8. Install the engine cover.
9. Connect the negative battery cable and tighten nut to the proper specification. Refer to **SPECIFICATIONS** .

PLUG, GLOW

DESCRIPTION

DESCRIPTION

Fig. 18: Glow Plug
Courtesy of CHRYSLER GROUP, LLC

Glow plugs are used to help start a cold or cool engine. The glow plugs will heat up and glow to heat the combustion chamber of each cylinder. An individual glow plug is used for each cylinder. Each glow plug is threaded into the cylinder head below the cylinder head cover.

OPERATION

OPERATION

The glow plugs are used to preheat the combustion chambers in order to achieve the ignition temperature required for the fuel-air mixture.

The heating element is integrated in the glow rod. It consists of a heating winding and a control winding connected in series.

The glow plug system is a quick start type. This allows for immediate start in practically all weather conditions without long periods of pre-glowing; this works in conjunction with the injectors.

RELAY, AUTO SHUT DOWN

DESCRIPTION

DESCRIPTION

The 5-pin, 12-volt, Automatic Shutdown (ASD) relay is located in the Power Distribution Center (PDC). Always refer to the label on the power distribution center cover for relay location.

OPERATION

OPERATION

The ground circuit for the coil within the Automatic Shutdown (ASD) relay is controlled by the Powertrain Control Module (PCM). The PCM operates the ASD relay by switching its ground circuit on and off.

The ASD relay powers a number of critical circuits through the Power Distribution Center (PDC). These circuits include:

- Four ASD feed circuits to the PCM
- Fuel Injectors
- Ignition Coils
- Upstream O2 Sensor Heater
- Downstream O2 Sensor Heater
- EVAP Purge (Control) Solenoid

One of the ASD feed circuits is used as an ASD sense so that the PCM can determine if the ASD circuit is powered or not.

REMOVAL

REMOVAL

The Automatic Shutdown (ASD) relay is located in the engine compartment within the Power Distribution Center (PDC). Always refer to the label on the power distribution center cover for relay location.

1. Remove the power distribution center cover.
2. Remove the relay from the power distribution center.
3. Check the condition of the relay terminals and power distribution center connector terminals for damage or corrosion. Repair if necessary before installing the relay.
4. Check for pin height (pin height should be the same for all terminals within the power distribution center connector). Repair if necessary before installing the relay.

INSTALLATION

INSTALLATION

The Automatic Shutdown (ASD) relay is located in the engine compartment within the Power Distribution Center (PDC). Always refer to the label on the power distribution center cover for relay location.

1. Install the relay to the power distribution center.
2. Install the cover to the power distribution center.

SENSOR, CAMSHAFT POSITION, 2.0L DIESEL

DESCRIPTION

2.0L-DIESEL

Fig. 25: Camshaft Position Sensor, Connector & Bolt
Courtesy of CHRYSLER GROUP, LLC

The camshaft position sensor (3) is mounted to the cylinder head cover. The hall effect sensor generates a signal that corresponds to the camshaft position of rotation. The Powertrain Control Module (PCM) uses the camshaft position sensor signal to detect the TDC position of cylinder 1. The PCM controls Injection timing and the duration of time each injector delivers fuel during an injection cycle based on the camshaft signal and the crankshaft signals.

OPERATION

2.0L-DIESEL

The signal circuit of the camshaft sensor has a voltage of approximately 5V. If the segment machined into the exhaust camshaft sprocket is positioned opposite the camshaft sensor, the camshaft signal is approximately 0V. This 0V to 5V signal is used by the Powertrain Control Module (PCM) for detecting ignition TDC of cylinder 1 as the engine rotates. If no signal is supplied by the camshaft position sensor, the vehicle will not start.

REMOVAL

DIESEL

SENSOR, CAMSHAFT POSITION

DESCRIPTION

DESCRIPTION

2906976

Fig. 30: Camshaft Position (CMP) Sensor
Courtesy of CHRYSLER GROUP, LLC

The Camshaft Position (CMP) sensor is a Hall effect type sensor and is used by the Powertrain Control Module (PCM) in conjunction with the Crankshaft Position (CKP) sensor and TDC signal to recognize the position of the cylinders and determine the injection and ignition point. The CMP sensor is located on the camshaft bearing housing and faces the camshaft.

OPERATION

OPERATION

A current-carrying semiconductor layer immersed in a normal magnetic field (force lines at right angles to current direction) generates a potential difference known as a Hall voltage at its terminals. If current intensity remains constant, the generated voltage depends on magnetic field intensity alone. Periodic changes in magnetic field intensity are sufficient to generate a modulated electrical signal with frequency proportional to the speed of magnetic field change. The distance between the sensor and the surface of the timing wheel on the cam axis is altered to produce this change.

REMOVAL

2.4L

2906894

Fig. 31: Connector, Mounting Bolt & Camshaft Position Sensor
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect negative battery cable.
2. Disconnect electrical connector at sensor (1).
3. Remove mounting bolt (2).

Fig. 32: Cam Sensor
Courtesy of CHRYSLER GROUP, LLC

4. Remove the exhaust cam sensor (3).

3.2L

Fig. 33: Magnetic Timing Wheels
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The magnetic timing wheels (1) must not come in contact with magnets (pickup tools, trays, etc.) or any other strong magnetic field. This will destroy the timing wheels ability to correctly relay camshaft position to the camshaft position sensor.

2906844

Fig. 34: Upper Intake Manifold & Bolts
Courtesy of CHRYSLER GROUP, LLC

The Camshaft Position (CMP) sensors are located at the rear of the cylinder head covers and are bolted to the cylinder head.

1. Disconnect and isolate the negative battery cable.
2. Remove the air cleaner resonator.
3. If removing the LH CMP sensor, first remove the upper intake manifold (2). Refer to **MANIFOLD, INTAKE, REMOVAL** .

2906961

Fig. 35: CMP Sensor & Bolt
Courtesy of CHRYSLER GROUP, LLC

NOTE: The RH CMP sensor is shown in illustration, the LH CMP sensor is similar.

If removing both RH and LH CMP sensors, mark the sensors so they can be installed in their original locations.

4. Disconnect the electrical connector (1) from the CMP sensor.
5. Loosen the sensor mounting bolt (2).

2906860

Fig. 36: O-Ring Seal
Courtesy of CHRYSLER GROUP, LLC

6. Pull the sensor and mounting bolt from the cylinder head cover.
7. The O-ring seal (1) can be reused if not damaged.

INSTALLATION

2.4L

2906906

Fig. 37: Cam Sensor
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Install camshaft position (CMP) sensor utilizing twisting motion. Make sure CMP sensor is fully seated. Do not drive CMP sensor into the bore with mounting screw. This may cause CMP sensor to be incorrectly seated causing a faulty signal or no signal at all.

1. Lubricate sensor O-ring.
2. Install the exhaust cam sensor (3) and mounting bolt (2) and tighten to the proper specification. Refer to **SPECIFICATIONS**.

2906933

Fig. 38: Connector, Mounting Bolt & Camshaft Position Sensor
Courtesy of CHRYSLER GROUP, LLC

3. Connect electrical connector (1) to the camshaft position sensor.
4. Connect negative battery cable. Tighten the nut to the proper specification. Refer to **SPECIFICATIONS** .

3.2L

CAUTION: The magnetic timing wheels (1) must not come in contact with magnets (pickup tools, trays, etc.) or any other strong magnetic field. This will destroy the timing wheels ability to correctly relay camshaft position to the camshaft position sensor.

2906991

Fig. 39: Magnetic Timing Wheels

2906871

Fig. 40: CMP Sensor Seal & Mounting Bolt Hole

Courtesy of CHRYSLER GROUP, LLC

1. Clean out the camshaft position (CMP) sensor mounting bolt hole (2) in cylinder head.
2. The CMP sensor seal (1) can be reused if not damaged.

Fig. 41: Installing CMP Sensor Seal
Courtesy of CHRYSLER GROUP, LLC

3. If required, install a new CMP sensor seal (2) in the cylinder head cover:
   - Lubricate the CMP sensor seal inner and outer diameters with clean engine oil.
   - Place the CMP sensor seal (2) on the Cam Sensor/Spark Plug Tube Seal Installer (special tool #10256, Installer, Cam Installer, Cam Sensor/Spark Plug Tube Seal) (1).
   - Push the seal into the cylinder head cover until the base of the seal is seated.
   - Remove the tool.

Fig. 42: Gap & CMP Sensor Seal
Courtesy of CHRYSLER GROUP, LLC

NOTE: **A properly installed CMP sensor seal (1) will have a 1.5 - 2.0 mm (0.06 - 0.08 in.) gap (2) between the cylinder head cover and the seal upper flange.**

Fig. 43: O-Ring Seal
Courtesy of CHRYSLER GROUP, LLC

4. The sensor mounting bolt O-ring (1) can be reused if not damaged.
5. Apply a small amount of engine oil to the sensor mounting bolt O-ring (1).

Fig. 44: CMP Sensor & Bolt
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The right CMP sensor is shown in illustration, the left CMP sensor is similar. If both right and left CMP sensors where removed, install them into their original locations.**

6. Install the CMP sensor to the cylinder head. Tighten the mounting bolt (2) to 9 N.m (80 in. lbs.).
7. Connect the electrical connector (1) to the sensor.

Fig. 45: Upper Intake Manifold Bolt Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

8. If required, install the upper intake manifold (1) and air inlet hose. Refer to **MANIFOLD, INTAKE, INSTALLATION** .
9. Connect the negative battery cable and tighten nut to 5 N.m (45 in. lbs.).

NOTE: **The Cam/Crank Variation Relearn procedure must be performed using the scan tool anytime there has been a repair/replacement made to a powertrain system, for example: flywheel, valvetrain, camshaft and/or crankshaft sensors or components.**

SENSOR, KNOCK

DESCRIPTION

DESCRIPTION

Fig. 46: Knock Sensor
Courtesy of CHRYSLER GROUP, LLC

The knock sensor is the piezoelectric type and is fitted on the crankcase to detect the intensity of the vibrations caused by detonation in the combustion chambers. The phenomenon produces a mechanical repercussion on a piezoelectric crystal that sends a signal to the powertrain control module (PCM) and, on the basis of this signal, the PCM reduces the ignition advance until the phenomenon disappears. Later on, the advance is gradually restored to the basic value.

OPERATION

OPERATION

0909005837

Fig. 47: Electrical Polarization Operation
Courtesy of CHRYSLER GROUP, LLC

The molecules of a quartz crystal are affected by electrical polarization. In rest conditions (A) the molecules are not arranged in a particular way. When the crystal is subjected to pressure or to an impact (B), the higher the pressure, the more marked their arrangement. This arrangement produces a voltage at the ends of the crystal.

REMOVAL

2.4L

Fig. 48: Knock Sensor Mounting Bolt
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
3. Remove the Intake manifold. Refer to **MANIFOLD, INTAKE, REMOVAL** .
4. Remove the knock sensor electrical connector.
5. Remove the mounting bolt (1) and knock sensor.

3.2L

Fig. 49: Knock Sensor 1 & Knock Sensor 2
Courtesy of CHRYSLER GROUP, LLC

NOTE: The forward sensor (1) is known to the powertrain control module (PCM) as knock sensor 1. The rear sensor (3) is known to the PCM as knock sensor 2.

1. Perform the fuel pressure release procedure. Refer to **FUEL SYSTEM PRESSURE RELEASE PROCEDURE** .
2. Disconnect and isolate the negative battery cable.
3. Drain the cooling system. Refer to **STANDARD PROCEDURE** .
4. Remove the air cleaner housing assembly, upper and lower intake manifolds and the oil filter housing. Refer to **HOUSING, OIL FILTER, REMOVAL** .
5. Remove the electrical connector (4).

NOTE: There may be a foam strip on the bolt threads. This foam is used only to retain the bolts to the sensors for plant assembly. It is not used as a sealant. Do not apply any adhesive, sealant or thread locking compound to these bolts.

6. Remove the mounting bolt (2) and knock sensor 1 (1) or knock sensor 2 (3).

INSTALLATION

2.4L

Fig. 50: Knock Sensor Mounting Bolt
Courtesy of CHRYSLER GROUP, LLC

1. Thoroughly clean the knock sensor mounting hole.

CAUTION: Over or under tightening the knock sensor mounting bolt will affect knock sensor performance, possibly causing improper spark control. Always use the specified torque when installing the knock sensor. Do not apply any adhesive, sealant or thread locking compound to the bolt.

2. Install the knock sensor with mounting bolt (1). Tighten the mounting bolt to the proper specification. Refer to **SPECIFICATIONS**.
3. Connect the electrical connector.
4. Install the Intake manifold. Refer to **MANIFOLD, INTAKE, INSTALLATION** .
5. Lower the vehicle.
6. Connect the negative battery cable and tighten nut to the proper specification. Refer to **SPECIFICATIONS** .

3.2L

Fig. 51: Knock Sensor 1 & Knock Sensor 2
Courtesy of CHRYSLER GROUP, LLC

NOTE: The forward sensor (1) is known to the powertrain control module (PCM) as knock sensor 1. The rear sensor (3) is known to the PCM as knock sensor 2.

1. Thoroughly clean the knock sensor mounting holes.

NOTE: Over or under tightening the sensor mounting bolts will affect knock sensor performance, possibly causing improper spark control. Always use the specified torque when installing the knock sensors. The torque specification for the knock sensor bolt is less than the typical 8 mm bolt.

NOTE: There may be a foam strip on the bolt threads. This foam is used only to retain the bolts to the sensors for plant assembly. It is not used as a sealant. Do not apply any adhesive, sealant or thread locking compound to these bolts.

2. Install knock sensor 1 (1) or knock sensor 2 (3) with mounting bolt (2). Tighten the mounting bolt to 20 N.m (15 ft. lbs.).
3. Connect the electrical connector (4).
4. Install the oil filter housing, upper and lower intake manifolds and air cleaner housing assembly. Refer to **HOUSING, OIL FILTER, INSTALLATION** .
5. If removed, install the oil filter and fill the engine crankcase with the proper oil to the correct level. Refer to **OIL - STANDARD PROCEDURE** .
6. Connect the negative battery cable and tighten nut to 5 N.m (45 in. lbs.).
7. Fill the cooling system. Refer to **STANDARD PROCEDURE** .
8. Operate the engine until it reaches normal operating temperature. Check cooling system for correct fluid level. Refer to **STANDARD PROCEDURE** .

SOLENOID, VARIABLE VALVE TIMING

DESCRIPTION

DESCRIPTION

Fig. 52: Variable Valve Timing Solenoid
Courtesy of CHRYSLER GROUP, LLC

The 3.6L engine is equipped with Variable Valve Timing (VVT). This system adjusts the timing of all four camshafts independently using solenoids and oil control valves to direct oil pressure into the camshaft phaser assemblies. The camshaft phaser assembly advances and/or retards camshaft timing to improve engine performance, mid-range torque, idle quality, fuel economy, and reduce emissions. The four VVT solenoids are located on the front of the cylinder head covers. The pintle should move freely within the solenoid body. Do not attempt to disassemble the solenoids, they are not serviceable. The solenoids are identical but should be installed in the same location as removed.

OPERATION

OPERATION

Fig. 53: Oil Control Valve (OCV), VVT Solenoid, Solenoid Pintle & Internal Spool Valve
Courtesy of CHRYSLER GROUP, LLC

Camshaft phaser position is adjusted using regulated oil pressure through an Oil Control Valve (OCV) (3). To begin Phaser movement, the Powertrain Control Module (PCM) applies a pulse-width modulated voltage signal to the VVT solenoid (1) to extend or retract the solenoid pintle (4). The pintle pushes against an internal spool valve (2) within the OCV moving the valve forwards and backwards to direct oil flow. The position of the spool inside the OCV determines which ports and chambers inside the phaser are being fed, either to advance the timing of the phaser sprocket relative to the camshaft, retard it, or hold a desired position. Refer to **ASSEMBLY, VARIABLE VALVE TIMING, PHASER/OIL CONTROL VALVE, OPERATION** .

The Camshaft Position (CMP) sensor monitors the position of the camshaft with respect to the crankshaft and provides feedback to the PCM.

The debris crush mode will only occur with the key on and the engine off (KOEO). If the ignition is cycled to the start position without a momentary pause (immediate crank), the debris crush mode will not occur. In this instance the procedure will be performed at the next key off cycle.

REMOVAL

LEFT

080770037

Fig. 54: Variable Valve Timing Solenoids, Connectors & Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.

NOTE: Mark the variable valve timing solenoid connectors (1) with a paint pen or equivalent so that they may be reinstalled in their original locations.

2. Mark the intake variable valve timing solenoid (4) and the exhaust variable valve timing solenoid (2) with a paint pen or equivalent so that they may be reinstalled in their original locations.
3. Disconnect the electrical connector (1) from the variable valve timing solenoid.
4. Remove the variable valve timing solenoid mounting bolts (3).

2. Refer to the markings made at disassembly and install the intake variable valve timing solenoid (2) and the exhaust variable valve timing solenoid (4) in their original locations.

3. Install the variable valve timing solenoid mounting bolts (3) and hand tighten.
4. Connect the electrical connector (1) to the variable valve timing solenoid.

Fig. 63: Liquid And Suction Line Assembly
Courtesy of CHRYSLER GROUP, LLC

5. Install the upper A/C liquid and suction line assembly (1). Refer to **LINE, A/C SUCTION, INSTALLATION** .
6. Install the resonator. Refer to **RESONATOR, AIR CLEANER, INSTALLATION** for 2.4L or **RESONATOR, AIR CLEANER, INSTALLATION** for 3.2L.
7. Connect the negative battery cable and tighten nut to the proper specification. Refer to **SPECIFICATIONS** .

NOTE: The Cam/Crank Variation Relearn procedure must be performed using the scan tool anytime there has been a repair/replacement made to a powertrain system, for example: flywheel, valvetrain, camshaft and/or crankshaft sensors or components.

SPARK PLUG

REMOVAL

2.4L

CAUTION: Handle the spark plugs with care. Do not drop or force the spark plugs into the wells, damage to the electrodes and/or porcelain body may occur. Always start each spark plug by hand in order to avoid cross-threading the spark plug in the cylinder head.

Always tighten spark plugs to the specified torque. Too much or not enough torque will cause damage to the cylinder head and/or spark plug and may lead to poor engine performance.

Fig. 64: Spark Plug Removed
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical

1. Install each spark plug to the cylinder head. Tighten spark plugs to 27 N.m (20 ft. lbs.).

0909005837

Courtesy of CHRYSLER GROUP, LLC

2. Install ignition coil onto spark plug.

0909005827

Fig. 66: Ignition Coil Bolt
Courtesy of CHRYSLER GROUP, LLC

3. Install ignition coil mounting bolt. Tighten to 9 N.m (79.5 in. lbs.).
4. Connect ignition coil electrical connectors.
5. Connect the negative battery cable.

3.2L

0909005829

Fig. 67: Electrical Connector, Ignition Coils & Ignition Coil Retaining Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: The left side ignition coils are shown in illustration, the right side ignition coils are similar.

1. Remove the ignition coil (2). Refer to **COIL, IGNITION, REMOVAL**.

CAUTION: The spark plug tubes (1) are a thin wall design. Avoid damaging the spark plug tubes. Damage to the spark plug tube can result in oil leaks.

Fig. 68: Spark Plug Tubes
Courtesy of CHRYSLER GROUP, LLC

2. Prior to removing the spark plug, spray compressed air into the cylinder head opening. This will help prevent foreign material from entering combustion chamber.
3. Remove the spark plug from the cylinder head using a quality thin wall socket with a rubber or foam insert.
4. Inspect the spark plug condition.

INSTALLATION

2.4L

CAUTION: Handle the spark plugs with care. Do not drop or force the spark plugs into the wells, damage to the electrodes and/or porcelain body may occur. Always start each spark plug by hand in order to avoid cross-threading the spark plug in the cylinder head.

Always tighten spark plugs to the specified torque. Too much or not enough torque will cause damage to the cylinder head and/or spark plug and may lead to poor engine performance.

0909005837

Fig. 69: Spark Plug Removed
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical

1. Install each spark plug to the cylinder head. Tighten spark plugs to 27 N.m (20 ft. lbs.).

0909005828

Fig. 70: Removing/Installing Ignition Coil
Courtesy of CHRYSLER GROUP, LLC

2. Install ignition coil onto spark plug.

Fig. 71: Ignition Coil Bolt
Courtesy of CHRYSLER GROUP, LLC

3. Install ignition coil mounting bolt. Tighten to 9 N.m (79.5 in. lbs.).
4. Connect ignition coil electrical connectors.
5. Connect the negative battery cable.

3.2L

Fig. 72: Gap Gauging Tool

Courtesy of CHRYSLER GROUP, LLC

1. Check and adjust the spark plug gap with a gap gauging tool (1). Refer to **SPECIFICATIONS**.

Fig. 73: Spark Plug Tubes
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Special care should be taken when installing spark plugs into the cylinder head spark plug wells. Be sure the plugs do not drop into the plug wells as electrodes can be damaged.

CAUTION: The spark plug tubes (1) are a thin wall design. Avoid damaging the spark plug tubes. Damage to the spark plug tube can result in oil leaks.

2. Start the spark plug into the cylinder head by hand to avoid cross threading.

CAUTION: Spark plug torque is critical and must not exceed the specified value. Overtightening stretches the spark plug shell reducing its heat transfer capability resulting in possible catastrophic engine failure.

3. Tighten the spark plugs to 17.5 N.m (13 ft. lbs.).

Fig. 74: Electrical Connector, Ignition Coils & Ignition Coil Retaining Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: The left side ignition coils are shown in illustration, the right side ignition coils are similar.

4. Install the ignition coil (2). Refer to **COIL, IGNITION, INSTALLATION**.

SWITCH, IGNITION

DESCRIPTION

DESCRIPTION

The ignition switch is located on the steering column. It is used as the main on/off switching device for most electrical components. The mechanical key cylinder is used to engage/disengage the electrical ignition switch.

OPERATION

OPERATION

Vehicles equipped with an automatic transmission and a steering column mounted shifter: an interlock device is located within the shift cable. This interlock device is used to lock the transmission shifter in the PARK position when the key cylinder is in any position and the brake pedal is not depressed.

REMOVAL

REMOVAL

1. Disconnect the and isolate the negative battery cable.
2. Remove the dash end cap. Refer to **CAP, INSTRUMENT PANEL END, REMOVAL** .
3. Remove the steering column opening cover.
4. Remove the HVAC control head. Refer to **CONTROL, A/C AND HEATER, REMOVAL** .
5. Remove the instrument cluster bezel. Refer to **BEZEL, INSTRUMENT CLUSTER, REMOVAL** .
6. Disconnect the wire harness connector from the Ignition Node Module.

7. Remove 4 screws from the I/P holding the Ignition Node Module in place.
8. Remove the Ignition Node Module from the backside of the I/P.

INSTALLATION

INSTALLATION

1. Install the Ignition Node Module into the Instrument Panel from the backside.
2. Pull the Ignition Node Module into place.

Fig. 76: Removing/Installing Switch Mounting Screws
Courtesy of CHRYSLER GROUP, LLC

3. Install 4 screws through the instrument Panel into the Ignition Node Module and tighten.
4. Connect Electrical harness connector into Ignition Node Module.
5. Install the Instrument Panel bezel and connect wire harness connectors. Refer to **BEZEL, INSTRUMENT CLUSTER, INSTALLATION** .
6. Install the HVAC control head and connect wire harness connectors. Refer to **CONTROL, A/C AND HEATER, INSTALLATION** .
7. Install the steering column opening cover and connect the wire harness connectors.
8. Install dash end cap. Refer to **CAP, INSTRUMENT PANEL END, INSTALLATION** .
9. Connect negative battery cable.
10. If Ignition Node Module is being replaced, program the module. Refer to **STANDARD PROCEDURE** . **This procedure will require you to log into DealerCONNECT and enter a PIN when requested. The PIN is temporary and will be active for 12 hours. After 12 hours, a new PIN will need to be obtained from DealerCONNECT.**

2014 ENGINE

Ignition System - Service Information - Cherokee

DESCRIPTION

DESCRIPTION

NOTE: All engines use a fixed ignition timing system. Basic ignition timing is not adjustable. All spark advance is determined by the Powertrain Control Module (PCM).

The ignition system used on these engines is referred to as coil on plug. The system's four main components are the coils, crankshaft position sensor, spark plugs, and camshaft position sensors. The coil on plug ignition system utilizes an ignition coil for every cylinder. The ignition coils are mounted directly over the each spark plug.

OPERATION

OPERATION

The crankshaft position sensor and camshaft position sensor are hall effect devices. The camshaft position sensor and crankshaft position sensor generate square wave pulses that are inputs to the PCM. The PCM determines engine position from these sensors. The PCM calculates injector sequence and ignition timing from crankshaft AND camshaft position.

SPECIFICATIONS

SPARK PLUG

Engine	Spark Plug	Electrode Gap
2.4L	REC10WMPB4	1.2mm (0.047 in.)
3.2L	RER8ZWYCB4	1.1mm (0.043 in.)

FIRING ORDER

2.4L

Fig. 1: Transverse 4 Cyl. Firing Order
Courtesy of CHRYSLER GROUP, LLC

The firing order is 1-3-4-2.

3.2L V6

Firing Order: 1-2-3-4-5-6

Fig. 2: Firing Order: 1 - 2 - 3 - 4 - 5 - 6

IGNITION RESISTANCE

IGNITION COIL RESISTANCE

Engine	Primary Resistance at 21°C-27°C (70°F-80°F)	Secondary Resistance at 21°C-27° C (70°F-80°F)
2.4L	0.468 to 0.572 Ohms	5.287 to 7.153 K Ohms
3.2L	0.6 - 0.9 Ohms	6, 000 - 9, 000 Ohms

TORQUE SPECIFICATION

DESCRIPTION	N.m	Ft. Lbs.	In. Lbs.
Camshaft Position Sensor Bolt	9	-	80
Ignition Coil Mounting Bolts	8	-	71
Spark Plugs	27	20	-
Knock Sensor	20	15	-
Ignition Coil Capacitor Bolt	10	-	89
Transmission mounting bolt	61	45	-
* Do not apply any sealant, thread-locker or adhesive to bolts. Poor sensor performance may result.			

CAPACITOR, IGNITION

REMOVAL

2.4L

Fig. 3: Connector, Ignition Capacitor & Mounting Bolt
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate negative battery cable.
2. Remove electrical connector (1).
3. Remove mounting bolt (3) and ignition capacitor (1) from the front of the cylinder head.

3.2L

0909005828

Fig. 4: Electrical Connector, Mounting Bolt & Ignition Capacitor
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Separate the engine harness connector retainers from the intake manifold and Position the main engine wiring harness aside.
3. Remove the electrical connector (1).
4. Remove the mounting bolt (3) and the ignition capacitor (2).

INSTALLATION

2.4L

Fig. 5: Connector, Ignition Capacitor & Mounting Bolt
Courtesy of CHRYSLER GROUP, LLC

1. Install ignition capacitor to the front of the cylinder head (2) and bolt (3), tighten bolt to the proper specification. Refer to **SPECIFICATIONS**.
2. Connect electrical connector (1).
3. Connect the negative battery cable, tighten the nut to the proper specification. Refer to **SPECIFICATIONS** .

3.2L

Fig. 6: Electrical Connector, Mounting Bolt & Ignition Capacitor
Courtesy of CHRYSLER GROUP, LLC

1. Position capacitor (2) to the rear of the cylinder head.
2. Tighten nut (3) to 7 N.m (60 in. lbs.).
3. Connect electrical connector (1) to coil capacitor.
4. Install the main engine harness retainers onto the intake manifold.
5. Connect the battery negative cable.

COIL, IGNITION

REMOVAL

2.4L

Fig. 7: Ignition Coils
Courtesy of CHRYSLER GROUP, LLC

NOTE: **View typical**

NOTE: **Prior to removing coil, spray compressed air around coil top to make sure no dirt drops into the spark plug tube.**

The electronic ignition coil attaches directly to the valve cover.

1. Remove the negative battery cable.
2. Disconnect electrical connector from ignition coil.

0909005837

Fig. 8: Ignition Coil Bolt
Courtesy of CHRYSLER GROUP, LLC

3. Remove ignition coil mounting bolts.

0909005827

Fig. 9: Removing/Installing Ignition Coil
Courtesy of CHRYSLER GROUP, LLC

4. Remove ignition coil.

3.2L

0909005829

Fig. 10: Engine Cover & Ball Studs
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Lift the engine cover from the retaining grommets off of the ball studs (2) and remove the engine cover (1).
3. If removing the ignition coils from cylinders 1, 3 or 5 on the right side of the engine. Remove the air intake resonator. Refer to **RESONATOR, AIR CLEANER, REMOVAL** .
4. If removing the ignition coils from cylinders 2, 4 or 6 on the left side of the engine. Remove the upper intake manifold and insulator. Refer to **MANIFOLD, INTAKE, REMOVAL** .

0909005828

Fig. 11: Electrical Connector, Ignition Coils & Ignition Coil Retaining Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: The left side ignition coils are shown in illustration, the right side ignition coils are similar.

5. Disconnect the harness connector (1) from the ignition coil (2).
6. Remove the ignition coil retaining bolt (3).
7. Pull the ignition coil (2) from cylinder head cover opening with a slight twisting action.

INSTALLATION

2.4L

Fig. 12: Removing/Installing Ignition Coil
Courtesy of CHRYSLER GROUP, LLC

NOTE: View typical

1. Install ignition coil.

Fig. 13: Ignition Coil Bolt
Courtesy of CHRYSLER GROUP, LLC

2. Tighten bolt to 9 N.m (79.5 in. lbs.).
3. Connect electrical connectors and lock.
4. Install the negative battery cable.

3.2L

Fig. 14: Ignition Coil Rubber Boot & Opening Of The Boot
Courtesy of CHRYSLER GROUP, LLC

1. Using compressed air, blow out any dirt or contaminants from around the top of spark plug.
2. Check the condition of the ignition coil rubber boot (1). Inspect the opening of the boot (2) for any debris, tears or rips. Carefully remove any debris with a lint free cloth.

Fig. 15: Fluostar 2LF Lubricant
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not apply a silicone based grease such as Mopar® Dielectric Grease to the ignition coil rubber boot. The silicone based grease will absorb into the boot causing it to stick and tear.

3. Place a small, 360° bead of **Uniflor 8172** lubricant (1) along the inside opening of the coil boot approximately 1 to 2 mm from the chamfer edge but not on the chamfered surface.

Fig. 16: Electrical Connector, Ignition Coils & Ignition Coil Retaining Bolts

Courtesy of CHRYSLER GROUP, LLC

NOTE: The LH ignition coils are shown in illustration, the RH ignition coils are similar.

4. Position the ignition coil (2) into the cylinder head cover opening. Using a twisting action, push the ignition coil onto the spark plug.
5. Install the ignition coil mounting bolt (3) and tighten to the proper specification. Refer to **SPECIFICATIONS**.
6. Connect the harness connector (1) to the ignition coil (2).
7. If removed, install the insulator and upper intake manifold. Refer to **MANIFOLD, INTAKE, INSTALLATION** .

Fig. 17: Engine Cover & Ball Studs
Courtesy of CHRYSLER GROUP, LLC

8. Install the engine cover.
9. Connect the negative battery cable and tighten nut to the proper specification. Refer to **SPECIFICATIONS** .

PLUG, GLOW

DESCRIPTION

DESCRIPTION

Fig. 18: Glow Plug
Courtesy of CHRYSLER GROUP, LLC

Glow plugs are used to help start a cold or cool engine. The glow plugs will heat up and glow to heat the combustion chamber of each cylinder. An individual glow plug is used for each cylinder. Each glow plug is threaded into the cylinder head below the cylinder head cover.

OPERATION

OPERATION

The glow plugs are used to preheat the combustion chambers in order to achieve the ignition temperature required for the fuel-air mixture.

The heating element is integrated in the glow rod. It consists of a heating winding and a control winding connected in series.

The glow plug system is a quick start type. This allows for immediate start in practically all weather conditions without long periods of pre-glowing; this works in conjunction with the injectors.

REMOVAL

REMOVAL

Fig. 19: Engine Cover
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the negative battery cable.
2. Remove the engine cover (1).

Fig. 20: Glow Plug Harness Connector

RELAY, AUTO SHUT DOWN

DESCRIPTION

DESCRIPTION

The 5-pin, 12-volt, Automatic Shutdown (ASD) relay is located in the Power Distribution Center (PDC). Always refer to the label on the power distribution center cover for relay location.

OPERATION

OPERATION

The ground circuit for the coil within the Automatic Shutdown (ASD) relay is controlled by the Powertrain Control Module (PCM). The PCM operates the ASD relay by switching its ground circuit on and off.

The ASD relay powers a number of critical circuits through the Power Distribution Center (PDC). These circuits include:

- Four ASD feed circuits to the PCM
- Fuel Injectors
- Ignition Coils
- Upstream O2 Sensor Heater
- Downstream O2 Sensor Heater
- EVAP Purge (Control) Solenoid

One of the ASD feed circuits is used as an ASD sense so that the PCM can determine if the ASD circuit is powered or not.

REMOVAL

REMOVAL

The Automatic Shutdown (ASD) relay is located in the engine compartment within the Power Distribution Center (PDC). Always refer to the label on the power distribution center cover for relay location.

1. Remove the power distribution center cover.
2. Remove the relay from the power distribution center.
3. Check the condition of the relay terminals and power distribution center connector terminals for damage or corrosion. Repair if necessary before installing the relay.
4. Check for pin height (pin height should be the same for all terminals within the power distribution center connector). Repair if necessary before installing the relay.

INSTALLATION

INSTALLATION

The Automatic Shutdown (ASD) relay is located in the engine compartment within the Power Distribution Center (PDC). Always refer to the label on the power distribution center cover for relay location.

1. Install the relay to the power distribution center.
2. Install the cover to the power distribution center.

SENSOR, CAMSHAFT POSITION, 2.0L DIESEL

DESCRIPTION

2.0L-DIESEL

Fig. 25: Camshaft Position Sensor, Connector & Bolt
Courtesy of CHRYSLER GROUP, LLC

The camshaft position sensor (3) is mounted to the cylinder head cover. The hall effect sensor generates a signal that corresponds to the camshaft position of rotation. The Powertrain Control Module (PCM) uses the camshaft position sensor signal to detect the TDC position of cylinder 1. The PCM controls Injection timing and the duration of time each injector delivers fuel during an injection cycle based on the camshaft signal and the crankshaft signals.

OPERATION

2.0L-DIESEL

The signal circuit of the camshaft sensor has a voltage of approximately 5V. If the segment machined into the exhaust camshaft sprocket is positioned opposite the camshaft sensor, the camshaft signal is approximately 0V. This 0V to 5V signal is used by the Powertrain Control Module (PCM) for detecting ignition TDC of cylinder 1 as the engine rotates. If no signal is supplied by the camshaft position sensor, the vehicle will not start.

REMOVAL

DIESEL

Fig. 26: Engine Cover
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the negative battery cable.
2. Remove the engine cover (1).

Fig. 27: Camshaft Position Sensor, Connector & Bolt
Courtesy of CHRYSLER GROUP, LLC

3. Disconnect Camshaft Position Sensor (CMP) wire harness connector (1).
4. Remove bolt (2) and the CMP sensor (3).

INSTALLATION

DIESEL

Fig. 28: Camshaft Position Sensor, Connector & Bolt
Courtesy of CHRYSLER GROUP, LLC

1. Install the Camshaft Position Sensor (CMP) (3). Tighten bolt (2) to 9 N.m (80 in. lbs.).
2. Connect the CMP wire harness connector (1).

Fig. 29: Engine Cover
Courtesy of CHRYSLER GROUP, LLC

3. Install the engine cover (1).
4. Connect the negative battery cable.

SENSOR, CAMSHAFT POSITION

DESCRIPTION

DESCRIPTION

Fig. 30: Camshaft Position (CMP) Sensor
Courtesy of CHRYSLER GROUP, LLC

The Camshaft Position (CMP) sensor is a Hall effect type sensor and is used by the Powertrain Control Module (PCM) in conjunction with the Crankshaft Position (CKP) sensor and TDC signal to recognize the position of the cylinders and determine the injection and ignition point. The CMP sensor is located on the camshaft bearing housing and faces the camshaft.

OPERATION

OPERATION

A current-carrying semiconductor layer immersed in a normal magnetic field (force lines at right angles to current direction) generates a potential difference known as a Hall voltage at its terminals. If current intensity remains constant, the generated voltage depends on magnetic field intensity alone. Periodic changes in magnetic field intensity are sufficient to generate a modulated electrical signal with frequency proportional to the speed of magnetic field change. The distance between the sensor and the surface of the timing wheel on the cam axis is altered to produce this change.

REMOVAL

2.4L

Fig. 31: Connector, Mounting Bolt & Camshaft Position Sensor
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect negative battery cable.
2. Disconnect electrical connector at sensor (1).
3. Remove mounting bolt (2).

Fig. 32: Cam Sensor
Courtesy of CHRYSLER GROUP, LLC

4. Remove the exhaust cam sensor (3).

3.2L

Fig. 33: Magnetic Timing Wheels
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The magnetic timing wheels (1) must not come in contact with magnets (pickup tools, trays, etc.) or any other strong magnetic field. This will destroy the timing wheels ability to correctly relay camshaft position to the camshaft position sensor.

Fig. 34: Upper Intake Manifold & Bolts
Courtesy of CHRYSLER GROUP, LLC

The Camshaft Position (CMP) sensors are located at the rear of the cylinder head covers and are bolted to the cylinder head.

1. Disconnect and isolate the negative battery cable.
2. Remove the air cleaner resonator.
3. If removing the LH CMP sensor, first remove the upper intake manifold (2). Refer to **MANIFOLD, INTAKE, REMOVAL** .

Fig. 35: CMP Sensor & Bolt
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The RH CMP sensor is shown in illustration, the LH CMP sensor is similar. If removing both RH and LH CMP sensors, mark the sensors so they can be installed in their original locations.**

4. Disconnect the electrical connector (1) from the CMP sensor.
5. Loosen the sensor mounting bolt (2).

Fig. 36: O-Ring Seal
Courtesy of CHRYSLER GROUP, LLC

6. Pull the sensor and mounting bolt from the cylinder head cover.
7. The O-ring seal (1) can be reused if not damaged.

INSTALLATION

2.4L

Fig. 37: Cam Sensor
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Install camshaft position (CMP) sensor utilizing twisting motion. Make sure CMP sensor is fully seated. Do not drive CMP sensor into the bore with mounting screw. This may cause CMP sensor to be incorrectly seated causing a faulty signal or no signal at all.

1. Lubricate sensor O-ring.
2. Install the exhaust cam sensor (3) and mounting bolt (2) and tighten to the proper specification. Refer to **SPECIFICATIONS**.

Fig. 38: Connector, Mounting Bolt & Camshaft Position Sensor
Courtesy of CHRYSLER GROUP, LLC

3. Connect electrical connector (1) to the camshaft position sensor.
4. Connect negative battery cable. Tighten the nut to the proper specification. Refer to **SPECIFICATIONS** .

3.2L

CAUTION: The magnetic timing wheels (1) must not come in contact with magnets (pickup tools, trays, etc.) or any other strong magnetic field. This will destroy the timing wheels ability to correctly relay camshaft position to the camshaft position sensor.

Fig. 39: Magnetic Timing Wheels
Courtesy of CHRYSLER GROUP, LLC

Fig. 40: CMP Sensor Seal & Mounting Bolt Hole
Courtesy of CHRYSLER GROUP, LLC

1. Clean out the camshaft position (CMP) sensor mounting bolt hole (2) in cylinder head.
2. The CMP sensor seal (1) can be reused if not damaged.

Fig. 41: Installing CMP Sensor Seal

Courtesy of CHRYSLER GROUP, LLC

3. If required, install a new CMP sensor seal (2) in the cylinder head cover:
   - Lubricate the CMP sensor seal inner and outer diameters with clean engine oil.
   - Place the CMP sensor seal (2) on the Cam Sensor/Spark Plug Tube Seal Installer (special tool #10256, Installer, Cam Installer, Cam Sensor/Spark Plug Tube Seal) (1).
   - Push the seal into the cylinder head cover until the base of the seal is seated.
   - Remove the tool.

Fig. 42: Gap & CMP Sensor Seal
Courtesy of CHRYSLER GROUP, LLC

NOTE: **A properly installed CMP sensor seal (1) will have a 1.5 - 2.0 mm (0.06 - 0.08 in.) gap (2) between the cylinder head cover and the seal upper flange.**

Fig. 43: O-Ring Seal
Courtesy of CHRYSLER GROUP, LLC

4. The sensor mounting bolt O-ring (1) can be reused if not damaged.
5. Apply a small amount of engine oil to the sensor mounting bolt O-ring (1).

Fig. 44: CMP Sensor & Bolt
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The right CMP sensor is shown in illustration, the left CMP sensor is similar. If both right and left CMP sensors where removed, install them into their original locations.**

6. Install the CMP sensor to the cylinder head. Tighten the mounting bolt (2) to 9 N.m (80 in. lbs.).

7. Connect the electrical connector (1) to the sensor.

Fig. 45: Upper Intake Manifold Bolt Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

8. If required, install the upper intake manifold (1) and air inlet hose. Refer to **MANIFOLD, INTAKE, INSTALLATION** .
9. Connect the negative battery cable and tighten nut to 5 N.m (45 in. lbs.).

NOTE: **The Cam/Crank Variation Relearn procedure must be performed using the scan tool anytime there has been a repair/replacement made to a powertrain system, for example: flywheel, valvetrain, camshaft and/or crankshaft sensors or components.**

SENSOR, KNOCK

DESCRIPTION

DESCRIPTION

Fig. 46: Knock Sensor
Courtesy of CHRYSLER GROUP, LLC

The knock sensor is the piezoelectric type and is fitted on the crankcase to detect the intensity of the vibrations caused by detonation in the combustion chambers. The phenomenon produces a mechanical repercussion on a piezoelectric crystal that sends a signal to the powertrain control module (PCM) and, on the basis of this signal, the PCM reduces the ignition advance until the phenomenon disappears. Later on, the advance is gradually restored to the basic value.

OPERATION

OPERATION

Fig. 47: Electrical Polarization Operation
Courtesy of CHRYSLER GROUP, LLC

The molecules of a quartz crystal are affected by electrical polarization. In rest conditions (A) the molecules are not arranged in a particular way. When the crystal is subjected to pressure or to an impact (B), the higher the pressure, the more marked their arrangement. This arrangement produces a voltage at the ends of the crystal.

REMOVAL

2.4L

Fig. 48: Knock Sensor Mounting Bolt
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
3. Remove the Intake manifold. Refer to **MANIFOLD, INTAKE, REMOVAL** .
4. Remove the knock sensor electrical connector.
5. Remove the mounting bolt (1) and knock sensor.

