; and will not be able to set the ignition state to ACCESSORY.

POSSIBLE CAUSES

Possible Causes
(T12) CLUTCH POSITION SIGNAL CIRCUIT SHORTED
CLUTCH INTERLOCK SWITCH
RADIO FREQUENCY HUB (RF HUB) MODULE

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Cycle the ignition on.
    2. Using the scan tool, record and erase the DTCs.
    3. With the scan tool, read the Active DTCs.

    Does the scan tool display: P0704-2A-CLUTCH SWITCH INPUT CIRCUIT-STUCK as active?

    Yes

    - Go To 2

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
2. **CHECK THE CLUTCH SWITCH CONNECTION**
    1. Cycle the ignition off.
    2. Disconnect the Clutch Switch connector.
    3. Cycle the ignition on.
    4. Using the scan tool, record and erase the DTCs.
    5. With the scan tool, read the Active DTCs.

    Does the scan tool display: P0704-2A-CLUTCH SWITCH INPUT CIRCUIT-STUCK as active?

    Yes

- Go To 3

No

- Check the Clutch Switch connection for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
- If no problem found with the connection, replace the Clutch Switch in accordance with the service information.

3. **CHECK THE (T12) CLUTCH POSITION SIGNAL CIRCUIT SHORTED TO GROUND**
   1. Cycle the ignition off.
   2. Disconnect the RF Hub Module C1 harness connector.
   3. Measure the resistance between ground and the (T12) Clutch Position Signal Circuit.

   Is the resistance below 30K Ohms?

   Yes

   - Repair the short to ground in the (T12) Clutch Position Signal Circuit.

   No

   - Check the RF Hub Module connection for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
   - If no problem found with the connection, replace the RF Hub in accordance with the Service Information. Refer to **MODULE, RADIO FREQUENCY (RF HUB), REMOVAL** .
   - Perform the RADIO FREQUENCY HUB (RF HUB) VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

P081C-01-PARK INPUT CIRCUIT-GENERAL ELECTRICAL FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 81: BTSI Park Control - Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

Continuously and the vehicle may not start (ignition cannot go to run).

SET CONDITION

There are two possible conditions that could take place in setting this fault: 1) The RF Hub has received CAN message that the transmission is in Park **AND** the hard wired input from the gated park switch to the RFHM indicates the transmission is **NOT** in Park. 2) The RF Hub has received a CAN message that the transmission is **NOT** in Park **AND** the hard wired input from the gated park switch to the RF Hub indicates the transmission is in Park.

POSSIBLE CAUSES

Possible Causes
BTSI PARK CONTROL CIRCUIT SHORTED OR OPEN
BTSI UNLOCK CONTROL CIRCUIT SHORTED OR OPEN
RADIO FREQUENCY HUB (RF HUB) MODULE

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
   1. Cycle the ignition on.
   2. Using the scan tool, record and erase the DTCs.
   3. With the scan tool, read the Active DTCs.

      NOTE: If any of the following DTC's are Active: P0928-11, P0928-12, P0928-13 or U1454-00, perform these diagnostic test(s) first before continuing.

      Does the scan tool display: P081C-01-PARK INPUT CIRCUIT-GENERAL ELECTRICAL FAILURE as active?

      Yes

      - Go To 2

      No

      - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
2. **CHECKING THE BTSI PARK CONTROL CIRCUIT FOR A SHORT TO GROUND**
   1. Cycle the ignition off.

      NOTE: Before proceeding check all related connections for not being fully connected, signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.

   2. Disconnect the RF Hub Module C1 harness connector and Electronic Shift Module connector.
   3. Measure the resistance between ground and the (T404) BTSI Park Control circuit.

      Is the resistance below 30K Ohms?

      Yes

      - Repair the short to ground in the (T404) BTSI Park Control circuit.

No

- Go To 3

3. **CHECKING THE BTSI UNLOCK CONTROL CIRCUIT FOR A SHORT TO GROUND**
   1. Measure the resistance between ground and the (K321) BTSI Unlock Control circuit.

      Is the resistance below 30K Ohms?

      Yes

      - Repair the short to ground in the (K321) BTSI Unlock Control circuit.

      No

      - Go To 4

4. **CHECKING THE BTSI PARK CONTROL CIRCUIT FOR AN OPEN**
   1. Measure the resistance of the (T404) BTSI Park Control circuit between the RF HUB C1 connector and the Electronic Shift Module connector.

      Is the resistance below 2.0 Ohms?

      Yes

      - Go To 5

      No

      - Repair the open in the (T404) BTSI Park Control circuit.

5. **CHECKING THE BTSI UNLOCK CONTROL CIRCUIT FOR AN OPEN**
   1. Measure the resistance of the (K321) BTSI Unlock Control circuit between the RF HUB C1 connector and the Electronic Shift Module connector.

      Is the resistance below 2.0 Ohms?

      Yes

      - Go To 6

      No

      - Repair the open in the (K321) BTSI Unlock Control circuit.

6. **CHECKING THE BTSI PARK CONTROL CIRCUIT BEING SHORTED TO THE BTSI UNLOCK CONTROL CIRCUIT**
   1. Measure the resistance between the (T404) BTSI Park Control circuit and the (K321) BTSI Unlock

Control circuit in the RF Hub C1 harness connector.

Is the resistance below 30K Ohms?

Yes

- Repair the short between the (T404) BTSI Park Control circuit and the (K321) BTSI Unlock Control circuit.

No

- Replace the RF Hub in accordance with the Service Information. Refer to **MODULE, RADIO FREQUENCY (RF HUB), REMOVAL** .

P0928-11-BTSI CONTROL - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 82: BTSI Park Control - Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Brake Transmission Safety Interlock (BTSI) is a safety feature that prohibits movement of the shift lever out of park unless certain conditions are met. The Radio Frequency Hub (RF-Hub) controls the BTSI solenoid. The RF-Hub module will engage the BTSI solenoid when the shifter is in Park, the module detects the depression of the brake pedal and the ignition position is in Run or Start, thus allowing the transmission shift lever to move from the park position to any other position.

WHEN MONITORED

When the ignition is in accessory, run or start position.

SET CONDITION

This DTC will set if the Radio Frequency Hub (RF-Hub) module detects a short to ground on the BTSI solenoid control circuit.

POSSIBLE CAUSES

Possible Causes
(K321) BRAKE TRANSMISSION SHIFT INTERLOCK (BTSI) CONTROL CIRCUIT SHORT TO GROUND
TRANSMISSION SHIFTER ASSEMBLY
RADIO FREQUENCY HUB (RF-HUB)

DIAGNOSTIC TEST

1. **DETERMINE IF THE DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, record and erase the RF-Hub DTCs.
    3. Apply the service brakes and try to shift the transmission from park to all other gears several times.
    4. Turn the ignition off.
    5. Turn the ignition on and wait 30 seconds.
    6. With the scan tool, read the active RF-Hub DTCs.

    Does the scan tool display: P0928-14-BTSI CONTROL - CIRCUIT SHORT TO GROUND OR OPEN as active?

    Yes

    - Go To 2

    No

    - Perform the THEFT AND SECURITY SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE**.
2. **CHECK THE BTSI SOLENOID FOR AN OPEN OR A SHORT TO GROUND**
    1. Turn the ignition off.
    2. Be sure the transmission is in Park.
    3. Disconnect the Shifter Lever Assembly harness connector.
    4. Connect a 12-volt test light between the (K321) BTSI Control circuit and the Ground circuit in the shifter harness connector.
    5. Turn the ignition on.
    6. Step on the brake pedal and observe the test light.

    Does the test light illuminate brightly?

Yes

- Replace the Shifter Assembly in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 3

3. **CHECK THE (K321) BTSI CONTROL CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Disconnect the RF-Hub C1 harness connector.
   3. Measure the resistance between ground and the (K321) BTSI Control circuit in the shifter harness connector.

   Is the resistance below 100K Ohms?

   Yes

   - Repair the (K321) BTSI Control circuit for a short to ground.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - **Replace the Radio Frequency Hub (RF-Hub) in accordance with the Service Information. Refer to MODULE, RADIO FREQUENCY (RF HUB), REMOVAL .**
   - Perform the RADIO FREQUENCY HUB (RF-HUB) VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

P0928-12-BTSI CONTROL - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 83: Brake Transmission Safety Interlock (BTSI) Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Brake Transmission Safety Interlock (BTSI) is a safety feature that prohibits movement of the shift lever out of park unless certain conditions are met. The Radio Frequency Hub (RF-Hub) controls the BTSI solenoid. The RF-Hub module will engage the BTSI solenoid when the shifter is in Park, the module detects the depression of the brake pedal and the ignition position is in Run or Start, thus allowing the transmission shift lever to move from the park position to any other position. A voltage on the control circuit, when it should be locked, can cause this DTC to set.

WHEN MONITORED

When the ignition is in accessory, run or start position.

SET CONDITION

This DTC will set if the Radio Frequency Hub (RF-Hub) module detects a voltage on the BTSI solenoid control circuit when there should not be any voltage there.

POSSIBLE CAUSES

Possible Causes
(K321) BRAKE TRANSMISSION SHIFT INTERLOCK (BTSI) CONTROL CIRCUIT SHORT TO VOLTAGE
RADIO FREQUENCY HUB (RF-HUB)

DIAGNOSTIC TEST

1. **DETERMINE IF THE DTC IS ACTIVE**
    1. Cycle the ignition on.
    2. With the scan tool, record and erase RF-Hub DTCs.
    3. Apply the service brakes and shift the transmission from park to all other gears several times.
    4. Cycle the ignition off.
    5. Apply the service brakes and try to shift the transmission from park to other gears.
    6. Cycle the ignition on and wait 30 seconds.
    7. With the scan tool, read the active RF-Hub DTCs.

    Does the scan tool display: P0928-12-BTSI CONTROL - CIRCUIT SHORT TO BATTERY?

    Yes

    - Go To 2

    No

    - Perform the THEFT AND SECURITY SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE**.
2. **CHECK THE (K321) BTSI CONTROL CIRCUIT FOR A SHORT TO VOLTAGE**
    1. Cycle the ignition off.
    2. Disconnect the Shifter Lever Assembly harness connector.
    3. Cycle the ignition on.
    4. Measure the voltage between ground and the (K321) BTSI Control circuit in the RF-Hub C1 harness connector.

Is there any voltage present?

Yes

- Repair the (K321) BTSI Control circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace the Radio Frequency Hub in accordance with the Service Information. Refer to **MODULE, RADIO FREQUENCY (RF HUB), REMOVAL** .
- Perform the RADIO FREQUENCY HUB (RF-HUB) VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

P0928-13-BTSI CONTROL - CIRCUIT OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 84: BTSI Park Control - Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Brake Transmission Safety Interlock (BTSI) is a safety feature that prohibits movement of the shift lever out of park unless certain conditions are met. The Radio Frequency Hub (RF-Hub) controls the BTSI solenoid. The RF-Hub module will engage the BTSI solenoid when the shifter is in Park, the module detects the depression of the brake pedal and the ignition position is in Run or Start, thus allowing the transmission shift lever to move from the park position to any other position.

WHEN MONITORED

When the ignition is in accessory, run or start position.

SET CONDITION

This DTC will set if the Radio Frequency Hub (RF-Hub) module detects an open on the BTSI solenoid control circuit.

POSSIBLE CAUSES

Possible Causes
(K321) BRAKE TRANSMISSION SHIFT INTERLOCK (BTSI) CONTROL CIRCUIT OPEN
TRANSMISSION SHIFTER ASSEMBLY
RADIO FREQUENCY HUB (RF-HUB)

DIAGNOSTIC TEST

1. **DETERMINE IF THE DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, record and erase the RF-Hub DTCs.
    3. Apply the service brakes and try to shift the transmission from park to all other gears several times.
    4. Turn the ignition off.
    5. Turn the ignition on and wait 30 seconds.
    6. With the scan tool, read the active RF-Hub DTCs.

    Does the scan tool display: P0928-14-BTSI CONTROL - CIRCUIT SHORT TO GROUND OR OPEN as active?

    Yes

    - Go To 2

    No

    - Perform the THEFT AND SECURITY SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE**.
2. **CHECK THE (K321) BTSI CONTROL CIRCUIT FOR AN OPEN**
    1. Measure the resistance of the (K321) BTSI Control circuit between the Shifter harness connector and the RF-Hub C1 harness connector.

    Is the resistance below 1.0 Ohms?

    Yes

    - Replace the Radio Frequency Hub in accordance with the Service Information. Refer to **MODULE, RADIO FREQUENCY (RF HUB), REMOVAL** .
    - Perform the RADIO FREQUENCY HUB (RF-HUB) VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Repair the (K321) BTSI Control circuit for an open.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U0001-00-CAN C BUS

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 85: Occupant Restraint Controller Module (ORC) Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

Continuously when the ignition is on.

Battery voltage between 10 and 16 volts.

SET CONDITION

The controller detects an open, short to ground or a short to voltage on the CAN C Bus circuit.

POSSIBLE CAUSES

Possible Causes
CAN C BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
BODY CONTROL MODULE (BCM) POWER AND GROUND
BODY CONTROL MODULE (BCM)
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

VERIFY DIAGNOSTIC TROUBLE CODE (DTC) IS ACTIVE

NOTE: Make sure the battery voltage is between 10 and 16 volts before proceeding.

1. Cycle the ignition on.
2. With the scan tool, read the active DTCs.

   Does the scan tool display: U0001-00-CAN C BUS?

   Yes

   - For the DTC U0001-00 Can C Bus, use the U0002-00 Can C Bus Off Performance diagnostic procedure.
   - **Refer to DTC INDEX** and perform the U0002-CAN C Bus Off Performance diagnostic procedure.

   No

   - **Refer to DIAGNOSIS AND TESTING** and perform the Stored Lost Communication DTCs diagnostic procedure.

U0002-00-CAN C BUS OFF PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Ignition run time is greater than one second. Battery voltage between 10 and 16 volts. Engine run time greater than three seconds.

SET CONDITION

Bus messages not received from the Body Control Module (BCM) for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
BODY CONTROL MODULE (BCM) POWER AND GROUND
BCM NOT CONFIGURED CORRECTLY
BODY CONTROL MODULE (BCM)
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

ACTIVE DTC

NOTE: For vehicle communication problems, use the scan tool to refer to the Network Review Screen. The screen depicts a high level view of the vehicle network. Fault and problem areas appear in red. Selecting any of the network components allows access to the source of the problem.

1. Cycle the ignition on.
2. With a scan tool, read the active DTCs.

   Does the scan tool display: U0002-00-CAN C BUS OFF PERFORMANCE?

   Yes

   - **Refer to DIAGNOSIS AND TESTING** and perform the CAN C BUS NO RESPONSE diagnostic procedure.

   No

   - **Refer to DIAGNOSIS AND TESTING** and perform the Stored Lost Communication DTCs diagnostic procedure.

U0037-00-LIN BUS

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 86: Security K Line Communication Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

Continuously when the ignition is on.

SET CONDITION

A short to ground OR short to battery condition is identified on the SECURITY K LINE Bus by the Radio Frequency Hub (RFH) Module 10 times consecutively that a fault exists.

POSSIBLE CAUSES

Possible Causes
RADIO FREQUENCY HUB (RFH) SECURITY K LINE BUS CIRCUIT SHORTED TO GROUND OR SHORTED TO BATTERY
KEYLESS IGNITION NODE (KIN) / IGNITION NODE MODULE (IGNM) INTERNAL FAULT
RADIO FREQUENCY HUB (RFH) MODULE INTERNAL FAULT

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**

   NOTE: Verify that the vehicles battery is fully charged before proceeding.

   NOTE: If DTC U103C-KIN/IGNM COMMUNICATION is Active perform the diagnostics for this fault before proceeding. Refer to U103C-00-KIN/IGNM COMMUNICATION.

   1. Turn the ignition on.
   2. With the scan tool, read active Radio Frequency Hub (RFH) Module DTCs.

      Does the scan tool display: U0037-00-LIN BUS as Active?

      Yes

      - Go To 2

      No

      - **Refer to DIAGNOSIS AND TESTING** and perform the Stored Lost Communication DTCs diagnostic procedure.
2. **CHECK THE (D122) SECURITY K LINE BUS CIRCUIT**
   1. Turn the ignition off.
   2. Disconnect the Keyless Ignition Node (KIN) / Ignition Control Module (IGNM) C1 harness connector.
   3. Turn the ignition on.
   4. Measure the voltage of the (D122) RFH Module SECURITY K LINE Bus circuit at the KIN /

IGNM connector.

Is the voltage above 7.0 volts?

Yes

- If equipped with a Keyless Ignition Node (KIN), replace it in accordance with Service Information. Refer to **MODULE, KEYLESS IGNITION NODE, REMOVAL** .
- If equipped with an Ignition Node Module (IGNM), replace it in accordance with Service Information. Refer to **MODULE, IGNITION NODE, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 3

3. **(D122) RFH MODULE LIN BUS CIRCUIT SHORTED TO GROUND**
   1. Turn the ignition off.
   2. Disconnect the RFH Module C1 harness connector.
   3. Measure the resistance between Ground and the (D122) RFH Module SECURITY K LINE Bus circuit.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the (D122) RFH Module SECURITY K LINE Bus circuit for a short to the ground.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 4

4. **(D122) RFH MODULE SECURITY K LINE BUS CIRCUIT SHORTED TO VOLTAGE**
   1. Measure the voltage on the (D122) RFH Module SECURITY K LINE Bus circuit.

   Is there any voltage?

   Yes

   - Repair the (D122) RFH Module SECURITY K LINE Bus circuit for a short to voltage.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the Radio Frequency Hub (RFH) Module in accordance with the Service

Information. Refer to **MODULE, RADIO FREQUENCY (RF HUB), REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U0100-00-LOST COMMUNICATION WITH PCM

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously when the ignition is on.

The battery voltage between 10 and 16 Volts.

Body Control Module (BCM) is configured correctly.

SET CONDITION

Bus messages not received from the Powertrain Control Module (PCM) for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
POWERTRAIN CONTROL MODULES POWER AND GROUND
BCM NOT CONFIGURED CORRECTLY
POWERTRAIN CONTROL MODULE (PCM)
ANY MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

VERIFY THE DIAGNOSTIC TROUBLE CODE (DTC) IS ACTIVE

NOTE: Make sure the battery is fully charged before proceeding.

1. Cycle the ignition on.
2. Using the scan tool, read the active DTCs.

   Does the scan tool display: U0100-00-LOST COMMUNICATION WITH PCM?

   Yes

   - **Refer to DIAGNOSIS AND TESTING** and perform the U0100-87-Lost Communication with ECM/PCM diagnostic procedure.

No

- **Refer to DIAGNOSIS AND TESTING** and perform the Stored Lost Communication DTCs diagnostic procedure.

U0101-00-LOST COMMUNICATION WITH TCM

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

Battery voltage between 10 and 16 volts.

Body Control Module (BCM) is configured correctly.

SET CONDITION

Bus messages not received from the Transmission Control Module (TCM) for approximately 500ms.

POSSIBLE CAUSES

Possible Causes
CAN BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
TRANSMISSION CONTROL MODULE (TCM) POWER AND GROUND
BCM NOT CONFIGURED CORRECTLY
TRANSMISSION CONTROL MODULE (TCM)
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

VERIFY DTC IS ACTIVE

NOTE: Make sure the battery is fully charged before proceeding.

1. Cycle the ignition on.
2. With the scan tool, read the active DTCs.

   Does the scan tool display: U0101-00-LOST COMMUNICATION WITH TCM?

   Yes

   - **Refer to DIAGNOSIS AND TESTING** and perform the U0101-87-Lost Communication with

TCM diagnostic procedure.

No

- **Refer to DIAGNOSIS AND TESTING** and perform the Stored Lost Communication DTCs diagnostic procedure.

U103C-00-KIN/IGNM COMMUNICATION

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Any time the module is awake.

SET CONDITION

Whenever the Radio Frequency Hub (RF Hub) senses an open, or a short to ground on the (D122) Security K Line Communication circuit, this code will set.

POSSIBLE CAUSES

Possible Causes
FUSED B+ CIRCUIT OR GROUND CIRCUIT
SECURITY K LINE COMMUNICATION CIRCUIT SHORTED TO GROUND
SECURITY K LINE COMMUNICATION CIRCUIT OPEN
KEYLESS IGNITION NODE (KIN) OR IGNITION MODULE (IGNM)
RADIO FREQUENCY HUB (RF HUB)

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**

NOTE: Be sure the battery is fully charged before continuing.

1. Cycle the ignition on.
2. Using the scan tool, record and erase the DTCs.
3. Try to start the engine.
4. With the scan tool, read the Active DTCs and wait one minute.

Does the scan tool display: U103C-00-KIN/IGNM COMMUNICATION as active?

Yes

- Go To 2

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **(A910) FUSED B+ OR (Z924) GROUND CIRCUIT OPEN**
   1. Cycle the ignition off.
   2. Disconnect the Keyless Ignition Node harness connector.
   3. Connect a 12 volt test light between the (A910) Fused B+ circuit and the (Z924) Ground circuit.

   Does the test light illuminate brightly? Compare the brightness to that of a direct connection to the battery.

   Yes

   - Go To 3

   No

   - Test the (A910) Fused B+ and (Z924) Ground circuits to determine where the high resistance is. Repair the high resisted circuit as necessary.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **(D122) SECURITY K LINE COMMUNICATION CIRCUIT OPEN**
   1. Measure the voltage between ground and the (D122) Security K Line Communication circuit.

   Is the voltage above 12.0 volts?

   Yes

   - If equipped with a Keyless Ignition Node (KIN), replace it in accordance with Service Information. Refer to **MODULE, KEYLESS IGNITION NODE, REMOVAL** .
   - If equipped with an Ignition Node Module (IGNM), replace it in accordance with Service Information. Refer to **MODULE, IGNITION NODE, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 4

4. **(D122) SECURITY K LINE COMMUNICATION WIRE OPEN**
   1. Disconnect the Radio Frequency Hub C1 harness connector.
   2. Measure the resistance of the (D122) Security K Line Communication wire between the Keyless Ignition Node harness connector and the RF Hub C1 harness connector.

Is the resistance below 1.0 Ohms?

Yes

- Go To 5

No

- Repair the open in the (D122) Security K Line Communication wire.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **(D122) SECURITY K LINE COMMUNICATION SHORT TO GROUND**
   1. Measure the resistance between ground and the (D122) Security K Line Communication circuit in the KIN or IGNM harness connector.

      Is the resistance below 10K Ohms?

      Yes

      - Repair the short to ground in the (D122) Security K Line Communication circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Replace the Radio Frequency Hub (RF Hub) Module in accordance with the Service Information. Refer to **MODULE, RADIO FREQUENCY (RF HUB), REMOVAL** .
      - Perform the RADIO FREQUENCY HUB VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

U0121-00-LOST COMMUNICATION WITH ANTI-LOCK BRAKE SYSTEM (ABS) CONTROL MODULE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously when the ignition is on.

The battery voltage between 10 and 16 volts.

Body Control Module (BCM) is configured correctly.

SET CONDITION

Bus messages not received from the Anti-lock Brake System (ABS) Module for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
ANTI LOCK BRAKE MODULE (ABS) POWER AND GROUND
BCM NOT CONFIGURED CORRECTLY
ANTI LOCK BRAKE MODULE (ABS)
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

VERIFY DTC IS ACTIVE

NOTE: Make sure the battery is fully charged before proceeding.

1. Cycle the ignition on.
2. With the scan tool, read the active DTCs.

   Does the scan tool display: U0121-00-LOST COMMUNICATION WITH ANTI-LOCK BRAKE SYSTEM (ABS) CONTROL MODULE?

   Yes

   - **Refer to DIAGNOSIS AND TESTING** and perform the U0121-87-Lost Communication with Anti-lock Brake System (ABS) Control Module diagnostic procedure.

   No

   - **Refer to DIAGNOSIS AND TESTING** and perform the Stored Lost Communication DTCs diagnostic procedure.

U0140-00-LOST COMMUNICATION WITH BODY CONTROL MODULE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously when the ignition is on.

The battery voltage between 10.0 and 16.0 Volts.

Body Control Module (BCM) is configured correctly.

SET CONDITION

Bus messages not received from the Body Control Module (BCM) for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
BODY CONTROL MODULE POWER AND GROUND
BCM NOT CONFIGURED CORRECTLY
BODY CONTROL MODULE (BCM)
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

VERIFY IF THE DTC IS ACTIVE

NOTE: **Make sure the battery is fully charged before performing any diagnostic procedure.**

With the scan tool, refer to the Network Review Screen to display a high level view of the vehicle communication network. Modules shown in red are problem areas.

Always diagnose any Body Control Module (BCM) DTCs first before proceeding.

1. Turn the ignition on.
2. With the scan tool, read DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Refer to **DIAGNOSIS AND TESTING** and perform the No Response from BCM (Body Control Module) diagnostic procedure.

   No

   - Refer to **DIAGNOSIS AND TESTING** and perform the Stored Lost Communication DTC diagnostic procedure.

U1415-00-IMPLAUSIBLE/MISSING VEHICLE CONFIGURATION DATA

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuous with the ignition on.

SET CONDITION

The fault when the ignition status reported by the Body Control Module (BCM) module is in RUN and no PROXI message is received by the Radio Frequency Hub (RFH) Module.

POSSIBLE CAUSES

Possible Causes
RADIO FREQUENCY HUB (RFH) MODULE
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
    1. Turn the ignition on.
    2. With the scan tool, record and erase the RF Hub DTCs.
    3. Turn the ignition off and wait one minute.
    4. Turn the ignition on.
    5. With the scan tool, read the RF Hub DTCs.

    Does the scan tool display; U1415-00-IMPLAUSIBLE/MISSING VEHICLE CONFIGURATION DATA as active?

    Yes

    - Go To 2

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CAN BUS DTCS SET IN BODY CONTROL MODULE (BCM)**

    NOTE: Verify that the BCM has the correct vehicle configuration before proceeding with this test step.

    1. With the scan tool, read the DTCs in the BCM.

    Are there any active CAN Bus DTCs present?

Yes

- Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

No

- Replace the Radio Frequency Hub in accordance with the Service Information. Refer to **MODULE, RADIO FREQUENCY (RF HUB), REMOVAL** .
- Perform the RADIO FREQUENCY HUB VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

U1433-00-IMPLAUSIBLE IGNITION SWITCH STATUS MESSAGE RECEIVED

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Anytime the ignition is in the Run, Start or Accessory position.

SET CONDITION

The Radio Frequency Hub (RF Hub) receives a Bussed Input message of the Ignition Switch status from the Body Control Module (BCM). If that message does not agree with the RF Hub Ignition Switch status, this code will set. The BCM also sends a Ignition Switch "Sensor" message (hard wired F20 circuit). If the RF Hub and the BCM do not agree on Both of those messages, the PCM will not allow the engine to start.

POSSIBLE CAUSES

Possible Causes
BODY CONTROL MODULE (BCM) RADIO FREQUENCY HUB (RF HUB)

DIAGNOSTIC TEST

1. **CHECK FOR ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
    1. With the scan tool, record and erase the DTCs.
    2. Cycle the ignition off and wait one minute.
    3. Cycle the ignition on.
    4. With the scan tool, select: RF Hub.
    5. With the scan tool, read the Active DTCs.

    Does the scan tool display: U1433-00-IMPLAUSIBLE IGNITION SWITCH STATUS MESSAGE RECEIVED as active?

    Yes

- Go To 2

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK THE IGNITION SWITCH STATUS**
   1. Cycle the ignition on.
   2. With the scan tool select; RF Hub, Data.
   3. Move the ignition in all positions.
   4. Read and record the Ignition Switch Status, Bussed Input.
   5. With the scan tool select; BCM, Data.
   6. Move the ignition in all positions.
   7. Read and record the Ignition Switch Status, Bussed Input.
   8. Compare the messages from both modules with the actual Ignition Switch position.

   Which module is displaying the wrong Ignition Switch status?

   Body Control Module

   - Replace the Body Control Module in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   Radio Frequency Hub

   - Replace the RF Hub module in accordance with the Service Information. Refer to **MODULE, RADIO FREQUENCY (RF HUB), REMOVAL** .
   - Perform the RADIO FREQUENCY HUB (RF HUB) VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

U1433-01-IMPLAUSIBLE IGNITION SWITCH STATUS MESSAGE RECEIVED - GENERAL ELECTRICAL FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

During a Passive Entry or Keyless Go event.

SET CONDITION

The Radio Frequency Hub (RF Hub) receives a Bussed Input message of the Ignition Switch status from the Body Control Module (BCM). If that message does not agree with the RF Hub Ignition Switch status, this code will set. The BCM also sends a Ignition Switch "Sensor" message (hard wired F20 circuit). If the RF Hub and the BCM do not agree on Both of those messages, the PCM will not allow the engine to start.

POSSIBLE CAUSES

Possible Causes
BODY CONTROL MODULE (BCM)
RADIO FREQUENCY HUB (RF HUB)

DIAGNOSTIC TEST

1. **CHECK FOR ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
    1. With the scan tool, record and erase the DTCs.
    2. Cycle the ignition off and wait one minute.
    3. Cycle the ignition on.
    4. With the scan tool, select: RF Hub.
    5. With the scan tool, read the Active DTCs.

    Does the scan tool display: U1433-01-IMPLAUSIBLE IGNITION SWITCH STATUS MESSAGE RECEIVED - GENERAL ELECTRICAL FAILURE as active?

    Yes

    - Go To 2

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE IGNITION SWITCH STATUS**
    1. Cycle the ignition on.
    2. With the scan tool select; RF Hub, Data.
    3. Read and record the Ignition Switch Status, Bussed Input.
    4. With the scan tool select; BCM, Data.
    5. Read and record the Ignition Switch Status, Bussed Input.
    6. Compare the messages from both modules with the actual Ignition Switch position.

    Which module is displaying the wrong Ignition Switch status?

Body Control Module

- Replace the Body Control Module in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

Radio Frequency Hub

- Replace the RF Hub module in accordance with the Service Information. Refer to **MODULE, RADIO FREQUENCY (RF HUB), REMOVAL** .
- Perform the RADIO FREQUENCY HUB (RF HUB) VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

U1454-00-IMPLAUSIBLE DATA RECEIVED FROM THE GATED PARK SWITCH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

When the Radio Frequency Hub (RF Hub) is awake, it sends a 12-volt reference signal on the T404 Transmission (TRS) Park Signal circuit. When that circuit is grounded or ungrounded by the shifter, transmission module or brake shift interlock solenoid (depending on the model) the RF-Hub broadcasts the hard wired park position message on the CAN Bus.

WHEN MONITORED

When the vehicle is being driven over 10 mph (16 km/h).

SET CONDITION

This DTC will set when the vehicle speed received over the CAN Bus indicates that the vehicle is moving but the hardware gated park input indicates that the vehicle is in park.

POSSIBLE CAUSES

Possible Causes
TRANSMISSION (TRS) PARK SIGNAL CIRCUIT SHORT TO GROUND
TRANSMISSION (TRS) PARK SIGNAL CIRCUIT SHORT TO VOLTAGE
TRANSMISSION (TRS) PARK SIGNAL CIRCUIT OPEN
GROUND CIRCUIT OPEN
SHIFTER COMPONENT
RADIO FREQUENCY HUB (RF HUB)

DIAGNOSTIC TEST

1. **CHECK FOR ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**

1. With the scan tool, record and erase the DTCs.
2. Turn the ignition off and wait one minute.
3. Cycle the ignition from on to off three times then to on.
4. Road test the vehicle over 10 mph (16 km/h) and shift gears several times.
5. With the scan tool, read the RF Hub active DTCs.

   Does the scan tool display: U1454-00-IMPLAUSIBLE DATA RECEIVED FROM THE GATED PARK SWITCH as active?

   Yes

   - Go To 2

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK (T404) TRANSMISSION (TRS) PARK SIGNAL CIRCUIT FOR A SHORT TO GROUND**
   1.

   NOTE: Using the mini schematic at the beginning of this test, identify the type of appropriate shifter component the vehicle has before proceeding.

   2.
   3. Turn the ignition off.
   4. Disconnect the appropriate component harness connector.
   5. Turn all lights off and close all doors.
   6. Wait 90 seconds to allow the modules to go to sleep.
   7. Measure the resistance between ground and the (T404) TRS Park Signal circuit in the appropriate component harness connector.

   NOTE: As long as the module is asleep the resistance should be approximately 200K Ohms.

   Is the resistance below 100K Ohms?

   Yes

   - Repair the short to ground in the (T404) TRS Park Signal circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 3

3. **CHECK (T404) TRANSMISSION (TRS) PARK SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**
   1. **NOTE: The RF Hub must NOT be awake for the result of this test to be valid.**
   2. Measure the voltage between ground and the (T404) TRS Park Signal circuit in the appropriate component harness connector.

      Is the voltage above 0.05 volts?

      Yes

      - Go To 7

      No

      - Go To 4

4. **CHECK (Z924) GROUND CIRCUIT FOR AN OPEN**
   1.
   2. Turn the ignition on.
   3. Using a 12-volt test light connected to 12-volts, test the (Z924) Ground circuit in the appropriate component harness connector.

      Does the test light illuminate brightly?

      Yes

      - Go To 5

      No

      - Repair the open in the (Z924) Ground circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **CHECK (T404) TRANSMISSION (TRS) PARK SIGNAL CIRCUIT FOR AN OPEN CIRCUIT**
   1.
   2. Measure the voltage between ground and the (T404) TRS Park Signal circuit in the appropriate component harness connector.

      Is the voltage above 12.0 volts?

      Yes

- Replace the appropriate component in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 6

6. **CHECK (T404) TRANSMISSION (TRS) PARK SIGNAL CIRCUIT FOR AN OPEN WIRE**
   1.
   2. Turn the ignition off.
   3. Disconnect the Radio Frequency Hub C1 harness connector.
   4. Measure the resistance of the (T404) TRS Park Signal circuit between the appropriate component harness connector and the RF Hub C1 connector.

   Is the resistance below 2.0 ohms?

   Yes

   - Replace the Radio Frequency Hub module in accordance with the Service Information. Refer to **MODULE, RADIO FREQUENCY (RF HUB), REMOVAL** .
   - Perform the RADIO FREQUENCY HUB VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Repair the open in the (T404) TRS Park Signal circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

7. **CHECK (T404) TRANSMISSION (TRS) PARK SIGNAL WIRE FOR A SHORT TO VOLTAGE**
   1.
   2. Turn the ignition off.
   3. Disconnect the Radio Frequency Hub C1 harness connector.
   4. Open the driver door and turn the park lamps on.
   5. Try to turn the ignition on.
   6. Measure the voltage between ground and the (T404) TRS Park Signal circuit in the appropriate component harness connector.

   Is there any voltage present?

   Yes

   - Repair the (T404) TRS Park Signal circuit for a short to voltage
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace the Radio Frequency Hub module in accordance with the Service Information. Refer to **MODULE, RADIO FREQUENCY (RF HUB), REMOVAL** .
- Perform the RADIO FREQUENCY HUB VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

U1517-62-BODY CONTROLLER SECRET CODE - SIGNAL COMPARE FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuous

SET CONDITION

When the secret code signal during activation from the BCM to the RF Hub fails.

POSSIBLE CAUSES

Possible Causes
LOSS OF COMMUNICATION WITH RF HUB/PCM/BCM/ESL
FOBIK
RF HUB (RADIO FREQUENCY HUB) MODULE
BCM (BODY CONTROL MODULE)

DIAGNOSTIC TEST

1. **CHECKING FOR ACTIVE DTCS IN THE RFHM, BCM, ESL AND PCM**
    1. With the scan tool perform a complete Vehicle Scan Report and save this information for continued reference throughout this diagnostic test.
    2. Check the following modules for active DTCs:
        - Radio Frequency Hub Module (RFHM) : B1A24-00, B1A25-00, B1A35-00, or U1517-62
        - Radio Frequency Hub Module (RFHM): any SKIM related faults listed between the RF Hub and BCM, the BCM and ESL, or the BCM and PCM
        - Body Control Module (BCM): U1514-64, U1515-64 or U1517-64
        - Powertrain Control Module (PCM): P0513 or U0426
        - Electronic Steering Lock Module (ESL): U1517-62

    Do any of the specific faults noted appear in the corresponding module?

    Yes

- Go To 3

No

- Go To 2

2. **CHECKING FOR RELATED RFHM AND BCM DTCs**
   1. Use the Vehicle Scan Report to check for active DTCs in the RFHM and BCM.

      Does the RFHM have active fault U1517-87 (OR) does the BCM have active fault U1516-87 and are there any Loss of Communication or CAN Bus faults between the RFHM and BCM?

      Yes

      - Perform the diagnostic for the active DTC in accordance with Service Information.

      No

      - There is no concern with BCM or RFHM perform the U1517-87 diagnostic procedure.

3. **CHECKING THE RFHM VIN AND STATUS**
   1. Use the Vehicle Scan Report; and if needed the scan tool to check the module status and VIN number in the RFHM.

      Is the RFHM locked and does it have the incorrect VIN?

      Yes

      - Replace the RFHM in accordance with Service Information. Refer to **MODULE, RADIO FREQUENCY (RF HUB), REMOVAL** .

      No

      - Go To 4

4. **RFHM STATUS CHECK**
   1. Use the Vehicle Scan Report and if needed the scan tool, to check the module status.

      Did the scan tool show the RFHM unlocked?

      Yes

      - Perform the RFHM replacement procedure in accordance with Service Information. Refer to **MODULE, RADIO FREQUENCY (RF HUB), REMOVAL** .

      No

- Go To 5

5. **RFHM DTC CHECK**
   1. Use the Vehicle Scan Report to check for active DTCs in the RFHM.

      Does the RFHM have active fault B1A24-00, B1A25-00 or B1A35-00?

      Yes

      - Perform the FOBIK replacement/programming procedure in accordance with Service Information.

        Refer to **TRANSMITTER, INTEGRATED KEY FOB, STANDARD PROCEDURE** .

      - If there is any problem with the FOBIK (i.e. Key Not Programmed, Invalid Key or Unidentified Key Communication Error) then replace the FOBIK in accordance with Service Information.

        Refer to **TRANSMITTER, INTEGRATED KEY FOB, STANDARD PROCEDURE** .

      No

      - Go To 6

6. **RFHM AND BCM DTC CHECK**
   1. Use the Vehicle Scan Report to check for active DTCs in the RFHM and BCM.

      Does the RFHM have active fault U1517-87 or the BCM active fault U1516-87 or are the any Loss of Communication or CAN Bus faults between the RFHM and BCM?

      Yes

      - Perform diagnostic for the active DTC found in accordance with Service Information. Refer to **DTC INDEX** .

      No

      - Go To 7

7. **RFHM AND BCM DTC CHECK**
   1. Use the Vehicle Scan Report to check for active DTCs in the RFHM and BCM.

      Does the RFHM have active fault U1517-62 or the BCM active fault U1517-64 or did the RFHM and BCM have a failed handshake?

      Yes

      - Go To 8

No

- There is no concern with BCM or RFHM. Refer to **DTC INDEX** and perform the U1517-87 diagnostic procedure .

8. **BCM PROGRAMMING CHECK**
   1. With the Scan Tool, verify the BCM is programmed.

      Is the BCM programmed?

      Yes

      - Replace the BCM in accordance with Service Information.

        Refer to **MODULE, BODY CONTROL, REMOVAL** .

      No

      - Perform the BCM replacement procedure in accordance with Service Information.

        Refer to **MODULE, BODY CONTROL, REMOVAL** .

STANDARD PROCEDURE

TPM SENSOR VERIFICATION TEST

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

DIAGNOSTIC TEST

TPM SENSOR REPLACEMENT

NOTE: If a TPM-RKE Tool is not available, let the vehicle sit stationary for more then 20 minutes, and then proceed to step 4 .

1. Using an updated TPM-RKE Analyzer Tool, select TPM Functions, then enter the Model Year and the Body Style of the vehicle, and for the Trigger Selection select PARK SENSOR
2. Scan each TPM Sensor at each road wheel, and store each TPM Sensor ID in the correct location. (LEFT FRONT, LEFT REAR, RIGHT FRONT, RIGHT REAR, and SPARE TIRE (if equipped).)
3. Connect the TPM-RKE Analyzer Tool to the scan tool, and then follow the programming steps outlined in the diagnostic scan tool for "Program Tire Pressure Sensor ID w/ TPM Tool" under "MISC" for the TPM.
4. Drive the vehicle for a minimum of 20 minutes while maintaining a continuous speed above 24 km/h (15 mph).
5. With the scan tool, read TPM DTCs.

Are there any TPM DTCs present?

Yes

- Perform the appropriate diagnostic procedure. Refer to **DIAGNOSIS AND TESTING**.

No

- Repair complete.

THEFT AND SECURITY SYSTEMS PRE-DIAGNOSTIC PROCEDURE

Before attempting to repair any theft or security system, technicians should be familiar with and fully understand the system operation. Refer to the Theft and Security System **DESCRIPTION** and **OPERATION** for complete details.

The following should be used as a checklist to be completed in its entirety prior to referencing specific Theft and Security Diagnostic Procedures.

1. **FOLLOW THE BASIC OUTLINE SET FORTH IN THE SIX-STEP TROUBLESHOOTING PROCEDURE**
    1. Verification of complaint.
    2. Verification of any related symptoms.
    3. Symptom analysis.
    4. Problem isolation.
    5. Repair of isolated problem.
    6. Verification of proper operation.
2. **TAKE INTO ACCOUNT CURRENT VEHICLE CONDITION, REPAIR HISTORY, AND TECHNICAL SERVICE BULLETINS (TSB's)**
    1. Verify there are no outward signs of vehicle damage that could impact the proper operation of the theft or security system. Check for aftermarket vehicle accessories that may have been installed improperly or could interfere with the system
    2. Check the vehicle repair history for repairs that may relate to the current condition.
    3. Perform a check of current Technical Service Bulletins (TSB) for the Theft/Security system related to the customer concern. If a TSB applies, follow the procedure outlined in the TSB.
3. **DIAGNOSE ONLY THOSE FAILURES THAT ARE ACTIVE AND CAN BE REPRODUCED**
    1.
        - Check the control module central to the subsystem that is exhibiting the condition for active DTCs
        - For an intermittent failure that is not current at the time of vehicle inspection, refer to the THEFT AND SECURITY SYSTEM INTERMITTENT TEST and document the event on the repair order. Refer to **STANDARD PROCEDURE**.
4. **ADDRESS ACTIVE DIAGNOSTIC TROUBLE CODES (DTCS) IN THE CORRECT ORDER**

1. As a general rule, for any theft/security system control module that exhibits more than one active DTC, address the codes in the order indicated:
    1. Low/High Voltage and Serial Data Loss of Communication Codes
    2. Module Internal Failure and Configuration Mismatch Codes
    3. Circuit specific DTC failures
2. Should the malfunction still be present after conducting this Pre-diagnostic Procedure, technicians should continue to the appropriate DTC procedure or symptom diagnostic.
3. For DTC Procedures, refer to **DIAGNOSIS AND TESTING** and perform the appropriate Diagnostic Procedure.
4. For Symptom Diagnostics, refer to **DIAGNOSIS AND TESTING** .

THEFT AND SECURITY SYSTEM INTERMITTENT TEST

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

DIAGNOSTIC TEST

1. **RECORD AND ERASE ALL THEFT AND SECURITY SYSTEM DTC'S**
    1. With the scan tool, record and erase all DTCs from all theft/security system modules. Monitor for any active codes as you work through the following steps.
        - Review the code monitor and set conditions for any DTCs that are stored and attempt to reproduce the conditions listed
        - Wiggle the wiring harness and connectors of the related circuit, sensor or component
        - Cycle the ignition off. Refer to any Technical Service Bulletins (TSBs) that may apply

    Was the source of the customer complaint found or did any DTCs appear and stay active?

    Yes

        - Make the appropriate repairs and perform the THEFT AND SECURITY SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
        - For DTC procedures, refer to **DIAGNOSIS AND TESTING**.

    No

        - Go To 2
2. **ATTEMPT TO REPRODUCE THE CONDITION**
    1. In the event the customer complaint cannot be duplicated due to an intermittent condition in the theft/security system, the following may aid in attempting to reproduce the condition.
        - Using the wiring diagram/schematic as a guide, inspect the wiring and connectors related to the stored code or component in question.
        - Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

- If the customer concern was related to a specific FOBIK, ensure the FOBIK in question is used while attempting reproduce the condition.
- Reconnect any disconnected components and harness connectors and ensure they are properly seated.
- If numerous trouble codes were set, use a schematic and inspect any common ground or supply circuits

Was the source of the intermittent condition located?

Yes

- Make the appropriate repairs and perform the THEFT AND SECURITY SYSTEM VERIFICATION PROCEDURE. Refer to **STANDARD PROCEDURE**.

No

- The problem cannot be found at this time. If repeated intermittent failures are encountered that cannot be reproduced and the condition has prompted multiple customer visits to the dealership, document any findings on the repair order.

THEFT AND SECURITY SYSTEM VERIFICATION TEST

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

DIAGNOSTIC TEST

1. **DETERMINE REQUIRED PROGRAMMING AND SET UP**

NOTE: Due the numerous functions performed by the Radio Frequency Hub (RF Hub) it is essential to follow all instructions carefully and be aware of the effects this module has on the Theft and Security and Remote Keyless Entry (RKE) subsystems. Service replacement will also affect a customers personalization settings.

Was the Radio Frequency Hub replaced?

Yes

- Perform the RADIO FREQUENCY HUB VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 2

2. **RF HUB REPAIR VERIFICATION**

1. Reconnect the previously disconnected components and connectors.
2. Connect the scan tool to the Data Link Connector - use the most current software available.
3. With the scan tool, erase stored DTCs in the RF Hub module.
4. Cycle the ignition off, and wait 15 seconds, then cycle the ignition on. If the customer complaint was due to a specific FOBIK, use the suspect FOBIK.
5. Exercise the Theft and Security System to duplicate the appropriate monitor conditions for any DTCs that were set
6. Wait one minute, and read the active codes.

   Are any DTCs present or, is the original condition still present?

   Yes

   - For DTC Diagnostics, refer to **DIAGNOSIS AND TESTING**.
   - For Symptom Diagnostics, refer to **DIAGNOSIS AND TESTING** .

   No

   - Repair is complete.

RADIO FREQUENCY HUB (RF HUB) VERIFICATION TEST

NOTE: If other electronic modules need to be replaced, besides the RF-Hub, see the "Replacement and Programming Order Guide" before proceeding. Refer to STANDARD PROCEDURE .

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Perform the following after completion of a diagnostic repair:

VERIFICATION TEST

1. Reconnect the previously disconnected components and connectors.
2. It may be necessary to obtain the vehicle's unique Personal Identification Number (PIN) assigned to the vehicle. This number can be obtained from the original vehicle invoice or from your Service Manager or Parts Manager.

   NOTE: If, during programming, the scan tool instructs to "Enter the vehicle PIN number", care should be taken because the RF Hub will only allow 3 consecutive attempts to enter the correct PIN. If 3 consecutive incorrect PIN's are entered, the RF Hub will Lock Out the scan tool. To exit Lock Mode, the ignition must remain in the On position for 25 minutes. All accessories must be off. A battery charger connected to the battery during this time period is recommended.

NOTE: The Body Control Module (BCM) stores the secret key information on the IGNM only. When the RF Hub needs to be replaced, the secret key information will be retrieved from the BCM and then transferred to the new RF Hub for security use.

NOTE: If the BCM is also being replaced at this time, refer to the RF-HUB, BCM, FOBIK Replacement and Programming Guide and follow the proper order before proceeding. Refer to STANDARD PROCEDURE .

3. Cycle the ignition on.
4. With the scan tool select: RFH (Radio Frequency Hub).

NOTE: If the scan tool displays a message indicating a "PROXI Configuration issue" press "Continue" and follow the directions on the scan tool.

5. Cycle the ignition off.
6. If the RF-Hub was replaced or any un-programmed or new FOBIKs, program all FOBIKs that are to be used with this vehicle. With the scan tool, select "Misc. Functions", "Program Ignition FOBIKs" and follow the instructions on the screen.

NOTE: All FOBIKs that are to be used in this vehicle must remain on the front seat near the console during programming.

NOTE: If the RF-Hub is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.

7. If the RF-Hub module was replaced, with the scan tool select "RFH", "Misc. Functions", "RF-HUB Replace" and follow the instructions on the screen.
8. Cycle the ignition on then off leaving the key in the On position.
9. If the RF Hub was replaced; Update the Front and Rear Axle Normal Tire Pressure Values.
10. If the RF Hub was replaced; Program the Tire Sensor IDs.
11. With the scan tool, erase all RF Hub DTCs.
12. Operate all equipped RF-Hub functions (Passive Entry, Remote Start, Ignition Positions etc.).
13. Wait four minutes.
14. With the scan tool, read the RF Hub DTCs.

Are there any RF Hub DTCs present or any RF-Hub functions not operating properly?

Yes

- Repair not complete, refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

No

- Repair is complete.

2014 ACCESSORIES AND EQUIPMENT

Right Blind Spot Sensor Module (BSM) (RBSS) - Electrical Diagnostics - Cherokee

DIAGNOSTIC CODE INDEX

DIAGNOSTIC CODE INDEX

DTC	Description
B129D-2A	RIGHT BLIND SPOT SENSOR - STUCK
B129D-48	RIGHT BLIND SPOT SENSOR - SUPERVISION SOFTWARE FAILURE
B129D-98	RIGHT BLIND SPOT SENSOR - COMPONENT OR SYSTEM OVER TEMPERATURE
B12A1-00	RBSS RADAR SENSOR ADDRESS FAULT
B2199-16	BATTERY VOLTAGE - CIRCUIT VOLTAGE BELOW THRESHOLD
B2199-17	BATTERY VOLTAGE - CIRCUIT VOLTAGE ABOVE THRESHOLD
B21DD-84	SYSTEM VOLTAGE - SIGNAL BELOW ALLOWABLE RANGE
B21DD-85	SYSTEM VOLTAGE - SIGNAL ABOVE ALLOWABLE RANGE
B223B-00	VEHICLE CONFIGURATION MISMATCH
B2599-00	DOOR MODULE FRONT RIGHT
U0020-00	CAN B BUS OFF PERFORMANCE
U0140-00	LOST COMMUNICATION WITH BODY CONTROL MODULE
U0155-00	LOST COMMUNICATION WITH CLUSTER/CCN
U0203-00	LOST COMMUNICATION WITH LEFT FRONT DOOR MODULE
U0204-00	LOST COMMUNICATION WITH RIGHT FRONT DOOR MODULE
U0422-00	IMPLAUSIBLE DATA RECEIVED FROM BODY CONTROL MODULE
U11FB-00	LOST COMMUNICATION WITH LEFT BLIND SPOT SENSOR
U147E-00	IMPLAUSIBLE DATA RECEIVED FROM LEFT BLIND SPOT SENSOR

DIAGNOSIS AND TESTING

B129D-2A-RIGHT BLIND SPOT SENSOR - STUCK

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

The Blind Spot Sensor detects an internal failure.

POSSIBLE CAUSES

Possible Causes
RIGHT BLIND SPOT SENSOR (RBSS)

DIAGNOSTIC TEST

CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)

1. Turn the ignition on.
2. With the scan tool, read DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Replace the Right Blind Spot Sensor in accordance with the Service Information. Refer to **SENSOR, BLIND SPOT, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B129D-48-RIGHT BLIND SPOT SENSOR - SUPERVISION SOFTWARE FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

The Blind Spot Sensor detects an internal failure.

POSSIBLE CAUSES

Possible Causes
RIGHT BLIND SPOT SENSOR (RBSS)

DIAGNOSTIC TEST

CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)

1. Turn the ignition on.
2. With the scan tool, read DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Replace the Right Blind Spot Sensor in accordance with the Service Information. Refer to **SENSOR, BLIND SPOT, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B129D-98-RIGHT BLIND SPOT SENSOR - COMPONENT OR SYSTEM OVER TEMPERATURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Blind Spot Monitor (BSM) system has two primary components; a Left Blind Spot Sensor (LBSS) and Right Blind Spot Sensor (RBSS). Each sensor includes an internal microprocessor that monitors and controls both the sensor and the blind spot indicator. The two sensors are concealed behind the outboard ends of the rear bumper fascia.

The microprocessor analyzes the sensor data to determine whether any detected objects should be reported. When it is determined that an object should be reported, the Sensor controls its respective left or right BSM display directly through a hard wired output to the Outside Rearview Mirrors. The sensor also sends an electronic request message over the CAN IHS Bus to the radio. The Radio then mutes any current output through the speakers and generates a chime as an audible alert.

Each sensor performs a bulb test by illuminating the triangle icon in the Outside Rearview Mirror at each ignition ON cycle.

WHEN MONITORED

With the ignition on.

SET CONDITION

The Blind Spot Sensor detects the internal temperature is too high.

POSSIBLE CAUSES

Possible Causes
BLIND SPOT SENSOR OBSTRUCTED (MUD OR DIRT COVERING INNER FASCIA)
BLIND SPOT SENSOR

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**

   NOTE: Before proceeding with this diagnostic procedure, remove any ice mud, dirt, or other obstructions from the underside of the Fascia/Bumper surrounding the sensors.

   1. Turn the ignition on.
   2. With the scan tool, read DTCs.

      Does the scan tool display this DTC as active?

      Yes

      - Go To 2

      No

      - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **BLIND SPOT SENSOR**
   1. Verify that none of the possible causes mentioned above are present. Repair as necessary.

      If none of the possible causes mentioned above are present, view repair.

      Repair

      - Replace the Blind Spot Sensor in accordance with the Service Information. Refer to **SENSOR, BLIND SPOT, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B12A1-00-RBSS RADAR SENSOR ADDRESS FAULT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

This DTC will set if the Blind Spot Sensor detects an extra ground circuit in the harness connector.

POSSIBLE CAUSES

Possible Causes
RIGHT BLIND SPOT SENSOR (RBSS)

DIAGNOSTIC TEST

CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)

NOTE: Before proceeding, disconnect the Right Blind Spot Sensor harness connector. Inspect the wiring harness, harness connector and module pins for any damage or corrosion. Repair as necessary.

1. Turn the ignition on.
2. With the scan tool, read DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Replace the Right Blind Spot Sensor in accordance with the Service Information. Refer to **SENSOR, BLIND SPOT, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B2199-16-BATTERY VOLTAGE - CIRCUIT VOLTAGE BELOW THRESHOLD

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 1: Identifying Left/Right Blind Spot Sensor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the ignition on.

SET CONDITION

Blind Spot Sensor supply voltage less than 9.5 volts.

POSSIBLE CAUSES

Possible Causes
FUSED IGNITION OUTPUT CIRCUIT EXCESSIVE RESISTANCE
GROUND CIRCUIT EXCESSIVE RESISTANCE
VEHICLE CHARGING SYSTEM
BLIND SPOT SENSOR

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
   1. Turn the ignition on.
   2. With the scan tool, read DTCs.

      Does the scan tool display this DTC as active?

      Yes

      - Go To 2

      No

      - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **VERIFY OPERATION OF THE VEHICLE CHARGING SYSTEM**

   NOTE: Troubleshoot any PCM charging/cranking DTCs before proceeding.

   NOTE: Make sure the battery is fully charged.

   Are any charging system DTCs present?

   Yes

   - Refer to the **DTC INDEX** article and perform the appropriate diagnostic procedure.

   No

   - Go To 3
3. **CHECK THE (F923) FUSED IGNITION OUTPUT (RUN) CIRCUIT FOR EXCESSIVE**

RESISTANCE

1. Turn the ignition off.
2. Disconnect the Right Blind Spot Sensor harness connector.
3. Turn the ignition on.
4. Measure the voltage of the (F923) Fused Ignition Output (RUN) circuit.

   Is the voltage below 9.5 volts?

   Yes

   - Repair the (F923) Fused Ignition Output (RUN) circuit for excessive resistance.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 4

4. **CHECK THE (Z923) GROUNDS CIRCUIT FOR EXCESSIVE RESISTANCE**
   1. Measure the resistance between ground and the (Z923) Grounds circuit.

      Is the resistance above 10.0 Ohms?

      Yes

      - Repair the (Z923) Grounds circuit for excessive resistance.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Replace the Blind Spot Sensor in accordance with the Service Information. Refer to **SENSOR, BLIND SPOT, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B2199-17-BATTERY VOLTAGE - CIRCUIT VOLTAGE ABOVE THRESHOLD

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 2: Identifying Left/Right Blind Spot Sensor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the ignition on.

SET CONDITION

Blind Spot Sensor supply voltage greater than 16.0 volts.

POSSIBLE CAUSES

Possible Causes
VEHICLE CHARGING SYSTEM BLIND SPOT SENSOR

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
   1. Turn the ignition on.
   2. With the scan tool, read DTCs.

      Does the scan tool display this DTC as active?

      Yes

      - Go To 2

      No

      - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **VERIFY OPERATION OF THE VEHICLE CHARGING SYSTEM**

   NOTE: Troubleshoot any PCM charging/cranking DTCs before proceeding.

   NOTE: Make sure the battery is fully charged.

   Are any charging system DTCs present?

   Yes

   - Refer to the **DTC INDEX** article and perform the appropriate diagnostic procedure.

   No

   - Replace the Blind Spot Sensor in accordance with the Service Information. Refer to **SENSOR, BLIND SPOT, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B21DD-84-SYSTEM VOLTAGE - SIGNAL BELOW ALLOWABLE RANGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 3: Identifying Left/Right Blind Spot Sensor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

Ignition on.

SET CONDITION

Monitored battery voltage is below 9.0 volts for over 5 seconds.

POSSIBLE CAUSES

Possible Causes
LOW SYSTEM VOLTAGE BATTERY OR CHARGING SYSTEM

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **VERIFY OPERATION OF THE VEHICLE CHARGING SYSTEM**

    NOTE: Troubleshoot any PCM charging/cranking DTCs before proceeding.

    NOTE: Make sure the battery is fully charged.

    Are any charging system DTCs present?

    Yes

    - Refer to the **DTC INDEX** article and perform the appropriate diagnostic procedure.

    No

- Replace the Blind Spot Sensor in accordance with the Service Information. Refer to **SENSOR, BLIND SPOT, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B21DD-85-SYSTEM VOLTAGE - SIGNAL ABOVE ALLOWABLE RANGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 4: Identifying Left/Right Blind Spot Sensor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

Ignition on

SET CONDITION

This is a Controller Monitored system voltage was above 16 volts for 5 seconds or more.

POSSIBLE CAUSES

Possible Causes
HIGH BATTERY SYSTEM VOLTAGE CHARGING SYSTEM

DIAGNOSTIC TEST

CHECK ENGINE DTCs

1. With the scan tool, read the Powertrain Control Module (PCM) DTCs.

   Are there any PCM Charging or Battery DTCs present?

   Yes

   - Refer to the **DTC INDEX** article and perform the appropriate diagnostic procedure.

   No

   - This code is a CAN system message for information only. Check the charging system in accordance with the Service Information.

B223B-00-VEHICLE CONFIGURATION MISMATCH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

This DTC will set if the vehicle type is not identified or incorrectly identified.

POSSIBLE CAUSES

Possible Causes
INCORRECT VEHICLE CONFIGURATION IN THE BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)

NOTE: Diagnose and repair any BCM VIN or Communication DTCs before continuing with this test.

1. Turn the ignition on.
2. With the scan tool, select View DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Verify the correct vehicle configuration in the BCM.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Use the scan tool to read DTCs in all other modules. If any communication DTCs are present, perform the appropriate diagnostic procedure. Perform any Technical Service Bulletins that apply. If no problems are found, test is complete.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B2599-00-DOOR MODULE FRONT RIGHT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

Vehicle speed greater than 6 mph (9.6 km/h).

SET CONDITION

The door module is reporting a DTC.

POSSIBLE CAUSES

Possible Causes
DTC IN FRONT RIGHT DOOR MODULE

DIAGNOSTIC TEST

CHECK FOR ACTIVE DTC

1. Turn the ignition on.
2. With the scan tool, read DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

   No

   - The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U0020-00-CAN B BUS OFF PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously when the ignition is on.

The battery voltage between 10.0 and 16.0 Volts.

Body Control Module (BCM) is configured correctly.

SET CONDITION

Bus messages not received from the Body Control Module (BCM) for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN IHS BUS (125K) CIRCUITS OPEN OR SHORTED DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES

BODY CONTROL MODULE (BCM) POWER AND GROUND
BCM NOT CONFIGURED CORRECTLY
BODY CONTROL MODULE (BCM)
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

VERIFY DTC IS ACTIVE

NOTE: Make sure the battery is fully charged before proceeding.

1. Turn the ignition on.
2. With the scan tool, read the active DTCs.

   Does the scan tool display; U0020-00-CAN B BUS OFF PERFORMANCE as active?

   Yes

   - **For this code, perform the U0011-00-CAN INTERIOR BUS OFF PERFORMANCE diagnostic procedure.** Refer to the **DTC INDEX** article.

   No

   - Refer to **DIAGNOSIS AND TESTING** and perform the STORED LOST COMMUNICATION DTCs diagnostic procedure.

U0140-00-LOST COMMUNICATION WITH BODY CONTROL MODULE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously when the ignition is on.

The battery voltage between 10.0 and 16.0 Volts.

Body Control Module (BCM) is configured correctly.

SET CONDITION

Bus messages not received from the Body Control Module (BCM) for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes

CAN BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
BODY CONTROL MODULE POWER AND GROUND
BCM NOT CONFIGURED CORRECTLY
BODY CONTROL MODULE (BCM)
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

VERIFY IF THE DTC IS ACTIVE

NOTE: **Make sure the battery is fully charged before performing any diagnostic procedure.**

With the scan tool, refer to the Network Review Screen to display a high level view of the vehicle communication network. Modules shown in red are problem areas.

Always diagnose any Body Control Module (BCM) DTCs first before proceeding.

1. Turn the ignition on.
2. With the scan tool, read DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM BCM (BODY CONTROL MODULE) diagnostic procedure.

   No

   - Refer to **DIAGNOSIS AND TESTING** and perform the STORED LOST COMMUNICATION DTCs diagnostic procedure.

U0155-00-LOST COMMUNICATION WITH CLUSTER/CCN

Perform the COMMUNICATION PRE-DIAGNOSTIC PROCEDURE. Refer to **STANDARD PROCEDURE** .

WHEN MONITORED

Continuously when the ignition is on.

Battery voltage between 10 and 16 volts.

Body Control Module (BCM) is configured correctly.

SET CONDITION

Bus messages not received from the Instrument Cluster (IC) for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN BUS (+) CIRCUIT SHORTED TO VOLTAGE
CAN BUS (-) CIRCUIT SHORTED TO GROUND
INSTRUMENT CLUSTER (IPC) POWER AND GROUND
BCM NOT CONFIGURED CORRECTLY
INSTRUMENT CLUSTER (IPC)
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

VERIFY DTC IS ACTIVE

NOTE: Make sure the battery is fully charged before proceeding.

1. Turn the ignition on.
2. With the scan tool, read the active DTCs.

   Does the scan tool display: U0155-00-LOST COMMUNICATION WITH CLUSTER/CCN?

   Yes

   - Refer to the **BODY CONTROL MODULE (BCM) - DIAGNOSTIC CODE INDEX** article and perform the U0155-87-LOST COMMUNICATION WITH CLUSTER/CCN diagnostic procedure.

   No

   - Refer to **DIAGNOSIS AND TESTING** and perform the STORED LOST COMMUNICATION DTCs diagnostic procedure.

U0203-00-LOST COMMUNICATION WITH LEFT FRONT DOOR MODULE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

Battery voltage between 10 and 16 volts.

Body Control Module (BCM) is configured correctly.

SET CONDITION

Bus messages not received from the Driver Door Module for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN INTERIOR BUS (+) CIRCUIT SHORTED TO VOLTAGE
CAN INTERIOR BUS (-) CIRCUIT SHORTED TO GROUND
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
DRIVER DOOR MODULE POWER AND GROUND
BCM NOT CONFIGURED CORRECTLY
DRIVER DOOR MODULE
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

VERIFY DTC IS ACTIVE

NOTE: Make sure the fuse is installed and the battery is fully charged before proceeding.

1. Turn the ignition on.
2. With the scan tool, read active DTCs.

   Is this DTC active?

   Yes

   - Refer to the **DTC INDEX** article and perform the U0203-00 LOST COMMUNICATION WITH DOOR MODULE FRONT LEFT diagnostic procedure.

   No

   - Refer to **DIAGNOSIS AND TESTING** and perform the STORED LOST COMMUNICATION DTCs diagnostic procedure.

U0204-00-LOST COMMUNICATION WITH RIGHT FRONT DOOR MODULE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

Battery voltage between 10 and 16 volts.

Body Control Module (BCM) is configured correctly.

SET CONDITION

Bus messages not received from the Passenger Door Module for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN INTERIOR BUS (+) CIRCUIT SHORTED TO VOLTAGE
CAN INTERIOR BUS (-) CIRCUIT SHORTED TO GROUND
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
PASSENGER DOOR MODULE POWER AND GROUND
BCM NOT CONFIGURED CORRECTLY
PASSENGER DOOR MODULE
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)

1. Turn the ignition on.
2. With the scan tool, read the active DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Refer to the **BODY CONTROL MODULE (BCM) - DIAGNOSTIC CODE INDEX** article and perform the U0200-00-LOST COMMUNICATION WITH PASSENGER DOOR MODULE diagnostic procedure.

   No

   - Refer to **DIAGNOSIS AND TESTING** and perform the STORED LOST COMMUNICATION DTCs diagnostic procedure.

U0422-00-IMPLAUSIBLE DATA RECEIVED FROM BODY CONTROL MODULE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

Incorrect data received from the Body Control Module (BCM).

POSSIBLE CAUSES

Possible Causes
NO COMMUNICATION WITH THE BODY CONTROL MODULE (BCM)
DTCS STORED OR ACTIVE IN THE BCM
BLIND SPOT SENSORS

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**

   NOTE: Diagnose and repair any Body Control Module DTCs before proceeding with this diagnostic procedure.

   1. Turn the ignition on.
   2. With the scan tool, read active DTCs.

      Does the scan tool display this DTC as active?

      Yes

      - Go To 2

      No

      - The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **VERIFY THE BCM IS ACTIVE ON THE CAN BUS**
   1. With the scan tool, verify that the BCM is active on the bus.

      Is the BCM active on the bus?

Yes

- Replace and program the Blind Spot Sensor in accordance with the Service Information. Refer to **SENSOR, BLIND SPOT, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM BCM diagnostic procedure.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U11FB-00-LOST COMMUNICATION WITH LEFT BLIND SPOT SENSOR

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 5: Rear Blind Spot Sensor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Blind Spot Monitor (BSM) system has two primary components; a Left Blind Spot Sensor (LBSS) and Right Blind Spot Sensor (RBSS). Each sensor includes an internal microprocessor that monitors and controls both the sensor and the blind spot indicator. The two sensors are concealed behind the outboard ends of the rear

bumper fascia.

The microprocessor analyzes the sensor data to determine whether any detected objects should be reported. When it is determined that an object should be reported, the Sensor controls its respective left or right BSM display directly through a hard wired output to the Outside Rearview Mirrors. The sensor also sends an electronic request message over the CAN IHS Bus to the radio. The Radio then mutes any current output through the speakers and generates a chime as an audible alert.

Each sensor performs a bulb test by illuminating the triangle icon in the Outside Rearview Mirror at each ignition ON cycle.

WHEN MONITORED

With the ignition on.

SET CONDITION

No BUS messages from the Left Blind Spot Sensor (LBSS) are received for greater than 1.05 seconds.

POSSIBLE CAUSES

Possible Causes
FUSED RUN RELAY CONTROL CIRCUIT OPEN
GROUND CIRCUIT OPEN
CAN IHS BUS CIRCUITS OPEN
LEFT BLIND SPOT SENSOR (LBSS)

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
   1. Turn the ignition on.

      NOTE: Make sure the battery voltage is between 10.0 and 16.0 volts.

   2. With the scan tool, read the module status.

      Does the scan tool indicate that the module is active on the bus?

      Yes

      - The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 2

2. **CHECK THE (F923) FUSED RUN RELAY CONTROL CIRCUIT FOR AN OPEN OR SHORT**
   1. Turn the ignition off.
   2. Disconnect the LBSS harness connector.
   3. Using a 12-volt test light connected to ground, check the (F923) Fused Run Relay Control circuit.

      Does the test light illuminate brightly?

      Yes

      - Go To 3

      No

      - Repair the open or short in the (F923) Fused Run Relay Control circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
3. **CHECK THE (Z923) GROUND CIRCUIT FOR AN OPEN**
   1. Using a 12-volt test light connected to 12-volts, check the (Z923) Ground circuit.

      Does the test light illuminate brightly?

      Yes

      - Go To 4

      No

      - Repair the open in the (Z923) Ground circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
4. **CHECK THE (D215) OR (D216) CAN IHS BUS CIRCUIT FOR AN OPEN**
   1. Disconnect the CAN IHS Body Star connector.
   2. Measure the resistance of the (D216) CAN IHS Bus (-) circuit between the CAN IHS Body Star connector and the LBSS harness connector.
   3. Measure the resistance of the (D215) CAN IHS Bus (+) circuit between the CAN IHS Body Star connector and the LBSS harness connector.

      Is resistance below 5.0 Ohms on both circuits?

      Yes

      - Replace the LBSS in accordance with the Service Information. Refer to **SENSOR, BLIND**

SPOT, REMOVAL .

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Repair the open in the (D215) or (D216) CAN IHS Bus circuit. Inspect the connector for damage.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U147E-00-IMPLAUSIBLE DATA RECEIVED FROM LEFT BLIND SPOT SENSOR

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 6: Identifying Left/Right Blind Spot Sensor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Blind Spot Monitor (BSM) system has two primary components; a Left Blind Spot Sensor (LBSS) and Right Blind Spot Sensor (RBSS). Each sensor includes an internal microprocessor that monitors and controls both the sensor and the blind spot indicator. The two sensors are concealed behind the outboard ends of the rear bumper fascia.

The microprocessor analyzes the sensor data to determine whether any detected objects should be reported. When it is determined that an object should be reported, the Sensor controls its respective left or right BSM display directly through a hard wired output to the Outside Rearview Mirrors. The sensor also sends an electronic request message over the CAN IHS Bus to the radio. The Radio then mutes any current output through the speakers and generates a chime as an audible alert.

Each sensor performs a bulb test by illuminating the triangle icon in the Outside Rearview Mirror at each ignition ON cycle.

WHEN MONITORED

With the ignition on.

SET CONDITION

Incorrect data received from the Left Blind Spot Sensor (LBSS).

POSSIBLE CAUSES

Possible Causes
NO COMMUNICATION WITH THE LEFT BLIND SPOT SENSOR (LBSS)
DTCS STORED OR ACTIVE IN THE LBSS
LEFT BLIND SPOT SENSOR (LBSS)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**

   NOTE: Diagnose and repair any Left Blind Spot Sensor DTCs before proceeding with this diagnostic procedure.

   1. Turn the ignition on.
   2. With the scan tool, read active DTCs.

      Does the scan tool display this DTC as active?

      Yes

      - Go To 2

      No

      - The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **VERIFY THE LBSS IS ACTIVE ON THE CAN IHS BUS**
   1. With the scan tool, verify that the LBSS is active on the bus.

      Is the LBSS active on the bus?

      Yes

      - Replace and program the Blind Spot Sensor in accordance with the Service Information. Refer to **SENSOR, BLIND SPOT, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM LBSS diagnostic procedure.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2014 ACCESSORIES AND EQUIPMENT

Speed Control - Service Information - Cherokee

DESCRIPTION

DESCRIPTION

Two electronic speed control systems are available factory-installed equipment on this vehicle: a conventional system and an adaptive system. Additional details of these two systems and their components can be found under the subheadings and paragraphs that follow.

ADAPTIVE SPEED CONTROL STOP AND GO

Quick Overview:

- Utilizes Radar and camera sensors to identify vehicles in forward path and maintains a selectable distance between the vehicle and the one in front of it;
- ACC with stop and go has full functionality between 0 and 100 mph;
- After ACC with stop and go brings the vehicle to a stop, the driver must indicate the intention to resume by either pressing the resume button or tapping the accelerator pedal;
- Driver can select one of four following distances depending on driver preference.

Functional Overview - The optional **ACC Plus (ACC +)** system (also known as ACC Stop and Go) has functionality beyond that of Normal Cruise Control and Adaptive Cruise Control. This system has the functionality of the cruise control system of maintaining a driver defined Set Speed without the driver needing to press the throttle. This system also has the functionality of the regular ACC system of increasing and decreasing the vehicle speed based on target vehicles moving slower than the ACC Set Speed. Beyond the functionality of the regular ACC system, this system offers a larger operational speed range, which constitutes of speeds from 0 mph to a configurable upper bound. If a target vehicle comes to a standstill, the ACC+ system will also bring the ACC+ host vehicle to a stop, and will keep the vehicle at a standstill for an undetermined period of time by first applying the brakes, and after the brakes time-out, cancelling the ACC+ system and applying the Electronic Park Brake (EPB). The ACC with stop and go system will also incorporate Forward Collision Warning-Plus (FCW). With grade braking, the transmission will automatically downshift to maintain selected vehicle speed and distance, preventing overheating of brakes.

The ACC sensor, the FFC, the ABM, the EMIC, the EVIC, the PCM and the SCM each contain a microprocessor and programming that allow them to communicate with each other using the Controller Area Network (CAN) data bus. This method of communication is used by the ACC module to provide inputs to the ABM, the EVIC and the PCM. This is also is used by the ABM to provide inputs to the PCM, by the SCM to relay the status of the speed control switches to the PCM and by the PCM for control of the indicators in the EMIC and the indications in the EVIC. Refer to **COMMUNICATION, DESCRIPTION** .

The ACC with stop and go system used also incorporates grade braking and Forward Collision Warning-Plus (FCW). With grade braking, the transmission will automatically downshift to maintain selected vehicle speed and distance, preventing overheating of brakes.

The optional equipment ACC+ system includes the following major components, which are described in further detail elsewhere in this service information:

- **Adaptive Speed Control Module** - An adaptive speed control sensor (also known as the Adaptive Cruise Control/ACC sensor or module and the radar sensor or module) is located on a bracket secured near the center of the underside of the front bumper support member of the Front End Module (FEM) behind the front fascia. Refer to **MODULE, ADAPTIVE CRUISE CONTROL, DESCRIPTION** .
- **Antilock Brake Module** - An Antilock Brake Module (ABM) (also known as Controller Antilock Brake/CAB or the Electronic Stability Control/ESC module) is located on the antilock brake Hydraulic Control Unit (HCU) in the engine compartment. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, DESCRIPTION** .
- **Brake Lamp Switch** - The brake (also known as stop) lamp switch is located on the brake pedal support bracket under the driver side of the instrument panel. Refer to **SWITCH, STOP LAMP, DESCRIPTION** .
- **ElectroMechanical Instrument Cluster** - A CRUISE indicator is located in the fixed segment display of the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN) that provides an indication to the vehicle operator when the speed control system is turned ON. Refer to **DESCRIPTION** .
- **Electronic Vehicle Information Center** - The Electronic Vehicle Information Center (EVIC) is located in the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN) and provides an interface to the vehicle operator for setting the adaptive speed control customer preferences as well as a display of the adaptive speed control and Forward Collision Warning (FCW) system status messages. Refer to **CENTER, ELECTRONIC VEHICLE INFORMATION, DESCRIPTION** .
- **Forward Facing Camera** - The Forward Facing Camera (FFC) is located inside the Combined Rear View Mirror Module (CRVMM) housing assembly. The FFC provides input for data fusion purposes allowing the ACC sensor radar data to be redundancy checked. Refer to **MODULE, FORWARD FACING CAMERA, DESCRIPTION** .
- **Powertrain Control Module** - The Powertrain Control Module (PCM) located in the right front corner of the engine compartment contains the software and hardware that monitors all of the speed control system inputs and controls all of the speed control system outputs. Refer to **MODULE, POWERTRAIN CONTROL, DESCRIPTION** .
- **Speed Control Switches** - A speed control switch pod containing six momentary switch push buttons is located in the right horizontal spoke of the steering wheel. Refer to **SWITCH, SPEED CONTROL, DESCRIPTION**.
- **Steering Control Module** - A Steering Control Module (SCM) is integral to the Steering Column Control Module (SCCM) located at the top of the steering column just below the steering wheel. Refer to **MODULE, STEERING COLUMN, DESCRIPTION** .
- **Wheel Speed Sensors** - A wheel speed sensor is located on the knuckle of each front and rear wheel. Refer to **SENSOR, WHEEL SPEED, FRONT, DESCRIPTION** .

Hard wired circuitry connects the adaptive electronic speed control system components to the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the speed control system components through the use of a combination of soldered

splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

CONVENTIONAL SPEED CONTROL

The standard equipment conventional electronic speed control system includes the following major components, which are described in further detail elsewhere in this service information:

- **Antilock Brake Module** - An Antilock Brake Module (ABM) (also known as Controller Antilock Brake/CAB or the Electronic Stability Control/ESC module) is located on the antilock brake Hydraulic Control Unit (HCU) in the engine compartment. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, DESCRIPTION** .
- **Brake Lamp Sensor** - The brake (also known as stop) lamp sensor is located on the brake pedal support bracket under the driver side of the instrument panel. (Refer to **SWITCH, STOP LAMP**).
- **ElectroMechanical Instrument Cluster** - A CRUISE indicator is located in the fixed segment display of the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN) that provides an indication to the vehicle operator when the speed control system is turned ON. Refer to **DESCRIPTION** .
- **Powertrain Control Module** - The Powertrain Control Module (PCM) in the right front corner of the engine compartment contains the software and hardware that monitors all of the speed control system inputs and controls all of the speed control system outputs. Refer to **MODULE, POWERTRAIN CONTROL, DESCRIPTION** .
- **Speed Control Switches** - A speed control switch pod containing four momentary switch push buttons is located in the right horizontal spoke of the steering wheel. Refer to **SWITCH, SPEED CONTROL, DESCRIPTION**.
- **Steering Control Module** - A Steering Control Module (SCM) is integral to the Steering Column Control Module (SCCM) located at the top of the steering column just below the steering wheel. Refer to **MODULE, STEERING COLUMN, DESCRIPTION** .
- **Wheel Speed Sensors** - A wheel speed sensor is located on the knuckle of each front and rear wheel. Refer to **SENSOR, WHEEL SPEED, FRONT, DESCRIPTION** .

The ABM, the EMIC, the PCM and the SCM each contain a microprocessor and programming that allow them to communicate with each other using the Controller Area Network (CAN) data bus. This method of communication is used by the SCM to relay the status of the speed control switches to the PCM, and by the PCM for control of the CRUISE indicator in the EMIC. Refer to **COMMUNICATION, DESCRIPTION** .

Hard wired circuitry connects the conventional electronic speed control system components to the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the speed control system components through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

OPERATION

OPERATION

ADAPTIVE SPEED CONTROL

The vehicle operator controls all adaptive speed control system (ACC) features through the speed control switch pod on the face of the right horizontal spoke of the steering wheel. When a push button of the switch pod is depressed, it provides a hard wired resistor multiplexed analog input to the Steering Control Module (SCM).

The SCM reads the speed control switch input, then relays an electronic **speed control switch** status message to the Powertrain Control Module (PCM) and to the adaptive speed control sensor (also known as the Adaptive Cruise Control/ACC sensor or module, or as the radar sensor or module) over the Controller Area Network (CAN) data bus. The PCM and ACC sensor microprocessors continually monitor these inputs as well as electronic **wheel speed** message inputs from the Antilock Brake Module (ABM) (also known as the Controller Antilock Brake/CAB, the Electronic Stability Control/ESC module or the Antilock Brake System/ABS module), electronic **gear selector** message inputs from the Transmission Control Module TCM, video data from the Forward Facing Camera (FFC) and numerous hard wired inputs including the brake (or stop) lamp switch, then provides the appropriate electronic message and hard wired outputs to invoke the requested electronic speed control features.

Using the MODE push button of the speed control switch pod on the face of the right horizontal spoke of the steering wheel, the vehicle operator can choose between adaptive speed control and conventional speed control modes of operation. As the name implies, when in the conventional speed control mode the speed control system is used and functions exactly like a conventional speed control system. When in the adaptive speed control mode, the vehicle operator can use the DISTANCE push button of the speed control switch pod to select from one of three distance settings for the adaptive cruise system to maintain. These settings equate to the time in seconds separating the vehicle from a preceding vehicle. The FFC and the ACC sensor share a private bus allowing data fusion to occur within the ACC sensor. The ACC sensor then uses this information to send electronic message outputs to the ABM, the TCM and the PCM to maintain the selected separation distance. The available distance settings are:

- **1** - 1.0 second
- **2** - 1.5 seconds
- **3** - 2.0 seconds

If the ECM/PCM detects a fault on one of the following systems, it will disable the cruise control system. The ECM/PCM will store an appropriate DTC.

- Engine Speed Sensor
- Sensor or actuators of the electric throttle (only for gasoline engines)
- Accelerator Pedal Potentiometer (APP Sensor)
- Brake Pedal Position
- Clutch Switch rationality
- Engine Load sensor (only for gasoline engines)

- Ignition Coils (only for gasoline engines)
- Fuel Injectors
- High pressure system components (only for GDI and Diesel engines)
- Turbo sensors or actuators.

The PCM and ACC sensor microprocessors continuously monitor all of the speed control system electrical circuits to determine the system readiness and accuracy. If the PCM or ACC sensor detects a monitored system fault, it sets and stores a Diagnostic Trouble Code (DTC). The PCM and ACC components use On-Board Diagnostics (OBD) and can communicate with other electronic modules in the vehicle as well as with the diagnostic scan tool using the CAN data bus. This method of communication is used for control of the Malfunction Indicator Lamp (MIL) (also known as the Check Engine lamp) in the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN) and for system diagnosis and testing through the 16-way data link connector located on the driver side lower edge of the instrument panel.

The hard wired inputs and outputs for the PCM and the ACC sensor may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the PCM, the ACC sensor or the electronic controls or communication between other modules and devices that provide features of the adaptive speed control system. The most reliable, efficient, and accurate means to diagnose the PCM, the ACC sensor or the electronic controls and communication related to speed control system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

CONVENTIONAL SPEED CONTROL

The vehicle operator controls all conventional speed control system features through the speed control switch pod on the face of the right horizontal spoke of the steering wheel. When a push button of the switch pod is depressed, it provides a hard wired resistor multiplexed analog input to the Steering Control Module (SCM).

The SCM reads the speed control switch input via LIN, then relays an electronic **speed control switch** status message to the Powertrain Control Module (PCM) over the Controller Area Network (CAN) C data bus. The PCM software continually monitors these inputs as well as electronic **vehicle distance** message inputs from the Antilock Brake Module (ABM) (also known as the Controller Antilock Brake/CAB, the Electronic Stability Control/ESC module or the Antilock Brake System/ABS module) and numerous hard wired inputs including the brake (or stop) lamp switch, then provides the appropriate electronic message and hard wired outputs to invoke the requested electronic speed control features.

The PCM microprocessor continuously monitors all of the speed control system electrical circuits to determine the system readiness. If the PCM detects a monitored system fault, it sets and stores a Diagnostic Trouble Code (DTC). The PCM uses On-Board Diagnostics (OBD) and can communicate with other electronic modules in the vehicle as well as with the diagnostic scan tool using the CAN data bus. This method of communication is used for control of the Malfunction Indicator Lamp (MIL) (also known as the Check Engine lamp) in the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN) and for system diagnosis and testing through the 16-way data link connector located on the driver side lower edge of the instrument panel.

If the ECM/PCM detects a fault on one of the following systems, it will disable the cruise control system. The

ECM/PCM will store an appropriate DTC.

- Engine Speed Sensor
- Sensor or actuators of the electric throttle (only for gasoline engines)
- Accelerator Pedal Potentiometer (APP Sensor)
- Brake Pedal Position
- Clutch Switch rationality
- Engine Load sensor (only for gasoline engines)
- Ignition Coils (only for gasoline engines)
- Fuel Injectors
- High pressure system components (only for GDI and Diesel engines)
- Turbo sensors or actuators.

The hard wired inputs and outputs for the PCM may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the PCM or the electronic controls or communication between other modules and devices that provide features of the conventional speed control system. The most reliable, efficient, and accurate means to diagnose the PCM or the electronic controls and communication related to speed control system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

SWITCH, SPEED CONTROL

DESCRIPTION

DESCRIPTION

Fig. 1: Speed Control Switch Pod
Courtesy of CHRYSLER GROUP, LLC

The speed control switch pod (1) is located in the right spoke of the steering wheel spoke bezel. Two different switches are used. One switch has five buttons and is used on vehicles not equipped with the optional adaptive speed control (also known as the Adaptive Cruise Control/ACC) system. The other switch has eight buttons and is used on vehicles equipped with the ACC system option. These switches are the primary control used by the vehicle operator to manage the particular speed control system installed in the vehicle. The only visible components of the switch pod are the switch push buttons and a decorative bezel around the push buttons, which stands slightly proud of the steering wheel spoke bezel. The remainder of the switch pod including its mounting provisions and its electrical connection are concealed beneath the spoke bezel.

The switch pod housing and push buttons are constructed of molded plastic. Each of the push buttons has white International Control and Display Symbol graphics or text applied to it, which clearly identify the function of each push button. The switch pod is secured through three integral mounting tabs to mounting bosses on the back of the spoke bezel by three screws. A connector receptacle integral to the inboard end of the switch pod housing connects the speed control switch and the Local Interface Network (LIN) slave node circuitry integral to the switch pod to the vehicle electrical system through a dedicated take out and connector of the steering wheel wire harness.

The speed control switch pod cannot be adjusted or repaired. If any function of the switch or the LIN slave node is ineffective or damaged, the entire switch pod unit must be replaced.

OPERATION

OPERATION

The speed control switch pod is a resistor multiplexed unit that provides LIN bussed inputs to the Steering Control Module (SCM) microprocessor integral to the Steering Column Control Module (SCCM). The speed control switch pod also contains the circuitry of a Local Interface Network (LIN) slave node, which provides source current for and communicates the switch or sensor states of the Electronic Vehicle Information Center (EVIC) switches, the remote radio switches, the paddle shifter switches (if equipped), the horn switch and the heated steering wheel sensor (if equipped) over the LIN data bus to the SCM, which is the LIN master node.

The speed control switch pod for vehicles equipped with a conventional electronic speed control system and not equipped with the optional adaptive speed control (also known as the Adaptive Cruise Control/ACC) system contains four switch push buttons whose functions are:

- **On/Off** - This switch button enables or disables the speed control system and clears any previous speed control set speed from system memory.
- **Resume / +** - This switch button restores the vehicle to a previously stored set speed or accelerates the vehicle from an already attained set speed.
- **Cancel** - This switch button cancels the current speed control event, but does not turn the system OFF or clear the currently stored set speed.
- **Set / -** - This switch button sets the current vehicle speed as the stored set speed or decelerates (coasts) the vehicle to a speed that is slower than the already attained set speed.

The optional adaptive speed control switch pod for vehicles equipped with the ACC system option contains the same four switch push buttons as the conventional speed control switch pod, then adds two buttons whose functions are:

- **Mode** - This switch button toggles the speed control system between adaptive (ACC) or conventional (non-ACC) modes of operation.
- **Distance Buttons** - These switch buttons select the separation or following distance (in seconds) that the ACC system maintains between this vehicle and any preceding vehicle.

The SCM LIN master node provides a clean ground and fused B(+) current for all of the switches and sensors on the rotating steering wheel through the LIN slave node circuitry of the speed control switch pod as well as for the Light Emitting Diode (LED) back lighting of both the speed control and the EVIC switch pods. The SCM continually monitors all of the hard wired speed control switch circuits as well as the LIN bus data. The SCM will set a Diagnostic Trouble Code (DTC) for any problem it detects in the speed control switch circuits, and will store a Signal Not Available (SNA) code for any LIN bus input errors. The SCM also communicates with other electronic modules over the Controller Area Network (CAN) data bus. Therefore, any SCM DTC information can be retrieved using a diagnostic scan tool connected to the Data Link Connector (DLC).

The analog resistor multiplexed circuits of the speed control switch pod as well as the hard wired circuits between the switch pod and the SCM may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the LIN slave or master nodes, the SCM, the SCCM or the electronic controls and communication between modules and other

devices that provide some features of the speed control system. The most reliable, efficient, and accurate means to diagnose the speed control switch pod, the LIN slave or master nodes, the SCM or the electronic controls and communication related to speed control system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - SPEED CONTROL SWITCH

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

Fig. 2: Speed Control Switch Harness Connector Terminal Identification
Courtesy of CHRYSLER GROUP, LLC

NOTE: The following test confirms only correct speed control switch functions. It does not test or confirm any of the Local Interface Network (LIN) slave node inputs, outputs or functions. LIN slave node testing requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

1. Remove the speed control switch pod from the steering wheel. Refer to **SWITCH, SPEED CONTROL, REMOVAL**.
2. Disconnect the steering wheel wire harness connector from the back of the speed control switch pod.
3. Using an ohmmeter, test the resistance between the terminals of the switch as shown in the Speed Control

Switch Tests table.

SPEED CONTROL SWITCH TESTS TABLE

SPEED CONTROL SWITCH TESTS	
SWITCH POSITION	**PINS (*RESISTANCE - OHMS)**
NO PUSH BUTTONS DEPRESSED	13 and 14 (20708) 14 and 15 (20591)
ON / OFF	13 and 14 (464) 14 and 15 (133)
CANCEL	13 and 14 (896) 14 and 15 (457)
DISTANCE (WITH ADAPTIVE SPEED CONTROL ONLY)	13 and 14 (1515) 14 and 15 (899)
MODE (WITH ADAPTIVE SPEED CONTROL ONLY)	13 and 14 (2468) 14 and 15 (1518)
SET / - (DECEL)	13 and 14 (4088) 14 and 15 (2471)
RESUME / + (ACCEL)	13 and 14 (7408) 14 and 15 (4091)
*All resistance values are plus or minus 5%.	

4. If the switch fails any of the tests, replace the ineffective speed control switch pod as required.

REMOVAL

REMOVAL

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

1. Disconnect and isolate the battery negative cable.
2. Remove the remote radio switch. Refer to **SWITCH, REMOTE RADIO, REMOVAL** .

Fig. 3: Steering Wheel Bezel & Screws
Courtesy of CHRYSLER GROUP, LLC

3. From the back of the steering wheel front bezel (2), remove the two screws (1) that secure the speed control switch pod to the bezel.
4. Remove the switch from the bezel.

INSTALLATION

INSTALLATION

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

Fig. 4: Steering Wheel Bezel & Screws
Courtesy of CHRYSLER GROUP, LLC

1. Position the Speed Control switch pod to the back of the steering wheel front bezel (2).
2. Install and tighten the two screws (1) that secure the switch to the bezel. Tighten the screws securely.
3. Install the remote radio switch. Refer to **SWITCH, REMOTE RADIO, INSTALLATION** .
4. Connect the negative battery cable.

2014 ACCESSORIES AND EQUIPMENT

Universal Transmitter - Cherokee

DESCRIPTION

DESCRIPTION

Fig. 1: Overhead Console Components
Courtesy of CHRYSLER GROUP, LLC

Vehicles equipped with the optional universal transmitter (also known as the HomeLink® transmitter or Universal Garage Door Opener/UGDO) have a universal transmitter switch pod (2) integral to the overhead console (1) located in the headliner just behind the windshield opening header. The switch buttons are centered between the two map/reading lamps (4), forward of the sunglasses storage bin (5) and, if equipped, the power sunroof switch (3). This switch has three momentary push buttons clearly marked by the Roman numerals **I** , **II** and **III** for identification of each of the three transmitter channels. A single transmission indicator illuminated by a red Light Emitting Diode (LED) unit is also integral to the switch pod in the overhead console. The switch push buttons have instrument panel dimmer controlled LED units that provide back lighting for visibility at night.

Each of the three universal transmitter push buttons controls an independent radio transmitter channel. Each of these three channels can be trained to transmit a different Radio Frequency (RF) signal for the remote operation of garage door openers, motorized gate openers, home or office lighting, security systems or most any other device equipped with a RF receiver operating in the 280 to 418 MegaHertz (MHz) frequency range. The transmitter is capable of operating systems using either rolling code or non-rolling code security technology.

The universal transmitter switch pod cannot be repaired and is only serviced as a unit with the overhead console. If the transmitter or any of the switches are ineffective or damaged, the entire overhead console unit must be replaced.

OPERATION

OPERATION

The universal transmitter (also known as the HomeLink® transmitter or Universal Garage Door Opener/UGDO) operates on a non-switched source of battery current received on a fused B(+) circuit through a fused B(+) fuse located in the Junction Block (JB) (also known as the interior Power Distribution Center/PDC). The universal transmitter has a path to ground through a security ground circuit received through the Body Control Module (BCM). These connections allow the universal transmitter to remain functional, regardless of the status of the ignition switch; however, the unit will become disabled any time the Vehicle Theft Alarm (VTA) is armed.

The universal transmitter has several modes of operation:

- **Cleared Memory Mode** - When Non-Volatile Memory (NVM) has been cleared by depressing and holding the channel 1 and 3 buttons simultaneously for about 20 seconds, successful erasure is indicated by the red transmission indicator being flashed at a fast rate. If the buttons are continuously pressed for about another 10 seconds, the transmission indicator is extinguished and all three channels are set to their respective factory default mode settings.
- **Default Mode** - The default mode of the universal transmitter is when only the factory preset codes are stored in NVM for any given channel, prior to a channel having been programmed. When the button for any such channel is depressed, the transmitter will transmit the factory preset code for that channel and illuminate the red transmission indicator as in Transmit Mode.
- **Emulate Mode** - While in the emulate mode (also known as the training or programming mode) the universal transmitter is capable of emulating and storing an original garage door opener transmitter Radio Frequency (RF) signal in one of the three selected channels. While in this mode, the universal transmitter will flash the red transmission indicator at a slow rate. Once in this mode all programming must be completed within 2.5 minutes. After successfully determining the frequency and code for the selected channel, the universal transmitter will flash the red transmission indicator at a fast rate to indicate that the selected transmitter button has been programmed. Once programmed, the universal transmitter stores the necessary emulation information in NVM.
- **Stuck Button Mode** - If one or more of the universal transmitter buttons has been depressed continually for over about 1 minute, the universal transmitter will enter a reduced power mode. If the button is held depressed for over about another 2 minutes, the universal transmitter will also flag the button in NVM as stuck and exit the current operating mode for as long as the transmitter is connected to power. To reset the universal transmitter from the reduced power or stuck button mode, the transmitter power feed must be disconnected, then reconnected.
- **Transmit Mode** - The universal transmitter activates the transmit mode when any of the three transmitter buttons is depressed. The transmitter will transmit the programmed code over the programmed frequency repeatedly while the button is being pressed, for up to about 20 seconds. The universal transmitter will also illuminate the red transmission indicator solid while the transmission is in process. The transmission will cease immediately when the transmitter button is released.

The hard wired input circuits for the universal transmitter may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The RF signal strength of the universal transmitter may also be tested. Refer to **DIAGNOSIS AND TESTING**.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - UNIVERSAL TRANSMITTER

Fig. 2: Identifying Radio Frequency Detector
Courtesy of CHRYSLER GROUP, LLC

If the universal transmitter (also known as the HomeLink® transmitter or Universal Garage Door Opener/UGDO) is inoperative, retrain the transmitter using a known good transmitter containing a known good battery. Refer to **STANDARD PROCEDURE**. Test the universal transmitter operation again. If the unit is still inoperative, test the universal transmitter with a Radio Frequency Detector special tool as follows:

1. Turn On the Radio Frequency (RF) detector special tool by depressing the ON/OFF button (3). An audible **chirp** will sound and the green Power indicator (2) will illuminate. If the Power indicator does not illuminate, replace the RF detector battery (4).
2. Hold the RF detector within 2.54 centimeters (1 inch) of the **trained** universal transmitter, then depress any one of the three universal transmitter channel push buttons.
3. The red Signal Strength Light Emitting Diode (LED) units (1) will illuminate and the tool will generate an audible **beep** if a radio signal is detected. Repeat this test for all three universal transmitter channel push buttons. If the tool does not detect a radio signal for any of the three push buttons, replace the ineffective universal transmitter unit. Refer to **CONSOLE, OVERHEAD, FRONT, REMOVAL** .

STANDARD PROCEDURE

ERASING UNIVERSAL TRANSMITTER CODES

NOTE: **Individual channels cannot be erased. Erasing any universal transmitter (also known as HomeLink® transmitter or Universal Garage Door Opener/UGDO) code will erase ALL programmed codes.**

The programming from all three channel push buttons can be erased using the following procedure. Individual channel push buttons cannot be erased, but can be reprogrammed.

1. Depress and hold the two outer universal transmitter push buttons until the red transmission indicator begins to flash slowly (about 20 seconds). Do not hold the buttons depressed for longer than 30 seconds.
2. Release both buttons.
3. The universal transmitter is now in the Emulate Mode (also known as the train or learning mode) and can be programmed at any time using the Programming standard procedure. Refer to **STANDARD PROCEDURE**.

PROGRAMMING UNIVERSAL TRANSMITTER CODES

WARNING: **Vehicle exhaust contains carbon monoxide, a dangerous gas. Do not run the engine while training the universal transmitter. Failure to follow these instructions may result in possible serious or fatal injury.**

WARNING: **A motorized door or gate may open and close while you are training the universal transmitter if the vehicle is within range of the device. Do not train the universal transmitter if people or pets are in the path of the door or gate. Failure to follow these instructions may result in possible serious or fatal injury.**

NOTE: **When programming a garage door opener, it is advised to park outside the garage. It is also recommended that a new battery be placed in the hand-held transmitter of the device being programmed to the universal transmitter for quicker training and accurate transmission of the Radio Frequency (RF) signal.**

NOTE: **If programing the universal transmitter is unsuccessful using the following procedure, refer to the Owner's Manual for the current customer assistance phone number.**

PROGRAMMING COMMON UNIVERSAL TRANSMITTER CODES

1. Press and hold the two outer universal transmitter (also known as HomeLink® transmitter or Universal Garage Door Opener/UGDO) buttons, and release only when the red transmission indicator begins to flash slowly (after 20 seconds). **Do not** hold the buttons for longer than 30 seconds and **do not** repeat Step 1 to program a second and/or third hand-held transmitter to the remaining two universal transmitter buttons.
2. Position the end of your hand-held transmitter 3 to 8 centimeters (1 to 3 inches) away from the universal transmitter buttons while keeping the red transmission indicator within view.

NOTE: Some gate operators and garage door openers may require that you replace Steps 3 and 4 with the Step noted in the CANADIAN PROGRAMMING OR GATE PROGRAMMING procedure, which follows this procedure.

3. Simultaneously depress and hold both the universal transmitter button that you want to program and the hand-held transmitter button. **Do not release these buttons until Step 4 has been completed.**
4. The universal transmitter red transmission indicator will transition from flashing slowly to flashing rapidly after the transmitter successfully acquires the frequency signal from the hand-held transmitter. Release both buttons after the transmission indicator begins flashing rapidly.
5. Press and hold the universal transmitter button just programmed and observe the red transmission indicator. If the transmission indicator stays on **solid** (not flashing), programming is complete. The newly programmed device should activate when this universal transmitter button is pressed and released.

NOTE: If the red transmission indicator flashes rapidly for two seconds and then changes to solid, proceed to Steps 6 through 8 to complete programming of a rolling code equipped device. Rolling code is most commonly found on garage door openers.

NOTE: To program the remaining two universal transmitter buttons, begin with Step 2. Do not repeat Step 1.

6. At the garage door opener receiver on the motor or head unit in the garage, locate the **Learn** or **Smart** button. This can usually be found near where the hanging antenna wire is attached to the motor or head unit. The name and color of the button varies by manufacturer.
7. Firmly press and release the **Learn** or **Smart** button.

NOTE: You have about 30 seconds after completing Step 7 in which to initiate Step 8.

8. Return to the vehicle and firmly depress, hold for two seconds then release the programmed universal transmitter button. Repeat the depress, hold, then release sequence a second time. Depending upon the brand of the garage door opener (or other rolling code equipped device), it may be necessary to repeat this sequence a third time to complete the programming. The newly programmed rolling code equipped device should now activate when this universal transmitter button is pressed and released.

NOTE: To program the remaining two universal transmitter buttons, begin with Step 2. Do not repeat Step 1.

CANADIAN PROGRAMMING OR GATE PROGRAMMING

Canadian Radio Frequency (RF) laws require transmitter signals to time-out (or cease) after several seconds of transmission, which may not be long enough for the universal transmitter to acquire the signal during programming. Similar to this Canadian law, some U.S. gate operators are designed to time-out in the same

manner. If you are located in Canada or if you are having difficulties programming a gate operator (regardless of where you live) using the PROGRAMMING COMMON UNIVERSAL TRANSMITTER CODES procedure, replace Steps 3 and 4 of that procedure with the following:

NOTE: **When programming a garage door opener or gate operator, it is advised to unplug the device or move the vehicle out of range during the Cycle process described in the following Step to prevent possible overheating and damage to that device.**

- **3 & 4** - Continue to depress and hold the universal transmitter button while every two seconds you press and release (Cycle) your hand-held transmitter until the frequency signal has been successfully acquired. The universal transmitter red transmission indicator will transition from flashing slowly to flashing rapidly after the transmitter successfully acquires the frequency signal from the hand-held transmitter. Release both buttons after the transmission indicator begins flashing rapidly.

REPROGRAMMING UNIVERSAL TRANSMITTER CODES

WARNING: **Vehicle exhaust contains carbon monoxide, a dangerous gas. Do not run the engine while training the universal transmitter. Failure to follow these instructions may result in possible serious or fatal injury.**

WARNING: **A motorized door or gate may open and close while you are training the universal transmitter if the vehicle is within range of the device. Do not train the universal transmitter if people or pets are in the path of the door or gate. Failure to follow these instructions may result in possible serious or fatal injury.**

NOTE: **When programming a garage door opener, it is advised to park outside the garage. It is also recommended that a new battery be placed in the hand-held transmitter of the device being programmed to the universal transmitter for quicker training and accurate transmission of the Radio Frequency (RF) signal.**

NOTE: **If programing the universal transmitter is unsuccessful using the following procedure, refer to the Owner's Manual for the current customer assistance phone number.**

REPROGRAMMING COMMON UNIVERSAL TRANSMITTER CODES

Program a device to the universal transmitter (also known as the HomeLink® transmitter or the Universal Garage Door Opener/UGDO) using a button previously trained, as follows:

1. Press and hold the universal transmitter button that you want to reprogram. **Do not** release the button. The red transmission indicator will begin to flash slowly after 20 seconds. Without releasing the transmitter button, proceed to Step 2.
2. Position the end of your hand-held transmitter 3 to 8 centimeters (1 to 3 inches) away from the universal

transmitter buttons while keeping the red transmission indicator within view.

NOTE: Some gate operators and garage door openers may require that you replace Steps 3 and 4 with the Step noted in the CANADIAN REPROGRAMMING OR GATE REPROGRAMMING procedure, which follows this procedure.

3. Simultaneously depress and hold both the universal transmitter button that you want to reprogram and the hand-held transmitter button. **Do not release these buttons until Step 4 has been completed.**
4. The universal transmitter red transmission indicator will transition from flashing slowly to flashing rapidly after the transmitter successfully acquires the frequency signal from the hand-held transmitter. Release both buttons after the transmission indicator begins flashing rapidly.
5. Press and hold the universal transmitter button just programmed and observe the red transmission indicator. If the transmission indicator stays on **solid** (not flashing), reprogramming is complete. The newly programmed device should activate when this universal transmitter button is pressed and released.

NOTE: If the red transmission indicator flashes rapidly for two seconds and then changes to solid, proceed to Steps 6 through 8 to complete programming of a rolling code equipped device. Rolling code is most commonly found on garage door openers.

6. At the garage door opener receiver on the motor or head unit in the garage, locate the **Learn** or **Smart** button. This can usually be found near where the hanging antenna wire is attached to the motor or head unit. The name and color of the button varies by manufacturer.
7. Firmly press and release the **Learn** or **Smart** button.

NOTE: You have about 30 seconds after completing Step 7 in which to initiate Step 8.

8. Return to the vehicle and firmly depress, hold for two seconds then release the reprogrammed universal transmitter button. Repeat the depress, hold, then release sequence a second time. Depending upon the brand of the garage door opener (or other rolling code equipped device), it may be necessary to repeat this sequence a third time to complete the programming. The newly programmed rolling code equipped device should now activate when this universal transmitter button is pressed and released.

CANADIAN REPROGRAMMING OR GATE REPROGRAMMING

Canadian Radio Frequency (RF) laws require transmitter signals to time-out (or cease) after several seconds of transmission, which may not be long enough for the universal transmitter to acquire the signal during programming. Similar to this Canadian law, some U.S. gate operators are designed to time-out in the same manner. If you are located in Canada or if you are having difficulties programming a gate operator (regardless of where you live) using the REPROGRAMMING COMMON UNIVERSAL TRANSMITTER CODES procedure, replace Steps 3 and 4 of that procedure with the following:

NOTE: When programming a garage door opener or gate operator, it is advised to

unplug the device or move the vehicle out of range during the Cycle process described in the following Step to prevent possible overheating and damage to that device.

- **3 & 4** - Continue to depress and hold the universal transmitter button while every two seconds you press and release (Cycle) your hand-held transmitter until the frequency signal has been successfully acquired. The universal transmitter red transmission indicator will transition from flashing slowly to flashing rapidly after the transmitter successfully acquires the frequency signal from the hand-held transmitter. Release both buttons after the transmission indicator begins flashing rapidly.

2014 ACCESSORIES AND EQUIPMENT

Vehicle Theft Security - Service Information - Cherokee

DESCRIPTION

VEHICLE THEFT SECURITY SYSTEM

The Vehicle Theft Security System (VTSS) is available factory-installed equipment for this vehicle. The VTSS includes various standard and optional features that provide protection against unauthorized vehicle access, operation and intrusion. The VTSS is comprised of two primary subsystems: The Sentry Key Immobilizer System (SKIS) and the Vehicle Theft Alarm (VTA). Additional details of each of these subsystems and their components can be found elsewhere within this service information.

Except for the Sentry Key transponders which rely upon Radio Frequency (RF) communication, hard wired circuitry connects the VTA and SKIS components to the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the SKIS or VTA components through the use of a combination of soldered splices, splice block connectors and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin out and location views for the various wire harness connectors, splices and grounds.

SENTRY KEY IMMOBILIZER SYSTEM

The Sentry Key Immobilizer System (SKIS) is factory-installed standard equipment on this model. The SKIS provides passive vehicle protection, immobilizing the vehicle by preventing the engine from operating unless a valid electronically encoded key or FOB with Integrated Key (FOBIK) is detected. In vehicles not equipped with the Passive Entry Keyless Go (PEKG) system, a valid encoded key or FOBIK must be present within the IGnition Node Module (IGNM) (also known as the Keyless Ignition Node/KIN) for the engine to continue to operate. In vehicles equipped with the optional PEKG system, the FOBIK must only be present somewhere within the passenger compartment of the vehicle for the engine to continue to operate.

The SKIS used in combination with the export premium version of the Vehicle Theft Alarm (VTA) adds a steering shaft lock feature that provides passive protection by preventing the vehicle from being steered unless a valid encoded key or FOBIK is present within the IGNM (without PEKG), or a valid FOBIK is present somewhere within the passenger compartment of the vehicle (with PEKG). The export premium version of the VTA is only available in vehicles manufactured for sale in certain markets where it is required equipment.

The SKIS includes the following major components, which are described in further detail elsewhere in this service information:

- **Body Control Module** - The Body Control Module (BCM) is concealed within the instrument panel outboard of the steering column. Refer to **MODULE, BODY CONTROL, DESCRIPTION** .
- **Ignition Node Module** - The IGnition Node Module (IGNM) (also known as the Keyless Ignition

Node/KIN) is located in the instrument panel just inboard of the steering column. Refer to **MODULE, IGNITION NODE, DESCRIPTION** .

- **Instrument Cluster** - The Instrument Cluster (IC) (also known as the Instrument Panel Cluster/IPC) is located in the instrument panel, above the steering column and directly in front of the vehicle operator. Refer to **DESCRIPTION** .
- **Low Frequency Antenna** - Vehicles equipped with the optional Passive Entry Keyless Go (PEKG) system have several low frequency antenna units strategically placed within the vehicle. Refer to **ANTENNA, PASSIVE ENTRY, DESCRIPTION** .
- **Powertrain Control Module** - The Powertrain Control Module (PCM) (also known as the Engine Control Module/ECM) is located on the inboard side of the battery tray in the left front corner of the engine compartment. Refer to **MODULE, POWERTRAIN CONTROL, DESCRIPTION** .
- **Radio Frequency Hub Module** - The Radio Frequency Hub Module (RFHM) (also known as the RF Hub) is located on the upper right D-pillar near the liftgate opening upper header where it is concealed behind the interior trim. Refer to **MODULE, RADIO FREQUENCY (RF HUB), DESCRIPTION** .
- **Sentry Key Transponder** - A Sentry Key transponder microchip is located within each key or FOB with Integrated Key (FOBIK). Refer to **KEY, TRANSPONDER, DESCRIPTION**.
- **Shaft Lock Module** - A shaft lock module (also known as the Electronic Steering Column Lock/ESCL module) is located on the steering column below the instrument panel in the passenger compartment of vehicles built for sale in certain export markets where it is required equipment and equipped with the export premium version of the VTA. Refer to **MODULE, SHAFT LOCK, DESCRIPTION**.

VEHICLE THEFT ALARM

The Vehicle Theft Alarm (VTA) is factory-installed optional equipment in this vehicle. The VTA is available in different configurations and versions. One configuration is designed for vehicles manufactured for sale in domestic markets; while, another configuration is designed for vehicles manufactured for sale in export markets. In addition, the VTA for export markets is available in two versions: base and premium.

Each of these systems provide perimeter vehicle protection by monitoring the vehicle doors, the liftgate and the status of the ignition (also known as the IGnition Node Module/IGNM or Keyless Ignition Node/KIN). In vehicles manufactured for some markets the VTA also monitors the hood. If unauthorized vehicle access, intrusion or tampering is detected with any of these systems, the vehicle horn is pulsed as an audible deterrent and certain exterior lamps are flashed as a visual deterrent.

The export premium version of the VTA system is only available in vehicles manufactured for sale in certain markets where it is required equipment. The export premium version of the VTA provides the same perimeter protection features as the base version, but adds interior vehicle intrusion and vehicle anti-tilt protection. The export premium VTA also replaces the pulsing horn feature of the base version with an alarm siren module providing the audible deterrent, while retaining the flashing exterior lamps as the visual deterrent.

The VTA includes the following major components, which are described in further detail elsewhere in this service information:

- **Alarm Siren Module** - An alarm siren module is located on the engine compartment side of the Front End Module (FEM) carrier between the right front lamp unit housing and the cooling module. The alarm siren is used only in vehicles built for sale in certain export markets where it is required equipment. Refer

to **SIREN, DESCRIPTION**.

- **Body Control Module** - The Body Control Module (BCM) is concealed within the instrument panel outboard of the steering column. The BCM is both a LIN bus master node and a gateway to the CAN data bus. Refer to **MODULE, BODY CONTROL, DESCRIPTION** .
- **Door Ajar Switches** - A door ajar switch is integral to the door latch mechanism of each front and rear door. Refer to **LATCH, LIFTGATE, REMOVAL** .
- **Hood Ajar Switch** - A hood ajar switch is integral to the hood latch assembly of vehicles manufactured for certain export markets. Refer to **SWITCH, HOOD AJAR, DESCRIPTION**.
- **Ignition Node Module** - The IGnition Node Module (IGNM) (also known as the Keyless Ignition Node/KIN) is located in the instrument panel just inboard of the upper steering column opening. Refer to **MODULE, KEYLESS IGNITION NODE, DESCRIPTION** .
- **Instrument Cluster** - The Instrument Cluster (IC) (also known as the Instrument Panel Cluster/IPC) is located in the instrument panel above the steering column and directly in front of the driver. Refer to **DESCRIPTION** .
- **Liftgate Ajar Switch** - A liftgate ajar switch is integral to the latch for the liftgate in the vehicle. Refer to **LATCH, LIFTGATE, REMOVAL** .
- **Radio Frequency Hub Module** - The Radio Frequency Hub Module (RFHM) (also known as the RF Hub) is located on the upper right D-pillar near the liftgate opening upper header where it is concealed behind the interior trim. Refer to **MODULE, RADIO FREQUENCY (RF HUB), DESCRIPTION** .
- **Ultrasonic And Anti-tilt Module** - In vehicles equipped with the premium VTA, an Ultrasonic and Anti-tilt Module (UAM) (also known as the Intrusion Transceiver Module/ITM) is located on and concealed above the overhead console trim cover on the headliner near the center of the upper windshield opening. Refer to **MODULE, ULTRASONIC AND ANTI-TILT, DESCRIPTION**.

OPERATION

VEHICLE THEFT SECURITY SYSTEM

The Vehicle Theft Security System (VTSS) is comprised of two primary subsystems: Sentry Key Immobilizer System (SKIS) and Vehicle Theft Alarm (VTA). Additional operational details on each of these two subsystems of the VTSS can be found elsewhere within this service information.

SENTRY KEY IMMOBILIZER SYSTEM

The Sentry Key Immobilizer System (SKIS) is designed to provide passive protection against unauthorized vehicle use by disabling the engine whenever an attempt is made to operate the vehicle using anything other than a key or FOB with Integrated Key (FOBIK) equipped with a valid Sentry Key transponder microchip. The SKIS is considered a passive protection system because it is always active when the ignition system is energized and does not require any customer intervention.

The microcontroller-based Radio Frequency Hub Module (RFHM) (also known as the RF Hub) uses Radio Frequency (RF) communication to challenge and obtain confirmation that the key or FOBIK being used is a valid key or FOBIK for operating the vehicle. The microcontroller-based RFHM hardware and software also uses electronic messages to communicate with the IGnition Node Module (IGNM) (also known as the Keyless Ignition Node/KIN) over a private serial bus and with other electronic modules in the vehicle over the

Controller Area Network (CAN) data bus. Refer to **COMMUNICATION, OPERATION** .

Pre-programmed Sentry Key transponders are provided with the vehicle from the factory. Each RFHM will recognize a maximum of eight Sentry Keys or FOBIK units. If the customer would like additional Sentry Keys or FOBIK units other than those provided with the vehicle, they may be purchased from any authorized dealer. These additional Sentry Keys or FOBIK units must be programmed to the RFHM in the vehicle in order for the system to recognize them as valid keys. This can be done by the dealer using a diagnostic scan tool. Refer to **STANDARD PROCEDURE**.

In vehicles equipped with an export premium version of the Vehicle Theft Alarm (VTA), the Body Control Module (BCM) controls an electronic shaft lock module (also known as the Electronic Steering Lock/ESL or the Electronic Steering Column Lock/ESCL) on the steering column that locks the steering shaft from rotation unless the BCM receives a electronic **valid key** message from the RFHM. The BCM also communicates with the electronic shaft lock module over the CAN data bus to monitor and control the shaft lock function.

The BCM performs a self-test of the SKIS and the shaft lock module each time the ignition status transitions to On, and will store fault information in the form of a Diagnostic Trouble Code (DTC) for any system or component malfunction that is detected. If a fault is detected, the BCM will illuminate the security indicator in the Instrument Cluster (IC) (also known as the Instrument Panel Cluster/IPC) or the IC will display a textual **SHAFT LOCK ERROR** message in the Electronic Vehicle Information Center (EVIC) display as appropriate.

The hard wired circuits between components related to the SKIS may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the SKIS or the electronic controls and communication between other modules and devices that provide some features of the SKIS. The most reliable, efficient and accurate means to diagnose the SKIS or the electronic controls and communication related to SKIS operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

VEHICLE THEFT ALARM

The base version of the Vehicle Theft Alarm (VTA) is designed to provide either active or passive perimeter protection of the vehicle by monitoring the vehicle doors, the ignition and the liftgate. In vehicles built for certain markets where it is required equipment, the perimeter protection also includes monitoring of the hood. If the VTA system detects any attempt to compromise a monitored vehicle system or feature, the vehicle horn is pulsed as an audible deterrent and certain exterior lamps are flashed as a visual deterrent.

The Body Control Module (BCM) includes the logic and control circuits for the base versions of the VTA. Each of the ajar switches provides hard wired inputs to the BCM, while the BCM provides control outputs to the vehicle horns and lighting systems. The Radio Frequency Hub Module (RFHM) (also known as the RF Hub) monitors the status of the IGnition Node Module (IGNM) (also known as the Keyless Ignition Node/KIN) through a private serial bus and relays this information to the BCM as electronic messages transmitted over the Controller Area Network (CAN) data bus.

The premium version of the VTA includes an Ultrasonic and Anti-tilt Module (UAM) (also known as the Intrusion Transceiver Module/ITM). The UAM provides interior intrusion protection as well as vehicle tow-away and tire theft protection. The UAM includes the logic and control circuits for these features of the VTA and is also a slave node communicating over the Local Interface Network (LIN) data bus. The UAM is armed and disarmed by electronic messages received over the LIN data bus from the BCM, which is a LIN master node. While armed, the UAM uses external ultrasonic transmit and receive transducers to monitor the vehicle interior for movement as well as internal accelerometers to monitor vehicle pitch and roll. When an exception is detected, the UAM relays this information to the BCM over the LIN bus, and the BCM invokes the VTA audible and visual alerts. In vehicles with an ITM, the horn output function of the BCM is replaced by an output of the alarm siren module that is controlled by the BCM over the LIN data bus.

The hard wired circuits between components related to the VTA system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the VTA system or the electronic controls and communication between modules and devices that provide some features of the VTA system. The most reliable, efficient and accurate means to diagnose the VTA system or the electronic controls and communication related to VTA system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

OPERATING MODES

Following are paragraphs that briefly describe the operation of each of the Vehicle Theft Alarm (VTA) operating modes.

- **Enabling** - The Body Control Module (BCM) and the Radio Frequency Hub Module (RFHM) (also known as the RF Hub) must have the Vehicle Theft Alarm (VTA) function electronically enabled in order for the VTA to perform as designed. The BCM stores and compares vehicle configuration data with other Electronic Control Units (ECU) in the vehicle, including the RFHM. This process is referred to as PRogramming Of Configuration of Systems Integrated (PROCSI) (also known as PROXI). If a configuration mismatch is detected, the BCM sets a Diagnostic Trouble Code (DTC). A configuration mismatch will require the performance of a Restore BCM PROXI Configuration routine, or a PROXI Configuration Alignment routine using a diagnostic scan tool.
- **Arming** - Passive arming of the VTA occurs when the vehicle is exited with the key or FOB with Integrated Key (FOBIK) removed from the ignition, the headlamps are turned Off and the doors are locked while they are open using the power lock switch. Active arming occurs when the Lock button on the Remote Keyless Entry (RKE) transmitter is depressed to lock the vehicle. For active arming to occur, the doors and the liftgate must be closed and the status of the ignition must be Off when the RKE transmitter Lock button is depressed. The power lock switch will not function if a key or FOBIK is in the ignition with the driver side front door open.

  Pre-arming of the VTA is initiated when the vehicle is locked using a power door lock switch or when the RKE transmitter Lock button is depressed. Pre-arming will not occur if the key or FOBIK is in the ignition with the driver side front door open. When the VTA is pre-armed, the arming sequence is delayed until all of the doors and the liftgate have been closed. The VTA will remain in pre-armed mode

for up to 16 seconds after all doors and the liftgate have been closed.

Once the VTA begins the passive or active arming sequence, the security indicator in the Instrument Cluster (IC) (also known as the Instrument Panel Cluster/IPC) will flash rapidly for about 16 seconds. This indicates that VTA arming is in progress. If the ignition status transitions to On, if a door or the liftgate is unlocked or opened by any means, or if the RKE Panic button (if equipped) is depressed during the 16 second arming process, the security indicator will stop flashing and the arming process will abort. Once the arming sequence is successfully completed, the security indicator will flash at a slower rate, indicating that the VTA is armed.

On vehicles equipped with the hood ajar switch, the VTA arming sequence will occur regardless of whether the hood is open or closed, but the security indicator will illuminate solid and the engine compartment will not be protected unless the hood is closed when the VTA arming sequence first begins. Also, if the status of the hood ajar switch changes from open to closed during the 16 second arming process, the security indicator will switch from solid to flashing. Once the arming process is successfully completed, the security indicator will flash at a slower rate, indicating that the VTA is armed.

- **Disarming** - Passive disarming of the Vehicle Theft Alarm (VTA) occurs by inserting a valid Sentry Key Immobilizer System (SKIS) key or FOB with Integrated Key (FOBIK) into the ignition or when the ignition status transitions to On. Active disarming of the VTA for all markets occurs when the vehicle is unlocked by depressing the Unlock button of the Remote Keyless Entry (RKE) transmitter. Once the alarm has been activated, either disarming method will also deactivate the alarm. Depressing the Panic button (if equipped) on the RKE transmitter will **not** disarm the VTA.
- **Alarm** - The Vehicle Theft Alarm (VTA) alarm output provides both visual and audible outputs; however, the time intervals of these outputs vary by the requirements of the market for which the vehicle is manufactured. In all cases, the visual output will be a flashing On and Off of the exterior lamps, while the audible output will be either a pulsing of the horn or, if the vehicle is so equipped, the siren. For vehicles with the base version of the VTA, the inputs that will trigger the alarm include a change in the status of the ignition, the door ajar switches, the liftgate ajar switch and, in vehicles built for certain markets where they are required, the hood ajar switch. In vehicles with the premium version of the VTA, the inputs that will trigger the alarm also include any movement detected within the vehicle passenger compartment, or a change in the vehicle pitch or roll of greater than about 0.5 degrees.
- **Power-Up Mode** - When the armed Vehicle Theft Alarm (VTA) senses that the battery has been disconnected and reconnected, it enters its power-up mode. In the power-up mode the armed alarm system remains armed following a battery failure or disconnect. If the VTA was armed prior to a battery disconnect or failure, the technician or vehicle operator will have to actively or passively disarm the alarm system after the battery is reconnected. The power-up mode will also apply if the battery goes dead while the system is armed, and battery jump-starting is attempted. The VTA will be armed until the technician or vehicle operator has actively or passively disarmed the alarm system.

  If the VTA is in the disarmed mode prior to a battery disconnect or failure, it will remain disarmed after the battery is reconnected or replaced, or if jump-starting is attempted.

- **Tamper Alert** - The Vehicle Theft Alarm (VTA) tamper alert feature will pulse the horn three times upon VTA disarming if the alarm was triggered and has since timed out, or if the battery has been disconnected and reconnected. This feature alerts the vehicle operator that the VTA alarm was activated while the vehicle was unattended. This feature is disabled in vehicles manufactured for certain export

markets where it is required.

- **Anti-tilt And Intrusion Alarm Disabling** - The anti-tilt and intrusion alarm is an exclusive feature of the premium version of the Vehicle Theft Alarm (VTA). When this version of the VTA is armed, the Ultrasonic and Anti-tilt Module (UAM) (also known as the Intrusion Transceiver Module/ITM) uses ultrasonic transmit and receive transducers to monitor the interior of the vehicle for movement and low gravity accelerometers to monitor vehicle pitch and roll. If interior motion or change in vehicle attitude are detected, the UAM sends an electronic message to the Body Control Module (BCM) over the Local Interface Network (LIN) data bus to invoke the audible and visual alarm features.

  The anti-tilt and intrusion alarm features of the premium VTA can be disabled by depressing the Lock button on the Remote Keyless Entry (RKE) transmitter 3 times within 15 seconds during VTA pre-arming, while the security indicator is still flashing rapidly. The VTA provides a single short siren chirp as an audible confirmation that the anti-tilt and intrusion alarm features disable request has been received. The default for the UAM features is enabled; therefore, the disable procedure must be repeated each time the VTA is disarmed, then armed again to prevent the system from monitoring interior movement and vehicle pitch and roll.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - VEHICLE THEFT SECURITY SYSTEM

The Vehicle Theft Security System (VTSS) is divided into two basic subsystems: Sentry Key Immobilizer System (SKIS) and Vehicle Theft Alarm (VTA). The recommended procedures for diagnosis and testing of each of these two VTSS subsystems can be found elsewhere within this service information.

DIAGNOSIS AND TESTING - SENTRY KEY IMMOBILIZER SYSTEM

WARNING: **To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.**

The hard wired circuits between modules and components related to the Sentry Key Immobilizer System (SKIS) may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the SKIS or the electronic controls and communication between other modules and devices that provide features of the SKIS. The most reliable, efficient and accurate means to diagnose the SKIS or the electronic controls and

communication related to SKIS operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

SENTRY KEY IMMOBILIZER SYSTEM DIAGNOSIS		
CONDITION	**POSSIBLE CAUSES**	**CORRECTION**
SECURITY INDICATOR FAILS TO LIGHT DURING BULB TEST	1. Ineffective Light-Emitting Diode (LED).	1. Use a diagnostic scan tool to perform the Instrument Cluster (IC) (also known as the Instrument Panel Cluster/IPC) actuator test. Refer to the appropriate diagnostic information.
	2. Ineffective security indicator circuit.	2. Check the security indicator circuit between the Body Control Module (BCM) and the IC for an open or short. Repair the circuit, if required.
	3. Ineffective ground circuit.	3. Test and repair the open ground circuit at the connector for the IC, if required.
	4. Ineffective battery feed circuit.	4. Test and repair the open battery feed circuit at the connector for the IC, if required.
	5. Ineffective ignition feed circuit.	5. Test and repair the open ignition feed circuit at the connector for the IC, if required.
SECURITY INDICATOR FLASHES FOLLOWING BULB TEST	1. Invalid key or FOB with Integrated Key (FOBIK) in the ignition.	1. Replace the invalid key or FOBIK with a known valid key or FOBIK.
	2. Key-related fault.	2. Use a diagnostic scan tool and the appropriate diagnostic information for further diagnosis.
SECURITY INDICATOR LIGHTS SOLID FOLLOWING BULB TEST	1. SKIS system malfunction/fault detected.	1. Use a diagnostic scan tool and the appropriate diagnostic information for further diagnosis.
	2. SKIS system ineffective.	2. Use a diagnostic scan tool and the appropriate diagnostic information for further diagnosis.

DIAGNOSIS AND TESTING - VEHICLE THEFT ALARM

WARNING: **To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in**

accidental airbag deployment.

The hard wired circuits between modules and components related to the Vehicle Theft Alarm (VTA) system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the VTA or the electronic controls and communication between other modules and devices that provide features of the VTA. The most reliable, efficient and accurate means to diagnose the VTA or the electronic controls and communication related to VTA operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

STANDARD PROCEDURE

SENTRY KEY IMMOBILIZER SYSTEM INITIALIZATION

The Sentry Key Immobilizer System (SKIS) must be initialized following the service replacement of a Body Control Module (BCM), a Radio Frequency Hub Module (RFHM) (also known as the RF Hub), a Powertrain Control Module (PCM) (also known as the Engine Control Module/ECM) or a electronic shaft lock module (also known as the Electronic Steering Lock/ESL or the Electronic Steering Column Lock/ESCL). SKIS initialization requires the use of a diagnostic scan tool. Initialization will also require that you have security access and a temporary authorization PIN code. The PIN code **MUST** be used to enter the Secured Access Mode. Refer to **STANDARD PROCEDURE** . This procedure will require you to log into DealerCONNECT and enter a PIN when requested. The PIN is temporary and will be active for 12 hours. After 12 hours, a new PIN will need to be obtained from DealerCONNECT.

NOTE: **If the Body Control Module (BCM) is replaced in a vehicle equipped with the Sentry Key Immobilizer System (SKIS), the unique Secret Key data must be transferred from the Radio Frequency Hub Module (RFHM) (also known as the RF Hub) to the new BCM using the appropriate programming procedure. This procedure also requires the use of a diagnostic scan tool to enter the Secured Access Mode in the RFHM.**

NOTE: **If the electronic shaft lock module (also known as the Electronic Steering Lock/ESL or the Electronic Steering Column Lock/ESCL) is replaced in a vehicle equipped with the Sentry Key Immobilizer System (SKIS), the unique Secret Key data must be transferred from the Body Control Module (BCM) to the new electronic shaft lock module using the appropriate programming procedure. This procedure also requires the use of a diagnostic scan tool to enter the Secured Access Mode in the BCM.**

NOTE: **If the Powertrain Control Module (PCM) (also known as the Engine Control Module/ECM) is replaced in a vehicle equipped with the Sentry Key Immobilizer**

System (SKIS), the unique Secret Key data must be transferred from the Body Control Module (BCM) to the new PCM using the appropriate programming procedure. This procedure also requires the use of a diagnostic scan tool to enter the Secured Access Mode in the BCM.

SENTRY KEY TRANSPONDER PROGRAMMING

All Sentry Keys or FOB with Integrated Key (FOBIK) units included with the vehicle are pre-programmed to work with the Radio Frequency Hub Module (RFHM) (also known as the RF Hub) when the vehicle is shipped from the factory. The RFHM can be programmed to recognize up to a total of eight Sentry Key or FOBIK transponder units. When programming a blank transponder, the Sentry Key mechanical key must first be cut to match the ignition lock cylinder (if equipped) or the FOBIK mechanical key must be cut to match the door lock cylinder in the vehicle for which it will be used. Once the mechanical key has been cut, the RFHM must be programmed to recognize it as a valid key transponder. To program the RFHM to recognize a new or additional valid key transponder, the Secured Access Method must be used. The details of this programming method can be found under **FOBIK Programming** elsewhere in this service information using the link that follows. Refer to **STANDARD PROCEDURE** . This procedure will require you to log into DealerCONNECT and enter a PIN when requested. The PIN is temporary and will be active for 12 hours. After 12 hours, a new PIN will need to be obtained from DealerCONNECT.

KEY, TRANSPONDER

DESCRIPTION

DESCRIPTION

Fig. 1: Transponder Keys
Courtesy of CHRYSLER GROUP, LLC

Three unique variations of a transponder key are available for this vehicle. They are:

- **Sentry Key Immobilizer System Transponder Key** - The Sentry Key Immobilizer System (SKIS) transponder key (1) is used in combination with an IGnition Node Module (IGNM) (also known as the Wireless Ignition Node/WIN) featuring a rotary-type ignition switch. This transponder key is used only for vehicles that are not equipped with the optional Remote Keyless Entry (RKE) system.
- **Remote Keyless Entry System Transponder Key** - The Remote Keyless Entry (RKE) system transponder key (2) is also known as a FOB with Integrated Key (FOBIK). Like the SKIS transponder key, the RKE FOBIK transponder key is used in combination with an IGnition Node Module (IGNM) (also known as the Wireless Ignition Node/WIN) featuring a rotary-type ignition switch. This transponder key is used for vehicles that are equipped with the RKE system, but not with the optional Passive Entry Keyless Go (PEKG) system.
- **Passive Entry Keyless Go System Transponder Key** - The Passive Entry Keyless Go (PEKG) system transponder key (3) is also known as a FOB with Integrated Key (FOBIK). However, unlike the SKIS transponder key and RKE FOBIK transponder key, the PEKG transponder key is used in combination with an IGnition Node Module (IGNM) (also known as the Keyless Ignition Node/KIN) featuring a push button-type ignition switch. This transponder key is used only for vehicles that are equipped with the PEKG system.

Regardless of the type of transponder key used for this vehicle, in addition to having to be cut to match the mechanical coding of the lock cylinders and programmed for operation of the RKE system, each ignition key has a transponder microchip included that carries a unique transponder identification code. This identification code that is permanently programmed into it by the manufacturer must be programmed into the Radio Frequency Hub Module (RFHM) (also known as the RF Hub) to be recognized by the SKIS as a valid key.

The Sentry Key transponder key cannot be adjusted or repaired. If ineffective or damaged, the entire transponder key or FOBIK and RKE transmitter unit must be replaced.

OPERATION

OPERATION

When the status of the ignition switch transitions to On the IGnition Node Module (IGNM) sends an electronic **ignition switch status** message over a private serial bus to the Radio Frequency Hub Module (RFHM) (also known as the RF-Hub). In vehicles not equipped with the Passive Entry Keyless Go (PEKG) system, the IGNM uses an internal antenna to communicate with the Sentry Key transponder based upon inputs received from the RFHM through the private serial bus. In vehicles that are equipped with the PEKG system, the RFHM relies upon several Low Frequency (LF) antenna units to challenge the Sentry Key transponders using a LF signal, then monitors responses from the Sentry Key transponders received as Very High Frequency (VHF) signals.

The RFHM determines whether a valid key is present based upon the response from the transponder. If a valid key is detected, that fact is communicated by the RFHM to the Body Control Module (BCM), and by the BCM to the Powertrain Control Module (PCM) (also known as the Engine Control Module/ECM) over the Controller Area Network (CAN) data bus, and the PCM allows the engine to continue running. If the BCM receives an electronic **invalid key** message or no message, or if the PCM receives an electronic **invalid key** message or no message over the CAN data bus, the engine will be disabled. The Instrument Cluster (IC) (also known as the Instrument Panel Cluster/IPC) will also respond to the **invalid key** message on the CAN data bus by flashing the security indicator On and Off.

Each Sentry Key has a unique transponder identification code permanently programmed into it by the manufacturer. Likewise, the RFHM has a unique Secret Key code programmed into it by the manufacturer. When a Sentry Key is programmed into the memory of the RFHM, the RFHM stores the transponder identification code from the Sentry Key and the Sentry Key learns the Secret Key code from the RFHM. Once the Sentry Key learns the Secret Key code of the RFHM, it is permanently stored in the memory of the transponder. Therefore, once a Sentry Key has been programmed to a particular vehicle, it cannot be used on any other vehicle. Refer to **STANDARD PROCEDURE**.

The Sentry Key Immobilizer System (SKIS) performs a self-test each time the ignition switch status transitions to On, and will store key-related fault information in the form of a Diagnostic Trouble Code (DTC) in RFHM memory if a Sentry Key transponder problem is detected. The Sentry Key transponder chip can be diagnosed, and any stored DTC can be retrieved using a diagnostic scan tool. Refer to the appropriate diagnostic information.

Common communication problems:

- Two transponder keys too close to each other.
- Another transponder device (i.e.: Speed Pass) too close to the Sentry Key transponder.

A security indicator illuminated solid (not flashing) in the IC indicates that there is a system failure.

- Loss of PCM/CAN data bus communication.
- Failed antenna circuit.

NOTE: **After a RFHM is replaced with a new unit, the Sentry Key transponders need to be programmed to the new RFHM. Follow the instructions found in the diagnostic scan tool for the Replace RFHM Routine . The Sentry Key transponders and the Remote Keyless Entry (RKE) transmitters (if equipped) will both be programmed during this operation. There is no need to program the RKE transmitter again once the Sentry Key transponder key has been programmed to the new RFHM. This procedure will require you to log into DealerCONNECT and enter a PIN when requested. The PIN is temporary and will be active for 12 hours. After 12 hours, a new PIN will need to be obtained from DealerCONNECT.**

MODULE, SENTRY KEY IMMOBILIZER (SKIM)

DESCRIPTION

DESCRIPTION

0831002982

Fig. 2: Sentry Key Immobilizer Module (SKIM)
Courtesy of CHRYSLER GROUP, LLC

The functions and features of the Sentry Key Immobilizer Module (SKIM) (also previously known as the Sentry Key REmote Entry Module/SKREEM, the Wireless Control Module/WCM or the Wireless Ignition Node/WIN) are all integral to the Radio Frequency Hub Module (RFHM) (also known as the RF Hub) and either the Keyless Ignition Node (KIN) in vehicles equipped with the push button ignition Keyless Go (KG) system or the IGnition Node Module (IGNM) in vehicles equipped with a rotary ignition key or FOB with Integrated Key (FOBIK).

The RFHM is the primary component of the Sentry Key Immobilizer System (SKIS). It is also the receiver for the Remote Keyless Entry (RKE) system, the Passive Entry (PE) system, the remote start system and the Tire Pressure Monitor (TPM) system on vehicles so equipped. The RFHM is located on the inner roof panel reinforcement near the liftgate opening within the passenger compartment, where it is concealed above the headliner trim. Refer to **MODULE, RADIO FREQUENCY (RF HUB), DESCRIPTION** .

The KIN includes the integral ignition push button. The IGNM includes the ignition rotary FOBIK switch or key cylinder switch. The KIN or the IGNM is located in the instrument panel, just to the right of the steering column. The remainder of the KIN or IGNM including its mounting provisions and electrical connections are concealed within the instrument panel. Refer to **MODULE, KEYLESS IGNITION NODE, DESCRIPTION** or **MODULE, IGNITION NODE, DESCRIPTION** .

OPERATION

OPERATION

The functions and features of the Sentry Key Immobilizer Module (SKIM) (also previously known as the Sentry Key REmote Entry Module/SKREEM, the Wireless Control Module/WCM or the Wireless Ignition Node/WIN) are all integral to the Radio Frequency Hub Module (RFHM) (also known as the RF Hub) and the IGnition Node Module/IGNM or the Keyless Ignition Node (KIN) in this vehicle. The RFHM contains a Radio Frequency (RF) transceiver and a microcontroller.

In vehicles with a rotary ignition switch the RFHM controls Low Frequency (LF) signaling with the Sentry Key transponder integral to the mechanical key or FOB with Integrated Key (FOBIK) through a tuned antenna internal to the IGNM. The IGNM transmits the received LF signal and the selected ignition switch status back to the RFHM. In vehicles with the push button Keyless Go (KG) system, the RFHM transmits LF signals to, and receives LF signals from the Sentry Key transponder integral to the FOBIK through a tuned antenna internal to the RFHM housing, while the KIN allows the vehicle operator to select and monitor the status of the ignition switch and also transmits the selected ignition switch status back to the RFHM.

The RFHM also serves as the Remote Keyless Entry (RKE) RF receiver and, if the vehicle is so equipped, the receiver for the remote start system and for the Tire Pressure Monitoring (TPM) system. Refer to **DESCRIPTION** , **OPERATION** and **TIRE PRESSURE MONITORING, DESCRIPTION** . The RFHM communicates over the Controller Area Network (CAN) data bus with the Body Control Module (BCM), the Instrument Cluster (IC) (also known as the Instrument Panel Cluster/IPC), the Powertrain Control Module (PCM) (also known as the Engine Control Module/ECM) or the diagnostic scan tool. It also communicates over a dedicated Local Interface Network (LIN) data bus circuit with the IGNM or the KIN.

The RFHM and the PCM both use software that includes a rolling code algorithm strategy, which helps to reduce the possibility of unauthorized Sentry Key Immobilizer System (SKIS) disarming. The rolling code algorithm ensures security by preventing an override of the SKIS through the unauthorized substitution of the RFHM or the PCM. However, the use of this strategy also means that replacement of either the RFHM or the PCM units will require a system initialization procedure to restore system operation.

The RFHM retains in memory the ID numbers of any Sentry Key or FOBIK transponder that is programmed into it. A maximum of eight Sentry Key transponders can be programmed into the RFHM. For added system security, each RFHM is programmed with a unique Secret Key code. This code is stored in memory, sent over

the CAN data bus to the PCM, and is encoded to the transponder of every Sentry Key that is programmed into the RFHM. Therefore, the Secret Key code is a common element that is found in every component of the SKIS.

Another security code called a PIN is used to gain access to the RFHM Secured Access Mode. The Secured Access Mode is required during service to perform the SKIS initialization and Sentry Key transponder programming procedures. The RFHM also stores the Vehicle Identification Number (VIN) in its memory, which it learns through a CAN data bus message from the PCM during SKIS initialization.

In the event that a RFHM replacement is required, the Secret Key code can be transferred to the new RFHM from the PCM using the diagnostic scan tool and the SKIS initialization procedure. Proper completion of the SKIS initialization will allow the existing Sentry Key transponder units to be programmed into the new RFHM so that new Sentry Key units will not be required. In the event that the original Secret Key code cannot be recovered, RFHM replacement will also require new Sentry Key units. The diagnostic scan tool will alert the technician during the SKIS initialization procedure if new Sentry Key units are required. Refer to **STANDARD PROCEDURE** .

When the status of the ignition switch transitions to On, the RFHM transmits a LF signal to excite the transponder in the FOBIK. The RFHM then waits for a LF signal response from the transponder. If the response received identifies the key or FOBIK as valid, the RFHM sends an electronic **valid key** message to the PCM over the CAN data bus. If the response received identifies the key or FOBIK as invalid or if no response is received from the key or FOBIK transponder, the RFHM sends an **invalid key** message to the PCM. The PCM will enable or disable engine operation based upon the status of the RFHM messages. It is important to note that the default condition in the PCM is an **invalid key** ; therefore, if no message is received from the RFHM by the PCM, the engine will be disabled and the vehicle immobilized after two seconds of running.

The RFHM also sends electronic **security indicator** request messages to the IC over the CAN data bus to tell the IC how to operate the security indicator. The **security indicator** request message from the RFHM tells the IC to turn the indicator On for about three seconds each time the status of the ignition switch transitions to On as a bulb test. After completion of the bulb test, the RFHM sends **security indicator** request messages to the IC to turn the indicator Off, turn the indicator On or to flash the indicator On and Off. If the security indicator flashes or stays On solid after the bulb test, it signifies a SKIS fault. If the RFHM detects a system malfunction or the SKIS has become ineffective, the security indicator will stay On solid. If the RFHM detects an invalid key or FOBIK, or if a key or FOBIK transponder-related fault exists, the security indicator will flash.

The SKIS performs a self-test each time the status of the ignition switch transitions to On, and will store fault information in the form of a Diagnostic Trouble Code (DTC) in RFHM memory if a system malfunction is detected. The hard wired circuits of the RFHM may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the RFHM or the electronic controls and communication between other modules and devices that provide some features of the SKIS. The most reliable, efficient and accurate means to diagnose the RFHM or the electronic controls and communication related to RFHM operation requires the use of a diagnostic scan tool.

MODULE, SHAFT LOCK

DESCRIPTION

DESCRIPTION

0831005390

Fig. 3: Shaft Lock Module, Locking Bolt, Mounting Bracket & Connector Receptacle
Courtesy of CHRYSLER GROUP, LLC

A shaft lock module (1) (also known as the Electronic Steering Column Lock/ESCL or the Elektronische Lenkungs Verriegelung/ELV) is part of the premium version of the Sentry Key Immobilizer System (SKIS) in the Vehicle Theft Security System (VTSS). The premium version of the SKIS is only available in vehicles built for certain markets, where the additional features offered by this system are required. The module is located near the upper end of the steering column housing below the instrument panel in the passenger compartment.

The shaft lock module includes a die cast aluminum cover that conceals and protects the electronic circuitry of the module, which includes a single integral connector receptacle (4). The electronics of the module are connected to the vehicle electrical system through a dedicated take out and connector of the instrument panel wire harness. The bi-directional electric motor that actuates the locking bolt (3) is also contained within a die cast metal housing. That housing includes an integral saddle type mounting bracket (2) that is clamped securely to the steering column housing by two tamper resistant screws.

The mounting provisions for the shaft lock module are designed to resist unauthorized tampering. The module cannot be removed from the steering column while the steering column is installed in the vehicle. The shaft lock module cannot be adjusted or repaired and, if ineffective or damaged it must be replaced.

OPERATION

OPERATION

The electronic shaft lock module (also known as the Electronic Steering Column Lock/ESCL or the

Elektronische Lenkungs Verriegelung/ELV) is designed to work in conjunction with the Body Control Module (BCM) to control a locking bolt that engages a machined slot in the steering shaft to prevent shaft rotation whenever a valid key is not present in the Ignition Node Module (IGNM) (without Keyless Go/KG), or when the status of the Keyless Ignition Node/KIN transitions to Off (with KG). The shaft lock module can only be unlocked if the presence of a valid FOB with Integrated Key (FOBIK) unit is detected within the IGNM (without KG), or when the status of the KIN (with KG) transitions from Off to any other status.

The electronic circuitry within the shaft lock module contains all of the logic circuits and components to monitor and control the operation of the shaft locking bolt. The module uses the Controller Area Network (CAN) data bus for bi-directional communication with the BCM. If the module detects a problem with the positioning or operation of the locking bolt, it sends an error message to the BCM. The BCM then sets and stores a Diagnostic Trouble Code (DTC) and sends an electronic error message over the CAN data bus to other electronic modules in the vehicle.

The shaft lock module continuously monitors inputs from the BCM and the Antilock Brake System module (ABS) (also known as the Antilock Brake Module/ABM or the Brake System Module/BSM), then energizes the electric motor to move the locking bolt to the locked or unlocked position based upon those inputs. If the BCM receives an input from the Radio Frequency Hub Module (RFHM) (also known as the RF Hub) indicating that an invalid FOBIK has been detected, the locking bolt remains in the locked position.

When the RFHM indicates that a valid FOBIK has been detected within the IGNM (without KG), or within the vehicle when the status of the KIN (with KG) transitions from Off to any other status, the BCM has the shaft lock module operate a motor to move the locking bolt to the unlocked position. However, to prevent inadvertent column locking due to a failure while the vehicle is being operated, the module cannot move the locking bolt from the unlocked position to the locked position while a vehicle speed input indicates that the vehicle is still moving.

The hard wired circuits of the shaft lock module may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the shaft lock module or the electronic controls and communication between other modules and devices that provide some features of the SKIS. The most reliable, efficient and accurate means to diagnose the shaft lock module or the electronic controls and communication related to SKIS operation requires the use of a diagnostic scan tool.

REMOVAL

REMOVAL

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

Fig. 4: Steering Column Housing, Tamper Resistant Screws & Shaft Lock Module
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative cable from the battery.
2. Remove the steering column from the vehicle. Refer to **COLUMN, REMOVAL** .
3. Remove and discard the two tamper resistant screws (2) that secure the shaft lock module (3) to the steering column housing (1). One of three methods is suggested:
   - Cut a straight slot in the top of each screw to enable removal with a screw driver.
   - Use a drift punch and a hammer to rotate each screw counterclockwise far enough to grasp and complete removal using locking pliers.
   - Use an appropriate drill bit to bore a hole in the center of each screw, then use an appropriate screw extractor to complete screw removal.
4. Remove the shaft lock module from the steering column.

INSTALLATION

INSTALLATION

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to

disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

0831010576

Fig. 5: Steering Column Housing, Tamper Resistant Screws & Shaft Lock Module
Courtesy of CHRYSLER GROUP, LLC

1. Carefully inspect the shaft lock module (also known as the Electronic Steering Column Lock/ESCL or the Elektronische Lenkungs Verriegelung/ELV) interface area of the module, the steering shaft and the steering column housing for damage or debris. Remove debris or replace damaged components that could hinder proper shaft lock module operation as required.
2. Position the shaft lock module (3) onto the steering column housing (1).
3. Install and tighten two new tamper resistant screws (2) to secure the shaft lock module to the steering column housing. Tighten the screws until the heads shear off.
4. Reinstall the steering column into the vehicle. Refer to **COLUMN, INSTALLATION** .
5. Reconnect the negative cable to the battery.

MODULE, ULTRASONIC AND ANTI-TILT

DESCRIPTION

DESCRIPTION

0831005635

Fig. 6: UAM Housing, Transducer & Connector Receptacle
Courtesy of CHRYSLER GROUP, LLC

The Ultrasonic and Anti-tilt Module (UAM) (also known as the Ultrasonic Alarm Module/UAM or the Intrusion Transceiver Module/ITM) is part of the premium version of the Vehicle Theft Alarm (VTA) available only in Right-Hand Drive (RHD) vehicles manufactured for certain export markets where it is required equipment. The UAM is concealed above the overhead console trim cover at the front center of the headliner. Only the rearward-facing transmit and receive ultrasonic transducer membranes are visible within small grilled openings on the outboard rear corners of the overhead console trim cover within the passenger compartment of the vehicle.

The molded black plastic UAM housing (1) and both transducers (3) are fit into mounts and fittings integral to and concealed on the inside surface of the overhead console trim cover. Each of the transducers is hard wired to the UAM housing. The overhead console trim cover is secured by snap clips that pass through the console opening in the headliner into the overhead console mounting bracket above the headliner substrate. A connector receptacle (2) integral to the right end of the UAM housing contains terminal pins that are connected to the vehicle electrical system through a dedicated take out and connector of the overhead wire harness.

Concealed within the center of the UAM housing is the electronic circuitry of the module. The UAM housing is sealed to enclose and protect the internal components of the module including a microcontroller, anti-tilt sensors and electronic communication circuitry. The UAM is also a Local Interface Network (LIN) slave node and communicates over the LIN data bus with the Body Control Module (BCM), which is a LIN master node.

The UAM and the two ultrasonic transducers cannot be adjusted or repaired. If ineffective or damaged, the entire UAM and both transducers must be replaced as a unit.

OPERATION

OPERATION

The Ultrasonic and Anti-tilt Module (UAM) (also known as the Ultrasonic Alarm Module/UAM or the Intrusion Transceiver Module/ITM) controls all of the added features of the premium version of the Vehicle Theft Alarm (VTA). The UAM adds personal property theft protection by detecting movement within the interior of the vehicle and provides tire-theft and tow-away protection by monitoring the pitch and roll of the vehicle. The microcontroller within the UAM contains both motion detection and anti-tilt logic and is also a Local Interface Network (LIN) slave node that communicates over the LIN data bus with the Body Control Module (BCM), which is a LIN master node.

The UAM receives battery voltage on a fused B+ circuit through a fuse in the Power Distribution Center (PDC) and is grounded at all times through a take out and connector of the body wire harness that is secured to the body sheet metal at a remote ground point. These connections allow the UAM to remain operational, regardless of the status of the ignition switch. The UAM receives an electronic **arm request** message from the BCM over the LIN data bus whenever the VTA is armed. However, the UAM features may be disarmed by the customer by pressing and releasing the Lock button of the Remote Keyless Entry (RKE) transmitter three additional times during the 16 second pre-arm period of the VTA, while the security indicator in the Instrument Cluster (IC) (also known as the Instrument Panel Cluster/IPC) is still flashing rapidly.

While the VTA is armed, the UAM generates ultra high frequency sound bursts into the vehicle interior through an ultrasonic transmit transducer and monitors the return signal input through an ultrasonic receive transducer. The UAM logic uses an algorithm to detect movement in the vehicle interior through modulation of the ultrasonic echo that occurs due to the Doppler effect. The UAM also monitors internal low gravity (also known as low G) accelerometers to detect changes in vehicle pitch and roll. If interior movement or changes in vehicle pitch and roll are detected, the UAM sends electronic **alarm request** messages to the BCM over the LIN data bus, and the BCM invokes the VTA visual and audible alerts. Vehicle operators must be made aware that items in the vehicle that could move or sway due to environmental conditions or external vibrations may cause nuisance or phantom alarms.

The hard wired circuits of the UAM may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the UAM or the electronic controls and communication between modules and other devices that provide some features of the VTA. The most reliable, efficient and accurate means to diagnose the UAM or the electronic controls and communication related to VTA operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - ULTRASONIC AND ANTITILT MODULE

The hard wired circuits between the Ultrasonic and Anti-tilt Module (UAM) (also known as the Ultrasonic Alarm Module/UAM or the Intrusion Transceiver Module/ITM) and the Body Control Module (BCM) may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the UAM or the electronic controls and communication between other modules and devices that provide some features of the Vehicle Theft Alarm (VTA) system. The most reliable, efficient and accurate means to diagnose the UAM or the electronic controls and communication related to VTA system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

REMOVAL

0831005636

Fig. 7: Console Trim Cover, Transducer & UAM
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative cable from the battery.
2. Remove the overhead console from the headliner. Refer to **CONSOLE, OVERHEAD, FRONT, REMOVAL** .
3. Working from above the overhead console trim cover (1) rotate each of the two Ultrasonic and Anti-tilt Module (UAM) transducers (3) counterclockwise about 30 degrees to disengage them from the rearward-facing receptacles on each side of the console trim cover inside surface.
4. Unlatch the UAM (2) from the mounting provisions integral to the inside surface of the console trim cover.
5. Remove the UAM and both transducers from the overhead console as a unit.

INSTALLATION

INSTALLATION

0831005636

Fig. 8: Console Trim Cover, Transducer & UAM
Courtesy of CHRYSLER GROUP, LLC

1. Position the Ultrasonic and Anti-tilt Module (UAM) (2) and both transducers (3) to the inside surface of the overhead console trim cover (1).
2. Latch the UAM into the mounting provisions integral to the inside surface of the console trim cover.
3. Carefully insert and rotate each of the two UAM transducers about 30 degrees clockwise into the rearward-facing receptacles on each side of the console trim cover inside surface.
4. Reinstall the overhead console onto the headliner. Refer to **CONSOLE, OVERHEAD, FRONT, INSTALLATION** .
5. Reconnect the negative cable to the battery.

SIREN

DESCRIPTION

DESCRIPTION

0831005296

Fig. 9: Siren Housing & Integral Connector Receptacle
Courtesy of CHRYSLER GROUP, LLC

An alarm siren module is part of the premium version of the Vehicle Theft Alarm (VTA) in the Vehicle Theft Security System (VTSS). The premium version of the VTA is only available in vehicles built for certain markets, where the additional features offered by this system are required. This unit is designed to provide the audible alert requirements for the premium VTA.

The alarm siren module consists of microcontroller based electronic control circuitry, the piezoelectric siren and a nickel metal hydride backup battery. All of the alarm module components are protected and sealed within a molded plastic housing (1). An integral connector receptacle (2) is integral to a stanchion that extends from the bottom of the housing and connects the unit to the vehicle electrical system through a dedicated take out and connector of the Front End Module (FEM) wire harness.

The back of the alarm siren module housing includes a threaded stud that is used to secure the unit to the vehicle. The siren is located on the engine compartment side of the Front End Module (FEM) carrier, below the upper radiator cross member between the right side of the cooling module and the right front lamp unit housing.

The alarm siren module cannot be repaired or adjusted and, if ineffective or damaged, it must be replaced.

OPERATION

OPERATION

The microcontroller within the alarm siren module provides the siren unit features and functions based upon internal programming and electronic **arm** and **disarm** messages received from the Body Control Module (BCM) over a Local Interface Network (LIN) data bus connection. The BCM monitors inputs from the

Intrusion Transceiver Module (ITM) to control the output to the alarm siren module. The siren module receives battery voltage on a fused B(+) circuit through a fuse in the BCM and receives a path to ground through a ground circuit in the Front End Module (FEM) wire harness. These connections allow the siren to remain operational, regardless of the status of the ignition switch.

When the premium version of the Vehicle Theft Alarm (VTA) is armed, the siren module continuously monitors electronic message inputs from the BCM to sound its internal siren. While armed, the siren also enters its auto-detect mode. While in the auto-detect mode, if the siren module detects that its power supply or communication circuits are being tampered with or have been sabotaged, it will sound an audible alarm and continue to operate through an on-board backup battery. If the siren module is in its disarmed mode when its power supply or communication circuits are interrupted, the siren will not sound.

The alarm siren module will also notify the BCM when the backup battery requires charging, and the BCM will send electronic messages that will allow the backup battery to be recharged through the battery voltage and ground circuits to the alarm siren module only while the status of the ignition switch is On and the engine is running. This prevents the potential discharge of the main battery while the vehicle is not being operated.

The alarm siren module will self-detect problems with its internal and external power supply and communication circuits, then send electronic messages indicating the problem to the BCM upon receiving an **arm** or **disarm** request message. The BCM will store a Diagnostic Trouble Code (DTC) for any detected alarm siren module fault. The DTC can then be retrieved with a diagnostic scan tool through the 16-way Data Link Connector (DLC) located under the driver side lower edge of the instrument panel over the Controller Area Network (CAN) data bus.

The hard wired inputs and outputs for the alarm siren module may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the alarm siren module or the electronic controls and communication between other modules and devices that provide some features of the VTA system. The most reliable, efficient and accurate means to diagnose the alarm siren module or the electronic controls and communication related to alarm siren module operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

REMOVAL

0831005389

Fig. 10: Upper Radiator Cross Member, FEM Carrier, Alarm Siren Module & Connector
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative cable from the battery.
2. Remove the engine air cleaner housing from the right side of the engine compartment. Refer to **BODY, AIR CLEANER, REMOVAL** for 2.0L Diesel, **BODY, AIR CLEANER, REMOVAL** for 2.4L or **BODY, AIR CLEANER, REMOVAL** for 3.2L.
3. Locate the alarm siren module (3) on the engine compartment side of the Front End Module (FEM) carrier (2), below the upper radiator cross member (1) between the right side of the cooling module and the back of the right front lamp unit housing.
4. Disconnect the FEM wire harness connector (4) from the connector receptacle for the siren.
5. Remove the appearance shield from the upper radiator cross member.
6. From the front of the FEM carrier, remove the nut that secures the siren to the FEM carrier located between the right side of the cooling module and the right front lamp unit housing.
7. Remove the siren from the engine compartment side of the FEM carrier.

INSTALLATION

INSTALLATION

0831005389

Fig. 11: Upper Radiator Cross Member, FEM Carrier, Alarm Siren Module & Connector
Courtesy of CHRYSLER GROUP, LLC

NOTE: **If the alarm siren module has been replaced with a new unit, a diagnostic scan tool MUST be used to initialize and configure the new unit in the Body Control Module (BCM) before the Vehicle Theft Security System (VTSS) can operate as designed. Follow the programming steps outlined in the diagnostic scan tool for INITIALIZE SIREN under MISCELLANEOUS FUNCTIONS for the BODY CONTROL MODULE/BCM menu item as appropriate.**

1. Position the alarm siren module (3) to the engine compartment side of the Front End Module (FEM) carrier (2), below the upper radiator cross member (1) between the right side of the cooling module and the back of the right front lamp unit housing.
2. From the front of the FEM carrier, install and tighten the nut that secures the siren to the FEM carrier located between the right side of the cooling module and the right front lamp unit housing. Tighten the nut to 6 N.m (53 in. lbs.).
3. Reinstall the appearance shield onto the upper radiator cross member.
4. Reconnect the FEM wire harness connector (4) to the connector receptacle of the siren.
5. Reinstall the engine air cleaner housing into the right side of the engine compartment. Refer to **BODY, AIR CLEANER, INSTALLATION** for 2.0L Diesel, **BODY, AIR CLEANER, INSTALLATION** for 2.4L or **BODY, AIR CLEANER, INSTALLATION** for 3.2L.
6. Reconnect the negative cable to the battery.