3.2L

Fig. 49: Knock Sensor 1 & Knock Sensor 2
Courtesy of CHRYSLER GROUP, LLC

NOTE: The forward sensor (1) is known to the powertrain control module (PCM) as knock sensor 1. The rear sensor (3) is known to the PCM as knock sensor 2.

1. Perform the fuel pressure release procedure. Refer to **FUEL SYSTEM PRESSURE RELEASE PROCEDURE** .
2. Disconnect and isolate the negative battery cable.
3. Drain the cooling system. Refer to **STANDARD PROCEDURE** .
4. Remove the air cleaner housing assembly, upper and lower intake manifolds and the oil filter housing. Refer to **HOUSING, OIL FILTER, REMOVAL** .
5. Remove the electrical connector (4).

NOTE: There may be a foam strip on the bolt threads. This foam is used only to retain the bolts to the sensors for plant assembly. It is not used as a sealant. Do not apply any adhesive, sealant or thread locking compound to these bolts.

6. Remove the mounting bolt (2) and knock sensor 1 (1) or knock sensor 2 (3).

INSTALLATION

2.4L

Fig. 50: Knock Sensor Mounting Bolt
Courtesy of CHRYSLER GROUP, LLC

1. Thoroughly clean the knock sensor mounting hole.

CAUTION: Over or under tightening the knock sensor mounting bolt will affect knock sensor performance, possibly causing improper spark control. Always use the specified torque when installing the knock sensor. Do not apply any adhesive, sealant or thread locking compound to the bolt.

2. Install the knock sensor with mounting bolt (1). Tighten the mounting bolt to the proper specification. Refer to **SPECIFICATIONS**.
3. Connect the electrical connector.
4. Install the Intake manifold. Refer to **MANIFOLD, INTAKE, INSTALLATION** .
5. Lower the vehicle.
6. Connect the negative battery cable and tighten nut to the proper specification. Refer to **SPECIFICATIONS** .

3.2L

Fig. 51: Knock Sensor 1 & Knock Sensor 2
Courtesy of CHRYSLER GROUP, LLC

NOTE: The forward sensor (1) is known to the powertrain control module (PCM) as knock sensor 1. The rear sensor (3) is known to the PCM as knock sensor 2.

1. Thoroughly clean the knock sensor mounting holes.

NOTE: Over or under tightening the sensor mounting bolts will affect knock sensor performance, possibly causing improper spark control. Always use the specified torque when installing the knock sensors. The torque specification for the knock sensor bolt is less than the typical 8 mm bolt.

NOTE: There may be a foam strip on the bolt threads. This foam is used only to retain the bolts to the sensors for plant assembly. It is not used as a sealant. Do not apply any adhesive, sealant or thread locking compound to these bolts.

2. Install knock sensor 1 (1) or knock sensor 2 (3) with mounting bolt (2). Tighten the mounting bolt to 20 N.m (15 ft. lbs.).
3. Connect the electrical connector (4).
4. Install the oil filter housing, upper and lower intake manifolds and air cleaner housing assembly. Refer to **HOUSING, OIL FILTER, INSTALLATION** .
5. If removed, install the oil filter and fill the engine crankcase with the proper oil to the correct level. Refer to **OIL - STANDARD PROCEDURE** .
6. Connect the negative battery cable and tighten nut to 5 N.m (45 in. lbs.).
7. Fill the cooling system. Refer to **STANDARD PROCEDURE** .
8. Operate the engine until it reaches normal operating temperature. Check cooling system for correct fluid level. Refer to **STANDARD PROCEDURE** .

SOLENOID, VARIABLE VALVE TIMING

DESCRIPTION

DESCRIPTION

Fig. 52: Variable Valve Timing Solenoid
Courtesy of CHRYSLER GROUP, LLC

The 3.6L engine is equipped with Variable Valve Timing (VVT). This system adjusts the timing of all four camshafts independently using solenoids and oil control valves to direct oil pressure into the camshaft phaser assemblies. The camshaft phaser assembly advances and/or retards camshaft timing to improve engine performance, mid-range torque, idle quality, fuel economy, and reduce emissions. The four VVT solenoids are located on the front of the cylinder head covers. The pintle should move freely within the solenoid body. Do not attempt to disassemble the solenoids, they are not serviceable. The solenoids are identical but should be installed in the same location as removed.

OPERATION

OPERATION

Fig. 53: Oil Control Valve (OCV), VVT Solenoid, Solenoid Pintle & Internal Spool Valve
Courtesy of CHRYSLER GROUP, LLC

Camshaft phaser position is adjusted using regulated oil pressure through an Oil Control Valve (OCV) (3). To begin Phaser movement, the Powertrain Control Module (PCM) applies a pulse-width modulated voltage signal to the VVT solenoid (1) to extend or retract the solenoid pintle (4). The pintle pushes against an internal spool valve (2) within the OCV moving the valve forwards and backwards to direct oil flow. The position of the spool inside the OCV determines which ports and chambers inside the phaser are being fed, either to advance the timing of the phaser sprocket relative to the camshaft, retard it, or hold a desired position. Refer to **ASSEMBLY, VARIABLE VALVE TIMING, PHASER/OIL CONTROL VALVE, OPERATION** .

The Camshaft Position (CMP) sensor monitors the position of the camshaft with respect to the crankshaft and provides feedback to the PCM.

The debris crush mode will only occur with the key on and the engine off (KOEO). If the ignition is cycled to the start position without a momentary pause (immediate crank), the debris crush mode will not occur. In this instance the procedure will be performed at the next key off cycle.

REMOVAL

LEFT

0909005826

Fig. 54: Variable Valve Timing Solenoids, Connectors & Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.

NOTE: **Mark the variable valve timing solenoid connectors (1) with a paint pen or equivalent so that they may be reinstalled in their original locations.**

2. Mark the intake variable valve timing solenoid (4) and the exhaust variable valve timing solenoid (2) with a paint pen or equivalent so that they may be reinstalled in their original locations.
3. Disconnect the electrical connector (1) from the variable valve timing solenoid.
4. Remove the variable valve timing solenoid mounting bolts (3).

Courtesy of CHRYSLER GROUP, LLC

5. Install the upper A/C liquid and suction line assembly (1). Refer to **LINE, A/C SUCTION, INSTALLATION** .
6. Install the resonator. Refer to **RESONATOR, AIR CLEANER, INSTALLATION** for 2.4L or **RESONATOR, AIR CLEANER, INSTALLATION** for 3.2L.
7. Connect the negative battery cable and tighten nut to the proper specification. Refer to **SPECIFICATIONS** .

NOTE: The Cam/Crank Variation Relearn procedure must be performed using the scan tool anytime there has been a repair/replacement made to a powertrain system, for example: flywheel, valvetrain, camshaft and/or crankshaft sensors or components.

SPARK PLUG

REMOVAL

2.4L

CAUTION: Handle the spark plugs with care. Do not drop or force the spark plugs into the wells, damage to the electrodes and/or porcelain body may occur. Always start each spark plug by hand in order to avoid cross-threading the spark plug in the cylinder head.

Always tighten spark plugs to the specified torque. Too much or not enough torque will cause damage to the cylinder head and/or spark plug and may lead to poor engine performance.

9400-9

Fig. 64: Spark Plug Removed
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical

1. Install each spark plug to the cylinder head. Tighten spark plugs to 27 N.m (20 ft. lbs.).

9400-9

Fig. 65: Removing/Installing Ignition Coil
Courtesy of CHRYSLER GROUP, LLC

2. Install ignition coil onto spark plug.

8181d713

Fig. 66: Ignition Coil Bolt
Courtesy of CHRYSLER GROUP, LLC

3. Install ignition coil mounting bolt. Tighten to 9 N.m (79.5 in. lbs.).
4. Connect ignition coil electrical connectors.
5. Connect the negative battery cable.

3.2L

2726572

Fig. 67: Electrical Connector, Ignition Coils & Ignition Coil Retaining Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: The left side ignition coils are shown in illustration, the right side ignition coils are similar.

1. Remove the ignition coil (2). Refer to **COIL, IGNITION, REMOVAL**.

CAUTION: The spark plug tubes (1) are a thin wall design. Avoid damaging the spark plug tubes. Damage to the spark plug tube can result in oil leaks.

Fig. 68: Spark Plug Tubes
Courtesy of CHRYSLER GROUP, LLC

2. Prior to removing the spark plug, spray compressed air into the cylinder head opening. This will help prevent foreign material from entering combustion chamber.
3. Remove the spark plug from the cylinder head using a quality thin wall socket with a rubber or foam insert.
4. Inspect the spark plug condition.

INSTALLATION

2.4L

CAUTION: Handle the spark plugs with care. Do not drop or force the spark plugs into the wells, damage to the electrodes and/or porcelain body may occur. Always start each spark plug by hand in order to avoid cross-threading the spark plug in the cylinder head.

Always tighten spark plugs to the specified torque. Too much or not enough torque will cause damage to the cylinder head and/or spark plug and may lead to poor engine performance.

Fig. 69: Spark Plug Removed
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical

1. Install each spark plug to the cylinder head. Tighten spark plugs to 27 N.m (20 ft. lbs.).

Fig. 70: Removing/Installing Ignition Coil
Courtesy of CHRYSLER GROUP, LLC

2. Install ignition coil onto spark plug.

Fig. 71: Ignition Coil Bolt
Courtesy of CHRYSLER GROUP, LLC

3. Install ignition coil mounting bolt. Tighten to 9 N.m (79.5 in. lbs.).
4. Connect ignition coil electrical connectors.
5. Connect the negative battery cable.

3.2L

Fig. 72: Gap Gauging Tool
Courtesy of CHRYSLER GROUP, LLC

1. Check and adjust the spark plug gap with a gap gauging tool (1). Refer to **SPECIFICATIONS**.

Fig. 73: Spark Plug Tubes
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Special care should be taken when installing spark plugs into the cylinder head spark plug wells. Be sure the plugs do not drop into the plug wells as electrodes can be damaged.

CAUTION: The spark plug tubes (1) are a thin wall design. Avoid damaging the spark plug tubes. Damage to the spark plug tube can result in oil leaks.

2. Start the spark plug into the cylinder head by hand to avoid cross threading.

CAUTION: Spark plug torque is critical and must not exceed the specified value. Overtightening stretches the spark plug shell reducing its heat transfer capability resulting in possible catastrophic engine failure.

3. Tighten the spark plugs to 17.5 N.m (13 ft. lbs.).

Fig. 74: Electrical Connector, Ignition Coils & Ignition Coil Retaining Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: The left side ignition coils are shown in illustration, the right side ignition coils are similar.

4. Install the ignition coil (2). Refer to **COIL, IGNITION, INSTALLATION**.

SWITCH, IGNITION

DESCRIPTION

DESCRIPTION

The ignition switch is located on the steering column. It is used as the main on/off switching device for most electrical components. The mechanical key cylinder is used to engage/disengage the electrical ignition switch.

OPERATION

OPERATION

Vehicles equipped with an automatic transmission and a steering column mounted shifter: an interlock device is located within the shift cable. This interlock device is used to lock the transmission shifter in the PARK position when the key cylinder is in any position and the brake pedal is not depressed.

REMOVAL

REMOVAL

1. Disconnect the and isolate the negative battery cable.
2. Remove the dash end cap. Refer to **CAP, INSTRUMENT PANEL END, REMOVAL** .
3. Remove the steering column opening cover.
4. Remove the HVAC control head. Refer to **CONTROL, A/C AND HEATER, REMOVAL** .
5. Remove the instrument cluster bezel. Refer to **BEZEL, INSTRUMENT CLUSTER, REMOVAL** .
6. Disconnect the wire harness connector from the Ignition Node Module.

Fig. 75: Removing/Installing Switch Mounting Screws
Courtesy of CHRYSLER GROUP, LLC

7. Remove 4 screws from the I/P holding the Ignition Node Module in place.
8. Remove the Ignition Node Module from the backside of the I/P.

INSTALLATION

INSTALLATION

1. Install the Ignition Node Module into the Instrument Panel from the backside.
2. Pull the Ignition Node Module into place.

Fig. 76: Removing/Installing Switch Mounting Screws
Courtesy of CHRYSLER GROUP, LLC

3. Install 4 screws through the instrument Panel into the Ignition Node Module and tighten.
4. Connect Electrical harness connector into Ignition Node Module.
5. Install the Instrument Panel bezel and connect wire harness connectors. Refer to **BEZEL, INSTRUMENT CLUSTER, INSTALLATION** .
6. Install the HVAC control head and connect wire harness connectors. Refer to **CONTROL, A/C AND HEATER, INSTALLATION** .
7. Install the steering column opening cover and connect the wire harness connectors.
8. Install dash end cap. Refer to **CAP, INSTRUMENT PANEL END, INSTALLATION** .
9. Connect negative battery cable.
10. If Ignition Node Module is being replaced, program the module. Refer to **STANDARD PROCEDURE** . **This procedure will require you to log into DealerCONNECT and enter a PIN when requested. The PIN is temporary and will be active for 12 hours. After 12 hours, a new PIN will need to be obtained from DealerCONNECT.**

2014 ENGINE PERFORMANCE

Driveability - Diesel - Non-DTC Based Diagnostics - Cherokee

DIAGNOSIS AND TESTING

ENGINE CRANKS BUT WILL NOT START

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

POSSIBLE CAUSES

Possible Causes
SKIM CODES PRESENT
INTAKE SYSTEM RESTRICTION
ENGINE COOLANT TEMPERATURE (ECT) SENSOR
FUEL SUPPLY CONTAMINATION
GLOW PLUG SYSTEM FAILURE
FUEL DELIVERY SYSTEM FAILURE
ENGINE DRIVE CHAIN/BELT
POWERTRAIN CONTROL MODULE (PCM)

DIAGNOSTIC TEST

1. **PCM CODES PRESENT**
    1. With the scan tool, read the PCM DTCs.

       Does the scan tool display any PCM DTCs?

       Yes

       - Perform the appropriate PCM DTC procedure.
       - Perform the PCM VERIFICATION TEST - 2.0L DIESEL. Refer to **PCM VERIFICATION TEST - 2.0L DIESEL** .

       No

       - Go To 3
2. **SKIM CODES PRESENT**
    1. With the scan tool, read the SKIM DTCs.

       Does the scan tool display any SKIM DTCs?

       Yes

- Refer to **DIAGNOSIS AND TESTING** and perform the appropriate SKIM DTC procedure.
- Perform the PCM VERIFICATION TEST - 2.0L DIESEL. Refer to **PCM VERIFICATION TEST - 2.0L DIESEL** .

No

- Go To 3

3. **CHECK FOR INTAKE SYSTEM RESTRICTIONS**
   1. Turn the ignition off.
   2. Ensure vehicle has adequate fuel supply in fuel tank.
   3. Inspect all air intake and Turbocharger related hoses/tubes and connections.
   4. Inspect the air filter for excessive dirt, soiling or other problems that may cause restricted air flow.

   Were any problems found?

   Yes

   - Repair or replace as necessary.
   - Perform the PCM VERIFICATION TEST - 2.0L DIESEL. Refer to **PCM VERIFICATION TEST - 2.0L DIESEL** .

   No

   - Go To 4

4. **ECT SENSOR**
   1. Using a temperature probe, check the vehicle temperature near the ECT Sensor.
   2. Turn the ignition on.
   3. With the scan tool in sensors, read the ECT Sensor temperature.
   4. Compare the temperature probe reading with the scan tool reading.

   Are the two readings within 10°C of each other?

   Yes

   - Go To 5

   No

   - Repair as necessary.
   - Perform the PCM VERIFICATION TEST - 2.0L DIESEL. Refer to **PCM VERIFICATION TEST - 2.0L DIESEL** .

5. **GLOW PLUGS**

1. Check the glow plugs for proper operation.

   Are the glow plugs operating properly?

   Yes

   - Go To 6

   No

   - Repair as necessary.
   - Perform the PCM VERIFICATION TEST - 2.0L DIESEL. Refer to **PCM VERIFICATION TEST - 2.0L DIESEL** .

6. **CHECK THE FUEL DELIVERY SYSTEM**
   1. Perform the CHECKING THE FUEL DELIVERY SYSTEM diagnostic procedure. Refer to **CHECKING THE FUEL DELIVERY SYSTEM** .

      Is the fuel delivery system operating properly?

      Yes

      - Repair as necessary.
      - Perform the PCM VERIFICATION TEST - 2.0L DIESEL. Refer to **PCM VERIFICATION TEST - 2.0L DIESEL** .

      No

      - Go To 7

7. **ENGINE DRIVE CHAINS**
   1. Make sure the Engine Drive Chains are installed correctly and the camshaft and crankshaft gears are timed correctly.

      Were any problems found?

      Yes

      - Repair as necessary.
      - Perform the PCM VERIFICATION TEST - 2.0L DIESEL. Refer to **PCM VERIFICATION TEST - 2.0L DIESEL** .

      No

      - Replace and program the Powertrain Control Module in accordance with the service information. Refer to **REMOVAL** .

- Perform the PCM VERIFICATION TEST - 2.0L DIESEL. Refer to **PCM VERIFICATION TEST - 2.0L DIESEL** .

LACK OF ENGINE POWER

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

POSSIBLE CAUSES

Possible Causes
INJECTOR QUANTITY ADJUSTMENT
BRAKE SWITCH PROBLEM
EGR SYSTEM PROBLEM
AIR LEAKS IN THE INTAKE SYSTEM (INCLUDING INTERCOOLER)
BOOST PRESSURE PROBLEM
LOW ENGINE COMPRESSION
FUEL DELIVERY SYSTEM FAILURE
ENGINE DRIVE BELT/CHAIN
FUEL INJECTOR(S)
FUEL INJECTION PUMP
TURBOCHARGER

DIAGNOSTIC TEST

1. **CHECKING ENGINE OIL LEVEL**
   1. Check that the engine oil level is correct.

      Is the oil at the correct level?

      Yes

      - Go To 2

      No

      - Correct the engine oil to the proper level.
      - Perform the PCM VERIFICATION TEST - 2.0L DIESEL. Refer to **PCM VERIFICATION TEST - 2.0L DIESEL** .
2. **CHECKING FOR PCM DTCS**

   WARNING: **High Pressure fuel lines deliver diesel fuel under extreme pressure from the injection pump to the fuel injectors. This may be as high as 23, 200 PSI (1600 BAR). Use extreme caution when inspecting for**

high pressure fuel leaks. Failure to follow these instructions may result in possible serious or fatal injury.

WARNING: **Fuel under this amount of pressure can penetrate skin causing possible serious or fatal injury. Inspect for high pressure fuel leaks with a sheet of cardboard. Wear safety goggles and adequate protective clothing when servicing fuel system. Failure to follow these instructions may result in possible serious or fatal injury.**

1. Turn the ignition on.
2. With the scan tool, read the PCM DTCs.

   Are there any DTCs present?

   Yes

   - Diagnose and repair the PCM DTCs before proceeding.
   - Perform the PCM VERIFICATION TEST - 2.0L DIESEL. Refer to **PCM VERIFICATION TEST - 2.0L DIESEL** .

   No

   - Go To 3

3. **CHECKING THE BRAKE SWITCH ADJUSTMENT**
   1. Check for proper Brake Switch adjustment.

      Is the Brake Switch adjusted correctly?

      Yes

      - Go To 4

      No

      - Adjust or replace the Brake Switch as necessary.
      - Perform the PCM VERIFICATION TEST - 2.0L DIESEL. Refer to **PCM VERIFICATION TEST - 2.0L DIESEL** .

4. **ENGINE COMPRESSION**
   1. Start and idle the engine.
   2. With the scan tool, perform the Cylinder Compression Test.

      Does the Cylinder Compression Test indicate low compression in any of the cylinders?

      Yes

- Using the service information, repair the engine as necessary to regain proper cylinder compression.
- Perform the PCM VERIFICATION TEST - 2.0L DIESEL. Refer to **PCM VERIFICATION TEST - 2.0L DIESEL** .

No

- Go To 5

5. **CHECK THE INTAKE SYSTEM**
   1. Inspect the entire Intake System, including the Intercooler for signs of a leak.

      Were any problems found with the Intake System?

      Yes

      - Repair or replace as necessary.
      - Perform the PCM VERIFICATION TEST - 2.0L DIESEL. Refer to **PCM VERIFICATION TEST - 2.0L DIESEL** .

      No

      - Go To 6

6. **CHECK THE EGR SYSTEM**
   1. Inspect the entire EGR System for signs of a leak.

      NOTE: Soot streaking around the EGR Valve or system components is an indication of a leak in the EGR System.

      Were any problems found with the EGR System?

      Yes

      - Repair or replace as necessary.
      - Perform the PCM VERIFICATION TEST - 2.0L DIESEL. Refer to **PCM VERIFICATION TEST - 2.0L DIESEL** .

      No

      - Go To 7

7. **CHECK THE EXHAUST SYSTEM FOR RESTRICTIONS**
   1. Visually inspect the exhaust system for signs of damage which could cause restrictions.

      Were any problems found with the exhaust system?

Yes

- Repair as necessary.
- Perform the PCM VERIFICATION TEST - 2.0L DIESEL. Refer to **PCM VERIFICATION TEST - 2.0L DIESEL** .

No

- Go To 8

8. **COMPARE THE FUEL PRESSURE ACTUAL READING AGAINST FUEL PRESSURE SET POINT**

NOTE: This test requires two people. One person to test drive the vehicle while a technician observes the scan tool readings.

1. With the scan tool, select add the fuel rail pressure to a graph.
2. With the scan tool, select add the fuel rail pressure setpoint to a graph.
3. Select merge graphs.
4. With the scan tool, compare the Fuel Pressure Actual reading with the Fuel Pressure Setpoint on the graph, while cranking the engine on a no start, or while test driving the vehicle under various load conditions such as idle, hard acceleration, cruise and deceleration.

NOTE: The Fuel Pressure reading should closely follow the Fuel Pressure Setpoint reading.

Does the Actual Fuel Pressure reading follow the Fuel Pressure Desired/Setpoint reading?

Yes

- Go To 9

No

- Perform the CHECKING THE FUEL DELIVERY SYSTEM diagnostic procedure. Refer to **CHECKING THE FUEL DELIVERY SYSTEM** .
- Perform the PCM VERIFICATION TEST - 2.0L DIESEL. Refer to **PCM VERIFICATION TEST - 2.0L DIESEL** .

9. **FUEL INJECTOR**

NOTE: An injector that sticks open can cause this symptom. A sticking injector will cause the engine to misfire and emit excessive black smoke from the exhaust system.

1. Start and idle the engine.

2. With the scan tool, perform the Cylinder Fuel Quantity Correction Test.

NOTE: A problem injector will be indicated by a significant change in correction quantity as compared to the rest of the injectors.

Are any of the injectors displaying a significant amount of injection quantity correction?

Yes

- Using the service information, remove and inspect the Fuel Injectors for signs of damage or debris that may cause the injector to stick. Sticking injectors may cause the combustion chamber to become black and oil soaked. Replace Injector(s) as necessary.
- Perform the PCM VERIFICATION TEST - 2.0L DIESEL. Refer to **PCM VERIFICATION TEST - 2.0L DIESEL** .

No

- Go To 10

10. **CHECKING BOOST PRESSURE**
    1. Turn the ignition on.

NOTE: This test requires two people. One person to test drive the vehicle while a technician observes the scan tool readings.

2. With the scan tool in Sensors, read and compare the Boost Pressure (PSI) with the Boost Pressure Desired/Setpoint (PSI) while test driving the vehicle under various load conditions such as idle, hard acceleration, and cruise.

NOTE: The Boost Pressure reading should directionally follow (trail) the Boost Pressure Desired/Setpoint reading.

Does the Boost Pressure reading follow the Boost Pressure Desired/Setpoint reading?

Yes

- Go To 11

No

- Check the vacuum supply lines and Turbocharger Actuator operation. If any problems are found, repair as necessary. If no problems are found, replace the Turbocharger.
- Perform the PCM VERIFICATION TEST - 2.0L DIESEL. Refer to **PCM VERIFICATION TEST - 2.0L DIESEL** .

11. **ENGINE DRIVE BELT/CHAIN**

1. Use the service information to ensure the Engine Drive Belt/Chain is installed correctly and the camshaft and crankshaft gears are timed correctly.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the PCM VERIFICATION TEST - 2.0L DIESEL. Refer to **PCM VERIFICATION TEST - 2.0L DIESEL** .

   No

   - Test Complete.

CHECKING THE EXHAUST SYSTEM FOR LEAKS

DIAGNOSTIC TEST

CHECKING THE EXHAUST SYSTEM FOR LEAKS

1. Turn the ignition off.
2. Raise the vehicle in accordance with the service information.

   WARNING: The normal operating temperature of the exhaust system is very high. Never work around or attempt to service any part of the exhaust system until it has cooled. Special care should be taken when working near the catalytic converter. The temperature of the converter rises to a high level after a short period of engine operating time.

3. Connect Exhaust Cone (special tool #8404-ECT, Exhaust Cone, Truck) to Air Pressure Regulator (with hose) W-18-MIL-1146AS.

   CAUTION: The air pressure must not exceed 27.6 kPa (4 psi), otherwise engine damage can occur.

4. Attach shop air to the air pressure regulator.
5. Adjust the Air Pressure Regulator to 27.6 kPa (4 psi)
6. Insert the exhaust cone into the vehicle tail pipe.
7. If the vehicle is equipped with dual exhaust. Use the (special tool #8404-ECT, Exhaust Cone, Truck) with equipped attached plug, plug one side of the dual exhaust pipe. Pressurize the other as described above.
8. Apply Mopar® Air Leak Detector PN 05191804AA (or an equivalent leak finder liquid) to the following areas:

- All welded joints from the exhaust manifold to 45.72 cm (18 inches) behind the downstream O2 Sensor
- O2 Sensor seal points
- O2 Sensor boss welds
- Flange/joint connection(s)
- Exhaust manifold to cylinder head connection(s)
- EGR solenoid gasket base and tube seal points (if equipped)

9. Watch for the Mopar® Air Leak Detector PN 05191804AA (or the equivalent leak finder liquid) to bubble.
10. Use the following definitions to help determine if system or component repair/replacement is necessary:
    - **Type 1 Leak** is defined as a leak where very small foam like bubbles 1 mm (0.04 of an inch) or less appear. Any Type 1 or greater leaks found in welded joints, O2 sensor seal points or O2 sensor boss welds must be repaired or the component must be replaced.
    - **Type 2 Leak** is defined as a leak where larger bubbles pea size, 8 mm (0.3 of an inch) or greater appear. Any Type 2 or greater leaks found in flange or joint connections, exhaust manifold to cylinder head connections, or EGR gasket and tube seal points must be repaired or the components must be replaced.

Leak Location	Repair required if results at 27.6 kPa (4 psi) reveal bubble size:
Welded joints	Type 1, 1 mm (0.04 of an inch) or greater
O2 Sensor seal points	Type 1, 1 mm (0.04 of an inch) or greater
O2 Sensor boss welds	Type 1, 1 mm (0.04 of an inch) or greater
Flange/joint connections	Type 2, 8 mm (0.3 of an inch) or greater
Exhaust Manifold to cylinder head connections	Type 2, 8 mm (0.3 of an inch) or greater
EGR gasket and tube seal points	Type 2, 8 mm (0.3 of an inch) or greater

11. If a leak is found that matches the above definition, repair or replace the component as necessary.
12. Once the repair is complete, repeat the procedure to verify that all leaks have been repaired.

Were any exhaust leaks found?

Yes

- Repair or replace the leaking exhaust parts as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **PCM VERIFICATION TEST - 2.0L DIESEL** .

No

- Test complete.

CHECKING THE ENGINE MECHANICAL SYSTEMS

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

POSSIBLE CAUSES

Possible Causes
CHECKING ENGINE MECHANICAL SYSTEMS

DIAGNOSTIC TEST

CHECKING ENGINE MECHANICAL

WARNING: Do not attempt to remove or separate high pressure fuel lines. Failure to follow these instructions may result in possible serious or fatal injury.

NOTE: The following items should be checked as a possible cause of a Driveability or No-Start problem:

- Engine Valve Timing - must be within specification.
- Engine Compression - must be within specifications.
- Camshaft Lobes - check for abnormal wear.
- Camshaft Position Sensor - check the camshaft position sensor tooth for debris and deterioration.
- Crankshaft Position Sensor - check the crankshaft tone wheel for debris and deterioration.
- Engine Exhaust System - must be free of any restriction.
- Engine Drive Chains and Sprockets - must be properly positioned.
- Vacuum System - must operate properly and be free of any vacuum leaks.
- Fuel - must have adequate supply and must be free of contamination (debris, water and gasoline).
- Fuel Injectors - must not be plugged or restricted.
- Fuel Lift Pump - must operate properly (where applicable).
- Fuel Injection Pump - must be producing the correct output volume and pressure.
- Inspect the Fuel Lines, Fuel Filter and Fuel Pressure Relief Valve for signs of restriction and leaks.

NOTE: Check for any Technical Service Bulletins that may relate to the problem.

Are there any problems evident?

Yes

- Repair as necessary.
- Perform the PCM VERIFICATION TEST - 2.0L DIESEL. Refer to **PCM VERIFICATION TEST -**

2.0L DIESEL .

No

- Test Complete.

CHECKING THE PCM POWER AND GROUND CIRCUITS

Fig. 1: Powertrain Control Module Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

POSSIBLE CAUSES

Possible Causes
FUSED ASD RELAY BATTERY SUPPLY CIRCUIT OPEN
(F942) FUSED IGNITION SWITCH OUTPUT (START/RUN) CIRCUIT OPEN
(F942) FUSED IGNITION SWITCH OUTPUT (START/RUN) CIRCUIT SHORTED TO GROUND
(K51) ASD RELAY CONTROL CIRCUIT OPEN/HIGH RESISTANCE
ASD RELAY OUTPUT CIRCUIT(S) OPEN/HIGH RESISTANCE
ASD RELAY OUTPUT CIRCUIT(S) SHORTED TO GROUND
PCM GROUND CIRCUIT(S) OPEN/HIGH RESISTANCE
ASD RELAY

DIAGNOSTIC TEST

1. **PCM GROUND CIRCUIT(S) OPEN**
    1. Turn the ignition off.
    2. Disconnect the PCM C1 harness connector.
    3. Using a 12-volt test light connected to 12 volts, probe each of the PCM ground circuits at the PCM C1 harness connector, cavities 2, 4 and 6.

       Did the test light illuminate for each cavity?

       Yes

       - Go To 2

       No

       - Repair the PCM Ground circuit(s) for an open.
       - Perform the PCM VERIFICATION TEST - 2.0L DIESEL. Refer to **PCM VERIFICATION TEST - 2.0L DIESEL** .
2. **(F942) FUSED IGNITION SWITCH OUTPUT (START/RUN) CIRCUIT OPEN**
    1. Turn the ignition to the Run position.
    2. Using a 12-volt test light connected to ground, check the Fused Ignition Switch Start/Run Output circuit at the PCM C1 harness connector, cavity 54.
    3. Turn the ignition to the Start position.
    4. Using a 12-volt test light connected to ground, check the Fused Ignition Switch Start/Run Output circuit at the PCM C1 harness connector, cavity 54.

       Is the test light on for both ignition switch positions?

       Yes

- Go To 3

No

- Repair the Fused Ignition Switch Start/Run Output circuit for an open.
- Perform the PCM VERIFICATION TEST - 2.0L DIESEL. Refer to **PCM VERIFICATION TEST - 2.0L DIESEL** .

3. **CHECKING THE MAIN RELAY SYSTEM**
   1. Turn the ignition off.
   2. Connect a jumper wire between ground and the (K51) ASD Relay Control circuit at the PCM C1 harness connector, cavity 29.
   3. Turn the ignition on.
   4. Using a 12-volt test light connected to ground, check the Fused ASD Relay Output circuits at the PCM C1 harness connector, cavities 1, 3 and 5.

      Does the test light illuminate brightly for each circuit?

      Yes

      - Test Complete.

      No

      - Go To 4
4. **FUSED ASD RELAY BATTERY SUPPLY CIRCUIT OPEN**
   1. Turn the ignition off.
   2. Remove the ASD Relay.
   3. Turn the ignition on.
   4. Using a 12-volt test light connected to ground, check both Fused ASD Relay Battery Supply circuits (terminal 30) at both ASD Relay connectors.

      Is the test light illuminated and bright?

      Yes

      - Go To 5

      No

      - Repair the Fused Main Relay Battery Supply circuit(s) for an open.
      - Perform the PCM VERIFICATION TEST - 2.0L DIESEL. Refer to **PCM VERIFICATION TEST - 2.0L DIESEL** .
5. **ASD RELAY OUTPUT CIRCUITS OPEN**

1. Connect a jumper wire between cavity 30 and cavity 87 at the ASD Relay connector.
2. Using a 12-volt test light connected to ground, check the ASD Relay Output circuit in PCM C1 harness connector, cavities 1, 3 and 5.

   Did the test light illuminate for each circuit?

   Yes

   - Go To 6

   No

   - Repair the Main Relay Output circuit(s) for an open.
   - Perform the PCM VERIFICATION TEST - 2.0L DIESEL. Refer to **PCM VERIFICATION TEST - 2.0L DIESEL** .

6. **ASD RELAY**
   1. Turn the ignition off.
   2. Install a known good relay in place of the ASD Relay.
   3. Connect a jumper wire between ground and the ASD Relay Control circuit in PCM C1 harness connector cavity 28.
   4. Turn the ignition on.
   5. Using a 12-volt test light connected to ground, check the Fused ASD Relay Output circuits at the PCM C1 harness connector, cavities 1, 3 and 5.

      Did the test light illuminate brightly for each circuit?

      Yes

      - Replace the ASD Relay.
      - Perform the PCM VERIFICATION TEST - 2.0L DIESEL. Refer to **PCM VERIFICATION TEST - 2.0L DIESEL** .

      No

      - Repair the ASD Relay Control circuit for an open.
      - Perform the PCM VERIFICATION TEST - 2.0L DIESEL. Refer to **PCM VERIFICATION TEST - 2.0L DIESEL** .

CHECKING THE FUEL DELIVERY SYSTEM

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

There are two sides to the 2.0L fuel system. A low pressure and high pressure side. The low pressure side components are the Fuel Lift Pump; the Fuel Filter; Cascade Valve; and the Fuel Quantity Solenoid (FQS). The Fuel Lift Pump, mounted inside the tank, delivers the fuel from the tank to the High Pressure Delivery Pump (HPDP). The Fuel Filter, mounted at the bulk head on the drivers side, removes water and debris from the fuel and helps to prevent damage to the HPDP and Fuel Injectors. The Cascade Valve, located inside the HPDP, regulates the low side pressure between approximately 4.0 bar (58 psi) and 5.5 (79.7psi). The Fuel Quantity Solenoid, mounted to the HPDP, controls the quantity of fuel entering the HPDP internal pumping chambers. Excess fuel is returned back to the tank via a return line from the HPDP. The high pressure side components include the High Pressure Delivery Pump; the Fuel Rail; and the Fuel Injectors. The HPDP raises the fuel pressure entering the Fuel Rail using two internal pumping chambers. The Fuel Rail holds the high pressure fuel for use by the Fuel Injectors and helps to dampen pressure spikes caused by the HPDP and the opening and closing of the injectors. The solenoid actuated Fuel Injectors deliver high pressure fuel directly into the engine cylinders. During injector operation, a small amount of fuel leaks into the injector return hoses. The injector return hoses connect a fuel return line which leads back to the Fuel Tank. During engine cranking, the FQS allows maximum fuel flow to allow pressure to build quickly. After the engine starts, the PCM controls the high side pressure by regulating the FQS.

Possible Causes
FUEL SYSTEM LEAK
FUEL CONTAMINATION
FUEL LINE RESTRICTIONS
FUEL FILTER
EXCESSIVE FUEL INJECTOR BACK FLOW LEAKAGE
FUEL QUANTITY SOLENOID
FUEL LIFT PUMP WIRING
FUEL LIFT PUMP
HIGH PRESSURE FUEL PUMP

DIAGNOSTIC TEST

1. **VISUAL INSPECTION**

NOTE: **For best results, perform Fuel Delivery System test with vehicle at room temperature. Extreme cold temperatures can cause inaccurate results.**

NOTE: **Make sure that the vehicle has at least 1/8 of a tank of fuel before proceeding with this test.**

1. Perform a visual inspection of the fuel system for any signs of a fuel leak.

   Were any visual signs of a leak detected?

   Yes

   - Repair as necessary

- Perform the PCM VERIFICATION TEST - 2.0L DIESEL. Refer to **PCM VERIFICATION TEST - 2.0L DIESEL** .

No

- Go To 2

2. **CHECKING SENSOR VALUES WITH THE SCAN TOOL**

NOTE: **If there are any DTCs present for the Fuel Quantity Solenoid, Fuel Injectors, Crank/Cam Sensors or Fuel Pump Control Circuit or relay, repair those DTCs before continuing with the Fuel Delivery System test.**

1. Turn the ignition on, engine not running.
2. With the scan tool, perform the following checks:
   - Check and compare the values of the Ambient Air Temperature Sensor, Coolant Temperature Sensor and Fuel Temperature Sensor with the key on. The values should read approximately the same as each other on a cold engine.
   - Check and compare the values of the Air Inlet Pressure Sensor, Boost Pressure Sensor and Exhaust Differential Pressure Sensor. The sensors should read approximately the same.
   - Check the plausibility of the Accelerator Pedal Position sensors.
3. If possible, start the engine and check the following:
   - Check the cam/crank synchronization during cranking.
   - Check and compare the MAF Sensor actual reading against the MAF Sensor setpoint.
   - Check the plausibility of the temperature and pressure sensors.

Are the cam and crank synchronized and the sensors reading normal?

Yes

- Go To 3

No

- Repair as necessary.
- Perform the PCM VERIFICATION TEST - 2.0L DIESEL. Refer to **PCM VERIFICATION TEST - 2.0L DIESEL** .

3. **SCAN TOOL TEST**
   1. Perform the following tests with the scan tool:
      - Injector Quantity Correction for each injector. Look for an injector that is reading noticeably different than the others indicating a faulty injector.
      - Compression Test. The RPM drop in each cylinder should be approximately equal.
      - Injector Kill Test. The RPM drop in each cylinder should be approximately equal.

Do any of the cylinders or injectors indicate a problem as compared to the others during the scan tool tests?

Yes

- Evaluate the results of the scan tool tests. If any of the cylinders are found to be performing poorly as compared to the others, check for engine mechanical issues on the suspect cylinder and repair as necessary.
- If no mechanical issues are found with the engine, Go To 4

No

- Go To 5

4. **CHECK THE FUEL INJECTOR SUPPLY**
   1. Turn the ignition off.
   2. Remove and check the High Pressure Supply Line to the Fuel Injector of the cylinder that indicated a problem for a restriction.

   Is the Fuel Injector supply line restricted?

   Yes

   - Clean or replace the Fuel Injector supply line and perform the scan tool test again.
   - Perform the PCM VERIFICATION TEST - 2.0L DIESEL. Refer to **PCM VERIFICATION TEST - 2.0L DIESEL** .

   No

   - Using the wiring diagram as a guide, check the resistance of the Fuel Injector circuits between the injector and the PCM. If the resistance is above 2.0 Ohms, repair the circuit for high resistance and perform the scan tool test again. If the resistance was below 2.0 Ohms for both circuits, replace the Fuel Injector in accordance with the service information.
   - Perform the PCM VERIFICATION TEST - 2.0L DIESEL. Refer to **PCM VERIFICATION TEST - 2.0L DIESEL** .

5. **COMPARE THE FUEL PRESSURE ACTUAL READING AGAINST FUEL PRESSURE SET POINT**

   NOTE: This test requires two people. One person to test drive the vehicle while a technician observes the scan tool readings.

   1. With the scan tool, select add the Fuel Pressure Actual to a graph.
   2. With the scan tool, select add the Fuel Pressure Setpoint to a graph.
   3. Select merge graphs.
   4. With the scan tool, compare the Fuel Pressure Actual reading with the Fuel Pressure Setpoint on

the graph, while cranking the engine on a no start, or while test driving the vehicle under various load conditions such as idle, hard acceleration, cruise and deceleration.

NOTE: The Fuel Pressure reading should closely follow the Fuel Pressure Setpoint reading.

Select the conclusion that best matches the result of the test:

The Fuel Pressure reading follows closely to the Fuel Pressure Setpoint reading.

- Go To 6

The Fuel Pressure reading is too low.

- If the vehicle is a no start, Go To 9
- If the vehicle starts and runs, Go To 10

The Fuel Pressure reading is too high.

- Go To 7

The Fuel Pressure reading is oscillating excessively above and below the Fuel Pressure Setpoint reading.

- Using a clear tube connected in-line on the low pressure side of the system, check for signs of air bubbles in the fuel supply system. If air bubbles are present, repair the cause of the air bubbles getting into the supply side system. If no air bubbles are present, replace the High Pressure Delivery Pump in accordance with the service information.
- Perform the PCM VERIFICATION TEST - 2.0L DIESEL. Refer to **PCM VERIFICATION TEST - 2.0L DIESEL** .

6. **CHECKING FUEL QUALITY/CONTAMINATION**
   1. Collect a fuel sample from the vehicle in a clean see through container.
   2. Collect a fuel sample of fresh clean fuel in a clean, transparent container for reference.
   3. Check the vehicle's fuel sample for the following:
      - Check the color of the fuel. Diesel fuel will generally be a yellow color.
      - Allow the fuel to settle and look for cloudiness indicating contamination.
      - Check the volatility of the fuel.
      - Look for a parting line in the fuel sample indicating another type of liquid mixed with the fuel.
      - Look for any signs of debris in the fuel sample.

   Were any problems found?

Yes

- Refer to the service information to replace the fuel in the entire fuel system.
- Perform the PCM VERIFICATION TEST - 2.0L DIESEL. Refer to **PCM VERIFICATION TEST - 2.0L DIESEL** .

No

- The fuel system is operating normally. Check for any Service Bulletins that may apply.
- Perform the PCM VERIFICATION TEST - 2.0L DIESEL. Refer to **PCM VERIFICATION TEST - 2.0L DIESEL** .

7. **CHECKING FOR A RESTRICTION IN THE FUEL RETURN**
   1. Disconnect the fuel return hose at the fuel return block.
   2. Connect the (special tool #8978A, Decay Tool, Fuel) in-line.
   3. While observing the gauge, start the engine and allow it to come to idle.

   NOTE: The return pressure should be below 1.0 bar (14.5 psi) if there are no restrictions.

   Is the return pressure above 1.0 bar (14.5 psi) ?