SWITCH, HOOD AJAR

DESCRIPTION

LATCH MOUNTED SWITCH

Fig. 12: Hood Latch Mounted Hood Ajar Switch
Courtesy of CHRYSLER GROUP, LLC

There are two types of hood ajar switches used on this vehicle. This information covers the hood latch mounted hood ajar switch (1) that is standard equipment on all vehicles. A stand alone switch is also used on some vehicles in addition to the latch mounted switch, but is discussed elsewhere in this service information.

The latch mounted hood ajar switch is integrated into the hood latch assembly and is a normally open, single pole, spring-loaded plunger actuated switch. The input of this switch may be used for the Vehicle Theft Alarm (VTA) system as well as for the optional remote start system. The switch is connected to the vehicle electrical system through a dedicated take out and connector of the headlamp and dash wire harness.

The latch mounted hood ajar switch can not be adjusted or repaired. If damaged or ineffective this switch type must be replaced as a unit with the hood latch assembly.

STAND ALONE SWITCH

Fig. 13: Hood Ajar Switch
Courtesy of CHRYSLER GROUP, LLC

There are two types of hood ajar switches used on this vehicle. This information covers the stand alone hood ajar switch (1) that is optional equipment on some vehicles. A latch mounted hood ajar switch is standard on most vehicles, but is discussed elsewhere in this service information.

The stand alone switch has a molded plastic switch body (5) with an integral molded connector receptacle (1) on the lower end containing two terminal pins. The switch is connected to the vehicle electrical system through a dedicated take out and connector of the headlamp and dash wire harness. Two integral latches (2) lock the switch into a keyed mounting hole in the switch mounting bracket. The mounting bracket is secured to the left front fender load beam. The switch plunger (3) extends through a mounting collar (4) and a sleeve-like retainer ring on the upper end of the switch body. The retainer ring has a one time, self-adjustment feature that is activated after the switch is installed by closing the hood. The input of this switch is used exclusively for the start-stop system, which is optional equipment with certain optional engines.

Once a stand alone hood ajar switch is installed it cannot be readjusted or repaired. If the switch is damaged, ineffective or requires readjustment, it must be replaced with a new unit. The stand alone hood ajar switch bracket is available for separate service replacement.

OPERATION

LATCH MOUNTED SWITCH

The hood latch mounted hood ajar switch is actuated by the hood latch mechanism and the hood latch striker. When the hood is closed and properly latched, the latch mounted hood ajar switch is an open circuit. When the hood is open or only partially latched, the hood ajar switch is a closed circuit. The switch has two 500 ohm diagnostic resistors connected in parallel to the switch contacts located between the two switch terminals. The hood ajar switch is hard wired in series between a return circuit and a signal circuit of the Body Control Module (BCM).

The BCM reads the hard wired hood ajar switch input through an internal pull-up resistor, then uses this input to control other electronic functions and features of the vehicle. Some of these features may include the remote start system and the Vehicle Theft Alarm (VTA). The BCM may also send electronic **hood ajar switch status** messages to other electronic modules in the vehicle over the Controller Area Network (CAN) data bus.

The latch mounted hood ajar switch as well as the hard wired inputs and outputs of the switch may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information.

STAND ALONE SWITCH

The plunger of the optional stand alone hood ajar switch is actuated by the underside of the hood panel inner reinforcement as the hood panel is closed. When the hood is closed and properly latched, the hood ajar switch is an open circuit. When the hood is open or only partially latched, the hood ajar switch is a closed circuit. The switch has a 1 kilohm diagnostic resistor connected in parallel to the switch contacts located between the two switch terminals. The stand alone hood ajar switch is hard wired in series between a return circuit and a signal circuit of the Powertrain Control Module (PCM) (also known as the Engine Control Module/ECM).

The PCM reads the hard wired hood ajar switch input through an internal pull-up resistor, then uses this input to control certain features of the start-stop system. The PCM may also send electronic **hood ajar switch status** messages to other electronic modules in the vehicle over the CAN data bus.

The stand alone hood ajar switch as well as the hard wired inputs and outputs of the switch may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - LATCH MOUNTED HOOD AJAR SWITCH

1. Disconnect and isolate the negative cable from the battery.
2. Disconnect the wire harness connector from the hood ajar switch.
3. Check for continuity between the two terminals of the hood ajar switch. There should be continuity with the hood latch open, and only the continuity of the two 500 ohm diagnostic resistors with the hood latch closed. If OK, use a diagnostic scan tool and the appropriate diagnostic procedure to complete testing of the Body Control Module (BCM) as well as the circuits between the BCM and the hood ajar switch. If not OK, replace the ineffective hood ajar switch.

DIAGNOSIS AND TESTING - STAND ALONE HOOD AJAR SWITCH

1. Disconnect and isolate the negative cable from the battery.
2. Disconnect the wire harness connector from the hood ajar switch.
3. Check for continuity between the two terminals of the hood ajar switch. There should be continuity with the switch plunger extended, and only the continuity of the 1 kilohm diagnostic resistor with the switch plunger depressed. If OK, use a diagnostic scan tool and the appropriate diagnostic procedure to complete testing of the Powertrain Control Module (PCM) (also known as the Engine Control Module/ECM) as well as the circuits between the PCM and the hood ajar switch. If not OK, replace the ineffective hood ajar switch.

REMOVAL

STAND ALONE SWITCH BRACKET

0831005684

Fig. 14: Mounting Bracket, Hood Ajar Switch, Screws & Load Beam
Courtesy of CHRYSLER GROUP, LLC

1. Remove the stand alone hood ajar switch (2) from the mounting bracket (1). Refer to **SWITCH, HOOD AJAR, REMOVAL**.
2. Remove the screw (3) that secures the mounting bracket to the left front fender load beam (4).
3. Remove the mounting bracket from the left front fender load beam.

LATCH MOUNTED SWITCH

The latch mounted hood ajar switch used in this vehicle is integral to and serviced only as a unit with the hood latch. Refer to **LATCH, HOOD, REMOVAL** .

STAND ALONE SWITCH

Fig. 15: Mounting Bracket, Load Beam, Latch Tabs & Switch
Courtesy of CHRYSLER GROUP, LLC

1. Unlatch and open the hood.
2. Disconnect and isolate the negative cable from the battery.
3. Working from the top of the mounting bracket (3) on the left front fender load beam (1), squeeze the two stand alone hood ajar switch latch tabs (4) together far enough to pull the switch (2) upward.
4. Pull the switch up through the hole in the mounting bracket far enough to access and disconnect the wire harness connector from the switch connector receptacle.
5. Remove the stand alone hood ajar switch from the vehicle.

INSTALLATION

STAND ALONE SWITCH BRACKET

0831005684

Fig. 16: Mounting Bracket, Hood Ajar Switch, Screws & Load Beam
Courtesy of CHRYSLER GROUP, LLC

1. Position the stand alone hood ajar switch mounting bracket (1) onto the left front fender load beam (4).
2. Install and tighten the screw (3) that secures the mounting bracket to the left front fender load beam. Tighten the screw to 5.5 N.m (4 ft. lbs.).
3. Reinstall the stand alone hood ajar switch (2) into the mounting bracket. Refer to **SWITCH, HOOD AJAR, INSTALLATION**.

LATCH MOUNTED SWITCH

The latch mounted hood ajar switch used in this vehicle is integral to and serviced only as a unit with the hood latch. Refer to **LATCH, HOOD, INSTALLATION** .

STAND ALONE SWITCH

Fig. 17: Mounting Bracket, Load Beam, Latch Tabs & Switch
Courtesy of CHRYSLER GROUP, LLC

1. Position the stand alone hood ajar switch (2) near the mounting bracket (3) on the left front fender load beam (1).
2. Route the wire harness connector for the switch through the mounting hole in the mounting bracket from beneath and reconnect it to the switch connector receptacle.
3. From the top of the mounting bracket, align and insert the switch through the mounting hole and press it downward until the two integral switch latch tabs (4) snap into place.
4. Reconnect the negative cable to the battery.
5. Close and latch the hood.

2014 ACCESSORIES AND EQUIPMENT

Wiper System & Washer System - Service Information - Cherokee

DESCRIPTION

FRONT

An electrically operated intermittent front wiper and washer system is standard factory-installed safety equipment on this vehicle. The wiper and washer system includes the following major components, which are described in further detail elsewhere in this service information:

- **Front Washer Nozzle** - Two fluidic front washer nozzles with integral check valves are secured by latch features to dedicated openings in the hood panel near the base of the windshield.
- **Front Washer Plumbing** - The plumbing for the front washer system consists of rubber hoses, hard plastic tubing and molded rubber or plastic fittings. The plumbing is routed to the dash panel from the washer reservoir along the outboard side of the left front fender load beam. From the dash panel the washer plumbing is routed along the left hood hinge to the hood, then across the underside of the hood panel to the washer nozzles.
- **Front Wiper Arms And Blades** - The two front wiper arms are secured with nuts to the threaded ends of the two wiper pivot shafts, which extend through the cowl plenum cover/grille panel located near the base of the windshield. The two front wiper blades are each secured to their wiper arm with an integral latch, and are parked on the glass near the bottom of the windshield when the front wiper system is not in operation. The left and right wiper arms and wiper blades are unique and are not interchangeable.
- **Front Wiper Module** - The wiper pivot shafts are the only visible components of the front wiper module. The remainder of the module is concealed within the cowl plenum beneath the cowl plenum cover/grille panel. The wiper module includes the wiper module bracket, three rubber-isolated wiper module mounts, the wiper motor, the wiper motor crank arm, the wiper drive link, the wiper connector link and the two wiper pivots.
- **Washer Fluid Level Switch** - The washer fluid level switch is located in a dedicated hole on the lower, outboard side of the washer reservoir, ahead of the left front fender wheel house splash shield.
- **Washer Pump/Motor** - The reversible electric washer pump/motor unit is located in a dedicated hole in a sump area on the lower, outboard side of the washer reservoir, ahead of the left front fender wheel house splash shield. This single reversible washer pump/motor provides washer fluid to either the front or the rear washer system plumbing, depending upon the direction of the pump motor rotation.
- **Washer Reservoir** - The washer reservoir is secured to the left outboard end of the Front End Module (FEM) where it is concealed between the left inner fender shield and the left outer fender panel, ahead of the left front fender wheel house splash shield. The filler neck and cap are the only visible components of the reservoir and, can be easily accessed from the left front corner of the engine compartment.

Certain functions and features of the front wiper and washer systems rely upon resources shared with other electronic modules in the vehicle over a Local Interface Network (LIN) data bus as well as over the Controller Area Network (CAN) data bus. Other electronic modules in the vehicle that may affect front wiper and washer system operation are:

- **Body Control Module** - The Body Control Module (BCM) is located within the instrument panel on the driver side of the vehicle. Refer to **MODULE, BODY CONTROL, DESCRIPTION** .
- **Light Rain Sensor Module** - A Light Rain Sensor Module (LRSM) (also known as the Rain Light Sensor Module/RLSM, the Light Sensor Module/LSM or the Rain Sensor Module/RSM) is used on vehicles equipped with the optional automatic wiper feature. The LRSM is located on a bracket bonded to the inside surface of the windshield glass, near the inside rear view mirror mount.
- **Right Multifunction Switch** - The right multifunction switch is integral to the Steering Column Control Module (SCCM) mounting housing along with the clockspring and the left multifunction switch on the top of the steering column just below the steering wheel. The right multifunction switch is connected to the Steering Control Module (SCM), which is also internal and integral to the SCCM mounting housing. Only the switch control stalk extending from the right side of the steering column is visible, while the remainder of the switch is concealed beneath the steering column shrouds. The right multifunction switch provides all of the driver controls for the front and rear wiper and washer systems.
- **Steering Control Module** - The Steering Control Module (SCM) is internal and integral to the Steering Column Control Module (SCCM) mounting housing which, along with the left and right multifunction switches and the clockspring, is located on the top of the steering column just below the steering wheel. The SCM is completely concealed within the SCCM mounting housing beneath the steering column shrouds. Refer to **MODULE, STEERING COLUMN, DESCRIPTION** .

The BCM and the SCM each contain a microcontroller and programming that allow them to communicate with each other and other electronic modules in the vehicle using the Controller Area Network (CAN) data bus. In addition the BCM and the RLSM communicate with each other using the Local Interface Network data bus. Refer to **COMMUNICATION, DESCRIPTION** .

Hard wired circuitry connects the front wiper and washer system components to the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the front wiper and washer system components through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin out and location views for the various wire harness connectors, splices and grounds.

HEADLAMP

An electrically operated headlamp washer system is standard factory-installed equipment on this vehicle when it is manufactured for certain markets with High Intensity Discharge (HID) headlamps. The headlamp washer system includes the following major components, which are described in further detail elsewhere in this service information:

- **Headlamp Washer Nozzle** - A headlamp washer nozzle is secured to the front fascia beneath each front lamp unit.
- **Headlamp Washer Pump/Motor** - The electric headlamp washer pump/motor unit is located in a dedicated hole on the lower, outboard side of the washer reservoir, ahead of the left front fender wheel house splash shield. This high pressure pump is located above and rearward of the reversible front and rear washer pump/motor unit on the reservoir.

- **Headlamp Washer Plumbing** - The plumbing for the headlamp washer system consists of large diameter rubber hoses and molded plastic fittings. The plumbing is routed to the washer nozzles on the front fascia from the washer reservoir. The connections at the headlamp washer pump and the two headlamp washer nozzles feature unique quick-connect fittings.
- **Headlamp Washer Relay** - The headlamp washer relay is soldered onto the Printed Circuit Board (PCB) located within the Power Distribution Center (PDC) and is not serviceable. The PDC is located within the engine compartment near the battery.
- **Washer Reservoir** - A unique washer reservoir is used on vehicles with the optional headlamp washer system, which has dedicated provisions for the headlamp washer pump and plumbing. This reservoir is mounted in the same location and using the same mounting hardware as is used for vehicles without the headlamp washers. The reservoir is concealed between the left inner fender shield and the left outer fender panel, ahead of the left front fender wheel house splash shield. The filler neck and cap are the only visible components of the reservoir and, are accessed from the left front corner of the engine compartment.

Certain functions and features of the headlamp washer system rely upon resources shared with other electronic modules in the vehicle over the Controller Area Network (CAN) data bus. Other electronic modules in the vehicle that may affect headlamp washer system operation are:

- **Body Control Module** - The Body Control Module (BCM) is located within the instrument panel on the driver side of the vehicle. Refer to **MODULE, BODY CONTROL, DESCRIPTION** .
- **Right Multifunction Switch** - The right multifunction switch is integral to the Steering Column Control Module (SCCM) along with the clockspring and the left multifunction switch on the top of the steering column just below the steering wheel. The right multifunction switch is connected to the Steering Control Module (SCM), which is also internal and integral to the SCCM mounting housing. Only the switch control stalk extending from the right side of the steering column is visible, while the remainder of the switch is concealed beneath the steering column shrouds. The right multifunction switch provides all of the driver controls for the headlamp washer system.
- **Steering Control Module** - The Steering Control Module (SCM) is internal and integral to the Steering Column Control Module (SCCM) mounting housing which, along with the left and right multifunction switches and the clockspring, is located on the top of the steering column just below the steering wheel. The SCM is completely concealed within the SCCM mounting housing beneath the steering column shrouds. Refer to **MODULE, STEERING COLUMN, DESCRIPTION** .

The BCM and the SCM each contain a microcontroller and programming that allow them to communicate with each other and other electronic modules in the vehicle using the Controller Area Network (CAN) data bus. Refer to **COMMUNICATION, DESCRIPTION** .

Hard wired circuitry connects the headlamp washer system components to the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the headlamp washer system components through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin out and location views for the various wire harness connectors, splices and grounds.

REAR

An electrically operated rear wiper and washer system is standard factory equipment on this vehicle. The rear wiper and washer system includes the following major components which are described in further detail elsewhere in this service information:

- **Rear Washer Nozzle** - The rear washer nozzle and the integrated rear washer system check valve are located in the spoiler on the outer liftgate panel above the center of the liftgate glass opening.
- **Rear Washer Plumbing** - The plumbing for the rear washer system consists of rubber hoses, hard plastic tubing and molded rubber or plastic fittings. The plumbing is routed to the dash panel from the washer reservoir along the outboard side of the left front fender load beam. The plumbing is then routed through the dash into the passenger compartment, up the inner A-pillar to the headliner, above the headliner to the upper liftgate opening header, then through the upper liftgate opening header and the upper liftgate to the rear washer nozzle in the spoiler on the upper liftgate.
- **Rear Wiper Arm and Blade** - The single rear wiper arm and blade assembly is secured by a nut directly to the rear wiper motor output shaft which extends through a rubber grommet inserted through a hole in the liftgate glass and is parked near the base of the liftgate glass when the rear wiper system is not in operation.
- **Rear Wiper Motor** - The rear wiper motor includes the motor and three rubber-isolated wiper motor mounts. The wiper motor output shaft is the only visible component of the rear wiper motor. The remainder of the motor is concealed by the inner liftgate trim panel on the inside of the liftgate beneath the liftgate glass opening.
- **Washer Pump/Motor** - The reversible electric washer pump/motor unit is located in a dedicated hole in a sump area on the lower, outboard surface of the washer reservoir, ahead of the left front fender wheel house. This single reversible washer pump/motor provides washer fluid to either the front or the rear washer system plumbing, depending upon the direction of the pump motor rotation.
- **Washer Reservoir** - The washer reservoir is secured to the left outboard end of the Front End Module (FEM) where it is concealed between the left inner fender shield and the left outer fender panel, ahead of the left front fender wheel house splash shield. The filler neck and cap are the only visible components of the reservoir and, can be easily accessed from the left front corner of the engine compartment.

Certain functions and features of the rear wiper and washer systems rely upon resources shared with other electronic modules in the vehicle over a Local Interface Network (LIN) data bus as well as over the Controller Area Network (CAN) data bus. Other electronic modules in the vehicle that may affect rear wiper and washer system operation are:

- **Body Control Module** - The Body Control Module (BCM) is located within the instrument panel on the driver side of the vehicle. Refer to **MODULE, BODY CONTROL, DESCRIPTION** .
- **Right Multifunction Switch** - The right multifunction switch is integral to the Steering Column Control Module (SCCM) mounting housing along with the clockspring and the left multifunction switch on the top of the steering column just below the steering wheel. The right multifunction switch is connected to the Steering Control Module (SCM), which is also internal and integral to the SCCM mounting housing. Only the switch control stalk extending from the right side of the steering column is visible, while the remainder of the switch is concealed beneath the steering column shrouds. The right multifunction switch provides all of the driver controls for the front and rear wiper and washer systems.

- **Steering Control Module** - The Steering Control Module (SCM) is internal and integral to the Steering Column Control Module (SCCM) mounting housing which, along with the left and right multifunction switches and the clockspring, is located on the top of the steering column just below the steering wheel. The SCM is completely concealed within the SCCM mounting housing beneath the steering column shrouds. Refer to **MODULE, STEERING COLUMN, DESCRIPTION** .

Hard wired circuitry connects the rear wiper and washer system components to the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the rear wiper and washer system components through the use of a combination of soldered splices, splice block connectors and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin out and location views for the various wire harness connectors, splices and grounds.

OPERATION

FRONT

0833005928

Fig. 1: Control Knob, Control Stalk & Right Multifunction Switch
Courtesy of CHRYSLER GROUP, LLC

The front wiper and washer system is designed to provide the vehicle operator with a convenient, safe and reliable means of maintaining visibility through the windshield glass. The various components of this system are designed to convert electrical energy produced and stored by the vehicle electrical system into the mechanical action of the wiper blades to wipe the outside surface of the glass, as well as into the hydraulic action of the washer system to apply washer fluid stored in an on-board reservoir to the area of the glass to be

wiped. When combined, these components provide the means to effectively maintain clear visibility for the vehicle operator by removing excess accumulations of rain, snow, bugs, mud or other minor debris from the outer surface of the windshield glass that might be encountered while driving the vehicle under numerous types of inclement operating conditions.

The vehicle operator initiates all front and rear wiper and washer system functions with the control knob (2) and control sleeve (3) on the control stalk (1) of the right multifunction switch that extends from the right side of the steering column, just below the steering wheel. Rotating the control knob on the end of the control stalk, selects the Off, Delay (except with the optional automatic wiper system), Automatic (with the optional automatic wiper system only), Low or High front wiper system operating modes. In the Delay mode, the control knob also allows the vehicle operator to select from one of four intermittent wipe Delay intervals. In the Automatic mode, the control knob allows the vehicle operator to select from one of four automatic wiper sensitivity levels.

Pulling the control stalk rearward actuates the momentary front washer system switch, which selects the Wash and Wipe-After-Wash modes depending upon when and how long the switch is held closed. Raising the control stalk upward actuates another momentary switch and selects the Mist mode, which cycles the wiper blades for as long as the switch is held closed then completes the current cycle and parks the blades at the base of the windshield after the control stalk is released.

The right multifunction switch provides hard wired digital inputs to the Steering Control Module (SCM) internal to the Steering Column Control Module (SCCM) mounting housing for all of the wiper and washer system functions. The SCM then sends electronic **wiper switch** and **washer switch** status messages to the Body Control Module (BCM) over the Controller Area Network (CAN) data bus requesting the appropriate wiper and washer system operating modes.

Front wiper and washer system operation is completely controlled by the SCM and BCM logic circuits, and that logic will only allow these systems to operate when the status of the ignition is Accessory or On. The BCM uses intelligent, high current, self-protected high side switches to control integrated wiper relays that control wiper system operation by energizing or de-energizing the wiper motor low and high speed brushes. The right multifunction switch circuitry receives battery current and a clean ground output from the SCM, then provides digital inputs to the SCM to indicate the selected wiper and washer system mode.

The hard wired circuits and components of the front wiper and washer system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the electronic controls and communication between other modules and devices that provide some features of the front wiper and washer system. The most reliable, efficient and accurate means to diagnose the front wiper and washer system or the electronic controls and communication related to front wiper and washer system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

OPERATING MODES

Following are paragraphs that briefly describe the operation of each of the front wiper and washer system operating modes.

- **Continuous Wipe Mode** - When the Low position of the control knob on the control stalk of the right multifunction switch is selected the SCM sends an electronic **wiper switch low** status message to the

BCM over the CAN data bus. The BCM then directs battery current to the low speed brush of the wiper motor, causing the wipers to cycle at low speed.

When the High position of the control knob is selected the SCM sends an electronic **wiper switch high** status message to the BCM. The BCM then directs battery current to the high speed brush of the wiper motor, causing the wipers to cycle at high speed.

When the Off position of the right multifunction switch control knob is selected, the SCM sends an electronic **wiper switch off** status message to the BCM, then one of two events will occur. The event that occurs depends upon the position of the wiper blades on the windshield at the moment that the control knob Off position is selected.

If the wiper blades are in the down position on the windshield when the Off position is selected, the park switch that is integral to the wiper motor is closed to ground, which provides a hard wired park switch sense input to the BCM. The BCM then de-energizes the wiper motor and the wiper motor ceases to operate.

If the wiper blades are not in the down position on the windshield at the moment the Off position is selected, the park switch is an open circuit and the BCM continues running the wiper motor at low speed until the wiper blades are in the down position on the windshield and the park switch input to the BCM is again closed to ground.

- **Intermittent Wipe Mode** - The following applies to vehicles not equipped with the optional automatic wiper system, or to vehicles equipped with the automatic wiper system that have had that feature disabled using the customer programmable features function.

  When the control knob on the control stalk of the right multifunction switch is moved to one of the four Delay interval positions the SCM sends an electronic **wiper switch delay interval** status message to the BCM. Then the BCM electronic intermittent wipe logic circuit responds by calculating the correct length of time between wiper sweeps based upon the selected delay interval input.

  The BCM monitors the changing state of the wiper motor park switch through a hard wired park switch sense input. This input allows the BCM to determine the proper intervals at which to energize and de-energize the wiper motor low speed brush to operate the wiper motor intermittently for one low speed cycle at a time.

  The BCM logic is also programmed to provide vehicle speed sensitivity to the selected intermittent wipe delay intervals. In order to provide this feature, the BCM monitors electronic **vehicle speed** messages from the Controller Antilock Brake (CAB) (also known as the Antilock Brake Module/ABM, the Antilock Brake System/ABS module or the Electronic Stability Control/ESC module) and doubles the selected delay interval whenever the vehicle speed is about 16 kilometers-per-hour (10 miles-per-hour) or less.

- **Automatic Wipe Mode** - If the vehicle is equipped with the optional automatic wiper system and it is enabled, when the control knob on the control stalk of the right multifunction switch is moved to one of the four sensitivity positions, the SCM sends an electronic **wiper switch sensitivity** message to the BCM over the CAN data bus. The BCM, which is also a Local Interface Network (LIN) data bus master node,

relays the **wiper switch sensitivity** message to the Light Rain Sensor Module (LRSM) (also known as the Rain Light Sensor Module/RLSM, the Light Sensor Module/LSM or the Rain Sensor Module/RSM), which is a LIN slave node over the LIN data bus.

The LRSM monitors an area within the wipe pattern of the windshield glass for the accumulation of moisture. Based upon internal programming and the selected sensitivity level, when sufficient moisture has accumulated the LRSM sends the appropriate electronic **wipe command** messages back to the BCM over the LIN data bus. Then the BCM operates the wiper system accordingly.

As the sensitivity level is set higher, the LRSM is more sensitive to moisture accumulation and will send **wipe commands** more frequently. The third (middle) sensitivity position of the control knob is designed to provide optimal wiper performance for most typical driving requirements. The BCM logic is also programmed to provide an immediate wipe cycle each time the control knob on the control stalk of the multifunction switch is moved from the Off position to one of the four sensitivity positions, and another immediate wipe cycle each time the control knob is moved from a lower sensitivity position to a higher sensitivity position.

Also, if a vehicle is equipped with automatic wipers but the feature has been disabled using the customer programmable features function, when any sensitivity position is selected with the right multifunction switch control knob the system will respond in the same manner as in the intermittent wipe mode. The automatic wiper system has features designed to protect the mechanical components of the wiper system, and will not allow automatic wiper operation under the following conditions:

- **Low Ambient Temperature** - When the ambient temperature is below 0° C (32° F), the automatic wipers will not operate during a new ignition cycle until the wiper switch has been moved to a different position than that which was selected at the moment the current ignition cycle began, or until a vehicle speed input is detected.
- **Transmission In Neutral** - When the transmission gear selector is placed in the Neutral **N** position while the ignition status is On, the automatic wipers will not operate during the current ignition cycle until the wiper switch has been moved to a different position than that which was selected at the moment that Neutral **N** was selected, until the vehicle speed is greater than 8 kilometers-per-hour (5 miles-per-hour) or until the transmission gear selector is moved out of the Neutral **N** position, whichever occurs first.

- **Mist Wipe Mode** - When the control stalk of the right multifunction switch is lifted upward to the momentary Mist position, the SCM sends an electronic **wiper mist mode** status message to the BCM. The BCM then energizes the low speed brush of the wiper motor for as long as the switch is held closed, then de-energizes the motor when the state of the switch changes to open, parking the wiper blades near the base of the windshield. The BCM can operate the wiper motor in this mode for only one low speed cycle at a time, or for an indefinite number of sequential low speed cycles, depending upon how long the switch is held closed.
- **Headlamps On With Wipers Mode** - The circuitry of the BCM provides an automatic Headlamps On With Wipers mode for vehicles equipped with the optional automatic headlamps. This is a customer programmable feature that can be enabled or disabled through the Electronic Vehicle Information Center (EVIC). If this feature is enabled, when the headlamp switch is in the Auto position, the headlamps will turn On automatically whenever the windshield wipers are turned On; and, if the headlamps were turned On automatically when the wipers were turned On, they will also turn Off automatically when the wipers are turned Off.

If this feature is enabled in vehicles equipped with the optional automatic wiper feature, when the automatic wiper mode is selected the headlamps will turn On automatically only after the wipers complete three automatic wipe cycles within about 30 seconds, and they will turn Off automatically after 3 minutes elapse without any automatic wipe cycles unless ambient light conditions dictate otherwise.

- **Wash Mode** - When the control stalk of the right multifunction switch is pulled rearward to the momentary Wash position for more than about one-half second with the wiper system operating, the SCM sends an electronic **washer switch** status message to the BCM. Then the BCM directs battery current and ground to the washer pump/motor. This will cause the washer pump/motor to be energized for as long as the switch is held closed (up to approximately 20 seconds) and to be de-energized when the control stalk is released.

  When the control stalk is pulled to the momentary Wash position while the wiper system is operating in one of the Delay interval (or sensitivity level with automatic wipers) positions, the washer pump/motor operation is the same. However, the BCM logic also overrides the selected delay interval or sensitivity level and operates the wiper motor in a continuous low speed mode for as long as the control stalk is held in the momentary Wash position, then reverts to the selected delay interval or sensitivity level several wipe cycles after the control stalk is released. If the Wash switch is held closed for more than about 20 seconds, the BCM will suspend washer pump/motor operation until the control stalk is released for about 2 seconds, then cycled back to the Wash position.

- **Wipe-After-Wash Mode** - When the control stalk of the right multifunction switch is pulled rearward to the momentary Wash position for more than about one-half second while the wiper system is not operating, the SCM sends an electronic **washer switch** status message to the BCM. Then the BCM directs battery current and ground to operate the washer pump/motor and energizes the wiper motor in a continuous low speed mode for as long as the switch is held closed (up to approximately 20 seconds). When the control stalk is released, the BCM de-energizes the washer pump/motor immediately, but allows the wiper motor to operate for two or three additional wipe cycles before it de-energizes the wiper motor and parks the wiper blades near the base of the windshield.

  If the control stalk is pulled rearward for more than about 20 seconds, the BCM will suspend washer pump/motor operation until the stalk is released for about 2 seconds and then cycled back to the Wash position; however, the wipers will continue to operate for as long as the switch is held closed. The BCM monitors the changing state of the wiper motor park switch through a hard wired wiper park switch sense circuit input. This input allows the BCM to count the number of wipe cycles that occur after the control stalk is released, and to determine the proper interval at which to de-energize the wiper motor to complete the Wipe-After-Wash mode cycle.

HEADLAMP

The headlamp washer system is designed to provide the vehicle operator with a convenient, safe, and reliable means of maintaining High Intensity Discharge (HID) headlamp lighting performance. The various components of this system are designed to convert electrical energy produced by the vehicle electrical system into the hydraulic action of the washer system to apply washer fluid stored in an on-board reservoir to the lenses of the two front lamp units, removing excess accumulations of snow, ice, bugs, mud, or other minor debris from the front lamps that might be encountered while driving the vehicle under numerous types of inclement operating conditions.

The vehicle operator initiates the headlamp washer system function using the control stalk of the right multifunction switch that extends from the right side of the steering column, just below the steering wheel. While the HID headlamp low beams are turned On, pulling the control stalk rearward towards the steering wheel beyond the actuation point for more than about 100 milliseconds (0.10 second) activates the front washer pump/motor. During any ignition cycle, the first time the front washer pump/motor is activated and; thereafter, each eleventh time the front washer pump/motor is activated, the headlamp washer pump/motor cycle is also activated.

Each time the headlamp washers are employed, the headlamp washer pump/motor is activated using a two shot strategy. The initial shot wets the lenses of the HID headlamps. The lenses are then allowed to soak for a short interval before a second shot is dispensed to rinse the lenses. Each shot results in several high pressure streams of washer fluid being dispensed upon the headlamp lenses by the headlamp washer nozzles.

Headlamp washer system operation is completely controlled by the Body Control Module (BCM) logic circuits based upon programming and electronic **wash command** message inputs received from the Steering Control Module (SCM) internal to the Steering Column Control Module (SCCM) for all of the wiper and washer system functions. The SCM then sends electronic **wiper switch** and **washer switch** status messages to the BCM over the Controller Area Network (CAN) data bus requesting the appropriate wiper and washer system operating modes.

The BCM will only allow this system to operate when the status of the ignition is On and the headlamp low beams are turned On. When the appropriate inputs are monitored and the appropriate programming requirements have been met, the BCM provides the appropriate output to the headlamp washer relay integral to the Printed Circuit Board (PCB) within the Power Distribution Center (PDC). The BCM uses a Low Side Driver (LSD) to energize or de-energize the headlamp washer relay which, in turn, controls the operation of the headlamp washer pump/motor unit.

The hard wired circuits and components of the headlamp washer system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the headlamp washer system or the electronic controls and communication between other modules and devices that provide some features of the headlamp washer system. The most reliable, efficient and accurate means to diagnose the headlamp washer system or the electronic controls and communication related to headlamp washer system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REAR

0833005928

Fig. 2: Control Knob, Control Stalk & Right Multifunction Switch
Courtesy of CHRYSLER GROUP, LLC

The rear wiper and washer system is designed to provide the vehicle operator with a convenient, safe, and reliable means of maintaining visibility through the liftgate glass. The various components of this system are designed to convert electrical energy produced by the vehicle electrical system into the mechanical action of the wiper blade to wipe the outside surface of the glass, as well as into the hydraulic action of the washer system to apply washer fluid stored in an on-board reservoir to the area of the glass to be wiped. When combined, these components provide the means to effectively maintain clear visibility for the vehicle operator by removing excess accumulations of rain, snow, bugs, mud, or other minor debris from the outer surface of the liftgate glass that might be encountered while driving the vehicle under numerous types of inclement operating conditions.

The vehicle operator initiates all rear wiper and washer system functions with the control sleeve (3) and the control stalk (1) of the right (wiper) multifunction switch that extends from the right side of the steering column, just below the steering wheel. Rotating the control sleeve to a detent position selects the Off or Delay (Intermittent) rear wiper system operating modes. Pushing the control stalk to a momentary forward position actuates the rear washer system switch, which selects the rear wash mode and dispenses washer fluid in the wipe pattern on the liftgate glass for as long as the switch is held closed.

The right multifunction switch provides hard wired digital inputs to the Steering Control Module (SCM) internal to the Steering Column Control Module (SCCM) mounting housing for all of the wiper and washer system functions. The SCM then sends electronic **wiper switch** and **washer switch** status messages to the Body Control Module (BCM) over the Controller Area Network (CAN) data bus requesting the appropriate wiper and washer system operating modes.

Rear wiper and washer system operation is completely controlled by the SCM and BCM logic circuits, and that logic will only allow these systems to operate when the status of the ignition is Accessory or On. The BCM uses

a High Side Driver (HSD) to control rear wiper system operation by energizing or de-energizing the rear wiper motor. The right multifunction switch circuitry receives battery current and a clean ground output from the SCM, then provides digital inputs to the SCM to indicate the selected wiper and washer system mode.

The hard wired circuits and components of the rear wiper and washer system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the rear wiper and washer system or the electronic controls and communication between other modules and devices that provide some features of the rear wiper and washer system. The most reliable, efficient and accurate means to diagnose the rear wiper and washer system or the electronic controls and communication related to rear wiper and washer system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

OPERATING MODES

Following are paragraphs that briefly describe the operation of each of the rear wiper and washer system operating modes.

- **Intermittent Wipe Mode** - When the right (wiper) multifunction switch control sleeve is moved to the Delay (Intermittent) position, the SCM sends an electronic **rear wiper switch on** status message to the BCM over the CAN data bus. The BCM responds by energizing a High Side Driver (HSD) that directs battery current to the rear wiper motor. If the front wiper system is inactive, the BCM will cycle the rear wiper at a fixed intermittent speed. If the front wiper system is active, the BCM cycles the rear wiper in a synchronous manner, at one-half the speed of the front wipers. If Reverse (**R**) has been selected with the transmission gear selector, the BCM operates the rear wiper in a continuous manner.

  When the Off position of the right multifunction switch control sleeve is selected, the SCM sends an electronic **rear wiper switch off** status message to the BCM over the CAN data bus. The event that occurs depends upon the position of the wiper blade on the liftgate glass at the moment that the control sleeve Off position is selected.

  If the rear wiper blade is in the down position on the glass when the Off position is selected, the park switch that is integral to the rear wiper motor is an open circuit, which provides a hard wired park switch sense input to the BCM. The internal BCM circuitry pulls the park switch sense input to ground when the switch is open so that the microcontroller sees a ground when the wiper blade is parked. The BCM then de-energizes the rear wiper motor and the wiper motor ceases to operate.

  If the rear wiper blade is not in the down position on the liftgate glass at the moment the Off position is selected, the park switch is closed to fused ignition output and the BCM continues running the wiper motor at low speed until the rear wiper blade is in the down position on the liftgate glass and the park switch input to the BCM is again pulled to ground.

- **Wash Mode** - When the control stalk of the right (wiper) multifunction switch is pushed forward to the momentary rear Wash position, the SCM sends an electronic **washer switch** status message to the BCM. Then the BCM directs battery current and ground to the washer pump/motor. This will cause the washer pump/motor to be energized for as long as the switch is held closed (up to approximately 20 seconds) and to be de-energized when the control stalk is released.

When the control stalk is pushed forward to the momentary Wash position while the rear wiper system is operating the washer pump/motor operation is the same. However, the BCM logic also overrides the selected wiper operating mode and operates the wiper motor in a continuous low speed mode for as long as the control stalk is held in the momentary Wash position, then reverts to the selected operating mode several wipe cycles after the control stalk is released. If the Wash switch is held closed for more than about 20 seconds, the BCM will suspend washer pump/motor operation until the control stalk is released for about 2 seconds, then cycled back to the Wash position.

- **Wipe-After-Wash Mode** - When the control stalk of the right (wiper) multifunction switch is pushed forward to the momentary rear Wash position for more than about one-half second while the rear wiper system is not operating, the BCM directs battery current and ground to the washer pump/motor and energizes the rear wiper motor in a continuous mode for as long as the switch is held closed. When the control stalk is released, the BCM de-energizes the washer pump/motor immediately, but allows the rear wiper motor to operate for about three additional wipe cycles. An additional wipe cycle is performed about six seconds later before the BCM de-energizes the rear wiper motor and parks the wiper blade near the base of the liftgate glass.

  The BCM monitors the changing state of the wiper motor park switch through a hard wired wiper park switch sense circuit input. This input allows the BCM to monitor the number of wipe cycles that occur after the control stalk is released, and to determine the proper interval at which to de-energize the wiper motor to complete the Wipe-After-Wash mode cycle.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - FRONT WIPER AND WASHER SYSTEM

WARNING: **To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.**

If the front wiper motor operates, but the wipers do not move on the windshield, replace the ineffective front wiper motor or wiper linkage module. If the washer pump/motor operates, but no washer fluid is dispensed on the glass; or, if the wipers operate, but chatter, lift or do not clear the glass, clean and inspect the front wiper and washer system components as required. Refer to **CLEANING** and **INSPECTION**.

The hard wired front wiper and washer system circuits and components may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the front wiper and washer system or the electronic controls and communication between other modules and devices that provide some features of the front wiper and washer system. The most reliable, efficient and accurate means to diagnose the front wiper and washer system or the electronic controls and communication related to front wiper and washer system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

NOTE: **The front wiper and washer switches are integral to the right multifunction switch in the Steering Column Control Module (SCCM) mounting housing. The right multifunction switch communicates with the Steering Control Module (SCM), which is also internal and integral to the SCCM mounting housing. The SCM communicates with the Body Control Module (BCM) over the Controller Area Network (CAN) data bus. The BCM controls front wiper motor operation through wiper relays that are integral to the Printed Circuit Board (PCB) within the BCM.**

Before performing any of the following tests, determine whether the other functions of the right multifunction switch are operational. If other right multifunction switch functions are ineffective, diagnose and repair that problem before attempting to repair the Wiper and Washer System.

FRONT WIPER AND WASHER SYSTEM DIAGNOSIS		
CONDITION	POSSIBLE CAUSES	CORRECTION
WIPER MOTOR DOES NOT OPERATE IN ANY SWITCH POSITION	1. Ineffective motor ground circuit.	1. Test and repair open wiper motor ground circuit if required.
	2. Ineffective motor feed circuits.	2. Test and repair low speed and high speed feed circuits between BCM and wiper motor if required.
	3. Ineffective SCM inputs or outputs.	3. Use a diagnostic scan tool and the appropriate diagnostic information for further SCM diagnosis.
	4. Ineffective BCM inputs or outputs.	4. Use a diagnostic scan tool and the appropriate diagnostic information for further BCM diagnosis.
	5. Ineffective wiper motor.	5. Test and replace open or shorted wiper motor as required.
WIPERS DO NOT PARK CORRECTLY	1. Ineffective wiper motor park switch input circuit.	1. Test and repair wiper park switch input circuit between BCM and wiper motor if required.
	2. Ineffective BCM inputs or outputs.	2. Use a diagnostic scan tool and the appropriate diagnostic information for further BCM diagnosis.
	3. Ineffective wiper motor park switch.	3. Test and replace wiper motor if required.
	1. Ineffective wiper motor.	1. Check amperage draw with linkage

WIPER MOTOR OPERATES SLOWLY IN ALL SWITCH POSITIONS		disconnected from wiper motor output shaft. Correct draw should be about 2 amperes on Low speed, or 3 amperes on High speed. If incorrect, refer to the appropriate Possible Cause that follows:
	2. Amperage draw too low.	2. Test and repair shorted low and high speed feed circuits if required.
	3. Amperage draw too high.	3. With linkage disconnected from wiper motor output shaft, check linkage and pivots for binding. If binding is detected, repair or replace wiper linkage module if required. If no linkage binding detected, replace the wiper motor if required.
WIPERS RUN AT HIGH SPEED WITH SWITCH LOW SPEED SELECTED OR AT LOW SPEED WITH SWITCH HIGH SPEED SELECTED	1. Ineffective motor feed circuit wiring.	1. Test and repair low speed and high speed feed circuits between BCM and wiper motor if required.
AUTOMATIC WIPERS ONLY ARE INOPERATIVE	1. Automatic wipers (Rain Sensing) feature has been disabled.	1. Be certain that the automatic wipers (Rain Sensing) feature is enabled in the Customer Programmable Features Settings menu.
WASHER PUMP DOES NOT OPERATE	1. Ineffective washer pump ground circuit.	1. Test and repair open washer pump ground circuit if required.
	2. Ineffective washer pump feed circuits.	2. Test and repair washer pump feed circuits between BCM and washer pump if required.
	3. Ineffective SCM inputs or outputs.	3. Use a diagnostic scan tool and the appropriate diagnostic information for further SCM diagnosis.
	4. Ineffective BCM inputs or outputs.	4. Use a diagnostic scan tool and the appropriate diagnostic information for further BCM diagnosis.
	5. Ineffective washer pump.	5. Test and replace open or shorted washer pump if required.

DIAGNOSING FALSE WIPES (AUTOMATIC WIPER ONLY)

False wipes are unnecessary wipes that occur when the control knob of the right multifunction switch is in one of the four automatic wiper sensitivity positions and no rain or moisture is apparent within the wipe pattern on the windshield glass. Because this system is designed to operate whenever it detects moisture, if the switch is in one of the automatic wiper sensitivity positions any road spray, bug splatters or mist from passing cars or trucks may occasionally cause the wipers to cycle. These are normal characteristics of this system and are not false wipes.

False wipes generally are the result of foreign material or flaws that interfere with the system optics. The optics for this system allow the Light Rain Sensor Module (LRSM) (also known as the Rain Light Sensor Module/RLSM, the Light Sensor Module/LSM or the Rain Sensor Module/RSM) to precisely transmit several

InfraRed (IR) light beams and monitor the intensity of these beams reflected from the outer surface of the windshield glass to determine the presence of moisture. The sensitivity of this system is such that anything that distorts the focus or intensity of the IR light beams or impacts the ability of the photo diodes within the LRSM to see and accurately measure these light beams can result in the LRSM logic misinterpreting the resulting input data as moisture on the windshield. The optics for this system include the lenses of the LRSM, the adhesive silicone gelatin (SilGel) layer that bonds the LRSM to the inside of the windshield and the windshield glass.

The following procedure should only be used if false wipe occurrences are frequent and persistent. Perform diagnosis of the wiper system, the right multifunction switch, the Steering Control Module (SCM) and the LRSM using a diagnostic scan tool and the appropriate diagnostic procedures before performing the following:

NOTE: The Light Rain Sensor Module (LRSM) mounting bracket is serviced as a unit with the windshield glass. If either the bracket or the glass is ineffective or damaged, the entire LRSM bracket and windshield glass unit must be replaced. Also, if the LRSM is removed from the mounting bracket for any reason, the integrity of the adhesive silicone gelatin (SilGel) layer of the LRSM will be compromised and the silicone gelatin pad must be replaced with a new unit.

1. Carefully inspect the outer surface of the windshield glass for physical damage, including scratches, cracks or chips in the vicinity of the LRSM mounting bracket. **Scratches, cracks or chips in the windshield glass outside the area of the LRSM mounting bracket lenses will not cause false wipes.** If OK, go to Step 2. If not OK, replace the damaged windshield.
2. From the outside of the windshield glass, carefully inspect the adhesive layer between the windshield glass and the LRSM bracket for any large voids (air pockets). If an adhesive void greater than about 1 millimeter (0.04 inch) is observed, replace the flawed silicone gelatin pad. If OK, go to Step 3.
3. Lightly pull the LRSM away from the windshield bracket to confirm that both sides of the spring steel LRSM mounting band are fully engaged with the mounting bracket on the inside of the windshield glass. If OK, go to Step 4. If not OK, install the LRSM mounting band onto the bracket as required.
4. Remove the LRSM from the mounting bracket. Carefully inspect the LRSM mounting bracket for any physical damage and inspect the windshield glass area within the LRSM mounting bracket for contamination. If OK, go to Step 5. If contaminated, clean any foreign material from the windshield glass using rubbing alcohol and a lint-free cloth. If damaged, replace the damaged LRSM bracket and windshield as a unit.
5. Carefully replace the LRSM with a new unit. Refer to **MODULE, LIGHT RAIN SENSOR, INSTALLATION**.

DIAGNOSIS AND TESTING - HEADLAMP WASHER SYSTEM

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to

disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

Before attempting to diagnose the headlamp washer system, confirm whether the front washer system operates satisfactorily. If the front washer system is ineffective or operates improperly, diagnose and repair that problem before attempting to repair the headlamp washer system. If the front washer system operates satisfactorily and the headlamp washer pump/motor unit operates, but both headlamp washer nozzles do not dispense washer fluid on the front lamp unit lenses, inspect the headlamp washer plumbing for pinched or leaking hoses and fittings. If the headlamp washer pump/motor unit does not operate, check the headlamp washer system fuse.

The hard wired headlamp washer system circuits and components may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the headlamp washer system or the electronic controls and communication between other modules and devices that provide some features of the headlamp washer system. The most reliable, efficient and accurate means to diagnose the headlamp washer system or the electronic controls and communication related to headlamp washer system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

DIAGNOSIS AND TESTING - REAR WIPER AND WASHER SYSTEM

WARNING: **To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.**

If the rear wiper motor operates, but the wiper motor output shaft does not move, replace the ineffective rear wiper motor. If the washer pump/motor operates, but no washer fluid is dispensed on the glass; or, if the wiper operates, but chatters, lifts, or does not clear the glass, clean and inspect the rear wiper and washer system components as required. Refer to **CLEANING** and **INSPECTION**.

The hard wired rear wiper and washer system circuits and components may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the electronic controls and communication between other modules and devices that provide some features of the rear wiper and washer system. The most reliable, efficient and accurate means to diagnose the rear wiper and washer system or the

electronic controls and communication related to rear wiper and washer system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

NOTE: **The rear wiper and washer switches are integral to the right multifunction switch in the Steering Column Control Module (SCCM). The right multifunction switch communicates with the Steering Control Module (SCM), which is also integral to the SCCM. The SCM communicates with the Body Control Module (BCM) over the Controller Area Network (CAN) data bus. The BCM controls rear wiper motor operation through the rear wiper relay that is integral to the Printed Circuit Board (PCB) within the BCM.**

Before performing any of the following tests, determine whether the other functions of the right multifunction switch are operational. If other right multifunction switch functions are ineffective, diagnose and repair that problem before attempting to repair the Rear Wiper and Washer System.

REAR WIPER AND WASHER SYSTEM DIAGNOSIS		
CONDITION	**POSSIBLE CAUSES**	**CORRECTION**
WIPER MOTOR DOES NOT OPERATE IN ANY SWITCH POSITION	1. Ineffective motor ground circuit.	1. Test and repair open wiper motor ground circuit if required.
	2. Ineffective motor feed circuits.	2. Test and repair motor feed circuit between BCM and rear wiper motor if required.
	3. Ineffective SCM inputs or outputs.	3. Use a diagnostic scan tool and the appropriate diagnostic information for further SCM diagnosis.
	4. Ineffective BCM inputs or outputs.	4. Use a diagnostic scan tool and the appropriate diagnostic information for further BCM diagnosis.
	5. Ineffective wiper motor.	5. Test and replace open or shorted wiper motor if required.
WIPER DOES NOT PARK CORRECTLY	1. Ineffective wiper motor park switch input circuit.	1. Test and repair wiper park switch input circuit between BCM and rear wiper motor if required.
	2. Ineffective BCM inputs or outputs.	2. Use a diagnostic scan tool and the appropriate diagnostic information for further BCM diagnosis.
	3. Ineffective wiper motor park switch.	3. Test and replace rear wiper motor if required.
	1. Ineffective wiper motor.	1. Check amperage draw with wiper arm disconnected from rear wiper motor output shaft. Correct draw should be about 6 amperes. If incorrect, refer to the appropriate Possible Cause that follows:

WIPER MOTOR OPERATES SLOWLY	2. Amperage draw too low.	2. Test and repair shorted rear wiper motor signal and fused ignition switch output (run - accessory) circuits if required.
	3. Amperage draw too high.	3. With wiper arm disconnected from wiper motor output shaft check for binding between output shaft and motor output shaft housing. If binding is detected, lubricate if required. If no binding is detected, replace the wiper motor if required.
WASHER PUMP DOES NOT OPERATE	1. Ineffective washer pump ground circuit.	1. Test and repair open washer pump ground circuit if required.
	2. Ineffective washer pump feed circuit.	2. Test and repair washer pump feed circuit between BCM and washer pump if required.
	3. Ineffective SCM inputs or outputs.	3. Use a diagnostic scan tool and the appropriate diagnostic information for further SCM diagnosis.
	4. Ineffective BCM inputs or outputs.	4. Use a diagnostic scan tool and the appropriate diagnostic information for further BCM diagnosis.
	5. Ineffective washer pump.	5. Test and replace open or shorted washer pump if required.

CLEANING

FRONT WASHER SYSTEM

CAUTION: Never introduce petroleum-based cleaners, solvents, or contaminants into the washer system. These products can rapidly deteriorate the rubber

seals and hoses of the washer system, as well as the rubber squeegees of the wiper blades.

CAUTION: Never use compressed air to flush the washer system plumbing. Compressed air pressures are too great for the washer system plumbing components and will result in further system damage. Never use sharp instruments to clear a plugged washer nozzle or damage to the nozzle orifice and improper nozzle spray patterns will result.

If the washer system is contaminated with foreign material, drain the washer reservoir by removing the washer pump/motor unit from the reservoir. Clean foreign material from the inside of the washer pump inlet filter screen and the washer reservoir using clean washer fluid, a mild detergent or a non-abrasive cleaner. Flush foreign material from the washer system plumbing by first disconnecting the washer hoses from the washer nozzles, then running the washer pump/motor to run clean washer fluid or water through the system. Plugged or restricted front washer nozzles cannot be back-flushed due to the integral check valve mechanism. If the washer nozzle obstruction cannot be cleared, replace the washer nozzle.

FRONT WIPER SYSTEM

CAUTION: Protect the rubber squeegees of the wiper blades from any petroleum-based cleaners, solvents, or contaminants. These products can rapidly deteriorate the rubber squeegees.

The squeegees of wiper blades exposed to the elements for a long time tend to lose their wiping effectiveness. Periodic cleaning of the squeegees is suggested to remove any deposits of salt or road film. The wiper blades, arms and windshield glass should only be cleaned using a sponge or soft cloth and windshield washer fluid, a mild detergent or a non-abrasive cleaner. If the wiper blades continue to leave streaks, smears, hazing or beading on the glass after thorough cleaning of the squeegees and the glass, the entire wiper blade assembly must be replaced.

REAR WASHER SYSTEM

CAUTION: Never introduce petroleum-based cleaners, solvents or contaminants into the washer system. These products can rapidly deteriorate the rubber seals and hoses of the washer system, as well as the rubber squeegee of the wiper blade.

CAUTION: Never use compressed air to flush the washer system plumbing. Compressed air pressures are too great for the washer system plumbing components and will result in further system damage. Never use sharp instruments to clear a plugged washer nozzle or damage to the nozzle orifice and improper nozzle spray patterns will result.

If the washer system is contaminated with foreign material, drain the washer reservoir by removing the washer pump/motor from the reservoir. Clean foreign material from the inside of the washer pump/motor inlet filter

screen and the washer reservoir using clean washer fluid, a mild detergent, or a non-abrasive cleaner. Flush foreign material from the washer system plumbing by first disconnecting the washer hose from the rear washer nozzle, then running the washer pump/motor to run clean washer fluid or water through the system. A plugged or restricted rear washer nozzle cannot be back-flushed due to the integral check valve mechanism. If the rear washer nozzle obstruction cannot be cleared, replace the rear washer nozzle.

REAR WIPER SYSTEM

CAUTION: Protect the rubber squeegee of the wiper blade from any petroleum-based cleaners, solvents or contaminants. These products can rapidly deteriorate the rubber squeegee.

The squeegee of a wiper blade exposed to the elements for a long time tends to lose its wiping effectiveness. Periodic cleaning of the squeegee is suggested to remove any deposits of salt or road film. The wiper blade, arm, and liftgate glass should only be cleaned using a sponge or soft cloth and windshield washer fluid, a mild detergent, or a non-abrasive cleaner. If the wiper blade continues to leave streaks, smears, hazing, or beading on the glass after thorough cleaning of the squeegees and the glass, the entire wiper blade assembly must be replaced.

INSPECTION

FRONT WASHER SYSTEM

The washer system components should be inspected periodically, not just when washer performance problems are experienced. This inspection should include the following points:

1. Check for ice or other foreign material in the washer reservoir. If contaminated, clean and flush the washer system. Refer to **CLEANING**.
2. Inspect the washer plumbing for pinched, leaking, deteriorated or incorrectly routed hoses and damaged or disconnected hose fittings. Replace damaged or deteriorated hoses and hose fittings. Leaking washer hoses can sometimes be repaired by cutting the hose at the leak and splicing it back together using an in-line connector fitting. Similarly, sections of deteriorated hose can be cut out and replaced by splicing in new sections of hose using in-line connector fittings. Whenever routing a washer hose or a wire harness containing a washer hose, it must be routed away from hot, sharp, or moving parts. Also, sharp bends that might pinch the washer hose must be avoided.

FRONT WIPER SYSTEM

Fig. 3: Wiper Blades And Wiper Arms
Courtesy of CHRYSLER GROUP, LLC

The wiper blades and wiper arms should be inspected periodically, not just when wiper performance problems are experienced. This inspection should include the following points:

1. Carefully inspect the wiper blades for any indications of worn or uneven edges (1), foreign material deposits (2), hardening or cracking (3), deformation or fatigue (4) or splitting (5). Inspect the wiper blade support components and the wiper arms for damage (6) or corrosion. If the wiper arms and blades are contaminated with any foreign material, clean them and the glass as required. Refer to **CLEANING**. If a wiper blade or arm is damaged, or if corrosion is evident, replace the affected wiper arm or blade with a new unit. Do not attempt to repair a wiper arm or blade that is damaged or corroded.
2. Carefully lift the wiper blade off of the glass. Note the action of the wiper arm hinge. The wiper arm should pivot freely at the hinge, but with no lateral looseness evident. If there is any binding evident in the wiper arm hinge, or if there is evident lateral play in the wiper arm hinge, replace the wiper arm.

CAUTION: Do not allow the wiper arm to spring back against the glass without the wiper blade in place or the glass may be damaged.

3. Once proper hinge action of the wiper arm is confirmed, check the hinge for proper spring tension. Remove the wiper blade from the wiper arm. Either place a small postal scale between the blade end of the wiper arm and the glass, or carefully lift the blade end of the arm away from the glass using a small fish scale. On vehicles with unequal wiper arm lengths, be certain that measurements on both arms are taken at a point an equal distance from their wiper arm hinge pins. Compare the scale readings between

the right and left wiper arms. Replace a wiper arm if it has comparatively lower spring tension, as evidenced by a lower scale reading.

4. After cleaning and inspecting the wiper components and the glass, if the wiper blade still fails to clear the glass without smearing, streaking, chattering, hazing or beading, replace the wiper blade.

REAR WASHER SYSTEM

The washer system components should be inspected periodically, not just when washer performance problems are experienced. This inspection should include the following points:

1. Check for ice or other foreign material in the washer reservoir. If contaminated, clean and flush the washer system. Refer to **CLEANING**.
2. Inspect the washer plumbing for pinched, leaking, deteriorated, or incorrectly routed hoses and damaged or disconnected hose fittings. Replace damaged or deteriorated hoses and hose fittings. Leaking washer hoses can sometimes be repaired by cutting the hose at the leak and splicing it back together using an in-line connector fitting. Similarly, sections of deteriorated hose can be cut out and replaced by splicing in new sections of hose using in-line connector fittings. Whenever routing a washer hose or a wire harness containing a washer hose, it must be routed away from hot, sharp, or moving parts. Also, sharp bends that might pinch the washer hose must be avoided.

REAR WIPER SYSTEM

Fig. 4: Inspecting Wiper Blades
Courtesy of CHRYSLER GROUP, LLC

The rear wiper blade and wiper arm should be inspected periodically, not just when wiper performance problems are experienced. This inspection should include the following points:

1. Carefully inspect the wiper blade for any indications of worn or uneven edges (1), foreign material deposits (2), hardening or cracking (3), deformation or fatigue (4), or splitting (5). Inspect the wiper blade support components and the wiper arm for damage (6). If the wiper arm and blade are contaminated with any foreign material, clean them and the glass as required. Refer to **CLEANING**. If the wiper blade or arm is damaged, replace it with a new unit. Do not attempt to repair a wiper arm or blade that is damaged or corroded.
2. Carefully lift the wiper blade off of the glass. Note the action of the wiper arm hinge. The wiper arm should pivot freely at the hinge, but with no lateral looseness evident. If there is any binding evident in the wiper arm hinge, or there is evident lateral play in the wiper arm hinge, replace the wiper arm.

CAUTION: Do not allow the wiper arm to spring back against the glass without the wiper blade in place or the glass may be damaged.

3. Once proper hinge action of the wiper arm is confirmed, check the hinge for proper spring tension. The spring tension of the wiper arm should be sufficient to cause the rubber squeegee to conform to the curvature of the glass. Replace a wiper arm if it has insufficient spring tension to maintain contact between the squeegee and the glass.
4. After cleaning and inspecting the wiper components and the glass, if the wiper blade still fails to clear the glass without smearing, streaking, chattering, hazing, or beading, replace the wiper blade.

ARM, WIPER

DESCRIPTION

FRONT

Fig. 5: Stamped Steel Channel, Aluminum Pivot End & Stamped Steel Strap

Courtesy of CHRYSLER GROUP, LLC

The front wiper arms are the rigid members located between the wiper pivots that protrude from the cowl plenum cover/grille panel near the base of the windshield and the wiper blades on the windshield glass. These wiper arms have a somewhat sculpted appearance that actually has a functional purpose. The sculpting is designed to reduce wind buffeting, which helps to reduce wind noise within the passenger compartment of the vehicle.

These wiper arms feature an over-center hinge design that allows easy access to the windshield glass for cleaning. The wiper arm has a die cast aluminum pivot end (2) with a large, internally tapered mounting hole at one end. A molded black plastic cap snaps over the pivot end to conceal the wiper arm retaining nut and the mounting hole following wiper arm installation.

The wide end of a tapered, stamped steel channel (1) hinges on and is secured with a hinge pin to the blade end of the wiper arm pivot end. One end of a rigid stamped steel strap (3), is riveted and crimped within the narrow end of the stamped steel channel. The tip of the wiper blade end of this strap is bent back under itself to form a small hook to cradle the pivot block of the front wiper blade. The entire wiper arm has a satin black finish applied to all of its visible surfaces.

Concealed within the stamped steel channel is a long tension spring which is engaged with a formed wire link hooked over a metal dowel pin that passes through the underside of the pivot end. The opposite end of the spring is hooked over another metal dowel pin that passes through the underside of the steel channel.

The driver and passenger side wiper arms are unique and are not interchangeable. A wiper arm cannot be adjusted or repaired. If damaged or ineffective, the entire wiper arm unit must be replaced.

REAR

Fig. 6: Rear Wiper Arm
Courtesy of CHRYSLER GROUP, LLC

The rear wiper arm is the rigid member located between the rear wiper motor output shaft that protrudes through the liftgate glass above the center of the liftgate glass opening and the wiper blade on the outside of the glass. The wiper arm is constructed of molded black plastic. A hinged pivot end is also molded plastic.

A molded black plastic nut cover (2) with two pivot pins on the back end and snap features on the end nearest the wiper blade fits over the wiper arm retaining nut to conceal the nut and mounting hole following wiper arm installation. The wiper arm hinge and tension spring are concealed on the underside of the wide end of the arm (1), while an integral latch feature (3) concealed on the underside of the narrow end of the wiper arm accepts the pivot pin of the matching molded plastic wiper blade unit.

The rear wiper arm cannot be adjusted or repaired. If damaged or ineffective, the entire wiper arm unit must be replaced.

OPERATION

FRONT

The front wiper arms are designed to mechanically transmit the motion from the wiper pivots to the front wiper blades. The front wiper arm must be properly indexed to the wiper pivot in order to maintain the proper wiper blade travel on the glass. The tapered mounting hole in the wiper arm pivot end interlocks with the serrations on the tapered outer circumference of the wiper pivot shaft, allowing positive engagement and finite adjustment of this connection.

The mounting nut locks the front wiper arm to the threaded stud of the wiper pivot shaft. The spring-loaded wiper arm hinge controls the down-force applied through the tip of the wiper arm to the front wiper blade on the glass. The hook formation on the tip of the wiper arm provides a cradle for securing and latching the wiper blade pivot block to the wiper arm.

REAR

The rear wiper arm is designed to mechanically transmit the motion from the rear wiper motor output shaft to the rear wiper blade. The wiper arm must be properly indexed to the motor output shaft in order to maintain the proper wiper blade travel on the glass. The tapered hole in the wiper arm pivot end interlocks with the serrations on the outer circumference of the tapered motor output shaft, allowing positive engagement and finite adjustment of this connection.

A hex nut secures the wiper arm pivot end to the threads on the rear wiper motor output shaft and the plastic cover snaps over this connection for a neat appearance. The spring-loaded wiper arm hinge controls the down-force applied through the tip of the wiper arm to the wiper blade on the glass. The latch formation on the tip of the wiper arm provides a cradle for securing and latching the wiper blade pivot pin to the wiper arm.

REMOVAL

FRONT

Fig. 7: Front Wiper Arm, Pivot Shaft, Nuts & Caps
Courtesy of CHRYSLER GROUP, LLC

1. Carefully pry the plastic nut cap (1) off of the pivot end of the wiper arm (4).
2. Remove the nut (2) that secures the wiper arm to the wiper pivot shaft (3).
3. Lift the front wiper arm to its over-center position to hold the wiper blade off of the glass and relieve the spring tension on the wiper arm to pivot shaft connection.
4. Use a slight rocking action to disengage the front wiper arm pivot end from the pivot shaft and remove the wiper arm.

CAUTION: The use of a battery terminal puller when removing the front wiper arm is NOT recommended except as a last resort, as this may damage the front wiper arm.

Fig. 8: Disengaging Wiper Arm From Pivot Shaft

Courtesy of CHRYSLER GROUP, LLC

5. If the rocking action failed to free the wiper arm from the pivot shaft, use a suitable battery terminal puller (3) to disengage the wiper arm (1) from the pivot shaft (2).
6. Remove the wiper arm pivot end from the pivot shaft.

REAR

Fig. 9: Wiper Arm, Pivot Cover & Nut
Courtesy of CHRYSLER GROUP, LLC

1. Unsnap and swing the molded plastic pivot cover (1) off of the pivot end of the wiper arm (2).
2. Remove the nut (3) that secures the wiper arm to the rear wiper motor output shaft.

CAUTION: The use of a battery terminal puller when removing the rear wiper arm is NOT recommended as this may damage the rear wiper arm.

3. Use a slight rocking action to disengage the rear wiper arm pivot end from the output shaft and remove the wiper arm.

INSTALLATION

FRONT

Fig. 10: Front Wiper Arm, Pivot Shaft, Nuts & Caps
Courtesy of CHRYSLER GROUP, LLC

NOTE: Be certain that the wiper motor is in the park position before attempting to install the front wiper arms. Transition the status of the ignition switch to On and move the right multifunction switch control knob to its front wiper Off position. If the wiper pivots move, wait until they stop moving, then transition the ignition switch status back to Off. The front wiper motor is now in its park position.

1. The front wiper arms must be indexed to the pivot shafts with the front wiper motor in the park position to be properly installed. Position the wiper arm pivot end onto the wiper pivot shaft so that the lower edge of the wiper blade is aligned with the wiper alignment marks located near or within the lower margin of the windshield.
2. Once the wiper blade is aligned, lift the wiper arm away from the windshield slightly to relieve the spring tension on the pivot end and push the pivot end of the wiper arm (4) down firmly and evenly over the pivot shaft (3).
3. Install and tighten the nut (2) that secures the wiper arm to the pivot shaft. Tighten the nut to 20 N.m (15 ft. lbs.).
4. Wet the windshield glass, then operate the front wipers. Turn the wiper switch to the Off position, then check for the correct wiper arm alignment position and readjust as required.
5. Reinstall the plastic cap (1) onto the wiper arm pivot end.

REAR

Fig. 11: Wiper Arm, Pivot Cover & Nut
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Be certain that the rear wiper motor is in the park position before attempting to install the rear wiper arm. Transition the status of the ignition switch to On and move the rear wiper switch to its Off position. If the wiper motor output shaft moves, wait until it stops moving, then transition the status of the ignition switch back to Off. The wiper motor is now in its park position.**

1. The rear wiper arm (2) must be indexed to the rear wiper motor output shaft with the motor in the park position to be properly installed. Position the wiper arm pivot end onto the output shaft so that the tip of the wiper blade is horizontal and parallel with the sine wave rear window defogger grid line at the bottom of the liftgate glass.
2. With the rear wiper arm properly indexed, push the tapered mounting hole on the pivot end of the wiper arm down over the output shaft.
3. Install and tighten the nut (3) that secures the rear wiper arm to the output shaft. Tighten the nut to 9 N.m (80 in. lbs.).
4. Fold and snap the molded plastic pivot cover (1) over the nut on the pivot end of the rear wiper arm.
5. Wet the liftgate glass and operate the rear wiper. Turn the rear wiper switch to the Off position, then check for correct wiper arm position and readjust as required.

BLADE, WIPER

DESCRIPTION

FRONT

Fig. 12: Blade Covers, Integral Latch & Pivot Block
Courtesy of CHRYSLER GROUP, LLC

Each front wiper blade is secured by an integral latch (2) and an integral pivot block (3) to the hook formation on the tip of each wiper arm, and rests on the glass near the base of the windshield when the wipers are not in operation. These wiper blades have a somewhat sculpted appearance that actually has a functional purpose. The sculpted appearance is due to molded plastic blade covers (1) securely fastened over the bridges and links of the wiper blade. This sculpting is designed to reduce wind buffeting, which helps to reduce wind noise within the passenger compartment of the vehicle.

The wiper blade consists of the following components:

- **Blade Covers** - The molded plastic blade covers shield the wiper superstructure and elements to reduce wind buffeting.
- **Element (4)** - The wiper element or squeegee is the resilient rubber member of the wiper blade that contacts the glass.
- **Flexor** - The flexor is a rigid metal component running along the length of each side of the wiper element where it is gripped by the claws of the superstructure.
- **Superstructure** - The superstructure includes several stamped steel bridges and links with claw formations that grip the wiper blade element. Also included in this unit is the latching, molded plastic pivot block that secures the superstructure to the wiper arm. All of the metal components of the wiper blade have a satin black finish applied.

The passenger side wiper blades are 45.00 centimeters (17.71 inches) long. The driver side wiper blades are 65.00 centimeters (25.59 inches) long. They have non-replaceable rubber elements (squeegees). The wiper blades cannot be adjusted or repaired. If ineffective, worn or damaged the entire wiper blade unit must be replaced.

REAR

Fig. 13: Rear Wiper Blade Is Secured By An Integral Pivot Pin
Courtesy of CHRYSLER GROUP, LLC

The rear wiper blade is secured by an integral pivot pin (2) to a receptacle at the tip of the rear wiper arm, and rests near the base of the liftgate glass when the wiper is not in operation. The rear wiper blade consists of the following components:

- **Superstructure (1)** - The superstructure includes a molded black plastic bridge and plastic links with claw formations that grip the wiper blade element. Also included in this unit is the pivot pin that secures the superstructure to the wiper arm.
- **Element (3)** - The wiper element or squeegee is the resilient rubber member of the wiper blade that contacts the glass.
- **Flexor** - The flexor is a rigid metal component running along the length of each side of the wiper element where it is gripped by the claws of the superstructure.

The rear wiper blade is 35 centimeters (13.78 inches) long with a non-replaceable element (squeegee). The wiper blade superstructure cannot be adjusted or repaired. If ineffective, worn or damaged the entire wiper blade unit must be replaced.

OPERATION

FRONT

The wiper blades are moved back and forth across the glass by the wiper arms when the wipers are being operated. The wiper blade superstructure is the flexible frame that grips the wiper blade element and evenly distributes the force of the spring-loaded wiper arm along the length of the element. The combination of the wiper arm force and the flexibility of the superstructure makes the element conform to and maintain proper contact with the glass, even as the blade is moved over the varied curvature that may be encountered across the

glass surface.

The wiper element flexor provides the claws of the blade superstructure with a rigid, yet flexible component on the element which can be gripped. The rubber element is designed to be stiff enough to maintain an even cleaning edge as it is drawn across the glass, yet be resilient enough to conform to the glass surface and flip from one cleaning edge to the other each time the wiper blade changes directions.

REAR

The rear wiper blade is moved back and forth across the liftgate glass by the wiper arm when the rear wiper system is in operation. The wiper blade superstructure is the flexible frame that grips the wiper blade element and evenly distributes the force of the spring-loaded wiper arm along the length of the element. The combination of the wiper arm force and the flexibility of the superstructure makes the element conform to and maintain proper contact with the glass, even as the blade is moved over the varied curvature found across the glass surface.

The wiper element flexor provides the claws of the blade superstructure with a rigid, yet flexible component on the element which can be gripped. The rubber element is designed to be stiff enough to maintain an even cleaning edge as it is drawn across the glass, but resilient enough to conform to the glass surface and flip from one cleaning edge to the other each time the wiper blade changes directions.

REMOVAL

FRONT

CAUTION: Do not allow the wiper arm to spring back against the glass without the wiper blade in place or the glass may be damaged.

Fig. 14: Tab, Wiper Arm & Element
Courtesy of CHRYSLER GROUP, LLC

NOTE: The notched end of the wiper element flexor should always be oriented towards the end of the wiper blade that is nearest to the wiper pivot.

1. Lift the wiper arm (2) to raise the wiper blade and element (3) off of the glass, until the wiper arm hinge is in its over-center position.
2. To remove the blade from the arm, lift or gently pry the latch release tab (1) located just in front of the pivot block at the tip of the arm upward until it stands perpendicular to the wiper arm.
3. Rotate the lower end of the blade slightly downward (toward the wiper element and away from the wiper arm), then slide the blade away from the tip towards the pivot end of the arm far enough to disengage the pivot block from the hook formation on the end of the arm.
4. Extract the hook formation on the tip of the wiper arm through the opening in the wiper blade superstructure between the latch and the pivot block.
5. Gently lower the tip of the wiper arm onto the glass.

REAR

0833005794

Fig. 15: Rear Wiper Arm & Cover
Courtesy of CHRYSLER GROUP, LLC

1. Lift the rear wiper arm pivot cover (1) upward to allow the rear wiper blade to be raised off of the glass.

NOTE: The rear wiper arm cannot be raised to its over-center hinge position unless the pivot cover is raised first.

2. Lift the rear wiper arm (2) to its over-center hinge position to raise the wiper blade and element off of the liftgate glass.

Fig. 16: Wiper Blade, Wiper Arm, Pivot Pin & Receptacle
Courtesy of CHRYSLER GROUP, LLC

3. To remove the wiper blade (3) from the wiper arm (1), grasp the end of the blade nearest to the motor output shaft, then over-rotate it out from under the arm and past its stop far enough to unsnap the blade pivot pin (2) from the receptacle (4) on the end of the arm.
4. Gently lower the tip of the wiper arm onto the glass.

INSTALLATION

FRONT

CAUTION: Do not allow the wiper arm to spring back against the glass without the wiper blade in place or the glass may be damaged.

Fig. 17: Tab, Wiper Arm & Element
Courtesy of CHRYSLER GROUP, LLC

NOTE: The notched end of the wiper element flexor should always be oriented towards the end of the wiper blade that is nearest to the wiper pivot.

1. Lift the wiper arm (2) off of the windshield glass, until the wiper arm hinge is in its over-center position.
2. Position the wiper blade and element unit (3) near the hook formation on the tip of the arm with the notched end of the wiper element flexor oriented towards the end of the wiper arm that is nearest to the wiper pivot.
3. Insert the hook formation on the tip of the arm through the opening in the blade superstructure between the latch (1) and the pivot block far enough to engage the pivot block into the hook.
4. Slide the pivot block up into the hook formation on the tip of the wiper arm until it is fully engaged.
5. Rotate the latch release tab down into the blade until it snaps into its locked position. Latch engagement will be accompanied by an audible click.
6. Gently lower the wiper blade and element onto the glass.

REAR

Fig. 18: Rear Wiper Arm & Cover
Courtesy of CHRYSLER GROUP, LLC

1. Lift the rear wiper arm pivot cap (1) upward to allow the rear wiper arm to be raised off of the glass.

NOTE: **The rear wiper arm cannot be raised to its over-center hinge position unless the pivot cover is raised first.**

2. Lift the rear wiper arm (2) to its over-center hinge position and off of the liftgate glass.

Fig. 19: Wiper Blade, Wiper Arm, Pivot Pin & Receptacle
Courtesy of CHRYSLER GROUP, LLC

3. Position the rear wiper blade (3) with the pivot pin (2) aligned with the opening of the receptacle (4) on the tip of the wiper arm (1).
4. Using hand pressure, press the wiper blade pivot pin firmly and evenly into the wiper arm receptacle until it snaps into place.
5. Lower the wiper blade onto the glass and snap the pivot cover back into place.

CHECK VALVE, WASHER

DESCRIPTION

DESCRIPTION

Diaphragm-type washer system check valves are standard equipment in this vehicle. The check valves for the washer system are integral to their respective front and rear washer nozzles. Refer to **NOZZLE, WASHER, DESCRIPTION**.

OPERATION

OPERATION

Diaphragm-type washer system check valves are standard equipment in this vehicle. The check valves for the washer system are integral to their respective front and rear washer nozzles. Refer to **NOZZLE, WASHER, OPERATION**.

HOSES AND TUBES, WASHER

DESCRIPTION

FRONT

0833005485

Fig. 20: Front Washer Plumbing, Rear Washer Plumbing, Hood Plumbing & Body Plumbing
Courtesy of CHRYSLER GROUP, LLC

The reservoir front washer plumbing (4) consists of small diameter rubber hose or hard plastic tubing that is routed along with the reservoir rear washer plumbing (1) from the washer reservoir located on the left outboard Front End Module (FEM) hydroform ahead of the left front wheel housing. The plumbing is attached to its respective front or rear barbed outlet nipple of the washer pump/motor unit near the bottom of the reservoir, then routed through dedicated troughs integral to the reservoir to the left front fender load beam.

Plastic push-in type retainers secure the plumbing to the underside and the outboard side of the load beam. The front and rear plumbing are then connected by molded plastic quick-connect fittings above the left front wheel house. The front plumbing is connected to the hood plumbing (2). The rear plumbing is connected to the body plumbing (3), which is routed through a grommet and a hole in the dash panel into the passenger compartment.

Fig. 21: Hood Plumbing, Hood Panel & Front Washer Nozzle
Courtesy of CHRYSLER GROUP, LLC

The hood plumbing (3) is routed from the load beam to the left hood hinge lower bracket, then to the left hood hinge upper bracket to the hood panel (1) and the inner hood reinforcement. The plumbing is then connected by molded rubber fittings to the barbed nipple of each front washer nozzle (2). The hood plumbing is also secured by plastic push-in type retainers to the load beam, the hood hinge and the inner hood reinforcement.

Washer hose or tube is available for service only as roll stock, which must then be cut to length. The molded plastic washer hose fittings and routing clips cannot be repaired. If these fittings or clips are ineffective or damaged, they must be replaced.

HEADLAMP

The headlamp washer system plumbing consists of a large diameter high pressure rubber supply line that is routed from the outlet nipple of the headlamp washer pump/motor unit on the washer reservoir to one barbed nipple of a wye fitting behind the center of the front fascia. The other two barbed nipples of the wye fitting are connected to two short lengths of supply line that each terminate at a headlamp washer nozzle behind the fascia and below the two front lamp units. The supply line connections at the nozzles and at the headlamp washer pump are secured using molded plastic quick-connect fittings.

Washer hose or tube is available for service only as roll stock, which must then be cut to length. The molded plastic washer plumbing fittings and routing clips cannot be repaired. If these fittings or clips are ineffective or damaged, they must be replaced.

REAR

Fig. 22: Rear Washer Plumbing
Courtesy of CHRYSLER GROUP, LLC

The reservoir rear washer plumbing consists of a small diameter rubber hose or hard plastic tubing that is routed along with the reservoir front washer plumbing from the washer reservoir under the left front fender ahead of the left front wheel house to the outboard side of the left front fender load beam. The plumbing is attached to its respective front or rear barbed outlet nipple of the washer pump/motor unit near the bottom of the reservoir. The plumbing is then secured by plastic push-in type retainers to the load beam.

The reservoir rear washer plumbing is connected by a molded plastic quick-connect fitting to the body rear washer plumbing above the left front wheel house. The body rear washer plumbing then passes from the engine compartment through a hole with a rubber grommet in the dash panel near the belt line to the left cowl side area within the passenger compartment.

The body rear washer plumbing (5) is routed up the inner left A-pillar (6), where it is connected by a molded plastic quick-connect fitting to the headliner rear washer plumbing (3). The plumbing is secured by plastic push-in type retainers (2) to the inner A-pillar. The headliner rear washer hose is secured to the headliner (1) substrate and routed along with the antenna wiring (4) toward the back of the vehicle.

Fig. 23: Headliner, Rear Washer Plumbing & Upper Liftgate Opening Header
Courtesy of CHRYSLER GROUP, LLC

Above the headliner (3) at the back of the vehicle the headliner rear washer plumbing (4) is connected to the liftgate rear washer plumbing (1) by another molded plastic quick-connect fitting. The liftgate rear washer plumbing is routed along with the liftgate wire harness through a clearance hole in the upper liftgate opening header (2) and rubber grommets in the upper liftgate opening trough and the liftgate inner and outer panels to the rear spoiler. The hose is secured to routing clips integral to the Center High Mounted Stop Lamp (CHMSL) housing within the spoiler to the barbed quick-connect nipple of the rear washer nozzle within the liftgate spoiler.

Washer hose or tube is available for service only as roll stock, which must then be cut to length. Portions of the rear washer plumbing is integral to the headliner. The molded plastic washer hose fittings and routing clips cannot be repaired. If these fittings or clips are ineffective or damaged, they must be replaced.

OPERATION

FRONT

Washer fluid in the washer reservoir is pressurized and fed by the washer pump/motor unit through the front washer system plumbing and fittings to the two front washer nozzles. Whenever routing the washer plumbing or a wire harness containing washer plumbing, it must be routed away from hot, sharp, or moving parts; and, sharp bends that might pinch the plumbing must be avoided.

HEADLAMP

Washer fluid in the washer reservoir is pressurized and fed by the headlamp washer pump/motor unit through

the headlamp washer system plumbing and fittings to the two telescopic headlamp washer nozzles. Whenever routing the washer plumbing, it must be routed away from hot, sharp, or moving parts; and, sharp bends that might pinch the plumbing must be avoided.

REAR

Washer fluid in the washer reservoir is pressurized and fed by the washer pump/motor unit through the rear washer system plumbing and fittings to the rear washer nozzle. Whenever routing the washer plumbing or a wire harness containing washer plumbing, it must be routed away from hot, sharp or moving parts; and, any sharp bends that might pinch the plumbing must be avoided.

STANDARD PROCEDURE

DISCONNECTING HIGH PRESSURE WASHER PLUMBING QUICK-CONNECT FITTINGS

Fig. 24: Disconnecting High Pressure Washer Plumbing Quick-Connect Fittings
Courtesy of CHRYSLER GROUP, LLC

Molded plastic quick-connect fittings join sections of the high pressure headlamp washer plumbing. To disconnect this fitting:

1. Push the molded plastic female half of the quick-connect fitting toward the male half quick-connect nipple of the headlamp washer pump, headlamp washer nozzle or other plumbing fitting.
2. While still pushing the two halves of the connector toward each other, squeeze or pinch the ribbed retainers on each side of the female half of the quick-connect between your thumb and forefinger.
3. Finally, pull the female half of the quick-connect fitting straight back from the male half quick-connect nipple to disconnect.

NOTE: **When reconnecting the quick-connect fitting, align the female half of the fitting to the male half of the fitting. Do not attempt to reconnect using an angled approach. Push the two halves together until an audible click is heard.**

DISCONNECTING LOW PRESSURE WASHER PLUMBING QUICK-CONNECT FITTINGS

3318084

Fig. 25: Molded Plastic Quick-Connect & Washer Hose Tubes
Courtesy of CHRYSLER GROUP, LLC

Molded plastic quick-connect fittings join sections of the low pressure front and rear washer plumbing. To disconnect this fitting:

1. Squeeze the two solid sides (not the open sides) of the female half of the quick-connect fitting at the outer edge.
2. While still squeezing the female half of the fitting, pull the two sections of the washer plumbing away from each other.

DISCONNECTING REAR WASHER NOZZLE QUICK-CONNECT FITTING

0833006926

Fig. 26: Rear Washer Nozzle Quick-Connect Fitting
Courtesy of CHRYSLER GROUP, LLC

A molded plastic quick-connect fitting (2) joins the rear washer nozzle to the rear washer hose (3). To disconnect this fitting:

1. Spread apart the two ends of the quick-connect fitting retention collar (1) far enough to release the quick-connect nipple fitting of the rear washer nozzle.
2. With the quick-connect nipple fitting of the rear washer nozzle released, pull the nozzle and the rear washer hose away from each other to disconnect them.

NOTE: **When reconnecting the quick-connect fitting, align the female half of the fitting to the male half of the fitting. Do not attempt to reconnect using an angled approach. Push the two halves together until an audible click is heard.**

LINKAGE, WIPER ARM

DESCRIPTION

DESCRIPTION

Fig. 27: Wiper Arm Linkage Components
Courtesy of CHRYSLER GROUP, LLC

The wiper linkage module is secured within the cowl plenum panel beneath the cowl plenum cover/grille panel. The ends of the wiper pivot shafts protrude through dedicated openings in the cowl plenum cover/grille panel to drive the wiper arms and blades and are the only visible components of the wiper linkage module.

The wiper linkage module consists of the following major components:

- **Bracket** - The wiper linkage module bracket (2) consists of two tubular members that extend from opposite sides of a die cast center section that serves as the wiper motor mount. Each tubular member has a die cast pivot bracket formation secured at the outboard end where the wiper pivots are secured. The wiper linkage module bracket is secured within the cowl plenum by two screws through two rubber insulators (1).
- **Crank Arm** - The wiper motor crank arm is a stamped steel unit with a slotted hole on the driven end that is secured to the wiper motor output shaft with a nut, and has a ball stud secured to the drive end.
- **Linkage** - A stamped steel drive link (5) connects the wiper motor crank arm to the left wiper pivot lever arm. A stamped steel connector link (4) connects the left wiper pivot lever arm to the right wiper pivot lever arm. Each link has a plastic socket-type bushing on each end. The bushing on the pivot end of each link is snap-fit over a ball stud on the crank arm or the pivot lever arm.
- **Motor** - The wiper motor (3) is secured by a bracket integral to the motor transmission housing with two screws and nuts near the center of the wiper linkage module bracket. A knob-like rubber insulator (6) on a stud integral to the motor transmission housing is engaged in a slot in a stamped bracket on the cowl plenum panel. The two-speed permanent magnet wiper motor features an integral transmission, an internal park switch and an internal automatic resetting circuit breaker. An integral connector receptacle connects the motor to the vehicle electrical system.
- **Pivots** - The two front wiper pivots (7) are secured to the ends of the wiper module bracket. The lever arm that extends from the lower end of the left pivot shaft has two ball studs that are engaged with the bushings of the drive and connector links. The lever arm of the right pivot shaft has a single ball stud that

is engaged with the bushing of the connector link. The upper end of each pivot shaft where the wiper arms will be fastened each is tapered and serrated with a threaded stud formation at the tip.

The wiper motor and crank arm unit is available for separate service replacement. Any other component of the wiper linkage module cannot be adjusted or repaired. If any component of the module other than the motor is ineffective or damaged, the entire wiper linkage module unit must be replaced.

OPERATION

OPERATION

The wiper linkage module operation is controlled by the battery current inputs received by the wiper motor through the Body Control Module (BCM). The wiper motor speed is controlled by current flow to either the low speed or the high speed set of brushes. The park switch is a single pole, single throw, momentary switch within the wiper motor that is mechanically actuated by the wiper motor transmission components. The park switch alternately closes the wiper park switch sense circuit to ground or to battery current, depending upon the position of the wipers on the glass. This feature allows the motor to complete its current wipe cycle after the wiper system has been turned Off, and to park the wiper blades in the lowest portion of the wipe pattern. The automatic resetting circuit breaker protects the motor from overloads.

The wiper motor crank arm, the two wiper linkage members and the two wiper pivots mechanically convert the rotary output of the wiper motor to the back and forth wiping motion of the wiper arms and blades on the glass.

The hard wired inputs and outputs of the wiper motor may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the wiper motor or the electronic controls and communication between other modules and devices that provide some features of the wiper and washer system. The most reliable, efficient and accurate means to diagnose the wiper motor, the BCM or the electronic controls and communication related to wiper motor operation requires the use of a diagnostic scan tool. Refer to **DIAGNOSIS AND TESTING** .

REMOVAL

REMOVAL

Fig. 28: Front Wiper Module, Brackets & Fasteners
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative cable from the battery.
2. Remove both front wiper arms from the wiper pivots. Refer to **ARM, WIPER, REMOVAL**.
3. Remove the cowl plenum cover/grille panel from over the front wiper module.
4. Disconnect the wire harness (2) connector from the connector receptacle for the front wiper motor.
5. Remove the two screws that secure the ends of the front wiper module (1) bracket to the stamped brackets (3 and 5) within the cowl plenum.
6. Pull the front wiper module inboard far enough to disengage the knob-like rubber isolator from the slotted bracket (4) on the rearward wall of the cowl plenum.
7. Remove the front wiper module from the cowl plenum as a unit.

INSTALLATION

INSTALLATION

Fig. 29: Front Wiper Module, Brackets & Fasteners
Courtesy of CHRYSLER GROUP, LLC

NOTE: The wiper motor can be removed from the wiper linkage module and is serviced independently from the remainder of the wiper linkage module for this vehicle. Refer to MOTOR, WIPER, REMOVAL.

1. Position the wiper linkage module (1) to the cowl as a unit.
2. Position the knob-like rubber isolator to the slotted bracket (4) on the rear wall of the cowl plenum panel and pull the module outboard far enough to seat the isolator into the bracket.
3. Starting on the outboard side, install and tighten the two screws that secure the wiper linkage module to the stamped brackets (3 and 5) within the cowl plenum. Tighten the screws to 5.5 N.m (49 in. lbs.).
4. Reconnect the wire harness connector (2) to the connector receptacle for the wiper motor. Be certain that the connector is fully engaged and locked.
5. Reinstall the cowl plenum cover/grille panel over the wiper linkage module. Refer to **COVER, COWL PANEL, INSTALLATION** .
6. Reinstall both wiper arms onto the wiper pivots. Refer to **ARM, WIPER, INSTALLATION**.
7. Reconnect the negative cable to the battery.

MODULE, LIGHT RAIN SENSOR

DESCRIPTION

DESCRIPTION

Fig. 30: Light Rain Sensor Module Components
Courtesy of CHRYSLER GROUP, LLC

The Light Rain Sensor Module (LRSM) (1) is the primary component of the automatic wiper system. The LRSM is also capable of performing an ambient light sensor function; therefore, it is alternately referred to as the Rain Light Sensor Module (RLSM), the Light Sensor Module (LSM) or the Rain Sensor Module (RSM). The LRSM is located on the inside of the windshield glass just below and to the right of the inside rear view mirror mounting button. The LRSM is concealed from view within the vehicle interior by a molded plastic inside rear view mirror bracket trim cover that fits over the top of the LRSM housing and the LRSM mounting bracket, but the LRSM is visible through the windshield glass from the exterior of the vehicle.

The molded black plastic LRSM housing has an integral connector receptacle (2) with three terminal pins. These terminal pins connect the LRSM to the vehicle electrical system through a dedicated take out and connector of the overhead wire harness that extends from above the headliner. The windshield side of the housing is filled with a clear, silicone gelatin (also known as SilGel) adhesive membrane pad (3), which serves as an optical coupler between the sensor and the inside of the windshield glass. A spring steel retaining strap or clip extends forward on each side of the housing to latch the LRSM to a molded black plastic mounting bracket, which is permanently bonded to the inside of the windshield glass.

Concealed and protected within the LRSM housing is the electronic circuitry of the module, which includes an InfraRed (IR) diode and photocell based light and rain sensors, control electronics and Local Interface Network (LIN) data bus communication management hardware. The LRSM is a LIN slave node and communicates over a single LIN bus circuit with the Body Control Module (BCM). The BCM is a LIN master node and a gateway to the Controller Area Network (CAN) data bus. The BCM controls the exchange of electronic messages back and forth between the LRSM and other electronic modules in the vehicle, as well as with a diagnostic scan tool connected to the Data Link Connector (DLC).

The LRSM cannot be adjusted or repaired. If ineffective or damaged, the entire module must be replaced. The silicone gelatin adhesive membrane pad is available for separate service replacement. The LRSM mounting bracket is serviced only as a unit with the windshield glass.

OPERATION

OPERATION

The Light Rain Sensor Module (LRSM) (1) (also known as the Rain Light Sensor Module/RLSM, the Light Sensor Module/LSM or the Rain Sensor Module/RSM) senses moisture and ambient light levels on the outside of the windshield glass and sends electronic messages to the Body Control Module (BCM) over the Local Interface Network (LIN) data bus to give an indication of the monitored conditions. The BCM relays messages back and forth between the LRSM and other electronic modules in the vehicle.

For the rain sensor function, InfraRed (IR) diodes within the LRSM generate infrared light beams that are aimed by the optics of the sensor through the windshield glass, while an IR photo diode monitors the infrared light reflected back from the windshield glass. When sufficient moisture accumulates within the wipe pattern on the windshield glass, less of the infrared light is reflected back and the sensor detects a change in the monitored infrared light intensity. For the light sensor function, an IR photo diode within the sensor monitors the intensity of the ambient infrared light received through the windshield glass and the sensor optics.

The internal programming of the LRSM sends the appropriate electronic **wipe command** messages to the BCM over the LIN data bus. The BCM then responds by activating or deactivating the wiper system. Similarly, the LRSM provides electronic **ambient light level** messages to the BCM, and the BCM relays these messages to other electronic modules in the vehicle.

The Steering Control Module (SCM) sends electronic **wiper switch status** and **automatic wipe sensitivity level** messages over the Controller Area Network (CAN) data bus to the BCM based upon the driver-selected settings of the control knob on the control stalk of the right multifunction switch. The higher the selected wipe sensitivity setting the more sensitive the LRSM is to the accumulated moisture on the windshield glass, and the more frequently the LRSM will send **wipe commands** to the BCM to operate the wiper system. The BCM also monitors electronic **automatic display brightness level** messages based upon the driver-selected settings of the Electronic Vehicle Information Center (EVIC) as well as electronic messages from other electronic modules in the vehicle received over the CAN data bus, then relays the messages to the LRSM over the LIN bus.

The LRSM operates on battery current received through a fused ignition output (run/accessory) circuit. The LRSM has a path to ground at all times through a take out of the body wire harness with an eyelet terminal that is secured to the body sheet metal. Therefore, the LRSM is operational only when the ignition switch status is On or Accessory.

If the BCM receives an electronic status message from the LRSM indicating a sensor failure condition, a **Rain Sensor Failure** message should be displayed by the Instrument Cluster (IC) (also known as the Instrument Panel Cluster/IPC). It is important to note that the default operation of the automatic wiper system is continuous wipe On, while the default operation for automatic lighting is On. Therefore, if no command message is received by the BCM from the LRSM for more than about five seconds when the Automatic wipe mode is selected, the wipers will default to Low Speed or High Speed continuous wipe operation. Likewise, if no command message is received by the BCM from the LRSM when the Automatic lighting mode is selected, the exterior lighting will default to On. The BCM must be properly configured for the automatic wipers and automatic lighting options in order for these systems to function.

The hard wired circuits of the LRSM may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the LRSM or the electronic controls and communication between other modules

and devices that provide some features of the automatic wiper and automatic lighting systems. The most reliable, efficient and accurate means to diagnose the LRSM or the electronic controls and communication related to LRSM operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

STANDARD PROCEDURE

PROTECTIVE CAP REMOVAL

Fig. 31: Protective Cap, Adhesive Membrane, LRSM & Latches
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The Light Rain Sensor Module (LRSM) (3) is equipped with a clear, silicone gelatin (SilGel) adhesive membrane (2) that serves as an optical coupler between the sensor and the windshield glass. Extreme care must be exercised to protect this membrane from contamination before it is installed in the vehicle. The LRSM should always be serviced only in a dust-free environment. Do not touch the membrane with your fingers or tools. The membrane should only come into contact with the clean and dry inside surface of the glass within the mounting bracket bonded to the windshield. The service replacement LRSM is shipped with a clear plastic protective cap (1) installed and secured to the outer circumference of the LRSM by two latch features (4). This protective cap should not be removed until immediately before the LRSM is to be installed using the following procedure.

Fig. 32: Tabs, Protective Cap & LRSM
Courtesy of CHRYSLER GROUP, LLC

1. Firmly grasp the LRSM (3) by the outer circumference from the side opposite the SilGel membrane pad.
2. Firmly grasp the protective shipping cap (2) of the LRSM by the two latch release tabs (1) between your thumb and index finger from the SilGel membrane pad side of the module.
3. Firmly pinch the two latch release tabs together between your thumb and index finger far enough to release the two latch features of the protective cap from the outer circumference of the LRSM.
4. Pull the protective cap off of the LRSM.
5. Install the LRSM into the mounting bracket bonded onto the windshield as instructed in the Installation procedure. Refer to **MODULE, LIGHT RAIN SENSOR, INSTALLATION**.

SILICONE GELATIN PAD REPLACEMENT

Fig. 33: LRSM & Adhesive Membrane
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The Light Rain Sensor Module (LRSM) is equipped with a clear, silicone gelatin (SilGel) adhesive membrane that serves as an optical coupler between the sensor and the windshield glass. Extreme care must be exercised to protect this membrane from contamination before it is installed in the vehicle. The LRSM should always be serviced only in a dust-free environment. Do not touch the membrane with your fingers or tools. The membrane should only come into contact with the clean and dry inside surface of the glass within the mounting bracket bonded to the windshield. If contaminated, clean any foreign material from the windshield glass using rubbing alcohol and a lint-free cloth. A contaminated SilGel membrane will negatively impact LRSM performance.

CAUTION: When installing the replacement silicone gelatin (SilGel) adhesive membrane pad onto the Light Rain Sensor Module (LRSM), it is necessary to minimize air pockets trapped between the SilGel membrane and the LRSM. Excessive air pockets will negatively impact LRSM performance. It is important to adhere to the procedure steps in a deliberate manner to achieve satisfactory results.

1. Carefully peel away the old silicone gelatin adhesive membrane pad (2) from the windshield (optics) side of the Light Rain Sensor Module (LRSM) (1).
2. Thoroughly clean the windshield (optics) side of the LRSM using isopropyl alcohol and a clean, lint-free cloth.

3. Using care not to contaminate, touch or damage the replacement pad, peel off the yellow protective foil.

Fig. 34: Protective Film & Replacement Pad
Courtesy of CHRYSLER GROUP, LLC

4. Looking through the transparent protective film (1), align and center the replacement pad (2) over the windshield (optics) side of the LRSM. Then use a slow, smooth and deliberate motion to roll the pad onto the windshield (optics) side of the LRSM.
5. With the transparent protective film still in place, use a thumb and a firm wiping motion to press the entire surface pad against the windshield (optics) side of the LRSM.
6. To avoid contamination or damage of the replacement pad, do not remove the transparent protective film until just before reinstalling the LRSM onto the windshield. Refer to **MODULE, LIGHT RAIN SENSOR, INSTALLATION**.

REMOVAL

REMOVAL

Fig. 35: LRSM, Harness Connector, Mount Bracket & Retaining Strap
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative cable from the battery.
2. Remove the inside rear view mirror from the mounting button (3) on the inside of the windshield glass (2). Refer to **MIRROR, REARVIEW, REMOVAL** .
3. Disconnect the wire harness connector (1) from the connector receptacle for the Light Rain Sensor Module (LRSM) (6).
4. Insert the tip of a small screwdriver into the rectangular cutout on one side of the spring steel retaining strap (5) on the LRSM and carefully pry the end of the strap closest to the glass away from the groove in the mounting bracket (4) on the windshield. Now rotate the loose side of the strap away from the glass far enough to disengage the other side of the strap from the mounting bracket groove.
5. Firmly grasp the connector receptacle of the LRSM to pull the module away from the windshield glass and the mounting bracket.
6. If the LRSM will be reinstalled, the silicone gelatin (also known as SilGel) adhesive membrane pad MUST be removed, discarded and replaced with a new unit as described in: Standard Procedure - Silicone Gelatin Pad Replacement. Refer to **MODULE, LIGHT RAIN SENSOR, STANDARD PROCEDURE**.

INSTALLATION

INSTALLATION

CAUTION: The Light Rain Sensor Module (LRSM) is equipped with a clear, silicone gelatin (SilGel) adhesive membrane that serves as an optical coupler between the sensor and the windshield glass. Extreme care must be exercised to protect this membrane from contamination before it is installed in the vehicle. The LRSM should always be serviced only in a dust-free environment. Do not touch the membrane with your fingers or tools. The membrane should only come into contact with the clean and dry

inside surface of the glass within the mounting bracket bonded to the windshield. If contaminated, clean any foreign material from the windshield glass using rubbing alcohol and a lint-free cloth. A contaminated SilGel membrane will negatively impact LRSM performance.

CAUTION: When installing the Light Rain Sensor Module (LRSM) it is necessary to minimize air pockets trapped between the SilGel membrane and the windshield glass. Excessive air pockets will negatively impact LRSM performance. It is important to adhere to the procedure steps in a deliberate manner to achieve satisfactory results.

CAUTION: To avoid excessive air pockets, do not try to install the spring steel retaining strap until AFTER the Light Rain Sensor Module (LRSM) has been successfully positioned to the glass within the mounting bracket bonded to the windshield.

Fig. 36: LRSM & Mounting Bracket
Courtesy of CHRYSLER GROUP, LLC

1. If a new Light Rain Sensor Module (LRSM) is being installed, remove the protective shipping cap from the LRSM as described in: Standard Procedure - Protective Cap Removal. Refer to **MODULE, LIGHT RAIN SENSOR, STANDARD PROCEDURE**. If an existing LRSM is being reused, the silicone gelatin (also known as SilGel) adhesive membrane pad MUST be removed, discarded and replaced with a new unit as described in: Standard Procedure - Silicone Gelatin Pad Replacement. Refer to **MODULE, LIGHT RAIN SENSOR, STANDARD PROCEDURE**.
2. Grasp the LRSM (2) by the connector receptacle between your thumb and middle finger. Place your index finger on the back of the LRSM at the point opposite the connector receptacle.
3. Align the LRSM with the mounting bracket (1) bonded onto the inside of the windshield glass near the inside rear view mirror mounting button.
4. Slowly insert the LRSM into the mounting bracket at a slight angle so that the edge of the module nearest

the tip of your index finger makes the initial contact with the windshield glass.

5. Using a slow, deliberate motion and light pressure, draw your index finger across the back of the LRSM toward the connector receptacle until the silicone gelatin adhesive membrane pad is in full contact with the windshield glass.

Fig. 37: LRSM, Harness Connector, Mount Bracket & Retaining Strap
Courtesy of CHRYSLER GROUP, LLC

6. Engage one side of the spring steel retaining strap (5) into the groove on one side of the LRSM mounting bracket (4) on the inside of the windshield glass (2).
7. Depress the opposite side of the retaining strap over the LRSM firmly and evenly until it fully engages the groove of the mounting bracket with an audible click.
8. Looking through the windshield from outside the vehicle, inspect the silicone gelatin adhesive membrane pad for air pockets. If air pockets are observed, let the vehicle stand for about four hours at room temperature to allow the air pockets to dissipate. If an adhesive void (air pocket) greater than about 1 millimeter (0.04 inch) is observed, replace the flawed silicone gelatin adhesive membrane pad with a new unit as described in: Standard Procedure - Silicone Gelatin Pad Replacement. Refer to **MODULE, LIGHT RAIN SENSOR, STANDARD PROCEDURE**.
9. Reconnect the wire harness connector (1) to the LRSM connector receptacle (6).
10. Reinstall the inside rear view mirror to the mounting button (3) on the inside of the windshield glass. Refer to **MIRROR, REARVIEW, INSTALLATION** .
11. Reconnect the negative cable to the battery.

NOZZLE, WASHER

DESCRIPTION

FRONT

Fig. 38: Washer Nozzle Components
Courtesy of CHRYSLER GROUP, LLC

The fluidic front washer nozzles (1) are constructed of molded plastic and include an integral check valve. Each nozzle has two integral latches (3) that secure it in a dedicated hole in the hood panel near the base of the windshield. A resilient rubber gasket (2) seals the nozzle to the outer hood panel. The domed upper surface of the washer nozzle is visible on the outside of the hood panel and the nozzle orifices are oriented towards the windshield glass.

An integral diaphragm type check valve is contained within the body of each nozzle. The barbed washer plumbing fittings (4) for the nozzles extend below the hood panel and are accessible from the engine compartment when the hood is opened.

A front washer nozzle cannot be adjusted or repaired and, if ineffective or damaged, it must be replaced.

HEADLAMP

0833005537

Fig. 39: On-Road Nozzle & Off-Road Nozzle
Courtesy of CHRYSLER GROUP, LLC

Vehicles equipped with the optional headlamp washer system have two static headlamp washer nozzles mounted in the front bumper fascia, one beneath each front lamp unit. Two unique versions of the nozzle are used and they are not interchangeable. The on-road version of the nozzle (1) used in vehicles that are not equipped with the optional off-road front bumper fascia can be identified by a more rounded bezel appearance and a straight quick-connect inlet nipple. The off-road version of the nozzle (2) used in vehicles that are equipped with the optional off-road front bumper fascia can be identified by a more elongated bezel appearance and a right angle quick-connect inlet nipple.

The fixed body of both molded plastic nozzles have a fixed integral mounting clip on the rearward side just below the bezel, and a movable integral mounting clip on the opposite side. Both also have an integral index tab that engages a notch in the front bumper fascia mounting hole. A large diameter high pressure washer fluid supply line from the dedicated headlamp washer pump/motor unit is connected to the inlet nipple on the nozzle body using a molded plastic quick-connect fitting.

The headlamp washer nozzle cannot be adjusted or repaired and, if ineffective or damaged, the nozzle must be replaced with a new unit.

REAR

Fig. 40: Fluidic Rear Washer Nozzle
Courtesy of CHRYSLER GROUP, LLC

The fluidic rear washer nozzle (4) is constructed of molded plastic and includes an integral check valve. The rear washer nozzle is secured by two integral latch features (3) within a mounting hole near the Center High-Mounted Stop Lamp (CHMSL) in the lower surface of the rear spoiler above the liftgate glass opening on the outer liftgate panel.

The outer surface of the washer nozzle is visible on the lower exterior surface of the spoiler, and a rubber gasket seals the nozzle bezel or flange (2) to the spoiler mounting hole. The nozzle orifice (1) is oriented downward towards the liftgate glass. The barbed washer plumbing quick-connect nipple fitting (5) is concealed between the spoiler and the liftgate outer panel.

The rear washer nozzle cannot be adjusted or repaired and, if ineffective or damaged, it must be replaced.

OPERATION

FRONT

The two washer nozzles are designed to dispense washer fluid into the wiper pattern area on the outside of the windshield glass. Pressurized washer fluid is fed to each nozzle from the washer reservoir by the washer pump/motor unit through a single supply line, which is attached to a barbed nipple on each washer nozzle below the hood panel. A fluidic matrix within the washer nozzle causes the pressurized washer fluid to be emitted from the nozzle orifice as an oscillating stream to more effectively cover a larger area of the glass to be cleaned.

The integral check valve in each nozzle prevents washer fluid from draining out of the washer supply lines back to the washer reservoir. This drain-back would result in a lengthy delay after the washer switch is actuated until

washer fluid was dispensed through the nozzles, because the washer pump would have to refill the washer plumbing from the reservoir to the nozzles. Such a drain-back condition could also result in water, dirt, or other outside contaminants being drawn into the washer system by a siphoning action through the washer nozzle orifice. This water could subsequently freeze and plug the nozzle, while other contaminants could interfere with proper nozzle operation and cause improper nozzle spray patterns. In addition, the check valve prevents washer fluid from siphoning out through the washer nozzles after the washer system is turned Off.

When the washer pump pressurizes and pumps washer fluid from the reservoir through the washer plumbing, the fluid pressure unseats a diaphragm from over a sump well within the nozzle by overriding the spring pressure applied to it by a piston. With the diaphragm unseated, washer fluid is allowed to flow toward the nozzle orifice. When the washer pump stops operating, the spring pressure on the piston seats the diaphragm over the sump well in the nozzle and fluid flow in either direction within the washer plumbing is prevented.

HEADLAMP

Each time the headlamp washer pump/motor unit is activated, pressure builds within the high pressure supply lines to each headlamp washer nozzle. As the hydraulic pressure is delivered to the nozzle, the nozzle sprays several high pressure streams against the lens of the front lamp unit.

REAR

The rear washer nozzle is designed to dispense washer fluid into the wiper pattern area on the outside of the liftgate glass. Pressurized washer fluid is fed to the nozzle from the washer reservoir by the washer pump/motor through a single supply line, which is attached to a barbed nipple on the back of the nozzle. A fluidic matrix within the nozzle causes the pressurized washer fluid to be emitted from the nozzle orifice as an oscillating stream to more effectively cover a larger area of the glass to be cleaned.

The integral check valve in the nozzle prevents washer fluid from draining out of the washer supply hose back to the washer reservoir. This drain-back would result in a lengthy delay after the washer switch is actuated until washer fluid was dispensed through the nozzle because the washer pump would have to refill the washer plumbing from the reservoir to the nozzle. Such a drain-back condition could also result in water, dirt, or other outside contaminants being siphoned into the washer system through the washer nozzle orifice. This water could subsequently freeze and plug the nozzle, while other contaminants could interfere with proper nozzle operation and cause improper nozzle spray patterns. In addition, the check valve prevents washer fluid from siphoning through the washer nozzle after the washer system is turned Off.

When the washer pump pressurizes and pumps washer fluid from the reservoir through the washer plumbing, the fluid pressure unseats a diaphragm from over a sump well within the nozzle by overriding the spring pressure applied to it by a piston. With the diaphragm unseated, washer fluid is allowed to flow toward the nozzle orifice. When the washer pump stops operating, the spring pressure on the piston seats the diaphragm over the sump well within the nozzle and fluid flow in either direction within the washer plumbing is prevented.

REMOVAL

FRONT

Fig. 41: Hood Plumbing, Hood Panel & Front Washer Nozzle
Courtesy of CHRYSLER GROUP, LLC

1. From the underside of the hood (1), remove the push-in retainers that secure the rear edge of the hood silencer pad to the inner hood reinforcement as necessary to access the washer nozzle (2) plumbing connections.
2. From the underside of the hood, disconnect the washer plumbing (3) fitting from the barbed nipple of the washer nozzle.
3. From the underside of the hood, release the integral latch features of the washer nozzle and push the nozzle out through the mounting hole toward the top side of the hood.
4. Remove the washer nozzle from the top of the hood panel.

HEADLAMP

Fig. 42: Headlamp Washer Nozzle
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Take proper precautions to ensure there is no cosmetic damage done to the paint finish of the headlamp washer nozzle cover or the front fascia during the following procedure.

NOTE: There are two headlamp washer nozzle configurations available for this vehicle: one for vehicles not equipped with an off-road package, and another for vehicles equipped with an off-road package (shown here). However, the removal and installation procedures for these two nozzle configurations is identical.

1. Remove the front fascia from the vehicle. Refer to **FASCIA, FRONT, REMOVAL** .
2. From the back side of the front fascia (1), disconnect the high pressure hose quick-connect fitting from the quick-connect nipple of the headlamp washer nozzle.

   Refer to **HOSES AND TUBES, WASHER, STANDARD PROCEDURE**.

3. From the back side of the front fascia, compress the movable mounting clip (2) of the headlamp washer nozzle (3) tightly against the body of the nozzle.
4. With the movable mounting clip fully compressed, tip the body of the nozzle forward far enough to raise the end of the movable clip through the mounting hole of the front fascia.
5. Disengage the fixed mounting clip (4) of the nozzle and pull it upward through the mounting hole of the front fascia.
6. Remove the headlamp washer nozzle from the front fascia.

REAR

Fig. 43: Rear Washer Nozzle
Courtesy of CHRYSLER GROUP, LLC

1. Remove the liftgate spoiler from the top of the liftgate outer panel. Refer to **SPOILER, REMOVAL** .
2. From the interior of the spoiler (1), disengage the rear washer hose from the routing clips on the back of the Center High Mounted Stop Lamp (CHMSL) housing (5).
3. Disconnect the quick-connect fitting (2) of the washer hose from the quick-connect nipple of the rear washer nozzle (4). Refer to **HOSES AND TUBES, WASHER, STANDARD PROCEDURE**.
4. From the interior of the spoiler, release the latch features (3) of the rear washer nozzle and push the nozzle out through the mounting hole to the outside of the spoiler.
5. Remove the rear washer nozzle from the liftgate spoiler.

INSTALLATION

FRONT

Fig. 44: Hood Plumbing, Hood Panel & Front Washer Nozzle
Courtesy of CHRYSLER GROUP, LLC

1. Position the washer nozzle (2) to the mounting hole on the outside of the hood panel (1).
2. Align the anti-rotation tabs of the nozzle with the anti-rotation notches in the mounting hole.
3. Using hand pressure, push firmly and evenly on the top of the washer nozzle until the integral latch features lock into place on the underside of the hood.
4. From the underside of the hood, reconnect the washer plumbing (3) fitting to the barbed nipple of the nozzle.
5. Reinstall the push-in retainers that secure the rear edge of the hood silencer pad to the inner hood reinforcement.

HEADLAMP

Fig. 45: Headlamp Washer Nozzle
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Take proper precautions to ensure there is no cosmetic damage done to the paint finish of the headlamp washer nozzle cover or the front fascia during the following procedure.

1. Insert the quick-connect nipple and body of the headlamp washer nozzle (3) into the mounting hole of the front fascia (1).
2. Engage the fixed mounting clip (4) on the nozzle body through the mounting hole.

   Tilt the nozzle body rearward far enough to engage the movable mounting clip (2) through the mounting hole and until the nozzle bezel is flush with the surface of the front fascia.

3. From the back side of the front fascia (1), reconnect the high pressure hose quick-connect fitting to the quick-connect nipple of the headlamp washer nozzle.
4. Reinstall the front fascia onto the vehicle. Refer to **FASCIA, FRONT, INSTALLATION** .

REAR

Fig. 46: Rear Washer Nozzle
Courtesy of CHRYSLER GROUP, LLC

1. Position the rear washer nozzle (4) to the mounting hole in the liftgate spoiler (1). Be certain that the rubber gasket is in position on the back of the nozzle bezel or flange.
2. Using hand pressure, push firmly and evenly on the nozzle bezel or flange until both integral latch features (3) are fully engaged on the inside of the spoiler mounting hole.
3. Reconnect the washer supply line quick-connect fitting (2) to the quick-connect barbed nipple on the back of the nozzle.
4. Engage the washer hose into the routing clips on the back of the Center High Mounted Stop Lamp (CHMSL) housing (5).
5. Reinstall the spoiler onto the liftgate outer panel. Refer to **SPOILER, INSTALLATION** .

MOTOR, WIPER

DESCRIPTION

FRONT

The front wiper motor is packaged with the wiper linkage module in this vehicle. Refer to **LINKAGE, WIPER ARM, DESCRIPTION**.

REAR

Fig. 47: Rear Wiper Motor, Motor Output Shaft, Integral Connector Receptacle & Rubber Isolators
Courtesy of CHRYSLER GROUP, LLC

The rear wiper motor is concealed behind the lower liftgate inside trim panel on the liftgate inner panel just below the liftgate glass near the center. The threaded and tapered end of the motor output shaft (1) that extends through the liftgate glass to drive the rear wiper arm and blade is the only visible component of the rear wiper motor. A rubber grommet is engaged within the output shaft clearance hole of the liftgate glass and seals the output shaft housing where it passes through the glass. An integral connector receptacle (4) connects the rear wiper motor to the vehicle electrical system through a dedicated take out and connector of the liftgate wire harness. The rear wiper motor consists of the following major components:

- **Bracket (2)** - The rear wiper motor bracket consists of a Stamped metal mounting plate for the wiper motor that is secured with screws to the wiper motor transmission housing. The bracket is secured with screws through three rubber isolators (5) to three mounting points that are integral to the liftgate inner panel.
- **Motor (3)** - The single-speed permanent magnet rear wiper motor is secured to the rear wiper motor bracket. The wiper motor includes an integral transmission, the motor output shaft, a park switch and an integral connector receptacle. An automatic resetting circuit breaker and an internal clutch mechanism protect the motor from overloads.

The rear wiper motor cannot be adjusted or repaired. If any component of the motor is ineffective or damaged, the entire rear wiper motor unit must be replaced. The motor output shaft grommet, the mounting hardware and the liftgate glass are available for individual service replacement.

OPERATION

FRONT

The front wiper motor is packaged with the wiper linkage module in this vehicle. Refer to **LINKAGE, WIPER ARM, OPERATION**.

REAR

The rear wiper motor operation is controlled by the Body Control Module (BCM), which uses relays soldered onto the BCM Printed Circuit Board (PCB) to control rear wiper system operation for energizing or de-energizing the rear wiper motor. The BCM uses internal programming, hard wired inputs received from the right (wiper) multifunction switch and the rear wiper motor park switch as well as electronic messages received over the Controller Area Network (CAN) data bus to provide the rear wiper and washer system operating modes.

The rear wiper motor park switch is a single pole, single throw, momentary switch within the wiper motor that is mechanically actuated by the wiper motor transmission components. The park switch alternately closes and opens a voltage signal for the rear wiper motor electronic control logic circuitry of the BCM. The park switch is normally an open circuit when the rear wiper blade is in the parked position, and is connected to fused ignition output when the rear wiper blade is anywhere except parked.

This park switch input allows the electronic logic circuits of the BCM to control all of the electronic features of rear wiper motor operation and to keep the motor energized long enough to complete its current wipe cycle and park the wiper blade at the base of the glass after the status of the rear wiper system or the ignition switch transitions to Off. The internal BCM circuitry pulls the park switch sense input to ground when the switch is open so that the microcontroller sees a ground when the wiper blade is parked.

The rear wiper motor is grounded at all times through a take out with an eyelet terminal connector in the body wire harness that is secured to a ground location in the passenger compartment. The automatic resetting circuit breaker protects the motor from overloads. The rear wiper motor transmission converts the rotary output of the wiper motor to the back and forth wiping motion of the rear wiper arm and blade on the liftgate glass.

The hard wired inputs and outputs of the rear wiper motor may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the rear wiper motor or the electronic controls and communication between other modules and devices that provide some features of the rear wiper and washer system. The most reliable, efficient and accurate means to diagnose the rear wiper motor or the electronic controls and communication related to rear wiper motor operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

FRONT

Fig. 48: Front Wiper Linkage Module
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not apply pressure to, or pry on the plastic drive link bushings. When removing a drive link from, or installing a drive link onto the ball stud on the wiper motor crank arm apply pressure to, or pry on only the metal portions of the drive link around the bushing. If the bushing is damaged, the entire wiper linkage module MUST be replaced.

CAUTION: Do not remove the crank arm nut from the wiper motor output shaft. The crank arm is indexed to the output shaft with the motor in the park position during the manufacturing process, but there are no provisions made for correctly indexing this connection in the field. If the crank arm to output shaft indexing is incorrect, the entire wiper motor and crank arm unit MUST be replaced.

1. Disconnect and isolate the negative cable from the battery.
2. Remove the front wiper linkage module from the cowl plenum and place it on a suitable work surface. Refer to **LINKAGE, WIPER ARM, REMOVAL**.
3. Disengage the socket bushing (1) of the wiper drive link (2) from the ball stud on the wiper motor crank arm (6) using two large screwdrivers, one on each side of the ball stud. Pry firmly and evenly between the crank arm and the metal portion of the drive link until the socket unsnaps from the ball.
4. Remove the two screws (5) that secure the motor bracket (3) to the module bracket (4).
5. Remove the wiper motor and crank arm as a unit from the module bracket.

REAR

Fig. 49: Liftgate Glass, Rear Wiper Arm & Output Shaft
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative cable from the battery.
2. From the outside of the liftgate glass (4), remove the rear wiper arm (2) from the rear wiper motor output shaft (5). Refer to **ARM, WIPER, REMOVAL**.

Fig. 50: Rear Wiper Motor
Courtesy of CHRYSLER GROUP, LLC

3. From the inside of the liftgate, remove the trim from the liftgate inner panel (1). Refer to **PANEL, TRIM, REMOVAL** .
4. Disconnect the liftgate wire harness connector (4) from the rear wiper motor (2) connector receptacle.
5. Remove the three screws (3) that secure the motor mounting bracket to the liftgate inner panel.

6. Carefully slide the rear wiper motor output shaft and housing out of the grommet installed in the clearance hole of the liftgate glass.
7. From the outside of the liftgate, remove the output shaft grommet from the clearance hole in the liftgate glass and discard.

INSTALLATION

FRONT

Fig. 51: Front Wiper Linkage Module
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not apply pressure to, or pry on the plastic drive link bushings. When removing a drive link from, or installing a drive link onto the ball stud on the wiper motor crank arm apply pressure to, or pry on only the metal portions of the drive link around the bushing. If the bushing is damaged, the entire wiper linkage module MUST be replaced.

CAUTION: Do not remove the crank arm nut from the wiper motor output shaft. The crank arm is indexed to the output shaft with the motor in the park position during the manufacturing process, but there are no provisions made for correctly indexing this connection in the field. If the crank arm to output shaft indexing is incorrect, the entire wiper motor and crank arm unit MUST be replaced.

1. Position the front wiper motor unit to the front wiper module bracket (4).

2. Install and tighten the two screws (5) into the two nuts that secure the motor bracket (3) to the module bracket. Tighten the screws to 7.5 N.m (66 in. lbs.).
3. Position the socket bushing (1) of the wiper drive link (2) over the ball stud on the crank arm (6).
4. Place a short 19 millimeter or 3/4 inch socket over the domed cap side of the socket bushing as an installation tool. Use large channel-lock pliers to firmly and evenly apply enough pressure to the underside of the crank arm and the top of the socket installation tool to snap the bushing onto the ball stud. **Do not apply pressure directly to the plastic bushing.**

NOTE: Be certain to transition the ignition switch to the On status, then turn the front wiper switch On and Off again to cycle the wiper motor and linkage to their natural park position before reinstalling the front wiper arms onto the wiper pivots.

5. Reinstall the front wiper linkage module into the vehicle. Refer to **LINKAGE, WIPER ARM, INSTALLATION**.
6. Reconnect the negative cable to the battery.

REAR

Fig. 52: Liftgate Glass, Rear Wiper Arm & Output Shaft
Courtesy of CHRYSLER GROUP, LLC

1. From the outside of the liftgate, install a new rubber grommet (3) into the rear wiper motor output shaft clearance hole of the liftgate glass (4). Always use a new grommet in the glass.

Fig. 53: Rear Wiper Motor
Courtesy of CHRYSLER GROUP, LLC

2. From the inside of the liftgate, position the rear wiper motor (2) output shaft and housing through the grommet in the liftgate glass clearance hole.
3. Position the rear wiper motor mounting bracket to the liftgate inner panel.
4. Install and tighten the three screws (3) that secure the motor mounting bracket to the liftgate inner panel. Tighten the screws securely.
5. Reconnect the liftgate wire harness connector (4) to the rear wiper motor connector receptacle.
6. Reinstall the trim onto the liftgate inner panel. Refer to **PANEL, TRIM, INSTALLATION** .
7. From the outside of the liftgate, reinstall the rear wiper arm onto the motor output shaft. Refer to **ARM, WIPER, INSTALLATION**.
8. Reconnect the negative cable to the battery.

PUMP, WINDSHIELD WASHER

DESCRIPTION

FRONT AND REAR

Fig. 54: Washer Pump/Motor
Courtesy of CHRYSLER GROUP, LLC

The washer pump/motor unit is located on the top of a sump area on the outboard side of the washer reservoir, which is located between the left front fender and the left front fender load beam ahead of the left front wheel house splash shield. A small permanently lubricated and sealed reversible electric motor (3) is coupled to the rotor-type washer pump (4). The use of an integral valve body (7) allows the washer pump/motor unit to provide washer fluid to either the front or the rear washer systems, depending upon the direction of the pump impeller rotation.

An inlet nipple (6) on the pump housing passes through a rubber grommet seal/filter screen installed in a dedicated mounting hole of the washer reservoir sump. The filter screen prevents most debris from entering the pump housing. When the pump is installed in the reservoir the front barbed outlet nipple (5) on the pump valve body housing connects the unit to the front washer plumbing, and the rear barbed outlet nipple (8) connects the unit to the rear washer plumbing. The letters **F** and **R** molded into the valve body housing adjacent to each nipple provide further clarification of the nipple assignments.

The washer pump/motor unit is retained on the reservoir by the interference fit between the pump inlet nipple and the grommet seal, which is a light press fit. The top of the washer pump is also secured to the washer reservoir by the use of a snap fit between the snap post (2) at the top of the pump motor housing and a receptacle molded into the reservoir that allows for mounting of the washer pump without the use of fasteners. An integral connector receptacle (1) on the top of the motor housing connects the unit to the vehicle electrical system through a dedicated take out and connector of the Front End Module (FEM) wire harness.

The washer pump/motor unit cannot be repaired. If ineffective or damaged, the entire washer pump/motor unit must be replaced. The rubber grommet seal/filter screen is available for separate service replacement.

HEADLAMP

Fig. 55: Headlamp Washer Pump/Motor Unit
Courtesy of CHRYSLER GROUP, LLC

The headlamp washer pump/motor unit (1) of vehicles so equipped is located on the top of a sump area just above and rearward of the reversible front and rear washer pump on the outboard side of the washer reservoir, between the left front fender and left front fender load beam ahead of the left front wheel house splash shield. A small permanently lubricated and sealed electric motor is coupled to the rotor-type washer pump.

An inlet nipple (4) on the bottom of the pump housing (3) passes through a rubber grommet seal/filter screen installed in a dedicated mounting hole of the washer reservoir. When the pump is installed in the reservoir the quick connect outlet nipple (5) on the pump housing points toward the left side of the vehicle and connects the unit to the headlamp washer plumbing.

The headlamp washer pump/motor unit is retained on the reservoir by the interference fit between the pump inlet nipple and the grommet seal, which is a light press fit. The top of the washer pump is also secured to the washer reservoir by a light snap fit into a receptacle molded into the reservoir that allows for mounting of the washer pump without the use of fasteners. An integral connector receptacle (2) on the top of the motor housing connects the unit to the vehicle electrical system through a dedicated take out and connector of the Front End Module (FEM) wire harness.

The headlamp washer pump/motor unit cannot be repaired. If ineffective or damaged, the entire headlamp washer pump/motor unit must be replaced. The rubber grommet seal/filter screen is available for separate service replacement.

OPERATION

FRONT AND REAR

Fig. 56: Washer Pump/Motor Operation
Courtesy of CHRYSLER GROUP, LLC

The washer pump/motor unit features a small Direct Current (DC) reversible electric motor. The direction of the motor is controlled by hard wired outputs from the Body Control Module (BCM). When battery current and ground are applied to the two pump motor terminals, the motor rotates in one direction. When the polarity of these connections is reversed, the motor rotates in the opposite direction. When the pump motor is energized, the rotor-type pump pressurizes the washer fluid and forces it through one of the two pump outlet nipples, and into the front or rear washer plumbing.

The BCM controls the hard wired outputs to the pump motor based upon electronic **washer switch** status messages received over the Controller Area Network (CAN) data bus from the Steering Control Module (SCM). The SCM monitors analog and digital inputs from the front and rear washer switch circuitry contained within the right multifunction switch to determine the proper electronic messages to send. Whenever the low washer fluid indicator is illuminated, the BCM is programmed to suppress all rear washer requests in order to give priority to the need for forward visibility.

Washer fluid is drawn through the pump inlet nipple from the washer reservoir to the inlet port of the washer pump housing. An integral valve body is located in a housing on the outlet port side (2) of the pump housing. A diaphragm (4) in this valve body controls which washer system plumbing receives the washer fluid being pressurized by the pump.

When the pump impeller (1) rotates in the counterclockwise direction (viewed from the bottom), the biased diaphragm is sealing off the rear washer system outlet and nipple so the pressurized washer fluid is pushed out through the pump front outlet port and the front washer outlet nipple (5). When the pump impeller rotates in the clockwise direction (viewed from the bottom), pressurized washer fluid is pushed out through the pump rear outlet port and moves the diaphragm to open the rear washer outlet nipple and seal off the front washer outlet nipple, then the pressurized washer fluid is pushed out through the rear washer outlet nipple (3).

The washer pump/motor unit and the hard wired motor control circuits from the BCM may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the washer pump/motor unit or the electronic controls and communication between other modules and devices that provide some features of the front and rear wiper and washer system. The most reliable, efficient and accurate means to diagnose the washer pump/motor unit or the electronic controls and communication related to washer pump/motor unit operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

HEADLAMP

Headlamp washer pump/motor unit operation is completely controlled by the Body Control Module (BCM) logic circuits based upon electronic **headlamp switch** and **washer switch** status messages received from the Steering Control Module (SCM) over the Controller Area Network (CAN) data bus. The SCM monitors hard wired analog and digital inputs from the headlamp switch circuitry of the left multifunction switch and from the front washer switch circuitry of the right multifunction switch to determine the proper status messages to send.

The headlamp washer relay control coil operates on ground received from the BCM, and the BCM will only allow the relay to function while the engine is running. In addition, the BCM will only allow the headlamp washers to operate when the headlamps are turned On. The BCM uses both a Low Side Driver (LSD) to energize or de-energize the headlamp washer relay in the Power Distribution Center (PDC) which, in turn, controls the operation of the headlamp washer pump/motor unit.

The hard wired circuits and components of the headlamp washer pump/motor unit may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the headlamp washer pump/motor or the electronic controls and communication between other modules and devices that provide some features of the headlamp washer system. The most reliable, efficient and accurate means to diagnose the headlamp washer pump/motor unit or the electronic controls and communication related to headlamp washer pump/motor unit operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

FRONT AND REAR

Fig. 57: Washer Pump/Motor Unit

Courtesy of CHRYSLER GROUP, LLC

NOTE: The washer pump/motor unit may be removed from the washer reservoir without removing the reservoir from the vehicle.

1. Disconnect and isolate the negative cable from the battery.
2. Turn the steering wheel to move the front wheels to the full left position.
3. Raise and support the vehicle.
4. Remove the plastic push-in fasteners that secure the forward end of the left front wheel house splash shield to the inner fender panel and the front fascia. Refer to **SHIELD, SPLASH, FRONT WHEELHOUSE, REMOVAL** .
5. Pull the forward end of the left front wheelhouse splash shield away from the inner fender panel and front fascia far enough to access the washer pump/motor unit (3) on the outboard side of the washer reservoir (1) on the outboard end of the Front End Module (FEM) hydroform.
6. Disconnect the FEM wire harness connector (2) for the washer pump motor from the motor connector receptacle.

NOTE: To aid in reinstallation, note the installed position of the front and rear washer plumbing fittings (4) prior to disconnecting them from the washer pump.

7. Disconnect the front and rear washer plumbing fittings from the barbed outlet nipples of the washer pump and allow the washer fluid to drain into a clean container for reuse.
8. Pull lightly outward on the top of the washer pump/motor housing away from the washer reservoir to disengage the snap post on the top of the motor from the receptacle in the reservoir.
9. Using hand pressure, firmly grasp and pull the washer pump upward far enough to disengage the pump inlet nipple from the rubber grommet seal/filter screen in the reservoir. Care must be taken not to damage the reservoir.
10. Remove the washer pump/motor unit from the washer reservoir.
11. Remove the rubber grommet seal from the washer pump mounting hole in the reservoir and discard.

HEADLAMP

Fig. 58: Headlamp Washer Pump/Motor Unit
Courtesy of CHRYSLER GROUP, LLC

NOTE: The headlamp washer pump/motor unit may be removed from the washer reservoir without removing the reservoir from the vehicle.

1. Disconnect and isolate the negative cable from the battery.
2. Siphon the washer fluid from the washer reservoir into a clean container for reuse.
3. Turn the steering wheel to move the front wheels to the full left position.
4. Raise and support the vehicle.
5. Remove the plastic push-in fasteners that secure the forward end of the left front wheelhouse splash shield to the inner fender panel and the front fascia. Refer to **SHIELD, SPLASH, FRONT WHEELHOUSE, REMOVAL** .
6. Pull the forward end of the left front wheelhouse splash shield away from the inner fender panel and front fascia far enough to access the headlamp washer pump/motor unit (3) on the outboard side of the washer reservoir (1) on the outboard end of the Front End Module (FEM) hydroform. The headlamp washer pump is above and behind the reversible front and rear washer pump/motor unit (5).
7. Disconnect the FEM wire harness connector (2) for the headlamp washer pump motor from the motor connector receptacle.
8. Disconnect the high pressure headlamp washer supply line quick connect fitting from the headlamp washer pump outlet quick connect nipple. Refer to **HOSES AND TUBES, WASHER, STANDARD PROCEDURE**.
9. Pull lightly outward on the top of the headlamp washer pump/motor housing away from the washer reservoir to unsnap it from the molded receptacle in the reservoir.
10. Using hand pressure, firmly grasp and pull the headlamp washer pump upward far enough to disengage

the pump inlet nipple from the rubber grommet seal/filter screen in the reservoir. Care must be taken not to damage the reservoir.

11. Remove the rubber grommet seal/filter screen from the pump mounting hole in the washer reservoir and discard.

INSTALLATION

FRONT AND REAR

Fig. 59: Washer Pump/Motor Unit
Courtesy of CHRYSLER GROUP, LLC

1. Lubricate a new rubber grommet seal/filter screen with clean washer fluid and install it into the washer pump mounting hole in the washer reservoir (1). Always use a new rubber grommet seal/filter screen on the reservoir.
2. Position the inlet nipple on the base of the pump housing of the washer pump/motor unit (3) to the rubber grommet seal/filter screen in the reservoir.
3. Using hand pressure, press firmly and evenly downward on the top of washer pump/motor unit until the inlet nipple is fully seated in the rubber grommet seal/filter screen in the pump mounting hole of the reservoir.
4. Align the snap post on the top of the motor housing with the snap post receptacle in the washer reservoir.
5. Using hand pressure, press firmly and evenly on the top of motor housing until the post snaps into the receptacle.

NOTE: Be certain to reconnect the front and rear washer plumbing fitting to the proper outlet nipples of the washer pump. Failure to properly connect the

fittings will cause the front and rear washer systems to operate incorrectly.

6. Reconnect the front and rear washer plumbing fittings (4) to the barbed outlet nipples of the washer pump.
7. Reconnect the Front End Module (FEM) wire harness connector (2) for the washer pump/motor unit to the connector receptacle on the top of the motor.
8. Reinstall the plastic push-in fasteners that secure the left front wheelhouse splash shield to the inner fender panel and the front fascia. Refer to **SHIELD, SPLASH, FRONT WHEELHOUSE, INSTALLATION** .
9. Lower the vehicle.
10. Reconnect the negative cable to the battery.
11. Refill the washer reservoir with the washer fluid drained from the reservoir during the removal procedure.

HEADLAMP

0833005536

Fig. 60: Headlamp Washer Pump/Motor Unit
Courtesy of CHRYSLER GROUP, LLC

1. Install a new rubber grommet seal/filter screen into the headlamp washer pump/motor unit mounting hole in the washer reservoir (1). Always use a new rubber grommet seal on the reservoir.
2. Position the inlet nipple of the headlamp washer pump/motor unit (3) to the rubber grommet seal/filter screen in the reservoir.
3. Using hand pressure, press firmly and evenly downward on the headlamp washer pump/motor unit until the inlet nipple is fully seated in the rubber grommet seal/filter screen in the pump mounting hole of the

reservoir.

4. Using hand pressure, press the top of the headlamp washer pump/motor housing firmly inward far enough to engage the snap fit between the motor housing and the molded motor receptacle in the reservoir.
5. Reconnect the Front End Module (FEM) wire harness connector (2) to the connector receptacle on the top of the pump motor.
6. Reconnect the headlamp washer high pressure supply line quick connect fitting to the headlamp washer pump outlet quick connect nipple. Refer to **HOSES AND TUBES, WASHER, STANDARD PROCEDURE**.
7. Reinstall the plastic push-in fasteners that secure the left front wheelhouse splash shield to the inner fender panel and the front fascia. Refer to **SHIELD, SPLASH, FRONT WHEELHOUSE, INSTALLATION** .
8. Lower the vehicle.
9. Refill the washer reservoir with the washer fluid drained during removal.
10. Reconnect the negative cable to the battery.

RESERVOIR, WINDSHIELD WASHER

DESCRIPTION

DESCRIPTION

Fig. 61: Windshield Washer Reservoir
Courtesy of CHRYSLER GROUP, LLC

A single washer fluid reservoir (1) is used for both the front and rear washer systems. The molded plastic

washer fluid reservoir is mounted on the left outboard side of the Front End Module (FEM) hydroform between the left front fender and the left front fender load beam, ahead of the left front wheel, where it is concealed by the left front wheel house splash shield. The only visible component of the washer reservoir is the filler neck and cap unit (2), which extends upward into the engine compartment just behind the upper radiator cross member. A bright yellow plastic filler cap with a rubber seal and an International Control and Display Symbol icon for **Windshield Washer** molded into it snaps over the open end of the filler neck. The cap hinges on and is secured to the reservoir filler neck by an integral retainer ring and bail strap.

There are separate, dedicated holes on the outboard side of the reservoir provided for the reversible front and rear washer pump/motor unit (5) and the washer fluid level switch (4). The inboard side of the washer reservoir has integral mounting tabs that are secured to weld studs on the FEM hydroform by two nuts. A mounting tab near the top of the filler neck is secured by a screw to the upper radiator cross member. A mounting tab at the upper rear corner of the reservoir is secured to the battery tray after the FEM is secured to the vehicle. The left front fender wheel house splash shield must be removed to access the washer reservoir for service.

A unique reservoir is used for vehicles manufactured for export markets with the optional High Intensity Discharge (HID) headlamps and the headlamp washer system. This reservoir has a dedicated sump and mounting receptacle for the headlamp washer pump (3) on the outboard side of the reservoir, above and rearward of the reversible front and rear washer pump. The location and mounting provisions for this reservoir are the same as those for vehicles without the headlamp washer system.

The washer reservoir cannot be repaired and, if ineffective or damaged, it must be replaced. The washer reservoir, rubber grommet seals for the washer pump/motor units and the washer fluid level switch as well as the filler cap are each available for individual service replacement.

OPERATION

OPERATION

The washer fluid reservoir provides a secure, on-vehicle storage location for a large reserve of washer fluid for operation of the front and rear washer systems. The washer reservoir filler neck provides a clearly marked and readily accessible point from which to add washer fluid to the reservoir.

The reversible front and rear washer pump/motor unit is located in a sump area near the bottom on the outboard side of the reservoir to be certain that washer fluid will be available to the pump as the fluid level in the reservoir becomes depleted. The front and rear washer pump/motor unit is mounted in the lowest position in the sump. The washer fluid level switch is mounted just above the sump area of the reservoir so that there will be adequate warning to the vehicle operator that the washer fluid level is low, before the front and rear washer systems will no longer operate.

On vehicles equipped with the headlamp washer system the reservoir features a second sump located rearward of and above the front and rear washer pump sump. This allows the front and rear washer systems to remain operational after the washer fluid level falls below the pump inlet for the headlamp washer pump.

REMOVAL

REMOVAL

Fig. 62: Upper Radiator Support, Filler Neck & Screw
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative cable from the battery.
2. Turn the steering wheel to move the front wheels to the full left position.
3. Remove the screw (3) that secures the washer reservoir filler neck (2) to the upper radiator support (1).

Fig. 63: Washer Fluid Level Switch, Pump/Motor & Headlamp Washer Pump/Motor
Courtesy of CHRYSLER GROUP, LLC

4. Raise and support the vehicle.
5. Remove the plastic push-in fasteners that secure the forward end of the left front wheelhouse splash shield to the inner fender panel and the front fascia. Refer to **SHIELD, SPLASH, FRONT WHEELHOUSE, REMOVAL** .
6. Pull the forward end of the front wheelhouse splash shield away from the inner fender panel and front fascia far enough to access the washer reservoir (4) for service.
7. Disconnect the Front End Module (FEM) wire harness connectors from the washer fluid level switch (6), the washer pump/motor (7) and, if equipped, the headlamp washer pump/motor (5).

NOTE: To aid in reinstallation, note the installed position of the washer hoses prior to disconnecting them from the washer pump.

8. Disconnect the front and rear washer hoses from the barbed outlet nipples of the washer pump and allow the washer fluid to drain into a clean container for reuse.
9. If the vehicle is so equipped, disconnect the headlamp washer supply hose quick-connect fitting from the headlamp washer pump/motor.
10. Remove the screw (3) that secures the mounting tab on the upper rear corner of the washer reservoir to the battery tray (2).
11. Remove the two nuts (8) that secure the forward mounting tabs of the washer reservoir to the weld studs on the outboard side of the FEM hydroform (1).
12. Lower the washer reservoir from the vehicle, rotating it as necessary for clearance.

INSTALLATION

INSTALLATION

Fig. 64: Washer Fluid Level Switch, Pump/Motor & Headlamp Washer Pump/Motor
Courtesy of CHRYSLER GROUP, LLC

1. Position the washer reservoir (4) into the left front fender wheel house from underneath the vehicle.
2. Raise the washer reservoir into position, rotating it as necessary for clearance.
3. Engage the two mounting tabs at the front of the washer reservoir over the weld studs on the outboard side of the Front End Module (FEM) hydroform (1).
4. Install and tighten the two nuts (8) that secure the washer reservoir to the weld studs on the FEM hydroform. Tighten the nuts to 7 N.m (60 in. lbs.).
5. Install and tighten the screw (3) that secures the mounting tab on the upper rear corner of the washer reservoir to the battery tray (2). Tighten the screw to 7 N.m (60 in. lbs.).

NOTE: **Be certain to reconnect the front and rear washer hoses to the proper outlet nipples of the washer pump. Failure to properly connect the hoses will cause the front and rear washer systems to operate incorrectly.**

6. Reconnect the front and rear washer hoses to the barbed outlet nipples of the washer pump (7).
7. If the vehicle is so equipped, reconnect the headlamp washer supply hose quick-connect fitting to the outlet nipple of the headlamp washer pump (5).
8. Reconnect the FEM wire harness connectors to the washer fluid level switch (6), the washer pump/motor and, if equipped, the headlamp washer pump/motor.
9. Reinstall the plastic push-in fasteners that secure the left front wheelhouse splash shield to the inner fender panel and the front fascia. Refer to **SHIELD, SPLASH, FRONT WHEELHOUSE, INSTALLATION** .
10. Lower the vehicle.

Fig. 65: Upper Radiator Support, Filler Neck & Screw
Courtesy of CHRYSLER GROUP, LLC

11. Install and tighten the screw (3) that secures the washer reservoir filler neck (2) mounting tab to the upper radiator cross member (1). Tighten the screw to 7 N.m (60 in. lbs.).
12. Refill the washer reservoir with the washer fluid drained during removal.
13. Reconnect the negative cable to the battery.

SWITCH, MULTIFUNCTION, RIGHT

DESCRIPTION

DESCRIPTION

Fig. 66: Steering Column Control Module (SCCM) & Clockspring
Courtesy of CHRYSLER GROUP, LLC

The right (wiper) multifunction switch (3) is integral to the Steering Column Control Module (SCCM) (2), which includes both the left (1) and right multifunction switches, the microcontroller based Steering Control Module (SCM) and serves as the carrier for the clockspring (4). The right multifunction switch is located on the right side of the steering column, just below the steering wheel. This switch is the primary control for the front and rear wiper and washer systems.

0833005928

Fig. 67: Control Knob, Control Stalk & Right Multifunction Switch
Courtesy of CHRYSLER GROUP, LLC

The only visible components of the switch are the control stalk (1), control knob (2) and control sleeve (3) that extend through the steering column shrouds on the right side of the column. The remainder of the switch including its mounting provisions and electrical connections are concealed within the SCCM beneath the steering column shrouds. The switch controls are constructed of molded black plastic. Each of the switch controls has white International Control and Display Symbol graphics applied to it, which clearly identify its many functions.

The right (wiper) multifunction switch provides the vehicle operator with a control interface for the following wiper and washer system functions:

- **Continuous Front Wipers** - The right multifunction switch control knob provides detent switching for two continuous front wipe modes, low speed or high speed.
- **Intermittent Front Wipers** - The right multifunction switch control knob provides detent switching for the intermittent front wipe mode with four minor detent delay interval positions. The four delay positions become four sensitivity positions for vehicles equipped with the optional automatic wiper system.
- **Front Wiper Mist Mode** - The right multifunction switch control stalk includes momentary switching of the front wiper motor low speed circuit to provide a mist mode features (sometimes referred to as pulse wipe), which allows the vehicle operator to momentarily operate the front wipers for one or more complete cycles.
- **Front Washer Mode** - The right multifunction switch control stalk provides momentary switching for control of the front washer system operation.
- **Intermittent Rear Wipe Mode** - The right multifunction switch control sleeve provides detent switching for a single fixed interval intermittent rear wiper mode.

- **Rear Washer Mode** - The right multifunction switch control stalk provides momentary switching for control of rear washer system operation.

The right multifunction switch cannot be adjusted or repaired. If any function of the switch is ineffective, or if the switch is damaged, the entire SCCM mounting housing, SCM and multifunction switches unit must be replaced. Refer to **MODULE, STEERING COLUMN, REMOVAL** . The clockspring is available for separate service replacement.

OPERATION

OPERATION

The right (wiper) multifunction switch uses resistor multiplexing to control the many functions and features it provides using a minimal number of hard wired circuits. The switch receives clean grounds from the Steering Control Module (SCM), then provides resistor multiplexed return outputs to the SCM to indicate the selected switch positions. The SCM then sends electronic **switch status** messages over the Controller Area Network (CAN) data bus to the Body Control Module (BCM) and other electronic modules in the vehicle.

If the SCM detects no inputs from the right multifunction switch, it transmits an electronic **Signal Not Available (SNA)** status message over the CAN data bus. The SNA status signals the other electronic modules to implement a fail-safe or default mode of operation for the front and rear wiper systems. The fail-safe mode will maintain the last selected front and rear wiper system operation for the remainder of the current ignition cycle, after which both wiper systems will default to Off.

The hard wired inputs and outputs of the SCM may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the right multifunction switch or the electronic controls and communication between other modules and devices that provide some features of the wiper and washer system. The most reliable, efficient and accurate means to diagnose the right multifunction switch or the electronic controls and communication related to right multifunction switch operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

Following are descriptions of how the right multifunction switch is operated to control the many front and rear wiper and washer system functions and features it provides:

- **Front Washer Control** - The right multifunction switch control stalk is pulled rearward towards the steering wheel to a momentary WASH position to activate the washer pump/motor in the front washer mode. The washer pump/motor will continue to operate for as long as the control stalk is held in this position. The SCM reads the resistor multiplexed input from the right multifunction switch and sends an electronic **front washer switch status** message over the CAN data bus to the BCM and to other electronic modules in the vehicle.
- **Front Wiper Control** - The control knob on the end of the right multifunction switch control stalk is rotated to one of the two continuous wiper detent positions (LO or HI), to one of four intermittent delay or sensitivity wiper detent positions, or to the OFF position to select the front wiper mode. The SCM reads the resistor multiplexed input from the right multifunction switch and sends electronic **front wiper switch status** messages over the CAN data bus to the BCM and to other electronic modules in the vehicle.

- **Front Wiper Mist Mode** - The right multifunction switch control stalk is lifted upward to a momentary MIST position to activate the front wiper MIST mode. The front wiper motor will continue to operate, one complete cycle at a time, for as long as the control stalk is held in this position. The SCM reads the resistor multiplexed input from the right multifunction switch and sends an electronic **front wiper switch status** message over the CAN data bus to the BCM and to other electronic modules in the vehicle.
- **Rear Washer Control** - The right multifunction switch control pushed forward away from the steering wheel to the momentary WASH positions to activate the washer pump/motor in the rear washer mode. The washer pump/motor will continue to operate in the rear washer mode for as long as the control stalk is held in this position. The SCM reads the input from the right multifunction switch and sends an electronic **rear washer switch status** message over the CAN data bus to the BCM and to other electronic modules in the vehicle.
- **Rear Wiper Control** - The rear wiper mode is selected when the right multifunction switch control sleeve is rotated to the fixed interval intermittent rear wipe detent ON position detent position. The SCM reads the input from the right multifunction switch and sends an electronic **rear wiper switch status** message over the CAN data bus to the BCM and to other electronic modules in the vehicle.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - RIGHT MULTIFUNCTION SWITCH

The hard wired inputs and outputs of the Steering Control Module (SCM) may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the right multifunction switch or the electronic controls and communication between other modules and devices that provide some features of the wiper and washer system. The most reliable, efficient and accurate means to diagnose the right multifunction switch or the electronic controls and communication related to right multifunction switch operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

REMOVAL

The right multifunction switch is serviced only as a unit with the Steering Column Control Module (SCCM) mounting housing, the Steering Control Module (SCM) and both multifunction switches. Refer to **MODULE, STEERING COLUMN, REMOVAL** . The clockspring is available for separate service replacement.

INSTALLATION

INSTALLATION

The right multifunction switch is serviced only as a unit with the Steering Column Control Module (SCCM) mounting housing, the Steering Control Module (SCM) and both multifunction switches. Refer to **MODULE, STEERING COLUMN, INSTALLATION** . The clockspring is available for separate service replacement.

SWITCH, WASHER FLUID LEVEL

DESCRIPTION

DESCRIPTION

Fig. 68: Washer Fluid Level Switch
Courtesy of CHRYSLER GROUP, LLC

The washer fluid level switch is a single pole, single throw reed-type switch mounted just above the sump area near the bottom of the washer reservoir. Only the molded plastic switch mounting flange (1) and the integral connector receptacle (5) are visible when the switch is installed in the reservoir. A short barbed nipple formation extends from the inner surface of the switch mounting flange and is pressed through a rubber grommet seal (4) installed in the mounting hole of the reservoir.

A molded plastic float (3) hangs under a molded plastic beam (2) that extends axially from the switch mounting flange. A small permanent magnet is secured within a receptacle on the bottom of the float, and the reed switch is concealed within the beam.

The washer fluid level switch cannot be adjusted or repaired. If ineffective or damaged, it must be replaced. The grommet seal should be replaced with a new unit each time the switch is removed from the washer reservoir.

OPERATION

OPERATION

The washer fluid level switch uses a float to monitor the level of the washer fluid in the washer reservoir. The float contains a small magnet. When the float moves, the proximity of this magnet to a stationary reed switch within the beam formation of the switch changes. When the fluid level in the washer reservoir is at or above the

float level, the float rises and the influence of the float magnetic field is applied to the reed switch causing the normally open reed switch contacts to close. When the fluid level in the washer reservoir falls below the level of the float, the float falls and the influence of the float magnetic field is removed from the reed switch, causing the contacts of the normally open reed switch to open.

The washer fluid level switch is connected to the vehicle electrical system through a dedicated take out and connector of the Front End Module (FEM) wire harness. The switch is connected in series between the washer fluid switch sense and return circuits of the Body Control Module (BCM). When the switch opens, the BCM senses the input on the washer fluid switch return circuit. The BCM is programmed to respond to this input by sending an electronic message to the Instrument Cluster (IC) (also known as the Instrument Panel Cluster/IPC) over the Controller Area Network (CAN) data bus requesting illumination of the low washer fluid indicator and the sounding of an audible chime tone warning.

The washer fluid level switch and the hard wired circuits between the switch and the BCM may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the washer fluid level switch or the electronic controls and communication between other modules and devices that provide some features of the wiper and washer systems. The most reliable, efficient and accurate means to diagnose the washer fluid level switch or the electronic controls and communication related to washer fluid level switch operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

REMOVAL

Fig. 69: Washer Fluid Level Sensor Unit & Connector
Courtesy of CHRYSLER GROUP, LLC

NOTE: The washer fluid level switch can be removed from the washer reservoir without removing the reservoir from the vehicle.

1. Disconnect and isolate the negative cable from the battery.
2. Turn the steering wheel to move the front wheels to the full left position.
3. Raise and support the vehicle.
4. Remove the plastic push-in fasteners that secure the forward end of the left front wheel house splash shield to the inner fender panel and the front fascia. Refer to **SHIELD, SPLASH, FRONT WHEELHOUSE, REMOVAL** .
5. Pull the forward end of the left front wheel house splash shield away from the inner fender panel and front fascia far enough to access the washer fluid level sensor unit (3) on the outboard side of the washer reservoir (1) on the outboard end of the Front End Module (FEM) hydroform.
6. Disconnect the FEM wire harness connector (2) for the washer fluid level sensor from the sensor connector receptacle.
7. Disconnect one of the reservoir washer plumbing fittings from the barbed outlet nipple of the washer pump (4) and allow the washer fluid to drain into a clean container for reuse.
8. Using a trim stick or another suitable wide flat-bladed tool, gently pry the barbed nipple of the washer fluid level sensor out of the rubber grommet seal on the reservoir just above the sump. Care must be taken not to damage the reservoir.
9. Remove the washer fluid level sensor from the washer reservoir.
10. Remove the rubber grommet seal from the washer fluid level sensor mounting hole in the washer reservoir and discard.

INSTALLATION

INSTALLATION

Fig. 70: Washer Fluid Level Sensor Unit & Connector
Courtesy of CHRYSLER GROUP, LLC

1. Lubricate a new rubber grommet seal with clean washer fluid and install it into the washer fluid level sensor mounting hole in the washer reservoir (1). Always use a new rubber grommet seal on the reservoir.
2. Insert the float of the washer fluid level sensor (3) through the rubber grommet seal and into the washer reservoir. The flat of the index tab on the washer fluid level switch mounting flange should be pointed downward.
3. Using hand pressure, press firmly and evenly on the washer fluid level sensor mounting flange until the barbed nipple is fully seated in the rubber grommet seal in the mounting hole of the washer reservoir.
4. Reconnect the Front End Module (FEM) wire harness connector (2) for the washer fluid level sensor to the sensor connector receptacle.
5. Reconnect the reservoir washer plumbing fitting to the barbed outlet nipple of the washer pump (4).
6. Reinstall the plastic push-in fasteners that secure the left front wheel house splash shield to the inner fender panel and the front fascia. Refer to **SHIELD, SPLASH, FRONT WHEELHOUSE, INSTALLATION** .
7. Lower the vehicle.
8. Reconnect the negative cable to the battery.
9. Refill the washer reservoir with the washer fluid siphoned from the reservoir during the removal procedure.

2014 AUTOMATIC TRANSMISSION

948TE - Service Information - Cherokee

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - AUTOMATIC TRANSMISSION - GENERAL CONDITIONS

CAUTION: Before attempting any repair on an automatic transmission, check for Diagnostic Trouble Codes with the appropriate scan tool.

CAUTION: A unique transmission fluid has been developed for the 8HP transmission. This fluid is NOT compatible with ATF+4 or any other current Chrysler transmission fluid. For specifics about this unique fluid, see FLUIDS, LUBRICANTS AND GENUINE PARTS in the owner's manual.

Transmission malfunctions may be caused by these general conditions:

- Poor engine performance.
- Improper adjustments.
- Hydraulic malfunctions.
- Mechanical malfunctions.
- Electronic malfunctions.
- Power Transfer Unit performance (if equipped).

Diagnosis of these problems should always begin by checking the easily accessible variables: fluid level, fluid condition, and transmission fault codes using the appropriate scan tool. Then perform a road test to determine if the problem has been corrected or if more diagnosis is necessary.

AIR TESTING

The 948TE transmission can be air tested to evaluate the condition of the seals and clutch apply circuits within the transmission. An adaptor plate in place of the valve body is required to perform this test. A rubber tipped air chuck connected to a 413 kPa (60 PSI) regulated shop air hose will provide adequate air pressure and volume to properly test the sealing components within the transmission.

1. Position the vehicle on a suitable hoist with the transmission in neutral. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove the valve body. Refer to **VALVE BODY, REMOVAL**.

Fig. 1: Installing Air Test Adaptor Plate
Courtesy of CHRYSLER GROUP, LLC

3. Place the (special tool #10507, Plate, Air Pressure Test) (1) in position on the transmission housing.

Fig. 2: Air Test Adaptor Plate Installed
Courtesy of CHRYSLER GROUP, LLC

4. Install the bolts (2) to hold the air test adaptor plate (1) to the transmission housing.

NOTE: **Do not exceed 60 psi air pressure. Air Pressure greater than 413 kPa (60 psi) may create a false positive result. Lip seals that are marginal may seal under higher pressure.**

Fig. 3: Applying Air Pressure At Adaptor Plate
Courtesy of CHRYSLER GROUP, LLC

5. Using a rubber tip blow chuck (2) on a 413 kPa (60 psi) **regulated** shop air hose, pressurize each of the clutch apply circuits marked on the adaptor plate (1).
6. Each circuit should thump when the clutch or dog applies and hold until the air chuck is released.
   - If a clutch or dog does not apply and air escapes past a damaged seal, the transmission will need to be replaced or overhauled as necessary.
   - If the transmission passes the air test, the valve body or solenoid valve will be the likely cause of the transmission shifting problem. If the valve body or solenoid valves are defective, they will need to be replaced as necessary.
7. Install the valve body. Refer to **VALVE BODY, INSTALLATION**.
8. Road test the vehicle to verify the repair.

PRELIMINARY DIAGNOSIS

VEHICLE IS DRIVABLE

1. Check for transmission fault codes using the appropriate scan tool.
2. Road test and note how the transmission upshifts, downshifts, and engages.
3. Check fluid level and condition. Refer to **FLUID AND FILTER, STANDARD PROCEDURE**.

VEHICLE IS DISABLED

1. Check for transmission fault codes using the appropriate scan tool.
2. Position the vehicle on a hoist with the transmission in neutral. Refer to **HOISTING, STANDARD PROCEDURE** .
3. Check for cracked, leaking cooler lines.

4. Check the fluid level and condition. Refer to **FLUID AND FILTER, STANDARD PROCEDURE**.
5. With the transmission in the park position, attempt to rotate halfshafts to make sure the transmission output shaft is intact.
6. Check the power transfer unit (PTU) (if equipped).
7. Raise and support vehicle on safety stands, start engine with transmission in the Park position and allow to idle for several minutes, shift transmission into gear, and note following:
   a. On AWD vehicle, if propeller shaft turns but wheels do not, problem is with the differential or halfshafts.
   b. If the propeller shaft does not turn and the transmission is noisy, stop the engine. Remove the oil pan, and check for debris. If the pan is clear, remove the transmission and check for damaged driveplate, torque converter, oil pump, or input shaft.
8. Check the transmission control module (TCM), wiring, valve body, and solenoids (Utilize fault codes to diagnose if available).

ROAD TEST

Prior to performing a road test, verify that the fluid level, fluid condition, and linkage adjustment have been verified.

During the road test, the transmission should be operated in each position to check for slipping and any variation in shifting.

If the vehicle operates properly at highway speeds, but has poor acceleration, the converter stator overrunning clutch may be slipping. If acceleration is normal, but high throttle opening is needed to maintain highway speeds, the converter stator clutch may have seized. Both of these stator defects require replacement of the torque converter and thorough transmission cleaning.

Slipping clutches can be isolated by comparing the "Elements in Use" chart with clutch operation encountered on a road test. This chart identifies which clutches are applied at each position of the selector lever.

A slipping clutch may also set a DTC and can be determined by operating the transmission in all selector positions.

948TE 9 Speed FWD/AWD/4WD Planetary Automatic Transmission with 6 shift elements and 4 planetary gear sets.								
		CLUTCH-A	**CLUTCH-B**	**CLUTCH-C**	**CLUTCH-D**	**CLUTCH-E**	**CLUTCH-F**	**RATIO**

Default Gear	**4th Gear**					**X**	**X**	

EMERGENCY RUNNING FUNCTION - LIMP IN MODE

In the event of a complete transmission electrical failure (loss of power to the transmission control module (TCM), the transmission enters default limp-in mode. When the TCM loses power, all solenoids are de-energized. Maximum pressure locks the transmission in fourth gear, and a diagnostic trouble code (DTC) is stored in memory. If the vehicle is in a forward gear range when the fault occurs, the transmission defaults to fourth gear.