   Yes

   - Go To 8

   No

   - Check the operation of the Fuel Quantity Solenoid and High Pressure Delivery Pump and repair as necessary.
   - Perform the PCM VERIFICATION TEST - 2.0L DIESEL. Refer to **PCM VERIFICATION TEST - 2.0L DIESEL** .

8. **CHECKING FUEL RETURN LINE FOR A RESTRICTION**
   1. Remove the (special tool #8978A, Decay Tool, Fuel).
   2. Disconnect the fuel return line at the Fuel Lift Pump.
   3. Blow regulated shop air through the return line and check for a restriction.

   Was the return line restricted?

   Yes

   - Repair the restriction in the fuel return line.
   - Perform the PCM VERIFICATION TEST - 2.0L DIESEL. Refer to **PCM VERIFICATION TEST - 2.0L DIESEL** .

No

- Check the Fuel Lift Pump for a restriction on the return circuit and repair as necessary.
- Perform the PCM VERIFICATION TEST - 2.0L DIESEL. Refer to **PCM VERIFICATION TEST - 2.0L DIESEL** .

9. **CHECK THE FUEL RAIL PRESSURE SENSOR**
   1. Disconnect the Fuel Rail Pressure Sensor harness connector.
   2. Attempt to start the engine.

   Does the engine start and run?

   Yes

   - Using the wiring diagram as a guide, check the resistance of the Fuel Rail Pressure Sensor circuits between the Fuel Rail Pressure Sensor and the PCM. If the resistance is above 2.0 Ohms on any circuit, repair the circuit for high resistance. If the circuits measure below 2.0 Ohms, replace the Fuel Rail Pressure Sensor in accordance with the service information.
   - Perform the PCM VERIFICATION TEST - 2.0L DIESEL. Refer to **PCM VERIFICATION TEST - 2.0L DIESEL** .

   No

   - Go To 10

10. **CHECK THE LOW SIDE FUEL SYSTEM PRESSURE**
    1. Turn the ignition off.
    2. Disconnect the quick connect fitting between the Fuel Filter outlet and the High Pressure Fuel Pump and connect the (special tool #8978A, Decay Tool, Fuel) in-line.
    3. Crank the engine or start the engine and observe the reading on the fuel pressure gauge.

    Does the fuel pressure read between 4.0 bar (58 psi) and 5.5 (79.7psi)?

    Yes, and vehicle starts and runs:

    - Go To 16

    Yes, and vehicle is a no start:

    - Go To 15

    No, pressure reading is below specification:

    - Go To 11

    No, pressure reading is above specification:

- If the pressure reading 116 psi (8 bar) or below, check for a restriction in the line between the quick connect fitting and the HPDP. If no restriction is found, replace the High Pressure Delivery Pump and retest the system.
- If the pressure is reading above 116 psi (8 bar), replace the Fuel Lift Pump and repair the restriction in the line between the quick connect fitting and the HPDP or replace the High Pressure Delivery Pump if no restriction is found and retest the system.
- Perform the PCM VERIFICATION TEST - 2.0L DIESEL. Refer to **PCM VERIFICATION TEST - 2.0L DIESEL** .

11. **CHECK THE FUEL SUPPLY PRESSURE AT FUEL FILTER INLET**
    1. Turn the ignition off.
    2. Remove the (special tool #8978A, Decay Tool, Fuel) from between the Fuel Filter outlet and the High Pressure Fuel Pump. Reconnect the fuel line.
    3. Disconnect the fuel supply line quick connect at the Fuel Filter inlet.
    4. Connect the (special tool #8978A, Decay Tool, Fuel) in-line between the fuel supply line and the Fuel Filter inlet fitting.
    5. Crank the engine or start the engine and observe the reading on the fuel pressure gauge.

    Does the fuel pressure read 4.0 bar (58 psi) or above?

    Yes

    - Replace the Fuel Filter in accordance with the service information.
    - Perform the PCM VERIFICATION TEST - 2.0L DIESEL. Refer to **PCM VERIFICATION TEST - 2.0L DIESEL** .

    No

    - Go To 12

12. **CHECK THE FUEL LIFT PUMP MAXIMUM OUTPUT**
    1. While the engine is cranking or running, close the valve after the gauge and observe the pressure gauge reading.

    NOTE: **Do not block the line for more than a few seconds or damage to the Fuel Lift Pump can occur. The pressure should spike up and then stabilize at approximately 116 psi (8 bar) in two or three seconds.**

    Does the fuel pressure rise to approximately 116 psi (8 bar)?

    Yes

    - Replace the High Pressure Delivery Pump in accordance with the service information.
    - Perform the PCM VERIFICATION TEST - 2.0L DIESEL. Refer to **PCM VERIFICATION TEST - 2.0L DIESEL** .

No

- Go To 13

13. **CHECK THE VOLTAGE DROP OF THE FUEL PUMP MOTOR CIRCUITS**
    1. Turn the engine off.
    2. Reconnect the fuel lines.

    NOTE: The Fuel Lift Pump Module harness connector should remain connected to the pump during this test step in order to accurately measure the voltage drop.

    3. Using a voltmeter, back probe the Fuel Pump Motor Feed circuit with the positive lead of the meter at the Fuel Lift Pump Module harness connector.
    4. Back probe the Fuel Lift Pump Ground circuit with the negative lead of the meter at the Fuel Lift Pump Module harness connector.

    CAUTION: Use only approved connector back probe tools when back probing a connector so as not to cause damage to the terminals or insulation of the connector. Damage to the terminals can cause poor terminal contact or retention. Damage to the insulation can introduce corrosion due to water infiltration.

    5. Turn the ignition on.
    6. With a scan tool, actuate the Fuel Lift Pump control to ON (100%).

    NOTE: The voltage should read the same as battery voltage if there is no resistance in the circuit.

    Is the voltage reading the same as battery voltage +/- 0.2 Volts?

    Yes

    - Check the supply line between the Fuel Lift Pump and the Fuel Filter for a restriction. If the line is not restricted, replace the Fuel Lift Pump in accordance with the service information.
    - Perform the PCM VERIFICATION TEST - 2.0L DIESEL. Refer to **PCM VERIFICATION TEST - 2.0L DIESEL** .

    No

    - Go To 14

14. **CHECK THE VOLTAGE DROP IN THE FUEL PUMP MOTOR FEED CIRCUIT**
    1. Turn the engine off.
    2. Remove the negative lead of the meter from the Fuel Lift Pump harness connector and connect the

lead to a good battery ground.

NOTE: The Fuel Lift Pump Module harness connector should remain connected.

3. Turn the ignition on.
4. With a scan tool, actuate the Fuel Lift Pump control to ON (100%).
5. Measure the voltage of the Fuel Pump Motor Feed circuit at the Fuel Lift Pump harness connector.

Is the voltage reading the same as battery voltage +/- 0.2 Volts?

Yes

- Repair the Fuel Lift Pump Ground circuit for an open circuit or high resistance.
- Perform the PCM VERIFICATION TEST - 2.0L DIESEL. Refer to **PCM VERIFICATION TEST - 2.0L DIESEL** .

No

- Repair the Fuel Pump Motor Feed circuit for an open circuit or high resistance.
- Perform the PCM VERIFICATION TEST - 2.0L DIESEL. Refer to **PCM VERIFICATION TEST - 2.0L DIESEL** .

15. **STATIC FUEL INJECTOR LEAK BACK CHECK**
    1. Turn the ignition off.
    2. Disconnect the fuel return hose fittings from the top of the Fuel Injectors.
    3. Install (special tool #9545, Test Vials, Fuel) to each Fuel Injector.
    4. Crank the engine for at least 10 seconds.

NOTE: It may be necessary to do this two or three times to collect a good sample for comparison.

5. Turn the ignition off.
6. Compare the quantity of fuel collected in each vial.

NOTE: There should be very minimal difference in the amount of fuel collected for each injector.

Is the quantity of fuel collected for each Fuel Injector approximately the same?

Yes

- Replace the High Pressure Delivery Pump in accordance with the service information. Re-run the test to confirm the repair.

- Perform the PCM VERIFICATION TEST - 2.0L DIESEL. Refer to **PCM VERIFICATION TEST - 2.0L DIESEL** .

No

- Replace any Fuel Injector that had noticeably more fuel leakage than the others. Re-run the test to confirm the repair.
- Perform the PCM VERIFICATION TEST - 2.0L DIESEL. Refer to **PCM VERIFICATION TEST - 2.0L DIESEL** .

16. **DYNAMIC FUEL LEAK BACK CHECK**
    1. Turn the ignition off.
    2. Disconnect the fuel return hose fittings from the top of the Fuel Injectors.
    3. Install (special tool #9545, Test Vials, Fuel) to each Fuel Injector.
    4. Start the engine and allow it to idle for up to 30 seconds to collect a good sample.
    5. Stop the engine.
    6. Measure the quantity of fuel collected in each measuring bottle.

NOTE: **There should be very minimal difference in the amount of fuel collected for each injector.**

Is the quantity of fuel collected for each Fuel Injector approximately the same?

Yes

- Using the wiring diagram as a guide, check the resistance of the Fuel Quantity Solenoid circuits between the Fuel Quantity Solenoid and the PCM. Replace the High Pressure Delivery Pump in accordance with the service information. Re-run the test to confirm the repair.
- Perform the PCM VERIFICATION TEST - 2.0L DIESEL. Refer to **PCM VERIFICATION TEST - 2.0L DIESEL** .

No

- Replace any Fuel Injector that had noticeably more fuel leakage than the others. Re-run the test to confirm the repair.
- Perform the PCM VERIFICATION TEST - 2.0L DIESEL. Refer to **PCM VERIFICATION TEST - 2.0L DIESEL** .

2014 ENGINE PERFORMANCE

Driveability - Gas - Non-DTC Based Diagnostics - Cherokee

DIAGNOSIS AND TESTING

CHECKING THE CHARGING SYSTEM OPERATION

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 1: Generator/Battery Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

DIAGNOSTIC TEST

1. **GENERATOR FULL FIELD TEST**

NOTE: Diagnose and repair any generator sense or field control circuit DTCs before proceeding with this test.

1. Start the engine and allow it to reach operating temperature.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.

2. With the scan tool, perform the Generator Full Field test. Follow the instructions displayed on the scan tool.
3. Monitor the system (battery) voltage and the generator sense voltage on the scan tool while performing the test.

NOTE: With the engine running, the difference between the system (battery) voltage and the generator sense voltage should be below 2 Volts.

NOTE: With the generator field fully actuated, the system (battery) voltage should be above 14.0 volts.

NOTE: With the generator field actuated off, the system (battery) voltage should be below 13.0 volts, and eventually drop as battery load is increased.

Did the system voltage change as described above during the Generator Full Field test?

Yes

- Test complete.

No

- Go To 2

2. **CHARGING SYSTEM INSPECTION**
   1. Inspect and test the battery in accordance with the Service Information.
   2. Inspect the generator drive belt for proper alignment and adjustment.

3. Inspect the vehicle for aftermarket accessories that may exceed the generator system output.
4. Inspect the fuses in the PDC. If an open fuse is found, use the wire diagram/schematics as a guide and inspect the wiring and connectors for a damaged or shorted circuit.

   Were any problems found?

   Yes

   - Repair as necessary.

   No

   - Go To 3

3. **BATTERY POSITIVE (+) CIRCUIT HIGH RESISTANCE**

NOTE: **Make sure all testing equipment and cables are clear of any engine parts before starting the engine.**

1. Start the engine.

   WARNING: **When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.**

2. Measure the voltage between the B (+) Terminal at the Generator and the Battery Positive (+) Post.

   Is the voltage below 0.25 volt?

   Yes

   - Go To 4

   No

   - Repair the battery positive (+) circuit between the generator and battery for high resistance.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to the appropriate Diagnosis & Testing article in Engine Performance .

4. **GENERATOR CASE GROUND HIGH RESISTANCE**

NOTE: **Make sure all testing equipment and cables are clear of any engine parts before starting the engine.**

1. Start the engine.

2. Measure the voltage between the Generator case and the Battery Negative (-) post.

   Is the voltage below 0.25 volt?

   Yes

   - Go To 5

   No

   - Repair the Generator Case ground for high resistance.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to the appropriate Diagnosis & Testing article in Engine Performance .

5. **(A209) FUSED B(+) CIRCUIT HIGH RESISTANCE**
   1. Turn the ignition off.

      CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the GPEC Diagnostic Adaptor to perform the diagnosis.

   2. Disconnect the PCM C1 harness connector and connect the (special tool #10436, Adapter, GPEC Diagnostic).
   3. Using a voltmeter, perform a voltage drop test by probing the battery positive (+) terminal and the PCM C1 harness connector. Make sure the voltmeter leads are connected so that positive polarity is displayed on the voltmeter.
   4. Start the engine.

      Is the voltage below 0.25 volt?

      Yes

      - Go To 6

      No

      - Repair the (A209) Fused B(+) circuit(s) for high resistance.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to the appropriate Diagnosis & Testing article in Engine Performance .

6. **(A804) GENERATOR SENSE CIRCUIT HIGH RESISTANCE**
   1. Turn the ignition off.

      CAUTION: Do not probe the PCM harness connectors. Probing the PCM

harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the GPEC Diagnostic Adaptor to perform the diagnosis.

2. Disconnect the PCM C2 harness connector and connect the (special tool #10436, Adapter, GPEC Diagnostic).
3. Using a voltmeter, perform a voltage drop test by probing the (A804) Generator Sense circuit at the Generator harness connector and the PCM C2 harness connector. Make sure the voltmeter leads are connected so that positive polarity is displayed on the voltmeter.
4. Start the engine.

   Is the voltage below 0.25 volt?

   Yes

   - Go To 7

   No

   - Repair the (A804) Generator Sense circuit for high resistance.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to the appropriate Diagnosis & Testing article in Engine Performance .

7. **GENERATOR**
   1. Turn the ignition off.
   2. Connect a 12 volt test light between ground and the (K20) Generator Field Control circuit in the C2 Generator harness connector.
   3. Turn the ignition on.
   4. With the scan tool, actuate the Alternator Field Control State to toggle.

   NOTE: The test light should toggle on and off with the actuation.

   NOTE: If a DTC is active, the actuation test may not be allowed by the PCM. If may be necessary to clear DTCs before starting the actuation.

   Does the test light illuminate on and off with the actuation?

   Yes

   - Replace the Generator in accordance with the service information.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to the appropriate Diagnosis & Testing article in Engine Performance .

   No

- Go To 8

8. **CHECK THE (K20) GENERATOR FIELD CONTROL CIRCUIT FOR A SHORT TO VOLTAGE**
   1. Turn the ignition on.
   2. Measure the voltage of the (K20) Generator Field Control circuit in the C2 Generator harness connector.

      Is there any voltage present?

      Yes

      - Repair the (K20) Gen Field Control circuit for a short to voltage.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to the appropriate Diagnosis & Testing article in Engine Performance .

      No

      - Go To 9
9. **CHECK THE (K20) GENERATOR FIELD CONTROL CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Measure the resistance between ground and the (K20) Generator Field Control circuit in the C2 Generator harness connector.

      Is the resistance above 10k Ohms?

      Yes

      - Go To 10

      No

      - Repair the (K20) Gen Field Control circuit for a short to ground.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to the appropriate Diagnosis & Testing article in Engine Performance .
10. **CHECK THE (K20) GENERATOR FIELD CONTROL CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
    1. Measure the resistance of the (K20) Generator Field Control circuit between the C2 Generator harness connector and the C2 PCM harness connector.

       Is the resistance below 5.0 Ohms?

       Yes

       - Go To 11

No

- Repair the (K20) Generator Field Control circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to the appropriate Diagnosis & Testing article in Engine Performance .

11. **CHECK THE PCM POWER AND GROUND CIRCUITS**
    1. Inspect the PCM power and ground circuits.

    Were any problems found?

    Yes

    - Repair the PCM power and ground circuit(s) as necessary.
    - Perform the POWERTRAIN VERIFICATION TEST. Refer to the appropriate Diagnosis & Testing article in Engine Performance .

    No

    - Go To 12

12. **POWERTRAIN CONTROL MODULE (PCM)**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Generator and the Powertrain Control Module (PCM).
    2. Look for any chafed, pierced, pinched, or partially broken wires.
    3. Look for broken, bent, pushed out or corroded terminals.
    4. Perform any Technical Service Bulletins that may apply.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the POWERTRAIN VERIFICATION TEST. Refer to the appropriate Diagnosis & Testing article in Engine Performance .

    No

    - Replace and program the Powertrain Control Module (PCM) in accordance with the service information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
    - Perform the POWERTRAIN VERIFICATION TEST. Refer to the appropriate Diagnosis & Testing article in Engine Performance .

CHECKING THE ENGINE MECHANICAL SYSTEM

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

DIAGNOSTIC TEST

CHECKING THE ENGINE MECHANICAL SYSTEM

1. Turn the ignition off.
2. Check for any of the following conditions/mechanical problems:
   - ENGINE VACUUM - must be at least 13 inches in neutral
   - ENGINE VALVE TIMING - must be within specifications
   - ENGINE COMPRESSION - must be within specifications
   - CYLINDER LEAKAGE TEST - must be within specifications
   - ENGINE EXHAUST SYSTEM - must be free of any restrictions or leaks
   - ENGINE PCV SYSTEM - must flow freely
   - TORQUE CONVERTER STALL SPEED - must be within specifications
   - POWER BRAKE BOOSTER - no internal vacuum leaks
   - FUEL - must be free of contamination
   - VALVE SPRINGS - cannot be weak or broken
   - CAM LOBES - must not be worn excessively
   - CAM SHAFTS - must not be worn or have excessive end play

   Are there any engine mechanical problems?

   Yes

   - Repair as necessary in accordance with the Service Information.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to the appropriate Diagnosis & Testing article in Engine Performance .

   No

   - Test Complete.

CHECKING THE EXHAUST SYSTEM FOR LEAKS

CHECKING THE EXHAUST SYSTEM FOR LEAKS

YouTube	A multimedia supplement to the instructions contained in this article is available. To view the multimedia example of the condition described go to; **http://www.youtube.com/user/Mitchell1Tips** **then type "A00641515.vid1" into the "Search Channel" box.**

DIAGNOSTIC TEST

CHECKING THE EXHAUST SYSTEM FOR LEAKS

1. Turn the ignition off.
2. Raise the vehicle in accordance with the service information.

WARNING: The normal operating temperature of the exhaust system is very high. Never work around or attempt to service any part of the exhaust system until it has cooled. Special care should be taken when working near the catalytic converter. The temperature of the converter rises to a high level after a short period of engine operating time.

3. Connect Exhaust Cone (special tool #8404-ECT, Exhaust Cone, Truck) to Air Pressure Regulator (with hose) W-18-MIL-1146AS.

CAUTION: The air pressure must not exceed 27.6 kPa (4 psi), otherwise engine damage can occur.

4. Attach shop air to the air pressure regulator.
5. Adjust the Air Pressure Regulator to 27.6 kPa (4 psi)
6. Insert the exhaust cone into the vehicle tail pipe.
7. If the vehicle is equipped with dual exhaust. Use the (special tool #8404-ECT, Exhaust Cone, Truck) with equipped attached plug, plug one side of the dual exhaust pipe. Pressurize the other as described above.
8. Apply Mopar® Air Leak Detector PN 05191804AA (or an equivalent leak finder liquid) to the following areas:
   - All welded joints from the exhaust manifold to 45.72 cm (18 inches) behind the downstream O2 Sensor
   - O2 Sensor seal points
   - O2 Sensor boss welds
   - Flange/joint connection(s)
   - Exhaust manifold to cylinder head connection(s)
   - EGR solenoid gasket base and tube seal points (if equipped)
9. Watch for the Mopar® Air Leak Detector PN 05191804AA (or the equivalent leak finder liquid) to bubble.
10. Use the following definitions to help determine if system or component repair/replacement is necessary:
    - **Type 1 Leak** is defined as a leak where very small foam like bubbles 1 mm (0.04 of an inch) or less appear. Any Type 1 or greater leaks found in welded joints, O2 sensor seal points or O2 sensor boss welds must be repaired or the component must be replaced.
    - **Type 2 Leak** is defined as a leak where larger bubbles pea size, 8 mm (0.3 of an inch) or greater appear. Any Type 2 or greater leaks found in flange or joint connections, exhaust manifold to cylinder head connections, or EGR gasket and tube seal points must be repaired or the components must be replaced.

Leak Location	Repair required if results at 27.6 kPa (4 psi) reveal bubble size:
Welded joints	Type 1, 1 mm (0.04 of an inch) or greater
O2 Sensor seal points	Type 1, 1 mm (0.04 of an inch) or greater
O2 Sensor boss welds	Type 1, 1 mm (0.04 of an inch) or greater
Flange/joint connections	Type 2, 8 mm (0.3 of an inch) or greater
Exhaust Manifold to cylinder head connections	Type 2, 8 mm (0.3 of an inch) or greater
EGR gasket and tube seal points	Type 2, 8 mm (0.3 of an inch) or greater

11. If a leak is found that matches the above definition, repair or replace the component as necessary.
12. Once the repair is complete, repeat the procedure to verify that all leaks have been repaired.

Were any exhaust leaks found?

Yes

- Repair or replace the leaking exhaust parts as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to the appropriate Diagnosis & Testing article in Engine Performance .

No

- Test complete.

CHECKING THE FUEL DELIVERY SYSTEM (HARD START)

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

POSSIBLE CAUSES

Possible Causes
FUEL DELIVERY SYSTEM LEAKING OR DAMAGED
RESTRICTED FUEL SUPPLY LINE
FUEL PUMP INLET STRAINER PLUGGED
FUEL PUMP CONTROL OUTPUT CIRCUIT OPEN
FUEL INJECTOR(S)
FUEL PUMP MODULE

WARNING: **Follow these safety precautions to reduce the risk of fire and possible serious or fatal injury when performing this test procedure.**

- **Fuel or fuel vapors are highly flammable. A fire could occur if an ignition source is present. Do not expose the fuel or the test equipment used in this procedure to open flames or sparks.**

- **Inhalation of fuel vapors could lead to disorientation and personal injury. Keep the service area well ventilated, or perform this test procedure in an area where there is a building exhaust removal system.**
- **Relieve fuel system pressure before servicing fuel system components.**
- **Use extreme caution when connecting and disconnecting fuel lines.**
- **Considerable fuel leakage may occur when servicing the fuel system. Wear protective eye wear and clothing to protect from fuel splash, and take suitable fuel containment measures.**
- **Wrap a shop towel around the fuel pressure gauge connection to absorb fuel leakage that occurs when connecting the test equipment. Place the towel in an approved container when complete.**
- **Never store fuel in an open container due to the possibility of fire or explosion. Have a dry chemical (Class B) fire extinguisher nearby.**

DIAGNOSTIC TEST

1. **CHECK THE FUEL DELIVERY SYSTEM FOR LEAKS AND DAMAGE**

   WARNING: **The fuel system is under a constant pressure (even with the engine off). Before testing or servicing any fuel system hose, fitting, or line, the fuel system pressure must be released. Failure to follow these instructions can result in possible serious or fatal injury.**

   1. Visually and physically inspect the fuel delivery system for external leaks and damage.

      Is the system leaking or damaged?

      Yes

      - Repair or replace as necessary.
      - Perform the PCM VERIFICATION TEST. Refer to the appropriate Diagnosis & Testing article in Engine Performance .

      No

      - Go To 2
2. **CHECK FUEL PUMP OPERATION**
   1. Ignition on, engine not running.
   2. With a scan tool, actuate the Fuel System test.

NOTE: It may be necessary to use a mechanics stethoscope in the next step.

3. Listen for fuel pump operation at the Fuel Tank.

   Does the Fuel Pump operate?

   Yes

   - Go To 3

   No

   - Check the power and ground circuits to the Fuel Pump Module assembly. If the circuits test good, replace the Fuel Pump Module assembly.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to the appropriate Diagnosis & Testing article in Engine Performance .

3. **INSTALL APPROPRIATE FUEL LINE ADAPTERS/FITTING FROM THE GAS AND DIESEL FUEL PRESSURE/DECAY TESTER 8978A**

Fig. 2: Fuel Line Adapters/Fitting
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.

WARNING: The fuel system is under a constant pressure (even with the engine off). Before testing or servicing any fuel system hose,

fitting, or line, the fuel system pressure must be released. Failure to follow these instructions can result in possible serious or fatal injury.

2. Release the fuel system pressure. Refer to **STANDARD PROCEDURE** .
3. Disconnect the rail fuel supply line connector between the fuel supply line and the fuel rail. Refer to **STANDARD PROCEDURE** .
4. Install the appropriate Fuel Line Adapters/Fitting from the Gas and Diesel Fuel Pressure/Decay Tester (special tool #8978A, Decay Tool, Fuel).

Proceed

- Go To 4

4. **INSTALL THE FUEL PRESSURE GAUGE ASSEMBLY**

Fig. 3: Fuel Pressure Gauge Assembly
Courtesy of CHRYSLER GROUP, LLC

1. Connect the (special tool #8978A, Decay Tool, Fuel), with the Fuel Inlet Hose (1) toward the Fuel tank side and the Fuel Outlet Hose (2) toward the fuel rail side of the system using the Fuel Line Adapters/Fitting as needed.
2. Connect special tool Drain Extension Hose 535680 (3) to the Fuel Pressure Gauge Assembly Drain Hose (5).
3. Connect Reservoir Assembly 534960 (4) to Drain Extension Hose 535680 (3).

WARNING: **To reduce the risk of fire and possible serious or fatal injury, place Reservoir Assembly 534960 (4) on the floor and out of the way so that it is not a trip hazard.**

Proceed

- Go To 5

5. **CHECK THE FUEL PRESSURE**

Fig. 4: Identifying Fuel System Isolation Valve & Flow Test Valves
Courtesy of CHRYSLER GROUP, LLC

1. Perform the following procedure to purge air from the system:
   - Open the Fuel System Isolation Valve (1).
   - Close the Flow Test Valve (2).
   - Ignition on, engine not running.
   - With the scan tool, actuate the Fuel Pump.
   - Open the Flow Test Valve (2) for 10 seconds, then close the Valve.
   - **CAUTION: Stop All Actuations.**
   - Turn the ignition off.
   - Disconnect, empty and then reconnect the Reservoir Assembly.
2. Turn the ignition on.
3. With the scan tool, actuate the Fuel Pump.

NOTE: On vehicles equipped with a PWM Fuel Pump, actuate the Fuel Pump at or above 60%.

4. Read the Fuel Pressure Gauge (3) and record the reading.

NOTE: The fuel pressure specification for all engines, including a Non SRT-4

is 407 kPa +/- 34 kPa (59 psi +/- 5 psi). SRT-4 fuel pressure specification is 552 kPa +/- 34 kPa (80 psi +/- 5 psi).

Choose a conclusion that best matches your fuel pressure reading.

Below Specification

- Go To 10

Within Specification

- Go To 6

Above Specification

- Replace the fuel filter/fuel pressure regulator.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to the appropriate Diagnosis & Testing article in Engine Performance .

CAUTION: Stop all actuation tests before proceeding.

6. **CHECK THE FUEL DELIVERY SYSTEM OUTPUT**

Fig. 5: Checking Fuel Delivery System Output
Courtesy of CHRYSLER GROUP, LLC

WARNING: The fuel system is under a constant pressure (even with the engine off). Before testing or servicing any fuel system hose, fitting, or line, the fuel system pressure must be released. Failure to follow these instructions can result in possible serious or fatal injury.

1. With the scan tool, continue to actuate the fuel pump.
2. Open the Flow Test Valve (1) for 20 seconds, then close the Valve.

CAUTION: Stop all actuation tests before proceeding.

3. Turn the ignition off.
4. Measure the amount of fuel in the Reservoir Assembly (2). The fuel output specification is ml/s X 20 seconds = fuel flow in ml.

FUEL FLOW		
ENGINE	**ml/s**	**ml per 20 Seconds**
4 Cylinder and 6 Cylinder	20.8333	417
8 Cylinder	38.88889	778
SRT-4	50	1000
10 cylinder	55.5	1110

Does the amount of fuel in the reservoir meet or exceed the specification?

Yes

- Go To 7

No

- Go To 8

7. **CHECK THE FUEL DELIVERY SYSTEM FOR LEAK DOWN**

Fig. 6: Fuel Inlet And Fuel Outlet Pressure Gauges
Courtesy of CHRYSLER GROUP, LLC

WARNING: The fuel system is under a constant pressure (even with the engine off). Before testing or servicing any fuel system hose, fitting, or line, the fuel system pressure must be released. Failure to follow these instructions can result in possible serious or fatal injury.

1. Ignition on, engine not running.
2. With the scan tool, actuate the fuel pump.
3. Close the Fuel System Isolation Valve (1).

CAUTION: Stop all actuation tests before proceeding.

4. Turn the ignition off and then wait five minutes before proceeding.
5. Read the Fuel Inlet (2) and Fuel Outlet (3) Pressure Gauges. The pressure should not drop more than 10 psi on either gauge.

   Does the fuel pressure drop more than 10 psi?

   Yes - On Fuel Inlet Gauge (2)

   - Replace the Fuel Pump Module.
   - Perform the PCM VERIFICATION TEST. Refer to the appropriate Diagnosis & Testing

article in Engine Performance .

Yes - On Fuel Outlet Gauge (3)

- Replace the leaking Fuel Injector(s).
- Perform the PCM VERIFICATION TEST. Refer to the appropriate Diagnosis & Testing article in Engine Performance .

No

- If directed here by another test, return to that test. Otherwise, test complete.

8. **CHECK FOR RESTRICTED FUEL SUPPLY LINE**

Fig. 7: Checking Fuel Delivery System Output
Courtesy of CHRYSLER GROUP, LLC

WARNING: **The fuel system is under a constant pressure even with the engine off. Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released.**

1. Turn the ignition off.
2. Disconnect the Fuel Pressure Decay Tester.
3. Raise the vehicle on a hoist, and disconnect the fuel pressure line at the Fuel Pump Module.
4. Install the Fuel Pressure Decay Tester between the fuel supply line and the Fuel Pump Module.
5. Again, purge air from the system.
6. Ignition on, engine not running.
7. With the scan tool, actuate the Fuel Pump.
8. Open the Flow Test Valve (1) for 20 seconds, then close the Valve.

CAUTION: Stop all actuation tests before proceeding.

9. Turn the ignition off.
10. Measure the amount of fuel in the Reservoir Assembly (2). The fuel output specification is ml/s X 20 seconds = fuel flow in ml.

FUEL FLOW		
ENGINE	**ml/s**	**ml per 20 Seconds**
4 Cylinder and 6 Cylinder	20.8333	417
8 Cylinder	38.88889	778
SRT-4	50	1000
10 cylinder	55.5	1110

Does the amount of fuel in the reservoir meet or exceed the specification?

Yes

- Repair/replace fuel supply line as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to the appropriate Diagnosis & Testing article in Engine Performance .

No

- Go To 9

CAUTION: Stop all actuation tests before proceeding.

9. **CHECKING THE FUEL INLET STRAINER**

WARNING: The fuel system is under a constant pressure (even with the engine off). Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released. Failure to follow these instructions can result in possible serious or fatal injury.

1. Turn the ignition off.
2. Remove the Fuel Pump Module and inspect the Fuel Inlet Strainer.

Is the Fuel Inlet Strainer plugged?

Yes

- Replace the Fuel Pump Inlet Strainer.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to the appropriate Diagnosis & Testing article in Engine Performance .

No

- Replace the Fuel Pump Module.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to the appropriate Diagnosis & Testing article in Engine Performance .

10. **CHECK FOR RESTRICTED FUEL SUPPLY LINE**

Fig. 8: Identifying Fuel System Isolation Valve & Flow Test Valves
Courtesy of CHRYSLER GROUP, LLC

WARNING: The fuel system is under a constant pressure even with the engine off. Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released.

1. Turn the ignition off.
2. Disconnect the Fuel Pressure Decay Tool.
3. Raise the vehicle on a hoist, and disconnect the fuel pressure line at the fuel pump module.
4. Install the Fuel Pressure Decay Tool between the fuel supply line and the fuel pump module.
5. Again, purge air from the system.
6. Turn the ignition on.
7. With the scan tool, actuate the Fuel Pump.

NOTE: On vehicles equipped with a PWM Fuel Pump, actuate the Fuel Pump at or above 60%.

8. Read the Fuel Pressure Gauge (3) and record the reading.

NOTE: The fuel pressure specification for all engines, including a Non SRT-4 is 407 kPa +/- 34 kPa (59 psi +/- 5 psi). SRT-4 fuel pressure specification is 552 kPa +/- 34 kPa (80 psi +/- 5 psi).

Is the fuel pressure now within specification?

Yes

- Repair/replace fuel supply line as necessary.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to the appropriate Diagnosis & Testing article in Engine Performance .

No

- Go To 11

CAUTION: Stop all actuation tests before proceeding.

11. **CHECKING FUEL INLET STRAINER**

WARNING: The fuel system is under a constant pressure (even with the engine off). Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released. Failure to follow these instructions can result in possible serious or fatal injury.

1. Turn the ignition off.
2. Remove the Fuel Pump Module and inspect the Fuel Inlet Strainer.

Is the Fuel Inlet Strainer plugged?

Yes

- Replace the Fuel Pump Inlet Strainer.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to the appropriate Diagnosis & Testing article in Engine Performance .

No

- Replace the Fuel Pump Module.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to the appropriate Diagnosis & Testing article in Engine Performance .

CHECKING THE MAP SENSOR OPERATION

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

DIAGNOSTIC TEST

1. **MAP SENSOR WIRING OR CONNECTORS**

   NOTE: Diagnose and repair any MAP Sensor circuit DTCs before proceeding with this test.

   NOTE: Diagnose and repair any sensor supply or system voltage DTCs before proceeding with this test.

   1. Turn the ignition off.
   2. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the MAP Sensor and the PCM.
   3. Look for any chafed, pierced, pinched, or partially broken wires.
   4. Look for broken, bent, pushed out or corroded terminals.
   5. Turn the ignition on.
   6. Monitor the scan tool data relative to the sensor and wiggle test the wiring and connectors.
   7. Look for the data to change or for a DTC to set during the wiggle test. If necessary, check each sensor circuit for high resistance or a shorted condition.

   Were any problems found?

   Yes

   - Repair as necessary in accordance with the Service Information.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to the appropriate Diagnosis & Testing article in Engine Performance .

   No

   - Go To 2

2. **MAP VACUUM/BAROMETRIC PRESSURE**
   1. With a scan tool, read the Barometric Pressure.

   NOTE: The Barometric Pressure should be approximately equal to the actual barometric pressure. If necessary, compare the Barometric Pressure value of the tested vehicle to the value of a known good vehicle of a similar make and model.

2. Connect a vacuum gauge to a manifold vacuum source.
3. Start the engine.

NOTE: **If the engine will not idle, maintain a constant RPM above idle.**

WARNING: **When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in possible serious or fatal injury.**

4. With the scan tool, read the MAP Sensor value.

NOTE: **The scan tool reading for MAP vacuum should be within 1" of the vacuum gauge reading.**

Were any problems found?

Yes

- Go To 4

No

- Go To 3

3. **CHECK THE MAP SENSOR VOLTAGE**
   1. With the scan tool, monitor the MAP Sensor signal voltage.
   2. With the engine idling in neutral or park, snap the throttle.

NOTE: **The MAP Sensor signal voltage should change from below 2.0 volts at idle to above 3.5 volts at wide open throttle.**

Were any problems found?

Yes

- Go To 4

No

- Test complete.

4. **CHECK THE 5-VOLT SUPPLY CIRCUIT FOR HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Using a voltmeter, perform a voltage drop test on the MAP Sensor 5-Volt Supply circuit between

the MAP Sensor harness connector and the PCM harness connector. Make sure the voltmeter leads are connected so that positive polarity is displayed on the voltmeter.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in possible serious or fatal injury.

3. Start the engine.

   Is the voltage reading below 0.1 volt?

   Yes

   - Go To 5

   No

   - Repair the 5-Volt Supply circuit for excessive resistance.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to the appropriate Diagnosis & Testing article in Engine Performance .

5. **CHECK THE MAP SENSOR SIGNAL CIRCUIT FOR HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Using a voltmeter, perform a voltage drop test on the MAP Sensor Signal circuit between the MAP Sensor harness connector and the PCM harness connector. Make sure the voltmeter leads are connected so that positive polarity is displayed on the voltmeter.

      WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in possible serious or fatal injury.

   3. Start the engine.

      Is the voltage reading below 0.1 volt?

      Yes

      - Go To 6

      No

      - Repair the MAP Sensor Signal circuit for excessive resistance.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to the appropriate Diagnosis & Testing article in Engine Performance .

6. **CHECK THE MAP SENSOR GROUND CIRCUIT FOR HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Using a voltmeter, perform a voltage drop test on the MAP Sensor Ground circuit between the MAP Sensor harness connector and the PCM harness connector. Make sure the voltmeter leads are connected so that positive polarity is displayed on the voltmeter.

      WARNING: **When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in possible serious or fatal injury.**

   3. Start the engine.

      Is the voltage below 0.1 volt?

      Yes

      - Go To 7

      No

      - Repair the MAP Sensor Ground circuit for excessive resistance.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to the appropriate Diagnosis & Testing article in Engine Performance .

7. **MAP SENSOR**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the MAP Sensor and the Powertrain Control Module (PCM).
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Perform any Technical Service Bulletins that may apply.

      Were any problems found?

      Yes

      - Repair as necessary.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to the appropriate Diagnosis & Testing article in Engine Performance .

      No

      - Replace the MAP Sensor in accordance with the service information. Refer to **SENSOR, MANIFOLD AIR PRESSURE (MAP), REMOVAL** .

- Perform the POWERTRAIN VERIFICATION TEST. Refer to the appropriate Diagnosis & Testing article in Engine Performance .

CHECKING THE PCM POWER AND GROUND CIRCUITS

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

DIAGNOSTIC TEST

1. **PCM WIRING OR CONNECTORS**
   1. Turn the ignition off.
   2. Using the wiring diagram/schematic as a guide, inspect the wiring and each connector at the PCM.
   3. Look for any chafed, pierced, pinched or partially broken wires.
   4. Look for broken, bent, pushed out or corroded terminals.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to the appropriate Diagnosis & Testing article in Engine Performance .

   No

   - Go To 2
2. **CHECK THE PCM GROUND CIRCUITS**
   1. Turn the ignition off.
   2. Using a 12 volt test light connected to 12 volts, probe the PCM ground circuits.
   3. Wiggle test the wiring during the test to check for an intermittent open in the circuit.

   NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

   Is the test light illuminated and bright?

   Yes

   - Go To 3

   No

   - Repair the PCM ground circuit(s) for an open or high resistance.

- Perform the POWERTRAIN VERIFICATION TEST. Refer to the appropriate Diagnosis & Testing article in Engine Performance .

3. **CHECK THE PCM FUSED B+ CIRCUIT**
   1. Using a 12 volt test light connected to ground, probe the PCM Fused B+ circuit.
   2. Wiggle test the wiring during the test to check for an intermittent open in the circuit.

   NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

   Is the test light illuminated and bright?

   Yes

   - Go To 4

   No

   - Repair the PCM Fused B+ circuit for an open or high resistance.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to the appropriate Diagnosis & Testing article in Engine Performance .

4. **CHECK THE PCM FUSED IGNITION SWITCH CIRCUITS**
   1. Turn the ignition on.
   2. Using a 12 volt test light connected to ground, probe the PCM Fused Ignition Switch circuit.
   3. Check the circuit with the ignition off, ignition on/engine not running position and during cranking.
   4. Wiggle test the wiring during the test to check for an intermittent open in the circuit.

   NOTE: The test light should be illuminated and bright with the ignition on and during cranking. The test light should not be illuminated with the ignition off. Compare the brightness to that of a direct connection to the battery.

   Is the test light illuminated as described above?

   Yes

   - Test complete.

   No

   - Repair the PCM Fused Ignition Switch circuit for as necessary.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to the appropriate Diagnosis & Testing article in Engine Performance .

ENGINE CRANKS BUT DOES NOT START

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

POSSIBLE CAUSES

Possible Causes
5-VOLT SUPPLY CIRCUIT OPEN OR SHORTED
UNDERCHARGED BATTERY
POWERTRAIN POWER AND GROUND CIRCUIT(S) OPEN OR HIGH RESISTANCE
POWERTRAIN FUSES OPEN
FUEL DELIVERY SYSTEM
FUEL CONTAMINATION
INADEQUATE SPARK
ENGINE MECHANICAL PROBLEM

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to the appropriate Diagnosis & Testing article in Engine Performance.

DIAGNOSTIC TEST

1. **UNDERCHARGED BATTERY**

   NOTE: Diagnose any 5-Volt Supply DTCs before continuing.

   1. Test the Battery in accordance with the service information.

      Were any problems found?

      Yes

      - Charge or replace the Battery as necessary and retest.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to the appropriate Diagnosis & Testing article in Engine Performance .

      No

      - Go To 2

2. **PCM POWER OR GROUND CIRCUIT OPEN OR HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Disconnect the PCM harness connector(s).
   3. Using a 12-volt test light, check all of the PCM B+, ignition feed and ground circuits.

NOTE: The test light must be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright when checking each of the PCM power and ground circuits?

Yes

- Repair the PCM power or ground circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to the appropriate Diagnosis & Testing article in Engine Performance .

No

- Go To 3

3. **OPEN FUSE(S)**
   1. Inspect all fuses. If any open fuses are found, check the related circuit(s) for a short to ground or high resistance.

      Were any problems found?

      Yes

      - Repair as necessary.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to the appropriate Diagnosis & Testing article in Engine Performance .

      No

      - Go To 4

4. **CHECKING THE FUEL DELIVERY SYSTEM**

NOTE: Verify that the fuel tank is not empty before continuing.

   1. Perform the CHECKING THE FUEL DELIVERY SYSTEM test procedure. Refer to **CHECKING THE FUEL DELIVERY SYSTEM (HARD START)** .

      Were any problems found?

      Yes

      - Repair as necessary in accordance with the service information.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to the appropriate Diagnosis & Testing article in Engine Performance .

No

- Go To 5

5. **FUEL CONTAMINATION**
   1. Check the fuel system for contamination in accordance with the service information. .

      Was any evidence of fuel contamination found?

      Yes

      - Clean and repair the fuel system as necessary in accordance with the service information.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to the appropriate Diagnosis & Testing article in Engine Performance .

      No

      - Go To 6

6. **CHECKING THE IGNITION COIL OPERATION**
   1. Verify that the ignition system is operating properly.

      Were any problems found?

      Yes

      - Repair as necessary in accordance with the service information.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to the appropriate Diagnosis & Testing article in Engine Performance .

      No

      - Go To 7

7. **CHECKING THE ENGINE MECHANICAL SYSTEM**
   1. Perform the diagnostic procedure for CHECKING THE ENGINE MECHANICAL SYSTEM. Refer to **CHECKING THE ENGINE MECHANICAL SYSTEM** .

      Were any problems found?

      Yes

      - Repair as necessary in accordance with the service information.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to the appropriate Diagnosis & Testing article in Engine Performance .

      No

- Test complete. Perform any Technical Service Bulletins that may apply.

2014 ENGINE PERFORMANCE

Emissions Control - Cherokee

DESCRIPTION

VEHICLE EMISSION CONTROL INFORMATION LABEL

All models have a Vehicle Emission Control Information (VECI) Label. Chrysler permanently attaches the label in the engine compartment. It cannot be removed without defacing information and destroying the label.

The label contains the vehicle's model year and what regulations the vehicle conforms to also if the vehicle is OBD II compliant.

TRIP DEFINITION

A "Trip" means vehicle operation (following an engine-off period) of duration and driving mode such that all components and systems are monitored at least once by the diagnostic system. The monitors must successfully pass before the PCM can verify that a previously malfunctioning component is meeting the normal operating conditions of that component. For misfire or fuel system malfunction, the MIL may be extinguished if the fault does not recur when monitored during three subsequent sequential driving cycles in which conditions are similar to those under which the malfunction was first determined.

Anytime the MIL is illuminated, a DTC is stored. The DTC can self erase only after the MIL has been extinguished. Once the MIL is extinguished, the PCM must pass the diagnostic test for the most recent DTC for 40 warm-up cycles (80 warm-up cycles for the Fuel System Monitor and the Misfire Monitor). A warm-up cycle can best be described by the following:

- The engine must be running
- A rise of 4.4° C (40°F) in engine temperature must occur from the time when the engine was started
- Engine coolant temperature must crossover 71° C (160°F)
- A "driving cycle" that consists of engine start up and engine shut off.

Once the above conditions occur, the PCM is considered to have passed a warm-up cycle. Due to the conditions required to extinguish the MIL and erase the DTC, it is most important that after a repair has been made, all DTC's be erased and the repair verified by running 1-good trip.

NON-MONITORED CIRCUITS

FUEL-PRESSURE

The PCM does not monitor all circuits, systems and conditions that could have malfunctions causing driveability problems. However, problems with these systems may cause the PCM to store diagnostic trouble codes for other systems or components. For example, a fuel pressure problem will not register a fault directly, but could cause a rich/lean condition or misfire. This could cause the PCM to store an oxygen sensor or misfire diagnostic trouble code.

The major non-monitored circuits are listed below along with examples of failures modes that do not directly cause the PCM to set a DTC, but for a system that is monitored.

FUEL PRESSURE

The fuel pressure regulator controls fuel system pressure. The PCM cannot detect a clogged fuel pump inlet filter or a pinched fuel supply. However, these could result in a rich or lean condition causing the PCM to store an oxygen sensor, fuel system, or misfire diagnostic trouble code.

SECONDARY IGNITION CIRCUIT

The PCM cannot detect an inoperative ignition coil, fouled or worn spark plugs, ignition cross firing, or open spark plug cables. The misfire will however, increase the oxygen content in the exhaust, deceiving the PCM in to thinking the fuel system is too lean. Also see misfire detection. There are DTC's that can detect misfire and Ionization shorts in the secondary ignition circuit, refer to the appropriate Powertrain Diagnosis and Testing article for more information.

CYLINDER COMPRESSION

The PCM cannot detect uneven, low, or high engine cylinder compression. Low compression lowers O2 content in the exhaust. Leading to fuel system, oxygen sensor, or misfire detection fault.

EXHAUST SYSTEM

The PCM cannot detect a plugged, restricted or leaking exhaust system. It may set a EGR (if equipped) or Fuel system or O2S fault.

FUEL INJECTOR MECHANICAL MALFUNCTIONS

The PCM cannot determine if a fuel injector is clogged, the needle is sticking or if the wrong injector is installed. However, these could result in a rich or lean condition causing the PCM to store a diagnostic trouble code for either misfire, an oxygen sensor, or the fuel system.

EXCESSIVE OIL CONSUMPTION

Although the PCM monitors engine exhaust oxygen content when the system is in closed loop, it cannot determine excessive oil consumption.

THROTTLE BODY AIR FLOW

The PCM cannot detect a clogged or restricted air cleaner inlet or filter element.

VACUUM ASSIST

The PCM cannot detect leaks or restrictions in the vacuum circuits of vacuum assisted engine control system devices. However, these could cause the PCM to store a MAP sensor diagnostic trouble code and cause a high idle condition.

PCM SYSTEM GROUND

The PCM cannot determine a poor system ground. However, one or more diagnostic trouble codes may be generated as a result of this condition. The module should be mounted to the body at all times, including when diagnostics are performed.

PCM CONNECTOR ENGAGEMENT

The PCM may not be able to determine spread or damaged connector pins. However, it might store diagnostic trouble codes as a result of spread connector pins.

MONITORED SYSTEMS

There are new electronic circuit monitors that check fuel, emission, engine and ignition performance. These monitors use information from various sensor circuits to indicate the overall operation of the fuel, engine, ignition and emission systems and thus the emissions performance of the vehicle.

The fuel, engine, ignition and emission systems monitors do not indicate a specific component problem. They do indicate that there is an implied problem within one of the systems and that a specific problem must be diagnosed.

If any of these monitors detect a problem affecting vehicle emissions, the Malfunction Indicator (Check Engine) Lamp will be illuminated. These monitors generate Diagnostic Trouble Codes that can be displayed with the a scan tool.

The following is a list of the system monitors:

- EGR Monitor (if equipped)
- Misfire Monitor
- Fuel System Monitor
- Oxygen Sensor Monitor
- Oxygen Sensor Heater Monitor
- Catalyst Monitor
- Evaporative System Leak Detection Monitor (if equipped)

Following is a description of each system monitor, and its DTC.

Refer to the appropriate Powertrain Diagnosis and Testing article for diagnostic procedures.

OXYGEN SENSOR (O2S) MONITOR

Effective control of exhaust emissions is achieved by an oxygen feedback system. The most important element of the feedback system is the O2S. The O2S is located in the exhaust path. Once it reaches operating temperatures of 300° to 350°C (572° to 662°F), the sensor generates a voltage that is inversely proportional to the amount of oxygen in the exhaust. The information obtained by the sensor is used to calculate the fuel injector pulse width. The PCM is programmed to maintain the optimum air/fuel ratio. At this mixture ratio, the

catalyst works best to remove hydrocarbons (HC), carbon monoxide (CO) and nitrous oxide (NOx) from the exhaust.

The O2S is also the main sensing element for the EGR (if equipped), Catalyst and Fuel Monitors.

The O2S may fail in any or all of the following manners:

- Slow response rate
- Reduced output voltage
- Dynamic shift
- Shorted or open circuits

Response rate is the time required for the sensor to switch from lean to rich once it is exposed to a richer than optimum A/F mixture or vice versa. As the sensor starts malfunctioning, it could take longer to detect the changes in the oxygen content of the exhaust gas.

The output voltage of the O2S ranges from 0 to 1 volt (voltages are offset by 2.5 volts on NGC vehicles). A good sensor can easily generate any output voltage in this range as it is exposed to different concentrations of oxygen. To detect a shift in the A/F mixture (lean or rich), the output voltage has to change beyond a threshold value. A malfunctioning sensor could have difficulty changing beyond the threshold value.

OXYGEN SENSOR HEATER MONITOR

If there is an oxygen sensor (O2S) DTC as well as a O2S heater DTC, the O2S heater fault MUST be repaired first. After the O2S fault is repaired, verify that the heater circuit is operating correctly.

Effective control of exhaust emissions is achieved by an oxygen feedback system. The most important element of the feedback system is the O2S. The O2S is located in the exhaust path. Once it reaches operating temperatures of 300° to 350°C (572 ° to 662°F), the sensor generates a voltage that is inversely proportional to the amount of oxygen in the exhaust. The information obtained by the sensor is used to calculate the fuel injector pulse width. This maintains a 14.7 to 1 Air Fuel (A/F) ratio. At this mixture ratio, the catalyst works best to remove hydrocarbons (HC), carbon monoxide (CO) and nitrogen oxide (NOx) from the exhaust.

The voltage readings taken from the O2S are very temperature sensitive. The readings are not accurate below 300°C (572 °F) Heating of the O2S is done to allow the engine controller to shift to closed loop control as soon as possible. The heating element used to heat the O2S must be tested to ensure that it is heating the sensor properly.

The O2S circuit is monitored for a drop in voltage. The sensor output is used to test the heater by isolating the effect of the heater element on the O2S output voltage from the other effects.

EGR MONITOR (IF EQUIPPED)

The Powertrain Control Module (PCM) performs an on-board diagnostic check of the EGR system.

The EGR monitor is used to test whether the EGR system is operating within specifications. The diagnostic

check activates only during selected engine/driving conditions. When the conditions are met, the EGR is turned off (solenoid energized) and the O2S compensation control is monitored. Turning off the EGR shifts the air fuel (A/F) ratio in the lean direction. The O2S data should indicate an increase in the O2 concentration in the combustion chamber when the exhaust gases are no longer recirculated. While this test does not directly measure the operation of the EGR system, it can be inferred from the shift in the O2S data whether the EGR system is operating correctly. Because the O2S is being used, the O2S test must pass its test before the EGR test. Also looks at EGR linear potentiometer for feedback.

MISFIRE MONITOR

Excessive engine misfire results in increased catalyst temperature and causes an increase in HC emissions. Severe misfires could cause catalyst damage. To prevent catalytic convertor damage, the PCM monitors engine misfire.

The Powertrain Control Module (PCM) monitors for misfire during most engine operating conditions (positive torque) by looking at changes in the crankshaft speed. If a misfire occurs the speed of the crankshaft will vary more than normal.

FUEL SYSTEM MONITOR

To comply with clean air regulations, vehicles are equipped with catalytic converters. These converters reduce the emission of hydrocarbons, oxides of nitrogen and carbon monoxide. The catalyst works best when the air fuel (A/F) ratio is at or near the optimum of 14.7 to 1.

The PCM is programmed to maintain the optimum air/fuel ratio. This is done by making short term corrections in the fuel injector pulse width based on the O2S output. The programmed memory acts as a self calibration tool that the engine controller uses to compensate for variations in engine specifications, sensor tolerances and engine fatigue over the life span of the engine. By monitoring the actual air-fuel ratio with the O2S (short term) and multiplying that with the program long-term (adaptive) memory and comparing that to the limit, it can be determined whether it will pass an emissions test. If a malfunction occurs such that the PCM cannot maintain the optimum A/F ratio, then the MIL will be illuminated.

CATALYST MONITOR

To comply with clean air regulations, vehicles are equipped with catalytic converters. These converters reduce the emission of hydrocarbons, oxides of nitrogen and carbon monoxide.

Normal vehicle miles or engine misfire can cause a catalyst to decay. A meltdown of the ceramic core can cause a reduction of the exhaust passage. This can increase vehicle emissions and deteriorate engine performance, driveability and fuel economy.

The catalyst monitor uses dual oxygen sensors (O2S's) to monitor the efficiency of the converter. The dual O2S's strategy is based on the fact that as a catalyst deteriorates, its oxygen storage capacity and its efficiency are both reduced. By monitoring the oxygen storage capacity of a catalyst, its efficiency can be indirectly calculated. The upstream O2S is used to detect the amount of oxygen in the exhaust gas before the gas enters the catalytic converter. The PCM calculates the A/F mixture from the output of the O2S. A low voltage indicates high oxygen content (lean mixture). A high voltage indicates a low content of oxygen (rich mixture).

When the upstream O2S detects a lean condition, there is an abundance of oxygen in the exhaust gas. A functioning converter would store this oxygen so it can use it for the oxidation of HC and CO. As the converter absorbs the oxygen, there will be a lack of oxygen downstream of the converter. The output of the downstream O2S will indicate limited activity in this condition.

As the converter loses the ability to store oxygen, the condition can be detected from the behavior of the downstream O2S. When the efficiency drops, no chemical reaction takes place. This means the concentration of oxygen will be the same downstream as upstream. The output voltage of the downstream O2S copies the voltage of the upstream sensor. The only difference is a time lag (seen by the PCM) between the switching of the O2S's.

To monitor the system, the number of lean-to-rich switches of upstream and downstream O2S's is counted. The ratio of downstream switches to upstream switches is used to determine whether the catalyst is operating properly. An effective catalyst will have fewer downstream switches than it has upstream switches i.e., a ratio closer to zero. For a totally ineffective catalyst, this ratio will be one-to-one, indicating that no oxidation occurs in the device.

The system must be monitored so that when catalyst efficiency deteriorates and exhaust emissions increase to over the legal limit, the MIL (Check Engine lamp) will be illuminated.

OPERATION

SYSTEM

Fig. 1: Data Link Connector
Courtesy of CHRYSLER GROUP, LLC

The Powertrain Control Module (PCM) monitors many different circuits in the fuel injection, ignition, emission and engine systems. If the PCM senses a problem with a monitored circuit and the fault occurs multiple times enough to indicate an actual problem, it stores a Diagnostic Trouble Code (DTC) in the PCM's memory. If the code applies to a non-emissions related component or system, and the problem is repaired or ceases to exist, the

PCM cancels the code after 40 warmup cycles. Diagnostic trouble codes that affect vehicle emissions will illuminate the Malfunction Indicator Lamp (MIL).

Certain criteria must be met before the PCM stores a DTC in memory. The criteria may be a specific range of engine RPM, engine temperature, and/or input voltage to the PCM.

The PCM might not store a DTC for a monitored circuit even though a malfunction has occurred. This may happen because one of the DTC criteria for the circuit has not been met. **For example** , assume the diagnostic trouble code criteria requires the PCM to monitor the circuit only when the engine operates between 750 and 2000 RPM. Suppose the sensor's output circuit shorts to ground when engine operates above 2400 RPM (resulting in 0 volt input to the PCM). Because the condition happens at an engine speed above the maximum threshold (2000 RPM), the PCM will not store a DTC.

For information on obtaining DTC information, refer to **CONNECTOR, DATA LINK** .

Various diagnostic procedures may actually cause a diagnostic monitor to set a DTC. For instance, pulling a spark plug wire to perform a spark test may set a misfire code. When a repair is completed and verified, use the scan tool to erase all DTC's and extinguish the MIL.

There are several operating conditions for which the PCM monitors and sets DTC's. Refer to **MONITORED SYSTEMS** and **NON-MONITORED CIRCUITS**.

SCAN TOOL STATE DISPLAY TEST MODE

OPERATION

The switch inputs to the Powertrain Control Module (PCM) have two recognized states; HIGH and LOW. For this reason, the PCM cannot recognize the difference between a selected switch position versus an open circuit, a short circuit, or a defective switch. If the State Display screen shows the change from HIGH to LOW or LOW to HIGH, assume the entire switch circuit to the PCM functions properly. From the state display screen, access either State Display Inputs and Outputs or State Display Sensors.

ON-BOARD DIAGNOSTICS

DESCRIPTION

DESCRIPTION

Acronym	Description
ACC	Adaptive Cruise Control
AHBM	Automatic High Beam Module
AHLM	Automatic Headlamp Leveling Module
AGS	Active Grill Shutter
AMP	Amplifier
ASBM	Auxiliary Switch Bank Module

APPS	Accelerator Pedal Position Sensor
AAT	Ambient Air Temperature
ABS	Anti-Lock Brake System
ASBS	Auto Sway Bar System
ASCM	Air Suspension Control Module
ASD	Auto Shut Down
BARO	Barometric
BCM	Body Control Module
CGW	Central Gateway
CKP	Crankshaft Position Sensor
CMP	Camshaft Position Sensor
CMTC	Compass/Mini-Trip Computer
COM	Compass Module
CRVMM	Combined Rear View Mirror Module
CSWM	Comfort Seat Wheel Module
CTM	Convergence Telematics Module
DCHA	Diesel Cabin Heater Assist
DDM	Drivers Door Module
DLC	Data Link Connector
DSBM	Drivers Switch Bank Module
DTC	Diagnostic Trouble Code
DTCM	Drivetrain Control Module
EATX	Electronic Automatic Transaxle
ECT	Engine Coolant Temperature
ECM	Engine Control Module
ECMM	EC Mirror/AHBM
EDM	External Disk Module
EGR	Exhaust Gas Recirculation
EPB	Electronic Park Brake
ETC	Electronic Throttle Control
EPS	Electronic Power Steering
ESL	Electronic Steering Lock
ESM	Electronic Shift Module
ETM	Radio
ETM	Entertainment Telematic Module (2014 BF Only)
FFCM	Forward Facing Camera Module
FCTP	CTP Chrysler Telematic Module
GEN	Generator
GPEC	Global Powertrain Engine Controller
FCM	Front Control Module
FDCM	Final Drive Control Module

FOBIK	Key Fob
FSM	Folding Seat Module
GPM	Glow Plug Module
HID	High Intensity Discharge
HSW	Heated Steering Wheel
HVAC	Heating, Ventilation and Cooling
IAT	Intake/Inlet Air Temperature
IAC	Idle Air Control
IBS	Intelligent Battery Sensor
ICS	Integrated Center Stack
IGNM	Ignition Node Module
IOD	Ignition Off-Draw
IPC	Instrument Panel Cluster
IPM	Integrated Power Module
ITM	Intrusion Theft Module
JTEC	Jeep Truck Engine Controller
KS	Knock Sensor
KIN	Keyless Ignition Node
LBSS	Left Blind Spot Sensor
LDP	Leak Detection Pump
LRSM	Light Rain Sensor Module
MAP	Manifold Air Pressure
MDS	Multi Displacement System
MGU	Motor Generating Unit
MIC	Mechanical Instrument Cluster
MIL	Malfunction Indicator Lamp
MSM	Memory Seat Module
MTV	Manifold Tuning Valve
NGC	Next Generation Controller
NVLD	Natural Vacuum Leak Detection
O2S	Oxygen Sensor
OCM	Occupant Classification Module
OBD	On Board Diagnostic
ORC	Occupant Restraint Controller
PAM	Parking Assist Module
PDC	Power Distribution Center
PCI	Programmable Communication Interface
PCM	Powertrain Control Module
PCV	Positive Crankcase Ventilation
PDM	Passenger Door Module
PEP	Peripheral Expansion Port

PLGM	Power Liftgate Module
PMU	Power Module Unit
RBSS	Right Blind Spot Sensor
RFHM	Radio Frequency Hub Module
RRM	Radio Receiver Module
RVCM	Rear Camera
SBEC	Single Board Engine Controller
SCM	Steering Control Module
S/C	Speed Control
SDAR	Satellite Digital Audio receiver
SKIM	Sentry Key Immobilizer Module
SKREEM	Sentry Key Remote Entry Module
SOL	Solenoid
SRV	Short Runner Valve
SWS	Steering Wheel Switch
TCM	Transmission Control Module
TCC	Torque Converter Clutch
TIP	Throttle Inlet Pressure
TIPM	Totally Integrated Power Module
TP	Throttle Position
TPMS	Tire Pressure Monitor System
TRS	Transmission Range Sensor
TSBM	Terrain Switch Bank Module
UAM	Ultrasonic & Anti-Tilt Module
UGDO	Universal Garage Door Opener
VSM	Voltage Stability Module
VSM2	Voltage Stability Module 2
VSS	Vehicle Speed Sensor/Signal
WCPM	Wireless Charging Pad Module
WCU	Wiper
WWSM	Windshield Wiper Smart Motor
WIN	Wireless Ignition Node

OPERATION

OPERATION

The following procedure has been established to assist technicians in the field with enabling and running OBD II Monitors. The order listed in the following procedure is intended to allow the technician to effectively complete each monitor and to set the CARB Readiness Status in the least time possible.

NOTE: Once the monitor run process has begun, do not turn off the ignition. By

turning the ignition key off, monitor enabling conditions will be lost. EVAP Monitor runs after key off. By performing a Battery Disconnect, or Selecting Erase DTCs, the CARB Readiness and all additional OBD II information will be cleared.

MONITOR PRELIMINARY CHECKS:

1. Plug a scan tool into the vehicle's Data Link Connector (DLC).
2. Turn the ignition, KEY ON - ENGINE OFF. Watch for the MIL lamp illumination during the bulb check. MIL lamp must illuminate, if not, repair MIL lamp.
3. Using a scan tool check for Powertrain related DTCs.

- Verify that No Emissions Related DTCs are Present. If an Emissions DTC is Present, the OBD II Monitors may not run and the CARB Readiness will not update.
- The Emissions related DTC, will need to be repaired, then cleared. By clearing DTCs, the OBD Monitors will need to be run and completed to set the CARB Readiness Status.

Using the scan tool check the CARB Readiness Status.

Do all the CARB Readiness Status Locations read YES?

- YES - all monitors have been completed and this vehicle is ready to be I/M or Emission Tested.
- NO - then the following procedure needs to be followed to run/complete all available monitors.

NOTE: **Only the monitors, which are not YES in the CARB Readiness Status, need to be completed. Specific criteria need to be met for each monitor. The most efficient order to run the monitors has been outlined below, including suggestions to aid the process.**

EVAPORATIVE EMISSION SYSTEM LEAK DETECTION WITH PURGE MONITOR

This monitor requires a cool down cycle, usually an overnight soak for at least 8 hours without the engine running. The ambient temperature must decrease overnight - parking the vehicle outside is advised. To run this test the fuel level must be between 15-85% full. Criteria for EVAP monitor:

- Engine off time greater than one hour.
- Fuel Level between 15% and 85%.
- Start Up ECT and IAT within 10°C (18°F).
- Vehicle started and run until Purge Monitor reports a result.

NOTE: **If the vehicle does not report a result and the conditions where correct. It may take up to two weeks to fail the small leak monitor. DO NOT use this test to attempt to determine a fault. Use the appropriate service information procedure for finding a small leak. If there are no faults and the conditions are correct this**

test will run and report a pass. Note the Small leak test can find leaks less than 10 thousands of an inch. If a small leak is present it takes approximately one week of normal driving to report a failure.

CATALYST/O2 MONITOR

The Catalyst and O2 Monitor information are acquired and processed at the same time. Most vehicles will need to be driven at highway speed (less than 50 mph) (73km/h) for a few minutes. Some vehicles run the monitor at idle in drive. If the vehicle is equipped with a manual transmission, using 4th gear may assist in meeting the monitor running criteria.

- Engine RPM between 1200 to 3000.
- Engine temperature greater than 70°C (158°F)
- Engine run time greater than 92 seconds
- MAP between 10 - 20 kPa (7.5 - 15 Hg)
- Vehicle speed between 20 - 70 mph (29-103 km/h)

EGR MONITOR

After the vehicle has reached the below conditions and during a throttle decel the EGR monitor will run.

- Engine RPM between 1375 - 2500
- Engine temperature greater than 70°C (158°F)
- Engine run time greater than 125 seconds
- Vehicle speed between 25 - 70 mph (37-103 km/h)

O2 SENSOR HEATER MONITOR

This monitor is now continuously running once the heaters are energized. Pass information will be processed at power down.

MIS-FIRE MONITOR

The Misfire Monitor is a continuous two-trip monitor. The monitor uses two different tests/counters:

NOTE: **The Adaptive Numerator must be learned before the PCM will run the Mis-Fire Monitor. The PCM updates the Adaptive Numerator at every key-ON, and is relearned after battery disconnect. The Misfire Monitor will not run until the Adaptive Numerator has updated since the last battery disconnect. If the Adaptive Numerator is equal to the default value then the PCM knows that the Adaptive Numerator has not been learned and does not permit the Misfire Monitor to run. If the Adaptive Numerator exceeds a calibrated percentage, the PCM sets a DTC for CKP NOT LEARNED and illuminates the MIL.**

- 200 Revolution Counter - Looks for misfire that can cause immediate catalyst damage.

- 1000 Revolution Counter - Looks for misfire that can cause emissions to increase 1.5 times the Federal Test Procedure (FTP) standards. This test must also identify misfire percentages that might cause a "durability demonstration vehicle" to fail an Inspection and Maintenance Program tailpipe emissions test.

EVAPORATIVE EMISSIONS

DESCRIPTION

DESCRIPTION

Fig. 2: EVAP System Components

CALL OUT	DESCRIPTION
1	Fresh Air Filter
2	Evaporative System Integrity Monitor (ESIM)
3	Evaporative Charcoal Canister
4	Fuel Tank Vent (Check Valve)
5	Control Valve
6	Inlet Check Valve
7	Fuel Tank Pressure Sensor

8	To Engine Purge Solenoid and Intake Manifold
9	Fuel Fill Tube

The evaporative emissions system is designed to control the release of fuel vapors into the atmosphere. The fuel tank check valve (4) and control valve (5) are used to reduce emissions due to the venting of vapor expansion within the fuel tank. When fuel evaporates from the fuel tank, vapors pass through a vent hose to the evaporative charcoal canister (3) where they are temporarily held. When the engine is running, the vapors are drawn into the intake manifold (8). In addition, fuel vapors produced during vehicle refueling are allowed to pass through the vent hose to the evaporative charcoal canister (3) for temporary storage (prior to being drawn into the intake manifold). The fuel tank check valve (4) and control valve (5) are non-serviceable components of the fuel tank assembly. The system is equipped with self-diagnosing capability using an Evaporative System Integrity Monitor (2). Refer to **SWITCH, EVAPORATIVE EMISSIONS SYSTEM MONITOR, OPERATION**.

The fuel tank pressure sensor (7) provides the PCM with information on vapor pressure inside the fuel tank. Excessive fuel tank pressure could cause fuel vapors to vent out the fuel filler cap or damage system components while insufficient fuel tank pressure (vacuum) caused by lack of fresh air entering the tank (1) to take the place of consumed fuel could lead to collapsed tank, lines or loss of fuel pressure.

The inlet check valve (6) prevents fuel from splashing back on the customer during vehicle refueling. This valve is also a non-serviceable component of the fuel tank assembly.

SPECIFICATIONS

CANISTER & PCV TORQUE SPECIFICATIONS

DESCRIPTION	N.m	Ft. Lbs.	In. Lbs.
Vapor Canister to Vehicle - Nuts	9	-	80
PCV Valve	2.5	-	22

CANISTER, VAPOR

REMOVAL

REMOVAL

Fig. 3: EVAP Canister & Mounting Fasteners
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the negative battery cable.
2. Partially raise the vehicle.
3. Remove the right rear wheel.
4. Remove the inner wheel splash shield.
5. Disconnect electrical connector to the ESIM (Evaporative System Integrity Monitor).
6. Disconnect the lines from the EVAP canister (2) side.
7. Remove the mounting fasteners (1).
8. Remove EVAP canister assembly.

INSTALLATION

INSTALLATION

Fig. 4: EVAP Canister & Mounting Fasteners
Courtesy of CHRYSLER GROUP, LLC

1. Install EVAP canister (2) mounting nuts. Tighten the nuts (1) to 5 N.m (44 in. lbs.).
2. Connect the filter lines to canister.
3. Connect the ESIM electrical connector.
4. Install the rear inner splash shield.
5. Install the right rear wheel.
6. Lower the vehicle.
7. Connect negative battery cable.

CAP, FUEL FILLER

DESCRIPTION

DESCRIPTION

The plastic fuel fill cap is a threaded/quarter turn onto the end of the fuel filler tube. Its purpose is to retain vapors and fuel in the fuel tank.

OPERATION

OPERATION

The loss of any fuel vapor out of fuel filler tube is prevented by the use of pressure-vacuum fuel fill cap. Relief valves inside the cap will release fuel tank pressure at predetermined pressures. Fuel tank vacuum will also be

released at predetermined values. This cap must be replaced by a similar unit if replacement is necessary. This is in order for the system to remain effective.

CAUTION: Remove the fill cap before servicing any fuel system component to relieve fuel tank pressure. If the cap is left off or loose, a Diagnostic Trouble Code (DTC) may be set.

REMOVAL

REMOVAL

If replacement of the 1/4 turn fuel tank filler tube cap is necessary, it must be replaced with an identical cap to be sure of correct system operation.

CAUTION: Remove the fuel tank filler tube cap to relieve fuel tank pressure. The cap must be removed prior to disconnecting any fuel system component or before draining the fuel tank.

ONBOARD REFUEL VAPOR RECOVERY (ORVR)

DESCRIPTION

DESCRIPTION

The ORVR (On-Board Refueling Vapor Recovery) system consists of a unique fuel tank, vapor control valve, one-way check valve and vapor canister.

OPERATION

OPERATION

The ORVR (On-Board Refueling Vapor Recovery) system is used to store and prevent the release into the atmosphere of the fuel tank vapors. This is done while the vehicle is being refueled.

Fuel flowing into the fuel filler tube (approx. 1" I.D.) creates an aspiration effect drawing air into the fuel fill tube. During refueling, the fuel tank is vented to the EVAP canister to capture escaping vapors. With air flowing into the filler tube, there are no fuel vapors escaping to the atmosphere. Once the refueling vapors are captured by the EVAP canister, the vehicle's computer controlled purge system draws vapor out of the canister for the engine to burn. The vapor flow is metered by the purge solenoid so that there is no, or minimal impact on driveability or tailpipe emissions.

As fuel starts to flow through the fuel fill tube, it opens the normally closed check valve and enters the fuel tank. Vapor or air is expelled from the tank through the control valve and on to the vapor canister. Vapor is absorbed in the EVAP canister until vapor flow in the lines stops. This stoppage occurs following fuel shut-off, or by having the fuel level in the tank rise high enough to close the control valve. This control valve contains a float that rises to seal the large diameter vent path to the EVAP canister. At this point in the refueling process, fuel tank pressure increases, the check valve closes (preventing liquid fuel from spiting back at the operator),

and fuel then rises up the fuel filler tube to shut off the dispensing nozzle.

SENSOR, FUEL TANK PRESSURE

DESCRIPTION

DESCRIPTION

Fig. 5: Fuel Tank Pressure Sensor
Courtesy of CHRYSLER GROUP, LLC

The fuel tank pressure sensor provides the PCM with information on vapor pressure inside the fuel tank. The sensor is a diaphragm-type pressure sensor and varies its voltage output depending on fuel tank pressure. When the fuel tank isolation valve is activated (closed), preventing fuel vapors from leaving the tank, the PCM will monitor the fuel tank pressure sensor to prevent pressure from increasing or decreasing to an unsafe level.

Excessive fuel tank pressure could cause fuel vapors to vent out the fuel filler cap or damage system components while insufficient fuel tank pressure (vacuum) caused by lack of air entering the tank to take the place of consumed fuel could lead to collapsed tank, lines or loss of fuel pressure.

REMOVAL

REMOVAL

1. Disconnect and isolate the negative battery cable.
2. Remove the fuel filler cap to relieve tank pressure.
3. Partially raise the vehicle.

4. Remove the right rear wheel house splash shield. Refer to **SHIELD, SPLASH, REAR WHEELHOUSE, REMOVAL** .

1. Connect vapor line quick-connect fitting (5) to solenoid.
2. Connect vapor line (1) to the throttle body.
3. Connect electrical wiring connector (4) to solenoid.
4. Carefully push the solenoid assembly (2) straight down onto the tongue-type bracket (3) without bending the vapor lines.

SWITCH, EVAPORATIVE EMISSIONS SYSTEM MONITOR

OPERATION

OPERATION

Fig. 25: Evaporative Emissions System Monitor Components
Courtesy of CHRYSLER GROUP, LLC

1 - Intake Manifold
2 - Throttle Body
3 - Purge Solenoid
4 - Filter
5 - ESIM
6 - Vapor Canister
7 - Control Valve
8 - Fuel Tank
9 - Gas Cap

The ESIM (Evaporative System Integrity Monitor) is very similar to the NVLD. However, the design of the ESIM has been simplified and unlike the NVLD the ESIM does not require a solenoid. The ESIM mounts directly to the canister, eliminating the need for a mounting bracket. It is critical that the ESIM is mounted vertically. On vehicles where the canister is mounted on an angle, the ESIM requires an adaptor to maintain a vertical position. When the ESIM is installed vertically, the electrical connector is in the 3 o'clock position.

Fig. 26: Exploded View Of ESIM
Courtesy of CHRYSLER GROUP, LLC

1 - ESIM Housing
2 - Diaphragm
3 - Switch
4 - Cover
5 - Small Check Valve
6 - Large Check Valve

The ESIM assembly consists of a housing, a small weight and a large weight that serve as check valves, a diaphragm, a switch and a cover. There is one large weight and one small weight check valve in the ESIM assembly. A seal is attached at the end of each weighted check valve. The large weight check valve seals for pressure. The small weight check valve seals for vacuum. The weighted check valves are contained within the ESIM housing.

4 - Small Check Valve
5 - Vapor Canister

The ESIM (Evaporative System Integrity Monitor), while physically different than the NVLD system, performs the same basic function as the NVLD does - controlling evaporative emissions. The ESIM has been simplified because the solenoid used on the NVLD is not used on the ESIM.

The ESIM consists of housing, two check valves (sometimes referred to as weights), a diaphragm, a switch and a cover. The larger check valve seals for pressure and the smaller one seals for vacuum.

During refueling, pressure is built up in the evaporative system. When pressure reaches approximately 0.5 inches of water, the large check valve unseats and pressure vents to the fresh air filter.

Conversely, when the system cools and the resulting vacuum lifts the small check valve from its seat and allows fresh air to enter the system and relieve the vacuum condition. When a calibrated amount of vacuum is achieved in the evaporative system, the diaphragm is pulled inward, pushing on the spring and closing the contacts.

The ESIM conducts test on the evaporative system as follows: An engine off, non-intrusive test for small leaks and an engine running, intrusive test for medium/large leaks.

The ESIM weights seal the EVAP. system during engine off conditions. If the EVAP. system is sealed, it will be pulled into a vacuum, either due to the cool down from operating temperature or diurnal ambient temperature cycling. When the vacuum in the system exceeds about 1" H20, the vacuum switch closes. The switch closure sends a signal to the GPEC1. In order to pass the non-intrusive small leak test, the ESIM switch must close within a calculated amount of time and within a specified amount of key-off events.

If the ESIM switch does not close as specified, the test is considered inconclusive and the intrusive engine running test will be run during the next key-on cycle. This intrusive test will run on the next cold engine running condition.

Conditions for running the intrusive test are:

- After the vehicle is started, the engine coolant temperature must be within 10° C (50°F) of ambient to indicate a cold start.
- The fuel level must be between 12% and 88%.
- The engine must be in closed loop.
- Manifold vacuum must be greater than a minimum specified value.
- Ambient temperature must be between 4° C and 37° C (39° F and 98° F) and the elevation level must be below 8500 feet.

The test is accomplished by the GPEC1 activating the purge solenoid to create a vacuum in the evaporative system. The GPEC1 then measures the amount of time it takes for the vacuum to dissipate. This is known as the vacuum decay method. If the switch opens quickly a large leak is recorded. If the switch opens after a predetermined amount of time, then the small leak matures. If the switch does not close, then a general evaporative failure is recorded. The purge monitor tests the integrity of the hose attached between the purge valve and throttle body/intake. The purge monitor is a two stage test and it runs only after the evaporative system passes the small leak test.

Even when all of the thresholds are met, a small leak won't be recorded until after the medium/large leak monitor has been run. This is accomplished by the GPEC1 activating the purge solenoid to create a vacuum in the evaporative system. The GPEC1 then measures the amount of time it takes for the vacuum to dissipate. This is known as the vacuum decay method. If the switch opens quickly a large leak is recorded. If the switch opens after a predetermined amount of time, then the small leak matures. If the medium/large leak test runs and the ESIM switch doesn't close, a general evaporative test is run. The purge solenoid is activated for approximately 10 seconds, increasing the amount of vacuum in the system. IF the ESIM switch closes after the extended purge activation, a large leak fault is generated. If the switch doesn't close, a general evaporative system fault is generated.

The purge monitor tests the integrity of the hose attached between the purge valve and throttle body/intake. The purge monitor is a two stage test and it runs only after the evaporative system passes the small leak test.

Stage one of the purge monitor is non-intrusive. GPEC1 monitors the purge vapor ratio. If the ratio is above a calibrated specification, the monitor passes. Stage two is an intrusive test and it runs only if stage one fails. During the stage two test, the GPEC commands the purge solenoid to flow at a specified rate to force the purge vapor ratio to update. The vapor ratio is compared to a calibrated specification and if it is less than specified, a one-trip failure is recorded.

The ESIM switch stuck closed monitor checks to see if the switch is stuck closed. This is a power down test that runs at key-off; when the GPEC1 sees 0 rpm's, the purge solenoid is energized for a maximum of 30 seconds, venting any vacuum trapped in the evaporative system. If the switch opens or was open before the test began, the monitor passes. If the switch doesn't open, the monitor fails. This is a two-trip MIL. The star scan tool can be used to force the ESIM switch stick closed monitor to run.

The GPEC1 also uses the ESIM to detect a loose or missing gas cap. The GPEC1 controller looks for a change in the fuel level (25% minimum) and then gas cap is loose or missing. If a medium/large leak is detected, a loose gas cap light illuminates and a pending one-trip fault code is set. On the GPEC1, this is a three-trip fault before the code matures

VALVE, POSITIVE CRANKCASE VENTILATION (PCV)

OPERATION

OPERATION

Fig. 28: Engine Off Or Engine Backfire No Vapor Flow
Courtesy of CHRYSLER GROUP, LLC

When the engine is not operating or during an engine backfire, the spring forces the plunger back against the seat. This prevents vapors from flowing through the valve.

Fig. 29: High Intake Manifold Vacuum Minimal Vapor Flow
Courtesy of CHRYSLER GROUP, LLC

When the engine is at idle or cruising, high manifold vacuum is present. At these times manifold vacuum is able to completely compress the spring and pull the plunger to the top of the valve. In this position there is minimal vapor flow through the valve.

Fig. 30: Moderate Intake Manifold Vacuum Maximum Vapor Flow
Courtesy of CHRYSLER GROUP, LLC

During periods of moderate intake manifold vacuum the plunger is only pulled part way back from the inlet. This results in maximum vapor flow through the valve.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - PCV SYSTEM

WARNING: Apply parking brake and/or block wheels before performing any test or adjustment with the engine operating.

1. With engine idling, remove the hose from the PCV valve. If the valve is not plugged, a hissing noise will be heard as air passes through the valve. A strong vacuum should also be felt when a finger is placed over the valve inlet.
2. Install hose on PCV valve. Remove the make-up air hose from the air plenum at the rear of the engine. Hold a piece of stiff paper (parts tag) loosely over the end of the make-up air hose.
3. After allowing approximately one minute for crankcase pressure to reduce, the paper should draw up against the hose with noticeable force. If the engine does not draw the paper against the grommet after installing a new valve, replace the PCV valve hose.
4. Turn the engine off. Remove the PCV valve from intake manifold. The valve should rattle when shaken.
5. Replace the PCV valve and retest the system if it does not operate as described in the preceding tests. **Do not attempt to clean the old PCV valve.**

REMOVAL

2.4L

Fig. 31: Removing/Installing Hose
Courtesy of CHRYSLER GROUP, LLC

1. Remove the engine cover.
2. Remove the hose from the PCV valve.

Fig. 32: PCV Removed

4. Install the PCV hose (1) between the upper intake manifold and the PCV valve (2).

EXHAUST GAS RECIRCULATION, DIESEL

DESCRIPTION

DESCRIPTION

Fig. 39: Exhaust Gas Recirculation (EGR) system
Courtesy of CHRYSLER GROUP, LLC

The Exhaust Gas Recirculation (EGR) system (1) reduces Oxides of Nitrogen (NOx) in the engine exhaust. This is accomplished by allowing a predetermined amount of hot exhaust gases to recirculate and dilute the incoming fuel and air mixture.

The Exhaust Gas Recirculation (EGR) system consists of the following components:

- EGR cooler
- EGR cooler manifold
- EGR vacuum valve solenoid
- EGR valve
- EGR wastegate vacuum solenoid
- EGR wastegate valve solenoid
- Powertrain Control Module (PCM)
- Vacuum pump
- Vacuum reservoir, lines and hoses

A malfunctioning EGR system can cause engine stumble, hesitation, rough idle, engine stalling and poor driveability.

OPERATION

OPERATION

When the Powertrain Control Module (PCM) supplies a variable ground signal to the Exhaust Gas Recirculation (EGR) vacuum valve solenoid, EGR operation begins. The PCM monitors and determines when to supply and remove the variable ground signal. This will depend on inputs from the engine coolant temperature, throttle position and engine speed sensors.

When the variable ground signal is supplied to the EGR vacuum valve solenoid, vacuum from the vacuum pump will be allowed to pass through the solenoid and on to the EGR system, by a connecting hose.

Exhaust gas recirculation will begin in this order when:

- The engine is running.
- The PCM determines that EGR system operation is necessary.
- A variable ground signal is supplied to the EGR vacuum valve solenoid.
- Variable vacuum passes through the EGR vacuum valve solenoid to the EGR system.
- The inlet seat (poppet valve) in the EGR valve opens to dilute and recirculate exhaust gas back into the EGR cooler manifold.
- Coolant flow through the EGR cooler is controlled by the EGR wastegate valve solenoid.

The EGR system will be shut down by the PCM after 60 seconds of continuous engine idling to improve idle quality.

2014 ENGINE

Starting - Non-DTC Based Diagnostics - Cherokee

DIAGNOSIS AND TESTING

NO CRANK (BCM EQUIPPED)

For a complete wiring diagram, **refer to SYSTEM WIRING DIAGRAMS article** .

Fig. 1: Options Layout (LHD)
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

This vehicle will come equipped with one of two types of ignitions, the IGNM (IGnition Node Module) or a KIN (Keyless Ignition Node). The KIN uses a Keyless Go Start/Stop push button for cycling the ignition on/off. The IGNM does not use a Keyless Go Start/Stop push button, instead providing a visible slot for the FOBIK to fit into for cycling the ignition on/off.

When the operator presses the Start/Stop Button on a KIN or cycles the FOBIK in a IGNM type ignition, the FOBIK is validated wirelessly by the RF Hub (Radio Frequency Hub Module). If the FOBIK is recognized as belonging to the vehicle and is inside the vehicle, the system allows the ignition state of the vehicle to be changed by the operator between the LOCK, ACCESSORY, RUN, and START ignition states.

LED Operation

The LEDs in the IGNM and Start/Stop Button provide visual indication of the ignition system and button use to aid the driver. The Logic for LED control is implemented in the IGNM and RF HUB. The IGNM and Start/Stop Button contain four LEDs:

- OFF Indication
- ACC Indication (Accessory)
- ON Indication (On or Run)
- Ignition Switch Indicator (button backlight)

The LEDs indicate the vehicle ignition position and are driven by the CAN bus signals related to the ignition position. The Center LED (Ignition Switch Indicator) will blink if there is a related concern.