The limp-in function remains active until the DTC is repaired or a stored DTC is erased with an appropriate scan tool.

FLUID LEAK DETECTION

The following procedure is for detecting transmission fluid leaks from the area between the transmission and the Power Transfer Unit (PTU). When transmission fluid is leaking form the weep hole in the area of the PTU, the seals around the differential output shaft and the differential side gear is most likely faulty. The large seals around the differential output shaft and side gear is serviceable without removing the transmission. The following procedure is recommended to determine which seal is leaking.

1. Disconnect the transmission vent tube from the adaptor nipple.
2. Adapt a compressed shop air coupling and a length neoprene hose onto the vent nipple.
3. Attach a 48 kPa (7 psi) regulated shop air source to the air coupling on the vent nipple.
4. Raise the vehicle on a suitable hoist.
5. Remove the PTU from the vehicle

   Refer to **REMOVAL** .

6. Apply a soapy solution to the seals inside and around the differential output shaft.
7. Observe over several minutes to see if air bubbles form in the leak area.

Test Results

- If bubbles are emanating from the inner differential side gear seal, remove the adapter sleeve and replace the inner seal.
- If bubbles are emanating from the outer output shaft seal, remove the adapter sleeve replace the seal.
- If bubbles are emanating from the transmission housing casting, replace the porous component.

STANDARD PROCEDURES

BEARING TURNING TORQUE MEASUREMENT

To determine proper select shim thickness for the differential and transfer gear bearings, the turning torque must be measured. If just the differential or transfer gear bearings are being replaced it is not necessary to measure the bearing turning torque. The original factory installed shims will be sufficient to properly preload the bearings when the transmission is assembled. If the differential, transfer gear, or transmission housing castings are replaced the differential and transfer gear bearing turning torque will need to be reestablished.

Verify that the bearings and races are **NEW** and properly installed on/in clean components with the factory installed select shims behind the bearing races. Lightly lubricate the bearings with transmission fluid.

Fig. 4: Special Tool #C-4995A
Courtesy of CHRYSLER GROUP, LLC

Tool (special tool #C-4995A, Tool, Differential Bearing Torque) must be modified to be compatible with the following operation. Two 3/8-24 nuts (1) must be added to keep the center shaft from rotating in the cone and sleeve.

1. Remove the nylok™ nut and expander cone from the center shaft.
2. Remove the sleeve from the center shaft.
3. Install a nut on the center shaft and tighten it against the existing nut. Install the sleeve.
4. Install the 2nd nut inside the sleeve just far enough to install the cone and nut.
5. Install the cone and nut tight enough to keep the center shaft from rotating inside the cone and sleeve.

MEASUREMENT PROCEDURE

1. Position the differential on a clean work surface.

210171737

Fig. 5: Differential Pinion Gears & Lock Tool
Courtesy of CHRYSLER GROUP, LLC

2. On 4WD transmissions tool 10425 is not required, there is no differential. on FWD and AWD transmissions, install the lock tool (special tool #10425, Tool, Pinion and Side Gear Locking) (2) between the differential (1) pinion gears next to the link pin to prevent the differential from rotating.
3. Position the transmission and bell housing on a suitable clean work bench.
4. Install new bearing races with the original select shims.
5. Install the differential with new bearings lightly lubricated with transmission fluid in the transmission housing.
6. Install the bell housing.
7. Install the bolts to hold the bell housing to the transmission housing. Tighten bolts to 50% on the specified torque value

   Refer to **SPECIFICATIONS**.

8. Insert modified tool (special tool #C-4995A, Tool, Differential Bearing Torque) into the differential until the sleeve (C-4995-1) enters the halfshaft spline in the differential side gear.
9. Tighten the nut until the sleeve expands tightly in the side gear.
10. Tighten the jamb nut to prevent the center shaft from rotating in the sleeve.
11. Using a suitable wrench, rotate the differential 20 rotations clockwise and 20 rotations counterclockwise.

Fig. 6: Torque Wrench & Differential
Courtesy of CHRYSLER GROUP, LLC

12. Using a torque wrench (1), measure the turning resistance of the differential (2) after the initial break away. It should measure between 1.7 to 2.8 N.m (15 and 25 in lbs)
13. Adjust the turning torque by adding to or subtracting from the thickness of the select shims behind the differential bearing races.
14. After achieving proper differential turning torque, separate the bell housing from the transmission housing.
15. Install the transfer gear with new bearings into the transmission housing.
16. Install the bell housing.
17. Install the bolts to hold the bell housing to the transmission housing. Tighten bolts to 50% on the specified torque value

    Refer to **SPECIFICATIONS**.

    NOTE: The turning torque of the differential and the transfer gear will be higher than the differential alone. The ring gear is driving a smaller gear on the transfer shaft.

18. Using a suitable wrench, rotate the differential 20 rotations clockwise and 20 rotations counterclockwise.

Fig. 7: Torque Wrench & Differential
Courtesy of CHRYSLER GROUP, LLC

19. Using a torque wrench (1), measure the turning resistance of the differential (2) after the initial break away. It should measure between 3.4 to 6.8 N.m (35 and 60 in lbs)
20. Adjust the turning torque by adding to or subtracting from the thickness of the select shims behind the transfer shaft bearing races.
21. Remove tool C-4995 from the differential.
22. Separate the bell housing from the transmission housing.
23. Remove the differential (1) and transfer gear (2).

210171737

Fig. 8: Differential Pinion Gears & Lock Tool
Courtesy of CHRYSLER GROUP, LLC

24. On FWD and AWD transmissions, remove lock tool 10425 (2) from the differential (1).
25. Prepare transmission components for final assembly.

INPUT SHAFT END PLAY MEASUREMENT

Before disassembling the 948TE transmission measure the end play of the input shaft. This will aid in the assembly process when selecting a select shim.

1. Place the transaxle on a suitable clean work surface.
2. Remove the torque converter.
3. Use tools (special tool #8266B, End Play Socket Set) and (special tool #C-3339A, Set, Dial Indicator) attached to the input shaft, to measure the input shaft end play.

Fig. 9: Measuring Input Shaft End Play
Courtesy of CHRYSLER GROUP, LLC

4. Attach the dial indicator to the handle 8266-8.
5. Attach the handle to the spline adapter 8266-6.
6. Attach the spline adapter to the input shaft.
7. Position the dial indicator plunger on the bellhousing rim.
8. Pull outward on the handle and zero the dial indicator face.

Fig. 10: Input Shaft End Play Measurement
Courtesy of CHRYSLER GROUP, LLC

9. Push inward on the handle and read the dial indicator.
10. Record the measurement as a reference number for selecting the proper thickness select spacer when assembling the transmission.

CLUTCH SPECIFICATIONS

The B, C, D and E clutch clearance must be measured and properly set during the assembly process of the 948TE transmission. The recommended measurement procedures can be found in the appropriate CLUTCH - ADJUSTMENTS procedure.

CLUTCH COMPOSITION

A - Clutch	Dog Clutch
B - Clutch	5 Discs
C - Clutch	4 Discs
D - Clutch	4 Discs
E - Clutch	5 Discs
F - Clutch	Dog Clutch

CLUTCH CLEARANCE

B-clutch = 1.28 - 1.77 (0.050 - 0.070 in)	C-clutch = 0.76 - 1.15 (0.030 - 0.045 in)
D-clutch = 1.01 - 1.50 (0.040 - 0.059 in)	E-clutch = 1.28 - 1.77 (0.050 - 0.070 in)

Fig. 11: Cutaway View Clutch Locations
Courtesy of CHRYSLER GROUP, LLC

TRANSMISSION GEAR RATIOS

Gear ratios for the 948TE automatic transmission are as follows:

GEAR	RATIO
1ST	4.70:1
2ND	2.824:1
3RD	1.909:1
4TH	1.382:1
5TH	1.00:1
6TH	0.808:1
7TH	0.699:1
8TH	0.58:1
9TH	0.479:1
REVERSE	3.805:1

SCHEMATICS AND DIAGRAMS

REMOVAL

FWD

WARNING: Hoisting and jack lift points provided in this service information are for a complete vehicle. When the transaxle is removed, the center of gravity will shift to the rear of the vehicle, possibly creating an unstable condition. Place safety stands under the rear frame rails behind the rear axle to stabilize the vehicle. Personal injury may result if safety stands are not used.

1. Position the vehicle on a suitable hoist with the transmission in neutral. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove the battery. Refer to **BATTERY, REMOVAL** .
3. Remove Powertrain Control Module (PCM). Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
4. Remove the power distribution center. Refer to **CENTER, POWER DISTRIBUTION (PDC), REMOVAL** .
5. Hoist the vehicle.
6. Remove the front wheels. Refer to **REMOVAL** .

7. Remove the left and right half shafts. Refer to **REMOVAL** . If accessible, install suitable cap-plugs in the axle seals to prevent leakage.
8. Remove the left front fender splash shield. Refer to **SHIELD, SPLASH, FRONT WHEELHOUSE, REMOVAL** .
9. Remove the front fascia lower outboard rivets to the right front splash shield for lower load beam bolt access.
10. Remove the belly pan. Refer to **BELLY PAN, REMOVAL** .
11. Lower the vehicle until the brake rotors are 100 mm (4 in.) above the ground.
12. Release the lock lever on the wire connector on the front of the battery tray.
13. Separate the wire connector from the main engine harness.
14. Remove the battery tray. Refer to **TRAY, BATTERY, REMOVAL** .
15. Disconnect the vacuum line from the vacuum pump. Refer to **PUMP, VACUUM, REMOVAL** .
16. Disconnect the wire connector from the vacuum pump
17. Remove the nuts holding the vacuum pump to the mount bracket.
18. Separate the vacuum pump from the mount bracket.

Fig. 16: Identifying Wire Connector Lock To TCM
Courtesy of CHRYSLER GROUP, LLC

19. Release the lock on the TCM connector (1).
20. Separate the wire connector (1) from the TCM.

Fig. 17: Ground Cable At Top Transmission
Courtesy of CHRYSLER GROUP, LLC

21. Remove the bolt (1) holding the ground cable to the top of the transmission.
22. Separate the ground cable (1) from the transmission.

Fig. 18: View Of Ground Cable & Shift Cable
Courtesy of CHRYSLER GROUP, LLC

23. Using a suitable prying tool (1), separate the shift cable end (2) from the manual lever on the transmission.

Fig. 19: View Of Shift Cable Housing & Mount Bracket
Courtesy of CHRYSLER GROUP, LLC

24. Release the locks holding the shift cable housing (2) to the mount bracket (1) on the transmission.
25. Separate the shift cable (2) from the mount bracket (2).

Fig. 20: Transmission Valve Body Solenoid Connector
Courtesy of CHRYSLER GROUP, LLC

26. Rotate the lock lever (2) counterclockwise on the transmission solenoid connector.
27. Separate the transmission solenoid connector (2) from the transmission.
28. Position a floor jack under the transmission.

29. Raise the jack enough to relieve tension on the upper transmission mount.

Fig. 21: Upper Transmission Mount Bolts
Courtesy of CHRYSLER GROUP, LLC

30. Remove the bolts (1) holding the upper transmission mount to the adaptor block (4).

Fig. 22: Wooden Block Placed Between Transmission And Frame Rail
Courtesy of CHRYSLER GROUP, LLC

31. Place a wooden block (1) between the transmission end cover and the frame rail load beam.
32. Lower the floor jack until the wood block supports the transmission.

Fig. 23: Transmission End Cover Ground Cable
Courtesy of CHRYSLER GROUP, LLC

33. Remove the bolt (1) holding the ground cable to the transmission end cover.
34. Separate the ground cable (1) from the transmission.

Fig. 24: Upper Transmission Mount Bolts
Courtesy of CHRYSLER GROUP, LLC

35. Remove the bolts (3) and hidden bolts (2) holding the transmission mount adaptor block (4) to the transmission.
36. Separate the transmission mount adaptor block (4) from the vehicle.

Fig. 25: Wire Harness Bracket & Bellhousing Bolt
Courtesy of CHRYSLER GROUP, LLC

37. Remove the upper bolt (1) holding the wire harness bracket and transmission bellhousing to the engine block

Fig. 26: Upper Starter Bolt
Courtesy of CHRYSLER GROUP, LLC

38. If equipped with a 2.4L engine, loosen and back out the upper starter bolt (1).

NOTE: The bolt will not be able to be removed due to lack of clearance.

Fig. 27: Upper Bellhousing Bolts
Courtesy of CHRYSLER GROUP, LLC

39. Remove upper bolts (1) holding the transmission bellhousing to the engine block located behind the main engine wire harness.
40. Raise the vehicle and place safety stands under the rear frame rails behind the rear axle to stabilize the vehicles center of gravity. Refer to the WARNING at beginning of this procedure (see **FWD**).
41. Place a suitable drain pan under the transmission to collect fluid that may leak from the differential seals and cooler lines.

Fig. 28: Transmission Cooler Lines
Courtesy of CHRYSLER GROUP, LLC

42. Disengage the quick couplings holding the cooler lines to the transmission.
43. Separate the cooler lines from the transmission. If accessible, install suitable cap-plugs in the male and female ends of the cooler lines to prevent leakage.

Fig. 29: Removing/Installing Starter
Courtesy of CHRYSLER GROUP, LLC

NOTE: After the bolts holding the starter motor to the bellhousing are removed the starter motor will remain the place.

44. If equipped with a 2.4L Remove the bolt (3) holding the starter (4) to the transmission bellhousing.

Fig. 30: Starter Bolts (3.2L)
Courtesy of CHRYSLER GROUP, LLC

45. If equipped with a 3.2L engine, remove the starter bolts (1).

Fig. 31: Transmission Bellhousing Bolts Above The Differential Housing
Courtesy of CHRYSLER GROUP, LLC

46. Remove the bolt (1) holding the transmission bellhousing to the engine block from above the differential housing.
47. Remove the front exhaust pipe. Refer to **PIPE, EXHAUST CROSSUNDER, REMOVAL** .

Fig. 32: Bellhousing Access Door
Courtesy of CHRYSLER GROUP, LLC

48. Remove the access door in the splash shield on the bellhousing.

NOTE: **The crankshaft can be rotated using a wrench to turn the balancer pulley end bolt.**

Fig. 33: Torque Converter Bolts
Courtesy of CHRYSLER GROUP, LLC

49. Through the access door opening, remove the bolts (1) holding the flexplate to the torque converter. Rotate the crankshaft to bring each set of bolts into view through the access door.

Fig. 34: Wooden Block Used To Protect Engine Oil Pan
Courtesy of CHRYSLER GROUP, LLC

50. Using a wooden block (3) to protect the engine oil pan, position a high stand (2) under the engine oil pan to support the engine.
51. Position a suitable transmission jack (1) under the transmission in a stable condition.
52. Secure the transmission to the lift plate of the transmission jack to avoid dropping the transmission during removal.

Fig. 35: Wooden Block Placed Between Transmission And Frame Rail
Courtesy of CHRYSLER GROUP, LLC

53. Lift the transmission jack and high stand until the wooden block (1) can be removed from between the

transmission end cover and the frame rail load beam.

Fig. 36: Rear Transmission Mount
Courtesy of CHRYSLER GROUP, LLC

54. Remove the through bolt (1) holding the rear transmission mount to the suspension cradle.
55. Remove the through bolt (2) holding the rear transmission mount to the adapter block on the transmission bellhousing.
56. Push the rear transmission mount rearward into the bracket on the suspension cradle and out of the way.

Fig. 37: Load Beam Bolts
Courtesy of CHRYSLER GROUP, LLC

57. Remove the bolts (2) holding the rear end of the load beam (1) to the suspension cradle.
58. Remove the bolts (3) holding the front of the load beam (1) to the radiator support panel.
59. Separate load beam (1) from the vehicle.

Fig. 38: Transmission Bellhousing Bolts Above The Differential Housing
Courtesy of CHRYSLER GROUP, LLC

60. Remove the bolts (2) holding the engine block and oil pan to the bellhousing next to the differential housing.

Fig. 39: Removing/Installing Transmission Bellhousing Bolts
Courtesy of CHRYSLER GROUP, LLC

61. Remove the bolts (1) holding the engine block and oil pan to the bellhousing from behind the exhaust maniverter.
62. Remove the bolt (1) holding the engine oil pan and exhaust bracket to the bellhousing.
63. Using a suitable prying tool, pry the bell housing away from the engine block
64. While guiding the transmission past obstacles, lower the transmission downward and away from the vehicle.

AWD/4WD

WARNING: **Hoisting and jack lift points provided in this service information are for a complete vehicle. When the transaxle is removed, the center of gravity will shift to the rear of the vehicle, possibly creating an unstable condition. Place safety stands under the rear frame rails behind the rear axle to stabilize the vehicle. Personal injury may result if safety stands are not used.**

1. Position the vehicle on a suitable hoist with the transmission in neutral. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove the battery. Refer to **BATTERY, REMOVAL** .
3. Remove the Powertrain Control Module (PCM). Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
4. Remove the Power Distribution Center (PDC). Refer to **CENTER, POWER DISTRIBUTION (PDC), REMOVAL** .
5. Remove the battery tray. Refer to **TRAY, BATTERY, REMOVAL** .
6. If equipped with a 2.4L, remove the intake manifold. Refer to **MANIFOLD, INTAKE, REMOVAL** .
7. If equipped with a 3.2L, disconnect the vacuum line from the vacuum pump. Refer to **PUMP, VACUUM, REMOVAL** .
8. For 3.2L disconnect the wire connector from the vacuum pump.
9. For 3.2L remove the nuts holding the vacuum pump to the mount bracket.
10. For 3.2L separate the vacuum pump from the mount bracket.

Fig. 40: Identifying Wire Connector Lock To TCM
Courtesy of CHRYSLER GROUP, LLC

11. Release the lock on the Transmission Control Module (TCM) connector (1).
12. Separate the wire connector (1) from the TCM.

Fig. 41: Ground Cable At Top Transmission
Courtesy of CHRYSLER GROUP, LLC

13. Remove the bolt (1) holding the ground cable to the top of the transmission.
14. Separate the ground cable (1) from the transmission.

Fig. 42: View Of Ground Cable & Shift Cable
Courtesy of CHRYSLER GROUP, LLC

15. Using a suitable prying tool (1), separate the shift cable end (2) from the manual lever on the transmission.

Fig. 43: View Of Shift Cable Housing & Mount Bracket
Courtesy of CHRYSLER GROUP, LLC

16. Release the locks holding the shift cable housing (2) to the mount bracket (1) on the transmission.
17. Separate the shift cable (2) from the mount bracket (2).

Fig. 44: Transmission Valve Body Solenoid Connector
Courtesy of CHRYSLER GROUP, LLC

18. Rotate the lock lever (2) counterclockwise on the transmission solenoid connector.
19. Separate the transmission solenoid connector (2) from the transmission.
20. Hoist the vehicle.
21. Remove the front wheels. Refer to **REMOVAL** .
22. Remove the belly pan. Refer to **BELLY PAN, REMOVAL** .
23. Remove the four rivets at the lower outboard edges of the front fascia to gain access to the lower load beam to core support bolts.
24. Remove the left and right half shafts. Refer to **REMOVAL** . If accessible, install suitable cap-plugs in the axle seals to prevent leakage.
25. Lower the vehicle until the brake rotors are 100 mm (4 in.) above the ground.
26. Position a floor jack under the transmission.
27. Raise the jack enough to relieve tension on the upper transmission mount.

Fig. 45: Upper Transmission Mount Bolts
Courtesy of CHRYSLER GROUP, LLC

28. Remove the bolts (1) holding the upper transmission mount to the adaptor block (4).

Fig. 46: Wooden Block Placed Between Transmission And Frame Rail
Courtesy of CHRYSLER GROUP, LLC

29. Place a wooden block (1) between the transmission end cover and the frame rail load beam.
30. Lower the floor jack until the wood block supports the transmission.

Fig. 47: Transmission End Cover Ground Cable
Courtesy of CHRYSLER GROUP, LLC

31. Remove the bolt (1) holding the ground cable to the transmission end cover.
32. Separate the ground cable (1) from the transmission.

45. Remove the access door in the splash shield on the bellhousing.

NOTE: **The crankshaft can be rotated using a wrench to turn the balancer pulley end bolt.**

Fig. 56: Torque Converter Bolts
Courtesy of CHRYSLER GROUP, LLC

46. Through the access door opening, remove the bolts (1) holding the flexplate to the torque converter. Rotate the crankshaft to bring each set of bolts into view through the access door.

Fig. 57: Wooden Block Used To Protect Engine Oil Pan
Courtesy of CHRYSLER GROUP, LLC

47. Position a suitable transmission jack (1) under the transmission in a stable condition.

48. Secure the transmission to the lift plate of the transmission jack to avoid dropping the transmission during removal.
49. Remove the bolts (2) holding the engine block and oil pan to the bellhousing next to the differential housing.

Fig. 58: Removing/Installing Transmission Bellhousing Bolts
Courtesy of CHRYSLER GROUP, LLC

50. Remove the bolts (1) holding the engine block and oil pan to the bellhousing from behind the catalytic converter.
51. Remove the bolt (1) holding the engine oil pan and exhaust bracket to the bellhousing.
52. Using a suitable prying tool, pry the bell housing away from the engine block.
53. While guiding the transmission past obstacles, lower the transmission downward and away from the vehicle.

DISASSEMBLY

DISASSEMBLY

The 948TE automatic transmission can be overhauled if the vehicle is beyond it's warranty coverage. Verify that the vehicle is no longer covered by warranty before proceeding with this procedure. A clean work area is necessary to assure a properly functioning transmission after the overhaul procedures are completed. Special tools have been developed and are required to disassemble this transmission. Acquire all of the special tools before starting this procedure.

WARNING: **Always wear safety glasses when cleaning, disassembling and assembling the transmission/transaxle. Contents of the transmission/transaxle can become projectiles (e.g., springs, snap-rings,**

as well as metal and other debris). Failure to wear safety glasses may result in severe personal injury.

Before disassembling the transmission, wash the transmission with a suitable solvent and a siphon pressure washer to remove oily grime and loose dirt. Place the transmission on a clean work surface with ample fluid drainage or absorbency.

Fig. 59: Wire Connector Socket Clip
Courtesy of CHRYSLER GROUP, LLC

1. Remove the clip holding the wire connector socket in the valve body cover pan.

Fig. 60: Valve Body Cover Pan Bolts

Courtesy of CHRYSLER GROUP, LLC

2. Remove the valve body cover pan bolts (1).
3. Remove the valve body cover pan from the transmission.

Fig. 61: Valve Body Bolts
Courtesy of CHRYSLER GROUP, LLC

4. Remove the valve body bolts (1).
5. Using a suitable prying tool, pry the valve body away from the adapter tubes.

Fig. 62: Fluid Pressure Transducer Wire Harness Connector

6. Turn the valve body over to gain access to wire harness connectors.
7. Release the lock (2) on the fluid pressure transducer wire connector and separate the wire connector (2) from the fluid pressure transducer (1).

Fig. 63: Removing/Installing Wire Harness Connector At Valve Body Solenoids
Courtesy of CHRYSLER GROUP, LLC

8. Remove the bolts (1) holding the wire harness connector to the valve body and solenoids.
9. Using a suitable prying tool, Separate the wire harness connector (2) from the solenoids.
10. Separate the valve body from the transmission.

NOTE: **If the valve body is to be reused without disassembling it, store the valve body in a clean area until it is installed.**

Fig. 64: Removing/Installing Transmission Range Sensor (TRS) Screw
Courtesy of CHRYSLER GROUP, LLC

11. Remove the Transmission Range Sensor (TRS) screw (1).

Fig. 65: Removing/Installing Transmission Range Sensor
Courtesy of CHRYSLER GROUP, LLC

12. Separate the TRS (1) from the transmission with the wire harness connected.

Fig. 66: Removing/Installing Speed Sensor Screw
Courtesy of CHRYSLER GROUP, LLC

13. Remove the speed sensor screw (1).

Fig. 67: Removing/Installing Speed Sensor
Courtesy of CHRYSLER GROUP, LLC

14. Separate the speed sensor (1) from the transmission with the wire harness connected.

Fig. 68: Fluid Adapter Tubes & O-Ring Seals
Courtesy of CHRYSLER GROUP, LLC

15. Using suitable pliers, remove the fluid adapter tubes (1) from the transmission.

Fig. 69: Bellhousing To Transmission Housing Bolts
Courtesy of CHRYSLER GROUP, LLC

16. From around the perimeter of the transmission, remove the bellhousing bolts (1) holding the bellhousing to the transmission housing.

Fig. 70: Bellhousing To Output Gear Support Bolts
Courtesy of CHRYSLER GROUP, LLC

17. Remove the bellhousing bolts (1) holding the bellhousing to the output gear support.
18. Using wooden blocks to stabilize the transmission on the work surface, position the transmission on the bench with the bellhousing facing upward.
19. Using a suitable pry-bar in the pry point locations, pry upward to dislodge the bellhousing from the transmission housing.

Fig. 71: Removing/Installing Bellhousing At Transmission Housing
Courtesy of CHRYSLER GROUP, LLC

20. Lift the bellhousing (1) upward and separate the assembly from the transmission housing (2).

Fig. 72: Port Seal
Courtesy of CHRYSLER GROUP, LLC

21. Remove the seal (1) from the port in the transmission housing.

Fig. 73: Sealing Surface Of Transmission Housing
Courtesy of CHRYSLER GROUP, LLC

22. Separate the gasket (1) from the sealing surface of the transmission housing (2).

Fig. 74: Removing/Installing Differential Assembly
Courtesy of CHRYSLER GROUP, LLC

23. Remove the differential assembly (1) from the transmission housing.

Fig. 75: Removing/Installing E-Clutch At E-Clutch Hub

34. Separate the thrust bearing (1) from the annulus gear 1 planetary hub (2).

Fig. 86: Annulus Gear 1 Planetary Hub & Carrier Gear 1 And 2
Courtesy of CHRYSLER GROUP, LLC

35. Separate the annulus gear 1 planetary hub (1) from the carrier gear 1&2 (2).

Fig. 87: Thrust Bearing & Annulus Gear 1 Planetary Hub
Courtesy of CHRYSLER GROUP, LLC

36. Separate the thrust bearing (1) from under the annulus gear 1 planetary hub (2).

Fig. 88: Annulus Gear 3 & Snap-Ring
Courtesy of CHRYSLER GROUP, LLC

37. Using a suitable screw driver, remove the snap-ring (1) holding the annulus gear 3 (2).

Fig. 89: Snap-Ring & Annulus Gear 3
Courtesy of CHRYSLER GROUP, LLC

38. Separate the snap-ring from the annulus gear 3 (2).

Fig. 90: Annulus Gear 3 & Carrier Gear 1&2
Courtesy of CHRYSLER GROUP, LLC

39. Separate the annulus gear 3 (1) from the carrier gear 1&2.

Fig. 91: Carrier Gear 1&2 & O-Ring Seal
Courtesy of CHRYSLER GROUP, LLC

40. Remove the O-ring seal (1) from the carrier gear 1&2.

Fig. 92: Carrier Gear, Annulus Gear & D-Clutch Hub
Courtesy of CHRYSLER GROUP, LLC

41. Separate the carrier gear 1&2 (1) annulus gear 2, D-clutch hub and input shaft assembly.
42. Position the transmission housing on a suitable arbor pressure using wooden blocks for support.

Fig. 93: Gaining Access To Snap Ring-Ring & Groove
Courtesy of CHRYSLER GROUP, LLC

43. Using Tool (special tool #8901A, Pressing Tool) (with pressure scale removed (1) and legs (special tool #10428, Adapter, Pressing Tool), Compress the bellville spring to gain access to the snap ring-ring (3) holding the D-clutch piston retainer (2) into the transmission housing (4).

Fig. 94: Prying D-Clutch Piston Retainer Out Of Transmission Housing
Courtesy of CHRYSLER GROUP, LLC

NOTE: The O-ring seal on the D-clutch piston retainer will hang up in the snap-ring groove during removal and will need to be pried out of the transmission housing.

44. Using a suitable pry-bar (1) vise-grip pliers (2) and a brass drift (3) coupled together, pry the D-clutch piston retainer (4) upward and out of the transmission housing.

Fig. 95: D-Clutch Piston Retainer
Courtesy of CHRYSLER GROUP, LLC

45. Separate the D-clutch piston retainer (1) from the transmission housing.

Fig. 96: D-Clutch Piston & Retainer
Courtesy of CHRYSLER GROUP, LLC

46. Remove the D-clutch piston from the retainer.

Fig. 97: D-Clutch Piston, Inner & Outer Seals
Courtesy of CHRYSLER GROUP, LLC

47. Remove the inner (1) and outer (2) lip seals from the D-clutch piston.

Fig. 98: D-Clutch Piston Retainer & O-Ring Seal
Courtesy of CHRYSLER GROUP, LLC

48. Remove the O-ring seal from the D-clutch piston retainer.

Fig. 99: Removing/Installing Bellville Spring
Courtesy of CHRYSLER GROUP, LLC

49. Separate the bellville spring from the transmission housing.

Fig. 100: Annulus Gear 2, D & C-Clutch Hub And Input Shaft Assembly
Courtesy of CHRYSLER GROUP, LLC

50. Separate the annulus gear 2, D and C-clutch hub and input shaft assembly (1) from the transmission housing.
51. Remove the annulus gear 2, D and C-clutch hub from the input shaft and B-clutch.

Fig. 101: Remove/Install Input Shaft Seal-Rings
Courtesy of CHRYSLER GROUP, LLC

52. Remove the seal-rings (1) from the lands (2) on the input shaft (3).

Fig. 102: Input Shaft/Dog Clutch A, B-Clutch Hub & Snap-Ring
Courtesy of CHRYSLER GROUP, LLC

NOTE: Dog clutch A is permanently attached to the input shaft and cannot be disassemble. If the dog clutch A fails an air test, replace the input shaft.

53. Using a suitable snap-ring pliers (3), remove the snap-ring (2) holding the input shaft to the B-clutch (1) hub.
54. Separate the input shaft/dog clutch A from the B-clutch (1) hub.

Fig. 103: Annulus Gear 2, D And C-Clutch Hub/B-Clutch Retainer
Courtesy of CHRYSLER GROUP, LLC

55. Place the annulus gear 2, D and C-clutch hub on tool (special tool #9611, Plug, Differential End) to hold the sun gear in position.

Fig. 104: Remove/Install Snap-Ring
Courtesy of CHRYSLER GROUP, LLC

56. Using a suitable snap-ring pliers (1), remove the snap-ring (2) holding the sun gear 1 to the annulus gear 2, D and C-clutch hub.

Fig. 105: Annulus Gear 2, D And C-Clutch Hub (3) & Sun Gear 1
Courtesy of CHRYSLER GROUP, LLC

57. Turn the annulus gear 2 (2), D and C-clutch hub (3) over and remove the sun gear 1 (1).

Fig. 106: Annulus Gear 2, D-Clutch Hub & C-Clutch Hub
Courtesy of CHRYSLER GROUP, LLC

58. Separate the Annulus gear 2, D-clutch hub (1) from the C-clutch hub.

Fig. 107: Thrust Bearing & C-Clutch Hub
Courtesy of CHRYSLER GROUP, LLC

59. Separate the thrust bearing (1) from the C-clutch hub (2).

Fig. 108: Thrust Bearing & Input Shaft Rear Support

61. Remove the input shaft rear support selective thrust washer (1).

Fig. 110: Removing D-Clutch Friction Discs & Steel Plates From Transmission Housing
Courtesy of CHRYSLER GROUP, LLC

62. Separate the D-clutch friction discs and steel plates (1) from the transmission housing.

Fig. 111: Removing Snap-Ring
Courtesy of CHRYSLER GROUP, LLC

63. Using two suitable screw drivers, lift (2) the snap-ring (1) and pry it inward (3) and out of from the groove in the transmission housing.

Fig. 112: Removing C-Clutch Friction Discs & Steel Plates From Transmission Housing
Courtesy of CHRYSLER GROUP, LLC

64. Separate the C-clutch friction discs and steel plates (1) from the transmission housing.

Fig. 113: C-Clutch Bellville Spring & Special Tool
Courtesy of CHRYSLER GROUP, LLC

65. Place the tool (special tool #10504, Compressor, Spring) (1) over the C-clutch bellville spring at the bottom of the transmission housing.

Fig. 114: C-Clutch Bellville Spring & Special Tools
Courtesy of CHRYSLER GROUP, LLC

66. Place tool (special tool #8228, Installer, Bearing) (3) over the input shaft support (tool 8901 with 10428 legs can also be used), compress the bellville spring to gain access to the stepped snap-ring (1).

Fig. 115: Removing/Installing Snap-Ring
Courtesy of CHRYSLER GROUP, LLC

67. Using a suitable screw driver, remove the snap-ring (1) holding the C-clutch bellville spring in the transmission housing.

Fig. 116: C-Clutch Bellville Spring & C-Clutch Piston
Courtesy of CHRYSLER GROUP, LLC

68. Separate the C-clutch bellville spring (1) from the C-clutch piston (2).

Fig. 117: Removing/Installing C-Clutch Piston
Courtesy of CHRYSLER GROUP, LLC

69. Using a suitable pliers (2), remove the C-clutch piston (1) from the transmission housing.

Fig. 118: C-Clutch Piston & Seals
Courtesy of CHRYSLER GROUP, LLC

70. If overhaul is being performed, remove inner (1) and outer (2) seals from the C-clutch piston.

Fig. 119: Removing/Installing Inner Seal-Rings
Courtesy of CHRYSLER GROUP, LLC

71. Using a suitable hook tool, remove the inner seal-rings (1) from the input shaft support.

Fig. 120: Removing/Installing Outer Seal-Rings
Courtesy of CHRYSLER GROUP, LLC

72. Using a suitable hook tool, remove the outer seal-rings (1) from the input shaft support.

Fig. 121: Removing/Installing Split Roller Bearing
Courtesy of CHRYSLER GROUP, LLC

73. Using a suitable hook tool, remove the split roller bearing (1) from the input shaft support.

ASSEMBLY

ASSEMBLY

The work area, counter surfaces and tools must be thoroughly cleaned before attempting to assemble the 948TE transmission. All of the sub assemblies should be disassembled, cleaned, and assembled with new sealing components where applicable. The transmission housing should be clean and oil free before beginning this procedure. The B, C, D, and E-clutches should be properly measured and adjusted prior to assembling the transmission. If the transmission was contaminated with metallic material, all of the thrust bearings and roller bearing should be replaced. The bearing in the output gear support assembly is not serviceable. The output gear support assembly should be replaced if metal debris is present.

WARNING: **Always wear safety glasses when cleaning, disassembling and assembling the transmission/transaxle. Contents of the transmission/transaxle can become projectiles (e.g., springs, snap-rings, as well as metal and other debris). Failure to wear safety glasses may result in severe personal injury.**

1. Place the transmission housing on a clean work surface with the open interior upward.
2. Place wooden blocks under the transmission to stabilize it for assembly.

Fig. 122: Removing/Installing Split Roller Bearing
Courtesy of CHRYSLER GROUP, LLC

3. Install the split roller bearing (1) in position on the input shaft support.

Fig. 123: Removing/Installing Outer Seal-Rings
Courtesy of CHRYSLER GROUP, LLC

4. Install the outer seal-rings (1) in the lands in the input shaft support.

Fig. 124: Removing/Installing Inner Seal-Rings
Courtesy of CHRYSLER GROUP, LLC

5. Install the inner seal-rings (1) in the lands in the input shaft support.

Fig. 125: Installing Inner Seal On C-Clutch Piston
Courtesy of CHRYSLER GROUP, LLC

6. Install the inner seal (2) on the C-clutch piston (1).

Fig. 126: Installing Outer Seal On C-Clutch Piston
Courtesy of CHRYSLER GROUP, LLC

7. Install the outer seal (2) on the C-clutch piston (1).

Fig. 127: Removing/Installing C-Clutch Piston
Courtesy of CHRYSLER GROUP, LLC

8. Install the C-clutch piston (1) in the transmission housing.

Fig. 128: Using Feeler Gauge To Turn Lip On Seal
Courtesy of CHRYSLER GROUP, LLC

9. If necessary, use a thin feeler gauge to turn the lip on the seal into the retainer as the piston is pushed downward.

Fig. 129: C-Clutch Bellville Spring & C-Clutch Piston
Courtesy of CHRYSLER GROUP, LLC

10. Place the C-clutch bellville spring (1) in position on the C-clutch piston (2).

Fig. 130: C-Clutch Bellville Spring & Special Tool
Courtesy of CHRYSLER GROUP, LLC

11. Place the tool (special tool #10504, Compressor, Spring) (1) over the C-clutch bellville spring (3) at the bottom of the transmission housing.

Fig. 131: C-Clutch Bellville Spring & Special Tools
Courtesy of CHRYSLER GROUP, LLC

12. Place tool (special tool #8228, Installer, Bearing) (3) over the input shaft support (tool 8901 with 10428 legs can also be used), compress the bellville spring to gain access to the snap-ring (1) groove.

Fig. 132: Removing/Installing Snap-Ring
Courtesy of CHRYSLER GROUP, LLC

13. Install the snap-ring (1), stepped side down, to hold the C-clutch bellville spring in the transmission housing.
14. Remove the transmission housing from the arbor press and position it on a clean work bench. Position wood blocks under transmission to stabilize it for assembly.

Fig. 133: Exploded View Of C-Clutch Wave Plate, Steel Plates, & Friction Discs
Courtesy of CHRYSLER GROUP, LLC

15. Install the C-clutch wave plate (5), one steel plate (2), then install the friction discs (1) alternately separated with steel plates (2) into the transmission housing on top of the C-clutch piston.

Fig. 134: C-Clutch Reaction Plate
Courtesy of CHRYSLER GROUP, LLC

16. Install the C-clutch reaction plate (1) with raised bosses upward on top of the C-clutch disc and plate

pack.

Fig. 135: Installing Snap-Ring
Courtesy of CHRYSLER GROUP, LLC

17. Install the snap-ring (1) in the groove (2) in the transmission housing.

NOTE: **Perform C-clutch measurements to verify that the correct selective plate is installed.**

Fig. 136: Exploded View Of D-Clutch, Select Plate, Friction Plate & Steel Plates
Courtesy of CHRYSLER GROUP, LLC

NOTE: Perform D-clutch measurements to verify that the correct select plate (2) is installed.

18. Install the correct thickness selective plate (2).
19. Starting with a friction plate (1), alternately install the friction (1) and steel plates (3) in to the case.

Fig. 137: Removing/Installing Input Shaft Rear Support Selective Thrust Washer
Courtesy of CHRYSLER GROUP, LLC

20. Install the input shaft rear support selective thrust washer.

Fig. 138: Thrust Bearing & Input Shaft Rear Support
Courtesy of CHRYSLER GROUP, LLC

21. Install the thrust bearing (1) onto the input shaft rear support.

Fig. 139: D And C-Clutch Hubs & Input Shaft Assembly
Courtesy of CHRYSLER GROUP, LLC

22. Use a suitable screw driver to align the gaps in the friction discs in to D (1) and C (2) -clutch to prepare for installing the annulus gear 2, D and C-clutch hubs and input shaft assembly (1).

NOTE: **Before Final assembly of the annulus gear 2, D and C-clutch hub and input shaft, measure the B-clutch to verify that proper select plate was installed**

and air test the dog-A clutch and input shaft to verify proper sealing. The input shaft dog-A clutch hub are not serviceable and must be replaced if leaking.

Fig. 140: Thrust Bearing & C-Clutch Hub
Courtesy of CHRYSLER GROUP, LLC

23. Place the thrust bearing (1) in position on the C-clutch hub/B-clutch retainer (2).

Fig. 141: Annulus Gear 2, D-Clutch Hub & C-Clutch Hub/B-Clutch Retainer
Courtesy of CHRYSLER GROUP, LLC

24. Place the Annulus gear 2, D-clutch hub (1) in position on the C-clutch hub/B-clutch retainer (2).

Fig. 142: Annulus Gear 2, D And C-Clutch Hub (3) & Sun Gear 1
Courtesy of CHRYSLER GROUP, LLC

25. Insert the sun gear 1 (1) into annulus gear 2 (2), D and C-clutch hub/B-clutch retainer (3).

Fig. 143: Annulus Gear 2, D And C-Clutch Hub/B-Clutch Retainer
Courtesy of CHRYSLER GROUP, LLC

26. Turn the annulus gear 2, D and C-clutch hub/B-clutch retainer over and place it on tool (special tool #9611, Plug, Differential End) (2) to hold the sun gear in position.

Fig. 144: Remove/Install Snap-Ring
Courtesy of CHRYSLER GROUP, LLC

27. Using a suitable snap-ring pliers (1), install the snap-ring (2) to hold the sun gear 1 to the annulus gear 2, D and C-clutch hub/B-clutch retainer.

Fig. 145: Remove/Install Input Shaft Seal-Rings
Courtesy of CHRYSLER GROUP, LLC

28. Install NEW seal-rings (1) in the lands (2) on the input shaft (3).
29. Insert the input shaft into the B-clutch hub.

Fig. 146: Input Shaft/Dog Clutch A, B-Clutch Hub & Snap-Ring
Courtesy of CHRYSLER GROUP, LLC

30. Using a suitable snap-ring pliers (3), install the snap-ring (2) to hold the input shaft to the B-clutch (1) hub.

Fig. 147: Thrust Bearing & B-Clutch Hub
Courtesy of CHRYSLER GROUP, LLC

31. Place the thrust bearing on the B-clutch hub.
32. Install the annulus gear 2, D and C-clutch hub on the input shaft, B-clutch assembly.

Fig. 148: Annulus Gear 2, D & C-Clutch Hub And Input Shaft Assembly
Courtesy of CHRYSLER GROUP, LLC

33. Install the annulus gear 2, D and C-clutch hub, input shaft and B-clutch assembly (1) into the transmission housing.

NOTE: **While not allowing the input shaft to slip inward, wriggle the annulus gear 2, D and C-clutch hubs and input shaft assembly (1) until they engage the D and C-clutch discs. A solid audible clunk will be heard if installed correctly. If the input shaft slips inward the B-clutch will come out of its retainer impeding proper installation.**

Fig. 149: Removing/Installing Bellville Spring

Courtesy of CHRYSLER GROUP, LLC

34. Place the D-clutch piston bellville spring (1) in position on the transmission housing (2).

Fig. 150: D-Clutch Piston Retainer & O-Ring Seal
Courtesy of CHRYSLER GROUP, LLC

35. Install NEW O-ring seal (2) in the D-clutch piston retainer (1).

Fig. 151: D-Clutch Piston & Outer Lip Seal Ring
Courtesy of CHRYSLER GROUP, LLC

36. Install NEW outer lip seal ring (2) in the D-clutch piston (1).

Fig. 152: D-Clutch Piston & Inner Lip Seal Ring
Courtesy of CHRYSLER GROUP, LLC

37. Install NEW inner lip seal ring (1) in the D-clutch piston (2).

Fig. 153: D-Clutch Piston & Retainer
Courtesy of CHRYSLER GROUP, LLC

38. Install the D-clutch piston (2) in the retainer (1).

Fig. 154: D-Clutch Piston Retainer
Courtesy of CHRYSLER GROUP, LLC

39. Place the D-clutch piston (2) and retainer (1) assembly in the transmission housing over the D-clutch bellville spring. The fingers on the D-clutch piston (2) rest against the D-clutch select plate.
40. Position the transmission housing on a suitable arbor pressure using wooden blocks for support.

Fig. 155: Gaining Access To Snap Ring-Ring & Groove
Courtesy of CHRYSLER GROUP, LLC

41. Using Tool (special tool #8901A, Pressing Tool) (with the pressure scale removed) (1) and legs (special tool #10428, Adapter, Pressing Tool), Compress the bellville spring to gain access to the snap ring-ring groove (4) in the transmission housing.

42. Install the snap-ring to hold the D-clutch piston retainer (2) into the transmission housing (4).
43. Remove the transmission housing from the arbor press and place the transmission housing on the clean work surface. Use wood blocks to stabilize the transmission.

Fig. 156: Carrier Gear, Annulus Gear & D-Clutch Hub
Courtesy of CHRYSLER GROUP, LLC

44. Insert the carrier gear 1 and 2 (1) annulus gear 2, D-clutch hub and input shaft assembly onto the annulus gear 2, D and C-clutch hub and input shaft assembly.

Fig. 157: Carrier Gear 1&2 & O-Ring Seal
Courtesy of CHRYSLER GROUP, LLC

45. Install the O-ring seal (1) into the carrier gear 1 and 2.

Fig. 158: Annulus Gear 3 & Carrier Gear 1&2
Courtesy of CHRYSLER GROUP, LLC

46. Install the annulus gear 3 (1) into the carrier gear 1 and 2.

Fig. 159: Snap-Ring & Annulus Gear 3
Courtesy of CHRYSLER GROUP, LLC

47. Install the snap-ring to hold the annulus gear 3 (2) into the carrier gear 1 and 2.

Fig. 160: Thrust Bearing & Annulus Gear 1 Planetary Hub
Courtesy of CHRYSLER GROUP, LLC

48. Place the thrust bearing (1) in position under the annulus gear 1 planetary hub (2).

Fig. 161: Annulus Gear 1 Planetary Hub & Carrier Gear 1 And 2
Courtesy of CHRYSLER GROUP, LLC

49. Install the annulus gear 1 planetary hub (1) into the carrier gear 1 and 2 (2).

Fig. 162: Thrust Bearing & Annulus Gear 1 Planetary Hub
Courtesy of CHRYSLER GROUP, LLC

50. Place the thrust bearing (1) onto the annulus gear 1 planetary hub (2).

Fig. 163: Installing Transfer Gear Bearing Cone Onto Transmission Housing
Courtesy of CHRYSLER GROUP, LLC

51. Using Bearing Installer (special tool #6888, Installer, Seal) (2), and handle (special tool #C-4171, Driver Handle, Universal) (3) install the transfer gear bearing cone (1) onto the transmission housing.

Fig. 164: Annulus Gear 4
Courtesy of CHRYSLER GROUP, LLC

52. Install the annulus gear 4 into the annulus gear 3 (2).

Fig. 165: Thrust Spacer & Underside Of Gear 4 Planetary Pinion Carrier
Courtesy of CHRYSLER GROUP, LLC

53. Install a NEW thrust spacer (1) on the underside of the gear 4 planetary pinion carrier (2).

Fig. 166: Thrust Spacer & Topside Of Gear 4 Planetary Pinion Carrier
Courtesy of CHRYSLER GROUP, LLC

54. Install a NEW thrust spacer (1) on the topside of the gear 4 planetary pinion carrier (2).

Fig. 167: Gear 4 Planetary Pinion Carrier
Courtesy of CHRYSLER GROUP, LLC

55. Install the gear 4 planetary pinion carrier (1) into the annulus gear 4.

Fig. 168: Removing/Installing Sun Gear 3, 4 And Dog Clutch-F At Gear 4 Planetary Pinion Carrier
Courtesy of CHRYSLER GROUP, LLC

56. Install the sun gear 3 and 4 and Dog Clutch-F (1) into the gear 4 planetary pinion carrier.

Fig. 169: Roller Type Thrust Bearing
Courtesy of CHRYSLER GROUP, LLC

57. Install the roller type thrust bearing (1) onto the sun gear 3 and 4 and Dog Clutch-F (2).

Fig. 170: Removing/Installing Transfer Gear
Courtesy of CHRYSLER GROUP, LLC

NOTE: **If new transfer gear (1) or transmission housing are being replaced measurements must be performed to determine correct thickness for the bearing preload shims. If the bearings and races are replaced the factory installed preload shims do not require replacement.**

58. If necessary, replace the bearings and races on the transfer gear (1).
59. Install the transfer gear (1) into the transmission housing.

Fig. 171: Output Gear Support
Courtesy of CHRYSLER GROUP, LLC

60. Install the output gear support (1) into the gear 4 planetary pinion carrier (2).

Fig. 172: E-Clutch Hub And Shaft
Courtesy of CHRYSLER GROUP, LLC

61. Install the E-clutch hub and shaft (1) into the output gear support (2).

Fig. 173: Removing/Installing Thrust Bearing At E-Clutch Hub
Courtesy of CHRYSLER GROUP, LLC

62. Install the thrust bearing (1) on the E-clutch (2) hub.

Fig. 174: Removing/Installing E-Clutch At E-Clutch Hub
Courtesy of CHRYSLER GROUP, LLC

NOTE: Before installing the E-clutch, use a suitable screwdriver to align the grooves in the friction.

63. Install the E-clutch onto the E-clutch hub and shaft (2).

Fig. 175: E-Clutch Hub And Shaft
Courtesy of CHRYSLER GROUP, LLC

64. Wriggle the E-clutch (1) until all of the friction discs are fully engaged on the E-clutch hub and shaft.

NOTE: **When the E-clutch (1) is fully seated the gap (2) will be very small between the E-clutch retainer and the output gear support.**

Fig. 176: Removing/Installing Differential Assembly
Courtesy of CHRYSLER GROUP, LLC

NOTE: **If new differential (1) or transmission housing are being replaced measurements must be performed to determine correct thickness for the bearing preload shims. If the bearings and races are replaced the factory installed preload shims do not require replacement.**

65. If necessary, replace the bearings and races on the differential (1).
66. Install the differential assembly (1) into the transmission housing.

Fig. 177: Sealing Surface Of Transmission Housing
Courtesy of CHRYSLER GROUP, LLC

67. Place a NEW gasket (1) in position on the sealing surface of the transmission housing (2).

Fig. 178: Port Seal
Courtesy of CHRYSLER GROUP, LLC

68. Install a NEW seal (1) in the port in the transmission housing.

Fig. 179: Sealing Surface Of Transmission Housing
Courtesy of CHRYSLER GROUP, LLC

69. Install the gasket (1) on the sealing surface of the transmission housing (2).
70. If necessary, replace the output seal and the impeller hub seal.

Fig. 180: Removing/Installing Bellhousing At Transmission Housing
Courtesy of CHRYSLER GROUP, LLC

71. While guiding the bellhousing (1) downward over the input and output shafts, place the bellhousing (1) in position on the transmission housing (2).

Fig. 181: Checking Guide Pin Alignment
Courtesy of CHRYSLER GROUP, LLC

72. Rotate the output gear clockwise to assure guide pin (1) alignment.

Fig. 182: Engaging Guide Pins In Transmission Housing Into Receptacle Holes
Courtesy of CHRYSLER GROUP, LLC

73. Rotate the output gear support (1) through the window (2) behind the valve body until the guide pin engages the receptacle hole in the bellhousing.
74. Engage the guide pins in the transmission housing into the receptacle holes bellhousing to assure proper alignment.
75. Install several bolts to hold the bell housing to the transmission housing. Tighten the bolts hand tight.

76. Position the transmission on the bench with the bellhousing facing outward.

Fig. 183: Bellhousing To Output Gear Support Bolts
Courtesy of CHRYSLER GROUP, LLC

77. Install the bolts (1) with NEW seal washers to hold the bellhousing to the output gear support and tighten to the proper specifications. Refer to **SPECIFICATIONS**.

Fig. 184: Bellhousing To Transmission Housing Bolts
Courtesy of CHRYSLER GROUP, LLC

78. Install the bolts (1) to hold the bellhousing to the transmission housing and tighten to the proper specifications. Refer to **SPECIFICATIONS**.

Fig. 185: Fluid Adapter Tubes & O-Ring Seals
Courtesy of CHRYSLER GROUP, LLC

79. Install NEW O-rings on both ends of the fluid transfer tubes.
80. Install the fluid adapter tubes (1) from the transmission.

Fig. 186: Removing/Installing Speed Sensor
Courtesy of CHRYSLER GROUP, LLC

81. Insert the speed sensor (1) into the transmission with the wire harness connected.

Fig. 187: Removing/Installing Speed Sensor Screw
Courtesy of CHRYSLER GROUP, LLC

82. Install the speed sensor screw (1) to hold the speed sensor to the transmission housing.

Fig. 188: Removing/Installing Transmission Range Sensor
Courtesy of CHRYSLER GROUP, LLC

83. Place the Transmission Range Sensor (TRS) (1) in position on the transmission with the wire harness connected.

Fig. 189: Removing/Installing Transmission Range Sensor (TRS) Screw
Courtesy of CHRYSLER GROUP, LLC

84. Install the TRS screw (1) to hold the TRS to the transmission housing and tighten to the proper specifications. Refer to **SPECIFICATIONS**.

Fig. 190: Valve Body & Solenoids Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

85. Place the valve body (1) in position on the transmission.
86. Place the wire harness connector (2) in position on the solenoids.
87. Press the connector (2) inward to engage the terminals on the solenoids.

Fig. 191: Removing/Installing Wire Harness Connector At Valve Body Solenoids
Courtesy of CHRYSLER GROUP, LLC

88. Install the screws to hold the wire harness connector to the valve body and solenoids and tighten to the proper specifications. Refer to **SPECIFICATIONS**.

Fig. 192: Fluid Pressure Transducer Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

89. Insert the wire harness connector into the fluid pressure transducer connector
90. Press connector together until the lock engages.

Fig. 193: Aligning Valve Body To Fluid Transfer Tubes
Courtesy of CHRYSLER GROUP, LLC

91. Turn the valve body (1) over and align the valve body (1) with the fluid transfer tubes.

Fig. 194: Engaging Valve Body To Fluid Transfer Tubes
Courtesy of CHRYSLER GROUP, LLC

92. Guide the manual lever cam (2) into the slot (3) on the manual valve.
93. Firmly press (4) the valve body (1) inward until the O-rings on the fluid transfer adapters engage into receptacle holes on the valve body.

Fig. 195: Valve Body Bolts
Courtesy of CHRYSLER GROUP, LLC

94. Install the valve body bolts (1) to hold the valve body to the transmission housing and tighten to the proper specifications. Refer to **SPECIFICATIONS**.

Fig. 196: Valve Body Solenoid Wire Harness Connector Socket O-Ring Seals
Courtesy of CHRYSLER GROUP, LLC

95. Install NEW O-ring seals (2) on the wire connector socket (1).

NOTE: **A light coating of assembly lube can be applied to the O-ring seals (2) to ease installation.**

Fig. 197: Valve Body Cover Pan & Wire Connector Socket
Courtesy of CHRYSLER GROUP, LLC

96. Place the valve body cover pan (1) in position on the transmission.
97. Insert the wire connector socket (3) into the opening on the inside of valve body cover pan (1) with the flat side (2) of the socket on the left.

Fig. 198: Wire Connector Socket Clip
Courtesy of CHRYSLER GROUP, LLC

98. Press the wire connector socket inward until the retainer clip groove (1) is exposed on the outside of the valve body cover pan (1).
99. Install the clip (2) to hold the wire connector socket in the valve body cover pan.

Fig. 199: Valve Body Cover Pan Gasket Seal
Courtesy of CHRYSLER GROUP, LLC

100. Install a NEW gasket seal (1) in the groove around the sealing surface of the valve body cover pan (2).

Fig. 200: Valve Body Cover Pan Bolts
Courtesy of CHRYSLER GROUP, LLC

101. Place the valve body cover pan gasket against the sealing surface of the transmission housing.
102. Install the valve body cover pan bolts (1) to hold the valve body cover pan to the transmission housing and tighten to the proper specifications. Refer to **SPECIFICATIONS**.
103. Install the transmission in the vehicle Refer to **INSTALLATION**.

.

104. Road test the vehicle to verify the repair.

INSTALLATION

FWD

WARNING: Hoisting and jack lift points provided in this service information are for a complete vehicle. When the transaxle is removed, the center of gravity will shift to the rear of the vehicle, possibly creating an unstable condition. Place safety stands under the rear frame rails behind the rear axle to stabilize the vehicle. Personal injury may result if safety stands are not used.

NOTE: If equipped with a 2.4L, be sure that the upper starter bolt is inserted into the proper hole in the transmission prior to mating transmission to block.

Fig. 201: Wooden Block Used To Protect Engine Oil Pan
Courtesy of CHRYSLER GROUP, LLC

1. While guiding the transmission past obstacles, jack (1) the transmission upward until the engine and the transmission are in line.
2. Push the bell housing against the engine block until the guide pins engage.

Fig. 202: Removing/Installing Transmission Bellhousing Bolts
Courtesy of CHRYSLER GROUP, LLC

3. Install the bolt (1) to hold the engine oil pan and exhaust bracket to the bellhousing. Refer to **SPECIFICATIONS**.
4. Install the bolts (1) to hold the engine block and oil pan to the bellhousing in position on behind the exhaust maniverter. Refer to **SPECIFICATIONS**.

Fig. 203: Transmission Bellhousing Bolts Above The Differential Housing
Courtesy of CHRYSLER GROUP, LLC

5. Install the bolts (2) to hold the engine block and oil pan to the bellhousing next to the differential housing. Refer to **SPECIFICATIONS**.

Fig. 204: Load Beam Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: Shown in illustration with fascia removed for clarity.

6. Place the load beam (1) in position on the vehicle.
7. Install the bolts (3) to hold the front of the load beam (1) to the radiator support panel.
8. Install the bolts (2) to hold the rear end of the load beam (1) to the suspension cradle.

Fig. 205: Rear Transmission Mount
Courtesy of CHRYSLER GROUP, LLC

9. Push the rear transmission mount forward until the bolt holes line up.
10. Install the through bolt (2) to hold the rear transmission mount to the adapter block on the transmission bellhousing. Refer to **SPECIFICATIONS**.
11. Install the through bolt (1) to hold the rear transmission mount to the suspension cradle. Refer to **SPECIFICATIONS**.

Fig. 206: Wooden Block Placed Between Transmission And Frame Rail
Courtesy of CHRYSLER GROUP, LLC

12. Place a wooden block (1) between the load beam and the transmission end cover.

Fig. 207: Wooden Block Used To Protect Engine Oil Pan

Courtesy of CHRYSLER GROUP, LLC

13. Remove the safety chain holding the transmission to the transmission jack lift plate.
14. Lower the high stand (2) and the transmission jack (1) until the transmission rests on the wooden block.
15. Remove the high stand (2) and transmission jack (1) from under the vehicle.

Fig. 208: Torque Converter Bolts
Courtesy of CHRYSLER GROUP, LLC

CAUTION: It is essential that correct length bolts be used to attach the converter to the driveplate. Failure to follow this caution may result in transmission damage.

16. Through the access door opening, Install **new** bolts (1) to hold the flexplate to the torque converter, Rotate the crankshaft to bring each set of bolts into view through the access door. Refer to **SPECIFICATIONS**.

Fig. 209: Bellhousing Access Door
Courtesy of CHRYSLER GROUP, LLC

17. Install the access door in the splash shield on the bellhousing.
18. Install the front exhaust pipe. Refer to **PIPE, EXHAUST CROSSUNDER, INSTALLATION** .

Fig. 210: Transmission Bellhousing Bolts Above The Differential Housing
Courtesy of CHRYSLER GROUP, LLC

19. Install the bolt (1) to hold the transmission bellhousing to the engine block above the differential housing. Refer to **SPECIFICATIONS**.

Fig. 211: Removing/Installing Starter
Courtesy of CHRYSLER GROUP, LLC

20. If equipped with a 2.4L, install the bolt (3) to hold the starter (4) to the transmission bellhousing. Refer to **SPECIFICATIONS** .

Fig. 212: Starter Bolts (3.2L)
Courtesy of CHRYSLER GROUP, LLC

21. If equipped with a 3.2L, install the starter bolts (1) and tighten to the proper specification. Refer to **SPECIFICATIONS** .

Fig. 213: Transmission Cooler Lines
Courtesy of CHRYSLER GROUP, LLC

22. Guide the cooler lines in position on the transmission.
23. Engage the quick couplings to hold the cooler lines to the transmission.
24. Install the left and right half shafts. Refer to **INSTALLATION** .
25. Remove the safety stands under the rear frame rails behind the rear axle and lower the vehicle.

Fig. 214: Upper Bellhousing Bolts
Courtesy of CHRYSLER GROUP, LLC

26. Install upper bolts (1) to hold the transmission bellhousing to the engine block located behind the main

engine wire harness. Refer to **SPECIFICATIONS**.

Fig. 215: Upper Starter Bolt
Courtesy of CHRYSLER GROUP, LLC

27. If equipped with a 2.4L, tighten the upper starter bolt (1). Refer to **SPECIFICATIONS** .

Fig. 216: Wire Harness Bracket & Bellhousing Bolt
Courtesy of CHRYSLER GROUP, LLC

28. Install the upper bolt (1) to hold the wire harness bracket and transmission bellhousing to the engine block. Refer to **SPECIFICATIONS**.

Fig. 217: Upper Transmission Mount Bolts
Courtesy of CHRYSLER GROUP, LLC

29. Place the transmission mount adaptor block (4) in position on the transmission.
30. Install the bolts (3) and hidden bolts (2) to hold the transmission mount adaptor block (4) to the transmission. Refer to **SPECIFICATIONS**.

Fig. 218: Transmission End Cover Ground Cable
Courtesy of CHRYSLER GROUP, LLC

31. Place the ground cable (1) in position on the transmission.
32. Install the bolt (1) to hold the ground cable to the transmission end cover. Refer to **SPECIFICATIONS**.
33. Position a floor jack under the transmission.
34. Raise the transmission until the wood block is free to be removed.

Fig. 219: Wooden Block Placed Between Transmission And Frame Rail
Courtesy of CHRYSLER GROUP, LLC

35. Remove the wooden block (1) from between the transmission end cover and the frame rail load beam.

Fig. 220: Upper Transmission Mount Bolts
Courtesy of CHRYSLER GROUP, LLC

36. Install the bolts (1) to hold the upper transmission mount to the adaptor block (4). Refer to **SPECIFICATIONS**.
37. Lower and remove the floor jack.

Fig. 221: Transmission Valve Body Solenoid Connector
Courtesy of CHRYSLER GROUP, LLC

38. Engage the transmission solenoid connector (2) into transmission connector.
39. Rotate the lock lever (2) clockwise on the transmission solenoid connector.

Fig. 222: View Of Shift Cable Housing & Mount Bracket
Courtesy of CHRYSLER GROUP, LLC

40. Place the shift cable (2) in position on the mount bracket (2).
41. Press the shift cable housing (2) into the mount bracket (1) on the transmission.

Fig. 223: View Of Ground Cable & Shift Cable
Courtesy of CHRYSLER GROUP, LLC

42. Snap the shift cable end (2) in position on the manual lever on the transmission.

Fig. 224: Ground Cable At Top Transmission
Courtesy of CHRYSLER GROUP, LLC

43. Place the ground cable (1) in position on the transmission.

44. Install the bolt (1) to hold the ground cable to the top of the transmission. Refer to **SPECIFICATIONS**.

Fig. 225: Identifying Wire Connector Lock To TCM
Courtesy of CHRYSLER GROUP, LLC

45. Engage the wire connector (1) into the TCM connector.
46. Close the lock on the TCM connector (1).
47. Place the vacuum pump in position on the mount bracket. Refer to **PUMP, VACUUM, INSTALLATION** .
48. Install the nuts to hold the vacuum pump to the mount bracket.
49. Connect the wire connector onto the vacuum pump.
50. Connect the vacuum line onto the vacuum pump.
51. Install the battery tray. Refer to **TRAY, BATTERY, INSTALLATION** .
52. Install the power distribution center. Refer to **CENTER, POWER DISTRIBUTION (PDC), INSTALLATION** .
53. Engage the wire connector into the main engine harness on the front of the battery tray.
54. Engage the lock lever on the wire connector.
55. Install the PCM. Refer to **MODULE, POWERTRAIN CONTROL, INSTALLATION** .
56. Raise the vehicle.
57. Fill the transmission to the proper level with the specified fluid.
58. Install the belly pan. Refer to **BELLY PAN, INSTALLATION** .
59. Install new rivets at the lower outboard front fascia to right front splash shield.
60. Install the left front fender splash shield. Refer to **SHIELD, SPLASH, FRONT WHEELHOUSE, INSTALLATION** .
61. Install the front wheels. Refer to **INSTALLATION** .

62. Lower the vehicle.
63. Install the battery. Refer to **BATTERY, INSTALLATION** .
64. If transmission is replaced, program the Vehicle Identification Number (VIN) into the Transmission Control Module (TCM).

NOTE: **Note; only perform the Valve Body Solenoid Learn procedure if the valve body and/or the TCM was replaced during a repair. Do not perform this procedure if the repair did not require the valve body and/or TCM to be replaced. Do not perform this procedure if the transmission is being replaced.**

65. If valve body or the TCM was replaced, perform Valve Body Solenoid Learn procedure.
66. If transmission is replaced or internal repairs were made, perform Transmission Verification Test-948TE. Refer to **STANDARD PROCEDURE** .
67. Road test the vehicle to verify the repair.

AWD / 4WD

WARNING: **Hoisting and jack lift points provided in this service information are for a complete vehicle. When the transaxle is removed, the center of gravity will shift to the rear of the vehicle, possibly creating an unstable condition. Place safety stands under the rear frame rails behind the rear axle to stabilize the vehicle. Personal injury may result if safety stands are not used.**

NOTE: **If equipped with a 2.4L, be sure that the upper starter bolt is inserted into the proper hole in the transmission prior to mating transmission to block.**

1. While guiding the transmission past obstacles, jack (1) the transmission upward until the engine and the transmission are in line.
2. Push the bell housing against the engine block until the guide pins engage.

Fig. 226: Removing/Installing Transmission Bellhousing Bolts
Courtesy of CHRYSLER GROUP, LLC

3. Install the bolt (1) to hold the engine oil pan and exhaust bracket to the bellhousing. Refer to **SPECIFICATIONS**.
4. Install the bolts (1) to hold the engine block and oil pan to the bellhousing in position on behind the exhaust maniverter. Refer to **SPECIFICATIONS**.
5. Install the bolts to hold the engine block and oil pan to the bellhousing next to the differential housing. Refer to **SPECIFICATIONS**.

Fig. 227: Torque Converter Bolts
Courtesy of CHRYSLER GROUP, LLC

CAUTION: It is essential that correct length bolts be used to attach the converter to the driveplate. Failure to follow this caution may result in transmission damage.

6. Through the access door opening, Install **new** bolts (1) to hold the flexplate to the torque converter, Rotate the crankshaft to bring each set of bolts into view through the access door. Refer to **SPECIFICATIONS**.

Fig. 228: Bellhousing Access Door
Courtesy of CHRYSLER GROUP, LLC

7. Install the access door in the splash shield on the bellhousing.

Fig. 229: Transmission Bellhousing Bolts Above The Differential Housing
Courtesy of CHRYSLER GROUP, LLC

8. Install the bolt (1) to hold the transmission bellhousing to the engine block above the differential housing. Refer to **SPECIFICATIONS**.

Fig. 230: Removing/Installing Starter
Courtesy of CHRYSLER GROUP, LLC

9. If equipped with a 2.4L, install the bolt (3) to hold the starter (4) to the transmission bellhousing. Refer to **SPECIFICATIONS** .

Fig. 231: Starter Bolts (3.2L)
Courtesy of CHRYSLER GROUP, LLC

10. If equipped with a 3.2L, install the starter bolts (1) and tighten to the proper specification. Refer to **SPECIFICATIONS** .
11. Install the power transfer unit (PTU). Refer to **INSTALLATION** .

Fig. 232: Wooden Block Placed Between Transmission And Frame Rail
Courtesy of CHRYSLER GROUP, LLC

12. Insert a wood block (1) between the load beam and the transmission.

Fig. 233: Wooden Block Used To Protect Engine Oil Pan
Courtesy of CHRYSLER GROUP, LLC

13. Remove the safety chain holding the transmission to the transmission jack lift plate.

14. Lower the high stand (2) and the transmission jack (1) until the transmission rests on the wooden block.
15. Remove the high stand (2) and transmission jack (1) from under the vehicle.

Fig. 234: Transmission Cooler Lines
Courtesy of CHRYSLER GROUP, LLC

16. Guide the cooler lines in position on the transmission.
17. Engage the quick couplings to hold the cooler lines to the transmission.
18. Install the left and right half shafts. Refer to **INSTALLATION** .
19. Remove the safety stands under the rear frame rails behind the rear axle and lower the vehicle.

Fig. 235: Upper Bellhousing Bolts

Courtesy of CHRYSLER GROUP, LLC

20. Install upper bolts (1) to hold the transmission bellhousing to the engine block located behind the main engine wire harness. Refer to **SPECIFICATIONS**.

Fig. 236: Upper Starter Bolt
Courtesy of CHRYSLER GROUP, LLC

21. If equipped with a 2.4L, tighten the upper starter bolt. Refer to **SPECIFICATIONS** .

Fig. 237: Wire Harness Bracket & Bellhousing Bolt
Courtesy of CHRYSLER GROUP, LLC

22. Install the upper bolt (1) to hold the wire harness bracket and transmission bellhousing to the engine block. Refer to **SPECIFICATIONS**.

Fig. 238: Upper Transmission Mount Bolts
Courtesy of CHRYSLER GROUP, LLC

23. Place the transmission mount adaptor block (4) in position on the transmission.
24. Install the bolts (3) and hidden bolts (2) to hold the transmission mount adaptor block (4) to the transmission. Refer to **SPECIFICATIONS**.
25. Place the ground cable (1) in position on the transmission.
26. Install the bolt (1) to hold the ground cable to the transmission end cover. Refer to **SPECIFICATIONS**.
27. Position a floor jack under the transmission.
28. Raise the transmission until the wood block is free to be removed.

Fig. 239: Wooden Block Placed Between Transmission And Frame Rail
Courtesy of CHRYSLER GROUP, LLC

29. Remove the wooden block (1) from between the transmission end cover and the frame rail load beam.

Fig. 240: Upper Transmission Mount Bolts
Courtesy of CHRYSLER GROUP, LLC

30. Install the bolts (1) to hold the upper transmission mount to the adaptor block (4). Refer to **SPECIFICATIONS**.
31. Lower and remove the floor jack.

Fig. 241: Transmission Valve Body Solenoid Connector
Courtesy of CHRYSLER GROUP, LLC

32. Engage the transmission solenoid connector (2) into transmission connector.
33. Rotate the lock lever (2) clockwise on the transmission solenoid connector.

Fig. 242: View Of Shift Cable Housing & Mount Bracket
Courtesy of CHRYSLER GROUP, LLC

34. Place the shift cable (2) in position on the mount bracket (2).
35. Press the shift cable housing (2) into the mount bracket (1) on the transmission.

Fig. 243: View Of Ground Cable & Shift Cable
Courtesy of CHRYSLER GROUP, LLC

36. Snap the shift cable end (2) in position on the manual lever on the transmission.

Fig. 244: Ground Cable At Top Transmission
Courtesy of CHRYSLER GROUP, LLC

37. Place the ground cable (1) in position on the transmission.
38. Install the bolt (1) to hold the ground cable to the top of the transmission. Refer to **SPECIFICATIONS**.

Fig. 245: Identifying Wire Connector Lock To TCM
Courtesy of CHRYSLER GROUP, LLC

39. Engage the wire connector (1) into the TCM connector.
40. Close the lock on the TCM connector (1).
41. If equipped with a 3.2L, place the vacuum pump in position on the mount bracket. Refer to **PUMP, VACUUM, INSTALLATION** .
42. For 3.2L install the nuts to hold the vacuum pump to the mount bracket.
43. For 3.2L connect the wire connector onto the vacuum pump.
44. For 3.2L connect the vacuum line onto the vacuum pump.
45. If equipped with a 2.4L, install the intake manifold. Refer to **MANIFOLD, INTAKE, INSTALLATION** .
46. Install the battery tray Refer to **TRAY, BATTERY, INSTALLATION** .
47. Install the power distribution center. Refer to **CENTER, POWER DISTRIBUTION (PDC), INSTALLATION** .
48. Install the PCM. Refer to **MODULE, POWERTRAIN CONTROL, INSTALLATION** .
49. Engage the connectors on the PCM.
50. Raise the vehicle.
51. Fill the transmission to the proper level with the specified fluid.
52. Install the belly pan. Refer to **BELLY PAN, INSTALLATION** .
53. Install new rivets at the lower outboard front fascia to wheel well liners.
54. Install the front wheels. Refer to **INSTALLATION** .
55. Lower the vehicle.
56. Install the battery. Refer to **BATTERY, INSTALLATION** .
57. If transmission is replaced, program the Vehicle Identification Number (VIN) into the Transmission

Control Module (TCM).

NOTE: **Note; only perform the Valve Body Solenoid Learn procedure if the valve body and/or the TCM was replaced during a repair. Do not perform this procedure if the repair did not require the valve body and/or TCM to be replaced. Do not perform this procedure if the transmission is being replaced.**

58. If valve body or the TCM was replaced, perform Valve Body Solenoid Learn procedure.
59. If transmission is replaced or internal repairs were made, perform Transmission Verification Test-948TE. Refer to **STANDARD PROCEDURE** .
60. Road test the vehicle to verify the repair.

SPECIAL TOOLS

SPECIAL TOOLS

	6052 - Installer, Bearing/Seal (Originally Shipped In Kit Number(s) 6303, 6672, 8853.)
	6888 - Installer, Seal (Originally Shipped In Kit Number(s) 6894, 6895, 6896, 6898, 9720-SUP.)

7794-A - Remover, Seal
(Originally Shipped In Kit Number(s) 6645.)

8148 - Cup
(Originally Shipped In Kit Number(s) 8104, 9975.)

8228 - Installer, Bearing
(Originally Shipped In Kit Number(s) 8295, 8295CC, 8636.)

8266B - End Play Socket Set
(Originally Shipped In Kit Number(s) 8283, 8527, 8575, 8575CC.)

8513A - Insert, Crankshaft
(Originally Shipped In Kit Number(s) 8283, 8527, 8575, 8999, 8999CC.)

8594 - Installer, Bearing Cup

	(Originally Shipped In Kit Number(s) 8666, 8667, 8705, 8705CC.)
	8840 - Installer, Oil Slinger (Originally Shipped In Kit Number(s) 8715, 8719, 8719CC, 9975, 9976.)

9588 - Installer, Bearing Cup
(Originally Shipped In Kit Number(s) 9692.)

9611 - Plug, Differential End
(Originally Shipped In Kit Number(s) 9690.)

	9664 - Remover, Bearing Cup (Originally Shipped In Kit Number(s) 9675, 9685, 9695.)
	9667 - Remover, Seal (Originally Shipped In Kit Number(s) 9691.)

9676 - Adapter Plug
(Originally Shipped In Kit Number(s) 9675, 9685, 9695.)

9677 - Installer, Seal
(Originally Shipped In Kit Number(s) 9675, 9685, 9695.)

9678 - Press Plug
(Originally Shipped In Kit Number(s) 9675, 9685, 9695.)

9738 - Blocks, Adapter
(Originally Shipped In Kit Number(s) 9720, 9967.)

10036 - Installer, Bearing Cup
(Originally Shipped In Kit Number(s) 10035.)

10323A - Dipstick
(Originally Shipped In Kit Number(s).)

10425 - Tool, Pinion and Side Gear Locking
(Originally Shipped In Kit Number(s) 10419.)

10428 - Adapter, Pressing Tool
(Originally Shipped In Kit Number(s).)

10429 - Gauge, Force
(Originally Shipped In Kit Number(s) 10419.)

10503 - Installer, Bearing
(Originally Shipped In Kit Number(s).)

10504 - Compressor, Spring
(Originally Shipped In Kit Number(s).)

10506 - Installer, Oil Seal
(Originally Shipped In Kit Number(s).)

2012900210 - Wrench, Spanner
(Originally Shipped In Kit Number(s).)

C-293-PA - Puller, Press
(Originally Shipped In Kit Number(s)
8418, 8837, C-293-M.)

	C-293-37 - Block Set, Puller (Originally Shipped In Kit Number(s) 8418, 8562, C-293-M, DD-914-CLT-L.)
	C-293-40 - Block Set, Puller (Originally Shipped In Kit Number(s) 9695, 9870, 9971.)
	C-637 - Slide Hammer, Universal (Originally Shipped In Kit Number(s)

	9202.)
	C-3339A - Set, Dial Indicator (Originally Shipped In Kit Number(s) 9202.)
	C-3752 - Slide Hammers (Originally Shipped In Kit Number(s) 9202, 9202A-CAN, 9202-CAN, 9202CC.)

C-3972-A - Installer, Seal
(Originally Shipped In Kit Number(s) 9975.)

C-4171 - Driver Handle, Universal
(Originally Shipped In Kit Number(s) 9202, 9202A-CAN, 9202CC, 9299, 9299CC, 9299CC, 9300A-CAN.)

	
	C-4310 - Installer, Bearing (Originally Shipped In Kit Number(s) C-4306.)

	C-4995A - Tool, Differential Bearing Torque
	MD998805 - Installer, Seal (Originally Shipped In Kit Number(s) 9926.)

CABLE, SHIFT

ADJUSTMENTS

ADJUSTMENTS

ADJUSTMENT

1. Park the vehicle on level ground and set the parking brake.

Fig. 246: Console Trim Pieces
Courtesy of CHRYSLER GROUP, LLC

2. Using (special tool #C-4755, Trim Stick) or equivalent, remove the front trim (3) covering the console fasteners.

Fig. 247: Shifter Bezel & Console Bezel
Courtesy of CHRYSLER GROUP, LLC

3. Detach shifter bezel (1) from console bezel using (special tool #C-4755, Trim Stick) or equivalent, pry up on bezel (1).

NOTE: Do not remove the shifter bezel, as it will fit through the opening in the console bezel when it is removed.

4. Place the shifter in the Neutral position by manually releasing the Brake Ignition Transmission Shift Interlock (BITSI). Refer to **SHIFT, BRAKE INTERLOCK, STANDARD PROCEDURE**.

Fig. 248: Shifter Bezel, Console Bezel & Electrical Connectors
Courtesy of CHRYSLER GROUP, LLC

5. Using (special tool #C-4755, Trim Stick) or equivalent, separate the console bezel (1) and disconnect the electrical connectors (2).
6. Place the gearshift lever in Park (P) and remove ignition key.

Fig. 249: Shifter Cable End & Adjustment Screw
Courtesy of CHRYSLER GROUP, LLC

7. Loosen the cable adjustment screw (3) at the shifter end of the cable.

8. Pull the gearshift lever fully forward to the park detent position.
9. Release the park brake, then rock the vehicle to assure it is in park. Reset the park brake.
10. Tighten the cable adjustment screw to proper specification, refer to **SPECIFICATIONS**.
11. Verify adjustment by using the verification procedure.
12. Place the shifter in the Neutral position by manually releasing the Brake Ignition Transmission Shifter Interlock (BITSI). Refer to **SHIFT, BRAKE INTERLOCK, STANDARD PROCEDURE**.

Fig. 250: Shifter Bezel, Console Bezel & Electrical Connectors
Courtesy of CHRYSLER GROUP, LLC

13. Insert the shifter bezel through the console bezel (1).
14. Connect the console bezel electrical connectors (2).
15. Install the console bezel (1) to the console.

Fig. 251: Shifter Bezel & Console Bezel
Courtesy of CHRYSLER GROUP, LLC

16. Install the shifter bezel (1) to the console bezel.

Fig. 252: Console Trim Pieces
Courtesy of CHRYSLER GROUP, LLC

17. Install the console front trim (3).

VERIFICATION

1. Place gearshift lever in Park (P).
2. Attempt to move vehicle by rocking back and forth on level ground. If vehicle does not move, attempt to start engine. If engine starts, the park position is correct.
3. Set parking brake.
4. Turn key to on/run and depress brake pedal. Place gearshift lever in Neutral (N).
5. Attempt to start engine. If engine starts in both Neutral (N) or Park (P), gearshift cable is adjusted properly. No adjustment is required.
6. If engine does not start in either Park (P) or Neutral (N), perform adjustment procedure.

REMOVAL

REMOVAL

1. Set the parking brake.
2. Disconnect and isolate the negative battery cable.

Fig. 253: Console Trim Pieces
Courtesy of CHRYSLER GROUP, LLC

3. Using (special tool #C-4755, Trim Stick) or equivalent, remove the front trim (3) covering the console fasteners.

Fig. 254: Shifter Bezel & Console Bezel
Courtesy of CHRYSLER GROUP, LLC

4. Detach shifter bezel (1) from console bezel using (special tool #C-4755, Trim Stick) or equivalent, pry up on bezel (1).

NOTE: Do not remove the shifter bezel, as it will fit through the opening in the console bezel when it is removed.

5. Place the shifter in the Neutral position by manually releasing the Brake Ignition Transmission Shift Interlock (BITSI)

   Refer to **SHIFT, BRAKE INTERLOCK, STANDARD PROCEDURE**.

Fig. 255: Shifter Bezel, Console Bezel & Electrical Connectors
Courtesy of CHRYSLER GROUP, LLC

6. Using (special tool #C-4755, Trim Stick) or equivalent, separate the console bezel (1) and disconnect the electrical connectors (2).
7. Remove the console bezel.
8. Place shifter in Park position.

Fig. 256: Shifter Cable End & Adjustment Screw

Courtesy of CHRYSLER GROUP, LLC

9. Disconnect shifter cable (1) from the shifter (2).

Fig. 257: Shifter Cable & Shifter Bracket
Courtesy of CHRYSLER GROUP, LLC

10. Release the lock (3) holding the shifter cable (4) to the shifter bracket (1).
11. Separate the shifter cable (4) from the shifter bracket (1).
12. Remove the Powertrain Control Module (PCM). Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
13. Remove the PCM bracket from the battery tray.

Fig. 258: Shifter Cable End & Manual Lever At Transmission
Courtesy of CHRYSLER GROUP, LLC

14. Separate the shifter cable end (1) from the manual lever (2) on the transmission.

Fig. 259: Shifter Cable & Shift Cable Bracket On Transmission
Courtesy of CHRYSLER GROUP, LLC

15. Release the lock (2) holding the shifter cable (1) to the shift cable bracket (3) on the transmission.
16. Separate the shifter cable (1) from the shift cable bracket (3).
17. Raise and support the vehicle on a hoist. Refer to **HOISTING, STANDARD PROCEDURE** .

Fig. 260: Exhaust Heat Shield Nuts
Courtesy of CHRYSLER GROUP, LLC

18. Remove the exhaust heat shield (1) nuts (2) and lower heat shield to gain access to the shifter cable and grommet.

Fig. 261: Shifter Cable Support Bracket & Shifter Cable Grommet
Courtesy of CHRYSLER GROUP, LLC

NOTE: Exhaust and heat shield removed for clarity.

19. Detach the shifter cable from the support bracket (1).

20. Detach the shifter cable grommet (2) from the floor pan.

Fig. 262: Shifter Cable Clip
Courtesy of CHRYSLER GROUP, LLC

21. Detach the shifter cable from the clip (1) attached to the steering gear.

Fig. 263: Shifter Cable & Floor Pan Access Hole
Courtesy of CHRYSLER GROUP, LLC

22. Pull the shifter cable (1) through the floor pan.
23. Disconnect front sway bar links from the sway bar.

Fig. 264: Shifter Cable
Courtesy of CHRYSLER GROUP, LLC

24. Rotate the sway bar (1) for shifter cable (2) clearance.
25. Remove the shifter cable from the vehicle.

INSTALLATION

INSTALLATION

Fig. 265: Shifter Cable
Courtesy of CHRYSLER GROUP, LLC

NOTE: Exhaust and heat shield are removed for clarity.

Fig. 266: Shifter Cable & Floor Pan Access Hole
Courtesy of CHRYSLER GROUP, LLC

1. Position the shifter cable (2) into the vehicle.
2. Push the shifter cable (1) up through the floor pan.

Fig. 267: Shifter Cable Clip
Courtesy of CHRYSLER GROUP, LLC

3. Attach the shifter cable to the clip (1) attached to the steering gear.

Fig. 268: Shifter Cable Support Bracket & Shifter Cable Grommet
Courtesy of CHRYSLER GROUP, LLC

4. Attach the shifter cable grommet (2) to the floor pan.
5. Attach the shifter cable to the support bracket (1).

Fig. 269: Exhaust Heat Shield Nuts
Courtesy of CHRYSLER GROUP, LLC

6. Position the heat shield (1) in place and install the heat shield nuts (2).
7. Attach the front sway bar links to the sway bar and tighten to the proper specification. Refer to **FRONT, SPECIFICATIONS** .

8. Lower the vehicle.

Fig. 270: Shifter Cable & Shift Cable Bracket On Transmission
Courtesy of CHRYSLER GROUP, LLC

9. Attach the shifter cable (1) in the shifter cable bracket (3) on the transmission.

Fig. 271: Shifter Cable End & Manual Lever At Transmission
Courtesy of CHRYSLER GROUP, LLC

10. Attach the shifter cable end (1) to the manual lever (2).

NOTE: **Make sure the transmission is in Park by rotating the manual lever to its forward most position.**

11. Install the Powertrain Control Module (PCM) bracket to the battery tray.
12. Install the PCM. Refer to **MODULE, POWERTRAIN CONTROL, INSTALLATION** .

Fig. 272: Shifter Cable & Shifter Bracket
Courtesy of CHRYSLER GROUP, LLC

13. Attach the shifter cable (4) to the shifter bracket (1).

Fig. 273: Shifter Cable End & Adjustment Screw

Courtesy of CHRYSLER GROUP, LLC

14. With shifter in the Park position, attach the shifter cable end (1) to the shifter (2).
15. If necessary, adjust the shifter cable. Refer to **CABLE, SHIFT, ADJUSTMENTS**.
16. Place the shifter in the Neutral position by manually releasing the Brake Ignition Transmission Shifter Interlock (BITSI). Refer to **SHIFT, BRAKE INTERLOCK, STANDARD PROCEDURE**.

Fig. 274: Shifter Bezel, Console Bezel & Electrical Connectors
Courtesy of CHRYSLER GROUP, LLC

17. Insert the shifter bezel through the console bezel (1).
18. Connect the console bezel electrical connectors (2).
19. Install the console bezel (1) to the console.

Fig. 275: Shifter Bezel & Console Bezel
Courtesy of CHRYSLER GROUP, LLC

20. Install the shifter bezel (1) to the console bezel.

Fig. 276: Console Trim Pieces
Courtesy of CHRYSLER GROUP, LLC

21. Install the console front trim (3).
22. Connect the negative battery cable.

BEARINGS, DIFFERENTIAL

REMOVAL

DIFFERENTIAL BEARING

1. Remove the transmission from the vehicle. Refer to **INSTALLATION**.
2. Position the transmission on a suitable, clean work surface.
3. Drain the fluid from the transmission.

Fig. 277: Bellhousing To Transmission Housing Bolts
Courtesy of CHRYSLER GROUP, LLC

4. Remove the bolts (1) from around the perimeter of the transmission, (1) holding the bellhousing to the transmission housing.

Fig. 278: Bellhousing To Output Gear Support Bolts
Courtesy of CHRYSLER GROUP, LLC

5. Remove the bolts (1) holding the bellhousing to the output gear support.
6. Using wooden blocks to stabilize the transmission on the work surface, position the transmission on the bench with the bellhousing facing upward.
7. Using a suitable pry-bar in the pry point locations, pry upward to dislodge the bellhousing from the

transmission housing.

Fig. 279: Removing/Installing Bellhousing At Transmission Housing
Courtesy of CHRYSLER GROUP, LLC

8. Lift the bellhousing (1) upward and separate the assembly from the transmission housing (2).
9. Remove the bellhousing from the transmission.

Fig. 280: Removing/Installing Differential Assembly
Courtesy of CHRYSLER GROUP, LLC

10. Remove the differential unit from the transmission

.

11. Clean the differential unit with solvent and blow it dry with regulated 344 kPa (50 psi) shop air.

Fig. 281: Removing Differential Side Bearings (Differential is Assembled)
Courtesy of CHRYSLER GROUP, LLC

If the Differential is Assembled remove bearings using following tools and procedure.

1. Using tools (special tool #9738, Blocks, Adapter) (2), and (special tool #8513A, Insert, Crankshaft) (3), along with (special tool #C-293-PA, Puller, Press) (1) remove the side bearings.

If the Differential is Disassembled remove the bearings using following tools and procedure.

Fig. 282: Removing Differential Side Bearings (Differential is Disassembled)
Courtesy of CHRYSLER GROUP, LLC

1. Using tools (special tool #C-293-37, Block Set, Puller) (2), and (special tool #9678, Press Plug) (3), along with (special tool #C-293-PA, Puller, Press) (1) remove the side bearing (4).

BEARING RACE

1. Remove the transmission from the vehicle. Refer to **REMOVAL**.
2. Position the transmission on a suitable, clean work surface.
3. Drain the fluid from the transmission.

Fig. 283: Bellhousing To Transmission Housing Bolts

Courtesy of CHRYSLER GROUP, LLC

4. From around the perimeter of the transmission, remove the bolts (1) holding the bellhousing to the transmission housing.

Fig. 284: Bellhousing To Output Gear Support Bolts
Courtesy of CHRYSLER GROUP, LLC

5. Remove the bolts (1) holding the bellhousing to the output gear support.
6. Using wooden blocks to stabilize the transmission on the work surface, position the transmission on the bench with the bellhousing facing upward.
7. Using a suitable pry-bar in the pry point locations, pry upward to dislodge the bellhousing from the transmission housing.

Fig. 285: Removing/Installing Bellhousing At Transmission Housing
Courtesy of CHRYSLER GROUP, LLC

8. Lift the bellhousing (1) upward and separate the assembly from the transmission housing (2).
9. Remove the bellhousing from the transmission.

Fig. 286: Remove Bearing Race From Bellhousing
Courtesy of CHRYSLER GROUP, LLC

10. Using tool (special tool #9664, Remover, Bearing Cup) (2), (special tool #C-637, Slide Hammer, Universal) (1) and a suitable vise-grip pliers (3) to hold the expansion screw in position, remove the bearing race (4) from the bellhousing.

Fig. 287: Removing/Installing Differential Assembly
Courtesy of CHRYSLER GROUP, LLC

11. Remove the differential unit (1) from the transmission.

Fig. 288: Removing Bearing Race From The Transmission Housing
Courtesy of CHRYSLER GROUP, LLC

12. Using tool (special tool #9664, Remover, Bearing Cup) (2), (special tool #C-637, Slide Hammer, Universal) (1) and a suitable vise-grip pliers (3) to hold the expansion screw in position, remove the bearing race (4) from the transmission housing.

INSTALLATION

DIFFERENTIAL BEARING

1. Clean the differential unit with solvent and blow it dry with regulated 344 kPa (50 psi) shop air.

Fig. 289: Installiing Differential Side Bearing
Courtesy of CHRYSLER GROUP, LLC

2. Using a suitable hammer (1) tool (special tool #6888, Installer, Seal) (3) and (special tool #C-4171, Driver Handle, Universal)

   install the side bearings.

3. If necessary, assemble the differential unit.

Fig. 290: Removing/Installing Differential Assembly
Courtesy of CHRYSLER GROUP, LLC

4. Install the differential unit (1) in the transmission.

Fig. 291: Removing/Installing Bellhousing At Transmission Housing
Courtesy of CHRYSLER GROUP, LLC

5. While guiding the bellhousing (1) downward over the input and output shafts, place the bellhousing (1) in position on the transmission housing (2).
6. Engage the guide pins in the transmission housing into the receptacle holes bellhousing to assure proper alignment.

Fig. 292: Bellhousing To Output Gear Support Bolts
Courtesy of CHRYSLER GROUP, LLC

7. Install the bolts (1) with NEW seal washers to hold the bellhousing to the output gear support and tighten to the proper specifications. Refer to **SPECIFICATIONS**.

Fig. 293: Bellhousing To Transmission Housing Bolts
Courtesy of CHRYSLER GROUP, LLC

8. Install the bolts (1) to hold the bellhousing to the transmission housing and tighten to the proper specifications. Refer to **SPECIFICATIONS**.
9. Install the transmission in the vehicle. Refer to **INSTALLATION**.
10. Fill the transmission with the specified type and quantity fluid. Refer to **FLUID AND FILTER,**

STANDARD PROCEDURE.

11. Road test the vehicle to verify the repair.

BEARING RACE

If only the bearing are being replaced the bearing preload does not require selecting a new select shim. If the transmission housing, bellhousing or differential is replaced the proper thickness select shim will have to be determined. Refer to **STANDARD PROCEDURES**.

1. Wipe the bearing bores clean with a clean lint free cloth.
2. Inspect the bearing bores to damage or cracks in the casting.

Fig. 294: Install Bearing Bore Shim
Courtesy of CHRYSLER GROUP, LLC

3. Install the original shim in the bearing bore of the transmission housing.

Fig. 295: Bearing Race
Courtesy of CHRYSLER GROUP, LLC

4. Place the NEW bearing race in the bearing bore of the transmission housing.

Fig. 296: Installing Bearing Race
Courtesy of CHRYSLER GROUP, LLC

5. Using tool (special tool #C-4310, Installer, Bearing) (2) and (special tool #C-4171, Driver Handle, Universal) (1) install the bearing race in the transmission housing.

Fig. 297: Removing/Installing Differential Assembly
Courtesy of CHRYSLER GROUP, LLC

6. Install the differential unit in the transmission housing.
7. Place the NEW bearing race in the bearing bore of the bellhousing.
8. Using tool (special tool #C-4310, Installer, Bearing) and (special tool #C-4171, Driver Handle, Universal) install the bearing race in the bellhousing.

Fig. 298: Removing/Installing Bellhousing At Transmission Housing
Courtesy of CHRYSLER GROUP, LLC

9. While guiding the bellhousing (1) downward over the input and output shafts, place the bellhousing (1) in position on the transmission housing (2).

10. Engage the guide pins in the transmission housing into the receptacle holes bellhousing to assure proper alignment.

Fig. 299: Bellhousing To Output Gear Support Bolts
Courtesy of CHRYSLER GROUP, LLC

11. Install the bolts (1) with NEW seal washers to hold the bellhousing to the output gear support and tighten to the proper specifications. Refer to **SPECIFICATIONS**.

Fig. 300: Bellhousing To Transmission Housing Bolts
Courtesy of CHRYSLER GROUP, LLC

12. Install the bolts (1) to hold the bellhousing to the transmission housing and tighten to the proper

specifications. Refer to **SPECIFICATIONS**.

13. Install the transmission in the vehicle. Refer to **INSTALLATION**.
14. Fill the transmission with the specified type and quantity fluid. Refer to **FLUID AND FILTER, STANDARD PROCEDURE**.
15. Road test the vehicle to verify the repair.

BEARINGS, TRANSFER GEAR

REMOVAL

TRANSFER GEAR INNER BEARING

WARNING: Always wear safety glasses when cleaning, disassembling and assembling the transmission/transaxle. Contents of the transmission/transaxle can become projectiles (e.g., springs, snap-rings, as well as metal and other debris). Failure to wear safety glasses may result in severe personal injury.

Before disassembling the transmission, wash the transmission with a suitable solvent and a siphon pressure washer to remove oily grime and loose dirt. Place the transmission on a clean work surface with ample fluid drainage or absorbency.

Fig. 301: Wire Connector Socket Clip
Courtesy of CHRYSLER GROUP, LLC

1. Remove the clip holding the wire connector socket in the valve body cover pan.

Fig. 302: Valve Body Cover Pan Bolts
Courtesy of CHRYSLER GROUP, LLC

2. Remove the bolts holding the valve body cover pan to the transmission housing.
3. Remove the valve body cover pan from the transmission.

Fig. 303: Valve Body Bolts
Courtesy of CHRYSLER GROUP, LLC

4. Remove the bolts holding the valve body to the transmission housing.
5. Using a suitable prying tool, pry the valve body away from the adapter tubes.
6. Turn the valve body over to gain access to wire harness connectors.

Fig. 304: Fluid Pressure Transducer Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

7. Release the lock (2) on the fluid pressure transducer wire connector.
8. Separate the wire connector from the fluid pressure transducer (1).

Fig. 305: Removing/Installing Wire Harness Connector At Valve Body Solenoids
Courtesy of CHRYSLER GROUP, LLC

9. Remove the bolts (1) holding the wire harness connector to the valve body and solenoids.
10. Using a suitable prying tool, Separate the wire harness connector (2) from the solenoids.
11. Separate the valve body from the transmission.

NOTE: **If the valve body is to be reused without disassembling it, store the valve body in a clean area until it is installed.**

Fig. 306: Removing/Installing Transmission Range Sensor (TRS) Screw
Courtesy of CHRYSLER GROUP, LLC

12. Remove the screw (1) holding the TRS to the transmission housing.

Fig. 307: Removing/Installing Transmission Range Sensor
Courtesy of CHRYSLER GROUP, LLC

13. Separate the TRS (1) from the transmission with the wire harness connected.

Fig. 308: Removing/Installing Speed Sensor Screw
Courtesy of CHRYSLER GROUP, LLC

14. Remove the screw (1) holding the speed sensors to the transmission housing.

Fig. 309: Removing/Installing Speed Sensor
Courtesy of CHRYSLER GROUP, LLC

15. Separate the speed sensor (1) from the transmission with the wire harness connected.

Fig. 310: Fluid Adapter Tubes & O-Ring Seals
Courtesy of CHRYSLER GROUP, LLC

16. Using suitable pliers, remove the fluid adapter tubes (1) from the transmission.

Fig. 311: Bellhousing To Transmission Housing Bolts
Courtesy of CHRYSLER GROUP, LLC

17. From around the perimeter of the transmission, remove the bolts (1) holding the bellhousing to the transmission housing.

Fig. 312: Bellhousing To Output Gear Support Bolts
Courtesy of CHRYSLER GROUP, LLC

18. Remove the bolts (1) holding the bellhousing to the output gear support.
19. Using wooden blocks to stabilize the transmission on the work surface, position the transmission on the bench with the bellhousing facing upward.
20. Using a suitable pry-bar in the pry point locations, pry upward to dislodge the bellhousing from the transmission housing.

Fig. 313: Removing/Installing Bellhousing At Transmission Housing
Courtesy of CHRYSLER GROUP, LLC

21. Lift the bellhousing (1) upward and separate the assembly from the transmission housing (2).

Fig. 314: Port Seal
Courtesy of CHRYSLER GROUP, LLC

22. Remove the seal (1) from the port in the transmission housing.

Fig. 315: Sealing Surface Of Transmission Housing
Courtesy of CHRYSLER GROUP, LLC

23. Separate the gasket (1) from the sealing surface of the transmission housing (2).

Fig. 316: Removing/Installing Differential Assembly
Courtesy of CHRYSLER GROUP, LLC

24. Remove the differential assembly (1) from the transmission housing.

Fig. 317: Removing/Installing E-Clutch At E-Clutch Hub
Courtesy of CHRYSLER GROUP, LLC

25. Separate the E-clutch from the E-clutch hub and shaft (2).

Fig. 318: Removing/Installing Thrust Bearing At E-Clutch Hub
Courtesy of CHRYSLER GROUP, LLC

26. Separate the thrust bearing (1) from the E-clutch (2) hub.

Fig. 319: E-Clutch Hub And Shaft
Courtesy of CHRYSLER GROUP, LLC

27. Separate the E-clutch hub and shaft (1) from the output gear support (2).

Fig. 320: Output Gear Support
Courtesy of CHRYSLER GROUP, LLC

28. Separate the output gear support (1) from the gear 4 planetary pinion carrier (2).

Fig. 321: Removing/Installing Transfer Gear
Courtesy of CHRYSLER GROUP, LLC

29. Remove the transfer gear from the transmission housing (1).

Fig. 322: Roller Type Thrust Bearing
Courtesy of CHRYSLER GROUP, LLC

30. Separate the roller type thrust bearing (1) from the sun gear 3 and 4 and Dog Clutch-F (2).

Fig. 323: Removing/Installing Sun Gear 3, 4 And Dog Clutch-F At Gear 4 Planetary Pinion Carrier
Courtesy of CHRYSLER GROUP, LLC

31. Separate the sun gear 3 and 4 and Dog Clutch-F (1) from the gear 4 planetary pinion carrier.

Fig. 324: Gear 4 Planetary Pinion Carrier
Courtesy of CHRYSLER GROUP, LLC

32. Separate the gear 4 planetary pinion carrier (1) from the annulus gear 4.

Fig. 325: Annulus Gear 4
Courtesy of CHRYSLER GROUP, LLC

33. Separate the annulus gear 4 from the annulus gear 3 (2).

Fig. 326: Removing Transfer Gear Bearing Cone
Courtesy of CHRYSLER GROUP, LLC

34. Using Puller Press (special tool #C-293-PA, Puller, Press) (1), Adapter Blocks (special tool #9738, Blocks, Adapter) (3) and a suitable socket as a plug (2), remove the transfer gear bearing cone from the transmission housing.

TRANSFER GEAR INNER RACE

1. Clean the transfer gear with solvent and blow it dry with regulated 344 kPa (50 psi) shop air.

Fig. 327: Removing Bearing Race From Transfer Gear
Courtesy of CHRYSLER GROUP, LLC

2. Clamp the transfer gear (1) in a suitable bench vise with protective jaws.

NOTE: It may be necessary to clamp vise grips (3) on the seal remover to keep the expander screw in place.

3. Using tool (special tool #C-637, Slide Hammer, Universal) (4) and (special tool #7794-A, Remover, Seal) (2) with the jaws expanded out under the inner edge on the bearing race.
4. Knock outward with the slide hammer (4) until the bearing race comes out of the transfer gear (1).

TRANSFER GEAR OUTER BEARING

Fig. 328: Removing Transfer Gear Outer Bearing
Courtesy of CHRYSLER GROUP, LLC

1. Clamp tool (special tool #C-293-PA, Puller, Press) (1) in a suitable vise with the ram blot head upward.
2. Using tool (special tool #C-293-40, Block Set, Puller) (2) with the transfer gear bearing inserted under the puller press and engage the blocks evenly spaced around the bearing.
3. Insert tool (special tool #8513A, Insert, Crankshaft) (3) between the press ram and the transfer gear (5) and hand tighten the press (1) ram down to the Insert
4. While holding the transfer gear, use a suitable wrench to tighten the press (1) ram until the bearing (4) comes off the transfer gear.

TRANSFER GEAR OUTER RACE

1. Disassemble the transmission. Refer to **DISASSEMBLY**.
2. Position the bellhousing on a stable, clean work surface.

Fig. 329: Removing Transfer Gear Outer Bearing Race From Bellhousing
Courtesy of CHRYSLER GROUP, LLC

3. Using tool (special tool #C-637, Slide Hammer, Universal) (1) and (special tool #9664, Remover, Bearing Cup) (2) with the tool fingers inserted in the channels behind the transfer gear outer bearing race (3), remove the transfer gear outer bearing race (3) from the bellhousing bore.

INSTALLATION

TRANSFER GEAR INNER BEARING

The work area, counter surfaces and tools must be thoroughly cleaned before attempting to assemble the 948TE transmission. All of the sub assemblies should be disassembled, cleaned, and assembled with new sealing components where applicable. The transmission housing should be clean and oil free before beginning this procedure. If the transmission was contaminated with metallic material, all of the thrust bearings and roller bearings should be replaced. The bearing in the output gear support assembly is not serviceable. The output gear support assembly should be replaced if metal debris is present.

WARNING: **Always wear safety glasses when cleaning, disassembling and assembling the transmission/transaxle. Contents of the transmission/transaxle can become projectiles (e.g., springs, snap-rings, as well as metal and other debris). Failure to wear safety glasses may result in severe personal injury.**

Fig. 330: Installing Transfer Gear Bearing Cone Onto Transmission Housing
Courtesy of CHRYSLER GROUP, LLC

1. Using Bearing Installer (special tool #6888, Installer, Seal) (2), and handle (special tool #C-4171, Driver Handle, Universal) (3) install the transfer gear bearing cone (1) onto the transmission housing.

Fig. 331: Annulus Gear 4
Courtesy of CHRYSLER GROUP, LLC

2. Install the annulus gear 4 into the annulus gear 3 (2).

Fig. 332: Thrust Spacer & Underside Of Gear 4 Planetary Pinion Carrier
Courtesy of CHRYSLER GROUP, LLC

3. Install a NEW thrust spacer (1) on the underside of the gear 4 planetary pinion carrier (2).

Fig. 333: Thrust Spacer & Topside Of Gear 4 Planetary Pinion Carrier
Courtesy of CHRYSLER GROUP, LLC

4. Install a NEW thrust spacer (1) on the topside of the gear 4 planetary pinion carrier (2).

Fig. 334: Gear 4 Planetary Pinion Carrier
Courtesy of CHRYSLER GROUP, LLC

5. Install the gear 4 planetary pinion carrier (1) into the annulus gear 4.

Fig. 335: Removing/Installing Sun Gear 3, 4 And Dog Clutch-F At Gear 4 Planetary Pinion Carrier
Courtesy of CHRYSLER GROUP, LLC

6. Install the sun gear 3 and 4 and Dog Clutch-F (1) into the gear 4 planetary pinion carrier.

Fig. 336: Roller Type Thrust Bearing
Courtesy of CHRYSLER GROUP, LLC

7. Install the roller type thrust bearing (1) onto the sun gear 3 and 4 and Dog Clutch-F (2).

Fig. 337: Removing/Installing Transfer Gear
Courtesy of CHRYSLER GROUP, LLC

NOTE: **If new transfer gear (1) or transmission housing are being replaced measurements must be preformed to determine correct thickness for the bearing preload shims. If the bearings and races are replaced the factory installed preload shims do not require replacement.**

8. If necessary, replace the bearings and races on the transfer gear (1).
9. Install the transfer gear (1) into the transmission housing.

Fig. 338: Output Gear Support
Courtesy of CHRYSLER GROUP, LLC

10. Install the output gear support (1) into the gear 4 planetary pinion carrier (2).

Fig. 339: E-Clutch Hub And Shaft
Courtesy of CHRYSLER GROUP, LLC

11. Install the E-clutch hub and shaft (1) into the output gear support (2)

Fig. 340: Removing/Installing Thrust Bearing At E-Clutch Hub
Courtesy of CHRYSLER GROUP, LLC

12. Install the thrust bearing (1) on the E-clutch (2) hub.

Fig. 341: Removing/Installing E-Clutch At E-Clutch Hub
Courtesy of CHRYSLER GROUP, LLC

NOTE: Before installing the E-clutch, use a suitable screwdriver to align the grooves in the friction.

13. Install the E-clutch onto the E-clutch hub and shaft (2).

Fig. 342: E-Clutch Hub And Shaft
Courtesy of CHRYSLER GROUP, LLC

14. Wriggle the E-clutch (1) until all of the friction discs are fully engaged on the E-clutch hub and shaft.

NOTE: When the E-clutch (1) is fully seated the gap (2) will be very small between the E-clutch retainer and the output gear support.

Fig. 343: Removing/Installing Differential Assembly
Courtesy of CHRYSLER GROUP, LLC

NOTE: If new differential (1) or transmission housing are being replaced

measurements must be preformed to determine correct thickness for the bearing preload shims. If the bearings and races are replaced the factory installed preload shims do not require replacement.

15. If necessary, replace the bearings and races on the differential (1).
16. Install the differential assembly (1) into the transmission housing.

Fig. 344: Sealing Surface Of Transmission Housing
Courtesy of CHRYSLER GROUP, LLC

17. Place a NEW gasket (1) in position on the sealing surface of the transmission housing (2).

Fig. 345: Port Seal
Courtesy of CHRYSLER GROUP, LLC

18. Install a NEW seal (1) in the port in the transmission housing.
19. If necessary, replace the output seal and the impeller hub seal.

Fig. 346: Removing/Installing Bellhousing At Transmission Housing
Courtesy of CHRYSLER GROUP, LLC

20. While guiding the bellhousing (1) downward over the input and output shafts, place the bellhousing (1) in position on the transmission housing (2).

Fig. 347: Checking Guide Pin Alignment

Courtesy of CHRYSLER GROUP, LLC

21. Rotate the output gear clockwise to assure guide pin (1) alignment.

Fig. 348: Engaging Guide Pins In Transmission Housing Into Receptacle Holes
Courtesy of CHRYSLER GROUP, LLC

22. Rotate the output gear support (1) through the window (2) behind the valve body until the guide pin engages the receptacle hole in the bellhousing
23. Engage the guide pins in the transmission housing into the receptacle holes bellhousing to assure proper alignment.
24. Install several bolts to hold the bell housing to the transmission housing. Tighten the bolts hand tight.
25. Position the transmission on the bench with the bellhousing facing outward.

Fig. 349: Bellhousing To Output Gear Support Bolts
Courtesy of CHRYSLER GROUP, LLC

26. Install the bolts (1) with NEW seal washers to hold the bellhousing to the output gear support. Refer to **SPECIFICATIONS**.

Fig. 350: Bellhousing To Transmission Housing Bolts
Courtesy of CHRYSLER GROUP, LLC

27. Install the bolts (1) to hold the bellhousing to the transmission housing. Refer to **SPECIFICATIONS**.

Fig. 351: Fluid Adapter Tubes & O-Ring Seals
Courtesy of CHRYSLER GROUP, LLC

28. Install NEW O-rings on both ends of the fluid transfer tubes.
29. Install the fluid adapter tubes (1) from the transmission.

Fig. 352: Removing/Installing Speed Sensor
Courtesy of CHRYSLER GROUP, LLC

30. Insert the speed sensor (1) into the transmission with the wire harness connected.

Fig. 353: Removing/Installing Speed Sensor Screw
Courtesy of CHRYSLER GROUP, LLC

31. Install the screw (1) to hold the speed sensors to the transmission housing.

Fig. 354: Removing/Installing Transmission Range Sensor
Courtesy of CHRYSLER GROUP, LLC

32. Place the TRS (1) in position on the transmission with the wire harness connected.

Fig. 355: Removing/Installing Transmission Range Sensor (TRS) Screw
Courtesy of CHRYSLER GROUP, LLC

33. Install the screw (1) to hold the TRS to the transmission housing. Refer to **SPECIFICATIONS**.

Fig. 356: Valve Body & Solenoids Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

34. Place the valve body (1) in position on the transmission.
35. Place the wire harness connector (2) in position on the solenoids.
36. Press the connector (2) inward to engage the terminals on the solenoids.

Fig. 357: Removing/Installing Wire Harness Connector At Valve Body Solenoids
Courtesy of CHRYSLER GROUP, LLC

37. Install the screws to hold the wire harness connector to the valve body and solenoids. Refer to **SPECIFICATIONS**.

Fig. 358: Fluid Pressure Transducer Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

38. Insert the wire harness connector into the fluid pressure transducer connector
39. Press connector together until the lock engages.

Fig. 359: Aligning Valve Body To Fluid Transfer Tubes
Courtesy of CHRYSLER GROUP, LLC

40. Turn the valve body (1) over and align the valve body (1) with the fluid transfer adapters.

Fig. 360: Engaging Valve Body To Fluid Transfer Tubes
Courtesy of CHRYSLER GROUP, LLC

41. Guide the manual lever cam (2) into the slot (3) on the manual valve.
42. Firmly press (4) the valve body (1) inward until the O-rings on the fluid transfer adapters engage into receptacle holes on the valve body.

Fig. 361: Valve Body Bolts
Courtesy of CHRYSLER GROUP, LLC

43. Install the bolts (1) to hold the valve body to the transmission housing. Refer to **SPECIFICATIONS**.

Fig. 362: Valve Body Solenoid Wire Harness Connector Socket O-Ring Seals
Courtesy of CHRYSLER GROUP, LLC

44. Install NEW O-ring seals (2) on the wire connector socket (1).

NOTE: **A light coating of assembly lube can be applied to the O-ring seals (2) to ease installation.**

Fig. 363: Valve Body Cover Pan & Wire Connector Socket
Courtesy of CHRYSLER GROUP, LLC

45. Place the valve body cover pan (1) in position on the transmission.
46. Insert the wire connector socket (3) into the opening on the inside of valve body cover pan (1) with the flat side (2) of the socket on the left.

Fig. 364: Wire Connector Socket Clip
Courtesy of CHRYSLER GROUP, LLC

47. Press the wire connector socket inward until the retainer clip groove (1) is exposed on the outside of the valve body cover pan (1).
48. Install the clip (2) to hold the wire connector socket in the valve body cover pan.

Fig. 365: Valve Body Cover Pan Gasket Seal
Courtesy of CHRYSLER GROUP, LLC

49. Install a NEW gasket seal (1) in the groove around the sealing surface of the valve body cover pan (2).

Fig. 366: Valve Body Cover Pan Bolts
Courtesy of CHRYSLER GROUP, LLC

50. Place the valve body cover pan gasket against the sealing surface of the transmission housing.
51. Install the bolts (1) to hold the valve body cover pan to the transmission housing. Refer to **SPECIFICATIONS**.
52. Install the transmission in the vehicle.

53. Road test the vehicle to verify the repair.

TRANSFER GEAR INNER RACE

1. Using a clean lint free cloth, wipe the transfer gear bore clean. Inspect the bore for burrs or other damage. Use crocus cloth the dress down burrs.
2. Place the transfer gear on the stable, clean work surface.

Fig. 367: Installing Bearing Race Into Transfer Gear Until
Courtesy of CHRYSLER GROUP, LLC

3. Place the NEW bearing race in the transfer gear bore.
4. Using a suitable hammer (1) and tool (special tool #9588, Installer, Bearing Cup)with (special tool #C-4171, Driver Handle, Universal), drive the bearing race into the transfer gear until it butts against the bottom surface.
5. Install the transfer gear in the transaxle.

TRANSFER GEAR OUTER BEARING

Clean the transfer gear with suitable solvent and blow it dry with 344 kPa (50psi) regulated shop air.

1. Place the transfer gear on a stable, clean work surface.

Fig. 368: Installing Transfer Gear Bearing Onto Transfer Gear
Courtesy of CHRYSLER GROUP, LLC

2. Place the NEW transfer gear bearing (3) on the transfer gear (4).
3. Using a suitable hammer (1) and tool (special tool #6052, Installer, Bearing/Seal) (2), drive the transfer gear bearing (3) onto the transfer gear (4).
4. Assemble the transaxle and install it in the vehicle. Refer to **ASSEMBLY**. Refer to **INSTALLATION**.
5. Properly fill the transaxle with specified type and quantity fluid. Refer to **CAPACITIES AND RECOMMENDED FLUIDS, SPECIFICATIONS** .
6. Road test the vehicle to verify the repair.

TRANSFER GEAR OUTER RACE

Clean the bearing bore with a lint free cloth and inspect for damage to the bellhousing casting. If the bellhousing is damaged the transmission will require replacement.

1. Place the NEW transfer gear outer bearing race in position in the bellhousing bore.

Fig. 369: Installing Transfer Gear Outer Bearing Race Into Bellhousing
Courtesy of CHRYSLER GROUP, LLC

2. Using and suitable hammer and tool (special tool #10036, Installer, Bearing Cup) (1) with (special tool #C-4171, Driver Handle, Universal) (2), drive the transfer gear outer bearing race (3) into the bellhousing bore until it seats down to the bottom stop.
3. Assemble the transmission and install the transmission in the vehicle. Refer to **ASSEMBLY**. Refer to **INSTALLATION**.
4. Fill the transmission with fluid. Refer to **FLUID AND FILTER, STANDARD PROCEDURE**.
5. Road test the vehicle to verify the repair.

BELLHOUSING

REMOVAL

REMOVAL

The following procedure is performed with the transmission drained and removed from the vehicle.

1. Place the transmission on a suitable, clean work surface.
2. Remove the torque converter.
3. Using a dial indicator, measure the input shaft end-play.

Fig. 370: Wire Connector Socket Clip
Courtesy of CHRYSLER GROUP, LLC

4. Remove the clip holding the wire connector socket in the valve body cover pan.

Fig. 371: Valve Body Cover Pan Bolts
Courtesy of CHRYSLER GROUP, LLC

5. Remove the valve body cover pan bolts (1).
6. Remove the valve body cover pan from the transmission.

Fig. 372: Valve Body Bolts
Courtesy of CHRYSLER GROUP, LLC

7. Remove the valve body bolts (1).
8. Using a suitable prying tool, pry the valve body away from the adapter tubes.

Fig. 373: Fluid Pressure Transducer Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

9. Turn the valve body over to gain access to wire harness connectors.
10. Release the lock (2) on the fluid pressure transducer wire connector and separate the wire connector (2) from the fluid pressure transducer (1).

Fig. 374: Removing/Installing Wire Harness Connector At Valve Body Solenoids
Courtesy of CHRYSLER GROUP, LLC

11. Remove the bolts (1) holding the wire harness connector to the valve body and solenoids.
12. Using a suitable prying tool, Separate the wire harness connector (2) from the solenoids.
13. Separate the valve body from the transmission.

Fig. 375: Removing/Installing Transmission Range Sensor (TRS) Screw
Courtesy of CHRYSLER GROUP, LLC

14. Remove the Transmission Range Sensor (TRS) screw (1).

Fig. 376: Removing/Installing Transmission Range Sensor
Courtesy of CHRYSLER GROUP, LLC

15. Separate the TRS (1) from the transmission with the wire harness connected.

Fig. 377: Removing/Installing Speed Sensor Screw
Courtesy of CHRYSLER GROUP, LLC

16. Remove the speed sensor screw (1).

Fig. 378: Removing/Installing Speed Sensor
Courtesy of CHRYSLER GROUP, LLC

17. Separate the speed sensor (1) from the from the transmission with the wiring harness connected.

Fig. 379: Fluid Adapter Tubes & O-Ring Seals
Courtesy of CHRYSLER GROUP, LLC

18. Using suitable pliers, remove the fluid adapter tubes (1) from the transmission.

Fig. 380: Bellhousing To Transmission Housing Bolts
Courtesy of CHRYSLER GROUP, LLC

19. From around the perimeter of the transmission, remove the bellhousing bolts (1) holding the bellhousing to the transmission housing.

Fig. 381: Bellhousing To Output Gear Support Bolts
Courtesy of CHRYSLER GROUP, LLC

20. Remove the bellhousing bolts (1) holding the bellhousing to the output gear support.
21. Using wooden blocks to stabilize the transmission on the work surface, position the transmission on the bench with the bellhousing facing upward.
22. Using a suitable pry-bar in the pry point locations, pry upward to dislodge the bellhousing from the

transmission housing.

Fig. 382: Removing/Installing Bellhousing At Transmission Housing
Courtesy of CHRYSLER GROUP, LLC

23. Lift the bellhousing (1) upward and separate the bellhousing from the transmission housing (2).

INSTALLATION

INSTALLATION

Fig. 383: Port Seal
Courtesy of CHRYSLER GROUP, LLC

1. Install a NEW crossover port seal (1) in the transmission housing.

Fig. 384: Sealing Surface Of Transmission Housing
Courtesy of CHRYSLER GROUP, LLC

2. Place a NEW gasket (1) on the clean sealing surface of the transmission housing (2).
3. If necessary, replace the output seal and the impeller hub seal.

Fig. 385: Removing/Installing Bellhousing At Transmission Housing
Courtesy of CHRYSLER GROUP, LLC

4. While guiding the bellhousing (1) downward over the input and output shafts, place the bellhousing (1) in position on the transmission housing (2).

Fig. 386: Checking Guide Pin Alignment
Courtesy of CHRYSLER GROUP, LLC

5. Rotate the output gear clockwise to assure guide pin (1) alignment.

Fig. 387: Engaging Guide Pins In Transmission Housing Into Receptacle Holes
Courtesy of CHRYSLER GROUP, LLC

6. Rotate the output gear support (1) through the window (2) behind the valve body until the guide pin engages the receptacle hole in the bellhousing.
7. Engage the guide pins in the transmission housing into the receptacle holes bellhousing to assure proper alignment.
8. Install several bolts to hold the bellhousing to the transmission housing. Tighten hand tight.

9. Position the transmission on the bench with the bellhousing facing outward.

Fig. 388: Bellhousing To Output Gear Support Bolts
Courtesy of CHRYSLER GROUP, LLC

10. Install the output gear support bellhousing bolts (1) to hold the bellhousing and tighten to the proper specifications. Refer to **SPECIFICATIONS**.

Fig. 389: Bellhousing To Transmission Housing Bolts
Courtesy of CHRYSLER GROUP, LLC

11. Install the bellhousing bolts (1) and tighten to the proper specifications. Refer to **SPECIFICATIONS**.

Fig. 390: Fluid Adapter Tubes & O-Ring Seals
Courtesy of CHRYSLER GROUP, LLC

12. Install NEW O-rings on both ends of the fluid transfer tubes.
13. Install the fluid adapter tubes (1) from the transmission.

Fig. 391: Removing/Installing Speed Sensor
Courtesy of CHRYSLER GROUP, LLC

14. Insert the speed sensor (1) into the transmission with the wire harness connected.

Fig. 392: Removing/Installing Speed Sensor Screw
Courtesy of CHRYSLER GROUP, LLC

15. Install the speed sensor screw (1) to hold the speed sensor to the transmission housing.

Fig. 393: Removing/Installing Transmission Range Sensor
Courtesy of CHRYSLER GROUP, LLC

16. Place the Transmission Range Sensor (TRS) (1) in position on the transmission with the wire harness connected.

Fig. 394: Removing/Installing Transmission Range Sensor (TRS) Screw
Courtesy of CHRYSLER GROUP, LLC

17. Install the TRS screw (1) to hold the TRS to the transmission housing and tighten to the proper specifications. Refer to **SPECIFICATIONS**.

Fig. 395: Valve Body & Solenoids Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

18. Place the valve body (1) in position on the transmission.
19. Place the wire harness connector (2) in position on the solenoids.
20. Press the connector (2) inward to engage the terminals on the solenoids.

Fig. 396: Removing/Installing Wire Harness Connector At Valve Body Solenoids
Courtesy of CHRYSLER GROUP, LLC

21. Install the screws (1) to hold the wire harness connector to the valve body and solenoids and tighten to the proper specifications. Refer to **SPECIFICATIONS**.

Fig. 397: Fluid Pressure Transducer Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

22. Insert the fluid pressure transducer connector (2) into the fluid pressure transducer (1).
23. Press connector together until the lock engages.

Fig. 398: Aligning Valve Body To Fluid Transfer Tubes
Courtesy of CHRYSLER GROUP, LLC

24. Turn the valve body (1) over and align the valve body (1) with the fluid transfer tubes.

Fig. 399: Engaging Valve Body To Fluid Transfer Tubes
Courtesy of CHRYSLER GROUP, LLC

25. Guide the manual lever cam (2) into the slot (3) on the manual valve.
26. Firmly press (4) the valve body (1) inward until the O-rings on the fluid transfer adapters engage into receptacle holes on the valve body.

Fig. 400: Valve Body Bolts
Courtesy of CHRYSLER GROUP, LLC

27. Install the valve body bolts (1) and tighten to the proper specifications. Refer to **SPECIFICATIONS**.

Fig. 401: Valve Body Solenoid Wire Harness Connector Socket O-Ring Seals
Courtesy of CHRYSLER GROUP, LLC

28. Install NEW O-ring seals (2) on the wire connector socket (1).

NOTE: **A light coating of assembly lube can be applied to the O-ring seals (2) to ease installation.**

Fig. 402: Valve Body Cover Pan & Wire Connector Socket
Courtesy of CHRYSLER GROUP, LLC

29. Place the valve body cover pan (1) in position on the transmission.
30. Insert the wire connector socket (3) into the opening on the inside of valve body cover pan (1) with the flat side (2) of the socket on the left.

Fig. 403: Wire Connector Socket Clip
Courtesy of CHRYSLER GROUP, LLC

31. Press the wire connector socket inward until the retainer clip groove (1) is exposed on the outside of the valve body cover pan (1).
32. Install the clip (2) to hold the wire connector socket in the valve body cover pan.

Fig. 404: Valve Body Cover Pan Gasket Seal
Courtesy of CHRYSLER GROUP, LLC

33. Install a NEW gasket seal (1) in the groove around the sealing surface of the valve body cover pan (2).

Fig. 405: Valve Body Cover Pan Bolts
Courtesy of CHRYSLER GROUP, LLC

34. Place the valve body cover pan gasket against the sealing surface of the transmission housing.
35. Install the valve body cover pan bolts (1) to hold the valve body cover pan to the transmission housing and tighten to the proper specifications. Refer to **SPECIFICATIONS**.
36. Install the torque converter.

37. Install the transmission in the vehicle. Refer to **INSTALLATION**.

CLUTCH, B

ADJUSTMENTS

B-CLUTCH MEASUREMENT

After the B-clutch is cleaned and assembled the end play must be measured to verify that the correct select reaction plate has been installed.

Fig. 406: Exploded View Of B-Clutch, Friction Discs & Steel Plates
Courtesy of CHRYSLER GROUP, LLC

1. Position the B-clutch on a arbor press with the reaction plate (4) facing upward.

Fig. 407: Compressing B-Clutch
Courtesy of CHRYSLER GROUP, LLC

2. Using tool (special tool #10429, Gauge, Force) (special tool #8901A, Pressing Tool) (with pressure scale removed (1) and legs (special tool #10428, Adapter, Pressing Tool) (3), compress the B-clutch (4) to collapse wave plate to 68 kgf (150 lb. force) (1).
3. Using as suitable feeler gauge, measure the gap between the B-clutch hub and the reaction plate. Refer to **SPECIFICATIONS**.
4. If the measurement is not within specification, replace the reaction plate with the correct plate.

DISASSEMBLY

B-CLUTCH DISASSEMBLY

WARNING: **Always wear safety glasses when cleaning, disassembling and assembling the transmission/transaxle. Contents of the transmission/transaxle can become projectiles (e.g., springs, snap-rings, as well as metal and other debris). Failure to wear safety glasses may result in severe personal injury.**

NOTE: **Clean the B-clutch components with suitable solvent and blow them dry with regulated 344 kPa (50 psi) shop air. Position all of the B-clutch components on a clean work surface in preparation for assembly.**

Fig. 408: Thrust Bearing & B-Clutch Hub
Courtesy of CHRYSLER GROUP, LLC

1. Remove the thrust bearing from B-clutch hub.

Fig. 409: Input Shaft/Dog Clutch A, B-Clutch Hub & Snap-Ring
Courtesy of CHRYSLER GROUP, LLC

2. Remove the snap-ring holding the B-clutch hub to the input shaft Dog A-clutch.
3. Remove the input shaft from the B-clutch (1).

Fig. 410: Compressing B-Clutch Piston To Gain Access To Snap-Ring
Courtesy of CHRYSLER GROUP, LLC

4. Place the B-clutch with piston up on a suitable arbor press.
5. Using tool (special tool #8901A, Pressing Tool) (with pressure scale removed (1) and legs (special tool #10428, Adapter, Pressing Tool), compress the B-clutch (2) piston to gain access to the snap-ring.

Fig. 411: Snap-Ring, B-Clutch Piston & B-Clutch Hub
Courtesy of CHRYSLER GROUP, LLC

6. Using a suitable snap-ring pliers (3), remove the snap-ring (2) holding the B-clutch piston in the B-clutch (1) hub.
7. Remove the B-clutch from the arbor press.

Fig. 412: B-Clutch Piston & B-Clutch
Courtesy of CHRYSLER GROUP, LLC

8. Remove the B-clutch piston (1) from the B-clutch (2).

Fig. 413: B-Clutch & B-Clutch Hub
Courtesy of CHRYSLER GROUP, LLC

9. Remove the B-clutch (2) From the B-clutch hub (1).

Fig. 414: Exploded View Of B-Clutch, Friction Discs & Steel Plates
Courtesy of CHRYSLER GROUP, LLC

10. Separate the friction discs (2) from the steel plates (1).

Fig. 415: Belleville Spring & B-Clutch Hub
Courtesy of CHRYSLER GROUP, LLC

11. Remove the belleville spring (2) from the B-clutch hub.

Fig. 416: Removing O-Ring Seals From B-Clutch Hub
Courtesy of CHRYSLER GROUP, LLC

12. Using a suitable hook tool (3) remove the O-ring seals (2) from the B-clutch hub (1).

Fig. 417: Remove/Install Balance Piston At B-Clutch Piston
Courtesy of CHRYSLER GROUP, LLC

13. Remove the balance piston (1) from the B-clutch piston (2).

Fig. 418: Removing B-Clutch Balance Piston O-Ring
Courtesy of CHRYSLER GROUP, LLC

14. Using a suitable hook tool, remove the O-ring (2) from the balance piston (1).

Fig. 419: Removing B-Clutch Piston O-Ring
Courtesy of CHRYSLER GROUP, LLC

15. Using a suitable hook tool, remove the O-ring seal from the B-clutch piston.

ASSEMBLY

B-CLUTCH ASSEMBLY

WARNING: Always wear safety glasses when cleaning, disassembling and assembling the transmission/transaxle. Contents of the transmission/transaxle can become projectiles (e.g., springs, snap-rings, as well as metal and other debris). Failure to wear safety glasses may result in severe personal injury.

Clean the B-clutch components with suitable solvent and blow them dry with regulated 344 kPa (50 psi) shop air. Position all of the B-clutch components on a clean work surface in preparation for assembly.

Fig. 420: Installing B-Clutch Piston O-Ring
Courtesy of CHRYSLER GROUP, LLC

1. Install the O-ring seal (2) on the B-clutch piston.

Fig. 421: Installing B-Clutch Balance Piston O-Ring
Courtesy of CHRYSLER GROUP, LLC

2. Install the O-ring seal (1) on the B-clutch balance piston (2).

Fig. 422: Remove/Install Balance Piston At B-Clutch Piston
Courtesy of CHRYSLER GROUP, LLC

3. Install the balance piston (1) in the B-clutch piston (2).

Fig. 423: B-Clutch Hub & O-Ring Seals
Courtesy of CHRYSLER GROUP, LLC

4. Install New O-ring seals (2) in the B-clutch hub (1).

Fig. 424: Belleville Spring & B-Clutch Hub
Courtesy of CHRYSLER GROUP, LLC

5. Install the belleville spring (2) in the B-clutch hub (1).

Fig. 425: Reaction Plate & B-Clutch Hub
Courtesy of CHRYSLER GROUP, LLC

6. Install the reaction plate (1) on the B-clutch hub (2).

Fig. 426: Exploded View Of B-Clutch, Friction Discs & Steel Plates
Courtesy of CHRYSLER GROUP, LLC

7. In alternating sequence, Install the B-clutch friction plates (2) and steel plates (1) On the B-clutch hub.

Fig. 427: B-Clutch & B-Clutch Hub
Courtesy of CHRYSLER GROUP, LLC

8. Install the wave spring plate (1) on the B-clutch hub.

Fig. 428: B-Clutch Piston & B-Clutch
Courtesy of CHRYSLER GROUP, LLC

9. Install the piston (1) the B-clutch (2).

Fig. 429: Compressing B-Clutch Piston To Gain Access To Snap-Ring
Courtesy of CHRYSLER GROUP, LLC

10. Using tool (special tool #8901A, Pressing Tool) (with pressure scale removed (1) and legs (special tool #10428, Adapter, Pressing Tool), compress the B-clutch (2) piston to gain access to the snap-ring.

Fig. 430: Snap-Ring, B-Clutch Piston & B-Clutch Hub
Courtesy of CHRYSLER GROUP, LLC

11. Compress the B-clutch belleville spring and piston until the snap-ring groove is exposed.
12. Using a suitable snap-ring pliers (3), install the snap-ring (2) in the B-clutch (1) hub.

NOTE: **Before installing the input shaft/Dog A-clutch, measure the B-clutch to determine if the proper select reaction plate was installed. Air test the dog A-clutch with shop air regulated to 344 kPa (50 psi), it fails the air test replace the input shaft.**

Fig. 431: Input Shaft/Dog Clutch A, B-Clutch Hub & Snap-Ring
Courtesy of CHRYSLER GROUP, LLC

13. Insert the input shaft/dog A-clutch into the B-clutch hub.
14. Using a suitable snap-ring pliers, install the snap-ring to hold the input shaft in the B-clutch hub.

Fig. 432: Thrust Bearing & B-Clutch Hub
Courtesy of CHRYSLER GROUP, LLC

15. Install the thrust bearing on the B-clutch hub.

CLUTCH, C

ADJUSTMENTS

C-CLUTCH MEASUREMENT

After the C-clutch is cleaned and assembled the end play must be measured to verify that the correct select reaction plate (3) has been installed.

Fig. 433: Exploded View Of C-Clutch Wave Plate, Steel Plates, & Friction Discs
Courtesy of CHRYSLER GROUP, LLC

1. Position the transaxle housing on a suitable arbor press.

Fig. 434: Compressing C-Clutch To Collapse Wave Plate
Courtesy of CHRYSLER GROUP, LLC

2. Using tool (special tool #10429, Gauge, Force) (2), (special tool #8901A, Pressing Tool) (with pressure scale removed (3) and legs (special tool #10428, Adapter, Pressing Tool), compress the C-clutch (4) to collapse wave plate (5, See **Fig. 433**) to 68 kgf (150 lb. force).

Fig. 435: Measuring Gap Between C-Clutch Snap-Ring & Reaction Plate
Courtesy of CHRYSLER GROUP, LLC

3. Using as suitable feeler gauge (1), measure the gap between the C-clutch snap-ring (2) and the reaction plate (2). Refer to **SPECIFICATIONS**.
4. If measurement does not match the specifications, replace the select reaction plate.

CLUTCH, D

ADJUSTMENTS

D-CLUTCH MEASUREMENT

After the D-clutch is cleaned and assembled the end play must be measured to verify that the correct select reaction plate has been installed.

Fig. 436: Exploded View Of D-Clutch, Select Plate, Friction Plate & Steel Plates
Courtesy of CHRYSLER GROUP, LLC

1. Install the D-clutch snap-ring (5) in the groove in the transaxle housing.

Fig. 437: Measuring Distance From The Bottom Of D-Clutch Snap-Ring To D-Clutch Shoulder
Courtesy of CHRYSLER GROUP, LLC

2. Using a suitable caliper (1), measure the distance from the bottom of the D-clutch snap-ring (2) to the D-clutch shoulder (3) in the transaxle housing. Record this number.

Fig. 438: Measuring Thickness Of D-Clutch
Courtesy of CHRYSLER GROUP, LLC

3. Place the D-clutch piston retainer/piston, belleville spring, and clutch stack on a suitable arbor press.
4. Using tool (special tool #10429, Gauge, Force) (1) and (special tool #8901A, Pressing Tool) (2) (with pressure scale and legs removed), compress the D-clutch (5) to 22.5 kgf (50 lb. force) (1).
5. Using a suitable caliper (1), measure the thickness from the snap-ring step in the D-clutch piston retainer

to the underside of the D-clutch reaction plate. Record this number.

6. Subtract the amount of step 5 from the amount of step 2. The difference is the amount of free-play in the D-clutch. Refer to **SPECIFICATIONS**.

Fig. 439: Exploded View Of D-Clutch, Select Plate, Friction Plate & Steel Plates
Courtesy of CHRYSLER GROUP, LLC

7. If the remainder from step 6 does not match the specifications, replace the select reaction plate (2).

CLUTCH, E

ADJUSTMENTS

E-CLUTCH MEASUREMENT

After the E-clutch is cleaned and assembled the end play must be measured to verify that the correct select snap-ring has been installed.

1. Use a dial indicator and a magnetic base attached to the E-clutch retainer with the stylist tip resting on the reaction plate.

Fig. 440: Pressing Downward On Reaction Plate
Courtesy of CHRYSLER GROUP, LLC

2. Press downward on the reaction plate (1) and zero the dial indicator face (2).

Fig. 441: Prying Center Friction Discs Upward
Courtesy of CHRYSLER GROUP, LLC

3. Using two suitable screw drivers (2), pry the center friction discs (3) upward while reading the dial indicator (1).

Fig. 442: Exploded View Of E-Clutch Components
Courtesy of CHRYSLER GROUP, LLC

4. The reading should be within specification. Refer to **SPECIFICATIONS**. If not, install the correct select snap-ring (4).

DISASSEMBLY

E-CLUTCH DISASSEMBLY

WARNING: **Always wear safety glasses when cleaning, disassembling and assembling the transmission/transaxle. Contents of the transmission/transaxle can become projectiles (e.g., springs, snap-rings, as well as metal and other debris). Failure to wear safety glasses may result in severe personal injury.**

NOTE: **Clean the E-clutch components with suitable solvent and blow them dry with regulated 344 kPa (50 psi) shop air. If the E-clutch failed an air test and air is bypassing the piston seals, the piston will require replacement. The seals are integral to the piston.**

Fig. 443: Removing Snap-Ring
Courtesy of CHRYSLER GROUP, LLC

1. Using a suitable screw driver, remove the snap-ring (2) holding the E-clutch thrust place in the E-clutch retainer (1).

Fig. 444: Thrust Plate & E-Clutch Retainer
Courtesy of CHRYSLER GROUP, LLC

2. Remove the thrust plate (1) from the E-clutch retainer (2).

Fig. 445: Exploded View Of E-Clutch Components
Courtesy of CHRYSLER GROUP, LLC

3. Remove the E-clutch friction plates (1) and steel plates (2) from the E-clutch retainer.

Fig. 446: E-Clutch Retainer & Arbor Press
Courtesy of CHRYSLER GROUP, LLC

4. Place the E-clutch retainer (3) on a suitable arbor press (4).
5. Using tool (special tool #8901A, Pressing Tool) (with pressure scale removed (1) and legs (special tool

#10428, Adapter, Pressing Tool) (2), compress the E-clutch spring retainer to gain access to the snap-ring.

Fig. 447: Removing Snap-Ring
Courtesy of CHRYSLER GROUP, LLC

6. Using a suitable snap-ring pliers (4), remove the snap-ring (3) holding the spring retainer to the E-clutch (2).
7. Remove the tools 8904 and 10428 (1) from the arbor press.

Fig. 448: Belleville Spring Retainer & E-Clutch
Courtesy of CHRYSLER GROUP, LLC

8. Remove the belleville spring retainer (1) from the E-clutch (2).

Fig. 449: Belleville Spring & E-Clutch
Courtesy of CHRYSLER GROUP, LLC

9. Remove the belleville spring (1) from the E-clutch (1).

Fig. 450: E-Clutch Retainer & Piston
Courtesy of CHRYSLER GROUP, LLC

10. Remove the piston (1) from the E-clutch retainer (2).

ASSEMBLY

E-CLUTCH ASSEMBLY

WARNING: Always wear safety glasses when cleaning, disassembling and assembling the transmission/transaxle. Contents of the transmission/transaxle can become projectiles (e.g., springs, snap-rings, as well as metal and other debris). Failure to wear safety glasses may result in severe personal injury.

NOTE: Clean the E-clutch components with suitable solvent and blow them dry with regulated 344 kPa (50 psi) shop air. Position all of the E-clutch components on a clean work surface in preparation for assembly. If the seals are damaged in any way clutch piston, retainer and belleville spring retainer will require replacement.

Fig. 451: E-Clutch Retainer & Piston
Courtesy of CHRYSLER GROUP, LLC

1. Install the piston (1) into the E-clutch retainer (2).

Fig. 452: Belleville Spring & E-Clutch
Courtesy of CHRYSLER GROUP, LLC

2. Install the belleville spring (1) into the E-clutch (1).

Fig. 453: Belleville Spring Retainer & E-Clutch
Courtesy of CHRYSLER GROUP, LLC

3. Install the belleville spring retainer (1) from the E-clutch (2).

Fig. 454: E-Clutch Retainer & Arbor Press
Courtesy of CHRYSLER GROUP, LLC

4. Using tool (special tool #8901A, Pressing Tool) (with pressure scale removed (1) and legs (special tool #10428, Adapter, Pressing Tool) (2), compress the E-clutch spring retainer to until snap-ring groove is exposed.

Fig. 455: Removing Snap-Ring
Courtesy of CHRYSLER GROUP, LLC

5. Using a suitable snap-ring pliers (4), remove the snap-ring (3) holding the spring retainer to the E-clutch (2).
6. Remove the tools 8904 and 10428 (1) from the arbor press.

7. Place the E-clutch retainer on a suitable clean work surface.

Fig. 456: Exploded View Of E-Clutch Components
Courtesy of CHRYSLER GROUP, LLC

8. In alternating sequence, Install the E-clutch friction plates (1) and steel plates (2) into the E-clutch retainer.

Fig. 457: Thrust Plate & E-Clutch Retainer
Courtesy of CHRYSLER GROUP, LLC

9. With stepped side up, install the thrust plate (1) into the E-clutch retainer (2).

Fig. 458: Installing Snap-Ring
Courtesy of CHRYSLER GROUP, LLC

10. Install the snap-ring (2) to hold the E-clutch thrust place in the E-clutch retainer (1).

CLUTCH, F DOG

DISASSEMBLY

DOG F-CLUTCH DISASSEMBLY

The Dog F-clutch is located in the output gear support.

1. Clamp the output gear support assembly in a suitable bench vise.

Fig. 459: Locking Plate
Courtesy of CHRYSLER GROUP, LLC

2. Using a suitable screw driver, pry the staking in the locking plate outward to allow to stake nut to rotate.

Fig. 460: Removing/Installing Stake Nut
Courtesy of CHRYSLER GROUP, LLC

3. Using tool (special tool #2012900210, Wrench, Spanner), remove the stake nut holding the output gear and bearing to the output gear support hub.

Fig. 461: Removing/Installing Lock Plate
Courtesy of CHRYSLER GROUP, LLC

4. Remove the lock plate from the output gear support.

Fig. 462: Removing/Installing Output Gear
Courtesy of CHRYSLER GROUP, LLC

5. Remove the output gear from the output gear support.

NOTE: **The double roller bearing in the output gear cannot be removed. If the bearing is damaged, replace the output gear as well.**

13. Remove the upper O-ring seal from the land inside the output gear support hub.

ASSEMBLY

DOG F-CLUTCH ASSEMBLY

Clean the dog F-clutch components with solvent and blow them dry with regulated 344 kPa (50 psi) shop air. Inspect the dog F-clutch components for damage or excessive wear. If dog F-clutch components a damaged the entire output gear support assembly will require replacement. Only the O-ring seals can be replaced. Apply assembly lubricant to the O-ring seals to aid installation.

11. Using tools (special tool #8148, Cup) (2) and (special tool #C-4171, Driver Handle, Universal) (1), install the dog F-clutch thrust plate into the output gear support (3) hub.

Fig. 481: Removing/Installing Output Gear
Courtesy of CHRYSLER GROUP, LLC

12. Install the output gear (1) onto the output gear support (2).

Fig. 482: Removing/Installing Lock Plate
Courtesy of CHRYSLER GROUP, LLC

13. Align the tab (3) on the lock plate (1) with the notch (4) on the output gear support hub and install the lock plate (3) onto the output gear (2) support.

Fig. 483: Removing/Installing Stake Nut
Courtesy of CHRYSLER GROUP, LLC

14. Using tool (special tool #2012900210, Wrench, Spanner), install the stake nut (2) to hold the output gear and bearing to the output gear support hub. Refer to **SPECIFICATIONS**.

Fig. 484: Locking Plate
Courtesy of CHRYSLER GROUP, LLC

15. Using a suitable punch, stake (1) the locking plate inward to lock the stake nut in position.
16. Install the output gear support in the transaxle.

DIFFERENTIAL AND RING GEAR

DISASSEMBLY

2WD

NOTE: The differential unit can be placed on tool (special tool #6888, Installer, Seal) as a stable holding fixture.

1. Remove the transmission from the vehicle. Refer to **REMOVAL**.
2. Place the transmission on a suitable clean work surface.
3. Position a suitable drain pan under the transmission drain plug.
4. Remove the drain plug and allow the fluid to drain into the drain pan.
5. Remove the bellhousing from the transmission. Refer to **BELLHOUSING, REMOVAL**.

Fig. 485: Removing/Installing Differential Assembly
Courtesy of CHRYSLER GROUP, LLC

6. Separate the differential unit (1) from the transmission.

Fig. 486: View Of Ring Gear To Differential Unit & Bolts
Courtesy of CHRYSLER GROUP, LLC

7. Remove the bolts (2) holding the ring gear (1) to the differential unit.

Fig. 487: View Of Ring Gear & Differential Unit

11. Using a suitable pencil magnet, remove the lock-pin (1) holding the pinion shaft in the differential housing (2).

Fig. 491: Removing/Installing Conical Thrust Washer
Courtesy of CHRYSLER GROUP, LLC

12. Slide the pinion shaft (4) outward and remove the conical thrust washer (1) from behind the pinion gear (2).

Fig. 492: Removing/Installing Pinion Gear 1
Courtesy of CHRYSLER GROUP, LLC

13. Slide the pinion shaft (2) outward and remove the pinion gear 1 (1).

Fig. 493: Removing/Installing Pinion Shaft & Pinion Gear 2
Courtesy of CHRYSLER GROUP, LLC

14. Slide the pinion shaft (2) outward and remove the pinion gear 2 (1).

Fig. 494: Removing/Installing Pinion Shaft & Conical Thrust Washer
Courtesy of CHRYSLER GROUP, LLC

15. Slide the pinion shaft (2) outward and remove the conical thrust washer (1) from behind the pinion gear 2.
16. Remove the pinion shaft (2) from the differential housing.

Fig. 495: Removing/Installing Differential Side Gear & Thrust Washer
Courtesy of CHRYSLER GROUP, LLC

17. Remove the differential side gear (1) and thrust washer (2) from the differential housing (3).

4WD

NOTE: There are no differential gears in the carrier housing of the 948TE Four Wheel Drive version transmission. The 2 speed PTU is equipped with a differential for the front wheels.

1. Remove the transmission from the vehicle. Refer to **REMOVAL**.
2. Place the transmission on a suitable clean work surface.
3. Position a suitable drain pan under the transmission drain plug.
4. Remove the drain plug and allow the fluid to drain into the drain pan.

Fig. 496: Removing Differential Adapter Sleeve
Courtesy of CHRYSLER GROUP, LLC

5. Using tool (special tool #7794-A, Remover, Seal) and (special tool #C-637, Slide Hammer, Universal), remove the differential adapter sleeve.
6. Remove the bellhousing from the transmission. Refer to **BELLHOUSING, REMOVAL**.

Fig. 497: Removing/Installing Differential Assembly
Courtesy of CHRYSLER GROUP, LLC

7. Separate the differential unit (1) from the transmission.

Fig. 498: View Of Ring Gear To Differential Unit & Bolts
Courtesy of CHRYSLER GROUP, LLC

8. Remove the bolts (2) holding the ring gear (1) to the differential unit.

Fig. 499: View Of Ring Gear & Differential Unit
Courtesy of CHRYSLER GROUP, LLC

9. Separate the ring gear (1) from the differential unit (2).

Fig. 500: View Of Upper Half Housing & Lower Differential Housing
Courtesy of CHRYSLER GROUP, LLC

10. Separate the two halves (1) of the differential housing (2) to gain access to the stub shaft that links the PTU to the left front wheel.

Fig. 501: Removing Snap-Ring
Courtesy of CHRYSLER GROUP, LLC

11. Using a suitable screw driver, remove the snap-ring holding the stub shaft bearing in the differential housing.

Fig. 502: Removing Stub Shaft & Bearing Out Of Differential Housing

27. Remove the differential side gear (1) and thrust washer (2) from the differential housing (3).

ASSEMBLY

2WD

The differential unit can be placed on tool (special tool #6888, Installer, Seal) as a stable holding fixture.

1. Clean the differential components with suitable solvent and blow then dry with 344 kPa (50 psi) shop air. Inspect the differential components for excess wear or damage. Replace the differential if damage is apparent.

Fig. 526: Removing/Installing Differential Side Gear & Thrust Washer
Courtesy of CHRYSLER GROUP, LLC

2. Install the differential side gear (1) and thrust washer (2) into the differential housing (3).

Fig. 527: Removing/Installing Pinion Shaft & Conical Thrust Washer
Courtesy of CHRYSLER GROUP, LLC

3. Install the pinion shaft (2) in the differential housing.
4. Slide the pinion shaft (2) inward and install the conical thrust washer (1).

Fig. 528: Removing/Installing Pinion Shaft & Pinion Gear 2
Courtesy of CHRYSLER GROUP, LLC

5. Slide the pinion shaft (2) inward and install the pinion gear 2 (1).

Fig. 529: Removing/Installing Pinion Gear 1
Courtesy of CHRYSLER GROUP, LLC

6. Slide the pinion shaft (2) inward and install the pinion gear 1 (1).

Fig. 530: Removing/Installing Conical Thrust Washer
Courtesy of CHRYSLER GROUP, LLC

7. Slide the pinion shaft (4) inward and install the conical thrust washer (1) behind the pinion gear (2).

Fig. 531: Removing/Installing Pinion Shaft Lock-Pin
Courtesy of CHRYSLER GROUP, LLC

8. Align the hole in the pinion shaft with the hole in the differential housing (2) and install the lock-pin (1) to hold the pinion shaft in the differential housing (2).

Fig. 532: Differential Side Gear & Thrust Washer
Courtesy of CHRYSLER GROUP, LLC

9. Install the differential side gear (1) and thrust washer (2) into the differential housing (3).

Fig. 533: View Of Upper Half Housing & Lower Differential Housing
Courtesy of CHRYSLER GROUP, LLC

10. Place the upper half (1) housing on the lower differential housing (2).

Fig. 534: View Of Ring Gear & Differential Unit
Courtesy of CHRYSLER GROUP, LLC

11. Place the ring gear (1) in position on the differential unit (2).

Fig. 535: View Of Ring Gear To Differential Unit & Bolts
Courtesy of CHRYSLER GROUP, LLC

12. Install the bolts (2) to hold the ring gear (1) to the differential unit.

Fig. 536: Tightening Ring Gear Bolts
Courtesy of CHRYSLER GROUP, LLC

13. Tighten the bolts to proper torque. Refer to **SPECIFICATIONS**.

Fig. 537: Removing/Installing Differential Assembly
Courtesy of CHRYSLER GROUP, LLC

14. Place the differential unit (1) in position in the transmission.
15. Install the bellhousing. Refer to **BELLHOUSING, INSTALLATION**.
16. Road test the vehicle to verify the repair.

4WD

NOTE: **There are no differential gears in the carrier housing of the 948TE Four Wheel Drive version transmission. The 2 speed PTU is equipped with a differential for the front wheels.**

Fig. 538: Installing Ball Bearing To Stub Shaft

1. Using tool (special tool #MD998805, Installer, Seal) (1) and an arbor press, install the ball bearing (2) from the stub shaft (3).

Fig. 539: Removing/Installing Snap-Ring At Ball Bearing On Stub Shaft
Courtesy of CHRYSLER GROUP, LLC

2. Using suitable snap-ring pliers (2), install the snap-ring to hold the ball bearing (3) on the stub shaft (1).

Fig. 540: Installing Stub Shaft Needle Roller Bearing
Courtesy of CHRYSLER GROUP, LLC

3. Using tool (special tool #8594, Installer, Bearing Cup) (3), (special tool #C-4171, Driver Handle, Universal) (2) and a suitable hammer (1), Install the stub shaft needle roller bearing (4) into the differential housing.

Fig. 541: Removing/Installing Stub Shaft
Courtesy of CHRYSLER GROUP, LLC

4. Insert the stub shaft into the differential housing.

Fig. 542: Removing Stub Shaft & Bearing Into Of Differential Housing
Courtesy of CHRYSLER GROUP, LLC

5. Using a solid surface, drive the stub shaft (2) and bearing into of the differential housing (1).

Fig. 543: Installing Snap-Ring
Courtesy of CHRYSLER GROUP, LLC

6. Install the snap-ring (2) to hold the stub shaft bearing in the differential housing (1).

Fig. 544: View Of Upper Half Housing & Lower Differential Housing
Courtesy of CHRYSLER GROUP, LLC

7. Place the two halves (1) of the differential housing (2) together.

Fig. 545: View Of Ring Gear & Differential Unit
Courtesy of CHRYSLER GROUP, LLC

8. Place the ring gear (1) in position on the differential unit (2).

Fig. 546: View Of Ring Gear To Differential Unit & Bolts
Courtesy of CHRYSLER GROUP, LLC

9. Install the bolts (2) to hold the ring gear (1) to the differential unit.

Fig. 547: Tightening Ring Gear Bolts
Courtesy of CHRYSLER GROUP, LLC

10. Using a suitable torque wrench (1) and a pry bar (2), tighten the bolts (4) to hold the ring gear (3) to the differential unit. Refer to **SPECIFICATIONS**.

Fig. 548: Removing/Installing Differential Assembly
Courtesy of CHRYSLER GROUP, LLC

11. Place the differential unit in position in the transmission.
12. Install the bellhousing on the transmission. Refer to **BELLHOUSING, INSTALLATION**.

Fig. 549: All Wheel Drive (AWD) Adapter Sleeve
Courtesy of CHRYSLER GROUP, LLC

13. Install the differential adapter sleeve (1), AWD shown in illustration.
14. Install the transmission in the vehicle. Refer to **INSTALLATION**.
15. Road test the vehicle to verify the repair.

AWD

The differential unit can be placed on tool (special tool #6888, Installer, Seal) as a stable holding fixture.

1. Clean the differential components with suitable solvent and blow then dry with 344 kPa (50 psi) shop air. Inspect the differential components for excess wear or damage. Replace the differential if damage is apparent.

16. Install the differential adapter sleeve (1).
17. Install the transmission in the vehicle. Refer to **INSTALLATION**.
18. Road test the vehicle to verify the repair.

FLUID AND FILTER

STANDARD PROCEDURE

FLUID LEVEL CHECK

2.4L

NOTE: It is not necessary to check the fluid level in the 948TE automatic transmission unless there are shifting issues and/or has evidence of a transmission fluid leak.

NOTE: Special Tool (special tool #10323A, Dipstick) Fluid level Indicator and a Scan-tool are required to accurately measure the fluid level (4) in the 948TE automatic transmission.

Checking the fluid level in the 948TE automatic transmission is to measure the distance from the upper lip of the fluid level check port, located on top of the transmission housing above the differential, down to the surface of the fluid. Tool 10323A fluid level indicator is marked in 5 mm increments with the base of the handle at 140 mm and the lower tip at "0". The engine must be running at idle with the transmission in park and the vehicle in a level position.

1. Connect a Scan Tool to the Diagnostic Connector under the instrument panel on the driver's side of the vehicle.
2. Navigate to a screen to display transmission fluid temperature.
3. Start the engine and allow it to run at idle with the transmission in Park.
4. Verify that the fluid temperature is above 50 °C.

NOTE: Vehicle must be level for accurate transmission fluid level readings.

5. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
6. Remove the left front tire and wheel assembly.
7. Turn the steering wheel to the full left position.

Fig. 563: Fluid Level Check Port
Courtesy of CHRYSLER GROUP, LLC

8. Remove the plug from the fluid level check port.

Fig. 564: Checking Trans Fluid Level Using Dipstick Special Tool
Courtesy of CHRYSLER GROUP, LLC

9. Insert tool (special tool #10323A, Dipstick) (1) into the fluid level check port and allow the handle of the tool to rest on the flat surface of the transmission housing (2) around the check port.
10. Remove the tool from the check port, keeping the handle above the tip so the level reading remains accurate.
11. Note the increment on the shaft of the tool where the fluid left a witness mark.

Fig. 565: Fluid Level & Temperature Chart
Courtesy of CHRYSLER GROUP, LLC

12. Based on the temperature of the fluid and the measurement on the tool, refer to the graph or the table to determine the proper level.
13. Install the plug into the fluid level check port. Tighten to specification.
14. Install the left front tire and wheel assembly. Refer to **INSTALLATION** .

FLUID LEVEL TABLE

TEMP in °C	MIN LEVEL (mm)	NOMINAL LEVEL (mm)	MAX LEVEL (mm)
50°	21 mm	26 mm	31.5 mm
55°	23 mm	27.5 mm	33 mm
60°	25 mm	30 mm	34 mm
65°	27 mm	31 mm	35.5 mm
70°	28.5 mm	33 mm	36.5 mm
75°	30 mm	35 mm	38 mm
80°	31.5 mm	36 mm	39 mm
85°	32.5 mm	37 mm	40 mm
90°	34 mm	38 mm	41.5 mm

FLUID LEVEL CHECK

YouTube	A multimedia supplement to the instructions contained in this article is available. To view the multimedia example of the condition described go to; **http://www.youtube.com/user/Mitchell1Tips** **then type "A00641450.vid1" into the "Search Channel" box.**

NOTE: **It is not necessary to check the fluid level in the 948TE automatic transmission unless there are shifting issues and/or has evidence of a transmission fluid leak.**

NOTE: **Special Tool (special tool #10323A, Dipstick) Fluid level Indicator and a Scan-tool are required to accurately measure the fluid level (4) in the 948TE automatic transmission.**

Checking the fluid level in the 948TE automatic transmission is to measure the distance from the upper lip of the fluid level check port, located on top of the transmission housing above the differential, down to the surface of the fluid. Tool 10323A fluid level indicator is marked in 5 mm increments with the base of the handle at 140 mm and the lower tip at "0". The engine must be running at idle with the transmission in park and the vehicle in a level position.

1. Connect a Scan Tool to the Diagnostic Connector under the instrument panel on the driver's side of the vehicle.
2. Navigate to a screen to display transmission fluid temperature.
3. Start the engine and allow it to run at idle with the transmission in Park.

4. Verify that the fluid temperature is above 50 °C.
5. Remove the engine cover.

Fig. 566: Fluid Level Check Port
Courtesy of CHRYSLER GROUP, LLC

6. Remove the plug from the fluid level check port.

7. Insert tool (special tool #10323A, Dipstick) (2) into the fluid level check port (3) and allow the handle of the tool to rest on the flat surface of the transmission housing (1) around the check port.
8. Remove the tool from the check port, keeping the handle above the tip so the level reading remains accurate.
9. Note the increment on the shaft of the tool where the fluid left a witness mark.

Fig. 568: Fluid Level & Temperature Chart
Courtesy of CHRYSLER GROUP, LLC

10. Based on the temperature of the fluid and the measurement on the tool, refer to the graph or the table to determine the proper level.
11. Install the plug into the fluid level check port. Tighten to specification.
12. Install the engine cover.

FLUID LEVEL TABLE

TEMP in °C	MIN LEVEL (mm)	NOMINAL LEVEL (mm)	MAX LEVEL (mm)
50°	21 mm	26 mm	31.5 mm
55°	23 mm	27.5 mm	33 mm
60°	25 mm	30 mm	34 mm
65°	27 mm	31 mm	35.5 mm
70°	28.5 mm	33 mm	36.5 mm
75°	30 mm	35 mm	38 mm
80°	31.5 mm	36 mm	39 mm
85°	32.5 mm	37 mm	40 mm
90°	34 mm	38 mm	41.5 mm

FLUID AND FILTER SERVICE

The 948TE automatic transmission is a sealed for life design and does not require periodic service. The only time the transmission fluid needs to be checked is when abnormal shifts frequently occur or evidence of a transmission fluid leak is present. The fluid filter is mounted internally and requires that the transmission be removed from the vehicle and disassembled to replace the filter. The fluid filter has a plastic body filled with polyester filter fleece.