The RF HUB will log a DTC indicating an incorrect Ignition status value is present; in this state the ignition status is unknown. This will continue until the correct signal is received by the RF Hub.

EVIC Operation

The Keyless Go feature requires the vehicle to be equipped with an EVIC display for prompts and status information. The display messages are:

- Service Keyless System
- FOB Not Detected
- FOB Left Vehicle
- Not in Park
- Push Brake Pedal and Push Button to Start
- Push Clutch Pedal and Push Button to Start
- Vehicle not in Park Warning

BCM/RF Hub Module Interaction

There are a few things that must take place before the starter relay can apply voltage to the starter. Below are some key points to check when diagnosing a no crank condition.

The BCM requires two signals from the RF HUB to verify the ignition is in the run or start position. The voltage on the F20 circuit is one of these signals. It can be monitored in both the RF HUB and BCM data display screens as the Ignition Run/Start under the "Sensor" value. The run or start position voltage on this circuit should be at or close to battery voltage.

Simultaneously the RF HUB busses the Ignition Run/Start status to the BCM. The BCM monitors the bussed input information as the secondary verification on the Ignition Run/Start status. The bussed messages can be monitored with the scan tool in both the RF HUB and BCM data display screens.

The F20 circuit voltage and the bussed ignition run/start status message received by the BCM must agree to enable starting. Once the vehicle is started, the loss of only one ignition signal will not cause the vehicle to cycle off as long as the other feed still indicates a "run status".

The RF HUB also requires an input from the Gated park switch (hardwired) and the OK to start CAN Bus message from the TCM (Crank Enable).

Diagnostic Aids

NOTE: The No Crank Diagnostic serves as an aid in diagnosing the concern and is intended to be used as a general guide, since each no crank condition can be unique.

The No Crank Diagnostic Test assumes all of the following to be true:

- The condition is currently present.
- The TCM, PCM, RF HUB, and BCM are at the latest calibration (part number) levels.
- There are no active DTCs.
- There are no applicable Recalls.
- There are no applicable TSBs.
- There are no PCM inhibits (i.e. RPM, Trans Range, Clutch).
- The FOBIKs complete function and operation is correct.
- All battery cables and connections are clean and tight.
- There are no open fuses.
- The battery is fully charged and can pass a load test from the GR8 tester.
- The engine rotates freely.
- Any aftermarket equipment/wiring that has been installed is operating correctly.

Starter Relay Operation

In a no crank condition the Starter Relay can be missing power at pin 85, feed at pin 30, controlled ground at

pin 86 or output at pin 87. Further explanation of how a relay operates is listed below:

- Pin 85 receives power from the BCM once the parameters for the Ignition Switch position and status, and all inhibit monitors (i.e. clutch switch, RPM, etc.) are satisfied.
- Pin 30 is a constant B+ feed.
- Pin 86 is a controlled ground by a module (i.e. PCM or BCM). Once power is sent from the BCM to the pin 85 of the relay it passes through a coil and leaves the relay through pin 86 to the control module.
- Pin 87 is an output circuit to the Starter solenoid. Once the circuit on pin 86 is grounded by the control module, the coil winding in the relay magnetically pulls the internal switch closed. When the internal switch is closed the power at pin 30 is sent to pin 87 of the relay.

DIAGNOSTIC TEST

1. **STARTER RELAY CHECK**
    1. When attempting to start the vehicle, listen and if needed feel for a click at the starter relay in the PDC.

        NOTE: Some starter relays are internal to a module and may not be accessible, making it more difficult to hear, or feel the clicking response. It is possible for a poor ground or the Trans Range Sensor position to be lost causing the starter to click once.

        Did you hear an audible click at the relay or starter?

        Yes

        - Go To 9

        No

        - Go To 2
2. **STARTER RELAY INPUT CHECK**
    1. Use a 12 volt test light/DVOM to check for power at pin 85 of the starter relay.

        Is there Power/12 volts at pin 85?

        Yes

        - Go To 8

        No

        - Go To 3
3. **RF HUB OPERATION**

1. Using the scan tool, confirm the ignition switch status changes in the RF HUB under the data display screen for the "Sensor" values.

   Does the ignition switch status on the data screen match the physical position of the KIN/IGNM?

   Yes

   - Go To 5

   No

   - Go To 4

4. **REMOTE START ANTENNA**

   NOTE: If the vehicle is not equipped with Remote Start, proceed to the next test step.

   1. Cycle the ignition off.
   2. Disconnect the Remote Start Antenna from the RF HUB.
   3. Using one FOBIK and sitting in the driver's seat, attempt to start the vehicle.

   Did the vehicle start?

   Yes

   - Replace the Remote Start Antenna in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

   No

   - Go To 5

5. **BCM IGNITION STATUS**
   1. Using the scan tool, confirm the ignition switch status changes in the BCM under the data display screen for the "Bussed Input" and "Sensor" values.

   NOTE: The change of status in the BCM for the "Sensor" value validates the voltage activity (with very low amperage) of the F20 circuit.

   In the BCM, do both values for the ignition switch status match; and do they match those in the RF HUB?

   Yes

   - Go To 6

No

- If the status of the Ignition Switch position is not changing under the "Sensor" value, check the F20 circuit at the BCM for battery voltage with a DVOM (not a test light).
- If there is Battery voltage **at the BCM on the F20 circuit** verify all power, ground and bus circuits are ok for the BCM. If no problem found replace the BCM in accordance with Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
- If there is **NO** Battery voltage **at the BCM** on the F20 circuit, then check for voltage on the F20 circuit at the RF HUB.
- If there is Battery voltage **coming out of the RF HUB on the F20 circuit** , check the F20 circuit between the RF HUB and BCM for a short, open condition or high resistance.
- If there is **NO** Battery voltage **coming out of the RF HUB on the F20 circuit** verify all power, ground & communication circuits, & connections to the RF HUB prior to replacing. Refer to **MODULE, RADIO FREQUENCY (RF HUB), REMOVAL** .
- In the data screen, if the status of the Ignition Switch was not changing under the "Bussed Input" value, further diagnosis is needed between the RF HUB, (bus circuits, connections) and the BCM.

6. **PCM IGNITION, TRANS RANGE/CLUTCH SWITCH STATUS VERIFICATION**
   1. Using the scan tool confirm there are no inhibits that have been triggered in the PCM (i.e. Ignition Switch, Trans Range or Clutch Switch) and any switch inputs (filtered states) relating to the starting system function and operate correctly under the data display screen.

      Does the PCM show any inhibits (**not DTCs**) for starting (**not remote starting**)?

      Yes

      - Correct the inhibit reason listed.
      - If no problem can be found, then verify all power, ground and bus circuits to the PCM and replace the PCM in accordance with the Service Information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .

      No

      - Go To 7

7. **BCM TO STARTER RELAY POWER INPUT CHECK**
   1. At this time if all the correct inputs for the ignition switch status are correct in the RF HUB, BCM and PCM, verify both power feeds are present (pin 30 and 85) to the Starter Relay while in the crank position.

      Are both power feeds present at the relay when the ignition is in the crank position?

      Yes

      - Go To 8

No

- If, there is no power to pin 30 or 85, no DTCs, TSBs, Recalls, or Inhibits replace the BCM in accordance with Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .

8. **STARTER RELAY CONTROL CIRCUIT CHECK**
   1. Using a test light/DVOM determine if the Starter Control circuit at pin 86 of the relay is missing ground (at the relay if equipped with a removable relay or wiring to the internal relay) when the ignition is in the crank position.

      Was the Starter Control circuit for pin 86 being grounded when the ignition was in the crank position?

      Yes

      - Go To 10

      No

      - Verify the Starter Relay Control circuit from pin 86, has no shorts, opens or high resistance on the wiring going from the Starter Relay in the BCM (or PDC) to the PCM.
      - Verify the cables do not have excessive resistance by performing a voltage drop on the battery cables.

9. **STARTER RELAY OUTPUT CIRCUIT CHECK**

   NOTE: At this point in the test, when the key is in the crank position power has been verified at Pin 30 & 85, along with the control circuit being grounded for pin 86.

   1. Remove the Starter Relay Output circuit connector from the Starter solenoid.
   2. Using a test light/DVOM and ignition in the crank position check for power at pin 87 (If equipped with a removable relay or wiring to the internal relay) of the relay and at the connection to the starter.

      Was there power at pin 87 for the output circuit?

      Yes

      - Go To 10

      No

      - If power is missing to pin 30 of the starter relay the BCM is suspect. Verify all power, ground, communication circuits and connections to the BCM before replacing in accordance with service information.

- If power is missing at pin 87 of the starter relay and the relay is replaceable, change out the relay and recheck the concern. If a known good relay causes no change, check the Starter Output circuit from pin 87 of the relay to the starter for an open, short, excessive resistance, or poor connections to the solenoid or starter.
- Verify and Inspect the Starter to ensure it is free of corrosion, oil, and there is no damage, or binding conditions.
- Verify that all wiring, cables and connections are clean and tight.

10. **STARTER RELAY OUTPUT CIRCUIT LOAD TEST**
    1. Load test the Starter Relay output circuit going from the BCM to the Starter.

       Does the starter relay output circuit pass the load test?

       Yes

       - Verify that all connections are clean, tight and there is no damage to starter when fully inspected. If no problem found then replace the Starter in accordance with Service Information. Refer to **STARTER, REMOVAL** .

       No

       - Adjust the shift cable in accordance with the Service Information. Perform the POWERTRAIN VERIFICATION TEST. Refer to appropriate ELECTRICAL DIAGNOSTICS article.

REMOTE START INOPERATIVE (BCM - RF HUB EQUIPPED)

For a complete wiring diagram, **refer to SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The customer may notice that the signal range of the Remote Keyless Entry (RKE) system is reduced. This condition may be due to the RKE antenna where the RKE key fob may need to be closer than 3 meters (10 feet) before the functions available on the key fob will operate. The diagnostic test is provided as a diagnostic aid for the dealer technician.

It is necessary to confirm the correct sales code(s) are present in the Standard and Optional Equipment sections of DealerCONNECT to determine if a factory or a Mopar® Accessory Remote Start kit was installed. If the vehicle has a Mopar® Accessory Remote Start kit, verify that at least 20 minutes has elapsed since the sales codes were added to DealerCONNECT. Once it has been confirmed that the proper sales codes have been added and the allotted time has passed, verify the vehicle has been configured properly using the scan tool. Also, make sure that the system shows as enabled in the BCM and that the temporary remote start override is set to disabled.

For any further assistance on diagnosing the installed Mopar® Accessory kit contact the Mopar® Accessories group at 800-84-MOPAR (66787).

DIAGNOSTIC TEST

1. **REMOTE START FUNCTION**

   NOTE: In some cases the vehicle will start then stall, indicating a fuel level concern (less than a quarter of a tank). Before proceeding verify there is enough fuel in the tank for the vehicle to start and run.

   1. Attempt to start the vehicle with the FOBIK.

      Does the vehicle start when using the FOBIK?

      Yes

      - At this time the Remote Start is functioning properly.
      - Using the scan tool, check for any related Starting, Communication, or Ignition related DTCs that may inhibit the Remote Starting feature. Check the BCM for any previous Remote Start Inhibits and mileage that were stored. Inhibits may be found under the system tests or miscellaneous functions tab.

      No

      - Go To 2

2. **REMOTE START VISUAL CHECK**

   1. While pressing the remote start button on the FOBIK, observe the exterior lights and the horn operation.

      Does the horn sound and the exterior parking lights flash?

      Yes

      - Go To 3

      No

      - Go To 4

3. **CHECKING BCM INHIBITS**

   NOTE: Since the horn sounds and the parking lights flash, this verifies the BCM is receiving the CAN BUS message from the RF HUB. It also verifies the RF signal for Remote Start from the FOBIK to the RF HUB is operating correctly.

   1. Using the scan tool, check the Remote Start inhibits of the BCM or any ACTIVE DTCs listed in all modules.

NOTE: Inhibits may be found under the system tests or miscellaneous functions tab. The fuel level may not be a listed inhibit.

Are there any Remote Start inhibits or any ACTIVE DTCs listed in the entire vehicle?

Yes

- For any inhibits for a complete list of Remote Start inhibits. Refer to **DIAGNOSIS AND TESTING** .
- For any ACTIVE DTCs, perform the appropriate diagnostic procedure in **DTC INDEX** article.

No

- Check for any related TSBs prior to replacing the BCM. If no related TSBs are found, then replace the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .

4. **RKE FUNCTION SHORT RANGE**
   1. While standing next to the Driver door and using the FOBIK, attempt to lock and unlock the doors.

      Does the RKE function properly?

      Yes

      - Go To 5

      No

      - Go To 7
5. **RKE FUNCTION MID RANGE**
   1. While standing 20 feet from the vehicle and using the FOBIK, attempt to lock and unlock the doors.

      Does the RKE function properly at 20 feet?

      Yes

      - Go To 6

      No

      - Go To 7
6. **RKE FUNCTION LONG RANGE**
   1. While standing 100 feet from the vehicle and using the FOBIK, attempt to lock and unlock the

doors.

Does the RKE function properly at 100 feet?

Yes

- Go To 9

No

- Go To 7

7. **FOBIK SIGNAL STRENGTH**
   1. Use the RF Tester 9001 to check the signal strength of the FOBIK.

      Does the FOBIK pass?

      Yes

      - Go To 10

      No

      - Go To 8

8. **CHECKING THE FOBIK**
   1. Replace the battery in the FOBIK with a known good battery and recheck the signal from the FOBIK with the RF Tester 9001.

      Does the FOBIK pass?

      Yes

      - Go To 9

      No

      - Check for any related TSBs prior to replacing the FOBIK. If no related TSBs are found, then replace the FOBIK in accordance with the Service Information. Refer to **TRANSMITTER, INTEGRATED KEY FOB, STANDARD PROCEDURE** .

9. **CHECKING FOR ACTIVE DTCs**

   NOTE: The RKE portion of the FOBIK is operational, this verifies that the RF HUB is capable of receiving signals and communicating to operate the locks.

   1. Use the scan tool to check for ACTIVE DTCs.

Did the scan tool show any ACTIVE DTCs in the entire vehicle?

Yes

- Diagnose the DTCs in accordance with the Service Information before proceeding with the Remote Start Inoperative concern.

No

- Go To 10

10. **CHECKING THE RF HUB**

NOTE: **Even though the RKE function of the system may work with no concern, the BCM is either not receiving a message or is receiving a corrupt message from the RF HUB for remote start operation.**

1. While sitting in the driver seat and using the scan tool, monitor the RF HUB on the data display screen for changes when the Remote Start button of the FOBIK is pressed.

   Did the status change when the Remote Start button of the FOBIK was pressed?

   Yes

   - Go To 11

   No

   - Go To 12

11. **CHECKING BCM INHIBITS**

NOTE: **The parking lights flash and the horn are inoperative when using the FOBIK, this indicates a faulty BCM or "Inhibit" that may be preventing the start request from occurring.**

1. Use the scan tool to check for any Remote Start inhibits listed in the BCM. This may be found under the system tests or miscellaneous functions tab.

   Were there any Remote Start inhibits listed in the BCM?

   Yes

   - Perform the REMOTE START SYSTEM Diagnosing and Testing. Refer to **DIAGNOSIS AND TESTING** .

   No

- If this has had a Mopar® Accessory kit installed verify the correct Sales Code for Remote Start has been added to Dealer Connect and a Restore Vehicle Configuration has been performed.
- Confirm the system is enabled; and the temporary Remote Start override is set to disabled in the BCM and contact the Mopar® Accessories group (800-84-Mopar) for further details before proceeding.
- If this has a factory installed Remote Start, check for any related TSBs prior to replacing the BCM. If no related TSBs are found, then replace the BCM in accordance with the Service Information.

12. **CHECKING THE REMOTE START ANTENNA**
    1. Cycle the ignition off
    2. Disconnect the Remote Start antenna from the RF Hub.
    3. Using one FOBIK and sitting in the driver's seat, attempt to start the vehicle.

    Did the vehicle start?

    Yes

    - Replace the Remote Start Antenna in accordance with the Service Information.
    - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

    No

    - Verify all power, ground, communication circuits, & connections to the RF HUB prior to replacing. Refer to **MODULE, RADIO FREQUENCY (RF HUB), REMOVAL** .

2014 ENGINE

Starting - Non-DTC Based Diagnostics - Cherokee

DIAGNOSIS AND TESTING

NO CRANK (BCM EQUIPPED)

For a complete wiring diagram, **refer to SYSTEM WIRING DIAGRAMS article** .

Fig. 1: Options Layout (LHD)
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

This vehicle will come equipped with one of two types of ignitions, the IGNM (IGnition Node Module) or a KIN (Keyless Ignition Node). The KIN uses a Keyless Go Start/Stop push button for cycling the ignition on/off. The IGNM does not use a Keyless Go Start/Stop push button, instead providing a visible slot for the FOBIK to fit into for cycling the ignition on/off.

When the operator presses the Start/Stop Button on a KIN or cycles the FOBIK in a IGNM type ignition, the FOBIK is validated wirelessly by the RF Hub (Radio Frequency Hub Module). If the FOBIK is recognized as belonging to the vehicle and is inside the vehicle, the system allows the ignition state of the vehicle to be changed by the operator between the LOCK, ACCESSORY, RUN, and START ignition states.

LED Operation

The LEDs in the IGNM and Start/Stop Button provide visual indication of the ignition system and button use to aid the driver. The Logic for LED control is implemented in the IGNM and RF HUB. The IGNM and Start/Stop Button contain four LEDs:

- OFF Indication
- ACC Indication (Accessory)
- ON Indication (On or Run)
- Ignition Switch Indicator (button backlight)

The LEDs indicate the vehicle ignition position and are driven by the CAN bus signals related to the ignition position. The Center LED (Ignition Switch Indicator) will blink if there is a related concern.

The RF HUB will log a DTC indicating an incorrect Ignition status value is present; in this state the ignition status is unknown. This will continue until the correct signal is received by the RF Hub.

EVIC Operation

The Keyless Go feature requires the vehicle to be equipped with an EVIC display for prompts and status information. The display messages are:

- Service Keyless System
- FOB Not Detected
- FOB Left Vehicle
- Not in Park
- Push Brake Pedal and Push Button to Start
- Push Clutch Pedal and Push Button to Start
- Vehicle not in Park Warning

BCM/RF Hub Module Interaction

There are a few things that must take place before the starter relay can apply voltage to the starter. Below are some key points to check when diagnosing a no crank condition.

The BCM requires two signals from the RF HUB to verify the ignition is in the run or start position. The voltage on the F20 circuit is one of these signals. It can be monitored in both the RF HUB and BCM data display screens as the Ignition Run/Start under the "Sensor" value. The run or start position voltage on this circuit should be at or close to battery voltage.

Simultaneously the RF HUB busses the Ignition Run/Start status to the BCM. The BCM monitors the bussed input information as the secondary verification on the Ignition Run/Start status. The bussed messages can be monitored with the scan tool in both the RF HUB and BCM data display screens.

The F20 circuit voltage and the bussed ignition run/start status message received by the BCM must agree to enable starting. Once the vehicle is started, the loss of only one ignition signal will not cause the vehicle to cycle off as long as the other feed still indicates a "run status".

The RF HUB also requires an input from the Gated park switch (hardwired) and the OK to start CAN Bus message from the TCM (Crank Enable).

Diagnostic Aids

NOTE: The No Crank Diagnostic serves as an aid in diagnosing the concern and is intended to be used as a general guide, since each no crank condition can be unique.

The No Crank Diagnostic Test assumes all of the following to be true:

- The condition is currently present.
- The TCM, PCM, RF HUB, and BCM are at the latest calibration (part number) levels.
- There are no active DTCs.
- There are no applicable Recalls.
- There are no applicable TSBs.
- There are no PCM inhibits (i.e. RPM, Trans Range, Clutch).
- The FOBIKs complete function and operation is correct.
- All battery cables and connections are clean and tight.
- There are no open fuses.
- The battery is fully charged and can pass a load test from the GR8 tester.
- The engine rotates freely.
- Any aftermarket equipment/wiring that has been installed is operating correctly.

Starter Relay Operation

In a no crank condition the Starter Relay can be missing power at pin 85, feed at pin 30, controlled ground at pin 86 or output at pin 87. Further explanation of how a relay operates is listed below:

- Pin 85 receives power from the BCM once the parameters for the Ignition Switch position and status, and all inhibit monitors (i.e. clutch switch, RPM, etc.) are satisfied.
- Pin 30 is a constant B+ feed.
- Pin 86 is a controlled ground by a module (i.e. PCM or BCM). Once power is sent from the BCM to the pin 85 of the relay it passes through a coil and leaves the relay through pin 86 to the control module.
- Pin 87 is an output circuit to the Starter solenoid. Once the circuit on pin 86 is grounded by the control

module, the coil winding in the relay magnetically pulls the internal switch closed. When the internal switch is closed the power at pin 30 is sent to pin 87 of the relay.

DIAGNOSTIC TEST

1. **STARTER RELAY CHECK**
   1. When attempting to start the vehicle, listen and if needed feel for a click at the starter relay in the PDC.

      NOTE: Some starter relays are internal to a module and may not be accessible, making it more difficult to hear, or feel the clicking response. It is possible for a poor ground or the Trans Range Sensor position to be lost causing the starter to click once.

      Did you hear an audible click at the relay or starter?

      Yes

      - Go To 9

      No

      - Go To 2
2. **STARTER RELAY INPUT CHECK**
   1. Use a 12 volt test light/DVOM to check for power at pin 85 of the starter relay.

      Is there Power/12 volts at pin 85?

      Yes

      - Go To 8

      No

      - Go To 3
3. **RF HUB OPERATION**
   1. Using the scan tool, confirm the ignition switch status changes in the RF HUB under the data display screen for the "Sensor" values.

      Does the ignition switch status on the data screen match the physical position of the KIN/IGNM?

      Yes

      - Go To 5

No

- Go To 4

4. **REMOTE START ANTENNA**

NOTE: If the vehicle is not equipped with Remote Start, proceed to the next test step.

1. Cycle the ignition off.
2. Disconnect the Remote Start Antenna from the RF HUB.
3. Using one FOBIK and sitting in the driver's seat, attempt to start the vehicle.

Did the vehicle start?

Yes

- Replace the Remote Start Antenna in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

No

- Go To 5

5. **BCM IGNITION STATUS**

1. Using the scan tool, confirm the ignition switch status changes in the BCM under the data display screen for the "Bussed Input" and "Sensor" values.

NOTE: The change of status in the BCM for the "Sensor" value validates the voltage activity (with very low amperage) of the F20 circuit.

In the BCM, do both values for the ignition switch status match; and do they match those in the RF HUB?

Yes

- Go To 6

No

- If the status of the Ignition Switch position is not changing under the "Sensor" value, check the F20 circuit at the BCM for battery voltage with a DVOM (not a test light).
- If there is Battery voltage **at the BCM on the F20 circuit** verify all power, ground and bus circuits are ok for the BCM. If no problem found replace the BCM in accordance with Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
- If there is **NO** Battery voltage **at the BCM** on the F20 circuit, then check for voltage on the

F20 circuit at the RF HUB.

- If there is Battery voltage **coming out of the RF HUB on the F20 circuit** , check the F20 circuit between the RF HUB and BCM for a short, open condition or high resistance.
- If there is **NO** Battery voltage **coming out of the RF HUB on the F20 circuit** verify all power, ground & communication circuits, & connections to the RF HUB prior to replacing. Refer to **MODULE, RADIO FREQUENCY (RF HUB), REMOVAL** .
- In the data screen, if the status of the Ignition Switch was not changing under the "Bussed Input" value, further diagnosis is needed between the RF HUB, (bus circuits, connections) and the BCM.

6. **PCM IGNITION, TRANS RANGE/CLUTCH SWITCH STATUS VERIFICATION**
   1. Using the scan tool confirm there are no inhibits that have been triggered in the PCM (i.e. Ignition Switch, Trans Range or Clutch Switch) and any switch inputs (filtered states) relating to the starting system function and operate correctly under the data display screen.

      Does the PCM show any inhibits (**not DTCs**) for starting (**not remote starting**)?

      Yes

      - Correct the inhibit reason listed.
      - If no problem can be found, then verify all power, ground and bus circuits to the PCM and replace the PCM in accordance with the Service Information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .

      No

      - Go To 7
7. **BCM TO STARTER RELAY POWER INPUT CHECK**
   1. At this time if all the correct inputs for the ignition switch status are correct in the RF HUB, BCM and PCM, verify both power feeds are present (pin 30 and 85) to the Starter Relay while in the crank position.

      Are both power feeds present at the relay when the ignition is in the crank position?

      Yes

      - Go To 8

      No

      - If, there is no power to pin 30 or 85, no DTCs, TSBs, Recalls, or Inhibits replace the BCM in accordance with Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
8. **STARTER RELAY CONTROL CIRCUIT CHECK**
   1. Using a test light/DVOM determine if the Starter Control circuit at pin 86 of the relay is missing

ground (at the relay if equipped with a removable relay or wiring to the internal relay) when the ignition is in the crank position.

Was the Starter Control circuit for pin 86 being grounded when the ignition was in the crank position?

Yes

- Go To 10

No

- Verify the Starter Relay Control circuit from pin 86, has no shorts, opens or high resistance on the wiring going from the Starter Relay in the BCM (or PDC) to the PCM.
- Verify the cables do not have excessive resistance by performing a voltage drop on the battery cables.

9. **STARTER RELAY OUTPUT CIRCUIT CHECK**

NOTE: At this point in the test, when the key is in the crank position power has been verified at Pin 30 & 85, along with the control circuit being grounded for pin 86.

1. Remove the Starter Relay Output circuit connector from the Starter solenoid.
2. Using a test light/DVOM and ignition in the crank position check for power at pin 87 (If equipped with a removable relay or wiring to the internal relay) of the relay and at the connection to the starter.

Was there power at pin 87 for the output circuit?

Yes

- Go To 10

No

- If power is missing to pin 30 of the starter relay the BCM is suspect. Verify all power, ground, communication circuits and connections to the BCM before replacing in accordance with service information.
- If power is missing at pin 87 of the starter relay and the relay is replaceable, change out the relay and recheck the concern. If a known good relay causes no change, check the Starter Output circuit from pin 87 of the relay to the starter for an open, short, excessive resistance, or poor connections to the solenoid or starter.
- Verify and Inspect the Starter to ensure it is free of corrosion, oil, and there is no damage, or binding conditions.
- Verify that all wiring, cables and connections are clean and tight.

10. **STARTER RELAY OUTPUT CIRCUIT LOAD TEST**
    1. Load test the Starter Relay output circuit going from the BCM to the Starter.

       Does the starter relay output circuit pass the load test?

       Yes

       - Verify that all connections are clean, tight and there is no damage to starter when fully inspected. If no problem found then replace the Starter in accordance with Service Information. Refer to **STARTER, REMOVAL** .

       No

       - Adjust the shift cable in accordance with the Service Information. Perform the POWERTRAIN VERIFICATION TEST. Refer to appropriate ELECTRICAL DIAGNOSTICS article.

REMOTE START INOPERATIVE (BCM - RF HUB EQUIPPED)

For a complete wiring diagram, **refer to SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The customer may notice that the signal range of the Remote Keyless Entry (RKE) system is reduced. This condition may be due to the RKE antenna where the RKE key fob may need to be closer than 3 meters (10 feet) before the functions available on the key fob will operate. The diagnostic test is provided as a diagnostic aid for the dealer technician.

It is necessary to confirm the correct sales code(s) are present in the Standard and Optional Equipment sections of DealerCONNECT to determine if a factory or a Mopar® Accessory Remote Start kit was installed. If the vehicle has a Mopar® Accessory Remote Start kit, verify that at least 20 minutes has elapsed since the sales codes were added to DealerCONNECT. Once it has been confirmed that the proper sales codes have been added and the allotted time has passed, verify the vehicle has been configured properly using the scan tool. Also, make sure that the system shows as enabled in the BCM and that the temporary remote start override is set to disabled.

For any further assistance on diagnosing the installed Mopar® Accessory kit contact the Mopar® Accessories group at 800-84-MOPAR (66787).

DIAGNOSTIC TEST

1. **REMOTE START FUNCTION**

NOTE: **In some cases the vehicle will start then stall, indicating a fuel level concern (less than a quarter of a tank). Before proceeding verify there is enough fuel in the tank for the vehicle to start and run.**

1. Attempt to start the vehicle with the FOBIK.

   Does the vehicle start when using the FOBIK?

   Yes

   - At this time the Remote Start is functioning properly.
   - Using the scan tool, check for any related Starting, Communication, or Ignition related DTCs that may inhibit the Remote Starting feature. Check the BCM for any previous Remote Start Inhibits and mileage that were stored. Inhibits may be found under the system tests or miscellaneous functions tab.

   No

   - Go To 2

2. **REMOTE START VISUAL CHECK**
   1. While pressing the remote start button on the FOBIK, observe the exterior lights and the horn operation.

      Does the horn sound and the exterior parking lights flash?

      Yes

      - Go To 3

      No

      - Go To 4

3. **CHECKING BCM INHIBITS**

   NOTE: Since the horn sounds and the parking lights flash, this verifies the BCM is receiving the CAN BUS message from the RF HUB. It also verifies the RF signal for Remote Start from the FOBIK to the RF HUB is operating correctly.

   1. Using the scan tool, check the Remote Start inhibits of the BCM or any ACTIVE DTCs listed in all modules.

      NOTE: Inhibits may be found under the system tests or miscellaneous functions tab. The fuel level may not be a listed inhibit.

      Are there any Remote Start inhibits or any ACTIVE DTCs listed in the entire vehicle?

      Yes

- For any inhibits for a complete list of Remote Start inhibits. Refer to **DIAGNOSIS AND TESTING** .
- For any ACTIVE DTCs, perform the appropriate diagnostic procedure in **DTC INDEX** article.

No

- Check for any related TSBs prior to replacing the BCM. If no related TSBs are found, then replace the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .

4. **RKE FUNCTION SHORT RANGE**
   1. While standing next to the Driver door and using the FOBIK, attempt to lock and unlock the doors.

      Does the RKE function properly?

      Yes

      - Go To 5

      No

      - Go To 7
5. **RKE FUNCTION MID RANGE**
   1. While standing 20 feet from the vehicle and using the FOBIK, attempt to lock and unlock the doors.

      Does the RKE function properly at 20 feet?

      Yes

      - Go To 6

      No

      - Go To 7
6. **RKE FUNCTION LONG RANGE**
   1. While standing 100 feet from the vehicle and using the FOBIK, attempt to lock and unlock the doors.

      Does the RKE function properly at 100 feet?

      Yes

      - Go To 9

No

- Go To 7

7. **FOBIK SIGNAL STRENGTH**
   1. Use the RF Tester 9001 to check the signal strength of the FOBIK.

      Does the FOBIK pass?

      Yes

      - Go To 10

      No

      - Go To 8

8. **CHECKING THE FOBIK**
   1. Replace the battery in the FOBIK with a known good battery and recheck the signal from the FOBIK with the RF Tester 9001.

      Does the FOBIK pass?

      Yes

      - Go To 9

      No

      - Check for any related TSBs prior to replacing the FOBIK. If no related TSBs are found, then replace the FOBIK in accordance with the Service Information. Refer to **TRANSMITTER, INTEGRATED KEY FOB, STANDARD PROCEDURE** .

9. **CHECKING FOR ACTIVE DTCs**

   NOTE: The RKE portion of the FOBIK is operational, this verifies that the RF HUB is capable of receiving signals and communicating to operate the locks.

   1. Use the scan tool to check for ACTIVE DTCs.

      Did the scan tool show any ACTIVE DTCs in the entire vehicle?

      Yes

      - Diagnose the DTCs in accordance with the Service Information before proceeding with the Remote Start Inoperative concern.

      No

- Go To 10

10. **CHECKING THE RF HUB**

NOTE: Even though the RKE function of the system may work with no concern, the BCM is either not receiving a message or is receiving a corrupt message from the RF HUB for remote start operation.

1. While sitting in the driver seat and using the scan tool, monitor the RF HUB on the data display screen for changes when the Remote Start button of the FOBIK is pressed.

   Did the status change when the Remote Start button of the FOBIK was pressed?

   Yes

   - Go To 11

   No

   - Go To 12

11. **CHECKING BCM INHIBITS**

NOTE: The parking lights flash and the horn are inoperative when using the FOBIK, this indicates a faulty BCM or "Inhibit" that may be preventing the start request from occurring.

1. Use the scan tool to check for any Remote Start inhibits listed in the BCM. This may be found under the system tests or miscellaneous functions tab.

   Were there any Remote Start inhibits listed in the BCM?

   Yes

   - Perform the REMOTE START SYSTEM Diagnosing and Testing. Refer to **DIAGNOSIS AND TESTING** .

   No

   - If this has had a Mopar® Accessory kit installed verify the correct Sales Code for Remote Start has been added to Dealer Connect and a Restore Vehicle Configuration has been performed.
   - Confirm the system is enabled; and the temporary Remote Start override is set to disabled in the BCM and contact the Mopar® Accessories group (800-84-Mopar) for further details before proceeding.
   - If this has a factory installed Remote Start, check for any related TSBs prior to replacing the BCM. If no related TSBs are found, then replace the BCM in accordance with the Service

Information.

12. **CHECKING THE REMOTE START ANTENNA**
    1. Cycle the ignition off
    2. Disconnect the Remote Start antenna from the RF Hub.
    3. Using one FOBIK and sitting in the driver's seat, attempt to start the vehicle.

    Did the vehicle start?

    Yes

    - Replace the Remote Start Antenna in accordance with the Service Information.
    - Perform the BODY VERIFICATION TEST. Refer to **BODY VERIFICATION TEST** .

    No

    - Verify all power, ground, communication circuits, & connections to the RF HUB prior to replacing. Refer to **MODULE, RADIO FREQUENCY (RF HUB), REMOVAL** .

2014 ENGINE

Starting - Service Information - Cherokee

DESCRIPTION

STANDARD STARTING SYSTEM

The starting system consists of:

- Starter relay
- Starter motor (including an integral starter solenoid)

Other components to be considered as part of starting system are:

- Battery
- Battery cables
- Ignition switch and key lock cylinder
- Clutch pedal position switch (manual transmission)
- Park/neutral position switch (automatic transmission)
- Neutral Position Sensor (manual transmission with Stop/Start system integrated)
- Wire harnesses and connections.

The Battery, Starting, and Charging systems operate in conjunction with one another, and must be tested as a complete system. For correct operation of starting/charging systems, all components used in these 3 systems must perform within specifications. When attempting to diagnose any of these systems, it is important that you keep their interdependency in mind.

The diagnostic procedures used in this Service Information include the most basic conventional diagnostic methods, to the more sophisticated On-Board Diagnostics (OBD) built into the Powertrain Control Module (PCM). Use of an induction-type milliampere ammeter, volt/ohmmeter, battery charger, carbon pile rheostat (load tester), and 12-volt test lamp may be required.

OPERATION

STANDARD STARTING SYSTEM

When you press the Keyless Go button (KIN Button), a request is sent to RFHM via the private LIN. Once the RFHM receives the request from the KIN it then looks for the valid key via the Passive Entry Module (PEM) antennas. If the RFHM detects a valid key and if the brake is engaged, then the RFHM sets the ignition position to START/CRANK. The BCM then turns the Ignition status to START/CRANK. Then the BCM sends command to turn the vehicle to the CRANK. For an IGNM (Ignition Node Module) vehicle, when the customer turns the key to Start position the RFHM sets the ignition to START/CRANK. The brake pedal status is not required to start the IGNM vehicle but can be started with brake pedal engaged. The BCM then turns the

Ignition status to START/CRANK. Then the BCM sends command to turn the vehicle to the CRANK. The functionality is the same except it is not wirelessly detected. If conditions are correct to start the ECM turn on the high side of the ECM starter relay and turns the Crank Hold Signal to True. If the BCM is still in crank and the Crank Hold is true then the BCM turns on the Low side of the BCM Starter relay and the engine will start cranking. Once the engine started the ECM deactivates the double start over ride. The BCM will then deactivate the starter either when the engine starts or the maximum time has been reach for the tip start (10 sec for Gas and 25 sec for diesel). The RFHM changes the ignition position to RUN if the start type is TIP start or the 5 second time expires or the engine controller indicates the vehicle is not in park or neutral The engine can be manually shut down by the driver with speeds over 5 MPH in any gear.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - STANDARD STARTING SYSTEM

NOTE: **Note: All voltage measurements are with respect to Ground unless otherwise specified. All relay coils checking (between 85 and 86) must be conducted with the respective relays removed.**

No start trouble shooting:

1. Check battery voltage.
2. Check Fuel followed by Fuel pump fuse F21.
3. Turn the ignition to start and complete the following procedures within 10 seconds (TIP start will disable after 10 seconds). Hook up the MM before turning the ignition to start.
4.
    1. Measure the voltage at pin 87 of the ECM relay.
    2. If not measured, remove the BCM and ECM relay. Connect test lamp between PIN 86 of BCM starter relay, PIN 85 of the ECM starter relay and start the car. Confirm the bulb lit up for 10 seconds. If the bulb is lit, the issue is either in starter motor, the starter solenoid, the wiring, loose connection or engine itself. If issue exists go to step 6.
    3. If the measured voltage equals Battery voltage then the Starting relays, BCM and ECM modules are working as designed, if there is no security key violation (The SKIM light will start flashing if there is security key mismatch and a DTC will be set by RFHM.
    4. Quick Check: Turn the radio on and turn the ignition to the start position, if the radio mutes and the car still doesn't start, then assume the issue is with the engine controller, or the engine itself.
5. If the above conditions are true, then issue is either in the starter motor, the starter solenoid, the wiring or can be a loose connection. Follow the procedure 6 to check the wiring from PIN 87 of the ECM relay and the starter solenoid. Go to step 6, If not go to step 11.
6. Connect a multi meter between the starter solenoid terminals and confirm the MM is measuring battery voltage.
7. If the voltage is equal to battery voltage, then the issue must either be in the solenoid, starter or the engine itself. If the issue cannot be identified go to step 8.
8.

   1. Turn the ignition to OFF.
   2. Check the voltage at terminal 30 of the RUN/START relay (T09). If not check for loose battery connection, wiring or the fuse feed to 30.
   3. Turn the ignition to RUN and check the battery voltage at 87 of the T09 relay. If not measured go to step 9.
9. Check the BCM starter relay fuse feed and confirm it is intact.
10. Check BCM relay connections/feed.
11. Turn the ignition to start and complete the following procedures within 10 seconds (TIP start will disable after 10 seconds). Hook up the test lamp before turning the ignition to start.
12. Connect a 12V test lamp between 86 and 85 of the BCM start relay and confirm the blub lights up for 10 seconds. The MM may give a false reading because it is driven by a low side driver.
13. If the 12v test lamp does **not** stay lit for 10 seconds, turn the ignition to the start position and using a DVOM, measure between battery voltage (+) and PIN 86 (-) of the BCM relay. Should read equal to battery voltage.
14. Check ECM relay connections/feed.
15. Turn the ignition to start and complete the following procedures within 10 seconds (TIP start will disable after 10 seconds). Hook up the test lamp before turning the ignition to start.
16. Connect a 12V test lamp between 86 and 85 of the ECM start relay and confirm the blub lights up for 10 seconds.
17. If not start the car and measure them individually.
18. Measure the resistance between the ground and pin 85 of the ECM start relay.

Additional diagnostic checks

1. Check the Ignition sense start line from RFHM to BCM. The vehicle will not start if this line is not intact.
2. The RFHM must detect brake input (Normally Open) to start the KIN (Keyless Ignition Node) car in case of auto trans vehicle.
3. The RFHM must detect clutch input (Normally Open) to start the manual trans vehicle. Check also the clutch output from RFHM to ECM.
4. The RFHM must detect gated park switch to start the car.

CONTROL CIRCUIT TEST

The starter control circuit has:

- Starter motor with integral solenoid
- Starter relay
- Transmission range sensor, or Park/Neutral Position switch with automatic transmissions
- Ignition switch
- Battery
- All related wiring and connections

- Powertrain Control Module (PCM)

CAUTION: Before performing any starter tests, the ignition and fuel systems must be disabled.

- Disable ignition and fuel systems.

STARTER SOLENOID

WARNING: Check to ensure that the transmission is in the park position with the parking brake applied. This may result in personal injury or death.

1. Verify battery condition. Battery must be in good condition with a full charge before performing any starter tests. Refer to Battery Tests. Refer to **DIAGNOSIS AND TESTING - BATTERY SYSTEM** .
2. Perform Starter Solenoid test BEFORE performing the starter **RELAY TEST**.
3. Perform a visual inspection of the starter/starter solenoid for corrosion, loose connections or faulty wiring.
4. Locate and remove the starter relay.
5. Connect a remote starter switch or a jumper wire between the remote battery positive post and terminal 87 of the starter relay connector.
   a. If engine cranks, starter/starter solenoid is good. Go to the Starter **RELAY TEST**.
   b. If engine does not crank or solenoid chatters, check wiring and connectors from starter relay to starter solenoid and from the battery positive terminal to starter post for loose or corroded connections. Particularly at starter terminals.
   c. Repeat test. If engine still fails to crank properly, trouble is within starter or starter mounted solenoid, and replace starter. Inspect the ring gear teeth.

STARTER RELAY

WARNING: Check to ensure that the transmission is in the park/neutral position with the parking brake applied. This may result in personal injury or death.

RELAY TEST

Remove the starter relay as described in this Service Information to perform the following tests:

1. A relay in the de-energized position should have continuity between terminals 87A and 30, and no continuity between terminals 87 and 30. If OK, go to 2. If not OK, replace the faulty relay.
2. Resistance between terminals 85 and 86 (electromagnet) should be 75 ±5 ohms. If OK, go to 3. If not OK, replace the faulty relay.
3. Connect a battery B+ lead to terminals 85 and a ground lead to terminal 86 to energize the relay. The relay should click. Also test for continuity between terminals 30 and 87, and no continuity between

terminals 87A and 30. If OK, refer to Relay Circuit Test procedure. If not OK, replace the faulty relay.

CAV	FUNCTION
30	B (+)
85	IGNITION SWITCH OUTPUT
86	PCM-CONTROLLED GROUND
87	STARTER RELAY OUTPUT
87A	NO CONNECT

RELAY CIRCUIT TEST

1. The relay common feed terminal cavity (30) is connected to battery voltage and should be hot at all times. If OK, go to 2. If not OK, repair the open circuit to the PDC fuse as required.
2. The relay normally closed terminal (87A) is connected to terminal 30 in the de-energized position, but is not used for this application. Go to 3.
3. The relay normally open terminal (87) is connected to the common feed terminal (30) in the energized position. This terminal supplies battery voltage to the starter solenoid field coils. There should be continuity between the cavity for relay terminal 87 and the starter solenoid terminal at all times. If OK, go to 4. If not OK, repair the open circuit to the starter solenoid as required.
4. The coil battery terminal (85) is connected to the electromagnet in the relay. It is energized when the ignition switch is held in the Start position and the clutch pedal is depressed (manual trans). Check for battery voltage at the cavity for relay terminal 86 with the ignition switch in the Start position and the clutch pedal is depressed (manual trans), and no voltage when the ignition switch is released to the On position. If OK, go to 5. If not OK, check for an open or short circuit to the ignition switch and repair, if required. If the circuit to the ignition switch is OK, see the **IGNITION SWITCH**.
5. The coil ground terminal (86) is connected to the electromagnet in the relay. It is grounded by the PCM if the conditions are right to start the car. For automatic transmission cars, the PCM must see Park Neutral switch low and near zero engine speed (RPM). For manual transmission cars, the PCM only needs to see near zero engine speed (RPM) and low clutch interlock input and see near zero engine speed (RPM). To diagnose the Park Neutral switch of the transmission range sensor refer to the **C635 MANUAL TRANSMISSION - SERVICE INFORMATION** . Check for continuity to ground while the ignition switch is in the start position and if equipped the clutch pedal depressed. If not OK and the vehicle has an automatic transmission verify Park Neutral switch operation. If that checks OK check for continuity between PCM and the terminal 86. Repair open circuit as required. Also check the clutch interlock switch

operation if equipped with a manual transmission. If OK, the PCM may be defective.

SAFETY SWITCHES

For diagnostics of the Transmission Range Sensor, refer to the appropriate Transmission article for more information.

If equipped with Clutch Interlock/Upstop Switch, refer to **DIAGNOSIS AND TESTING** in the Clutch System article.

IGNITION SWITCH

After testing starter solenoid and relay, test ignition switch and wiring. Refer to the **IGNITION SYSTEM - SERVICE INFORMATION** or **SYSTEM WIRING DIAGRAMS** article for more information. Check all wiring for opens or shorts, and all connectors for being loose or corroded.

BATTERY

For battery diagnosis and testing, refer to **DIAGNOSIS AND TESTING - BATTERY SYSTEM** for procedures.

ALL RELATED WIRING AND CONNECTORS

Refer to **SYSTEM WIRING DIAGRAMS** article for more information.

FEED CIRCUIT RESISTANCE TEST

Before proceeding with this operation, review Diagnostic Preparation and Starter Feed Circuit Tests. The following operation will require a voltmeter, accurate to 1/10 of a volt.

CAUTION: Ignition and Fuel systems must be disabled to prevent engine start while performing the following tests.

1. To disable the Ignition and Fuel systems, disconnect the Automatic Shutdown Relay (ASD).
2. Gain access to battery terminals.
3. With all wiring harnesses and components properly connected, perform the following:
   a. Connect the negative lead of the voltmeter to the battery negative post, and positive lead to the battery negative cable clamp. Rotate and hold the ignition switch in the START position. Observe the voltmeter. If voltage is detected, correct poor contact between cable clamp and post.
   b. Connect positive lead of the voltmeter to the battery positive post, and negative lead to the battery positive cable clamp. Rotate and hold the ignition switch key in the START position. Observe the voltmeter. If voltage is detected, correct poor contact between the cable clamp and post.
   c. Connect negative lead of voltmeter to battery negative terminal, and positive lead to engine block near the battery cable attaching point. Rotate and hold the ignition switch in the START position. If voltage reads above 0.2 volt, correct poor contact at ground cable attaching point. If voltage reading

is still above 0.2 volt after correcting poor contacts, replace ground cable.

d. Connect positive voltmeter lead to the starter motor housing and the negative lead to the battery negative terminal. Hold the ignition switch key in the START position. If voltage reads above 0.2 volt, correct poor starter to engine ground.

e. Connect the positive voltmeter lead to the battery positive terminal, and negative lead to battery cable terminal on starter solenoid. Rotate and hold the ignition switch in the START position. If voltage reads above 0.2 volt, correct poor contact at battery cable to solenoid connection. If reading is still above 0.2 volt after correcting poor contacts, replace battery positive cable.

f. If resistance tests do not detect feed circuit failures, replace the starter motor.

STARTING SYSTEM TEST

For circuit descriptions and diagrams, refer to the **SYSTEM WIRING DIAGRAMS** article .

WARNING: On vehicles equipped with airbags, refer to the RESTRAINTS - SERVICE INFORMATION article before attempting steering wheel, steering column, or instrument panel component diagnosis or service. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury.

STARTING SYSTEM DIAGNOSIS

CONDITION	POSSIBLE CAUSE	CORRECTION
STARTER FAILS TO ENGAGE.	1. Battery discharged or faulty.	1. Refer to **DIAGNOSIS AND TESTING - BATTERY SYSTEM** for more information. Charge or replace battery, if required.
	2. Starting circuit wiring faulty.	2. Refer to **FEED CIRCUIT RESISTANCE TEST** .
	3. Starter relay faulty.	3. Refer to **RELAY TEST**. Replace relay, if necessary.
	4. Ignition switch faulty.	4. Refer to ignition switch test, in the **IGNITION SYSTEM - SERVICE INFORMATION** or **SYSTEM WIRING DIAGRAMS** article. Replace switch, if necessary.
	5. Park/neutral position switch (auto trans) faulty or mis-adjusted.	5. Refer to **948TE AUTOMATIC TRANSMISSION - SERVICE INFORMATION** for more information. Replace switch, if necessary.
	6. Clutch interlock switch (man trans) faulty.	6. Refer to **DIAGNOSIS AND TESTING - CLUTCH PEDAL POSITION SWITCH** . Replace switch, if necessary.
	7. Starter solenoid faulty.	7. Refer to **STARTER SOLENOID** . Replace starter assembly, if necessary.
	8. Starter assembly faulty.	8. If all other starting system components and circuits check ok, replace starter assembly.
	9. Faulty teeth on ring gear.	9. Rotate flywheel 360°, and inspect teeth and ring gear replaced if damaged.

	10. PCM double start override output failure.	10. Refer to **CHECKING THE PCM POWER AND GROUND CIRCUITS** . Check for continuity between PCM and terminal 85. Repair open circuit as required. If ok, PCM may be defective.
STARTER ENGAGES, FAILS TO TURN ENGINE.	1. Battery discharged or faulty.	1. Refer to the **BATTERY SYSTEM - SERVICE INFORMATION** for more information. Charge or replace battery as necessary.
	2. Starting circuit wiring faulty.	2. Refer to the **FEED CIRCUIT RESISTANCE TEST** . Repair as necessary.
	3. Starter assembly faulty.	3. If all other starting system components and circuits check ok, replace starter assembly.
	4. Engine seized.	4. Refer to the appropriate Engine Service Information article for diagnostic and service procedures.
	5. Loose connection at battery, PDC (Diesel Only), TIPM, starter, or engine ground.	5. Inspect for loose connections.
	6. Faulty teeth on ring gear.	6. Rotate flywheel 360°, and inspect teeth and ring gear replaced if damaged.
STARTER ENGAGES, SPINS OUT BEFORE ENGINE STARTS.	1. Broken teeth on starter ring gear.	1. Remove starter. Inspect ring gear and replace if necessary.
	2. Starter assembly faulty.	2. If all other starting system components and circuits check ok, replace starter assembly.
STARTER DOES NOT DISENGAGE.	1. Starter improperly installed.	1. Install starter. Tighten starter mounting hardware to correct torque specifications.
	2. Starter relay faulty.	2. Refer to **RELAY TEST**. Replace relay, if necessary.
	3. Ignition switch faulty.	3. Refer to **IGNITION SYSTEM - SERVICE INFORMATION** . Replace switch, if necessary.
	4. Starter assembly faulty.	4. If all other starting system components and circuits check ok, replace starter assembly.
	5. Faulty teeth on ring gear.	5. Rotate flywheel 360°, and inspect teeth and ring gear replaced if damaged.

INSPECTION

Before removing any unit from the starting system for repair or diagnosis, perform the following inspections:

- **Battery** - Visually inspect the battery for indications of physical damage and loose or corroded cable connections. Determine the state-of-charge and cranking capacity of the battery. Charge or replace the battery, if required. Refer to the **BATTERY SYSTEM - SERVICE INFORMATION** for more information.
- **Ignition Switch** - Visually inspect the ignition switch for indications of physical damage and loose or corroded wire harness connections.

- **Transmission Range Sensor or Park/Neutral Switch** - Visually inspect the transmission range sensor for indications of physical damage and loose or corroded wire harness connections.
- **Starter Relay** - Visually inspect the starter relay for indications of physical damage and loose or corroded wire harness connections.
- **Starter Motor** - Visually inspect the starter motor for indications of physical damage and loose or corroded wire harness connections.
- **Starter Solenoid** - Visually inspect the starter solenoid for indications of physical damage and loose or corroded wire harness connections.
- **Wiring** - Visually inspect the wire harness for damage. Repair or replace any faulty wiring, as required. Check for loose or corroded wire harness connections at main engine ground and remote jump post.

Courtesy of CHRYSLER GROUP, LLC

9. Remove bolt (1, 2) and the starter motor (3)

2.4L

Fig. 7: Upper Starter Bolt

Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the battery negative cable.
2. Loosen the upper starter bolt (1).

NOTE: The bolt will not be able to be removed due to lack of clearance.

3. Remove the intake manifold assembly Refer to **MANIFOLD, INTAKE, REMOVAL** .

Fig. 8: Removing/Installing Starter
Courtesy of CHRYSLER GROUP, LLC

4. Remove the 12 volt feed cable (1).
5. Disconnect the ignition feed connector.
6. Remove the lower starter bolt (3).
7. Remove the starter (4) from the block (5).

3.2L

Fig. 9: Removing/Installing Catalytic Converter
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Raise and support the vehicle.
3. Remove the catalytic converter (3). Refer to **CONVERTER, CATALYTIC , REMOVAL** .

Fig. 10: Starter Solenoid Electrical Connector, Solenoid Stud, Starter Mounting Bolts & Starter Assembly
Courtesy of CHRYSLER GROUP, LLC

4. Disconnect the starter solenoid electrical connector (1) from the starter solenoid terminal.
5. Remove the battery cable nut and battery cable from the solenoid stud (2).

6. Remove the starter mounting bolts (4).
7. Remove the starter assembly (3) from the transmission.

INSTALLATION

2.0L DIESEL

Fig. 11: Lower Starter Mounting Stud Bolt, Center Starter Mounting Bolt & Starter
Courtesy of CHRYSLER GROUP, LLC

1. Install the starter (3). Tighten bolts (1, 2) to 24 N.m (18 ft. lbs.).

Fig. 12: B+ Cable Retainer
Courtesy of CHRYSLER GROUP, LLC

2. Install the B+ on the starter solenoid stud. Tighten Nut (1) to 10 N.m (89 in. lbs.).
3. Install the ground cable onto bottom stud. Tighten nut (2) to 10 N.m (89 in. lbs.).
4. Install the cable bracket on upper stud. Tighten nut (3) to 10 N.m (89 in. lbs.).
5. Connect the solenoid connector to the starter.

Fig. 13: Removing/Installing Starter
Courtesy of CHRYSLER GROUP, LLC

6. Install the belly pan (2) and securely tighten bolts (3).
7. Lower the vehicle.
8. Connect the negative battery cable.

2.4L

Fig. 14: Removing/Installing Starter
Courtesy of CHRYSLER GROUP, LLC

1. Install the starter into position.
2. Start the upper bolt by hand.
3. Start the lower bolt by hand.
4. Tighten the upper and lower bolts to 54 N.m (40 ft. lbs.).

Fig. 15: Electrical Connector, Battery Positive Cable Nut & Engine
Courtesy of CHRYSLER GROUP, LLC

5. Install the battery cable (2) onto the starter and install the nut. Torque the nut to 10 N.m (90 in. lbs.).
6. Reconnect the starter electrical connector (1).
7. Install the intake manifold assembly Refer to **MANIFOLD, INTAKE, INSTALLATION** .

   .

8. Reconnect the negative battery cable.

3.2L

Fig. 16: Starter Solenoid Electrical Connector, Solenoid Stud, Starter Mounting Bolts & Starter Assembly

1. Position the starter (3) inside the transmission.
2. Install the starter mounting bolts (4) and tighten to 55 N.m (41 ft. lbs.).
3. Connect the starter solenoid electrical connector (1) to starter solenoid terminal.
4. Install the battery cable and nut to the solenoid stud (2). Tighten the nut to 10 N.m (86 in. lbs.).

Fig. 17: Removing/Installing Catalytic Converter
Courtesy of CHRYSLER GROUP, LLC

5. Install the catalytic converter (3). Refer to **CONVERTER, CATALYTIC , INSTALLATION** .

6. Lower the vehicle.
7. Connect the negative battery cable and tighten nut to 5 N.m (4.5 in. lbs.).

ANTENNA, REMOTE START

DESCRIPTION

DESCRIPTION

The Remote Start Antenna Module Assembly consists of an electrical connection to the Radio Frequency Hub (RF Hub), a short length of coaxial cable with a connection to the RF HUB, two mounting clips, and the control module/antenna. The antenna is located in the rear cargo area next to the RF HUB assembly concealed by the headliner. The antenna which is printed on a circuit board in an enclosed plastic housing that is fed regulated 5v DC (+/-5%) via the attached coaxial cable pigtail. The Remote Start Antenna captures radiated RF signals that are transmitted from the Key FOB transmitter throughout the intended broadcast bands. The RF signal captured is then amplified and sent to the desired receiver/tuner.

OPERATION

OPERATION

The Remote Start Antenna is used for receive the signal from the remote key. The antenna captures radiated RF signals that are transmitted from the Key FOB transmitter throughout the intended broadcast bands. The RF signal captured is then amplified and sent to the Remote Frequency Hub Module (RFHUB).

REMOVAL

REMOVAL

Fig. 18: Removing/Installing Remote Start Antenna
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Lower the rear of the headliner. Refer to **HEADLINER, REMOVAL** .
3. Disconnect the remote start antenna connector (3) from the Radio Frequency Hub (RF Hub) (4).
4. Remove the two fasteners (1) securing the remote start antenna (2) to the roof.

INSTALLATION

INSTALLATION

Fig. 19: Removing/Installing Remote Start Antenna
Courtesy of CHRYSLER GROUP, LLC

1. Position the remote start antenna (2) to its mounting surface and secure the antenna using two fasteners (1).
2. Connect the remote start connector (3) to the RF Hub (4).
3. Install the headliner. Refer to **HEADLINER, INSTALLATION** .
4. Connect the negative battery cable.
5. Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

NOTE: **If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.**

SYSTEM, START STOP

DESCRIPTION

STOP START SYSTEM

The Stop-Start system automatically stops and starts the engine when certain conditions are met to improve fuel economy and lower CO2 emissions.

The primary input for manual transmission vehicles to an autostop is zero vehicle speed with the transmission in neutral and the clutch pedal released, while the primary input to autostarting is depression of the clutch pedal. The primary input for an automatic transmission vehicle to gain an autostop is zero vehicle speed with the brake pedal depressed, while the primary input to autostarting is release of the brake pedal. Many secondary inputs determine if it is acceptable to autostop and autostart. A number of devices on the vehicle are added or improved to support the Stop-Start function.

- **Voltage Stabilization Module (VSM)**

  - This component is required to maintain system voltage during Start events. This also provides a buffer for the vehicles ECU's when battery power is being sent to the starter for cranking.

- **InRush Current Relay (ICR)** - This component works in conjunction with the VSM in order to prevent voltage dips.
- **High Durability Starter** - This is a modified starter used for the Stop Start system. Changes are hardened gears with lead in chamfer, a spring pinion (Diesel), reinforced castings, a higher power motor, long-life brushes, precision bearings and motor shaft.
- **Advanced Glass Mat (AGM) Battery with High Durability Battery Cables** - The AGM type battery and the high durability cables are capable of withstanding the increased cycling that a stop/start vehicle will experience.
- **Generator** - A 220a generator that is up-sized specifically for use with the stop/start system.
- **Intelligent Battery Sensor (IBS)** - The IBS is responsible for measuring the state-of-charge. It will also predict voltage and capacity (ah) for future crank events. The IBS is also responsible for measuring battery temperature and alternator voltage current.
- **Transmission Neutral Sensor (MTX Only)** - This is located on the transmission selector cable.
- **Powertrain Control Module (PCM)** - The PCM monitors conditions for STOP/START.

The Battery, Starting, and Charging systems operate in conjunction with one another, and must be tested as a complete system. For correct operation of starting/charging systems, all components used in these 3 systems must perform within specifications. When attempting to diagnose any of these systems, it is important that you keep their interdependency in mind.

The diagnostic procedures used in this Service Information include the most basic conventional diagnostic methods, to the more sophisticated On-Board Diagnostics (OBD) built into the Powertrain Control Module (PCM). Use of an induction-type milliampere ammeter, volt/ohmmeter, battery charger, carbon pile rheostat (load tester), and 12-volt test lamp may be required.

Certain starting system components are monitored by the PCM and may produce a Diagnostic Trouble Code (DTC).

OPERATION

OPERATION

Primary Autostop Enablers - Brake pedal depressed (automatic transmission). Shifter/transmission in neutral and clutch pedal released (manual transmissions).

Secondary Autostop Enablers - Vehicle speed, coolant temperature, hood closed, doors closed, driver's seat belt latched, interior climate and settings, battery state and energy demand, steering wheel angle, steering wheel torque, ambient temperature, time and speed since last autostop, transfer case position, and ESC status, No stop-start related faults present.

Autostop Events

- Autostop state broadcast on CAN Buss
- Cluster telltale illuminates.
- EVIC displays message indicating autostop.
- Engine shutdown begins.

As the engine slows it passes through three phases:

- Fuel and spark restart permissible.
- Restart prohibited.
- Restart permitted, based on start system employed.

Autostart requests are evaluated throughout the autostop event.

When in autostop:

- Instrument cluster stop/start telltale remains illuminated.
- EVIC displays the autostop state message.
- Body controller starter relay is energized providing the engine controller with direct starter control.

Vehicle Function:

- Consumer electronics continue to function in a normal manner.
- HVAC fan speed and other setting adjusted to maximize cabin comfort and autostop duration (based on climate control settings and conditions).
- Electric Power Steering (EPS) maintained during autostop, possibly with reduced maximum assist.

System Requested Autostarts:

- Battery State
- Brake Vacuum
- Climate control stress
- Vehicle speed
- Steering wheel angle or torque
- Transmission selector position.

Stop-Start Disable (while autostopped)

- Vehicle systems monitored that may disable stop-start (requiring a key restart if in autostop) include: hood opened, occupant sensing indicating driver not present, unsafe gear shift position for autostart and critical system faults.

Autostart Decision:

- All autostart enablers present
- Brake pedal released or shifter place in reverse (automatic transmissions)
- Clutch pedal depressed past the up-stop position (manual transmission)
- Throttle pedal depressed

Autostart Events:

- Autostart state broadcasted on the CAN Bus
- instrument cluster stop/start telltale illumination cancelled
- EVIC display changed to previous EVIC message (outside temp and compass, etc.)
- VSMs are placed in voltage conditioning mode
- Hill Assist requested
- Starter relay commanded to initiate cranking
- Engine achieves idle speed

Launch Events:

- Automatic transmission clutches engaged
- Hill assist released
- Climate control returned to pre-autostop conditions
- Stop-Start Ready state broadcast on the CAN Bus
- Embedded EVIC stop-start message indicating "Stop/Start Ready"

Planned Autostart (Engine On) Enable Conditions:
1. Valid target gear and brake switch pressure condition
2. Completed initial engine key start

3. Occupant sensing allow engine start condition met
4. OBD allow engine start condition met
5. Vehicle hood not Ajar

Potential Autostop (Engine Off) Enable Conditions:
1. Tow Haul mode not active
2. Steering wheel angle within defined range
3. Steering wheel angle gradient within defined range
4. Steering column torque within defined range
5. Battery health state of function greater than threshold

Planned Autostop (Engine Off) Enable Conditions:
1. Valid target gear and brake switch pressure state combination
2. Threshold vehicle speed exceeded or timed-out since last shift out of reverse
3. Transmission ready
4. 4WD Low mode not active
5. Starter cool down condition met after reaching max allowable consecutive restarts
6. Ambient temperature within defined range
7. Engine coolant temperature within defined range
8. Catalyst temperature within defined range
9. Battery temperature within defined range
10. Barometric pressure greater than threshold
11. Brake booster delta pressure less than threshold
12. Fuel level greater than threshold
13. Vehicle hood not Ajar
14. No throttle request
15. No engine stop inhibit request by HVAC
16. Battery state of charge greater than threshold
17. Battery voltage state of function greater than threshold
18. Engine speed less than threshold
19. Vehicle speed less than threshold
20. Threshold vehicle speed exceeded since last engine start
21. Occupant sensing allow engine stop condition met
22. OBD allow engine stop condition met
23. Engine runtime greater than threshold
24. Stop-Start "Off" switch not activated
25. Flex fuel learn mode not active
26. ABS brake event not present

EVIC Pop Up Messages Displayed on the EVIC

- EVIC message states Stop/Start Autostop Active

- No Chime
- Normal Use
- Pop-up maintained for 5 seconds
- Displays with green hard telltale

Stop/Start To Restart Press

- Single Chime
- Driver put gear shift in gear without using Clutch; customer needs to return to Neutral or fully depress clutch pedal
- Pop up maintained for 5 seconds

Stop/Start Restart Required Fault Detected

- Single Chime
- MIL or ESS system fault preventing safe state confirmation during autostop.

EVIC Pop Up Messages Displayed within EVIC "Ring" menu

Stop/Start Ready

- Stop-Start conditions met to enable engine stop.

Stop/Start Off

- Stop-Start turned off by the customer at the switch

Stop/Start Not Ready

- Stop-Start conditions are not met to enable engine stop (ex: HVAC settings, engine temperature, etc.)

Stop/Start Not Ready Steering Wheel Turned

- Stop-Start condition not met with steering wheel turned past calibratable angle

DIAGNOSIS AND TESTING

STOP START SYSTEM DIAGNOSIS

For diagnostics of the starting system, refer to **DIAGNOSIS AND TESTING**.

For diagnostics of the Stop Start system, the scan tool can be used to review the inhibitor menu to help root cause a potential Stop Start concern.

Possible Reasons The Engine Does Not AUTO STOP

Prior to engine shut down, the system will check many safety and comfort conditions to see if they are fulfilled. In following situations the engine will not stop:

- Driver's seat belt is not buckled
- Outside temperature is less than 1°F (-17°C) or greater than 104°F (40°C)
- Actual cabin temperature is significantly different than temperature set on Auto HVAC
- HVAC is set to full defrost mode
- Engine has not reached normal operating temperature
- Battery discharged
- When driving in REVERSE
- Hood is open
- Vehicle is in 4LO transfer case mode

It may be possible for the vehicle to be driven several times without the STOP/START system going into a STOP/START READY state under more extreme conditions of the items listed above.

For a more technical and detailed explanation of AutoStop, review the following inhibitors.

When it comes to Stop Start, we allow AutoStop event if:

- Accelerator pedal is in the rest position.
- HVAC Control allows an auto stop event. The AC load can not be in a high demand mode of operation
- Battery state (charge 65%, function 8 volts, health 40 ampere hour) is within an acceptable range.
- Current master cylinder brake pressure exceeds the required HSA brake pressure and is sufficient to hold the vehicle on a grade.
- Electronic Stability Control (ECS) is not requesting control.
- Fuel level is greater than the minimum fuel level threshold.
- Both hood switches indicate the hood is closed.
- Predefined OBD faults are not present.
- Vehicle occupants are not attempting a vehicle exit maneuver.
- Absolute Barometric Pressure is within range. Barometric pressure is greater then a minimum of 605 kPa.
- Brake Booster is sufficient to maintain master cylinder pressure with current applied pedal force. Minimum 205 kPa
- Starter motor engagement has not exceeded prescribed frequency use.
- Vehicle speed is 0
- Steering angle has not exceeded the prescribed range.
- Steering torque is less than the prescribed value.
- Ambient Air Temperature is within the prescribed range (-10F - 110F).

- Catalyst temperature is within the prescribed range (150F - 950F)
- Coolant temperature is within the prescribed range.
- Engine oil temperature is within the prescribed range (40C - 110C).
- Anti-lock brake system is not active.
- Transfer case is not in 4WDLO
- Vehicle is not in tow haul mode.
- Vehicle is in valid target gear and brake switch combination.
- Threshold vehicle speed exceeded or timeout since last shift out of reverse.
- Transmission ready.
- Battery temperature is within the prescribed range (-256F - 256F).
- Engine speed is below a set threshold of 1000 RPM.
- Engine runtime is greater then threshold of 3 seconds.
- Start Stop disable switch is not active.
- Flex fuel learn mode is not active.
- Vehicle is not on a grade.
- Threshold vehicle speed exceeded since last engine start is 8 mph.

Conditions that will cause the engine to start automatically while in STOP/START AUTO STOP ACTIVE mode:

- Actual cabin temperature is significantly different than temperature set in Auto HVAC.
- HVAC is set to full defrost mode.
- STOP/START AUTO STOP TIME ACTIVE exceeds 5 minutes.
- Battery Voltage drops too low.
- Low brake vacuum e.g. after several brake pedal applications.
- Vehicle is moving faster then 3 mph (5 km/h)
- STOP/START OFF switch is pressed.
- 4WD is put into 4LO mode.

We allow Stop Start AutoStarts to occur when any of the conditions are made active:

- Accelerator pedal is in the "rest" position.
- HVAC Control is allows an Auto Stop event.
- Battery State (charge, function, health) is within acceptable range.
- Current master cylinder brake pressure exceeds the required HSA brake pressure and is sufficient to hold the vehicle on a grade.
- Electronic Stability Control system is not requesting control.
- Fuel Level is greater than the minimum fuel level threshold.
- Both hood switches indicate hood is closed.

- Predefined OBD faults are not present.
- Vehicle occupants are not attempting a vehicle exit maneuver.
- Absolute Barometric Pressure is within range.
- Brake Booster Pressure is sufficient to maintain master cylinder pressure with current applied pedal force.
- Starter motor engagement has not exceeded prescribed frequency of use.
- Vehicle speed is 0.
- Steering Angle has not exceeded the prescribed range.
- Steering Torque is less than the prescribed value.
- Ambient Air Temperature is within the prescribed range.
- Catalyst Temperature is within the prescribed range.
- Coolant Temperature is within the prescribed range.
- Engine Oil Temperature is within the prescribed range.
- Anti-Lock Brake System is not active.
- Transfer Case Mode is not in 4WDLO.
- Vehicle is not in TOW-HAUL mode.
- Vehicle is in valid target gear and brake switch state combination
- Threshold vehicle speed exceeded or timeout since last shift out of reverse
- Transmission ready
- Battery temperature is within the prescribed range
- Engine speed is below a set threshold
- Threshold vehicle speed exceeded since last engine start
- Engine runtime greater than threshold
- Stop-Start disable switch is not Active
- Flex fuel learn mode not active
- Vehicle is not on a grade.

We allow Stop Start AutoStarts to occur when any of the conditions are made active:

- Accelerator pedal is not in the "rest" position.
- HVAC Control is active.
- Battery State (charge, function, health) is out of range.
- Current master cylinder brake pressure does not have enough HSA brake pressure.
- Electronic Stability Control system is requesting control.
- Fuel Level is lower than the minimum fuel level threshold.
- One or both hood switches indicate hood is open.
- Predefined OBD faults are present.
- Absolute Barometric Pressure is out of range.
- Brake Booster Pressure is insufficient to maintain master cylinder pressure with current applied pedal

force.
- Starter motor engagement has exceeded prescribed frequency of use.
- Vehicle speed is above 0.
- Steering Angle has exceeded the prescribed range.
- Steering Torque is more than the prescribed value.
- Ambient Air Temperature is outside the prescribed range.
- Catalyst Temperature is outside the prescribed range.
- Coolant Temperature is outside the prescribed range.
- Engine Oil Temperature is outside the prescribed range.
- Anti-Lock Brake System is active.
- Transfer Case Mode is in 4WDLO.
- Vehicle is in TOW-HAUL mode.
- Transmission not ready
- Battery temperature is out of the prescribed range
- Stop-Start disable switch is Active
- Flex fuel learn mode is active

The above conditions can restart the vehicle as long as:

1. Completed initial engine key start.
2. Occupant sensing allow engine start condition met.
3. OBD allow engine start condition met.
4. Vehicle hood closed.

System Malfunction:

If there is a malfunction in the STOP/START system, the system will not shut down the engine. A SERVICE STOP/START SYSTEM message will appear in the EVIC.

SENSOR, NEUTRAL POSITION

DESCRIPTION

DESCRIPTION

Fig. 20: Neutral Position Sensor
Courtesy of CHRYSLER GROUP, LLC

The Neutral Position Sensor (NPS) (1) is a component of the automatic stop/start feature on KL platform vehicles with manual transmissions. It is located on the transmission shift cable and it is only serviced by replacing the shift cable assembly.

OPERATION

OPERATION

The purpose of the Neutral Position Sensor (NPS) is to provide an output from the sensor to a controller concerning gear range position. On vehicles equipped with a manual transmission, the shift cable position is interpreted by the controller from the NPS to determine if the transmission is in neutral or in some gear range, for the purpose of determining when the stop/start system can safely restart the vehicle without the clutch pedal being depressed. The switch outputs a PWM signal whose percentage of duty cycle corresponds to the ranged denoted in Neutral, in a gear range, or as a fault value. The NPS is attached to shift cable such that it is nominally outputting 50% duty cycle at or when the vehicle is shifted to Neutral. Higher or lower duty cycle outputs are denoted as the magnet on the shift cable moves with respect to the NPS when the vehicle is shifted to gear range positions.

The NPS receives an Input of 5 volts excitation, has a common ground and outputs Pulse-width modulated signal to the controller.

Outputs reading less than 5% or more than 95% of duty cycle will trigger diagnostic trouble codes. Outputs reading between 5-25% or 75-95% represent in-gear positions and outputs readings between 25-75% represent Neutral position. Check that the sensor is attached properly to shift cable (inside the center console, at the shifter) and that wiring lead is attached to wiring harness coming up from rearward in vehicle from shifter. Check that the shift cable is properly attached to shifter and transmission ends to levers and load reaction points. With a jumper, voltages from the sensor input and output can be read with a voltmeter and compared with

expected values. As an example, 90% of 5 volts is 4.5 Volts, so if you read 4.5 volts, the transmission has been shifted into a gear range.

This NPS is not available to order as a standalone component. To obtain the NPS, the Shift Cable assembly will need to be ordered.

REMOVAL

REMOVAL

The Neutral Position Sensor (NPS) can only be replaced by replacing the gear shift control cable. (Refer to **CABLE, GEARSHIFT CONTROL - REMOVAL**).

INSTALLATION

INSTALLATION

The Neutral Position Sensor (NPS) is installed as an assembly with the gear shift control cable. (Refer to **CABLE, GEARSHIFT CONTROL - INSTALLATION**).

RELAY, IN-RUSH CURRENT REDUCTION

DESCRIPTION

DESCRIPTION

In-rush Current Reduction Relay

Fig. 21: In-Rush Current Reduction (ICR) Relay Module
Courtesy of CHRYSLER GROUP, LLC

The In-rush Current Reduction (ICR) Relay Module is intended to reduce the in-rush current drawn by the starter motor during the initial stage of the crank sequence, thus maintaining an adequate voltage level and allowing critical electrical/electronic systems to function without interruption, or reset. At the same time, the relay will allow sufficient current and voltage to reach the starter motor, to allow cranking the engine at an adequate speed, so that the engine can generate the air-fuel mixture necessary for self-sustained operation, even under adverse conditions.

This component is mounted to a bracket that mounts to the top of the starter assembly. The relay is serviceable and is shipped along with a bracket that secures the ICR.

OPERATION

OPERATION

In-Rush Current Reduction Relay.

Within the ICR relay, prior to the starter motor solenoid's contact closure, the shorting bar opens contacts, thus routing the starter motor current through a resistor bar (10 mOhm for V6 Pentastar). The increase in series resistance reduces/eliminates the initial current spike (or, inrush current) and reduces the consequent voltage drop. After a set time (185 msec), the power to the ICR relay is cut, the shorting bar closes the contacts, removing the resistor bar from the circuit and restoring full power to the starter motor. At this point, there is a rebound of the current surge and subsequent drop in voltage; however, neither is as intense as they would be would be without initial jump in resistance.

2014 ENGINE

Starting - Service Information - Cherokee

DESCRIPTION

STANDARD STARTING SYSTEM

The starting system consists of:

- Starter relay
- Starter motor (including an integral starter solenoid)

Other components to be considered as part of starting system are:

- Battery
- Battery cables
- Ignition switch and key lock cylinder
- Clutch pedal position switch (manual transmission)
- Park/neutral position switch (automatic transmission)
- Neutral Position Sensor (manual transmission with Stop/Start system integrated)
- Wire harnesses and connections.

The Battery, Starting, and Charging systems operate in conjunction with one another, and must be tested as a complete system. For correct operation of starting/charging systems, all components used in these 3 systems must perform within specifications. When attempting to diagnose any of these systems, it is important that you keep their interdependency in mind.

The diagnostic procedures used in this Service Information include the most basic conventional diagnostic methods, to the more sophisticated On-Board Diagnostics (OBD) built into the Powertrain Control Module (PCM). Use of an induction-type milliampere ammeter, volt/ohmmeter, battery charger, carbon pile rheostat (load tester), and 12-volt test lamp may be required.

OPERATION

STANDARD STARTING SYSTEM

When you press the Keyless Go button (KIN Button), a request is sent to RFHM via the private LIN. Once the RFHM receives the request from the KIN it then looks for the valid key via the Passive Entry Module (PEM) antennas. If the RFHM detects a valid key and if the brake is engaged, then the RFHM sets the ignition position to START/CRANK. The BCM then turns the Ignition status to START/CRANK. Then the BCM sends command to turn the vehicle to the CRANK. For an IGNM (Ignition Node Module) vehicle, when the customer turns the key to Start position the RFHM sets the ignition to START/CRANK. The brake pedal status is not required to start the IGNM vehicle but can be started with brake pedal engaged. The BCM then turns the

Ignition status to START/CRANK. Then the BCM sends command to turn the vehicle to the CRANK. The functionality is the same except it is not wirelessly detected. If conditions are correct to start the ECM turn on the high side of the ECM starter relay and turns the Crank Hold Signal to True. If the BCM is still in crank and the Crank Hold is true then the BCM turns on the Low side of the BCM Starter relay and the engine will start cranking. Once the engine started the ECM deactivates the double start over ride. The BCM will then deactivate the starter either when the engine starts or the maximum time has been reach for the tip start (10 sec for Gas and 25 sec for diesel). The RFHM changes the ignition position to RUN if the start type is TIP start or the 5 second time expires or the engine controller indicates the vehicle is not in park or neutral The engine can be manually shut down by the driver with speeds over 5 MPH in any gear.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - STANDARD STARTING SYSTEM

NOTE: **Note: All voltage measurements are with respect to Ground unless otherwise specified. All relay coils checking (between 85 and 86) must be conducted with the respective relays removed.**

No start trouble shooting:

1. Check battery voltage.
2. Check Fuel followed by Fuel pump fuse F21.
3. Turn the ignition to start and complete the following procedures within 10 seconds (TIP start will disable after 10 seconds). Hook up the MM before turning the ignition to start.
4.
    1. Measure the voltage at pin 87 of the ECM relay.
    2. If not measured, remove the BCM and ECM relay. Connect test lamp between PIN 86 of BCM starter relay, PIN 85 of the ECM starter relay and start the car. Confirm the bulb lit up for 10 seconds. If the bulb is lit, the issue is either in starter motor, the starter solenoid, the wiring, loose connection or engine itself. If issue exists go to step 6.
    3. If the measured voltage equals Battery voltage then the Starting relays, BCM and ECM modules are working as designed, if there is no security key violation (The SKIM light will start flashing if there is security key mismatch and a DTC will be set by RFHM.
    4. Quick Check: Turn the radio on and turn the ignition to the start position, if the radio mutes and the car still doesn't start, then assume the issue is with the engine controller, or the engine itself.
5. If the above conditions are true, then issue is either in the starter motor, the starter solenoid, the wiring or can be a loose connection. Follow the procedure 6 to check the wiring from PIN 87 of the ECM relay and the starter solenoid. Go to step 6, If not go to step 11.
6. Connect a multi meter between the starter solenoid terminals and confirm the MM is measuring battery voltage.
7. If the voltage is equal to battery voltage, then the issue must either be in the solenoid, starter or the engine itself. If the issue cannot be identified go to step 8.
8.

   1. Turn the ignition to OFF.
   2. Check the voltage at terminal 30 of the RUN/START relay (T09). If not check for loose battery connection, wiring or the fuse feed to 30.
   3. Turn the ignition to RUN and check the battery voltage at 87 of the T09 relay. If not measured go to step 9.
9. Check the BCM starter relay fuse feed and confirm it is intact.
10. Check BCM relay connections/feed.
11. Turn the ignition to start and complete the following procedures within 10 seconds (TIP start will disable after 10 seconds). Hook up the test lamp before turning the ignition to start.
12. Connect a 12V test lamp between 86 and 85 of the BCM start relay and confirm the blub lights up for 10 seconds. The MM may give a false reading because it is driven by a low side driver.
13. If the 12v test lamp does **not** stay lit for 10 seconds, turn the ignition to the start position and using a DVOM, measure between battery voltage (+) and PIN 86 (-) of the BCM relay. Should read equal to battery voltage.
14. Check ECM relay connections/feed.
15. Turn the ignition to start and complete the following procedures within 10 seconds (TIP start will disable after 10 seconds). Hook up the test lamp before turning the ignition to start.
16. Connect a 12V test lamp between 86 and 85 of the ECM start relay and confirm the blub lights up for 10 seconds.
17. If not start the car and measure them individually.
18. Measure the resistance between the ground and pin 85 of the ECM start relay.

Additional diagnostic checks

1. Check the Ignition sense start line from RFHM to BCM. The vehicle will not start if this line is not intact.
2. The RFHM must detect brake input (Normally Open) to start the KIN (Keyless Ignition Node) car in case of auto trans vehicle.
3. The RFHM must detect clutch input (Normally Open) to start the manual trans vehicle. Check also the clutch output from RFHM to ECM.
4. The RFHM must detect gated park switch to start the car.

CONTROL CIRCUIT TEST

The starter control circuit has:

- Starter motor with integral solenoid
- Starter relay
- Transmission range sensor, or Park/Neutral Position switch with automatic transmissions
- Ignition switch
- Battery
- All related wiring and connections

- Powertrain Control Module (PCM)

CAUTION: Before performing any starter tests, the ignition and fuel systems must be disabled.

- Disable ignition and fuel systems.

STARTER SOLENOID

WARNING: Check to ensure that the transmission is in the park position with the parking brake applied. This may result in personal injury or death.

1. Verify battery condition. Battery must be in good condition with a full charge before performing any starter tests. Refer to Battery Tests. Refer to **DIAGNOSIS AND TESTING - BATTERY SYSTEM** .
2. Perform Starter Solenoid test BEFORE performing the starter **RELAY TEST**.
3. Perform a visual inspection of the starter/starter solenoid for corrosion, loose connections or faulty wiring.
4. Locate and remove the starter relay.
5. Connect a remote starter switch or a jumper wire between the remote battery positive post and terminal 87 of the starter relay connector.
   a. If engine cranks, starter/starter solenoid is good. Go to the Starter **RELAY TEST**.
   b. If engine does not crank or solenoid chatters, check wiring and connectors from starter relay to starter solenoid and from the battery positive terminal to starter post for loose or corroded connections. Particularly at starter terminals.
   c. Repeat test. If engine still fails to crank properly, trouble is within starter or starter mounted solenoid, and replace starter. Inspect the ring gear teeth.

STARTER RELAY

WARNING: Check to ensure that the transmission is in the park/neutral position with the parking brake applied. This may result in personal injury or death.

RELAY TEST

Remove the starter relay as described in this Service Information to perform the following tests:

1. A relay in the de-energized position should have continuity between terminals 87A and 30, and no continuity between terminals 87 and 30. If OK, go to 2. If not OK, replace the faulty relay.
2. Resistance between terminals 85 and 86 (electromagnet) should be 75 ±5 ohms. If OK, go to 3. If not OK, replace the faulty relay.
3. Connect a battery B+ lead to terminals 85 and a ground lead to terminal 86 to energize the relay. The relay should click. Also test for continuity between terminals 30 and 87, and no continuity between

terminals 87A and 30. If OK, refer to Relay Circuit Test procedure. If not OK, replace the faulty relay.

30 COMMON FEED 85 COIL GROUND 86

COIL BATTERY 87 NORMALLY OPEN 87A NORMALLY CLOSED

Fig. 3: Starter Relay Pinout
Courtesy of CHRYSLER GROUP, LLC

CAV	FUNCTION
30	B (+)
85	IGNITION SWITCH OUTPUT
86	PCM-CONTROLLED GROUND
87	STARTER RELAY OUTPUT
87A	NO CONNECT

RELAY CIRCUIT TEST

1. The relay common feed terminal cavity (30) is connected to battery voltage and should be hot at all times. If OK, go to 2. If not OK, repair the open circuit to the PDC fuse as required.
2. The relay normally closed terminal (87A) is connected to terminal 30 in the de-energized position, but is not used for this application. Go to 3.
3. The relay normally open terminal (87) is connected to the common feed terminal (30) in the energized position. This terminal supplies battery voltage to the starter solenoid field coils. There should be continuity between the cavity for relay terminal 87 and the starter solenoid terminal at all times. If OK, go to 4. If not OK, repair the open circuit to the starter solenoid as required.
4. The coil battery terminal (85) is connected to the electromagnet in the relay. It is energized when the ignition switch is held in the Start position and the clutch pedal is depressed (manual trans). Check for

battery voltage at the cavity for relay terminal 86 with the ignition switch in the Start position and the clutch pedal is depressed (manual trans), and no voltage when the ignition switch is released to the On position. If OK, go to 5. If not OK, check for an open or short circuit to the ignition switch and repair, if required. If the circuit to the ignition switch is OK, see the **IGNITION SWITCH**.

5. The coil ground terminal (86) is connected to the electromagnet in the relay. It is grounded by the PCM if the conditions are right to start the car. For automatic transmission cars, the PCM must see Park Neutral switch low and near zero engine speed (RPM). For manual transmission cars, the PCM only needs to see near zero engine speed (RPM) and low clutch interlock input and see near zero engine speed (RPM). To diagnose the Park Neutral switch of the transmission range sensor refer to the **C635 MANUAL TRANSMISSION - SERVICE INFORMATION** . Check for continuity to ground while the ignition switch is in the start position and if equipped the clutch pedal depressed. If not OK and the vehicle has an automatic transmission verify Park Neutral switch operation. If that checks OK check for continuity between PCM and the terminal 86. Repair open circuit as required. Also check the clutch interlock switch operation if equipped with a manual transmission. If OK, the PCM may be defective.