NOTE: **The fluid used in the 948TE automatic transmission is not compatible with other types of transmission fluid, use only Shell® L12108 Automatic Transmission Fluid or Mopar® equivalent after repairs have been completed. Refer to Star Parts for the part number.**

Use of improper fluid will cause premature failure, poor shift quality and possible leaks.

REMOVAL

REMOVAL

NOTE: **The fluid filter does not require periodic replacement. It should only be replaced in conjunction with a major failure that caused excessive fluid contamination or during an overhaul.**

1. Remove the transmission from the vehicle. Refer to **REMOVAL**.
2. Drain the fluid from the transmission.
3. Remove the bellhousing from the transmission. Refer to **BELLHOUSING, REMOVAL**.

Fig. 569: Fluid Tube
Courtesy of CHRYSLER GROUP, LLC

4. Remove the fluid tube (1) from the intermediate support plate and bellhousing.

Fig. 570: Oil Filter, Intermediate Support Plate & Fastener
Courtesy of CHRYSLER GROUP, LLC

5. Remove the bolt (2) holding the oil filter (1) to the intermediate support plate.

Fig. 571: Removing/Installing Transmission Oil Filter
Courtesy of CHRYSLER GROUP, LLC

6. Separate the oil filter (1) from the intermediate support plate (2).

INSTALLATION

INSTALLATION

1. Clean the intermediate support plate in preparation for the NEW filter.

Fig. 572: Removing/Installing Transmission Oil Filter
Courtesy of CHRYSLER GROUP, LLC

2. Verify that the O-ring (3) is in good condition. Replace the O-ring (3) if damage is present.
3. Insert the oil filter neck (3) into the oil pump orifice and align the bolt hole with the bore in the intermediate support plate (2).

Fig. 573: Oil Filter, Intermediate Support Plate & Fastener
Courtesy of CHRYSLER GROUP, LLC

4. Install the bolt (2) to hold the oil filter (1) to the intermediate support plate and tighten to the proper specifications. Refer to **SPECIFICATIONS**.
5. Install the bellhousing on the transmission. Refer to **BELLHOUSING, INSTALLATION**.
6. Install the transmission in the vehicle. Refer to **INSTALLATION**.
7. Road test the vehicle to verify the repair.

MANUAL LEVER AND PARK ROD

REMOVAL

PARK DETENT AND MANUAL SHAFT

The transmission doe not require removal to complete the following procedure.

1. Remove the valve body from the transmission. Refer to **VALVE BODY, REMOVAL**.

Fig. 574: View Of Ground Cable & Shift Cable
Courtesy of CHRYSLER GROUP, LLC

2. Using a suitable prying tool (1), separate the shift cable end (2) from the manual lever on the transmission.
3. Remove the nut holding the manual shift lever to the manual shaft.
4. Pry the manual shift lever upward and off the manual shaft.

Fig. 575: Prying Spring Over Top Of Detent
Courtesy of CHRYSLER GROUP, LLC

5. Using a suitable screw driver (3), pry the spring (1) to the inside and off of the detent (2).

Fig. 576: Removing/Installing Detent Hub Roll Pin
Courtesy of CHRYSLER GROUP, LLC

6. Using a suitable hammer (3) and pin-punch (2), drive the roll-pin out of the detent hub (1).

Fig. 577: Removing/Installing Manual Shaft
Courtesy of CHRYSLER GROUP, LLC

7. Using a suitable pliers (3), pull the manual shaft (2) out of the detent hub (1) and transmission housing.

Fig. 578: Park Rod, Park Rod Guide And Detent
Courtesy of CHRYSLER GROUP, LLC

8. Separate the detent (2) and park rod (1) from the transmission.

INSTALLATION

PARK DETENT AND MANUAL SHAFT

Fig. 579: Park Rod, Park Rod Guide And Detent
Courtesy of CHRYSLER GROUP, LLC

1. Insert the and park rod (1) into the Park rod guide and the detent (2) into the transmission.

Fig. 580: Removing/Installing Manual Shaft
Courtesy of CHRYSLER GROUP, LLC

2. Insert the manual shaft (2) into the detent hub (1) and transmission housing and align the holes in the detent hub and the manual shaft.

Fig. 581: Detent Hub Roll-Pin
Courtesy of CHRYSLER GROUP, LLC

3. Insert the tapered end of the roll-pin into the hole in the detent hub.

Fig. 582: Removing/Installing Detent Hub Roll Pin
Courtesy of CHRYSLER GROUP, LLC

4. Using a suitable hammer (3) and pin-punch (2), drive the roll-pin into of the detent hub (1) until the head is flush.

Fig. 583: Prying Spring Over Top Of Detent
Courtesy of CHRYSLER GROUP, LLC

5. Using a suitable screw driver (3), pry the spring (1) over the top of the detent (2).
6. Place the manual lever in position on the manual shift lever.
7. Install the nut to hold the manual shift lever to the manual shaft to the manual shaft. Refer to **SPECIFICATIONS**.
8. Snap the shift cable end onto the ball link on the manual shift lever.
9. Install the valve body into the transmission. Refer to **VALVE BODY, INSTALLATION**.

NEEDLE BEARING, OIL PUMP SPROCKET

REMOVAL

REMOVAL

1. Remove the transmission from the vehicle. Refer to **REMOVAL**.
2. Drain the fluid from the transmission.
3. Remove the bellhousing from the transmission. Refer to **BELLHOUSING, REMOVAL**.

Fig. 584: Fluid Tube
Courtesy of CHRYSLER GROUP, LLC

4. Remove the fluid tube (1) from the bellhousing.

Fig. 585: Oil Filter, Intermediate Support Plate & Fastener
Courtesy of CHRYSLER GROUP, LLC

5. Remove the bolt (1) holding the oil filter (2) to the bellhousing.

Fig. 586: Removing/Installing Transmission Oil Filter
Courtesy of CHRYSLER GROUP, LLC

6. Separate the oil filter (1) from the bellhousing (2).

Fig. 587: Removing/Installing Bolts At Reaction Shaft To Intermediate Support Plate
Courtesy of CHRYSLER GROUP, LLC

7. Remove the bolts (2) holding the reaction shaft (1) to the intermediate support plate (4).

Fig. 588: Removing/Installing Reaction Shaft At Intermediate Support Plate
Courtesy of CHRYSLER GROUP, LLC

8. Separate the reaction shaft (2) from the intermediate support plate (1).

Fig. 589: Removing/Installing Bolts At Reaction Shaft To Intermediate Support Plate
Courtesy of CHRYSLER GROUP, LLC

9. Remove the bolts (3) holding the intermediate support plate and oil pump (1) to the bellhousing.

Fig. 590: Removing/Installing Intermediate Support Plate And Oil Pump
Courtesy of CHRYSLER GROUP, LLC

10. Separate the intermediate support plate and oil pump (1) from the bellhousing (3).
11. Using a suitable screw driver, remove the input shaft seal from the bellhousing.

Fig. 591: View Of Snap-Ring Holding Oil Pump Sprocket Needle Bearing In Bellhousing
Courtesy of CHRYSLER GROUP, LLC

12. Using a suitable screw driver (2), remove the snap-ring (1) holding the oil pump sprocket needle bearing (3) in the bellhousing.

Fig. 592: Removing Oil Pump Sprocket Needle Bearing
Courtesy of CHRYSLER GROUP, LLC

13. Using a suitable punch tool, remove the oil pump sprocket needle bearing by tapping outward while alternating between the three notches in the bellhousing bore flange.

INSTALLATION

INSTALLATION

1. Clean the oil pump sprocket needle bearing and input shaft seal bore.

Fig. 593: Installing Oil Pump Sprocket Needle Bearing Into Bellhousing

Courtesy of CHRYSLER GROUP, LLC

2. Place the oil pump sprocket needle bearing (1) in position into the bore in the center of the bellhousing.

Fig. 594: Seating Oil Pump Sprocket Needle Bearing Against Flange
Courtesy of CHRYSLER GROUP, LLC

3. Using tool (special tool #10503, Installer, Bearing) (3) and (special tool #C-4171, Driver Handle, Universal), install the oil pump sprocket needle bearing (2) in the bellhousing (1) bore until the bearing butts against the flange.

Fig. 595: View Of Snap-Ring Holding Oil Pump Sprocket Needle Bearing In Bellhousing
Courtesy of CHRYSLER GROUP, LLC

4. Install the snap-ring (1) to hold the oil pump sprocket needle bearing (3) in the bellhousing.
5. Apply assembly lube on the lip of the NEW seal.
6. Place the seal on tool (special tool #9677, Installer, Seal), with the tension spring away from the tool, and insert the seal into the bore in the bellhousing.

Fig. 596: Installing Seal Into Bellhousing
Courtesy of CHRYSLER GROUP, LLC

7. Using a suitable hammer, drive the seal into the bore in the center of the bellhousing until the tool seats against the bellhousing.

Fig. 597: Removing/Installing Intermediate Support Plate And Oil Pump

Courtesy of CHRYSLER GROUP, LLC

8. Place the intermediate support plate and oil pump (1) in position on the bellhousing (3) while guiding the oil pump sprocket into oil pump sprocket needle bearing.

Fig. 598: Removing/Installing Bolts At Reaction Shaft To Intermediate Support Plate
Courtesy of CHRYSLER GROUP, LLC

9. Install the bolts (2) to hold the reaction shaft (1) to the intermediate support plate (4) and tighten to the proper specifications. Refer to **SPECIFICATIONS**.

Fig. 599: Removing/Installing Reaction Shaft At Intermediate Support Plate
Courtesy of CHRYSLER GROUP, LLC

10. Place the reaction shaft (2) in position on the intermediate support plate (1).

Fig. 600: Removing/Installing Bolts At Reaction Shaft To Intermediate Support Plate
Courtesy of CHRYSLER GROUP, LLC

11. Install the bolts (2) to hold the reaction shaft (1) to the intermediate support plate (4) and tighten to the proper specifications. Refer to **SPECIFICATIONS**.

Fig. 601: Removing/Installing Transmission Oil Filter
Courtesy of CHRYSLER GROUP, LLC

12. Place the oil filter (1) in position on the bellhousing (2) and insert feed tube into the oil pump.

Fig. 602: Oil Filter, Intermediate Support Plate & Fastener
Courtesy of CHRYSLER GROUP, LLC

13. Install the bolt (1) to hold the oil filter (2) to the bellhousing and tighten to the proper specifications. Refer to **SPECIFICATIONS**.

Fig. 603: Fluid Tube
Courtesy of CHRYSLER GROUP, LLC

14. Install the fluid tube (1) in the bellhousing.
15. Install the bellhousing on the transmission. Refer to **BELLHOUSING, INSTALLATION**.
16. Install the transmission in the vehicle. Refer to **INSTALLATION**.

17. Road test the vehicle to verify the repair.

PARKING SPRAG AND GUIDE

REMOVAL

REMOVAL

1. Remove the transmission from the vehicle. Refer to **REMOVAL**.
2. Position the transmission on the clean, stable work surface.
3. Remove the bellhousing from the transmission housing. Refer to **BELLHOUSING, REMOVAL**.

Fig. 604: Removing/Installing Park Pawl
Courtesy of CHRYSLER GROUP, LLC

4. Compress and release the park pawl (2) return spring (3).
5. Pull the reaction pin (1) outward and separate the reaction pin (1) from the park pawl (2).
6. Separate the park pawl (2) from the park rod guide.

Fig. 605: Removing/Installing Park Rod Guide Bolt
Courtesy of CHRYSLER GROUP, LLC

7. Remove the bolt (2) holding the park rod guide (1) to the transmission housing.

Fig. 606: Removing/Installing Park Rod Guide
Courtesy of CHRYSLER GROUP, LLC

8. Separate the park rod guide (1) from the transmission.

INSTALLATION

PARK ROD GUIDE AND PAWL

NOTE: **If the park pawl is damaged the transfer gear may also be damaged. Replace the transfer gear if damage if present. If the transfer gear is replaced the proper thickness bearing preload select shim will have to be established.**

Fig. 607: Removing/Installing Park Rod Guide
Courtesy of CHRYSLER GROUP, LLC

1. Place the park rod guide (1) in position on the transmission.

Fig. 608: Removing/Installing Park Rod Guide Bolt
Courtesy of CHRYSLER GROUP, LLC

2. Install the bolt (2) to hold the park rod guide (1) to the transmission housing and tighten to the proper

specifications. Refer to **SPECIFICATIONS**.

Fig. 609: Removing/Installing Park Pawl
Courtesy of CHRYSLER GROUP, LLC

3. Place the park pawl (2) in position in park rod guide.
4. Insert the reaction pin (1) through the park pawl (2) and into the transmission housing.
5. Slide the park pawl return spring (3) over the reaction pin (1) and insert the tail of the spring into the notch in the transmission housing.
6. Wind the park pawl return spring (3) counterclockwise and hook the bent end of the spring over the park pawl (2).
7. Install the bellhousing into the transmission housing. Refer to **BELLHOUSING, INSTALLATION**.
8. Install the torque converter.
9. Install the transmission into the vehicle. Refer to **INSTALLATION**.
10. Road test the vehicle to verify the repair.

PUMP, FLUID

REMOVAL

REMOVAL

1. Remove the transmission from the vehicle. Refer to **REMOVAL**.
2. Drain the fluid from the transmission.
3. Remove the bellhousing from the transmission. Refer to **BELLHOUSING, REMOVAL**.

Fig. 610: Fluid Tube
Courtesy of CHRYSLER GROUP, LLC

4. Remove the fluid tube (1) from the intermediate support plate and bellhousing.

Fig. 611: Oil Filter, Intermediate Support Plate & Fastener
Courtesy of CHRYSLER GROUP, LLC

5. Remove the bolt (2) holding the oil filter (1) to the intermediate support plate.

Fig. 612: Removing/Installing Transmission Oil Filter
Courtesy of CHRYSLER GROUP, LLC

6. Separate the oil filter (1) from the intermediate support plate (2).

Fig. 613: Removing/Installing Bolts At Reaction Shaft To Intermediate Support Plate
Courtesy of CHRYSLER GROUP, LLC

7. Remove the bolts (2) holding the reaction shaft (1) to the intermediate support plate (4).

Fig. 614: Removing/Installing Reaction Shaft At Intermediate Support Plate
Courtesy of CHRYSLER GROUP, LLC

8. Separate the reaction shaft (2) from the intermediate support plate (1).

Fig. 615: Removing/Installing Bolts At Reaction Shaft To Intermediate Support Plate
Courtesy of CHRYSLER GROUP, LLC

9. Remove the bolts (3) holding the intermediate support plate and oil pump (1) to the bellhousing.

Fig. 616: Removing/Installing Intermediate Support Plate And Oil Pump
Courtesy of CHRYSLER GROUP, LLC

10. Separate the intermediate support plate and oil pump (1) from the bellhousing (3).
11. Turn the intermediate support plate and oil pump (1) outside up on the work surface.

Fig. 617: View Of Oil Pump Drive Sprocket & Drive Chain
Courtesy of CHRYSLER GROUP, LLC

12. Separate the oil pump drive sprocket (1) from the drive chain (2).

Fig. 618: View Of Oil Pump Drive Chain & Oil Pump Driven Sprocket
Courtesy of CHRYSLER GROUP, LLC

13. Separate the oil pump drive chain (3) from the oil pump driven sprocket (2).

Fig. 619: Compressing Snap-Ring At Oil Pump
Courtesy of CHRYSLER GROUP, LLC

14. Using a suitable pliers (1), compress the snap-ring holding the oil pump (2) into the intermediate support plate (3).
15. While holding compression on the snap-ring (1), pry the oil pump out of the bore in the intermediate support plate (3).

Fig. 620: Removing/Installing Oil Pump At Intermediate Support Plate
Courtesy of CHRYSLER GROUP, LLC

16. Separate the oil pump (1) from the intermediate support plate (2).

INSTALLATION

INSTALLATION

1. Clean the intermediate support plate and oil pump with suitable solvent and blow them dry with regulated 344 kPa (50 psi) shop air.
2. Inspect the intermediate support plate and oil pump for apparent damage or ware. If the intermediate support plate is damaged, the transmission will require replacement. If the oil pump is damaged, replace the oil pump.

Fig. 621: Removing/Installing Oil Pump At Intermediate Support Plate
Courtesy of CHRYSLER GROUP, LLC

3. Insert the oil pump (1) into the intermediate support plate (2). Align the tabs on the pump with the notches on the intermediate support plate.

Fig. 622: Compressing Snap-Ring At Oil Pump
Courtesy of CHRYSLER GROUP, LLC

4. Using a suitable pliers (1), compress the snap-ring to hold the oil pump (2) into the intermediate support plate (3).
5. While holding compression on the snap-ring (1), tap the oil pump into the bore in the intermediate support plate (3) until it seats.

Fig. 623: View Of Oil Pump Drive Chain & Oil Pump Driven Sprocket
Courtesy of CHRYSLER GROUP, LLC

6. install the oil pump drive chain (3) onto the oil pump driven sprocket (2).

Fig. 624: View Of Oil Pump Drive Sprocket & Drive Chain
Courtesy of CHRYSLER GROUP, LLC

7. Install the oil pump drive sprocket (1) onto the drive chain (2).
8. While holding the chain on the drive sprocket, turn the intermediate support plate and oil pump (1) inside up on the work surface.

Fig. 625: Removing/Installing Intermediate Support Plate And Oil Pump
Courtesy of CHRYSLER GROUP, LLC

9. Place the intermediate support plate and oil pump (1) in position on the bellhousing (3).
10. Insert the oil pump drive sprocket into the oil pump sprocket needle bearing.

Fig. 626: Removing/Installing Bolts At Reaction Shaft To Intermediate Support Plate
Courtesy of CHRYSLER GROUP, LLC

11. Install the bolts (3) to hold the intermediate support plate and oil pump (1) to the bellhousing and tighten to the proper specifications. Refer to **SPECIFICATIONS**.

Fig. 627: Removing/Installing Reaction Shaft At Intermediate Support Plate
Courtesy of CHRYSLER GROUP, LLC

12. Place the reaction shaft (2) into the intermediate support plate (1).

Fig. 628: Removing/Installing Bolts At Reaction Shaft To Intermediate Support Plate
Courtesy of CHRYSLER GROUP, LLC

13. Install the bolts (2) to hold the reaction shaft (1) to the intermediate support plate (4) and tighten to the proper specifications. Refer to **SPECIFICATIONS**.

Fig. 629: Removing/Installing Transmission Oil Filter
Courtesy of CHRYSLER GROUP, LLC

14. Insert the oil filter neck (3) into the oil pump orifice and align the bolt hole with the bore in the intermediate support plate (2).

Fig. 630: Oil Filter, Intermediate Support Plate & Fastener
Courtesy of CHRYSLER GROUP, LLC

15. Install the bolt (2) to hold the oil filter (1) to the intermediate support plate and tighten to the proper specifications. Refer to **SPECIFICATIONS**.

Fig. 631: Fluid Tube
Courtesy of CHRYSLER GROUP, LLC

16. Replace the O-ring seals (2) on the fluid tube (1).
17. Install the fluid tube (1) into the bellhousing and intermediate support plate.
18. Install the bellhousing on the transmission. Refer to **BELLHOUSING, INSTALLATION**.
19. Install the transmission in the vehicle. Refer to **INSTALLATION**.
20. Road test the vehicle to verify the repair.

SENSOR, FLUID PRESSURE

REMOVAL

REMOVAL

1. Position the vehicle on a suitable hoist with the transmission in neutral. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove the valve body. Refer to **VALVE BODY, REMOVAL**.
3. Turn the valve body over to gain access to the pressure sensor.

Fig. 632: Fluid Pressure Sensor Wire Connector
Courtesy of CHRYSLER GROUP, LLC

4. Release the lock on the pressure sensor wire connector.
5. Pull the wire connector from the pressure sensor.

Fig. 633: Loosening/Tightening Fluid Pressure Sensor
Courtesy of CHRYSLER GROUP, LLC

6. Using a suitable wrench, loosen the pressure sensor.

Fig. 634: Removing/Installing Fluid Pressure Sensor
Courtesy of CHRYSLER GROUP, LLC

7. Remove the pressure sensor from the valve body.

INSTALLATION

INSTALLATION

1. Remove the old O-ring from the pressure sensor if the old pressure sensor is reused.

Fig. 635: Fluid Pressure Sensor & O-Ring
Courtesy of CHRYSLER GROUP, LLC

2. Install a NEW O-ring (2) on the pressure sensor (1).

Fig. 636: Removing/Installing Fluid Pressure Sensor
Courtesy of CHRYSLER GROUP, LLC

3. Thread the pressure sensor (1) into the valve body.

Fig. 637: Loosening/Tightening Fluid Pressure Sensor
Courtesy of CHRYSLER GROUP, LLC

4. Using a suitable wrench, tighten the pressure sensor (1).

Fig. 638: Fluid Pressure Transducer Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

5. Push the pressure sensor wire connector (2) into the pressure sensor (1).
6. The lock on the pressure sensor wire connector will click when fully engaged.
7. Turn the valve body over into position on transmission.
8. Install the valve body. Refer to **VALVE BODY, INSTALLATION**.
9. Road test the vehicle to verify the repair.

SEAL, AXLE

REMOVAL

FWD BOTH SIDES - AWD AND 4WD LEFT SIDE

1. Remove the halfshaft from the vehicle. Refer to **REMOVAL** .

Fig. 639: Punching Hole In Differential Seal
Courtesy of CHRYSLER GROUP, LLC

NOTE: Keep the punch tool in the center of the seal to avoid damage to the transmission housing.

2. Using a suitable punch tool and hammer, punch a hole in the metal armature inside the seal.

Fig. 640: Slide Hammer & Differential Seal
Courtesy of CHRYSLER GROUP, LLC

3. Use a suitable Slide Hammer Dent Puller (2), to remove the seal (1).

4. Thread the sheet metal screw of the dent puller into the punched hole in the seal.
5. Tap outward on the slide hammer until the seal comes out of the seal bore.

RIGHT SIDE - 4WD

NOTE: The 948TE automatic transmission configured for Four Wheel Drive (4WD) utilizes an adapter sleeve to couple the Power Transfer Unit (PTU) to the differential. Lip seals are used to seal the inner and outer surfaces of the adapter sleeve.

1. Remove the Power Transfer Unit (PTU). Refer to **REMOVAL** .

2101009395

Fig. 641: Removing Differential Adapter Sleeve
Courtesy of CHRYSLER GROUP, LLC

2. Using tool (special tool #7794-A, Remover, Seal) and (special tool #C-637, Slide Hammer, Universal), Remove the adapter sleeve from the transmission.

Fig. 642: Removing Seal From Transmission
Courtesy of CHRYSLER GROUP, LLC

3. Using tool (special tool #9667, Remover, Seal) (2) and (special tool #C-3752, Slide Hammers) (1), remove the seal from the transmission.

Fig. 643: View of Adapter Sleeve Seal Tension Spring
Courtesy of CHRYSLER GROUP, LLC

4. Position the adapter sleeve on the work surface with the seal tension spring down.

Fig. 644: Removing Seal From Inside Of Adapter Sleeve
Courtesy of CHRYSLER GROUP, LLC

5. Insert tool (special tool #9611, Plug, Differential End) (2) into the outer end of the adapter sleeve (3).
6. Using a suitable hammer (1), drive the seal from the inside of the adapter sleeve (3).

RIGHT SIDE - AWD

Fig. 645: All Wheel Drive (AWD) Adapter Sleeve
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The 948TE automatic transmission configured for All Wheel Drive (AWD) utilizes an adapter sleeve (1) to couple the Power Transfer Unit (PTU) to the differential.**

Lip seals are used to seal the inner and outer surfaces of the adapter sleeve.

1. Remove the PTU from the vehicle. Refer to **REMOVAL** .

Fig. 646: Removing Differential Adapter Sleeve
Courtesy of CHRYSLER GROUP, LLC

2. Using tool (special tool #7794-A, Remover, Seal) and (special tool #C-637, Slide Hammer, Universal), Remove the adapter sleeve from the transmission.

Fig. 647: Removing Seal From Transmission
Courtesy of CHRYSLER GROUP, LLC

3. Using tool (special tool #9667, Remover, Seal) (2) and (special tool #C-3752, Slide Hammers) (1), remove the seal from the transmission.

Fig. 648: View of Adapter Sleeve Seal Tension Spring
Courtesy of CHRYSLER GROUP, LLC

4. Position the adapter sleeve on the work surface with the seal tension spring down.

Fig. 649: PTU Side Of Adapter Sleeve And Special Tool
Courtesy of CHRYSLER GROUP, LLC

5. Insert tool (special tool #9676, Adapter Plug) (1) into the outer, PTU side of the adapter sleeve (2).

Fig. 650: Removing Seal From Inside Of Adapter Sleeve
Courtesy of CHRYSLER GROUP, LLC

6. Using a suitable hammer (1), drive the seal from the inside of the adapter sleeve (3).

INSTALLATION

FWD BOTH SIDES - AWD AND 4WD LEFT SIDE

NOTE: Clean the seal bore in the transmission housing with a clean lint-free cloth.

1. Apply assembly lube on the lip of the NEW seal to avoid damage after installation.

Fig. 651: Inserting Seal Into Transmission Bore
Courtesy of CHRYSLER GROUP, LLC

2. Using tool (special tool #10506, Installer, Oil Seal) (2) and (special tool #C-4171, Driver Handle, Universal) (1) with the seal (3) positioned on the installer, insert the seal in the transmission bore around the output shaft.

Fig. 652: Installing Seal Into Transmission
Courtesy of CHRYSLER GROUP, LLC

3. Using a suitable hammer, drive the seal into the transmission until it is seated.
4. Install the Left Hand (LH) halfshaft. Refer to **INSTALLATION** .
5. Verify that the transmission fluid is at the proper level. Refer to **FLUID AND FILTER, STANDARD PROCEDURE**.

RIGHT SIDE - 4WD

NOTE: Clean the adapter sleeve with suitable solvent and blow it dry with regulated 344 kPa (50 psi) shop air.

1. Apply assembly lube on the inner seal lip to avoid damaging the seal after installation.
2. Place the adapter sleeve on a suitable work surface with the transmission side up.

Fig. 653: Inserting Lip Seal Into Adapter Sleeve
Courtesy of CHRYSLER GROUP, LLC

3. Insert the **NEW** lip seal (1) into the adapter sleeve (2), (AWD Shown in illustration) with the tension spring up.

Fig. 654: Installing Seal Into Adapter Sleeve
Courtesy of CHRYSLER GROUP, LLC

4. Using tool (special tool #9611, Plug, Differential End) (2) and a hammer (1), install the seal in the adapter sleeve (3).

Fig. 655: Inserting Lip Seal Into Transmission
Courtesy of CHRYSLER GROUP, LLC

5. Apply assembly lube on the outer seal (1) lip to avoid damaging the seal after installation.
6. Insert the **NEW** lip seal (1) into the transmission (2).

Fig. 656: Installing Outer Lip Seal Into Transmission
Courtesy of CHRYSLER GROUP, LLC

7. Using tool (special tool #C-3972-A, Installer, Seal) (3) and (special tool #C-4171, Driver Handle, Universal) (2) and a hammer (1), Install the outer lip seal in the transmission.
8. Install the Power Transfer Unit (PTU) into the vehicle. Refer to **INSTALLATION** .

9. Verify that the transmission fluid level is at the proper level. Refer to **FLUID AND FILTER, STANDARD PROCEDURE**.
10. Road test the vehicle to verify the repair.

RIGHT SIDE - AWD

NOTE: Clean the adapter sleeve with suitable solvent and blow it dry with regulated 344 kPa (50 psi) shop air.

1. Apply assembly lube on the inner seal lip to avoid damaging the seal after installation.
2. Place the adapter sleeve on a suitable work surface with the transmission side up.

Fig. 657: Inserting Lip Seal Into Adapter Sleeve
Courtesy of CHRYSLER GROUP, LLC

3. Insert the NEW lip seal (1) into the adapter sleeve (2) with the tension spring up.

Fig. 658: Installing Seal Into Adapter Sleeve
Courtesy of CHRYSLER GROUP, LLC

4. Using tool (special tool #8840, Installer, Oil Slinger) (2) and a hammer (1), install the seal in the adapter sleeve (3).

Fig. 659: Inserting Lip Seal Into Transmission
Courtesy of CHRYSLER GROUP, LLC

5. Apply assembly lube on the outer seal (1) lip to avoid damaging the seal after installation.
6. Insert the NEW lip seal (1) into the transmission (2).

Fig. 660: Installing Outer Lip Seal Into Transmission
Courtesy of CHRYSLER GROUP, LLC

7. Using tool (special tool #C-3972-A, Installer, Seal) (3) and (special tool #C-4171, Driver Handle, Universal) (2) and a hammer (1), Install the outer lip seal in the transmission.
8. Install the Power Transfer Unit (PTU) into the vehicle. Refer to **INSTALLATION** .
9. Verify that the transmission fluid level is at the proper level. Refer to **FLUID AND FILTER, STANDARD PROCEDURE**.
10. Road test the vehicle to verify the repair.

SEAL, INPUT SHAFT

REMOVAL

REMOVAL

1. Remove the transmission from the vehicle, Refer to **REMOVAL**.
2. Drain the fluid from the transmission.
3. Remove the torque converter from the transmission.
4. Using a suitable punch tool, pierce a 3 mm (0.125 in.) hole in the center of the seals front surface through the metal armature.

Fig. 661: Removing Seal From Center Of Bellhousing
Courtesy of CHRYSLER GROUP, LLC

5. Using a suitable dent puller (2) threaded into the hole in the seal (1), remove the seal (1) from the bore in the center of the bellhousing.

INSTALLATION

INSTALLATION

1. Clean the seal bore in the center of the bellhousing.
2. Apply assembly lube on the lip of the NEW seal.
3. Place the seal on tool (special tool #9677, Installer, Seal), with the tension spring away from the tool, and insert the seal into the bore in the bellhousing.

Fig. 662: Installing Seal Into Bellhousing
Courtesy of CHRYSLER GROUP, LLC

4. Using a suitable hammer, drive the seal into the bore in the center of the bellhousing until the tool seats against the bellhousing.
5. Install the torque converter.
6. Install the transmission in the vehicle. Refer to **INSTALLATION**.
7. Fill the transmission to the proper level. Refer to **STANDARD PROCEDURES**.
8. Road test the vehicle to verify the repair.

SENSORS, SPEED

REMOVAL

REMOVAL

The speed sensors can be replaced with the transmission in the vehicle.

1. Position the vehicle on a suitable hoist with the transmission in neutral.
2. Remove the valve body. Refer to **VALVE BODY, REMOVAL**.

Fig. 663: Removing/Installing Speed Sensor Screw
Courtesy of CHRYSLER GROUP, LLC

3. Remove the screw (1) holding the speed sensors to the transmission housing.

Fig. 664: Removing/Installing Speed Sensor
Courtesy of CHRYSLER GROUP, LLC

4. Separate the speed sensor (1) from the transmission.
5. Release the lock on the wire connector.
6. Separate the wire connector from the speed sensor.

INSTALLATION

INSTALLATION

1. Insert the wire connector into the speed sensor.
2. Engage the lock on the wire connector.

Fig. 665: Removing/Installing Speed Sensor
Courtesy of CHRYSLER GROUP, LLC

3. Insert the speed sensor (1) into the transmission housing.

Fig. 666: Removing/Installing Speed Sensor Screw
Courtesy of CHRYSLER GROUP, LLC

4. Install the screw (1) to hold the speed sensors to the transmission housing.
5. Install the valve body. Refer to **VALVE BODY, INSTALLATION**.
6. Road test the vehicle to verify repair.

SENSOR, TRANSAXLE RANGE

REMOVAL

REMOVAL

The Transmission Range Sensor (TRS) can be replaced with the transmission in the vehicle

1. Position the vehicle on a suitable hoist with the transmission in neutral.
2. Remove the valve body. Refer to **VALVE BODY, REMOVAL**.

Fig. 667: Removing/Installing Transmission Range Sensor (TRS) Screw
Courtesy of CHRYSLER GROUP, LLC

3. Remove the screw (1) holding the TRS to the transmission housing.

Fig. 668: Removing/Installing Transmission Range Sensor
Courtesy of CHRYSLER GROUP, LLC

4. Separate the TRS (1) from the transmission.
5. Release the lock on the wire connector.
6. Separate the wire connector from the TRS.

INSTALLATION

INSTALLATION

1. Insert the wire connector into the Transmission Range Sensor (TRS).
2. Engage the lock on the wire connector.

Fig. 669: Removing/Installing Transmission Range Sensor
Courtesy of CHRYSLER GROUP, LLC

3. Insert the TRS (1) into the transmission housing.

Fig. 670: Removing/Installing Transmission Range Sensor (TRS) Screw
Courtesy of CHRYSLER GROUP, LLC

4. Install the screw (1) to hold the TRS to the transmission housing.
5. Install the valve body. Refer to **VALVE BODY, INSTALLATION**.
6. Road test the vehicle to verify repair.

SHAFT, REACTION

REMOVAL

REMOVAL

1. Remove the transmission from the vehicle. Refer to **REMOVAL**.
2. Drain the fluid from the transmission.
3. Remove the bellhousing from the transmission. Refer to **BELLHOUSING, REMOVAL**.

Fig. 671: Removing/Installing Bolts At Reaction Shaft To Intermediate Support Plate
Courtesy of CHRYSLER GROUP, LLC

4. Remove the bolts (2) holding the reaction shaft (1) to the intermediate support plate (4).

Fig. 672: Removing/Installing Reaction Shaft At Intermediate Support Plate
Courtesy of CHRYSLER GROUP, LLC

5. Separate the reaction shaft (2) from the intermediate support plate (1).

Fig. 673: Removing/Installing Seal Rings At Ring Land In Inner Reaction Shaft Hub
Courtesy of CHRYSLER GROUP, LLC

6. Remove the seal rings (1) from the ring lands in the inner reaction shaft hub (2).

Fig. 674: Removing/Installing Seal Ring At Ring Land In Outer Reaction Shaft Hub
Courtesy of CHRYSLER GROUP, LLC

7. Remove the seal ring (1) from the ring land in the outer reaction shaft hub (2).

INSTALLATION

INSTALLATION

1. Clean the reaction shaft with suitable solvent and blow it dry using regulated 344 kPa (50 psi) shop air.
2. Inspect the reaction shaft for excess damage or ware. Replace the reaction shaft if damage is present.

Fig. 675: Removing/Installing Seal Ring At Ring Land In Outer Reaction Shaft Hub

Courtesy of CHRYSLER GROUP, LLC

3. Install a New seal ring (1) in the land of the outer reaction shaft hub (2).

Fig. 676: Removing/Installing Seal Rings At Ring Land In Inner Reaction Shaft Hub
Courtesy of CHRYSLER GROUP, LLC

4. Install New seal rings (1) in the lands of the inner reaction shaft hub (2).

Fig. 677: Removing/Installing Reaction Shaft At Intermediate Support Plate
Courtesy of CHRYSLER GROUP, LLC

5. Place the reaction shaft (2) into the intermediate support plate (1).

Fig. 678: Removing/Installing Bolts At Reaction Shaft To Intermediate Support Plate
Courtesy of CHRYSLER GROUP, LLC

6. Install the bolts (2) to hold the reaction shaft (1) to the intermediate support plate (4). Refer to **SPECIFICATIONS**.
7. Install the bellhousing on the transmission. Refer to **BELLHOUSING, INSTALLATION**.
8. Install the transmission in the vehicle. Refer to **INSTALLATION**.
9. Fill the transmission to the proper level. Refer to **FLUID AND FILTER, STANDARD PROCEDURE**.
10. Road test the vehicle to verify the repair.

SHIFTER, FLOOR CONSOLE

REMOVAL

REMOVAL

1. Disconnect the battery negative cable.
2. Remove the center floor console

   Refer to **CONSOLE, FLOOR, REMOVAL** .

210171835

Fig. 679: PRND Wire Connector & Shifter Assembly
Courtesy of CHRYSLER GROUP, LLC

3. Release the wire connector lock and disconnect the PRND wire connector from the shifter assembly.

210171740

Fig. 680: Shifter Assembly & Gear Shift Cable End
Courtesy of CHRYSLER GROUP, LLC

4. Pry the gear shift cable end (2) from the pin under the shifter assembly (3).
5. Release the shift cable housing retainer and disengage the cable from the shifter assembly.

Fig. 681: Gear Shifter
Courtesy of CHRYSLER GROUP, LLC

6. Remove the nuts holding the gear shifter to the floor.
7. Separate the gear shifter from the vehicle.

INSTALLATION

INSTALLATION

1. Place the gear shifter in position on the floor pan.

Fig. 682: Gear Shifter
Courtesy of CHRYSLER GROUP, LLC

2. Install nuts to hold the gear shifter assembly (1) to the floor pan.
3. Insert the shift cable into the access hole on the front of the shifter and lock the retainer into the shifter.

Fig. 683: Shifter Assembly & Gear Shift Cable End

Courtesy of CHRYSLER GROUP, LLC

4. Push the gear shift cable end (2) onto the pin under the shifter assembly (3).

210171835

Fig. 684: PRND Wire Connector & Shifter Assembly
Courtesy of CHRYSLER GROUP, LLC

5. Connect the PRND wire connector into the shifter assembly connector.
6. Install the center floor console

   Refer to **CONSOLE, FLOOR, INSTALLATION** .

7. Connect the battery negative cable.

TUBE, OIL

REMOVAL

REMOVAL

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove the left front wheel and tire. Refer to **REMOVAL** .

Fig. 685: Oil Supply Tube
Courtesy of CHRYSLER GROUP, LLC

3. Remove the oil supply tube bolts (1, 3).
4. Remove the oil supply tube (1) from the transmission.

INSTALLATION

INSTALLATION

Fig. 686: O-Ring Seal Near Differential End For Oil Supply Tube
Courtesy of CHRYSLER GROUP, LLC

1. Replace the O-ring seal (1) near the differential end for the oil supply tube.

Fig. 687: O-Ring Seal Near Transmission For Oil Supply Tube
Courtesy of CHRYSLER GROUP, LLC

2. Replace the O-ring seal (1) near the end of the transmission for the oil supply tube.

Fig. 688: Oil Supply Tube
Courtesy of CHRYSLER GROUP, LLC

3. Install the oil supply tube (2) onto transmission.
4. Install the oil supply tube fasteners (3) and tighten to the proper specification. Refer to **SPECIFICATIONS**.

5. Install the left front wheel and tire. Refer to **INSTALLATION** .
6. Fill the transaxle to the proper level with the correct fluid. Refer to **FLUID AND FILTER, STANDARD PROCEDURE**.

VALVE BODY

REMOVAL

REMOVAL

1. Disconnect and isolate the negative battery cable.
2. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
3. Remove the belly pan. Refer to **BELLY PAN, REMOVAL** .
4. Remove the drain plug and allow the fluid to drain from the transmission.
5. Install the drain plug.

Fig. 689: Transmission Valve Body Solenoid Connector
Courtesy of CHRYSLER GROUP, LLC

6. Rotate the lock lever (2) counterclockwise on the transmission solenoid connector.
7. Disengage the wire connector from the socket on the transmission pan.

Fig. 690: Wire Connector Socket Clip
Courtesy of CHRYSLER GROUP, LLC

8. Using a suitable pry tool, remove the clip (2) holding the wire connector socket (1) in the valve body cover.
9. Press the wire connector socket inside the valve body cover.

Fig. 691: Valve Body Cover Pan Bolts
Courtesy of CHRYSLER GROUP, LLC

10. Remove the bolts (1) holding the valve body cover to the transmission.
11. Remove the valve body cover from the transmission housing.

Fig. 692: Valve Body Bolts
Courtesy of CHRYSLER GROUP, LLC

12. Remove the larger (T45) bolts (1) holding the valve body to the transmission housing.
13. Using a suitable prying tool, separate the valve body from the fluid transfer adapter tubes.
14. Turn the valve body over to gain access to wire harness connectors.

Fig. 693: Fluid Pressure Transducer Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

15. Release the lock (2) on the fluid pressure transducer wire connector.
16. Separate the wire connector from the fluid pressure transducer (1).

Fig. 694: Removing/Installing Wire Harness Connector At Valve Body Solenoids
Courtesy of CHRYSLER GROUP, LLC

17. Remove the bolts (1) holding the wire harness connector to the valve body and solenoids.
18. Using a suitable prying tool, Separate the wire harness connector (2) from the solenoids.
19. Separate the valve body from the vehicle.

NOTE: **If the valve body is to be reused without disassembling it, store the valve body in a clean area until it is installed.**

DISASSEMBLY

DISASSEMBLY

Remove the valve body from the transmission and place the valve body on a clean oil absorbent work surface. Position wood blocks at each end of the valve body to provide a stable work fixture.

Fig. 695: View Of Valve Body & Solenoids
Courtesy of CHRYSLER GROUP, LLC

1. Remove the solenoids (2 - 5) from the valve body (1).

NOTE: Each type solenoid has a unique color end cover.

- 2 = System Pressure Regulator Solenoid
- 3 = Pressure Regulator Solenoids
- 4 = Dog Clutch Solenoids
- 5 = Parking Lock Solenoid

Fig. 696: Parking Lock Valve & Outer Valve Body
Courtesy of CHRYSLER GROUP, LLC

2. Remove the parking lock valve (1) from the park lock solenoid bore in the outer valve body (2).
3. Remove the pressure sensor from the valve body.
4. Position the valve body on the wooden blocks with outer side up.

Fig. 697: Valve Body & 14 Screws
Courtesy of CHRYSLER GROUP, LLC

5. Remove the screws (1) holding the valve body halves together.

Fig. 698: Outer Valve Body & Separator Plate

Courtesy of CHRYSLER GROUP, LLC

6. Separate the outer valve body (1) from the separator plate (2).

Fig. 699: Lifting Separator Plate Off Of Inner Valve Body
Courtesy of CHRYSLER GROUP, LLC

7. Lift the separator plate (1) upward and off of the inner valve body (2).

Fig. 700: Inner Valve Body & Guide Pins
Courtesy of CHRYSLER GROUP, LLC

8. Remove the guide pins (1) from the inner valve body.

Fig. 701: Inner Valve Body, Color Coded Check Valves & Check-Balls
Courtesy of CHRYSLER GROUP, LLC

9. Remove the color coded check valves (1) from the inner valve body.
10. Remove the toggling, connected check-balls (2) from the inner valve body.
11. Position the outer valve body on the work surface inside up to gain access to the valve retaining spring clips.

NOTE: DO NOT damage the filter screen during removal.

Fig. 702: Outer Valve Body Components
Courtesy of CHRYSLER GROUP, LLC

12. Using a suitable prying tool, remove the filter screen (1) from the bore in the outer valve body (11).
13. Remove the bullets (8), sleeves (7), and pressure regulator valves (6) from the bores in the outer valve body (11).
14. Remove the parking lock valve (10) from the bore in the outer valve body (11).
15. Using a suitable prying tool, remove the spring clips (12) holding the lubrication valve plugs in the bores in the outer valve body (11).
16. Remove the plugs (5), lubrication valves and springs (3) from the bores in the outer valve body (11).
17. Using a suitable prying tool, remove the spring clip (12) holding the MV park lock valve plug in the bore in the outer valve body (11).
18. Remove the spring and MV park lock valve (9) from the bore in the outer valve body (11).
19. Rotate the outer valve (11) body to gain access to the pressure and lubrication valves.

Fig. 703: Outer Valve Body & Pressure Valve
Courtesy of CHRYSLER GROUP, LLC

20. The support plates (3) and spring clip (6) are located in pockets (8) in the outer valve body (1).
21. Remove the support plate (3) holding the spring and converter pressure valve (2) in the bore in the outer valve body (1).
22. Remove the spring and converter pressure valve (2) from the bore in the outer valve body (1).
23. Remove the support plate (3) holding the plug (5), spring and system pressure valve (7) in the bore in the outer valve body (1).

24. Remove the plug (5), spring and system pressure valve (7) from the bore in the outer valve body (1).
25. Remove the spring clip (6) holding the plug (5), spring and lubrication valve (4) in the bore in the outer valve body (1).
26. Remove the plug (5), spring and lubrication valve (4) from the bore in the outer valve body (1).

Fig. 704: Inner Valve Body With The Valves Bores Facing Up
Courtesy of CHRYSLER GROUP, LLC

27. Place the inner valve body on the clean work surface with the valves bores facing up.

NOTE: The spring clips holding (2) the plugs (1) in the inner valve are located in pockets (2) on the separator plate side of the inner valve body.

28. Press each of the valve plugs (1) downward and remove the spring clips (2) holding the valves in the bores in the inner valve body.

Fig. 705: Inner Valve Body Components
Courtesy of CHRYSLER GROUP, LLC

29. Remove the plug (2), spring and boost valve (1) from the bore in the inner valve body (6).
30. Remove the plug (2), spring and solenoid limit valve (4) from the bore in the inner valve body (6).
31. Remove the plugs (2), springs and PCV valves (5) from the bores in the inner valve body (6).
32. Perform the cleaning and inspection procedures.

INSPECTION

VALVE BODY CLEANING AND INSPECTION

Clean the valve body components with a suitable clean solvent. The valve body components can be blown dry with compressed regulated 344 kPa (50 psi) shop air.

Inspect the valve components and bores for excessive scoring, porosity, warping or other damage that may cause the valves to bind or leak excessively. If damage is evident the complete valve body must be replace.

ASSEMBLY

ASSEMBLY

Before assembling the valve body, thoroughly clean all of the components with a suitable solvent and blow them dry with 344 kPa (50 psi) **regulated** shop air. Clean the work surface and lay out a clean lint free cloth to avoid contaminating the clean valve body components. Lay the valve components out on the cloth in the order they will be installed in the valve body. The cloth will hold the valve components in place and keep them from rolling out of position. light lubricating oil can be applied the each component as the valve body is assembled.

Fig. 706: Inner Valve Body Components
Courtesy of CHRYSLER GROUP, LLC

1. Install the springs, PCV valves, and (5) plugs (2), from the bores in the inner valve body (6).
2. Install the solenoid limit valve (4), spring, and plug (2) into the bore in the inner valve body (6).
3. Install the boost valve (1), spring, and plug (2) into the bore in the inner valve body (6).

Fig. 707: Inner Valve Body With The Valves Bores Facing Up
Courtesy of CHRYSLER GROUP, LLC

4. Turn the inner valve body so the plugs (1) are facing upward
5. While pressing downward on the plugs (1), install the spring clips (2) to hold the plugs in the inner valve body.

Fig. 708: Outer Valve Body & Pressure Valve
Courtesy of CHRYSLER GROUP, LLC

6. The support plates (3) and spring clip (6) are go into pockets (8) in the outer valve body (1).
7. Install the lubrication valve (4), spring, and plug (5) into the bore in the outer valve body (1).
8. Install the spring clip (6) to hold the plug (5), spring and lubrication valve (4) in the bore in the outer valve body (1).
9. Install the system pressure valve (7), spring, and plug (5) in the bore in the outer valve body (1).
10. Install the support plate (3) to hold the plug (5), spring and system pressure valve (7) into the bore in the outer valve body (1).
11. Install the converter pressure valve (2) and spring into the bore in the outer valve body (1).
12. Install the support plate (3) to hold the spring and converter pressure valve (2) in the bore in the outer valve body (1).

Fig. 709: Outer Valve Body Components
Courtesy of CHRYSLER GROUP, LLC

13. Position the outer valve body (11) on the work surface inside up to gain access to the valve retaining spring clips (13).
14. Install the MV park lock valve (9), spring, and plug into the bore in the outer valve body (11).
15. While pressing down on the plug to align the slot, install the spring clip (13) to hold the MV park lock valve and plug in the bore in the outer valve body (11).
16. Install the lubrication valves, springs (3), a plugs (5), into the bores in the outer valve body (11).
17. While pressing down on the plug to align the slot, install the spring clips (13) to hold the lubrication valve plugs in the bores in the outer valve body (11).
18. Install the parking lock valve (10) into the bore in the outer valve body (11).
19. Install the pressure regulator valves (6), sleeves (7), and bullets (8) into the bores in the outer valve body (11).
20. Install NEW O-rings (2) on the filter screen (1).
21. Install the filter screen (1) into the bore in the outer valve body (11).

Fig. 710: Inner Valve Body, Color Coded Check Valves & Check-Balls
Courtesy of CHRYSLER GROUP, LLC

22. Place the inner valve body on the work surface resting on wood blocks to elevate the center for clearance underneath.
23. Install the toggling, connected check-balls (2) into the inner valve body.
24. Install the color coded check valves (1) into the inner valve body.

Fig. 711: Inner Valve Body & Guide Pins
Courtesy of CHRYSLER GROUP, LLC

25. With the smaller diameter end downward, install the guide pins (1) into the inner valve body.

Fig. 712: Separator Plate & Inner Valve Body
Courtesy of CHRYSLER GROUP, LLC

26. Place the separator plate (1) in position on of the inner valve body over the guide pins (2).

Fig. 713: Outer Valve Body & Separator Plate
Courtesy of CHRYSLER GROUP, LLC

27. Place the outer valve body (1) in position on the separator plate (2).

Fig. 714: Valve Body & 2 Screws
Courtesy of CHRYSLER GROUP, LLC

28. Install two screws (1) to hold the outer valve body to the inner valve body and separator plate. Tighten the screws snug with a suitable torx-drive screw driver.

Fig. 715: Valve Body & 12 Screws
Courtesy of CHRYSLER GROUP, LLC

29. Install the remaining screws (1) to hold the inner valve body to the outer valve body.
30. Install the pressure sensor in the valve body.

Fig. 716: View Of Valve Body & Solenoids
Courtesy of CHRYSLER GROUP, LLC

31. Install the solenoids (2 - 5) in the valve body (1).

NOTE: Each type solenoid has a unique color end cover.

- 2 = System Pressure Regulator Solenoid
- 3 = Pressure Regulator Solenoids
- 4 = Dog Clutch Solenoids
- 5 = Parking Lock Solenoid

32. Install the valve body in the transmission.
33. Finish assemble the vehicle.
34. Road test the vehicle to verify the repair.

INSTALLATION

INSTALLATION

NOTE: Before installing the valve body, replace the O-ring seals on the fluid transfer adapter tubes. Apply a light coating of assembly lube on the O-rings to ease valve body installation.

1. Clean the mating surfaces between the valve body and the transmission housing with a clean lint-free cloth.

Fig. 717: Removing/Installing Wire Harness Connector At Valve Body Solenoids
Courtesy of CHRYSLER GROUP, LLC

2. Place the valve body in position on the transmission.
3. Place the wire harness connector in position on the solenoids.
4. Press the connector inward to engage the terminals on the solenoids.
5. Install the bolts to hold the wire harness connector to the valve body and solenoids and tighten to the proper specifications. Refer to **SPECIFICATIONS**.

Fig. 718: Fluid Pressure Transducer Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

6. Insert the wire harness connector (2) into the fluid pressure transducer connector (1).
7. Press connector together until the lock engages.

Fig. 719: Aligning Valve Body To Fluid Transfer Tubes
Courtesy of CHRYSLER GROUP, LLC

8. Turn the valve body (1) over and align the valve body (1) with the fluid transfer adapters.

Fig. 720: Engaging Valve Body To Fluid Transfer Tubes
Courtesy of CHRYSLER GROUP, LLC

9. Guide the manual lever cam (2) into the slot (3) on the manual valve.

10. Firmly press (4) the valve body (1) inward until the O-rings on the fluid transfer adapters engage into receptacle holes on the valve body.

Fig. 721: Valve Body Bolts
Courtesy of CHRYSLER GROUP, LLC

11. Install the bolts (1) to hold the valve body to the transmission housing and tighten to the proper specifications. Refer to **SPECIFICATIONS**.

Fig. 722: Valve Body Solenoid Wire Harness Connector Socket O-Ring Seals
Courtesy of CHRYSLER GROUP, LLC

12. Install NEW O-ring seals (2) on the wire connector socket (1).

NOTE: **A light coating of assembly lube can be applied to the O-ring seals (2) to ease installation.**

Fig. 723: Valve Body Cover Pan & Wire Connector Socket
Courtesy of CHRYSLER GROUP, LLC

13. Place the valve body cover (1) in position on the transmission.
14. Insert the wire connector socket (3) into the opening on the inside of valve body cover (1) with the flat side (2) of the socket on the left.

Fig. 724: Wire Connector Socket Clip
Courtesy of CHRYSLER GROUP, LLC

15. Press the wire connector socket inward until the retainer clip groove (1) is exposed on the outside of the valve body cover (1).
16. Install the clip (2) to hold the wire connector socket in the valve body cover.

Fig. 725: Valve Body Cover Pan Gasket Seal
Courtesy of CHRYSLER GROUP, LLC

17. Install a NEW gasket seal (1) in the groove around the sealing surface of the valve body cover (2).

Fig. 726: Valve Body Cover Pan Bolts
Courtesy of CHRYSLER GROUP, LLC

18. Place the valve body cover pan gasket against the sealing surface of the transmission housing.

19. Install the bolts (1) to hold the valve body cover to the transmission housing and tighten to the proper specifications. Refer to **SPECIFICATIONS**.

Fig. 727: Transmission Valve Body Solenoid Connector
Courtesy of CHRYSLER GROUP, LLC

20. Engage the wire connector into the socket on the valve body cover.
21. Rotate the lock lever (1) clockwise onto the transmission solenoid connector.
22. Fill the transmission. Refer to **FLUID AND FILTER, STANDARD PROCEDURE**.
23. Install the belly pan.
24. Connect the negative battery cable.
25. Perform the Valve Body Solenoid Learn procedure if the valve body and/or the TCM was replaced during a repair.
26. Perform Transmission Verification Test-948TE. Refer to **STANDARD PROCEDURE** .

VALVES, SOLENOID

REMOVAL

REMOVAL

1. Position the vehicle on a suitable hoist with the transmission in neutral. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove the valve body from the transmission. Refer to **VALVE BODY, REMOVAL**.
3. Place the valve body on a clean work surface supported on each end by wooden blocks with the outer half facing upward.

Fig. 728: View Of Solenoid Valve Retainer
Courtesy of CHRYSLER GROUP, LLC

4. Remove the screws (1) holding the solenoid retainers to the outer valve body.

Fig. 729: View Of Solenoid Valve Small Retainer
Courtesy of CHRYSLER GROUP, LLC

5. Separate the small retainer (1) from the valve body.

Fig. 730: View Of Solenoid Valve Retainer
Courtesy of CHRYSLER GROUP, LLC

6. Separate the large retainer (1) from the valve body.

Fig. 731: Solenoid Valves & Outer Valve Body
Courtesy of CHRYSLER GROUP, LLC

7. Turn the valve body over so the inner valve body (1) is on top.
8. Pull the solenoid valves (3) straight out of the outer valve body (2).

Fig. 732: Parking Lock Valve & Outer Valve Body
Courtesy of CHRYSLER GROUP, LLC

9. Remove the parking lock valve (1) from the outer valve body (2).

INSTALLATION

INSTALLATION

Place the valve body on a clean work surface supported on each end by wooden blocks with the upper half facing upward.

Fig. 733: Parking Lock Valve & Outer Valve Body

Courtesy of CHRYSLER GROUP, LLC

1. Insert the parking lock valve into the bore in the outer valve body.

Fig. 734: Solenoid Valves & Outer Valve Body
Courtesy of CHRYSLER GROUP, LLC

2. Insert the solenoids (3) straight into the outer valve body (2).

Fig. 735: Test Fitting Wire Connector
Courtesy of CHRYSLER GROUP, LLC

3. Test fit the wire connector (1) into the solenoid connectors (2) to assure alignment.

4. Remove the wire connector with care not to rotate the solenoids.

Fig. 736: Placing Large Retainer In Position On Valve Body
Courtesy of CHRYSLER GROUP, LLC

5. Turn the valve body over so the inner valve body (1) is on top.
6. Place the large retainer (1) in position on the valve body with the index tabs (3) on the retainer in the notches (2) on the center dog clutch solenoids.

Fig. 737: View Of Solenoid Valve Small Retainer
Courtesy of CHRYSLER GROUP, LLC

7. Place the small retainer (1) in position on the valve body.

Fig. 738: View Of Solenoid Valve Retainer
Courtesy of CHRYSLER GROUP, LLC

8. Install the screws (1) to hold the solenoid retainers to the outer valve body.
9. Install the valve body in the transmission.
10. Perform the Valve Body Solenoid Learn procedure if the valve body and/or the TCM was replaced during a repair.
11. Perform Transmission Verification Test-948TE. Refer to **STANDARD PROCEDURE** .

SHIFT, BRAKE INTERLOCK

DESCRIPTION

DESCRIPTION

The Brake Transmission Shift Interlock (BTSI) system prevents the driver from shifting out of Park unless the service brake pedal is actuated. The BTSI system is a "Power to Release" shift mechanism. The system is mechanically locked in Park until power is applied to the solenoid contained within the shifter. No brake interlock adjustment is required. In the event of a solenoid problem or power loss, the shifter cannot be moved from Park unless a manual override is actuated. A BTSI override mechanism is provided with this shifter to allow the vehicle to be shifted out of PARK in the event of an electrical failure.

OPERATION

OPERATION

Fig. 739: Ignition Key/Switch Positions
Courtesy of CHRYSLER GROUP, LLC

1 - LOCK 2 - ACC 3 - ON 4 - START

The Brake Transmission Shifter/Ignition Interlock (BTSI) is engaged whenever the ignition switch is in the LOCK (1) position. An additional electrically activated feature will prevent shifting out of the PARK position unless the brake pedal is depressed at least one-half inch. A solenoid in the shifter assembly is energized when the ignition is in the ON position and the brake pedal is depressed. When the key is in the ON position and the brake pedal is depressed, the shifter is unlocked and will move into any position. The interlock system also prevents the ignition switch from being turned to the LOCK position, unless the shifter is in the gated PARK position.

The following chart describes the normal operation of the Brake Transmission Shift Interlock (BTSI) system. If the "expected response" differs from the vehicle's response, then system repair and/or adjustment is necessary.

ACTION	EXPECTED RESPONSE
1. Turn key to the "ACC" position and depress brake pedal.	1. Shifter CAN be shifted out of park.
2. Turn key to the "ON" position, with foot off of brake pedal.	2. Shifter CANNOT be shifted out of park.
3. Turn key to the "ON" position and depress the brake pedal.	3. Shifter CAN be shifted out of park.
4. Leave shifter in any gear, except "PARK", and try to return key to the "LOCK" position.	4. Key cannot be returned to the "LOCK" position.

5. Return shifter to "PARK" and try to remove the key.	5. Key can be removed (after returning to "LOCK" position).
6. With the key removed, and the brake depressed, try to shift out of "PARK".	6. Shifter cannot be shifted out of "PARK".
NOTE: Any failure to meet these expected responses requires system adjustment or repair.	

STANDARD PROCEDURE

BTSI OVERRIDE

If a malfunction occurs and the shift lever cannot be moved out of the PARK position, you can use the following procedure to temporarily move the shift lever.

1. Turn the engine OFF.
2. Apply the parking brake.

Fig. 740: Removing Shifter Bezel And Boot Assembly
Courtesy of CHRYSLER GROUP, LLC

3. Using a screwdriver (2) or similar tool, carefully separate the shifter bezel and boot assembly (1) from the center console bezel.
4. Press and maintain firm pressure on the brake pedal.

Fig. 741: Holding The Override Release Lever Down
Courtesy of CHRYSLER GROUP, LLC

5. Insert a small screwdriver (1) or similar tool down into the shift lever override access hole (2) (at the right front corner of the shift lever assembly), and push and hold the override release lever down.
6. Move the shift lever to the NEUTRAL position
7. The vehicle may then be started in NEUTRAL.
8. Reinstall the shift lever boot.

2014 AUTOMATIC TRANSMISSION

Electronic Shift Module (ESM) - Electrical Diagnostics, 948TE - Cherokee

DIAGNOSTIC CODE INDEX

DIAGNOSTIC CODE INDEX

DTC	Description
P0606-49	INTERNAL CONTROL PROCESSOR - INTERNAL ELECTRONIC FAILURE
P0929-1D	GEAR SHIFT LOCK SOLENOID/ACTUATOR CONTROL CIRCUIT 1 PERFORMANCE - CIRCUIT CURRENT OUT OF RANGE
P1C81-49	SHIFT LEVER POSITION INDETERMINATE - INTERNAL ELECTRONIC FAILURE
P1C81-54	SHIFT LEVER POSITION INDETERMINATE-MISSING CALIBRATION
P1C81-62	SHIFT LEVER POSITION INDETERMINATE - SIGNAL COMPARE FAILURE
P1C81-78	SHIFT LEVER POSITION INDETERMINATE - ALIGNMENT OR ADJUSTMENT INCORRECT
P1C84-63	AUTOSTICK DISENGAGE FAILURE - CIRCUIT / COMPONENT PROTECTION TIME-OUT
P1C86-1D	PRNDL DISPLAY - CIRCUIT CURRENT OUT OF RANGE
P1C8B-16	BATTERY VOLTAGE - CIRCUIT VOLTAGE BELOW THRESHOLD
P1C8B-17	BATTERY VOLTAGE - CIRCUIT VOLTAGE ABOVE THRESHOLD
U0001-00	CAN C BUS
U0100-87	LOST COMMUNICATION WITH ECM/PCM - MISSING MESSAGE
U0101-87	LOST COMMUNICATION WITH TCM-MISSING MESSAGE
U0140-87	LOST COMMUNICATION WITH BODY CONTROL MODULE-MISSING MESSAGE
U0401-86	IMPLAUSIBLE DATA RECEIVED FROM ECM/PCM-SIGNAL INVALID
U0402-86	IMPLAUSIBLE DATA RECEIVED FROM TCM - SIGNAL INVALID
U0422-86	IMPLAUSIBLE DATA RECEIVED FROM BODY CONTROL MODULE - SIGNAL INVALID

DIAGNOSIS AND TESTING

P0606-49-INTERNAL CONTROL PROCESSOR - INTERNAL ELECTRONIC FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 1: Gear Shift Module (GSM) / Electronic Shift Module (ESM) Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Gear Shift Module (GSM) / Electronic Shift Module (ESM) performs various internal tests to verify proper controller operation. This DTC indicates that there is an error with the Shifter's internal processor.

WHEN MONITORED

Continuously with the ignition in the run position.

SET CONDITION

If the Shift Lever Assembly controller detects an internal fault.

POSSIBLE CAUSES

Possible Causes
SHIFTER LEVER ASSEMBLY

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

SHIFTER LEVER ASSEMBLY

Repair

- Using the schematics as a guide, check the Gear Shift / Electronic Shifter Control Module terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Shift Lever Assembly. Refer to **SHIFTER, FLOOR CONSOLE, REMOVAL** .
- Perform the ESM VERIFICATION TEST. Refer to **ESM VERIFICATION TEST**.

P0929-1D-GEAR SHIFT LOCK SOLENOID/ACTUATOR CONTROL CIRCUIT 1 PERFORMANCE - CIRCUIT CURRENT OUT OF RANGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 2: Gear Shift Module (GSM) / Electronic Shift Module (ESM) Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Gear Shift Module (GSM) / Electronic Shift Module (ESM) performs various internal tests to verify proper controller operation. This DTC indicates that there is a fault with the ESM circuitry or the ESM internal processor.

WHEN MONITORED

Continuously with the ignition in the run position.

SET CONDITION

The ESM controller detects an over or under current condition with Gear Shift Lock Solenoid.

POSSIBLE CAUSES

Possible Causes
ELECTRONIC SHIFT MODULE (ESM) HARNESS CONNECTORS
ELECTRONIC SHIFT MODULE (ESM) INTERNAL ERROR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK IF THE DTC IS CURRENT**
    1. Turn ignition ON, engine NOT running.
    2. Record the Environmental Data for this DTC.
    3. With the scan tool, clear the DTC.
    4. Remove the Shift Lever Assembly bezel and inspect the ESM connectors for proper installation.
    5. Using the Environmental Data recorded earlier, try to duplicate the conditions in which the DTC set. It may be necessary to test drive the vehicle.
    6. With the scan tool, read ESM DTC's.

    Did the DTC reset?

    Yes

    - Using the schematics as a guide, check the ESM terminals for corrosion, damage or terminal push out. Pay particular attention to power and ground circuits. Check Service Information Tune-ups or Service Bulletins for possible causes that may apply. If no trouble is found, replace the Shift Lever Assembly. Refer to **SHIFTER, FLOOR CONSOLE, REMOVAL** .
    - Perform the ESM VERIFICATION TEST. Refer to **ESM VERIFICATION TEST**.

    No

    - Go To 2
2. **INTERMITTENT WIRING AND CONNECTORS**
    1. The conditions necessary to set this DTC are not present at this time.
    2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

3. Wiggle the wiring and connectors while checking for any possible open or shorted circuits.
4. Check for any Service Information Tune-ups or Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the ESM VERIFICATION TEST. Refer to **ESM VERIFICATION TEST**.

   No

   - Test Complete.

P1C81-49-SHIFT LEVER POSITION INDETERMINATE - INTERNAL ELECTRONIC FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 3: Gear Shift Module (GSM) / Electronic Shift Module (ESM) Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Gear Shift Module (GSM) / Electronic Shift Module (ESM) performs various internal tests to verify proper controller operation. This DTC indicates that there is a fault with the ESM circuitry or the ESM internal processor.

WHEN MONITORED

Continuously with the ignition in the run position.

SET CONDITION

The ESM controller detects an internal sensor electrical error.

POSSIBLE CAUSES

Possible Causes
ELECTRONIC SHIFT MODULE (ESM) INTERNAL ERROR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK IF THE DTC IS CURRENT**
    1. Turn the Ignition ON, Engine not running.
    2. Record the Environmental Data for this DTC.
    3. With the scan tool, clear the DTC.
    4. Using the Environmental Data recorded earlier, try to duplicate the conditions in which the DTC set. It may be necessary to test drive the vehicle.
    5. With the scan tool, read ESM DTC's.

    Did the DTC reset?

    Yes

    - Using the schematics as a guide, check the ESM terminals for corrosion, damage or terminal push out. Pay particular attention to power and ground circuits. Check Service Information Tune-ups or Service Bulletins for possible causes that may apply. If no trouble is found, replace the Shift Lever Assembly. Refer to **SHIFTER, FLOOR CONSOLE, REMOVAL** .
    - Perform the ESM VERIFICATION TEST. Refer to **ESM VERIFICATION TEST**.

    No

    - Go To 2
2. **INTERMITTENT WIRING AND CONNECTORS**
    1. The conditions necessary to set this DTC are not present at this time.
    2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
    3. Wiggle the wiring and connectors while checking for any possible open or shorted circuits.
    4. Check for any Service Information Tune-ups or Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ESM VERIFICATION TEST. Refer to **ESM VERIFICATION TEST**.

No

- Test Complete.

P1C81-54-SHIFT LEVER POSITION INDETERMINATE-MISSING CALIBRATION

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 4: Gear Shift Module (GSM) / Electronic Shift Module (ESM) Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Gear Shift Module (GSM) / Electronic Shift Module (ESM) performs various internal tests to verify proper controller operation. This DTC indicates that there is a fault with the ESM circuitry or the ESM internal processor.

WHEN MONITORED

Continuously with the ignition in the run position.

SET CONDITION

The ESM controller detects an internal sensor missing calibration data error.

POSSIBLE CAUSES

Possible Causes
ELECTRONIC SHIFT MODULE (ESM) INTERNAL ERROR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK IF THE DTC IS CURRENT**
    1. Turn the Ignition ON, Engine not running.
    2. Record the Environmental Data for this DTC.
    3. With the scan tool, clear the DTC.
    4. Using the Environmental Data recorded earlier, try to duplicate the conditions in which the DTC set. It may be necessary to test drive the vehicle.
    5. With the scan tool, read ESM DTC's.

    Did the DTC reset?

    Yes

    - Using the schematics as a guide, check the ESM terminals for corrosion, damage or terminal push out. Pay particular attention to power and ground circuits. Check Service Information Tune-ups or Service Bulletins for possible causes that may apply. If no trouble is found, replace the Shift Lever Assembly. Refer to **SHIFTER, FLOOR CONSOLE, REMOVAL** .
    - Perform the ESM VERIFICATION TEST. Refer to **ESM VERIFICATION TEST**.

    No

    - Go To 2
2. **INTERMITTENT WIRING AND CONNECTORS**
    1. The conditions necessary to set this DTC are not present at this time.
    2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
    3. Wiggle the wiring and connectors while checking for any possible open or shorted circuits.
    4. Check for any Service Information Tune-ups or Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ESM VERIFICATION TEST. Refer to **ESM VERIFICATION TEST**.

No

- Test Complete.

P1C81-62-SHIFT LEVER POSITION INDETERMINATE - SIGNAL COMPARE FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 5: Gear Shift Module (GSM) / Electronic Shift Module (ESM) Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Gear Shift Module (GSM) / Electronic Shift Module (ESM) performs various internal tests to verify proper controller operation. This DTC indicates that there is a fault with the ESM circuitry or the ESM internal processor.

WHEN MONITORED

Continuously with the ignition in the run position.

SET CONDITION

The ESM controller detects a sensor mismatch error.

POSSIBLE CAUSES

Possible Causes
ELECTRONIC SHIFT MODULE (ESM) INTERNAL ERROR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK IF THE DTC IS CURRENT**
    1. Turn the Ignition ON, Engine not running.
    2. Record the Environmental Data for this DTC.
    3. With the scan tool, clear the DTC.
    4. Using the Environmental Data recorded earlier, try to duplicate the conditions in which the DTC set. It may be necessary to test drive the vehicle.
    5. With the scan tool, read ESM DTC's.

    Did the DTC reset?

    Yes

    - Using the schematics as a guide, check the ESM terminals for corrosion, damage or terminal push out. Pay particular attention to power and ground circuits. Check Service Information Tune-ups or Service Bulletins for possible causes that may apply. If no trouble is found, replace the Shift Lever Assembly. Refer to **SHIFTER, FLOOR CONSOLE, REMOVAL** .
    - Perform the ESM VERIFICATION TEST. Refer to **ESM VERIFICATION TEST**.

    No

    - Go To 2
2. **INTERMITTENT WIRING AND CONNECTORS**
    1. The conditions necessary to set this DTC are not present at this time.
    2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
    3. Wiggle the wiring and connectors while checking for any possible open or shorted circuits.
    4. Check for any Service Information Tune-ups or Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ESM VERIFICATION TEST. Refer to **ESM VERIFICATION TEST**.

No

- Test Complete.

P1C81-78-SHIFT LEVER POSITION INDETERMINATE - ALIGNMENT OR ADJUSTMENT INCORRECT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 6: Gear Shift Module (GSM) / Electronic Shift Module (ESM) Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Gear Shift Module (GSM) / Electronic Shift Module (ESM) performs various internal tests to verify proper controller operation. This DTC indicates that there is a fault with the ESM circuitry or the ESM internal processor.

WHEN MONITORED

Continuously with the ignition in the run position.

SET CONDITION

The ESM controller detects the Shift Lever in an invalid position.

POSSIBLE CAUSES

Possible Causes
BINDING SHIFT LEVER
ELECTRONIC SHIFT MODULE (ESM) INTERNAL ERROR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK IF THE DTC IS CURRENT**
    1. Turn the Ignition ON, Engine not running.
    2. Record the Environmental Data for this DTC.
    3. With the scan tool, clear the DTC.
    4. Using the Environmental Data recorded earlier, try to duplicate the conditions in which the DTC set. It may be necessary to test drive the vehicle.
    5. Attempt to move the shift lever out of the normal gate path several times.
    6. With the scan tool, read ESM DTC's.

    Did the DTC reset?

    Yes

    - Using the schematics as a guide, check the ESM terminals for corrosion, damage or terminal push out. Pay particular attention to power and ground circuits. Check Service Information Tune-ups or Service Bulletins for possible causes that may apply. If no trouble is found, replace the Shift Lever Assembly. Refer to **SHIFTER, FLOOR CONSOLE, REMOVAL** .
    - Perform the ESM VERIFICATION TEST. Refer to **ESM VERIFICATION TEST**.

    No

    - Go To 2
2. **INTERMITTENT WIRING AND CONNECTORS**
    1. The conditions necessary to set this DTC are not present at this time.
    2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

3. Wiggle the wiring and connectors while checking for any possible open or shorted circuits.
4. Check for any Service Information Tune-ups or Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the ESM VERIFICATION TEST. Refer to **ESM VERIFICATION TEST**.

   No

   - Test Complete.

P1C84-63-AUTOSTICK DISENGAGE FAILURE - CIRCUIT / COMPONENT PROTECTION TIME-OUT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 7: Gear Shift Module (GSM) / Electronic Shift Module (ESM) Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Gear Shift Module (GSM) / Electronic Shift Module (ESM) performs various internal tests to verify proper controller operation. This DTC indicates that there is a fault with the ESM circuitry or the ESM internal processor.

WHEN MONITORED

Continuously with the ignition in the run position.

SET CONDITION

The ESM controller detects the Autostick Upshift or Downshift switch stuck for more than 60 seconds.

POSSIBLE CAUSES

Possible Causes
AUTOSTICK UPSHIFT OR DOWNSHIFT SWITCH STUCK
ELECTRONIC SHIFT MODULE (ESM) INTERNAL ERROR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK IF THE DTC IS CURRENT**

NOTE: A vehicle operator leaning or pushing on the shift lever for more than 60 seconds could set this DTC.

1. Turn the Ignition ON, Engine not running.
2. Record the Environmental Data for this DTC.
3. With the scan tool, erase DTCs.
4. Using the Environmental Data recorded earlier, try to duplicate the conditions in which the DTC set. It may be necessary to test drive the vehicle.
5. Operate the Autostick in the upshift and downshift positions. Shift lever should return to normal position when released.
6. With the scan tool, read ESM DTC's.

Did the Shift Lever stick in either of the Autostick positions or did the DTC reset?

Yes

- Using the schematics as a guide, check the ESM terminals for corrosion, damage or terminal push out. Pay particular attention to power and ground circuits. Check Service Information Tune-ups or Service Bulletins for possible causes that may apply. If no trouble is found, replace the Shift Lever Assembly. Refer to **SHIFTER, FLOOR CONSOLE, REMOVAL** .
- Perform the ESM VERIFICATION TEST. Refer to **ESM VERIFICATION TEST**.

No

- Go To 2

2. **INTERMITTENT WIRING AND CONNECTORS**
    1. The conditions necessary to set this DTC are not present at this time.
    2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
    3. Wiggle the wiring and connectors while checking for any possible open or shorted circuits.
    4. Check for any Service Information Tune-ups or Technical Service Bulletins that may apply.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the ESM VERIFICATION TEST. Refer to **ESM VERIFICATION TEST**.

    No

    - Test Complete.

P1C86-1D-PRNDL DISPLAY - CIRCUIT CURRENT OUT OF RANGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 8: Gear Shift Module (GSM) / Electronic Shift Module (ESM) Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Gear Shift Module (GSM) / Electronic Shift Module (ESM) performs various internal tests to verify proper controller operation. This DTC indicates that there is a fault with the ESM circuitry or the ESM internal processor.

WHEN MONITORED

Continuously with the ignition in the run position.

SET CONDITION

The ESM controller detects an error with the PRNDL LED display.

POSSIBLE CAUSES

Possible Causes
ELECTRONIC SHIFT MODULE (ESM) HARNESS CONNECTORS
SHIFT LEVER ASSEMBLY BEZEL
ELECTRONIC SHIFT MODULE (ESM) INTERNAL ERROR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK IF THE DTC IS CURRENT**
    1. Turn the Ignition ON, Engine not running.
    2. Record the Environmental Data for this DTC.
    3. With the scan tool, erase DTCs.
    4. Remove the Shift Lever Assembly bezel and inspect the ESM connectors for proper installation.
    5. Using the Environmental Data recorded earlier, try to duplicate the conditions in which the DTC set. It may be necessary to test drive the vehicle.
    6. With the scan tool, read ESM DTC's.

    Did the DTC reset?

    Yes

    - Using the schematics as a guide, check the ESM terminals for corrosion, damage or terminal push out. Pay particular attention to power and ground circuits. Check Service Information Tune-ups or Service Bulletins for possible causes that may apply. If no trouble is found, replace the Shift Lever Bezel. Refer to **BEZEL, SHIFTER, REMOVAL** .
    - Clear DTCs and recheck for the DTC. If the DTC resets, replace the Shift Lever Assembly. Refer to **SHIFTER, FLOOR CONSOLE, REMOVAL** .
    - Perform the ESM VERIFICATION TEST. Refer to **ESM VERIFICATION TEST**.

    No

    - Go To 2

2. **INTERMITTENT WIRING AND CONNECTORS**
    1. The conditions necessary to set this DTC are not present at this time.
    2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
    3. Wiggle the wiring and connectors while checking for any possible open or shorted circuits.
    4. Check for any Service Information Tune-ups or Technical Service Bulletins that may apply.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the ESM VERIFICATION TEST. Refer to **ESM VERIFICATION TEST**.

    No

    - Test Complete.

P1C8B-16-BATTERY VOLTAGE - CIRCUIT VOLTAGE BELOW THRESHOLD

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 9: Gear Shift Module (GSM) / Electronic Shift Module (ESM) Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Electronic Shift Module (ESM) monitors battery voltage. The DTC sets if the monitored battery voltage drops below 8.0 volts and a temporary limp in will be activated. If the voltage rises above 8.0 volts, normal operations is resumed.

WHEN MONITORED

Continuously with the ignition in the run position.

SET CONDITION

When monitored battery voltage drops below 8.0 volts.

POSSIBLE CAUSES

Possible Causes
ELECTRONIC SHIFT MODULE (ESM)
VEHICLE CHARGING SYSTEM
ESM BATTERY CIRCUIT

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK FOR ENGINE CHARGING SYSTEM DTCS**
   1. With the scan tool, read Engine DTCs.

      Are any Engine Charging System DTCs present?

      Yes

      - Refer to the **DTC INDEX** article and perform the appropriate diagnostic procedure.
      - Perform the ESM VERIFICATION TEST. Refer to **ESM VERIFICATION TEST**.

      No

      - Go To 2
2. **CHECK ESM POWER CIRCUIT**
   1. Turn the Ignition OFF.
   2. Disconnect the ESM harness connector.
   3. Turn the Ignition ON, Engine not running.
   4. Using a 12-volt test light connected to ground, check the ESM battery power circuit in the Shift Lever Assembly harness connector.

      NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

      Does the test light illuminate brightly?

Yes

- Go To 3

No

- Repair the ESM power circuit for high resistance.
- Perform the ESM VERIFICATION TEST. Refer to **ESM VERIFICATION TEST**.

3. **CHECK GROUND CIRCUIT**
   1. Turn the Ignition OFF.
   2. Using a 12-volt test light connected to 12-volts, check the ESM ground circuit in the Shift Lever Assembly harness connector.

NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly?

Yes

- Go To 4

No

- Repair the ground circuit for high resistance.
- Perform the ESM VERIFICATION TEST. Refer to **ESM VERIFICATION TEST**.

4. **ELECTRONIC SHIFT MODULE**
   1. Reconnect all disconnected harness connectors.
   2. With the scan tool, erase ESM DTCs.
   3. Start the engine and raise the engine speed to 2, 000 rpm for 10 seconds.
   4. With the scan tool, read ESM DTCs.

Did the DTC reset?

Yes

- Using the schematics as a guide, check the Electronic Shift Module (ESM) terminals for corrosion, damage or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the ESM in accordance to the Service Information. Refer to **SHIFTER, FLOOR CONSOLE, REMOVAL** .
- Perform the ESM VERIFICATION TEST. Refer to **ESM VERIFICATION TEST**.

No

- Test Complete.

P1C8B-17-BATTERY VOLTAGE - CIRCUIT VOLTAGE ABOVE THRESHOLD

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 10: Gear Shift Module (GSM) / Electronic Shift Module (ESM) Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Electronic Shift Module (ESM) monitors ignition voltage. The DTC will set, if the monitored voltage is above 16.0 volts.

WHEN MONITORED

Continuously with the ignition in the run position.

SET CONDITION

When the monitored battery voltage rises above 16.0 volts.

POSSIBLE CAUSES

Possible Causes
CHARGING SYSTEM DTCS
VEHICLE WAS JUMP STARTED INCORRECTLY
SYSTEM VOLTAGE HIGH
ESM - INTERNAL ERROR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK FOR CHARGING SYSTEM DTCS**
   1. With the scan tool, read Engine DTCs.

      NOTE: This includes one trip faults.

      Are any Engine Charging System DTCs present?

      Yes

      - Refer to the **DTC INDEX** article and perform the appropriate diagnosis.
      - Perform the ESM VERIFICATION TEST. Refer to **ESM VERIFICATION TEST**.

      No

      - Go To 2
2. **VEHICLE WAS JUMP STARTED INCORRECTLY**
   1. Verify if the vehicle was jump started by another vehicle using a 24-volt charging system or incorrectly jump started with the 12 volt battery in series.

Was the vehicle jump started by another vehicle?

Yes

- This is the cause of the DTC. Clear the DTC and return the vehicle to the customer.
- Perform the ESM VERIFICATION TEST. Refer to **ESM VERIFICATION TEST**.

No

- Go To 3

3. **CHECK SYSTEM VOLTAGE**
   1. Start the engine and let idle for at least 10 seconds.
   2. With the scan tool, monitor system voltage.

   Is the system voltage above 16V for more than 5 seconds?

   Yes

   - **Refer to DIAGNOSIS AND TESTING** and perform the appropriate diagnosis.
   - Perform the ESM VERIFICATION TEST. Refer to **ESM VERIFICATION TEST**.

   No

   - Go To 4

4. **SHIFT LEVER ASSEMBLY**
   1. Reconnect all disconnected harness connectors.
   2. With the scan tool, erase ESM DTC's.
   3. Start the engine and raise the engine speed to 2, 000 rpm.
   4. With the scan tool, read ESM DTC's.

   Did the DTC reset?

   Yes

   - Replace the Shift Lever Assembly in accordance to the Service Information. Refer to **SHIFTER, FLOOR CONSOLE, REMOVAL** .
   - Perform the ESM VERIFICATION TEST. Refer to **ESM VERIFICATION TEST**.

   No

   - Test Complete.

U0001-00-CAN C BUS

Perform the COMMUNICATION PRE-DIAGNOSTIC PROCEDURE. Refer to **STANDARD PROCEDURE** .

U0100-87-LOST COMMUNICATION WITH ECM/PCM - MISSING MESSAGE

Perform the COMMUNICATION PRE-DIAGNOSTIC PROCEDURE. Refer to **STANDARD PROCEDURE** .

U0101-87-LOST COMMUNICATION WITH TCM-MISSING MESSAGE

Perform the COMMUNICATION PRE-DIAGNOSTIC PROCEDURE. Refer to **STANDARD PROCEDURE** .

U0140-87-LOST COMMUNICATION WITH BODY CONTROL MODULE-MISSING MESSAGE

Perform the COMMUNICATION PRE-DIAGNOSTIC PROCEDURE. Refer to **STANDARD PROCEDURE** .

U0401-86-IMPLAUSIBLE DATA RECEIVED FROM ECM/PCM-SIGNAL INVALID

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously with the ignition on.

One valid CAN message received at least once.

U0002-00-CAN C Bus Off Performance DTC is not present

SET CONDITION

Electronic Shift Module (ESM) detects an incorrect CAN message from the Powertrain Control Module (PCM).

POSSIBLE CAUSES

Possible Causes
ELECTRONIC SHIFT MODULE (ESM) CAN BUS DTCS
POWERTRAIN CONTROL MODULE (PCM) DTCS
ELECTRONIC SHIFT MODULE (ESM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the Ignition ON, Engine not running.
    2. With the scan tool, record and erase the DTCs.
    3. Cycle the Ignition from OFF to ON.
    4. With the scan tool, read the DTCs.

    Is the DTC active at this time?

    Yes

    - Go To 2

    No

    - Go To 4
2. **CHECK IF BODY CONTROL MODULE (BCM) CAN BUS DTCS ARE PRESENT**
    1. With the scan tool, read the BCM DTCs.

    Are there any BCM CAN BUS DTCs present?

    Yes

    - Perform the appropriate diagnostic procedure. Refer to **DIAGNOSTIC CODE INDEX** .

    No

    - Go To 3
3. **CHECK IF POWERTRAIN CONTROL MODULE (PCM) DTCS ARE PRESENT**
    1. With the scan tool, read PCM DTCs.

    Are there any PCM DTCs present?

    Yes

    - Perform the appropriate diagnostic procedure. Refer to the **DTC INDEX** article .

    No

    - Using the schematics as a guide, check the Electronic Shift Module (ESM) terminals and connectors for corrosion, damage or pushed out terminals. Pay particular attention to the power and ground circuits. If no problems are found, replace the ESM. Refer to **SHIFTER, FLOOR CONSOLE, REMOVAL** .
    - Perform the ESM VERIFICATION TEST. Refer to **ESM VERIFICATION TEST**.

4. **INTERMITTENT WIRING AND CONNECTORS**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
    2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
    3. Look for the data to change or for the DTC to reset during the wiggle test.
    4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
    5. Look for the data to change other than as expected or for the DTC to reset.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the ESM VERIFICATION TEST. Refer to **ESM VERIFICATION TEST**.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time.

U0402-86-IMPLAUSIBLE DATA RECEIVED FROM TCM - SIGNAL INVALID

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously with the ignition on.

One valid CAN message received at least once

U0002-00-CAN C Bus Off Performance DTC not present.

SET CONDITION

Electronic Shift Module (ESM) detects an incorrect CAN message from the Transmission Control Module (TCM).

POSSIBLE CAUSES

Possible Causes
ELECTRONIC SHIFT MODULE (ESM) CAN BUS DTCS
TRANSMISSION CONTROL MODULE (TCM) DTCS
ELECTRONIC SHIFT MODULE (ESM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the Ignition ON, Engine not running.
    2. With the scan tool, record and erase the DTCs.
    3. Cycle the Ignition from OFF to ON.
    4. With the scan tool, read the DTCs.

    Is the DTC active at this time?

    Yes

    - Go To 2

    No

    - Go To 4
2. **CHECK IF BODY CONTROL MODULE (BCM) CAN BUS DTCS ARE PRESENT**
    1. With the scan tool, read the BCM DTCs.

    Are there any BCM CAN BUS DTCs present?

    Yes

    - Perform the appropriate diagnostic procedure. Refer to **DIAGNOSTIC CODE INDEX** .

    No

    - Go To 3
3. **CHECK IF TRANSMISSION CONTROL MODULE (TCM) DTCS ARE PRESENT**
    1. With the scan tool, read TCM DTCs.

    Are there any TCM DTCs present?

    Yes

    - Perform the appropriate diagnostic procedure. Refer to **DIAGNOSTIC CODE INDEX** .

    No

    - Using the schematics as a guide, check the Electronic Shift Module (ESM) terminals and

connectors for corrosion, damage or pushed out terminals. Pay particular attention to the power and ground circuits. If no problems are found, replace the ESM. Refer to **SHIFTER, FLOOR CONSOLE, REMOVAL** .

- Perform the ESM VERIFICATION TEST. Refer to **ESM VERIFICATION TEST**.

4. **INTERMITTENT WIRING AND CONNECTORS**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
   2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
   3. Look for the data to change or for the DTC to reset during the wiggle test.
   4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
   5. Look for the data to change other than as expected or for the DTC to reset.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the ESM VERIFICATION TEST. Refer to **ESM VERIFICATION TEST**.

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time.

U0422-86-IMPLAUSIBLE DATA RECEIVED FROM BODY CONTROL MODULE - SIGNAL INVALID

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously with the ignition on.

One valid CAN message received at least once

U0002-00-CAN C Bus Off Performance DTC not present.

SET CONDITION

Electronic Shift Module (ESM) detects an incorrect CAN message from the Body Control Module (BCM).

POSSIBLE CAUSES

Possible Causes
ELECTRONIC SHIFT MODULE (ESM) CAN BUS DTCS
BODY CONTROL MODULE (BCM) DTCS
ELECTRONIC SHIFT MODULE (ESM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the Ignition ON, Engine not running.
    2. With the scan tool, record and erase the DTCs.
    3. Cycle the Ignition from OFF to ON.
    4. With the scan tool, read the DTCs.

    Is the DTC active at this time?

    Yes

    - Go To 2

    No

    - Go To 3
2. **CHECK IF BODY CONTROL MODULE (BCM) DTCS ARE PRESENT**
    1. With the scan tool, read the BCM DTCs.

    Are there any BCM DTCs present?

    Yes

    - Perform the appropriate diagnostic procedure. Refer to **DIAGNOSTIC CODE INDEX** .

    No

    - Using the schematics as a guide, check the Electronic Shift Module (ESM) terminals and connectors for corrosion, damage or pushed out terminals. Pay particular attention to the power and ground circuits. If no problems are found, replace the ESM. Refer to **SHIFTER, FLOOR CONSOLE, REMOVAL** .
    - Perform the ESM VERIFICATION TEST. Refer to **ESM VERIFICATION TEST**.
3. **INTERMITTENT WIRING AND CONNECTORS**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.

2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
3. Look for the data to change or for the DTC to reset during the wiggle test.
4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
5. Look for the data to change other than as expected or for the DTC to reset.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ESM VERIFICATION TEST. Refer to **ESM VERIFICATION TEST**.

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time.

STANDARD PROCEDURE

PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Perform the following pre-diagnostic troubleshooting procedures prior to performing any diagnostic test.

NOTE: Due to different power control configurations, the Transmission Control Relay (if equipped) may be referred to as a PCM relay.

NOTE: Incorrect fluid level, and/or poor fluid condition can be the cause of many transmission problems. Visually inspect the transmission and cooler lines for leakage and repair as necessary. Adjust the transmission fluid level according to Service Information.

Always perform diagnostics with a fully charged battery to avoid false symptoms.

1. With the scan tool, read the engine DTCs. Check and repair all engine DTCs prior to performing transmission symptom diagnostic procedures.
2. With the scan tool, read and record all transmission DTCs. Record the controller software version and variant ID (configuration or level).

NOTE: Check for Service Information Tune-ups or Technical Service Bulletins (TSB) that may apply.

NOTE: If the TCM detects and stores a DTC, the TCM also stores the vehicles operating conditions under which the DTC originally set. Using a scan tool this information is located under Environmental Data. Before erasing any stored DTCs, it is recommended to record all available data to assist in troubleshooting and duplicating the conditions and in which the DTC set.

3. Verify the current software level of transmission controller. Various problems are corrected by software upgrades (flash) to the transmission controller.

NOTE: If TCM software updates are performed, all DTC information (Environmental Data) will be lost.

4. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors to all components related to the transmission and shift lever assembly. Clean and repair as necessary.
5. Most DTCs set on start up but some may only set by driving the vehicle. Note the when monitored and set conditions of the reported DTC. If variant DTCs are present, perform their respective test first.
6. Verify the axle ratio and transfer case ratio.

Did any of the above procedures repair the vehicle?

Yes

- Testing is complete.
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **TRANSMISSION VERIFICATION TEST-948TE** .

No

- Refer to **DIAGNOSTIC CODE INDEX** and perform the appropriate diagnostic procedure.

ESM VERIFICATION TEST

To validate the repair(s) that fixed the vehicle, perform the following steps.

1. Reconnect any disconnected components.
2. Connect the scan tool to the Data Link Connector.
3. With the scan tool, erase ABS DTCs.
4. With the scan tool, erase PCM DTCs.
5. With the scan tool, erase ESM DTCs.
6. With the scan tool, erase TCM DTCs.

CAUTION: Apply the parking brake.

7. With the scan tool, display the Transmission Temperature. Start and run the engine until the transmission temperature is above 43° C (110° F).
8. If internal transmission components were repaired or replaced check the transmission fluid and adjust if necessary. Refer to the CHECK OIL LEVEL procedure. Refer to **FLUID AND FILTER, STANDARD PROCEDURE** .
9. If internal transmission repairs are performed or the Transmission Control Module (TCM) is replaced, perform a TCM ADAPTATION procedure. Refer to **TCM ADAPTATION-948TE AND 9HP48** .
10. After performing the above procedures, perform the "**Road Test Procedure** " below.

ROAD TEST PROCEDURE

1. Road test the vehicle. Make fifteen to twenty upshifts so all gear ranges are complete.
2. Perform these shifts from a standing start to 72 Km/h (45 mph) with a constant throttle opening of 20 to 25 degrees.
3. With speeds below 40 Km/h (25 mph), make five to eight wide open throttle kickdowns to 1st gear. Allow at least 5 seconds each in 2nd and 3rd gear between each kickdown.
4. With the scan tool, read DTCs.

Did any DTCs set?

Yes

- Refer to the **DTC INDEX** article and perform the appropriate diagnostic procedure.

No

- Testing is complete.

2014 AUTOMATIC TRANSMISSION

Transmission Control Module (TCM) - Electrical Diagnostics, 948TE - Cherokee

DIAGNOSIS AND TESTING

P0219-00-ENGINE OVERSPEED

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 1: TCM System Voltage Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

This diagnostic monitors the Input (Turbine) Speed Sensor signal and engine speed signal via CAN in order to detect conditions that could indicate a transmission that is slipping or does not engage a gear properly. This diagnostic monitors for these conditions while the transmission is in a fixed gear and during shift events. Under certain conditions, an Engine mechanical problem can cause this DTC to set.

WHEN MONITORED

In Fixed Gear

Gear position must be in Drive or Reverse.

At a Gear Shift Request

Gear position must be in Drive or Reverse.

SET CONDITION

In Fixed Gear

The failure is detected if the engine speed is greater than a threshold for a calibrated amount of time.

At a Gear Shift Request

The failure is detected if the calculated input speed of the target gear, i.e. the actual output speed, target gear ratio, is greater than a calibrated threshold for a calibrated amount of time.

POSSIBLE CAUSES

Possible Causes
MECHANICAL ENGINE PROBLEM
MECHANICAL TRANSMISSION PROBLEM
TCM - INTERNAL ERROR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK FOR OTHER TRANSMISSION DTCS**
    1. With the scan tool, check for other transmission DTCs.

       Are any gear ratio and/or speed sensor DTCs present in addition to DTC P0219?

       Yes

       - Refer to **DIAGNOSTIC CODE INDEX** .

       No

       - Go To 2
2. **CHECK FOR ENGINE DTCS**

1. With the scan tool, check for engine DTCs.

   Are any engine DTCs present?

   Yes

   - Refer to the **DTC INDEX** article .

   No

   - Go To3

3. **CHECK IF ENGINE MECHANICAL PROBLEMS ARE PRESENT**
   1. Determine if any Engine mechanical problems are present.

      Are any Engine mechanical problems present?

      Yes

      - Repair engine as necessary. Refer to the applicable ENGINE-SERVICE INFORMATION for the appropriate repair procedures.
      - Perform TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 4

4. **CHECK IF TRANSMISSION MECHANICAL PROBLEMS ARE PRESENT**
   1. Check transmission fluid level and check for leaks if necessary.
   2. Determine if any Transmission mechanical problems are present.
   3. Turn the ignition OFF.
   4. Remove the Transmission Oil Pan and inspect for excessive debris or a plugged Transmission Oil Filter.

      Is there any fluid leaks, debris, plugged Transmission Oil Filter, or signs of an internal transmission problem?

      Yes

      - Repair Transmission as necessary.
      - Perform TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To5

5. **TEST DRIVE THE VEHICLE**

NOTE: The Engine and Transmission must not have mechanical problems and be operating normally before proceeding with this test.

1. With the scan tool, erase Transmission DTCs.
2. Road test the vehicle.
3. With the scan tool, read Transmission DTCs.

Did DTC P0219-ENGINE OVERSPEED reset?

Yes

NOTE: If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.

- Using the schematics as a guide, check the Transmission Control Module (TCM) terminals and connectors for corrosion, damage or pushed out terminals. Pay particular attention to the power and ground circuits. If no problems are found, replace the TCM and perform programming and PROXI Configuration Alignment procedures. Refer to **MODULE, TRANSMISSION CONTROL, REMOVAL** .
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Test Complete.
- Perform TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

P0562-00-SYSTEM VOLTAGE LOW

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 2: TCM System Voltage Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Transmission Control Module (TCM) monitors the system voltage level at the TCM supply voltage pin for the following failure conditions:

- System Voltage Excessively Low

- System Voltage Low
- System Voltage High

If the TCM supply voltage is below a threshold that is lower than the system voltage excessively low threshold, then the solenoid valves and pressure regulators are not powered.

WHEN MONITORED

Transmission solenoid valves and pressure regulators are powered on.

Engine speed via CAN message from PCM is greater than a calibrated value.

SET CONDITION

The failure is detected if the system voltage is less than a calibrated threshold for a calibrated amount of time.

POSSIBLE CAUSES

Possible Causes
FUSE
LOW BATTERY VOLTAGE
ENGINE CHARGING SYSTEM
BATTERY VOLTAGE CIRCUIT HIGH RESISTANCE
TCM - INTERNAL ERROR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK FOR RELATED CHARGING SYSTEM DTCS**
    1. With the scan tool, read the Engine DTCs.

       Are there any Charging System related DTCs present?

       Yes

       - Refer to the **DTC INDEX** article and repair any Charging System DTCs before proceeding. After repairing the Charging System DTCs, perform the Transmission Verification test to verify the transmission and or controller was not damaged.
       - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

       No

- Go To 2

2. **CHECK IF DTC IS CURRENT**
   1. With the scan tool, read TCM DTCs.
   2. Record the Environmental Data and any DTCs.
   3. With the scan tool, erase DTCs.
   4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
   5. With the scan tool, read TCM DTCs.

   Did the DTC reset?

   Yes

   - Go To 3.

   No

   - Go To 4.

3. **CHECK POWER SUPPLY CIRCUIT**
   1. Turn the Ignition OFF.
   2. Disconnect the TCM C1 harness connector.
   3. Turn the Ignition ON, Engine not running.
   4. Measure the voltage of the (A190) battery circuit.

   Is the voltage above 9 volts?

   Yes

   NOTE: **If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.**

   - Using the schematics as a guide, check the Transmission Control Module (TCM) terminals and connectors for corrosion, damage or pushed out terminals. Pay particular attention to the power and ground circuits. If no problems are found, replace the TCM and perform programming and PROXI Configuration Alignment procedures. Refer to **MODULE, TRANSMISSION CONTROL, REMOVAL** .
   - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

- Repair the (A190) battery circuit for an open or high resistance.
- Perform the TRANSMISSION VERIFICATION TEST.

  Refer to **STANDARD PROCEDURE** .

4. **CHECK WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. Check for any Service Bulletins that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Test complete.

P0563-00-SYSTEM VOLTAGE HIGH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 3: TCM System Voltage Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Transmission Control Module (TCM) monitors the system voltage level at the TCM supply voltage pin for the following failure conditions:

- System Voltage Excessively Low

- System Voltage Low
- System Voltage High

If the TCM supply voltage is below a threshold that is lower than the system voltage excessively low threshold, then the solenoid valves and pressure regulators are not powered.

WHEN MONITORED

Transmission solenoid valves and pressure regulators are powered on.

No jump start detected.

TCM supply voltage is greater than a calibrated value after TCM power up for a calibrated amount of time.

Transmission range switch is in Drive or Reverse position.

SET CONDITION

The failure is detected if the system voltage is greater than a calibrated threshold for a calibrated amount of time.

POSSIBLE CAUSES

Possible Causes
CHARGING SYSTEM OVERCHARGE CONDITION JUMP START OFF A 24 VOLT SYSTEM TCM - INTERNAL ERROR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK FOR CHARGING SYSTEM DTCS**
    1. With the scan tool, read engine DTCs.

        NOTE: This includes any one trip faults.

        Are any engine charging system DTCs present?

        Yes

        - Repair any charging system DTCs before proceeding. After repairing the Charging System, perform the transmission verification test to verify the Transmission and or TCM was not damaged. Refer to **STANDARD PROCEDURE** .

No

- Go To 2

2. **CHECK IF VOLTAGE IS GREATER THAN 16 VOLTS**
   1. Start the Engine and raise the engine speed to 2, 000 rpm.
   2. With the scan tool, monitor the transmission system voltage for 60 seconds.

   Does the transmission system voltage read greater than 16 volts?

   Yes

   - Go To 4

   No

   - Go To 3

3. **VERIFY IF THE VEHICLE WAS JUMP STARTED WITH 24-VOLT SYSTEM**
   1. Verify the vehicle was jump started by another vehicle using a 24-Volt Charging System.

   Was the vehicle jump started by another vehicle using a 24-Volt Charging System?

   Yes

   - This is the cause of the DTC. Erase the DTC and return the vehicle to the customer.
   - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 4

4. **CHECK BATTERY VOLTAGE**
   1. Start the Engine and raise the engine speed to 2, 000 rpm.
   2. With the Scan Tool, read the transmission system voltage.
   3. With a voltmeter, measure the battery voltage at the Battery.
   4. Compare the readings.

   Does the voltmeter reading match the scan tool reading?

   Yes

   - Repair the Charging System for an over charging condition. After repairing the Charging System, perform the TRANSMISSION VERIFICATION TEST to verify the Transmission and or TCM was not damaged.

- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

NOTE: If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.

- Using the schematics as a guide, check the TCM Connector Terminals for corrosion, damage or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the TCM and perform programming and PROXI Configuration Alignment procedures. Refer to **MODULE, TRANSMISSION CONTROL, REMOVAL** .
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

P0601-00-INTERNAL CONTROL MODULE MEMORY CHECKSUM ERROR

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The purpose of the diagnostic is to monitor the validity of the Read Only Memory (ROM) flash memory. A Cyclic Redundancy Check (CRC) checksum is calculated for each memory block of the flash memory and compared with the stored reference checksum. There is a different stored reference checksum for each memory block. If the checksum rationality check of the last memory block has finished, the calculation starts all over again beginning with the first memory block.

WHEN MONITORED

Ignition On.

TCM initialization has completed.

SET CONDITION

The failure is detected if the calculated checksum does not match the stored reference checksum for any of the memory blocks.

POSSIBLE CAUSES

POSSIBLE CAUSES
TRANSMISSION CONTROL MODULE (TCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

CHECK IF TCM IS FLASHABLE

1. With the scan tool, record the vehicles controller part number.
2. Select Use Controller Part Number under the Flash Tab.
3. Flash the controller with the correct software.

Were you able to update (flash) the controller successfully?

Yes

- Test Complete.
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

NOTE: **If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.**

- Using the schematics as a guide, check the Transmission Control Module (TCM) terminals and connectors for corrosion, damage or pushed out terminals. Pay particular attention to the power and ground circuits. If no problems are found, replace the TCM and perform programming and PROXI Configuration Alignment procedures. Refer to **MODULE, TRANSMISSION CONTROL, REMOVAL** .
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

P0610-00-ECU VEHICLE OPTIONS MISMATCH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The purpose of the diagnostic is to detect an incorrect Vehicle Identification Number (VIN) stored in the TCM. This diagnostic compares the VIN stored in the TCM to the VIN received via CAN.

WHEN MONITORED

Ignition switch is on.

SET CONDITION

The VIN stored in the TCM is not equal to the VIN received via CAN.

POSSIBLE CAUSES

Possible Causes
USED CONTROLLER INSTALLED WITH WRONG CONFIGURATION
BODY CONTROL MODULE (BCM) NOT PROPERLY PROGRAMED OR WAS REPLACED AND NOT PROGRAMED
TCM NOT PROPERLY PROGRAMED OR WAS REPLACED AND NOT PROGRAMED
TCM - INTERNAL ERROR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK IF THE DTC IS ACTIVE**
   1. With the scan tool, read transmission DTCs.

      Is the status Active for this DTC?

      Yes

      - Go To 2

      No

      - Go To 4
2. **CHECK THE BCM**

   Has the BCM been reprogrammed or replaced without being programed?

   Yes

   - Program the BCM if not programed. With the scan tool perform the proxi update procedure.
   - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 3
3. **CHECK THE TCM**

   Has the TCM been recently replaced with a new or used controller?

Yes

- With the scan tool perform a TCM proxi relearn.
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

NOTE: If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.

- With the scan tool perform a TCM proxi relearn and recheck for DTC. If DTC reset and using the schematics as a guide, check the TCM terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Check for any Service Bulletins for possible causes that may apply. If no problems are found, replace the TCM and perform programming and PROXI Configuration Alignment procedures. Refer to **MODULE, TRANSMISSION CONTROL, REMOVAL** .
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Test Complete.

P0613-00-INTERNAL TRANSMISSION PROCESSOR

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The purpose of the diagnostic is to check if the Analog to Digital Converter (ADC), which is included as part of the microcontroller in the TCM, is functioning properly. The monitoring consists of the following three separate

checks:

1. **Sampling check:**

   The RAM area used by the ADC is checked to determine if samples have been stored, overwriting the known data stored during TCM initialization.

2. **Out of range check:**

   The sampled voltages in the ADC are checked to be within a valid operating range.

3. **Rationality check:**

   The microcontroller generates multiple control voltages, which are sampled by the ADC. The sampled voltages are compared to the control voltages.

.

WHEN MONITORED

TCM is powered.

TCM initialization has completed.

SET CONDITION

The failure is detected if one of the following occurs:

- No samples have been stored overwriting the known data stored during TCM initialization.
- The sampled voltages are not within a valid operating range.
- The sampled voltages do not equal the control voltages generated by the microcontroller.

POSSIBLE CAUSES

Possible Causes
TCM - INTERNAL ERROR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

TRANSMISSION CONTROL MODULE

View repair

Repair

NOTE: If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.

- Using the schematics as a guide, check the Transmission Control Module (TCM) terminals and Transmission Assembly connectors for corrosion, damage or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, Replace the TCM and perform programming and PROXI Configuration Alignment procedures. Refer to **MODULE, TRANSMISSION CONTROL, REMOVAL** .
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

P061B-00-INTERNAL CONTROL MODULE TORQUE CALCULATION PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 4: TCM System Voltage Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The purpose of the diagnostic is to monitor the positive engine torque request calculation in the TCM and the engine response resulting from the positive engine torque request. This diagnostic includes the following checks:

- Rationality check of the engine torque request
- Rationality check of the engine torque request magnitude
- Rationality check of speed gradients during gearshifts

WHEN MONITORED

Rationality check of the positive engine torque request:

- Ignition On

Rationality check of the positive engine torque request magnitude:

- Ignition On
- No gearshift in progress
- Driver request is not in PARK or NEUTRAL

Rationality check of speed gradients during gearshifts:

- Ignition On
- No gearshift in progress
- Driver request is not in PARK or NEUTRAL
- Positive engine request active

SET CONDITION

Rationality check of the positive engine torque request: A fault is detected if a positive or negative engine torque request is sent via CAN and no positive or negative torque request was calculated by the shift control software.

Rationality check of the positive engine torque request magnitude: A fault is detected if the actual calculated engine torque request and the delivered engine torque request sent via CAN are both greater than a first threshold for a calibrated amount of time or if the actual calculated engine torque and the delivered engine torque request sent via CAN are both greater than a second threshold for a calibrated amount of time. Depending on the torque request magnitude, two different torque thresholds and two different filtering times are used. For example, if the torque request is high, a short filtering time is used or if the torque request is low, a long filtering time is used.

Rationality check of speed gradients during gearshifts: A fault is detected if the difference between the actual input speed gradient and the actual output speed gradient multiplied by the actual gear ratio is lower than a calibrated threshold.

POSSIBLE CAUSES

Possible Causes

ENGINE DTCS
ENGINE MECHANICAL
TRANSMISSION CONTROL MODULE (TCM - INTERNAL ERROR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURES .

DIAGNOSTIC TEST

1. **CHECK IF DTC IS CURRENT**
    1. With the scan tool, read TCM DTCs.
    2. Record the Environmental Data and any DTCs.
    3. With the scan tool, erase DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. With the scan tool, read TCM DTCs.

    Did the DTC reset?

    Yes

    - Go To 2.

    No

    - Go To 5.
2. **CHECK FOR ENGINE DTCS**
    1. With the scan tool, check for engine DTCs.

    Are any engine DTCs present?

    Yes

    - Refer to the **DTC INDEX** article .

    No

    - Go To3
3. **CHECK IF ENGINE MECHANICAL PROBLEMS ARE PRESENT**
    1. Determine if any Engine mechanical problems are present.

    Are any Engine mechanical problems present?

    Yes

- Repair engine as necessary. Refer to the applicable ENGINE-SERVICE INFORMATION for the appropriate repair procedures.
- Perform TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 4

4. **PROGRAM PCM AND TCM**
   1. With the scan tool, record the vehicles controller part number.
   2. Select Use Controller Part Number under the Flash Tab.
   3. Flash the TCM and PCM with the latest software

   Were you able to program (flash) the PCM and TCM successfully?

   Yes

   - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   NOTE: **If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.**

   - Using the schematics as a guide, check the Transmission Control Module (TCM) terminals and connectors for corrosion, damage or pushed out terminals. Pay particular attention to the power and ground circuits. If no problems are found, replace the TCM and perform programming and PROXI Configuration Alignment procedures. Refer to **MODULE, TRANSMISSION CONTROL, REMOVAL** .
   - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **CHECK WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. Check for any Service Bulletins that may apply.

   Were there any problems found?

   Yes

- Repair as necessary.
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Test complete.

P062F-00-INTERNAL CONTROL MODULE EEPROM ERROR

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 5: TCM System Voltage Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The purpose of the diagnostic is to detect data failures in the EEPROM address space following read and write operations. The EEPROM is sub divided into two sector groups (SG). Each SG is divided into separate channels. The channels are controlled by the corresponding software component (e.g. diagnostic event handler). Each software component has a mechanism using either a Cyclic Redundancy Check (CRC) or a redundant

complement to recognize the validity of the data stored.

WHEN MONITORED

An EEPROM read or write operation has occurred.

SET CONDITION

The failure is detected if one of the following conditions occur:

- The read data or write data does not correspond to the associated CRC checksum.
- The read data or write data does not correspond to the associated complement.

POSSIBLE CAUSES

Possible Causes
TCM - INTERNAL ERROR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

NOTE: If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.

- Using the schematics as a guide, check the Transmission Control Module (TCM) terminals and Transmission Assembly connectors for corrosion, damage or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, Replace the TCM and perform programming and PROXI Configuration Alignment procedures. Refer to **MODULE, TRANSMISSION CONTROL, REMOVAL** .
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

P0631-00-VIN NOT PROGRAMMED OR INCOMPATIBLE TCM

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The purpose of the diagnostic is to detect incorrect TCM configuration (calibration data) stored in the TCM. This diagnostic compares the Vehicle Identification Number (VIN) stored in the TCM to the VIN received via CAN. It is assumed that the correct transmission has been installed in the vehicle.

WHEN MONITORED

Ignition on.

SET CONDITION

The VIN received via CAN message does not match the VIN stored in the TCM.

POSSIBLE CAUSES

Possible Causes
TRANSMISSION CONTROL MODULE (TCM) IS NOT PROGRAMMED PROPERLY
TRANSMISSION CONTROL MODULE (TCM) INSTALLED FROM ANOTHER VEHICLE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

CHECK TCM PROGRAMMING

NOTE: This DTC is set when a TCM from another vehicle is installed or a new TCM is installed into the current vehicle.

1. Perform programming and PROXI Configuration Alignment procedures. Refer to **MODULE, TRANSMISSION CONTROL, REMOVAL** .
2. Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   Did the TCM pass the TRANSMISSION VERIFICATION TEST?

   Yes

   - Test complete.

   No

   NOTE: If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool

for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.

- Using the schematics as a guide, check the Transmission Control Module (TCM) terminals and connectors for corrosion, damage or pushed out terminals. Pay particular attention to the power and ground circuits. If no problems are found, replace the TCM and perform programming and PROXI Configuration Alignment procedures. Refer to **MODULE, TRANSMISSION CONTROL, REMOVAL** .
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

P0634-00-PCM-ECM-TCM INTERNAL TEMPERATURE TOO HIGH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 6: TCM System Voltage Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The purpose of the diagnostic is to detect an over temperature of the TCM to protect the TCM hardware.

WHEN MONITORED

TCM is powered ON.

TCM initialization is completed.

SET CONDITION

Temperature measured on the printed circuit board of the TCM is greater than a calibrated threshold.

POSSIBLE CAUSES

Possible Causes
TCM INTERNAL ERROR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

P0643-00-SENSOR REFERENCE VOLTAGE 1 CIRCUIT HIGH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 7: Power & Ground, Temperature, Oil Pressure And Speed Sensors Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The purpose of the diagnostic is to detect circuit failures on the sensor supply voltage. The 9 volt sensor supply voltage is used by the Input and Output Speed Sensors and the Transmission Range Switch (TRS) in the Transmission. The monitoring is performed internal to the TCM by evaluating the sensor supply voltage output level to detect short to battery, short to ground or open circuit failures.

WHEN MONITORED

Battery voltage is greater than a calibrated threshold.

SET CONDITION

The failure is detected if one of the following conditions occur:

- A short to battery voltage failure is detected if the sensor supply voltage is greater than 9.6 volts for a calibrated amount of time.
- A short to ground or open circuit failure is detected if the sensor supply voltage is less than 3.4 volts for a calibrated amount of time.
- A failure is detected if both the input and output speed sensors are reporting an electrical failure within a fixed amount of time.

POSSIBLE CAUSES

Possible Causes
(T69) 9-VOLT SUPPLY CIRCUIT OPEN
(T69) 9-VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE
(T69) 9-VOLT SUPPLY CIRCUIT SHORTED TO GROUND
TRANSMISSION RANGE SENSOR (TRS) - INTERNAL ERROR
OUTPUT SHAFT SPEED SENSOR
INPUT (TURBINE) SPEED SENSOR
TCM - INTERNAL ERROR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK IF DTC IS CURRENT**
    1. With the scan tool, read TCM DTCs.
    2. Record the Environmental Data and any DTCs.
    3. With the scan tool, erase DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. With the scan tool, read TCM DTCs.

    Did the DTC reset?

    Yes

    - Go To 2.

No

- Go To 5.

2. **CHECK 9-VOLT SUPPLY CIRCUIT OPERATION**
   1. Turn the Ignition OFF.
   2. Disconnect the Transmission Assembly harness connector.
   3. Turn the Ignition ON, Engine not running.
   4. Measure the voltage between the (T69) 9-Volt Supply circuit and ground.

   Is the voltage between 3.4 and 9.6 volts?

   Yes

   - Replace the Lead Frame assembly in accordance with the Service Information.
   - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 3.

3. **CHECK 9-VOLT SUPPLY CIRCUIT FOR A SHORT TO GROUND OR A SHORT TO ANOTHER CIRCUIT**
   1. Turn the Ignition OFF.
   2. Disconnect the TCM harness connector.
   3. Measure the resistance between (T69) 9-Volt Supply circuit and ground.
   4. Measure the resistance between (T69) 9-Volt Supply circuit and all other circuits in the TCM harness connector.

   Is there continuity between the (T69) 9-Volt Supply circuit and ground or another circuit in the TCM harness connector?

   Yes

   - Repair the (T69) 9-Volt Supply circuit for a short to ground or a short to another circuit in the TCM harness.
   - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 4

4. **CHECK 9-VOLT SUPPLY CIRCUIT FOR AN OPEN**
   1. Measure the resistance of (T69) 9-Volt Supply circuit between the TCM harness connector and the

Transmission Assembly harness connector.

Is the resistance below 5.0 ohms?

Yes

NOTE: If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.

- Using the schematics as a guide, check the Transmission Control Module (TCM) terminals and connectors for corrosion, damage or pushed out terminals. Pay particular attention to the power and ground circuits. If no problems are found, replace the TCM and perform programming and PROXI Configuration Alignment procedures. Refer to **MODULE, TRANSMISSION CONTROL, REMOVAL** .
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Repair the (T69) 9-Volt Supply circuit for an open.
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **CHECK WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. Check for any Service Bulletins that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Test complete.

P064F-00-UNAUTHORIZED SOFTWARE-CALIBRATION DETECTED

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The purpose of the diagnostic is to detect if the internal part numbers of the TCM software, calibration, and hardware do not correlate.

WHEN MONITORED

TCM is powered ON.

TCM is initializing.

SET CONDITION

Internal part numbers of the software, calibration, and hardware do not correlate.

POSSIBLE CAUSES

Possible Causes
WRONG TCM SOFTWARE/CALIBRATION INSTALLED

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK IF DTC IS CURRENT**
    1. With the scan tool, read TCM DTCs.
    2. Record the Environmental Data and any DTCs.
    3. With the scan tool, erase DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. With the scan tool, read TCM DTCs.

    Did the DTC reset?

    Yes

    - Using the schematics as a guide, check the Transmission Control Module (TCM) terminals and connectors for corrosion, damage or pushed out terminals. Pay particular attention to the power and ground circuits. If no problems are found, reprogram the TCM and perform the PROXI Configuration Alignment procedures. Refer to **MODULE, TRANSMISSION CONTROL, REMOVAL** .
    - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD**

PROCEDURE .

No

- Go To 2

2. **CHECK WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. Check for any Service Bulletins that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Test complete.

P0653-00-SENSOR REFERENCE VOLTAGE 2 CIRCUIT HIGH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 8: Power & Ground, Temperature, Oil Pressure And Speed Sensors Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The purpose of the diagnostic is to detect circuit failures on the sensor supply voltage. The 5 volt sensor supply voltage is used by the oil pressure sensor in the transmission. The monitoring is performed internal to the TCM by evaluating the sensor supply voltage output level to detect short to battery, short to ground, or open circuit failures.

WHEN MONITORED

Battery voltage is above a calibrated value.

SET CONDITION

The failure is detected if one of the following conditions occur:

- A short to battery voltage failure is detected if the sensor supply voltage is greater than a calibrated threshold for a calibrated amount of time.
- A short to ground or open circuit failure is detected if the sensor supply voltage is lower than a calibrated threshold for a calibrated amount of time.

POSSIBLE CAUSES

Possible Causes
(T376) 5-VOLT SUPPLY CIRCUIT OPEN
(T376) 5-VOLT SUPPLY CIRCUIT SHORT TO GROUND
(T376) 5-VOLT SUPPLY CIRCUIT SHORT TO VOLTAGE
TRANSMISSION OIL PRESSURE SENSOR
TCM - INTERNAL ERROR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK IF DTC IS CURRENT**
    1. With the scan tool, read TCM DTCs.
    2. Record the Environmental Data and any DTCs.
    3. With the scan tool, erase DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. With the scan tool, read TCM DTCs.

    Did the DTC reset?

    Yes

    - Go To 2

    No

    - Go To 8

2. **CHECK 5-VOLT SUPPLY CIRCUIT OPERATION**
    1. Turn the Ignition OFF.
    2. Disconnect the Transmission Assembly harness connector.
    3. Turn the Ignition ON, Engine not running.
    4. Measure the voltage between the (T376) 5-Volt Supply circuit and ground.

    Is the voltage between 4.7 and 5.3 volts?

    Yes

    - Go To 5

    No

    - Go To 3
3. **CHECK 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO GROUND OR A SHORT TO ANOTHER CIRCUIT**
    1. Turn the Ignition OFF.
    2. Disconnect the TCM harness connector.
    3. Measure the resistance between (T376) 5-Volt Supply circuit and ground.
    4. Measure the resistance between (T376) 5-Volt Supply circuit and all other circuits in the TCM harness connector.

    Is there continuity between the (T376) 5-Volt Supply circuit and ground or another circuit in the TCM harness connector?

    Yes

    - Repair the (T376) 5-Volt Supply circuit for a short to ground or a short to another circuit in the TCM harness.
    - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

    No

    - Go To 4
4. **CHECK 5-VOLT SUPPLY CIRCUIT FOR AN OPEN**
    1. Measure the resistance of (T376) 5-Volt Supply circuit between the TCM harness connector and the Transmission Assembly harness connector.

    Is the resistance below 5.0 ohms?

    Yes

NOTE: **If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.**

- Using the schematics as a guide, check the Transmission Control Module (TCM) terminals and connectors for corrosion, damage or pushed out terminals. Pay particular attention to the power and ground circuits. If no problems are found, replace the TCM and perform programming and PROXI Configuration Alignment procedures. Refer to **MODULE, TRANSMISSION CONTROL, REMOVAL** .
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Repair the (T376) 5-Volt Supply circuit for an open.
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **CHECK THE LEAD FRAME HARNESS (T376) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the Ignition OFF.
   2. Measure the resistance between the (T376) 5-Volt Supply circuit in the Lead Frame harness connector and ground.

      Is there continuity between the (T376) 5-Volt Supply circuit and ground?

      Yes

      - Replace the Lead Frame assembly in accordance with the Service Information.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To6

6. **CHECK THE LEAD FRAME HARNESS (T376) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**
   1. Remove the Transmission Side Cover and disconnect the Transmission Oil Pressure Sensor harness connector.
   2. Measure the resistance between the (T376) 5-Volt Supply circuit and all other circuits on the Lead Frame harness connector.

      Is there continuity between the (T376) 5-Volt Supply circuit and another circuit in the Lead Frame

harness?

Yes

- Replace the Lead Frame assembly in accordance with the Service Information.
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 7

7. **CHECK THE LEAD FRAME HARNESS (T376) 5-VOLT SUPPLY CIRCUIT FOR AN OPEN CIRCUIT**
   1. Measure the resistance of the (T376) 5-Volt Supply circuit between the Lead Frame harness connector and the Transmission Oil Pressure Sensor harness connector.

      Is the resistance less than 5.0 ohms?

      Yes

      - Replace the Transmission Oil Pressure Sensor in accordance with the Service Information.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Replace the Lead Frame assembly in accordance with the Service Information.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
8. **CHECK WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. Check for any Service Bulletins that may apply.

      Were there any problems found?

      Yes

      - Repair as necessary.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

- Test complete.

P0701-00-TRANSMISSION CONTROL SYSTEM PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The purpose of the diagnostic is to monitor the solenoid valve actuation of the dog clutch A, dog clutch F and the parking lock (if equipped). A solenoid valve is actuated by an on/off output stage that is controlled by the low level software. Solenoid actuation is commanded by the high level application software in the TCM. After this command has occurred, the diagnostic checks the functionality of the low level software, microcontroller output pin and on/off output stage.

The monitoring is performed by measuring the voltage drop at the drain of the on/off output stage. This voltage is compared with the actual battery voltage to detect whether the on/off output stage is actuated

WHEN MONITORED

Ignition On.

No actuation of solenoid valve commanded by the high level application software.

SET CONDITION

The failure is detected if the voltage at any of the three solenoid valve output stages is greater than a calibrated threshold

POSSIBLE CAUSES

Possible Causes
TRANSMISSION CONTROL MODULE (TCM) - INTERNAL ERROR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURES .

NOTE: If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into

the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.

- Using the schematics as a guide, check the Transmission Control Module (TCM) terminals and Transmission Assembly connectors for corrosion, damage or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, Replace the TCM and perform programming and PROXI Configuration Alignment procedures. Refer to **MODULE, TRANSMISSION CONTROL, REMOVAL** .
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

P0703-00-BRAKE SWITCH 2 PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The purpose of the diagnostic is to monitor the CAN bus, the transmitted messages on the CAN bus and the validity of the CAN signals. Several control units are connected to the CAN bus which send their messages cyclically in a defined time window. The messages contain multiple signals representing vehicle information.

CAN Bus Monitoring: To distinguish general problems with the CAN bus (e.g. electrical problems) from problems with certain messages or signals, the general state of the CAN bus is monitored.

CAN Message Monitoring: All messages received and used by the TCU are monitored for timeout and validity of the DLC (Data Length Code) information in the message header. If available, the message is also monitored for the validity of a checksum and for the correct behavior of an alive-counter that the sending control unit is expected to increment on each transmittal.

CAN Signal Monitoring: If the sending control unit does not have valid information to send, it may send a defined failure value indicating an invalid signal. Incoming signals with a defined failure value are monitored for signal validity.

WHEN MONITORED

TCM supply voltage is greater than a calibrated threshold.

Ignition Switch is ON.

No failure in CAN bus or CAN massage monitoring.

SET CONDITION

The ABS reports via CAN message that the Brake signal is not available or a Brake signal failure has been detected.

POSSIBLE CAUSES

Possible Causes
ANTILOCK BRAKE SYSTEM (ABS) DTCS TCM - INTERNAL ERROR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the Ignition ON.
    2. With the scan tool, record and erase the DTCs.
    3. Cycle the ignition switch from off to on.
    4. With the scan tool, read the DTCs.

    Is the DTC active at this time?

    Yes

    - Go To 2

    No

    - Go To 3
2. **CHECK IF Antilock Brake System (ABS) DTCS ARE PRESENT**
    1. With the scan tool, read the ABS DTCs.

    Are there any ABS DTCs present?

    Yes

    - Perform the appropriate diagnostic procedure. Refer to **DIAGNOSTIC CODE INDEX** .

    No

    NOTE: **If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.**

    - Using the schematics as a guide, check the Transmission Control Module (TCM) terminals

and connectors for corrosion, damage or pushed out terminals. Pay particular attention to the power and ground circuits. If no problems are found, replace the TCM and perform programming and PROXI Configuration Alignment procedures. Refer to **MODULE, TRANSMISSION CONTROL, REMOVAL** .

- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **INTERMITTENT WIRING AND CONNECTORS**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
   2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
   3. Look for the data to change or for the DTC to reset during the wiggle test.
   4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
   5. Look for the data to change other than as expected or for the DTC to reset.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time.

P0711-00-TRANSMISSION FLUID TEMPERATURE SENSOR A CIRCUIT RANGE-PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 9: Power & Ground, Temperature, Oil Pressure And Speed Sensors Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The purpose of the diagnostic is to detect rationality failures of the transmission oil temperature sensor by evaluating the following conditions:

Comparison to a Temperature Model

- The measured transmission oil temperature is compared to a calculated model temperature. The calculation of the modeled temperature is based on the fact that the resistance of the pressure regulator coil is correlated with the oil temperature. The calculation is based on the actual duty cycle of pressure regulator for a given commanded current and the value of the pressure regulator power supply.

Low Temperature Detection

- The measured transmission oil temperature is monitored for a low value after having first reached a fixed temperature value.

Stuck in Low Temperature Detection

- The measured transmission oil temperature is monitored for a minimum amount of temperature change at low temperatures.

Temperature Jump Detection

- The measured transmission oil temperature is monitored for a maximum amount of temperature change between two consecutive data samples.

WHEN MONITORED

Temperature Jump Detection:

Ignition on.

No failure detected in oil temperature sensor circuit high or low fault monitoring.

Comparison to Temperature Model:

Ignition on.

No failure detected in oil temperature sensor circuit high or low fault monitoring.

No failure detected in oil temperature jump detection monitoring.

The engine speed is greater than a calibrated value or the input speed is greater than a calibrated value.

The output speed is greater than a calibrated value.

Pressure regulator power supply is switched on.

No failure detected in supply voltage of pressure regulator monitoring.

No failure detected in pressure regulator circuit monitoring.

Calibrated time has expired after engine start.

Low Temperature Detection:

Ignition on.

No failure detected in oil temperature sensor circuit high or low fault monitoring.

No failure detected in oil temperature jump detection monitoring.

The engine speed is greater than a calibrated value or the input speed is greater than a calibrated value.

The output speed is greater than a calibrated value.

Stuck in Low Temperature Detection:

Ignition on.

No failure detected in oil temperature sensor circuit high or low fault monitoring.

No failure detected in oil temperature jump detection monitoring.

The engine speed is greater than a calibrated value or the input speed is greater than a calibrated value.

The output speed is greater than a calibrated value.

Transmission oil temperature is less than a calibrated value.

SET CONDITION

Temperature Jump Detection:

The TCM detects that there has been a transmission fluid temperature change greater than 10°C (50°F) in less than 1 second.

Comparison to a Temperature Model:

The failure is detected if the absolute value of the difference between the oil temperature sensor signal measured by the TCM and the calculated oil temperature is greater than a calibrated threshold for a calibrated amount of time.

Low Temperature Detection:

The failure is detected if the oil temperature sensor signal is less than a calibrated threshold after having first reached another higher calibrated threshold in the same driving cycle.

Stuck in Low Temperature Detection:

The failure is detected if the absolute value of the difference between the current transmission oil temperature and a previous oil temperature stored a calibrated time before is less than a calibrated threshold.

POSSIBLE CAUSES

Possible Causes
INCORRECT TRANSMISSION FLUID LEVEL
RESTRICTION IN TRANSMISSION COOLING SYSTEM
VEHICLE AIRFLOW RESTRICTED
TORQUE CONVERTER
CASE VENT PLUGGED OR DAMAGED
TRANSMISSION FLUID TEMPERATURE SENSOR CIRCUIT FAULT
TRANSMISSION FLUID TEMPERATURE SENSOR
TCM - INTERNAL FAULT

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Perform the TRANSMISSION VERIFICATION TEST. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

Before performing this Diagnostic Test, be certain that there are no problems that could cause the Transmission to overheat. Check for restricted transmission oil cooler and lines, air flow restrictions, and low transmission fluid. Towing loads weighing more than the recommended towing capacity could cause excessively high transmission temperatures.

1. **CHECK FOR ENGINE COOLING DTCS**
    1. With the scan tool, read Engine DTCs.

       Are any engine cooling or Active Grille Shutter (AGS) DTCs present?

       Yes

       - Refer to the **DTC INDEX** article and perform the appropriate diagnostic procedure.

       No

       - Go To 2
2. **CHECK FOR OTHER TRANSMISSION DTCS**
    1. With the scan tool, read Transmission DTCs.
    2. Record any Transmission Freeze Frame data.

       Are there any other transmission DTCs?

Yes

- Perform the appropriate diagnostic procedure in the Service Information.

No

- Go To 3

3. **CHECK IF DTC IS CURRENT**
   1. Using the scan tool, read TCM DTCs.
   2. Record the Environmental Data and any DTCs.
   3. Clear DTCs.
   4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
   5. Read TCM DTCs.

   Did the DTC reset?

   Yes

   - Go To 4

   No

   - Go To 9

4. **CHECK TRANSMISSION TEMPERATURE SENSOR CIRCUITS FOR HIGH RESISTANCE**
   1. Turn the Ignition OFF.
   2. Disconnect the TCM harness connector.
   3. Remove the transmission side cover and disconnect the transmission temperature sensor harness connector.
   4. Connect a jumper between the (T54) Transmission Temperature Signal circuit and the (T820) Sensor Ground circuit at the transmission temperature sensor harness connector.
   5. Measure resistance between (T54) Transmission Temperature Signal circuit and the (T820) Sensor Ground circuit at the TCM harness connector.

   Is the resistance below 5.0 ohms?

   Yes

   - Go To 5

   No

   - Repair the (T54) Transmission Temperature Signal circuit or the (T820) Sensor Ground

circuit for an open or high resistance.

- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **CHECK TRANSMISSION TEMPERATURE SENSOR CIRCUITS FOR A SHORT TO GROUND**
   1. With the jumper still connected, measure resistance between (T54) Transmission Temperature Signal circuit at the TCM harness connector and ground.

      Is there continuity between (T54) Transmission Temperature Signal circuit and ground?

      Yes

      - Repair the (T54) Transmission Temperature Signal circuit or (T820) Sensor Ground circuit for a short to ground.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 6
6. **CHECK THE (T54) TRANSMISSION TEMPERATURE SIGNAL CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**
   1. Remove the jumper from the transmission temperature sensor harness connector.
   2. Measure resistance between (T54) Transmission Temperature Signal circuit and all other circuits in the TCM harness connector.

      Is there continuity between (T54) transmission temperature signal circuit and any other TCM circuit?

      Yes

      - Repair the (T54) Transmission Temperature Signal circuit for a short to another circuit.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 7
7. **CHECK THE (T820) SENSOR GROUND CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**
   1. Measure resistance between (T820) Sensor Ground circuit and all other circuits in the TCM harness connector.

      Is there continuity between (T820) Sensor Ground circuit and any other TCM circuit?

Yes

- Repair the (T820) Sensor Ground circuit for a short to another circuit.
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 8

8. **VERIFY TRANSMISSION TEMPERATURE SENSOR RESISTANCE / TEMPERATURE CORRELATION**
   1. Measure the resistance between (T54) Transmission Temperature Signal terminal and (T820) Sensor Ground terminal at the transmission temperature sensor.

TYPICAL VALUES FOR TRANSMISSION TEMPERATURE SENSOR	
TEMPERATURE	**APPROXIMATE RESISTANCE**
-30°C (-22°F)	44000 Ohms ± 6600
10°C (50°F)	6455 Ohms ± 645
110°C (230°F)	247 Ohms ± 16
145°C (293°F)	111 Ohms ± 6

Using the chart above, compare the Temperature Sensor temperature to the correlating resistance value.

Is the resistance within the specified range when the sensor is at the given temperature?

Yes

NOTE: **If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.**

- Using the schematics as a guide, check the Transmission Control Module (TCM) terminals and connectors for corrosion, damage or pushed out terminals. Pay particular attention to the power and ground circuits. If no problems are found, replace the TCM and perform programming and PROXI Configuration Alignment procedures. Refer to **MODULE, TRANSMISSION CONTROL, REMOVAL** .
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace the Transmission Temperature Sensor in accordance with the Service Information.
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

9. **CHECK WIRING AND CONNECTORS**
    1. The conditions necessary to set the DTC are not present at this time.
    2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
    3. Wiggle the wires while checking for shorted and open circuits.
    4. Check for any Service Bulletins that may apply.

    Were there any problems found?

    Yes

    - Repair as necessary.
    - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

    No

    - Test complete.

P0712-00-TRANSMISSION FLUID TEMPERATURE SENSOR A CIRCUIT LOW

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 10: Power & Ground, Temperature, Oil Pressure And Speed Sensors Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The purpose of the diagnostic is to detect electrical failures of the transmission temperature sensor circuits. The transmission temperature sensor is a discrete analog resistor with a positive temperature coefficient. The monitoring is performed by comparing the sensor output voltage to minimum and maximum thresholds.

WHEN MONITORED

Ignition switch is on.

No failures detected by the analog to digital converter monitoring.

SET CONDITION

The failure is detected if one of the following conditions occur:

- Short to battery or open circuit (can not be distinguished) is detected if the sensor output voltage is greater than a fixed threshold.
- Short to ground is detected if the sensor output voltage is less than a fixed threshold.

POSSIBLE CAUSES

Possible Causes
(T54) TRANSMISSION TEMPERATURE SIGNAL CIRCUIT SHORTED TO GROUND TRANSMISSION TEMPERATURE SENSOR TCM - INTERNAL ERROR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK IF DTC IS CURRENT**
    1. With the scan tool, read TCM DTCs.
    2. Record the Environmental Data and any DTCs.
    3. With the scan tool, erase DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. With the scan tool, read TCM DTCs.

    Did the DTC reset?

    Yes

    - Go To 2

    No

    - Go To 5
2. **CHECK (T54) TRANSMISSION TEMPERATURE SIGNAL CIRCUIT OPERATION**
    1. Turn the Ignition OFF.
    2. Remove the Transmission Side Cover and disconnect the Transmission Temperature Sensor

harness connector.

3. Turn the Ignition ON, Engine not running.
4. Measure the voltage between (T54) Transmission Temperature Signal circuit and ground.

Is the voltage greater than 4.8 volts?

Yes

- Go To 4

No

- Go To 3

3. **CHECK (T54) TRANSMISSION TEMPERATURE SENSOR CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the Ignition OFF.
   2. Disconnect the TCM harness connector.
   3. Measure the resistance of the (T54) Transmission Temperature Signal circuit between the TCM harness connector and ground.

   Is there continuity between (T54) transmission temperature signal circuit and ground?

   Yes

   - Repair (T54) Transmission Temperature Signal circuit for a short to ground.
   - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   NOTE: If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.

   - Using the schematics as a guide, check the Transmission Control Module (TCM) terminals and connectors for corrosion, damage or pushed out terminals. Pay particular attention to the power and ground circuits. If no problems are found, replace the TCM and perform programming and PROXI Configuration Alignment procedures. Refer to **MODULE, TRANSMISSION CONTROL, REMOVAL** .
   - Perform TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
4. **VERIFY TRANSMISSION TEMPERATURE SENSOR RESISTANCE / TEMPERATURE CORRELATION**

1. Measure the resistance of the Transmission Temperature Sensor between the (T54) Transmission Temperature Signal terminal and the (T820) Sensor Ground terminal.

TYPICAL VALUES FOR TRANSMISSION TEMPERATURE SENSOR	
TEMPERATURE	**APPROXIMATE RESISTANCE**
-30°C (-22°F)	44000 Ohms ± 6600
10°C (50°F)	6455 Ohms ± 645

P0716-00-INPUT SHAFT SPEED SENSOR 1 PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 12: Power & Ground, Temperature, Oil Pressure And Speed Sensors Circuit Diagram

Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The purpose of the diagnostic is to detect rationality failures of the input speed sensor signal. This diagnostic checks if the input speed sensor signal is within the calculated tolerance bands.

The upper threshold of the first tolerance band is the greater value of either the engine speed or calculated input speed, plus a calibrated offset. The calculated input speed is based upon the output speed signal multiplied by the gear ratio factor. This factor corresponds to either the target gear or current gear depending on which gear provides the greater ratio.

The lower threshold of the first tolerance band is the lesser value of either the engine speed or calculated input speed, minus a calibrated offset. The calculated input speed is based upon the output speed signal multiplied by the gear ratio factor. This factor corresponds to either the target gear or current gear depending on which gear provides the lesser ratio.

The thresholds of the second tolerance bands are calculated using the same method described above. In place of the output speed signal, the wheel speed signal via CAN is used for the calculation.

WHEN MONITORED

No failure detected in the sensor supply voltage monitoring.

No failure detected in the input speed sensor circuit monitoring.

No failure detected in the output speed sensor monitoring.

No CAN failure of the wheel speed signal received via CAN used for the rationality monitoring.

No CAN failure of the engine speed signal received via CAN used for the rationality monitoring.

SET CONDITION

The failure is detected if the input speed sensor signal is not within the calculated tolerance bands for the input speed sensor signal for a calibrated amount of time.

POSSIBLE CAUSES

Possible Causes
INPUT SHAFT SPEED SENSOR OR WIRING
OUTPUT SHAFT SPEED SENSOR OR WIRING
TRANSMISSION INTERNAL FAILURE
TCM - INTERNAL ERROR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD

PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK IF CONDITION IS CURRENT**
    1. Turn the Ignition ON, Engine not running.
    2. With the scan tool, erase TCM DTCs.
    3. Raise the vehicle on the hoist.
    4. Start the Engine.
    5. Select 4th gear to keep the transmission from shifting into 5th or higher gear.
    6. With the scan tool, view the Data Display, read the Input Speed Sensor RPM.
    7. Firmly apply the Brake Pedal and place the Gear Selector in DRIVE.

    WARNING: To avoid personal injury or death, keep hands and feet clear of rotating wheels.

    8. Release the Brakes and raise the Engine RPM to allow the Transmission to perform a 2-3 and 3-4 upshift while observing the Input Speed Sensor RPM.

    Did the Input Speed Sensor display an RPM above 7, 700 at any time during the test?

    Yes

    - Go To 2

    No

    NOTE: If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.

    - Using the schematics as a guide, check the Transmission Control Module (TCM) terminals and connectors for corrosion, damage or pushed out terminals. Pay particular attention to the power and ground circuits. If no problems are found, replace the TCM and perform programming and PROXI Configuration Alignment procedures. Refer to **MODULE, TRANSMISSION CONTROL, REMOVAL** .
    - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **INSPECT FOR INTERNAL TRANSMISSION FAILURE**
    1. This DTC is an indication of an internal transmission failure.
    2. Remove the Transmission Oil Pan and inspect for excessive debris such as clutch friction material

or metal contamination.

Is there any indication of an internal transmission failure?

Yes

- Repair internal transmission as necessary in accordance with the Service Information.
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

Go To 3

3. **CHECK SPEED SENSORS AND WIRING**
   1. Check the Output and Input Speed Sensors wiring for high resistance and high resistance short to ground. Also check connections for corrosion and pushed out terminals.

      Were any problems found?

      Yes

      - Repair in accordance with the Service Information.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      NOTE: If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.

      - Using the schematics as a guide, check the Transmission Control Module (TCM) terminals and connectors for corrosion, damage or pushed out terminals. Pay particular attention to the power and ground circuits. If no problems are found, replace the TCM and perform programming and PROXI Configuration Alignment procedures. Refer to **MODULE, TRANSMISSION CONTROL, REMOVAL** .
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

P0721-00-OUTPUT SHAFT SPEED SENSOR CIRCUIT PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 13: Power & Ground, Temperature, Oil Pressure And Speed Sensors Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The purpose of the diagnostic is to detect rationality failures of the output speed sensor signal. This diagnostic checks if the output speed sensor signal is within the calculated tolerance bands.

The upper threshold of the first tolerance band is the calculated output speed plus a calibrated offset. The calculated output speed is based upon the input speed signal multiplied by the gear ratio factor. This factor

corresponds to either the target gear or current gear depending on which gear provides the greater ratio.

The lower threshold of the first tolerance band is the calculated output speed, minus a calibrated offset. The calculated output speed is based upon the input speed signal multiplied by the gear ratio factor. This factor corresponds to either the target gear or current gear depending on which gear provides the lesser ratio.

The thresholds of the second tolerance bands are calculated using the same method described above. In place of the input speed signal, the wheel speed signal via CAN is used for the calculation.

In addition, this diagnostic checks if the rotating direction of the output speed sensor signal corresponds to the actual gear position.

WHEN MONITORED

No failure detected in the sensor supply voltage monitoring.

No failure detected in the output speed sensor circuit monitoring.

No failure detected in the input speed sensor monitoring.

No CAN failure of the wheel speed signal received via CAN used for the rationality monitoring.

SET CONDITION

The failure is detected if one of the following conditions occur:

The rotating direction of the output speed sensor signal does not correspond to the actual gear position.

The output speed sensor signal is not within the calculated tolerance bands for the output speed sensor signal for a calibrated amount of time.

POSSIBLE CAUSES

Possible Causes
TRANSMISSION INTERNAL FAILURE TCM - INTERNAL ERROR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK IF CONDITION IS CURRENT**
    1. Turn the Ignition ON, Engine not running.
    2. With the scan tool, erase TCM DTCs.

3. Raise the vehicle on the hoist.
4. Start the Engine.
5. With the scan tool, view the Data Display, read the Output Speed Sensor RPM.
6. Firmly apply the Brake Pedal and place the Gear Selector in DRIVE.

WARNING: To avoid personal injury or death, keep hands and feet clear of rotating wheels.

7. Release the Brakes and raise the Engine RPM to allow the Transmission to perform a 2-3 and 3-4 upshift while observing the Output Speed Sensor RPM.

   Did the Output Speed Sensor display an RPM above 1, 000?

   Yes

   - Go To 2

   No

   NOTE: If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.

   - Using the schematics as a guide, check the Transmission Control Module (TCM) terminals and connectors for corrosion, damage or pushed out terminals. Pay particular attention to the power and ground circuits. If no problems are found, replace the TCM and perform programming and PROXI Configuration Alignment procedures. Refer to **MODULE, TRANSMISSION CONTROL, REMOVAL** .
   - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **INSPECT FOR INTERNAL TRANSMISSION FAILURE**
   1. This DTC is an indication of a internal transmission failure.
   2. Remove the Transmission Oil Pan and inspect for excessive debris such as clutch friction material or metal contamination.

      Is there any indication of an internal transmission failure?

      Yes

      - Repair internal transmission as necessary in accordance to the Service Information.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD**

PROCEDURE .

No

Go To 3

3. **CHECK SPEED SENSORS AND WIRING**
   1. Check the Output and Input Speed Sensors wiring for high resistance and high resistance short to ground. Also check connections for corrosion and pushed out terminals.

      Were any problems found?

      Yes

      - Repair in accordance with the Service Information.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      NOTE: If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.

      - Using the schematics as a guide, check the Transmission Control Module (TCM) terminals and connectors for corrosion, damage or pushed out terminals. Pay particular attention to the power and ground circuits. If no problems are found, replace the TCM and perform programming and PROXI Configuration Alignment procedures. Refer to **MODULE, TRANSMISSION CONTROL, REMOVAL** .
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

P0729-00-GEAR 6 SHIFT INCORRECT RATIO

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Transmission Control Module (TCM) monitors for conditions which lead to an unexpected transmission gear ratio (e.g. slipping clutches, hydraulic or mechanical defects, etc.). The TCM compares the actual gear ratio (i.e. the ratio of input speed to output speed) to a minimum and maximum calibrated gear ratio value. The TCM performs this comparison while driving in a fix gear, during gear engagement, and during shifting from one gear to another.

WHEN MONITORED

Gear Selector position is in Drive or Reverse.

Transmission Fluid temperature is above a calibrated threshold.

No clutch slip control functions commanded.

No failure in input speed signal.

Input speed above a calibrated threshold.

Valid output speed signal from the output speed sensor or calculated from the wheel speed signal if output speed sensor is not available.

Valid engine speed signal from the PCM.

During Gearshifts:

The output speed and the output speed gradient must be higher than a calibrated threshold.

SET CONDITION

During Gearshifts:

A symptom is detected if the measured gear ratio exceeds the gear ratio range.

If a symptom is detected during downshifts requiring the engagement of a dog clutch or during upshifts, the diagnostic system aborts the gear shifting and the gear from which the shifting has been started is engaged. After a calibrated number of symptoms have been detected a failure is stored and the diagnostic system engages a calibrated gear.

If a symptom is detected during a downshift requiring the engagement of a dog clutch, a fault code is stored indicating the associated dog clutch.

In Fixed Gears:

If the output speed is greater than a threshold then a symptom is detected if the measured gear ratio exceeds the gear ratio range for calibrated amount of time.

If the output speed is lower than this threshold, then a symptom is detected if the absolute difference between output speed multiplied by the fix gear ratio of the actual gear and input speed exceeds a threshold for a calibrated amount of time

If a symptom is detected while driving in a fixed gear, the diagnostic system commands an up shift to the next gear. After a calibrated number of symptoms have been detected a failure is stored and the diagnostic system engages a calibrated gear. This gear is monitored as well and if a failure is detected for this gear, an alternative

gear is engaged and so on. The selection of alternative gears follows a calibrated logic. The aim of this logic is to detect a damaged clutch and to finally select an alternative gear that consists of a combination of clutches in which the damaged clutch is not involved. If a further failure symptom occurs in this final alternative gear, a failure for general transmission ratio malfunction is stored.

POSSIBLE CAUSES

Possible Causes
A DOG CLUTCH
CLUTCH C
CLUTCH E
TRANSMISSION CONTROL MODULE (TCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK IF DTC IS CURRENT**
    1. With the scan tool, read TCM DTCs.
    2. Record the Environmental Data and any DTCs.
    3. With the scan tool, erase DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. With the scan tool, read TCM DTCs.

    Did the DTC reset?

    Yes

    - Go To 2

    No

    - Go To 3
2. **TRANSMISSION**

    If the DTC returns, view repair.

    Repair

    - Verify proper fluid level. Refer to **FLUID AND FILTER, STANDARD PROCEDURE** .
    - Verify proper operation of the input and output speed sensors.
    - Refer to **DIAGNOSIS AND TESTING** and using the clutch application chart, inspect the

clutches, valve body solenoids, and valves associated with this gear ratio error.
- Repair or replace the Transmission in accordance with the Service Information.
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. Check for any Service Bulletins that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Test complete.

P072F-00-STUCK IN GEAR 4

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The purpose of the diagnostic is to detect if the dog clutch F is stuck in the engaged position while shifting from the extended neutral position (all clutches should be disengaged) to the drive position. To be able to detect if dog clutch F is stuck, the friction clutch E is engaged after the extended neutral position has occurred. If the input speed is equal to the output speed multilplied by the gear ratio of the fourth gear, the dog clutch F is stuck in the engaged position

A dog clutch is a type of clutch that couples two rotating shifting elements not by friction but by interference. The two parts of the clutch are designed such that one will push the other, causing both to rotate at the same speed and will never slip. The speeds of the shifting elements must match before the dog clutch can be engaged. If the rotational speed difference of the shifting elements is too high during the engagement, the dog clutch is damaged. If torque is transmitted via the shifting elements of the dog clutch, the dog clutch cannot be disengaged.

WHEN MONITORED

Dog clutch F has been commanded in the engaged position.

The extended neutral position is active (maximum time = 1s).

Friction clutch E is commanded in the engaged position.

No failure in input speed signal monitoring.

No failure in output speed signal monitoring.

SET CONDITION

The failure is detected if the measured input speed is within a calibrated range of the output speed multiplied by the gear ratio of the fourth gear for a calibrated amount of time.

POSSIBLE CAUSES

Possible Causes
INTERNAL TRANSMISSION PROBLEM TRANSMISSION CONTROL MODULE (TCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

CHECK FOR INTERNAL TRANSMISSION PROBLEM

Repair

- Inspect Dog Clutch F and related O-ring for damage and repair in accordance with the Service Information.
- Perform the TRANSMISSION VERIFICATION TEST.

  Refer to **STANDARD PROCEDURE** .

P0731-00-GEAR 1 SHIFT INCORRECT RATIO

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Transmission Control Module (TCM) monitors for conditions which lead to an unexpected transmission gear ratio (e.g. slipping clutches, hydraulic or mechanical defects, etc.). The TCM compares the actual gear ratio (i.e. the ratio of input speed to output speed) to a minimum and maximum calibrated gear ratio value. The TCM performs this comparison while driving in a fix gear, during gear engagement, and during shifting from one gear to another.

WHEN MONITORED

Gear Selector position is in DRIVE or REVERSE.

Transmission Fluid temperature is above a calibrated threshold.

No clutch slip control functions commanded.

No failure in input speed signal.

Input speed above a calibrated threshold.

Valid output speed signal from the output speed sensor or calculated from the wheel speed signal if output speed sensor is not available.

Valid engine speed signal from the PCM.

During Gearshifts:

The output speed and the output speed gradient must be higher than a calibrated threshold.

SET CONDITION

During Gearshifts:

A symptom is detected if the measured gear ratio exceeds the gear ratio range.

If a symptom is detected during downshifts requiring the engagement of a dog clutch or during upshifts, the diagnostic system aborts the gear shifting and the gear from which the shifting has been started is engaged. After a calibrated number of symptoms have been detected a failure is stored and the diagnostic system engages a calibrated gear.

If a symptom is detected during a downshift requiring the engagement of a dog clutch, a fault code is stored indicating the associated dog clutch.

In Fixed Gears:

If the output speed is greater than a threshold then a symptom is detected if the measured gear ratio exceeds the gear ratio range for calibrated amount of time.

If the output speed is lower than this threshold, then a symptom is detected if the absolute difference between output speed multiplied by the fix gear ratio of the actual gear and input speed exceeds a threshold for a calibrated amount of time

If a symptom is detected while driving in a fixed gear, the diagnostic system commands an up shift to the next gear. After a calibrated number of symptoms have been detected a failure is stored and the diagnostic system engages a calibrated gear. This gear is monitored as well and if a failure is detected for this gear, an alternative gear is engaged and so on. The selection of alternative gears follows a calibrated logic. The aim of this logic is to detect a damaged clutch and to finally select an alternative gear that consists of a combination of clutches in

which the damaged clutch is not involved. If a further failure symptom occurs in this final alternative gear, a failure for general transmission ratio malfunction is stored.

POSSIBLE CAUSES

Possible Causes
CLUTCH C VALVE BODY TRANSMISSION CONTROL MODULE (TCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK IF DTC IS CURRENT**
   1. With the scan tool, read TCM DTCs.
   2. Record the Environmental Data and any DTCs.
   3. With the scan tool, erase DTCs.
   4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
   5. With the scan tool, read TCM DTCs.

      Did the DTC reset?

      Yes

      - Go To 2

      No

      - Go To 3
2. **TRANSMISSION**

   If the DTC returns, view repair.

   Repair

   - Verify proper fluid level. Refer to **FLUID AND FILTER, STANDARD PROCEDURE** .
   - Verify proper operation of the input and output speed sensors.
   - Refer to **DIAGNOSIS AND TESTING** and using the clutch application chart, inspect the clutches, valve body solenoids, and valves associated with this gear ratio error.
   - Repair or replace the Transmission in accordance with the Service Information.

- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. Check for any Service Bulletins that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Test complete.

P073E-00-UNABLE TO ENGAGE REVERSE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

This diagnostic detects a sticking Dog Clutch A when the shifter is shifted into the REVERSE position. If the error is detected, all clutches will be disengaged and the Malfunction Indicator Lamp (MIL) will not be illuminated. The diagnostic monitors the Input and Output Speed sensor signals and compares them to calibrated values to determine if the failure is present.

WHEN MONITORED

When Monitored: This diagnostic runs continuously when the following conditions are met:

- Engine running.
- Gear Selector is shifted into the REVERSE position.

SET CONDITION

Input speed and Output speed sensor signals indicate a sticking Dog Clutch A.

DEFAULT ACTIONS

- MIL is illuminated on the first trip that the diagnostic fails.
- Reverse will be disabled.

POSSIBLE CAUSES

Possible Causes

P077C-00-OUTPUT SHAFT SPEED SENSOR CIRCUIT LOW

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 14: Power & Ground, Temperature, Oil Pressure And Speed Sensors Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The TCM monitors the Input Speed and Output Speed Sensors for electrical malfunctions. This monitoring is done by comparing the sensor voltage (measured across a shunt resistor) to a high and low signal voltage threshold. If the high or low voltage threshold is exceeded, a DTC is set for the specific sensor.

WHEN MONITORED

No failure detected in sensor supply voltage monitoring.

No failure detected in analog to digital converter monitoring.

SET CONDITION

Short to ground or open circuit is detected if the Output Speed Signal voltage is less than 0.35 volt for a calibrated amount of time.

POSSIBLE CAUSES

Possible Causes
(T14) OUTPUT SPEED SIGNAL CIRCUIT OPEN
(T14) OUTPUT SPEED SIGNAL CIRCUIT SHORTED TO GROUND
OUTPUT SPEED SENSOR
TCM - INTERNAL ERROR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK IF DTC IS CURRENT**
    1. With the scan tool, read TCM DTCs.
    2. Record the Environmental Data and any DTCs.
    3. With the scan tool, erase DTCs.

    5. With the scan tool, read TCM DTCs.

    Did the DTC reset?

    Yes

    - Go To 2

    No

- Go To 5

2. **CHECK (T14) OUTPUT SPEED SIGNAL CIRCUIT FOR AN OPEN**
   1. Turn the Ignition OFF.
   2. Disconnect the Transmission Assembly harness connector.
   3. Disconnect the TCM harness connector.
   4. Measure the resistance of the (T14) Output Speed Signal circuit between the TCM harness connector and the Transmission Assembly harness connector.

      Is the resistance below 5.0 ohms?

      Yes

      - Go To 3

      No

      - Repair the (T14) Output Speed Signal circuit for an open.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK (T14) OUTPUT SPEED SIGNAL CIRCUIT FOR A SHORT TO GROUND OR ANOTHER CIRCUIT**
   1. Measure the resistance between ground and the (T14) Output Speed Signal circuit.
   2. Measure the resistance between the (T14) Output Speed Signal circuit and all other circuits in the TCM harness connector.

      Is there continuity between the (T14) Output Speed Signal circuit and ground or another circuit?

      Yes

      - Repair the (T14) Output Speed Signal circuit for a short to ground or another circuit.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      Go To 4

4. **CHECK OUTPUT SPEED SENSOR FOR AN OPEN**

   NOTE: The Output Speed Sensor must be at room temperature to perform the next test.

   1. With the RED lead on terminal 24 and the BLACK lead on terminal 22, measure the resistance of

the Output Speed Sensor at the Transmission side of the Transmission Assembly harness connector.

Is the resistance between 5.5 and 7.0 ohms?

Yes

NOTE: If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.

- Using the schematics as a guide, check the Transmission Control Module (TCM) terminals and connectors for corrosion, damage or pushed out terminals. Pay particular attention to the power and ground circuits. If no problems are found, replace the TCM and perform programming and PROXI Configuration Alignment procedures. Refer to **MODULE, TRANSMISSION CONTROL, REMOVAL** .
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace the Output Speed Sensor in accordance with the Service Information.
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **CHECK WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. Check for any Service Bulletins that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Test complete.

P077D-00-OUTPUT SHAFT SPEED SENSOR CIRCUIT HIGH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 15: Power & Ground, Temperature, Oil Pressure And Speed Sensors Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The TCM monitors the Input Speed and Output Speed Sensors for electrical malfunctions. This monitoring is done by comparing the sensor voltage (measured across a shunt resistor) to a high and low signal voltage threshold. If the high or low voltage threshold is exceeded, a DTC is set for the specific sensor.

WHEN MONITORED

No failure detected in sensor supply voltage monitoring.

No failure detected in analog to digital converter monitoring.

SET CONDITION

Short to voltage is detected if the Output Speed Signal voltage is greater than 1.95 volts for a calibrated amount of time.

POSSIBLE CAUSES

Possible Causes
(T14) OUTPUT SPEED SIGNAL CIRCUIT SHORTED TO VOLTAGE
OUTPUT SPEED SENSOR
TCM - INTERNAL ERROR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK IF DTC IS CURRENT**
    1. With the scan tool, read TCM DTCs.
    2. Record the Environmental Data and any DTCs.
    3. With the scan tool, erase DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. With the scan tool, read TCM DTCs.

    Did the DTC reset?

    Yes

    - Go To 2

    No

    - Go To 4
2. **CHECK (T14) OUTPUT SPEED SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**
    1. Turn the Ignition OFF.
    2. Disconnect the Transmission Assembly harness connector.
    3. Turn the Ignition ON, Engine not running.

4. Measure the voltage of the (T14) Output Speed Signal circuit in the Transmission Assembly harness connector.

   Is the voltage above 1.95 volts?

   Yes

   - Go To 3

   No

   - Replace the Output Speed Sensor in accordance with the Service Information.
   - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK (T14) OUTPUT SPEED SIGNAL CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**
   1. Turn the Ignition OFF.
   2. Disconnect the TCM harness connector.
   3. Measure the resistance between the (T14) Output Speed Signal circuit and all other circuits in the TCM harness connector.

      Is there continuity between the (T14) Output Speed Signal circuit and any other circuit in the TCM harness connector?

      Yes

      - Repair the (T14) Output Speed Signal circuit for a short to another circuit
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      NOTE: If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.