SAFETY SWITCHES

For diagnostics of the Transmission Range Sensor, refer to the appropriate Transmission article for more information.

If equipped with Clutch Interlock/Upstop Switch, refer to **DIAGNOSIS AND TESTING** in the Clutch System article.

IGNITION SWITCH

After testing starter solenoid and relay, test ignition switch and wiring. Refer to the **IGNITION SYSTEM - SERVICE INFORMATION** or **SYSTEM WIRING DIAGRAMS** article for more information. Check all wiring for opens or shorts, and all connectors for being loose or corroded.

BATTERY

For battery diagnosis and testing, refer to **DIAGNOSIS AND TESTING - BATTERY SYSTEM** for procedures.

ALL RELATED WIRING AND CONNECTORS

Refer to **SYSTEM WIRING DIAGRAMS** article for more information.

FEED CIRCUIT RESISTANCE TEST

Before proceeding with this operation, review Diagnostic Preparation and Starter Feed Circuit Tests. The following operation will require a voltmeter, accurate to 1/10 of a volt.

CAUTION: Ignition and Fuel systems must be disabled to prevent engine start while performing the following tests.

1. To disable the Ignition and Fuel systems, disconnect the Automatic Shutdown Relay (ASD).
2. Gain access to battery terminals.
3. With all wiring harnesses and components properly connected, perform the following:
   a. Connect the negative lead of the voltmeter to the battery negative post, and positive lead to the battery negative cable clamp. Rotate and hold the ignition switch in the START position. Observe the voltmeter. If voltage is detected, correct poor contact between cable clamp and post.
   b. Connect positive lead of the voltmeter to the battery positive post, and negative lead to the battery positive cable clamp. Rotate and hold the ignition switch key in the START position. Observe the voltmeter. If voltage is detected, correct poor contact between the cable clamp and post.
   c. Connect negative lead of voltmeter to battery negative terminal, and positive lead to engine block near the battery cable attaching point. Rotate and hold the ignition switch in the START position. If voltage reads above 0.2 volt, correct poor contact at ground cable attaching point. If voltage reading is still above 0.2 volt after correcting poor contacts, replace ground cable.
   d. Connect positive voltmeter lead to the starter motor housing and the negative lead to the battery negative terminal. Hold the ignition switch key in the START position. If voltage reads above 0.2 volt, correct poor starter to engine ground.
   e. Connect the positive voltmeter lead to the battery positive terminal, and negative lead to battery cable terminal on starter solenoid. Rotate and hold the ignition switch in the START position. If voltage reads above 0.2 volt, correct poor contact at battery cable to solenoid connection. If reading is still above 0.2 volt after correcting poor contacts, replace battery positive cable.
   f. If resistance tests do not detect feed circuit failures, replace the starter motor.

STARTING SYSTEM TEST

For circuit descriptions and diagrams, refer to the **SYSTEM WIRING DIAGRAMS** article .

WARNING: **On vehicles equipped with airbags, refer to the RESTRAINTS - SERVICE INFORMATION article before attempting steering wheel, steering column, or instrument panel component diagnosis or service. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury.**

STARTING SYSTEM DIAGNOSIS

CONDITION	POSSIBLE CAUSE	CORRECTION
STARTER FAILS TO ENGAGE.	1. Battery discharged or faulty.	1. Refer to **DIAGNOSIS AND TESTING - BATTERY SYSTEM** for more information. Charge or replace battery, if required.
	2. Starting circuit wiring faulty.	2. Refer to **FEED CIRCUIT RESISTANCE TEST** .
	3. Starter relay faulty.	3. Refer to **RELAY TEST**. Replace relay, if necessary.
	4. Ignition switch faulty.	4. Refer to ignition switch test, in the **IGNITION SYSTEM - SERVICE INFORMATION** or **SYSTEM WIRING DIAGRAMS** article. Replace switch, if

		necessary.
	5. Park/neutral position switch (auto trans) faulty or mis-adjusted.	5. Refer to **948TE AUTOMATIC TRANSMISSION - SERVICE INFORMATION** for more information. Replace switch, if necessary.
	6. Clutch interlock switch (man trans) faulty.	6. Refer to **DIAGNOSIS AND TESTING - CLUTCH PEDAL POSITION SWITCH** . Replace switch, if necessary.
	7. Starter solenoid faulty.	7. Refer to **STARTER SOLENOID** . Replace starter assembly, if necessary.
	8. Starter assembly faulty.	8. If all other starting system components and circuits check ok, replace starter assembly.
	9. Faulty teeth on ring gear.	9. Rotate flywheel 360°, and inspect teeth and ring gear replaced if damaged.
	10. PCM double start override output failure.	10. Refer to **CHECKING THE PCM POWER AND GROUND CIRCUITS** . Check for continuity between PCM and terminal 85. Repair open circuit as required. If ok, PCM may be defective.
STARTER ENGAGES, FAILS TO TURN ENGINE.	1. Battery discharged or faulty.	1. Refer to the **BATTERY SYSTEM - SERVICE INFORMATION** for more information. Charge or replace battery as necessary.
	2. Starting circuit wiring faulty.	2. Refer to the **FEED CIRCUIT RESISTANCE TEST** . Repair as necessary.
	3. Starter assembly faulty.	3. If all other starting system components and circuits check ok, replace starter assembly.
	4. Engine seized.	4. Refer to the appropriate Engine Service Information article for diagnostic and service procedures.
	5. Loose connection at battery, PDC (Diesel Only), TIPM, starter, or engine ground.	5. Inspect for loose connections.
	6. Faulty teeth on ring gear.	6. Rotate flywheel 360°, and inspect teeth and ring gear replaced if damaged.
STARTER ENGAGES, SPINS OUT BEFORE ENGINE STARTS.	1. Broken teeth on starter ring gear.	1. Remove starter. Inspect ring gear and replace if necessary.
	2. Starter assembly faulty.	2. If all other starting system components and circuits check ok, replace starter assembly.
STARTER DOES NOT DISENGAGE.	1. Starter improperly installed.	1. Install starter. Tighten starter mounting hardware to correct torque specifications.
	2. Starter relay faulty.	2. Refer to **RELAY TEST**. Replace relay, if necessary.
	3. Ignition switch faulty.	3. Refer to **IGNITION SYSTEM - SERVICE INFORMATION** . Replace switch, if necessary.
	4. Starter assembly	4. If all other starting system components and circuits

	faulty.	check ok, replace starter assembly.
	5. Faulty teeth on ring gear.	5. Rotate flywheel 360°, and inspect teeth and ring gear replaced if damaged.

INSPECTION

Before removing any unit from the starting system for repair or diagnosis, perform the following inspections:

- **Battery** - Visually inspect the battery for indications of physical damage and loose or corroded cable connections. Determine the state-of-charge and cranking capacity of the battery. Charge or replace the battery, if required. Refer to the **BATTERY SYSTEM - SERVICE INFORMATION** for more information.
- **Ignition Switch** - Visually inspect the ignition switch for indications of physical damage and loose or corroded wire harness connections.
- **Transmission Range Sensor or Park/Neutral Switch** - Visually inspect the transmission range sensor for indications of physical damage and loose or corroded wire harness connections.
- **Starter Relay** - Visually inspect the starter relay for indications of physical damage and loose or corroded wire harness connections.
- **Starter Motor** - Visually inspect the starter motor for indications of physical damage and loose or corroded wire harness connections.
- **Starter Solenoid** - Visually inspect the starter solenoid for indications of physical damage and loose or corroded wire harness connections.
- **Wiring** - Visually inspect the wire harness for damage. Repair or replace any faulty wiring, as required. Check for loose or corroded wire harness connections at main engine ground and remote jump post.

SPECIFICATIONS

TORQUE-DIESEL

DESCRIPTION	N.m	Ft. Lbs.	In. Lbs.
Battery Cable Nut	9	-	80

4. Disconnect the starter solenoid electrical connector (1) from the starter solenoid terminal.
5. Remove the battery cable nut and battery cable from the solenoid stud (2).
6. Remove the starter mounting bolts (4).
7. Remove the starter assembly (3) from the transmission.

INSTALLATION

2.0L DIESEL

Fig. 11: Lower Starter Mounting Stud Bolt, Center Starter Mounting Bolt & Starter
Courtesy of CHRYSLER GROUP, LLC

1. Install the starter (3). Tighten bolts (1, 2) to 24 N.m (18 ft. lbs.).

Fig. 12: B+ Cable Retainer
Courtesy of CHRYSLER GROUP, LLC

2. Install the B+ on the starter solenoid stud. Tighten Nut (1) to 10 N.m (89 in. lbs.).
3. Install the ground cable onto bottom stud. Tighten nut (2) to 10 N.m (89 in. lbs.).
4. Install the cable bracket on upper stud. Tighten nut (3) to 10 N.m (89 in. lbs.).
5. Connect the solenoid connector to the starter.

0811003271

Fig. 13: Removing/Installing Starter
Courtesy of CHRYSLER GROUP, LLC

6. Install the belly pan (2) and securely tighten bolts (3).
7. Lower the vehicle.
8. Connect the negative battery cable.

2.4L

Fig. 14: Removing/Installing Starter
Courtesy of CHRYSLER GROUP, LLC

1. Install the starter into position.
2. Start the upper bolt by hand.
3. Start the lower bolt by hand.
4. Tighten the upper and lower bolts to 54 N.m (40 ft. lbs.).

Fig. 15: Electrical Connector, Battery Positive Cable Nut & Engine
Courtesy of CHRYSLER GROUP, LLC

5. Install the battery cable (2) onto the starter and install the nut. Torque the nut to 10 N.m (90 in. lbs.).
6. Reconnect the starter electrical connector (1).
7. Install the intake manifold assembly Refer to **MANIFOLD, INTAKE, INSTALLATION** .

   .

8. Reconnect the negative battery cable.

3.2L

Fig. 16: Starter Solenoid Electrical Connector, Solenoid Stud, Starter Mounting Bolts & Starter Assembly
Courtesy of CHRYSLER GROUP, LLC

1. Position the starter (3) inside the transmission.
2. Install the starter mounting bolts (4) and tighten to 55 N.m (41 ft. lbs.).
3. Connect the starter solenoid electrical connector (1) to starter solenoid terminal.
4. Install the battery cable and nut to the solenoid stud (2). Tighten the nut to 10 N.m (86 in. lbs.).

Fig. 17: Removing/Installing Catalytic Converter
Courtesy of CHRYSLER GROUP, LLC

5. Install the catalytic converter (3). Refer to **CONVERTER, CATALYTIC , INSTALLATION** .
6. Lower the vehicle.
7. Connect the negative battery cable and tighten nut to 5 N.m (4.5 in. lbs.).

ANTENNA, REMOTE START

DESCRIPTION

DESCRIPTION

The Remote Start Antenna Module Assembly consists of an electrical connection to the Radio Frequency Hub (RF Hub), a short length of coaxial cable with a connection to the RF HUB, two mounting clips, and the control module/antenna. The antenna is located in the rear cargo area next to the RF HUB assembly concealed by the headliner. The antenna which is printed on a circuit board in an enclosed plastic housing that is fed regulated 5v DC (+/-5%) via the attached coaxial cable pigtail. The Remote Start Antenna captures radiated RF signals that are transmitted from the Key FOB transmitter throughout the intended broadcast bands. The RF signal captured is then amplified and sent to the desired receiver/tuner.

OPERATION

OPERATION

The Remote Start Antenna is used for receive the signal from the remote key. The antenna captures radiated RF signals that are transmitted from the Key FOB transmitter throughout the intended broadcast bands. The RF signal captured is then amplified and sent to the Remote Frequency Hub Module (RFHUB).

REMOVAL

REMOVAL

0821006695

Fig. 18: Removing/Installing Remote Start Antenna

Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Lower the rear of the headliner. Refer to **HEADLINER, REMOVAL** .
3. Disconnect the remote start antenna connector (3) from the Radio Frequency Hub (RF Hub) (4).
4. Remove the two fasteners (1) securing the remote start antenna (2) to the roof.

INSTALLATION

INSTALLATION

0821008033

Fig. 19: Removing/Installing Remote Start Antenna
Courtesy of CHRYSLER GROUP, LLC

1. Position the remote start antenna (2) to its mounting surface and secure the antenna using two fasteners (1).
2. Connect the remote start connector (3) to the RF Hub (4).
3. Install the headliner. Refer to **HEADLINER, INSTALLATION** .
4. Connect the negative battery cable.
5. Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

NOTE: **If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.**

SYSTEM, START STOP

DESCRIPTION

STOP START SYSTEM

The Stop-Start system automatically stops and starts the engine when certain conditions are met to improve fuel economy and lower CO2 emissions.

The primary input for manual transmission vehicles to an autostop is zero vehicle speed with the transmission in neutral and the clutch pedal released, while the primary input to autostarting is depression of the clutch pedal. The primary input for an automatic transmission vehicle to gain an autostop is zero vehicle speed with the brake pedal depressed, while the primary input to autostarting is release of the brake pedal. Many secondary inputs determine if it is acceptable to autostop and autostart. A number of devices on the vehicle are added or improved to support the Stop-Start function.

- **Voltage Stabilization Module (VSM)**

  - This component is required to maintain system voltage during Start events. This also provides a buffer for the vehicles ECU's when battery power is being sent to the starter for cranking.

- **InRush Current Relay (ICR)** - This component works in conjunction with the VSM in order to prevent voltage dips.
- **High Durability Starter** - This is a modified starter used for the Stop Start system. Changes are hardened gears with lead in chamfer, a spring pinion (Diesel), reinforced castings, a higher power motor, long-life brushes, precision bearings and motor shaft.
- **Advanced Glass Mat (AGM) Battery with High Durability Battery Cables** - The AGM type battery and the high durability cables are capable of withstanding the increased cycling that a stop/start vehicle will experience.
- **Generator** - A 220a generator that is up-sized specifically for use with the stop/start system.
- **Intelligent Battery Sensor (IBS)** - The IBS is responsible for measuring the state-of-charge. It will also predict voltage and capacity (ah) for future crank events. The IBS is also responsible for measuring battery temperature and alternator voltage current.
- **Transmission Neutral Sensor (MTX Only)** - This is located on the transmission selector cable.
- **Powertrain Control Module (PCM)** - The PCM monitors conditions for STOP/START.

The Battery, Starting, and Charging systems operate in conjunction with one another, and must be tested as a complete system. For correct operation of starting/charging systems, all components used in these 3 systems must perform within specifications. When attempting to diagnose any of these systems, it is important that you keep their interdependency in mind.

The diagnostic procedures used in this Service Information include the most basic conventional diagnostic methods, to the more sophisticated On-Board Diagnostics (OBD) built into the Powertrain Control Module (PCM). Use of an induction-type milliampere ammeter, volt/ohmmeter, battery charger, carbon pile rheostat (load tester), and 12-volt test lamp may be required.

Certain starting system components are monitored by the PCM and may produce a Diagnostic Trouble Code (DTC).

OPERATION

OPERATION

Primary Autostop Enablers - Brake pedal depressed (automatic transmission). Shifter/transmission in neutral and clutch pedal released (manual transmissions).

Secondary Autostop Enablers - Vehicle speed, coolant temperature, hood closed, doors closed, driver's seat belt latched, interior climate and settings, battery state and energy demand, steering wheel angle, steering wheel torque, ambient temperature, time and speed since last autostop, transfer case position, and ESC status, No stop-start related faults present.

Autostop Events

- Autostop state broadcast on CAN Buss
- Cluster telltale illuminates.
- EVIC displays message indicating autostop.
- Engine shutdown begins.

As the engine slows it passes through three phases:

- Fuel and spark restart permissible.
- Restart prohibited.
- Restart permitted, based on start system employed.

Autostart requests are evaluated throughout the autostop event.

When in autostop:

- Instrument cluster stop/start telltale remains illuminated.
- EVIC displays the autostop state message.
- Body controller starter relay is energized providing the engine controller with direct starter control.

Vehicle Function:

- Consumer electronics continue to function in a normal manner.
- HVAC fan speed and other setting adjusted to maximize cabin comfort and autostop duration (based on climate control settings and conditions).
- Electric Power Steering (EPS) maintained during autostop, possibly with reduced maximum assist.

System Requested Autostarts:

- Battery State
- Brake Vacuum
- Climate control stress
- Vehicle speed
- Steering wheel angle or torque
- Transmission selector position.

Stop-Start Disable (while autostopped)

- Vehicle systems monitored that may disable stop-start (requiring a key restart if in autostop) include: hood opened, occupant sensing indicating driver not present, unsafe gear shift position for autostart and critical system faults.

Autostart Decision:

- All autostart enablers present
- Brake pedal released or shifter place in reverse (automatic transmissions)
- Clutch pedal depressed past the up-stop position (manual transmission)
- Throttle pedal depressed

Autostart Events:

- Autostart state broadcasted on the CAN Bus
- instrument cluster stop/start telltale illumination cancelled
- EVIC display changed to previous EVIC message (outside temp and compass, etc.)
- VSMs are placed in voltage conditioning mode
- Hill Assist requested
- Starter relay commanded to initiate cranking
- Engine achieves idle speed

Launch Events:

- Automatic transmission clutches engaged
- Hill assist released
- Climate control returned to pre-autostop conditions
- Stop-Start Ready state broadcast on the CAN Bus
- Embedded EVIC stop-start message indicating "Stop/Start Ready"

Planned Autostart (Engine On) Enable Conditions:
1. Valid target gear and brake switch pressure condition
2. Completed initial engine key start

3. Occupant sensing allow engine start condition met
4. OBD allow engine start condition met
5. Vehicle hood not Ajar

Potential Autostop (Engine Off) Enable Conditions:
1. Tow Haul mode not active
2. Steering wheel angle within defined range
3. Steering wheel angle gradient within defined range
4. Steering column torque within defined range
5. Battery health state of function greater than threshold

Planned Autostop (Engine Off) Enable Conditions:
1. Valid target gear and brake switch pressure state combination
2. Threshold vehicle speed exceeded or timed-out since last shift out of reverse
3. Transmission ready
4. 4WD Low mode not active
5. Starter cool down condition met after reaching max allowable consecutive restarts
6. Ambient temperature within defined range
7. Engine coolant temperature within defined range
8. Catalyst temperature within defined range
9. Battery temperature within defined range
10. Barometric pressure greater than threshold
11. Brake booster delta pressure less than threshold
12. Fuel level greater than threshold
13. Vehicle hood not Ajar
14. No throttle request
15. No engine stop inhibit request by HVAC
16. Battery state of charge greater than threshold
17. Battery voltage state of function greater than threshold
18. Engine speed less than threshold
19. Vehicle speed less than threshold
20. Threshold vehicle speed exceeded since last engine start
21. Occupant sensing allow engine stop condition met
22. OBD allow engine stop condition met
23. Engine runtime greater than threshold
24. Stop-Start "Off" switch not activated
25. Flex fuel learn mode not active
26. ABS brake event not present

EVIC Pop Up Messages Displayed on the EVIC

- EVIC message states Stop/Start Autostop Active

- No Chime
- Normal Use
- Pop-up maintained for 5 seconds
- Displays with green hard telltale

Stop/Start To Restart Press

- Single Chime
- Driver put gear shift in gear without using Clutch; customer needs to return to Neutral or fully depress clutch pedal
- Pop up maintained for 5 seconds

Stop/Start Restart Required Fault Detected

- Single Chime
- MIL or ESS system fault preventing safe state confirmation during autostop.

EVIC Pop Up Messages Displayed within EVIC "Ring" menu

Stop/Start Ready

- Stop-Start conditions met to enable engine stop.

Stop/Start Off

- Stop-Start turned off by the customer at the switch

Stop/Start Not Ready

- Stop-Start conditions are not met to enable engine stop (ex: HVAC settings, engine temperature, etc.)

Stop/Start Not Ready Steering Wheel Turned

- Stop-Start condition not met with steering wheel turned past calibratable angle

DIAGNOSIS AND TESTING

STOP START SYSTEM DIAGNOSIS

For diagnostics of the starting system, refer to **DIAGNOSIS AND TESTING**.

For diagnostics of the Stop Start system, the scan tool can be used to review the inhibitor menu to help root cause a potential Stop Start concern.

Possible Reasons The Engine Does Not AUTO STOP

Prior to engine shut down, the system will check many safety and comfort conditions to see if they are fulfilled. In following situations the engine will not stop:

- Driver's seat belt is not buckled
- Outside temperature is less than 1°F (-17°C) or greater than 104°F (40°C)
- Actual cabin temperature is significantly different than temperature set on Auto HVAC
- HVAC is set to full defrost mode
- Engine has not reached normal operating temperature
- Battery discharged
- When driving in REVERSE
- Hood is open
- Vehicle is in 4LO transfer case mode

It may be possible for the vehicle to be driven several times without the STOP/START system going into a STOP/START READY state under more extreme conditions of the items listed above.

For a more technical and detailed explanation of AutoStop, review the following inhibitors.

When it comes to Stop Start, we allow AutoStop event if:

- Accelerator pedal is in the rest position.
- HVAC Control allows an auto stop event. The AC load can not be in a high demand mode of operation
- Battery state (charge 65%, function 8 volts, health 40 ampere hour) is within an acceptable range.
- Current master cylinder brake pressure exceeds the required HSA brake pressure and is sufficient to hold the vehicle on a grade.
- Electronic Stability Control (ECS) is not requesting control.
- Fuel level is greater than the minimum fuel level threshold.
- Both hood switches indicate the hood is closed.
- Predefined OBD faults are not present.
- Vehicle occupants are not attempting a vehicle exit maneuver.
- Absolute Barometric Pressure is within range. Barometric pressure is greater then a minimum of 605 kPa.
- Brake Booster is sufficient to maintain master cylinder pressure with current applied pedal force. Minimum 205 kPa
- Starter motor engagement has not exceeded prescribed frequency use.
- Vehicle speed is 0
- Steering angle has not exceeded the prescribed range.
- Steering torque is less than the prescribed value.
- Ambient Air Temperature is within the prescribed range (-10F - 110F).

- Catalyst temperature is within the prescribed range (150F - 950F)
- Coolant temperature is within the prescribed range.
- Engine oil temperature is within the prescribed range (40C - 110C).
- Anti-lock brake system is not active.
- Transfer case is not in 4WDLO
- Vehicle is not in tow haul mode.
- Vehicle is in valid target gear and brake switch combination.
- Threshold vehicle speed exceeded or timeout since last shift out of reverse.
- Transmission ready.
- Battery temperature is within the prescribed range (-256F - 256F).
- Engine speed is below a set threshold of 1000 RPM.
- Engine runtime is greater then threshold of 3 seconds.
- Start Stop disable switch is not active.
- Flex fuel learn mode is not active.
- Vehicle is not on a grade.
- Threshold vehicle speed exceeded since last engine start is 8 mph.

Conditions that will cause the engine to start automatically while in STOP/START AUTO STOP ACTIVE mode:

- Actual cabin temperature is significantly different than temperature set in Auto HVAC.
- HVAC is set to full defrost mode.
- STOP/START AUTO STOP TIME ACTIVE exceeds 5 minutes.
- Battery Voltage drops too low.
- Low brake vacuum e.g. after several brake pedal applications.
- Vehicle is moving faster then 3 mph (5 km/h)
- STOP/START OFF switch is pressed.
- 4WD is put into 4LO mode.

We allow Stop Start AutoStarts to occur when any of the conditions are made active:

- Accelerator pedal is in the "rest" position.
- HVAC Control is allows an Auto Stop event.
- Battery State (charge, function, health) is within acceptable range.
- Current master cylinder brake pressure exceeds the required HSA brake pressure and is sufficient to hold the vehicle on a grade.
- Electronic Stability Control system is not requesting control.
- Fuel Level is greater than the minimum fuel level threshold.
- Both hood switches indicate hood is closed.

- Predefined OBD faults are not present.
- Vehicle occupants are not attempting a vehicle exit maneuver.
- Absolute Barometric Pressure is within range.
- Brake Booster Pressure is sufficient to maintain master cylinder pressure with current applied pedal force.
- Starter motor engagement has not exceeded prescribed frequency of use.
- Vehicle speed is 0.
- Steering Angle has not exceeded the prescribed range.
- Steering Torque is less than the prescribed value.
- Ambient Air Temperature is within the prescribed range.
- Catalyst Temperature is within the prescribed range.
- Coolant Temperature is within the prescribed range.
- Engine Oil Temperature is within the prescribed range.
- Anti-Lock Brake System is not active.
- Transfer Case Mode is not in 4WDLO.
- Vehicle is not in TOW-HAUL mode.
- Vehicle is in valid target gear and brake switch state combination
- Threshold vehicle speed exceeded or timeout since last shift out of reverse
- Transmission ready
- Battery temperature is within the prescribed range
- Engine speed is below a set threshold
- Threshold vehicle speed exceeded since last engine start
- Engine runtime greater than threshold
- Stop-Start disable switch is not Active
- Flex fuel learn mode not active
- Vehicle is not on a grade.

We allow Stop Start AutoStarts to occur when any of the conditions are made active:

- Accelerator pedal is not in the "rest" position.
- HVAC Control is active.
- Battery State (charge, function, health) is out of range.
- Current master cylinder brake pressure does not have enough HSA brake pressure.
- Electronic Stability Control system is requesting control.
- Fuel Level is lower than the minimum fuel level threshold.
- One or both hood switches indicate hood is open.
- Predefined OBD faults are present.
- Absolute Barometric Pressure is out of range.
- Brake Booster Pressure is insufficient to maintain master cylinder pressure with current applied pedal

force.
- Starter motor engagement has exceeded prescribed frequency of use.
- Vehicle speed is above 0.
- Steering Angle has exceeded the prescribed range.
- Steering Torque is more than the prescribed value.
- Ambient Air Temperature is outside the prescribed range.
- Catalyst Temperature is outside the prescribed range.
- Coolant Temperature is outside the prescribed range.
- Engine Oil Temperature is outside the prescribed range.
- Anti-Lock Brake System is active.
- Transfer Case Mode is in 4WDLO.
- Vehicle is in TOW-HAUL mode.
- Transmission not ready
- Battery temperature is out of the prescribed range
- Stop-Start disable switch is Active
- Flex fuel learn mode is active

The above conditions can restart the vehicle as long as:

1. Completed initial engine key start.
2. Occupant sensing allow engine start condition met.
3. OBD allow engine start condition met.
4. Vehicle hood closed.

System Malfunction:

If there is a malfunction in the STOP/START system, the system will not shut down the engine. A SERVICE STOP/START SYSTEM message will appear in the EVIC.

SENSOR, NEUTRAL POSITION

DESCRIPTION

DESCRIPTION

Fig. 20: Neutral Position Sensor
Courtesy of CHRYSLER GROUP, LLC

The Neutral Position Sensor (NPS) (1) is a component of the automatic stop/start feature on KL platform vehicles with manual transmissions. It is located on the transmission shift cable and it is only serviced by replacing the shift cable assembly.

OPERATION

OPERATION

The purpose of the Neutral Position Sensor (NPS) is to provide an output from the sensor to a controller concerning gear range position. On vehicles equipped with a manual transmission, the shift cable position is interpreted by the controller from the NPS to determine if the transmission is in neutral or in some gear range, for the purpose of determining when the stop/start system can safely restart the vehicle without the clutch pedal being depressed. The switch outputs a PWM signal whose percentage of duty cycle corresponds to the ranged denoted in Neutral, in a gear range, or as a fault value. The NPS is attached to shift cable such that it is nominally outputting 50% duty cycle at or when the vehicle is shifted to Neutral. Higher or lower duty cycle outputs are denoted as the magnet on the shift cable moves with respect to the NPS when the vehicle is shifted to gear range positions.

The NPS receives an Input of 5 volts excitation, has a common ground and outputs Pulse-width modulated signal to the controller.

Outputs reading less than 5% or more than 95% of duty cycle will trigger diagnostic trouble codes. Outputs reading between 5-25% or 75-95% represent in-gear positions and outputs readings between 25-75% represent Neutral position. Check that the sensor is attached properly to shift cable (inside the center console, at the shifter) and that wiring lead is attached to wiring harness coming up from rearward in vehicle from shifter. Check that the shift cable is properly attached to shifter and transmission ends to levers and load reaction points. With a jumper, voltages from the sensor input and output can be read with a voltmeter and compared with

expected values. As an example, 90% of 5 volts is 4.5 Volts, so if you read 4.5 volts, the transmission has been shifted into a gear range.

This NPS is not available to order as a standalone component. To obtain the NPS, the Shift Cable assembly will need to be ordered.

REMOVAL

REMOVAL

The Neutral Position Sensor (NPS) can only be replaced by replacing the gear shift control cable. (Refer to **CABLE, GEARSHIFT CONTROL - REMOVAL**).

INSTALLATION

INSTALLATION

The Neutral Position Sensor (NPS) is installed as an assembly with the gear shift control cable. (Refer to **CABLE, GEARSHIFT CONTROL - INSTALLATION**).

RELAY, IN-RUSH CURRENT REDUCTION

DESCRIPTION

DESCRIPTION

In-rush Current Reduction Relay

Fig. 21: In-Rush Current Reduction (ICR) Relay Module
Courtesy of CHRYSLER GROUP, LLC

The In-rush Current Reduction (ICR) Relay Module is intended to reduce the in-rush current drawn by the starter motor during the initial stage of the crank sequence, thus maintaining an adequate voltage level and allowing critical electrical/electronic systems to function without interruption, or reset. At the same time, the relay will allow sufficient current and voltage to reach the starter motor, to allow cranking the engine at an adequate speed, so that the engine can generate the air-fuel mixture necessary for self-sustained operation, even under adverse conditions.

This component is mounted to a bracket that mounts to the top of the starter assembly. The relay is serviceable and is shipped along with a bracket that secures the ICR.

OPERATION

OPERATION

In-Rush Current Reduction Relay.

Within the ICR relay, prior to the starter motor solenoid's contact closure, the shorting bar opens contacts, thus routing the starter motor current through a resistor bar (10 mOhm for V6 Pentastar). The increase in series resistance reduces/eliminates the initial current spike (or, inrush current) and reduces the consequent voltage drop. After a set time (185 msec), the power to the ICR relay is cut, the shorting bar closes the contacts, removing the resistor bar from the circuit and restoring full power to the starter motor. At this point, there is a rebound of the current surge and subsequent drop in voltage; however, neither is as intense as they would be would be without initial jump in resistance.

2014 GENERAL INFORMATION

Circuit Testing Procedures - Non-DTC-Based Diagnostics - Cherokee

WARNING

GENERAL WARNINGS

WARNINGS provide information to prevent personal injury and vehicle damage. Below is a list of general warnings that should be followed any time a vehicle is being serviced.

WARNING: **Always wear safety glasses for eye protection.**

WARNING: **Use safety stands anytime a procedure requires being under a vehicle.**

WARNING: **Be sure that the ignition switch is always in the off position, unless the procedure requires it to be on.**

WARNING: **Set the parking brake when working on any vehicle. An automatic transmission should be in park. A manual transmission should be in neutral.**

WARNING: **Operate the engine only in a well-ventilated area.**

WARNING: **Keep away from moving parts when the engine is running, especially the fan and belts.**

WARNING: **To prevent serious burns, avoid contact with hot parts such as the radiator, exhaust manifold(s), tail pipe, catalytic converter and muffler.**

WARNING: **Do not allow flame or sparks near the battery. Gases are always present in and around the battery.**

WARNING: **Always remove rings, watches, loose hanging jewelry and avoid loose clothing.**

DESCRIPTION

CIRCUIT FUNCTIONS

All circuits in the wiring diagrams use an alpha/numeric code to identify the wire and its function. To identify which circuit code applies to a system, refer to the Circuit Identification Code Chart.

NOTE: This chart shows the main circuits only and does not show the secondary codes that may apply to some models.

CIRCUIT IDENTIFICATION CODE CHART

CIRCUIT CODE	FUNCTION
A	BATTERY FEED
B	BRAKE CONTROLS
C	CLIMATE CONTROLS
D	DIAGNOSTIC CIRCUITS
E	DIMMING ILLUMINATION CIRCUITS
F	FUSED CIRCUITS
G	MONITORING CIRCUITS (GAUGES)
H	MULTIPLE
I	NOT USED
J	OPEN
K	POWERTRAIN CONTROL MODULE
L	EXTERIOR LIGHTING
M	INTERIOR LIGHTING
N	MULTIPLE
O	NOT USED
P	POWER OPTION (BATTERY FEED)
Q	POWER OPTIONS (IGNITION FEED)

CIRCUIT INFORMATION

Each wire shown in the wiring diagrams contains a code which identifies the main circuit, a specific portion of the main circuit, gauge of wire, and color.

As an example, circuit **A 2 18 LB/YL** is decoded in the following manner:

Circuit Type:	**A** (Battery Feed Circuit)
Circuit Level:	**2** (Level Two)
Wire Size:	**18** (Eighteen Gauge Wire)
Wire Color:	**LB/YL** (Light Blue with Yellow Tracer)

WIRE COLOR CODE CHART

COLOR CODE	COLOR
BL	BLUE
BK	BLACK
BR	BROWN
DB	DARK BLUE
DG	DARK GREEN
GY	GRAY
LB	LIGHT BLUE
LG	LIGHT GREEN
OR	ORANGE
PK	PINK
RD	RED
TN	TAN
VT	VIOLET
WT	WHITE
YL	YELLOW
*	WITH TRACER

DIAGNOSIS AND TESTING

WIRING HARNESS TESTING

TROUBLESHOOTING TOOLS

When diagnosing a problem in an electrical circuit there are several common tools necessary. These tools are listed and explained below:

Voltmeter

The voltmeter is used to measure the electrical pressure or the voltage difference between two points. A voltmeter reads available voltages such as battery voltage, generator output voltage, and voltage drop across a component or conductor. A high voltage drop may indicate a high resistance in the circuit. The voltmeter can be used to locate an open circuit and circuits with an unintentional ground. Observing polarity, always connect a voltmeter in parallel to the existing circuit. If the leads are reversed on a digital multimeter, a minus sign

appears in the display.

CAUTION: Most of the electrical components used in today's vehicles are Solid State. When checking voltages in these circuits, use a meter with a 10 - megohm or greater impedance rating.

Ohmmeter

The ohmmeter is used to measure the resistance of a component or the resistance between two points in a circuit in ohms, and to check a portion of the circuit for continuity. Some meters have a built-in tone to indicate that the circuit has continuity. No resistance indicates a short circuit or unintentional ground whereas resistance that is higher than specification indicates a high resistance in the circuit such as a loose, dirty or corroded connection, or a defective component. An "OL" reading means that the circuit or component had infinite resistance; an open circuit or defective component is indicated. Ohmmeters have an internal battery and must never be connected to a power circuit. Connecting an ohmmeter to a powered circuit causes the meter fuse to blow and can damage its dry cell battery. Ohmmeters can be connected into a circuit without regard to polarity, unless the circuit contains a diode. When using an ohmmeter, the component or portion of the circuit must be isolated from other components or branches to avoid false readings.

CAUTION: Most of the electrical components used in today's vehicles are Solid State. When checking resistance in these circuits use a meter with a 10 - megohm or greater impedance rating. In addition, make sure the power is disconnected from the circuit. Circuits that are powered up by the vehicle's electrical system can cause damage to the equipment and provide false readings.

Ammeter

Amperage or current is the measure of the rate of electron "flow" in a circuit. It is measured in the unit of the Ampere, simply called an Amp (A). In order to measure current in a circuit, the circuit must be broken or opened, and an ammeter must be inserted in series (in-line) with the circuit so that all the current that flows through the circuit will have to go through the meter. When measuring current in this manner, it requires the meter be made part of the circuit, this type of measurement is more difficult than measuring either voltage or resistance.

When an ammeter is placed in series with a circuit, it ideally drops no voltage as current goes through it. In other words, it acts very much like a piece of wire, with very little resistance from one test probe to the other. Consequently, an ammeter will act as a short circuit if placed in parallel (across the terminals of) a substantial source of voltage. If this is done, a surge in current will result, potentially damaging the meter. Ammeters are generally protected from excessive current by means of a small fuse located inside the meter housing. If the ammeter is accidently connected across a substantial voltage source, the resultant surge in current will "blow" the fuse and render the meter incapable of measuring current until the fuse is replaced.

Consult the owner's manual of the particular model of meter you own for details on measuring current.

CAUTION: Do not crank the engine or turn on any accessories that may draw more

than 10 Amps. You may open the protective fuse in the multimeter.

12-Volt Test Light

The 12-Volt test light when properly used, is one of the best and quickest pieces of test equipment available for troubleshooting 12-volt power systems. It's especially good for times when there are only two voltages, battery voltage and no voltage. For example, if you're checking to see if you have 12-volts on the Battery(+), the test light will immediately tell you if voltage is present or not.

With any test equipment, you should confirm that it's in good working order before you begin testing. For a test light, you have to have a voltage source. Connect the test light's ground clip to a good ground and touch it to a point where you believe that there is 12-volt supply. If the light doesn't light up, check the light by connecting it directly across the battery. Initially, make sure that you have the ground clip on the negative battery terminal. If you touch the probe to the positive terminal, the test light should light up. If it doesn't and the battery is not completely dead, the test light isn't working properly. The test light must be in proper working order before any circuit testing can occur.

Jumper Wire

The sole purpose of the jumper wire is to complete a circuit. It is nothing more than a suitable length of insulated wire with terminals or connectors on each end. Jumper wires may be bought or made with various sizes of wire and styles of terminals including alligator clips, spade lugs and pin plugs, and should include a fuse device of some type for circuit and component protection. A jumper wire is used to verify a faulty conductor by substituting a known good one. It is jumped across a suspicious conductor in the circuit. If the circuit works with the jumper, but not without, there is an open somewhere in the area being jumped. A jumper wire is ONLY used to bypass a faulty conductor (including switches and connectors). NEVER bypass a load device with a jumper wire. The circuit needs the resistance from the load device and shorting across it causes high current flow, which could damage other components.

WARNING: **Never use a jumper wire across a load, such as a motor, connected between a battery feed and ground.**

Fig. 1: Probing Tool
Courtesy of CHRYSLER GROUP, LLC

1 - SPECIAL TOOL 6801 2 - PROBING END

Probing Tools

These tools are used for probing terminals in connectors. Select the proper size tool from Special Tool Package (special tool #6807, Terminal Tools), and insert the probing end (2) into the terminal being tested. Use the other end of the tool (1) to insert the meter probe.

INTERMITTENT AND POOR CONNECTIONS

Most intermittent electrical problems are caused by faulty electrical connections or wiring. It is also possible for a sticking component or relay to cause a problem.

Before condemning a component or wiring assembly, check the following items:

- Connectors are fully seated
- Spread terminals, or terminal push out
- Terminals in the wiring assembly are fully seated into the connector/component and locked into position
- Dirt or corrosion on the terminals. Any amount of corrosion or dirt could cause an intermittent problem
- Damaged connector/component casing exposing the item to dirt or moisture

- Wire insulation that has rubbed through causing a short to ground
- Some or all of the wiring strands broken inside of the insulation
- Wiring broken inside of the insulation

TROUBLESHOOTING WIRING PROBLEMS

When troubleshooting wiring problems there are six steps which can aid in the procedure. The steps are listed and explained below. Always check for non-factory items added to the vehicle before doing any diagnosis. If the vehicle is equipped with these items, disconnect them to verify these add-on items are not the cause of the problem.

Perform the following Six Step Diagnosis Process:

1. Verify the problem.
2. Verify any related symptoms. Do this by performing operational checks on components that are in the same circuit. Refer to **SYSTEM WIRING DIAGRAMS** .
3. Analyze the symptoms. Use the wiring diagrams to determine what the circuit is doing, where the problem most likely is occurring and where the diagnosis will continue.
4. Isolate the problem area.
5. Repair the problem area.
6. Verify the proper operation. For this step, check for proper operation of all items on the repaired circuit. Refer to **SYSTEM WIRING DIAGRAMS** .

NOTE: **The Six Step Diagnosis Process used by Chrysler is a time proven process. The basic concepts of this process have been used by others for problem solving for many years. The successful application of this process requires a solid understanding of the conditions that affect each step, and when its time to advance to the next step. These conditions based on experience formulate what is known as "Best Practices".**

STANDARD PROCEDURE

CHECK A 12-VOLT FUSED BATTERY B(+) CIRCUIT FOR VOLTAGE

THEORY OF OPERATION

Fig. 2: Checking 12-Volt Fused Battery B(+) Circuit For Voltage
Courtesy of CHRYSLER GROUP, LLC

The purpose of the following procedure(s) is to demonstrate how to check the voltage of a 12-volt fused battery B(+) circuit with a test light or voltmeter.

NOTE: The circuit shown is an example, and is intended for demonstrational purpose only.

The following are circuit tests covered in this procedure:

- Testing 12-Volt Fused Battery B(+) Circuit Voltage With A Test Light
- Testing 12-Volt Fused Battery B(+) Circuit Voltage With A Voltmeter

NOTE: Perform the following test using a known good test light or functioning multimeter.

Below is a list of possible causes that could be related to a No Voltage condition.

Possible Causes
OPEN CIRCUIT (CHAFED, PIERCED, PINCHED OR BROKEN WIRES)
OPEN FUSE
OPEN IN-LINE CONNECTOR (BENT, PUSHED OUT OR CORRODED TERMINALS)

DIAGNOSTIC TEST

1. **TESTING 12-VOLT FUSED BATTERY B(+) CIRCUIT VOLTAGE WITH A TEST LIGHT**

Fig. 3: Checking 12-Volt Fused Battery B(+) Circuit Voltage With A Test Light
Courtesy of CHRYSLER GROUP, LLC

NOTE: Before testing any circuits, first verify the 12-volt test light is operating properly. Connect the 12-volt test light to battery ground or to any other known good ground. Touch the lead of the test light to Battery(+). If the test light is operational, it should illuminate brightly.

1. Turn the ignition off.
2. Disconnect the wire harness connector from the component that is being tested.

NOTE: Check connectors - Clean/repair as necessary.

3. At this time, leave all in-line connectors connected.
4. Connect the 12-volt test light to a known good ground.
5. Use the test light lead to carefully probe the Battery or Ignition voltage circuit in the harness connector.
6. First check with the ignition off, next check with the ignition on, and lastly check while cranking the engine.

   Does the test light illuminate brightly?

   Yes

   - The circuit is not open at this time or the condition that originally caused the open may not be present at this time. Continue to monitor the test light and wiggle the wire harness and connectors to check for an intermittent open or excessive resistance condition.
   - Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors where the open could occur intermittently.