      - Using the schematics as a guide, check the Transmission Control Module (TCM) terminals and connectors for corrosion, damage or pushed out terminals. Pay particular attention to the power and ground circuits. If no problems are found, replace the TCM and perform programming and PROXI Configuration Alignment procedures. Refer to **MODULE, TRANSMISSION CONTROL, REMOVAL** .
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK WIRING AND CONNECTORS**
    1. The conditions necessary to set the DTC are not present at this time.
    2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
    3. Wiggle the wires while checking for shorted and open circuits.
    4. Check for any Service Bulletins that may apply.

    Were there any problems found?

    Yes

    - Repair as necessary.
    - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

    No

    - Test complete.

P077E-00-TRANSMISSION FLUID TEMPERATURE MULTIPLE SENSOR CORRELATION

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The purpose of the diagnostic is to detect failures in the analog to digital conversion of the temperature sensor signal. The temperature sensor signal is converted using two independent Analog to Digital Converter (ADC) channels. The diagnostic is performed by comparing the result of each ADC channel to determine if the signals are equivalent.

WHEN MONITORED

Battery voltage is greater than a calibrated value.

SET CONDITION

The failure is detected if the difference in the two analog to digital channels of the temperature sensor signal is not equal to zero.

POSSIBLE CAUSES

Possible Causes
OTHER TRANSMISSION FLUID TEMPERATURE SENSOR DTCS SET TRANSMISSION CONTROL MODULE (TCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD

PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK FOR RELATED TRANSMISSION TEMPERATURE DTCS**
   1. With the scan tool, read transmission DTCs.

      Are any other Transmission Fluid Temperature DTCs present?

      Yes

      - Refer to **DIAGNOSTIC CODE INDEX** and perform the appropriate repair for those DTCs first.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 2
2. **TRANSMISSION CONTROL MODULE (TCM)**

   If there are no possible causes remaining, view repair.

   Repair

   NOTE: If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.

   - Using the schematics as a guide, check the Transmission Control Module (TCM) terminals and connectors for corrosion, damage or pushed out terminals. Pay particular attention to the power and ground circuits. If no problems are found, replace the TCM and perform programming and PROXI Configuration Alignment procedures. Refer to **MODULE, TRANSMISSION CONTROL, REMOVAL** .
   - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

P07BF-00-INPUT-TURBINE SHAFT SPEED SENSOR 1 CIRCUIT LOW

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 16: Power & Ground, Temperature, Oil Pressure And Speed Sensors Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The TCM monitors the Input Speed and Output Speed Sensors for electrical malfunctions. This monitoring is done by comparing the sensor voltage (measured across a shunt resistor) to a high and low signal voltage threshold. If the high or low voltage threshold is exceeded, a DTC is set for the specific sensor.

WHEN MONITORED

No failure detected in sensor supply voltage monitoring.

No failure detected in analog to digital converter monitoring.

SET CONDITION

Short to ground or open circuit is detected if the Input Speed Signal voltage is less than 0.35 volt for a calibrated amount of time.

POSSIBLE CAUSES

Possible Causes
(T14) INPUT SPEED SIGNAL CIRCUIT OPEN
(T14) INPUT SPEED SIGNAL CIRCUIT SHORTED TO GROUND
INPUT SPEED SENSOR
TCM - INTERNAL ERROR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK IF DTC IS CURRENT**
    1. With the scan tool, read TCM DTCs.
    2. Record the Environmental Data and any DTCs.
    3. With the scan tool, erase DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. With the scan tool, read TCM DTCs.

    Did the DTC reset?

    Yes

    - Go To 2

    No

    - Go To 5
2. **CHECK (T52) INPUT SPEED SIGNAL CIRCUIT FOR AN OPEN**
    1. Turn the Ignition OFF.
    2. Disconnect the Transmission Assembly harness connector.
    3. Disconnect the TCM harness connector.

4. Measure the resistance of the (T52) Input Speed Signal circuit between the TCM harness connector and the Transmission Assembly harness connector.

   Is the resistance below 5.0 ohms?

   Yes

   - Go To 3

   No

   - Repair the (T52) Input Speed Signal circuit for an open.
   - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK (T52) INPUT SPEED SIGNAL CIRCUIT FOR A SHORT TO GROUND OR ANOTHER CIRCUIT**
   1. Measure the resistance between ground and the (T52) Input Speed Signal circuit.
   2. Measure the resistance between the (T52) Input Speed Signal circuit and all other circuits in the TCM harness connector.

      Is there continuity between the (T52) Input Speed Signal circuit and ground or another circuit?

      Yes

      - Repair the (T52) Input Speed Signal circuit for a short to ground or another circuit.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      Go To 4

4. **CHECK INPUT SPEED SENSOR FOR AN OPEN**
   1. **NOTE: The Input Speed Sensor must be at room temperature to perform the next test.**

   2. With the RED lead on terminal 24 and the BLACK lead on terminal 23, measure the resistance of the Input Speed Sensor at the Transmission side of the Transmission Assembly harness connector.

      Is the resistance between 5.5 and 7.0 ohms?

      Yes

      NOTE: If this Electronic Control Unit (ECU) is being replaced with a new unit,

a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.

- Using the schematics as a guide, check the Transmission Control Module (TCM) terminals and connectors for corrosion, damage or pushed out terminals. Pay particular attention to the power and ground circuits. If no problems are found, replace the TCM and perform programming and PROXI Configuration Alignment procedures. Refer to **MODULE, TRANSMISSION CONTROL, REMOVAL** .
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace the Input Speed Sensor in accordance with the Service Information.
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **CHECK WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. Check for any Service Bulletins that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Test complete.

   Yes

   - Repair as necessary.
   - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Test complete.

P07D9-00-GEAR 8 SHIFT INCORRECT RATIO

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Transmission Control Module (TCM) monitors for conditions which lead to an unexpected transmission gear ratio (e.g. slipping clutches, hydraulic or mechanical defects, etc.). The TCM compares the actual gear ratio (i.e. the ratio of input speed to output speed) to a minimum and maximum calibrated gear ratio value. The TCM performs this comparison while driving in a fix gear, during gear engagement, and during shifting from one gear to another.

WHEN MONITORED

Gear Selector position is in DRIVE or REVERSE.

Transmission Fluid temperature is above a calibrated threshold.

No clutch slip control functions commanded.

No failure in input speed signal.

Input speed above a calibrated threshold.

Valid output speed signal from the output speed sensor or calculated from the wheel speed signal if output speed sensor is not available.

Valid engine speed signal from the PCM.

During Gearshifts:

The output speed and the output speed gradient must be higher than a calibrated threshold.

SET CONDITION

During Gearshifts:

A symptom is detected if the measured gear ratio exceeds the gear ratio range.

If a symptom is detected during downshifts requiring the engagement of a dog clutch or during upshifts, the diagnostic system aborts the gear shifting and the gear from which the shifting has been started is engaged. After a calibrated number of symptoms have been detected a failure is stored and the diagnostic system engages a calibrated gear.

If a symptom is detected during a downshift requiring the engagement of a dog clutch, a fault code is stored indicating the associated dog clutch.

In Fixed Gears:

If the output speed is greater than a threshold then a symptom is detected if the measured gear ratio exceeds the gear ratio range for calibrated amount of time.

If the output speed is lower than this threshold, then a symptom is detected if the absolute difference between output speed multiplied by the fix gear ratio of the actual gear and input speed exceeds a threshold for a calibrated amount of time

If a symptom is detected while driving in a fixed gear, the diagnostic system commands an up shift to the next gear. After a calibrated number of symptoms have been detected a failure is stored and the diagnostic system engages a calibrated gear. This gear is monitored as well and if a failure is detected for this gear, an alternative gear is engaged and so on. The selection of alternative gears follows a calibrated logic. The aim of this logic is to detect a damaged clutch and to finally select an alternative gear that consists of a combination of clutches in which the damaged clutch is not involved. If a further failure symptom occurs in this final alternative gear, a failure for general transmission ratio malfunction is stored.

POSSIBLE CAUSES

   No

   - Test complete.

P0810-00-CLUTCH POSITION CONTROL ERROR

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 18: TCM System Voltage Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The purpose of the diagnostic is to detect an incorrect dog clutch position due to either hydraulic, electrical or mechanical failures. The actual position of either dog clutch A or F is calculated based upon the pressure variation resulting from the dog clutch actuation. The pressure is measured by a pressure sensor. A symptom of an incorrect dog clutch position is detected if the actual position does not correspond to the commanded

position for greater than a calibrated amount of time. A fault is set, when the number of symptoms is greater than a calibrated threshold.

An additional diagnostic is performed immediately after engine restart. The time between the states "initialization" and either "engaged" or "disengaged" is monitored. If the time required between the "initialization" state and the recognition of the "engaged" or "disengaged" state is greater than a calibrated threshold, a fault is stored

WHEN MONITORED

State Monitoring

Engine speed is greater than a calibrated value.

No electrical or rationality failures in the oil pressure sensor.

Initialization Monitoring

Dog clutches A and F are in the "initialization" state.

Engine speed is greater than a calibrated value.

No electrical or rationality failures in the oil pressure sensor.

SET CONDITION

State Monitoring

The failure is detected if the actual dog clutch position does not correspond to the commanded "engaged", "initialization / intermediate" or "disengaged" state for greater than a calibrated amount of time.

A fault is set after a calibrated number of failures has occurred.

Initialization Monitoring

The failure is detected if the actual dog clutch position does not transition to either the commanded "engaged" or "disengaged" state within a calibrated amount of time

POSSIBLE CAUSES

Possible Causes

- Test Complete.

P0885-00-TCM POWER CONTROL CIRCUIT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 19: TCM System Voltage Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The purpose of the diagnostic is to detect electrical failures in the power supply of the solenoid and pressure regulator output stages. Diagnostics are performed in the microcontroller as well as the output stage ASICs. The open circuit diagnostics are performed in the output stage ASICs and the other electrical diagnostics are performed in the microcontroller.

WHEN MONITORED

Short to Battery Failure: Power supply is switched OFF.

Open Circuit Failure: Power supply is switched ON and battery voltage is above a calibrated threshold.

Short to Ground / Overcurrent Failure: Power supply is switched ON.

SET CONDITION

Short to Battery Failure: A failure is detected if the output stage power supply voltage level is greater than a predefined voltage threshold.

Open Circuit Failure: A failure is detected if two or more output stage ASICs are reporting to the microcontroller an open circuit failure within a predefined period of time.

Short to Ground / Overcurrent Failure: A failure is detected if the measured current through the output stage power supply is greater than a predefined maximum allowed current threshold.

POSSIBLE CAUSES

Possible Causes
CHARGING SYSTEM DTCS
SOLENOID CIRCUIT DTCS
TCM POWER SUPPLY CIRCUIT FAILURES
TCM GROUND CIRCUIT FAILURES
TRANSMISSION CONTROL MODULE (TCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURES .

DIAGNOSTIC TEST

1. **CHECK IF DTC IS CURRENT**
    1. Using the scan tool, read TCM DTCs.
    2. Record the Environmental Data and any DTCs.
    3. Clear DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions

above, operate the vehicle in the conditions that set the DTC.

5. Read TCM DTCs.

   Did the DTC reset?

   Yes

   - Go To 2

   No

   - Go To 9

2. **CHECK FOR ENGINE CHARGING SYSTEM DTCS**
   1. With the scan tool, read Engine DTCs.

      Are any Engine Charging System DTCs present?

      Yes

      - Repair any Charging System DTCs before proceeding. After repairing the Charging System, perform the TRANSMISSION VERIFICATION TEST to verify the transmission and or controller was not damaged. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 3

3. **CHECK FOR SOLENOID SUPPLY CIRCUIT DTCS**
   1. Refer to recorded Transmission DTCs.

      Were any solenoid supply circuit DTCs set?

      Yes

      - Perform the appropriate diagnostic procedure. Refer to **DIAGNOSTIC CODE INDEX** .
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 4.

4. **CHECK SYSTEM VOLTAGE**
   1. Start the engine.
   2. With the scan tool, under transmission, check system voltage.

Is the transmission system voltage above 9.0 volts?

Yes

- Go To 5

No

- Go To 7

5. **CHECK IF VOLTAGE IS GREATER THAN 16.9 VOLTS**
   1. Start the engine and raise the engine speed to 2000 rpm.
   2. With the scan tool, monitor the Transmission system voltage for at least 60 seconds.

   Does the Transmission system voltage read above 16.9 volts for any period of time?

   Yes

   - Repair the charging system for an over charging condition. and repair any Charging System symptoms before proceeding. Refer to **DIAGNOSIS AND TESTING** . After repairing the Charging System, perform the TRANSMISSION VERIFICATION TEST to verify the transmission and or controller was not damaged.
   - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 6

6. **VERIFY IF VEHICLE WAS JUMP STARTED WITH 24-VOLT SYSTEM**
   1. Verify if the vehicle was jump started by another vehicle using a 24-volt charging system.

   Was the vehicle jump started by another vehicle using a 24-volt charging system?

   Yes

   - This is the cause of the DTC. Erase the DTC and return the vehicle to the customer.
   - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 9

7. **CHECK THE TCM POWER INPUT CIRCUITS**
   1. Turn the ignition OFF.
   2. Disconnect the TCM C1 harness connector.

3. Ignition ON, Engine not running.
4. Using a 12-volt test light connected to ground, check the TCM power input circuits at the TCM C1 harness connector.

NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly?

Yes

- Go To 8

No

- Repair the TCM power input circuits for an open or high resistance.
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

8. **CHECK THE TCM GROUND CIRCUITS**
   1. Ignition ON, Engine not running.
   2. Using a 12-volt test light connected to B(+), check the ground circuits at the TCM C1 harness connector.

NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly?

Yes

NOTE: If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.

- Using the schematics as a guide, check the Transmission Control Module (TCM) terminals and connectors for corrosion, damage or pushed out terminals. Pay particular attention to the power and ground circuits. If no problems are found, replace the TCM and perform programming and PROXI Configuration Alignment procedures. Refer to **MODULE, TRANSMISSION CONTROL, REMOVAL** .
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Repair the TCM grounds circuits for an open or high resistance.
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

9. **INTERMITTENT WIRING AND CONNECTORS**
    1. The conditions necessary to set this DTC are not present at this time.
    2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
    3. Wiggle the wires while checking for shorted and open circuits.

    Were there any problems found?

    Yes

    - Repair as necessary.
    - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

    No

    - Test Complete.

P0887-00-TCM POWER CONTROL CIRCUIT HIGH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 20: TCM System Voltage Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The purpose of the diagnostic is to detect a functional failure of the pressure control solenoid output stages in the TCM. The diagnostic monitors for an incorrect current feed to the pressure control solenoids which control the friction clutches. The monitoring is performed using two independent methods of comparing the commanded current to the measured current:

Current Summation Check: The sum current (total current of pressure control solenoids B, C, D, E) is measured using a shunt resistor. The measured value is compared to the summed commanded currents of pressure control solenoids B, C, D, E (Sum Current Calculation).

PWM Feedback Signal Check: The pulse width modulation (PWM) feedback signal generated by the current regulator in the output stage ASIC identifies a deviating output current for each current regulator. To perform a functional check of the output stage current, the TCM calculates the actual current based upon the PWM feedback signal, the output stage power supply voltage and the resistance of the corresponding pressure control solenoid. This calculated current is compared to the commanded current from the current regulator.

WHEN MONITORED

Battery voltage is greater than a calibrated threshold.

All commanded currents are greater than zero.

SET CONDITION

Current Summation Check: The failure is detected if the calculated current summation deviates from the commanded current summation by a calibrated amount. The difference is compared to positive and negative calibrated thresholds.

PWM Feedback Signal Check: The failure is detected if the calculated pressure control solenoid current deviates from the commanded current by a calibrated amount. The difference is compared to positive and negative calibrated thresholds.

POSSIBLE CAUSES

Possible Causes
PRESSURE CONTROL SOLENOID DTCS SET TRANSMISSION CONTROL MODULE (TCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

CHECK FOR PRESSURE CONTROL SOLENOID DTCS

1. With the scan tool, read TCM DTCs.

   Are other Pressure Control Solenoid DTCs set?

   Yes

   - Repair the Pressure Control Solenoid DTCs in accordance with the Service Information. Refer to

the appropriate DTC procedure. See the **DIAGNOSTIC CODE INDEX** .

- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

NOTE: If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.

- Using the schematics as a guide, check the Transmission Control Module (TCM) terminals and connectors for corrosion, damage or pushed out terminals. Pay particular attention to the power and ground circuits. If no problems are found, replace the TCM and perform programming and PROXI Configuration Alignment procedures. Refer to **MODULE, TRANSMISSION CONTROL, REMOVAL** .
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

P0933-00-HYDRAULIC PRESSURE SENSOR RANGE-PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 21: Power & Ground, Temperature, Oil Pressure And Speed Sensors Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The purpose of the diagnostic is to detect range and rationality failures of the Transmission Oil Pressure Sensor. The Transmission Oil Pressure Sensor detects actuation of the dog clutches A and F. When both dog clutches A and F are in a stable end position, the diagnostic performs the following checks:

Range Check

- The Transmission Oil Pressure Sensor output is compared to a minimum and maximum threshold at the boundary of the normal operating range.

Gradient Check

- The rate of change of the Transmission Oil Pressure Sensor output is compared to a maximum value within the normal operating range.

WHEN MONITORED

Engine speed is greater than 430 rpm.

No failure detected in the electrical monitoring of dog clutch solenoids A and F.

No failure detected in the electrical monitoring of the dog clutch pressure sensor.

No failure detected in the dog clutch position monitoring.

Dog clutch actuation pressure variation is less than a calibrated value (Both dog clutches are in end position).

SET CONDITION

Range Check

The failure is detected if the dog clutch pressure sensor value is not within the calibrated range.

Gradient check

The failure is detected if the absolute value of the gradient of the dog clutch pressure sensor value is greater than a calibrated threshold for a calibrated amount of time.

POSSIBLE CAUSES

Possible Causes
(T376) 5-VOLT SUPPLY CIRCUIT OPEN CIRCUIT OR HIGH RESISTANCE
(T377) OIL PRESSURE SIGNAL CIRCUIT OPEN CIRCUIT OR HIGH RESISTANCE
(T917) SENSOR GROUND CIRCUIT OPEN CIRCUIT OR HIGH RESISTANCE
TRANSMISSION OIL PRESSURE SENSOR
TRANSMISSION MECHANICAL PROBLEM
TCM - INTERNAL ERROR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK IF DTC IS CURRENT**
    1. With the scan tool, read TCM DTCs.
    2. Record the Environmental Data and any DTCs.
    3. With the scan tool, erase DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. With the scan tool, read TCM DTCs.

    Did the DTC reset?

    Yes

    - Go To 2

    No

    - Go To 10
2. **CHECK FOR OTHER TCM DTCS**
    1. Refer to the recorded DTCs.

    Are any other TCM DTCs set?

    Yes

    - Perform the appropriate diagnostic procedure. Refer to the **DIAGNOSTIC CODE INDEX** .
    - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

    No

    - Go To 3
3. **CHECK OIL PRESSURE SENSOR (T376) 5-VOLT SUPPLY AND (T377) OIL PRESSURE SIGNAL CIRCUIT OPERATION**
    1. Turn the Ignition OFF.
    2. Disconnect the Transmission Assembly harness connector.
    3. Connect a jumper between the (T376) 5-Volt Supply circuit and the (T377) Oil Pressure Signal circuit at the TCM harness side of the Transmission Assembly harness connector.
    4. Turn the Ignition ON, Engine not running.
    5. With the scan tool, view Data Display, read the Oil Pressure Sensor voltage.

    Does the Oil Pressure Sensor voltage display 5 volts?

    Yes

- Go To 4

No

- Go To 7

4. **CHECK (T917) SENSOR GROUND CIRCUIT OPERATION**
   1. Connect another jumper between the (T377) Oil Pressure Signal circuit and the (T917) Sensor Ground circuit at the TCM harness side of the Transmission Assembly harness connector.
   2. With the scan tool, view Data Display, read the Oil Pressure Sensor voltage.

      Does the Oil Pressure Sensor voltage display 0 volts?

      Yes

      - Go To 5

      No

      - Go To 9

5. **CHECK OIL PRESSURE SENSOR RESISTANCE**
   1. Turn the Ignition OFF.
   2. Remove both jumpers from the Transmission Assembly harness connector.
   3. **NOTE: The Oil Pressure Sensor must be at room temperature to perform the next test.**
   4. Measure the resistance of the Oil Pressure Sensor between terminal 15 and terminal 16 at the Transmission side of the Transmission Assembly harness connector.

      Is the resistance between 4.6 and 5.0 ohms?

      Yes

      - Go To 6

      No

      - Replace the Transmission Oil Pressure sensor in accordance with the Service Information.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

6. **CHECK THE TRANSMISSION FOR MECHANICAL PROBLEMS**
   1. Check the Transmission for mechanical problems. Refer to **DIAGNOSIS AND TESTING** .

      Did the Transmission have any mechanical problems?

Yes

- Repair as needed in accordance with the Service Information.
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

NOTE: **If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.**

- Using the schematics as a guide, check the Transmission Control Module (TCM) terminals and connectors for corrosion, damage or pushed out terminals. Pay particular attention to the power and ground circuits. If no problems are found, replace the TCM and perform programming and PROXI Configuration Alignment procedures. Refer to **MODULE, TRANSMISSION CONTROL, REMOVAL** .
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

7. **CHECK THE (T376) 5-VOLT CIRCUIT FOR OPEN/HIGH RESISTANCE**
   1. Turn the Ignition OFF.
   2. Disconnect the TCM harness connector.
   3. Measure the resistance of (T376) 5-Volt Supply circuit between the TCM harness connector and the Transmission Assembly harness connector.

      Is the resistance below 5 ohms?

      Yes

      - Go To 8

      No

      - Repair the (T376) 5-Volt Supply circuit for an open circuit or high resistance.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
8. **CHECK THE (T377) OIL PRESSURE SIGNAL CIRCUIT FOR OPEN/HIGH RESISTANCE**
   1. Measure the resistance of the (T377) Oil Pressure Signal circuit between the TCM harness connector and the Transmission Assembly harness connector.

      Is the resistance below 5 ohms?

Yes

NOTE: **If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.**

- Using the schematics as a guide, check the Transmission Control Module (TCM) terminals and connectors for corrosion, damage or pushed out terminals. Pay particular attention to the power and ground circuits. If no problems are found, replace the TCM and perform programming and PROXI Configuration Alignment procedures. Refer to **MODULE, TRANSMISSION CONTROL, REMOVAL** .
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Repair the (T377) Oil Pressure Signal circuit for an open circuit or high resistance.
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

9. **CHECK THE (T917) SENSOR GROUND CIRCUIT FOR OPEN/HIGH RESISTANCE**
   1. Turn the Ignition OFF.
   2. Disconnect the TCM harness connector.
   3. Measure the resistance of the (T917) Sensor Ground circuit between the TCM harness connector and the Transmission Assembly harness connector.

      Is the resistance below 5 ohms?

      Yes

      NOTE: **If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.**

      - Using the schematics as a guide, check the Transmission Control Module (TCM) terminals and connectors for corrosion, damage or pushed out terminals. Pay particular attention to the power and ground circuits. If no problems are found, replace the TCM and perform programming and PROXI Configuration Alignment procedures. Refer to **MODULE, TRANSMISSION CONTROL, REMOVAL** .
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Repair the (T917) Sensor Ground circuit for an open circuit or high resistance.
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

10. **CHECK WIRING AND CONNECTORS**
    1. The conditions necessary to set the DTC are not present at this time.
    2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
    3. Wiggle the wires while checking for shorted and open circuits.
    4. Check for any Service Bulletins that may apply.

    Were there any problems found?

    Yes

    - Repair as necessary.
    - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

    No

    - Test complete.

P0934-00-HYDRAULIC PRESSURE SENSOR CIRCUIT LOW

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 22: Power & Ground, Temperature, Oil Pressure And Speed Sensors Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The purpose of this diagnostic is to detect electrical failures of the oil pressure sensor circuit. The pressure sensor measures the oil pressure which actuates both dog clutches. The monitoring is performed by comparing the sensor voltage to calibrated thresholds.

WHEN MONITORED

No failure detected in sensor supply voltage monitoring.

No failure detected in analog to digital converter monitoring.

SET CONDITION

Short to ground or open circuit is detected if the sensor voltage is less than a fixed threshold.

POSSIBLE CAUSES

Possible Causes
(T377) OIL PRESSURE SIGNAL CIRCUIT OPEN
(T377) OIL PRESSURE SIGNAL CIRCUIT SHORT TO GROUND
TRANSMISSION OIL PRESSURE SENSOR
TCM - INTERNAL ERROR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK IF DTC IS CURRENT**
    1. With the scan tool, read TCM DTCs.
    2. Record the Environmental Data and any DTCs.
    3. With the scan tool, erase DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. With the scan tool, read TCM DTCs.

    Did the DTC reset?

    Yes

    - Go To 2

    No

    - Go To 6
2. **CHECK (T377) OIL PRESSURE SIGNAL CIRCUIT AND (T376) 5-VOLT SUPPLY CIRCUIT OPERATION**
    1. Turn the Ignition OFF.
    2. Disconnect the Transmission Assembly harness connector.
    3. Connect a jumper between the (T377) Oil Pressure Signal Circuit and the (T376) 5-Volt Supply Circuit at the TCM harness side of the Transmission Assembly harness connector.

4. Turn the Ignition ON, Engine not running.
5. With the scan tool, view Data Display, read the Oil Pressure Sensor voltage.

   Does the Oil Pressure Sensor voltage read 5 volts?

   Yes

   - Replace the Transmission Oil Pressure sensor in accordance with the Service Information.
   - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 3

3. **CHECK THE (T376) 5-VOLT CIRCUIT FOR OPEN/HIGH RESISTANCE**
   1. Turn the Ignition OFF.
   2. Disconnect the TCM harness connector.
   3. Measure the resistance of the (T376) 5-Volt Supply circuit between the TCM harness connector and the Transmission Assembly harness connector.

      Is the resistance below 5 ohms?

      Yes

      - Go To 4

      No

      - Repair the (T376) 5-Volt Supply circuit for an open circuit or high resistance.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK THE (T377) OIL PRESSURE SIGNAL CIRCUIT FOR OPEN/HIGH RESISTANCE**
   1. Measure the resistance of (T377) Oil Pressure Signal circuit between the TCM harness connector and the Transmission Assembly harness connector.

      Is the resistance below 5 ohms?

      Yes

      Go To 5

      No

      - Repair the (T377) Oil Pressure Signal circuit for an open circuit or high resistance.

- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **CHECK (T377) OIL PRESSURE SIGNAL CIRCUIT FOR A SHORT TO GROUND OR ANOTHER CIRCUIT**
   1. Measure the resistance between the (T377) Oil Pressure Signal circuit and ground at the TCM harness connector.
   2. Measure the resistance between the (T377) Oil Pressure Signal circuit and all other circuits in the TCM harness connector.

   Is there continuity between the (T377) Oil Pressure Signal circuit and ground or any other circuit?

   Yes

   - Repair the (T377) Oil Pressure Signal circuit for a short to ground or another circuit.

   No

   NOTE: If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.

   - Using the schematics as a guide, check the Transmission Control Module (TCM) terminals and connectors for corrosion, damage or pushed out terminals. Pay particular attention to the power and ground circuits. If no problems are found, replace the TCM and perform programming and PROXI Configuration Alignment procedures. Refer to **MODULE, TRANSMISSION CONTROL, REMOVAL** .
   - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

6. **CHECK WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. Check for any Service Bulletins that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Test complete.

THEORY OF OPERATION

The purpose of this diagnostic is to detect electrical failures of the oil pressure sensor circuit. The pressure sensor measures the oil pressure which actuates both dog clutches. The monitoring is performed by comparing the sensor voltage to calibrated thresholds.

WHEN MONITORED

No failure detected in sensor supply voltage monitoring.

No failure detected in analog to digital converter monitoring.

SET CONDITION

Short to battery is detected if the sensor voltage is greater than a fixed threshold.

POSSIBLE CAUSES

Possible Causes
(T377) OIL PRESSURE SIGNAL CIRCUIT SHORTED TO VOLTAGE
(T917) SENSOR GROUND CIRCUIT OPEN
TRANSMISSION OIL PRESSURE SENSOR
TCM - INTERNAL ERROR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK IF DTC IS CURRENT**
    1. With the scan tool, read TCM DTCs.
    2. Record the Environmental Data and any DTCs.
    3. With the scan tool, erase DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. With the scan tool, read TCM DTCs.

    Did the DTC reset?

    Yes

    - Go To 2

No

- Go To 5

2. **CHECK (T377) OIL PRESSURE SIGNAL CIRCUIT FOR SHORT TO ANOTHER CIRCUIT**
   1. Turn the Ignition OFF.
   2. Disconnect the Transmission Assembly harness connector.
   3. Disconnect the TCM harness connector.
   4. Measure the resistance between the (T377) Oil Pressure Signal circuit and all other circuits in the TCM harness connector.

   Is there continuity between (T377) Oil Pressure Signal circuit and any other circuit?

   Yes

   - Repair the (T377) Oil Pressure Signal circuit for a short to another circuit.
   - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 3

3. **CHECK THE (T917) SENSOR GROUND CIRCUIT FOR AN OPEN**
   1. Measure the resistance of (T917) Sensor Ground circuit between the TCM harness connector and the Transmission Assembly harness connector.

   Is the resistance less than 5 ohms?

   Yes

   - Go To 4

   No

   - Repair the (T917) Sensor Ground circuit for an open circuit.
   - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK THE TCM FOR A SHORT TO VOLTAGE**
   1. Connect the TCM harness connector.
   2. Turn the Ignition ON, Engine not running.
   3. Measure the voltage of the (T377) Oil Pressure Signal circuit at the Transmission Assembly harness connector.

   Is the voltage above 1 volt?

Yes

NOTE: If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.

- Using the schematics as a guide, check the Transmission Control Module (TCM) terminals and connectors for corrosion, damage or pushed out terminals. Pay particular attention to the power and ground circuits. If no problems are found, replace the TCM and perform programming and PROXI Configuration Alignment procedures. Refer to **MODULE, TRANSMISSION CONTROL, REMOVAL** .
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace the Transmission Oil Pressure Sensor in accordance with the Service Information.
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **CHECK WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. Check for any Service Bulletins that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Test complete.

P0960-00-PRESSURE CONTROL SOLENOID 1 CONTROL CIRCUIT OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 24: Pressure Regulators & Solenoids Control Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The purpose of the diagnostic is to detect circuit failures on any of the output stages. All output stages are controlled by a current controller that can operate an output stage in two different modes:

- Current controlled mode (pressure regulators)
- Switched mode or PWM controlled (solenoids)

Pressure Regulator Monitoring: The current regulator ASIC in the TCM indicates the following circuit failures via SPI bus to the CPU:

- Short to ground
- Short to battery or open circuit

Solenoid Monitoring: The TCM measures the actual solenoid voltages and compares them to calibrated thresholds to identify the following electrical failures:

- Short to ground or open circuit
- Short to battery

WHEN MONITORED

Output stages power supply switched on.

Power supply voltage is greater than a calibrated value.

SET CONDITION

Pressure Regulator Monitoring: A failure is detected if one of the following conditions occur:

An short to ground failure is detected if the ASIC indicates a short to ground failure.

A short to battery or open circuit failure is detected if the ASIC indicates a short to battery or open circuit failure.

Solenoid Monitoring: A failure is detected if one of the following conditions occur:

An short to ground or open circuit failure is detected if the ratio between the voltage at the solenoid valve and the output stages power supply is above a calibrated threshold.

A short to battery failure is detected if the ratio between the voltage at the solenoid valve and the output stages power supply is below a calibrated threshold.

POSSIBLE CAUSES

Possible Causes
(T78) SOLENOID SUPPLY 1 CIRCUIT OPEN
(T78) SOLENOID SUPPLY 1 CIRCUIT SHORTED TO GROUND
(T812) PRESSURE CONTROL SOLENOID - LINE PRESSURE CIRCUIT OPEN
(T812) PRESSURE CONTROL SOLENOID - LINE PRESSURE CIRCUIT SHORTED TO GROUND
(T812) PRESSURE CONTROL SOLENOID - LINE PRESSURE CIRCUIT SHORTED TO VOLTAGE
PRESSURE CONTROL SOLENOID - LINE PRESSURE
TRANSMISSION CONTROL MODULE (TCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK IF THE DTC IS CURRENT**
    1. Using the scan tool, read TCM DTCs.
    2. Record the Environmental Data and any DTCs.
    3. Clear DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. Read TCM DTCs.

    Did the DTC reset?

    Yes

    - Go To 2

    No

    - Go To 9
2. **CHECK THE PRESSURE CONTROL SOLENOID - LINE PRESSURE**
    1. Turn the Ignition OFF.
    2. Disconnect the Transmission Assembly harness connector.
    3. Measure the resistance of the Pressure Control Solenoid - Line Pressure at the appropriate terminals in the Transmission Assembly interface connector.

    Is the resistance of the Pressure Control Solenoid - Line Pressure 11.0 Ohms ± 1.0 Ohms?

    Yes

    - Go To 3

    No

    - Replace the Pressure Control Solenoid - Line Pressure in accordance with the Service Information.
    - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
3. **CHECK THE (T78) SOLENOID SUPPLY 1 CIRCUIT FOR AN OPEN**
    1. Disconnect the TCM harness connector.
    2. Measure the resistance of the (T78) Solenoid Supply 1 circuit between the Transmission Assembly

harness connector and the TCM harness connector.

Is the resistance below 5.0 Ohms?

Yes

- Go To 4

No

- Repair the (T78) Solenoid Supply 1 circuit for an open or high resistance.
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK THE (T78) SOLENOID SUPPLY 1 CIRCUIT FOR A SHORT TO GROUND**
   1. Measure the resistance between ground and the (T78) Solenoid Supply 1 circuit.

   Is there continuity between ground and the (T78) Solenoid Supply 1 circuit?

   Yes

   - Repair the (T78) Solenoid Supply 1 circuit for a short to ground.
   - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 5

5. **CHECK THE (T78) SOLENOID SUPPLY 1 CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**
   1. Measure the resistance between the (T78) Solenoid Supply 1 circuit and all other circuits in the TCM harness connector.

   Is there continuity between the (T78) Solenoid Supply 1 circuit and any other circuits in the TCM harness connector?

   Yes

   - Repair the (T78) Solenoid Supply 1 circuit for a short to another circuit.
   - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 6.

6. **CHECK THE (T812) PRESSURE CONTROL SOLENOID - LINE PRESSURE CIRCUIT FOR**

AN OPEN

1. Measure the resistance of the (T812) Pressure Control Solenoid - Line Pressure circuit between the Transmission Assembly harness connector and the TCM harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 7

   No

   - Repair the (T812) Pressure Control Solenoid - Line Pressure circuit for an open or high resistance.
   - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

7. **CHECK THE (T812) PRESSURE CONTROL SOLENOID - LINE PRESSURE CIRCUIT FOR A SHORT TO GROUND**
   1. Measure the resistance between ground and the (T812) Pressure Control Solenoid - Line Pressure circuit.

      Is there continuity between ground and the (T812) Pressure Control Solenoid - Line Pressure circuit?

      Yes

      - Repair the (T812) Pressure Control Solenoid - Line Pressure circuit for a short to ground.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 8.

8. **CHECK THE (T812) PRESSURE CONTROL SOLENOID - LINE PRESSURE CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**
   1. Measure the resistance between the (T812) Pressure Control Solenoid - Line Pressure circuit and all other circuits in the TCM harness connector.

      Is there continuity between the (T812) Pressure Control Solenoid - Line Pressure circuit and any other circuits in the TCM harness connector?

      Yes

      - Repair the (T812) Pressure Control Solenoid - Line Pressure circuit for a short to another circuit.

- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

NOTE: If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.

- Using the schematics as a guide, check the Transmission Control Module (TCM) terminals and connectors for corrosion, damage or pushed out terminals. Pay particular attention to the power and ground circuits. If no problems are found, replace the TCM and perform programming and PROXI Configuration Alignment procedures. Refer to **MODULE, TRANSMISSION CONTROL, REMOVAL** .
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

9. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Use the Freeze Frame Data to help duplicate the conditions in which the DTC originally set. Pay particular attention to the DTC set conditions, such as, VSS, MAP, ECT, and Load.
   3. Using the schematics as a guide, visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires.
   4. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.
   5. Wiggle the wiring and connectors while checking for any possible open or shorted circuits.
   6. Check for any Service Information Tune-ups or Technical Service Bulletins that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Test Complete.

P0962-00-PRESSURE CONTROL SOLENOID 1 CONTROL CIRCUIT LOW

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 25: Pressure Regulators & Solenoids Control Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The purpose of the diagnostic is to detect circuit failures on any of the output stages. All output stages are controlled by a current controller that can operate an output stage in two different modes:

- Current controlled mode (pressure regulators)
- Switched mode or PWM controlled (solenoids)

Pressure Regulator Monitoring: The current regulator ASIC in the TCM indicates the following circuit failures via SPI bus to the CPU:

- Short to ground
- Short to battery or open circuit

Solenoid Monitoring: The TCM measures the actual solenoid voltages and compares them to calibrated thresholds to identify the following electrical failures:

- Short to ground or open circuit
- Short to battery

WHEN MONITORED

Output stages power supply switched on.

Power supply voltage is greater than a calibrated value.

SET CONDITION

Pressure Regulator Monitoring: A failure is detected if one of the following conditions occur:

An short to ground failure is detected if the ASIC indicates a short to ground failure.

A short to battery or open circuit failure is detected if the ASIC indicates a short to battery or open circuit failure.

Solenoid Monitoring: A failure is detected if one of the following conditions occur:

An short to ground or open circuit failure is detected if the ratio between the voltage at the solenoid valve and the output stages power supply is above a calibrated threshold.

A short to battery failure is detected if the ratio between the voltage at the solenoid valve and the output stages power supply is below a calibrated threshold.

POSSIBLE CAUSES

Possible Causes
(T78) SOLENOID SUPPLY 1 CIRCUIT OPEN
(T78) SOLENOID SUPPLY 1 CIRCUIT SHORTED TO GROUND
(T812) PRESSURE CONTROL SOLENOID - LINE PRESSURE CIRCUIT OPEN
(T812) PRESSURE CONTROL SOLENOID - LINE PRESSURE CIRCUIT SHORTED TO GROUND
(T812) PRESSURE CONTROL SOLENOID - LINE PRESSURE CIRCUIT SHORTED TO VOLTAGE
PRESSURE CONTROL SOLENOID - LINE PRESSURE
TRANSMISSION CONTROL MODULE (TCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK IF THE DTC IS CURRENT**
    1. Using the scan tool, read TCM DTCs.
    2. Record the Environmental Data and any DTCs.
    3. Clear DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. Read TCM DTCs.

    Did the DTC reset?

    Yes

    - Go To 2

    No

    - Go To 9
2. **CHECK THE PRESSURE CONTROL SOLENOID - LINE PRESSURE**
    1. Turn the Ignition OFF.
    2. Disconnect the Transmission Assembly harness connector.
    3. Measure the resistance of the Pressure Control Solenoid - Line Pressure at the appropriate terminals in the Transmission Assembly interface connector.

    Is the resistance of the Pressure Control Solenoid - Line Pressure 11.0 Ohms ± 1.0 Ohms?

    Yes

    - Go To 3

    No

    - Replace the Pressure Control Solenoid - Line Pressure in accordance with the Service Information.
    - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
3. **CHECK THE (T78) SOLENOID SUPPLY 1 CIRCUIT FOR AN OPEN**
    1. Disconnect the TCM harness connector.
    2. Measure the resistance of the (T78) Solenoid Supply 1 circuit between the Transmission Assembly

harness connector and the TCM harness connector.

Is the resistance below 5.0 Ohms?

Yes

- Go To 4

No

- Repair the (T78) Solenoid Supply 1 circuit for an open or high resistance.
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK THE (T78) SOLENOID SUPPLY 1 CIRCUIT FOR A SHORT TO GROUND**
   1. Measure the resistance between ground and the (T78) Solenoid Supply 1 circuit.

   Is there continuity between ground and the (T78) Solenoid Supply 1 circuit?

   Yes

   - Repair the (T78) Solenoid Supply 1 circuit for a short to ground.
   - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 5

5. **CHECK THE (T78) SOLENOID SUPPLY 1 CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**
   1. Measure the resistance between the (T78) Solenoid Supply 1 circuit and all other circuits in the TCM harness connector.

   Is there continuity between the (T78) Solenoid Supply 1 circuit and any other circuits in the TCM harness connector?

   Yes

   - Repair the (T78) Solenoid Supply 1 circuit for a short to another circuit.
   - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 6.

6. **CHECK THE (T812) PRESSURE CONTROL SOLENOID - LINE PRESSURE CIRCUIT FOR**

AN OPEN

1. Measure the resistance of the (T812) Pressure Control Solenoid - Line Pressure circuit between the Transmission Assembly harness connector and the TCM harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 7

   No

   - Repair the (T812) Pressure Control Solenoid - Line Pressure circuit for an open or high resistance.
   - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

7. **CHECK THE (T812) PRESSURE CONTROL SOLENOID - LINE PRESSURE CIRCUIT FOR A SHORT TO GROUND**
   1. Measure the resistance between ground and the (T812) Pressure Control Solenoid - Line Pressure circuit.

      Is there continuity between ground and the (T812) Pressure Control Solenoid - Line Pressure circuit?

      Yes

      - Repair the (T812) Pressure Control Solenoid - Line Pressure circuit for a short to ground.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 8.

8. **CHECK THE (T812) PRESSURE CONTROL SOLENOID - LINE PRESSURE CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**
   1. Measure the resistance between the (T812) Pressure Control Solenoid - Line Pressure circuit and all other circuits in the TCM harness connector.

      Is there continuity between the (T812) Pressure Control Solenoid - Line Pressure circuit and any other circuits in the TCM harness connector?

      Yes

      - Repair the (T812) Pressure Control Solenoid - Line Pressure circuit for a short to another circuit.

- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

NOTE: If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.

- Using the schematics as a guide, check the Transmission Control Module (TCM) terminals and connectors for corrosion, damage or pushed out terminals. Pay particular attention to the power and ground circuits. If no problems are found, replace the TCM and perform programming and PROXI Configuration Alignment procedures. Refer to **MODULE, TRANSMISSION CONTROL, REMOVAL** .
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

9. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Use the Freeze Frame Data to help duplicate the conditions in which the DTC originally set. Pay particular attention to the DTC set conditions, such as, VSS, MAP, ECT, and Load.
   3. Using the schematics as a guide, visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires.
   4. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.
   5. Wiggle the wiring and connectors while checking for any possible open or shorted circuits.
   6. Check for any Service Information Tune-ups or Technical Service Bulletins that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Test Complete.

No

- Repair the (T801) Dog Clutch A Solenoid circuit for an open or high resistance.
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

7. **CHECK THE (T801) DOG CLUTCH A SOLENOID CIRCUIT FOR A SHORT TO GROUND**
   1. Measure the resistance between ground and the (T801) Dog Clutch A Solenoid circuit.

      Is there continuity between ground and the (T801) Dog Clutch A Solenoid circuit?

      Yes

      - Repair the (T801) Dog Clutch A Solenoid circuit for a short to ground.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 8.

8. **CHECK THE (T801) DOG CLUTCH A SOLENOID CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**
   1. Measure the resistance between the (T801) Dog Clutch A Solenoid circuit and all other circuits in the TCM harness connector.

      Is there continuity between the (T801) Dog Clutch A Solenoid circuit and any other circuits in the TCM harness connector?

      Yes

      - Repair the (T801) Dog Clutch A Solenoid circuit for a short to another circuit.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      NOTE: **If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in**

the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.

- Using the schematics as a guide, check the Transmission Control Module (TCM) terminals and connectors for corrosion, damage or pushed out terminals. Pay particular attention to the power and ground circuits. If no problems are found, replace the TCM and perform programming and PROXI Configuration Alignment procedures. Refer to **MODULE, TRANSMISSION CONTROL, REMOVAL** .
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

9. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Use the Freeze Frame Data to help duplicate the conditions in which the DTC originally set. Pay particular attention to the DTC set conditions, such as, VSS, MAP, ECT, and Load.
   3. Using the schematics as a guide, visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires.
   4. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.
   5. Wiggle the wiring and connectors while checking for any possible open or shorted circuits.
   6. Check for any Service Information Tune-ups or Technical Service Bulletins that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Test Complete.

P0975-00-SHIFT SOLENOID B CONTROL CIRCUIT PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 28: Pressure Regulators & Solenoids Control Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The purpose of the diagnostic is to detect a functional failure of the pressure regulator output stages in the TCM. The diagnostic monitors for an incorrect current feed to the pressure regulators which control the friction clutches. The monitoring is performed using two independent methods of comparing the commanded current to the measured current.

Current Summation Check: The sum current (total current of pressure regulators B, C, D, E) is measured using a shunt resistor. The measured value is compared to the summed commanded currents of pressure

regulators B, C, D, E (Sum Current Calculation).

PWM Feedback Signal Check: The pulse width modulation (PWM) feedback signal generated by the current regulator in the output stage identifies a deviating output current for each current regulator. To perform a functional check of the output stage current, the TCM calculates the actual current based upon the PWM feedback signal, the output stage power supply voltage and the resistance of the corresponding pressure regulator. This calculated current is compared to the commanded current from the current regulator.

WHEN MONITORED

Continuously after the ignition switch is turned to the run position.

All commanded solenoid currents are greater than zero.

SET CONDITION

Current Summation Check: The failure is detected if the calculated current summation deviates from the commanded current summation by a calibrated amount. The difference is compared to positive and negative calibrated thresholds.

PWM Feedback Signal Check: The failure is detected if the calculated pressure regulator current deviates from the commanded current by a calibrated amount. The difference is compared to positive and negative calibrated thresholds.

POSSIBLE CAUSES

Possible Causes
(T118) SOLENOID SUPPLY 2 CIRCUIT OPEN
(T118) SOLENOID SUPPLY 2 CIRCUIT SHORTED TO GROUND
(T814) PRESSURE CONTROL SOLENOID B CIRCUIT OPEN
(T814) PRESSURE CONTROL SOLENOID B CIRCUIT SHORTED TO GROUND
PRESSURE CONTROL SOLENOID B
TRANSMISSION CONTROL MODULE (TCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK IF THE DTC IS CURRENT**
    1. Using the scan tool, read TCM DTCs.
    2. Record the Environmental Data and any DTCs.
    3. Clear DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.

5. Read TCM DTCs.

   Did the DTC reset?

   Yes

   - Go To 2

   No

   - Go To 9

2. **CHECK THE PRESSURE CONTROL SOLENOID B**
   1. Turn the Ignition OFF.
   2. Disconnect the Transmission Assembly harness connector.
   3. Measure the resistance of the Pressure Control Solenoid B at the appropriate terminals in the Transmission Assembly interface connector.

      Is the resistance of the Pressure Control Solenoid B 5.4 Ohms ± 0.5 Ohms?

      Yes

      - Go To 3

      No

      - Replace the Pressure Control Solenoid B in accordance with the service information.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (T118) SOLENOID SUPPLY 2 CIRCUIT FOR AN OPEN**
   1. Disconnect the TCM harness connector.
   2. Measure the resistance of the (T118) Solenoid Supply 2 circuit between the Transmission Assembly harness connector and the TCM harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 4

      No

      - Repair the (T118) Solenoid Supply 2 circuit for an open or high resistance.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK THE (T118) SOLENOID SUPPLY 2 CIRCUIT FOR A SHORT TO GROUND**
   1. Measure the resistance between ground and the (T118) Solenoid Supply 2 circuit.

      Is there continuity between ground and the (T118) Solenoid Supply 2 circuit?

      Yes

      - Repair the (T118) Solenoid Supply 2 circuit for a short to ground.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 5
5. **CHECK THE (T118) SOLENOID SUPPLY 2 CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**
   1. Measure the resistance between the (T118) Solenoid Supply 2 circuit and all other circuits in the TCM harness connector.

      Is there continuity between the (T118) Solenoid Supply 2 circuit and any other circuits in the TCM harness connector?

      Yes

      - Repair the (T118) Solenoid Supply 2 circuit for a short to another circuit.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 6.
6. **CHECK THE (T814) PRESSURE CONTROL SOLENOID B CIRCUIT FOR AN OPEN**
   1. Measure the resistance of the (T814) Pressure Control Solenoid B circuit between the Transmission Assembly harness connector and the TCM harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 7

      No

      - Repair the (T814) Pressure Control Solenoid B circuit for an open or high resistance.

- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

7. **CHECK THE (T814) PRESSURE CONTROL SOLENOID B CIRCUIT FOR A SHORT TO GROUND**
   1. Measure the resistance between ground and the (T814) Pressure Control Solenoid B circuit.

      Is there continuity between ground and the (T814) Pressure Control Solenoid B circuit?

      Yes

      - Repair the (T814) Pressure Control Solenoid B circuit for a short to ground.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 8.

8. **CHECK THE (T814) PRESSURE CONTROL SOLENOID B CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**
   1. Measure the resistance between the (T814) Pressure Control Solenoid B circuit and all other circuits in the TCM harness connector.

      Is there continuity between the (T814) Pressure Control Solenoid B circuit and any other circuits in the TCM harness connector?

      Yes

      - Repair the (T814) Pressure Control Solenoid B circuit for a short to another circuit.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      NOTE: If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.

      - Using the schematics as a guide, check the Transmission Control Module (TCM) terminals and connectors for corrosion, damage or pushed out terminals. Pay particular attention to the power and ground circuits. If no problems are found, replace the TCM and perform programming and PROXI Configuration Alignment procedures. Refer to **MODULE, TRANSMISSION CONTROL, REMOVAL** .

- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

9. **CHECK THE WIRING AND CONNECTORS**
    1. The conditions necessary to set this DTC are not present at this time.
    2. Use the Freeze Frame Data to help duplicate the conditions in which the DTC originally set. Pay particular attention to the DTC set conditions, such as, VSS, MAP, ECT, and Load.
    3. Using the schematics as a guide, visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires.
    4. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.
    5. Wiggle the wiring and connectors while checking for any possible open or shorted circuits.
    6. Check for any Service Information Tune-ups or Technical Service Bulletins that may apply.

    Were there any problems found?

    Yes

    - Repair as necessary.
    - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

    No

    - Test Complete.

P0976-00-SHIFT SOLENOID 2 CONTROL CIRCUIT LOW

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 29: Pressure Regulators & Solenoids Control Circuit Diagram

THEORY OF OPERATION

The purpose of the diagnostic is to detect circuit failures on any of the output stages. All output stages are controlled by a current controller that can operate an output stage in two different modes:

- Current controlled mode (pressure regulators)
- Switched mode or PWM controlled (solenoids)

Pressure Regulator Monitoring: The current regulator ASIC in the TCM indicates the following circuit failures via SPI bus to the CPU:

- Short to ground
- Short to battery or open circuit

Solenoid Monitoring: The TCM measures the actual solenoid voltages and compares them to calibrated thresholds to identify the following electrical failures:

- Short to ground or open circuit
- Short to battery

WHEN MONITORED

Output stages power supply switched on.

Power supply voltage is greater than a calibrated value.

SET CONDITION

Pressure Regulator Monitoring: A failure is detected if one of the following conditions occur:

An short to ground failure is detected if the ASIC indicates a short to ground failure.

A short to battery or open circuit failure is detected if the ASIC indicates a short to battery or open circuit failure.

Solenoid Monitoring: A failure is detected if one of the following conditions occur:

An short to ground or open circuit failure is detected if the ratio between the voltage at the solenoid valve and the output stages power supply is above a calibrated threshold.

A short to battery failure is detected if the ratio between the voltage at the solenoid valve and the output stages power supply is below a calibrated threshold.

POSSIBLE CAUSES

Possible Causes
(T118) SOLENOID SUPPLY 2 CIRCUIT OPEN
(T118) SOLENOID SUPPLY 2 CIRCUIT SHORTED TO GROUND
(T814) PRESSURE CONTROL SOLENOID B CIRCUIT OPEN
(T814) PRESSURE CONTROL SOLENOID B CIRCUIT SHORTED TO GROUND
(T814) PRESSURE CONTROL SOLENOID B CIRCUIT SHORTED TO VOLTAGE
PRESSURE CONTROL SOLENOID B
TRANSMISSION CONTROL MODULE (TCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK IF THE DTC IS CURRENT**
    1. Using the scan tool, read TCM DTCs.
    2. Record the Environmental Data and any DTCs.
    3. Clear DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. Read TCM DTCs.

    Did the DTC reset?

    Yes

    - Go To 2

    No

    - Go To 9
2. **CHECK THE PRESSURE CONTROL SOLENOID B**
    1. Turn the Ignition OFF.
    2. Disconnect the Transmission Assembly harness connector.
    3. Measure the resistance of the Pressure Control Solenoid B at the appropriate terminals in the Transmission Assembly interface connector.

    Is the resistance of the Pressure Control Solenoid B 5.4 Ohms ± 0.5 Ohms?

    Yes

    - Go To 3

    No

    - Replace the Pressure Control Solenoid B in accordance with the service information.
    - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
3. **CHECK THE (T118) SOLENOID SUPPLY 2 CIRCUIT FOR AN OPEN**
    1. Disconnect the TCM harness connector.
    2. Measure the resistance of the (T118) Solenoid Supply 2 circuit between the Transmission Assembly harness connector and the TCM harness connector.

Is the resistance below 5.0 Ohms?

Yes

- Go To 4

No

- Repair the (T118) Solenoid Supply 2 circuit for an open or high resistance.
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK THE (T118) SOLENOID SUPPLY 2 CIRCUIT FOR A SHORT TO GROUND**
   1. Measure the resistance between ground and the (T118) Solenoid Supply 2 circuit.

      Is there continuity between ground and the (T118) Solenoid Supply 2 circuit?

      Yes

      - Repair the (T118) Solenoid Supply 2 circuit for a short to ground.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 5

5. **CHECK THE (T118) SOLENOID SUPPLY 2 CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**
   1. Measure the resistance between the (T118) Solenoid Supply 2 circuit and all other circuits in the TCM harness connector.

      Is there continuity between the (T118) Solenoid Supply 2 circuit and any other circuits in the TCM harness connector?

      Yes

      - Repair the (T118) Solenoid Supply 2 circuit for a short to another circuit.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 6.

6. **CHECK THE (T814) PRESSURE CONTROL SOLENOID B CIRCUIT FOR AN OPEN**
   1. Measure the resistance of the (T814) Pressure Control Solenoid B circuit between the Transmission

Assembly harness connector and the TCM harness connector.

Is the resistance below 5.0 Ohms?

Yes

- Go To 7

No

- Repair the (T814) Pressure Control Solenoid B circuit for an open or high resistance.
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

7. **CHECK THE (T814) PRESSURE CONTROL SOLENOID B CIRCUIT FOR A SHORT TO GROUND**
   1. Measure the resistance between ground and the (T814) Pressure Control Solenoid B circuit.

      Is there continuity between ground and the (T814) Pressure Control Solenoid B circuit?

      Yes

      - Repair the (T814) Pressure Control Solenoid B circuit for a short to ground.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 8.
8. **CHECK THE (T814) PRESSURE CONTROL SOLENOID B CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**
   1. Measure the resistance between the (T814) Pressure Control Solenoid B circuit and all other circuits in the TCM harness connector.

      Is there continuity between the (T814) Pressure Control Solenoid B circuit and any other circuits in the TCM harness connector?

      Yes

      - Repair the (T814) Pressure Control Solenoid B circuit for a short to another circuit.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

NOTE: **If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.**

- Using the schematics as a guide, check the Transmission Control Module (TCM) terminals and connectors for corrosion, damage or pushed out terminals. Pay particular attention to the power and ground circuits. If no problems are found, replace the TCM and perform programming and PROXI Configuration Alignment procedures. Refer to **MODULE, TRANSMISSION CONTROL, REMOVAL** .
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

9. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Use the Freeze Frame Data to help duplicate the conditions in which the DTC originally set. Pay particular attention to the DTC set conditions, such as, VSS, MAP, ECT, and Load.
   3. Using the schematics as a guide, visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires.
   4. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.
   5. Wiggle the wiring and connectors while checking for any possible open or shorted circuits.
   6. Check for any Service Information Tune-ups or Technical Service Bulletins that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Test Complete.

P0978-00-SHIFT SOLENOID 3 CONTROL CIRCUIT RANGE-PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 30: Pressure Regulators & Solenoids Control Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The purpose of the diagnostic is to detect a functional failure of the pressure regulator output stages in the TCM. The diagnostic monitors for an incorrect current feed to the pressure regulators which control the friction clutches. The monitoring is performed using two independent methods of comparing the commanded current to the measured current.

Current Summation Check: The sum current (total current of pressure regulators B, C, D, E) is measured using a shunt resistor. The measured value is compared to the summed commanded currents of pressure

regulators B, C, D, E (Sum Current Calculation).

PWM Feedback Signal Check: The pulse width modulation (PWM) feedback signal generated by the current regulator in the output stage identifies a deviating output current for each current regulator. To perform a functional check of the output stage current, the TCM calculates the actual current based upon the PWM feedback signal, the output stage power supply voltage and the resistance of the corresponding pressure regulator. This calculated current is compared to the commanded current from the current regulator.

WHEN MONITORED

Continuously after the ignition switch is turned to the run position.

All commanded solenoid currents are greater than zero.

SET CONDITION

Current Summation Check: The failure is detected if the calculated current summation deviates from the commanded current summation by a calibrated amount. The difference is compared to positive and negative calibrated thresholds.

PWM Feedback Signal Check : The failure is detected if the calculated pressure regulator current deviates from the commanded current by a calibrated amount. The difference is compared to positive and negative calibrated thresholds.

POSSIBLE CAUSES

Possible Causes
(T118) SOLENOID SUPPLY 2 CIRCUIT OPEN
(T118) SOLENOID SUPPLY 2 CIRCUIT SHORTED TO GROUND
(T816) PRESSURE CONTROL SOLENOID C CIRCUIT OPEN
(T816) PRESSURE CONTROL SOLENOID C CIRCUIT SHORTED TO GROUND
(T816) PRESSURE CONTROL SOLENOID C CIRCUIT SHORTED TO VOLTAGE
PRESSURE CONTROL SOLENOID C
TRANSMISSION CONTROL MODULE (TCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK IF THE DTC IS CURRENT**
    1. Using the scan tool, read TCM DTCs.
    2. Record the Environmental Data and any DTCs.
    3. Clear DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions

above, operate the vehicle in the conditions that set the DTC.

5. Read TCM DTCs.

   Did the DTC reset?

   Yes

   - Go To 9

   No

   - Go To 2

2. **CHECK THE PRESSURE CONTROL SOLENOID C**
   1. Turn the Ignition OFF.
   2. Disconnect the Transmission Assembly harness connector.
   3. Measure the resistance of the Pressure Control Solenoid C at the appropriate terminals in the Transmission Assembly interface connector.

      Is the resistance of the Pressure Control Solenoid C 5.4 Ohms ± 0.5 Ohms?

      Yes

      - Go To 3

      No

      - Replace the Pressure Control Solenoid C in accordance with the service information.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (T118) SOLENOID SUPPLY 2 CIRCUIT FOR AN OPEN**
   1. Disconnect the TCM harness connector.
   2. Measure the resistance of the (T118) Solenoid Supply 2 circuit between the Transmission Assembly harness connector and the TCM harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 4

      No

      - Repair the (T118) Solenoid Supply 2 circuit for an open or high resistance.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD**

PROCEDURE .

4. **CHECK THE (T118) SOLENOID SUPPLY 2 CIRCUIT FOR A SHORT TO GROUND**
   1. Measure the resistance between ground and the (T118) Solenoid Supply 2 circuit.

      Is there continuity between ground and the (T118) Solenoid Supply 2 circuit?

      Yes

      - Repair the (T118) Solenoid Supply 2 circuit for a short to ground.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 5
5. **CHECK THE (T118) SOLENOID SUPPLY 2 CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**
   1. Measure the resistance between the (T118) Solenoid Supply 2 circuit and all other circuits in the TCM harness connector.

      Is there continuity between the (T118) Solenoid Supply 2 circuit and any other circuits in the TCM harness connector?

      Yes

      - Repair the (T118) Solenoid Supply 2 circuit for a short to another circuit.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 6.
6. **CHECK THE (T816) PRESSURE CONTROL SOLENOID C CIRCUIT FOR AN OPEN**
   1. Measure the resistance of the (T816) Pressure Control Solenoid C circuit between the Transmission Assembly harness connector and the TCM harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 7

      No

- Repair the (T816) Pressure Control Solenoid C circuit for an open or high resistance.
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

7. **CHECK THE (T816) PRESSURE CONTROL SOLENOID C CIRCUIT FOR A SHORT TO GROUND**
   1. Measure the resistance between ground and the (T816) Pressure Control Solenoid C circuit.

      Is there continuity between ground and the (T816) Pressure Control Solenoid C circuit?

      Yes

      - Repair the (T816) Pressure Control Solenoid C circuit for a short to ground.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 8.

8. **CHECK THE (T816) PRESSURE CONTROL SOLENOID C CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**
   1. Measure the resistance between the (T816) Pressure Control Solenoid C circuit and all other circuits in the TCM harness connector.

      Is there continuity between the (T816) Pressure Control Solenoid C circuit and any other circuits in the TCM harness connector?

      Yes

      - Repair the (T816) Pressure Control Solenoid C circuit for a short to another circuit.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      NOTE: **If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. THEORY OF OPERATION

The purpose of the diagnostic is to detect circuit failures on any of the output stages. All output stages are controlled by a current controller that can operate an output stage in two different modes:

- Current controlled mode (pressure regulators)
- Switched mode or PWM controlled (solenoids)

Pressure Regulator Monitoring: The current regulator ASIC in the TCM indicates the following circuit failures via SPI bus to the CPU:

- Short to ground
- Short to battery or open circuit

Solenoid Monitoring: The TCM measures the actual solenoid voltages and compares them to calibrated thresholds to identify the following electrical failures:

- Short to ground or open circuit
- Short to battery

WHEN MONITORED

Output stages power supply switched on.

Power supply voltage is greater than a calibrated value.

SET CONDITION

Pressure Regulator Monitoring: A failure is detected if one of the following conditions occur:

An short to ground failure is detected if the ASIC indicates a short to ground failure.

A short to battery or open circuit failure is detected if the ASIC indicates a short to battery or open circuit failure.

Solenoid Monitoring: A failure is detected if one of the following conditions occur:

An short to ground or open circuit failure is detected if the ratio between the voltage at the solenoid valve and the output stages power supply is above a calibrated threshold.

A short to battery failure is detected if the ratio between the voltage at the solenoid valve and the output stages power supply is below a calibrated threshold.

POSSIBLE CAUSES

Possible Causes
(T118) SOLENOID SUPPLY 2 CIRCUIT OPEN
(T118) SOLENOID SUPPLY 2 CIRCUIT SHORTED TO GROUND
(T816) PRESSURE CONTROL SOLENOID C CIRCUIT OPEN
(T816) PRESSURE CONTROL SOLENOID C CIRCUIT SHORTED TO GROUND
(T816) PRESSURE CONTROL SOLENOID C CIRCUIT SHORTED TO VOLTAGE
PRESSURE CONTROL SOLENOID C
TRANSMISSION CONTROL MODULE (TCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURES .

DIAGNOSTIC TEST

1. **CHECK IF THE DTC IS CURRENT**
    1. Using the scan tool, read TCM DTCs.
    2. Record the Environmental Data and any DTCs.
    3. Clear DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. Read TCM DTCs.

    Did the DTC reset?

    Yes

    - Go To 9

    No

    - Go To 2
2. **CHECK THE PRESSURE CONTROL SOLENOID C**
    1. Turn the Ignition OFF.
    2. Disconnect the Transmission Assembly harness connector.
    3. Measure the resistance of the Pressure Control Solenoid C at the appropriate terminals in the Transmission Assembly interface connector.

    Is the resistance of the Pressure Control Solenoid C 5.4 Ohms ± 0.5 Ohms?

    Yes

    - Go To 3

    No

    - Replace the Pressure Control Solenoid C in accordance with the service information.
    - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
3. **CHECK THE (T118) SOLENOID SUPPLY 2 CIRCUIT FOR AN OPEN**
    1. Disconnect the TCM harness connector.
    2. Measure the resistance of the (T118) Solenoid Supply 2 circuit between the Transmission Assembly harness connector and the TCM harness connector.

Is the resistance below 5.0 Ohms?

Yes

- Go To 4

No

- Repair the (T118) Solenoid Supply 2 circuit for an open or high resistance.
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK THE (T118) SOLENOID SUPPLY 2 CIRCUIT FOR A SHORT TO GROUND**
   1. Measure the resistance between ground and the (T118) Solenoid Supply 2 circuit.

      Is there continuity between ground and the (T118) Solenoid Supply 2 circuit?

      Yes

      - Repair the (T118) Solenoid Supply 2 circuit for a short to ground.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 5

5. **CHECK THE (T118) SOLENOID SUPPLY 2 CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**
   1. Measure the resistance between the (T118) Solenoid Supply 2 circuit and all other circuits in the TCM harness connector.

      Is there continuity between the (T118) Solenoid Supply 2 circuit and any other circuits in the TCM harness connector?

      Yes

      - Repair the (T118) Solenoid Supply 2 circuit for a short to another circuit.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 6.

6. **CHECK THE (T816) PRESSURE CONTROL SOLENOID C CIRCUIT FOR AN OPEN**
   1. Measure the resistance of the (T816) Pressure Control Solenoid C circuit between the Transmission

Assembly harness connector and the TCM harness connector.

Is the resistance below 5.0 Ohms?

Yes

- Go To 7

No

- Repair the (T816) Pressure Control Solenoid C circuit for an open or high resistance.
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

7. **CHECK THE (T816) PRESSURE CONTROL SOLENOID C CIRCUIT FOR A SHORT TO GROUND**
   1. Measure the resistance between ground and the (T816) Pressure Control Solenoid C circuit.

      Is there continuity between ground and the (T816) Pressure Control Solenoid C circuit?

      Yes

      - Repair the (T816) Pressure Control Solenoid C circuit for a short to ground.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 8.

8. **CHECK THE (T816) PRESSURE CONTROL SOLENOID C CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**
   1. Measure the resistance between the (T816) Pressure Control Solenoid C circuit and all other circuits in the TCM harness connector.

      Is there continuity between the (T816) Pressure Control Solenoid C circuit and any other circuits in the TCM harness connector?

      Yes

      - Repair the (T816) Pressure Control Solenoid C circuit for a short to another circuit.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

NOTE: **If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.**

- Using the schematics as a guide, check the Transmission Control Module (TCM) terminals and connectors for corrosion, damage or pushed out terminals. Pay particular attention to the power and ground circuits. If no problems are found, replace the TCM and perform programming and PROXI Configuration Alignment procedures. Refer to **MODULE, TRANSMISSION CONTROL, REMOVAL** .
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

9. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Use the Freeze Frame Data to help duplicate the conditions in which the DTC originally set. Pay particular attention to the DTC set conditions, such as, VSS, MAP, ECT, and Load.
   3. Using the schematics as a guide, visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires.
   4. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.
   5. Wiggle the wiring and connectors while checking for any possible open or shorted circuits.
   6. Check for any Service Information Tune-ups or Technical Service Bulletins that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Test Complete.

P097B-00-SHIFT SOLENOID 2 CONTROL CIRCUIT OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The purpose of the diagnostic is to detect circuit failures on any of the output stages. All output stages are controlled by a current controller that can operate an output stage in two different modes:

- Current controlled mode (pressure regulators)
- Switched mode or PWM controlled (solenoids)

Pressure Regulator Monitoring: The current regulator ASIC in the TCM indicates the following circuit failures via SPI bus to the CPU:

- Short to ground
- Short to battery or open circuit

Solenoid Monitoring: The TCM measures the actual solenoid voltages and compares them to calibrated thresholds to identify the following electrical failures:

- Short to ground or open circuit
- Short to battery

WHEN MONITORED

Output stages power supply switched on.

Power supply voltage is greater than a calibrated value.

SET CONDITION

Pressure Regulator Monitoring: A failure is detected if one of the following conditions occur:

An short to ground failure is detected if the ASIC indicates a short to ground failure.

A short to battery or open circuit failure is detected if the ASIC indicates a short to battery or open circuit failure.

Solenoid Monitoring: A failure is detected if one of the following conditions occur:

An short to ground or open circuit failure is detected if the ratio between the voltage at the solenoid valve and the output stages power supply is above a calibrated threshold.

A short to battery failure is detected if the ratio between the voltage at the solenoid valve and the output stages power supply is below a calibrated threshold.

POSSIBLE CAUSES

Possible Causes
(T118) SOLENOID SUPPLY 2 CIRCUIT OPEN
(T118) SOLENOID SUPPLY 2 CIRCUIT SHORTED TO GROUND
(T814) PRESSURE CONTROL SOLENOID B CIRCUIT OPEN
(T814) PRESSURE CONTROL SOLENOID B CIRCUIT SHORTED TO GROUND
(T814) PRESSURE CONTROL SOLENOID B CIRCUIT SHORTED TO VOLTAGE
PRESSURE CONTROL SOLENOID B
TRANSMISSION CONTROL MODULE (TCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK IF THE DTC IS CURRENT**
    1. Using the scan tool, read TCM DTCs.
    2. Record the Environmental Data and any DTCs.
    3. Clear DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. Read TCM DTCs.

    Did the DTC reset?

    Yes

    - Go To 2

    No

    - Go To 9
2. **CHECK THE PRESSURE CONTROL SOLENOID B**
    1. Turn the Ignition OFF.
    2. Disconnect the Transmission Assembly harness connector.
    3. Measure the resistance of the Pressure Control Solenoid B at the appropriate terminals in the Transmission Assembly interface connector.

    Is the resistance of the Pressure Control Solenoid B 5.4 Ohms ± 0.5 Ohms?

    Yes

    - Go To 3

    No

    - Replace the Pressure Control Solenoid B in accordance with the service information.
    - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
3. **CHECK THE (T118) SOLENOID SUPPLY 2 CIRCUIT FOR AN OPEN**
    1. Disconnect the TCM harness connector.
    2. Measure the resistance of the (T118) Solenoid Supply 2 circuit between the Transmission Assembly harness connector and the TCM harness connector.

Is the resistance below 5.0 Ohms?

Yes

- Go To 4

No

- Repair the (T118) Solenoid Supply 2 circuit for an open or high resistance.
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK THE (T118) SOLENOID SUPPLY 2 CIRCUIT FOR A SHORT TO GROUND**
   1. Measure the resistance between ground and the (T118) Solenoid Supply 2 circuit.

      Is there continuity between ground and the (T118) Solenoid Supply 2 circuit?

      Yes

      - Repair the (T118) Solenoid Supply 2 circuit for a short to ground.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 5

5. **CHECK THE (T118) SOLENOID SUPPLY 2 CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**
   1. Measure the resistance between the (T118) Solenoid Supply 2 circuit and all other circuits in the TCM harness connector.

      Is there continuity between the (T118) Solenoid Supply 2 circuit and any other circuits in the TCM harness connector?

      Yes

      - Repair the (T118) Solenoid Supply 2 circuit for a short to another circuit.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 6.

6. **CHECK THE (T814) PRESSURE CONTROL SOLENOID B CIRCUIT FOR AN OPEN**
   1. Measure the resistance of the (T814) Pressure Control Solenoid B circuit between the Transmission

Assembly harness connector and the TCM harness connector.

Is the resistance below 5.0 Ohms?

Yes

- Go To 7

No

- Repair the (T814) Pressure Control Solenoid B circuit for an open or high resistance.
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

7. **CHECK THE (T814) PRESSURE CONTROL SOLENOID B CIRCUIT FOR A SHORT TO GROUND**
   1. Measure the resistance between ground and the (T814) Pressure Control Solenoid B circuit.

      Is there continuity between ground and the (T814) Pressure Control Solenoid B circuit?

      Yes

      - Repair the (T814) Pressure Control Solenoid B circuit for a short to ground.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 8.
8. **CHECK THE (T814) PRESSURE CONTROL SOLENOID B CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**
   1. Measure the resistance between the (T814) Pressure Control Solenoid B circuit and all other circuits in the TCM harness connector.

      Is there continuity between the (T814) Pressure Control Solenoid B circuit and any other circuits in the TCM harness connector?

      Yes

      - Repair the (T814) Pressure Control Solenoid B circuit for a short to another circuit.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

NOTE: **If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.**

- Using the schematics as a guide, check the Transmission Control Module (TCM) terminals and connectors for corrosion, damage or pushed out terminals. Pay particular attention to the power and ground circuits. If no problems are found, replace the TCM and perform programming and PROXI Configuration Alignment procedures. Refer to **MODULE, TRANSMISSION CONTROL, REMOVAL** .
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

9. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Use the Freeze Frame Data to help duplicate the conditions in which the DTC originally set. Pay particular attention to the DTC set conditions, such as, VSS, MAP, ECT, and Load.
   3. Using the schematics as a guide, visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires.
   4. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.
   5. Wiggle the wiring and connectors while checking for any possible open or shorted circuits.
   6. Check for any Service Information Tune-ups or Technical Service Bulletins that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Test Complete.

PRESSURE CONTROL SOLENOID C
TRANSMISSION CONTROL MODULE (TCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURES .

DIAGNOSTIC TEST

1. **CHECK IF THE DTC IS CURRENT**
    1. Using the scan tool, read TCM DTCs.
    2. Record the Environmental Data and any DTCs.
    3. Clear DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. Read TCM DTCs.

    Did the DTC reset?

    Yes

    - Go To 9

    No

    - Go To 2
2. **CHECK THE PRESSURE CONTROL SOLENOID C**
    1. Turn the Ignition OFF.
    2. Disconnect the Transmission Assembly harness connector.
    3. Measure the resistance of the Pressure Control Solenoid C at the appropriate terminals in the Transmission Assembly interface connector.

    Is the resistance of the Pressure Control Solenoid C 5.4 Ohms ± 0.5 Ohms?

    Yes

    - Go To 3

    No

    - Replace the Pressure Control Solenoid C in accordance with the service information.
    - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
3. **CHECK THE (T118) SOLENOID SUPPLY 2 CIRCUIT FOR AN OPEN**
    1. Disconnect the TCM harness connector.
    2. Measure the resistance of the (T118) Solenoid Supply 2 circuit between the Transmission Assembly harness connector and the TCM harness connector.

Is the resistance below 5.0 Ohms?

Yes

- Go To 4

No

- Repair the (T118) Solenoid Supply 2 circuit for an open or high resistance.
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK THE (T118) SOLENOID SUPPLY 2 CIRCUIT FOR A SHORT TO GROUND**
   1. Measure the resistance between ground and the (T118) Solenoid Supply 2 circuit.

      Is there continuity between ground and the (T118) Solenoid Supply 2 circuit?

      Yes

      - Repair the (T118) Solenoid Supply 2 circuit for a short to ground.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 5

5. **CHECK THE (T118) SOLENOID SUPPLY 2 CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**
   1. Measure the resistance between the (T118) Solenoid Supply 2 circuit and all other circuits in the TCM harness connector.

      Is there continuity between the (T118) Solenoid Supply 2 circuit and any other circuits in the TCM harness connector?

      Yes

      - Repair the (T118) Solenoid Supply 2 circuit for a short to another circuit.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 6.

6. **CHECK THE (T816) PRESSURE CONTROL SOLENOID C CIRCUIT FOR AN OPEN**
   1. Measure the resistance of the (T816) Pressure Control Solenoid C circuit between the Transmission

Assembly harness connector and the TCM harness connector.

Is the resistance below 5.0 Ohms?

Yes

- Go To 7

No

- Repair the (T816) Pressure Control Solenoid C circuit for an open or high resistance.
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

7. **CHECK THE (T816) PRESSURE CONTROL SOLENOID C CIRCUIT FOR A SHORT TO GROUND**
   1. Measure the resistance between ground and the (T816) Pressure Control Solenoid C circuit.

      Is there continuity between ground and the (T816) Pressure Control Solenoid C circuit?

      Yes

      - Repair the (T816) Pressure Control Solenoid C circuit for a short to ground.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 8.

8. **CHECK THE (T816) PRESSURE CONTROL SOLENOID C CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**
   1. Measure the resistance between the (T816) Pressure Control Solenoid C circuit and all other circuits in the TCM harness connector.

      Is there continuity between the (T816) Pressure Control Solenoid C circuit and any other circuits in the TCM harness connector?

      Yes

      - Repair the (T816) Pressure Control Solenoid C circuit for a short to another circuit.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

NOTE: **If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.**

- Using the schematics as a guide, check the Transmission Control Module (TCM) terminals and connectors for corrosion, damage or pushed out terminals. Pay particular attention to the power and ground circuits. If no problems are found, replace the TCM and perform programming and PROXI Configuration Alignment procedures. Refer to **MODULE, TRANSMISSION CONTROL, REMOVAL** .
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

9. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Use the Freeze Frame Data to help duplicate the conditions in which the DTC originally set. Pay particular attention to the DTC set conditions, such as, VSS, MAP, ECT, and Load.
   3. Using the schematics as a guide, visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires.
   4. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.
   5. Wiggle the wiring and connectors while checking for any possible open or shorted circuits.
   6. Check for any Service Information Tune-ups or Technical Service Bulletins that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Test Complete.

WHEN MONITORED

Output stages power supply switched on.

Power supply voltage is greater than a calibrated value.

SET CONDITION

Pressure Regulator Monitoring: A failure is detected if one of the following conditions occur:

An short to ground failure is detected if the ASIC indicates a short to ground failure.

A short to battery or open circuit failure is detected if the ASIC indicates a short to battery or open circuit failure.

Solenoid Monitoring: A failure is detected if one of the following conditions occur:

An short to ground or open circuit failure is detected if the ratio between the voltage at the solenoid valve and the output stages power supply is above a calibrated threshold.

A short to battery failure is detected if the ratio between the voltage at the solenoid valve and the output stages power supply is below a calibrated threshold.

POSSIBLE CAUSES

Possible Causes
(T118) SOLENOID SUPPLY 2 CIRCUIT OPEN
(T118) SOLENOID SUPPLY 2 CIRCUIT SHORTED TO GROUND
(T790) PRESSURE CONTROL SOLENOID E CIRCUIT OPEN
(T790) PRESSURE CONTROL SOLENOID E CIRCUIT SHORTED TO GROUND
(T790) PRESSURE CONTROL SOLENOID E CIRCUIT SHORTED TO VOLTAGE
PRESSURE CONTROL SOLENOID E
TRANSMISSION CONTROL MODULE (TCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK IF THE DTC IS CURRENT**
    1. Using the scan tool, read TCM DTCs.
    2. Record the Environmental Data and any DTCs.
    3. Clear DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. Read TCM DTCs.

    Did the DTC reset?

    Yes

    - Go To 2

    No

    - Go To 9
2. **CHECK THE PRESSURE CONTROL SOLENOID E**
    1. Turn the Ignition OFF.
    2. Disconnect the Transmission Assembly harness connector.
    3. Measure the resistance of the Pressure Control Solenoid E at the appropriate terminals in the Transmission Assembly interface connector.

    Is the resistance of the Pressure Control Solenoid E 5.4 Ohms ± 0.5 Ohms?

    Yes

    - Go To 3

    No

    - Replace the Pressure Control Solenoid E in accordance with the service information.
    - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
3. **CHECK THE (T118) SOLENOID SUPPLY 2 CIRCUIT FOR AN OPEN**
    1. Disconnect the TCM harness connector.
    2. Measure the resistance of the (T118) Solenoid Supply 2 circuit between the Transmission Assembly harness connector and the TCM harness connector.

Is the resistance below 5.0 Ohms?

Yes

- Go To 4

No

- Repair the (T118) Solenoid Supply 2 circuit for an open or high resistance.
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK THE (T118) SOLENOID SUPPLY 2 CIRCUIT FOR A SHORT TO GROUND**
   1. Measure the resistance between ground and the (T118) Solenoid Supply 2 circuit.

      Is there continuity between ground and the (T118) Solenoid Supply 2 circuit?

      Yes

      - Repair the (T118) Solenoid Supply 2 circuit for a short to ground.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 5

5. **CHECK THE (T118) SOLENOID SUPPLY 2 CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**
   1. Measure the resistance between the (T118) Solenoid Supply 2 circuit and all other circuits in the TCM harness connector.

      Is there continuity between the (T118) Solenoid Supply 2 circuit and any other circuits in the TCM harness connector?

      Yes

      - Repair the (T118) Solenoid Supply 2 circuit for a short to another circuit.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 6.

6. **CHECK THE (T790) PRESSURE CONTROL SOLENOID E CIRCUIT FOR AN OPEN**
   1. Measure the resistance of the (T790) Pressure Control Solenoid E circuit between the Transmission

Assembly harness connector and the TCM harness connector.

Is the resistance below 5.0 Ohms?

Yes

- Go To 7

No

- Repair the (T790) Pressure Control Solenoid E circuit for an open or high resistance.
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

7. **CHECK THE (T790) PRESSURE CONTROL SOLENOID E CIRCUIT FOR A SHORT TO GROUND**
   1. Measure the resistance between ground and the (T790) Pressure Control Solenoid E circuit.

      Is there continuity between ground and the (T790) Pressure Control Solenoid E circuit?

      Yes

      - Repair the (T790) Pressure Control Solenoid E circuit for a short to ground.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 8.

8. **CHECK THE (T790) PRESSURE CONTROL SOLENOID E CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**
   1. Measure the resistance between the (T790) Pressure Control Solenoid E circuit and all other circuits in the TCM harness connector.

      Is there continuity between the (T790) Pressure Control Solenoid E circuit and any other circuits in the TCM harness connector?

      Yes

      - Repair the (T790) Pressure Control Solenoid E circuit for a short to another circuit.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

NOTE: **If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.**

- Using the schematics as a guide, check the Transmission Control Module (TCM) terminals and connectors for corrosion, damage or pushed out terminals. Pay particular attention to the power and ground circuits. If no problems are found, replace the TCM and perform programming and PROXI Configuration Alignment procedures. Refer to **MODULE, TRANSMISSION CONTROL, REMOVAL** .
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

9. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Use the Freeze Frame Data to help duplicate the conditions in which the DTC originally set. Pay particular attention to the DTC set conditions, such as, VSS, MAP, ECT, and Load.
   3. Using the schematics as a guide, visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires.
   4. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.
   5. Wiggle the wiring and connectors while checking for any possible open or shorted circuits.
   6. Check for any Service Information Tune-ups or Technical Service Bulletins that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Test Complete.

P0981-00-SHIFT SOLENOID 4 CONTROL CIRCUIT RANGE-PERFORMANCE

THEORY OF OPERATION

The purpose of the diagnostic is to detect a functional failure of the pressure regulator output stages in the TCM. The diagnostic monitors for an incorrect current feed to the pressure regulators which control the friction clutches. The monitoring is performed using two independent methods of comparing the commanded current to the measured current.

Current Summation Check: The sum current (total current of pressure regulators B, C, D, E) is measured using a shunt resistor. The measured value is compared to the summed commanded currents of pressure

regulators B, C, D, E (Sum Current Calculation).

PWM Feedback Signal Check: The pulse width modulation (PWM) feedback signal generated by the current regulator in the output stage identifies a deviating output current for each current regulator. To perform a functional check of the output stage current, the TCM calculates the actual current based upon the PWM feedback signal, the output stage power supply voltage and the resistance of the corresponding pressure regulator. This calculated current is compared to the commanded current from the current regulator.

WHEN MONITORED

Continuously after the ignition switch is turned to the run position.

All commanded solenoid currents are greater than zero.

SET CONDITION

Current Summation Check: The failure is detected if the calculated current summation deviates from the commanded current summation by a calibrated amount. The difference is compared to positive and negative calibrated thresholds.

PWM Feedback Signal Check: The failure is detected if the calculated pressure regulator current deviates from the commanded current by a calibrated amount. The difference is compared to positive and negative calibrated thresholds.

POSSIBLE CAUSES

Possible Causes
(T118) SOLENOID SUPPLY 2 CIRCUIT OPEN
(T118) SOLENOID SUPPLY 2 CIRCUIT SHORTED TO GROUND
(T818) PRESSURE CONTROL SOLENOID D CIRCUIT OPEN
(T818) PRESSURE CONTROL SOLENOID D CIRCUIT SHORTED TO GROUND
(T818) PRESSURE CONTROL SOLENOID D CIRCUIT SHORTED TO VOLTAGE
PRESSURE CONTROL SOLENOID D
TRANSMISSION CONTROL MODULE (TCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK IF THE DTC IS CURRENT**
    1. Using the scan tool, read TCM DTCs.
    2. Record the Environmental Data and any DTCs.
    3. Clear DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions

above, operate the vehicle in the conditions that set the DTC.

5. Read TCM DTCs.

   Did the DTC reset?

   Yes

   - Go To 2

   No

   - Go To 9

2. **CHECK THE PRESSURE CONTROL SOLENOID D**
   1. Turn the Ignition OFF.
   2. Disconnect the Transmission Assembly harness connector.
   3. Measure the resistance of the Pressure Control Solenoid D at the appropriate terminals in the Transmission Assembly interface connector.

      Is the resistance of the Pressure Control Solenoid D 5.4 Ohms ± 0.5 Ohms?

      Yes

      - Go To 3

      No

      - Replace the Pressure Control Solenoid D in accordance with the service information.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (T118) SOLENOID SUPPLY 2 CIRCUIT FOR AN OPEN**
   1. Disconnect the TCM harness connector.
   2. Measure the resistance of the (T118) Solenoid Supply 2 circuit between the Transmission Assembly harness connector and the TCM harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 4

      No

      - Repair the (T118) Solenoid Supply 2 circuit for an open or high resistance.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD**

PROCEDURE .

4. **CHECK THE (T118) SOLENOID SUPPLY 2 CIRCUIT FOR A SHORT TO GROUND**
   1. Measure the resistance between ground and the (T118) Solenoid Supply 2 circuit.

      Is there continuity between ground and the (T118) Solenoid Supply 2 circuit?

      Yes

      - Repair the (T118) Solenoid Supply 2 circuit for a short to ground.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 5
5. **CHECK THE (T118) SOLENOID SUPPLY 2 CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**
   1. Measure the resistance between the (T118) Solenoid Supply 2 circuit and all other circuits in the TCM harness connector.

      Is there continuity between the (T118) Solenoid Supply 2 circuit and any other circuits in the TCM harness connector?

      Yes

      - Repair the (T118) Solenoid Supply 2 circuit for a short to another circuit.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 6.
6. **CHECK THE (T818) PRESSURE CONTROL SOLENOID D CIRCUIT FOR AN OPEN**
   1. Measure the resistance of the (T818) Pressure Control Solenoid D circuit between the Transmission Assembly harness connector and the TCM harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 7

      No

- Repair the (T818) Pressure Control Solenoid D circuit for an open or high resistance.
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

7. **CHECK THE (T818) PRESSURE CONTROL SOLENOID D CIRCUIT FOR A SHORT TO GROUND**
   1. Measure the resistance between ground and the (T818) Pressure Control Solenoid D circuit.

      Is there continuity between ground and the (T818) Pressure Control Solenoid D circuit?

      Yes

      - Repair the (T818) Pressure Control Solenoid D circuit for a short to ground.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 8.

8. **CHECK THE (T818) PRESSURE CONTROL SOLENOID D CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**
   1. Measure the resistance between the (T818) Pressure Control Solenoid D circuit and all other circuits in the TCM harness connector.

      Is there continuity between the (T818) Pressure Control Solenoid D circuit and any other circuits in the TCM harness connector?

      Yes

      - Repair the (T818) Pressure Control Solenoid D circuit for a short to another circuit.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      NOTE: **If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.**

      - Using the schematics as a guide, check the Transmission Control Module (TCM) terminals and connectors for corrosion, damage or pushed out terminals. Pay particular attention to the power and ground circuits. If no problems are found, replace the TCM and perform programming and PROXI Configuration Alignment procedures. Refer to **MODULE,**

TRANSMISSION CONTROL, REMOVAL .

- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

9. **CHECK THE WIRING AND CONNECTORS**
    1. The conditions necessary to set this DTC are not present at this time.
    2. Use the Freeze Frame Data to help duplicate the conditions in which the DTC originally set. Pay particular attention to the DTC set conditions, such as, VSS, MAP, ECT, and Load.
    3. Using the schematics as a guide, visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires.
    4. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.
    5. Wiggle the wiring and connectors while checking for any possible open or shorted circuits.
    6. Check for any Service Information Tune-ups or Technical Service Bulletins that may apply.

    Were there any problems found?

    Yes

    - Repair as necessary.
    - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

    No

    - Test Complete.

P0982-00-SHIFT SOLENOID 4 CONTROL CIRCUIT LOW

THEORY OF OPERATION

The purpose of the diagnostic is to detect circuit failures on any of the output stages. All output stages are controlled by a current controller that can operate an output stage in two different modes:

- Current controlled mode (pressure regulators)
- Switched mode or PWM controlled (solenoids)

Pressure Regulator Monitoring: The current regulator ASIC in the TCM indicates the following circuit failures via SPI bus to the CPU:

- Short to ground
- Short to battery or open circuit

Solenoid Monitoring: The TCM measures the actual solenoid voltages and compares them to calibrated thresholds to identify the following electrical failures:

- Short to ground or open circuit
- Short to battery

WHEN MONITORED

Output stages power supply switched on.

Power supply voltage is greater than a calibrated value.

SET CONDITION

Pressure Regulator Monitoring: A failure is detected if one of the following conditions occur:

An short to ground failure is detected if the ASIC indicates a short to ground failure.

A short to battery or open circuit failure is detected if the ASIC indicates a short to battery or open circuit failure.

Solenoid Monitoring: A failure is detected if one of the following conditions occur:

An short to ground or open circuit failure is detected if the ratio between the voltage at the solenoid valve and the output stages power supply is above a calibrated threshold.

A short to battery failure is detected if the ratio between the voltage at the solenoid valve and the output stages power supply is below a calibrated threshold.

POSSIBLE CAUSES

Possible Causes
(T118) SOLENOID SUPPLY 2 CIRCUIT OPEN
(T118) SOLENOID SUPPLY 2 CIRCUIT SHORTED TO GROUND
(T818) PRESSURE CONTROL SOLENOID D CIRCUIT OPEN
(T818) PRESSURE CONTROL SOLENOID D CIRCUIT SHORTED TO GROUND
(T818) PRESSURE CONTROL SOLENOID D CIRCUIT SHORTED TO VOLTAGE
PRESSURE CONTROL SOLENOID D
TRANSMISSION CONTROL MODULE (TCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK IF THE DTC IS CURRENT**
    1. Using the scan tool, read TCM DTCs.
    2. Record the Environmental Data and any DTCs.
    3. Clear DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. Read TCM DTCs.

    Did the DTC reset?

    Yes

    - Go To 2

    No

    - Go To 9
2. **CHECK THE PRESSURE CONTROL SOLENOID D**
    1. Turn the Ignition OFF.
    2. Disconnect the Transmission Assembly harness connector.
    3. Measure the resistance of the Pressure Control Solenoid D at the appropriate terminals in the Transmission Assembly interface connector.

    Is the resistance of the Pressure Control Solenoid D 5.4 Ohms ± 0.5 Ohms?

    Yes

    - Go To 3

    No

    - Replace the Pressure Control Solenoid D in accordance with the service information.
    - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
3. **CHECK THE (T118) SOLENOID SUPPLY 2 CIRCUIT FOR AN OPEN**
    1. Disconnect the TCM harness connector.
    2. Measure the resistance of the (T118) Solenoid Supply 2 circuit between the Transmission Assembly harness connector and the TCM harness connector.

Is the resistance below 5.0 Ohms?

Yes

- Go To 4

No

- Repair the (T118) Solenoid Supply 2 circuit for an open or high resistance.
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK THE (T118) SOLENOID SUPPLY 2 CIRCUIT FOR A SHORT TO GROUND**
   1. Measure the resistance between ground and the (T118) Solenoid Supply 2 circuit.

      Is there continuity between ground and the (T118) Solenoid Supply 2 circuit?

      Yes

      - Repair the (T118) Solenoid Supply 2 circuit for a short to ground.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 5

5. **CHECK THE (T118) SOLENOID SUPPLY 2 CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**
   1. Measure the resistance between the (T118) Solenoid Supply 2 circuit and all other circuits in the TCM harness connector.

      Is there continuity between the (T118) Solenoid Supply 2 circuit and any other circuits in the TCM harness connector?

      Yes

      - Repair the (T118) Solenoid Supply 2 circuit for a short to another circuit.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 6.

6. **CHECK THE (T818) PRESSURE CONTROL SOLENOID D CIRCUIT FOR AN OPEN**
   1. Measure the resistance of the (T818) Pressure Control Solenoid D circuit between the Transmission

Assembly harness connector and the TCM harness connector.

Is the resistance below 5.0 Ohms?

Yes

- Go To 7

No

- Repair the (T818) Pressure Control Solenoid D circuit for an open or high resistance.
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

7. **CHECK THE (T818) PRESSURE CONTROL SOLENOID D CIRCUIT FOR A SHORT TO GROUND**
   1. Measure the resistance between ground and the (T818) Pressure Control Solenoid D circuit.

      Is there continuity between ground and the (T818) Pressure Control Solenoid D circuit?

      Yes

      - Repair the (T818) Pressure Control Solenoid D circuit for a short to ground.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 8.

8. **CHECK THE (T818) PRESSURE CONTROL SOLENOID D CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**
   1. Measure the resistance between the (T818) Pressure Control Solenoid D circuit and all other circuits in the TCM harness connector.

      Is there continuity between the (T818) Pressure Control Solenoid D circuit and any other circuits in the TCM harness connector?

      Yes

      - Repair the (T818) Pressure Control Solenoid D circuit for a short to another circuit.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

NOTE: **If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.**

- Using the schematics as a guide, check the Transmission Control Module (TCM) terminals and connectors for corrosion, damage or pushed out terminals. Pay particular attention to the power and ground circuits. If no problems are found, replace the TCM and perform programming and PROXI Configuration Alignment procedures. Refer to **MODULE, TRANSMISSION CONTROL, REMOVAL** .
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

9. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Use the Freeze Frame Data to help duplicate the conditions in which the DTC originally set. Pay particular attention to the DTC set conditions, such as, VSS, MAP, ECT, and Load.
   3. Using the schematics as a guide, visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires.
   4. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.
   5. Wiggle the wiring and connectors while checking for any possible open or shorted circuits.
   6. Check for any Service Information Tune-ups or Technical Service Bulletins that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Test Complete.

DIAGNOSTIC TEST

1. **CHECK IF THE DTC IS CURRENT**
    1. Using the scan tool, read TCM DTCs.
    2. Record the Environmental Data and any DTCs.
    3. Clear DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. Read TCM DTCs.

    Did the DTC reset?

    Yes

    - Go To 2

    No

    - Go To 9
2. **CHECK THE PRESSURE CONTROL SOLENOID E**
    1. Turn the Ignition OFF.
    2. Disconnect the Transmission Assembly harness connector.
    3. Measure the resistance of the Pressure Control Solenoid E at the appropriate terminals in the Transmission Assembly interface connector.

    Is the resistance of the Pressure Control Solenoid E 5.4 Ohms ± 0.5 Ohms?

    Yes

    - Go To 3

    No

    - Replace the Pressure Control Solenoid E in accordance with the service information.
    - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
3. **CHECK THE (T118) SOLENOID SUPPLY 2 CIRCUIT FOR AN OPEN**
    1. Disconnect the TCM harness connector.
    2. Measure the resistance of the (T118) Solenoid Supply 2 circuit between the Transmission Assembly harness connector and the TCM harness connector.

Is the resistance below 5.0 Ohms?

Yes

- Go To 4

No

- Repair the (T118) Solenoid Supply 2 circuit for an open or high resistance.
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK THE (T118) SOLENOID SUPPLY 2 CIRCUIT FOR A SHORT TO GROUND**
   1. Measure the resistance between ground and the (T118) Solenoid Supply 2 circuit.

      Is there continuity between ground and the (T118) Solenoid Supply 2 circuit?

      Yes

      - Repair the (T118) Solenoid Supply 2 circuit for a short to ground.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 5

5. **CHECK THE (T118) SOLENOID SUPPLY 2 CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**
   1. Measure the resistance between the (T118) Solenoid Supply 2 circuit and all other circuits in the TCM harness connector.

      Is there continuity between the (T118) Solenoid Supply 2 circuit and any other circuits in the TCM harness connector?

      Yes

      - Repair the (T118) Solenoid Supply 2 circuit for a short to another circuit.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 6.

6. **CHECK THE (T790) PRESSURE CONTROL SOLENOID E CIRCUIT FOR AN OPEN**
   1. Measure the resistance of the (T790) Pressure Control Solenoid E circuit between the Transmission

Assembly harness connector and the TCM harness connector.

Is the resistance below 5.0 Ohms?

Yes

- Go To 7

No

- Repair the (T790) Pressure Control Solenoid E circuit for an open or high resistance.
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

7. **CHECK THE (T790) PRESSURE CONTROL SOLENOID E CIRCUIT FOR A SHORT TO GROUND**
   1. Measure the resistance between ground and the (T790) Pressure Control Solenoid E circuit.

      Is there continuity between ground and the (T790) Pressure Control Solenoid E circuit?

      Yes

      - Repair the (T790) Pressure Control Solenoid E circuit for a short to ground.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 8.

8. **CHECK THE (T790) PRESSURE CONTROL SOLENOID E CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**
   1. Measure the resistance between the (T790) Pressure Control Solenoid E circuit and all other circuits in the TCM harness connector.

      Is there continuity between the (T790) Pressure Control Solenoid E circuit and any other circuits in the TCM harness connector?

      Yes

      - Repair the (T790) Pressure Control Solenoid E circuit for a short to another circuit.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

NOTE: **If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.**

- Using the schematics as a guide, check the Transmission Control Module (TCM) terminals and connectors for corrosion, damage or pushed out terminals. Pay particular attention to the power and ground circuits. If no problems are found, replace the TCM and perform programming and PROXI Configuration Alignment procedures. Refer to **MODULE, TRANSMISSION CONTROL, REMOVAL** .
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

9. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Use the Freeze Frame Data to help duplicate the conditions in which the DTC originally set. Pay particular attention to the DTC set conditions, such as, VSS, MAP, ECT, and Load.
   3. Using the schematics as a guide, visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires.
   4. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.
   5. Wiggle the wiring and connectors while checking for any possible open or shorted circuits.
   6. Check for any Service Information Tune-ups or Technical Service Bulletins that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Test Complete.

P0998-00-SHIFT SOLENOID 6 CONTROL CIRCUIT LOW

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 40: Pressure Regulators & Solenoids Control Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The purpose of the diagnostic is to detect circuit failures on any of the output stages. All output stages are controlled by a current controller that can operate an output stage in two different modes:

- Current controlled mode (pressure regulators)
- Switched mode or PWM controlled (solenoids)

Pressure Regulator Monitoring: The current regulator ASIC in the TCM indicates the following circuit failures via SPI bus to the CPU:

- Short to ground
- Short to battery or open circuit

Solenoid Monitoring: The TCM measures the actual solenoid voltages and compares them to calibrated thresholds to identify the following electrical failures:

- Short to ground or open circuit
- Short to battery

WHEN MONITORED

Output stages power supply switched on.

Power supply voltage is greater than a calibrated value.

SET CONDITION

Pressure Regulator Monitoring: A failure is detected if one of the following conditions occur:

An short to ground failure is detected if the ASIC indicates a short to ground failure.

A short to battery or open circuit failure is detected if the ASIC indicates a short to battery or open circuit failure.

Solenoid Monitoring: A failure is detected if one of the following conditions occur:

An short to ground or open circuit failure is detected if the ratio between the voltage at the solenoid valve and the output stages power supply is above a calibrated threshold.

A short to battery failure is detected if the ratio between the voltage at the solenoid valve and the output stages power supply is below a calibrated threshold.

POSSIBLE CAUSES

Possible Causes
(T78) SOLENOID SUPPLY 1 CIRCUIT OPEN
(T78) SOLENOID SUPPLY 1 CIRCUIT SHORTED TO GROUND
(T802) DOG CLUTCH F SOLENOID CIRCUIT OPEN
(T802) DOG CLUTCH F SOLENOID CIRCUIT SHORTED TO GROUND
(T802) DOG CLUTCH F SOLENOID CIRCUIT SHORTED TO VOLTAGE
DOG CLUTCH F SOLENOID
TRANSMISSION CONTROL MODULE (TCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK IF THE DTC IS CURRENT**
    1. Using the scan tool, read TCM DTCs.
    2. Record the Environmental Data and any DTCs.
    3. Clear DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. Read TCM DTCs.

    Did the DTC reset?

    Yes

    - Go To 2

    No

    - Go To 9
2. **CHECK THE DOG CLUTCH F SOLENOID**
    1. Turn the Ignition OFF.
    2. Disconnect the Transmission Assembly harness connector.
    3. Measure the resistance of the Dog Clutch F Solenoid at the appropriate terminals in the Transmission Assembly interface connector.

    Is the resistance of the Dog Clutch F Solenoid 11.0 Ohms ± 1.0 Ohms?

    Yes

    - Go To 3

    No

    - Replace the Dog Clutch F Solenoid in accordance with the Service Information.
    - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
3. **CHECK THE (T78) SOLENOID SUPPLY 1 CIRCUIT FOR AN OPEN**
    1. Disconnect the TCM harness connector.
    2. Measure the resistance of the (T78) Solenoid Supply 1 circuit between the Transmission Assembly harness connector and the TCM harness connector.

Is the resistance below 5.0 Ohms?

Yes

- Go To 4

No

- Repair the (T78) Solenoid Supply 1 circuit for an open or high resistance.
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK THE (T78) SOLENOID SUPPLY 1 CIRCUIT FOR A SHORT TO GROUND**
   1. Measure the resistance between ground and the (T78) Solenoid Supply 1 circuit.

      Is there continuity between ground and the (T78) Solenoid Supply 1 circuit?

      Yes

      - Repair the (T78) Solenoid Supply 1 circuit for a short to ground.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 5

5. **CHECK THE (T78) SOLENOID SUPPLY 1 CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**
   1. Measure the resistance between the (T78) Solenoid Supply 1 circuit and all other circuits in the TCM harness connector.

      Is there continuity between the (T78) Solenoid Supply 1 circuit and any other circuits in the TCM harness connector?

      Yes

      - Repair the (T78) Solenoid Supply 1 circuit for a short to another circuit.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 6.

6. **CHECK THE (T802) DOG CLUTCH F SOLENOID CIRCUIT FOR AN OPEN**
   1. Measure the resistance of the (T802) Dog Clutch F Solenoid circuit between the Transmission Assembly harness connector and the TCM harness connector.

Is the resistance below 5.0 Ohms?

Yes

- Go To 7

No

- Repair the (T802) Dog Clutch F Solenoid circuit for an open or high resistance.
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

7. **CHECK THE (T802) DOG CLUTCH F SOLENOID CIRCUIT FOR A SHORT TO GROUND**
   1. Measure the resistance between ground and the (T802) Dog Clutch F Solenoid circuit.

      Is there continuity between ground and the (T802) Dog Clutch F Solenoid circuit?

      Yes

      - Repair the (T802) Dog Clutch F Solenoid circuit for a short to ground.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 8.

8. **CHECK THE (T802) DOG CLUTCH F SOLENOID CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**
   1. Measure the resistance between the (T802) Dog Clutch F Solenoid circuit and all other circuits in the TCM harness connector.

      Is there continuity between the (T802) Dog Clutch F Solenoid circuit and any other circuits in the TCM harness connector?

      Yes

      - Repair the (T802) Dog Clutch F Solenoid circuit for a short to another circuit.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      NOTE: **If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in**

the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.

- Using the schematics as a guide, check the Transmission Control Module (TCM) terminals and connectors for corrosion, damage or pushed out terminals. Pay particular attention to the power and ground circuits. If no problems are found, replace the TCM and perform programming and PROXI Configuration Alignment procedures. Refer to **MODULE, TRANSMISSION CONTROL, REMOVAL** .
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

9. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Use the Freeze Frame Data to help duplicate the conditions in which the DTC originally set. Pay particular attention to the DTC set conditions, such as, VSS, MAP, ECT, and Load.
   3. Using the schematics as a guide, visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires.
   4. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.
   5. Wiggle the wiring and connectors while checking for any possible open or shorted circuits.
   6. Check for any Service Information Tune-ups or Technical Service Bulletins that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Test Complete.

THEORY OF OPERATION

The purpose of the diagnostic is to detect circuit failures on any of the output stages. All output stages are controlled by a current controller that can operate an output stage in two different modes:

- Current controlled mode (pressure regulators)
- Switched mode or PWM controlled (solenoids)

Pressure Regulator Monitoring: The current regulator ASIC in the TCM indicates the following circuit failures via SPI bus to the CPU:

- Short to ground
- Short to battery or open circuit

Solenoid Monitoring: The TCM measures the actual solenoid voltages and compares them to calibrated thresholds to identify the following electrical failures:

- Short to ground or open circuit
- Short to battery

WHEN MONITORED

Output stages power supply switched on.

Power supply voltage is greater than a calibrated value.

SET CONDITION

Pressure Regulator Monitoring: A failure is detected if one of the following conditions occur:

An short to ground failure is detected if the ASIC indicates a short to ground failure.

A short to battery or open circuit failure is detected if the ASIC indicates a short to battery or open circuit failure.

Solenoid Monitoring: A failure is detected if one of the following conditions occur:

An short to ground or open circuit failure is detected if the ratio between the voltage at the solenoid valve and the output stages power supply is above a calibrated threshold.

A short to battery failure is detected if the ratio between the voltage at the solenoid valve and the output stages power supply is below a calibrated threshold.

POSSIBLE CAUSES

Possible Causes
(T78) SOLENOID SUPPLY 1 CIRCUIT OPEN
(T78) SOLENOID SUPPLY 1 CIRCUIT SHORTED TO GROUND
(T802) DOG CLUTCH F SOLENOID CIRCUIT OPEN
(T802) DOG CLUTCH F SOLENOID CIRCUIT SHORTED TO GROUND
(T802) DOG CLUTCH F SOLENOID CIRCUIT SHORTED TO VOLTAGE
DOG CLUTCH F SOLENOID
TRANSMISSION CONTROL MODULE (TCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK IF THE DTC IS CURRENT**
    1. Using the scan tool, read TCM DTCs.
    2. Record the Environmental Data and any DTCs.
    3. Clear DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. Read TCM DTCs.

    Did the DTC reset?

    Yes

    - Go To 2

    No

    - Go To 9
2. **CHECK THE DOG CLUTCH F SOLENOID**
    1. Turn the Ignition OFF.
    2. Disconnect the Transmission Assembly harness connector.
    3. Measure the resistance of the Dog Clutch F Solenoid at the appropriate terminals in the Transmission Assembly interface connector.

    Is the resistance of the Dog Clutch F Solenoid 11.0 Ohms ± 1.0 Ohms?

    Yes

    - Go To 3

    No

    - Replace the Dog Clutch F Solenoid in accordance with the Service Information.
    - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
3. **CHECK THE (T78) SOLENOID SUPPLY 1 CIRCUIT FOR AN OPEN**
    1. Disconnect the TCM harness connector.
    2. Measure the resistance of the (T78) Solenoid Supply 1 circuit between the Transmission Assembly harness connector and the TCM harness connector.

Is the resistance below 5.0 Ohms?

Yes

- Go To 4

No

- Repair the (T78) Solenoid Supply 1 circuit for an open or high resistance.
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK THE (T78) SOLENOID SUPPLY 1 CIRCUIT FOR A SHORT TO GROUND**
   1. Measure the resistance between ground and the (T78) Solenoid Supply 1 circuit.

      Is there continuity between ground and the (T78) Solenoid Supply 1 circuit?

      Yes

      - Repair the (T78) Solenoid Supply 1 circuit for a short to ground.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 5

5. **CHECK THE (T78) SOLENOID SUPPLY 1 CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**
   1. Measure the resistance between the (T78) Solenoid Supply 1 circuit and all other circuits in the TCM harness connector.

      Is there continuity between the (T78) Solenoid Supply 1 circuit and any other circuits in the TCM harness connector?

      Yes

      - Repair the (T78) Solenoid Supply 1 circuit for a short to another circuit.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 6.

6. **CHECK THE (T802) DOG CLUTCH F SOLENOID CIRCUIT FOR AN OPEN**
   1. Measure the resistance of the (T802) Dog Clutch F Solenoid circuit between the Transmission Assembly harness connector and the TCM harness connector.

Is the resistance below 5.0 Ohms?

Yes

- Go To 7

No

- Repair the (T802) Dog Clutch F Solenoid circuit for an open or high resistance.
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

7. **CHECK THE (T802) DOG CLUTCH F SOLENOID CIRCUIT FOR A SHORT TO GROUND**
   1. Measure the resistance between ground and the (T802) Dog Clutch F Solenoid circuit.

      Is there continuity between ground and the (T802) Dog Clutch F Solenoid circuit?

      Yes

      - Repair the (T802) Dog Clutch F Solenoid circuit for a short to ground.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 8.

8. **CHECK THE (T802) DOG CLUTCH F SOLENOID CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**
   1. Measure the resistance between the (T802) Dog Clutch F Solenoid circuit and all other circuits in the TCM harness connector.

      Is there continuity between the (T802) Dog Clutch F Solenoid circuit and any other circuits in the TCM harness connector?

      Yes

      - Repair the (T802) Dog Clutch F Solenoid circuit for a short to another circuit.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      NOTE: **If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in**

the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.

- Using the schematics as a guide, check the Transmission Control Module (TCM) terminals and connectors for corrosion, damage or pushed out terminals. Pay particular attention to the power and ground circuits. If no problems are found, replace the TCM and perform programming and PROXI Configuration Alignment procedures. Refer to **MODULE, TRANSMISSION CONTROL, REMOVAL** .
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

9. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Use the Freeze Frame Data to help duplicate the conditions in which the DTC originally set. Pay particular attention to the DTC set conditions, such as, VSS, MAP, ECT, and Load.
   3. Using the schematics as a guide, visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires.
   4. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.
   5. Wiggle the wiring and connectors while checking for any possible open or shorted circuits.
   6. Check for any Service Information Tune-ups or Technical Service Bulletins that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Test Complete.

P1500-00-ECU CONFIGURATION MISMATCH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 42: TCM System Voltage Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The purpose of the diagnostic is to detect an incorrect vehicle configuration stored in the TCM. This diagnostic compares the vehicle configuration codes stored in the TCM to the vehicle configuration codes received via CAN from the Body Control Module (BCM).

WHEN MONITORED

Ignition is ON.

SET CONDITION

The failure is detected if the vehicle configuration codes stored in the TCM are not equal to the vehicle configuration codes received via CAN from the Body Control Module (BCM).

POSSIBLE CAUSES

Possible Causes
USED CONTROLLER INSTALLED WITH WRONG CONFIGURATION
BCM NOT PROPERLY PROGRAMED OR WAS REPLACED AND NOT PROGRAMED
TCM NOT PROPERLY PROGRAMED OR WAS REPLACED AND NOT PROGRAMED
TCM - INTERNAL ERROR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK IF DTC IS CURRENT**
    1. With the scan tool, read TCM DTCs.
    2. Record the Environmental Data and any DTCs.
    3. With the scan tool, erase DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. With the scan tool, read TCM DTCs.

    Did the DTC reset?

    Yes

    - Go To 2

    No

    - Go To 4
2. **CHECK THE BCM**

    Has the BCM been reprogrammed or replaced without being programed?

    Yes

- Program the BCM if not programed. With the scan tool perform the proxi update procedure.
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 3

3. **CHECK THE TCM**

Has the TCM been recently replaced with a new or used controller?

Yes

- With the scan tool perform a TCM proxi relearn.
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

NOTE: **If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.**

- Using the schematics as a guide, check the Transmission Control Module (TCM) terminals and connectors for corrosion, damage or pushed out terminals. Pay particular attention to the power and ground circuits. If no problems are found, replace the TCM and perform programming and PROXI Configuration Alignment procedures. Refer to **MODULE, TRANSMISSION CONTROL, REMOVAL** .
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. Check for any Service Bulletins that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Test complete.

P1614-00-ECU RESET-RECOVERY OCCURRED

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 43: TCM System Voltage Circuit Diagram

Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The purpose of the diagnostic is to detect the reason of a TCM reset. The reason is determined after a reset following TCM re-initialization. There are several situations where a reset of the TCM can occur. Some of these are initiated by the TCM software itself and others may be caused by an under voltage condition. There are three reset categories which include low level software, high level / application software and under voltage conditions. The following failures are examples of each of these categories that can cause resets of the TCM:

- A function call is out of sequence in the high level / application software
- A division by zero has occurred in the low level software
- An under voltage condition has occurred in the TCM supply voltage

If the software detects a condition for initiating a reset, the reason of the reset is stored in an area of the RAM that is not initialized (non volatile) during TCM re-initialization. Upon TCM initialization, this information is read and the appropriate fault code indicating the reason of the reset is stored.

WHEN MONITORED

TCM is powered on.

The output speed is greater than a calibrated value or the engine speed is greater than a calibrated value.

SET CONDITION

Reset in Low Level Software or Under Voltage Condition:

The failure is detected during re-initialization of the TCM if a reset code for low level software or under voltage condition has been stored in the non volatile RAM.

Reset in High Level / Application Software:

The failure is detected during re-initialization of the TCM if a reset code for high level / application software has been stored in the non volatile RAM.

POSSIBLE CAUSES

Possible Causes
TCM - INTERNAL ERROR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK FOR OTHER DTCS**
   1. With the scan tool, read TCM DTCs.
   2. Record the Environmental Data and any DTCs.

      Are any other TCM DTCs set?

      Yes

      - Repair the other DTCs before proceeding. After the repair is complete, perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 2
2. **CHECK IF DTC IS CURRENT**
   1. With the scan tool, erase DTCs.
   2. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
   3. With the scan tool, read TCM DTCs.

      Did the DTC reset?

      Yes

      NOTE: If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.

      - Using the schematics as a guide, check the Transmission Control Module (TCM) terminals and connectors for corrosion, damage or pushed out terminals. Pay particular attention to the power and ground circuits. If no problems are found, replace the TCM and perform programming and PROXI Configuration Alignment procedures. Refer to **MODULE, TRANSMISSION CONTROL, REMOVAL** .
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 3
3. **CHECK WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.

2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
3. Wiggle the wires while checking for shorted and open circuits.
4. Check for any Service Bulletins that may apply.

Were there any problems found?

Yes

- Repair as necessary.
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Test complete.

P1634-00-TCM INTERNAL INTERNAL WATCHDOG PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 44: TCM System Voltage Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The TCM monitors for internal hardware and software failures. If a failure is detected, a DTC will set that indicates the exact nature of the failure.

WHEN MONITORED

Continuously with the ignition switch in the run position.

The Inhibit Path Test that is done during initialization has successfully completed.

SET CONDITION

A failure is detected if one of the following conditions occurs:

- A failure in the SPI communication between the CPU and the watchdog ASIC (e.g. timeout of SPI message) is detected.
- The status value of the watchdog ASIC, which includes the watchdog error counter, is unequal to the expected value in the CPU software.
- The watchdog error counter is above the threshold to switch off the output stages.
- The number of safety relevant software modules monitored by the Program Flow Control is not as expected.
- A safety relevant software module monitored by the Program Flow Control has calculated an invalid checksum.
- The actual sequence of safety relevant software modules monitored by the Program Flow Control is not equal to the expected sequence.

POSSIBLE CAUSES

Possible Causes
TCM - INTERNAL ERROR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK IF DTC IS CURRENT**
    1. With the scan tool, read TCM DTCs.
    2. Record the Environmental Data and any DTCs.
    3. With the scan tool, erase DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. With the scan tool, read TCM DTCs.

    Did the DTC reset?

    Yes

    NOTE: If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI

configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.

- Using the schematics as a guide, check the Transmission Control Module (TCM) terminals and connectors for corrosion, damage or pushed out terminals. Pay particular attention to the power and ground circuits. If no problems are found, replace the TCM and perform programming and PROXI Configuration Alignment procedures. Refer to **MODULE, TRANSMISSION CONTROL, REMOVAL** .
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 2

2. **CHECK WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. Check for any Service Bulletins that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Test complete.

P167A-00-CALIBRATION MISMATCH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 45: TCM System Voltage Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The purpose of the diagnostic is to detect if the programmed TCM software does not match the hydraulic identification number stored in the EEPROM of the TCM which indicates the type of hydraulic hardware in the transmission. This hydraulic identification number is stored during manufacturing of the hydraulic by the transmission supplier.

WHEN MONITORED

Ignition is ON.

SET CONDITION

A failure is detected if the hydraulic identification number stored during the manufacturing of the hydraulic does not match the expected value in the TCM software.

POSSIBLE CAUSES

Possible Causes
TRANSMISSION CONTROL MODULE (TCM) IS NOT PROGRAMMED TCM INTERNAL ERROR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

PERFORM TCM PROGRAM PROCEDURE

1. With the scan tool, attempt to program the TCM with the latest calibrations and perform the PROXI Configuration Alignment procedure.

   Were you able to program the TCM successfully?

   Yes

   - Test complete.
   - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   NOTE: If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.

   - Using the schematics as a guide, check the Transmission Control Module (TCM) terminals and connectors for corrosion, damage or pushed out terminals. Pay particular attention to the power and ground circuits. If no problems are found, replace the TCM and perform programming and PROXI Configuration Alignment procedures. Refer to **MODULE, TRANSMISSION CONTROL, REMOVAL** .
   - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

P1725-00-TRANSMISSION RANGE SENSOR C CIRCUIT LOW

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 46: Transmission Range Sensor (TRS) Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The purpose of this DTC is to monitor the TRS signal circuits for electrical faults. Each of the four TRS signal circuits are monitored for open, short to ground, and short to voltage electrical faults. A DTC will set depending on the nature of the electrical fault, and on which circuit the fault occurs. The TRS signal circuits are connected to the TCM by four independent circuits which distinguish between the possible gear selector positions (park, reverse, neutral, and drive). The monitoring is performed by comparing the sensor voltage measured across a small shunt resistor to a threshold value for each sensor pin.

WHEN MONITORED

Ignition is ON.

No failure detected in Transmission Range Sensor (TRS) supply voltage monitoring.

No failure detected in the analog to digital converter monitoring.

Battery voltage is more than a calibrated value.

SET CONDITION

TRS circuit (T3) signal voltage is less than 0.245 volt for a calibrated amount of time.

POSSIBLE CAUSES

Possible Causes
TRANSMISSION RANGE SENSOR (TRS) SIGNAL CIRCUIT (T3) SHORTED TO GROUND
TRS - INTERNAL FAULT
TCM - INTERNAL FAULT

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK IF DTC IS CURRENT**
    1. With the scan tool, read TCM DTCs.
    2. Record the Environmental Data and any DTCs.
    3. With the scan tool, erase DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. With the scan tool, read TCM DTCs.

    Did the DTC reset?

    Yes

- Go To 2.

No

- Go To 4.

2. **CHECK (T3) TRS SIGNAL CIRCUIT FOR AN OPEN**
   1. Turn the Ignition OFF.
   2. Disconnect the TCM harness connector.
   3. Disconnect the transmission assembly harness connector.
   4. Measure the resistance of the (T3) TRS signal circuit between the TCM harness connector and the transmission assembly harness connector.

   Is the resistance below 5.0 ohms?

   Yes

   - Go To 3.

   No

   - Repair the (T3) TRS signal circuit for an open.
   - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK (T3) TRS SIGNAL CIRCUIT FOR A SHORT TO GROUND OR A SHORT ANOTHER CIRCUIT**
   1. Measure the resistance between the (T3) TRS signal circuit at the TCM harness connector and ground.
   2. Measure the resistance between the (T3) TRS signal circuit and all other circuits in the TCM harness connector.

   Is the resistance more than 100K ohms for both measurements?

   Yes

   NOTE: **If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.**

   - Using the schematics as a guide, check the Transmission Control Module (TCM) terminals and connectors for corrosion, damage or pushed out terminals. Pay particular attention to the power and ground circuits. If no problems are found, replace the TCM and perform programming and PROXI Configuration Alignment procedures. Refer to **MODULE,**

TRANSMISSION CONTROL, REMOVAL .

- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
- If vehicle does not pass the TRANSMISSION VERIFICATION TEST, replace the TRS in accordance with the Service Information.
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Repair the (T3) TRS signal circuit for a short to ground or short to another circuit.
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. Check for any Service Bulletins that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Test complete.

P1726-00-TRANSMISSION RANGE SENSOR C CIRCUIT HIGH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 47: Transmission Range Sensor (TRS) Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The purpose of this DTC is to monitor the TRS signal circuits for electrical faults. Each of the four TRS signal circuits are monitored for open, short to ground, and short to voltage electrical faults. A DTC will set depending on the nature of the electrical fault, and on which circuit the fault occurs. The TRS signal circuits are connected to the TCM by four independent circuits which distinguish between the possible gear selector positions (park, reverse, neutral, and drive). The monitoring is performed by comparing the sensor voltage measured across a

small shunt resistor to a threshold value for each sensor pin.

WHEN MONITORED

Ignition is ON.

No failure detected in Transmission Range Sensor (TRS) supply voltage monitoring.

No failure detected in the analog to digital converter monitoring.

Battery voltage is more than a calibrated value.

SET CONDITION

TRS circuit (T3) signal voltage is greater than 6.2 volts for a calibrated amount of time.

POSSIBLE CAUSES

Possible Causes
TRANSMISSION RANGE SENSOR (TRS) SIGNAL CIRCUIT (T3) OPEN CIRCUIT
TRS SIGNAL CIRCUIT (T3) SHORTED TO VOLTAGE
TRS - INTERNAL FAULT
TCM - INTERNAL FAULT

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK IF DTC IS CURRENT**
    1. With the scan tool, read TCM DTCs.
    2. Record the Environmental Data and any DTCs.
    3. With the scan tool, erase DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. With the scan tool, read TCM DTCs.

    Did the DTC reset?

    Yes

    - Go To 2.

    No

- Go To 4.

2. **CHECK (T3) TRS SIGNAL CIRCUIT FOR AN OPEN**
   1. Turn the Ignition OFF.
   2. Disconnect the TCM harness connector.
   3. Disconnect the transmission assembly harness connector.
   4. Measure the resistance of the (T3) TRS signal circuit between the TCM harness connector and the transmission assembly harness connector.

      Is the resistance below 5.0 ohms?

      Yes

      - Go To 3.

      No

      - Repair the (T3) TRS signal circuit for an open.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK (T3) TRS SIGNAL CIRCUIT FOR A SHORT ANOTHER CIRCUIT**
   1. Measure the resistance between the (T3) TRS signal circuit and all other circuits in the TCM harness connector.

      Is the resistance more than 100K ohms for both measurements?

      Yes

      NOTE: If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.

      - Using the schematics as a guide, check the Transmission Control Module (TCM) terminals and connectors for corrosion, damage or pushed out terminals. Pay particular attention to the power and ground circuits. If no problems are found, replace the TCM and perform programming and PROXI Configuration Alignment procedures. Refer to **MODULE, TRANSMISSION CONTROL, REMOVAL** .
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
      - If vehicle does not pass the TRANSMISSION VERIFICATION TEST, replace the TRS in accordance with the Service Information.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD**

PROCEDURE .

No

- Repair the (T3) TRS signal circuit for a short to another circuit.
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. Check for any Service Bulletins that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Test complete.

P1727-00-TRANSMISSION RANGE SENSOR D CIRCUIT LOW

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 48: Transmission Range Sensor (TRS) Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The purpose of this DTC is to monitor the TRS signal circuits for electrical faults. Each of the four TRS signal circuits are monitored for open, short to ground, and short to voltage electrical faults. A DTC will set depending on the nature of the electrical fault, and on which circuit the fault occurs. The TRS signal circuits are connected to the TCM by four independent circuits which distinguish between the possible gear selector positions (park, reverse, neutral, and drive). The monitoring is performed by comparing the sensor voltage measured across a

small shunt resistor to a threshold value for each sensor pin.

WHEN MONITORED

Ignition is ON.

No failure detected in Transmission Range Sensor (TRS) supply voltage monitoring.

No failure detected in the analog to digital converter monitoring.

Battery voltage is more than a calibrated value.

SET CONDITION

TRS circuit (T1) signal voltage is less than 0.245 volt for a calibrated amount of time.

POSSIBLE CAUSES

Possible Causes
TRANSMISSION RANGE SENSOR (TRS) SIGNAL CIRCUIT (T1) SHORTED TO GROUND TRS - INTERNAL FAULT TCM - INTERNAL FAULT

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK IF DTC IS CURRENT**
    1. With the scan tool, read TCM DTCs.
    2. Record the Environmental Data and any DTCs.
    3. With the scan tool, erase DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. With the scan tool, read TCM DTCs.

    Did the DTC reset?

    Yes

    - Go To 2.

    No

    - Go To 4.

2. **CHECK (T1) TRS SIGNAL CIRCUIT FOR AN OPEN**
   1. Turn the Ignition OFF.
   2. Disconnect the TCM harness connector.
   3. Disconnect the transmission assembly harness connector.
   4. Measure the resistance of the (T1) TRS signal circuit between the TCM harness connector and the transmission assembly harness connector.

      Is the resistance below 5.0 ohms?

      Yes

      - Go To 3.

      No

      - Repair the (T1) TRS signal circuit for an open.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
3. **CHECK (T1) TRS SIGNAL CIRCUIT FOR A SHORT TO GROUND OR A SHORT ANOTHER CIRCUIT**
   1. Measure the resistance between the (T1) TRS signal circuit at the TCM harness connector and ground.
   2. Measure the resistance between the (T1) TRS signal circuit and all other circuits in the TCM harness connector.

      Is the resistance more than 100K ohms for both measurements?

      Yes

      NOTE: If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.

      - Using the schematics as a guide, check the Transmission Control Module (TCM) terminals and connectors for corrosion, damage or pushed out terminals. Pay particular attention to the power and ground circuits. If no problems are found, replace the TCM and perform programming and PROXI Configuration Alignment procedures. Refer to **MODULE, TRANSMISSION CONTROL, REMOVAL** .
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
      - If vehicle does not pass the TRANSMISSION VERIFICATION TEST, replace the TRS in accordance with the Service Information.

- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Repair the (T1) TRS signal circuit for a short to ground or short to another circuit.
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. Check for any Service Bulletins that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Test complete.

P1728-00-TRANSMISSION RANGE SENSOR D CIRCUIT HIGH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 49: Transmission Range Sensor (TRS) Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The purpose of this DTC is to monitor the TRS signal circuits for electrical faults. Each of the four TRS signal circuits are monitored for open, short to ground, and short to voltage electrical faults. A DTC will set depending on the nature of the electrical fault, and on which circuit the fault occurs. The TRS signal circuits are connected to the TCM by four independent circuits which distinguish between the possible gear selector positions (park, reverse, neutral, and drive). The monitoring is performed by comparing the sensor voltage measured across a

small shunt resistor to a threshold value for each sensor pin.

WHEN MONITORED

Ignition is ON.

No failure detected in Transmission Range Sensor (TRS) supply voltage monitoring.

No failure detected in the analog to digital converter monitoring.

Battery voltage is more than a calibrated value.

SET CONDITION

TRS circuit (T1) signal voltage is greater than 6.2 volts for a calibrated amount of time.

POSSIBLE CAUSES

Possible Causes
TRANSMISSION RANGE SENSOR (TRS) SIGNAL CIRCUIT (T1) OPEN CIRCUIT
TRS SIGNAL CIRCUIT (T1) SHORTED TO VOLTAGE
TRS - INTERNAL FAULT
TCM - INTERNAL FAULT

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK IF DTC IS CURRENT**
    1. With the scan tool, read TCM DTCs.
    2. Record the Environmental Data and any DTCs.
    3. With the scan tool, erase DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. With the scan tool, read TCM DTCs.

    Did the DTC reset?

    Yes

    - Go To 2.

    No

- Go To 4.

2. **CHECK (T1) TRS SIGNAL CIRCUIT FOR AN OPEN**
   1. Turn the Ignition OFF.
   2. Disconnect the TCM harness connector.
   3. Disconnect the transmission assembly harness connector.
   4. Measure the resistance of the (T1) TRS signal circuit between the TCM harness connector and the transmission assembly harness connector.

      Is the resistance below 5.0 ohms?

      Yes

      - Go To 3.

      No

      - Repair the (T1) TRS signal circuit for an open.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK (T1) TRS SIGNAL CIRCUIT FOR A SHORT ANOTHER CIRCUIT**
   1. Measure the resistance between the (T1) TRS signal circuit and all other circuits in the TCM harness connector.

      Is the resistance more than 100K ohms for both measurements?

      Yes

      NOTE: If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.

      - Using the schematics as a guide, check the Transmission Control Module (TCM) terminals and connectors for corrosion, damage or pushed out terminals. Pay particular attention to the power and ground circuits. If no problems are found, replace the TCM and perform programming and PROXI Configuration Alignment procedures. Refer to **MODULE, TRANSMISSION CONTROL, REMOVAL** .
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
      - If vehicle does not pass the TRANSMISSION VERIFICATION TEST, replace the TRS in accordance with the Service Information.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD**

PROCEDURE .

No

- Repair the (T1) TRS signal circuit for a short to another circuit.
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. Check for any Service Bulletins that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Test complete.

P1731-00-INCORRECT GEAR ENGAGED

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The purpose of this diagnostic is to detect if a change in transmission gear position has occurred that was not requested.

WHEN MONITORED

TCM powered.

TCM initialization has completed.

SET CONDITION

The failure is detected if one of the following occurs:

The shift by wire software output did change from P, N or D to R although R should not have been determined

based on the input signals.

POSSIBLE CAUSES

Possible Causes
LOW FLUID LEVEL
TRANSMISSION SOLENOID, SPEED SENSOR, OR OTHER ELECTRICAL RELATED DTCS PRESENT
INTERMITTENT STICKING VALVE IN VALVE BODY
TRANSMISSION INTERNAL PROBLEM
TCM - INTERNAL ERROR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK IF TRANSMISSION SOLENOID DTCS ARE PRESENT**
   1. With the scan tool, check for other transmission DTCs.

      Are any transmission solenoid, speed sensor and/or any other transmission electrical related DTCs present?

      Yes

      - Refer to **DIAGNOSTIC CODE INDEX** and perform the appropriate repair.

      No

      - Go To 2
2. **CHECK TRANSMISSION FLUID LEVEL**
   1. Turn the Ignition OFF.

      NOTE: Low fluid level can be the cause of many transmission problems. Visually inspect the transmission and cooler lines for leakage and repair as necessary and adjust the fluid level in accordance to the Service Information. If no visual leaks are observed and the vehicle has obtained over 1610 km (1000 miles) from new or transmission service, a fluid level check is unnecessary.

   2. Check the transmission fluid level and condition in accordance to the Service Information.

      Is the fluid level correct?

      Yes

- Go To 3

No

- Correct the fluid level in accordance to the Service Information. Refer to **FLUID AND FILTER, STANDARD PROCEDURE** .
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK FOR INTERNAL TRANSMISSION PROBLEM**
   1. Check for an internal transmission mechanical problems.
   2. Remove the transmission oil pan and inspect for excessive debris or a plugged transmission oil filter in accordance to the Service Information.
   3. Inspect the valve body for foreign material.
   4. This DTC is usually set due to an internal transmission problem such as, but not limited to: stuck solenoid valve and/or contamination in the valve body, broken springs, leaking clutch seals, dislodged or broken snap ring etc.
   5. Check Service Information for the appropriate service procedure and any other possible causes.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   NOTE: If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.

   - Using the schematics as a guide, check the Transmission Control Module (TCM) terminals and connectors for corrosion, damage or pushed out terminals. Pay particular attention to the power and ground circuits. If no problems are found, replace the TCM and perform programming and PROXI Configuration Alignment procedures. Refer to **MODULE, TRANSMISSION CONTROL, REMOVAL** .
   - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

P176D-00-TRANSMISSION FLUID TEMPERATURE TOO HIGH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The purpose of the diagnostic is to detect rationality failures of the transmission oil temperature sensor by evaluating the following conditions:

Comparison to a Temperature Model

- The measured transmission oil temperature is compared to a calculated model temperature. The calculation of the modeled temperature is based on the fact that the resistance of the pressure regulator coil is correlated with the oil temperature. The calculation is based on the actual duty cycle of pressure regulator for a given commanded current and the value of the pressure regulator power supply.

Low Temperature Detection

- The measured transmission oil temperature is monitored for a low value after having first reached a fixed temperature value.

Stuck in Low Temperature Detection

- The measured transmission oil temperature is monitored for a minimum amount of temperature change at low temperatures.

Temperature Jump Detection

- The measured transmission oil temperature is monitored for a maximum amount of temperature change between two consecutive data samples.

WHEN MONITORED

Temperature Jump Detection:

Ignition on.

No failure detected in oil temperature sensor circuit high or low fault monitoring.

Comparison to Temperature Model:

Ignition on.

No failure detected in oil temperature sensor circuit high or low fault monitoring.

No failure detected in oil temperature jump detection monitoring.

The engine speed is greater than a calibrated value or the input speed is greater than a calibrated value.

The output speed is greater than a calibrated value.

Pressure regulator power supply is switched on.

No failure detected in supply voltage of pressure regulator monitoring.

No failure detected in pressure regulator circuit monitoring.

Calibrated time has expired after engine start.

Low Temperature Detection:

Ignition on.

No failure detected in oil temperature sensor circuit high or low fault monitoring.

No failure detected in oil temperature jump detection monitoring.

The engine speed is greater than a calibrated value or the input speed is greater than a calibrated value.

The output speed is greater than a calibrated value.

Stuck in Low Temperature Detection:

Ignition on.

No failure detected in oil temperature sensor circuit high or low fault monitoring.

No failure detected in oil temperature jump detection monitoring.

The engine speed is greater than a calibrated value or the input speed is greater than a calibrated value.

The output speed is greater than a calibrated value.

Transmission oil temperature is less than a calibrated value.

SET CONDITION

Temperature Jump Detection:

The TCM detects that there has been a transmission fluid temperature change greater than 10°C (50°F) in less than 1 second.

Comparison to a Temperature Model:

The failure is detected if the absolute value of the difference between the oil temperature sensor signal

measured by the TCM and the calculated oil temperature is greater than a calibrated threshold for a calibrated amount of time.

Low Temperature Detection:

The failure is detected if the oil temperature sensor signal is less than a calibrated threshold after having first reached another higher calibrated threshold in the same driving cycle.

Stuck in Low Temperature Detection:

The failure is detected if the absolute value of the difference between the current transmission oil temperature and a previous oil temperature stored a calibrated time before is less than a calibrated threshold.

POSSIBLE CAUSES

Possible Causes
INCORRECT TRANSMISSION FLUID LEVEL
RESTRICTION IN TRANSMISSION COOLING SYSTEM
VEHICLE AIRFLOW RESTRICTED
TORQUE CONVERTER
CASE VENT PLUGGED OR DAMAGED
TRANSMISSION FLUID TEMPERATURE SENSOR CIRCUIT FAULT
TRANSMISSION FLUID TEMPERATURE SENSOR
TCM - INTERNAL FAULT

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Perform the TRANSMISSION VERIFICATION TEST. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **VISUAL INSPECTION**

NOTE: Make certain that the vehicle is not towing loads weighing more than the recommended towing capacity

1. Check Transmission Cooler for airflow restrictions and internal fluid restrictions.
2. Check Transmission fluid level and if low, check for leaks.
3. Check Transmission Cooler lines for restrictions.
4. Check Transmission case vent for restrictions.

Were any problems found?

Yes

- Repair in accordance with the Service Information.
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 2

2. **CHECK FOR OTHER TRANSMISSION DTCS**
   1. With the scan tool, read Transmission DTCs.
   2. Record any Transmission Freeze Frame data.

   Are there any other transmission DTCs?

   Yes

   - Perform the appropriate diagnostic procedure(s) in accordance with the Service Information.

   No

   - Go To 3

3. **CHECK TRANSMISSION TEMPERATURE SENSOR CIRCUITS FOR HIGH RESISTANCE**
   1. Turn the Ignition OFF.
   2. Disconnect the TCM harness connector.
   3. Remove the transmission side cover and disconnect the transmission temperature sensor harness connector.
   4. Connect a jumper between the (T54) Transmission Temperature Signal circuit and the (T820) Sensor Ground circuit at the transmission temperature sensor harness connector.
   5. Measure resistance between (T54) Transmission Temperature Signal circuit and the (T820) Sensor Ground circuit at the TCM harness connector.

   Is the resistance below 5.0 ohms?

   Yes

   - Go To 4

   No

   - Repair the (T54) Transmission Temperature Signal circuit or the (T820) Sensor Ground circuit for an open or high resistance.
   - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK TRANSMISSION TEMPERATURE SENSOR CIRCUITS FOR A SHORT TO**

GROUND

1. With the jumper still connected, measure resistance between (T54) Transmission Temperature Signal circuit at the TCM harness connector and ground.

   Is there continuity between (T54) Transmission Temperature Signal circuit and ground?

   Yes

   - Repair the (T54) Transmission Temperature Signal circuit or (T820) Sensor Ground circuit for a short to ground.
   - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 5

5. **CHECK THE (T54) TRANSMISSION TEMPERATURE SIGNAL CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**
   1. Remove the jumper from the transmission temperature sensor harness connector.
   2. Measure resistance between (T54) Transmission Temperature Signal circuit and all other circuits in the TCM harness connector.

      Is there continuity between (T54) transmission temperature signal circuit and any other TCM circuit?

      Yes

      - Repair the (T54) Transmission Temperature Signal circuit for a short to another circuit.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 6

6. **CHECK THE (T820) SENSOR GROUND CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**
   1. Measure resistance between (T820) Sensor Ground circuit and all other circuits in the TCM harness connector.

      Is there continuity between (T820) Sensor Ground circuit and any other TCM circuit?

      Yes

      - Repair the (T820) Sensor Ground circuit for a short to another circuit.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD**

PROCEDURE .

No

- Go To 7

7. **VERIFY TRANSMISSION TEMPERATURE SENSOR RESISTANCE / TEMPERATURE CORRELATION**
   1. Measure the resistance between (T54) Transmission Temperature Signal terminal and (T820) Sensor Ground terminal at the transmission temperature sensor.

TYPICAL VALUES FOR TRANSMISSION TEMPERATURE SENSOR	
TEMPERATURE	**APPROXIMATE RESISTANCE**
-30°C (-22°F)	44000 Ohms ± 6600
10°C (50°F)	6455 Ohms ± 645
110°C (230°F)	247 Ohms ± 16
145°C (293°F)	111 Ohms ± 6

Using the chart above, compare the Temperature Sensor temperature to the correlating resistance value.

Is the resistance within the specified range when the sensor is at the given temperature?

Yes

NOTE: **If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.**

- Using the schematics as a guide, check the Transmission Control Module (TCM) terminals and connectors for corrosion, damage or pushed out terminals. Pay particular attention to the power and ground circuits. If no problems are found, replace the TCM and perform programming and PROXI Configuration Alignment procedures. Refer to **MODULE, TRANSMISSION CONTROL, REMOVAL** .
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace the Transmission Fluid Temperature Sensor in accordance with the Service Information.
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2014 AUTOMATIC TRANSMISSION

Transmission Control Module (TCM) - Electrical Diagnostics, 948TE - Cherokee

DIAGNOSIS AND TESTING

P1C4E-00-ABS DTC PRESENT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The purpose of the diagnostic is to prevent a down shift or engaging the park pawl during a lock up of the driven wheels which is caused by a failure or disablement of the Anti-lock Brake System (ABS).

WHEN MONITORED

When the ignition switch is turned to the run position.

Failure of ABS functionality or disablement of ABS functionality as indicated by the ABS module.

Engaged brake switch or failure in brake signal is indicated.

SET CONDITION

The failure is detected if the delta output speed (difference between previous and current measurement) is greater than a calibrated threshold for an amount of time.

POSSIBLE CAUSES

Possible Causes
ABS MODULE DTCS

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK FOR TCM CAN BUS DTCS**
    1. With the scan tool, read TCM DTCs.

       Are any TCM CAN BUS DTCs present?

       Yes

       - Refer to **DIAGNOSTIC CODE INDEX** and perform the appropriate diagnostic procedure.

Perform the diagnostic procedure for DTC U0001-CAN C BUS first. Refer to **U0001-00-CAN C BUS**.

- Perform the Transmission Verification Test. Refer to **STANDARD PROCEDURE** .

No

- Go To 2

2. **CHECK IF ABS DTCS ARE PRESENT**
   1. With the scan tool, read ABS DTCs.

   Are any ABS DTCs present?

   Yes

   - Refer to **DIAGNOSTIC CODE INDEX** and perform the appropriate diagnostic procedure.
   - Perform the Transmission Verification Test. Refer to **STANDARD PROCEDURE** .

   No

   NOTE: **If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.**

   - Using the schematics as a guide, check the Transmission Control Module (TCM) terminals and connectors for corrosion, damage or pushed out terminals. Pay particular attention to the power and ground circuits. If no problems are found, replace the TCM and perform programming and PROXI Configuration Alignment procedures. Refer to **MODULE, TRANSMISSION CONTROL, REMOVAL** .
   - Perform the Transmission Verification Test. Refer to **STANDARD PROCEDURE** .

P1C8C-00-SYSTEM VOLTAGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 1: TCM System Voltage Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The purpose of the diagnostic is to detect failures of the internal TCM voltage supply circuit. The internal TCM voltage is converted independently into two digital values using two separate Analog-to-Digital Converter (ADC) channels. The diagnostic is performed by comparing the two digital values of the system voltage.

WHEN MONITORED

TCM powered.

SET CONDITION

The failure is detected if the absolute difference between the independent voltage conversions of the internal TCM voltage is greater than a calibrated threshold.

POSSIBLE CAUSES

Possible Causes
TCM - INTERNAL ERROR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK IF DTC IS CURRENT**
    1. With the scan tool, read TCM DTCs.
    2. Record the Environmental Data and any DTCs.
    3. With the scan tool, erase DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. With the scan tool, read TCM DTCs.

    Did the DTC reset?

    Yes

    NOTE: If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.

    - Using the schematics as a guide, check the Transmission Control Module (TCM) terminals and connectors for corrosion, damage or pushed out terminals. Pay particular attention to the power and ground circuits. If no problems are found, replace the TCM and perform programming and PROXI Configuration Alignment procedures. Refer to **MODULE, TRANSMISSION CONTROL, REMOVAL** .
    - Perform the Transmission Verification Test. Refer to **STANDARD PROCEDURE** .

    No

- Go to 2

2. **CHECK WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. Check for any Service Bulletins that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the Transmission Verification Test. Refer to **STANDARD PROCEDURE** .

   No

   - Test complete.

P1CC9-00-UNABLE TO ENGAGE GEAR

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The purpose of this diagnostic is to detect that a dog clutch is not able to engage within a calibrated amount of time. During normal operating conditions, a dog clutch shift in progress may be temporarily interrupted by disengaging the drive-line ("extended neutral") if a successful dog clutch engagement has not occurred. If this "extended neutral" state of dog clutch disengagement is active for greater than a calibrated amount of time without a successful re-engagement, a failure is detected.

WHEN MONITORED

Gear shift requiring a dog clutch is in progress.

SET CONDITION

The failure is detected if the time of a temporary disengaged drive-line condition ("extended neutral") is greater than a calibrated amount of time.

POSSIBLE CAUSES

Possible Causes
INTERNAL TRANSMISSION PROBLEM

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD

PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK IF DTC IS CURRENT**

   NOTE: The Transmission Control Module stores under Environmental Data the transmission operating conditions when the DTC was set. Before clearing any DTCs, record all information pertaining to the DTC.

   1. With the scan tool, erase transmission DTCs.
   2. Using the Environmental Data previously recorded, drive the vehicle and try to duplicate the condition in which the DTC set.

      Does the DTC reset?

      Yes

      - Go To 2

      No

      - Go To 3
2. **TRANSMISSION**

   If the DTC returns, view repair.

   Repair

   - Verify proper fluid level. Refer to **FLUID AND FILTER, STANDARD PROCEDURE** .
   - Verify proper operation of the input and output speed sensors.
   - Refer to **DIAGNOSIS AND TESTING** and using the clutch application chart, inspect the clutches, valve body solenoids, and valves associated with this error.
   - Repair or replace the Transmission in accordance with the Service Information.
   - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
3. **INTERMITTENT WIRING AND CONNECTORS**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wiring and connectors while checking for any possible open or shorted circuits.
   4. Check for any Service Information Tune-ups or Technical Service Bulletins that may apply.

      Were any problems found?

Yes

- Repair as necessary.
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Test Complete.

P1D25-00-SHIFT CONTROL RATIONALITY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The TCM monitors for internal hardware and software failures. If a failure is detected, a DTC will set that indicates the exact nature of the failure.

WHEN MONITORED

TCM powered up.

TCM initialization has completed.

SET CONDITION

Faulty calculated position:

The failure is detected if one of the following occurs:

The calibration data stored at two different locations of the RAM has changed at only one location.

The initially determined gearbox position (P, R, N or D) after power up which is determined with two different methods has unequal results.

The calculated gearbox position stored in the buffer does not match the current gearbox position.

Faulty position on interface:

The failure is detected if the comparison of the commanded position sent on the interface between the shift by wire software and the shift control software to the actual position from the interface is not equal.

POSSIBLE CAUSES

Possible Causes

TCM - INTERNAL FAULT

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK IF DTC IS CURRENT**
   1. With the scan tool, read TCM DTCs.
   2. Record the Environmental Data and any DTCs.
   3. With the scan tool, erase DTCs.
   4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
   5. With the scan tool, read TCM DTCs.

   Did the DTC reset?

   Yes

   NOTE: If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.

   - Using the schematics as a guide, check the Transmission Control Module (TCM) terminals and connectors for corrosion, damage or pushed out terminals. Pay particular attention to the power and ground circuits. If no problems are found, replace the TCM and perform programming and PROXI Configuration Alignment procedures. Refer to **MODULE, TRANSMISSION CONTROL, REMOVAL** .
   - Perform the Transmission Verification Test. Refer to **STANDARD PROCEDURE** .

   No

   - Go to 2
2. **CHECK WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. Check for any Service Bulletins that may apply.

   Were there any problems found?

Yes

- Repair as necessary.
- Perform the Transmission Verification Test. Refer to **STANDARD PROCEDURE** .

No

- Test complete.

P1D78-00-LIMP HOME MODE SOLENOID CIRCUIT LOW

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 2: Pressure Regulators & Solenoids Control Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The purpose of the diagnostic is to detect circuit failures on any of the output stages. All output stages are controlled by a current controller that can operate an output stage in two different modes:

- Current controlled mode (pressure regulators)
- Switched mode or PWM controlled (solenoids)

Pressure Regulator Monitoring: The current regulator ASIC in the TCM indicates the following circuit failures via SPI bus to the CPU:

- Short to ground
- Short to battery or open circuit

Solenoid Monitoring: The TCM measures the actual solenoid voltages and compares them to calibrated thresholds to identify the following electrical failures:

- Short to ground or open circuit
- Short to battery

WHEN MONITORED

Output stages power supply switched on.

Power supply voltage is greater than a calibrated value.

SET CONDITION

Pressure Regulator Monitoring: A failure is detected if one of the following conditions occur:

An short to ground failure is detected if the ASIC indicates a short to ground failure.

A short to battery or open circuit failure is detected if the ASIC indicates a short to battery or open circuit failure.

Solenoid Monitoring: A failure is detected if one of the following conditions occur:

An short to ground or open circuit failure is detected if the ratio between the voltage at the solenoid valve and the output stages power supply is above a calibrated threshold.

A short to battery failure is detected if the ratio between the voltage at the solenoid valve and the output stages power supply is below a calibrated threshold.

POSSIBLE CAUSES

Possible Causes
(T78) SOLENOID SUPPLY 1 CIRCUIT OPEN
(T78) SOLENOID SUPPLY 1 CIRCUIT SHORTED TO GROUND
(T803) LIMP HOME MODE SOLENOID CIRCUIT OPEN
(T803) LIMP HOME MODE SOLENOID CIRCUIT SHORTED TO GROUND
(T803) LIMP HOME MODE SOLENOID CIRCUIT SHORTED TO VOLTAGE
LIMP HOME MODE SOLENOID
TRANSMISSION CONTROL MODULE (TCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK IF THE DTC IS CURRENT**
    1. Using the scan tool, read TCM DTCs.
    2. Record the Environmental Data and any DTCs.
    3. Clear DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. Read TCM DTCs.

    Did the DTC reset?

    Yes

    - Go To 2

    No

    - Go To 9
2. **CHECK THE LIMP HOME MODE SOLENOID**
    1. Turn the Ignition OFF.
    2. Disconnect the Transmission Assembly harness connector.
    3. Measure the resistance of the Limp Home Mode Solenoid at the appropriate terminals in the Transmission Assembly interface connector.

    Is the resistance of the Limp Home Mode Solenoid 11.0 Ohms ± 1.0 Ohms?

    Yes

    - Go To 3

    No

    - Replace the Limp Home Mode Solenoid in accordance with the Service Information.
    - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
3. **CHECK THE (T78) SOLENOID SUPPLY 1 CIRCUIT FOR AN OPEN**
    1. Disconnect the TCM harness connector.
    2. Measure the resistance of the (T78) Solenoid Supply 1 circuit between the Transmission Assembly harness connector and the TCM harness connector.

Is the resistance below 5.0 Ohms?

Yes

- Go To 4

No

- Repair the (T78) Solenoid Supply 1 circuit for an open or high resistance.
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK THE (T78) SOLENOID SUPPLY 1 CIRCUIT FOR A SHORT TO GROUND**
   1. Measure the resistance between ground and the (T78) Solenoid Supply 1 circuit.

      Is there continuity between ground and the (T78) Solenoid Supply 1 circuit?

      Yes

      - Repair the (T78) Solenoid Supply 1 circuit for a short to ground.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 5

5. **CHECK THE (T78) SOLENOID SUPPLY 1 CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**
   1. Measure the resistance between the (T78) Solenoid Supply 1 circuit and all other circuits in the TCM harness connector.

      Is there continuity between the (T78) Solenoid Supply 1 circuit and any other circuits in the TCM harness connector?

      Yes

      - Repair the (T78) Solenoid Supply 1 circuit for a short to another circuit.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 6.

6. **CHECK THE (T803) LIMP HOME MODE SOLENOID CIRCUIT FOR AN OPEN**
   1. Measure the resistance of the (T803) Limp Home Mode Solenoid circuit between the Transmission Assembly harness connector and the TCM harness connector.

Is the resistance below 5.0 Ohms?

Yes

- Go To 7

No

- Repair the (T803) Limp Home Mode Solenoid circuit for an open or high resistance.
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

7. **CHECK THE (T803) LIMP HOME MODE SOLENOID CIRCUIT FOR A SHORT TO GROUND**
   1. Measure the resistance between ground and the (T803) Limp Home Mode Solenoid circuit.

      Is there continuity between ground and the (T803) Limp Home Mode Solenoid circuit?

      Yes

      - Repair the (T803) Limp Home Mode Solenoid circuit for a short to ground.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 8.

8. **CHECK THE (T803) LIMP HOME MODE SOLENOID CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**
   1. Measure the resistance between the (T803) Limp Home Mode Solenoid circuit and all other circuits in the TCM harness connector.

      Is there continuity between the (T803) Limp Home Mode Solenoid circuit and any other circuits in the TCM harness connector?

      Yes

      - Repair the (T803) Limp Home Mode Solenoid circuit for a short to another circuit.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      NOTE: **If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in**

the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.

- Using the schematics as a guide, check the Transmission Control Module (TCM) terminals and connectors for corrosion, damage or pushed out terminals. Pay particular attention to the power and ground circuits. If no problems are found, replace the TCM and perform programming and PROXI Configuration Alignment procedures. Refer to **MODULE, TRANSMISSION CONTROL, REMOVAL** .
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

9. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Use the Freeze Frame Data to help duplicate the conditions in which the DTC originally set. Pay particular attention to the DTC set conditions, such as, VSS, MAP, ECT, and Load.
   3. Using the schematics as a guide, visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires.
   4. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.
   5. Wiggle the wiring and connectors while checking for any possible open or shorted circuits.
   6. Check for any Service Information Tune-ups or Technical Service Bulletins that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Test Complete.

P1D79-00-LIMP HOME MODE SOLENOID CIRCUIT HIGH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 3: Pressure Regulators & Solenoids Control Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The purpose of the diagnostic is to detect circuit failures on any of the output stages. All output stages are controlled by a current controller that can operate an output stage in two different modes:

- Current controlled mode (pressure regulators)
- Switched mode or PWM controlled (solenoids)

Pressure Regulator Monitoring: The current regulator ASIC in the TCM indicates the following circuit failures via SPI bus to the CPU:

- Short to ground
- Short to battery or open circuit

Solenoid Monitoring: The TCM measures the actual solenoid voltages and compares them to calibrated thresholds to identify the following electrical failures:

- Short to ground or open circuit
- Short to battery

WHEN MONITORED

Output stages power supply switched on.

Power supply voltage is greater than a calibrated value.

SET CONDITION

Pressure Regulator Monitoring: A failure is detected if one of the following conditions occur:

An short to ground failure is detected if the ASIC indicates a short to ground failure.

A short to battery or open circuit failure is detected if the ASIC indicates a short to battery or open circuit failure.

Solenoid Monitoring: A failure is detected if one of the following conditions occur:

An short to ground or open circuit failure is detected if the ratio between the voltage at the solenoid valve and the output stages power supply is above a calibrated threshold.

A short to battery failure is detected if the ratio between the voltage at the solenoid valve and the output stages power supply is below a calibrated threshold.

POSSIBLE CAUSES

Possible Causes
(T78) SOLENOID SUPPLY 1 CIRCUIT OPEN
(T78) SOLENOID SUPPLY 1 CIRCUIT SHORTED TO GROUND
(T803) LIMP HOME MODE SOLENOID CIRCUIT OPEN
(T803) LIMP HOME MODE SOLENOID CIRCUIT SHORTED TO GROUND
(T803) LIMP HOME MODE SOLENOID CIRCUIT SHORTED TO VOLTAGE
LIMP HOME MODE SOLENOID
TRANSMISSION CONTROL MODULE (TCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK IF THE DTC IS CURRENT**
    1. Using the scan tool, read TCM DTCs.
    2. Record the Environmental Data and any DTCs.
    3. Clear DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. Read TCM DTCs.

    Did the DTC reset?

    Yes

    - Go To 2

    No

    - Go To 9
2. **CHECK THE LIMP HOME MODE SOLENOID**
    1. Turn the Ignition OFF.
    2. Disconnect the Transmission Assembly harness connector.
    3. Measure the resistance of the Limp Home Mode Solenoid at the appropriate terminals in the Transmission Assembly interface connector.

    Is the resistance of the Limp Home Mode Solenoid 11.0 Ohms ± 1.0 Ohms?

    Yes

    - Go To 3

    No

    - Replace the Limp Home Mode Solenoid in accordance with the Service Information.
    - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
3. **CHECK THE (T78) SOLENOID SUPPLY 1 CIRCUIT FOR AN OPEN**
    1. Disconnect the TCM harness connector.
    2. Measure the resistance of the (T78) Solenoid Supply 1 circuit between the Transmission Assembly harness connector and the TCM harness connector.

Is the resistance below 5.0 Ohms?

Yes

- Go To 4

No

- Repair the (T78) Solenoid Supply 1 circuit for an open or high resistance.
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK THE (T78) SOLENOID SUPPLY 1 CIRCUIT FOR A SHORT TO GROUND**
   1. Measure the resistance between ground and the (T78) Solenoid Supply 1 circuit.

      Is there continuity between ground and the (T78) Solenoid Supply 1 circuit?

      Yes

      - Repair the (T78) Solenoid Supply 1 circuit for a short to ground.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 5

5. **CHECK THE (T78) SOLENOID SUPPLY 1 CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**
   1. Measure the resistance between the (T78) Solenoid Supply 1 circuit and all other circuits in the TCM harness connector.

      Is there continuity between the (T78) Solenoid Supply 1 circuit and any other circuits in the TCM harness connector?

      Yes

      - Repair the (T78) Solenoid Supply 1 circuit for a short to another circuit.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 6.

6. **CHECK THE (T803) LIMP HOME MODE SOLENOID CIRCUIT FOR AN OPEN**
   1. Measure the resistance of the (T803) Limp Home Mode Solenoid circuit between the Transmission Assembly harness connector and the TCM harness connector.

Is the resistance below 5.0 Ohms?

Yes

- Go To 7

No

- Repair the (T803) Limp Home Mode Solenoid circuit for an open or high resistance.
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

7. **CHECK THE (T803) LIMP HOME MODE SOLENOID CIRCUIT FOR A SHORT TO GROUND**
   1. Measure the resistance between ground and the (T803) Limp Home Mode Solenoid circuit.

      Is there continuity between ground and the (T803) Limp Home Mode Solenoid circuit?

      Yes

      - Repair the (T803) Limp Home Mode Solenoid circuit for a short to ground.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 8.

8. **CHECK THE (T803) LIMP HOME MODE SOLENOID CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**
   1. Measure the resistance between the (T803) Limp Home Mode Solenoid circuit and all other circuits in the TCM harness connector.

      Is there continuity between the (T803) Limp Home Mode Solenoid circuit and any other circuits in the TCM harness connector?

      Yes

      - Repair the (T803) Limp Home Mode Solenoid circuit for a short to another circuit.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      NOTE: **If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in**

the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.

- Using the schematics as a guide, check the Transmission Control Module (TCM) terminals and connectors for corrosion, damage or pushed out terminals. Pay particular attention to the power and ground circuits. If no problems are found, replace the TCM and perform programming and PROXI Configuration Alignment procedures. Refer to **MODULE, TRANSMISSION CONTROL, REMOVAL** .
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

9. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Use the Freeze Frame Data to help duplicate the conditions in which the DTC originally set. Pay particular attention to the DTC set conditions, such as, VSS, MAP, ECT, and Load.
   3. Using the schematics as a guide, visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires.
   4. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.
   5. Wiggle the wiring and connectors while checking for any possible open or shorted circuits.
   6. Check for any Service Information Tune-ups or Technical Service Bulletins that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Test Complete.

P1D8F-00-INCORRECT GEAR RATIO CLUTCH 1 DEFECTIVE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Transmission Control Module (TCM) monitors for conditions which lead to an unexpected transmission gear ratio (e.g. slipping clutches, hydraulic or mechanical defects, etc.). The TCM compares the actual gear ratio (i.e. the ratio of input speed to output speed) to a minimum and maximum calibrated gear ratio value. The TCM performs this comparison while driving in a fix gear, during gear engagement, and during shifting from one gear to another.

WHEN MONITORED

General Enable Conditions:

Driving position is in Drive or Reverse.

Oil temperature above a calibrated threshold.

No clutch slip control functions commanded.

No failure in input speed signal.

Input speed above a calibrated threshold.

Valid output speed signal from the output speed sensor or calculated from the wheel speed signal if output speed sensor is not available.

Valid engine speed signal from the PCM.

During Gear Shifts:

The output speed and the output speed gradient must be greater than a calibrated value.

SET CONDITION

During Gear Shifts:

A symptom is detected if the measured gear ratio exceeds the gear ratio range.

If a symptom is detected during downshifts requiring the engagement of a dog clutch or during upshifts, the diagnostic system aborts the gear shifting and the gear from which the shifting has been started is engaged. After a calibrated number of symptoms have been detected a failure is stored and the diagnostic system engages a calibrated gear

If a symptom is detected during a downshift requiring the engagement of a dog clutch, a fault code is stored indicating the associated dog clutch.

In Fixed Gears:

If the output speed is greater than a threshold then a symptom is detected if the measured gear ratio exceeds the gear ratio range for calibrated amount of time.

If the output speed is lower than this threshold, then a symptom is detected if the absolute difference between output speed multiplied by the fix gear ratio of the actual gear and input speed exceeds a threshold for a calibrated amount of time.

If a symptom is detected while driving in a fixed gear, the diagnostic system commands an up shift to the next

gear. After a calibrated number of symptoms have been detected a failure is stored and the diagnostic system engages a calibrated gear. This gear is monitored as well and if a failure is detected for this gear, an alternative gear is engaged and so on. The selection of alternative gears follows a calibrated logic. The aim of this logic is to detect a damaged clutch and to finally select an alternative gear that consists of a combination of clutches in which the damaged clutch is not involved. If a further failure symptom occurs in this final alternative gear, a failure for general transmission ratio malfunction is stored.

POSSIBLE CAUSES

Possible Causes
TRANSMISSION - INTERNAL COMPONENTS

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK IF DTC IS CURRENT**
    1. With the scan tool, read TCM DTCs.
    2. Record the Environmental Data and any DTCs.
    3. With the scan tool, erase DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. With the scan tool, read TCM DTCs.

    Did the DTC reset?

    Yes

    - Go to 2

    No

    - Go to 3
2. **TRANSMISSION**

    If the DTC returns, view repair.

    Repair

    - Verify proper fluid level. Refer to **FLUID AND FILTER, STANDARD PROCEDURE** .
    - Verify proper operation of the input and output speed sensors.
    - Refer to **DIAGNOSIS AND TESTING** and using the clutch application chart, inspect the clutches, valve body solenoids, and valves associated with this gear ratio error.

- Repair or replace the Transmission in accordance with the Service Information.
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. Check for any Service Bulletins that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Test complete.

P1D90-00-INCORRECT GEAR RATIO CLUTCH 2 DEFECTIVE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Transmission Control Module (TCM) monitors for conditions which lead to an unexpected transmission gear ratio (e.g. slipping clutches, hydraulic or mechanical defects, etc.). The TCM compares the actual gear ratio (i.e. the ratio of input speed to output speed) to a minimum and maximum calibrated gear ratio value. The TCM performs this comparison while driving in a fix gear, during gear engagement, and during shifting from one gear to another.

WHEN MONITORED

General Enable Conditions:

Driving position is in Drive or Reverse.

Oil temperature above a calibrated threshold.

No clutch slip control functions commanded.

No failure in input speed signal.

Input speed above a calibrated threshold.

Valid output speed signal from the output speed sensor or calculated from the wheel speed signal if output speed sensor is not available.

Valid engine speed signal from the PCM.

During Gear Shifts:

The output speed and the output speed gradient must be greater than a calibrated value.

SET CONDITION

During Gear Shifts:

A symptom is detected if the measured gear ratio exceeds the gear ratio range.

If a symptom is detected during downshifts requiring the engagement of a dog clutch or during upshifts, the diagnostic system aborts the gear shifting and the gear from which the shifting has been started is engaged. After a calibrated number of symptoms have been detected a failure is stored and the diagnostic system engages a calibrated gear

If a symptom is detected during a downshift requiring the engagement of a dog clutch, a fault code is stored indicating the associated dog clutch.

In Fixed Gears:

If the output speed is greater than a threshold then a symptom is detected if the measured gear ratio exceeds the gear ratio range for calibrated amount of time.

If the output speed is lower than this threshold, then a symptom is detected if the absolute difference between output speed multiplied by the fix gear ratio of the actual gear and input speed exceeds a threshold for a calibrated amount of time.

If a symptom is detected while driving in a fixed gear, the diagnostic system commands an up shift to the next gear. After a calibrated number of symptoms have been detected a failure is stored and the diagnostic system engages a calibrated gear. This gear is monitored as well and if a failure is detected for this gear, an alternative gear is engaged and so on. The selection of alternative gears follows a calibrated logic. The aim of this logic is to detect a damaged clutch and to finally select an alternative gear that consists of a combination of clutches in which the damaged clutch is not involved. If a further failure symptom occurs in this final alternative gear, a failure for general transmission ratio malfunction is stored.

P1D94-00-TCM INTERNAL SBW CALIBRATION MISMATCH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The shift by wire software output did not change from R, N or D to P although P should have been determined based on the input signals.

WHEN MONITORED

TCM powered.

TCM initialization has completed.

SET CONDITION

The failure is detected if one of the following occurs:

The shift by wire software output did change from P, N or D to R although R should not have been determined based on the input signals.

POSSIBLE CAUSES

Possible Causes
LOW FLUID LEVEL
TRANSMISSION SOLENOID, SPEED SENSOR, OR OTHER ELECTRICAL RELATED DTCS PRESENT
INTERMITTENT STICKING VALVE IN VALVE BODY
TRANSMISSION INTERNAL PROBLEM
TCM - INTERNAL ERROR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK IF TRANSMISSION SOLENOID DTCS ARE PRESENT**
   1. With the scan tool, check for other transmission DTCs.

      Are any transmission solenoid, speed sensor and/or any other transmission electrical related DTCs present?

      Yes

      - Refer to **DIAGNOSTIC CODE INDEX** and perform the appropriate repair.

      No

      - Go to 2
2. **CHECK TRANSMISSION FLUID LEVEL**
   1. Turn the Ignition OFF.

      NOTE: Low fluid level can be the cause of many transmission problems. Visually inspect the transmission and cooler lines for leakage and repair as necessary and adjust the fluid level in accordance to the Service Information. If no visual leaks are observed and the vehicle has obtained over 1610 km (1000 miles) from new or transmission service, a fluid level check is unnecessary.

   2. Check the transmission fluid level and condition in accordance to the Service Information.

      Is the fluid level correct?

      Yes

      - Go to 3

      No

      - Correct the fluid level in accordance to the Service Information. Refer to **FLUID AND FILTER, STANDARD PROCEDURE** .
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
3. **CHECK FOR INTERNAL TRANSMISSION PROBLEM**
   1. Check for an internal transmission mechanical problems.
   2. Remove the transmission oil pan and inspect for excessive debris or a plugged transmission oil filter in accordance to the Service Information.
   3. Inspect the valve body for foreign material.

4. This DTC is usually set due to an internal transmission problem such as, but not limited to: stuck solenoid valve and/or contamination in the valve body, broken springs, leaking clutch seals, dislodged or broken snap ring etc.
5. Check Service Information for the appropriate service procedure and any other possible causes.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the Transmission Verification Test. Refer to **STANDARD PROCEDURE** .

   No

   NOTE: If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.

   - Using the schematics as a guide, check the Transmission Control Module (TCM) terminals and connectors for corrosion, damage or pushed out terminals. Pay particular attention to the power and ground circuits. If no problems are found, replace the TCM and perform programming and PROXI Configuration Alignment procedures. Refer to **MODULE, TRANSMISSION CONTROL, REMOVAL** .
   - Perform the Transmission Verification Test. Refer to **STANDARD PROCEDURE** .

P1D95-00-TCM CLUTCH FAILURE UNDETERMINED

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Transmission Control Module (TCM) monitors for conditions which lead to an unexpected transmission gear ratio (e.g. slipping clutches, hydraulic or mechanical defects, etc.). The TCM compares the actual gear ratio (i.e. the ratio of input speed to output speed) to a minimum and maximum calibrated gear ratio value. The TCM performs this comparison while driving in a fix gear, during gear engagement, and during shifting from one gear to another.

P1D99-00-INCORRECT GEAR RATIO CLUTCH B OR E DEFECTIVE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Transmission Control Module (TCM) monitors for conditions which lead to an unexpected transmission gear ratio (e.g. slipping clutches, hydraulic or mechanical defects, etc.). The TCM compares the actual gear ratio (i.e. the ratio of input speed to output speed) to a minimum and maximum calibrated gear ratio value. The TCM performs this comparison while driving in a fix gear, during gear engagement, and during shifting from one gear to another.

WHEN MONITORED

General Enable Conditions:

Driving position is in Drive or Reverse.

Oil temperature above a calibrated threshold.

No clutch slip control functions commanded.

No failure in input speed signal.

Input speed above a calibrated threshold.

Valid output speed signal from the output speed sensor or calculated from the wheel speed signal if output speed sensor is not available.

Valid engine speed signal from the PCM.

During Gear Shifts:

The output speed and the output speed gradient must be greater than a calibrated value.

SET CONDITION

During Gear Shifts:

A symptom is detected if the measured gear ratio exceeds the gear ratio range.

If a symptom is detected during downshifts requiring the engagement of a dog clutch or during upshifts, the diagnostic system aborts the gear shifting and the gear from which the shifting has been started is engaged. After a calibrated number of symptoms have been detected a failure is stored and the diagnostic system engages a calibrated gear

If a symptom is detected during a downshift requiring the engagement of a dog clutch, a fault code is stored

indicating the associated dog clutch.

In Fixed Gears:

If the output speed is greater than a threshold then a symptom is detected if the measured gear ratio exceeds the gear ratio range for calibrated amount of time.

If the output speed is lower than this threshold, then a symptom is detected if the absolute difference between output speed multiplied by the fix gear ratio of the actual gear and input speed exceeds a threshold for a calibrated amount of time.

If a symptom is detected while driving in a fixed gear, the diagnostic system commands an up shift to the next gear. After a calibrated number of symptoms have been detected a failure is stored and the diagnostic system engages a calibrated gear. This gear is monitored as well and if a failure is detected for this gear, an alternative gear is engaged and so on. The selection of alternative gears follows a calibrated logic. The aim of this logic is to detect a damaged clutch and to finally select an alternative gear that consists of a combination of clutches in which the damaged clutch is not involved. If a further failure symptom occurs in this final alternative gear, a failure for general transmission ratio malfunction is stored.

POSSIBLE CAUSES

Possible Causes
TRANSMISSION - INTERNAL COMPONENTS

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK IF DTC IS CURRENT**
    1. With the scan tool, read TCM DTCs.
    2. Record the Environmental Data and any DTCs.
    3. With the scan tool, erase DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. With the scan tool, read TCM DTCs.

    Did the DTC reset?

    Yes

    - Go to 2

    No

- Go to 3

2. **TRANSMISSION**

   If the DTC returns, view repair.

   Repair

   - Verify proper fluid level. Refer to **FLUID AND FILTER, STANDARD PROCEDURE** .
   - Verify proper operation of the input and output speed sensors.
   - Refer to **DIAGNOSIS AND TESTING** and using the clutch application chart, inspect the clutches, valve body solenoids, and valves associated with this gear ratio error.
   - Repair or replace the Transmission in accordance with the Service Information.
   - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. Check for any Service Bulletins that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Test complete.

P1DA9-00-TRANSMISSION FLUID TEMPERATURE RATIONALITY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 4: Power & Ground, Temperature, Oil Pressure And Speed Sensors Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The purpose of the diagnostic is to detect rationality failures of the transmission oil temperature sensor by evaluating the following conditions:

Comparison to a Temperature Model

- The measured transmission oil temperature is compared to a calculated model temperature. The calculation of the modeled temperature is based on the fact that the resistance of the pressure regulator coil is correlated with the oil temperature. The calculation is based on the actual duty cycle of pressure regulator for a given commanded current and the value of the pressure regulator power supply.

Low Temperature Detection

- The measured transmission oil temperature is monitored for a low value after having first reached a fixed temperature value.

Stuck in Low Temperature Detection

- The measured transmission oil temperature is monitored for a minimum amount of temperature change at low temperatures.

Temperature Jump Detection

- The measured transmission oil temperature is monitored for a maximum amount of temperature change between two consecutive data samples.

WHEN MONITORED

Temperature Jump Detection:

Ignition on.

No failure detected in oil temperature sensor circuit high or low fault monitoring.

Comparison to Temperature Model:

Ignition on.

No failure detected in oil temperature sensor circuit high or low fault monitoring.

No failure detected in oil temperature jump detection monitoring.

The engine speed is greater than a calibrated value or the input speed is greater than a calibrated value.

The output speed is greater than a calibrated value.

Pressure regulator power supply is switched on.

No failure detected in supply voltage of pressure regulator monitoring.

No failure detected in pressure regulator circuit monitoring.

Calibrated time has expired after engine start.

Low Temperature Detection:

Ignition on.

No failure detected in oil temperature sensor circuit high or low fault monitoring.

No failure detected in oil temperature jump detection monitoring.

The engine speed is greater than a calibrated value or the input speed is greater than a calibrated value.

The output speed is greater than a calibrated value.

Stuck in Low Temperature Detection:

Ignition on.

No failure detected in oil temperature sensor circuit high or low fault monitoring.

No failure detected in oil temperature jump detection monitoring.

The engine speed is greater than a calibrated value or the input speed is greater than a calibrated value.

The output speed is greater than a calibrated value.

Transmission oil temperature is less than a calibrated value.

SET CONDITION

Temperature Jump Detection:

The TCM detects that there has been a transmission fluid temperature change greater than 10°C (50°F) in less than 1 second.

Comparison to a Temperature Model:

The failure is detected if the absolute value of the difference between the oil temperature sensor signal measured by the TCM and the calculated oil temperature is greater than a calibrated threshold for a calibrated amount of time.

Low Temperature Detection:

The failure is detected if the oil temperature sensor signal is less than a calibrated threshold after having first reached another higher calibrated threshold in the same driving cycle.

Stuck in Low Temperature Detection:

The failure is detected if the absolute value of the difference between the current transmission oil temperature and a previous oil temperature stored a calibrated time before is less than a calibrated threshold.

POSSIBLE CAUSES

Possible Causes
INCORRECT TRANSMISSION FLUID LEVEL
RESTRICTION IN TRANSMISSION COOLING SYSTEM
VEHICLE AIRFLOW RESTRICTED
TORQUE CONVERTER
CASE VENT PLUGGED OR DAMAGED
TRANSMISSION FLUID TEMPERATURE SENSOR CIRCUIT FAULT
TRANSMISSION FLUID TEMPERATURE SENSOR
TCM - INTERNAL FAULT

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Perform the Transmission Verification Test. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

Before performing this Diagnostic Test, be certain that there are no problems that could cause the Transmission to overheat. Check for restricted transmission oil cooler and lines, air flow restrictions, and low transmission fluid. Towing loads weighing more than the recommended towing capacity could cause excessively high transmission temperatures.

1. **CHECK FOR ENGINE COOLING DTCS**
    1. With the scan tool, read Engine DTCs.

       Are any engine cooling or Active Grille Shutter (AGS) DTCs present?

       Yes

       - Refer to the **DTC INDEX** article and perform the appropriate diagnostic procedure.

       No

       - Go to 2
2. **CHECK FOR OTHER TRANSMISSION DTCS**
    1. With the scan tool, read Transmission DTCs.
    2. Record any Transmission Freeze Frame data.

       Are there any other transmission DTCs?

Yes

- Perform the appropriate diagnostic procedure in the Service Information.

No

- Go to 3

3. **CHECK IF DTC IS CURRENT**
   1. Using the scan tool, read TCM DTCs.
   2. Record the Environmental Data and any DTCs.
   3. Clear DTCs.
   4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
   5. Read TCM DTCs.

   Did the DTC reset?

   Yes

   - Go to 4

   No

   - Go to 9

4. **CHECK TRANSMISSION TEMPERATURE SENSOR CIRCUITS FOR HIGH RESISTANCE**
   1. Turn the Ignition OFF.
   2. Disconnect the TCM harness connector.
   3. Remove the transmission side cover and disconnect the transmission temperature sensor harness connector.
   4. Connect a jumper between the (T54) Transmission Temperature Signal circuit and the (T820) Sensor Ground circuit at the transmission temperature sensor harness connector.
   5. Measure resistance between (T54) Transmission Temperature Signal circuit and the (T820) Sensor Ground circuit at the TCM harness connector.

   Is the resistance below 5.0 ohms?

   Yes

   - Go to 5

   No

   - Repair the (T54) Transmission Temperature Signal circuit or the (T820) Sensor Ground

circuit for an open or high resistance.

- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **CHECK TRANSMISSION TEMPERATURE SENSOR CIRCUITS FOR A SHORT TO GROUND**
   1. With the jumper still connected, measure resistance between (T54) Transmission Temperature Signal circuit at the TCM harness connector and ground.

      Is there continuity between (T54) Transmission Temperature Signal circuit and ground?

      Yes

      - Repair the (T54) Transmission Temperature Signal circuit or (T820) Sensor Ground circuit for a short to ground.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go to 6
6. **CHECK THE (T54) TRANSMISSION TEMPERATURE SIGNAL CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**
   1. Remove the jumper from the transmission temperature sensor harness connector.
   2. Measure resistance between (T54) Transmission Temperature Signal circuit and all other circuits in the TCM harness connector.

      Is there continuity between (T54) transmission temperature signal circuit and any other TCM circuit?

      Yes

      - Repair the (T54) Transmission Temperature Signal circuit for a short to another circuit.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go to 7
7. **CHECK THE (T820) SENSOR GROUND CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**
   1. Measure resistance between (T820) Sensor Ground circuit and all other circuits in the TCM harness connector.

      Is there continuity between (T820) Sensor Ground circuit and any other TCM circuit?

Yes

- Repair the (T820) Sensor Ground circuit for a short to another circuit.
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go to 8

8. **VERIFY TRANSMISSION TEMPERATURE SENSOR RESISTANCE / TEMPERATURE CORRELATION**
   1. Measure the resistance between (T54) Transmission Temperature Signal terminal and (T820) Sensor Ground terminal at the transmission temperature sensor.

TYPICAL VALUES FOR TRANSMISSION TEMPERATURE SENSOR	
TEMPERATURE	**APPROXIMATE RESISTANCE**
-30°C (-22°F)	44000 Ohms ± 6600
10°C (50°F)	6455 Ohms ± 645
110°C (230°F)	247 Ohms ± 16
145°C (293°F)	111 Ohms ± 6

Using the chart above, compare the Temperature Sensor temperature to the correlating resistance value.

Is the resistance within the specified range when the sensor is at the given temperature?

Yes

NOTE: **If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.**

- Using the schematics as a guide, check the Transmission Control Module (TCM) terminals and connectors for corrosion, damage or pushed out terminals. Pay particular attention to the power and ground circuits. If no problems are found, replace the TCM and perform programming and PROXI Configuration Alignment procedures. Refer to **MODULE, TRANSMISSION CONTROL, REMOVAL** .
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace the Transmission Temperature Sensor in accordance with the Service Information.
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

9. **CHECK WIRING AND CONNECTORS**
    1. The conditions necessary to set the DTC are not present at this time.
    2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
    3. Wiggle the wires while checking for shorted and open circuits.
    4. Check for any Service Bulletins that may apply.

    Were there any problems found?

    Yes

    - Repair as necessary.
    - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

    No

    - Test complete.

P1DAB-00-VEHICLE SPEED UNDETERMINED

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 5: Power & Ground, Temperature, Oil Pressure And Speed Sensors Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The purpose of the diagnostic is to detect rationality failures of the output speed sensor signal. This diagnostic checks if the output speed sensor signal is within the calculated tolerance bands.

The upper threshold of the first tolerance band is the calculated output speed plus a calibrated offset. The calculated output speed is based upon the input speed signal multiplied by the gear ratio factor. This factor

corresponds to either the target gear or current gear depending on which gear provides the greater ratio.

The lower threshold of the first tolerance band is the calculated output speed, minus a calibrated offset. The calculated output speed is based upon the input speed signal multiplied by the gear ratio factor. This factor corresponds to either the target gear or current gear depending on which gear provides the lesser ratio.

The thresholds of the second tolerance bands are calculated using the same method described above. In place of the input speed signal, the wheel speed signal via CAN is used for the calculation.

In addition, this diagnostic checks if the rotating direction of the output speed sensor signal corresponds to the actual gear position.

WHEN MONITORED

No failure detected in the speed sensor supply voltage monitoring.

SET CONDITION

The failure is detected if more than one of the speed sensor signals is not rational.

POSSIBLE CAUSES

Possible Causes
MISMATCHED TIRE CIRCUMFERENCES
FRONT OR REAR WHEELS BEING ON A SLIPPERY SURFACE WHILE THE OPPOSITE TIRES ARE NOT
POWERTRAIN CONTROL MODULE (PCM) - INTERNAL ERROR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK FOR ACTIVE DTCs**
    1. Turn the Ignition ON, Engine not running.
    2. With the scan tool, read TCM DTCs.

    NOTE: Check for Bus Communication DTCs. If no Bus or Communication DTCs are set, check for active DTCs stored in the Anti-Lock Brake Module. Any bus or communication DTCs or VSS DTCs in the Anti-Lock Brake Module must be properly diagnosed before continuing.

    3. Record the Environmental Data and any DTCs.
    4. With the scan tool, erase DTCs.
    5. Using the recorded Environmental Data, along with the When Monitored and Set Conditions

above, operate the vehicle in the conditions that set the DTC.

6. With the scan tool, read TCM DTCs.

NOTE: It may be necessary to drive the vehicle to meet the conditions to set this DTC, try to repeat the conditions in which the fault set by reviewing the Freeze Frame data.

Is the DTC Active or Pending at this time?

Yes

- Go to 2

No

- Go to 4

2. **VISUAL INSPECTION**

NOTE: This code can set due to tire circumference differences and from the front or rear wheels being on a slippery surface while the opposite tires are not.

1. This code may also set on a hard acceleration on loose gravel or during other off road driving conditions.
2. Check tire pressure of all the tires.
3. Check for correct tire sizes.
4. Check tire wear on all the tires.
5. Ask the customer what the road and driving conditions were like when the fault set.

Were any problems found?

Yes

- Repair as necessary. If the code set during a front or rear wheel spin condition, no repair is necessary.
- Perform the Transmission Verification Test. Refer to **STANDARD PROCEDURE** .

No

- Go to 3

3. **CHECK PCM WIRING AND CONNECTIONS**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Vehicle Speed Sensors, ABS Module, and the Powertrain Control Module (PCM).
   2. Look for any chafed, pierced, pinched, or partially broken wires.

3. Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the Vehicle Speed Sensors, ABS Module, and PCM connectors.
4. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the Transmission Verification Test. Refer to **STANDARD PROCEDURE** .

   No

   NOTE: If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.

   - Replace the TCM and perform programming and PROXI Configuration Alignment procedures. Refer to **MODULE, TRANSMISSION CONTROL, REMOVAL** .
   - Perform the Transmission Verification Test. Refer to **STANDARD PROCEDURE** .

4. **CHECK WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. Check for any Service Bulletins that may apply.

      Were there any problems found?

      Yes

      - Repair as necessary.
      - Perform the Transmission Verification Test. Refer to **STANDARD PROCEDURE** .

      No

      - Test complete.

P1DAD-00-INPUT SHAFT-OUTPUT SHAFT DIRECTION CORRELATION

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 6: Power & Ground, Temperature, Oil Pressure And Speed Sensors Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The purpose of the diagnostic is to detect an unwanted driving direction. A rationality check is performed between the measured directions of input speed and output speed signal and the calculated driving direction. The calculated driving direction is based on the commanded currents of the pressure regulators.

WHEN MONITORED

No input speed or output speed sensor DTCs set.

Input speed and output speed greater than a calibrated threshold.

Shift not in progress.

No clutch slip control function active.

SET CONDITION

The failure is detected if the measured directions of input speed and output speed signal do not correspond to the calculated driving direction for a calibrated amount of time.

Calculated Driving Direction is Forward:

A failure is detected if the input speed and output speed direction are different.

Calculated Driving Direction is Reverse:

A failure is detected if the input speed and output speed direction are the same.

POSSIBLE CAUSES

Possible Causes
TRANSMISSION - INTERNAL

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK IF DTC IS CURRENT**
    1. Turn the Ignition ON.
    2. With the scan tool, CLEAR transmission DTCs.
    3. Raise the vehicle on the hoist.
    4. Start the engine.
    5. With the scan tool, monitor the Output Speed Sensor RPM.
    6. Firmly apply the brakes and place the gear selector in Drive.

    WARNING: To avoid personal injury or death, keep hands and feet clear of rotating wheels.

    7. Release the brakes and raise the engine rpm to allow the transmission to upshift to the 1-2 and 2-3 shift schedule.

Did the Output Speed Sensor display an rpm below 1, 000?

Yes

- Go To 2

No

- Perform the Transmission Verification Test. Refer to **STANDARD PROCEDURE** .

2. **INTERNAL TRANSMISSION**

NOTE: This DTC is an indication of a internal transmission failure.

1. Turn the Ignition OFF.
2. Remove the Transmission Oil Pan and inspect for excessive debris such as clutch friction material or metal contamination.

Is there any indication of an internal transmission failure?

Yes

- Repair internal transmission as necessary in accordance with the Service Information. Refer to **REMOVAL** .
- Perform the Transmission Verification Test. Refer to **STANDARD PROCEDURE** .

No

NOTE: If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.

- Using the schematics as a guide, check the Transmission Control Module (TCM) terminals and connectors for corrosion, damage or pushed out terminals. Pay particular attention to the power and ground circuits. If no problems are found, replace the TCM and perform programming and PROXI Configuration Alignment procedures. Refer to **MODULE, TRANSMISSION CONTROL, REMOVAL** .
- Perform the Transmission Verification Test. Refer to **STANDARD PROCEDURE** .

P1DAF-00-INCOMPATIBLE LIMP IN ACTION REQUESTED

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The purpose of the diagnostic is to determine unique failure situations when multiple failures requiring conflicting limp-in actions occur. If conflicting limp-in actions are commanded, the mechanical limp-home mode is activated as the final limp-in action.

WHEN MONITORED

Ignition On.

SET CONDITION

Multiple failures requiring conflicting limp-in actions occur.

POSSIBLE CAUSES

Possible Causes
OTHER TRANSMISSION CONTROL MODULE (TCM) DIAGNOSTIC TROUBLE CODES (DTS) ARE SET POWERTRIAN CONTROL MODULE (PCM) DTCS ARE SET

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK FOR TCM DTCS**
    1. With the scan tool, read TCM DTCs.

       Are any other TCM DTCs present?

       Yes

       - Refer to **DIAGNOSTIC CODE INDEX** and perform the appropriate diagnostic procedure.
       - Perform the Transmission Verification Test. Refer to **STANDARD PROCEDURE** .

       No

       - Go to 2
2. **CHECK IF PCM DTCS ARE PRESENT**
    1. With the scan tool, read PCM DTCs.

       Are any PCM DTCs present?

       Yes

       - **Refer to** and perform the appropriate diagnostic procedure.

- Perform the Transmission Verification Test. Refer to **STANDARD PROCEDURE** .

No

NOTE: If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.

- Using the schematics as a guide, check the Transmission Control Module (TCM) terminals and connectors for corrosion, damage or pushed out terminals. Pay particular attention to the power and ground circuits. If no problems are found, replace the TCM and perform programming and PROXI Configuration Alignment procedures. Refer to **MODULE, TRANSMISSION CONTROL, REMOVAL** .
- Perform the Transmission Verification Test. Refer to **STANDARD PROCEDURE** .

P1DB1-00-TCM SYSTEM VOLTAGE EXCESSIVELY LOW

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 7: TCM System Voltage Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Transmission Control Module (TCM) monitors the system voltage level at the TCM supply voltage pin for the following failure conditions:

- System Voltage Excessively Low

- System Voltage Low
- System Voltage High

If the TCM supply voltage is below a threshold that is lower than the system voltage excessively low threshold, then the solenoid valves and pressure regulators are not powered.

WHEN MONITORED

Transmission solenoid valves and pressure regulators are powered on.

SET CONDITION

The failure is detected if the system voltage is less than a calibrated threshold.

POSSIBLE CAUSES

Possible Causes
FUSE
LOW BATTERY VOLTAGE
ENGINE CHARGING SYSTEM
BATTERY VOLTAGE CIRCUIT HIGH RESISTANCE
TCM - INTERNAL ERROR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK FOR ENGINE CHARGING SYSTEM DTCS**
    1. With the scan tool, read Engine DTCs.

       Are any Engine Charging System DTCs present?

       Yes

       - Repair any Charging System DTCs before proceeding. After repairing the Charging System, perform the Transmission Verification test to verify the transmission and or controller was not damaged. Refer to **STANDARD PROCEDURE** .

       No

       - Go to 2
2. **CHECK SYSTEM VOLTAGE**
    1. Start the engine.

2. With the scan tool, under transmission, check system voltage.

   Is the transmission system voltage above 7.0 volts?

   Yes

   - Go to 3

   No

   - Go to 4

3. **INTERMITTENT WIRING AND CONNECTORS**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.

   Where any problems found?

   Yes

   - Repair as necessary.
   - Perform the Transmission Verification Test. Refer to **STANDARD PROCEDURE** .

   No

   - Go to 4

4. **CHECK THE BATT CIRCUIT**
   1. Ignition ON, Engine Not Running.
   2. Using a 12-volt test light connected to ground, check the (A190) BATT circuit at the TCM connector.

   NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

   Does the test light illuminate brightly?

   Yes

   NOTE: If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.

- Replace the TCM and perform programming and PROXI Configuration Alignment procedures. Refer to **MODULE, TRANSMISSION CONTROL, REMOVAL** .
- Perform the Transmission Verification Test. Refer to **STANDARD PROCEDURE** .

No

- Repair the (A190) BATT circuit for an open or high resistance.
- Perform the Transmission Verification Test. Refer to **STANDARD PROCEDURE** .

P1DB2-00-ACTUATOR SUPPLY VOLTAGE A CIRCUIT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 8: Pressure Regulators & Solenoids Control Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The voltage supply circuit(s) for the solenoids and pressure regulators are monitored for open circuits, shorts to ground, and shorts to voltage. If a failure is detected, the TCMA will deactivate the affected power supply circuit and set a corresponding DTC relevant to the fault that was detected.

WHEN MONITORED

Ignition is OFF.

SET CONDITION

A failure is detected if the output stage power supply voltage level is greater than 4 volts.

POSSIBLE CAUSES

Possible Causes
TCM - INTERNAL ERROR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK IF DTC IS CURRENT**
    1. With the scan tool, read TCM DTCs.
    2. Record the Environmental Data and any DTCs.
    3. With the scan tool, erase DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. With the scan tool, read TCM DTCs.

    Did the DTC reset?

    Yes

    NOTE: If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.

    - Using the schematics as a guide, check the Transmission Control Module (TCM) terminals and connectors for corrosion, damage or pushed out terminals. Pay particular attention to the power and ground circuits. If no problems are found, replace the TCM and perform programming and PROXI Configuration Alignment procedures. Refer to **MODULE, TRANSMISSION CONTROL, REMOVAL** .
    - Perform the Transmission Verification Test. Refer to **STANDARD PROCEDURE** .

    No

    - Go to 2
2. **CHECK WIRING AND CONNECTORS**
    1. The conditions necessary to set the DTC are not present at this time.

2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
3. Wiggle the wires while checking for shorted and open circuits.
4. Check for any Service Bulletins that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the Transmission Verification Test. Refer to **STANDARD PROCEDURE** .

   No

   - Test complete.

P1DB3-00-TCM ECU RESET-RECOVERY OCCURRED

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The purpose of the diagnostic is to detect the reason of a TCM reset. The reason is determined after a reset following TCM re-initialization. There are several situations where a reset of the TCM can occur. Some of these are initiated by the TCM software itself and others may be caused by an under voltage condition. There are three reset categories which include low level software, high level / application software and under voltage conditions. The following failures are examples of each of these categories that can cause resets of the TCM:

- A function call is out of sequence in the high level / application software
- A division by zero has occurred in the low level software
- An under voltage condition has occurred in the TCM supply voltage

If the software detects a condition for initiating a reset, the reason of the reset is stored in an area of the RAM that is not initialized (non volatile) during TCM re-initialization. Upon TCM initialization, this information is read and the appropriate fault code indicating the reason of the reset is stored.

WHEN MONITORED

TCM is powered on.

The output speed is greater than a calibrated value or the engine speed is greater than a calibrated value.

SET CONDITION

Reset in Low Level Software or Under Voltage Condition:

The failure is detected during re-initialization of the TCM if a reset code for low level software or under voltage condition has been stored in the non volatile RAM.

Reset in High Level / Application Software:

The failure is detected during re-initialization of the TCM if a reset code for high level / application software has been stored in the non volatile RAM.

POSSIBLE CAUSES

Possible Causes
TCM - INTERNAL ERROR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK FOR OTHER DTCS**
   1. With the scan tool, read TCM DTCs.
   2. Record the Environmental Data and any DTCs.

      Are any other TCM DTCs set?

      Yes

      - Repair the other DTCs before proceeding. After the repair is complete, perform the Transmission Verification Test. Refer to **STANDARD PROCEDURE** .

      No

      - Go to 2
2. **CHECK IF DTC IS CURRENT**
   1. With the scan tool, erase DTCs.
   2. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
   3. With the scan tool, read TCM DTCs.

      Did the DTC reset?

      Yes

      NOTE: If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI

configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.

- Using the schematics as a guide, check the Transmission Control Module (TCM) terminals and connectors for corrosion, damage or pushed out terminals. Pay particular attention to the power and ground circuits. If no problems are found, replace the TCM and perform programming and PROXI Configuration Alignment procedures. Refer to **MODULE, TRANSMISSION CONTROL, REMOVAL** .
- Perform the Transmission Verification Test. Refer to **STANDARD PROCEDURE** .

No

- Go to 3

3. **CHECK WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. Check for any Service Bulletins that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the Transmission Verification Test. Refer to **STANDARD PROCEDURE** .

   No

   - Test complete.

P1DB7-00-TORQUE CONVERTER CLUTCH PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 9: Pressure Regulators & Solenoids Control Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The purpose of the monitoring is to detect a failure in the Torque Converter Clutch (TCC) system. The TCC is used to bypass the torque converter. The TCC can be open, closed or in closed loop control mode where a specific clutch slip is controlled. The actual slip and the target slip are compared to detect a failure.

WHEN MONITORED

TCC closed or in closed loop control mode.

Pressure inside the TCC (calculated by a software model) must be greater than a calibrated threshold.

Engine torque must be lower than a calibrated threshold.

SET CONDITION

A failure is detected if the difference between the actual slip and target slip of the TCC is greater than a calibrated threshold for an amount of time.

A fault is set if a failure has occurred twice.

POSSIBLE CAUSES

Possible Causes
TORQUE CONVERTER CIRCUIT DTCs
INPUT SPEED SENSOR CIRCUIT OR PERFORMANCE DTCS
TORQUE CONVERTER
TRANSMISSION CONTROL MODULE (TCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK IF DTC IS CURRENT**
    1. With the scan tool, read TCM DTCs.
    2. Record the Environmental Data and any DTCs.
    3. With the scan tool, erase DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. With the scan tool, read TCM DTCs.

    Did the DTC reset?

    Yes

    Go To 2

    No

    - Go to 4
2. **CHECK FOR OTHER TCM DTCS**
    1. With the scan tool, read TCM DTCs.

Are Input Speed Sensor, CAN, or Torque Converter Clutch Circuit DTCs set?

Yes

- Repair DTCs in accordance with the Service Information. Refer to **DIAGNOSTIC CODE INDEX** .
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 3

3. **CHECK VALVE BODY AND SOLENOID FOR CONTAMINATION AND DAMAGE**
   1. Check the Valve Body and related Pressure Control Solenoid for contamination or damage that could cause this condition.

   Was a problem found?

   Yes

   - Repair in accordance with the Service Information.
   - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the Torque Converter in accordance with the Service Information.
   - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **INTERMITTENT WIRING AND CONNECTORS**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wiring and connectors while checking for any possible open or shorted circuits.
   4. Check for any Service Information Tune-ups or Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

- Test Complete.

P1DB8-00-UNINTENDED TORQUE APPLIED WHILE IN NEUTRAL

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The purpose of the diagnostic is to detect an unwanted power flow in the transmission. A rationality check of the ratio of input speed to engine speed is done while no power flow is requested.

WHEN MONITORED

No failure in input speed signal.

No failure in engine speed signal.

Engine speed greater than a calibrated threshold.

No mechanical limp home mode active.

No power flow requested.

SET CONDITION

The failure is detected if the ratio of input speed to engine speed is less than a calibrated threshold for an amount of time.

POSSIBLE CAUSES

Possible Causes
TCM - INTERNAL ERROR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK IF DTC IS CURRENT**
    1. With the scan tool, read TCM DTCs.
    2. Record the Environmental Data and any DTCs.
    3. With the scan tool, erase DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. With the scan tool, read TCM DTCs.

Did the DTC reset?

Yes

NOTE: If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.

- Using the schematics as a guide, check the Transmission Control Module (TCM) terminals and connectors for corrosion, damage or pushed out terminals. Pay particular attention to the power and ground circuits. If no problems are found, replace the TCM and perform programming and PROXI Configuration Alignment procedures. Refer to **MODULE, TRANSMISSION CONTROL, REMOVAL** .
- Perform the Transmission Verification Test. Refer to **STANDARD PROCEDURE** .

No

- Go to 2

2. **CHECK WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. Check for any Service Bulletins that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the Transmission Verification Test. Refer to **STANDARD PROCEDURE** .

   No

   - Test complete.

P1DB9-00-TCM ECU RESET EXTENDED LOW VOLTAGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 10: TCM System Voltage Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The purpose of the diagnostic is to ensure power flow after a Transmission Control Module (TCM) reset during a mechanical limp-in action or after an under voltage reset due to a low voltage condition of the TCM source voltage. The diagnostic is performed once during the reset initialization.

WHEN MONITORED

TCM reset has occurred.

Output speed is above a calibrated value.

SET CONDITION

Reset has occurred with Mechanical Limp-In Action Active.

Reset has occurred during an under voltage condition and the shifter position and driving direction information stored in RAM has been cleared.

POSSIBLE CAUSES

Possible Causes
TCM - INTERNAL ERROR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK FOR ENGINE CHARGING SYSTEM DTCS**
    1. With the scan tool, read Engine DTCs.

       Are any Engine Charging System DTCs present?

       Yes

       - Repair Charging System DTCs before proceeding. Refer to **DIAGNOSIS AND TESTING** .
       - Perform the Transmission Verification Test. Refer to **STANDARD PROCEDURE** .

       No

       - Go To 2
2. **CHECK IF DTC IS CURRENT**
    1. With the scan tool, read TCM DTCs.
    2. Record the Environmental Data and any DTCs.
    3. With the scan tool, erase DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. With the scan tool, read TCM DTCs.

Did the DTC reset?

Yes

NOTE: If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.

- Using the schematics as a guide, check the Transmission Control Module (TCM) terminals and connectors for corrosion, damage or pushed out terminals. Pay particular attention to the power and ground circuits. If no problems are found, replace the TCM and perform programming and PROXI Configuration Alignment procedures. Refer to **MODULE, TRANSMISSION CONTROL, REMOVAL** .
- Perform the Transmission Verification Test. Refer to **STANDARD PROCEDURE** .

No

- Go to 3

3. **CHECK WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. Check for any Service Bulletins that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the Transmission Verification Test. Refer to **STANDARD PROCEDURE** .

   No

   - Test complete.

P1DC8-00-CLUTCH TEMP THRESHOLD ACHIEVED AUTOSTICK INHIBIT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 11: Power & Ground, Temperature, Oil Pressure And Speed Sensors Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Transmission Control Module (TCM) performs several diagnostic checks to determine whether the temperature of a clutch is above a calibrated temperature value. These diagnostic checks use temperature models which are based upon input speed and output speed, current gear, target gear, calculated effective pressure on engaging clutch and on the disengaging clutch. The DTCs set by these diagnostics are used to protect the durability of the clutches by controlling the shift operation. No repair action is required. This fault is

only used to initiate a calibration strategy and for diagnostic information in case other faults are set.

WHEN MONITORED

A gear shift or gear engagement is active.

SET CONDITION

The calculated clutch temperature is above a calibrated value.

Default Action When DTC Sets:

Auto Stick function will be deactivated.

POSSIBLE CAUSES

Possible Causes
EXCESSIVE AMOUNT OF WIDE OPEN THROTTLE DRIVING
EXCESSIVE AMOUNT PADDLE SHIFT USAGE IN LOW GEARS

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

CHECK FOR OTHER DTCS

NOTE: No repair action is required. This fault is only used to initiate a calibration strategy and for diagnostic information in case other faults are set.

1. With the scan tool, read TCM DTCs.

   View Repair

   - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.
   - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

P1DCD-00-TCM MONITORING PROCESSOR PERFORMANCE MULTIPLE CLUTCHES LOCKED UP

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The monitoring of the pressure regulator and solenoid logic is used to detect a failure in the activation of the pressure regulators and solenoids. The pressure regulators are used to control the pressure to the clutches and

the solenoids are used to activate the pressure to the park lock and to the position valve. The commanded currents of all regulators and solenoids are monitored. The monitoring consists of several monitoring strategies, transmission blocking, wrong driving direction, gear engagement of reverse gear while driving forward, unwanted engaging or disengaging of the park lock.

This diagnostic monitors for conditions that could cause a combination of clutches, that do not correlate to a desired gear engagement, to be applied at the same time.

WHEN MONITORED

No limp home mode active.

No position valve monitoring active.

Transmission oil temperature must be greater than a calibrated threshold.

SET CONDITION

A failure is detected if more than 3 clutches or the combination of clutches C, D, and F is activated at the same time.

POSSIBLE CAUSES

Possible Causes
CLUTCH A
CLUTCH B
CLUTCH C
CLUTCH D
CLUTCH E
TCM - INTERNAL ERROR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK IF DTC IS CURRENT**
    1. With the scan tool, read TCM DTCs.
    2. Record the Environmental Data and any DTCs.
    3. With the scan tool, erase DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. With the scan tool, read TCM DTCs.

    Did the DTC reset?

Yes

NOTE: If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.

- Using the schematics as a guide, check the Transmission Control Module (TCM) terminals and connectors for corrosion, damage or pushed out terminals. Pay particular attention to the power and ground circuits. If no problems are found, replace the TCM and perform programming and PROXI Configuration Alignment procedures. Refer to **MODULE, TRANSMISSION CONTROL, REMOVAL** .
- Perform the Transmission Verification Test. Refer to **STANDARD PROCEDURE** .

No

- Go to 2

2. **CHECK WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. Check for any Service Bulletins that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the Transmission Verification Test. Refer to **STANDARD PROCEDURE** .

   No

   - Test complete.

P1DCE-00-TCM MONITORING PROCESSOR PERFORMANCE INCORRECT DRIVING DIRECTION

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The monitoring of the pressure regulator and solenoid logic is used to detect a failure in the activation of the pressure regulators and solenoids. The pressure regulators are used to control the pressure to the clutches and the solenoids are used to activate the pressure to the park lock and to the position valve. The commanded

currents of all regulators and solenoids are monitored. The monitoring consists of several monitoring strategies, transmission blocking, wrong driving direction, gear engagement of reverse gear while driving forward, unwanted engaging or disengaging of the park lock.

WHEN MONITORED

No limp home mode active.

No position valve monitoring active.

Driving position must be in Drive or Reverse.

SET CONDITION

In the Drive position, a failure is detected if a pressure regulator combination for reverse gear is detected (clutches B, D, and F activated). In the Reverse position, a failure is detected if a pressure regulator combination different from reverse gear is detected (clutches B, D, and F activated).

P1DCF-00-TCM MONITORING PROCESSOR PERFORMANCE UNALLOWED PARK ENGAGEMENT DO TO ABS FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The monitoring of the pressure regulator and solenoid logic is used to detect a failure in the activation of the pressure regulators and solenoids. The pressure regulators are used to control the pressure to the clutches and the solenoids are used to activate the pressure to the park lock and to the position valve. The commanded currents of all regulators and solenoids are monitored. The monitoring consists of several monitoring strategies, transmission blocking, wrong driving direction, gear engagement of reverse gear while driving forward,

unwanted engaging or disengaging of the park lock.

WHEN MONITORED

No limp home mode active.

No position valve monitoring active.

Vehicle speed signal is not valid.

SET CONDITION

A failure is detected if the solenoid valve for the park lock is deactivated for greater than a calibrated amount of time.

POSSIBLE CAUSES

Possible Causes
ANTI-LOCK BRAKE SYSTEM (ABS) ERROR TCM - INTERNAL ERROR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK IF ABS DTCS ARE PRESENT**
    1.
    2. With the scan tool, read ABS DTCs.

       Are any ABS DTCs set?

       Yes

       - Perform the appropriate diagnostic procedure. Refer to **DIAGNOSTIC CODE INDEX** .

   - Repair as necessary.
   - Perform the Transmission Verification Test. Refer to **STANDARD PROCEDURE** .

   No

   - Test complete.

P1DDC-00-TCM MONITORING PROCESSOR PERFORMANCE UNALLOWED REVERSE ENGAGEMENT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The monitoring of the pressure regulator and solenoid logic is used to detect a failure in the activation of the pressure regulators and solenoids. The pressure regulators are used to control the pressure to the clutches and the solenoids are used to activate the pressure to the park lock and to the position valve. The commanded

currents of all regulators and solenoids are monitored. The monitoring consists of several monitoring strategies, transmission blocking, wrong driving direction, gear engagement of reverse gear while driving forward, unwanted engaging or disengaging of the park lock.

WHEN MONITORED

No limp home mode active.

No position valve monitoring active.

No failure in vehicle speed signal.

Vehicle speed above calibrated threshold.

Power flow in forward direction.

SET CONDITION

A failure is detected if a pressure regulator combination for reverse gear is detected (clutches B, D and F activated).

POSSIBLE CAUSES

Possible Causes
SPEED SENSOR DTCS SET OPERATOR ERROR - SHIFT TO PARK WHILE VEHICLE IS MOVING FORWARD

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

CHECK FOR SPEED SENSOR DTCS

1. With the scan tool, read TCM DTCs.

   Are Speed Sensor DTCs set?

   Yes

   - Repair DTCs in accordance with the Service Information. Refer to **DIAGNOSTIC CODE INDEX** .
   - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

- Verify the customer did not shift into REVERSE while vehicle was moving forward at high speed.

P1DDD-00-TCM MONITORING PERFORMANCE UNABLE TO DISENGAGE DRIVE OR REVERSE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The purpose of the diagnostic is to detect a failure in the activation of the pressure regulators and solenoids during gear disengagement or while position N or P is engaged. The pressure regulators are used to control the pressure to the clutches (B, C, D, and E). The solenoids are used to activate the pressure to the dog-clutches (A and F). The commanded currents calculated by the TCM to control the pressure regulators for the clutches and to activate the solenoids for the dog clutches are compared to the requested driving position from the shift-by-wire system.

WHEN MONITORED

Gear disengagement:

NEUTRAL or PARK requested.

Engaged position NEUTRAL or PARK:

NEUTRAL or PARK requested.

NEUTRAL or PARK engaged for greater than a calibrated amount of time.

Clutch-combination E and F is not activated for greater than a calibrated amount of time.

SET CONDITION

A failure is detected if three or more clutches including dog-clutches are activated at the same time, or clutch combination E and F is activated (based upon the calculated commanded currents) for a calibrated amount of time.

POSSIBLE CAUSES

Possible Causes
TCM - INTERNAL ERROR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK IF DTC IS CURRENT**
   1. With the scan tool, read TCM DTCs.
   2. Record the Environmental Data and any DTCs.
   3. With the scan tool, erase DTCs.
   4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
   5. With the scan tool, read TCM DTCs.

   Did the DTC reset?

   Yes

   NOTE: If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.

   - Using the schematics as a guide, check the Transmission Control Module (TCM) terminals and connectors for corrosion, damage or pushed out terminals. Pay particular attention to the power and ground circuits. If no problems are found, replace the TCM and perform programming and PROXI Configuration Alignment procedures. Refer to **MODULE, TRANSMISSION CONTROL, REMOVAL** .
   - Perform the Transmission Verification Test. Refer to **STANDARD PROCEDURE** .

   No

   - Go to 2
2. **CHECK WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. Check for any Service Bulletins that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the Transmission Verification Test. Refer to **STANDARD PROCEDURE** .

   No

- Test complete.

P1DEB-00-INCORRECT GEAR DISPLAYED DUE TO INCORRECT GEAR RATIO

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The purpose of the diagnostic is to ensure that the output of the TCM shift by wire software corresponds to the input of the TCM shift by wire software. The input to the TCM shift by wire software is the driver request, vehicle and transmission conditions.

WHEN MONITORED

Ignition on.

TCM initialization has completed.

SET CONDITION

The failure is detected if one of the following occurs:

The displayed position is not equal to the transmitted position (N or P instead of D or R).

The displayed position is not equal to the transmitted position (R instead of D or D instead of R).

The displayed position is not equal to the transmitted position (P instead of N).

POSSIBLE CAUSES

Possible Causes
INCORRECT GEAR RATIO DTCS TCM - INTERNAL ERROR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK FOR INCORRECT GEAR RATIO DTCS**
    1. With the scan tool, read TCM DTCs.

       Are any Incorrect Gear Ratio DTCs present?

       Yes

- Repair any Incorrect Gear Ratio DTCs before proceeding.
- Perform the Transmission Verification Test. Refer to **STANDARD PROCEDURE** .

No

- Go To 2

2. **CHECK IF DTC IS CURRENT**
   1. With the scan tool, read TCM DTCs.
   2. Record the Environmental Data and any DTCs.
   3. With the scan tool, erase DTCs.
   4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
   5. With the scan tool, read TCM DTCs.

   Did the DTC reset?

   Yes

   NOTE: If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.

   - Using the schematics as a guide, check the Transmission Control Module (TCM) terminals and connectors for corrosion, damage or pushed out terminals. Pay particular attention to the power and ground circuits. If no problems are found, replace the TCM and perform programming and PROXI Configuration Alignment procedures. Refer to **MODULE, TRANSMISSION CONTROL, REMOVAL** .
   - Perform the Transmission Verification Test. Refer to **STANDARD PROCEDURE** .

   No

   - Go to 3

3. **CHECK WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. Check for any Service Bulletins that may apply.

   Were there any problems found?

   Yes

- Repair as necessary.
- Perform the Transmission Verification Test. Refer to **STANDARD PROCEDURE** .

No

- Test complete.

P1DF3-00-ECU NOT INITIALIZED

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The purpose of the diagnostic is to detect a failure in the signal from the requested shift selector position (PRND position).

WHEN MONITORED

Ignition on.

SET CONDITION

The failure is detected if one of the following occurs:

A failure in the comparison check is detected.

A driver position massage failure from the on-board network is detected.

A driver position signal failure from the on-board network is detected.

POSSIBLE CAUSES

Possible Causes
(F1) IGNITION/OFF/RUN/START CONTROL OUTPUT CIRCUIT OPEN
(F1) IGNITION/OFF/RUN/START CONTROL OUTPUT CIRCUIT SHORT TO GROUND
BODY CONTROL MODULE (BCM) DTCS SET
CAN DTCS SET
TCM - INTERNAL FAILURE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK IF CAN DTCS ARE SET IN OTHER CONTROLLERS**

1. With the scan tool, read DTCs.

   Are any CAN DTCs set?

   Yes

   - Perform the appropriate diagnostic procedure.
   - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go to 2

2. **CHECK WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. Check for any Service Bulletins that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the Transmission Verification Test. Refer to **STANDARD PROCEDURE** .

   No

   - Test complete.

P1DF8-00-ACTUAL DECREASE OF ENGINE TORQUE HIGH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The purpose of the diagnostic is to monitor if the PCM executed the torque requested by the TCM. This is determined by comparing the PCM's executed torque to the original torque requested by the TCM via CAN. These torque requests only occur during shift operations.

WHEN MONITORED

Ignition on.

No failure detected in the CAN Bus monitoring.

No failure detected in the CAN torque message monitoring.

No limp in action active, that suppresses the torque requests.

SET CONDITION

The failure is detected if the absolute value of the difference between the torque requested by the TCM and the PCM's executed torque is not within a calibrated range.

POSSIBLE CAUSES

Possible Causes
POWERTRIAN CONTROL MODULE (PCM) DTCS TCM CAN BUS DTCS

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK FOR TCM CAN BUS DTCS**
    1. With the scan tool, read TCM DTCs.

       Are any TCM CAN BUS DTCs present?

       Yes

       - Refer to **DIAGNOSTIC CODE INDEX** and perform the appropriate diagnostic procedure. Perform the diagnostic procedure for DTC U0001-CAN C BUS first if the fault is present. Refer to **U0001-00-CAN C BUS**.
       - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

       No

       - Go to 2
2. **CHECK FOR PCM DTCS**
    1. With the scan tool, read PCM DTCs.

       Are any PCM DTCs present?

       Yes

- Refer to and perform the appropriate diagnostic procedure.
- Perform the Transmission Verification Test. Refer to **STANDARD PROCEDURE** .

No

- Go to 3

3. **CHECK IF DTC IS CURRENT**
   1. With the scan tool, read TCM DTCs.
   2. Record the Environmental Data and any DTCs.
   3. With the scan tool, erase DTCs.
   4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
   5. With the scan tool, read TCM DTCs.

   Did the DTC reset?

   Yes

   NOTE: If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.

   - Using the schematics as a guide, check the Transmission Control Module (TCM) terminals and connectors for corrosion, damage or pushed out terminals. Pay particular attention to the power and ground circuits. If no problems are found, replace the TCM and perform programming and PROXI Configuration Alignment procedures. Refer to **MODULE, TRANSMISSION CONTROL, REMOVAL** .
   - Perform the Transmission Verification Test. Refer to **STANDARD PROCEDURE** .

   No

   - Go to 4

4. **CHECK WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. Check for any Service Bulletins that may apply.

   Were there any problems found?

   Yes

- Repair as necessary.
- Perform the Transmission Verification Test. Refer to **STANDARD PROCEDURE** .

No

- Test complete.

P1E23-00-INCORRECT GEAR RATIO CLUTCH 6 DEFECTIVE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Transmission Control Module (TCM) monitors for conditions which lead to an unexpected transmission gear ratio (e.g. slipping clutches, hydraulic or mechanical defects, etc.). The TCM compares the actual gear ratio (i.e. the ratio of input speed to output speed) to a minimum and maximum calibrated gear ratio value. The TCM performs this comparison while driving in a fix gear, during gear engagement, and during shifting from one gear to another.

WHEN MONITORED

General Enable Conditions:

Driving position is in Drive or Reverse.

Oil temperature above a calibrated threshold.

No clutch slip control functions commanded.

No failure in input speed signal.

Input speed above a calibrated threshold.

Valid output speed signal from the output speed sensor or calculated from the wheel speed signal if output speed sensor is not available.

Valid engine speed signal from the PCM.

During Gear Shifts:

The output speed and the output speed gradient must be greater than a calibrated value.

SET CONDITION

During Gear Shifts:

A symptom is detected if the measured gear ratio exceeds the gear ratio range.

If a symptom is detected during downshifts requiring the engagement of a dog clutch or during upshifts, the diagnostic system aborts the gear shifting and the gear from which the shifting has been started is engaged. After a calibrated number of symptoms have been detected a failure is stored and the diagnostic system engages a calibrated gear

If a symptom is detected during a downshift requiring the engagement of a dog clutch, a fault code is stored indicating the associated dog clutch.

In Fixed Gears:

If the output speed is greater than a threshold then a symptom is detected if the measured gear ratio exceeds the gear ratio range for calibrated amount of time.

If the output speed is lower than this threshold, then a symptom is detected if the absolute difference between output speed multiplied by the fix gear ratio of the actual gear and input speed exceeds a threshold for a calibrated amount of time.

If a symptom is detected while driving in a fixed gear, the diagnostic system commands an up shift to the next gear. After a calibrated number of symptoms have been detected a failure is stored and the diagnostic system engages a calibrated gear. This gear is monitored as well and if a failure is detected for this gear, an alternative gear is engaged and so on. The selection of alternative gears follows a calibrated logic. The aim of this logic is to detect a damaged clutch and to finally select an alternative gear that consists of a combination of clutches in which the damaged clutch is not involved. If a further failure symptom occurs in this final alternative gear, a failure for general transmission ratio malfunction is stored.

POSSIBLE CAUSES

Possible Causes
TRANSMISSION - INTERNAL COMPONENTS

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK IF DTC IS CURRENT**
    1. With the scan tool, read TCM DTCs.
    2. Record the Environmental Data and any DTCs.
    3. With the scan tool, erase DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. With the scan tool, read TCM DTCs.

Did the DTC reset?

Yes

- Go to 2

No

- Go to 3

2. **TRANSMISSION**

   If the DTC returns, view repair.

   Repair

   - Verify proper fluid level. Refer to **FLUID AND FILTER, STANDARD PROCEDURE** .
   - Verify proper operation of the input and output speed sensors.
   - Refer to **DIAGNOSIS AND TESTING** and using the clutch application chart, inspect the clutches, valve body solenoids, and valves associated with this gear ratio error.
   - Repair or replace the Transmission in accordance with the Service Information.
   - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. Check for any Service Bulletins that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Test complete.

P215C-00-OUTPUT SHAFT SPEED WHEEL SPEED CORRELATION

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 12: Power & Ground, Temperature, Oil Pressure And Speed Sensors Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The purpose of the diagnostic is to detect rationality failures of the wheel speed signal via CAN. This diagnostic checks if the wheel speed signal is within the calculated tolerance bands.

The upper threshold of the first tolerance band is the calculated wheel speed plus a calibrated offset. The calculated wheel speed is based upon the input speed signal multiplied by the gear ratio factor. This factor

corresponds to either the target gear or current gear depending on which gear provides the greater ratio.

The lower threshold of the first tolerance band is the calculated wheel speed, minus a calibrated offset. The calculated wheel speed is based upon the input speed signal multiplied by the gear ratio factor. This factor corresponds to either the target gear or current gear depending on which gear provides the lesser ratio.

The thresholds of the second tolerance bands are calculated using the same method described above. In place of the input speed signal, the output speed signal is used for the calculation.

WHEN MONITORED

No failure detected in the input speed sensor monitoring.

No failure detected in the output speed sensor monitoring.

No CAN failure of the wheel speed signal received via CAN used for the rationality monitoring.

SET CONDITION

The failure is detected if the wheel speed signal via CAN is not within the calculated tolerance bands for the wheel speed signal for a calibrated amount of time.

POSSIBLE CAUSES

Possible Causes
CAN BUS DTC IS SET ANTI-LOCK BRAKE SYSTEM (ABS) MODULE - INTERNAL ERROR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK DTC IS CURRENT**
    1. Ignition ON, engine NOT running.
    2. With the scan tool, select View TCM DTCs.

    Is the DTC Active?

    Yes

    - Go to 2

    No

    - Go to 3

2. **U0121-LOST COMMUNICATION WITH ABS MODULE ALSO SET**
   1. With the scan tool continue reading DTCs.

      Is U0121-LOST COMMUNICATION WITH ABS MODULE set?

      Yes

      - Follow the diagnostics for U0121-Lost Communication With ABS Module. Refer to **DIAGNOSIS AND TESTING** .
      - Perform the Transmission Verification Test. Refer to **STANDARD PROCEDURE** .

      No

      NOTE: If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.

      - Using the schematics as a guide, check the Transmission Control Module (TCM) terminals and connectors for corrosion, damage or pushed out terminals. Pay particular attention to the power and ground circuits. If no problems are found, replace the TCM and perform programming and PROXI Configuration Alignment procedures. Refer to **MODULE, TRANSMISSION CONTROL, REMOVAL** .
      - Perform the Transmission Verification Test. Refer to **STANDARD PROCEDURE** .
3. **CHECK WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. Check for any Service Bulletins that may apply.

      Were there any problems found?

      Yes

      - Repair as necessary.
      - Perform the Transmission Verification Test. Refer to **STANDARD PROCEDURE** .

      No

      - Test complete.

P2761-00-TORQUE CONVERTER CLUTCH PRESSURE CONTROL SOLENOID CONTROL CIRCUIT-OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 13: Pressure Regulators & Solenoids Control Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The purpose of the diagnostic is to detect circuit failures on any of the output stages. All output stages are controlled by a current controller that can operate an output stage in two different modes:

- Current controlled mode (pressure regulators)

- Switched mode or PWM controlled (solenoids)

Pressure Regulator Monitoring: The current regulator ASIC in the TCM indicates the following circuit failures via SPI bus to the CPU:

- Short to ground
- Short to battery or open circuit

Solenoid Monitoring: The TCM measures the actual solenoid voltages and compares them to calibrated thresholds to identify the following electrical failures:

- Short to ground or open circuit
- Short to battery

WHEN MONITORED

Output stages power supply switched on.

Power supply voltage is greater than a calibrated value.

SET CONDITION

Pressure Regulator Monitoring: A failure is detected if one of the following conditions occur:

An short to ground failure is detected if the ASIC indicates a short to ground failure.

A short to battery or open circuit failure is detected if the ASIC indicates a short to battery or open circuit failure.

Solenoid Monitoring: A failure is detected if one of the following conditions occur:

An short to ground or open circuit failure is detected if the ratio between the voltage at the solenoid valve and the output stages power supply is above a calibrated threshold.

A short to battery failure is detected if the ratio between the voltage at the solenoid valve and the output stages power supply is below a calibrated threshold.

POSSIBLE CAUSES

Possible Causes
(T78) SOLENOID SUPPLY 1 CIRCUIT OPEN
(T78) SOLENOID SUPPLY 1 CIRCUIT SHORTED TO GROUND
(T792) TORQUE CONVERTER PRESSURE CONTROL SOLENOID CIRCUIT OPEN
(T792) TORQUE CONVERTER PRESSURE CONTROL SOLENOID CIRCUIT SHORTED TO GROUND

(T792) TORQUE CONVERTER PRESSURE CONTROL SOLENOID CIRCUIT SHORTED TO VOLTAGE
TORQUE CONVERTER PRESSURE CONTROL SOLENOID
TRANSMISSION CONTROL MODULE (TCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK IF THE DTC IS CURRENT**
    1. Using the scan tool, read TCM DTCs.
    2. Record the Environmental Data and any DTCs.
    3. Clear DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. Read TCM DTCs.

    Did the DTC reset?

    Yes

    - Go To 2

    No

    - Go To 9
2. **CHECK THE TORQUE CONVERTER PRESSURE CONTROL SOLENOID (7)**
    1. Turn the Ignition OFF.
    2. Disconnect the Transmission Assembly harness connector.
    3. Measure the resistance of the Torque Converter Pressure Control Solenoid (7) at the appropriate terminals in the Transmission Assembly interface connector.

    Is the resistance of the Torque Converter Pressure Control Solenoid (7) 11.0 Ohms ± 1.0 Ohms?

    Yes

    - Go To 3

    No

    - Replace the Torque Converter Pressure Control Solenoid (7) in accordance with the Service Information.

- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (T78) SOLENOID SUPPLY 1 CIRCUIT FOR AN OPEN**
   1. Disconnect the TCM harness connector.
   2. Measure the resistance of the (T78) Solenoid Supply 1 circuit between the Transmission Assembly harness connector and the TCM harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 4

      No

      - Repair the (T78) Solenoid Supply 1 circuit for an open or high resistance.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
4. **CHECK THE (T78) SOLENOID SUPPLY 1 CIRCUIT FOR A SHORT TO GROUND**
   1. Measure the resistance between ground and the (T78) Solenoid Supply 1 circuit.

      Is there continuity between ground and the (T78) Solenoid Supply 1 circuit?

      Yes

      - Repair the (T78) Solenoid Supply 1 circuit for a short to ground.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 5
5. **CHECK THE (T78) SOLENOID SUPPLY 1 CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**
   1. Measure the resistance between the (T78) Solenoid Supply 1 circuit and all other circuits in the TCM harness connector.

      Is there continuity between the (T78) Solenoid Supply 1 circuit and any other circuits in the TCM harness connector?

      Yes

      - Repair the (T78) Solenoid Supply 1 circuit for a short to another circuit.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 6.

6. **CHECK THE (T792) TORQUE CONVERTER PRESSURE CONTROL SOLENOID (7) CIRCUIT FOR AN OPEN**
   1. Measure the resistance of the (T792) Torque Converter Pressure Control Solenoid (7) circuit between the Transmission Assembly harness connector and the TCM harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 7

      No

      - Repair the (T792) Torque Converter Pressure Control Solenoid (7) circuit for an open or high resistance.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

7. **CHECK THE (T792) TORQUE CONVERTER PRESSURE CONTROL SOLENOID (7) CIRCUIT FOR A SHORT TO GROUND**
   1. Measure the resistance between ground and the (T792) Torque Converter Pressure Control Solenoid (7) circuit.

      Is there continuity between ground and the (T792) Torque Converter Pressure Control Solenoid (7) circuit?

      Yes

      - Repair the (T792) Torque Converter Pressure Control Solenoid (7) circuit for a short to ground.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 8.

8. **CHECK THE (T792) TORQUE CONVERTER PRESSURE CONTROL SOLENOID (7) CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**
   1. Measure the resistance between the (T792) Torque Converter Pressure Control Solenoid (7) circuit and all other circuits in the TCM harness connector.

      Is there continuity between the (T792) Torque Converter Pressure Control Solenoid (7) circuit and any other circuits in the TCM harness connector?

Yes

- Repair the (T792) Torque Converter Pressure Control Solenoid (7) circuit for a short to another circuit.
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

NOTE: **If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.**

- Using the schematics as a guide, check the Transmission Control Module (TCM) terminals and connectors for corrosion, damage or pushed out terminals. Pay particular attention to the power and ground circuits. If no problems are found, replace the TCM and perform programming and PROXI Configuration Alignment procedures. Refer to **MODULE, TRANSMISSION CONTROL, REMOVAL** .
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

9. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Use the Freeze Frame Data to help duplicate the conditions in which the DTC originally set. Pay particular attention to the DTC set conditions, such as, VSS, MAP, ECT, and Load.
   3. Using the schematics as a guide, visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires.
   4. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.
   5. Wiggle the wiring and connectors while checking for any possible open or shorted circuits.
   6. Check for any Service Information Tune-ups or Technical Service Bulletins that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Test Complete.

P2764-00-TORQUE CONVERTER CLUTCH PRESSURE CONTROL SOLENOID CONTROL CIRCUIT LOW

THEORY OF OPERATION

The purpose of the diagnostic is to detect circuit failures on any of the output stages. All output stages are controlled by a current controller that can operate an output stage in two different modes:

- Current controlled mode (pressure regulators)
- Switched mode or PWM controlled (solenoids)

Pressure Regulator Monitoring: The current regulator ASIC in the TCM indicates the following circuit failures via SPI bus to the CPU:

- Short to ground
- Short to battery or open circuit

Solenoid Monitoring: The TCM measures the actual solenoid voltages and compares them to calibrated thresholds to identify the following electrical failures:

- Short to ground or open circuit
- Short to battery

WHEN MONITORED

Output stages power supply switched on.

Power supply voltage is greater than a calibrated value.

SET CONDITION

Pressure Regulator Monitoring: A failure is detected if one of the following conditions occur:

An short to ground failure is detected if the ASIC indicates a short to ground failure.

A short to battery or open circuit failure is detected if the ASIC indicates a short to battery or open circuit failure.

Solenoid Monitoring: A failure is detected if one of the following conditions occur:

An short to ground or open circuit failure is detected if the ratio between the voltage at the solenoid valve and the output stages power supply is above a calibrated threshold.

A short to battery failure is detected if the ratio between the voltage at the solenoid valve and the output stages power supply is below a calibrated threshold.

POSSIBLE CAUSES

Possible Causes
(T78) SOLENOID SUPPLY 1 CIRCUIT OPEN (T78) SOLENOID SUPPLY 1 CIRCUIT SHORTED TO GROUND (T792) TORQUE CONVERTER PRESSURE CONTROL SOLENOID CIRCUIT OPEN (T792) TORQUE CONVERTER PRESSURE CONTROL SOLENOID CIRCUIT SHORTED TO

GROUND
(T792) TORQUE CONVERTER PRESSURE CONTROL SOLENOID CIRCUIT SHORTED TO VOLTAGE
TORQUE CONVERTER PRESSURE CONTROL SOLENOID
TRANSMISSION CONTROL MODULE (TCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK IF THE DTC IS CURRENT**
    1. Using the scan tool, read TCM DTCs.
    2. Record the Environmental Data and any DTCs.
    3. Clear DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. Read TCM DTCs.

    Did the DTC reset?

    Yes

    - Go To 2

    No

    - Go To 9
2. **CHECK THE TORQUE CONVERTER PRESSURE CONTROL SOLENOID (7)**
    1. Turn the Ignition OFF.
    2. Disconnect the Transmission Assembly harness connector.
    3. Measure the resistance of the Torque Converter Pressure Control Solenoid (7) at the appropriate terminals in the Transmission Assembly interface connector.

    Is the resistance of the Torque Converter Pressure Control Solenoid (7) 11.0 Ohms ± 1.0 Ohms?

    Yes

    - Go To 3

    No

    - Replace the Torque Converter Pressure Control Solenoid (7) in accordance with the Service Information.

- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (T78) SOLENOID SUPPLY 1 CIRCUIT FOR AN OPEN**
   1. Disconnect the TCM harness connector.
   2. Measure the resistance of the (T78) Solenoid Supply 1 circuit between the Transmission Assembly harness connector and the TCM harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 4

      No

      - Repair the (T78) Solenoid Supply 1 circuit for an open or high resistance.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
4. **CHECK THE (T78) SOLENOID SUPPLY 1 CIRCUIT FOR A SHORT TO GROUND**
   1. Measure the resistance between ground and the (T78) Solenoid Supply 1 circuit.

      Is there continuity between ground and the (T78) Solenoid Supply 1 circuit?

      Yes

      - Repair the (T78) Solenoid Supply 1 circuit for a short to ground.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 5
5. **CHECK THE (T78) SOLENOID SUPPLY 1 CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**
   1. Measure the resistance between the (T78) Solenoid Supply 1 circuit and all other circuits in the TCM harness connector.

      Is there continuity between the (T78) Solenoid Supply 1 circuit and any other circuits in the TCM harness connector?

      Yes

      - Repair the (T78) Solenoid Supply 1 circuit for a short to another circuit.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 6.

6. **CHECK THE (T792) TORQUE CONVERTER PRESSURE CONTROL SOLENOID (7) CIRCUIT FOR AN OPEN**
   1. Measure the resistance of the (T792) Torque Converter Pressure Control Solenoid (7) circuit between the Transmission Assembly harness connector and the TCM harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 7

      No

      - Repair the (T792) Torque Converter Pressure Control Solenoid (7) circuit for an open or high resistance.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

7. **CHECK THE (T792) TORQUE CONVERTER PRESSURE CONTROL SOLENOID (7) CIRCUIT FOR A SHORT TO GROUND**
   1. Measure the resistance between ground and the (T792) Torque Converter Pressure Control Solenoid (7) circuit.

      Is there continuity between ground and the (T792) Torque Converter Pressure Control Solenoid (7) circuit?

      Yes

      - Repair the (T792) Torque Converter Pressure Control Solenoid (7) circuit for a short to ground.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 8.

8. **CHECK THE (T792) TORQUE CONVERTER PRESSURE CONTROL SOLENOID (7) CIRCUIT FOR A SHORT TO ANOTHER CIRCUIT**
   1. Measure the resistance between the (T792) Torque Converter Pressure Control Solenoid (7) circuit and all other circuits in the TCM harness connector.

      Is there continuity between the (T792) Torque Converter Pressure Control Solenoid (7) circuit and any other circuits in the TCM harness connector?

Yes

- Repair the (T792) Torque Converter Pressure Control Solenoid (7) circuit for a short to another circuit.
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

NOTE: **If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.**

- Using the schematics as a guide, check the Transmission Control Module (TCM) terminals and connectors for corrosion, damage or pushed out terminals. Pay particular attention to the power and ground circuits. If no problems are found, replace the TCM and perform programming and PROXI Configuration Alignment procedures. Refer to **MODULE, TRANSMISSION CONTROL, REMOVAL** .
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

9. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Use the Freeze Frame Data to help duplicate the conditions in which the DTC originally set. Pay particular attention to the DTC set conditions, such as, VSS, MAP, ECT, and Load.
   3. Using the schematics as a guide, visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires.
   4. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.
   5. Wiggle the wiring and connectors while checking for any possible open or shorted circuits.
   6. Check for any Service Information Tune-ups or Technical Service Bulletins that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Test Complete.

P2784-00-INPUT SPEED SENSOR 1-2 CORRELATION

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The purpose of the diagnostic is to detect computational failures of the TCM which are related to the speed signal monitoring.

WHEN MONITORED

Ignition is ON.

SET CONDITION

The failure is detected if the speed sensor computations in the TCM are not valid

POSSIBLE CAUSES

Possible Causes
INTERNAL TRANSMISSION TRANSMISSION CONTROL MODULE (TCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK FOR SPEED SENSOR OR SENSOR SUPPLY VOLTAGE DTCS**
    1. With the scan tool, check for other transmission DTCs.

       Are any Speed Sensor or Sensor Supply Voltage DTCs present?

       Yes

       - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

       No

       - Go To 2
2. **CHECK IF DTC IS CURRENT**
    1. With the scan tool, read TCM DTCs.
    2. Record the Environmental Data and any DTCs.
    3. With the scan tool, erase DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions

above, operate the vehicle in the conditions that set the DTC.

5. With the scan tool, read TCM DTCs.

   Did the DTC reset?

   Yes

   - Go to 3.

   No

   - Go to 4.

3. **INTERNAL TRANSMISSION**
   1. Turn the Ignition OFF.
   2. Remove the Transmission Oil Pan and inspect for debris, a plugged Transmission Oil Filter, or any sign of an internal transmission problem.

      Is there any debris, plugged Transmission Oil Filter, or any sign of an internal transmission problem?

      Yes

      - Repair as necessary. Refer to **REMOVAL** .
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      NOTE: If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.

      - Using the schematics as a guide, check the Transmission Control Module (TCM) terminals and connectors for corrosion, damage or pushed out terminals. Pay particular attention to the power and ground circuits. If no problems are found, replace the TCM and perform programming and PROXI Configuration Alignment procedures. Refer to **MODULE, TRANSMISSION CONTROL, REMOVAL** .
      - Perform the Transmission Verification Test. Refer to **STANDARD PROCEDURE** .

4. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wiring and connectors while checking for any possible open or shorted circuits.

4. Check for any Service Information Tune-ups or Technical Service Bulletins that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Test Complete.

U0401-IMPLAUSIBLE DATA RECEIVED FROM ECM/PCM

For a complete wiring diagram **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The purpose of the diagnostic is to monitor the CAN bus, the transmitted messages on the CAN bus and the validity of the CAN signals. Several control units are connected to the CAN bus which send their messages cyclically in a defined time window. The messages contain multiple signals representing vehicle information.

CAN Bus Monitoring: To distinguish general problems with the CAN bus (e.g. electrical problems) from problems with certain messages or signals, the general state of the CAN bus is monitored.

CAN Message Monitoring: All messages received and used by the TCU are monitored for timeout and validity of the DLC (Data Length Code) information in the message header. If available, the message is also monitored for the validity of a checksum and for the correct behavior of an alive-counter that the sending control unit is expected to increment on each transmittal.

CAN Signal Monitoring: If the sending control unit does not have valid information to send, it may send a defined failure value indicating an invalid signal. Incoming signals with a defined failure value are monitored for signal validity.

WHEN MONITORED

Continuously with the ignition on and voltage within a valid range.

No failure in CAN BUS monitoring.

No failure in CAN BUS or message monitoring.

SET CONDITION

When the TCM detects an incorrect CAN ID from the Powertrain Control Module (PCM).

POSSIBLE CAUSES

Possible Causes
BODY CONTROL MODULE (BCM) CAN BUS DTCS PRESENT

POWERTRAIN CONTROL MODULE (PCM) DTCS PRESENT
TCM - INTERNAL ERROR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the Ignition ON.
    2. With the scan tool, record and erase the DTCs.
    3. Cycle the ignition switch from OFF to ON.
    4. With the scan tool, read the DTCs.

    Is the DTC active at this time?

    Yes

    - Go To 2

    No

    - Go To 4
2. **CHECK IF BODY CONTROL MODULE (BCM) CAN BUS DTCS ARE PRESENT**
    1. With the scan tool, read the BCM DTCs.

    Are there any BCM CAN BUS DTCs present?

    Yes

    - Perform the appropriate diagnostic procedure. Refer to **DIAGNOSIS AND TESTING** .

    No

    - Go To 3
3. **CHECK IF POWERTRAIN CONTROL MODULE (PCM) DTCS ARE PRESENT**
    1. With the scan tool, read PCM DTCs.

    Are there any PCM DTCs present?

    Yes

    - Perform the appropriate diagnostic procedure. Refer to .

No

NOTE: If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.

- Using the schematics as a guide, check the Transmission Control Module (TCM) terminals and connectors for corrosion, damage or pushed out terminals. Pay particular attention to the power and ground circuits. If no problems are found, replace the TCM and perform programming and PROXI Configuration Alignment procedures. Refer to **MODULE, TRANSMISSION CONTROL, REMOVAL** .
- Perform the Transmission Verification Test. Refer to **STANDARD PROCEDURE** .

4. **INTERMITTENT WIRING AND CONNECTORS**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
   2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
   3. Look for the data to change or for the DTC to reset during the wiggle test.
   4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
   5. Look for the data to change other than as expected or for the DTC to reset.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the Transmission Verification Test. Refer to **STANDARD PROCEDURE** .

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time.

U0403-IMPLAUSIBLE DATA RECEIVED FROM T-CASE

For a complete wiring diagram **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The purpose of the diagnostic is to monitor the CAN bus, the transmitted messages on the CAN bus and the validity of the CAN signals. Several control units are connected to the CAN bus which send their messages cyclically in a defined time window. The messages contain multiple signals representing vehicle information.

CAN Bus Monitoring: To distinguish general problems with the CAN bus (e.g. electrical problems) from problems with certain messages or signals, the general state of the CAN bus is monitored.

CAN Message Monitoring: All messages received and used by the TCU are monitored for timeout and validity of the DLC (Data Length Code) information in the message header. If available, the message is also monitored for the validity of a checksum and for the correct behavior of an alive-counter that the sending control unit is expected to increment on each transmittal.

CAN Signal Monitoring: If the sending control unit does not have valid information to send, it may send a defined failure value indicating an invalid signal. Incoming signals with a defined failure value are monitored for signal validity.

WHEN MONITORED

Continuously with the ignition on, one valid CAN ID received at least once, and no U0002-CAN BUS Off Performance DTC present.

SET CONDITION

When the TCM detects an incorrect CAN ID from the Drivetrain Control Module (DTCM).

POSSIBLE CAUSES

Possible Causes
BODY CONTROL MODULE (BCM) CAN BUS DTCS PRESENT
DRIVETRAIN CONTROL MODULE (DTCM) DTCS PRESENT
POWERTRAIN CONTROL MODULE (PCM) - INTERNAL ERROR
TCM - INTERNAL ERROR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK FOR BCM CAN BUS DTCS**
    1. With the scan tool, read BCM DTCs.

       Are any BCM CAN BUS DTCs present?

       Yes

       - Refer to **DIAGNOSTIC CODE INDEX** and perform the appropriate diagnostic procedure. Perform the diagnostic procedure for DTC U0001-CAN C BUS first if the fault is present. Refer to **U0001-00-CAN C BUS**.
       - Perform the Transmission Verification Test. Refer to **STANDARD PROCEDURE** .

No

- Go To 2

2. **DRIVETRAIN CONTROL MODULE (DTCM) DTCS PRESENT**
   1. With the scan tool, read Drivetrain Control Module (DTCM) DTCs.

      Are any DTCM DTCs present?

      Yes

      - Refer to **DIAGNOSTIC CODE INDEX** and perform the appropriate diagnostic procedure.

      No

      NOTE: If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.

      - Using the schematics as a guide, check the Transmission Control Module (TCM) terminals and connectors for corrosion, damage or pushed out terminals. Pay particular attention to the power and ground circuits. If no problems are found, replace the TCM and perform programming and PROXI Configuration Alignment procedures. Refer to **MODULE, TRANSMISSION CONTROL, REMOVAL** .
      - Perform the Transmission Verification Test. Refer to **STANDARD PROCEDURE** .

U0404-IMPLAUSIBLE DATA RECEIVED FROM ESM

For a complete wiring diagram **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The messages sent on a dedicated CAN BUS and are distinguished by an identifier (ID). Each CAN ID is defined to contain a certain number of bytes. The Transmission Control Module (TCM) verifies that it has received the proper number of bytes for each ID.

WHEN MONITORED

Continuously with the ignition on and one valid CAN ID received.

SET CONDITION

When the TCM detects an incorrect CAN ID from the Electronic Shift Module (ESM).

POSSIBLE CAUSES

Possible Causes
ELECTRONIC SHIFT MODULE (ESM) DTCS PRESENT TCM - INTERNAL ERROR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

CHECK FOR ESM CAN BUS DTCS

1. With the scan tool, read ESM DTCs.

   Are any ESM CAN BUS DTCs present?

   Yes

   - Refer to **DIAGNOSTIC CODE INDEX** and perform the appropriate diagnostic procedure.
   - Perform the Transmission Verification Test. Refer to **STANDARD PROCEDURE** .

   No

   NOTE: If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.

   - Using the schematics as a guide, check the Transmission Control Module (TCM) terminals and connectors for corrosion, damage or pushed out terminals. Pay particular attention to the power and ground circuits. If no problems are found, replace the TCM and perform programming and PROXI Configuration Alignment procedures. Refer to **MODULE, TRANSMISSION CONTROL, REMOVAL** .
   - Perform the Transmission Verification Test. Refer to **STANDARD PROCEDURE** .

U0415-IMPLAUSIBLE DATA RECEIVED FROM ABS

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The purpose of the diagnostic is to monitor the CAN bus, the transmitted messages on the CAN bus and the validity of the CAN signals. Several control units are connected to the CAN bus which send their messages cyclically in a defined time window. The messages contain multiple signals representing vehicle information.

CAN Bus Monitoring: To distinguish general problems with the CAN bus (e.g. electrical problems) from problems with certain messages or signals, the general state of the CAN bus is monitored.

CAN Message Monitoring: All messages received and used by the TCU are monitored for timeout and validity of the DLC (Data Length Code) information in the message header. If available, the message is also monitored for the validity of a checksum and for the correct behavior of an alive-counter that the sending control unit is expected to increment on each transmittal.

CAN Signal Monitoring: If the sending control unit does not have valid information to send, it may send a defined failure value indicating an invalid signal. Incoming signals with a defined failure value are monitored for signal validity.

WHEN MONITORED

Continuously with the ignition on, one valid CAN ID received at least once, and no U0002-CAN BUS Off Performance DTC present.

SET CONDITION

When the TCM detects an incorrect CAN ID from the Anti-Lock Brake Module (ABS).

POSSIBLE CAUSES

Possible Causes
BCM CAN BUS DTCS PRESENT
ABS DTCS PRESENT
TCM - INTERNAL ERROR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK FOR BCM CAN BUS DTCS**
    1. With the scan tool, read BCM DTCs.

       Are any BCM CAN BUS DTCs present?

       Yes

       - Refer to **DIAGNOSTIC CODE INDEX** and perform the appropriate diagnostic procedure. Perform the diagnostic procedure for DTC U0001-CAN C BUS first if the fault is present. Refer to **U0001-00-CAN C BUS**.
       - Perform the Transmission Verification Test. Refer to **STANDARD PROCEDURE** .

       No

- Go To 2

2. **ANTI-LOCK BRAKE MODULE (ABS) DTCS PRESENT**
   1. With the scan tool, read ABS DTCs.

      Are any ABS DTCs present?

      Yes

      - Refer to **DIAGNOSTIC CODE INDEX** and perform the appropriate diagnostic procedure.

      No

      NOTE: If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.

      - Using the schematics as a guide, check the Transmission Control Module (TCM) terminals and connectors for corrosion, damage or pushed out terminals. Pay particular attention to the power and ground circuits. If no problems are found, replace the TCM and perform programming and PROXI Configuration Alignment procedures. Refer to **MODULE, TRANSMISSION CONTROL, REMOVAL** .
      - Perform the Transmission Verification Test. Refer to **STANDARD PROCEDURE** .

U0420-INVALID DATA RECEIVED FROM POWER STEERING CONTROL MODULE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The purpose of the diagnostic is to monitor the CAN bus, the transmitted messages on the CAN bus and the validity of the CAN signals. Several control units are connected to the CAN bus which send their messages cyclically in a defined time window. The messages contain multiple signals representing vehicle information.

CAN Bus Monitoring: To distinguish general problems with the CAN bus (e.g. electrical problems) from problems with certain messages or signals, the general state of the CAN bus is monitored.

CAN Message Monitoring: All messages received and used by the TCU are monitored for timeout and validity of the DLC (Data Length Code) information in the message header. If available, the message is also monitored for the validity of a checksum and for the correct behavior of an alive-counter that the sending control unit is expected to increment on each transmittal.

CAN Signal Monitoring: If the sending control unit does not have valid information to send, it may send a defined failure value indicating an invalid signal. Incoming signals with a defined failure value are monitored

for signal validity.

WHEN MONITORED

Ignition Switch is ON.

SET CONDITION

Module did not receive a valid CAN message from the Electronic Power Steering (EPS) Module.

POSSIBLE CAUSES

Possible Causes
OTHER RELATED BODY CONTROL MODULE (BCM) DTCS ARE SET
BATTERY HAS BEEN DISCONNECTED OR BATTERY VOLTAGE IS TOO LOW
ELECTRONIC POWER STEERING (EPS) MODULE
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

1. **ACTIVE ABS OR EPS DTCS**

   NOTE: If this fault was present along with ABS or EPS DTC C0054-54, a battery disconnect may have caused this fault to set. Perform the EPS Sensor learn routine.

   NOTE: Diagnose all CAN B and C communication DTCs before continuing.

   1. Ignition on, engine not running.
   2. With a scan tool, view DTCs.

      Was the DTC C0054-54 present along with this fault?

      Yes

      - Go To 2

      No

      - Go To 3
2. **INITIALIZE EPS MODULE**
   1. With the scan tool, under "Miscellaneous Functions" run the EPS Learn routine.
   2. Cycle the ignition off to on.
   3. With the scan tool, erase the DTCs.

4. Cycle the ignition off to on.
5. Wait ten seconds.
6. With the scan tool, read the DTCs.

   Did the DTC return as active or pending?

   Yes

   - Go To 3

   No

   - Test complete.

3. **SAS COMMUNICATION RELATED DTCs IN OTHER MODULES**
   1. With the scan tool, select Network Diagnostics.

      Is there more than one module with active DTCs "Logged Against" the SAS at this time?

      Yes

      - Refer to **DIAGNOSTIC CODE INDEX** and perform the U110A-87-Lost Communication with SCM - CAN C - Missing Message diagnostic procedure.

      No

      - Using the schematics as a guide, check the Transmission Control Module (TCM) terminals and connectors for corrosion, damage or pushed out terminals. Pay particular attention to the power and ground circuits. If no problems are found, replace the TCM and perform programming procedures. Refer to **MODULE, TRANSMISSION CONTROL, REMOVAL** .
      - Perform the Transmission Verification Test. Refer to **STANDARD PROCEDURE** .

U0422-IMPLAUSIBLE DATA RECEIVED FROM BODY CONTROL MODULE

For a complete wiring diagram **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The purpose of the diagnostic is to monitor the CAN bus, the transmitted messages on the CAN bus and the validity of the CAN signals. Several control units are connected to the CAN bus which send their messages cyclically in a defined time window. The messages contain multiple signals representing vehicle information.

CAN Bus Monitoring: To distinguish general problems with the CAN bus (e.g. electrical problems) from problems with certain messages or signals, the general state of the CAN bus is monitored.

CAN Message Monitoring: All messages received and used by the TCU are monitored for timeout and validity of the DLC (Data Length Code) information in the message header. If available, the message is also monitored for the validity of a checksum and for the correct behavior of an alive-counter that the sending control unit is expected to increment on each transmittal.

CAN Signal Monitoring: If the sending control unit does not have valid information to send, it may send a defined failure value indicating an invalid signal. Incoming signals with a defined failure value are monitored for signal validity.

WHEN MONITORED

Continuously with the ignition on, one valid CAN ID received at least once, and no U0002-CAN BUS Off Performance DTC present.

SET CONDITION

When the TCM detects an incorrect CAN ID from the Body Control Module (BCM).

POSSIBLE CAUSES

Possible Causes
BODY CONTROL MODULE (BCM) CAN BUS DTCS PRESENT
POWERTRAIN CONTROL MODULE (PCM) - INTERNAL ERROR
TCM - INTERNAL ERROR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

CHECK FOR BCM CAN BUS DTCS

1. With the scan tool, read BCM DTCs.

   Are any BCM CAN BUS DTCs present?

   Yes

   - Refer to **DIAGNOSTIC CODE INDEX** and perform the appropriate diagnostic procedure. Perform the diagnostic procedure for DTC U0001-CAN C BUS first if the fault is present. Refer to **U0001-00-CAN C BUS**.
   - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

NOTE: If this Electronic Control Unit (ECU) is being replaced with a new unit, a

diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.

- Using the schematics as a guide, check the Transmission Control Module (TCM) terminals and connectors for corrosion, damage or pushed out terminals. Pay particular attention to the power and ground circuits. If no problems are found, replace the TCM and perform programming and PROXI Configuration Alignment procedures. Refer to **MODULE, TRANSMISSION CONTROL, REMOVAL** .
- Perform the Transmission Verification Test. Refer to **STANDARD PROCEDURE** .

U0429-IMPLAUSIBLE DATA RECEIVED FROM SCM

For a complete wiring diagram **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The purpose of the diagnostic is to monitor the CAN bus, the transmitted messages on the CAN bus and the validity of the CAN signals. Several control units are connected to the CAN bus which send their messages cyclically in a defined time window. The messages contain multiple signals representing vehicle information.

CAN Bus Monitoring: To distinguish general problems with the CAN bus (e.g. electrical problems) from problems with certain messages or signals, the general state of the CAN bus is monitored.

CAN Message Monitoring: All messages received and used by the TCU are monitored for timeout and validity of the DLC (Data Length Code) information in the message header. If available, the message is also monitored for the validity of a checksum and for the correct behavior of an alive-counter that the sending control unit is expected to increment on each transmittal.

CAN Signal Monitoring: If the sending control unit does not have valid information to send, it may send a defined failure value indicating an invalid signal. Incoming signals with a defined failure value are monitored for signal validity.

WHEN MONITORED

Continuously with the ignition on, one valid CAN ID received at least once, and no U0002-CAN BUS Off Performance DTC present.

SET CONDITION

When the TCM detects an incorrect CAN ID from the Steering Control Module (SCM).

POSSIBLE CAUSES

Possible Causes

STEERING CONTROL MODULE (SCM) DTCS
BODY CONTROL MODULE (BCM) CAN BUS DTCS
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE CAN BUS DTCS
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE
TCM - INTERNAL ERROR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK FOR BCM CAN BUS DTCS**
   1. With the scan tool, read BCM DTCs.

      Are any BCM CAN BUS DTCs present?

      Yes

      - Refer to **DIAGNOSTIC CODE INDEX** and perform the appropriate diagnostic procedure. Perform the diagnostic procedure for DTC U0001-CAN C BUS first if the fault is present. Refer to **U0001-00-CAN C BUS**.
      - Perform the Transmission Verification Test. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 2
2. **CHECK IF STEERING CONTROL MODULE (SCM) DTCS ARE PRESENT**
   1. With the scan tool, read SCM DTCs.

      Are any SCM DTCs present?

      Yes

      - Refer to **DIAGNOSTIC CODE INDEX** and perform the appropriate diagnostic procedure.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      NOTE: **If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.**

- Using the schematics as a guide, check the Transmission Control Module (TCM) terminals and connectors for corrosion, damage or pushed out terminals. Pay particular attention to the power and ground circuits. If no problems are found, replace the TCM and perform programming and PROXI Configuration Alignment procedures. Refer to **MODULE, TRANSMISSION CONTROL, REMOVAL** .
- Perform the Transmission Verification Test. Refer to **STANDARD PROCEDURE** .

U11E3-00-TCM LOST COMMUNICATION WITH ESM ON DPT CAN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The purpose of the diagnostic is to monitor the CAN bus, the transmitted messages on the CAN bus and the validity of the CAN signals. Several control units are connected to the CAN bus which send their messages cyclically in a defined time window. The messages contain multiple signals representing vehicle information.

CAN Bus Monitoring: To distinguish general problems with the CAN bus (e.g. electrical problems) from problems with certain messages or signals, the general state of the CAN bus is monitored.

CAN Message Monitoring: All messages received and used by the TCU are monitored for timeout and validity of the DLC (Data Length Code) information in the message header. If available, the message is also monitored for the validity of a checksum and for the correct behavior of an alive-counter that the sending control unit is expected to increment on each transmittal.

CAN Signal Monitoring: If the sending control unit does not have valid information to send, it may send a defined failure value indicating an invalid signal. Incoming signals with a defined failure value are monitored for signal validity.

WHEN MONITORED

With the ignition on for at least five seconds.

SET CONDITION

Bus messages not received from the Electronic Shift Module (ESM) for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
ELECTRONIC SHIFT MODULE (ESM) POWERS AND GROUNDS
BOTH CAN C BUS CIRCUITS OPEN
ELECTRONIC SHIFT MODULE (ESM)
TRANSMISSION CONTROL MODULE (TCM)

DIAGNOSTIC TEST

VERIFY DTC IS ACTIVE

1. Turn the Ignition on.
2. With the scan tool, read active DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM ESM (ELECTRONIC SHIFT MODULE) diagnostic procedure.

   No

   - Refer to **DIAGNOSIS AND TESTING** and perform the STORED LOST COMMUNICATION DTCS diagnostic procedure.

U1400-IMPLAUSIBLE TPS SIGNAL RECEIVED

For a complete wiring diagram **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The purpose of the diagnostic is to monitor the CAN bus, the transmitted messages on the CAN bus and the validity of the CAN signals. Several control units are connected to the CAN bus which send their messages cyclically in a defined time window. The messages contain multiple signals representing vehicle information.

CAN Bus Monitoring: To distinguish general problems with the CAN bus (e.g. electrical problems) from problems with certain messages or signals, the general state of the CAN bus is monitored.

CAN Message Monitoring: All messages received and used by the TCU are monitored for timeout and validity of the DLC (Data Length Code) information in the message header. If available, the message is also monitored for the validity of a checksum and for the correct behavior of an alive-counter that the sending control unit is expected to increment on each transmittal.

CAN Signal Monitoring: If the sending control unit does not have valid information to send, it may send a defined failure value indicating an invalid signal. Incoming signals with a defined failure value are monitored for signal validity.

WHEN MONITORED

TCM supply voltage is greater than a calibrated threshold.

Ignition Switch is ON.

No failure in CAN bus or CAN massage monitoring.

SET CONDITION

The PCM reports via CAN message that the Throttle Position Sensor (TPS) signal is not available or a TPS signal failure has been detected.

POSSIBLE CAUSES

Possible Causes
BODY CONTROL MODULE (BCM) CAN BUS DTCS
POWERTRAIN CONTROL MODULE (PCM) DTCS
TCM - INTERNAL ERROR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the Ignition ON.
    2. With the scan tool, record and erase the DTCs.
    3. Cycle the ignition switch from OFF to ON.
    4. With the scan tool, read the DTCs.

    Is the DTC active at this time?

    Yes

    - Go To 2

    No

    - Go To 4
2. **CHECK IF BODY CONTROL MODULE (BCM) CAN BUS DTCS ARE PRESENT**
    1. With the scan tool, read the BCM DTCs.

    Are there any BCM CAN BUS DTCs present?

    Yes

    - Perform the appropriate diagnostic procedure. Refer to **DIAGNOSTIC CODE INDEX** .

    No

    - Go To 3

3. **CHECK IF POWERTRAIN CONTROL MODULE (PCM) DTCS ARE PRESENT**
   1. With the scan tool, read PCM DTCs.

      Are there any PCM DTCs present?

      Yes

      - Perform the appropriate diagnostic procedure. Refer to the **DTC INDEX** article .

      No

      NOTE: If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.

      - Using the schematics as a guide, check the Transmission Control Module (TCM) terminals and connectors for corrosion, damage or pushed out terminals. Pay particular attention to the power and ground circuits. If no problems are found, replace the TCM and perform programming and PROXI Configuration Alignment procedures. Refer to **MODULE, TRANSMISSION CONTROL, REMOVAL** .
      - Perform the Transmission Verification Test. Refer to **STANDARD PROCEDURE** .
4. **INTERMITTENT WIRING AND CONNECTORS**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
   2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
   3. Look for the data to change or for the DTC to reset during the wiggle test.
   4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
   5. Look for the data to change other than as expected or for the DTC to reset.

      Were any problems found?

      Yes

      - Repair as necessary.
      - Perform the Transmission Verification Test. Refer to **STANDARD PROCEDURE** .

      No

      - Test complete, the condition or conditions that originally set this DTC are not present at this time.

THEORY OF OPERATION

The purpose of the diagnostic is to monitor the CAN bus, the transmitted messages on the CAN bus and the validity of the CAN signals. Several control units are connected to the CAN bus which send their messages cyclically in a defined time window. The messages contain multiple signals representing vehicle information.

CAN Bus Monitoring: To distinguish general problems with the CAN bus (e.g. electrical problems) from problems with certain messages or signals, the general state of the CAN bus is monitored.

CAN Message Monitoring: All messages received and used by the TCU are monitored for timeout and validity of the DLC (Data Length Code) information in the message header. If available, the message is also monitored for the validity of a checksum and for the correct behavior of an alive-counter that the sending control unit is expected to increment on each transmittal.

CAN Signal Monitoring: If the sending control unit does not have valid information to send, it may send a defined failure value indicating an invalid signal. Incoming signals with a defined failure value are monitored for signal validity.

U1401-IMPLAUSIBLE ENGINE SPEED SIGNAL RECEIVED

For a complete wiring diagram **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The purpose of the diagnostic is to monitor the CAN bus, the transmitted messages on the CAN bus and the validity of the CAN signals. Several control units are connected to the CAN bus which send their messages cyclically in a defined time window. The messages contain multiple signals representing vehicle information.

CAN Bus Monitoring: To distinguish general problems with the CAN bus (e.g. electrical problems) from problems with certain messages or signals, the general state of the CAN bus is monitored.

CAN Message Monitoring: All messages received and used by the TCU are monitored for timeout and validity of the DLC (Data Length Code) information in the message header. If available, the message is also monitored for the validity of a checksum and for the correct behavior of an alive-counter that the sending control unit is expected to increment on each transmittal.

CAN Signal Monitoring: If the sending control unit does not have valid information to send, it may send a defined failure value indicating an invalid signal. Incoming signals with a defined failure value are monitored for signal validity.

WHEN MONITORED

TCM supply voltage is greater than a calibrated threshold.

Ignition Switch is ON.

No failure in CAN bus or CAN massage monitoring.

SET CONDITION

The PCM reports via CAN message that the Engine Speed signal is not available or an Engine Speed signal failure has been detected.

POSSIBLE CAUSES

Possible Causes
BODY CONTROL MODULE (BCM) CAN BUS DTCS
POWERTRAIN CONTROL MODULE (PCM) DTCS
TCM - INTERNAL ERROR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the Ignition ON.
    2. With the scan tool, record and erase the DTCs.
    3. Cycle the ignition switch from OFF to ON.
    4. With the scan tool, read the DTCs.

    Is the DTC active at this time?

    Yes

    - Go To 2

    No

    - Go To 4
2. **CHECK IF BODY CONTROL MODULE (BCM) CAN BUS DTCS ARE PRESENT**
    1. With the scan tool, read the BCM DTCs.

    Are there any BCM CAN BUS DTCs present?

    Yes

    - Perform the appropriate diagnostic procedure. Refer to **DIAGNOSTIC CODE INDEX** .

    No

    - Go To 3

3. **CHECK IF POWERTRAIN CONTROL MODULE (PCM) DTCS ARE PRESENT**
   1. With the scan tool, read PCM DTCs.

      Are there any PCM DTCs present?

      Yes

      - Perform the appropriate diagnostic procedure. Refer to .

      No

      NOTE: If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.

      - Using the schematics as a guide, check the Transmission Control Module (TCM) terminals and connectors for corrosion, damage or pushed out terminals. Pay particular attention to the power and ground circuits. If no problems are found, replace the TCM and perform programming and PROXI Configuration Alignment procedures. Refer to **MODULE, TRANSMISSION CONTROL, REMOVAL** .
      - Perform the Transmission Verification Test. Refer to **STANDARD PROCEDURE** .
4. **INTERMITTENT WIRING AND CONNECTORS**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
   2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
   3. Look for the data to change or for the DTC to reset during the wiggle test.
   4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
   5. Look for the data to change other than as expected or for the DTC to reset.

      Were any problems found?

      Yes

      - Repair as necessary.
      - Perform the Transmission Verification Test. Refer to **STANDARD PROCEDURE** .

      No

      - Test complete, the condition or conditions that originally set this DTC are not present at this time.

U1408-IMPLAUSIBLE BRAKE SIGNAL RECEIVED

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The purpose of the diagnostic is to monitor the CAN bus, the transmitted messages on the CAN bus and the validity of the CAN signals. Several control units are connected to the CAN bus which send their messages cyclically in a defined time window. The messages contain multiple signals representing vehicle information.

CAN Bus Monitoring: To distinguish general problems with the CAN bus (e.g. electrical problems) from problems with certain messages or signals, the general state of the CAN bus is monitored.

CAN Message Monitoring: All messages received and used by the TCU are monitored for timeout and validity of the DLC (Data Length Code) information in the message header. If available, the message is also monitored for the validity of a checksum and for the correct behavior of an alive-counter that the sending control unit is expected to increment on each transmittal.

CAN Signal Monitoring: If the sending control unit does not have valid information to send, it may send a defined failure value indicating an invalid signal. Incoming signals with a defined failure value are monitored for signal validity.

WHEN MONITORED

TCM supply voltage is greater than a calibrated threshold.

Ignition Switch is ON.

No failure in CAN bus or CAN massage monitoring.

SET CONDITION

The ABS reports via CAN message that the Brake signal is not available or a Brake signal failure has been detected.

POSSIBLE CAUSES

Possible Causes
ANTILOCK BRAKE SYSTEM (ABS) DTCS
TCM - INTERNAL ERROR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the Ignition ON.
    2. With the scan tool, record and erase the DTCs.
    3. Cycle the ignition switch from off to on.
    4. With the scan tool, read the DTCs.

    Is the DTC active at this time?

    Yes

    - Go To 2

    No

    - Go To 3
2. **CHECK IF Antilock Brake System (ABS) DTCS ARE PRESENT**
    1. With the scan tool, read the ABS DTCs.

    Are there any ABS DTCs present?

    Yes

    - Perform the appropriate diagnostic procedure. Refer to **DIAGNOSTIC CODE INDEX** .

    No

    NOTE: **If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.**

    - Using the schematics as a guide, check the Transmission Control Module (TCM) terminals and connectors for corrosion, damage or pushed out terminals. Pay particular attention to the power and ground circuits. If no problems are found, replace the TCM and perform programming and PROXI Configuration Alignment procedures. Refer to **MODULE, TRANSMISSION CONTROL, REMOVAL** .
    - Perform the Transmission Verification Test. Refer to **STANDARD PROCEDURE** .
3. **INTERMITTENT WIRING AND CONNECTORS**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
    2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
    3. Look for the data to change or for the DTC to reset during the wiggle test.

4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
5. Look for the data to change other than as expected or for the DTC to reset.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the Transmission Verification Test. Refer to **STANDARD PROCEDURE** .

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time.

U1412-IMPLAUSIBLE VEHICLE SPEED SIGNAL RECEIVED

For a complete wiring diagram **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The purpose of the diagnostic is to monitor the CAN bus, the transmitted messages on the CAN bus and the validity of the CAN signals. Several control units are connected to the CAN bus which send their messages cyclically in a defined time window. The messages contain multiple signals representing vehicle information.

CAN Bus Monitoring: To distinguish general problems with the CAN bus (e.g. electrical problems) from problems with certain messages or signals, the general state of the CAN bus is monitored.

CAN Message Monitoring: All messages received and used by the TCU are monitored for timeout and validity of the DLC (Data Length Code) information in the message header. If available, the message is also monitored for the validity of a checksum and for the correct behavior of an alive-counter that the sending control unit is expected to increment on each transmittal.

CAN Signal Monitoring: If the sending control unit does not have valid information to send, it may send a defined failure value indicating an invalid signal. Incoming signals with a defined failure value are monitored for signal validity.

WHEN MONITORED

Battery voltage is greater than a calibrated threshold.

Ignition is on.

No failure in CAN bus or message monitoring.

SET CONDITION

The Anti-Lock Brake System (ABS) Module reports via CAN message that the Vehicle Speed signal is not available or a Vehicle Speed signal failure has been detected.

POSSIBLE CAUSES

Possible Causes
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE DTCS
BODY CONTROL MODULE (BCM) DTCS
TCM - INTERNAL ERROR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the Ignition ON.
    2. With the scan tool, record and erase the DTCs.
    3. Cycle the ignition switch from OFF to ON.
    4. With the scan tool, read the DTCs.

    Is the DTC active at this time?

    Yes

    - Go to 2

    No

    - Go to 4
2. **CHECK IF BODY CONTROL MODULE (BCM) CAN BUS DTCS ARE PRESENT**
    1. With the scan tool, read the BCM DTCs.

    Are there any BCM CAN BUS DTCs present?

    Yes

    - Perform the appropriate diagnostic procedure. Refer to **DIAGNOSTIC CODE INDEX** .

    No

    - Go To 3

3. **CHECK IF ANTILOCK BRAKE SYSTEM (ABS) MODULE DTCS ARE PRESENT**
   1. With the scan tool, read ABS DTCs.

      Are there any ABS DTCs present?

      Yes

      - Perform the appropriate diagnostic procedure. Refer to **DIAGNOSTIC CODE INDEX** .

      No

      NOTE: If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.

      - Using the schematics as a guide, check the Transmission Control Module (TCM) terminals and connectors for corrosion, damage or pushed out terminals. Pay particular attention to the power and ground circuits. If no problems are found, replace the TCM and perform programming and PROXI Configuration Alignment procedures. Refer to **MODULE, TRANSMISSION CONTROL, REMOVAL** .
      - Perform the Transmission Verification Test. Refer to **STANDARD PROCEDURE** .
4. **INTERMITTENT WIRING AND CONNECTORS**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
   2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
   3. Look for the data to change or for the DTC to reset during the wiggle test.
   4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
   5. Look for the data to change other than as expected or for the DTC to reset.

      Were any problems found?

      Yes

      - Repair as necessary.
      - Perform the Transmission Verification Test. Refer to **STANDARD PROCEDURE** .

      No

      - Test complete, the condition or conditions that originally set this DTC are not present at this time.

U1424-IMPLAUSIBLE ENGINE TORQUE SIGNAL RECEIVED

For a complete wiring diagram **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The purpose of the diagnostic is to monitor the CAN bus, the transmitted messages on the CAN bus and the validity of the CAN signals. Several control units are connected to the CAN bus which send their messages cyclically in a defined time window. The messages contain multiple signals representing vehicle information.

CAN Bus Monitoring: To distinguish general problems with the CAN bus (e.g. electrical problems) from problems with certain messages or signals, the general state of the CAN bus is monitored.

CAN Message Monitoring: All messages received and used by the TCU are monitored for timeout and validity of the DLC (Data Length Code) information in the message header. If available, the message is also monitored for the validity of a checksum and for the correct behavior of an alive-counter that the sending control unit is expected to increment on each transmittal.

CAN Signal Monitoring: If the sending control unit does not have valid information to send, it may send a defined failure value indicating an invalid signal. Incoming signals with a defined failure value are monitored for signal validity.

WHEN MONITORED

TCM supply voltage is greater than a calibrated threshold.

Ignition Switch is ON.

No failure in CAN bus or CAN massage monitoring.

SET CONDITION

The PCM reports via CAN message that the Engine Torque signal is not available or an Engine Torque signal failure has been detected.

POSSIBLE CAUSES

Possible Causes
BODY CONTROL MODULE (BCM) CAN BUS DTCS
POWERTRAIN CONTROL MODULE (PCM) DTCS
TCM - INTERNAL ERROR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the Ignition ON.
    2. With the scan tool, record and erase the DTCs.
    3. Cycle the ignition switch from OFF to ON.
    4. With the scan tool, read the DTCs.

    Is the DTC active at this time?

    Yes

    - Go To 2

    No

    - Go To 4
2. **CHECK IF BODY CONTROL MODULE (BCM) CAN BUS DTCS ARE PRESENT**
    1. With the scan tool, read the BCM DTCs.

    Are there any BCM CAN BUS DTCs present?

    Yes

    - Perform the appropriate diagnostic procedure. Refer to **DIAGNOSTIC CODE INDEX** .

    No

    - Go To 3
3. **CHECK IF POWERTRAIN CONTROL MODULE (PCM) DTCS ARE PRESENT**
    1. With the scan tool, read PCM DTCs.

    Are there any PCM DTCs present?

    Yes

    - Perform the appropriate diagnostic procedure. Refer to .

    No

    NOTE: **If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.**

- Using the schematics as a guide, check the Transmission Control Module (TCM) terminals and connectors for corrosion, damage or pushed out terminals. Pay particular attention to the power and ground circuits. If no problems are found, replace the TCM and perform programming and PROXI Configuration Alignment procedures. Refer to **MODULE, TRANSMISSION CONTROL, REMOVAL** .
- Perform the Transmission Verification Test. Refer to **STANDARD PROCEDURE** .

4. **INTERMITTENT WIRING AND CONNECTORS**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
   2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
   3. Look for the data to change or for the DTC to reset during the wiggle test.
   4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
   5. Look for the data to change other than as expected or for the DTC to reset.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the Transmission Verification Test. Refer to **STANDARD PROCEDURE** .

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time.

U1461-IMPLAUSIBLE DATA RECEIVED FROM ESM ON D-PT

For a complete wiring diagram **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The purpose of the diagnostic is to monitor the CAN bus, the transmitted messages on the CAN bus and the validity of the CAN signals. Several control units are connected to the CAN bus which send their messages cyclically in a defined time window. The messages contain multiple signals representing vehicle information.

CAN Bus Monitoring: To distinguish general problems with the CAN bus (e.g. electrical problems) from problems with certain messages or signals, the general state of the CAN bus is monitored.

CAN Message Monitoring: All messages received and used by the TCU are monitored for timeout and validity of the DLC (Data Length Code) information in the message header. If available, the message is also monitored for the validity of a checksum and for the correct behavior of an alive-counter that the sending control unit is expected to increment on each transmittal.

CAN Signal Monitoring: If the sending control unit does not have valid information to send, it may send a defined failure value indicating an invalid signal. Incoming signals with a defined failure value are monitored for signal validity.

WHEN MONITORED

TCM supply voltage is greater than a calibrated threshold.

Ignition Switch is ON.

No failure in CAN bus or CAN massage monitoring.

SET CONDITION

The Electronic Shift Module (ESM) reports via CAN message that an ESM signal is not available or an ESM signal failure has been detected.

POSSIBLE CAUSES

Possible Causes
BODY CONTROL MODULE (BCM) CAN BUS DTCS
ELECTRONIC SHIFT MODULE (ESM) DTCS
TCM - INTERNAL ERROR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the Ignition ON.
    2. With the scan tool, record and erase the DTCs.
    3. Cycle the ignition switch from OFF to ON.
    4. With the scan tool, read the DTCs.

    Is the DTC active at this time?

    Yes

    - Go To 2

    No

    - Go To 4
2. **CHECK IF BODY CONTROL MODULE (BCM) CAN BUS DTCS ARE PRESENT**

1. With the scan tool, read the BCM DTCs.

   Are there any BCM CAN BUS DTCs present?

   Yes

   - Perform the appropriate diagnostic procedure. Refer to **DIAGNOSTIC CODE INDEX** .

   No

   - Go To 3

3. **CHECK IF ELECTRONIC SHIFT MODULE (ESM) DTCS ARE PRESENT**
   1. With the scan tool, read ESM DTCs.

      Are there any ESM DTCs present?

      Yes

      - Perform the appropriate diagnostic procedure. Refer to **DIAGNOSIS AND TESTING** .

      No

      NOTE: If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.

      - Using the schematics as a guide, check the Transmission Control Module (TCM) terminals and connectors for corrosion, damage or pushed out terminals. Pay particular attention to the power and ground circuits. If no problems are found, replace the TCM and perform programming and PROXI Configuration Alignment procedures. Refer to **MODULE, TRANSMISSION CONTROL, REMOVAL** .
      - Perform the Transmission Verification Test. Refer to **STANDARD PROCEDURE** .

4. **INTERMITTENT WIRING AND CONNECTORS**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
   2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
   3. Look for the data to change or for the DTC to reset during the wiggle test.
   4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
   5. Look for the data to change other than as expected or for the DTC to reset.

      Were any problems found?

Yes

- Repair as necessary.
- Perform the Transmission Verification Test. Refer to **STANDARD PROCEDURE** .

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time.

U1467-IMPLAUSIBLE DRIVER SHIFT REQUEST SIGNAL RECEIVED ON CAN AND D-PT CAN

For a complete wiring diagram **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The purpose of the diagnostic is to monitor the CAN bus, the transmitted messages on the CAN bus and the validity of the CAN signals. Several control units are connected to the CAN bus which send their messages cyclically in a defined time window. The messages contain multiple signals representing vehicle information.

CAN Bus Monitoring: To distinguish general problems with the CAN bus (e.g. electrical problems) from problems with certain messages or signals, the general state of the CAN bus is monitored.

CAN Message Monitoring: All messages received and used by the TCU are monitored for timeout and validity of the DLC (Data Length Code) information in the message header. If available, the message is also monitored for the validity of a checksum and for the correct behavior of an alive-counter that the sending control unit is expected to increment on each transmittal.

CAN Signal Monitoring: If the sending control unit does not have valid information to send, it may send a defined failure value indicating an invalid signal. Incoming signals with a defined failure value are monitored for signal validity.

WHEN MONITORED

TCM supply voltage is greater than a calibrated threshold.

Ignition Switch is ON.

No failure in CAN bus or CAN massage monitoring.

SET CONDITION

The Electronic Shift Module (ESM) reports via CAN message that an ESM signal is not available or an ESM signal failure has been detected.

POSSIBLE CAUSES

Possible Causes

BODY CONTROL MODULE (BCM) CAN BUS DTCS
ELECTRONIC SHIFT MODULE (ESM) DTCS
TCM - INTERNAL ERROR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the Ignition ON.
    2. With the scan tool, record and erase the DTCs.
    3. Cycle the ignition switch from OFF to ON.
    4. With the scan tool, read the DTCs.

    Is the DTC active at this time?

    Yes

    - Go To 2

    No

    - Go To 4
2. **CHECK IF BODY CONTROL MODULE (BCM) CAN BUS DTCS ARE PRESENT**
    1. With the scan tool, read the BCM DTCs.

    Are there any BCM CAN BUS DTCs present?

    Yes

    - Perform the appropriate diagnostic procedure. Refer to **DIAGNOSTIC CODE INDEX** .

    No

    - Go To 3
3. **CHECK IF ELECTRONIC SHIFT MODULE (ESM) DTCS ARE PRESENT**
    1. With the scan tool, read ESM DTCs.

    Are there any ESM DTCs present?

    Yes

    - Perform the appropriate diagnostic procedure. Refer to **DIAGNOSIS AND TESTING** .

No

NOTE: If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.

- Using the schematics as a guide, check the Transmission Control Module (TCM) terminals and connectors for corrosion, damage or pushed out terminals. Pay particular attention to the power and ground circuits. If no problems are found, replace the TCM and perform programming and PROXI Configuration Alignment procedures. Refer to **MODULE, TRANSMISSION CONTROL, REMOVAL** .
- Perform the Transmission Verification Test. Refer to **STANDARD PROCEDURE** .

4. **INTERMITTENT WIRING AND CONNECTORS**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
   2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
   3. Look for the data to change or for the DTC to reset during the wiggle test.
   4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
   5. Look for the data to change other than as expected or for the DTC to reset.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the Transmission Verification Test. Refer to **STANDARD PROCEDURE** .

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time.

2014 AUTOMATIC TRANSMISSION

Transmission Control Module (TCM) - Electrical Diagnostics, 948TE - Cherokee

STANDARD PROCEDURE

PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE

For a complete wiring diagram, **refer to the appropriate Wiring Information** .

Perform the following pre-diagnostic troubleshooting procedures prior to performing any diagnostic test.

NOTE: Due to different power control configurations, the Transmission Control Relay (if equipped) may be referred to as a PCM relay.

NOTE: Incorrect fluid level, and/or poor fluid condition can be the cause of many transmission problems. Visually inspect the transmission and cooler lines for leakage and repair as necessary. Adjust the transmission fluid level according to Service Information.

Always perform diagnostics with a fully charged battery to avoid false symptoms.

1. With the scan tool, read the engine DTCs. Check and repair all engine DTCs prior to performing transmission symptom diagnostic procedures.
2. With the scan tool, read and record all transmission DTCs. Record the controller software version and variant ID (configuration or level).

   NOTE: Check for Service Information Tune-ups or Technical Service Bulletins (TSB) that may apply.

   NOTE: If the TCM detects and stores a DTC, the TCM also stores the vehicles operating conditions under which the DTC originally set. Using a scan tool this information is located under Environmental Data. Before erasing any stored DTCs, it is recommended to record all available data to assist in troubleshooting and duplicating the conditions and in which the DTC set.

3. Verify the current software level of transmission controller. Various problems are corrected by software upgrades (flash) to the transmission controller.

   NOTE: If TCM software updates are performed, all DTC information (Environmental Data) will be lost.

4. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors to all components related to the transmission and shift lever assembly. Clean and repair as necessary.

5. Most DTCs set on start up but some may only set by driving the vehicle. Note the when monitored and set conditions of the reported DTC. If variant DTCs are present, perform their respective test first.
6. Verify the axle ratio and transfer case ratio.

Did any of the above procedures repair the vehicle?

Yes

- Testing is complete.
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **TRANSMISSION VERIFICATION TEST-948TE**.

No

- Refer to the **DIAGNOSTIC CODE INDEX** and perform the appropriate diagnostic procedure.

TRANSMISSION VERIFICATION TEST-948TE

To validate the repair(s) that fixed the vehicle, perform the following steps.

1. Reconnect any disconnected components.
2. Connect the scan tool to the Data Link Connector.
3. With the scan tool, erase ABS DTCs.
4. With the scan tool, erase PCM DTCs.
5. With the scan tool, erase TCM DTCs.

CAUTION: Apply the parking brake.

6. With the scan tool, display the Transmission Temperature. Start and run the engine until the transmission temperature is above 43° C (110° F).
7. If internal transmission components were repaired or replaced check the transmission fluid and adjust if necessary. Refer to the Check Oil Level procedure. Refer to **FLUID AND FILTER, STANDARD PROCEDURE** .
8. If the Transmission Control Module (TCM), Valve Body, or Transmission without TCM was replaced, perform the Valve Body Solenoid Learn Procedure with a scan tool.
9. If internal transmission repairs were performed or the Transmission Control Module (TCM) was replaced, perform the TCM ADAPTATION procedure. Refer to **TCM ADAPTATION-948TE AND 9HP48**.
10. After performing the above procedures, perform the "ROAD TEST PROCEDURE" below.

ROAD TEST PROCEDURE

1. Road test the vehicle. Make fifteen to twenty upshifts so all gear ranges are complete.

2. Perform these shifts from a standing start to 72 Km/h (45 mph) with a constant throttle opening of 20 to 25 degrees.
3. With speeds below 40 Km/h (25 mph), make five to eight wide open throttle kick downs to 1st gear. Allow at least 5 seconds each in 2nd and 3rd gear between each kickdown.
4. With the scan tool, read DTCs.

Did any DTCs set?

Yes

- Refer to the **DTC INDEX** article and perform the appropriate diagnostic procedure.

No

- Testing is complete.

TCM PROGRAMMING PROCEDURE-948TE

TCM PROGRAMMING-948TE

PROGRAMMING THE TRANSMISSION CONTROL MODULE (TCM)

NOTE: When replacing a Transmission Control Module (TCM), the TCM must be programmed.

NOTE: Failure to properly program the TCM may result in the illumination of the Malfunction Indicator Lamp (MIL) and setting DTC(s).

NOTE: While performing the TCM programming procedure, the vehicle battery must be maintained between 10 and 16 volts. Ambient temperature must be between 0° C (32° F) 60° C (140° F). Vehicle must be in Park with brake pedal depressed.

1. Using the scan tool and Dealer Connect, download the appropriate TCM flash file to the scan tool.
2. Turn the Ignition ON, Engine not running.
3. Make sure the gear selector is in the PARK position.
4. Apply and hold the brake pedal for the duration of the programming procedure.
5. Following the menu on the scan tool, program the TCM.

NOTE: If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU.

Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body

Control Module (BCM) Miscellaneous Functions menu.

NOTE: **If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to perform the Valve Body Solenoid Learn procedure. Failure to perform the Valve Body Solenoid Learn procedure will result in reduced shift quality.**

Using a scan tool, follow the on-screen instructions to perform the Valve Body Solenoid Learn procedure.

NOTE: **If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to perform the TCM Adaptation procedure. Failure to perform the TCM Adaptation procedure will result in reduced shift quality.**

Perform the TCM ADAPTATION procedure. Refer to **TCM ADAPTATION-948TE AND 9HP48**.

6. With the scan tool, erase DTCs.
7. With the scan tool, read TCM DTCs.

Does the scan tool display any DTCs?

Yes

- Perform the appropriate diagnostic procedure(s).

No

- Test Complete
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

TCM ADAPTATION-948TE AND 9HP48

YouTube	A multimedia supplement to the instructions contained in this article is available. To view the multimedia example of the condition described go to; **http://www.youtube.com/user/Mitchell1Tips** **then type "A00641451.vid1" into the "Search Channel" box.**

The 948TE and 9HP48 Automatic Transmissions use a sophisticated shift algorithm that includes learned information so that the shift quality remains excellent even as the Transmission wears. This learned information is recorded in memory cells referred to "Adaptation Memory Cells". Each applied clutch records the amount of time it takes to fill the clutch (Fast Filling Counter/Filling Time) and the amount of pressure (Filling Counter/Filling Pressure) required to apply the clutches. The adaptation memory cells should be set to zero (0) on every new Transmission (in a new vehicle and/or when the Transmission is replaced for service) and when the Transmission Control Module (TCM) is replaced for service. In addition, the adaptation memory cells are

set to zero (0) anytime the TCM is flashed, and when the TCM adaptation memory cells are cleared using the scan tool diagnostic scan tool (Via Quick Learn/Valve Body Solenoid Learn). Until the adaptation has been learned/relearned, the Transmission shift quality may not meet the customers expectations.

NOTE: **Anytime the Valve Body assembly is replaced and/or the Transmission has been overhauled, the adaptation memory cells must be cleared using the scan tool.**

NOTE: **THE ADAPTATION LEARN PROCEDURE SHOULD NOT BE CONFUSED WITH "QUICK LEARN" SOON TO BE CALLED "VALVE BODY SOLENOID LEARN". THE VALVE BODY SOLENOID LEARN PROCEDURE WILL MATCH THE TRANSMISSION CONTROL MODULE WITH THE SOLENOIDS IN THE VALVE BODY. THIS PROCEDURE SHOULD ONLY BE PERFORMED WHEN THE VALVE BODY AND/OR THE TRANSMISSION CONTROL MODULE HAS BEEN REPLACED. DO NOT PERFORM A QUICK LEARN/VALVE BODY SOLENOID LEARN WHEN THE TRANSMISSION ASSEMBLY HAS BEEN REPLACED. QUICK LEARN/VALVE BODY SOLENOID LEARN WILL ERASE ALL FACTORY SETTINGS WHEN PERFORMED. IT ALSO WILL ERASE ALL ADAPTATION MEMORY CELLS AS WELL. DO NOT PERFORM THE QUICK LEARN/VALVE BODY SOLENOID LEARN WHEN THE ADAPTATION LEARN PROCEDURE IS ALL THAT IS REQUIRED.**

The following 948TE/9HP48 Clutch Application Chart will help in identifying the clutches that are applied in each gear. Keep in mind that shift quality is greatly affected by the timing of disengaging one clutch and applying another smoothly. If a clutch remains on too long, then harsh shifts can occur or if the clutch disengages too quickly, then poor shift quality can occur.

948TE/9HP48 Clutch Application Chart

Gear	Clutch - A (Dog Clutch)	Clutch - B	Clutch - C	Clutch - D	Clutch - E	Clutch - F (Dog Clutch)	Ratio
First	X			X		X	4.700
Second	X		X			X	2.842
Third	X	X				X	1.909
Fourth	X				X	X	1.382
Fifth	X	X			X		1.000
Sixth	X		X		X		0.808
Seventh	X			X	X		0.699
Eighth			X	X	X		0.580
Ninth		X		X	X		0.479
P/N				X		X	
Reverse		X		X		X	3.805
Default Fourth Gear					X	X	

The adaptation memory cells appear on the scan tool for every clutch except the dog clutches. Each clutch will include:

- Fast Filling Counter = the number of filling time events that has taken place
- Filling Time = +/- number of ms (milli seconds) from zero (standard set value)
- Filling Counter = the number of filling pressure events that has taken place
- Filling Pressure = +/- mb (millibar)/PSI (Pounds Per Square Inch) from zero (standard set value)

If the adaptation memory cell "counter" is zero (0), then the adaptation memory cell has not been updated. It will take a minimum of two counts to improve shift quality and with each subsequent count, shift quality will improve even more. Shift quality with continue to improve until the count reaches five, at which time improvements will be negligible.

The Adaptation Drive Learn procedure is very sensitive to transmission temperature, transmission input shaft torque, and transmission turbine RPM. The Adaptation Drive Learn procedure must be performed at the following:

- Transmission Oil Temperature between 50°C (122°F) - 110°C (230°F).
- Transmission input Shaft Torque between 24 Nm (18 ft. lbs.) - 150 Nm (110 ft. lbs.) (will be monitored on the scan tool as Engine Crankshaft Torque).
- Transmission input shaft RPM 1100 - 2500 RPM (can be monitored by monitoring Engine RPM using the tachometer on the cluster).

NOTE: The longer the above criteria are held constant, the quicker the procedure can be accomplished.

NOTE: Perform this procedure on a smooth road surface. The TCM or TCMA will abort the adaptation process if it senses rough road conditions. The road should be clear of traffic due to the start, stop, and slow vehicle speeds required during this procedure.

NOTE: The learn process may produce small, regular torque pulsations. This is normal, and indicates the learn process is working.

NOTE: The Adaptation Drive Learn procedure must be performed with an assistant so that the scan tool can be properly monitored while maintaining safe driving practices.

The B AND C CLUTCHES ADAPTATION LEARN PROCEDURE affects the following primary shifts:

- Reverse Engagement
- 1-2 Up-Shift
- 2-1 Coast Down-Shift

- 2-3 Up-Shift
- 3-2 Down-Shift
- 4-5 Up-Shift
- 5-6 Up-Shift
- 6-5 Down-Shift
- 5-4 Power on Down-Shift
- 3-2 Down-Shift
- 4-3 Coast Down-Shift

B AND C CLUTCHES ADAPTATION LEARN PROCEDURE

1. With the Scan Tool, erase DTCs.
2. Setup the scan tool to display the Transmission Oil Temperature, Engine Crankshaft Torque, Turbine (Input) Speed Sensor RPM, and Clutch 'X' - Filling Counter for each clutch.
3. Drive the vehicle until the Transmission Oil Temperature is above 50° C (122° F).
4. Accelerate the vehicle moderately to seventh (7th) gear. It will be necessary to maintain seventh gear during this process by utilizing the Electronic Range Selector (ERS).
5. Drive vehicle at constant vehicle speed between 80 - 96 kph (50 - 60 mph).
6. Maintain seventh gear, steady pedal, and constant speed continuously for approximately 10 minutes while staying within the following conditions:
    - Transmission input Shaft Torque should be between 24 Nm (18 ft. lbs.) - 150 Nm (110 ft. lbs.) (will be monitored on the scan tool as Engine Crankshaft Torque)
    - Transmission input shaft RPM should be between 1100 - 2500 RPM (can be monitored by monitoring Engine RPM using the tachometer on the cluster)
7. Using the scan tool, inspect the Clutch - B and Clutch - C Filling Counter/Fast Filling Counter status.
8. Continue the drive adaptation procedure until Clutch - B and Clutch - C Filling and Fast Filling Counters are at least 2 or greater.
9. Proceed to the "D CLUTCH ADAPTATION LEARN PROCEDURE" below.

The D CLUTCH ADAPTATION LEARN PROCEDURE affects the following primary shifts:

- 1-2 Up-Shift
- 2-1 Down-Shift
- 6-7 Up-Shift
- 7-6 Down-Shift
- Drive engagement when rolling backwards (or in cases of spline locked dog clutch A)

D CLUTCH ADAPTATION LEARN PROCEDURE

1. With the Scan Tool, erase DTCs.
2. Setup the scan tool to display the Transmission Oil Temperature, Engine Crankshaft Torque, Turbine

(Input) Speed Sensor RPM, and Clutch 'D' - Filling Counter.

3. Drive the vehicle until the Transmission Oil Temperature is above 50° C (122° F).
4. Accelerate the vehicle moderately to sixth (6th) gear. It will be necessary to maintain sixth gear during this process by utilizing Electronic Range Shifter (ERS).
5. Drive vehicle at constant vehicle speed between 64 - 80 kph (40 - 50 mph).
6. Maintain sixth gear, steady pedal, and constant speed continuously for approximately 10 minutes while staying within the following conditions:
   - Transmission input Shaft Torque should be between 24 Nm (18 ft. lbs.) - 150 Nm (110 ft. lbs.) (will be monitored on the scan tool as Engine Crankshaft Torque).
   - Transmission input shaft RPM should be between 1100 - 2500 RPM (can be monitored by monitoring Engine RPM using the tachometer on the cluster).
7. Using the scan tool, inspect the Clutch - D Filling Counter/Fast Filling Counter status.
8. Continue the drive adaptation procedure until Clutch - D Filling and Fast Filling Counter is at least 2 or greater.
9. If necessary, proceed to the "E Clutch Adaptation Learn Procedure" below.

NOTE: If the 3-4 upshift and/or the 4-3 downshift requires improvement, perform the E CLUTCH ADAPTATION LEARN PROCEDURE.

The E CLUTCH ADAPTATION LEARN PROCEDURE affects the following primary shifts:

- 3-4 Up-Shift
- 4-3 Down-Shift
- PRNDL in DRIVE Position

NOTE: This procedure will require the vehicle to be driven on a smooth road that is mostly flat that can be driven safely while maintaining a constant speed of 24-kph (15 mph) for approximately 10 miles.

NOTE: During the E CLUTCH ADAPTATION LEARN PROCEDURE, the vehicle must come to a complete stop in between each adaptation in order to learn the next adaptation. In some cases, it may be necessary to shift the transmission into Park, then into Reverse, then back to Park before proceeding to the next adaptation learn cycle.

E CLUTCH ADAPTATION LEARN PROCEDURE

1. With the Scan Tool, erase DTCs.
2. Drive the vehicle until the Transmission Oil Temperature is above 50° C (122° F).
3. Accelerate the vehicle moderately to third (3rd) gear. It will be necessary to maintain 3rd gear during this process by utilizing Electronic Range Shifter (ERS).
4. Drive vehicle at constant vehicle speed at 24 kph (15 mph).

5. Maintain 3rd gear, steady pedal, and constant vehicle speed continuously for a minimum of 1 minute, making sure engine speed is less than 2, 000 RPM while driving 24 kph (15 mph). This will require adjusting the gas pedal position to keep the engine speed below 2, 000 RPM.
6. After 1 minute of driving at 15 mph, bring vehicle to a stop, then proceed to 24 kph (15 mph) as described above and repeat 5 times.
7. Stop the vehicle and shift to PARK. Using the scan tool, inspect Clutch E Filling Counter/Fast Filling Counter status.
8. Continue this procedure until Clutch - E Filling and Fast Filling Counters are at least 2 or greater.

DIAGNOSTIC CODE INDEX

DIAGNOSTIC CODE INDEX

DTC	Description
C0020-01	ABS PUMP MOTOR CONTROL - GENERAL ELECTRICAL FAILURE
C0020-16	ABS PUMP MOTOR CONTROL - CIRCUIT VOLTAGE BELOW THRESHOLD
C0020-35	ABS PUMP MOTOR CONTROL - SIGNAL HIGH TIME>MAXIMUM
C0021-02	BRAKE BOOSTER - GENERAL SIGNAL FAILURE
C0031-1D	LEFT FRONT WHEEL SPEED SENSOR - CIRCUIT CURRENT OUT OF RANGE
C0031-2F	LEFT FRONT WHEEL SPEED SENSOR - SIGNAL ERRATIC
C0031-4A	LEFT FRONT WHEEL SPEED SENSOR - INCORRECT COMPONENT INSTALLED
C0031-62	LEFT FRONT WHEEL SPEED SENSOR - SIGNAL COMPARE FAILURE
C0034-1D	RIGHT FRONT WHEEL SPEED SENSOR - CIRCUIT CURRENT OUT OF RANGE
C0034-2F	RIGHT FRONT WHEEL SPEED SENSOR - SIGNAL ERRATIC
C0034-4A	RIGHT FRONT WHEEL SPEED SENSOR - INCORRECT COMPONENT INSTALLED
C0034-62	RIGHT FRONT WHEEL SPEED SENSOR - SIGNAL COMPARE FAILURE
C0036-02	LEFT REAR TONE WHEEL - GENERAL SIGNAL FAILURE
C0037-1D	LEFT REAR WHEEL SPEED SENSOR - CIRCUIT CURRENT OUT OF RANGE
C0037-2F	LEFT REAR WHEEL SPEED SENSOR - SIGNAL ERRATIC
C0037-4A	LEFT REAR WHEEL SPEED SENSOR - INCORRECT COMPONENT INSTALLED
C0037-62	LEFT REAR WHEEL SPEED SENSOR - SIGNAL COMPARE FAILURE
C0039-02	RIGHT REAR TONE WHEEL - GENERAL SIGNAL FAILURE
C003A-1D	RIGHT REAR WHEEL SPEED SENSOR - CIRCUIT CURRENT OUT OF RANGE
C003A-2F	RIGHT REAR WHEEL SPEED SENSOR - SIGNAL ERRATIC
C003A-4A	RIGHT REAR WHEEL SPEED SENSOR - INCORRECT COMPONENT INSTALLED
C003A-62	RIGHT REAR WHEEL SPEED SENSOR - SIGNAL COMPARE FAILURE
C0040-29	BRAKE PEDAL SWITCH - SIGNAL INVALID
C0040-2A	BRAKE PEDAL SWITCH - STUCK
C0040-62	BRAKE PEDAL SWITCH - SIGNAL COMPARE FAILURE
C0044-01	BRAKE PRESSURE SENSOR 1 - GENERAL ELECTRICAL FAILURE
C0044-28	BRAKE PRESSURE SENSOR 1 - SIGNAL BIAS LEVEL OUT OF RANGE / ZERO ADJUSTMENT FAILURE
C0044-64	BRAKE PRESSURE SENSOR 1 - SIGNAL PLAUSIBILITY FAILURE

C0051-22	STEERING WHEEL POSITION SENSOR - SIGNAL AMPLITUDE > MAXIMUM
C0051-28	STEERING WHEEL POSITION SENSOR - SIGNAL BIAS LEVEL OUT OF RANGE / ZERO ADJUSTMENT FAILURE
C0051-2F	STEERING WHEEL POSITION SENSOR - SIGNAL ERRATIC
C0051-49	STEERING WHEEL POSITION SENSOR - INTERNAL ELECTRONIC FAILURE
C0051-54	STEERING WHEEL POSITION SENSOR - MISSING CALIBRATION
C0051-62	STEERING WHEEL POSITION SENSOR - SIGNAL COMPARE FAILURE
C006A-28	MULTI-AXIS ACCELERATION SENSOR - SIGNAL BIAS LEVEL OUT OF RANGE / ZERO ADJUSTMENT FAILURE
C006A-49	MULTI-AXIS ACCELERATION SENSOR - INTERNAL ELECTRONIC FAILURE
C006A-54	MULTI-AXIS ACCELERATION SENSOR - MISSING CALIBRATION
C006A-62	MULTI-AXIS ACCELERATION SENSOR - SIGNAL COMPARE FAILURE
C0078-86	TIRE DIAMETER - SIGNAL INVALID
C008B-12	WHEEL SPEED SENSOR SUPPLY - CIRCUIT SHORT TO BATTERY
C107B-62	WHEEL SPEED COMPARATIVE PERFORMANCE-SIGNAL COMPARE FAILURE
C1082-01	VACUUM PRESSURE SENSOR - GENERAL ELECTRICAL FAILURE
C1082-02	VACUUM PRESSURE SENSOR - GENERAL SIGNAL FAILURE
C1082-2F	VACUUM PRESSURE SENSOR - SIGNAL ERRATIC
C1086-4B	ABS SYSTEM CONTROL TOO LONG - OVER TEMPERATURE
C1086-9A	ABS SYSTEM CONTROL TOO LONG - COMPONENT OR SYSTEM OPERATING CONDITIONS

DIAGNOSIS AND TESTING

C0020-01-ABS PUMP MOTOR CONTROL - GENERAL ELECTRICAL FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

NOTE: If DTC C0020-16 or C0020-35 are present, refer to the appropriate diagnostics for these DTCs before continuing with this procedure.

WHEN MONITORED

With the ignition on and no system under voltage condition present.

SET CONDITION

OPEN CIRCUIT: The Anti-lock Brake System (ABS) Module has detected improper voltage level when the motor is not running.

LOCKED MOTOR: The Anti-lock Brake System (ABS) Module is not seeing the proper response when motor is running.

POSSIBLE CAUSES

Possible Causes
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE/INTEGRATED CONTROL UNIT (ICU)

DIAGNOSTIC TEST

ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

1. Perform any Technical Service Bulletins (TSBs) that may apply.
2. Turn the ignition off to the lock position.
3. Inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires.
4. Inspect the related wire harness connectors. Look for broken, bent, pushed out, or corroded terminals.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Replace the Integrated Control Unit (ICU) in accordance with the Service Information. Refer to **INTEGRATED CONTROL UNIT (ICU), REMOVAL** .
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C0020-16-ABS PUMP MOTOR CONTROL - CIRCUIT VOLTAGE BELOW THRESHOLD

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 1: Identifying Anti-lock Brake Module Circuit Schematic
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the ignition on and no system under voltage condition present.

SET CONDITION

The motor voltage supplied to the Anti-lock Brake System (ABS) Module is 50 percent of ignition voltage.

POSSIBLE CAUSES

Possible Causes
FUSE F93 (40A)
(A107) FUSED B+ CIRCUIT SHORTED TO GROUND
(A107) FUSED B+ CIRCUIT OPEN OR HIGH RESISTANCE
(Z905) GROUND CIRCUITS OPEN OR HIGH RESISTANCE
INTEGRATED CONTROL UNIT (ICU)

DIAGNOSTIC TEST

1. **CHECK THE FUSE**
    1. Ignition on, engine not running.
    2. Using a 12-volt test light connected to ground, check the fuse for power.

    Is the fuse good?

    Yes

    - Go To 3

    No

    - Go To 2
2. **(A107) FUSED B+ CIRCUIT SHORTED TO GROUND**
    1.
    2. Turn the ignition off to the lock position.
    3. Remove the F04 40A Fuse.
    4. Disconnect the ABS Module harness connector.
    5. Measure the resistance between Ground and the (A107) Fused B+ Circuit in the ABS Module harness connector.

    Is the resistance above 5.0 Ohms?

    Yes

    - Go To 3

    No

    - Repair the (A107) Fused B+ circuit for a short to ground.

- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

3. **ABS PUMP MOTOR**
   1. Connect the ABS Module harness connector.
   2. Install the F93 40A Fuse.
   3. Ignition on, engine not running.
   4. With the scan tool, read and record the DTCs.
   5. With the scan tool, actuate the ABS pump motor.

   Did the Pump Motor operate correctly when actuated with out blowing the fuse?

   Yes

   - Go To 4

   No

   - Go To 6

4. **(A107) FUSED B+ CIRCUIT OPEN OR HIGH RESISTANCE**
   1. Turn the ignition off to the lock position.
   2. Disconnect the ABS Module harness connector.
   3. Using a 12-volt test light connected to ground, check the (A107) Fused B+ circuit.

   NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

   Is the test light illuminated and bright?

   Yes

   - Go To 5

   No

   - Repair the (A107) Fused B+ circuit for an open circuit or high resistance.
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

5. **(Z905) GROUND CIRCUITS OPEN OR HIGH RESISTANCE**
   1. Using a 12-volt test light connected to 12-volts, check the (Z905) Ground circuits.

   NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

   Is the test light illuminated and bright?

Yes

- Go To 6

No

- Repair the (Z905) Ground circuit(s) for an open circuit or high resistance.
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

6. **INTEGRATED CONTROL UNIT (ICU)**
   1. Turn the ignition off to the lock position.
   2. Inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Inspect the related wire harness connectors. Look for broken, bent, pushed out, or corroded terminals.
   4. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Replace the Integrated Control Unit (ICU) in accordance with the Service Information. Refer to **INTEGRATED CONTROL UNIT (ICU), REMOVAL** .
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C0020-35-ABS PUMP MOTOR CONTROL - SIGNAL HIGH TIME>MAXIMUM

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 2: Identifying Anti-lock Brake Module Circuit Schematic
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the ignition on and no system under voltage condition present.

SET CONDITION

If the Anti-lock Brake System (ABS) Module detects that the pump motor has a poor ground or the ABS has

internal pump motor driver shorted, this DTC will be active.

POSSIBLE CAUSES

Possible Causes
(A107) FUSED B+ CIRCUIT OPEN OR HIGH RESISTANCE (Z905) GROUND CIRCUITS OPEN OR HIGH RESISTANCE INTEGRATED CONTROL UNIT (ICU)

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**

   NOTE: After erasing ACTIVE DTCs it may be necessary for the Anti-lock Brake System (ABS) Module to go to sleep before the DTCs are cleared. IF the DTC is still ACTIVE after the clear command then Turn the ignition off, disconnect the Scan Tool, close the doors and wait until all indicators on the Cluster have gone out, typically about 30 seconds.

   1. Turn the ignition on.
   2. With the scan tool, read and record the DTCs.
   3. With the scan tool, read and record the Environmental Data to help identify the conditions in which the DTC was set.
   4. With the scan tool, erase the DTCs.

   CAUTION: Make sure brake capability is available before road testing.

   5. Road test the vehicle above 16 km/h (10 mph).
   6. With the scan tool, read and record the DTCs.

   Is the DTC active at this time?

   Yes

   - Go To 2

   No

   - Perform the ABS-INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.

2. **(A107) FUSED B+ CIRCUIT OPEN OR HIGH RESISTANCE**
   1. Turn the ignition off to the lock position.

2. Disconnect the ABS Module harness connector.
3. Using a 12-volt test light connected to ground, check the (A107) Fused B+ circuit.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes

- Go To 3

No

- Repair the (A107) Fused B+ circuit for an open circuit or high resistance.
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

3. **(Z905) GROUND CIRCUITS OPEN OR HIGH RESISTANCE**
   1. Using a 12-volt test light connected to 12-volts, check the (Z905) Ground circuits.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes

- Go To 4

No

- Repair the (Z905) Ground circuit(s) for an open circuit or high resistance.
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

4. **INTEGRATED CONTROL UNIT (ICU)**
   1. Turn the ignition off to the lock position.
   2. Inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Inspect the related wire harness connectors. Look for broken, bent, pushed out, or corroded terminals.
   4. Perform any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Replace the Integrated Control Unit (ICU) in accordance with the Service Information. Refer to **INTEGRATED CONTROL UNIT (ICU), REMOVAL** .
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C0021-02-BRAKE BOOSTER - GENERAL SIGNAL FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

When the Vacuum Pressure Sensor indicates a failure in the Vacuum Booster. After the cold start phase (i.e. 3 min after engine is running) and if the engine is running above 600 RPM there should be at least -135 mbar (-1.96 psi) of differential pressure in the vacuum-chamber for boosting the pedal force. If the pressure remains below this value for more than two minutes. Timer resets if the pressure remains above 220 mbar (3.19 psi) for 10 seconds or engine off vehicle speed present and low booster vacuum present.

POSSIBLE CAUSES

Possible Causes
ENGINE STALLED WHILE ROLLING IN NEUTRAL
PINCHED, CUT OR OPEN VACUUM SUPPLY LINE
BRAKE BOOSTER
VACUUM PRESSURE SENSOR

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**

NOTE: **After erasing ACTIVE DTCs it may be necessary for the Anti-lock Brake System (ABS) Module to go to sleep before the DTCs are cleared. IF the DTC is still ACTIVE after the clear command then Turn the ignition off, disconnect the Scan Tool, close the doors and wait until all indicators on the Cluster have gone out, typically about 30 seconds.**

1. Turn the ignition on.
2. With the scan tool, read and record the DTCs.

3. With the scan tool, read and record Environmental Data to help identify the conditions in which the DTC was set.
4. With the scan tool, erase the DTCs.
5. Start the engine.
6. Press and release the brake pedal.
7. Wait five minutes or until red brake lamp illuminates.

WARNING: To avoid possible serious or fatal injury, check brake capability is available before road testing.

8. Test drive the vehicle at speeds above 10 km/h (6 mph).
9. With the scan tool, read and record the DTCs.

Is the DTC Active at this time?

Yes

- Go To 2.

No

- Check the vacuum supply line to brake booster for a pinched, cut, loose or cracked vacuum hose which could cause an intermittent condition.
- Perform the ABS-INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.

2. **CHECK VACUUM SUPPLY LINE**
   1. Turn the ignition off.
   2. Check the vacuum supply line to brake booster for a pinched, cut, loose or open vacuum hose.
   3. Disconnect the booster vacuum supply line and attach a vacuum pressure gauge.
   4. Start the engine.

   Does the vacuum fluctuate with RPM change?

   Yes

   - Repair as necessary.
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 3
3. **CHECK FOR VACUUM PRESSURE SIGNAL CHANGE**

1. Turn the ignition on.
2. Remove the Vacuum Pressure Sensor from the Booster.
3. Block off the vacuum feed port.
4. Connect a vacuum pump to the Vacuum Pressure Sensor.
5. Apply vacuum to the Vacuum Pressure Sensor.
6. Using the scan tool, and a pressure gauge watch for the signal change.
7. Using the scan tool, watch for signal change.

   Is the signal changing and does it compare to the pressure gauge reading?

   Yes

   - Go To 4

   No

   - Replace the Vacuum Pressure Sensor in accordance with the Service Information. Refer to **BOOSTER, POWER BRAKE, REMOVAL** .
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

4. **CHECK BRAKE BOOSTER CHECK VALVE**
   1. Remove the Brake Booster Check Valve.
   2. Apply vacuum to the booster side of the check valve.

      Is the Brake Booster Check Valve holding vacuum?

      Yes

      - Replace the Brake Booster in accordance with the Service Information. Refer to **BOOSTER, POWER BRAKE, REMOVAL** .
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Replace Brake Booster Check Valve in accordance with the Service Information. Refer to **BOOSTER, POWER BRAKE, REMOVAL** .
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C0031-1D-LEFT FRONT WHEEL SPEED SENSOR - CIRCUIT CURRENT OUT OF RANGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 3: Wheel Speed Sensor Circuit Schematic
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the ignition on and no system under voltage or over voltage condition present.

SET CONDITION

When the Left Front Wheel Speed Sensor circuit fails the diagnostic test.

POSSIBLE CAUSES

Possible Causes
CONNECTOR/TERMINAL DAMAGE
(B8) LEFT FRONT WHEEL SPEED SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
(B9) LEFT FRONT WHEEL SPEED SENSOR SUPPLY CIRCUIT SHORTED TO VOLTAGE
(B8) LEFT FRONT WHEEL SPEED SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
(B9) LEFT FRONT WHEEL SPEED SENSOR SUPPLY CIRCUIT SHORTED TO GROUND
(B8) LEFT FRONT WHEEL SPEED SENSOR SIGNAL CIRCUIT OPEN
(B9) LEFT FRONT WHEEL SPEED SENSOR SUPPLY CIRCUIT OPEN
(B9) LEFT FRONT WHEEL SPEED SENSOR SUPPLY CIRCUIT SHORTED TO THE (B8) LEFT FRONT WHEEL SPEED SENSOR SIGNAL CIRCUIT
LEFT FRONT WHEEL SPEED SENSOR
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**

NOTE: **After erasing ACTIVE DTCs it may be necessary for the Anti-lock Brake System (ABS) Module to go to sleep before the DTCs are cleared. IF the DTC is still ACTIVE after the clear command then Turn the ignition off, disconnect the Scan Tool, close the doors and wait until all indicators on the Cluster have gone out, typically about 30 seconds.**

1. Ignition on, engine not running.
2. With the scan tool, erase DTCs.
3. Cycle the ignition switch from off to on.
4. With the scan tool, select View DTCs.

Is the DTC active at this time?

Yes

- Go To 2

No

- The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.
- Perform the ABS INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.

2. **CHECK CONNECTOR/TERMINAL FOR DAMAGE**

NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals.

1. Turn the ignition off to the lock position.
2. Inspect the Wheel Speed Sensor for proper mounting.
3. Inspect the Wheel Speed Sensor harness and connector.
4. Inspect the Wheel Speed Sensor for excessive debris on the sensor.

Were any problems found?

Yes

- Repair as necessary in accordance with the Service Information.
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 3

3. **CHECK (B9) LEFT FRONT WHEEL SPEED SENSOR SUPPLY CIRCUIT VOLTAGE**
   1. Disconnect the Left Front Wheel Speed Sensor harness connector.
   2. Turn the ignition on.
   3. Measure the voltage between the (B9) Left Front Wheel Speed Sensor Supply circuit and ground.

   Is the voltage above 10 volts?

   Yes

   - Go To 6

   No

   - Go To 4

4. **(B9) LEFT FRONT WHEEL SPEED SENSOR SUPPLY CIRCUIT SHORTED TO GROUND**
   1. Turn the ignition off.
   2. Disconnect the ABS Module harness connector.
   3. Measure the resistance between the (B9) Left Front Wheel Speed Sensor Supply circuit and ground.

   Is the resistance below 5.0 Ohms?

   Yes

   - Repair the (B9) Left Front Wheel Speed Sensor Supply circuit for a short to ground.
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 5

5. **(B9) LEFT FRONT WHEEL SPEED SENSOR SUPPLY CIRCUIT OPEN**
   1. Measure the resistance of the (B9) Left Front Wheel Speed Sensor Supply circuit between the Left Front Wheel Speed Sensor harness connector and the ABS harness connector.

      Is the resistance below 5 Ohms?

      Yes

      - Go To 6

      No

      - Repair the open (B9) Left Front Wheel Speed Sensor Supply circuit.
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
6. **(B8) LEFT FRONT WHEEL SPEED SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE**
   1. Turn the ignition on.
   2. Measure the voltage of the (B8) Left Front Wheel Speed Sensor Signal circuit at the Left Front Wheel Speed Sensor harness connector.

      Is there any voltage present?

      Yes

      - Repair the (B8) Left Front Wheel Speed Sensor Signal circuit for a short to voltage.
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Go To 7
7. **(B8) LEFT FRONT WHEEL SPEED SENSOR SIGNAL CIRCUIT SHORTED TO GROUND**
   1. Turn the ignition off.
   2. Measure the resistance between the (B8) Left Front Wheel Speed Sensor Signal circuit and ground.

      Is the resistance below 5.0 Ohms?

      Yes

      - Repair the (B8) Left Front Wheel Speed Sensor Signal circuit for a short to ground.
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 8

8. **(B8) LEFT FRONT WHEEL SPEED SENSOR SIGNAL CIRCUIT OPEN**
   1. Measure the resistance of the (B8) Left Front Wheel Speed Sensor Signal circuit between the Left Front Wheel Speed Sensor harness connector and the ABS harness connector.

      Is the resistance below 5 Ohms?

      Yes

      - Go To 9

      No

      - Repair the open (B8) Left Front Wheel Speed Sensor Signal circuit.
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
9. **(B9) LEFT FRONT WHEEL SPEED SENSOR SUPPLY CIRCUIT SHORTED TO THE (B8) LEFT FRONT WHEEL SPEED SENSOR SIGNAL CIRCUIT**
   1. Turn the ignition off to the lock position.
   2. Measure the resistance between the (B9) Left Front Wheel Speed Sensor Supply circuit and the (B8) Left Front Wheel Speed Sensor Signal circuit at the Wheel Speed Sensor harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Repair (B9) Left Front Wheel Speed Sensor Supply circuit for a short to the (B8) Left Front Wheel Speed Sensor Signal circuit.
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Go To 10
10. **LEFT FRONT WHEEL SPEED SENSOR**
    1. Replace the Left Front Wheel Speed Sensor in accordance with the Service Information. Refer to **SENSOR, WHEEL SPEED, FRONT, REMOVAL** .
    2. Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

       CAUTION: Make sure brake capability is available before road testing.

    3. Road test the vehicle over 40 km/h (25 mph).

NOTE: Vehicle must be driven above 40 km/h (25 mph) for set conditions to be meet.

4. With the scan tool, read ABS DTCs.

   Is the status Active for this DTC?

   Yes

   - Replace the Anti-lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

C0031-2F-LEFT FRONT WHEEL SPEED SENSOR - SIGNAL ERRATIC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on and no system under voltage or over voltage condition present.

SET CONDITION

When the Anti-lock Brake System (ABS) Module detects multiple drastic changes in Left Front wheel speed.

POSSIBLE CAUSES

Possible Causes
CHECK LEFT FRONT WHEEL SPEED SENSOR FOR LOOSENESS
INSPECT CIRCUITS/CONNECTOR/TERMINALS FOR DAMAGE
LEFT FRONT WHEEL BEARING AND HUB OR ENCODER FOR DAMAGE
LEFT FRONT WHEEL SPEED SENSOR
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**

   NOTE: If DTC C0031-1D is present, perform the diagnostics for this DTC before continuing with this diagnostic procedure.

NOTE: After erasing ACTIVE DTCs it may be necessary for the Anti-lock Brake System (ABS) Module to go to sleep before the DTCs are cleared. IF the DTC is still ACTIVE after the clear command then Turn the ignition off, disconnect the Scan Tool, close the doors and wait until all indicators on the Cluster have gone out, typically about 30 seconds.

1. Turn the ignition on.
2. With the scan tool, record and erase DTCs.

CAUTION: Make sure brake capability is available before road testing.

3. Road test the vehicle over 40 km/h (25 mph).

NOTE: Vehicle must be driven above 40 km/h (25 mph) for set conditions to be met.

4. With the scan tool, read DTCs.

Is the DTC active at this time?

Yes

- Go To 3

No

- Go To 2

2. **CHECK WHEEL SPEED SENSOR SIGNALS**
   1. Turn the ignition on.
   2. With the scan tool, monitor and graph ALL the WSS speeds and compare graph while an assistant drives the vehicle.

NOTE: If graph shows periodic dropouts pay close attention to the tone wheel.

   3. Slowly accelerate as straight as possible from a stop to 40 km/h (25 mph).

Is the Left Front WSS speed showing 0 km/h (0 mph), not matching other wheels, or showing erratic behavior?

Yes

- Go To 3

No

- Perform the ABS INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE**.

3. **CHECK LEFT FRONT WSS FOR LOOSENESS, INSPECT CIRCUITS/CONNECTORS/TERMINALS FOR DAMAGE**

NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals.

1. Turn the ignition off to the lock position.
2. Inspect the ABS Module harness connector and the Left Front WSS harness connector.
3. Check the Left Front WSS for looseness, excessive corrosion and not properly fastened.
4. Inspect the (B8) Left Front WSS Signal and (B9) Left Front WSS Supply circuits between the Left Front WSS and Anti-Lock Brake Module for damage.

Is the Left Front WSS loose or any of the wiring/connectors/terminals damaged?

Yes

- Repair as necessary.
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 4

4. **CHECK LEFT FRONT WHEEL SPEED SENSOR FOR DAMAGE**

1. Remove the Left Front Wheel Speed Sensor.
2. Inspect the Wheel Speed Sensor for proper mounting.
3. Inspect the Wheel Speed Sensor harness and connector.
4. Inspect the Wheel Speed Sensor for excessive debris on the sensor.

Is the Left Front Wheel Speed Sensor damaged?

Yes

- Replace the Left Front Wheel Speed Sensor in accordance with the Service Information. Refer to **SENSOR, WHEEL SPEED, FRONT, REMOVAL** .
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 5

5. **CHECK LEFT FRONT WHEEL BEARING AND HUB OR ENCODER FOR DAMAGE**

1. Inspect the Left Front wheel bearing, hub and Encoder for excessive runout, clearance or damage.

   NOTE: Refer to the appropriate service information, if necessary, for procedures or specifications.

   Is the Left Front Wheel Bearing, Hub or Encoder Damaged?

   Yes

   - Replace the Hub and Wheel Bearing in accordance with the Service Information. Refer to **HUB AND BEARING, REMOVAL** .
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 6

6. **LEFT FRONT WHEEL SPEED SENSOR**
   1. Replace the Left Front Wheel Speed Sensor in accordance with the Service Information. Refer to **SENSOR, WHEEL SPEED, FRONT, REMOVAL** .
   2. Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
   3. Road test the vehicle over 40 km/h (25 mph).

      NOTE: Vehicle must be driven above 40 km/h (25 mph) for set conditions to be met.

   4. With the scan tool, read ABS DTCs.

      Does the DTC remain active?

      Yes

      - Replace the Anti-Lock Brakes Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Test Complete.

C0031-4A-LEFT FRONT WHEEL SPEED SENSOR - INCORRECT COMPONENT INSTALLED

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on and no system under voltage or over voltage condition present.

SET CONDITION

When the Anti-lock Brake System (ABS) Module detects that the wrong component is installed.

POSSIBLE CAUSES

Possible Causes
LEFT FRONT WHEEL SPEED SENSOR ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**

   NOTE: If DTC C0031-1D is present, perform the diagnostics for this DTC before continuing with this diagnostic procedure.

   NOTE: This vehicle uses non-directional front wheel speed sensors and directional rear wheel speed sensors.

   NOTE: After erasing ACTIVE DTCs it may be necessary for the Anti-lock Brake System (ABS) Module to go to sleep before the DTCs are cleared. IF the DTC is still ACTIVE after the clear command then Turn the ignition off, disconnect the Scan Tool, close the doors and wait until all indicators on the Cluster have gone out, typically about 30 seconds.

   1. Ignition on.
   2. With the scan tool, record and erase DTCs.
   3. With the scan tool, read DTCs.

   Is the DTC active at this time?

   Yes

   - Go To 2

   No

   - Test Complete.

2. **LEFT FRONT WHEEL SPEED SENSOR**

   NOTE: This vehicle uses a non-directional front wheel speed sensor, make sure

the correct wheel speed sensor is installed on the vehicle.

1. Replace the Left Front Wheel Speed Sensor in accordance with the Service Information. Refer to **SENSOR, WHEEL SPEED, FRONT, REMOVAL** . Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   CAUTION: Make sure brake capability is available before road testing.

2. Road test the vehicle over 40 km/h (25 mph).
3. With the scan tool, read DTCs.

   Does the DTC remain active?

   Yes

   - Replace the Anti-lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

C0031-62-LEFT FRONT WHEEL SPEED SENSOR - SIGNAL COMPARE FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on, no system under voltage or over voltage condition present, no open or shorted wheel speed sensor DTCs set, vehicle not under high acceleration, and vehicle speed greater than 0.

SET CONDITION

This DTC will be set if the wheel speed signal is 0 km/h (0 mph) or very low when compared to the other wheel speed signals.

POSSIBLE CAUSES

Possible Causes
IMPROPER LEFT FRONT TIRE PRESSURE/MISMATCHED TIRES CHECK LEFT FRONT WHEEL SPEED SENSOR FOR LOOSENESS INSPECT CIRCUITS/CONNECTOR/TERMINALS FOR DAMAGE

LEFT FRONT HUB AND WHEEL BEARING
LEFT FRONT WHEEL SPEED SENSOR
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**

NOTE: **If DTC C0031-1D is present, perform the diagnostics for this DTC before continuing with this diagnostic procedure.**

NOTE: **After erasing ACTIVE DTCs it may be necessary for the Anti-lock Brake System (ABS) Module to go to sleep before the DTCs are cleared. IF the DTC is still ACTIVE after the clear command then Turn the ignition off, disconnect the Scan Tool, close the doors and wait until all indicators on the Cluster have gone out, typically about 30 seconds.**

1. Turn the ignition on.
2. With the scan tool, record and erase DTCs.

CAUTION: Make sure brake capability is available before road testing.

3. Road test the vehicle over 40 km/h (25 mph).

NOTE: **Vehicle must be driven above 40 km/h (25 mph) for set conditions to be met.**

4. With the scan tool, read DTCs.

   Is the DTC active at this time?

   Yes

   - Go To 3

   No

   - Go To 2

2. **CHECK WHEEL SPEED SENSOR SIGNALS**
   1. Turn the ignition on.
   2. With the scan tool, monitor and graph ALL the WSS speeds and compare graph while an assistant drives the vehicle.

NOTE: If graph shows periodic dropouts pay close attention to the tone wheel.

3. Slowly accelerate as straight as possible from a stop to 40 km/h (25 mph).

   Is the Left Front WSS speed showing 0 km/h (0 mph), not matching other wheels, or showing erratic behavior?

   Yes

   - Go To 3

   No

   - Perform the ABS INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE**.

3. **CHECK FOR IMPROPER LEFT FRONT TIRE PRESSURE/MISMATCHED TIRES**
   1. Turn the ignition off.
   2. Check and adjust the Left Front Tire pressure.
   3. Check and adjust all other tire pressures.
   4. Inspect for mismatched tires on vehicle.

   Is the Left Front Tire improperly inflated or mismatched tires on vehicle?

   Yes

   - Repair as necessary
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 4

4. **CHECK LEFT FRONT WSS FOR LOOSENESS, INSPECT CIRCUITS/CONNECTORS/TERMINALS FOR DAMAGE**

   NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals.

   1. Turn the ignition off to the lock position.
   2. Inspect the ABS Module harness connector and the Left Front WSS harness connector.
   3. Check the Left Front WSS for looseness, excessive corrosion and not properly fastened.
   4. Inspect the (B8) Left Front WSS Signal and (B9) Left Front WSS Supply circuits between the Left Front WSS and Anti-Lock Brake Module for damage.

Is the Left Front WSS loose or any of the wiring/connectors/terminals damaged?

Yes

- Repair as necessary.
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 5

5. **CHECK LEFT FRONT WHEEL SPEED SENSOR FOR DAMAGE**
   1. Remove the Left Front Wheel Speed Sensor.
   2. Inspect the Wheel Speed Sensor for proper mounting.
   3. Inspect the Wheel Speed Sensor harness and connector.
   4. Inspect the Wheel Speed Sensor for excessive debris on the sensor.

   Is the Left Front Wheel Speed Sensor damaged?

   Yes

   - Replace the Left Front Wheel Speed Sensor in accordance with the Service Information. Refer to **SENSOR, WHEEL SPEED, FRONT, REMOVAL** .
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 6

6. **CHECK LEFT FRONT WHEEL BEARING AND HUB OR ENCODER FOR DAMAGE**
   1. Inspect the Left Front wheel bearing, hub and Encoder for excessive runout, clearance or damage.

   NOTE: Refer to the appropriate service information, if necessary, for procedures or specifications.

   Is the Left Front Wheel Bearing, Hub or Encoder Damaged?

   Yes

   - Replace the Hub and Wheel Bearing in accordance with the Service Information. Refer to **HUB AND BEARING, REMOVAL** .
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

- Go To 7

7. **LEFT FRONT WHEEL SPEED SENSOR**
   1. Replace the Left Front Wheel Speed Sensor in accordance with the Service Information. Refer to **SENSOR, WHEEL SPEED, FRONT, REMOVAL** .
   2. Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
   3. Road test the vehicle over 40 km/h (25 mph).

      NOTE: Vehicle must be driven above 40 km/h (25 mph) for set conditions to be met.

   4. With the scan tool, read ABS DTCs.

      Does the DTC remain active?

      Yes

      - Replace the Anti-Lock Brakes Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Test Complete.

C0034-1D-RIGHT FRONT WHEEL SPEED SENSOR - CIRCUIT CURRENT OUT OF RANGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 4: Wheel Speed Sensor Circuit Schematic
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the ignition on and no system under voltage or over voltage condition present.

SET CONDITION

When the Right Front Wheel Speed Sensor circuit fails the diagnostic test.

POSSIBLE CAUSES

Possible Causes
CONNECTOR/TERMINAL DAMAGE
(B6) RIGHT FRONT WHEEL SPEED SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
(B7) RIGHT FRONT WHEEL SPEED SENSOR SUPPLY CIRCUIT SHORTED TO VOLTAGE
(B6) RIGHT FRONT WHEEL SPEED SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
(B7) RIGHT FRONT WHEEL SPEED SENSOR SUPPLY CIRCUIT SHORTED TO GROUND
(B6) RIGHT FRONT WHEEL SPEED SENSOR SIGNAL CIRCUIT OPEN
(B7) RIGHT FRONT WHEEL SPEED SENSOR SUPPLY CIRCUIT OPEN
(B7) RIGHT FRONT WHEEL SPEED SENSOR SUPPLY CIRCUIT SHORTED TO THE (B6) RIGHT FRONT WHEEL SPEED SENSOR SIGNAL CIRCUIT
RIGHT FRONT WHEEL SPEED SENSOR
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**

NOTE: **After erasing ACTIVE DTCs it may be necessary for the Anti-lock Brake System (ABS) Module to go to sleep before the DTCs are cleared. IF the DTC is still ACTIVE after the clear command then Turn the ignition off, disconnect the Scan Tool, close the doors and wait until all indicators on the Cluster have gone out, typically about 30 seconds.**

1. Ignition on, engine not running.
2. With the scan tool, erase DTCs.
3. Cycle the ignition switch from off to on.
4. With the scan tool, select View DTCs.

Is the DTC active at this time?

Yes

- Go To 2

No

- The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.
- Perform the ABS-INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.

2. **CHECK CONNECTOR/TERMINAL FOR DAMAGE**

NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals.

1. Turn the ignition off to the lock position.
2. Inspect the Wheel Speed Sensor for proper mounting.
3. Inspect the Wheel Speed Sensor harness and connector.
4. Inspect the Wheel Speed Sensor for excessive debris on the sensor.

Were any problems found?

Yes

- Repair as necessary in accordance with the Service Information.
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 3

3. **CHECK (B7) RIGHT FRONT WHEEL SPEED SENSOR SUPPLY CIRCUIT VOLTAGE**
   1. Disconnect the Right Front Wheel Speed Sensor harness connector.
   2. Turn the ignition on.
   3. Measure the voltage between the (B7) Right Front Wheel Speed Sensor Supply circuit and ground.

   Is the voltage above 10 volts?

   Yes

   - Go To 6

   No

   - Go To 4

4. **(B7) RIGHT FRONT WHEEL SPEED SENSOR SUPPLY CIRCUIT SHORTED TO GROUND**
   1. Turn the ignition off.
   2. Disconnect the ABS Module harness connector.
   3. Measure the resistance between the (B7) Right Front Wheel Speed Sensor Supply circuit and ground.

   Is the resistance below 5.0 Ohms?

   Yes

   - Repair the (B7) Right Front Wheel Speed Sensor Supply circuit for a short to ground.
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 5

5. **(B7) RIGHT FRONT WHEEL SPEED SENSOR SUPPLY CIRCUIT OPEN**
   1. Measure the resistance of the (B7) Right Front Wheel Speed Sensor Supply circuit between the Right Front Wheel Speed Sensor harness connector and the ABS harness connector.

      Is the resistance below 5 Ohms?

      Yes

      - Go To 6

      No

      - Repair the open (B7) Right Front Wheel Speed Sensor Supply circuit.
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
6. **(B6) RIGHT FRONT WHEEL SPEED SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE**
   1. Turn the ignition on.
   2. Measure the voltage of the (B6) Right Front Wheel Speed Sensor Signal circuit at the Right Front Wheel Speed Sensor harness connector.

      Is there any voltage present?

      Yes

      - Repair the (B6) Right Front Wheel Speed Sensor Signal circuit for a short to voltage.
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Go To 7
7. **(B6) RIGHT FRONT WHEEL SPEED SENSOR SIGNAL CIRCUIT SHORTED TO GROUND**
   1. Turn the ignition off.
   2. Measure the resistance between the (B6) Right Front Wheel Speed Sensor Signal circuit and ground.

      Is the resistance below 5.0 Ohms?

      Yes

      - Repair the (B6) Right Front Wheel Speed Sensor Signal circuit for a short to ground.
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Refer to 8.

8. **(B6) RIGHT FRONT WHEEL SPEED SENSOR SIGNAL CIRCUIT OPEN**
   1. Measure the resistance of the (B6) Right Front Wheel Speed Sensor Signal circuit between the Right Front Wheel Speed Sensor harness connector and the ABS harness connector.

      Is the resistance below 5 Ohms?

      Yes

      - Go To 9

      No

      - Repair the open (B6) Right Front Wheel Speed Sensor Signal circuit.
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
9. **(B7) RIGHT FRONT WHEEL SPEED SENSOR SUPPLY CIRCUIT SHORTED TO THE (B6) RIGHT FRONT WHEEL SPEED SENSOR SIGNAL CIRCUIT**
   1. Turn the ignition off to the lock position.
   2. Measure the resistance between the (B7) Right Front Wheel Speed Sensor Supply circuit and the (B6) Right Front Wheel Speed Sensor Signal circuit at the Wheel Speed Sensor harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Repair (B7) Right Front Wheel Speed Sensor Supply circuit for a short to the (B6) Right Front Wheel Speed Sensor Signal circuit.
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Go To 10
10. **RIGHT FRONT WHEEL SPEED SENSOR**
    1. Replace the Right Front Wheel Speed Sensor in accordance with the Service Information. Refer to **SENSOR, WHEEL SPEED, FRONT, REMOVAL** .
    2. Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

       CAUTION: Make sure brake capability is available before road testing.

    3. Road test the vehicle over 40 km/h (25 mph).

NOTE: Vehicle must be driven above 40 km/h (25 mph) for set conditions to be meet.

4. With the scan tool, read ABS DTCs.

   Is the status Active for this DTC?

   Yes

   - Replace the Anti-lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

C0034-2F-RIGHT FRONT WHEEL SPEED SENSOR - SIGNAL ERRATIC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on and no system under voltage or over voltage condition present.

SET CONDITION

When the Anti-lock Brake System (ABS) Module detects multiple drastic changes in Right Front wheel speed.

POSSIBLE CAUSES

Possible Causes
CHECK RIGHT FRONT WHEEL SPEED SENSOR FOR LOOSENESS
INSPECT CIRCUITS/CONNECTOR/TERMINALS FOR DAMAGE
RIGHT FRONT WHEEL BEARING AND HUB OR ENCODER FOR DAMAGE
RIGHT FRONT WHEEL SPEED SENSOR
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**

   NOTE: If DTC C0034-1D is present, perform the diagnostics for this DTC before continuing with this diagnostic procedure.

NOTE: After erasing ACTIVE DTCs it may be necessary for the Anti-lock Brake System (ABS) Module to go to sleep before the DTCs are cleared. IF the DTC is still ACTIVE after the clear command then Turn the ignition off, disconnect the Scan Tool, close the doors and wait until all indicators on the Cluster have gone out, typically about 30 seconds.

1. Turn the ignition on.
2. With the scan tool, record and erase DTCs.

CAUTION: Make sure brake capability is available before road testing.

3. Road test the vehicle over 40 km/h (25 mph).

NOTE: Vehicle must be driven above 40 km/h (25 mph) for set conditions to be met.

4. With the scan tool, read DTCs.

   Is the DTC active at this time?

   Yes

   - Go To 3

   No

   - Go To 2

2. **CHECK WHEEL SPEED SENSOR SIGNALS**
   1. Turn the ignition on.
   2. With the scan tool, monitor and graph ALL the WSS speeds and compare graph while an assistant drives the vehicle.

   NOTE: If graph shows periodic dropouts pay close attention to the tone wheel.

   3. Slowly accelerate as straight as possible from a stop to 40 km/h (25 mph).

      Is the Right Front WSS speed showing 0 km/h (0 mph), not matching other wheels, or showing erratic behavior?

      Yes

      - Go To 3

No

- Perform ABS INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE**.

3. **CHECK RIGHT FRONT WSS FOR LOOSENESS, INSPECT CIRCUITS/CONNECTORS/TERMINALS FOR DAMAGE**

NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals.

1. Turn the ignition off to the lock position.
2. Inspect the ABS Module harness connector and the Right Front WSS harness connector.
3. Check the Right Front WSS for looseness, excessive corrosion and not properly fastened.
4. Inspect the (B6) Right Front WSS Signal and (B7) Right Front WSS Supply circuits between the Right Front WSS and Anti-Lock Brake Module for damage.

Is the Right Front WSS loose or any of the wiring/connectors/terminals damaged?

Yes

- Repair as necessary.
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 4

4. **CHECK RIGHT FRONT WHEEL SPEED SENSOR FOR DAMAGE**

1. Remove the Right Front Wheel Speed Sensor.
2. Inspect the Wheel Speed Sensor for proper mounting.
3. Inspect the Wheel Speed Sensor harness and connector.
4. Inspect the Wheel Speed Sensor for excessive debris on the sensor.

Is the Right Front Wheel Speed Sensor damaged?

Yes

- Replace the Right Front Wheel Speed Sensor in accordance with the Service Information. Refer to **SENSOR, WHEEL SPEED, FRONT, REMOVAL** .
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 5

5. **CHECK RIGHT FRONT WHEEL BEARING AND HUB OR ENCODER FOR DAMAGE**

1. Inspect the Right Front wheel bearing, hub and Encoder for excessive runout, clearance or damage.

   NOTE: Refer to the appropriate service information, if necessary, for procedures or specifications.

   Is the Right Front Wheel Bearing, Hub or Encoder Damaged?

   Yes

   - Replace the Hub and Wheel Bearing in accordance with the Service Information. Refer to **HUB AND BEARING, REMOVAL** .
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 6

6. **RIGHT FRONT WHEEL SPEED SENSOR**
   1. Replace the Right Front Wheel Speed Sensor in accordance with the Service Information. Refer to **SENSOR, WHEEL SPEED, FRONT, REMOVAL** .
   2. Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
   3. Road test the vehicle over 40 km/h (25 mph).

      NOTE: Vehicle must be driven above 40 km/h (25 mph) for set conditions to be met.

   4. With the scan tool, read ABS DTCs.

      Does the DTC remain active?

      Yes

      - Replace the Anti-Lock Brakes Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Test Complete.

C0034-4A-RIGHT FRONT WHEEL SPEED SENSOR - INCORRECT COMPONENT INSTALLED

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on and no system under voltage or over voltage condition present.

SET CONDITION

When the Anti-lock Brake System (ABS) Module detects that the wrong component is installed.

POSSIBLE CAUSES

Possible Causes
RIGHT FRONT WHEEL SPEED SENSOR ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**

   NOTE: If DTC C0034-1D is present, perform the diagnostics for this DTC before continuing with this diagnostic procedure.

   NOTE: This vehicle uses non-directional front wheel speed sensors and directional rear wheel speed sensors.

   NOTE: After erasing ACTIVE DTCs it may be necessary for the Anti-lock Brake System (ABS) Module to go to sleep before the DTCs are cleared. IF the DTC is still ACTIVE after the clear command then Turn the ignition off, disconnect the Scan Tool, close the doors and wait until all indicators on the Cluster have gone out, typically about 30 seconds.

   1. Ignition on.
   2. With the scan tool, record and erase DTCs.
   3. With the scan tool, read DTCs.

   Is the DTC active at this time?

   Yes

   - Go To 2

   No

   - Test Complete.

2. **RIGHT FRONT WHEEL SPEED SENSOR**

   NOTE: This vehicle uses a non-directional front wheel speed sensor, make sure

the correct wheel speed sensor is installed on the vehicle.

1. Replace the Right Front Wheel Speed Sensor in accordance with the Service Information. Refer to **SENSOR, WHEEL SPEED, FRONT, REMOVAL** . Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   CAUTION: Make sure brake capability is available before road testing.

2. Road test the vehicle over 40 km/h (25 mph).
3. With the scan tool, read DTCs.

   Does the DTC remain active?

   Yes

   - Replace the Anti-lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

C0034-62-RIGHT FRONT WHEEL SPEED SENSOR - SIGNAL COMPARE FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on, no system under voltage or over voltage condition present, no open or shorted wheel speed sensor DTCs set, vehicle not under high acceleration, and vehicle speed greater than 0.

SET CONDITION

This DTC will be set if the wheel speed signal is 0 km/h (0 mph) or very low when compared to the other wheel speed signals.

POSSIBLE CAUSES

Possible Causes
IMPROPER RIGHT FRONT TIRE PRESSURE/MISMATCHED TIRES CHECK RIGHT FRONT WHEEL SPEED SENSOR FOR LOOSENESS INSPECT CIRCUITS/CONNECTOR/TERMINALS FOR DAMAGE

RIGHT FRONT WHEEL BEARING AND HUB OR ENCODER FOR DAMAGE
RIGHT FRONT WHEEL SPEED SENSOR
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**

NOTE: **If DTC C0034-1D is present, perform the diagnostics for this DTC before continuing with this diagnostic procedure.**

NOTE: **After erasing ACTIVE DTCs it may be necessary for the Anti-lock Brake System (ABS) Module to go to sleep before the DTCs are cleared. IF the DTC is still ACTIVE after the clear command then Turn the ignition off, disconnect the Scan Tool, close the doors and wait until all indicators on the Cluster have gone out, typically about 30 seconds.**

1. Turn the ignition on.
2. With the scan tool, record and erase DTCs.

CAUTION: Make sure brake capability is available before road testing.

3. Road test the vehicle over 40 km/h (25 mph).

NOTE: **Vehicle must be driven above 40 km/h (25 mph) for set conditions to be met.**

4. With the scan tool, read DTCs.

   Is the DTC active at this time?

   Yes

   - Go To 3

   No

   - Go To 2

2. **CHECK WHEEL SPEED SENSOR SIGNALS**
   1. Turn the ignition on.
   2. With the scan tool, monitor and graph ALL the WSS speeds and compare graph while an assistant drives the vehicle.

NOTE: If graph shows periodic dropouts pay close attention to the tone wheel.

3. Slowly accelerate as straight as possible from a stop to 40 km/h (25 mph).

   Is the Right Front WSS speed showing 0 km/h (0 mph), not matching other wheels, or showing erratic behavior?

   Yes

   - Go To 3

   No

   - Perform ABS INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE**.

3. **CHECK FOR IMPROPER RIGHT FRONT TIRE PRESSURE/MISMATCHED TIRES**
   1. Turn the ignition off.
   2. Check and adjust the Right Front Tire pressure.
   3. Check and adjust all other tire pressures.
   4. Inspect for mismatched tires on vehicle.

   Is the Right Front Tire improperly inflated or mismatched tires on vehicle?

   Yes

   - Repair as necessary
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 4

4. **CHECK RIGHT FRONT WSS FOR LOOSENESS, INSPECT CIRCUITS/CONNECTORS/TERMINALS FOR DAMAGE**

   NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals.

   1. Turn the ignition off to the lock position.
   2. Inspect the ABS Module harness connector and the Right Front WSS harness connector.
   3. Check the Right Front WSS for looseness, excessive corrosion and not properly fastened.
   4. Inspect the (B6) Right Front WSS Signal and (B7) Right Front WSS Supply circuits between the Right Front WSS and Anti-Lock Brake Module for damage.

Is the Right Front WSS loose or any of the wiring/connectors/terminals damaged?

Yes

- Repair as necessary.
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 5

5. **CHECK RIGHT FRONT WHEEL SPEED SENSOR FOR DAMAGE**
   1. Remove the Right Front Wheel Speed Sensor.
   2. Inspect the Wheel Speed Sensor for proper mounting.
   3. Inspect the Wheel Speed Sensor harness and connector.
   4. Inspect the Wheel Speed Sensor for excessive debris on the sensor.

   Is the Right Front Wheel Speed Sensor damaged?

   Yes

   - Replace the Right Front Wheel Speed Sensor in accordance with the Service Information. Refer to **SENSOR, WHEEL SPEED, FRONT, REMOVAL** .
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 6

6. **CHECK RIGHT FRONT WHEEL BEARING AND HUB OR ENCODER FOR DAMAGE**
   1. Inspect the Right Front wheel bearing, hub and Encoder for excessive runout, clearance or damage.

   NOTE: Refer to the appropriate service information, if necessary, for procedures or specifications.

   Is the Right Front Wheel Bearing, Hub or Encoder Damaged?

   Yes

   - Replace the Hub and Wheel Bearing in accordance with the Service Information. Refer to **HUB AND BEARING, REMOVAL** .
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

- Go To 7

7. **RIGHT FRONT WHEEL SPEED SENSOR**
   1. Replace the Right Front Wheel Speed Sensor in accordance with the Service Information. Refer to **SENSOR, WHEEL SPEED, FRONT, REMOVAL** .
   2. Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
   3. Road test the vehicle over 40 km/h (25 mph).

      NOTE: Vehicle must be driven above 40 km/h (25 mph) for set conditions to be met.

   4. With the scan tool, read ABS DTCs.

      Does the DTC remain active?

      Yes

      - Replace the Anti-Lock Brakes Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Test Complete.

C0036-02-LEFT REAR TONE WHEEL - GENERAL SIGNAL FAILURE

For a complete wiring diagram **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

When the Anti-lock Brake System (ABS) Module detects changes in Left Rear wheel speed.

POSSIBLE CAUSES

Possible Causes
CHECK LEFT REAR WHEEL SPEED SENSOR FOR LOOSENESS
INSPECT CIRCUITS/CONNECTOR/TERMINALS FOR DAMAGE
LEFT REAR WHEEL BEARING AND HUB OR ENCODER FOR DAMAGE
LEFT REAR WHEEL SPEED SENSOR
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**

NOTE: This DTC must be active for the results of this test to be valid. If DTC C0037-1D is present it must be repaired before continuing.

NOTE: After erasing ACTIVE DTCs it may be necessary for the Anti-lock Brake System (ABS) Module to go to sleep before the DTCs are cleared. IF the DTC is still ACTIVE after the clear command then Turn the ignition off, disconnect the Scan Tool, close the doors and wait until all indicators on the Cluster have gone out, typically about 30 seconds.

1. Turn the ignition on.
2. With the scan tool, read DTCs.
3. With the scan tool, read and record Environmental Data to help identify the conditions in which the DTC was set.
4. With the scan tool, erase DTCs.
5. Cycle the ignition switch off then on.

CAUTION: Ensure brake capability is available before road testing.

6. Test drive the vehicle in a straight line to 40 km/h (25 mph).

NOTE: Vehicle must be driven above 40 km/h (25 mph) for set conditions to be met.

7. With the scan tool, read DTCs.

Is the DTC active at this time?

Yes

- Go To 2

No

- The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.
- Perform the ABS-INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.

2. **CHECK LEFT REAR WSS FOR LOOSENESS, INSPECT CIRCUITS/CONNECTORS/TERMINALS FOR DAMAGE**

   NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals.

   1. Turn the ignition off to the lock position.
   2. Inspect the ABS Module harness connector and the Left Rear WSS harness connector.
   3. Check the Left Rear WSS for looseness, excessive corrosion and not properly fastened.
   4. Inspect the (B3) Left Rear WSS Signal and (B4) Left Rear WSS Supply circuits between the Left Rear WSS and Anti-Lock Brake Module for damage.

   Is the Left Rear WSS loose or any of the wiring/connectors/terminals damaged?

   Yes

   - Repair as necessary.
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 3

3. **CHECK LEFT REAR WHEEL SPEED SENSOR FOR DAMAGE**
   1. Remove the Left Rear Wheel Speed Sensor.
   2. Inspect the Wheel Speed Sensor for proper mounting.
   3. Inspect the Wheel Speed Sensor harness and connector.
   4. Inspect the Wheel Speed Sensor for excessive debris on the sensor.

   Is the Left Rear Wheel Speed Sensor damaged?

   Yes

   - Replace the Left Rear Wheel Speed Sensor in accordance with the Service Information. Refer to **SENSOR, WHEEL SPEED, REAR, REMOVAL** .
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 4

4. **CHECK LEFT REAR WHEEL BEARING AND HUB OR ENCODER FOR DAMAGE**
   1. Inspect the Left Rear wheel bearing, hub and Encoder for excessive runout, clearance or damage.

   NOTE: Refer to the appropriate service information, if necessary, for

procedures or specifications.

Is the Left Rear Wheel Bearing, Hub or Encoder Damaged?

Yes

- Replace the Hub and Wheel Bearing in accordance with the Service Information. Refer to **HUB AND BEARING, REMOVAL** .
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 5

5. **LEFT REAR WHEEL SPEED SENSOR**
   1. Replace the Left Rear Wheel Speed Sensor in accordance with the Service Information. Refer to **SENSOR, WHEEL SPEED, REAR, REMOVAL** .
   2. Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
   3. Road test the vehicle over 40 km/h (25 mph).

      NOTE: Vehicle must be driven above 40 km/h (25 mph) for set conditions to be met.

   4. With the scan tool, read ABS DTCs.

      Does the DTC remain active?

      Yes

      - Replace the Anti-lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Test Complete.

C0037-1D-LEFT REAR WHEEL SPEED SENSOR - CIRCUIT CURRENT OUT OF RANGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 5: Wheel Speed Sensor Circuit Schematic
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the ignition on and no system under voltage or over voltage condition present.

SET CONDITION

When the Left Rear Wheel Speed Sensor circuit fails the diagnostic test.

POSSIBLE CAUSES

Possible Causes
CONNECTOR/TERMINAL DAMAGE
(B3) LEFT REAR WHEEL SPEED SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
(B4) LEFT REAR WHEEL SPEED SENSOR SUPPLY CIRCUIT SHORTED TO VOLTAGE
(B3) LEFT REAR WHEEL SPEED SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
(B4) LEFT REAR WHEEL SPEED SENSOR SUPPLY CIRCUIT SHORTED TO GROUND
(B3) LEFT REAR WHEEL SPEED SENSOR SIGNAL CIRCUIT OPEN
(B4) LEFT REAR WHEEL SPEED SENSOR SUPPLY CIRCUIT OPEN
(B4) LEFT REAR WHEEL SPEED SENSOR SUPPLY CIRCUIT SHORTED TO THE (B3) LEFT REAR WHEEL SPEED SENSOR SIGNAL CIRCUIT
LEFT REAR WHEEL SPEED SENSOR
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**

NOTE: **After erasing ACTIVE DTCs it may be necessary for the Anti-lock Brake System (ABS) Module to go to sleep before the DTCs are cleared. IF the DTC is still ACTIVE after the clear command then Turn the ignition off, disconnect the Scan Tool, close the doors and wait until all indicators on the Cluster have gone out, typically about 30 seconds.**

1. Ignition on, engine not running.
2. With the scan tool, erase DTCs.
3. Cycle the ignition switch from off to on.
4. With the scan tool, select View DTCs.

Is the DTC active at this time?

Yes

- Go To 2

No

- The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.
- Perform the ABS-INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.

2. **CHECK CONNECTOR/TERMINAL FOR DAMAGE**

NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals.

1. Turn the ignition off to the lock position.
2. Inspect the Wheel Speed Sensor for proper mounting.
3. Inspect the Wheel Speed Sensor harness and connector.
4. Inspect the Wheel Speed Sensor for excessive debris on the sensor.

Were any problems found?

Yes

- Repair as necessary in accordance with the Service Information.
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 3

3. **CHECK (B4) LEFT REAR WHEEL SPEED SENSOR SUPPLY CIRCUIT VOLTAGE**
   1. Disconnect the Left Rear Wheel Speed Sensor harness connector.
   2. Turn the ignition on.
   3. Measure the voltage between the (B4) Left Rear Wheel Speed Sensor Supply circuit and ground.

   Is the voltage above 10 volts?

   Yes

   - Go To 6

   No

   - Go To 4

4. **(B4) LEFT REAR WHEEL SPEED SENSOR SUPPLY CIRCUIT SHORTED TO GROUND**
   1. Turn the ignition off.
   2. Disconnect the ABS Module harness connector.
   3. Measure the resistance between the (B4) Left Rear Wheel Speed Sensor Supply circuit and ground.

   Is the resistance below 5.0 Ohms?

   Yes

   - Repair the (B4) Left Rear Wheel Speed Sensor Supply circuit for a short to ground.
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 5

5. **(B4) LEFT REAR WHEEL SPEED SENSOR SUPPLY CIRCUIT OPEN**
   1. Measure the resistance of the (B4) Left Rear Wheel Speed Sensor Supply circuit between the Left Rear Wheel Speed Sensor harness connector and the ABS harness connector.

      Is the resistance below 5 Ohms?

      Yes

      - Go To 6

      No

      - Repair the open (B4) Left Rear Wheel Speed Sensor Supply circuit.
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
6. **(B3) LEFT REAR WHEEL SPEED SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE**
   1. Turn the ignition on.
   2. Measure the voltage of the (B3) Left Rear Wheel Speed Sensor Signal circuit at the Left Rear Wheel Speed Sensor harness connector.

      Is there any voltage present?

      Yes

      - Repair the (B3) Left Rear Wheel Speed Sensor Signal circuit for a short to voltage.
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Go To 7
7. **(B3) LEFT REAR WHEEL SPEED SENSOR SIGNAL CIRCUIT SHORTED TO GROUND**
   1. Turn the ignition off.
   2. Measure the resistance between the (B3) Left Rear Wheel Speed Sensor Signal circuit and ground.

      Is the resistance below 5.0 Ohms?

      Yes

      - Repair the (B3) Left Rear Wheel Speed Sensor Signal circuit for a short to ground.
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 8

8. **(B3) LEFT REAR WHEEL SPEED SENSOR SIGNAL CIRCUIT OPEN**
   1. Measure the resistance of the (B3) Left Rear Wheel Speed Sensor Signal circuit between the Left Rear Wheel Speed Sensor harness connector and the ABS harness connector.

      Is the resistance below 5 Ohms?

      Yes

      - Go To 9

      No

      - Repair the open (B3) Left Rear Wheel Speed Sensor Signal circuit.
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
9. **(B4) LEFT REAR WHEEL SPEED SENSOR SUPPLY CIRCUIT SHORTED TO THE (B3) LEFT REAR WHEEL SPEED SENSOR SIGNAL CIRCUIT**
   1. Turn the ignition off to the lock position.
   2. Measure the resistance between the (B4) Left Rear Wheel Speed Sensor Supply circuit and the (B3) Left Rear Wheel Speed Sensor Signal circuit at the Wheel Speed Sensor harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Repair (B4) Left Rear Wheel Speed Sensor Supply circuit for a short to the (B3) Left Rear Wheel Speed Sensor Signal circuit.
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Go To 10
10. **LEFT REAR WHEEL SPEED SENSOR**
    1. Replace the Left Rear Wheel Speed Sensor in accordance with the Service Information. Refer to **SENSOR, WHEEL SPEED, REAR, REMOVAL** .
    2. Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

       CAUTION: Make sure brake capability is available before road testing.

    3. Road test the vehicle over 40 km/h (25 mph).

NOTE: Vehicle must be driven above 40 km/h (25 mph) for set conditions to be meet.

4. With the scan tool, read ABS DTCs.

   Is the status Active for this DTC?

   Yes

   - Replace the Anti-lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

C0037-2F-LEFT REAR WHEEL SPEED SENSOR - SIGNAL ERRATIC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

When the Anti-lock Brake System (ABS) Module detects multiple drastic changes in Left Rear wheel speed.

POSSIBLE CAUSES

Possible Causes
CHECK LEFT REAR WHEEL SPEED SENSOR FOR LOOSENESS
INSPECT CIRCUITS/CONNECTOR/TERMINALS FOR DAMAGE
LEFT REAR WHEEL BEARING AND HUB OR ENCODER FOR DAMAGE
LEFT REAR WHEEL SPEED SENSOR
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**

NOTE: If DTC C0037-1D is present, perform the diagnostics for this DTC before continuing with this diagnostic procedure.

NOTE: After erasing ACTIVE DTCs it may be necessary for the Anti-lock Brake System (ABS) Module to go to sleep before the DTCs are cleared. IF the DTC is still ACTIVE after the clear command then Turn the ignition off, disconnect the Scan Tool, close the doors and wait until all indicators on the Cluster have gone out, typically about 30 seconds.

1. Turn the ignition on.
2. With the scan tool, record and erase DTCs.

CAUTION: Make sure brake capability is available before road testing.

3. Road test the vehicle over 40 km/h (25 mph).

NOTE: Vehicle must be driven above 40 km/h (25 mph) for set conditions to be met.

4. With the scan tool, read DTCs.

   Is the DTC active at this time?

   Yes

   - Go To 3

   No

   - Go To 2

2. **CHECK WHEEL SPEED SENSOR SIGNALS**
   1. Turn the ignition on.
   2. With the scan tool, monitor and graph ALL the WSS speeds and compare graph while an assistant drives the vehicle.

   NOTE: If graph shows periodic dropouts pay close attention to the tone wheel.

   3. Slowly accelerate as straight as possible from a stop to 40 km/h (25 mph).

      Is the Left Rear WSS speed showing 0 km/h (0 mph), not matching other wheels, or showing erratic behavior?

      Yes

      - Go To 3

No

- Perform ABS INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE**.

3. **CHECK LEFT REAR WSS FOR LOOSENESS, INSPECT CIRCUITS/CONNECTORS/TERMINALS FOR DAMAGE**

NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals.

1. Turn the ignition off to the lock position.
2. Inspect the ABS Module harness connector and the Left Rear WSS harness connector.
3. Check the Left Rear WSS for looseness, excessive corrosion and not properly fastened.
4. Inspect the (B3) Left Rear WSS Signal and (B4) Left Rear WSS Supply circuits between the Left Rear WSS and Anti-Lock Brake Module for damage.

Is the Left Rear WSS loose or any of the wiring/connectors/terminals damaged?

Yes

- Repair as necessary.
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 4

4. **CHECK LEFT REAR WHEEL SPEED SENSOR FOR DAMAGE**

1. Remove the Left Rear Wheel Speed Sensor.
2. Inspect the Wheel Speed Sensor for proper mounting.
3. Inspect the Wheel Speed Sensor harness and connector.
4. Inspect the Wheel Speed Sensor for excessive debris on the sensor.

Is the Left Rear Wheel Speed Sensor damaged?

Yes

- Replace the Left Rear Wheel Speed Sensor in accordance with the Service Information. Refer to **SENSOR, WHEEL SPEED, REAR, REMOVAL** .
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 5

5. **CHECK LEFT REAR WHEEL BEARING AND HUB OR ENCODER FOR DAMAGE**

1. Inspect the Left Rear wheel bearing, hub and Encoder for excessive runout, clearance or damage.

   NOTE: Refer to the appropriate service information, if necessary, for procedures or specifications.

   Is the Left Rear Wheel Bearing, Hub or Encoder Damaged?

   Yes

   - Replace the Hub and Wheel Bearing in accordance with the Service Information. Refer to **HUB AND BEARING, REMOVAL** .
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 6

6. **LEFT REAR WHEEL SPEED SENSOR**
   1. Replace the Left Rear Wheel Speed Sensor in accordance with the Service Information. Refer to **SENSOR, WHEEL SPEED, REAR, REMOVAL** .
   2. Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
   3. Road test the vehicle over 40 km/h (25 mph).

      NOTE: Vehicle must be driven above 40 km/h (25 mph) for set conditions to be met.

   4. With the scan tool, read ABS DTCs.

      Does the DTC remain active?

      Yes

      - Replace the Anti-lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Test Complete.

C0037-4A-LEFT REAR WHEEL SPEED SENSOR - INCORRECT COMPONENT INSTALLED

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on and no system under voltage or over voltage condition present.

SET CONDITION

When the Anti-lock Brake System (ABS) Module detects that the wrong component is installed.

POSSIBLE CAUSES

Possible Causes
LEFT REAR WHEEL SPEED SENSOR ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**

   NOTE: If DTC C0037-1D is present, perform the diagnostics for this DTC before continuing with this diagnostic procedure.

   NOTE: This vehicle uses non-directional front wheel speed sensors and directional rear wheel speed sensors.

   NOTE: After erasing ACTIVE DTCs it may be necessary for the Anti-lock Brake System (ABS) Module to go to sleep before the DTCs are cleared. IF the DTC is still ACTIVE after the clear command then Turn the ignition off, disconnect the Scan Tool, close the doors and wait until all indicators on the Cluster have gone out, typically about 30 seconds.

   1. Ignition on.
   2. With the scan tool, record and erase DTCs.
   3. With the scan tool, read DTCs.

   Is the DTC active at this time?

   Yes

   - Go To 2

   No

   - Test Complete.

2. **LEFT REAR WHEEL SPEED SENSOR**

   NOTE: This vehicle uses a directional rear wheel speed sensor, make sure the

correct wheel speed sensor is installed on the vehicle.

1. Replace the Left Rear Wheel Speed Sensor in accordance with the Service Information. Refer to **SENSOR, WHEEL SPEED, REAR, REMOVAL** . Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   CAUTION: Make sure brake capability is available before road testing.

2. Road test the vehicle over 40 km/h (25 mph).
3. With the scan tool, read DTCs.

   Does the DTC remain active?

   Yes

   - Replace the Anti-lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

C0037-62-LEFT REAR WHEEL SPEED SENSOR - SIGNAL COMPARE FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on, no system under voltage or over voltage condition present, no open or shorted wheel speed sensor DTCs set, vehicle not under high acceleration, and vehicle speed greater than 0.

SET CONDITION

This DTC will be set if the wheel speed signal is 0 km/h (0 mph) or very low when compared to the other wheel speed signals.

POSSIBLE CAUSES

Possible Causes
IMPROPER LEFT REAR TIRE PRESSURE/MISMATCHED TIRES CHECK LEFT REAR WHEEL SPEED SENSOR FOR LOOSENESS INSPECT CIRCUITS/CONNECTOR/TERMINALS FOR DAMAGE

LEFT REAR WHEEL BEARING AND HUB OR ENCODER FOR DAMAGE
LEFT REAR WHEEL SPEED SENSOR
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**

NOTE: **If DTC C0037-1D is present, perform the diagnostics for this DTC before continuing with this diagnostic procedure.**

NOTE: **After erasing ACTIVE DTCs it may be necessary for the Anti-lock Brake System (ABS) Module to go to sleep before the DTCs are cleared. IF the DTC is still ACTIVE after the clear command then Turn the ignition off, disconnect the Scan Tool, close the doors and wait until all indicators on the Cluster have gone out, typically about 30 seconds.**

1. Turn the ignition on.
2. With the scan tool, record and erase DTCs.

CAUTION: Make sure brake capability is available before road testing.

3. Road test the vehicle over 40 km/h (25 mph).

NOTE: **Vehicle must be driven above 40 km/h (25 mph) for set conditions to be met.**

4. With the scan tool, read DTCs.

   Is the DTC active at this time?

   Yes

   - Go To 3

   No

   - Go To 2

2. **CHECK WHEEL SPEED SENSOR SIGNALS**
   1. Turn the ignition on.
   2. With the scan tool, monitor and graph ALL the WSS speeds and compare graph while an assistant drives the vehicle.

NOTE: If graph shows periodic dropouts pay close attention to the tone wheel.

3. Slowly accelerate as straight as possible from a stop to 40 km/h (25 mph).

   Is the Left Rear WSS speed showing 0 km/h (0 mph), not matching other wheels, or showing erratic behavior?

   Yes

   - Go To 3

   No

   - Perform ABS-INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE**.

3. **CHECK FOR IMPROPER LEFT REAR TIRE PRESSURE/MISMATCHED TIRES**
   1. Turn the ignition off.
   2. Check and adjust the Left Rear Tire pressure.
   3. Check and adjust all other tire pressures.
   4. Inspect for mismatched tires on vehicle.

   Is the Left Rear Tire improperly inflated or mismatched tires on vehicle?

   Yes

   - Repair as necessary
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 4

4. **CHECK LEFT REAR WSS FOR LOOSENESS, INSPECT CIRCUITS/CONNECTORS/TERMINALS FOR DAMAGE**

   NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals.

   1. Turn the ignition off to the lock position.
   2. Inspect the ABS Module harness connector and the Left Rear WSS harness connector.
   3. Check the Left Rear WSS for looseness, excessive corrosion and not properly fastened.
   4. Inspect the (B3) Left Rear WSS Signal and (B4) Left Rear WSS Supply circuits between the Left Rear WSS and Anti-Lock Brake Module for damage.

Is the Left Rear WSS loose or any of the wiring/connectors/terminals damaged?

Yes

- Repair as necessary.
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 5

5. **CHECK LEFT REAR WHEEL SPEED SENSOR FOR DAMAGE**
   1. Remove the Left Rear Wheel Speed Sensor.
   2. Inspect the Wheel Speed Sensor for proper mounting.
   3. Inspect the Wheel Speed Sensor harness and connector.
   4. Inspect the Wheel Speed Sensor for excessive debris on the sensor.

   Is the Left Rear Wheel Speed Sensor damaged?

   Yes

   - Replace the Left Rear Wheel Speed Sensor in accordance with the Service Information. Refer to **SENSOR, WHEEL SPEED, REAR, REMOVAL** .
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 6

6. **CHECK LEFT REAR WHEEL BEARING AND HUB OR ENCODER FOR DAMAGE**
   1. Inspect the Left Rear wheel bearing, hub and Encoder for excessive runout, clearance or damage.

   NOTE: Refer to the appropriate service information, if necessary, for procedures or specifications.

   Is the Left Rear Wheel Bearing, Hub or Encoder Damaged?

   Yes

   - Replace the Hub and Wheel Bearing in accordance with the Service Information. Refer to **HUB AND BEARING, REMOVAL** .
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

- Go To 7

7. **LEFT REAR WHEEL SPEED SENSOR**
   1. Replace the Left Rear Wheel Speed Sensor in accordance with the Service Information. Refer to **SENSOR, WHEEL SPEED, REAR, REMOVAL** .
   2. Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
   3. Road test the vehicle over 40 km/h (25 mph).

      NOTE: Vehicle must be driven above 40 km/h (25 mph) for set conditions to be met.

   4. With the scan tool, read ABS DTCs.

      Does the DTC remain active?

      Yes

      - Replace the Anti-Lock Brakes Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Test Complete.

C0039-02-RIGHT REAR TONE WHEEL - GENERAL SIGNAL FAILURE

For a complete wiring diagram **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on and no system under voltage or over voltage condition present.

SET CONDITION

When the Anti-lock Brake System (ABS) Module detects changes in Right Rear wheel speed.

POSSIBLE CAUSES

Possible Causes
CHECK RIGHT REAR WHEEL SPEED SENSOR FOR LOOSENESS
INSPECT CIRCUITS/CONNECTOR/TERMINALS FOR DAMAGE
RIGHT REAR WHEEL BEARING AND HUB OR ENCODER FOR DAMAGE
RIGHT REAR WHEEL SPEED SENSOR
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**

NOTE: **If DTC C003A-1D is present, perform the diagnostics for this DTC before continuing with this diagnostic procedure.**

NOTE: **After erasing ACTIVE DTCs it may be necessary for the Anti-lock Brake System (ABS) Module to go to sleep before the DTCs are cleared. IF the DTC is still ACTIVE after the clear command then Turn the ignition off, disconnect the Scan Tool, close the doors and wait until all indicators on the Cluster have gone out, typically about 30 seconds.**

1. Turn the ignition on.
2. With the scan tool, record and erase DTCs.

CAUTION: Make sure brake capability is available before road testing.

3. Road test the vehicle over 40 km/h (25 mph).

NOTE: **Vehicle must be driven above 40 km/h (25 mph) for set conditions to be met.**

4. With the scan tool, read DTCs.

Is the DTC active at this time?

Yes

- Go To 2

No

- The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.
- Perform the ABS-INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.

2. **CHECK RIGHT REAR WSS FOR LOOSENESS, INSPECT CIRCUITS/CONNECTORS/TERMINALS FOR DAMAGE**

NOTE: **Check all terminals for broken, bent, pushed out, or corroded terminals.**

1. Turn the ignition off to the lock position.
2. Inspect the ABS Module harness connector and the Right Rear WSS harness connector.
3. Check the Right Rear WSS for looseness, excessive corrosion and not properly fastened.
4. Inspect the (B1) Right Rear WSS Signal and (B2) Right Rear WSS Supply circuits between the Right Rear WSS and Anti-Lock Brake Module for damage.

   Is the Right Rear WSS loose or any of the wiring/connectors/terminals damaged?

   Yes

   - Repair as necessary.
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 3

3. **CHECK RIGHT REAR WHEEL SPEED SENSOR FOR DAMAGE**
   1. Remove the Right Rear Wheel Speed Sensor.
   2. Inspect the Wheel Speed Sensor for proper mounting.
   3. Inspect the Wheel Speed Sensor harness and connector.
   4. Inspect the Wheel Speed Sensor for excessive debris on the sensor.

   Is the Right Rear Wheel Speed Sensor damaged?

   Yes

   - Replace the Right Rear Wheel Speed Sensor in accordance with the Service Information. Refer to **SENSOR, WHEEL SPEED, REAR, REMOVAL** .
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 4

4. **CHECK RIGHT REAR WHEEL BEARING AND HUB OR ENCODER FOR DAMAGE**
   1. Inspect the Right Rear wheel bearing, hub and Encoder for excessive runout, clearance or damage.

   NOTE: Refer to the appropriate service information, if necessary, for procedures or specifications.

   Is the Right Rear Wheel Bearing, Hub or Encoder Damaged?

   Yes

- Replace the Hub and Wheel Bearing in accordance with the Service Information. Refer to **HUB AND BEARING, REMOVAL** .
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 5

5. **RIGHT REAR WHEEL SPEED SENSOR**
   1. Replace the Right Rear Wheel Speed Sensor in accordance with the Service Information. Refer to **SENSOR, WHEEL SPEED, FRONT, REMOVAL** .
   2. Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
   3. Road test the vehicle over 40 km/h (25 mph).

      NOTE: Vehicle must be driven above 40 km/h (25 mph) for set conditions to be met.

   4. With the scan tool, read ABS DTCs.

      Does the DTC remain active?

      Yes

      - Replace the Anti-Lock Brakes Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Test Complete.

C003A-1D-RIGHT REAR WHEEL SPEED SENSOR - CIRCUIT CURRENT OUT OF RANGE

For a complete wiring diagram **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 6: Wheel Speed Sensor Circuit Schematic
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the ignition on and no system under voltage or over voltage condition present.

SET CONDITION

When the Right Rear Wheel Speed Sensor circuit fails the diagnostic test.

POSSIBLE CAUSES

Possible Causes
CONNECTOR/TERMINAL DAMAGE
(B1) RIGHT REAR WHEEL SPEED SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
(B2) RIGHT REAR WHEEL SPEED SENSOR SUPPLY CIRCUIT SHORTED TO VOLTAGE
(B1) RIGHT REAR WHEEL SPEED SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
(B2) RIGHT REAR WHEEL SPEED SENSOR SUPPLY CIRCUIT SHORTED TO GROUND
(B1) RIGHT REAR WHEEL SPEED SENSOR SIGNAL CIRCUIT OPEN
(B2) RIGHT REAR WHEEL SPEED SENSOR SUPPLY CIRCUIT OPEN
(B2) RIGHT REAR WHEEL SPEED SENSOR SUPPLY CIRCUIT SHORTED TO THE (B1) RIGHT REAR WHEEL SPEED SENSOR SIGNAL CIRCUIT
RIGHT REAR WHEEL SPEED SENSOR
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**

NOTE: **After erasing ACTIVE DTCs it may be necessary for the Anti-lock Brake System (ABS) Module to go to sleep before the DTCs are cleared. IF the DTC is still ACTIVE after the clear command then Turn the ignition off, disconnect the Scan Tool, close the doors and wait until all indicators on the Cluster have gone out, typically about 30 seconds.**

1. Ignition on, engine not running.
2. With the scan tool, erase DTCs.
3. Cycle the ignition switch from off to on.
4. With the scan tool, select View DTCs.

Is the DTC active at this time?

Yes

- Go To 2

No

- The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.
- Perform the ABS-INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.

2. **CHECK CONNECTOR/TERMINAL FOR DAMAGE**

NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals.

1. Turn the ignition off to the lock position.
2. Inspect the Wheel Speed Sensor for proper mounting.
3. Inspect the Wheel Speed Sensor harness and connector.
4. Inspect the Wheel Speed Sensor for excessive debris on the sensor.

Were any problems found?

Yes

- Repair as necessary in accordance with the Service Information.
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 3

3. **CHECK (B2) RIGHT REAR WHEEL SPEED SENSOR SUPPLY CIRCUIT VOLTAGE**
   1. Disconnect the Right Rear Wheel Speed Sensor harness connector.
   2. Turn the ignition on.
   3. Measure the voltage between the (B2) Right Rear Wheel Speed Sensor Supply circuit and ground.

   Is the voltage above 10 volts?

   Yes

   - Go To 6

   No

   - Go To 4

4. **(B2) RIGHT REAR WHEEL SPEED SENSOR SUPPLY CIRCUIT SHORTED TO GROUND**
   1. Turn the ignition off.
   2. Disconnect the ABS Module harness connector.
   3. Measure the resistance between the (B2) Right Rear Wheel Speed Sensor Supply circuit and ground.

   Is the resistance below 5.0 Ohms?

   Yes

   - Repair the (B2) Right Rear Wheel Speed Sensor Supply circuit for a short to ground.
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 5

5. **(B2) RIGHT REAR WHEEL SPEED SENSOR SUPPLY CIRCUIT OPEN**
   1. Measure the resistance of the (B2) Right Rear Wheel Speed Sensor Supply circuit between the Right Rear Wheel Speed Sensor harness connector and the ABS harness connector.

      Is the resistance below 5 Ohms?

      Yes

      - Go To 6

      No

      - Repair the open (B2) Right Rear Wheel Speed Sensor Supply circuit.
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

6. **(B1) RIGHT REAR WHEEL SPEED SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE**
   1. Turn the ignition on.
   2. Measure the voltage of the (B1) Right Rear Wheel Speed Sensor Signal circuit at the Right Rear Wheel Speed Sensor harness connector.

      Is there any voltage present?

      Yes

      - Repair the (B1) Right Rear Wheel Speed Sensor Signal circuit for a short to voltage.
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Go To 7

7. **(B1) RIGHT REAR WHEEL SPEED SENSOR SIGNAL CIRCUIT SHORTED TO GROUND**
   1. Turn the ignition off.
   2. Measure the resistance between the (B1) Right Rear Wheel Speed Sensor Signal circuit and ground.

      Is the resistance below 5.0 Ohms?

      Yes

      - Repair the (B1) Right Rear Wheel Speed Sensor Signal circuit for a short to ground.
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 8

8. **(B1) RIGHT REAR WHEEL SPEED SENSOR SIGNAL CIRCUIT OPEN**
   1. Measure the resistance of the (B1) Right Rear Wheel Speed Sensor Signal circuit between the Right Rear Wheel Speed Sensor harness connector and the ABS harness connector.

      Is the resistance below 5 Ohms?

      Yes

      - Go To 9

      No

      - Repair the open (B1) Right Rear Wheel Speed Sensor Signal circuit.
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

9. **(B2) RIGHT REAR WHEEL SPEED SENSOR SUPPLY CIRCUIT SHORTED TO THE (B1) RIGHT REAR WHEEL SPEED SENSOR SIGNAL CIRCUIT**
   1. Turn the ignition off to the lock position.
   2. Measure the resistance between the (B2) Right Rear Wheel Speed Sensor Supply circuit and the (B1) Right Rear Wheel Speed Sensor Signal circuit at the Wheel Speed Sensor harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Repair (B2) Right Rear Wheel Speed Sensor Supply circuit for a short to the (B1) Right Rear Wheel Speed Sensor Signal circuit.
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Go To 10

10. **RIGHT REAR WHEEL SPEED SENSOR**
    1. Replace the Right Rear Wheel Speed Sensor in accordance with the Service Information. Refer to **SENSOR, WHEEL SPEED, REAR, REMOVAL** .
    2. Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

       CAUTION: Make sure brake capability is available before road testing.

    3. Road test the vehicle over 40 km/h (25 mph).

NOTE: Vehicle must be driven above 40 km/h (25 mph) for set conditions to be meet.

4. With the scan tool, read ABS DTCs.

   Is the status Active for this DTC?

   Yes

   - Replace the Anti-lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

C003A-2F-RIGHT REAR WHEEL SPEED SENSOR - SIGNAL ERRATIC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on and no system under voltage or over voltage condition present.

SET CONDITION

When the Anti-lock Brake System (ABS) Module detects multiple drastic changes in Right Rear wheel speed.

POSSIBLE CAUSES

Possible Causes
CHECK RIGHT REAR WHEEL SPEED SENSOR FOR LOOSENESS
INSPECT CIRCUITS/CONNECTOR/TERMINALS FOR DAMAGE
RIGHT REAR WHEEL BEARING AND HUB OR ENCODER FOR DAMAGE
RIGHT REAR WHEEL SPEED SENSOR
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**

NOTE: If DTC C003A-1D is present, perform the diagnostics for this DTC before continuing with this diagnostic procedure.

NOTE: After erasing ACTIVE DTCs it may be necessary for the Anti-lock Brake System (ABS) Module to go to sleep before the DTCs are cleared. IF the DTC is still ACTIVE after the clear command then Turn the ignition off, disconnect the Scan Tool, close the doors and wait until all indicators on the Cluster have gone out, typically about 30 seconds.

1. Turn the ignition on.
2. With the scan tool, record and erase DTCs.

CAUTION: Make sure brake capability is available before road testing.

3. Road test the vehicle over 40 km/h (25 mph).

NOTE: Vehicle must be driven above 40 km/h (25 mph) for set conditions to be met.

4. With the scan tool, read DTCs.

   Is the DTC active at this time?

   Yes

   - Go To 3

   No

   - Go To 2

2. **CHECK WHEEL SPEED SENSOR SIGNALS**
   1. Turn the ignition on.
   2. With the scan tool, monitor and graph ALL the WSS speeds and compare graph while an assistant drives the vehicle.

   NOTE: If graph shows periodic dropouts pay close attention to the tone wheel.

   3. Slowly accelerate as straight as possible from a stop to 40 km/h (25 mph).

      Is the Right Rear WSS speed showing 0 km/h (0 mph), not matching other wheels, or showing erratic behavior?

      Yes

      - Go To 3

No

- Perform the ABS INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE**.

3. **CHECK RIGHT REAR WSS FOR LOOSENESS, INSPECT CIRCUITS/CONNECTORS/TERMINALS FOR DAMAGE**

NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals.

1. Turn the ignition off to the lock position.
2. Inspect the ABS Module harness connector and the Right Rear WSS harness connector.
3. Check the Right Rear WSS for looseness, excessive corrosion and not properly fastened.
4. Inspect the (B1) Right Rear WSS Signal and (B2) Right Rear WSS Supply circuits between the Right Rear WSS and Anti-Lock Brake Module for damage.

Is the Right Rear WSS loose or any of the wiring/connectors/terminals damaged?

Yes

- Repair as necessary.
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 4

4. **CHECK RIGHT REAR WHEEL SPEED SENSOR FOR DAMAGE**

1. Remove the Right Rear Wheel Speed Sensor.
2. Inspect the Wheel Speed Sensor for proper mounting.
3. Inspect the Wheel Speed Sensor harness and connector.
4. Inspect the Wheel Speed Sensor for excessive debris on the sensor.

Is the Right Rear Wheel Speed Sensor damaged?

Yes

- Replace the Right Rear Wheel Speed Sensor in accordance with the Service Information. Refer to **SENSOR, WHEEL SPEED, REAR, REMOVAL** .
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 5

5. **CHECK RIGHT REAR WHEEL BEARING AND HUB OR ENCODER FOR DAMAGE**

1. Inspect the Right Rear wheel bearing, hub and Encoder for excessive runout, clearance or damage.

   NOTE: Refer to the appropriate service information, if necessary, for procedures or specifications.

   Is the Right Rear Wheel Bearing, Hub or Encoder Damaged?

   Yes

   - Replace the Hub and Wheel Bearing in accordance with the Service Information. Refer to **HUB AND BEARING, REMOVAL** .
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 6

6. **RIGHT REAR WHEEL SPEED SENSOR**
   1. Replace the Right Rear Wheel Speed Sensor in accordance with the Service Information. Refer to **SENSOR, WHEEL SPEED, REAR, REMOVAL** .
   2. Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
   3. Road test the vehicle over 40 km/h (25 mph).

      NOTE: Vehicle must be driven above 40 km/h (25 mph) for set conditions to be met.

   4. With the scan tool, read ABS DTCs.

      Does the DTC remain active?

      Yes

      - Replace the Anti-Lock Brakes Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Test Complete.

C003A-4A-RIGHT REAR WHEEL SPEED SENSOR - INCORRECT COMPONENT INSTALLED

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on and no system under voltage or over voltage condition present.

SET CONDITION

When the Anti-lock Brake System (ABS) Module detects that the wrong component is installed.

POSSIBLE CAUSES

Possible Causes
RIGHT REAR WHEEL SPEED SENSOR ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**

   NOTE: If DTC C003A-1D is present, perform the diagnostics for this DTC before continuing with this diagnostic procedure.

   NOTE: This vehicle uses non-directional front wheel speed sensors and directional rear wheel speed sensors.

   NOTE: After erasing ACTIVE DTCs it may be necessary for the Anti-lock Brake System (ABS) Module to go to sleep before the DTCs are cleared. IF the DTC is still ACTIVE after the clear command then Turn the ignition off, disconnect the Scan Tool, close the doors and wait until all indicators on the Cluster have gone out, typically about 30 seconds.

   1. Ignition on.
   2. With the scan tool, record and erase DTCs.
   3. With the scan tool, read DTCs.

   Is the DTC active at this time?

   Yes

   - Go To 2

   No

   - Test Complete.

2. **RIGHT REAR WHEEL SPEED SENSOR**

   NOTE: This vehicle uses a directional rear wheel speed sensor, make sure the

correct wheel speed sensor is installed on the vehicle.

1. Replace the Right Rear Wheel Speed Sensor in accordance with the Service Information. Refer to **SENSOR, WHEEL SPEED, REAR, REMOVAL** . Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   CAUTION: Make sure brake capability is available before road testing.

2. Road test the vehicle over 40 km/h (25 mph).
3. With the scan tool, read DTCs.

   Does the DTC remain active?

   Yes

   - Replace the Anti-lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

C003A-62-RIGHT REAR WHEEL SPEED SENSOR - SIGNAL COMPARE FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on, no system under voltage or over voltage condition present, no open or shorted wheel speed sensor DTCs set, vehicle not under high acceleration, and vehicle speed greater than 0.

SET CONDITION

This DTC will be set if the wheel speed signal is 0 km/h (0 mph) or very low when compared to the other wheel speed signals.

POSSIBLE CAUSES

Possible Causes
IMPROPER RIGHT REAR TIRE PRESSURE/MISMATCHED TIRES CHECK RIGHT REAR WHEEL SPEED SENSOR FOR LOOSENESS INSPECT CIRCUITS/CONNECTOR/TERMINALS FOR DAMAGE

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**

NOTE: **If DTC C003A-1D is present, perform the diagnostics for this DTC before continuing with this diagnostic procedure.**

NOTE: **After erasing ACTIVE DTCs it may be necessary for the Anti-lock Brake System (ABS) Module to go to sleep before the DTCs are cleared. IF the DTC is still ACTIVE after the clear command then Turn the ignition off, disconnect the Scan Tool, close the doors and wait until all indicators on the Cluster have gone out, typically about 30 seconds.**

1. Turn the ignition on.
2. With the scan tool, record and erase DTCs.

CAUTION: Make sure brake capability is available before road testing.

3. Road test the vehicle over 40 km/h (25 mph).

NOTE: **Vehicle must be driven above 40 km/h (25 mph) for set conditions to be met.**

4. With the scan tool, read DTCs.

Is the DTC active at this time?

Yes

- Go To 3

No

- Go To 2

2. **CHECK WHEEL SPEED SENSOR SIGNALS**
   1. Turn the ignition on.
   2. With the scan tool, monitor and graph ALL the WSS speeds and compare graph while an assistant drives the vehicle.

NOTE: If graph shows periodic dropouts pay close attention to the tone wheel.

3. Slowly accelerate as straight as possible from a stop to 40 km/h (25 mph).

   Is the Right Rear WSS speed showing 0 km/h (0 mph), not matching other wheels, or showing erratic behavior?

   Yes

   - Go To 3

   No

   - Perform ABS-INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE**.

3. **CHECK FOR IMPROPER RIGHT REAR TIRE PRESSURE/MISMATCHED TIRES**
   1. Turn the ignition off.
   2. Check and adjust the Right Rear Tire pressure.
   3. Check and adjust all other tire pressures.
   4. Inspect for mismatched tires on vehicle.

   Is the Right Rear Tire improperly inflated or mismatched tires on vehicle?

   Yes

   - Repair as necessary
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 4

4. **CHECK RIGHT REAR WSS FOR LOOSENESS, INSPECT CIRCUITS/CONNECTORS/TERMINALS FOR DAMAGE**

   NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals.

   1. Turn the ignition off to the lock position.
   2. Inspect the ABS Module harness connector and the Right Rear WSS harness connector.
   3. Check the Right Rear WSS for looseness, excessive corrosion and not properly fastened.
   4. Inspect the (B1) Right Rear WSS Signal and (B2) Right Rear WSS Supply circuits between the Right Rear WSS and Anti-Lock Brake Module for damage.

Is the Right Rear WSS loose or any of the wiring/connectors/terminals damaged?

Yes

- Repair as necessary.
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 5

5. **CHECK RIGHT REAR WHEEL SPEED SENSOR FOR DAMAGE**
   1. Remove the Right Rear Wheel Speed Sensor.
   2. Inspect the Wheel Speed Sensor for proper mounting.
   3. Inspect the Wheel Speed Sensor harness and connector.
   4. Inspect the Wheel Speed Sensor for excessive debris on the sensor.

   Is the Right Rear Wheel Speed Sensor damaged?

   Yes

   - Replace the Right Rear Wheel Speed Sensor in accordance with the Service Information. Refer to **SENSOR, WHEEL SPEED, REAR, REMOVAL** .
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 6

6. **CHECK RIGHT REAR WHEEL BEARING AND HUB OR ENCODER FOR DAMAGE**
   1. Inspect the Right Rear wheel bearing, hub and Encoder for excessive runout, clearance or damage.

   NOTE: Refer to the appropriate service information, if necessary, for procedures or specifications.

   Is the Right Rear Wheel Bearing, Hub or Encoder Damaged?

   Yes

   - Replace the Hub and Wheel Bearing in accordance with the Service Information. Refer to **HUB AND BEARING, REMOVAL** .
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

- Go To 7

7. **RIGHT REAR WHEEL SPEED SENSOR**
   1. Replace the Right Rear Wheel Speed Sensor in accordance with the Service Information. Refer to **SENSOR, WHEEL SPEED, REAR, REMOVAL** .
   2. Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
   3. Road test the vehicle over 40 km/h (25 mph).

      NOTE: Vehicle must be driven above 40 km/h (25 mph) for set conditions to be met.

   4. With the scan tool, read ABS DTCs.

      Does the DTC remain active?

      Yes

      - Replace the Anti-Lock Brakes Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Test Complete.

C0040-29-BRAKE PEDAL SWITCH - SIGNAL INVALID

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 7: Identifying Stop Lamp Switch Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Anti-lock Brake System (ABS) Module monitors the Normally Open and Normally Closed Brake Switch status from the Body Control Module (BCM) over the CAN BUS. The Normally Open switch should always activate before the Normally Closed switch.

WHEN MONITORED

With the ignition on and no system under voltage condition present.

SET CONDITION

When the Body Control Module (BCM) indicates that the Normally Closed brake switch signal indicates brake applied and the Normally Open Brake Switch signal Indicates Brake Not applied for 500 msec.

POSSIBLE CAUSES

Possible Causes
BRAKE SIGNAL 1 CIRCUIT OPEN OR SHORTED TO GROUND
BRAKE SIGNAL 2 CIRCUIT OPEN OR SHORTED TO GROUND
STOPLAMP SWITCH
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**

NOTE: **After erasing ACTIVE DTCs it may be necessary for the Anti-lock Brake System (ABS) Module to go to sleep before the DTCs are cleared. IF the DTC is still ACTIVE after the clear command then Turn the ignition off, disconnect the Scan Tool, close the doors and wait until all indicators on the Cluster have gone out, typically about 30 seconds.**

NOTE: **Check for loose terminals at Fuse 26 in the PDC. Repair as necessary.**

NOTE: **Verify that the Brake Switch is installed correctly on the vehicle before proceeding.**

1. Turn the ignition on.
2. With the scan tool, read DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Go To 2

   No

   - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK THE (B135) BRAKE SIGNAL 1 CIRCUIT FOR A SHORT TO GROUND OR OPEN**

NOTE: The (B135) Brake Signal 1 circuit is normally OPEN when the brake pedal is NOT PRESSED.

1. Turn the ignition off.
2. Disconnect the BCM C4 harness connector.
3. With the Brake Pedal PRESSED, measure the voltage of the (B135) Brake Signal 1 circuit at the BCM C4 harness connector.

   Is the voltage above 10 volts?

   Yes

   - Go To 3

   No

   - Using the wiring diagrams as a guide, repair the (B135) Brake Signal 1 circuit for an open or short to ground.

     NOTE: Check for loose terminals at Fuse 26 in the PDC. Repair as necessary.

   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (B134) BRAKE SIGNAL 2 CIRCUIT FOR A SHORT TO GROUND OR OPEN**

NOTE: The (B134) Brake Signal 2 circuit is normally CLOSED when the brake pedal is NOT PRESSED.

1. Turn the ignition on.
2. With the Brake Pedal NOT PRESSED, measure the voltage of the (B135) Brake Signal 1 circuit at the BCM C4 harness connector.

   Is the voltage above 10 volts?

   Yes

   - Replace the Body Control Module (BCM) in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

- Using the wiring diagrams as a guide, repair the (B134) Brake Signal 2 circuit for an open or short to ground.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

C0040-2A-BRAKE PEDAL SWITCH - STUCK

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 8: Identifying Stop Lamp Switch Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The brake switch stuck on test checks for a high vehicle speed condition where the brake switch is continually pressed.

WHEN MONITORED

Monitoring conditions

SET CONDITION

The brake switch rationality checks both failure modes of the brake switch. The brake switch stuck on test checks for a high vehicle speed condition where the brake switch is continually depressed. The brake switch stuck off test checks for brake pressure present with the brake switch saying not pressed.

POSSIBLE CAUSES

Possible Causes
STOPLAMP SWITCH INSTALLATION/ADJUSTMENT
BODY CONTROL MODULE (BCM) DTCs
POWERTRAIN CONTROL MODULE (PCM) DTCS
(B134) BRAKE SWITCH 2 SIGNAL CIRCUIT SHORTED TO GROUND
(B134) BRAKE SWITCH 2 SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
(B135) BRAKE SWITCH 1 SIGNAL CIRCUIT SHORTED TO VOLTAGE
STOPLAMP SWITCH
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

1. **CHECK BODY CONTROL MODULE (BCM) DTCs**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs in the BCM.

       Are there any BCM Stop Lamp Switch related DTCs present?

       Yes

       - Perform the appropriate diagnostic procedure. Refer to the **BODY CONTROL MODULE (BCM) - DIAGNOSTIC CODE INDEX** article .

       No

       - Go To 2
2. **CHECK POWERTRAIN CONTROL MODULE (PCM) DTCs**
    1. Turn the ignition on.

2. With the scan tool, read DTCs in the PCM.

   Are there any PCM Stop Lamp Switch related DTCs present?

   Yes

   - Perform the appropriate diagnostic procedure. Refer to the **DTC INDEX** article .

   No

   - Go To 3

3. **STOP LAMP SWITCH OPERATION**
   1. Start the engine.
   2. Using the scan tool, monitor the brake pedal switch status while pressing the brake pedal and releasing.

      Is the Stop Lamp Switch operating correctly?

      Yes

      - Go To 4

      No

      - Go To 5

4. **BRAKE PEDAL PRESSURE**
   1. Using the scan tool, monitor the brake pedal pressure and the status of the brake pedal switch while slowly pressing the brake pedal.

      Was there Brake Pressure before the Brake Pedal Switch status changed?

      Yes

      - Check for correct Stop Lamp Switch Installation. Refer to **SWITCH, STOP LAMP, INSTALLATION** .

      No

      - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE** for 2.0L diesel engine, **STANDARD PROCEDURE** for 2.4L gasoline engine or **STANDARD PROCEDURE** for 3.2L gasoline engine. .

5. **(B134) BRAKE SIGNAL 2 CIRCUIT**
   1. Turn the ignition off.
   2. Disconnect the Stop Lamp Switch harness connector.

3. Using a 12-volt test light connected to 12 volts, check the (B134) Brake Signal 2 circuit at the Stop Lamp Switch harness connector while pressing and releasing the brake pedal several times.

   Does the test light change from illuminated to not illuminated as the brake pedal is pressed and released?

   Yes

   - Go To 6

   No

   - Go To 7

6. **(B135) BRAKE SIGNAL 1 CIRCUIT**
   1. Turn the ignition on.
   2. Using a 12-volt test light connected to ground, check the (B135) Brake Signal 1 circuit at the Stop Lamp Switch harness connector while pressing and releasing the brake pedal several times.

      Does the test light change from illuminated to not illuminated as the brake pedal is pressed and released?

      Yes

      - Go To 11

      No

      - Go To 9

7. **(B134) BRAKE SIGNAL 2 CIRCUIT SHORTED TO GROUND**
   1. Disconnect the PCM C1 harness connector.
   2. Measure the resistance between ground and the (B134) Brake Signal 2 circuit in the Stop Lamp Switch harness connector.

      Is the resistance below 100 Ohms?

      Yes

      - Repair the (B134) Brake Signal 2 circuit for a short to ground.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **STANDARD PROCEDURE** for 2.0L diesel engine, **STANDARD PROCEDURE** for 2.4L gasoline engine or **STANDARD PROCEDURE** for 3.2L gasoline engine.

      No

- Go To 8

8. **(B134) BRAKE SIGNAL 2 CIRCUIT OPEN OR HIGH RESISTANCE**
   1. Measure the resistance of the (B134) Brake Signal 2 circuit between the Stop Lamp Switch harness connector and the PCM C1 harness connector.

      Is the resistance below 5.0 ohms?

      Yes

      - Go To 10

      No

      - Repair the (B134) Brake Signal 2 circuit for an open or high resistance.
      - Perform the PCM VERIFICATION Test. Refer to **STANDARD PROCEDURE** for 2.0L diesel engine, **STANDARD PROCEDURE** for 2.4L gasoline engine or **STANDARD PROCEDURE** for 3.2L gasoline engine.
9. **(B135) BRAKE SIGNAL 1 CIRCUIT SHORTED TO VOLTAGE**
   1. Measure the voltage of the (B135) Brake Signal 1 circuit in the Stop Lamp Switch harness connector.

      Is there any voltage present?

      Yes

      - Repair the (B135) Brake Signal 1 circuit for a short to voltage.
      - Perform the PCM VERIFICATION Test. Refer to **STANDARD PROCEDURE** for 2.0L diesel engine, **STANDARD PROCEDURE** for 2.4L gasoline engine or **STANDARD PROCEDURE** for 3.2L gasoline engine.

      No

      - Go To 10
10. **STOPLAMP SWITCH**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Stop Lamp Switch and the Powertrain Control Module (PCM).
    2. Look for any chafed, pierced, pinched, or partially broken wires.
    3. Look for broken, bent, pushed out or corroded terminals.
    4. Refer to any Technical Service Bulletins that may apply.
    5. Replace the Stop Lamp Switch in accordance with the Service Information. Perform the PCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** for 2.0L diesel engine, **STANDARD PROCEDURE** for 2.4L gasoline engine or **STANDARD PROCEDURE** for 3.2L gasoline engine.

6. With the scan tool, read DTCs in the ABS Module.

   Does the DTC remain active?

   Yes

   - Go To 11

   No

   - Replace the Stop Lamp Switch in accordance with the Service Information.
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

11. **ANTI-LOCK BRAKE SYSTEM (ABS) MODULE**
    1. With the scan tool, erase DTCs in the ABS Module.
    2. Press and release the brake pedal.
    3. With the scan tool, read DTCs in the ABS Module.

       Does the DTC remain active?

       Yes

       - Replace the Anti-lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
       - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

       No

       - Test Complete.
       - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C0040-62-BRAKE PEDAL SWITCH - SIGNAL COMPARE FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 9: Identifying Stop Lamp Switch Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The brake switch stuck on test checks for a high vehicle speed condition where the brake switch is continually pressed.

WHEN MONITORED

Monitoring conditions

SET CONDITION

The brake switch rationality checks both failure modes of the brake switch. The brake switch stuck on test checks for a high vehicle speed condition where the brake switch is continually depressed. The brake switch stuck off test checks for brake pressure present with the brake switch saying not pressed.

POSSIBLE CAUSES

Possible Causes
STOPLAMP SWITCH INSTALLATION/ADJUSTMENT
BODY CONTROL MODULE (BCM) DTCs
POWERTRAIN CONTROL MODULE (PCM) DTCS
(B135) BRAKE SWITCH 1 SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
STOPLAMP SWITCH
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

1. **CHECK BODY CONTROL MODULE (BCM) DTCs**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs in the BCM.

    Are there any BCM Stop Lamp Switch related DTCs present?

    Yes

    - Perform the appropriate diagnostic procedure. Refer to the **BODY CONTROL MODULE (BCM) - DIAGNOSTIC CODE INDEX** article .

    No

    - Go To 2
2. **CHECK POWERTRAIN CONTROL MODULE (PCM) DTCs**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs in the PCM.

    Are there any PCM Stop Lamp Switch related DTCs present?

    Yes

    - Perform the appropriate diagnostic procedure. Refer to the **DTC INDEX** article .

    No

- Go To 3

3. **STOP LAMP SWITCH OPERATION**
   1. Start the engine.
   2. Using the scan tool, monitor the brake pedal switch status while pressing the brake pedal and releasing.

      Is the Stop Lamp Switch operating correctly?

      Yes

      - Go To 4

      No

      - Go To 5
4. **BRAKE PEDAL PRESSURE**
   1. Using the scan tool, monitor the brake pedal pressure and the status of the brake pedal switch while slowly pressing the brake pedal.

      Was there Brake Pressure before the Brake Pedal Switch status changed?

      Yes

      - Check for correct Stop Lamp Switch Installation. Refer to **SWITCH, STOP LAMP, INSTALLATION** .

      No

      - Perform the INTERMITTENT CONDITION diagnostic procedure. Refer to **STANDARD PROCEDURE** for 2.0L diesel engine, **STANDARD PROCEDURE** for 2.4L gasoline engine or **STANDARD PROCEDURE** for 3.2L gasoline engine.
5. **(B134) BRAKE SIGNAL 2 CIRCUIT**
   1. Turn the ignition off.
   2. Disconnect the Stop Lamp Switch harness connector.
   3. Using a 12-volt test light connected to 12 volts, check the (B134) Brake Signal 2 circuit at the Stop Lamp Switch harness connector while pressing and releasing the brake pedal several times.

      Does the test light change from illuminated to not illuminated as the brake pedal is pressed and released?

      Yes

      - Go To 6

No

- Go To 7

6. **(B135) BRAKE SIGNAL 1 CIRCUIT**
   1. Turn the ignition on.
   2. Using a 12-volt test light connected to ground, check the (B135) Brake Signal 1 circuit at the Stop Lamp Switch harness connector while pressing and releasing the brake pedal several times.

      Does the test light change from illuminated to not illuminated as the brake pedal is pressed and released?

      Yes

      - Go To 8

      No

      - Go To 7
7. **(B135) BRAKE SIGNAL 1 CIRCUIT OPEN OR HIGH RESISTANCE**
   1. Measure the resistance of the (B135) Brake Signal 1 circuit between the Stop Lamp Switch harness connector and the PCM C1 harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 8

      No

      - Repair the (B135) Brake Signal 1 circuit for an open or high resistance.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **STANDARD PROCEDURE** for 2.0L diesel engine, **STANDARD PROCEDURE** for 2.4L gasoline engine or **STANDARD PROCEDURE** for 3.2L gasoline engine.
8. **STOPLAMP SWITCH**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Stop Lamp Switch and the Powertrain Control Module (PCM).
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Refer to any Technical Service Bulletins that may apply.
   5. Replace the Stop Lamp Switch in accordance with the Service Information. Perform the PCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** for 2.0L diesel engine, **STANDARD PROCEDURE** for 2.4L gasoline engine or **STANDARD PROCEDURE** for 3.2L gasoline engine.

6. With the scan tool, read DTCs in the ABS Module.

   Does the DTC remain active?

   Yes

   - Go To 9

   No

   - Replace the Stop Lamp Switch in accordance with the Service Information.
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

9. **ANTI-LOCK BRAKE SYSTEM (ABS) MODULE**
   1. With the scan tool, erase DTCs in the ABS Module.
   2. Press and release the brake pedal.
   3. With the scan tool, read DTCs in the ABS Module.

      Does the DTC remain active?

      Yes

      - Replace the Integrated Control Unit (ICU) in accordance with the Service Information. Refer to **INTEGRATED CONTROL UNIT (ICU), REMOVAL** .
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Test Complete.
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C0044-01-BRAKE PRESSURE SENSOR 1 - GENERAL ELECTRICAL FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

When the Anti-Lock Brake Module indicates that the Brake Pressure Sensor Signal is out of range.

POSSIBLE CAUSES

Possible Causes
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE HYDRAULIC CONTROL UNIT (HCU)

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**

NOTE: **After erasing ACTIVE DTCs it may be necessary for the Anti-lock Brake System (ABS) Module to go to sleep before the DTCs are cleared. IF the DTC is still ACTIVE after the clear command then Turn the ignition off, disconnect the Scan Tool, close the doors and wait until all indicators on the Cluster have gone out, typically about 30 seconds.**

NOTE: **This DTC must be active for the results of this test to be valid.**

1. Turn the ignition on.
2. With the scan tool, read and record DTCs.
3. With the scan tool, read and record Freeze Fame information.
4. With the scan tool, erase DTCs.
5. Start the engine.
6. Press the brake pedal firmly and release.
7. With the scan tool, read and record DTCs.

Is the DTC active at this time?

Yes

- Go To 2

No

- Perform the ABS-INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.

2. **ANTI-LOCK BRAKE SYSTEM (ABS) MODULE**
   1. Replace the Anti-Lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
   2. Ignition on, engine not running.
   3. With the scan tool, erase DTCs.
   4. Start the engine.
   5. Press the brake pedal firmly and release.
   6. With the scan tool, read and record DTCs.

Does the DTC remain active?

Yes

- Replace the Hydraulic Control Unit (HCU) in accordance with the Service Information.
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete.

C0044-28-BRAKE PRESSURE SENSOR 1 - SIGNAL BIAS LEVEL OUT OF RANGE / ZERO ADJUSTMENT FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

NOTE: Repair all other DTC's before continuing with this diagnostic procedure.

WHEN MONITORED

Ignition on.

SET CONDITION

The Anti-lock Brake System (ABS) Module has detected brake pressure when the brake pedal has not been applied.

POSSIBLE CAUSES

Possible Causes
BRAKE FLUID CONTAMINATION
STOP LAMP SWITCH INSTALLATION/ADJUSTMENT
PINCHED OR BENT BRAKE LINES
STOP LAMP SWITCH
POWER BRAKE BOOSTER
INTEGRATED CONTROL UNIT (ICU)

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**

NOTE: After erasing ACTIVE DTCs it may be necessary for the Anti-lock Brake System (ABS) Module to go to sleep before the DTCs are cleared. IF the DTC is still ACTIVE after the clear command then Turn the ignition off, disconnect the Scan Tool, close the doors and wait until all indicators on

the Cluster have gone out, typically about 30 seconds.

NOTE: This DTC must be active for the results of this test to be valid.

1. Turn the ignition on.
2. With the scan tool, read and record DTCs.
3. With the scan tool, read and record Freeze Fame information.
4. With the scan tool, erase DTCs.
5. Start the engine.
6. Press the brake pedal firmly and release.
7. With the scan tool, read and record DTCs.

   Is the DTC active at this time?

   Yes

   - Go To 2

   No

   - Perform the ABS INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.

2. **MECHANICAL BRAKE SYSTEM INSPECTION**
   1. Turn the ignition off.
   2. Check the brake fluid for contaminants.
   3. Visually inspect the brake lines between the Brake Master Cylinder and the Integrated Control Unit (ICU) for bent, damaged, or pinched restrictions.

      Where any problems found?

      Yes

      - Repair as necessary.
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Go To 3

3. **BRAKE FLUID PRESSURE**
   1. Start the engine.
   2. The brake pedal released.
   3. With the scan tool, under "Data Display" read the Brake Fluid Pressure.

Is the Brake Fluid Pressure below 10 bar (145 psi)?

Yes

- Go To 4

No

- Go To 5

4. **BRAKE PEDAL INSPECTION**
   1. Turn the ignition off.
   2. Check the brake pedal for damage or restrictions not allowing it to fully return.

   Where any problems found?

   Yes

   - Repair as necessary.
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Replace the Integrated Control Unit (ICU) in accordance with the Service Information.
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
5. **BRAKE PEDAL STOP LAMP SWITCH**
   1. Start the engine.
   2. With the scan tool, under "Data Display" monitor the BL Switch and the Brake Fluid Pressure.
   3. Press the brake pedal slowly.

   Did the BL Switch indicate pressed before their was Brake Fluid Pressure?

   Yes

   - Go To 6

   No

   - Repair or replace the Stop Lamp Switch in accordance with the Service Information. Refer to **SWITCH, STOP LAMP, REMOVAL** .
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
6. **INTEGRATED CONTROL UNIT (ICU)**
   1. Disconnect the Primary brake line between the master cylinder and the Integrated Control Unit (ICU).

2. With the scan tool, under "Data Display" read the Brake Oil Pressure.

   Is the Brake Oil Pressure below 10 bar (145 psi)?

   Yes

   - Replace the Brake Master Cylinder in accordance with the Service Information. Refer to **MASTER CYLINDER, BRAKE, REMOVAL** .
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Replace the Integrated Control Unit (ICU) in accordance with the Service Information. Refer to **INTEGRATED CONTROL UNIT (ICU), REMOVAL** .
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C0044-64-BRAKE PRESSURE SENSOR 1 - SIGNAL PLAUSIBILITY FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Ignition on.

SET CONDITION

The Anti-lock Brake System (ABS) Module has detected a moderate deceleration without a change in brake pressure.

POSSIBLE CAUSES

Possible Causes
BRAKE FLUID LEVEL LOW OR CONTAMINATED
AIR IN BRAKE SYSTEM
INTEGRATED CONTROL UNIT (ICU)

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**

   NOTE: After erasing ACTIVE DTCs it may be necessary for the Anti-lock Brake System (ABS) Module to go to sleep before the DTCs are cleared. IF the DTC is still ACTIVE after the clear command then Turn the ignition off, disconnect the Scan Tool, close the doors and wait until all indicators on the Cluster have gone out, typically about 30 seconds.

NOTE: This DTC must be active for the results of this test to be valid.

1. Turn the ignition on.
2. With the scan tool, read and record DTCs.
3. With the scan tool, read and record Freeze Fame information.
4. With the scan tool, erase DTCs.
5. Start the engine.
6. Press the brake pedal firmly and release.
7. With the scan tool, read and record DTCs.

   Is the DTC active at this time?

   Yes

   - Go To 2

   No

   - Perform the ABS INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.

2. **MECHANICAL BRAKE SYSTEM INSPECTION**
   1. Turn the ignition off.
   2. Check the brake fluid level.
   3. Visually inspect the brake fluid for contaminants.
   4. Check base brake issues.
   5. Visually inspect all the brake lines for bent, damaged, or pinched restrictions.

      Where any problems found?

      Yes

      - Repair as necessary.
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Replace the Integrated Control Unit (ICU) in accordance with the Service Information. Refer to **INTEGRATED CONTROL UNIT (ICU), REMOVAL** .
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C0051-22-STEERING WHEEL POSITION SENSOR - SIGNAL AMPLITUDE > MAXIMUM

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With ignition on, but not if a CAN time out failure is detected.

SET CONDITION

If the Anti-Lock Brakes System (ABS) Module detects sensor overtravel over 720 degrees.

NOTE: The Steering Angle Sensor (SAS) is internal to the Steering Gear.

POSSIBLE CAUSES

Possible Causes
STEERING WHEEL ALIGNMENT
STEERING COLUMN OR INTERMEDIATE SHAFT IMPROPERLY INSTALLED OR DAMAGED
ELECTRIC POWER STEERING (EPS) MODULE
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE/INTEGRATED CONTROL UNIT (ICU)

NOTE: Diagnose and repair any Electric Power Steering (EPS) Module DTCs before continuing with this diagnostic procedure.

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**

NOTE: After erasing ACTIVE DTCs it may be necessary for the Anti-lock Brake System (ABS) Module to go to sleep before the DTCs are cleared. IF the DTC is still ACTIVE after the clear command then Turn the ignition off, disconnect the Scan Tool, close the doors and wait until all indicators on the Cluster have gone out, typically about 30 seconds.

NOTE: This DTC must be active for the results of this test to be valid.

1. Perform any Technical Service Bulletins (TSBs) that may apply.
2. Ignition on, engine not running.
3. Using the scan tool, read and record DTCs.
4. Using the scan tool, read and record Environmental Data.
5. Using the scan tool, erase DTCs.
6. Start the engine.
7. Slowly turn the steering wheel from lock to lock.
8. Using the scan tool, read and record DTCs.

Is the DTC active at this time?

Yes

- Go To 2

No

- Perform the ABS-INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.

2. **INSPECT THE WHEEL ALIGNMENT, STEERING COLUMN AND INTERMEDIATE SHAFT FOR INCORRECT INSTALLATION OR DAMAGE**

NOTE: If available, check the vehicle repair history for collision damage.

1. Turn the ignition off.
2. Inspect the vehicle for proper wheel alignment.
3. Inspect the vehicle for damage causing tracking problems or steering wheel misalignment.
4. Inspect the steering column and intermediate shaft for damage.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 3

3. **CHECK THE STEERING ANGLE**
   1. Turn steering wheel so wheels point in a straight ahead position.
   2. With scan tool, read the steering angle.

Is the Steering Angle reading within ±15°?

Yes

- Go To 4

No

- Replace the Electric Power Steering (EPS) Module in accordance with the Service Information. Refer to **GEAR, REMOVAL** .

4. **CHECK STEERING ANGLE CHANGE**
    1. Turn steering wheel so wheels point in a straight ahead position.
    2. With scan tool, graph the steering angle to see if reading never travels above 720° whiling rotating wheel from lock to lock.
    3. Rotate steering wheel to the right and the degrees will decrease and rotating steering wheel to the left the degrees will increase.

    Did the steering angle change accordingly with no irregularities and display lower than ±720° from lock to lock?

    Yes

    - Replace the Anti-lock Brake System (ABS) Module in accordance with the Service Information. Refer to **INTEGRATED CONTROL UNIT (ICU), REMOVAL** .
    - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Replace the Electric Power Steering (EPS) Module in accordance with the Service Information. Refer to **GEAR, REMOVAL** .

C0051-28-STEERING WHEEL POSITION SENSOR - SIGNAL BIAS LEVEL OUT OF RANGE / ZERO ADJUSTMENT FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Driving straight with speeds above 15 km/h (9 mph).

SET CONDITION

If the Anti-lock Brakes System (ABS) Module detects that the sensor signal is showing to great of a value while driving straight.

NOTE: The Steering Angle Sensor (SAS) is internal to the Steering Gear.

POSSIBLE CAUSES

Possible Causes
STEERING WHEEL ALIGNMENT
STEERING COLUMN OR INTERMEDIATE SHAFT IMPROPERLY INSTALLED OR DAMAGED
ELECTRIC POWER STEERING (EPS) MODULE
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

NOTE: Diagnose and repair any Electric Power Steering (EPS) Module DTCs before continuing with this diagnostic procedure.

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**

NOTE: After erasing ACTIVE DTCs it may be necessary for the Anti-lock Brake System (ABS) Module to go to sleep before the DTCs are cleared. IF the DTC is still ACTIVE after the clear command then Turn the ignition off, disconnect the Scan Tool, close the doors and wait until all indicators on the Cluster have gone out, typically about 30 seconds.

NOTE: This DTC must be active for the results of this test to be valid.

1. Perform any Technical Service Bulletins (TSBs) that may apply.
2. Ignition on, engine not running.
3. Using the scan tool, read and record DTCs.
4. Using the scan tool, read and record Environmental Data.
5. Using the scan tool, erase DTCs.
6. Test drive the vehicle straight with speeds above 15 km/h (9 mph).
7. Stop the vehicle.
8. Slowly turn the steering wheel from lock to lock.
9. Using the scan tool, read DTCs.

Is the DTC active at this time?

Yes

- Go To 2

No

- Perform the ABS-INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.

2. **INSPECT THE WHEEL ALIGNMENT, STEERING COLUMN AND INTERMEDIATE SHAFT FOR INCORRECT INSTALLATION OR DAMAGE**

NOTE: If available, check the vehicle repair history for collision damage.

1. Turn the ignition off.
2. Inspect the vehicle for proper wheel alignment.

3. Inspect the vehicle for damage causing tracking problems or steering wheel misalignment.
4. Inspect the steering column and intermediate shaft for damage.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 3

3. **CHECK THE STEERING ANGLE**
   1. Test drive the vehicle straight with speeds above 15 km/h (9 mph).
   2. With scan tool, read the steering angle.

   Is the Steering Angle reading within ±15°?

   Yes

   - Replace the Anti-lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Replace the Electric Power Steering (EPS) Module in accordance with the Service Information. Refer to **GEAR, REMOVAL** .

C0051-2F-STEERING WHEEL POSITION SENSOR - SIGNAL ERRATIC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article**

WHEN MONITORED

Continuously.

SET CONDITION

When the Anti-lock Brake System (ABS) Module detects an erratic signal from the Steering Angle Sensor (SAS).

NOTE: The Steering Angle Sensor (SAS) is internal to the Steering Gear.

POSSIBLE CAUSES

Possible Causes
STEERING ANGLE SENSOR (SAS) NOT CALIBRATED
ELECTRONIC POWER STEERING (EPS) MODULE
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

NOTE: Diagnose and repair any Electric Power Steering (EPS) Module DTCs before continuing with this diagnostic procedure.)

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**

   NOTE: After erasing ACTIVE DTCs it may be necessary for the Anti-lock Brake System (ABS) Module to go to sleep before the DTCs are cleared. IF the DTC is still ACTIVE after the clear command then Turn the ignition off, disconnect the Scan Tool, close the doors and wait until all indicators on the Cluster have gone out, typically about 30 seconds.

   NOTE: This DTC must be active for the results of this test to be valid.

   1. Perform any Technical Service Bulletins (TSBs) that may apply.
   2. Ignition on, engine not running.
   3. Using the scan tool, read and record DTCs.
   4. Using the scan tool, read and record Environmental Data.
   5. Using the scan tool, erase DTCs.
   6. Start the engine.
   7. Slowly turn the steering wheel from lock to lock.
   8. Using the scan tool, read and record DTCs.

   Is the DTC active at this time?

   Yes

   - Go To 2

   No

   - Perform the ABS-INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.

2. **INSPECT THE WHEEL ALIGNMENT, STEERING COLUMN AND INTERMEDIATE SHAFT FOR INCORRECT INSTALLATION OR DAMAGE**

NOTE: If available, check the vehicle repair history for collision damage.

1. Turn the ignition off.
2. Inspect the vehicle for proper wheel alignment.
3. Inspect the vehicle for damage causing tracking problems or steering wheel misalignment.
4. Inspect the steering column and intermediate shaft for damage.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 3

3. **CHECK THE STEERING ANGLE**
   1. Turn steering wheel so wheels point in a straight ahead position.
   2. With scan tool, read the steering angle.

   Is the Steering Angle reading within ±15°?

   Yes

   - Go To 4

   No

   - Replace the Electric Power Steering (EPS) Module in accordance with the Service Information. Refer to **GEAR, REMOVAL** .

4. **CHECK STEERING ANGLE CHANGE**
   1. Turn steering wheel so wheels point in a straight ahead position.
   2. With scan tool, graph the steering angle to see if reading never travels above 720° whiling rotating wheel from lock to lock.
   3. Rotate steering wheel to the right and the degrees will decrease and rotating steering wheel to the left the degrees will increase.

   Did the steering angle change accordingly with no irregularities and display lower than ±720° from lock to lock?

   Yes

- Replace the Anti-lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Replace the Electric Power Steering (EPS) Module in accordance with the Service Information. Refer to **GEAR, REMOVAL** .

C0051-49-STEERING WHEEL POSITION SENSOR - INTERNAL ELECTRONIC FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

When vehicle speed is above 15 km/h (9 mph) and the Yaw rate, lateral acceleration, steering angle and vehicle-speed are all valid.

SET CONDITION

When the Anti-Lock Brake System (ABS) Module detects that the Steering angle Sensor (SAS) has sent an internal failure status.

NOTE: The Steering Angle Sensor (SAS) is internal to the Steering Gear.

POSSIBLE CAUSES

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE
ELECTRIC POWER STEERING (EPS) MODULE

NOTE: Diagnose and repair any Electric Power Steering (EPS) Module DTCs before continuing with this diagnostic procedure.

DIAGNOSTIC TEST

STEERING WHEEL POSITION SENSOR-INTERNAL ELECTRONIC FAILURE

1. Perform any Technical Service Bulletins (TSBs) that may apply.
2. The ABS Module is reporting internal errors from the SAS.

NOTE: Before continuing, check the Electric Power Steering (EPS) Module harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.

3. Using the schematics as a guide, inspect the wire harness and connectors. Pay particular attention to all Power and Ground circuits.
4. Perform any Technical Service Bulletins that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Replace the Electric Power Steering (EPS) Module in accordance with the Service Information. Refer to **GEAR, REMOVAL** .
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C0051-54-STEERING WHEEL POSITION SENSOR - MISSING CALIBRATION

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Ignition on.

SET CONDITION

When the Steering Angle Sensor (SAS) indicates that the EPS battery power was disconnected or low and the correct driving conditions have occurred.

NOTE: The Steering Angle Sensor (SAS) is internal to the Steering Gear.

POSSIBLE CAUSES

Possible Causes
TERMINAL/CONNECTOR/WIRING HARNESS DAMAGE
STEERING ANGLE SENSOR (SAS)
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE/INTEGRATED CONTROL UNIT (ICU)

NOTE: The Electrical Power Steering (EPS) will erase their DTC when the low battery condition is corrected so it may not be present. Refer to DIAGNOSIS AND TESTING .

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**

NOTE: After erasing ACTIVE DTCs it may be necessary for the Anti-lock Brake System (ABS) Module to go to sleep before the DTCs are cleared. IF the DTC is still ACTIVE after the clear command then Turn the ignition off, disconnect the Scan Tool, close the doors and wait until all indicators on the Cluster have gone out, typically about 30 seconds.

NOTE: This DTC must be active for the results of this test to be valid.

1. Turn the ignition on.
2. With the scan tool, erase the DTCs.

WARNING: To avoid possible serious or fatal injury, check brake capability is available before road testing.

3. Test drive the vehicle by turning the vehicle left and right in a curving manner at a velocity between 15 and 35 km/h (9 and 22 mph).
4. Park the vehicle.
5. With the scan tool, read ABS DTCs.

Is the DTC active at this time?

Yes

- Go To 2

No

- Test complete.

2. **STEERING ANGLE SENSOR**
   1. Turn the ignition off to the lock position.

NOTE: The Steering Angle Sensor (SAS) is internal to the Steering Gear.

Replace the Steering Angle Sensor (SAS) in accordance with the Service Information. Refer to **GEAR, REMOVAL** .

2. Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

WARNING: To avoid possible serious or fatal injury, check brake capability is available before road testing.

3. Test drive the vehicle by turning the vehicle left and right in a curving manner at a velocity between 15 and 35 km/h (9 and 22 mph).
4. With the scan tool, read the DTCs.

   Does the DTC remain active?

   Yes

   - Replace the Anti-lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

C0051-62-STEERING WHEEL POSITION SENSOR - SIGNAL COMPARE FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

When vehicle speed is above 15 km/h (9 mph) and the Yaw rate, lateral acceleration, steering angle and vehicle-speed are all valid.

SET CONDITION

When the Anti-lock Brake System (ABS) Module detects that the Electronic Stability Control (ESC) calculated Steering Angle does not match the sensor signal from the Electric Power Steering (EPS) Module.

NOTE: The Steering Angle Sensor (SAS) is internal to the Steering Gear.

POSSIBLE CAUSES

Possible Causes
STEERING WHEEL ALIGNMENT
STEERING COLUMN OR INTERMEDIATE SHAFT IMPROPERLY INSTALLED OR DAMAGED
ELECTRIC POWER STEERING (EPS) MODULE
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

NOTE: Diagnose and repair any Electric Power Steering (EPS) Module DTCs before continuing with this diagnostic procedure.)

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**

NOTE: After erasing ACTIVE DTCs it may be necessary for the Anti-lock Brake System (ABS) Module to go to sleep before the DTCs are cleared. IF the DTC is still ACTIVE after the clear command then Turn the ignition off, disconnect the Scan Tool, close the doors and wait until all indicators on the Cluster have gone out, typically about 30 seconds.

NOTE: This DTC must be active for the results of this test to be valid.

1. Perform any Technical Service Bulletins (TSBs) that may apply.
2. Ignition on, engine not running.
3. Using the scan tool, read and record DTCs.
4. Using the scan tool, read and record Environmental Data.
5. Using the scan tool, erase DTCs.
6. Start the engine.
7. Slowly turn the steering wheel from lock to lock.
8. Using the scan tool, read and record DTCs.

Is the DTC active at this time?

Yes

- Go To 2

No

- Perform the ABS-INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.

2. **INSPECT THE WHEEL ALIGNMENT, STEERING COLUMN AND INTERMEDIATE SHAFT FOR INCORRECT INSTALLATION OR DAMAGE**

NOTE: If available, check the vehicle repair history for collision damage.

1. Perform any Technical Service Bulletins (TSBs) that may apply
2. Inspect the vehicle for proper wheel alignment.
3. Inspect the vehicle for damage causing tracking problems or steering wheel misalignment.
4. Inspect the steering column and intermediate shaft for damage.

Were any problems found?

Yes

- Repair as necessary.
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 3

3. **CHECK THE STEERING ANGLE**
   1. Turn steering wheel so wheels point in a straight ahead position.
   2. With scan tool, graph the steering angle while slowly rotating steering wheel from lock to lock.

      Is the Steering Angle reading within ±15°?

      Yes

      - Go To 4

      No

      - Replace the Electric Power Steering (EPS) module in accordance with the Service Information. Refer to **GEAR, REMOVAL** .
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
4. **CHECK STEERING ANGLE CHANGE**
   1. Turn steering wheel so wheels point in a straight ahead position.
   2. With scan tool, graph the steering angle to see while rotating wheel from lock to lock.

      NOTE: Sensor damage can occur if wheel is turned over 720°.

   3. Rotate steering wheel to the right and the degrees will decrease and rotating steering wheel to the left the degrees will increase.

      Did the steering angle change accordingly and display lower then 720° from lock to lock with no erratic signal behavior?

      Yes

      - Replace the Anti-lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Replace the Electric Power Steering (EPS) module in accordance with the Service Information. Refer to **GEAR, REMOVAL** .

- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C006A-28-MULTI-AXIS ACCELERATION SENSOR - SIGNAL BIAS LEVEL OUT OF RANGE / ZERO ADJUSTMENT FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Ignition on.

SET CONDITION

When the Anti-lock Brake System (ABS) Module detects that one of the Dynamics Sensors offset levels are above reasonable levels.

NOTE: The Dynamics Sensor is internal to the Occupant Restraint Controller (ORC).

POSSIBLE CAUSES

Possible Causes
LONGITUDINAL G-SENSOR ROUTINE PERFORMED INCORRECTLY
OCCUPANT RESTRAINT CONTROLLER (ORC) INSTALLATION
OCCUPANT RESTRAINT CONTROLLER (ORC)
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE/INTEGRATED CONTROL UNIT (ICU)

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**

NOTE: After erasing ACTIVE DTCs it may be necessary for the Anti-lock Brake System (ABS) Module to go to sleep before the DTCs are cleared. IF the DTC is still ACTIVE after the clear command then Turn the ignition off, disconnect the Scan Tool, close the doors and wait until all indicators on the Cluster have gone out, typically about 30 seconds.

NOTE: This DTC must be active for the results of this test to be valid.

1. Perform any Technical Service Bulletins (TSBs) that may apply.
2. Ignition on, engine not running.
3. Using the scan tool, read and record DTCs.
4. Using the scan tool, read and record Environmental Data.
5. Using the scan tool, erase DTCs.
6. Start the engine.

7. Slowly turn the steering wheel from lock to lock.
8. Using the scan tool, read and record DTCs.

   Is the DTC active at this time?

   Yes

   - Go To 2

   No

   - Perform the ABS-INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.

2. **CHECK FOR OCCUPANT RESTRAINT CONTROLLER (ORC) DTCs**
   1. Perform any Technical Service Bulletins (TSBs) that may apply.
   2. Turn the ignition on.
   3. With the scan tool, read DTCs in the ORC.

      Are there any ORC related DTCs present?

      Yes

      - Perform the appropriate diagnostic procedure. Refer to the **OCCUPANT RESTRAINT CONTROLLER (ORC) - DIAGNOSTIC CODE INDEX** article .

      No

      - Go To 3

3. **LONGITUDINAL G-SENSOR ROUTINE**

   NOTE: The Longitudinal G-Sensor Calibration routine must be performed on a level surface.

   With the scan tool, under "Miscellaneous Functions" run the Longitudinal G-Sensor Calibration routine.

   1. Cycle the ignition from off to on.
   2. With the scan tool, read the DTCs.

      Does the DTC remain active?

      Yes

      - Go To 4

No

- Test complete.
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

4. **YAW RATE**
   1. On a flat surface with the scan tool, under "Data" monitor the Yaw Rate, Longitudinal and Lateral Acceleration.

      Is the Yaw Rate outside of ±6°/sec or the Longitudinal and Lateral Acceleration outside of ±1.7meters/sec^2 ?

      Yes

      - Go To 5

      No

      - Replace the Anti-lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
5. **CHECK THE ORC INSTALLATION**

   NOTE: The Occupant Restraint Controller (ORC) installation and mounting bolt torque is crucial for proper operation.

   1. Check the ORC for damaged, modified, and bent mounting brackets.
   2. Check the ORC mounting bolts for a loose or over tightened condition.

      Were any problems found?

      Yes

      - Repair as necessary.
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Replace the Occupant Restraint Controller (ORC) in accordance with the Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C006A-49-MULTI-AXIS ACCELERATION SENSOR - INTERNAL ELECTRONIC FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Ignition on.

SET CONDITION

The Dynamics Sensor has indicated that it has detected an internal failure.

NOTE: The Dynamics Sensor is internal to the Occupant Restraint Controller (ORC).

POSSIBLE CAUSES

Possible Causes
OCCUPANT RESTRAINT CONTROLLER (ORC) ANTI-LOCK BRAKE SYSTEM (ABS) MODULE/INTEGRATED CONTROL UNIT (ICU)

NOTE: If DTC U0002-88 is present, perform the diagnostics for this DTC before continuing with this test.

DIAGNOSTIC TEST

1. **VERIFY THE IS ACTIVE**

NOTE: After erasing ACTIVE DTCs it may be necessary for the Anti-lock Brake System (ABS) Module to go to sleep before the DTCs are cleared. IF the DTC is still ACTIVE after the clear command then Turn the ignition off, disconnect the Scan Tool, close the doors and wait until all indicators on the Cluster have gone out, typically about 30 seconds.

NOTE: This DTC must be active for the results of this test to be valid.

1. Perform any Technical Service Bulletins (TSBs) that may apply.
2. Ignition on, engine not running.
3. With the scan tool, read and record the ABS DTCs.
4. With the scan tool, read and record Environmental Data (EV Data).
5. With the scan tool, erase ABS DTCs.

WARNING: To avoid possible serious or fatal injury, check brake capability is available before road testing.

6. Test drive the vehicle by turning the vehicle left or right in a curving manner at a velocity between

15 and 35 km/h (9 and 22 mph).

7. Park the vehicle on level ground.
8. With the scan tool, read the ABS DTCs.

   Is the DTC active at this time?

   Yes

   - Go To 2

   No

   - Perform the ABS-INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.

2. **ANTI-LOCK BRAKE SYSTEM (ABS) MODULE**
   1. Turn the ignition off to the lock position.
   2. Replace the Occupant Restraint Controller (ORC) in accordance with the Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
   3. Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
   4. Test drive the vehicle on mainly straight road conditions at a velocity between 15 and 35 km/h (9 and 22 mph).
   5. With the scan tool, read the DTCs.

      Does the DTC remain active?

      Yes

      - Replace the Anti-lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Test complete.

C006A-54-MULTI-AXIS ACCELERATION SENSOR - MISSING CALIBRATION

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Ignition on.

SET CONDITION

When the Anti-lock Brake System (ABS) Module detects that a new Dynamics Sensor has been placed on the vehicle.

NOTE: The Dynamics Sensor is internal to the Occupant Restraint Controller (ORC).

POSSIBLE CAUSES

Possible Causes
DYNAMIC SENSOR NOT CALIBRATED
OCCUPANT RESTRAINT CONTROLLER (ORC)
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE/INTEGRATED CONTROL UNIT (ICU)

DIAGNOSTIC TEST

1. **PERFORM THE LONGITUDINAL G SENSOR CALIBRATION ROUTINE**
   1. Turn the ignition on.
   2. With the scan tool, read and record the ABS DTCs.

      NOTE: The Longitudinal G-Sensor Calibration routine must be performed on a level surface.

      With the scan tool, perform the "Longitudinal G-Sensor Calibration" routine and perform and the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   3. Park the vehicle.

      Was the Longitudinal G-Sensor Calibration routine successful?

      Yes

      - Go To 2

      No

      - Perform the Longitudinal G-Sensor routine again, if still unsuccessful.
      - Go To 4
2. **VERIFY THE DTC IS ACTIVE**

   NOTE: After erasing ACTIVE DTCs it may be necessary for the Anti-lock Brake System (ABS) Module to go to sleep before the DTCs are cleared. IF the DTC is still ACTIVE after the clear command then Turn the ignition off, disconnect the Scan Tool, close the doors and wait until all indicators on the Cluster have gone out, typically about 30 seconds.

NOTE: This DTC must be active for the results of this test to be valid.

1. Turn the ignition on.
2. With the scan tool, erase the DTCs.
3. Cycle the ignition from off to on.
4. With the scan tool, read ABS DTCs.

   Does the DTC remain active?

   Yes

   - Go To 4

   No

   - Test complete.

3. **CHECK THE ORC INSTALLATION**

NOTE: The Occupant Restraint Controller (ORC) installation and mounting bolt torque is crucial for proper operation.

1. Check the ORC for damaged, modified, and bent mounting brackets.
2. Check the ORC mounting bolts for a loose or over tightened condition.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 4

4. **ANTI-LOCK BRAKE SYSTEM (ABS) MODULE**
   1. Turn the ignition off to the lock position.
   2. Replace the Occupant Restraint Controller (ORC) in accordance with the Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
   3. Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
   4. Test drive the vehicle by turning the vehicle left and right in a curving manner at a velocity between 15 and 35 km/h (9 and 22 mph).
   5. With the scan tool, read the DTCs.

Does the DTC remain active?

Yes

- Replace the Anti-lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete.

C006A-62-MULTI-AXIS ACCELERATION SENSOR - SIGNAL COMPARE FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

When ignition is on and vehicle speed is above 15 km/h (9 mph).

SET CONDITION

When the Anti-lock Brake System (ABS) Module detects that one of the three Dynamics Sensor signals does not agree with the calculated value.

NOTE: The Dynamics Sensor is internal to the Occupant Restraint Controller (ORC).

POSSIBLE CAUSES

Possible Causes
OCCUPANT RESTRAINT CONTROLLER (ORC)
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE/INTEGRATED CONTROL UNIT (ICU)

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Perform any Technical Service Bulletins (TSBs) that may apply.
    2. Ignition on, engine not running.
    3. With the scan tool, read and record the ABS DTCs.
    4. With the scan tool, erase ABS DTCs.

WARNING: To avoid possible serious or fatal injury, check brake capability is available before road testing.

5. Test drive the vehicle by turning left or right in a curving manner at a velocity between 15 and 35 km/h (9 and 22 mph).
6. Park the vehicle on level ground.
7. With the scan tool, read the ABS DTCs.

   Is the DTC active at this time?

   Yes

   - Go To 2

   No

   - Perform the ABS-INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.

2. **CHECK THE ORC INSTALLATION**

   NOTE: The Occupant Restraint Controller (ORC) installation and mounting bolt torque is crucial for proper operation.

   1. Check the ORC for damaged, modified, and bent mounting brackets.
   2. Check the ORC mounting bolts for a loose or over tightened condition.

      Were any problems found?

      Yes

      - Repair as necessary.
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Go To 3

3. **ANTI-LOCK BRAKE SYSTEM (ABS) MODULE**
   1. Turn the ignition off to the lock position.
   2. Replace the Occupant Restraint Controller (ORC) in accordance with the Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
   3. Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      WARNING: To avoid possible serious or fatal injury, check brake capability is available before road testing.

   4. Test drive the vehicle by turning left or right in a curving manner at a velocity between 15 and 35

km/h (9 and 22 mph).

5. With the scan tool, read the DTCs.

   Does the DTC remain active?

   Yes

   - Replace the Anti-lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

C0078-86-TIRE DIAMETER - SIGNAL INVALID

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

The DTC will set if the stored tire size is out of range or has changed from the previous initialization.

POSSIBLE CAUSES

Possible Causes
INCORRECT TIRE SIZE PROGRAMMED INTO BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **INCORRECT TIRES PROGRAMMED INTO BCM**
   1. Inspect all four tires on the vehicle and note the size of each tire.

      NOTE: A non-production size tire cannot be programmed into the BCM. The production Powertrain, with the production size tires, is the only emissions certified configuration that is available for reprogramming.

   2. Verify the correct Tire/wheel information is programmed in the BCM.

      Is the correct value programmed in the BCM?

Yes

- Go To 2

No

- Program the correct Tire/Wheel information in the BCM.
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

2. **PERFORM ABS MODULE INITIALIZATION**
   1. Turn the ignition on.
   2. With the scan tool, read and record the ABS DTCs.
   3. With the scan tool, under "Miscellaneous Functions" perform the ABS Initialization routine. Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
   4. With the scan tool, read the DTCs.

   Does the DTC remain active?

   Yes

   - Perform the ABS Module Initialization routine again, if still unsuccessful.
   - Replace the Anti-Lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

C008B-12-WHEEL SPEED SENSOR SUPPLY - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 10: Wheel Speed Sensor Circuit Schematic
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the ignition on and no system under voltage or over voltage condition present.

SET CONDITION

When Wheel Speed Sensor Supply circuit detects a short to battery voltage.

POSSIBLE CAUSES

Possible Causes
CONNECTOR/TERMINAL DAMAGE
(B9) LEFT FRONT WHEEL SPEED SENSOR SUPPLY CIRCUIT SHORTED TO VOLTAGE
(B7) RIGHT FRONT WHEEL SPEED SENSOR SUPPLY CIRCUIT SHORTED TO VOLTAGE
(B4) LEFT REAR WHEEL SPEED SENSOR SUPPLY CIRCUIT SHORTED TO VOLTAGE
(B2) RIGHT REAR WHEEL SPEED SENSOR SUPPLY CIRCUIT SHORTED TO VOLTAGE
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**

NOTE: **After erasing ACTIVE DTCs it may be necessary for the Anti-lock Brake System (ABS) Module to go to sleep before the DTCs are cleared. IF the DTC is still ACTIVE after the clear command then Turn the ignition off, disconnect the Scan Tool, close the doors and wait until all indicators on the Cluster have gone out, typically about 30 seconds.**

NOTE: **This DTC must be active for the results of this test to be valid.**

1. Ignition on, engine not running.
2. With the scan tool, erase DTCs.
3. Cycle the ignition switch from off to on.
4. With the scan tool, select View DTCs.

Is the DTC active at this time?

Yes

- Go To 2

No

- The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.
- Perform the ABS INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.

2. **CHECK CONNECTOR/TERMINAL FOR DAMAGE**

NOTE: **Check all terminals for broken, bent, pushed out, or corroded terminals.**

1. Turn the ignition off.
2. Inspect the Wheel Speed Sensor for proper mounting.
3. Inspect the Wheel Speed Sensor harness and connector.
4. Inspect the Wheel Speed Sensor for excessive debris on the sensor.

   Were any problems found?

   Yes

   - Repair as necessary in accordance with the Service Information.
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 3

3. **CHECK (B9) LEFT FRONT WHEEL SPEED SENSOR SUPPLY CIRCUIT VOLTAGE**
   1. Turn the ignition off.
   2. Disconnect the ABS Module harness connector.
   3. Turn the ignition on.
   4. Measure the voltage between the (B9) Left Front Wheel Speed Sensor Supply circuit and ground.

      Is the voltage above 10 volts?

      Yes

      - Repair the (B9) Left Front Wheel Speed Sensor Supply circuit for short to voltage.
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Go To 4

4. **(B7) RIGHT FRONT WHEEL SPEED SENSOR SUPPLY CIRCUIT SHORTED TO VOLTAGE**
   1. Turn the ignition off.
   2. Turn the ignition on.
   3. Measure the voltage between the (B7) Right Front Wheel Speed Sensor Supply circuit and ground.

      Is the resistance below 5 Ohms?

      Yes

      - Go To 5

No

- Repair the (B7) Right Front Wheel Speed Sensor Supply circuit for short to voltage.
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

5. **CHECK (B4) LEFT REAR WHEEL SPEED SENSOR SUPPLY CIRCUIT VOLTAGE**
   1. Turn the ignition off.
   2. Turn the ignition on.
   3. Measure the voltage between the (B4) Left Rear Wheel Speed Sensor Supply circuit and ground.

   Is the voltage above 10 volts?

   Yes

   - Repair the (B4) Left Rear Wheel Speed Sensor Supply circuit for short to voltage.
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 6

6. **(B2) RIGHT REAR WHEEL SPEED SENSOR SUPPLY CIRCUIT SHORTED TO VOLTAGE**
   1. Turn the ignition off.
   2. Turn the ignition on.
   3. Measure the voltage between the (B2) Right Rear Wheel Speed Sensor Supply circuit and ground.

   Is the resistance below 5 Ohms?

   Yes

   - Replace the Anti-lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Repair the (B2) Right Rear Wheel Speed Sensor Supply circuit for short to voltage.
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C107B-62-WHEEL SPEED COMPARATIVE PERFORMANCE-SIGNAL COMPARE FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

NOTE: Repair all other Wheel Speed Sensor DTCs first before continuing with this diagnostic procedure.

WHEN MONITORED

With the ignition on and no under voltage, vehicle speed above 15 km/h (9 mph) driving straight with no braking.

SET CONDITION

This DTC will set when multiple Wheel Speed Sensor signals are questionable, sensors are swapped, or directional sensors do not match.

POSSIBLE CAUSES

Possible Causes
IMPROPER TIRE PRESSURE/MISMATCHED TIRES
WHEEL SPEED SENSORS (WSS) SWAPPED
WHEEL SPEED SENSOR (WSS)
HUB AND WHEEL BEARING DAMAGED OR INSTALLED INCORRECTLY
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**

NOTE: Inspect the tires for improper air pressure and or mismatched tires before continuing, repair as necessary.

1. Turn the ignition on.
2. With the scan tool, record and erase DTCs.

CAUTION: Make sure brake capability is available before road testing.

3. Road test the vehicle over 40 km/h (25 mph).
4. With the scan tool, read DTCs.

Is the DTC active at this time?

Yes

- Go To 2

No

- Perform the ABS-INTERMITTENT CONDITION TEST. Refer to **STANDARD**

PROCEDURE.

2. **CHECK WHEEL SPEED SENSOR SIGNALS**
   1. Turn the ignition on.
   2. With the scan tool, monitor and graph ALL the Wheel Speed Sensors speeds and compare.
   3. Slowly accelerate as straight as possible from a stop to 40 km/h (25 mph).

   Is one or more of the WSS speeds showing 0 km/h (0 mph) or not matching the other WSS speeds?

   Yes

   - Go To 3

   No

   - Perform the ABS-INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.

3. **INSPECT WHEEL SPEED SENSORS FOR DAMAGE**

   NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals.

   1. Turn the ignition off.
   2. Verify the correct WSS are installed and not swapped.
   3. Inspect each WSS for looseness and or not properly fastened.

   Are any WSS swapped, loose or any of the wiring/connectors/terminals damaged?

   Yes

   - Repair as necessary.
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 4

4. **CHECK EACH HUB AND WHEEL BEARING FOR DAMAGE**
   1. Inspect each Hub and Wheel Bearing for damage, corrosion, cracks, looseness, or improper installation.

   Are any of the Hub and or Wheel Bearings damaged?

   Yes

   - Replace the Hub and Wheel Bearing in accordance with the Service Information. Refer to

HUB AND BEARING, REMOVAL or **HUB AND BEARING, REMOVAL** .
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 5

5. **WHEEL SPEED SENSORS**
   1. Replace the Wheel Speed Sensor(s) in accordance with the Service Information. Refer to **SENSOR, WHEEL SPEED, FRONT, REMOVAL** or **SENSOR, WHEEL SPEED, REAR, REMOVAL**
   2. Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
   3. With the scan tool, monitor and graph ALL the Wheel Speed Sensors speeds and compare.
   4. Slowly accelerate as straight as possible from a stop to 40 km/h (25 mph).
   5. With the scan tool, read the DTCs.

   Does this DTC remain active?

   Yes

   - Replace the Anti-lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

C1082-01-VACUUM PRESSURE SENSOR - GENERAL ELECTRICAL FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 11: Vacuum Pressure Sensor Circuit Schematic
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

Continuous

SET CONDITION

The Vacuum Sensor Signal indicates that the voltage level is below 0.1 volt or greater than 3.5 volts for 100 msec.

POSSIBLE CAUSES

Possible Causes
(B31) VACUUM PRESSURE SENSOR SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE
(B32) VACUUM PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
(B32) VACUUM PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
(B32) VACUUM PRESSURE SENSOR SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
(B33) VACUUM PRESSURE SENSOR RETURN CIRCUIT OPEN OR HIGH RESISTANCE
VACUUM PRESSURE SENSOR
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Perform any Technical Service Bulletins (TSBs) that may apply.
    2. Ignition on, engine not running.
    3. With the scan tool, record and erase the DTCs.
    4. Cycle the ignition switch from off to on.
    5. With the scan tool, read the DTCs.

    Is the DTC active at this time?

    Yes

    - Go To 2

    No

    - The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.
    - Perform the ABS-INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.
2. **(B31) VACUUM PRESSURE SENSOR SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE**
    1. Turn ignition off to the lock position.
    2. Disconnect the ABS Module harness connector.
    3. Measure the resistance of the (B31) Vacuum Pressure Sensor Supply circuit between the Vacuum Pressure Sensor harness connector and the ABS Module harness connector.

    Is the resistance below 5.0 Ohms?

    Yes

    - Go To 3

No

- Repair the (B31) Vacuum Pressure Sensor Supply circuit for an open or high resistance.
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

3. **(B32) VACUUM PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE**
   1. Turn ignition off to the lock position.
   2. Disconnect the ABS Module harness connector.
   3. Disconnect the Vacuum Pressure Sensor harness connector.
   4. Ignition on, engine not running.
   5. Measure the voltage between ground and the (B32) Vacuum Pressure Sensor Signal circuit at the Vacuum Pressure Sensor harness connector.

   Is there any voltage present?

   Yes

   - Repair the (B32) Vacuum Pressure Sensor Signal circuit for a short to ground.
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 4
4. **(B32) VACUUM PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO GROUND**
   1. Turn ignition off to the lock position.
   2. Disconnect the ABS Module harness connector.
   3. Measure the resistance between ground and the (B32) Vacuum Pressure Sensor Signal circuit at the Vacuum Pressure Sensor harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Repair the (B32) Vacuum Pressure Sensor Signal circuit for a short to ground.
   - Perform ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 5
5. **(B32) VACUUM PRESSURE SENSOR SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE**
   1. Turn ignition off to the lock position.
   2. Disconnect the ABS Module harness connector.
   3. Measure the resistance of the (B32) Vacuum Pressure Sensor Signal circuit between the Vacuum

Pressure Sensor harness connector and the ABS Module harness connector.

Is the resistance below 5.0 Ohms?

Yes

- Go To 6

No

- Repair the (B32) Vacuum Pressure Sensor Signal circuit for an open or high resistance.
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

6. **(B33) VACUUM PRESSURE SENSOR RETURN CIRCUIT OPEN OR HIGH RESISTANCE**
   1. Turn ignition off to the lock position.
   2. Measure the resistance of the (B33) Vacuum Pressure Sensor Return circuit between the Vacuum Pressure Sensor harness connector and the ABS Module harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 7

   No

   - Repair the (B33) Vacuum Pressure Sensor Return circuit for an open or high resistance.
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

7. **ANTI-LOCK BRAKE SYSTEM (ABS) MODULE**
   1. Turn the ignition off to the lock position.
   2. Replace the Vacuum Pressure Sensor.
   3. Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
   4. With the scan tool, read the DTCs.

   Is the DTC still active?

   Yes

   - Replace the Anti-Lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

- Test complete.

C1082-02-VACUUM PRESSURE SENSOR - GENERAL SIGNAL FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on and engine running for five minutes.

SET CONDITION

When the Anti-Lock Brake Module detects that the vacuum sensor signal does not make sense based on other vehicle conditions. No signal change, signal rapid change, unexpected change.

POSSIBLE CAUSES

Possible Causes
VACUUM PRESSURE SENSOR BRAKE VACUUM BOOSTER ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

1. **VACUUM PRESSURE SIGNAL**
    1. Start the engine.
    2. With the scan tool, view and record the vacuum pressure signal with no brake applied.
    3. Turn the engine off.
    4. Ignition on.
    5. With the scan tool, view and record the vacuum pressure with no brake applied.

    Is the vacuum pressure signal staying consistent?

    Yes

    - Go To 2

    No

    - Go To 4
2. **MEASURE THE VACUUM PRESSURE SIGNAL**
    1. Start the engine.
    2. Measure the vacuum pressure while pressing the brake pedal several times.
    3. Turn the engine off.

4. Ignition on.

   Does the vacuum drop below 14 mbar (2 psi)?

   Yes

   - Go To 3

   No

   - Perform the ABS-INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.

3. **CHECK FOR VACUUM PRESSURE SIGNAL CHANGE**
   1. Turn the ignition on.
   2. Remove the Vacuum Pressure Sensor from the Booster.
   3. Connect a vacuum pump to the Vacuum Pressure Sensor.
   4. Apply vacuum to the Vacuum Pressure Sensor and watch for signal change.

      Is the vacuum pressure signal changing on the scan tool as vacuum is being applied?

      Yes

      - Go To 4

      No

      - Replace the Vacuum Pressure Sensor.
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

4. **CHECK BRAKE BOOSTER CHECK VALVE**
   1. Remove the Brake Booster Check Valve.
   2. Apply vacuum to the booster side of the check valve.

      Is the Brake Booster Check Valve holding vacuum?

      Yes

      - Go To 5

      No

      - Replace the Brake Booster Check Valve.
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

5. **CHECK BRAKE BOOSTER**

1. Reinstall the Brake Booster Check Valve.
2. Using a vacuum pump apply vacuum to the Brake Booster.

   Is the Brake Booster holding vacuum?

   Yes

   - Go To 6

   No

   - Replace the Power Brake Booster in accordance with the Service Information. Refer to **BOOSTER, POWER BRAKE, REMOVAL** .
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

6. **EXTERNAL VACUUM PUMP**
   1. Verify the vehicle is equipped with a external vacuum pump.

      Is the vehicle equipped with a external vacuum pump?

      Yes

      - Repair or replace the External Vacuum Pump in accordance with the Service Information.
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Go To 7

7. **ANTI-LOCK BRAKE SYSTEM (ABS) MODULE**
   1. Turn the ignition off to the lock position.
   2. Replace the Vacuum Pressure Sensor.
   3. Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
   4. With the scan tool, read the DTCs.

      Does the DTC remain active?

      Yes

      - Replace the Anti-Lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

- Test complete, the condition or conditions that originally set this DTC are not present at this time.

C1082-2F-VACUUM PRESSURE SENSOR - SIGNAL ERRATIC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 12: Vacuum Pressure Sensor Circuit Schematic
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

Ignition On, Continuous

SET CONDITION

The erratic vacuum pressure sensor fault is set when the ABS module detects multiple quick voltage transitions to faulted levels.

NOTE: If any other DTCs are present, repair them first before continuing with this diagnostic procedure.

POSSIBLE CAUSES

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE
VACUUM PRESSURE SENSOR
POWER BRAKE BOOSTER
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

1. **INSPECT RELATED WIRING HARNESS, TERMINALS, AND CONNECTORS**
    1. Perform any Technical Service Bulletins (TSBs) that may apply.
    2. Review the scan tool Environmental Data (EV Data). If possible, try to duplicate the conditions under which the DTC set.
    3. Turn the ignition off.
    4. Visually inspect the related wire harness. Disconnect all the related harness connectors. Look for any chafed, pierced, pinched, partially broken wires and broken, bent, pushed out, or corroded terminals.
    5. Wiggle the wires while checking for shorts and open circuits.
    6. Inspect and clean all ABS, engine, and chassis grounds that are related to the most current DTC.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Go To 2
2. **ANTI-LOCK BRAKE SYSTEM (ABS) MODULE**
    1. Turn the ignition off to the lock position.
    2. Replace the Vacuum Pressure Sensor.
    3. Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

4. With the scan tool, read the DTCs.

   Is the DTC still active?

   Yes

   - Replace the Anti-Lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C1086-4B-ABS SYSTEM CONTROL TOO LONG - OVER TEMPERATURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

NOTE: If any other DTCs are present, repair them first before continuing with this diagnostic procedure.

WHEN MONITORED

With the ignition on.

SET CONDITION

When the Anti-lock Brake System (ABS) Module calculated thermal model has determined that there has been excessive system activation.

POSSIBLE CAUSES

Possible Causes
ABS, TCS, ESP CONTROL TOO LONG OR TO FREQUENT
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**

   NOTE: This DTC must be active for the results of this test to be valid.

   1. Perform any related Technical Service Bulletins (TSBs) for this DTC.
   2. Allow vehicle to sit for 10 minutes before continuing with test.

3. Turn the ignition on.
4. With the scan tool, read and record the DTCs.
5. With the scan tool, read and record the Environmental Data to help identify the conditions in which the DTC was set.
6. With the scan tool, erase the DTCs.
7. Start the engine.
8. With the scan tool, read and record the DTCs.

   Is the DTC active at this time?

   Yes

   - Go To 2

   No

   - Perform the ABS-INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.

2. **ANTI-LOCK BRAKE SYSTEM (ABS) MODULE**

   NOTE: Check with customer on driving terrain (e.g. mud, snow, ice) for set condition.

   1. Visually inspect the ABS Module wiring.
   2. Visually inspect the braking system.

      Were any problems found?

      Yes

      - Repair as necessary.
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Replace the Anti-lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C1086-9A-ABS SYSTEM CONTROL TOO LONG - COMPONENT OR SYSTEM OPERATING CONDITIONS

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

When the Anti-lock Brake System (ABS) Module calculated thermal model has determined that there has been excessive system activation.

POSSIBLE CAUSES

Possible Causes
ABS, TCS, ESP CONTROL TOO LONG OR TOO FREQUENT ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

NOTE: If any other DTCs are present, repair them first before continuing with this diagnostic procedure.

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**

NOTE: After erasing ACTIVE DTCs it may be necessary for the Anti-lock Brake System (ABS) Module to go to sleep before the DTCs are cleared. IF the DTC is still ACTIVE after the clear command then Turn the ignition off, disconnect the Scan Tool, close the doors and wait until all indicators on the Cluster have gone out, typically about 30 seconds.

NOTE: This DTC must be active for the results of this test to be valid.

NOTE: Check with customer on driving terrain (e.g. mud, snow, ice) for set condition.

Perform any related Technical Service Bulletins (TSBs) for this DTC.

1. Allow vehicle to sit for 10 minutes before continuing with test.
2. Turn the ignition on.
3. With the scan tool, read and record the DTCs.
4. With the scan tool, erase the DTCs.
5. Start the engine.
6. With the scan tool, read and record the DTCs.

Is the DTC active at this time?

Yes

- Go To 2

No

- Perform the ABS-INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.

2. **ANTI-LOCK BRAKE SYSTEM (ABS) MODULE**
   1. Visually inspect the ABS Module wiring.
   2. Visually inspect the braking system.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Replace the Anti-lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C121A-09-STEERING ANGLE SENSOR NOT INITIALIZED - COMPONENT FAILURES

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

NOTE: If any Electrical Power Steering (EPS) DTCs are present, perform the appropriate diagnostic procedure. Refer to DIAGNOSIS AND TESTING .

WHEN MONITORED

Ignition on.

SET CONDITION

When the Anti-lock Brake System (ABS) Module detects that a new Steering Angle Sensor has been placed on the vehicle, but it has not been calibrated.

NOTE: The Steering Angle Sensor (SAS) is internal to the Steering Gear.

POSSIBLE CAUSES

Possible Causes
STEERING ANGLE SENSOR (SAS) LOOSE OR WIRING HARNESS DAMAGE ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

1. **PERFORM THE EPS LEARN ROUTINE**
   1. Turn the ignition on.
   2. With the scan tool, read and record the ABS DTCs.
   3. With the scan tool, under "Miscellaneous Functions" perform the EPS Learn routine in the EPS Module. Refer to **STANDARD PROCEDURE** .
   4. Perform and the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   Was the routine successful?

   Yes

   - Go To 2

   No

   - Perform the " EPS Learn" routine again, if still unsuccessful.
   - Go To 3
2. **VERIFY IF THE DTC IS STILL ACTIVE**

   NOTE: After erasing ACTIVE DTCs it may be necessary for the Anti-lock Brake System (ABS) Module to go to sleep before the DTCs are cleared. IF the DTC is still ACTIVE after the clear command then Turn the ignition off, disconnect the Scan Tool, close the doors and wait until all indicators on the Cluster have gone out, typically about 30 seconds.

   NOTE: This DTC must be active for the results of this test to be valid.

   1. Turn the ignition on.
   2. With the scan tool, erase the DTCs.
   3. Cycle the ignition from off to on.
   4. With the scan tool, read ABS DTCs.

   Does the DTC remain active?

   Yes

   - Go To 3

No

- Test complete.

3. **ANTI-LOCK BRAKE SYSTEM (ABS) MODULE**
   1. Turn the ignition off to the lock position.
   2. Using the schematics as a guide, check the EPS pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Electric Power Steering (EPS) Module in accordance with the Service Information. Refer to **GEAR, REMOVAL** .
   3. Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
   4. Start the vehicle.
   5. Turn the steering wheel from lock to lock several times.
   6. With the scan tool, read the DTCs.

   Does the DTC remain active?

   Yes

   - Using the schematics as a guide, check the ABS Module pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace thee Anti-lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

C121C-00-TORQUE REQUEST SIGNAL DENIED

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on, engine running.

SET CONDITION

When the Powertrain Control Module (PCM) has informed the Anti-lock Brake System (ABS) Module that it can no longer allow the engine torque reduction requests when engine is above 360 rpm.

POSSIBLE CAUSES

Possible Causes
EXCESSIVE LOAD ON ENGINE ANTI-LOCK BRAKE SYSTEM (ABS) MODULE POWERTRAIN CONTROL MODULE (PCM)

NOTE: If any PCM DTCs are present, perform the appropriate diagnostic procedure. Refer to the DTC INDEX article .

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**

NOTE: After erasing ACTIVE DTCs it may be necessary for the Anti-lock Brake System (ABS) Module to go to sleep before the DTCs are cleared. IF the DTC is still ACTIVE after the clear command then Turn the ignition off, disconnect the Scan Tool, close the doors and wait until all indicators on the Cluster have gone out, typically about 30 seconds.

NOTE: This DTC must be active for the results of this test to be valid and this DTC may set while driving under severe load conditions.

1. Turn the ignition on.
2. With the scan tool, read and record DTCs.
3. With the scan tool, read and record Freeze Frame information.
4. With the scan tool, erase DTCs.
5. Cycle the ignition switch from off to on.
6. Start the engine and raise the engine RPM to 2500.
7. With the scan tool, read and record DTCs.

Is the DTC active at this time?

Yes

- Go To 2

No

- Perform the ABS-INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.

2. **CHECK ENGINE IDLE**
   1. Allow the engine to idle.

Does the engine run rough at idle?

Yes

- Replace the Powertrain Control Module (PCM) in accordance with the Service Information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **STANDARD PROCEDURE** for 2.0L diesel engine, **STANDARD PROCEDURE** for 2.4L gasoline engine or **STANDARD PROCEDURE** for 3.2L gasoline engine.

No

- Replace the Anti-Lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C1239-00-EMISSION ROLLS TEST ACTIVE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously with the ignition on and the Body Control Module (BCM) has the Emissions Test Mode bit set.

SET CONDITION

If the Anti-lock Brake System (ABS) Module receives two messages in a row indicating that the Body Control Module (BCM) has been requested to activate the Emission Rolls Test.

POSSIBLE CAUSES

Possible Causes
EMISSION ROLLS TEST ENABLED
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool record and erase the DTCs.
    3. Turn the ignition off.
    4. Turn the ignition on.
    5. Using the scan tool, read the DTCs.

    Is this DTC active?

Yes

- Go To 2

No

- Perform the ABS-INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.

2. **EMISSION ROLLS TEST ENABLED**
   1. Turn the ignition on.
   2. Using the scan tool, under "Miscellaneous Functions" DISABLE the Emission Rolls Test in the BCM.
   3. With the scan tool, erase the DTCs.
   4. Turn the ignition off and wait ten seconds.
   5. Turn the ignition on.
   6. Using the scan tool, the read DTCs in ABS.

   Is the DTC active at this time?

   Yes

   - Go To 3

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time.

3. **ANTI-LOCK BRAKE SYSTEM (ABS) MODULE**
   1. Turn the ignition off.
   2. Replace the Anti-Lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
   3. Turn the ignition on.
   4. Using the scan tool, read DTCs in the ABS.

   Is the DTC still remain active?

   Yes

   - Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .

   No

- Test complete.

C123B-4B-ESP SYSTEM CONTROL TOO LONG - OVER TEMPERATURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

NOTE: If any other DTCs are present, repair them first before continuing with this diagnostic procedure.

WHEN MONITORED

With the ignition on.

SET CONDITION

When the Anti-Lock Brake System (ABS) Module indicates excessive valve control.

POSSIBLE CAUSES

Possible Causes
AGGRESSIVE DRIVING MANEUVERS, MISMATCHED TIRES, FRONT END ALIGNMENT
TCS, ESP CONTROL TOO LONG OR TO FREQUENT
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

ANTI-LOCK BRAKE SYSTEM (ABS)

NOTE: Check with customer for unusual driving terrain (e.g. mud, snow, ice) or aggressive driving maneuvers at the time of set condition.

1. Perform any related Technical Service Bulletins (TSBs) for this DTC.
2. Check for mismatched tires.
3. Visually inspect the ABS Module wiring.
4. Visually inspect the braking system.
5. Check the alignment.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Perform the ABS-INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.

C1246-1C-VACUUM PRESSURE SENSOR SUPPLY - CIRCUIT VOLTAGE OUT OF RANGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 13: Vacuum Pressure Sensor Circuit Schematic
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

Continuous.

SET CONDITION

The Vacuum Sensor five volt supply voltage feedback indicates that the voltage level is less than 4.75 volts or greater than 5.25 volts for more than 50 msec.

POSSIBLE CAUSES

Possible Causes
(B31) VACUUM PRESSURE SENSOR SUPPLY CIRCUIT SHORTED TO VOLTAGE
(B31) VACUUM PRESSURE SENSOR SUPPLY CIRCUIT SHORTED TO GROUND
VACUUM PRESSURE SENSOR
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. With the scan tool, record and erase the DTCs.
    3. Cycle the ignition switch from off to on.
    4. With the scan tool, read the DTCs.

    Is the DTC active at this time?

    Yes

    - Go To 2

    No

    - The condition that caused this DTC to set is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.
    - Perform the ABS INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.
2. **(B31) VACUUM PRESSURE SENSOR SUPPLY CIRCUIT SHORTED TO VOLTAGE**
    1. Turn ignition off to the lock position.
    2. Disconnect the ABS Module harness connector.
    3. Disconnect the Vacuum Pressure Sensor harness connector.
    4. Ignition on, engine not running.
    5. Measure the voltage of the (B31) Vacuum Pressure Sensor Supply circuit in the Vacuum Pressure Sensor harness connector.

Is the voltage above 5.25 volts?

Yes

- Repair the (B31) Vacuum Pressure Sensor Supply circuit for a short to voltage.
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 3

3. **(B31) VACUUM PRESSURE SENSOR SUPPLY CIRCUIT SHORTED TO GROUND**
   1. Turn ignition off to the lock position.
   2. Measure the resistance between ground and the (B31) Vacuum Pressure Sensor Supply circuit at the Vacuum Pressure Sensor harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Repair the (B31) Vacuum Pressure Sensor Supply circuit for a short to ground.
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 4

4. **ANTI-LOCK BRAKE SYSTEM (ABS) MODULE**
   1. Turn the ignition off to the lock position.
   2. Replace the Vacuum Pressure Sensor.
   3. Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
   4. With the scan tool, read the DTCs.

   Does the DTC remain active?

   Yes

   - Replace the Anti-lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

C124A-00-ACC TORQUE REQUEST SIGNAL DENIED

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously with the ignition on.

SET CONDITION

When the Anti-lock Brake System (ABS) Module detects an actual deceleration message from the Adaptive Cruise Control (ACC) Module.

POSSIBLE CAUSES

Possible Causes
ADAPTIVE CRUISE CONTROL (ACC) MODULE ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

ADAPTIVE CRUISE CONTROL (ACC) MODULE

1. Replace the Adaptive Cruise Control (ACC) Module in accordance with the Service Information. Refer to **MODULE, ADAPTIVE CRUISE CONTROL, REMOVAL** .

   NOTE: After erasing ACTIVE DTCs it may be necessary for the Anti-lock Brake System (ABS) Module to go to sleep before the DTCs are cleared. IF the DTC is still ACTIVE after the clear command then Turn the ignition off, disconnect the Scan Tool, close the doors and wait until all indicators on the Cluster have gone out, typically about 30 seconds.

   NOTE: This DTC must be active for the results of this test to be valid.

2. Turn the ignition on.
3. With the scan tool, record and erase DTCs.
4. Cycle the ignition switch from off to on.
5. With the scan tool, read DTCs.

   Does the DTC remain active?

   Yes

   - Using the schematics as a guide, check the Anti-lock Brake System (ABS) Module pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power

and ground circuits. If no problems are found, replace Anti-lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .

No

- Test complete.

C124E-00-HILL START ASSIST DISABLED - CONDITIONS NOT CORRECT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously with the ignition on.

SET CONDITION

When the Anti-Lock Brake System (ABS) Module detects an incorrect clutch interlock switch message from the Powertrain Control Module (PCM).

POSSIBLE CAUSES

Possible Causes
POWERTRAIN CONTROL (PCM) DTCS
RADIO FREQUENCY (RF) HUB DTCS
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**

NOTE: After erasing ACTIVE DTCs it may be necessary for the Anti-lock Brake System (ABS) Module to go to sleep before the DTCs are cleared. IF the DTC is still ACTIVE after the clear command then Turn the ignition off, disconnect the Scan Tool, close the doors and wait until all indicators on the Cluster have gone out, typically about 30 seconds.

NOTE: This DTC must be active for the results of this test to be valid.

1. Perform any Technical Service Bulletins (TSBs) that may apply.
2. Turn the ignition on.
3. With the scan tool, record and erase the DTCs.
4. Cycle the ignition switch from off to on.
5. With the scan tool, read the DTCs.

Is the DTC active at this time?

Yes

- Go To 2

No

- Perform the ABS-INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.

2. **CHECK FOR POWERTRAIN CONTROL MODULE (PCM) DTCS ARE PRESENT**
   1. With the scan tool, read the PCM DTCs.

   Are there any PCM DTCs present?

   Yes

   - Perform the appropriate diagnostic procedures. Refer to the **DTC INDEX** article .

   No

   - Go To 3

3. **CHECK FOR RADIO FREQUENCY (RF) HUB DTCS ARE PRESENT**
   1. With the scan tool, read the RF Hub DTCs.

   Are there any RF Hub DTCs present?

   Yes

   - Perform the appropriate diagnostic procedures. Refer to **DIAGNOSIS AND TESTING** .

   No

   - Go To 4

4. **CHECK THE REVERSE GEAR SWITCH**
   1. With the scan tool, in the PCM under "Data Display" check the Reverse Gear Switch functionality.

   NOTE: If equipped.

   With the scan tool, in the PCM under "Data Display" check the Clutch Switch functionality.

   Are the switches operating correctly?

   Yes

- Using the schematics as a guide, check the Anti-Lock Brake System (ABS) Module pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Anti-lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Repair as necessary.
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C124F-00-ESP REQUEST DENIED FROM ACC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

NOTE: If any ACC DTCs are present, repair them first before continuing with this diagnostic procedure.

WHEN MONITORED

Ignition On.

SET CONDITION

When the Anti-Lock Brake System (ABS) Module has determined that there is a disagreement between what ACC is requesting and what ESP thinks it should be requesting.

POSSIBLE CAUSES

Possible Causes
ADAPTIVE CRUISE CONTROL (ACC) MODULE
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

ADAPTIVE CRUISE CONTROL (ACC) MODULE

1. Replace the Adaptive Cruise Control (ACC) Module in accordance with the Service Information. Refer to **MODULE, ADAPTIVE CRUISE CONTROL, REMOVAL** .
2. Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

NOTE: After erasing ACTIVE DTCs it may be necessary for the Anti-lock Brake System (ABS) Module to go to sleep before the DTCs are cleared. IF the DTC is still ACTIVE after the clear command then Turn the ignition off,

disconnect the Scan Tool, close the doors and wait until all indicators on the Cluster have gone out, typically about 30 seconds.

3. Turn the ignition on.
4. With the scan tool, record and erase DTCs.
5. Cycle the ignition switch from off to on.
6. With the scan tool, read DTCs.

Does the DTC remain active?

Yes

- Using the schematics as a guide, check the Anti-Lock Brake System (ABS) Module pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Anti-lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete.

C1252-92-VACUUM PUMP CONTROL CIRCUIT - PERFORMANCE OR INCORRECT OPERATION

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

NOTE: If any PCM DTCs are present, repair them first before continuing with this diagnostic procedure.

WHEN MONITORED

Continuously with the ignition on.

SET CONDITION

The Powertrain Control (PCM) has indicated that there is a Vacuum Pump failure.

POSSIBLE CAUSES

Possible Causes
ELECTRIC VACUUM PUMP (3.6L) ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

POWERTRAIN CONTROL MODULE (PCM)

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**

NOTE: **After erasing ACTIVE DTCs it may be necessary for the Anti-lock Brake System (ABS) Module to go to sleep before the DTCs are cleared. IF the DTC is still ACTIVE after the clear command then Turn the ignition off, disconnect the Scan Tool, close the doors and wait until all indicators on the Cluster have gone out, typically about 30 seconds.**

NOTE: **This DTC must be active for the results of this test to be valid.**

1. Perform any Technical Service Bulletins (TSBs) that may apply.
2. Ignition on, engine not running.
3. Using the scan tool, read and record DTCs.
4. Using the scan tool, read and record Environmental Data.
5. Using the scan tool, erase DTCs.
6. Start the engine.
7. Slowly turn the steering wheel from lock to lock.
8. Using the scan tool, read and record DTCs.

Is the DTC active at this time?

Yes

- Go To 2

No

- Perform the ABS-INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.

2. **CHECK FOR ANY ENGINE DTCs**
   1. Turn the ignition on.
   2. With the scan tool, record and erase DTCs in the PCM.
   3. Cycle the ignition switch from off to on.
   4. With the scan tool, read DTCs in the PCM.

   Are there any PCM DTCs?

   Yes

- Perform the appropriate diagnostic procedure. Refer to the **DTC INDEX** article .

No

- Using the schematics as a guide, check the Anti-lock Brake System (ABS) Module pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Anti-lock Brake Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C2100-16-BATTERY VOLTAGE LOW - CIRCUIT VOLTAGE BELOW THRESHOLD

Fig. 14: Identifying Anti-lock Brake Module Circuit Schematic
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

Ignition on.

SET CONDITION

If the sensed ignition voltage drops below 9 volts with engine running or vehicle speed present for 100 msec or

if voltage is below 7 volts the maturation time changes to 15 ms.

POSSIBLE CAUSES

Possible Causes
CHARGING SYSTEM
POWER CIRCUITS OPEN OR HIGH RESISTANCE
GROUND CIRCUITS OPEN OR HIGH RESISTANCE
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**

NOTE: **After erasing ACTIVE DTCs it may be necessary for the Anti-lock Brake System (ABS) Module to go to sleep before the DTCs are cleared. IF the DTC is still ACTIVE after the clear command then Turn the ignition off, disconnect the Scan Tool, close the doors and wait until all indicators on the Cluster have gone out, typically about 30 seconds.**

NOTE: **This DTC must be active for the results of this test to be valid.**

NOTE: **Diagnose and repair any Powertrain Charging system DTCs before continuing with this procedure.**

NOTE: **Make sure the battery is fully charged.**

NOTE: **This DTC must be active for the results of this test to be valid.**

1. Ignition on, engine not running.
2. With the scan tool, record and erase DTCs.
3. Turn ignition off to the lock position.
4. Start the engine.
5. With the scan tool, read DTCs.

Is the DTC active at this time?

Yes

- Go To 2

No

- Perform the ABS-INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.

2. **POWER CIRCUITS FOR AN OPEN OR HIGH RESISTANCE**
   1. Turn ignition off to the lock position.
   2. Disconnect the ABS Module harness connector.
   3. Ignition on, engine not running.
   4. With a 12-volt test light connected to ground, check the (A107) Fused B+, (A200) Fused B+ and (F941) Fused Ignition Switch Output circuits at the ABS harness connector.

      Does the test light illuminate brightly?

      Yes

      - Go To 3

      No

      - Repair the Power circuits for an open or high resistance.
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
3. **GROUND CIRCUITS OPEN OR HIGH RESISTANCE**
   1. Turn ignition off to the lock position.
   2. With a test light connected to B+ check the (Z905) Ground circuits at the ABS harness connector.

      Does the test light illuminate brightly?

      Yes

      - Replace the Anti-lock Brake System (ABS) Module in accordance with the service information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Repair the Ground circuits for an open or high resistance.
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C2101-17-BATTERY VOLTAGE HIGH - CIRCUIT VOLTAGE ABOVE THRESHOLD

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Ignition on.

SET CONDITION

If the sensed ignition voltage is above 18V or if the ignition voltage is above 16.5V with vehicle speed greater than 6 kph (4 mph).

POSSIBLE CAUSES

Possible Causes
POWERTRAIN CONTROL MODULE (PCM) CHARGING SYSTEM DTCS PRESENT ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

1. **CHARGING SYSTEM DTCS PRESENT**

   NOTE: Disconnect battery charger before continuing.

   1. Start the engine.
   2. With the scan tool, read DTCs in the PCM.

      Are there any Charging System or related voltage DTCs present?

      Yes

      - Perform the appropriate Charging System DTC diagnostic procedures before continuing with this test. Refer to the **DTC INDEX** article .

      No

      - Go To 2

2. **VERIFY THE DTC IS ACTIVE**

   NOTE: After erasing ACTIVE DTCs it may be necessary for the Anti-lock Brake System (ABS) Module to go to sleep before the DTCs are cleared. IF the DTC is still ACTIVE after the clear command then Turn the ignition off, disconnect the Scan Tool, close the doors and wait until all indicators on the Cluster have gone out, typically about 30 seconds.

   NOTE: This DTC must be active for the results of this test to be valid.

   1. Ignition on, engine not running.
   2. With the scan tool, record and erase DTCs.
   3. Turn ignition off to the lock position.
   4. Start the engine.

5. With the scan tool, read DTCs.

   Is the DTC active at this time?

   Yes

   - Replace the Anit-lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Perform the ABS-INTERMITTENT TEST. Refer to **STANDARD PROCEDURE**.

C2104-13-ABS/ESC VALVE SUPPLY VOLTAGE - CIRCUIT OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 15: Identifying Anti-lock Brake Module Circuit Schematic
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

Continuous.

SET CONDITION

The Anti-lock Brake System (ABS) Module has detected a low voltage on the Valve supply battery feed.

POSSIBLE CAUSES

Possible Causes
FUSE 53 30A
POWER CIRCUITS OPEN OR HIGH RESISTANCE
GROUND CIRCUITS OPEN OR HIGH RESISTANCE
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**

   NOTE: After erasing ACTIVE DTCs it may be necessary for the Anti-lock Brake System (ABS) Module to go to sleep before the DTCs are cleared. IF the DTC is still ACTIVE after the clear command then Turn the ignition off, disconnect the Scan Tool, close the doors and wait until all indicators on the Cluster have gone out, typically about 30 seconds.

   NOTE: This DTC must be active for the results of this test to be valid.

   1. Turn the ignition on.
   2. With the scan tool, read and record the ABS DTCs.
   3. With the scan tool, read and record the Environmental Data to help identify the conditions in which the DTC was set.
   4. With the scan tool, erase the ABS DTCs.
   5. Cycle the ignition switch.
   6. With the scan tool, read the ABS DTCs.

   Is the DTC active at this time?

   Yes

   - Go To 2

   No

   - Perform the ABS-INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.

2. **CHECK THE FUSE**
   1. Ignition on, engine not running.
   2. Using a 12-volt test light connected to ground, check the fuse for power.

   Is the fuse good?

Yes

- Go To 4

No

- Go To 3

3. **(A200) FUSED B+ CIRCUIT SHORTED TO GROUND**
   1. Turn the ignition off to the lock position.
   2. Remove the F53 (30A) Fuse.
   3. Disconnect the ABS Module harness connector.
   4. Measure the resistance between Ground and the (A200) Fused B+ Circuit in the ABS Module harness connector.

      Is the resistance above 5.0 Ohms?

      Yes

      - Go To 4

      No

      - Repair the (A107) Fused B+ circuit for a short to ground.
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
4. **(A200) FUSED B+ CIRCUIT OPEN OR HIGH RESISTANCE**
   1. Turn the ignition off to the lock position.
   2. Using a 12-volt test light connected to ground, check the (A200) Fused B+ circuit.

      NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

      Is the test light illuminated and bright?

      Yes

      - Go To 5

      No

      - Repair the (A107) Fused B+ circuit for an open circuit or high resistance.
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
5. **(Z905) GROUND CIRCUITS OPEN OR HIGH RESISTANCE**
   1. Using a 12-volt test light connected to 12-volts, check the (Z905) Ground circuits.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes

- Replace the Anti-lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Repair the (Z905) Ground circuit(s) for an open circuit or high resistance.
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C211B-92-IGNITION RUN/START INPUT CIRCUIT - PERFORMANCE OR INCORRECT OPERATION

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 16: Identifying Anti-lock Brake Module Circuit Schematic
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

Continuous.

SET CONDITION

The Ignition Status reported on the CAN Bus does not match the state of the Ignition Input.

POSSIBLE CAUSES

Possible Causes
FUSE (10A)
(F941) FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT SHORT TO VOLTAGE
POWER CIRCUITS OPEN OR HIGH RESISTANCE
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

NOTE: If any other DTCs are present, repair them first before continuing with this diagnostic procedure.

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**

   NOTE: After erasing ACTIVE DTCs it may be necessary for the Anti-lock Brake System (ABS) Module to go to sleep before the DTCs are cleared. IF the DTC is still ACTIVE after the clear command then Turn the ignition off, disconnect the Scan Tool, close the doors and wait until all indicators on the Cluster have gone out, typically about 30 seconds.

   NOTE: This DTC must be active for the results of this test to be valid.

   1. Turn the ignition on.
   2. With the scan tool, read and record the DTCs.
   3. With the scan tool, erase the DTCs.
   4. Start the engine.
   5. With the scan tool, read and record the DTCs.

   Is the DTC active at this time?

   Yes

   - Go To 2

   No

   - Perform the ABS-INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.

2. **CHECK THE FUSE**
   1. Ignition on, engine not running.
   2. Using a 12-volt test light connected to ground, check the fuse for power.

Is the fuse good?

Yes

- Go To 3

No

- If the related fuse is open, check the (F941) Fused Ignition Switch Output (RUN/START) circuit for a short to ground.
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

3. **(F941) FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT SHORT TO VOLTAGE**
   1. Turn ignition off to the lock position.
   2. Disconnect the ABS Module harness connector.
   3. With a test light connected to ground check the (F941) Fused Ignition Switch Output (RUN/START) circuit at the ABS harness connector.

NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly?

Yes

- Go To 4

No

- Repair the Power circuits for an open or high resistance.
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

4. **POWER CIRCUITS FOR AN OPEN OR HIGH RESISTANCE**
   1. Ignition on, engine not running.
   2. With a test light connected to ground check (A107) Fused B+, (A200) Fused B+ and (F941) Fused Ignition Switch Output (RUN/START) circuits at the ABS harness connector.

NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly?

Yes

- Replace the Anti-lock System Brake (ABS) Module in accordance with the service

information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Repair the Power circuits for an open or high resistance.
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C212A-16-SYSTEM VOLTAGE LOW - CIRCUIT VOLTAGE BELOW THRESHOLD

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuous.

SET CONDITION

The Anti-lock Brake System (ABS) Module has detected a low voltage system error and the Body Control Module (BCM) battery voltage CAN message also indicates a low voltage condition.

POSSIBLE CAUSES

Possible Causes
CHARGING SYSTEM DTCS PRESENT BATTERY ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

1. **CHARGING SYSTEM DTCS PRESENT**
    1. Ignition on, engine not running.
    2. With the scan tool, read DTCs in the Powertrain Control Module.

    Are there any Charging System or related voltage DTCs present?

    Yes

    - Perform the appropriate Charging System DTC diagnostic procedures before continuing with this test. Refer to the **DTC INDEX** article .

    No

    - Go To 2
2. **BATTERY**

NOTE: Make sure the Battery is in good condition. Using the Midtronics Battery Tester or an equivalent Battery tester, test the Battery before continuing.

Does the Battery pass the load test for this specific application?

Yes

- Go To 3

No

- Replace the Battery in accordance with the Service Information. Refer to **BATTERY, REMOVAL** .

3. **VERIFY THE DTC IS ACTIVE**

NOTE: After erasing ACTIVE DTCs it may be necessary for the Anti-lock Brake System (ABS) Module to go to sleep before the DTCs are cleared. IF the DTC is still ACTIVE after the clear command then Turn the ignition off, disconnect the Scan Tool, close the doors and wait until all indicators on the Cluster have gone out, typically about 30 seconds.

NOTE: This DTC must be active for the results of this test to be valid.

1. Turn the ignition on.
2. With the scan tool, read and record the DTCs.
3. With the scan tool, erase the DTCs.
4. Start the engine.
5. With the scan tool, read and record the DTCs.

Is the DTC active at this time?

Yes

- Replace the Anti-lock Brake System (ABS) Module in accordance with the service information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Perform the ABS-INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.

C212A-17-SYSTEM VOLTAGE HIGH - CIRCUIT VOLTAGE ABOVE THRESHOLD

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuous.

SET CONDITION

The Anti-lock Brake System (ABS) Module has detected a high voltage system error and the Body Control Module (BCM) battery voltage CAN message also indicates a high voltage condition.

POSSIBLE CAUSES

Possible Causes
CHARGING SYSTEM DTCS PRESENT BATTERY ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

1. **CHARGING SYSTEM DTCS PRESENT**
    1. Ignition on, engine not running.
    2. With the scan tool, read DTCs in the Powertrain Control Module.

    Are there any Charging System or related voltage DTCs present?

    Yes

    - Perform the appropriate Charging System DTC diagnostic procedures before continuing with this test. Refer to the **DTC INDEX** article .

    No

    - Go To 2
2. **BATTERY**

    NOTE: Make sure the Battery is in good condition. Using the Midtronics Battery Tester or an equivalent Battery tester, test the Battery before continuing.

    Does the Battery pass the load test for this specific application?

    Yes

    - Go To 3

No

- Replace the Battery in accordance with the Service Information. Refer to **BATTERY, REMOVAL** .

3. **VERIFY THE DTC IS ACTIVE**

NOTE: After erasing ACTIVE DTCs it may be necessary for the Anti-lock Brake System (ABS) Module to go to sleep before the DTCs are cleared. IF the DTC is still ACTIVE after the clear command then Turn the ignition off, disconnect the Scan Tool, close the doors and wait until all indicators on the Cluster have gone out, typically about 30 seconds.

NOTE: This DTC must be active for the results of this test to be valid.

1. Turn the ignition on.
2. With the scan tool, read and record the DTCs.
3. With the scan tool, erase the DTCs.
4. Start the engine.
5. With the scan tool, read and record the DTCs.

Is the DTC active at this time?

Yes

- Replace the Anti-lock Brake System (ABS) Module in accordance with the service information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Perform the ABS-INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.

C2200-41-ANTI-LOCK BRAKE MODULE INTERNAL - GENERAL CHECKSUM FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Ignition on.

SET CONDITION

The Anti-lock Brake System (ABS) Module has detected an internal error.

POSSIBLE CAUSES

Possible Causes
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

1. The Anti-lock Brake System (ABS) Module is reporting internal errors.

   NOTE: Before continuing, check the Anti-lock Brake System (ABS) Module harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.

2. Using the schematics as a guide, inspect the wire harness and connectors. Pay particular attention to all Power and Ground circuits.
3. Perform any Technical Service Bulletins that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Replace the Anti-lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C2200-44-ANTI-LOCK BRAKE MODULE INTERNAL - DATA MEMORY FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Ignition on.

SET CONDITION

The Anti-lock Brake System (ABS) Module has detected an internal error.

POSSIBLE CAUSES

Possible Causes
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

ANTI-LOCK BRAKE SYSTEM (ABS) MODULE INTERNAL CONDITION

1. The ABS Module is reporting internal errors.

   NOTE: Before continuing, check the Anti-lock Brake System (ABS) Module harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.

2. Using the schematics as a guide, inspect the wire harness and connectors. Pay particular attention to all Power and Ground circuits.
3. Perform any Technical Service Bulletins that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Replace the Anti-lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C2200-46-ANTI-LOCK BRAKE MODULE INTERNAL - CALIBRATION / PARAMETER MEMORY FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Ignition on.

SET CONDITION

The Anti-lock Brake System (ABS) Module has detected an internal error.

POSSIBLE CAUSES

Possible Causes
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

ANTI-LOCK BRAKE SYSTEM (ABS) MODULE INTERNAL CONDITION

1. The ABS Module is reporting internal errors.

   NOTE: Before continuing, check the Anti-lock Brake System (ABS) Module harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.

2. Using the schematics as a guide, inspect the wire harness and connectors. Pay particular attention to all Power and Ground circuits.
3. Perform any Technical Service Bulletins that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Replace the Anti-lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C2200-47-ANTI-LOCK BRAKE MODULE INTERNAL - WATCHDOG / SAFETY AUC FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Ignition on.

SET CONDITION

The Anti-lock Brake System (ABS) Module has detected an internal error.

POSSIBLE CAUSES

Possible Causes

ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

ANTI-LOCK BRAKE SYSTEM (ABS) MODULE INTERNAL CONDITION

1. The ABS Module is reporting internal errors.

   NOTE: Before continuing, check the Anti-lock Brake System (ABS) Module harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.

2. Using the schematics as a guide, inspect the wire harness and connectors. Pay particular attention to all Power and Ground circuits.
3. Perform any Technical Service Bulletins that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Replace the Anti-lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C2200-48-ANTI-LOCK BRAKE MODULE INTERNAL - SUPERVISION SOFTWARE FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Ignition on.

SET CONDITION

The Anti-lock Brake System (ABS) Module has detected an internal error.

POSSIBLE CAUSES

Possible Causes
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

ANTI-LOCK BRAKE SYSTEM (ABS) MODULE INTERNAL CONDITION

1. The ABS Module is reporting internal errors.

   NOTE: Before continuing, check the Anti-lock Brake System (ABS) Module harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.

2. Using the schematics as a guide, inspect the wire harness and connectors. Pay particular attention to all Power and Ground circuits.
3. Perform any Technical Service Bulletins that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Replace the Anti-lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C2200-49-ANTI-LOCK BRAKE MODULE INTERNAL - INTERNAL ELECTRONIC FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Ignition on.

SET CONDITION

The Anti-lock Brake System (ABS) Module has detected an internal error.

POSSIBLE CAUSES

Possible Causes
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE/HYDRAULIC CONTROL UNIT DO NOT MATCH ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

ANTI-LOCK BRAKE SYSTEM (ABS) MODULE INTERNAL CONDITION

1. The ABS Module is reporting internal errors.
2. Verify that the Anti-lock Brake System (ABS) Module or the Hydraulic Control Unit (HCU) were not replaced individually from another vehicle.

NOTE: Before continuing, check the Anti-lock Brake System (ABS) Module harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.

3. Using the schematics as a guide, inspect the wire harness and connectors. Pay particular attention to all Power and Ground circuits.
4. Perform any Technical Service Bulletins that may apply.

Were there any problems found?

Yes

- Repair as necessary.
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Replace the Anti-lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C2202-00-ORIGINAL VIN MISMATCH / MISSING

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

NOTE: Diagnose and repair any Powertrain Control Module (PCM), VIN or Communication DTCs before continuing with this diagnostic procedure.

WHEN MONITORED

Ignition on.

SET CONDITION

This DTC will set if the current VIN does not match the broadcast VIN.

POSSIBLE CAUSES

Possible Causes
BODY CONTROL MODULE (BCM) PROXI CONFIGURATION ALIGNMENT NOT PERFORMED POWERTRAIN CONTROL MODULE (PCM) VIN NOT PROGRAMMED ANTI-LOCK BRAKE SYSTEM (ABS) MODULE/INTEGRATED CONTROL UNIT (ICU) POWERTRAIN CONTROL MODULE (PCM)

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**

   NOTE: After erasing ACTIVE DTCs it may be necessary for the Anti-lock Brake System (ABS) Module to go to sleep before the DTCs are cleared. IF the DTC is still ACTIVE after the clear command then Turn the ignition off, disconnect the Scan Tool, close the doors and wait until all indicators on the Cluster have gone out, typically about 30 seconds.

   NOTE: This DTC must be active for the results of this test to be valid.

   1. Ignition on, engine not running.
   2. With the scan tool, erase DTCs.
   3. Turn ignition off to the lock position.
   4. Ignition on, engine not running.
   5. Wait ten seconds.
   6. With the scan tool, read DTCs.

   Is the DTC active at this time?

   Yes

   - Go To 2

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time.

2. **WRONG VIN PROGRAMMED IN PCM**
   1. Ignition on, engine not running.
   2. With the scan tool, read the VIN in the PCM.
   3. Compare VIN in the PCM to the vehicle VIN.

   Is the correct VIN programmed in the PCM?

   Yes

- Go To 3

No

- Program the correct VIN into the PCM. Follow the VIN programing procedure in the PCM/ECM reprogramming procedure. Refer to **STANDARD PROCEDURE** for 2.0L diesel engine, **STANDARD PROCEDURE** for 2.4L gasoline engine or **STANDARD PROCEDURE** for 3.2L gasoline engine. .
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

3. **VERIFY THE BCM PROXI CONFIGURATION ALIGNMENT ROUTINE WAS PERFORMED**
   1. In the Body Control Module (BCM) with the scan tool, under "Miscellaneous Functions" run the "PROXI Configuration Alignment" routine.
   2. With the scan tool, erase the ABS DTCs.
   3. Cycle the ignition switch from off to on, leaving the ignition on for a minimum of ten seconds.
   4. With the scan tool, read the ABS DTCs.

   Does the DTC remain active?

   Yes

   - Using the schematics as a guide, check the Anti-Lock Brake System (ABS) Module pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Anti-Lock Brake Module accordance with Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C2206-00-VEHICLE CONFIGURATION MISMATCH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

NOTE: **If the BCM has been serviced make sure that the PROXI Configuration Alignment routine is performed before continuing with this diagnostic procedure.**

WHEN MONITORED

Ignition on.

SET CONDITION

This DTC will set if the Body Control Module (BCM) and the Anti-lock Brake System (ABS) configuration codes do not match on power up.

POSSIBLE CAUSES

Possible Causes
BODY CONTROL MODULE (BCM) PROXI CONFIGURATION ALIGNMENT NOT PERFORMED
BODY CONTROL MODULE (BCM) AND ANTI-LOCK BRAKE SYSTEM (ABS) MODULE PROXI CONFIGURATION DO NOT MATCH
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE/INTEGRATED CONTROL UNIT (ICU)

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**

NOTE: **After erasing ACTIVE DTCs it may be necessary for the Anti-lock Brake System (ABS) Module to go to sleep before the DTCs are cleared. IF the DTC is still ACTIVE after the clear command then Turn the ignition off, disconnect the Scan Tool, close the doors and wait until all indicators on the Cluster have gone out, typically about 30 seconds.**

NOTE: **This DTC must be active for the results of this test to be valid.**

1. Perform any Technical Service Bulletins that may apply.
2. Ignition on, engine not running.
3. With the scan tool, erase DTCs.
4. Turn ignition off to the lock position.
5. Ignition on, engine not running.
6. Wait ten seconds.
7. With the scan tool, read DTCs.

Is the DTC active at this time?

Yes

- Go To 2

No

- Perform the ABS-INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.

2. **INITIALIZE THE ABS MODULE**

1. In the Body Control Module (BCM) with the scan tool, under "Miscellaneous Functions" run the "PROXI Configuration Alignment" routine.
2. Turn ignition off to the lock position.
3. Cycle the ignition from off to on.
4. Wait ten seconds.
5. With the scan tool, read DTCs.

   Does the DTC remain active?

   Yes

   - Replace the Anti-lock Brake System (ABS) Module in accordance with the service information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time.

P1DCB-72-REVERSE GEAR SWITCH - ACTUATOR STUCK OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article**

WHEN MONITORED

Ignition on.

SET CONDITION

The Anti-lock Brake System (ABS) Module is receiving a signal that the reverse gear switch is indicating reverse for longer than 3 seconds while vehicle is moving forward at over 11 km/h (7 mph).

POSSIBLE CAUSES

Possible Causes
POWERTRAIN CONTROL MODULE (PCM) DTCs (T22) REVERSE SWITCH SIGNAL SHORTED TO VOLTAGE BACKUP LAMP SWITCH ANTI-LOCK BRAKE SYSTEM (ABS) MODULE/INTEGRATED CONTROL UNIT (ICU)

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**

NOTE: Diagnose and repair any Powertrain Control Module (PCM), VIN or Communication DTCs before continuing with this diagnostic procedure.

NOTE: After erasing ACTIVE DTCs it may be necessary for the Anti-lock Brake System (ABS) Module to go to sleep before the DTCs are cleared. IF the DTC is still ACTIVE after the clear command then Turn the ignition off, disconnect the Scan Tool, close the doors and wait until all indicators on the Cluster have gone out, typically about 30 seconds.

NOTE: This DTC must be active for the results of this test to be valid.

1. Perform any Technical Service Bulletins (TSBs) that may apply.
2. Turn the ignition on.
3. With the scan tool, record and erase the DTCs.
4. Cycle the ignition switch from off to on.
5. With the scan tool, read the DTCs.

   Is the DTC active at this time?

   Yes

   - Go To 2

   No

   - Perform the ABS-INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.

2. **CHECK IF POWERTRAIN CONTROL MODULE DTCS ARE PRESENT**
   1. With the scan tool, read the PCM DTCs.

      Are there any PCM DTCs present?

      Yes

      - Perform the appropriate diagnostic procedures. Refer to the **DTC INDEX** article .

      No

      - Go To 3

3. **(T22) REVERSE SWITCH SIGNAL CIRCUIT SHORTED TO VOLTAGE**
   1. Turn ignition off to the lock position.
   2. Disconnect the PCM C3 harness connector.
   3. Disconnect the Back-up Lamp Switch harness connector.

4. Ignition on, engine not running.
5. Measure the voltage of the (T22) Reverse Switch Signal circuit in the Back-up Lamp Switch harness connector harness connector.

   Is the voltage above 5.25 volts?

   Yes

   - Repair the (T22) Reverse Switch Signal circuit for a short to voltage.
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 4

4. **ANTI-LOCK BRAKE SYSTEM (ABS) MODULE**
   1. Turn the ignition off to the lock position.
   2. Replace the Backup Lamp Switch.
   3. Perform the PCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** for 2.0L diesel engine, **STANDARD PROCEDURE** for 2.4L gasoline engine or **STANDARD PROCEDURE** for 3.2L gasoline engine.
   4. With the scan tool, read the DTCs.

      Does the DTC remain active?

      Yes

      - Replace the Anti-Lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Test complete.

U0002-88-CAN C BUS OFF PERFORMANCE - BUS OFF

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Ignition on, battery voltage between 9 and 16 volts.

SET CONDITION

The Anti-lock Brake Module (ABS) Module has detected catastrophic failure on the CAN bus.

POSSIBLE CAUSES

Possible Causes
CAN BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
BODY CONTROL MODULE (BCM) POWER AND GROUND
BCM NOT CONFIGURED CORRECTLY
BODY CONTROL MODULE (BCM)
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

VERIFY THE DTC IS ACTIVE

1. Ignition on, engine not running.
2. With the scan tool, read DTCs and record on vehicle work order.

   Is the DTC Active at this time?

   Yes

   NOTE: Diagnose the U0002-88 CAN C BUS OFF PERFORMANCE-BUSS OFF as the U0010-00 CAN C BUS CIRCUIT test.

   - Perform the U0010-00-CAN C BUS diagnostic procedure. Refer to the **BODY CONTROL MODULE (BCM) - DIAGNOSTIC CODE INDEX** article .

   No

   - Perform the STORED LOST COMMUNICATION DTCs diagnostic procedure. Refer to **DIAGNOSIS AND TESTING** .

U0100-00-LOST COMMUNICATION WITH ECM/PCM

Perform the COMMUNICATION PRE-DIAGNOSTIC PROCEDURE. Refer to **STANDARD PROCEDURE** .

U0101-00-LOST COMMUNICATION WITH TCM

Perform the COMMUNICATION PRE-DIAGNOSTIC PROCEDURE. Refer to **STANDARD PROCEDURE** .

U0102-00-LOST COMMUNICATION WITH TRANSFER CASE CONTROL MODULE / AWD

Perform the COMMUNICATION PRE-DIAGNOSTIC PROCEDURE. Refer to **STANDARD PROCEDURE** .

U0104-00-LOST COMMUNICATION WITH CRUISE CONTROL MODULE

Perform the COMMUNICATION PRE-DIAGNOSTIC PROCEDURE. Refer to **STANDARD PROCEDURE** .

U0125-00-LOST COMMUNICATION WITH DYNAMICS SENSOR

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Ignition on, battery voltage between 9 and 16 volts.

SET CONDITION

If the Anti-lock Brake System (ABS) Module fails to receive bus messages from the Dynamic Sensor for approximately 150 ms.

NOTE: The Dynamics Sensor is internal to the Occupant Restraints Controller (ORC)

POSSIBLE CAUSES

Possible Causes
CAN B OR CAN C BUS CIRCUITS OPEN OR SHORTED DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Using the scan tool, read the DTCs.

       Is the DTC active at this time?

       Yes

       - Go To 2

       No

       - Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM ORC diagnostic procedure.

2. **VERIFY THAT THE OCCUPANT RESTRAINT CONTROLLER (ORC) IS ACTIVE ON THE BUS**
   1. Turn the ignition on.
   2. Using the scan tool, select Network Diagnostics.
   3. Verify that the ORC is active on the bus.

      Is the ORC active on the bus?

      Yes

      - Go To 3

      No

      - Perform the U0151-87 LOST COMMUNICATION WITH ORC diagnostic procedure. Refer to the **BODY CONTROL MODULE (BCM) - DIAGNOSTIC CODE INDEX** .
3. **ANTI-LOCK BRAKE SYSTEM (ABS) MODULE**

   WARNING: **To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS). Refer to RESTRAINTS - SERVICE INFORMATION before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.**

   1. Replace the Anti-Lock Brakes System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
   2. Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
   3. Using the scan tool, read ABS DTCs.

      Does the DTC remain active?

      Yes

      - Replace the Occupant Restraint Controller (ORC) in accordance with the Service Information.
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

- Test complete.

U0126-00-LOST COMMUNICATION WITH STEERING ANGLE SENSOR

Perform the COMMUNICATION PRE-DIAGNOSTIC PROCEDURE. Refer to **STANDARD PROCEDURE** .

U0128-00-LOST COMMUNICATION WITH PARK BRAKE CONTROL MODULE

Perform the COMMUNICATION PRE-DIAGNOSTIC PROCEDURE. Refer to **STANDARD PROCEDURE** .

U0131-00-LOST COMMUNICATION WITH ELECTRIC POWER STEERING CONTROL MODULE

Perform the COMMUNICATION PRE-DIAGNOSTIC PROCEDURE. Refer to **STANDARD PROCEDURE** .

U0140-00-LOST COMMUNICATION WITH BODY CONTROL MODULE

Perform the COMMUNICATION PRE-DIAGNOSTIC PROCEDURE. Refer to **STANDARD PROCEDURE** .

U0159-00-LOST COMMUNICATION WITH PARKING ASSIST CONTROL MODULE

Perform the COMMUNICATION PRE-DIAGNOSTIC PROCEDURE. Refer to **STANDARD PROCEDURE** .

U0401-00-IMPLAUSIBLE DATA RECEIVED FROM ECM/PCM

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

NOTE: Check for DTCs in the associated module before continuing with this diagnostic procedure.

WHEN MONITORED

Continuously with the ignition on, one valid CAN message received at least once, and no U0002-88-CAN C Bus Off Performance DTC present.

SET CONDITION

When the Anti-Lock Brake System (ABS) Module detects an incorrect CAN message from the Powertrain Control Module (PCM).

POSSIBLE CAUSES

Possible Causes
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE CAN BUS DTCS ENGINE DTCS POWERTRAIN CONTROL (PCM) CAN BUS DTCS ANTI-LOCK BRAKE SYSTEM (ABS) MODULE POWERTRAIN CONTROL (PCM)

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**

   NOTE: This DTC must be active for the results of this test to be valid.

   1. Perform any Technical Service Bulletins (TSBs) that may apply.
   2. Turn the ignition on.
   3. With the scan tool, record and erase the DTCs.
   4. Cycle the ignition switch from off to on.
   5. With the scan tool, read the DTCs.

   Is the DTC active at this time?

   Yes

   - Go To 2

   No

   - Perform the ABS-INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.

2. **CHECK IF POWERTRAIN CONTROL MODULE DTCS ARE PRESENT**
   1. With the scan tool, read the PCM DTCs.

   Are there any PCM DTCs present?

   Yes

   - Perform the appropriate diagnostic procedures. Refer to the **DTC INDEX** article .

   No

   - Go To 3

3. **CHECK OTHER MODULES FOR CAN BUS DTCS**
   1. With the scan tool, read the DTCs.

Are there any CAN BUS DTCs present?

Yes

- Using the schematics as a guide, check the Powertrain Control Module (PCM) pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Powertrain Control Module (PCM) in accordance with the Service Information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .

No

- Using the schematics as a guide, check the Anti-Lock Brake System (ABS) Module pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Anti-Lock Brake Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

U0402-00-IMPLAUSIBLE DATA RECEIVED FROM TCM

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

NOTE: Check for DTCs in the associated module before continuing with this diagnostic procedure.

WHEN MONITORED

Continuously with the ignition on, one valid CAN message received at least once, and no U0002-88-CAN C Bus Off Performance DTC present.

SET CONDITION

When the Anti-Lock Brake Module detects an incorrect CAN message from the Powertrain Control Module (PCM).

POSSIBLE CAUSES

Possible Causes
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE CAN BUS DTCS
POWERTRAIN CONTROL MODULE (PCM) DTCS
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE
POWERTRAIN CONTROL MODULE (PCM)

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**

   NOTE: This DTC must be active for the results of this test to be valid.

   1. Perform any Technical Service Bulletins (TSBs) that may apply.
   2. Turn the ignition on.
   3. With the scan tool, record and erase the DTCs.
   4. Cycle the ignition switch from off to on.
   5. With the scan tool, read the DTCs.

   Is the DTC active at this time?

   Yes

   - Go To 2

   No

   - Perform the ABS-INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.

2. **CHECK IF POWERTRAIN CONTROL MODULE DTCS ARE PRESENT**
   1. With the scan tool, read PCM DTCs.

   Are there any PCM DTCs present?

   Yes

   - Perform the appropriate diagnostic procedures. Refer to the **DTC INDEX** article .

   No

   - Go To 3

3. **CHECK OTHER MODULES FOR CAN BUS DTCS**
   1. With the scan tool, read the DTCs.

   Are there any CAN BUS DTCs present?

   Yes

   - Using the schematics as a guide, check the Powertrain Control Module (PCM) pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Powertrain Control Module (PCM) in accordance with the Service Information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .

No

- Using the schematics as a guide, check the Anti-Lock Brake System (ABS) Module pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Anti-Lock Brake Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

U0403-00-IMPLAUSIBLE DATA RECEIVED FROM T-CASE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously with the ignition on, one valid CAN message received at least once, and no CAN C Bus Off Performance DTC present.

SET CONDITION

When the Anti-Lock Brake System (ABS) Module detects an incorrect CAN message from the Drive Train Control Module (DTCM).

POSSIBLE CAUSES

Possible Causes
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE CAN BUS DTCS
DRIVE TRAIN CONTROL MODULE (DTCM) DTCS
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. If any CAN Communication DTCs are present, perform the diagnostics for them first before continuing with this diagnostic procedure.

    NOTE: This DTC must be active for the results of this test to be valid.

    2. Perform any Technical Service Bulletins (TSBs) that may apply.
    3. Turn the ignition on.
    4. With the scan tool, record and erase the DTCs.
    5. Cycle the ignition switch from off to on.
    6. With the scan tool, read the DTCs.

Is the DTC active at this time?

Yes

- Go To 2

No

- Perform the ABS-INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.

2. **CHECK IF DTCM DTCS ARE PRESENT**
   1. With the scan tool, read the DTCM DTCs.

   Are there any DTCM DTCs present?

   Yes

   - Perform the appropriate diagnostic procedures. Refer to **DIAGNOSIS AND TESTING** .

   No

   - Using the schematics as a guide, check the Anti-lock Brake System (ABS) Module pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Anti-Lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
   - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

U0405-00-INVALID DATA RECEIVED FROM CRUISE CONTROL MODULE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously with the ignition on, one valid CAN message received at least once, and no U0002-88-CAN C Bus Off Performance DTC present.

SET CONDITION

When the Anti-lock Brake System (ABS) Module detects an incorrect CAN message from the Adaptive Cruise Control (ACC) Module.

POSSIBLE CAUSES

Possible Causes
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE CAN BUS DTCS

ADAPTIVE CRUISE CONTROL (ACC) MODULE DTCS
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE
ADAPTIVE CRUISE CONTROL (ACC) MODULE

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**

   NOTE: This DTC must be active for the results of this test to be valid.

   1. Perform any Technical Service Bulletins (TSBs) that may apply.
   2. Turn the ignition on.
   3. With the scan tool, record and erase the DTCs.
   4. Cycle the ignition switch from off to on.
   5. With the scan tool, read the DTCs.

   Is the DTC active at this time?

   Yes

   - Go To 2

   No

   - Perform the ABS-INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.

2. **CHECK IF ADAPTIVE CRUISE CONTROL (ACC) MODULE DTCS ARE PRESENT**
   1. With the scan tool, read ACC DTCs.

   Are there any ACC DTCs present?

   Yes

   - Perform the appropriate diagnostic procedures. Refer to **DIAGNOSIS AND TESTING** .

   No

   - Go To 3

3. **CHECK OTHER MODULES FOR CAN BUS DTCS**
   1. With the scan tool, read the DTCs.

   Are there any CAN BUS DTCs present?

Yes

- Using the schematics as a guide, check the Adaptive Cruise Control (ACC) Module pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Adaptive Cruise Control (ACC) Module.

No

- Using the schematics as a guide, check the Anti-lock Brake System (ABS) Module pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Anti-lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

U0417-00-IMPLAUSIBLE DATA RECEIVED FROM PARK BRAKE CONTROL MODULE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously with the ignition on, one valid CAN message received at least once, and no CAN C Bus Off Performance DTC present.

SET CONDITION

When the Anti-lock Brake System (ABS) Module detects an incorrect CAN message from the Electric Park Brake (EPB) Module.

POSSIBLE CAUSES

Possible Causes
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE CAN BUS DTCS
BODY CONTROL MODULE (BCM) DTCS
ELECTRIC PARK BRAKE (EPB) MODULE DTCS
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, record and erase DTCs.
    3. Cycle the ignition from off to on.
    4. With the scan tool, read DTCs.

Is the DTC active at this time?

Yes

- Go To 2

No

- Perform the ABS-INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.

2. **CHECK FOR BODY CONTROL MODULE (BCM) DTCS**
   1. With the scan tool, read BCM DTCs.

      Are there any BCM CAN Bus DTCs present?

      Yes

      - Perform the appropriate diagnostic procedure. Refer to the **BODY CONTROL MODULE (BCM) - DIAGNOSTIC CODE INDEX** article .

      No

      - Go To 3

3. **CHECK FOR ELECTRIC PARKING BRAKE (EPB) MODULE**
   1. With the scan tool, read EPB DTCs.

      Are there any EPB DTCs present?

      Yes

      - Perform the appropriate diagnostic procedure. Refer to **DIAGNOSIS AND TESTING** .

      No

      - Go To 4

4. **CHECK OTHER MODULES FOR DTCS**
   1. With the scan tool, read DTCs.

      Are there any other modules reporting implausible communication DTCs against the EPB?

      Yes

      - Using the schematics as a guide, check the EPB Module pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Electric Parking Brake (EPB) Module in

accordance with the Service Information. Refer to **MODULE, ELECTRIC PARK BRAKE, REMOVAL** .

- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Using the schematics as a guide, check the ABS Module pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Anti-Lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

U0420-00-INVALID DATA RECEIVED FROM POWER STEERING CONTROL MODULE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Ignition in Run/Start.

SET CONDITION

Incorrect data received from Electric Power Steering Control Module (EPS).

POSSIBLE CAUSES

Possible Causes
DTCS STORED OR ACTIVE IN THE EPS ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

NOTE: Repair all other ABS or EPS DTCs before continuing with this diagnostic procedure.

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, read the DTCs.

    Is the DTC active at this time?

    Yes

    - Go To 2

No

- The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **DTCS STORED OR ACTIVE IN THE EPS**
   1. With the scan tool, read EPS DTCs.

      Are any DTCs active or stored in the EPS?

      Yes

      - Perform the appropriate diagnostic procedure. Refer to **DIAGNOSIS AND TESTING** .

      No

      - Go To 3

3. **INITIALIZE EPS MODULE**
   1. With the scan tool, under "Miscellaneous Functions" run the EPS Learn routine.
   2. Cycle the ignition off to on.
   3. With the scan tool, erase the DTCs.
   4. Cycle the ignition off to on.
   5. Wait ten seconds.
   6. With the scan tool, read the DTCs.

      Does the DTC remain active?

      Yes

      - Using the schematics as a guide, check the Anti-lock Brake System (ABS) Module pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Anti-lock Brake Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Test complete.

U0422-00-IMPLAUSIBLE DATA RECEIVED FROM BODY CONTROL MODULE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

NOTE: Check for DTCs in the associated module before continuing with this diagnostic procedure.

WHEN MONITORED

Continuously with the ignition on, one valid CAN message received at least once, and no U0002-88-CAN C Bus Off Performance DTC present.

SET CONDITION

When the Anti-Lock Brake System (ABS) Module detects an incorrect CAN message from the Body Control Module (BCM).

POSSIBLE CAUSES

Possible Causes
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE CAN BUS DTCS
BODY CONTROL MODULE (BCM) DTCS
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**

   NOTE: This DTC must be active for the results of this test to be valid.

   1. Perform any Technical Service Bulletins (TSBs) that may apply.
   2. Turn the ignition on.
   3. With the scan tool, record and erase the DTCs.
   4. Cycle the ignition switch from off to on.
   5. With the scan tool, read the DTCs.

   Is the DTC active at this time?

   Yes

   - Go To 2

   No

   - Perform the ABS-INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.

2. **CHECK BODY CONTROL MODULE (BCM) CAN BUS DTCS ARE PRESENT**
   1. With the scan tool, read the BCM DTCs.

      Are there any BCM CAN BUS DTCs present?

      Yes

      - Perform the appropriate diagnostic procedures. Refer to the **BODY CONTROL MODULE (BCM) - DIAGNOSTIC CODE INDEX** article .
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Using the schematics as a guide, check the Anti-Lock Brake System (ABS) Module pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Anti-Lock Brake Module accordance with Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

U0432-00-INVALID DATA RECEIVED FROM MULTI - AXIS ACCELERATION SENSOR MODULE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously with the ignition on, one valid CAN message received at least once.

SET CONDITION

When the Anti-Lock Brake system (ABS) Module detects an incorrect CAN message from the Dynamics Sensor.

NOTE: The Dynamics Sensor is internal to the Occupant Restraints Controller (ORC)

POSSIBLE CAUSES

Possible Causes
OCCUPANT RESTRAINT CONTROLLER (ORC)
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE/INTERNAL CONTROL UNIT (ICU)

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**

NOTE: This DTC must be active for the results of this test to be valid.

1. Perform any Technical Service Bulletins (TSBs) that may apply.
2. Turn the ignition on.
3. With the scan tool, read and record the DTCs.
4. With the scan tool, read and record the Environmental Data to help identify the conditions in which the DTC was set.
5. With the scan tool, erase the DTCs.
6. Start the engine.
7. With the scan tool, read the DTCs.

   Is the DTC active at this time?

   Yes

   - Go To 2

   No

   - Perform the ABS-INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.

2. **CHECK FOR OCCUPANT RESTRAINT CONTROLLER (ORC) DTCS PRESENT**
   1. With the scan tool, read the DTCs.

      Are there any ORC DTCs present?

      Yes

      - Perform the appropriate diagnostic procedures. Refer to the **OCCUPANT RESTRAINT CONTROLLER (ORC) - DIAGNOSTIC CODE INDEX** article .

      No

      - Go To 3

3. **CHECK OTHER MODULES FOR CAN BUS DTCS**
   1. With the scan tool, read the DTCs.

      Are there any CAN BUS DTCs present?

      Yes

      - Using the schematics as a guide, check the Occupant Restraint Controller (ORC) pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Occupant

Restraint Controller (ORC) in accordance with the Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .

No

- Using the schematics as a guide, check the Anti-lock Brake System (ABS) Module pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Anti-lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

U045A-00-IMPLAUSIBLE DATA RECEIVED FROM PARKING ASSIST MODULE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously with the ignition on, one valid CAN message received at least once, and no CAN C Bus Off Performance DTC present.

SET CONDITION

When the Anti-lock Brake System (ABS) Module detects an incorrect CAN message from the Park Assist Module (PAM).

POSSIBLE CAUSES

Possible Causes
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE CAN BUS DTCS
BODY CONTROL MODULE (BCM) DTCS
PARK ASSIST MODULE (PAM) DTCS
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, record and erase DTCs.
    3. Cycle the ignition from off to on.
    4. With the scan tool, read DTCs.

    Is the DTC active at this time?

    Yes

- Go To 2

No

- Perform the ABS-INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.

2. **CHECK FOR BODY CONTROL MODULE (BCM) DTCS**
   1. With the scan tool, read BCM DTCs.

      Are there any BCM CAN Bus DTCs present?

      Yes

      - Perform the appropriate diagnostic procedure. Refer to the **BODY CONTROL MODULE (BCM) - DIAGNOSTIC CODE INDEX** article .

      No

      - Go To 3
3. **CHECK FOR PARK ASSIST MODULE (PAM) DTCS**
   1. With the scan tool, read PAM DTCs.

      Are there any PAM DTCs present?

      Yes

      - Perform the appropriate diagnostic procedure. Refer to **DIAGNOSIS AND TESTING** .

      No

      - Go To 4
4. **CHECK OTHER MODULES FOR DTCS**
   1. With the scan tool, read DTCs.

      Are there any other modules reporting implausible communication DTCs against the PAM?

      Yes

      - Replace the Park Assist Module (PAM) in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

- Using the schematics as a guide, check the ABS Module pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Anti-Lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

U140E-00-IMPLAUSIBLE VEHICLE CONFIGURATION DATA RECEIVED

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

NOTE: If any other DTCs are present, repair them first before continuing with this diagnostic procedure.

NOTE: If the BCM has been replaced and or the PROXI Configuration Alignment has not been performed, address this issue first before continuing with this diagnostic procedure.

WHEN MONITORED

Continuously.

SET CONDITION

The Body Control Module (BCM) Indicates that the PROXI Configuration Alignment has not been performed.

POSSIBLE CAUSES

Possible Causes
BODY CONTROL MODULE (BCM) PROXI CONFIGURATION ALIGNMENT NOT PERFORMED
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE/INTEGRATED CONTROL UNIT (ICU)

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**

NOTE: This DTC must be active for the results of this test to be valid.

1. Turn the ignition on.
2. With the scan tool, read and record the DTCs.
3. With the scan tool, read and record the Environmental Data to help identify the conditions in which the DTC was set.
4. With the scan tool, erase the DTCs.
5. Cycle the ignition from off to on.

6. With the scan tool, read and record the DTCs.

   Is the DTC active at this time?

   Yes

   - Go To 2

   No

   - Perform the ABS-INTERMITTENT CONDITION TEST. Refer to **STANDARD PROCEDURE**.

2. **VERIFY THE BCM PROXI CONFIGURATION ALIGNMENT ROUTINE WAS PERFORMED**
   1. In the Body Control Module (BCM) with the scan tool, under "Miscellaneous Functions" run the "PROXI Configuration Alignment" routine.
   2. With the scan tool, erase the ABS DTCs.
   3. Cycle the ignition switch from off to on, leaving the ignition on for a minimum of ten seconds.
   4. With the scan tool, read the ABS DTCs.

      Does the DTC remain active?

      Yes

      - Using the schematics as a guide, check the Anti-Lock Brake System (ABS) Module pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Anti-Lock Brake Module accordance with Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Test complete.

STANDARD PROCEDURE

ABS VERIFICATION TEST

DIAGNOSTIC TEST

ABS VERIFICATION TEST

WARNING: To avoid possible serious or fatal injury, check brake capability is available before road testing.

1. Turn the ignition off.
2. Connect all previously disconnected components and connectors.
3. Verify all accessories are turned off and the battery is fully charged.
4. The Body Control Module (BCM) PROXI Configuration Alignment routine must be performed first if any of the following components were replaced listed in the table below.

NOTE: If the BCM PROXI is not performed, the ABS indicator will illuminate continuously.

- Turn the ignition on and using the scan tool, go into the Body Control Module (BCM) under "Miscellaneous Functions" and perform the "PROXI Configuration Alignment" routine.

5. Perform the correct routines using the scan tool under "Miscellaneous Functions" with the wheels pointing straight ahead on level ground:

NOTE: If the ABS is not initialized, the ABS indicator will flash continuously.

Component	Routines
Anti-lock Brake System (ABS) Module	ABS Initialization
Hydraulic Control Unit (HCU)	ABS Initialization/ABS Bleed Brakes
Integrated Control Unit (ICU)	ABS Initialization/ABS Bleed Brakes
Dynamics Sensor/Occupant Restraints Controller (ORC)	ABS Initialization
Steering Column Control Module (SCCM)/Steering Angle Sensor (SAS)	ABS Initialization

NOTE: If any of the Wheel Speed Sensors were replaced, test drive the vehicle at a speed above 25 km/h (15 mph) for several minutes.

NOTE: After erasing ACTIVE DTCs it may be necessary for the Anti-lock Brake System (ABS) Module to go to sleep before the DTCs are cleared. IF the DTC is still ACTIVE after the clear command then Turn the ignition off, disconnect the Scan Tool, close the doors and wait until all indicators on the Cluster have gone out, typically about 30 seconds.

6. Verify that the ignition is on, with the scan tool, erase all Diagnostic Trouble Codes (DTCs) from All modules. Start the engine and allow it to run for two minutes and fully operate the system that was indicating the failure.
7. Turn the ignition off and wait five seconds. Turn the ignition on and using the scan tool, read DTCs from all modules.
8. If any Diagnostic Trouble Codes are present, and perform the diagnostic procedure. Refer to **DIAGNOSIS AND TESTING**.
9. **NOTE: For Sensor Signal Plausibility and Pump Motor faults, the ABS Module must verify that**

the failure conditions are no longer present in the current ignition cycle before it can turn off the failure lamp(s). This may require the vehicle to be driven for several minutes above 15 km/h (9 mph). Once it has been determined that the failure condition is no longer present the lamp(s) will be turned off.

10. If there are no DTCs present after turning ignition on, road test the vehicle for at least five minutes.
    - Slowly turn the steering wheel from lock to lock.
    - Test drive the vehicle by turning the vehicle left or right in a curving manner at a speeds between 10 and 25 km/h (6 and 15 mph).
    - Perform several anti-lock braking stops.
11. Again, with the scan tool read DTCs. If any DTCs are present, for the diagnostic procedure and troubleshoot the new or recurring DTC. Refer to **DIAGNOSIS AND TESTING**.
12. If there are no Diagnostic Trouble Codes (DTCs) present, and the customer's concern can no longer be duplicated, the repair is complete.

    Are any DTCs present or is the original concern still present?

    Yes

    - Repair is not complete, perform the appropriate diagnostic procedure. Refer to **DIAGNOSIS AND TESTING**.

    No

    - Repair is complete.

ABS INTERMITTENT CONDITION

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

DIAGNOSTIC TEST

PERFORM ABS INTERMITTENT CONDITION TEST

NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.

1. Perform any Technical Service Bulletins (TSBs) that may apply.
2. Review the scan tool Environmental Data (EV Data). If possible, try to duplicate the conditions under which the DTC set.

3. Turn the ignition off.
4. Visually inspect the related wire harness. Disconnect all the related harness connectors. Look for any chafed, pierced, pinched, partially broken wires and broken, bent, pushed out, or corroded terminals.
5. Wiggle the wires while checking for shorts and open circuits.
6. Perform a voltage drop test on the related circuits between the suspected inoperative component and the Anti-Lock Brake System (ABS) Module.
7. Inspect and clean all PCM, ABS, engine, and chassis grounds that are related to the most current DTC.
8. If numerous trouble codes were set, use a wire schematic and look for any common ground or supply circuits.
9. For any Relay DTCs, actuate the Relay with the scan tool and wiggle the related wire harness to try to interrupt the actuation.
10. Use the scan tool to perform a System Test if one applies to failing component.
11. A co-pilot, data recorder, or lab scope should be used to help diagnose intermittent conditions.
12. Test drive the vehicle over 15 km/h (9 mph).

Were any problems found during the above inspections?

Yes

- Perform the necessary repairs.
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time.

2014 BRAKES

Antilock Brake System (ABS) - Service Information - Cherokee

CAUTION

CAUTION

The antilock brake system uses an electronic control module known as the Antilock Brake Module (ABM). This module is designed to withstand normal current draws associated with vehicle operation. Care must be taken to avoid overloading the circuits.

CAUTION: In testing for open or short circuits, do not ground or apply voltage to any of the circuits unless instructed to do so for a diagnostic procedure.

CAUTION: These circuits should only be tested using a high impedance multi-meter or the designated scan tool as described in this service information . Power should never be removed or applied to any control module with the ignition in the ON position. Before removing or connecting battery cables, fuses, or connectors, always turn the ignition to the OFF position.

CAUTION: The ABM 47-way connector should never be connected or disconnected with the ignition switch in the ON position.

CAUTION: This vehicle utilizes active wheel speed sensors. Do not apply voltage to wheel speed sensors at any time.

CAUTION: Use only factory wiring harnesses. Do not cut or splice wiring to the brake circuits. The addition of aftermarket electrical equipment (car phone, radar detector, citizen band radio, trailer lighting, trailer brakes, etc.) on a vehicle equipped with antilock brakes may affect the function of the antilock brake system.

CAUTION: When performing any service procedure on a vehicle equipped with ABS, do not apply a 12-volt power source to the ground circuit of the pump motor in the HCU. Doing this will damage the pump motor and will require replacement of the entire HCU.

CAUTION: An attempt to remove or disconnect certain system components may result in improper system operation. Only those components with approved removal and installation procedures in this service information should be serviced.

CAUTION: If welding work is to be performed on the vehicle using an electric arc welder, the ABM connector should be disconnected during the welding operation.

CAUTION: Many components of the ABS are not serviceable and must be replaced as an assembly. Do not disassemble any component which is not designed to be serviced.

CAUTION: Brake fluid will damage painted surfaces. If brake fluid is spilled on any painted surface, wash off with water immediately.

CAUTION: Only the recommended jacking or hoisting positions for this vehicle are to be used whenever it is necessary to lift a vehicle.

DESCRIPTION

ANTILOCK BRAKE SYSTEM

This vehicle uses an antilock brake system standard with Electronic Stability Control (ESC) and All-Speed Traction Control.

This antilock brake system uses components of the base brake system, but also features the following components:

- Integrated Control Unit (ICU) - Hydraulic Control Unit (HCU) and Antilock Brake Module (ABM)
- Wheel Speed Sensors (WSS) - Four sensors (one at each wheel)
- Steering Angle Sensor - Part of the Electronic Power Steering (EPS) Module, located in the EPS steering gear
- Dynamics Sensor Module - Includes Yaw rate, longitudinal, and lateral acceleration sensors. Located in the Occupant Restraint Controller (ORC) Module.

The ABS system is made up of the Hydraulic Control Unit (HCU) and the Antilock Brake Module (ABM). For additional information on these components, refer to **HYDRAULIC CONTROL UNIT (HCU), DESCRIPTION** and **MODULE, ANTI-LOCK BRAKE SYSTEM, DESCRIPTION** .

ABS

The purpose of the antilock brake system (ABS) is to prevent wheel lockup under braking conditions on virtually any type of road surface. Antilock braking is desirable because a vehicle that is stopped without locking the wheels retains directional stability and some steering capability. This allows the driver to retain greater control of the vehicle during braking.

All vehicles use Electronic Variable Brake Proportioning (EVBP) to balance front-to-rear braking when the brakes are applied in the partial braking range. For more information on electronic brake distribution, refer to

DESCRIPTION.

ELECTRONIC STABILITY CONTROL

For information on the Electronic Stability Control, refer to **DESCRIPTION**.

TRACTION CONTROL

For information on the All-Speed Traction Control, refer to **DESCRIPTION**.

ELECTRONIC STABILITY CONTROL

Electronic Stability Control (ESC), which includes Hydraulic Brake Assist, Traction Control, and Electronic Roll Mitigation, is standard on all vehicles. ESC aids the driver in maintaining vehicle directional stability. ESC will do whatever can be done, within the limits of available traction, to keep the car on course.

ESC uses the ABS with Traction Control along with the following components to operate:

- Dynamics (ESC) Sensor
- Steering Angle Sensor (SAS)

The Dynamics Sensor is incorporated with the Occupant Restraint Controller (ORC) Module. The ORC is mounted under the center console, which is near the center of gravity of the car for effective sensing. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, DESCRIPTION** . The Steering Angle Sensor is located in the Electric Power Steering (EPS) gear. Refer to **SENSOR, STEERING WHEEL ANGLE, DESCRIPTION**.

HYDRAULIC BRAKE ASSIST

Brake Assist is programmed into the ESC system. Brake assist helps the driver overcome the tendency to not apply the brakes hard enough or quick enough to achieve the minimum stopping distance during a panic stop. During this situation, the ESC system instantly applies the maximum available pressure to the brakes and the vehicle stops as quickly as available traction will allow.

TRACTION CONTROL

The traction control system that is part of the Electronic Stability Control (ESC), is an all-speed traction control. All-Speed Traction Control enhances mobility and prevents wheel slip when accelerating on slippery surfaces. It also provides a measure of directional stability control. Using the wheel-speed sensors, it can detect excessive yaw and help keep the car on the intended course, as for instance, when accelerating around a curve.

All-Speed Traction Control is effective up to 85 mph (137 km/h).

The traction control system may be turned off or on by depressing the ESC Off switch button, located near the middle of the dash.

ELECTRONIC VARIABLE BRAKE PROPORTIONING

Vehicles equipped with ABS use Electronic Variable Brake Proportioning (EVBP) to balance front-to-rear braking. The EVBP is used in place of a rear proportioning valve. The EVBP system uses the ABS system to control the slip of the rear wheels in partial braking range. The braking force of the rear wheels is controlled electronically by using the inlet and outlet valves located in the Integrated Control Unit (ICU).

OPERATION

ANTILOCK BRAKE SYSTEM

ABS

There are a few performance characteristics of the Antilock Brake System (ABS) that may at first seem abnormal, but in fact are normal. These characteristics are described below.

NORMAL BRAKING

Under normal braking conditions, the ABS functions the same as a standard base brake system with a diagonally split master cylinder and conventional vacuum assist.

ABS BRAKING

ABS operation is available at all vehicle speeds above 5-8 km/h (3-5 mph) If a wheel locking tendency is detected during a brake application, the brake system enters the ABS mode. During ABS braking, hydraulic pressure in the four wheel circuits is modulated to prevent any wheel from locking. Each wheel circuit is designed with a set of electric solenoids to allow modulation, although for vehicle stability, both rear wheel solenoids receive the same electrical signal. Wheel lockup may be perceived at the very end of an ABS stop and is considered normal.

During an ABS event, the Integrated Control Unit (ICU) regulates hydraulic pressure at all four of the vehicle's wheels.

The hydraulic pressure at each front wheel is controlled independently (relative to the amount of slip at each wheel) in order to maximize the braking force generated by the front brakes. The rear wheels are controlled such that the hydraulic pressure at either rear wheel does not exceed that of the highest slip rear wheel in order to maintain vehicle stability.

The system can build and release pressure at each wheel, depending on signals generated by the Wheel Speed Sensors (WSS) at each wheel and received at the Antilock Brake Module (ABM).

NOISE AND BRAKE PEDAL FEEL

During ABS braking, some brake pedal movement may be felt. In addition, ABS braking will create ticking, popping, or groaning noises heard by the driver. This is normal and is due to pressurized fluid being transferred between the master cylinder and the brakes. If ABS operation occurs during hard braking, some pulsation may be felt in the vehicle body due to fore and aft movement of the suspension as brake pressures are modulated.

At the end of an ABS stop, ABS is turned off when the vehicle is slowed to a speed of 5-6 km/h (3-4 mph).

There may be a slight brake pedal drop anytime that the ABS is deactivated, such as at the end of the stop when the vehicle speed is less than 3 mph (5 km/h) or during an ABS stop where ABS is no longer required. These conditions exist when a vehicle is being stopped on a road surface with patches of ice, loose gravel, or sand on it. Also, stopping a vehicle on a bumpy road surface activates ABS because of the wheel hop caused by the bumps.

TIRE NOISE AND MARKS

Although the ABS system prevents complete wheel lockup, some wheel slip is desired in order to achieve optimum braking performance. Wheel slip is defined as follows: 0 percent slip means the wheel is rolling freely and 100 percent slip means the wheel is fully locked. During brake pressure modulation, wheel slip is allowed to reach up to 25-30 percent. This means that the wheel rolling velocity is 25-30 percent less than that of a free rolling wheel at a given vehicle speed. This slip may result in some tire chirping, depending on the road surface. This sound should not be interpreted as total wheel lockup.

Complete wheel lockup normally leaves black tire marks on dry pavement. The ABS will not leave dark black tire marks since the wheel never reaches a fully locked condition. However, tire marks may be noticeable as light patched marks.

START-UP AND DRIVE-OFF CYCLES

When the ignition is turned on, a popping sound and a slight brake pedal movement may be noticed. The ABS warning lamp will also be on for up to 5 seconds after the ignition is turned on.

When the vehicle is first driven off, a humming may be heard or felt by the driver at approximately 12-25 mph (20-40 km/h). All of these conditions are a normal function of ABS as the system is performing a diagnosis check.

PREMATURE ABS CYCLING

Symptoms of premature ABS cycling include: clicking sounds from the solenoid valves; pump/motor running; and pulsations in the brake pedal. Premature ABS cycling can occur at any braking rate of the vehicle and on any type of road surface. Neither the red BRAKE indicator lamp, nor the amber ABS indicator lamp, illuminate and no faults are stored in the ABM.

Premature ABS cycling is a condition that needs to be correctly assessed when diagnosing problems with the antilock brake system. It may be necessary to use a scan tool to detect and verify premature ABS cycling.

Check the following common causes when diagnosing premature ABS cycling: damaged wheel bearings (causing tone wheel issues); damaged wheel speed sensor mounting bosses; and loose wheel speed sensor mounting screws.

After diagnosing the defective component, repair or replace it as required. When the component repair or replacement is completed, test drive the vehicle to verify that premature ABS cycling has been corrected.

ELECTRONIC STABILITY CONTROL

For information on the Electronic Stability Control, refer to **OPERATION**.

TRACTION CONTROL

For information on the All-Speed Traction Control, refer to **OPERATION**.

ELECTRONIC STABILITY CONTROL

To determine whether the car is responding properly to cornering commands, ESC uses steering wheel angle, yaw (turning) rate and lateral acceleration sensors (combined into Dynamics Sensor). Using signals from these sensors, in addition to individual wheel speed sensor signals, the system determines appropriate brake and throttle actions. Once initiated, ESC operates much like All-Speed Traction Control, except that the goal is directional stability. If the vehicle yaw response, or rate of turning, is inconsistent with the steering angle and vehicle speed indications, the ESC system applies the brakes and, if necessary closes the throttle, to restore control. This occurs whether the vehicle is turning too rapidly (oversteering) or not rapidly enough (understeering).

HYDRAULIC BRAKE ASSIST

Brake Assist is programmed into the ESC system. During a panic stop, a pressure sensor determines when the driver is doing so by measuring the brake pedal pressure application rate. A high rate of pedal pressure application causes the ESC system to apply maximum available pressure to the brakes and the vehicle stops as quickly as available traction will allow.

TRACTION CONTROL

For information on the All-Speed Traction Control, refer to **OPERATION**.

TRACTION CONTROL

Traction control systems sense impending wheel spin based on a model of the rate of change of wheel speed under normal traction conditions. The All-Speed Traction Control uses signals from the same wheel speed sensors as ABS to determine when to apply the brakes to one or more wheels and when to reduce engine torque output using the electronic throttle control (ETC) to prevent wheel slip during acceleration. Throttle control makes the vehicle less reliant on brake application alone to maintain traction, increasing the operating speed range and more closely modulates speed, resulting in smoother operation. With All-Speed Traction Control reducing engine torque as well as applying the brakes, it is possible to achieve almost seamless torque application at the wheels.

If the wheel slip is severe enough to require throttle intervention, All-Speed Traction Control will reduce engine torque and sometimes upshift the transmission to avoid the condition. In milliseconds, All-Speed Traction Control interrogates the engine control system to determine the current torque output, determines how much the torque output the current conditions will allow, and signals this requirement to the engine control system, which reduces the torque by partially closing the throttle. With execution of the torque reduction, the brake system reduces brake pressure to make the transition smooth, while maintaining forward progress. By reducing engine power, braking effectiveness is maintained and the system can operate throughout the normal vehicle speed range. That is why the system is identified as providing "all-speed" traction control.

The traction control system is enabled at each ignition cycle. It may be turned off by depressing the ESC OFF switch button. The ESC OFF lamp illuminates immediately upon depressing the button. Pressing this button again or turning off and restarting the vehicle will enable the traction control system.

ELECTRONIC VARIABLE BRAKE PROPORTIONING

Upon entry into EVBP, the inlet valve for the rear brake circuit is switched on so that the fluid supply from the master cylinder is shut off. In order to decrease the rear brake pressure, the outlet valve for the rear brake circuit is pulsed. This allows fluid to enter the Low Pressure Accumulator (LPA) in the Hydraulic Control Unit (HCU) resulting in a drop in fluid pressure to the rear brakes. In order to increase the rear brake pressure, the outlet valve is switched off and the inlet valve is pulsed. This increases the pressure to the rear brakes. This back-and-forth process will continue until the required slip difference is obtained. At the end of EVBP braking (brakes released) the fluid in the LPA is pumped back to the master cylinder by switching on the motor for ABS systems or by opening the ESVs for ESC systems. At the same time the inlet valve is switched on in case of another brake application.

The EVBP will remain functional during many ABS fault modes. If both the red BRAKE and amber ABS warning indicators are illuminated, the EVBP may not be functioning.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - INSPECTION AND ROAD TEST

1. Visually inspect the ABS for damaged or disconnected components and connectors.
2. Verify the brake lamps are operational. If they are not, repair them prior to continuing.
3. Connect a scan tool to the Data Link Connector located under the instrument panel to the left of the steering column. If the scan tool does not power-up, check the power and ground supplies to the connector.
4. Turn the ignition key to the ON position.
5. Using the scan tool, read and record any Diagnostic Trouble Codes (DTCs). If any DTCs are present, refer to the appropriate diagnostic information.

   If no problems are observed, it will be necessary to road test the vehicle.

   Many ABS conditions judged to be a problem by the driver may be normal operating conditions. To become familiarized with the normal operating characteristics of this antilock brake system, refer to **OPERATION**.

   WARNING: **Conditions that result in turning on the red brake warning indicator lamp may indicate reduced braking ability.**

   Before road testing a brake complaint vehicle, note whether the red BRAKE warning indicator lamp, amber ABS warning indicator lamp, or both are turned on. If it is the red BRAKE warning indicator, there is a brake hydraulic problem that must be corrected before driving the vehicle

Refer to **DIAGNOSIS AND TESTING** or **DIAGNOSIS AND TESTING** .

The following conditions will cause the red BRAKE lamp to illuminate:

- Low fluid in the brake reservoir
- Park Brake engaged
- Brake hydraulic problem
- ABS issue that will not allow the Brake Proportioning function

If the amber ABS warning indicator is on, road test the vehicle as described below. While only the amber ABS warning indicator is on, the ABS is not functional. The ability to stop the car using the base brake system should not be affected.

6. Turn the key to the OFF position and then back to the ON position. Note whether the amber ABS warning indicator lamp continues to stay on.
7. If the amber ABS warning indicator lamp stays on, shift into gear and drive the car to a speed of approximately 25 km/h (15 mph) to complete the ABS Start-Up and Drive-Off Cycles. Refer to **OPERATION**. If at this time the amber ABS warning indicator lamp stays on, refer to the appropriate diagnostic information.
8. If the amber ABS warning indicator lamp goes out at any time, drive the vehicle a short distance. Accelerate the vehicle to a speed of at least 64 km/h (40 mph). Bring the vehicle to a complete stop, braking hard enough to cause the ABS to cycle. Repeat this action several times. Using the scan tool, read and record any Diagnostic Trouble Codes (DTCs). If any DTCs are present, refer to the appropriate diagnostic information.

STANDARD PROCEDURE

BLEEDING

PRESSURE BLEEDING

NOTE: Pressure bleeding is the preferred method after ICU replacement.

NOTE: Follow pressure bleeder manufacturer instructions for use of pressure bleeding equipment.

NOTE: ABS pressure bleeding is done with the use of power pressure brake bleed equipment

NOTE: To bleed the brakes with a pressure bleeder, the aid of a helper will be required.

ABS system bleeding requires conventional bleeding methods plus use of a scan tool. The procedure involves performing a base brake bleeding, followed by use of the scan tool to cycle and bleed the HCU pump and solenoids.

1. Perform base brake bleeding. Refer to **STANDARD PROCEDURE** .
2. Install pressure bleeding equipment by following the pressure bleeder manufacturer instructions.
3. Connect scan tool to the Data Link Connector and navigate to the ABS menu to begin bleed process.
4. Starting at the LF wheel, following the scan tool on screen instructions, open the bleed screw and continue following scan tool process until cycle completes. Repeat this process for each remaining wheel going to RF, RR, LR.
5. Top off master cylinder fluid level and verify proper brake operation before moving vehicle.
6. Test drive the vehicle to be sure the brakes are operating correctly and that the brake pedal does not feel spongy.

MANUAL BLEEDING

NOTE: ABS manual bleeding is done without the use of power pressure brake bleed equipment.

NOTE: To bleed the brakes manually, the aid of a helper will be required.It is critical that during this process that the master cylinder brake fluid remains within operating range.

ABS system bleeding requires conventional bleeding methods plus use of a scan tool. The procedure involves performing a base brake bleeding, followed by use of the scan tool to cycle and bleed the HCU pump and solenoids.

1. Perform base brake bleeding. Refer to **STANDARD PROCEDURE** .
2. Connect scan tool to the Data Link Connector and navigate to the ABS menu to begin bleed process.
3. Starting at the LF wheel, following the scan tool prompts, open the bleed screw and begin stroking the brake pedal every two seconds while continuing to follow scan tool process until cycle is completed. Repeat this process for each remaining wheel going to RF, RR, LR.
4. Top off master cylinder fluid level and verify proper brake operation before moving vehicle.
5. Test drive the vehicle to be sure the brakes are operating correctly and that the brake pedal does not feel spongy.

SPECIFICATIONS

TORQUE

For ABS fastener torque specifications, see Brake Fastener Torque. Refer to **SPECIFICATIONS** .

ELECTRICAL

SENSOR, DYNAMICS

DESCRIPTION

DESCRIPTION

Fig. 1: Identifying Occupant Restraint Controller
Courtesy of CHRYSLER GROUP, LLC

The Yaw Rate and Lateral Acceleration Sensors are referred to as the Dynamics Sensor and are housed within the Occupant Restraint Controller (ORC) (1). The sensors are used to measure side-to-side (Lateral) motion and vehicle rotational sensing (how fast the vehicle is turning - Yaw).

Yaw and Lateral Acceleration Sensors cannot be serviced separately. The Occupant Restraint Controller (ORC) must be replaced when necessary. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .

SENSOR, STEERING WHEEL ANGLE

DESCRIPTION

DESCRIPTION

The steering angle sensor is an integral part of the Electric Power Steering (EPS) rack. If the steering angle sensor requires service, the EPS rack must be replaced. Refer to **GEAR, REMOVAL** .

SENSOR, WHEEL SPEED, FRONT

DESCRIPTION

DESCRIPTION

Fig. 2: Identifying Front Wheel Speed Sensor
Courtesy of CHRYSLER GROUP, LLC

The antilock brake system uses two-wire wheel speed sensors, known as active wheel speed sensors. The sensors use an electronic principle known as magneto-resistive to help increase performance and durability. The sensors convert wheel speed into a small digital signal. A Wheel Speed Sensor (WSS) is used at each wheel. A magnetic pole encoder serves as the trigger mechanism for each sensor. At each wheel of the vehicle there is one wheel speed sensor and one encoder.

WSS air gaps are not adjustable.

REMOVAL

REMOVAL

Fig. 3: Wheel Speed Sensor Cable, Connector & Retainers
Courtesy of CHRYSLER GROUP, LLC

NOTE: Before proceeding, refer to CAUTION and WARNING .

1. Raise and support the vehicle. refer to **HOISTING, STANDARD PROCEDURE** .
2. Disconnect the wheel speed sensor harness (2) connector from the wiring harness connector (1) on the inner fender.
3. Separate sensor harness clips from retainers (3, 4).
4. Separate the wheel speed sensor harness from the strut bracket.

1715005813

Fig. 4: Removing/Installing Screw Fastening The Wheel Speed Sensor Head
Courtesy of CHRYSLER GROUP, LLC

5. Remove the mounting screw (2) fastening the wheel speed sensor head (1) to the knuckle. Pull the sensor head out of the knuckle and remove the wheel speed cable from the vehicle.

INSTALLATION

INSTALLATION

NOTE: Before proceeding, refer to CAUTION and WARNING .

1715005813

Fig. 5: Removing/Installing Screw Fastening The Wheel Speed Sensor Head
Courtesy of CHRYSLER GROUP, LLC

1. Install the wheel speed sensor head (1) into the knuckle. Install the mounting screw (2) and tighten it to 12 N.m (106 in. lbs.).

050768827

Fig. 6: Wheel Speed Sensor Cable, Connector & Retainers
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Failure to install speed sensor cables properly may result in contact with moving parts or an over extension of cables causing an open circuit. Be sure that cables are installed, routed, and clipped properly.

2. Connect the wheel speed sensor to the harness connector (1) on the inner fender well.
3. Connect the harness routing clips (3, 4) on the inner fender well.
4. Connect the sensor harness to the strut bracket.
5. Lower the vehicle.
6. Perform the Diagnostic Verification Test and clear any faults. Refer to **STANDARD PROCEDURE** .

SENSOR, WHEEL SPEED, REAR

DESCRIPTION

DESCRIPTION

1715005817

Fig. 7: Removing/Installing Rear Wheel Speed Sensor

3. Route wheel speed sensor cable and snap into clips and retainers.
4. Connect wheel speed sensor cable connector (1) to body wiring harness connector.
5. Lower the vehicle.

SWITCH, ELECTRONIC STABILITY PROGRAM (ESP)

DESCRIPTION

DESCRIPTION

The Electronic Stability Control (ESC) switch is mounted in the switch bank assembly of the instrument panel.

The ESC Off switch turns the Electronic Stability Control off and back on. The system resets to ESC-on each time the ignition is cycled.

When the ESC Off switch is depressed and released, turning ESC off, it does not completely turn the system off. The ESC system reduces torque management to a lesser amount, but ESC function can still occur if the system perceives the need.

HYDRAULIC/MECHANICAL

HYDRAULIC CONTROL UNIT (HCU)

DESCRIPTION

DESCRIPTION

The Hydraulic Control Unit (HCU) is mounted to the Antilock Brake Module (ABM) as part of the Integrated Control Unit (ICU). The HCU controls the flow of brake fluid to the brakes using a series of valves and accumulators. A pump/motor is mounted on the HCU to empty the accumulators during an ABS stop and supply build pressure to the brakes during a traction control or ESC event. If the HCU needs replacement it is removed as an assembly with the ABM and then disassembled. Refer to **INTEGRATED CONTROL UNIT (ICU), REMOVAL**.

VALVES AND SOLENOIDS

The valve block contains four inlet valves and four outlet solenoid valves. The inlet valves are spring-loaded in the open position and the outlet valves are spring-loaded in the closed position during normal braking. The fluid is allowed to flow from the master cylinder to the wheel brakes.

During an ABS stop, these valves cycle to maintain the proper slip ratio for each wheel. The inlet valve closes preventing further pressure increase and the outlet valve opens to provide a path from the wheel brake to the HCU accumulators and pump/motor. This releases (decays) pressure from the wheel brake, thus releasing the wheel from excessive slippage. Once the wheel is no longer slipping, the outlet valve is closed and the inlet valve is opened to reapply (build) pressure.

If the ABS includes the traction control feature, there are four other valves in the HCU. Two Traction Control (TC) (or ESC) valves, mounted in the HCU valve block, are normally in the open position and close only when the traction control is applied. There are also two normally closed shuttle valves which open during traction control and ESC events to provide a direct fluid path from the brake fluid reservoir to the inlet of the HCU pump.

These TC valves are used to isolate the rear (non-driving) wheels of the vehicle from the hydraulic pressure that the HCU pump/motor is sending to the front (driving) wheels when traction control is being applied. The rear brakes need to be isolated from the master cylinder when traction control is being applied so the rear wheels do not drag.

BRAKE FLUID ACCUMULATORS

There are two fluid accumulators in the HCU: one for the primary hydraulic circuit, and one for the secondary hydraulic circuit. Each hydraulic circuit uses a 3 cc accumulator.

The fluid accumulators temporarily store brake fluid that is removed from the wheel brakes during an ABS cycle. This stored fluid is used by the pump/motor to provide build pressure for the brake hydraulic system. When the antilock stop is complete, the accumulators are drained by the pump/motor.

There are two noise dampening chambers in the HCU on this vehicle equipped with traction control.

PUMP/MOTOR

There are two pump assemblies in the HCU: one for the primary hydraulic circuit, and one for the secondary hydraulic circuit. Both pumps are driven by a common electric motor. This DC-type motor is integral to the HCU and is controlled by the ABM.

Brake fluid is released to the accumulators when the outlet valve is opened during an antilock stop. The pump mechanism consists of two opposing pistons operated by an eccentric camshaft. In operation, these pistons are used to purge fluid from the accumulators back into the master cylinder circuits. When the antilock stop is complete, the pump/motor drains the accumulators.

The pump motor is also used to build pressure when the system goes into Electronic Stability Control (ESC) and traction control mode.

The ABM may turn on the pump/motor when an antilock stop is detected. The pump/motor continues to run during the antilock stop and is turned off after the stop is complete. Under some conditions, the pump/motor runs to drain the accumulators during the next drive-off.

The pump/motor is not a serviceable item; if it requires replacement, the HCU must be replaced.

INTEGRATED CONTROL UNIT (ICU)

DESCRIPTION

DESCRIPTION

Fig. 12: Identifying Integrated Control Unit (ICU)
Courtesy of CHRYSLER GROUP, LLC

The Hydraulic Control Unit (HCU) and the Antilock Brake Module (ABM) used with this antilock brake system are combined (integrated) into one unit, which is called the Integrated Control Unit (ICU) (4).

The ICU (4) is located in the engine compartment, mounted to the left side body frame rail near the brake master cylinder.

The ABS with ESC and All-Speed Traction Control ICU consists of the following components: the ABM, solenoid valves, traction control solenoid valves, hydraulic shuttle valves, valve block, fluid accumulators, a pump, and an electric pump/motor.

The ICU can be disassembled to service either the HCU or the ABM. The HCU and ABM (ICU) should be removed from the vehicle as an assembly . Refer to **INTEGRATED CONTROL UNIT (ICU), REMOVAL**.

For additional information on the ABS, refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, DESCRIPTION** .

OPERATION

OPERATION

For information of the ICU, refer to these individual components of the ICU:

- ANTILOCK BRAKE MODULE (ABM). Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, DESCRIPTION** .
- HYDRAULIC CONTROL UNIT (HCU). Refer to **HYDRAULIC CONTROL UNIT (HCU), DESCRIPTION**.

REMOVAL

REMOVAL

NOTE: Before proceeding, refer to CAUTION and WARNING .

CAUTION: Before disassembling the ICU, the ICU must be thoroughly cleaned. This must be done to prevent dirt particles and debris from entering into vital areas of the ICU.

1. Install the brake pedal holding tool.
2. Disconnect and isolate battery negative cable from battery post.

Fig. 13: Power Distribution Center (PDC)
Courtesy of CHRYSLER GROUP, LLC

3. Remove the Power Distribution Center (PDC) (2). Refer to **CENTER, POWER DISTRIBUTION (PDC), REMOVAL** .

Fig. 14: Power Distribution Center (PDC) Mount
Courtesy of CHRYSLER GROUP, LLC

4. Remove the bolts (2) from the PDC mount (1), lift up and disconnect the wire harness retaining clips from the underside of the PDC mount and set the mount aside.

Fig. 15: Identifying Integrated Control Unit (ICU)
Courtesy of CHRYSLER GROUP, LLC

5. Disconnect the ABM connector (3) from the ICU (4).
6. Remove the brake lines (1, 5) at the ICU.
7. Loosen the two nuts (2) securing the ICU (4) to the bracket and remove the ICU.

8. If removing the brake booster, remove the ICU bracket mounting bolts and remove the bracket from the vehicle.

INSTALLATION

INSTALLATION

1. If removed, place ICU bracket into position on body, then install mounting bolts and tighten to 25 N.m (18 ft. lbs.).

Fig. 16: Identifying Integrated Control Unit (ICU)
Courtesy of CHRYSLER GROUP, LLC

2. Install ICU (4) to mounting bracket, then install retaining nuts (2) and tighten to 8 N.m (71 in. lbs.).
3. Install the brake lines (1, 5) to the ICU. Torque to specifications. Refer to **SPECIFICATIONS** .
4. Install the ABM connector (3) to the ICU (4).

Fig. 17: Power Distribution Center (PDC) Mount
Courtesy of CHRYSLER GROUP, LLC

5. Install the PDC mount, route the wire harness retaining clips under the mount and install and tighten the bolts (2).

Fig. 18: Identifying Power Distribution Center (PDC)
Courtesy of CHRYSLER GROUP, LLC

6. Install the PDC (2). Refer to **CENTER, POWER DISTRIBUTION (PDC), INSTALLATION** .
7. Reconnect the negative battery cable.
8. Remove the brake pedal holding tool.

9. Install a scan tool to initialize the ABS module and perform the following:
   a. Clear any faults.
   b. Fill the master cylinder to the proper fill level and bleed the base and hydraulic system. Refer to **STANDARD PROCEDURE** .
10. Perform the Verification Test and clear any faults. Refer to **STANDARD PROCEDURE** .

NOTE: **If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.**

2014 BRAKES

Base - Service Information - Cherokee

WARNING

WARNING

WARNING: Chrysler LLC does not manufacture any vehicles or replacement parts that contain asbestos. Aftermarket products may or may not contain asbestos. Refer to aftermarket product packaging for product information.

Whether the product contains asbestos or not, dust and dirt can accumulate on brake parts during normal use. Follow practices prescribed by appropriate regulations for the handling, processing and disposing of dust and debris.

CAUTION

CAUTION

CAUTION: If the electric park brake (EPB) switch is actuated with the caliper removed from the caliper bracket and still connected electrically, the EPB motor will fully extend causing damage to the caliper piston. Disconnect and isolate the negative battery cable before servicing any EPB component.

CAUTION: Use only Mopar® Brake Fluid DOT 3 Motor Vehicle or equivalent from a tightly sealed container. Do not use petroleum-based fluid because seal damage in the brake system will result.

CAUTION: Brake fluid will damage painted surfaces. If brake fluid is spilled on any painted surfaces, wash it off immediately with water.

CAUTION: Never use gasoline, kerosene, alcohol, motor oil, transmission fluid, or any fluid containing mineral oil to clean system components. These fluids damage rubber cups and seals.

CAUTION: During service procedures, grease or any other foreign material must be kept off the caliper assembly, brake linings, brake rotor and external surfaces of the hub.

CAUTION: When handling the brake rotor and caliper, be careful to avoid damaging

the brake rotor and caliper, and scratching or nicking the brake shoe lining.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - BASE BRAKE SYSTEM DIAGNOSIS CHARTS

NOTE: There are three diagnosis charts following that cover the RED BRAKE WARNING INDICATOR, BRAKE NOISE and OTHER BRAKE CONDITIONS.

RED BRAKE WARNING INDICATOR

CONDITION	POSSIBLE CAUSES	CORRECTION
RED BRAKE WARNING INDICATOR ON	1. Electric park brake is not released.	Refer to **DIAGNOSIS AND TESTING**
	2. Park brake warning switch.	Refer to **DIAGNOSIS AND TESTING**
	3. Brake fluid level low in reservoir.	3. Fill reservoir. Check entire system for leaks. Repair or replace as required.
	4. Brake fluid level switch.	4. Disconnect switch wiring connector. If lamp goes out, replace switch.
	5. Mechanical instrument cluster (MIC) problem.	5. Refer to appropriate diagnostic information.
	6. ABS EVBP malfunction.	6. Refer to the appropriate ABS diagnostic service information.

BRAKE NOISE

CONDITION	POSSIBLE CAUSES	CORRECTION
DISC BRAKE CHIRP	1. Excessive brake rotor runout.	1. Diagnose and correct as necessary. Refer to **ROTOR, BRAKE, DIAGNOSIS AND TESTING**.
DISC BRAKE MOAN OR HOWL WHILE BRAKING IN REVERSE	1. Rear disc brake caliper guide pin bolts installed in incorrect locations.	1. Remove lower guide pin bolt and inspect for special sleeve on tip. If sleeve is present, remove upper and lower guide pin bolts and install special sleeved bolt in upper location and standard guide pin bolt in lower location. Refer to **CALIPER, DISC BRAKE, FRONT, REMOVAL** or **CALIPER, DISC BRAKE, REAR, REMOVAL**. Perform on both sides of vehicle as necessary.
DISC BRAKE RATTLE OR CLUNK	1. Broken or missing spring clips. 2. Caliper guide pin bolts loose. 3. Missing	1. Replace brake pads. 2. Tighten guide pin bolts. 3. Replace missing abutment shims.

	abutment shims.	
DISC BRAKE SQUEAK AT LOW SPEED (WHILE APPLYING LIGHT BRAKE PEDAL EFFORT)	1. Brake pad linings.	1. Replace brake pads.
SCRAPING (METAL-TO-METAL).	1. Foreign object interference with brakes.	1. Inspect brakes and remove foreign object.
	2. Brake pads worn out.	2. Replace brake pads. Inspect rotors. Reface or replace as necessary.
SCRAPING OR WHIRRING	1. ABS wheel speed sensor hitting tone wheel.	1. Inspect, correct or replace faulty component(s).

OTHER BRAKE CONDITIONS

CONDITION	POSSIBLE CAUSES	CORRECTION
BRAKES CHATTER	1. Disc brake rotor has excessive thickness variation.	1. Isolate condition as rear or front. Reface or replace brake rotors as necessary.
BRAKES DRAG (FRONT OR ALL)	1. Contaminated brake fluid.	1. Check for swollen seals. Replace all system components containing rubber.
	2. Binding caliper pins or bushings.	2. Replace pins and bushings
	3. Misadjusted brake lamp switch.	3. Replace brake lamp switch. Refer to **SWITCH, STOP LAMP, REMOVAL** .
	4. Master cylinder not fully returning.	4. Inspect master cylinder and replace as necessary.
	5. Binding brake pedal.	5. Replace brake pedal/bushings.
BRAKES DRAG (REAR ONLY)	1. Operator error.	1. Describe operation of electric park brake.
2. Electric park brake does not release.		2. Refer to **DIAGNOSIS AND TESTING**
BRAKES GRAB	1. Contaminated brake pad.	1. Inspect and clean, or replace pads. Repair source of contamination.
	2. Improper power brake booster assist.	2. Refer to POWER BRAKE BOOSTER in this service information .
EXCESSIVE PEDAL EFFORT	1. Obstruction of brake pedal.	1. Inspect, remove or move

		obstruction.
	2. Low power brake booster assist.	2. Refer to POWER BRAKE BOOSTER in this service information .
	3. Glazed brake linings.	3. Reface or replace brake rotors as necessary.
	4. Brake pad lining transfer to brake rotor.	4. Reface or replace brake rotors as necessary. Replace brake pads.
EXCESSIVE PEDAL EFFORT (HARD PEDAL - CAN'T SKID WHEELS)	1. Power brake booster runout (vacuum assist).	1. Check booster vacuum hose and engine tune for adequate vacuum supply. Refer to POWER BRAKE BOOSTER.
EXCESSIVE PEDAL TRAVEL (VEHICLE STOPS OK)	1. Air in brake lines.	1. Bleed brakes.
	2. Brake fluid low in reservoir	2. Fill reservoir. Check entire system for leaks; repair or replace as required.
EXCESSIVE PEDAL TRAVEL (ONE FRONT WHEEL LOCKS UP DURING HARD BRAKING)	1. One of the two hydraulic circuits is malfunctioning.	1. Inspect system for leaks. Check master cylinder for internal malfunction.
PEDAL PULSATES/SURGES DURING BRAKING	1. Disc brake rotor has excessive thickness variation.	1. Isolate condition as rear or front. Reface or replace brake rotors as necessary.
PEDAL IS SPONGY	1. Air in brake lines.	1. Bleed brakes.
	2. ABS EVBP not functioning.	2. Refer to the appropriate ABS diagnostic service information.
STOP LAMPS STAY ON	1. Brake lamp switch out of adjustment.	1. Replace brake lamp switch. Refer to **SWITCH, STOP LAMP, REMOVAL** .
	2. Brake pedal binding.	2. Inspect and replace as necessary.
	3. Power brake booster not allowing pedal to return completely.	3. Replace power brake booster.
VEHICLE PULLS TO RIGHT OR LEFT ON BRAKING	1. Frozen brake caliper piston.	1. Replace frozen piston or caliper. Bleed brakes.
	2. Contaminated brake pad lining (most likely front lining).	2. Inspect and clean, or replace pads. Repair source of contamination.
	3. Pinched brake lines.	3. Replace pinched line.
	4. Leaking piston seal.	4. Replace piston seal or brake caliper.
	5. Suspension problem.	5. Refer to the appropriate Suspension service information .

STANDARD PROCEDURE

STANDARD PROCEDURE - BASE BRAKE BLEEDING

CAUTION: Before removing the master cylinder cap, wipe it clean to prevent dirt and other foreign matter from dropping into the master cylinder reservoir.

CAUTION: Use only Mopar® brake fluid or an equivalent from a fresh, tightly sealed container. Brake fluid must conform to DOT 3 specifications.

Do not pump the brake pedal at any time while having a bleeder screw open during the bleeding process. This will only increase the amount of air in the system and make additional bleeding necessary.

Do not allow the master cylinder reservoir to run out of brake fluid while bleeding the system. An empty reservoir will allow additional air into the brake system. Check the fluid level frequently and add fluid as needed.

The following wheel circuit sequence for bleeding the brake hydraulic system should be used to ensure adequate removal of all trapped air from the hydraulic system.

- Left rear wheel
- Right front wheel
- Right rear wheel
- Left front wheel

MANUAL BLEEDING

NOTE: To bleed the brakes manually, the aid of a helper will be required.

Fig. 1: Bleeding Brakes

Courtesy of CHRYSLER GROUP, LLC

1. Attach, (special tool #8358-1, Bleed Tube) (1) to the bleeder screw and feed the hose into a clear jar (2) containing enough fresh brake fluid to submerge the end of the hose.
2. Have a helper pump the brake pedal three or four times and hold it in the down position.
3. With the pedal in the down position, open the bleeder screw at least one full turn.
4. Once the brake pedal has dropped, close the bleeder screw. After the bleeder screw is closed, release the brake pedal.
5. Repeat the above steps until all trapped air is removed from that wheel circuit (usually four or five times).
6. Bleed the remaining wheel circuits in the same manner until all air is removed from the brake system. Monitor the fluid level in the master cylinder reservoir to make sure it does not go dry.
7. Check and adjust brake fluid level to the FULL mark.
8. Check the brake pedal travel. If pedal travel is excessive or has not been improved, some air may still be trapped in the system. Re-bleed the brakes as necessary.
9. Test drive the vehicle to verify the brakes are operating properly and pedal feel is correct.

PRESSURE BLEEDING

NOTE: Follow pressure bleeder manufacturer's instructions for use of pressure bleeding equipment.

1. Attach the pressure bleeding equipment to the Master Cylinder.

Fig. 2: Bleeding Brakes
Courtesy of CHRYSLER GROUP, LLC

2. Attach, (special tool #8358-1, Bleed Tube) (1) to the bleeder screw and feed the hose into a clear jar (2) containing enough fresh brake fluid to submerge the end of the hose.
3. Open the bleeder screw at least one full turn or more to obtain a steady stream of brake fluid.
4. After approximately 120-240 ml (4-8 ounces) of fluid have been bled through the brake circuit and an air-

free flow is maintained in the clear plastic hose and jar, close the bleeder screw.

5. Repeat this procedure at all the remaining bleeder screws.
6. Check and adjust brake fluid level to the FULL mark on the reservoir.
7. Check the brake pedal travel. If pedal travel is excessive or has not been improved, some air may still be trapped in the system. Re-bleed the brakes as necessary.
8. Test drive the vehicle to verify the brakes are operating properly and pedal feel is correct.

ELECTRICAL

PUMP, ELECTRIC VACUUM

DESCRIPTION

DESCRIPTION

Fig. 3: Electric Vacuum Pump, Connector & Two Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: Only the 3.6L engine has an electric vacuum pump.

On the 3.6L engine there is an electric vacuum pump (1) located on the left side of the engine. The vacuum

pump (1) has one electrical connector (3) on a pigtail connected to the mounting bracket. The mounting bracket is secured to the engine with two bolts (2).

Fig. 4: Vacuum Pump, Two Rubber Insulated Studs, Quick-Connect Type End & Vacuum Pump
Courtesy of CHRYSLER GROUP, LLC

The vacuum pump (2) mounts to the bracket with two rubber insulated studs (4) to reduce vibration. The vacuum hose has a quick-connect type end (1) with a locking tab at the vacuum pump (2).

OPERATION

OPERATION

The Electric Vacuum Pump (EVP) system is installed to provide supplemental vacuum to the brake booster when the engine vacuum supply is low. The vacuum pump is connected to the engine and the brake booster through a series of hoses and one-way flow check valves. A pressure sensor, mounted in the brake booster, provides information to the Antilock Brake System (ABS) module, then the vacuum level is sent over CAN to the Powertrain Control Module (PCM). The PCM modulates the EVP operation to maintain the brake booster vacuum within a given range. This system ensures that the customer experiences a consistent brake pedal feel under all driving conditions.

A two wire electrical connector is used to supply power and ground for the vacuum pump. Operating voltage is between 9V - 16V. Control of the vacuum pump is provided by the Powertrain Control Module (PCM) using a low side driver to a normally open relay (coil side). The relay coil side power is from a fuse in the under hood PDC. The switched power circuit to the vacuum pump relay is wired directly from the battery through an inline fuse holder located below the remote battery post connection on the RH side in the engine compartment. The relay is located on the LH shock tower in the engine compartment.

The PCM monitors the Manifold Absolute Pressure (MAP) sensor and when the signal indicates low engine vacuum the PCM will cycle the vacuum pump as necessary to add vacuum to the power brake booster. The vacuum hoses are connected between the vacuum pump, the engine manifold (for MAP sensor signal), and the power brake booster vacuum sensor (on the brake booster). When the PCM cycles the vacuum pump on, the

PCM monitors the MAP sensor and if the vacuum signal does not indicate a rising vacuum then DTCs will be set. Additionally, the Antilock Brake System (ABS) module monitors the vacuum at the brake booster vacuum sensor and DTCs will also set in the ABS module.

REMOVAL

REMOVAL

Fig. 5: Vacuum Pump, Two Rubber Insulated Studs, Quick-Connect Type End & Vacuum Pump
Courtesy of CHRYSLER GROUP, LLC

1. Remove the engine appearance cover.
2. Disconnect the electrical connector (3) and remove the harness connector from the back side of the mounting bracket.
3. Release the locking tab and disconnect the quick connect vacuum hose (1) from the vacuum pump (2).

Fig. 6: Electric Vacuum Pump, Connector & Two Bolts
Courtesy of CHRYSLER GROUP, LLC

4. Remove the vacuum pump bracket bolts (2) and remove the vacuum pump assembly (1) from the vehicle.

INSTALLATION

INSTALLATION

Fig. 7: Electric Vacuum Pump, Connector & Two Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Position the vacuum pump assembly (1), ensuring that the two ground leads are in place while installing bracket mounting bolts (2). .
2. Attach the harness connector to the bracket and connect the electrical connector (3).

Fig. 8: Vacuum Pump, Two Rubber Insulated Studs, Quick-Connect Type End & Vacuum Pump
Courtesy of CHRYSLER GROUP, LLC

3. Connect the quick-connect vacuum hose (1) to the vacuum pump (2) and seat the locking tab.
4. Install the engine appearance cover.

SWITCH, BRAKE FLUID LEVEL

DESCRIPTION

DESCRIPTION

Fig. 9: Identifying Brake Master Cylinder Fluid Reservoir Components
Courtesy of CHRYSLER GROUP, LLC

The brake fluid level switch (2) is an internal part of the master cylinder brake fluid reservoir (1). The switch **cannot** be serviced separately from the brake master cylinder fluid reservoir (1). Refer to **RESERVOIR, BRAKE MASTER CYLINDER, REMOVAL**.

HYDRAULIC/MECHANICAL

DESCRIPTION

DESCRIPTION

Each disc brake assembly consists of the following major components:

- Caliper
- Caliper adapter bracket

- Pads
- Rotor
- Electric Park Brake (rear calipers)

REAR DISC CALIPER The rear brake caliper features an Electric Park Brake (EPB) which combines a electromechanical motor and gear unit (EPB actuator) with a conventional rear caliper. Refer to **PARKING BRAKE, DESCRIPTION**. The EPB actuator can be removed and serviced separately from the caliper.

CAUTION: If the electric park brake (EPB) switch is actuated with the caliper removed from the caliper bracket and still connected electrically, the EPB motor will fully extend causing damage to the caliper piston. Disconnect and isolate the negative battery cable before servicing any EPB component.

BOOSTER, POWER BRAKE

DESCRIPTION

DESCRIPTION

Fig. 10: Pedal And Booster Mounting - LHD
Courtesy of CHRYSLER GROUP, LLC

The power brake booster (3) is mounted to the engine side of the dash panel. The master cylinder is bolted to the front of the booster. A vacuum check valve is also mounted on the front of the booster. A vacuum line connects the check valve to engine source vacuum. The booster input rod extends through the dash panel and connects to the brake pedal.

This vehicle uses a single diaphragm, single rate vacuum power brake booster with 279 mm (11 in.) diaphragm.

The power brake booster can be identified by the tag attached to the body of the booster. This tag contains the following information:

- The production part number
- The date it was built, and
- The booster manufacturer.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - MASTER CYLINDER/POWER BOOSTER

1. Start the engine and check the booster vacuum hose connections. A hissing noise indicates a vacuum leak. Correct any vacuum leaks before proceeding.
2. Stop the engine and pump the brake pedal until all vacuum reserve in the booster is depleted.
3. Press and hold the brake pedal under light foot pressure. The pedal should hold firm. If the pedal falls away, there may be an external leak or the master cylinder is faulty (internal leakage).
4. Start the engine and note pedal action. It should fall away slightly under light foot pressure, then hold firm. If no pedal action is discernible, the power booster, vacuum supply or vacuum check valve is faulty, proceed to the POWER BOOSTER VACUUM TEST.
5. If the POWER BOOSTER VACUUM TEST passes, rebuild the booster vacuum reserve as follows: Release the brake pedal. Increase engine speed to 1500 RPM, close the throttle and immediately turn off the ignition to stop the engine.
6. Wait a minimum of 90 seconds and try brake action again. The booster should provide two or more vacuum assisted pedal applications. If the vacuum assist is not provided, the booster is faulty.

POWER BOOSTER VACUUM TEST

1. Connect a vacuum gauge to the booster check valve with a short length of hose and T-fitting.
2. Start and run the engine at curb idle for one minute.
3. Observe the vacuum supply. If the vacuum supply is less that 12 inches HG (406 millibars), repair the vacuum supply.
4. Clamp the hose shut between the intake vacuum source and the check valve.
5. Stop the engine and observe the vacuum gauge.
6. If the vacuum drops more than one inch HG (33 millibars) within 15 seconds, the booster diaphragm or check valve is faulty.

POWER BOOSTER CHECK VALVE TEST

1. Remove the power booster check valve from the power booster.
2. Using a hand operated vacuum pump, apply 15-20 inches HG (508-677 millibars) vacuum at the booster side of the check valve.
3. The vacuum should hold steady. If the gauge on the pump indicates vacuum loss, the check valve is faulty and should be replaced.

REMOVAL

REMOVAL

NOTE: Before proceeding, refer to CAUTION and WARNING.

1. Disconnect and isolate the battery negative cable from its post on the battery.
2. Remove the Power Distribution Center (PDC) from the mounting location and position aside. Refer to **CENTER, POWER DISTRIBUTION (PDC), REMOVAL** .
3. Remove the ICU. Refer to **INTEGRATED CONTROL UNIT (ICU), REMOVAL** .
4. Remove the ICU mounting bracket.
5. Remove the master cylinder and reservoir assembly. Refer to **MASTER CYLINDER, BRAKE, REMOVAL**.
6. Disconnect the vacuum sensor and remove the vacuum hose from the booster.

Fig. 11: Identifying Intermediate Shaft, Pinch Bolt And Steering Gear Pinion Shaft
Courtesy of CHRYSLER GROUP, LLC

7. Remove intermediate shaft pinch bolt (3) and separate the intermediate shaft (1) at the base of the column from the steering gear pinion shaft (2). Discard the pinch bolt (3); it is not to be reused.
8. Position the intermediate shaft (1) so that the pedal assembly can be accessed.
9. Remove the stop lamp switch. Refer to **SWITCH, STOP LAMP, REMOVAL** .

Fig. 12: Retainer & Clips
Courtesy of CHRYSLER GROUP, LLC

10. Disengage clips (1) on booster rod keeper assembly retainer (2). Position retainer (2) up to remove booster rod from pedal assembly.

Fig. 13: Remove/Install Power Brake Booster Nuts
Courtesy of CHRYSLER GROUP, LLC

11. Remove the four nuts (1) attaching the power brake booster to the dash panel.
12. Slide the power brake booster forward until its mounting studs clear the dash panel, then remove it through the engine compartment.

INSTALLATION

INSTALLATION

1. Install the power brake booster by sliding the push rod and studs through the dash panel and into mounting position. Insure vacuum check valve opening on front shell of booster is at approximately 9 o'clock.

0508007146

Fig. 14: Remove/Install Power Brake Booster Nuts
Courtesy of CHRYSLER GROUP, LLC

2. Install the four power brake booster mounting nuts (1) in following sequence: Top inboard, bottom outboard, top outboard, bottom inboard. Failure to do so may result in damage to the booster. Tighten to the proper specification

   Refer to **TORQUE SPECIFICATIONS** .

   NOTE: Make sure the cup that the booster push rod reacts against is still in place in the pedal before installing the new booster rod keeper.

   NOTE: The brake pedal booster rod keeper (2) cannot be reused. Always install a new keeper if the brake pedal push rod was separated from the keeper.

Fig. 15: Retainer & Clips
Courtesy of CHRYSLER GROUP, LLC

3. Install the power brake booster push rod and retainer (2) into NEW booster rod keeper, ensuring that the clips (1) are engaged.
4. Install and adjust the stop lamp switch in the brake pedal bracket. Refer to **SWITCH, STOP LAMP, INSTALLATION** .

Fig. 16: Identifying Intermediate Shaft, Pinch Bolt And Steering Gear Pinion Shaft
Courtesy of CHRYSLER GROUP, LLC

5. Verify the front wheels of vehicle are in the STRAIGHT-AHEAD position.
6. Install the intermediate shaft (1) onto the steering gear input shaft (2).

NOTE: A new pinch bolt (3) must be installed every time the pinch bolt is removed.

7. Install a **NEW** pinch bolt (3) and tighten to the proper specification. Refer to **COLUMN, SPECIFICATIONS** .
8. Connect the vacuum sensor and install the vacuum hose in the booster.
9. Install the master cylinder and reservoir assembly. Refer to **MASTER CYLINDER, BRAKE, INSTALLATION**.
10. Install the ICU mounting bracket and tighten to the proper specification. Refer to **TORQUE SPECIFICATIONS** .
11. Install the ICU. Refer to **INTEGRATED CONTROL UNIT (ICU), INSTALLATION** .
12. Install the PDC. Refer to **CENTER, POWER DISTRIBUTION (PDC), INSTALLATION** .
13. Connect the battery negative cable to its post on the battery.
14. Bleed the base brake system. Refer to **STANDARD PROCEDURE** .
15. Road test the vehicle to ensure proper operation of the brakes.

CALIPER, DISC BRAKE, FRONT

REMOVAL

REMOVAL

NOTE: Before proceeding, Refer to CAUTION and WARNING.

1. Using a brake pedal holding tool, depress the brake pedal past its first 25 mm (1 inch) of travel and hold it in this position. This will isolate the master cylinder from the brake hydraulic system and will not allow the brake fluid to drain out of the master cylinder reservoir when the lines are opened.
2. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
3. Remove the wheel mounting bolts, then the tire and wheel assembly.

Fig. 17: Brake Line Connector & Clip
Courtesy of CHRYSLER GROUP, LLC

4. Remove the brake line connector (2) from the junction on the inner fender.
5. Separate the clip (1) from the strut and remove the brake hose from the strut.

Fig. 18: Identifying Brake Hose Connector And Pin Bolts

Courtesy of CHRYSLER GROUP, LLC

6. Remove the brake hose connector (1) from the brake caliper.
7. Remove the two brake caliper guide pin bolts (4).
8. Slide the disc brake caliper from the disc brake adapter bracket and remove.

DISASSEMBLY

DISASSEMBLY

NOTE: Before disassembling the brake caliper, remove it from the vehicle. Refer to CALIPER, DISC BRAKE, FRONT, REMOVAL or CALIPER, DISC BRAKE, REAR, REMOVAL.

NOTE: Before disassembling the brake caliper, clean and inspect it. Refer to CALIPER, DISC BRAKE, FRONT, INSPECTION and CALIPER, DISC BRAKE, FRONT, CLEANING.

WARNING: Under no condition should high pressure air ever be used to remove a piston from a caliper bore. Personal injury could result from such a practice.

CAUTION: Do not use excessive force when clamping caliper in vise. Excessive vise pressure will cause bore distortion.

1. Mount the caliper in a vise equipped with protective jaws.

Fig. 19: Identifying Wooden Block Placed In Brake Caliper

Courtesy of CHRYSLER GROUP, LLC

1 - WOOD BLOCK

WARNING: Do not place face or hands near caliper and piston if using compressed air pressure to remove piston. Do not use high pressure.

2. Place a wooden block (1) in the caliper as shown in the illustration.
3. If necessary, apply low pressure compressed air to the caliper fluid inlet in short spurts to force the piston out.
4. Remove the piston from the caliper.
5. Remove the dust boot from the piston and discard it.

Fig. 20: Piston Seal Removal
Courtesy of CHRYSLER GROUP, LLC

1 - TRIM STICK 2 - SEAL

CAUTION: Do not use a screw driver or other metal tool for seal removal. Using such tools can scratch the bore or leave burrs on the seal groove edges.

6. Using a soft tool such as a plastic trim stick (1), work the piston seal (2) out of its groove in caliper piston bore. Discard the used seal.
7. Clean the piston bore and drilled passage ways with alcohol or a suitable solvent. Wipe it dry using only a lint-free cloth.
8. Inspect both the piston and bore for scoring or pitting. Bores that show light scratches or corrosion can usually be cleared of the light scratches or corrosion using crocus cloth.

CLEANING

CLEANING

WARNING: Chrysler LLC does not manufacture any vehicles or replacement parts that contain asbestos. Aftermarket products may or may not contain asbestos. Refer to aftermarket product packaging for product information.

Whether the product contains asbestos or not, dust and dirt can accumulate on brake parts during normal use. Follow practices prescribed by appropriate regulations for the handling, processing and disposing of dust and debris.

To clean or flush the internal passages of the brake caliper, use fresh brake fluid or Mopar® Non-Chlorinated Brake Parts Cleaner. Never use gasoline, kerosene, alcohol, oil, transmission fluid or any fluid containing mineral oil to clean the caliper. These fluids will damage rubber cups and seals.

INSPECTION

INSPECTION

Inspect the disc brake caliper for the following:

- Brake fluid leaks in and around piston boot area
- Ruptures, brittleness or damage to the piston dust boot

If caliper fails inspection, disassemble and recondition caliper, replacing the seals and dust boots.

ASSEMBLY

ASSEMBLY

NOTE: Always have clean hands when assembling a brake caliper.

NOTE: Always use fresh, clean brake fluid when assembling a brake caliper.

Fig. 21: New Piston Seal Installation
Courtesy of CHRYSLER GROUP, LLC

1 - SEAL 2 - GROOVE

NOTE: Never use an old piston seal.

1. Dip the NEW piston seal in clean brake fluid and install it in the groove (2) of the caliper bore. The seal (1) should be started at one area of the groove and gently worked around into the groove using only your clean fingers to seat it.

Fig. 22: Boot Installation
Courtesy of CHRYSLER GROUP, LLC

2. Coat the NEW piston with clean brake fluid.
3. Coat the NEW piston boot with clean brake fluid leaving a generous amount inside the boot.
4. Position the dust boot over the lower section of the piston.
5. Extend the dust boot below the bottom of the piston and guide the lip seal into the groove in the caliper

piston bore.

Fig. 23: Piston Installation
Courtesy of CHRYSLER GROUP, LLC

1 - PISTON GROOVE

CAUTION: Force applied to the piston (1) to seat it in the bore must be applied uniformly to avoid cocking and binding of the piston.

6. Install the piston (1) into the bore, carefully pushing it past the piston seal using **hand pressure** . Push the piston in until it bottoms in the caliper bore and the dust boot lip seal falls into the groove near the top of the piston.
7. Install the caliper on the vehicle and bleed the brakes as necessary. Refer to **CALIPER, DISC BRAKE, FRONT, INSTALLATION** or **CALIPER, DISC BRAKE, REAR, INSTALLATION**.

INSTALLATION

INSTALLATION

1715005815

Fig. 24: Identifying Brake Hose Connector And Pin Bolts
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Use care when installing the caliper onto the adapter bracket to avoid damaging the guide pin boots.

1. Completely retract the caliper piston back into the bore of the caliper. Use a C-clamp to retract the piston. Place a wood block over the piston before installing the C-clamp to avoid damaging the piston.
2. Install the disc brake caliper over the brake pads on the brake caliper adapter bracket.
3. Align the caliper guide pin bolt holes with the adapter bracket. Install the caliper guide pin bolts (4) and tighten to 43 N.m (32 ft. lbs.).
4. Install the brake hose (1) connector to the brake caliper and tighten to 18 N.m (159 in. lbs.).

Fig. 25: Brake Line Connector & Clip
Courtesy of CHRYSLER GROUP, LLC

5. Install brake hose fitting to brake line connector (2) and tighten to 18 N.m (159 in. lbs.).
6. Install brake hose to mounting location on strut (1) and secure with the clip.
7. Install the tire and wheel assembly. Refer to **INSTALLATION** .
8. Lower the vehicle.

Fig. 26: Bleeding Brakes
Courtesy of CHRYSLER GROUP, LLC

9. Remove the brake pedal holding tool.

10. Bleed the caliper as necessary. Refer to **STANDARD PROCEDURE** .
11. Road test the vehicle and make several stops to wear off any foreign material on the brakes and to seat the brake pads.

CALIPER, DISC BRAKE, REAR

REMOVAL

REMOVAL

NOTE: Before proceeding, refer to CAUTION and WARNING.

The electronic park brake (EPB) actuator must be retracted prior to removing the brake caliper assembly. This can be done in two ways:

- A diagnostic scan tool (Service Mode position).
- Through Uconnect

CAUTION: If the electric park brake (EPB) switch is actuated with the caliper removed from the caliper bracket and still connected electrically, the EPB motor will fully extend causing damage to the caliper piston. Disconnect and isolate the negative battery cable before servicing any EPB component.

1. Using a brake pedal holding tool, depress the brake pedal past its first one inch of travel and hold it in this position. This will isolate the master cylinder from the brake hydraulic system and will not allow the brake fluid to drain out of the master cylinder reservoir while the lines are disconnected.
2. Disconnect and isolate the negative battery cable.
3. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
4. Remove the wheel mounting bolts, then the rear tire and wheel assembly.

1715005817

Fig. 27: Identifying Brake Line Bracket, Brake Line, Flex Hose And Wheel Speed Sensor
Courtesy of CHRYSLER GROUP, LLC

5. Remove the nut and brake line bracket (2) from the brake caliper.
6. Remove the brake line (3) from the flex hose (4).

1715005819

Fig. 28: Caliper Guide Pin Bolts

Courtesy of CHRYSLER GROUP, LLC

7. While holding guide pins from turning, remove caliper guide pin bolts (3).
8. Slide and remove the disc brake caliper from the disc brake adapter bracket.

INSTALLATION

INSTALLATION

CAUTION: Use care when installing the caliper onto the disc brake adapter to avoid damaging the guide pin boots.

Fig. 29: Caliper Guide Pin Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Install the disc brake caliper with outboard brake pad attached over the inboard brake pad and rotor, onto the brake caliper adapter bracket.
2. Align the caliper guide pin bolt holes with the adapter bracket. Install the caliper guide pin bolts (3) and tighten the guide pin bolts to 43N.m (32 ft. lbs.).

1715005817

Fig. 30: Identifying Brake Line Bracket, Brake Line, Flex Hose And Wheel Speed Sensor
Courtesy of CHRYSLER GROUP, LLC

3. Install brake line fitting (3) to the flex hose (4) and tighten to 18 N.m (159 in. lbs.).
4. Install the brake line bracket and nut (2) to the brake caliper.
5. Install the tire and wheel assembly. Refer to **INSTALLATION** .
6. Lower the vehicle.
7. Remove the brake pedal holding tool.

Fig. 31: Bleeding Brakes
Courtesy of CHRYSLER GROUP, LLC

8. Bleed the caliper as necessary. Refer to **STANDARD PROCEDURE** .
9. Pump the brake pedal several times to ensure the vehicle has a firm brake pedal before moving the vehicle.
10. Exit the Service Mode prior to road testing the vehicle. This can be done in two ways:
    - Exit the Service Mode with diagnostic scan tool.
    - While depressing the brake pedal, press the EPB switch.
11. Road test the vehicle and make several stops to wear off any foreign material on the brakes and to seat the brake pads.

FLUID

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - BRAKE FLUID CONTAMINATION

Indications of fluid contamination are swollen or deteriorated rubber parts. Swelling indicates the presence of petroleum in the brake fluid.

To test for contamination, put a small amount of drained brake fluid in clear glass jar. If the fluid separates into layers, there is mineral oil or other fluid contamination of the brake fluid.

If the brake fluid is contaminated, drain and thoroughly flush the brake system. Replace all the rubber parts or components containing rubber coming into contact with the brake fluid including: the master cylinder and reservoir; caliper seals; ABS hydraulic control unit; and all hydraulic fluid hoses.

SPECIFICATIONS

SPECIFICATIONS

The brake fluid used in this vehicle must conform to DOT 3 specifications and SAE J1703 standards. No other type of brake fluid is recommended or approved for usage in the vehicle brake system. Use only Mopar® Brake Fluid DOT 3 Motor Vehicle or equivalent from a tightly sealed container.

CAUTION: Never use reclaimed brake fluid or fluid from a container which has been left open. An open container will absorb moisture from the air and contaminate the fluid.

CAUTION: Never use any type of a petroleum-based fluid in the brake hydraulic system. Use of such type fluids will result in seal damage of the vehicle brake hydraulic system causing a failure of the vehicle brake system. Petroleum based fluids would be items such as engine oil, transmission fluid, power steering fluid, etc.

MASTER CYLINDER, BRAKE

DESCRIPTION

DESCRIPTION

All master cylinders are a two-outlet design and the brake tubes from these primary and secondary outlet ports lead directly to the Integrated Control Unit (ICU) before going to each wheel brake.

The master cylinder body is an anodized aluminum casting. It has a machined bore to accept the master cylinder pistons and also has threaded ports with seats for hydraulic brake tube connections.

The master cylinder has the brake fluid reservoir mounted on top of it which gravity feeds brake fluid to the master cylinder when it is required. On manual transmission model vehicles the brake fluid reservoir also feeds the clutch hydraulic circuit. The reservoir is made of see-through plastic and it houses the brake fluid level switch.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - MASTER CYLINDER/POWER BOOSTER

1. Start the engine and check the booster vacuum hose connections. A hissing noise indicates a vacuum leak. Correct any vacuum leaks before proceeding.
2. Stop the engine and pump the brake pedal until all vacuum reserve in the booster is depleted.
3. Press and hold the brake pedal under light foot pressure. The pedal should hold firm. If the pedal falls away, there may be an external leak or the master cylinder is faulty (internal leakage).
4. Start the engine and note pedal action. It should fall away slightly under light foot pressure, then hold firm. If no pedal action is discernible, the power booster, vacuum supply or vacuum check valve is faulty, proceed to the POWER BOOSTER VACUUM TEST.
5. If the POWER BOOSTER VACUUM TEST passes, rebuild the booster vacuum reserve as follows: Release the brake pedal. Increase engine speed to 1500 RPM, close the throttle and immediately turn off the ignition to stop the engine.
6. Wait a minimum of 90 seconds and try brake action again. The booster should provide two or more vacuum assisted pedal applications. If the vacuum assist is not provided, the booster is faulty.

POWER BOOSTER VACUUM TEST

1. Connect a vacuum gauge to the booster check valve with a short length of hose and T-fitting.
2. Start and run the engine at curb idle for one minute.
3. Observe the vacuum supply. If the vacuum supply is less that 12 inches HG (406 millibars), repair the vacuum supply.
4. Clamp the hose shut between the intake vacuum source and the check valve.
5. Stop the engine and observe the vacuum gauge.
6. If the vacuum drops more than one inch HG (33 millibars) within 15 seconds, the booster diaphragm or check valve is faulty.

POWER BOOSTER CHECK VALVE TEST

1. Remove the power booster check valve from the power booster.
2. Using a hand operated vacuum pump, apply 15-20 inches HG (508-677 millibars) vacuum at the booster side of the check valve.
3. The vacuum should hold steady. If the gauge on the pump indicates vacuum loss, the check valve is faulty and should be replaced.

STANDARD PROCEDURE

STANDARD PROCEDURE - MASTER CYLINDER BLEEDING

Fig. 32: Bleeding Master Cylinder With ABS
Courtesy of CHRYSLER GROUP, LLC

1. Clamp the master cylinder in a vise with soft-jaw caps.
2. Attach the special tools for bleeding the master cylinder in the following fashion:
   a. Thread a Bleeder Tube (2) (special tool #8358-1, Bleed Tube), into the primary and secondary ports. Tighten bleeder tube nuts to 20 N.m (177 in. lbs.).
   b. Flex each Bleeder Tube and place the open ends into the neck of the master cylinder reservoir. Position the open ends of the tubes into the reservoir so their outlets are below the surface of the brake fluid in the reservoir when filled.

NOTE: Make sure the ends of the Bleeder Tubes stay below the surface of the brake fluid in the reservoir at all times during the bleeding procedure.

3. Fill the brake fluid reservoir with fresh Mopar® Brake Fluid DOT 3 Motor Vehicle, or equivalent. Refer to **FLUID, SPECIFICATIONS**.
4. Using an appropriately sized wooden dowel as a pushrod, slowly press the pistons inward discharging brake fluid through the Bleeder Tubes, then release the pressure, allowing the pistons to return to the released position. Repeat this several times until all air bubbles are expelled from the master cylinder bore

and Bleeder Tubes.

5. Remove the Bleeder Tubes from the master cylinder and plug the master cylinder outlet ports.
6. Install the fill cap on the reservoir.
7. Remove the master cylinder from the vise.
8. Install the master cylinder on the vehicle. Refer to **MASTER CYLINDER, BRAKE, INSTALLATION**.

REMOVAL

REMOVAL

CAUTION: The vacuum in the power brake booster must be pumped down before removing the master cylinder to prevent the booster from sucking in any contamination. This can be done by pumping the brake pedal while the engine is not running until a firm brake pedal is achieved.

NOTE: Before proceeding, refer to CAUTION and WARNING.

1. With the engine not running, pump the brake pedal 4-5 strokes until the pedal feel is firm.
2. Remove the engine cover, if equipped.
3. Disconnect and isolate the battery negative cable from its post on the battery.

Fig. 33: Identifying Power Distribution Center (PDC)
Courtesy of CHRYSLER GROUP, LLC

4. Remove the PDC (2) from the vehicle. Refer to **CENTER, POWER DISTRIBUTION (PDC), REMOVAL** .

Fig. 34: Power Distribution Center (PDC) Mount
Courtesy of CHRYSLER GROUP, LLC

5. Remove the bolts (2) from the PDC mounting bracket (1) and remove from the vehicle.
6. Siphon as much fluid as possible from master cylinder reservoir.

Fig. 35: Identifying Integrated Control Unit (ICU)
Courtesy of CHRYSLER GROUP, LLC

7. Remove the primary and secondary brake tubes (1) from the Integrated Control Unit (ICU) to the master cylinder.

Fig. 36: Removing/Installing Wire Harness From Brake Fluid Level Switch
Courtesy of CHRYSLER GROUP, LLC

8. Disconnect wire harness (2) from brake fluid level switch on master cylinder reservoir.
9. Disconnect wire harness from brake vacuum check valve. Remove vacuum tube from power brake booster.
10. Remove master cylinder retaining nuts. Taking care not to lose o-ring seal between power brake booster and master cylinder, remove master cylinder from vehicle.

INSTALLATION

INSTALLATION

NOTE: The master cylinder must be bled before installing it on the vehicle.

1. Bench bleed the master cylinder. Refer to **MASTER CYLINDER, BRAKE, STANDARD PROCEDURE**.
2. Wipe the face of the power brake booster clean where the vacuum seal on the rear of the master cylinder comes in contact when it's installed. Do not get any cleaner or debris inside the booster.
3. Line up the master cylinder mounting holes with the mounting studs on the power brake booster. Ensure o-ring seal is located on rear of master cylinder before installing into the booster. Ensure the master cylinder piston push rod lines up with the booster push rod, then carefully slide the master cylinder into the power brake booster until it contacts the face of the booster.
4. Install two **NEW** master cylinder mounting nuts (1). Tighten each nut to 25 N.m (18 ft. lbs.).

Fig. 37: Removing/Installing Wire Harness From Brake Fluid Level Switch
Courtesy of CHRYSLER GROUP, LLC

5. Connect the wiring harness connector (2) to the brake fluid level switch.

Fig. 38: Identifying Integrated Control Unit (ICU)
Courtesy of CHRYSLER GROUP, LLC

6. Connect the primary and secondary brake tubes (1) from the ICU to the master cylinder. Tighten the tube nuts to 25 N.m (18 ft. lbs.).
7. Connect the wiring harnesses to the brake vacuum sensor and connect the vacuum tube to the brake booster.

Fig. 39: Power Distribution Center (PDC) Mount
Courtesy of CHRYSLER GROUP, LLC

8. Install the PDC mount (1) and tighten the bolts (2).

Fig. 40: Identifying Power Distribution Center (PDC)
Courtesy of CHRYSLER GROUP, LLC

9. Install the PDC (2). Refer to **CENTER, POWER DISTRIBUTION (PDC), INSTALLATION** .
10. Connect the negative (ground) cable on the battery.
11. Fill the master cylinder reservoir to the proper level.
12. Install the engine cover, if equipped.

13. Install a scan tool to initialize the ABS and perform the following:
    a. Clear any faults.
    b. Fill the master cylinder to the proper fill level and bleed the base hydraulic system. Refer to **STANDARD PROCEDURE** .
    c. Check for leaks.
    d. Perform the ABS Verification Test. Refer to **STANDARD PROCEDURE**
14. Road test the vehicle to ensure proper operation of the brakes.

PADS, BRAKE, FRONT

REMOVAL

REMOVAL

NOTE: Before proceeding, refer to CAUTION and WARNING.

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove the wheel mounting bolts, then the tire and wheel assembly.

1715005815

Fig. 41: Identifying Brake Hose Connector And Pin Bolts
Courtesy of CHRYSLER GROUP, LLC

3. Remove the two brake caliper guide pin bolts (4).
4. Remove the disc brake caliper from the disc brake adapter bracket and hang it out of the way using wire or a bungee cord. Use care not to overextend the brake hose when doing this.

5. Remove the brake pads from the caliper adapter bracket.

CLEANING

CLEANING

WARNING: Chrysler LLC does not manufacture any vehicles or replacement parts that contain asbestos. Aftermarket products may or may not contain asbestos. Refer to aftermarket product packaging for product information.

Whether the product contains asbestos or not, dust and dirt can accumulate on brake parts during normal use. Follow practices prescribed by appropriate regulations for the handling, processing and disposing of dust and debris.

INSPECTION

INSPECTION

Visually inspect brake pads for uneven lining wear. Also inspect for excessive lining deterioration. Check the clearance between the tips of the wear indicators (if equipped) on the pads and the brake rotors.

If a visual inspection does not adequately determine the condition of the lining, a physical check will be necessary. To check the amount of lining wear, remove the disc brake pads from the vehicle.

Fig. 42: Brake Pad Friction Material Thickness Measurement
Courtesy of CHRYSLER GROUP, LLC

1 - BRAKE SHOE ASSEMBLY FRICTION MATERIAL THICKNESS IS TO BE MEASURED AT THE THINNEST POINT. 2 - BRAKE SHOE ASSEMBLY FRICTION MATERIAL

3 - BRAKE SHOE ASSEMBLY BACKING PLATE

Measure brake pad minimum thickness (1). Brake pads must be replaced when usable material on a brake pad lining (2) measured at its **thinnest point** measures 1.5 mm (0.06 inches) or less.

If a brake pad fails inspection, replace **both** disc brake pads (inboard and outboard) at each caliper. It is also necessary to replace the pads on the opposite side of the vehicle as well as the pads failing inspection to maintain proper braking characteristics.

If the brake pad assemblies do not require replacement, be sure to reinstall the brake pads in the original position they were removed from.

NOTE: It is important to inspect both front and rear brake pads during the same inspection.

INSTALLATION

INSTALLATION

NOTE: Make sure that the audible wear indicators (if equipped) are placed toward the top side nearest the bleeder screw when the inboard brake pads are installed on each side of the vehicle.

1. Place the brake pads in the abutment shims clipped into the disc brake caliper adapter bracket. Place the pad with the wear indicator attached on the inboard side.
2. Completely retract the caliper piston back into the bore of the caliper.

1715005815

Fig. 43: Identifying Brake Hose Connector And Pin Bolts
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Use care when installing the caliper onto the adapter bracket to avoid damaging the guide pin boots.

3. Install the disc brake caliper over the brake pads on the brake caliper adapter bracket.
4. Align the caliper guide pin bolt holes with the adapter bracket. Install the caliper guide pin bolts (4) and tighten to 43 N.m (32 ft. lbs.).
5. Install the tire and wheel assembly. Refer to **INSTALLATION** .
6. Lower the vehicle.
7. Pump the brake pedal several times before moving the vehicle to set the pads to the brake rotor.
8. Check and adjust the brake fluid level in the reservoir as necessary.
9. Road test the vehicle and make several stops to wear off any foreign material on the brakes and to seat the brake pads.

PADS, BRAKE, REAR

REMOVAL

REMOVAL

NOTE: Before proceeding, refer to CAUTION and WARNING.

The electronic parking brake actuator (EPB) must be retracted prior to removing the brake caliper assembly.

This can be done in two ways:

- A diagnostic scan tool (Service Mode position)
- Through Uconnect

CAUTION: If the electric park brake (EPB) switch is actuated with the caliper removed from the caliper bracket and still connected electrically, the EPB motor will fully extend causing damage to the caliper piston. Disconnect and isolate the negative battery cable before servicing any EPB component.

1. Disconnect and isolate the negative battery cable.
2. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
3. Remove the wheel mounting bolts, then the rear tire and wheel assembly.

1715005817

Fig. 44: Identifying Brake Line Bracket, Brake Line, Flex Hose And Wheel Speed Sensor
Courtesy of CHRYSLER GROUP, LLC

4. Remove the nut and brake line bracket (2).

Fig. 45: Caliper Guide Pin Bolts
Courtesy of CHRYSLER GROUP, LLC

5. While holding guide pins from turning, remove caliper guide pin bolts (3).
6. Slide and remove the disc brake caliper from the disc brake adapter bracket.

Fig. 46: Removing Brake Pads From The Caliper Adapter Bracket

Courtesy of CHRYSLER GROUP, LLC

7. Remove the brake pads from the caliper adapter bracket.

CLEANING

CLEANING

WARNING: Chrysler LLC does not manufacture any vehicles or replacement parts that contain asbestos. Aftermarket products may or may not contain asbestos. Refer to aftermarket product packaging for product information.

Whether the product contains asbestos or not, dust and dirt can accumulate on brake parts during normal use. Follow practices prescribed by appropriate regulations for the handling, processing and disposing of dust and debris.

INSPECTION

INSPECTION

Visually inspect brake pads for uneven lining wear. Also inspect for excessive lining deterioration. Check the clearance between the tips of the wear indicators (if equipped) on the pads and the brake rotors.

If a visual inspection does not adequately determine the condition of the lining, a physical check will be necessary. To check the amount of lining wear, remove the disc brake pads from the vehicle.

Fig. 47: Brake Pad Friction Material Thickness Measurement
Courtesy of CHRYSLER GROUP, LLC

1 - BRAKE SHOE ASSEMBLY FRICTION MATERIAL THICKNESS IS TO BE MEASURED AT THE THINNEST POINT.

2 - BRAKE SHOE ASSEMBLY FRICTION MATERIAL
3 - BRAKE SHOE ASSEMBLY BACKING PLATE

Measure brake pad minimum thickness (1). Brake pads must be replaced when usable material on a brake pad lining (2) measured at its **thinnest point** measures 1.5 mm (0.06 inches) or less.

If a brake pad fails inspection, replace **both** disc brake pads (inboard and outboard) at each caliper. It is also necessary to replace the pads on the opposite side of the vehicle as well as the pads failing inspection to maintain proper braking characteristics.

If the brake pad assemblies do not require replacement, be sure to reinstall the brake pads in the original position they were removed from.

NOTE: It is important to inspect both front and rear brake pads during the same inspection.

INSTALLATION

INSTALLATION

0508012591

Fig. 48: Identifying Lubricant Application Areas
Courtesy of CHRYSLER GROUP, LLC

1. Before installing the brake pads, apply WOLFRACOAT® C (1) or equivalent lubricant to the abutment clips as shown in the illustration.

NOTE: WOLFRACOAT® C or equivalent lubricant must be applied to prevent noise.

Fig. 49: Caliper Bracket Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

2. Install the pads to the caliper adapter bracket making sure the wear indicators are on the bottom side opposite of the bleeder screw.

Fig. 50: Caliper Guide Pin Bolts
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Use care when installing the caliper onto the disc brake adapter to avoid damaging the guide pin boots.

3. Align the caliper guide pin bolt holes with the adapter bracket. Install the caliper guide pin bolts (3) and tighten the guide pin bolts to 43 N.m (32 ft. lbs.).

1715005817

Fig. 51: Identifying Brake Line Bracket, Brake Line, Flex Hose And Wheel Speed Sensor
Courtesy of CHRYSLER GROUP, LLC

4. Install the brake line bracket and nut (2).
5. Install the tire and wheel assembly Refer to **INSTALLATION** .
6. Lower the vehicle.
7. Pump the brake pedal several times to ensure the vehicle has a firm brake pedal before moving the vehicle.
8. Exit the Service Mode prior to road testing the vehicle. This can be done in two ways:
   - Exit the Service Mode with diagnostic scan tool.
   - While depressing the brake pedal, press the EPB switch.
9. Road test the vehicle and make several stops to wear off any foreign material on the brakes and to seat the brake pads.

PEDAL(S), BRAKE AND/OR ACCELERATOR

REMOVAL

REMOVAL

NOTE: Before proceeding, refer to CAUTION and WARNING.

1. Disconnect and isolate the battery negative cable from its post on the battery.

Fig. 52: Identifying Intermediate Shaft, Pinch Bolt And Steering Gear Pinion Shaft
Courtesy of CHRYSLER GROUP, LLC

2. Remove intermediate shaft pinch bolt (3) and separate the intermediate shaft (1) at the base of the column from the steering gear pinion shaft (2). Discard the pinch bolt (3); it is not to be reused.
3. Position the intermediate shaft (1) so that the pedal assembly can be accessed.

Fig. 53: Stop Lamp Switch, Connector & Nuts
Courtesy of CHRYSLER GROUP, LLC

4. Remove the stop lamp switch (2). Refer to **SWITCH, STOP LAMP, REMOVAL** .
5. Disconnect accelerator pedal electrical connector (3).

Fig. 54: Retainer & Clips

Courtesy of CHRYSLER GROUP, LLC

6. Disengage clips (1) on booster rod keeper assembly retainer (2). Position retainer (2) up to remove booster rod from pedal assembly.
7. Disconnect the clutch safety switch electrical connector and disengage clutch rod from clutch pedal, if equipped. Refer to **PEDAL AND PAD, CLUTCH, REMOVAL** .

0508007146

Fig. 55: Remove/Install Power Brake Booster Nuts
Courtesy of CHRYSLER GROUP, LLC

8. Remove the four nuts (1) attaching the brake pedal sled (and power brake booster) to the dash panel.

Fig. 56: Stop Lamp Switch, Connector & Nuts
Courtesy of CHRYSLER GROUP, LLC

9. Remove the remaining two nuts (1, 4) attaching the brake pedal sled to the dash panel.
10. Remove the brake pedal and bracket assembly from vehicle.

INSTALLATION

INSTALLATION

1. Carefully install the brake pedal and bracket assembly in the vehicle lining up the bracket with the power brake booster mounting studs and the studs on the dash panel.

0508007146

Fig. 57: Remove/Install Power Brake Booster Nuts
Courtesy of CHRYSLER GROUP, LLC

2. Install the four nuts (1) attaching the brake pedal (and power brake booster) to the dash panel. **Do not tighten the nuts at this time.**
3. Tighten the nuts in the following sequence: Top inboard, bottom outboard, top outboard, bottom inboard to the proper specifications. Refer to **SPECIFICATIONS** . Failure to do so may result in damage to the booster.

Fig. 58: Stop Lamp Switch, Connector & Nuts
Courtesy of CHRYSLER GROUP, LLC

4. Install the two remaining nuts (1, 4) attaching the brake pedal sled to the dash panel and tighten to the proper specifications. Refer to **SPECIFICATIONS** .

Fig. 59: Retainer & Clips
Courtesy of CHRYSLER GROUP, LLC

NOTE: The brake pedal booster rod keeper (2) cannot be reused. Always install a new keeper if the brake pedal push rod was separated from the keeper.

5. Install the power brake booster push rod and retainer (2) into a NEW booster rod keeper, ensuring that the clips (1) are engaged.

NOTE: Make sure the cup that the booster push rod reacts against is still in place in the pedal before installing the new booster rod keeper.

Connect the clutch safety switch electrical connector and engage clutch rod to clutch pedal, if equipped. Refer to **PEDAL AND PAD, CLUTCH, INSTALLATION** .

Fig. 60: Stop Lamp Switch, Connector & Nuts
Courtesy of CHRYSLER GROUP, LLC

6. Install and adjust the stop lamp switch (2) in the brake pedal bracket. Refer to **SWITCH, STOP LAMP, INSTALLATION** .
7. Connect accelerator pedal electrical connector (3).

Fig. 61: Identifying Intermediate Shaft, Pinch Bolt And Steering Gear Pinion Shaft
Courtesy of CHRYSLER GROUP, LLC

NOTE: A new pinch bolt (3) must be installed every time the pinch bolt is removed.

8. Verify the front wheels of vehicle are in the STRAIGHT-AHEAD position.
9. Install the intermediate shaft (1) onto the steering gear pinion shaft (2).
10. Install a **NEW** pinch bolt (3) and tighten to specifications. Refer to **COLUMN, SPECIFICATIONS** .
11. If equipped, install the silencer pad below the instrument panel.
12. Connect the battery negative cable to its post on the battery.
13. Check the stop lamps to verify they are operating properly and not staying on when the pedal is in the released position.
14. Road test the vehicle to ensure proper operation of the brakes.

RESERVOIR, BRAKE MASTER CYLINDER

REMOVAL

REMOVAL

1. Remove the brake master cylinder and brake master cylinder reservoir assembly. Refer to **MASTER CYLINDER, BRAKE, REMOVAL**.

Fig. 62: Identifying Brake Master Cylinder Fluid Reservoir Components
Courtesy of CHRYSLER GROUP, LLC

2. Thoroughly clean all surfaces of brake fluid reservoir (1) and master cylinder (3). Use only Mopar® Brake Parts Cleaner or equivalent.

CAUTION: When removing fluid reservoir from the master cylinder, do not pry off using any type of tool. This can damage the fluid reservoir or master cylinder housing.

3. Using the appropriate tool, remove the roll pin (4) retaining the brake master cylinder reservoir (1) to the brake master cylinder (3).
4. Rock the brake fluid reservoir (1) side-to-side while pulling up to remove it from the seal grommets in master cylinder housing (3).

INSTALLATION

INSTALLATION

Fig. 63: Identifying Brake Master Cylinder Fluid Reservoir Components
Courtesy of CHRYSLER GROUP, LLC

1. Install **NEW** brake master cylinder reservoir (1) sealing grommets in brake master cylinder housing (3).
2. Lubricate reservoir mounting area with fresh clean brake fluid. Place reservoir (1) in position over sealing grommets. Seat reservoir into sealing grommets using a rocking motion while firmly pressing down on fluid reservoir. Once installed, make sure fluid reservoir is touching the top of both sealing grommets or reservoir is not properly installed.
3. Using the appropriate tool, install the roll pin (4) retaining the brake master cylinder reservoir (1) to the brake master cylinder (3).
4. Install the brake master cylinder and brake master cylinder reservoir assembly. Refer to **MASTER CYLINDER, BRAKE, INSTALLATION**.

ROTOR, BRAKE

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - BRAKE ROTOR

Any servicing of the rotor requires extreme care to maintain the rotor within service tolerances to ensure proper brake action.

Excessive runout or wobble in a rotor can increase pedal travel due to piston knock-back. This increases guide pin sleeve wear due to the tendency of the caliper to follow the rotor wobble.

When diagnosing a brake noise or pulsation, the machined disc braking surface should be inspected.

BRAKING SURFACE INSPECTION

Light braking surface scoring and wear is acceptable. If heavy scoring or warping is evident, the rotor must be

refaced or replaced.

Excessive wear and scoring of the rotor can cause improper lining contact on the rotor's braking surface. If the ridges on the rotor are not removed before new brake shoes are installed, improper wear of the shoes will result.

If a vehicle has not been driven for a period of time, the rotor's braking surface will rust in the areas not covered by the brake shoes at that time. Once the vehicle is driven, noise and chatter from the disc brakes can result when the brakes are applied.

Some discoloration or wear of the rotor surface is normal and does not require resurfacing when linings are replaced. If cracks or burned spots are evident, the rotor must be replaced.

ROTOR MINIMUM THICKNESS

Fig. 64: Measuring Rotor Thickness
Courtesy of CHRYSLER GROUP, LLC

Measure rotor thickness (1) at the center of the brake pad contact surface. Replace the rotor if it is worn below minimum thickness or if machining the rotor will cause its thickness to fall below specifications.

CAUTION: Do not machine the rotor if it will cause the rotor to fall below minimum thickness.

On front rotors, Minimum thickness specifications are cast on the rotor's unmachined surface on the OD of the brake plate.

On rear rotors, Minimum thickness specifications are cast into the rotor's unmachined surface on the side of the hub mounting face. This area also shows the maximum thickness specifications for the hat section of the rotor.

ROTOR THICKNESS VARIATION

Fig. 65: Measuring Rotor Thickness
Courtesy of CHRYSLER GROUP, LLC

Thickness variation in a rotor's braking surface can result in pedal pulsation, chatter and surge. This can also be caused by excessive runout in the rotor or the hub.

Rotor thickness variation measurements should be made in conjunction with measuring runout. Measure thickness of the brake rotor (2) at 12 equal points around the rotor braking surface with a micrometer (1) at a radius approximately 25 mm (1 inch) from edge of rotor.

1. If excessive rotor thickness variation is found, reface or replace brake rotor. Refer to **ROTOR, BRAKE, STANDARD PROCEDURE**.

ROTOR RUNOUT

On-vehicle rotor runout is the combination of the individual runout of the hub face and the runout of the brake rotor (hub runout can be measured separately). To measure rotor runout on the vehicle:

1. Raise and support the vehicle.
2. Remove the tire and wheel assembly. Refer to **REMOVAL** .
3. Install wheel mounting (lug) bolts and spacers (washers) to secure rotor onto the hub assembly. Progressively tighten the (lug) bolts to specifications.
4. Mount Dial Indicator (special tool #C-3339A, Set, Dial Indicator) with Wheel (special tool #25-W, Roller Contact Point), or equivalent, to the knuckle. Position the dial indicator wheel to contact the rotor braking surface approximately 10 mm (0.39 in.) from the outer edge of the rotor.
5. Slowly rotate the brake rotor checking lateral runout, marking the low and high spots. Record these measurements.

6. Check and record the runout on the opposite side of the rotor in the same fashion, marking the low and high spots.
7. Compare runout measurement to specifications. Refer to **SPECIFICATIONS** .
8. If runout is in excess of specifications, check the lateral runout of the hub face. Before removing the rotor from the hub, place a chalk mark across both the rotor and the one wheel stud closest to where the high runout measurement was taken. This way, the original mounting spot of the rotor on the hub is indexed.
9. Remove the rotor from the hub. Refer to **ROTOR, BRAKE, REMOVAL**.

NOTE: Before measuring hub runout, clean the hub face surface with an appropriate cleaner. This provides a clean surface to get an accurate indicator reading.

10. Mount Dial Indicator (special tool #C-3339A, Set, Dial Indicator) to the knuckle. Position the dial indicator stem so it contacts the hub face near the outer diameter. Care must be taken to position the stem outside of the stud circle, but inside of the chamfer on the hub rim.
11. Slowly rotate the hub measuring runout. Hub runout should not exceed 0.040 mm (0.0016 inch). If runout exceeds this specification, the hub must be replaced. Refer to **HUB AND BEARING, REMOVAL** and **KNUCKLE, STEERING, REMOVAL** .
12. If hub runout does not exceed this specification, install the original rotor back on the hub, aligning the chalk mark on the rotor with a wheel mounting stud, two studs apart from the original stud.
13. Install wheel mounting (lug) bolts and spacers (washers) to secure rotor onto the hub assembly. Progressively tighten the (lug) bolts to specifications.
14. Mount the Dial Indicator (special tool #C-3339A, Set, Dial Indicator) (1) and remeasure runout on both sides of the brake rotor as explained in earlier steps to see if runout is now within specifications.
15. If runout is still not within specifications, reface or replace brake rotor. Refer to **ROTOR, BRAKE, STANDARD PROCEDURE**.

STANDARD PROCEDURE

STANDARD PROCEDURE - BRAKE ROTOR MACHINING

NOTE: Refacing the rotor is not required each time the brake pads are replaced, only when the need is foreseen.

Any servicing of the rotor requires extreme care to maintain the rotor within service tolerances to ensure proper brake action.

Fig. 66: On-Car Brake Lathe
Courtesy of CHRYSLER GROUP, LLC

1 - ON-CAR BRAKE LATHE

If the rotor surface is deeply scored or warped, or there is a complaint of brake roughness or brake pedal pulsation, the rotor should be refaced using a hub-mounted on-car brake lathe (1), or replaced.

The use of a hub-mounted on-car brake lathe (1) is highly recommended to eliminate the possibility of excessive runout. It trues the brake rotor to the vehicle's hub and bearing.

NOTE: All brake rotors have markings for minimum allowable thickness cast on an unmachined surface of the rotor or stamped into the hat section. On this vehicle, the minimum thickness specification for the front brake rotor is located on the OD of the brake plate. The minimum thickness specification for the rear brake rotor is located on the side of the hub mounting face.

Minimum allowable thickness is the minimum thickness which the brake rotor machined surface may be cut to.

CAUTION: Do not machine the rotor if it will cause the rotor to fall below minimum thickness.

Before lathe installation, verify the brake rotor face and the hub adapters are free of any chips, rust, or contamination.

When mounting and using the brake lathe, strict attention to the brake lathe manufacturer's operating instructions is required.

Machine both sides of the brake rotor at the same time. Cutting both sides at the same time minimizes the possibility of a tapered or uneven cut.

When refacing a rotor, the required TIR (Total Indicator Reading) and thickness variation limits MUST BE

MAINTAINED. Extreme care in the operation of rotor turning equipment is required.

REMOVAL

FRONT BRAKE ROTOR

NOTE: Before proceeding, refer to CAUTION and WARNING.

1. Raise and support the vehicle, refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove the wheel mounting bolts, then the tire and wheel assembly.

1715005815

Fig. 67: Identifying Brake Hose Connector And Pin Bolts
Courtesy of CHRYSLER GROUP, LLC

3. Remove the two brake caliper adapter bolts (2).

NOTE: The bolts are one time use and need to be discarded.

4. Remove the disc brake caliper and adapter as an assembly and hang it out of the way using wire or a bungee cord. Use care not to overextend the brake hose when doing this.
5. Remove the rotor retaining bolt and remove the rotor from the hub and bearing.

REAR BRAKE ROTOR

NOTE: Before proceeding, refer to CAUTION and WARNING.

The electronic parking brake actuator (EPB) must be retracted prior to removing the brake caliper assembly. This can be done in two ways:

- A diagnostic scan tool (Service Mode position)
- Through Uconnect

CAUTION: If the electric park brake (EPB) switch is actuated with the caliper removed from the caliper bracket and still connected electrically, the EPB motor will fully extend causing damage to the caliper piston. Disconnect and isolate the negative battery cable before servicing any EPB component.

1. Disconnect and isolate the negative battery cable.
2. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
3. Remove the wheel mounting bolts, then the tire and wheel assembly.

1715005817

Fig. 68: Identifying Brake Line Bracket, Brake Line, Flex Hose And Wheel Speed Sensor

5. While holding the hex fitting on the caliper slides, remove caliper guide pin bolts (3).

1715005821

Fig. 70: Removing Caliper Bracket Mounting Bolts And Mounting Bracket
Courtesy of CHRYSLER GROUP, LLC

6. Remove caliper from mounting bracket and support with a bungee cord or wire. Do not let it hang from the brake hose.
7. Remove caliper bracket mounting bolts (2) and remove caliper mounting bracket.

NOTE: The bolts are one time use and need to be discarded.

Fig. 71: Rotor & Retaining Bolt
Courtesy of CHRYSLER GROUP, LLC

8. Remove retaining bolt (1) and slide brake rotor (2) off the hub and bearing.

INSTALLATION

FRONT BRAKE ROTOR

NOTE: Inspect disc brake pads before installation. Refer to INSPECTION .

1. Clean the hub face to remove any dirt or corrosion where the rotor mounts.
2. Install the brake rotor on the hub and bearing.
3. Install the brake rotor retaining bolt and tighten to 20 N.m (177 in. lbs.).

1715005815

Fig. 72: Identifying Brake Hose Connector And Pin Bolts
Courtesy of CHRYSLER GROUP, LLC

4. Install the disc brake caliper and adapter bracket assembly over the brake rotor and knuckle.
5. Install **NEW** mounting bolts (2) securing the caliper adapter bracket to the knuckle and tighten to 175 N.m (129 ft. lbs.).
6. Install the tire and wheel assembly. Refer to **INSTALLATION** .
7. Lower the vehicle.
8. Pump the brake pedal several times before moving the vehicle to set the pads to the brake rotor.
9. Check and adjust the brake fluid level in the reservoir as necessary.
10. Road test the vehicle and make several stops to seat the brake pads to the rotor.

REAR BRAKE ROTOR

Fig. 73: Rotor & Retaining Bolt
Courtesy of CHRYSLER GROUP, LLC

NOTE: Inspect disc brake pads before installation. Refer to INSPECTION .

1. Clean the hub face to remove any dirt or corrosion where the rotor mounts.
2. Install the brake rotor (2) on the hub and bearing.
3. Install rotor retaining bolt (1) and tighten to 20 N.m (177 in. lbs.).

1715005821

Fig. 74: Installing Caliper Mounting Bracket And Two New Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

4. Install caliper mounting bracket and install two **NEW** mounting bolts (2) and tighten to 120 N.m (89 ft. lbs.).

0508012591

Fig. 75: Identifying Lubricant Application Areas
Courtesy of CHRYSLER GROUP, LLC

5. Before installing the brake pads, apply WOLFRACOAT® C (1) or equivalent lubricant to the abutment clips as shown in the illustration.

NOTE: WOLFRACOAT® C or equivalent lubricant must be applied to prevent

noise.

6. There is a small post on the lower backside of the inboard pad. Make sure that this post lines up with one of the slots on the piston to ensure the pad interfaces with the piston correctly.

CAUTION: Use care when installing the caliper onto the adapter bracket to avoid damaging the guide pin boot.

050868487

Fig. 76: Installing The Brake Pads To The Adapter Bracket
Courtesy of CHRYSLER GROUP, LLC

7. Install the brake pads to the adapter bracket and install the caliper to the adapter bracket.
8. Install the disc brake caliper guide pin bolts (3). While holding the hex fitting on the caliper slides, tighten the guide pin bolts (1) to 43 N.m (32 ft. lbs.).

1715005817

Fig. 77: Identifying Brake Line Bracket, Brake Line, Flex Hose And Wheel Speed Sensor
Courtesy of CHRYSLER GROUP, LLC

9. Install the brake line bracket and nut (2).
10. Install tire and wheel assembly. Refer to **INSTALLATION** .
11. Lower the vehicle.
12. Pump the brake pedal several times before moving the vehicle to set the pads to the brake rotor.
13. Check and adjust the brake fluid level in the reservoir as necessary.
14. Exit the Service Mode prior to road testing the vehicle. This can be done in two ways:
    - Exit the Service Mode with diagnostic scan tool.
    - While depressing the brake pedal, press the EPB switch.
15. Road test the vehicle and make several stops to seat the brake pads to the rotor.

PARKING BRAKE

DESCRIPTION

DESCRIPTION

The electric park brakes consist of the following components:

- Electric park brake switch and indicator
- Electric park brake control module
- Two electromechanical motor gear units attached to conventional sliding calipers

- Communication to other modules allowing seamless operation of the electric parking brake

The electromechanical motor gear units attach directly to the rear brake calipers and provide clamp load through the caliper transferred to the brake rotor.

The motors are controlled by a bi-directional 12-volt feed and ground through the electric brake control module.

The module does not maintain voltage to the motors to keep the parking brake applied. Once engaged, the parking brake remains engaged even if the motors are disconnected.

For information on Service Mode and normal operating conditions. Refer to **MODULE, ELECTRIC PARK BRAKE, OPERATION** .

CAUTION: If the electric park brake (EPB) switch is actuated with the caliper removed from the caliper bracket and still connected electrically, the EPB motor will fully extend causing damage to the caliper piston. Disconnect and isolate the negative battery cable before servicing any EPB component.

SWITCH, ELECTRIC PARK BRAKE

DESCRIPTION

DESCRIPTION

Fig. 78: Identifying Electric Park Brake (EPB) Switch
Courtesy of CHRYSLER GROUP, LLC

All vehicles are equipped with a center-mounted, electric park brake (EPB) switch mounted between the front seats.

The EPB switch is a three-position switch that can be pulled up to apply or pressed down to release. The switch communicates with the EPB module through hard-wired circuits. The switch housing also includes an indicator to let the driver know when the parking brake is applied. If the vehicle is turned off, the indicator will extinguish after ten seconds.

CAUTION: If the electric park brake (EPB) switch is actuated with the caliper removed from the caliper bracket and still connected electrically, the EPB motor will fully extend causing damage to the caliper piston. Disconnect and isolate the negative battery cable before servicing any EPB component.

OPERATION

OPERATION

The EPB switch sends an on/off request signal to the EPB module to apply or release the EPB.

At any time, the EPB switch can be actuated. Depending on the speed of the vehicle when the EPB switch is actuated, the EPB module will output different commands to request the EPB to apply under the following conditions:

Static Apply (under 5 kph) - Retracts the EPB motors attached to the rear calipers to release the rear brakes.

Dynamic Apply (over 5 kph) - Actuates the hydraulic braking system.

Fig. 79: Identifying Brake Warning And EPB Fault Lamp
Courtesy of CHRYSLER GROUP, LLC

There are two indicators in the instrument cluster to give feedback for the electric parking brake system. The

traditional red BRAKE warning lamp is illuminated when the EPB is applied. If there is a fault in the EPB system, an amber EPB fault lamp is illuminated.

NOTE: **To remove the vehicle from Service Mode, press the EPB switch while also depressing the brake pedal.**

For information on Service Mode and normal operating conditions. Refer to MODULE, ELECTRIC PARK BRAKE, OPERATION .

CAUTION: If the electric park brake (EPB) switch is actuated with the caliper removed from the caliper bracket and still connected electrically, the EPB motor will fully extend causing damage to the caliper piston. Disconnect and isolate the negative battery cable before servicing any EPB component.

REMOVAL

REMOVAL

0508007143

Fig. 80: Identifying Electric Park Brake (EPB) Switch, Shift Bezel And Screws
Courtesy of CHRYSLER GROUP, LLC

CAUTION: If the electric park brake (EPB) switch is actuated with the caliper removed from the caliper bracket and still connected electrically, the EPB motor will fully extend causing damage to the caliper piston. Disconnect and isolate the negative battery cable before servicing any EPB component.

NOTE: **If the EPB switch is removed while power is still applied to the vehicle, it will set a General Switch Fault (DTC) in the EPB module. The EPB switch is monitored by the EPB module to confirm it's availability at all times.**

1. Disconnect negative (ground) cable from the battery and isolate it.
2. Remove the shift bezel (4). Refer to **BEZEL, SHIFTER, REMOVAL** .
3. Disconnect the electrical connector (1) from the EPB switch (3).
4. Remove the screws (2) from the EPB switch.

INSTALLATION

INSTALLATION

0508007143

Fig. 81: Identifying Electric Park Brake (EPB) Switch, Shift Bezel And Screws
Courtesy of CHRYSLER GROUP, LLC

1. Install the EPB switch (3) to the shift bezel (4).
2. Install the screws (2) securing the EPB switch (3) to the shift bezel (4).
3. Connect the electrical connector (1).
4. Install the shift bezel. Refer to **BEZEL, SHIFTER, INSTALLATION** .
5. Connect negative (ground) cable to the battery.

ACTUATOR, ELECTRIC PARK BRAKE

DESCRIPTION

DESCRIPTION

Fig. 82: Identifying Guide Pin Bolts
Courtesy of CHRYSLER GROUP, LLC

CAUTION: If the electric park brake (EPB) switch is actuated with the caliper removed from the caliper bracket and still connected electrically, the EPB motor will fully extend causing damage to the caliper piston. Disconnect and isolate the negative battery cable before servicing any EPB component.

The electromechanical motor gear units (1) attach directly to the conventional hydraulic rear brake calipers with two fasteners and provide clamp load through the caliper transferred to the brake rotor.

NOTE: If the electric park brake actuator is found to be defective or needs to be replaced, it can only be replaced as an assembly. There are no serviceable parts inside and is non-repairable.

OPERATION

OPERATION

CAUTION: If the electric park brake (EPB) switch is actuated with the caliper removed from the caliper bracket and still connected electrically, the EPB motor will fully extend causing damage to the caliper piston. Disconnect and isolate the negative battery cable before servicing any EPB component.

The electric park brake (EPB) actuator is driven by the EPB module. It is a bi-directional motor that receives 12

volt power and ground through the EPB module to apply or release clamp load to the brake rotor. Once applied, it does not need voltage to maintain clamp load.

For information on Service Mode and normal operating conditions. Refer to **MODULE, ELECTRIC PARK BRAKE, OPERATION** .

REMOVAL

REMOVAL

NOTE: Release the electric park brake (EPB) before proceeding.

CAUTION: If the electric park brake (EPB) switch is actuated with the caliper removed from the caliper bracket and still connected electrically, the EPB motor will fully extend causing damage to the caliper piston. Disconnect and isolate the negative battery cable before servicing any EPB component.

1. Disconnect and isolate battery negative cable from battery post.
2. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .

1715005817

Fig. 83: Identifying Brake Line Bracket, Brake Line, Flex Hose And Wheel Speed Sensor
Courtesy of CHRYSLER GROUP, LLC

3. Disconnect electrical connector (1) at the electric park brake actuator (EPB).

Fig. 84: Identifying EPB Actuator
Courtesy of CHRYSLER GROUP, LLC

4. Remove the two bolts (2) attaching the EPB actuator (1) from the brake caliper.

INSTALLATION

INSTALLATION

NOTE: Using an appropriate lubricant, lightly lubricate the O-ring on the body of the new EPB actuator before installing it.

1710009336

Fig. 85: Identifying EPB Actuator
Courtesy of CHRYSLER GROUP, LLC

1. Position the electric park brake (EPB) actuator (1) to the brake caliper and install the two bolts (2). Tighten the bolts to 12 N.m (106 in. lbs.).

1715005817

Fig. 86: Identifying Brake Line Bracket, Brake Line, Flex Hose And Wheel Speed Sensor
Courtesy of CHRYSLER GROUP, LLC

2. Connect the electrical connector (1) to the EPB actuator.
3. Lower the vehicle.
4. Connect negative (ground) cable to the battery.
5. Using the EPB switch, release the EPB, followed by an EPB apply and then another EPB release. Only in that order, even if the EPB is already in the released state. This will make sure the new actuator is working, recognized by the EPB module and there is correlation between the left and right sides.

DIAGNOSIS AND TESTING

C0062-54-LONGITUDINAL ACCELERATION SENSOR - MISSING CALIBRATION

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Ignition on.

SET CONDITION

When the Electric Parking Brake (EPB) Module has not been calibrated and a new Dynamics Sensor has been installed on the vehicle.

NOTE: The Dynamics Sensor is internal to the Occupant Restraint Controller (ORC).

POSSIBLE CAUSES

Possible Causes
OCCUPANT RESTRAINT CONTROLLER (ORC) DTCS
G-SENSOR ALIGNMENT ROUTINE CALIBRATION NOT PERFORMED
ELECTRIC PARKING BRAKE (EPB) MODULE

DIAGNOSTIC TEST

1. **CHECK FOR OCCUPANT RESTRAINT CONTROLLER (ORC) DTCs**
    1. Perform any Technical Service Bulletins (TSBs) that may apply.
    2. Turn the ignition on.
    3. With the scan tool, read DTCs in the ORC.

    Are there any ORC related DTCs present?

    Yes

    - Perform the appropriate diagnostic procedure. Refer to the **OCCUPANT RESTRAINT CONTROLLER (ORC) - DIAGNOSTIC CODE INDEX** article.

    No

- Go To 2

2. **PERFORM THE G-SENSOR ALIGNMENT ROUTINE**
   1. With the scan tool, under "Miscellaneous Functions" perform the G-Sensor Alignment routine.

      Was the routine successful?

      Yes

      - The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring harness and electrical connectors.
      - Perform the EPB VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Perform the " G-Sensor Alignment" routine again, if still unsuccessful.
      - Go To 3

3. **VERIFY THE DTC IS ACTIVE**
   1. Turn the ignition on.
   2. With the scan tool, record and erase the DTCs.
   3. Cycle the ignition from off to on.
   4. Push the EPB Switch down to release the Electric Parking Brakes.
   5. Pull the EPB Switch up to set the Electric Parking Brakes.
   6. Push the EPB Switch down to release the Electric Parking Brakes.
   7. Cycle the ignition from off to on.
   8. With the scan tool, read EPB DTCs.

      Does the DTC remain active?

      Yes

      - Replace the Electric Parking Brake (EPB) Module in accordance with service information. Refer to **MODULE, ELECTRIC PARK BRAKE, REMOVAL** .
      - Perform the EPB VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Test complete.

C008E-00-ECU INTERNAL PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Ignition on.

SET CONDITION

The Electric Parking Brake (EPB) Module runs a self diagnostic test to validate proper controller operation. This DTC will set if the controller has failed one or more internal test.

POSSIBLE CAUSES

Possible Causes
ELECTRIC PARKING BRAKE (EPB) MODULE

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, record and erase the DTCs.
    3. Cycle the ignition from off to on.
    4. Push the EPB Switch down to release the Electric Parking Brakes.
    5. Pull the EPB Switch up to set the Electric Parking Brakes.
    6. Push the EPB Switch down to release the Electric Parking Brakes.
    7. Cycle the ignition from off to on.
    8. With the scan tool, read EPB DTCs.

    Is the DTC active at this time?

    Yes

    - Replace the Electric Parking Brake (EPB) Module in accordance with service information. Refer to **MODULE, ELECTRIC PARK BRAKE, REMOVAL** .
    - Perform the EPB VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Go To 2
2. **CHECK THE WIRING AND CONNECTORS**
    1. The conditions necessary to set the DTC are not present at this time.
    2. Using the schematics as a guide, inspect the wiring and connectors specific to this module. Wiggle the wiring and connectors while checking for shorted and open circuits.
    3. Check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    4. Check Service Bulletins for any possible causes that may apply.

Were there any problems found?

Yes

- Repair as necessary.
- Perform the EPB VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete.

C10CD-01-ELECTRONIC PARK BRAKE SWITCH - GENERAL ELECTRICAL FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 1: Identifying Parking Brake Switch Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the ignition on and no system under voltage or over voltage condition present.

SET CONDITION

When the Electric Parking Brake (EPB) Module detects improper EPB Switch inputs.

POSSIBLE CAUSES

Possible Causes
PARKING BRAKE (EPB) SWITCH/CONNECTOR/TERMINAL DAMAGE
(B60) EPB SWITCH POSITION 1 SIGNAL CIRCUIT SHORTED TO VOLTAGE
(B67) EPB SWITCH POSITION 2 SIGNAL CIRCUIT SHORTED TO VOLTAGE
(B68) EPB SWITCH POSITION 3 SIGNAL CIRCUIT SHORTED TO VOLTAGE
(B69) EPB SWITCH POSITION 4 SIGNAL CIRCUIT SHORTED TO VOLTAGE
(B70) EPB SWITCH POSITION 5 SIGNAL CIRCUIT SHORTED TO VOLTAGE
(B71) EPB SWITCH POSITION 6 SIGNAL CIRCUIT SHORTED TO VOLTAGE
(B60) EPB SWITCH POSITION 1 SIGNAL CIRCUIT SHORTED TO GROUND
(B67) EPB SWITCH POSITION 2 SIGNAL CIRCUIT SHORTED TO GROUND
(B68) EPB SWITCH POSITION 3 SIGNAL CIRCUIT SHORTED TO GROUND
(B69) EPB SWITCH POSITION 4 SIGNAL CIRCUIT SHORTED TO GROUND
(B70) EPB SWITCH POSITION 5 SIGNAL CIRCUIT SHORTED TO GROUND
(B71) EPB SWITCH POSITION 6 SIGNAL CIRCUIT SHORTED TO GROUND
(B60) EPB SWITCH POSITION 1 SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
(B67) EPB SWITCH POSITION 2 SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
(B68) EPB SWITCH POSITION 3 SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
(B69) EPB SWITCH POSITION 4 SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
(B70) EPB SWITCH POSITION 5 SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
(B71) EPB SWITCH POSITION 6 SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
PARKING BRAKE SWITCH
ELECTRIC PARKING BRAKE (EPB) MODULE

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, record and erase the DTCs.
    3. Cycle the ignition from off to on.
    4. Push the EPB Switch down to release the Electric Parking Brakes.
    5. Pull the EPB Switch up to set the Electric Parking Brakes.
    6. Push the EPB Switch down to release the Electric Parking Brakes.
    7. Cycle the ignition from off to on.
    8. With the scan tool, read EPB DTCs.

    Is the DTC active at this time?

Yes

- Go To 2

No

- The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring harness and electrical connectors.
- Perform the EPB VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

2. **CHECK PARKING BRAKE SWITCH CONNECTOR/TERMINAL FOR DAMAGE**

NOTE: Check all terminals for broken, bent, pushed out, or corroded terminals.

1. Turn the ignition off.
2. Inspect the Parking Brake Switch for proper mounting.
3. Inspect the Parking Brake Switch for correct mechanical operation.
4. Inspect the Parking Brake Switch harness and connector.

Were any problems found?

Yes

- Repair as necessary.
- Perform the EPB VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 3

3. **(B60) EPB SWITCH POSITION 1 SIGNAL CIRCUIT SHORTED TO VOLTAGE**
   1. Disconnect the EPB Module harness connector.
   2. Disconnect the Parking Brake Switch harness connector.
   3. Turn the ignition on.
   4. Measure the voltage of the (B60) EPB Switch Position 1 Signal circuit at the Parking Brake Switch harness connector.

   Is there any voltage present?

   Yes

   - Repair the (B60) EPB Switch Position 1 Signal circuit for a short to voltage.
   - Perform the EPB VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

- Go To 4

4. **(B67) EPB SWITCH POSITION 2 SIGNAL CIRCUIT SHORTED TO VOLTAGE**
   1. Measure the voltage of the (B67) EPB Switch Position 2 Signal circuit at the Parking Brake Switch harness connector harness connector.

      Is there any voltage present?

      Yes

      - Repair the (B67) EPB Switch Position 2 Signal circuit for a short to voltage.
      - Perform the EPB VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Go To 5

5. **(B68) EPB SWITCH POSITION 3 SIGNAL CIRCUIT SHORTED TO VOLTAGE**
   1. Measure the voltage of the (B68) EPB Switch Position 3 Signal circuit at the Parking Brake Switch harness connector harness connector.

      Is there any voltage present?

      Yes

      - Repair the (B68) EPB Switch Position 3 Signal circuit for a short to voltage.
      - Perform the EPB VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Go To 6

6. **(B69) EPB SWITCH POSITION 4 SIGNAL CIRCUIT SHORTED TO VOLTAGE**
   1. Measure the voltage of the (B69) EPB Switch Position 4 Signal circuit at the Parking Brake Switch harness connector harness connector.

      Is there any voltage present?

      Yes

      - Repair the (B69) EPB Switch Position 4 Signal circuit for a short to voltage.
      - Perform the EPB VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Go To 7

7. **(B70) EPB SWITCH POSITION 5 SIGNAL CIRCUIT SHORTED TO VOLTAGE**
   1. Measure the voltage of the (B70) EPB Switch Position 5 Signal circuit at the Parking Brake Switch harness connector harness connector.

      Is there any voltage present?

      Yes

      - Repair the (B70) EPB Switch Position 5 Signal circuit for a short to voltage.
      - Perform the EPB VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Go To 8
8. **(B71) EPB SWITCH POSITION 6 SIGNAL CIRCUIT SHORTED TO VOLTAGE**
   1. Measure the voltage of the (B71) EPB Switch Position 6 Signal circuit at the Parking Brake Switch harness connector harness connector.

      Is there any voltage present?

      Yes

      - Repair the (B71) EPB Switch Position 6 Signal circuit for a short to voltage.
      - Perform the EPB VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Go To 9
9. **(B60) EPB SWITCH POSITION 1 SIGNAL CIRCUIT SHORTED TO GROUND**
   1. Turn the ignition off.
   2. Measure the resistance between the (B60) EPB Switch Position 1 Signal circuit and ground.

      Is the resistance below 5.0 Ohms?

      Yes

      - Repair the (B60) EPB Switch Position 1 Signal circuit for a short to ground.
      - Perform the EPB VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Go To 10
10. **(B67) EPB SWITCH POSITION 2 SIGNAL CIRCUIT SHORTED TO GROUND**

1. Measure the resistance between the (B67) EPB Switch Position 2 Signal circuit and ground.

   Is the resistance below 5.0 Ohms?

   Yes

   - Repair the (B67) EPB Switch Position 2 Signal circuit for a short to ground.
   - Perform the EPB VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 11

11. **(B68) EPB SWITCH POSITION 3 SIGNAL CIRCUIT SHORTED TO GROUND**
    1. Measure the resistance between the (B68) EPB Switch Position 3 Signal circuit and ground.

       Is the resistance below 5.0 Ohms?

       Yes

       - Repair the (B68) EPB Switch Position 3 Signal circuit for a short to ground.
       - Perform the EPB VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

       No

       - Go To 12

12. **(B69) EPB SWITCH POSITION 4 SIGNAL CIRCUIT SHORTED TO GROUND**
    1. Measure the resistance between the (B69) EPB Switch Position 4 Signal circuit and ground.

       Is the resistance below 5.0 Ohms?

       Yes

       - Repair the (B69) EPB Switch Position 4 Signal circuit for a short to ground.
       - Perform the EPB VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

       No

       - Go To 13

13. **(B70) EPB SWITCH POSITION 5 SIGNAL CIRCUIT SHORTED TO GROUND**
    1. Measure the resistance between the (B70) EPB Switch Position 5 Signal circuit and ground.

       Is the resistance below 5.0 Ohms?

       Yes

- Repair the (B70) EPB Switch Position 5 Signal circuit for a short to ground.
- Perform the EPB VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 14

14. **(B71) EPB SWITCH POSITION 6 SIGNAL CIRCUIT SHORTED TO GROUND**
    1. Measure the resistance between the (B71) EPB Switch Position 6 Signal circuit and ground.

    Is the resistance below 5.0 Ohms?

    Yes

    - Repair the (B71) EPB Switch Position 6 Signal circuit for a short to ground.
    - Perform the EPB VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Go To 15

15. **(B60) EPB SWITCH POSITION 1 SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE**
    1. Measure the resistance of the (B60) EPB Switch Position 1 Signal circuit between the Parking Brake Switch harness connector and the EPB Module harness connector.

    Is the resistance below 5 Ohms?

    Yes

    - Go To 16

    No

    - Repair the (B60) EPB Switch Position 1 Signal circuit for an open or high resistance.
    - Perform the EPB VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

16. **(B67) EPB SWITCH POSITION 2 SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE**
    1. Measure the resistance of the (B67) EPB Switch Position 2 Signal circuit between the Parking Brake Switch harness connector and the EPB Module harness connector.

    Is the resistance below 5 Ohms?