- Look for any chafed, pierced, pinched, or partially broken wires.
- Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the related wire harness connectors.
- Perform any Technical Service Bulletins (TSBs) that may apply.

No

- Repair the open in the circuit. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors where the open could occur.
- One method to help isolate the open is to disconnect any in-line connectors and measure the resistance from one side of the in-line connector to the matching component harness connector. If the open goes away, the open is on the other side of the in-line connector.
- If this is a fused circuit, make sure to inspect the fuse. If the fuse is open, check the circuit for a short to ground before installing a new fuse. The circuit may have a short to ground causing the fuse to open. This short to ground could be in the wire harness or in one of the components the circuit is supplying voltage to.

2. **TESTING 12-VOLT FUSED BATTERY B(+) CIRCUIT VOLTAGE WITH A VOLTMETER**

Fig. 4: Checking Testing 12-Volt Fused Battery B(+) Circuit Voltage With A Voltmeter
Courtesy of CHRYSLER GROUP, LLC

NOTE: The connector displayed in the graphics are only an example.

1. Turn the ignition off.
2. Disconnect the wire harness connector from the component that is being tested.

NOTE: Check connectors - Clean/repair as necessary.

3. At this time leave all in-line connectors connected.

4. Use a multimeter set to measure DC voltage.
5. Connect the ground lead of the meter to a known good ground.
6. Use the positive lead of the multimeter and probe the circuit that is being checked for voltage.
7. Ignition on, engine not running.

Is the voltage within specifications for this circuit?

Yes

- The circuit is functioning properly or the condition that originally caused the open or short may not be present at this time. Continue to measure the voltage and wiggle the wire harness and connectors while checking for an intermittent open or short.
- Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors where the short could occur intermittently.
- Look for any chafed, pierced, pinched, or partially broken wires.
- Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the related wire harness connectors.
- Perform any Technical Service Bulletins (TSBs) that may apply.

No

- Repair the open or short to ground in the circuit. Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors where the short could occur.
- One method to help isolate the open or short is to disconnect any in-line connectors that the circuit being checked runs through and check for the voltage again. If the voltage is present, the open or short is on the other side of the in-line connector.

CHECK A 12-VOLT SWITCHED BATTERY B(+) CIRCUIT FOR VOLTAGE

THEORY OF OPERATION

Fig. 5: Checking 12-Volt Switched Battery B(+) Circuit For Voltage
Courtesy of CHRYSLER GROUP, LLC

The purpose of the following procedure is to demonstrate how to check the voltage of a 12-Volt switched battery B(+) circuit with a test light or voltmeter.

NOTE: The circuit shown is an example, and is intended for demonstrational purpose only.

The following are circuit tests covered in this procedure:

- Testing 12-Volt Switched Battery B(+) Circuit Voltage With A Test Light
- Testing 12-Volt Switched Battery B(+) Circuit Voltage With A Voltmeter

NOTE: Perform the following test using a known good test light or functioning multimeter.

Below is a list of possible causes that could be related to a No Voltage condition.

Possible Causes
OPEN CIRCUIT (CHAFED, PIERCED, PINCHED OR BROKEN WIRES)
OPEN FUSE
OPEN IN-LINE CONNECTOR (BENT, PUSHED OUT OR CORRODED TERMINALS)

DIAGNOSTIC TEST

1. **TESTING 12-VOLT SWITCHED BATTERY B(+) CIRCUIT VOLTAGE WITH A TEST LIGHT**

Fig. 6: Testing 12-Volt Switched Battery B(+) Circuit Voltage With A Test Light
Courtesy of CHRYSLER GROUP, LLC

NOTE: Before testing any circuits, first verify the 12-volt test light is operating properly. Connect the 12-volt test light to battery ground or to any other known good ground. Touch the lead of the test light to Battery(+). If the test light is operational, it should illuminate brightly.

1. Turn the ignition off.
2. Disconnect the wire harness connector from the component that is being tested.

NOTE: Check connectors - Clean/repair as necessary.

3. At this time, leave all in-line connectors connected.
4. Connect the 12-volt test light to a known good ground.
5. Use the test light lead to carefully probe the Battery or Ignition voltage circuit in the harness connector.
6. First check with the ignition off, next check with the ignition on, and lastly check while cranking the engine.

   Does the test light illuminate brightly?

   Yes

   - The circuit is not open at this time or the condition that originally caused the open may not be present at this time. Continue to monitor the test light and wiggle the wire harness and connectors to check for an intermittent open or excessive resistance condition.
   - Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors where the open could occur intermittently.

- Look for any chafed, pierced, pinched, or partially broken wires.
- Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the related wire harness connectors.
- Perform any Technical Service Bulletins (TSBs) that may apply.

No

- Repair the open in the circuit. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors where the open could occur.
- One method to help isolate the open is to disconnect any in-line connectors and measure the resistance from one side of the in-line connector to the matching component harness connector. If the open goes away, the open is on the other side of the in-line connector.
- If this is a fused circuit, make sure to inspect the fuse. If the fuse is open, check the circuit for a short to ground before installing a new fuse. The circuit may have a short to ground causing the fuse to open. This short to ground could be in the wire harness or in one of the components the circuit is supplying voltage to.

2. **TESTING 12-VOLT SWITCHED BATTERY B(+) CIRCUIT VOLTAGE WITH A VOLTMETER**

Fig. 7: Testing 12-Volt Switched Battery B(+) Circuit Voltage With A Voltmeter
Courtesy of CHRYSLER GROUP, LLC

NOTE: The connector displayed in the graphics are only an example.

1. Turn the ignition off.
2. Disconnect the wire harness connector from the component that is being tested.

NOTE: Check connectors - Clean/repair as necessary.

3. At this time leave all in-line connectors connected.
4. Use a multimeter set to measure DC voltage.
5. Connect the ground lead of the meter to a known good ground.
6. Use the positive lead of the multimeter and probe the circuit that is being checked for voltage.
7. Ignition on, engine not running.

Is the voltage within specifications for this circuit?

Yes

- The circuit is functioning properly or the condition that originally caused the open or short may not be present at this time. Continue to measure the voltage and wiggle the wire harness and connectors while checking for an intermittent open or short.
- Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors where the short could occur intermittently.
- Look for any chafed, pierced, pinched, or partially broken wires.
- Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the related wire harness connectors.
- Perform any Technical Service Bulletins (TSBs) that may apply.

No

- Repair the open or short to ground in the circuit. Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors where the short could occur.
- One method to help isolate the open or short is to disconnect any in-line connectors that the circuit being checked runs through and check for the voltage again. If the voltage is present, the open or short is on the other side of the in-line connector.

CHECK A 5-VOLT SUPPLY CIRCUIT FOR VOLTAGE

THEORY OF OPERATION

Fig. 8: Checking 5-Volt Supply Circuit For Voltage
Courtesy of CHRYSLER GROUP, LLC

The purpose of the following procedure is to demonstrate how to check the voltage of a 5-Volt supply circuit with a voltmeter.

NOTE: The circuit shown is an example, and is intended for demonstrational purpose only.

The following are circuit tests covered in this procedure:

- Testing A 5-Volt Supply Circuit For Voltage
- Testing A 5-Volt Supply Circuit And Sensor Ground Circuit

NOTE: Perform the following test using a known good multimeter.

Below is a list of possible causes that could be related to a No Voltage condition.

Possible Causes
OPEN CIRCUIT (CHAFED, PIERCED, PINCHED OR BROKEN WIRES)
OPEN IN-LINE CONNECTOR (BENT, PUSHED OUT OR CORRODED TERMINALS)
ELECTRONIC CONTROL MODULE (5-VOLT SUPPLY OUTPUT)

DIAGNOSTIC TEST

1. **TESTING A 5-VOLT SUPPLY CIRCUIT FOR VOLTAGE**

Fig. 9: Checking 5-Volt Supply Circuit For Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the sensor harness connector.

NOTE: Check connectors - Clean/repair as necessary.

3. Turn the ignition on.
4. Set the multimeter to measure DC voltage.
5. Connect the negative lead of the multimeter to a known good ground.
6. With the positive lead of the multimeter, carefully probe the 5-volt supply circuit.

Is the voltage between 4.7 and 5.2 volts?

Yes

- Go To 2

No

- Check the 5-volt supply circuit for an open or short to ground. For further assistance, perform the appropriate Sensor Reference Voltage DTC diagnostic procedure.

2. **TESTING A 5-VOLT SUPPLY CIRCUIT AND SENSOR GROUND CIRCUIT**

Fig. 10: Checking 5-Volt Supply Circuit And Sensor Ground Circuit
Courtesy of CHRYSLER GROUP, LLC

1. With the multimeter set to measure DC voltage.
2. Move the negative lead of the multimeter to carefully probe the sensor ground or sensor return circuit in the harness connector.
3. With the positive lead of the multimeter, carefully probe the 5-volt supply circuit.

   Is the voltage between 4.7 and 5.2 volts?

   Yes

   - At this time the 5-volt supply and sensor ground circuit are working properly. Continue to measure the voltage between the wires, wiggle the wire harness and connectors while checking for an intermittent condition.
   - Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors where the open could occur intermittently.
   - Look for any chafed, pierced, pinched, or partially broken wires.
   - Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the related wire harness connectors.
   - Perform any Technical Service Bulletins (TSBs) that may apply.

   No

   - Repair the open or excessive resistance in the Sensor Ground (Sensor Return) circuit.

CHECK A CIRCUIT FOR A SHORT TO GROUND

THEORY OF OPERATION

Fig. 11: Checking Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

The purpose of the following procedure is to demonstrate how to check a circuit for a Short to Ground.

NOTE: The circuit shown is an example, and is intended for demonstrational purpose only.

The following are circuit tests covered in this procedure:

- Testing For A Short To Ground Using An Ohmmeter

NOTE: Perform the following test using a known good multimeter.

Below is a list of possible causes that could be related to a Short to Ground condition.

Possible Causes
SHORTED CIRCUIT (CHAFED, PIERCED OR PINCHED WIRES)
SHORTED IN-LINE CONNECTOR (BENT, PUSHED OUT OR CORRODED TERMINALS)

DIAGNOSTIC TEST

TESTING FOR A SHORT TO GROUND USING AN OHMMETER

Fig. 12: Checking For A Short To Ground Using An Ohmmeter
Courtesy of CHRYSLER GROUP, LLC

NOTE: Before measuring the resistance of any circuit, first measure the resistance between the two leads of the multimeter. Take this value and subtract it from the value recorded when measuring the resistance of the circuit being checked (The meter leads can add 0.5 ohm or more of total resistance).

1. Turn the ignition off.
2. Disconnect the wire harness connectors from the module and component for the suspected circuit being shorted to ground.

NOTE: Check connectors - Clean/repair as necessary.

3. With the component wire harness connectors disconnected, use a meter set to measure Ohms (?), and measure the resistance between the circuit and a known good ground.
4. Use the negative lead of the meter and touch a known good ground.
5. Use the positive lead of the meter and carefully probe the circuit suspected of having the short.

Is the resistance to ground below 10k ohms ?

Yes

- Repair the short to ground. Use the wiring diagram as a guide to follow the path of the circuit.
- One method to help isolate the short is to disconnect any in-line connectors that the circuit being tested runs through and measure for the short again. If the short goes away, the short is on the other side of the in-line connector.

No

- The circuit is not shorted to ground or the condition that originally caused the short may not be present at this time. Continue to measure the resistance, wiggle the wire harness and connectors while checking for an intermittent short.
- Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors where the short could occur intermittently.
- Look for any chafed, pierced, pinched, or partially broken wires.
- Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the related wire harness connectors.
- Perform any Technical Service Bulletins (TSBs) that may apply.

CHECK A CIRCUIT FOR A SHORT TO VOLTAGE

THEORY OF OPERATION

Fig. 13: Battery Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

The purpose of the following procedure is to demonstrate different methods of checking for a short to voltage in a circuit. When diagnosing a DTC it might be necessary to verify that proper voltage is on a circuit or that a circuit is not shorted high.

NOTE: The circuit shown is an example, and is intended for demonstrational purpose only.

The following are circuit tests covered in this procedure:

- Testing For A Short To Battery Voltage Using A Voltmeter
- Testing For A Short To Switched Battery Voltage Using A Voltmeter
- Testing For A Short To Battery Voltage Using A 12-Volt Test Light

- Testing For A Short To Switched Battery Voltage Using A 12-Volt Test Light

NOTE: Perform the following test using a known good test light or functioning multimeter.

Below is a list of possible causes that could be related to a Short To Voltage condition.

Possible Causes
SHORTED CIRCUIT (CHAFED, PIERCED OR PINCHED WIRES)
SHORTED IN-LINE CONNECTOR (BENT, PUSHED OUT OR CORRODED TERMINALS)

DIAGNOSTIC TEST

1. **TESTING FOR A SHORT TO BATTERY VOLTAGE USING A TEST LIGHT**

Fig. 14: Checking For A Short To Battery Voltage Using A Test Light
Courtesy of CHRYSLER GROUP, LLC

NOTE: Before testing any circuits, first verify the 12-volt test light is operating properly. Connect the 12-volt test light to battery ground or to any other known good ground. Touch the lead of the test light to Battery(+). If the test light is operational, it should illuminate brightly.

1. Turn the ignition off.
2. Disconnect the wire harness connectors of all components that contain the circuits that are suspected of having the short.

NOTE: Check connectors - Clean/repair as necessary.

3. At this time leave all in-line connectors connected.
4. Connect the 12-volt test light to a known good ground.
5. Use the lead of the test light and carefully probe the circuit suspected of having the short.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.

6. First, check with the ignition off, next with the ignition on, and lastly while cranking the engine.

   Does the test light illuminate brightly?

   Yes

   - Repair the short to voltage. Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors where the short could occur.
   - One method to help isolate the short is to disconnect any in-line connectors that the circuit being checked runs through and check for the short again. If the short goes away, the short is on the other side of the in-line connector.

   No

   - The circuit is not shorted to voltage or the condition that originally caused the short may not be present at this time. Continue to measure the resistance and wiggle the wire harness to check for an intermittent short.

   NOTE: By disconnecting the wire harness connectors you may have eliminated the source of the voltage causing the short. Use the wiring diagram as a guide, check to see if there are any battery circuits in the same wire harness as the circuit you are testing. It is necessary to check for a short to those circuits using an ohmmeter. Refer to STANDARD PROCEDURE and perform the Check for a Short Between Multiple Circuits diagnostic procedure.

   - Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors where the short could occur intermittently.
   - Look for any chafed, pierced, pinched, or partially broken wires.
   - Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the related component and wire harness connectors.
   - Perform any Technical Service Bulletins (TSBs) that may apply.

2. **TESTING FOR A SHORT TO SWITCHED IGNITION VOLTAGE USING A TEST LIGHT**

Fig. 15: Checking For A Short To Switched Ignition Voltage Using A Test Light
Courtesy of CHRYSLER GROUP, LLC

NOTE: Before testing any circuits, first verify the 12-volt test light is operating properly. Connect the 12-volt test light to battery ground or to any other known good ground. Touch the lead of the test light to Battery(+). If the test light is operational, it should illuminate brightly.

1. Turn the ignition off.
2. Disconnect the wire harness connectors of all components that contain the circuits that are suspected of having the short.

NOTE: Check connectors - Clean/repair as necessary.

3. At this time leave all in-line connectors connected.
4. Connect the 12-volt test light to a known good ground.
5. Use the lead of the test light and carefully probe the circuit suspected of having the short.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.

6. First, check with the ignition off, next with the ignition on, and lastly while cranking the engine.

   Does the test light illuminate brightly?

   Yes

- Repair the short to voltage. Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors where the short could occur.
- One method to help isolate the short is to disconnect any in-line connectors that the circuit being checked runs through and check for the short again. If the short goes away, the short is on the other side of the in-line connector.

No

- The circuit is not shorted to voltage or the condition that originally caused the short may not be present at this time. Continue to measure the resistance and wiggle the wire harness to check for an intermittent short.

NOTE: **By disconnecting the wire harness connectors you may have eliminated the source of the voltage causing the short. Use the wiring diagram as a guide, check to see if there are any battery circuits in the same wire harness as the circuit you are testing. It is necessary to check for a short to those circuits using an ohmmeter. Refer to STANDARD PROCEDURE and perform the Check for a Short Between Multiple Circuits diagnostic procedure.**

- Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors where the short could occur intermittently.
- Look for any chafed, pierced, pinched, or partially broken wires.
- Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the related component and wire harness connectors.
- Perform any Technical Service Bulletins (TSBs) that may apply.

3. **TESTING FOR A SHORT TO BATTERY VOLTAGE USING A VOLTMETER**

Fig. 16: Checking For A Short To Battery Voltage Using A Voltmeter
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the wire harness connectors of the components that contain the circuit that is suspected as having a short.

NOTE: Check connectors - Clean/repair as necessary.

3. At this time leave all in-line connectors connected.
4. With all the component wire harness connectors disconnected, use a multimeter set to measure DC voltage.
5. Connect the ground lead of the meter to a known good ground.
6. Use the positive lead of the multimeter and probe the circuit that is being checked for a short.

Is there any voltage present?

Yes

- Repair the short to battery voltage. Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors where the short could occur.
- One method to help isolate the short is to disconnect any in-line connectors that the circuit being checked runs through and measure for the short again. If the short goes away, the short is on the other side of the in-line connector.

No

- The circuit is not shorted to voltage or the condition that originally caused the short may not

be present at this time. Continue to measure the voltage and wiggle the wire harness to check for an intermittent short.

NOTE: By disconnecting the wire harness connectors you may have eliminated the source of the voltage causing the short. Use the wiring diagram as a guide, check to see if there are any battery circuits in the same wire harness as the circuit you are testing. It is necessary to check for a short to those circuits using an ohmmeter. Refer to STANDARD PROCEDURE and perform the Check for a Short Between Multiple Circuits diagnostic procedure.

- Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors where the short could occur intermittently.
- Look for any chafed, pierced, pinched, or partially broken wires.
- Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the related wire harness connectors.
- Perform any Technical Service Bulletins (TSBs) that may apply.

4. **TESTING FOR A SHORT TO SWITCHED IGNITION VOLTAGE USING A VOLTMETER**

Fig. 17: Checking For A Short To Switched Ignition Voltage Using A Voltmeter
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the wire harness connectors of all components that contain the circuits that are suspected as being shorted.

NOTE: Check connectors - Clean/repair as necessary.

3. At this time leave all in-line connectors connected.
4. With all the component wire harness connectors disconnected, use a multimeter set to measure DC voltage.
5. Connect the ground lead of the meter to a known good ground.
6. Use the positive lead of the multimeter and probe the circuit suspected of having the short.
7. Ignition on, engine not running.

Is any voltage present?

Yes

- Repair the short to ignition voltage. Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors where the short could occur.
- One method to help isolate the short is to disconnect any in-line connectors that the circuit being checked runs through and check for the short again. If the short goes away, the short is on the other side of the in-line connector.

No

- The circuit is not shorted to voltage or the condition that originally caused the short may not be present at this time. Continue to measure the voltage and wiggle the wire harness to check for an intermittent short.

NOTE: By disconnecting the wire harness connectors you may have eliminated the source of the voltage causing the short. Use the wiring diagram as a guide, check to see if there are any battery circuits in the same wire harness as the circuit you are testing. It is necessary to check for a short to those circuits using an ohmmeter. Refer to STANDARD PROCEDURE and perform the Check for a Short Between Multiple Circuits diagnostic procedure.

- Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors where the short could occur intermittently.
- Look for any chafed, pierced, pinched, or partially broken wires.
- Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the related wire harness connectors.
- Perform any Technical Service Bulletins (TSBs) that may apply.

CHECK FOR AN OPEN GROUND CIRCUIT

THEORY OF OPERATION

Fig. 18: Checking 12-Volt Switched Battery B(+) Circuit For Voltage
Courtesy of CHRYSLER GROUP, LLC

The purpose of the following procedure is to demonstrate how to check the operation of a generic ground circuit with a test light.

NOTE: The circuit shown is an example, and is intended for demonstrational purpose only.

The following are circuit tests covered in this procedure:

- Testing Ground Circuit With Test Light

NOTE: Perform the following test using a known good test light.

Possible Causes
OPEN GROUND CIRCUIT (CHAFED, PIERCED, PINCHED OR BROKEN WIRE)
OPEN IN-LINE CONNECTOR (BENT, PUSHED OUT OR CORRODED TERMINALS)

DIAGNOSTIC TEST

TESTING GROUND CIRCUIT WITH TEST LIGHT

Fig. 19: Checking Ground Circuit With Test Light
Courtesy of CHRYSLER GROUP, LLC

NOTE: Before testing any circuits, first verify the 12-volt test light is operating properly. Connect the 12-volt test light to battery ground or to any other known good ground. Touch the lead of the test light to Battery(+). If the test light is operational, it should illuminate brightly.

1. Turn the ignition off.
2. Disconnect the wire harness connectors of the components that contain the ground circuit suspected of containing excessive resistance.

NOTE: Check connectors - Clean/repair as necessary.

3. At this time leave all in-line connectors connected.
4. With all the component wire harness connectors disconnected, connect the 12-volt test light to Battery(+).
5. Use the test light lead to lightly probe the ground circuit in the harness connector.

Does the test light illuminate brightly?

Yes

- The suspected ground circuit is not open or the condition that originally caused the open or excessive resistance is not present at this time. Another way to check for an open would be to use an ohmmeter and measure the resistance of the ground circuit. While continuing to measure the resistance of the circuit, wiggle the wire harness and connectors to check for an intermittent open or poor connection.
- Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors where the

open could occur intermittently.

- Look for any chafed, pierced, pinched, or partially broken wires.
- Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the related wire harness connectors.
- Perform any Technical Service Bulletins (TSBs) that may apply.

No

- Repair the open in the ground circuit. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors where the open could occur.
- One method to help isolate the open is to disconnect any in-line connectors and measure the resistance from one side of the in-line connector to the matching component harness connector. If the open goes away, the open is on the other side of the in-line connector.

CHECK FOR A SHORT BETWEEN MULTIPLE CIRCUITS

THEORY OF OPERATION

Fig. 20: Battery Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

The purpose of the following procedure is to demonstrate how to check for a short circuit between multiple circuits.

NOTE: The circuit shown is an example, and is intended for demonstrational purpose only.

The following are circuit tests covered in this procedure:

- Testing For A Short Between Multiple Circuits

NOTE: Perform the following test using a known good multimeter.

Below is a list of possible causes that could be related to a Multiple Short condition.

Possible Causes
SHORTED CIRCUIT (CHAFED, PIERCED OR PINCHED WIRES)
SHORTED IN-LINE CONNECTOR (BENT, PUSHED OUT OR CORRODED TERMINALS)

DIAGNOSTIC TEST

TESTING FOR A SHORT BETWEEN MULTIPLE CIRCUITS

Fig. 21: Checking For A Short Between Multiple Circuits
Courtesy of CHRYSLER GROUP, LLC

NOTE: Before measuring the resistance of any circuit, first measure the resistance between the two leads of the multimeter. Take this value and subtract it from the value recorded when measuring the resistance of the circuit being checked (The meter leads can add 0.5 ohm or more of total resistance).

1. Turn the ignition off.
2. Disconnect the wire harness connectors of the components that contain the circuits that are suspected of being shorted together.

   NOTE: Check connectors - Clean/repair as necessary.

3. At this time leave all in-line connectors connected.

4. With all the component wire harness connectors disconnected, use a multimeter set to Ohms (?), and measure the resistance between the applicable circuits in one of the harness connectors.
5. Use one lead of the multimeter and carefully probe the circuit suspected of being shorted.
6. Use the other lead of the meter and one at a time, carefully probe the other circuits in the harness connector.

   Is the resistance below 10k ohms when probing any two circuits?

   Yes

   - Repair the short between the circuits. Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors where the short could occur.
   - One method to help isolate the short is to disconnect any in-line connectors that the circuit being tested runs through and measure for the short again. If the short goes away, the short is on the other side of the in-line connector.

   No

   - The circuit is not shorted or the condition that originally caused the short may not be present at this time. Continue to measure the resistance and wiggle the wire harness and connectors while checking for an intermittent short.

   NOTE: By disconnecting the wire harness connectors you may have eliminated the source that was causing the short.

   - Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors where the short could occur intermittently.
   - Look for any chafed, pierced, pinched, or partially broken wires.
   - Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the related wire harness connectors.
   - Perform any Technical Service Bulletins (TSBs) that may apply.

CHECK THE RESISTANCE OF A CIRCUIT USING AN OHMMETER

THEORY OF OPERATION

Fig. 22: Battery Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

The purpose of the following procedure is to demonstrate how to check the resistance of a circuit with an ohmmeter.

NOTE: The circuit shown is an example, and is intended for demonstrational purpose only.

The following are circuit tests covered in this procedure:

- Testing For An Open Circuit Using An Ohmmeter

NOTE: Perform the following test using a known good multimeter.

Below is a list of possible causes that could be related to an Open Circuit condition.

Possible Causes
OPEN CIRCUIT (CHAFED, PIERCED, PINCHED OR BROKEN WIRES)
OPEN IN-LINE CONNECTOR (BENT, PUSHED OUT OR CORRODED TERMINALS)

DIAGNOSTIC TEST

TESTING FOR AN OPEN CIRCUIT USING AN OHMMETER

Fig. 23: Checking For An Open Circuit Using An Ohmmeter
Courtesy of CHRYSLER GROUP, LLC

NOTE: Before measuring the resistance of any circuit, first measure the resistance between the two leads of the multimeter. Take this value and subtract it from the value recorded when measuring the resistance of the circuit being checked (The meter leads can add 0.5 ohm or more of total resistance).

1. Turn the ignition off.
2. Disconnect the wire harness connectors of the components that contain the circuit suspected of being open.

NOTE: Check connectors - Clean/repair as necessary.

3. At this time leave all in-line connectors connected.
4. With the component wire harness connectors disconnected, use a multimeter set to Ohms (?), and measure the resistance of the circuit.
5. Use one lead of the meter and probe the circuit in one harness connector.
6. Use the other lead of the meter and probe the same circuit in the other harness connector.

Is the resistance in the circuit below 10k ohms?

Yes

- The circuit does not contain any excessive resistance or the condition that originally caused the excessive resistance may not be present at this time. Continue to measure the resistance of the circuit, wiggle the wire harness and connectors to check for an intermittent open or poor connection.
- Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors where the

open could occur intermittently.
- Look for any chafed, pierced, pinched, or partially broken wires.
- Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the related wire harness connectors.
- Perform any Technical Service Bulletins (TSBs) that may apply.

No

- Repair the excessive resistance in the circuit between the two wire harness connectors. Using the wiring diagram as a guide, trace the circuit and check for any in-line connectors where the open or excessive resistance could occur.
- One method to help isolate the open is to disconnect any in-line connectors and measure the resistance from one side of the in-line connector to the matching component harness connector. If the open or excessive resistance is not present, the open or excessive resistance is on the other side of the in-line connector.

CHECK FOR EXCESSIVE CURRENT DRAW

THEORY OF OPERATION

What is current draw?

Current draw, or parasitic draw is an electrical load that draws current from the battery when the ignition is turned off. Some are considered normal, some above normal. Normal draw comes from various electronic devices connected to battery positive at all times. Many vehicle modules draw a few mA (milliamps) as a means to "Keep Alive Memory". Whether it's the clock in the radio or the last known position of the memory mirrors, these tiny amounts of current typically will only add up to 20 or 30 mA. The vehicle can sit parked for days, even a few weeks without any problems of excessive battery drain that might prevent starting. As long as the vehicle is driven periodically in order for the alternator to recharge the battery there is no problem. A problem may occur, in situations such as new vehicles in dealer stock or long term airport parking situations.

Below are some examples of modules and components that require keep alive memory:

- Powertrain Control Module (PCM)
- Body Control Module (BCM)
- Memory Seat Module (MSM)
- Radio

What is excessive current draw?

Excessive current draw can be determined by an ammeter reading in excess of 50 mA. The typical "normal" current draw will not exceed 20 or 30 mA.

How to locate the problem?

Locating the problem involves a process of elimination. If the problem is not obvious, like the trunk light staying on, you will have to start troubleshooting:

- Start by removing one fuse at a time until you see the reading on the meter drop off (be careful to reinstall the fuses in their proper location).
- Once you've determined the high-draw circuit, there still may be a half-dozen loads, each individually drawing current from the battery.
- To zero in on that circuit or circuits, use the schematic diagram and disconnect each device on the circuit one-at-a-time and check the meter.
- When the milliamp reading drops off significantly, you've found the problem.

Perform the following test to determine where the cause of the draw is located.

Possible Causes
INSTALLED AFTERMARKET ACCESSORIES (AUDIO SYSTEMS, VEHICLE ALARMS, ETC.)
COURTESY LIGHTS REMAINING ON (INTERIOR, TRUNK, HOOD, ETC.)
BATTERY CHARGERS PLUGGED INTO THE CIGARETTE LIGHTER/POWER OUTLETS

DIAGNOSTIC TEST

TESTING FOR PARASITIC DRAW

NOTE: For a more accurate current draw reading, wait 20 minutes to make sure all modules have powered down before continuing. Some modules may stay powered up longer than others.

Fig. 24: Checking For Parasitic Draw Using Multimeter
Courtesy of CHRYSLER GROUP, LLC

Turn the ignition off.

1. Disconnect the Negative battery cable (ground).
2. Using a multimeter, set the multimeter leads up to properly measure Amperage.
3. Connect the ground lead that is plugged into the COM port of the multimeter to the Negative battery post/terminal.
4. Connect the other lead of the multimeter that is plugged into the Amp port of the multimeter to the Negative battery cable.

CAUTION: Do not crank the engine or turn on any accessories that may draw more than 10 Amps. You may open the protective fuse in the multimeter.

5. While monitoring the amperage reading on the multimeter, begin to remove fuses (one at a time) from each fuse location on the vehicle and see if the amperage drops.

NOTE:

- **Only remove one fuse at a time until the cause of the voltage draw is determined.**
- **Many vehicles have multiple fuse locations on the vehicle.**

6. If the amperage does not drop, install the fuse you just removed and remove the next fuse.

   Does the amperage drop to between 0.02 to 0.04 of an Amp when removing any fuses?

   Yes

   - Use the wiring diagram as a guide to help indicate what components or modules are powered by the fuse.
   - At this point you can install the fuse and begin disconnecting the components powered by the fuse.
     - When the amperage drops after disconnecting a component this will indicate which component is at fault.
     - It is important to know how long some modules are designed to remain awake.
     - You don't want to replace a component that is operating normally.
     - The condition that originally caused the draw may not be present at this time.

   No

   - The condition that originally caused the draw may not be present at this time.
   - Look for any chafed, pierced, pinched, or partially broken wires.
   - Look for broken, bent, pushed out or corroded ground terminals.
   - Perform any Technical Service Bulletins (TSBs) that may apply.

CIRCUIT LOAD TESTING PROCEDURE

THEORY OF OPERATION

A circuit load test can be performed to test the ability of a circuit to carry the current required to operate a connected device. A circuit load test should be performed after a circuit has passed a resistance test using a DVOM and the circuit is still suspected of a failure.

- A single copper wire strand will carry enough current to light a test light bulb, while showing very low resistance using a DVOM.
- Some test lights are insufficient for load testing because of the very low resistance bulb being used.
- The Load Test tool listed below will require higher current flow to power the bulb; and this will test the ability of the circuit to carry a load.
- This test will indicate if the circuit being tested can carry the current required to operate a connected device.

WARNING: To avoid possible serious or fatal injury, DO NOT load test any air bag/restraint system components or circuits using the procedures listed here. Refer to RESTRAINTS - SERVICE INFORMATION for proper air bag/restraint system testing procedures.

CAUTION: Do not load test any circuits with components still connected to the circuit.

NOTE: Depending upon the location of the circuit in question, this test may require jumper wires.

NOTE: Use the wiring diagrams as a guide to trace the circuits and look for any in-line connectors where the circuit failure could occur intermittently. Look for any chafed, pierced, pinched, or partially broken wires. Look for broken, bent, pushed out or corroded terminals - clean/repair as necessary. Verify that there is good pin to terminal contact in the related wire harness connectors.

091174655

Fig. 25: Load Test Tool
Courtesy of CHRYSLER GROUP, LLC

Here is an example of a simple tool you can build to test a circuit`s ability to carry a load.

Fig. 26: Load Test Tool Components
Courtesy of CHRYSLER GROUP, LLC

The following is a list of components required to build a load test tool:

1. 3156 Bulb
2. 3156 Bulb socket
3. Negative alligator clip with covers
4. Positive alligator clip with covers

5. 2 Amp mini fuse
6. Mini fuse holder
7. 2' to 4' of Black 16ga wire
8. 2' to 4' of Red 16ga wire
9. Approved back probe tool
10. Shrink tubing
11. Solder

LOAD TESTING A GROUND CIRCUIT

DIAGNOSTIC LOAD TEST (GROUND CIRCUIT)

091174654

Fig. 27: Performing Diagnostic Load Test (Ground Circuit)
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the connector from the device(s) to gain access and isolate the terminal for the circuit being tested.
2. Connect the positive lead of the load test tool to the positive side of the battery.
3. Using an approved connector back probe tool, connect the negative lead of the load test tool to the circuit being tested at point (A).

CAUTION: Use only approved connector back probe tools when back probing a connector so as not to cause damage to the terminals or insulation of the connector. Damage to the terminals can cause poor terminal contact or retention. Damage to the insulation can introduce

corrosion due to water infiltration.

Does the bulb light bright, when compared to a direct battery connection?

Yes

- The circuit being tested can carry a load, check other circuits, connectors and terminals for concerns.

No

- Repair the circuit, connector or terminal that has an open or excessive resistance.
- Perform any related Recalls or Technical Service Bulletins (TSBs) that may apply.

LOAD TESTING A BATTERY OR IGNITION FEED CIRCUIT

DIAGNOSTIC LOAD TEST (BATTERY/IGNITION FEED CIRCUIT)

091174655

Fig. 28: Performing Diagnostic Load Test (Battery/Ignition Feed Circuit)
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the connector from the device(s) to gain access and isolate the terminal for the circuit being tested.
2. Using an approved connector back probe tool, connect the positive lead of the load test tool to the circuit being tested at point (A).
3. Connect the negative lead of the load test tool to the negative side of the battery or ground.

CAUTION: Use only approved connector back probe tools when back probing a connector so as not to cause damage to the terminals or insulation

of the connector. Damage to the terminals can cause poor terminal contact or retention. Damage to the insulation can introduce corrosion due to water infiltration.

Does the bulb light bright, when compared to a direct battery connection?

Yes

- The circuit being tested can carry a load, check other circuits, connectors and terminals for concerns.

No

- Repair the circuit, connector or terminal that has an open or excessive resistance.
- Perform any related Recalls or Technical Service Bulletins (TSBs) that may apply.

LOAD TESTING A BATTERY OR IGNITION FEED CIRCUIT AND GROUND CIRCUIT

DIAGNOSTIC LOAD TEST (BATTERY FEED & GROUND CIRCUIT)

091174654

Fig. 29: Performing Diagnostic Load Test (Battery Feed & Ground Circuit)
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the connector from the device(s) to gain access and isolate the terminal for the circuit being tested.
2. Using an approved connector back probe tool, connect the positive lead of the load test tool to the circuit being tested at point (A).

3. Using an approved connector back probe tool, connect the negative lead of the load test tool to the circuit being tested at point (B).

CAUTION: Use only approved connector back probe tools when back probing a connector so as not to cause damage to the terminals or insulation of the connector. Damage to the terminals can cause poor terminal contact or retention. Damage to the insulation can introduce corrosion due to water infiltration.

Does the bulb light bright, when compared to a direct battery connection?

Yes

- The circuit being tested can carry a load, check other circuits, connectors and terminals for concerns.

No

- Test the circuits individually to determine which circuit is the cause of the test failure.
- Repair the circuit, connector or terminal that has an open or excessive resistance.
- Perform any related Recalls or Technical Service Bulletins (TSBs) that may apply.

LOAD TESTING A CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

DIAGNOSTIC LOAD TEST (OPEN/HIGH RESISTANCE CIRCUIT)

Fig. 30: Performing Diagnostic Load Test (Open/High Resistance Circuit)
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect all components from the circuit being tested.

2. Connect the positive lead of the load test tool to the positive side of the battery (A).
3. Using an approved connector back probe tool, connect the negative lead of the load test tool to the circuit being tested at point (B).
4. Using an approved connector back probe tool, connect a jumper wire to the circuit being tested at point (C).
5. Then connect the other end of the jumper wire to the negative side of the battery or ground (D).

CAUTION: Use only approved connector back probe tools when back probing a connector so as not to cause damage to the terminals or insulation of the connector. Damage to the terminals can cause poor terminal contact or retention. Damage to the insulation can introduce corrosion due to water infiltration.

Does the bulb light bright, when compared to a direct battery connection?

Yes

- The circuit being tested can carry a load, check other circuits, connectors and terminals for concerns.

No

- Repair the circuit, connector or terminal that has an open or excessive resistance.
- Perform any related Recalls or Technical Service Bulletins (TSBs) that may apply.

VOLTAGE DROP TEST PROCEDURE

THEORY OF OPERATION

Voltage drop is the reduction in voltage in an electrical circuit between the voltage source and load components. The wires and connectors of a circuit should contain almost no resistance and **all** the voltage should be consumed through the load. The "load" is the component using the power, such as a light, starter, or blower motor. If a circuit has excessive resistance, it prevents the wire from carrying sufficient current under high load conditions. A voltage drop test is an effective way to locate excessive resistance in connections and circuits.

To perform a voltage drop test, a Digital Volt Ohm Meter (DVOM) is used to measure the voltage drop across a live circuit or connection while it is under the load. If the circuit or connection being tested has excessive resistance, the DVOM will measure the voltage that the resistance is using. **Little or no voltage drop should be read, ideally less than 0.2 of a volt** , anything greater indicates excessive resistance and the circuit or connection should be inspected for cleaning or repair.

Possible Causes
EXCESSIVE CIRCUIT RESISTANCE (CHAFED, PIERCED OR CORRODED WIRES)
HIGH RESISTANCE WITH IN-LINE CONNECTOR (BENT, PUSHED OUT OR CORRODED TERMINALS)

DIAGNOSTIC TEST

TESTING FOR VOLTAGE DROP

Fig. 31: Testing for Voltage Drop
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Use the wiring diagram as a guide, trace the circuit being tested and locate the components related to the circuit.
3. Set the multimeter to measure DC voltage.
4. Carefully back probe the two component harness connectors of the circuit being tested.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.

NOTE: If you are testing the starting circuit, disable the engine so the engine does not start.

5. Crank the engine for five seconds if you are testing the starting circuit and monitor the multimeter voltage reading.
6. For circuits that don't require the engine running, turn the ignition on.
7. For circuits that require the engine running, start the engine.

NOTE: If the circuit you are checking needs to be operating, such as the Blower Motor or a Lamp, do so now.

8. Monitor the voltage reading.
9. The voltmeter will show the difference in voltage between the two points.

   Is the voltage less than 0.2 of a Volt?

   Yes

   - At this time the circuit is functioning properly. Continue to measure the voltage between the components and wiggle the wire harness and connectors while checking for an intermittent condition.
   - Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors where the excessive resistance could occur intermittently.
   - Look for any chafed, pierced, pinched, or partially broken wires.
   - Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the related wire harness connectors.
   - Perform any Technical Service Bulletins (TSBs) that may apply.

   No

   - Repair the excessive resistance in the circuit.
   - Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors where the excessive resistance may occur.
   - Look for any chafed, pierced, pinched, or partially broken wires.
   - Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the related wire harness connectors.
   - Perform any Technical Service Bulletins (TSBs) that may apply.

ELECTROSTATIC DISCHARGE (ESD) SENSITIVE DEVICES

Fig. 32: Electrostatic Discharge Symbol
Courtesy of CHRYSLER GROUP, LLC

All ESD sensitive components are solid state and a symbol is used to indicate this. When handling any component with this symbol, comply with the following procedures to reduce the possibility of electrostatic charge build up on the body and inadvertent discharge into the component. If it is not known whether the component is ESD sensitive, assume that it is.

Perform the following procedure when handling ESD sensitive components:

1. Always touch a known good ground before handling the component. This should be repeated while handling the component and more frequently after sliding across a seat, sitting down from a standing position, or walking a distance.
2. Avoid touching electrical terminals of the component, unless instructed to do so by a written procedure.
3. When using a voltmeter, be sure to connect the ground lead first.
4. Do not remove the component from its protective packing until it is time to install the component.
5. Before removing the component from its package, ground the package to a known good ground on the vehicle.

WIRE SPLICING

YouTube	A multimedia supplement to the instructions contained in this article is available. To view the multimedia example of the condition described go to; **http://www.youtube.com/user/Mitchell1Tips** **then type "A00641526.vid1" into the "Search Channel" box.**

CAUTION: If additional wire is needed when making a splice repair to any wire, it is

important that the same or next larger size wire gauge be used. Refer to SYSTEM WIRING DIAGRAMS for the original wire gauge size.

Fig. 33: Splice Band
Courtesy of CHRYSLER GROUP, LLC

1. Remove 13 millimeters (0.50 inch) of insulation from each wire that needs to be spliced.
2. Place a piece of adhesive sealant-lined heat shrink tubing (Part Number 04778570 or equivalent) over the wire on one side of the splice. Be certain the length of tubing will be sufficient to cover and seal the entire repair area.
3. Place the strands of the wires being spliced so that they are overlapping each other within the splice band (1).

Fig. 34: Crimping Tool

Courtesy of CHRYSLER GROUP, LLC

4. Using a crimping tool (1) (MOPAR Part Number 05019912AA, Miller Special Tool Number (special tool #10042, Crimper, Wire/Terminal) or equivalent) crimp the splice band and wires together securely.

Fig. 35: Solder Splice
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Never use acid core solder for electrical wiring repairs.

5. Using Rosin Core type solder (1) only and a suitable soldering iron (3), solder the wire and splice band connection (2) together.

Fig. 36: Heat Shrink Tube
Courtesy of CHRYSLER GROUP, LLC

6. Center the heat shrink tubing (2) over the splice joint repair and heat using a suitable heat gun. Heat the joint until the tubing is tightly sealed and sealant (1) begins to ooze out of both ends of the tubing.

REMOVAL

CONNECTOR TERMINAL REMOVAL

Fig. 37: Removal Of Dress Cover
Courtesy of CHRYSLER GROUP, LLC

1 - DRESS COVER
2 - CONNECTOR LOCK
3 - CONNECTOR

1. Disconnect battery.
2. Release Connector Lock (2).
3. Disconnect the connector (3) being repaired from its mating half/component.
4. Remove the dress cover (if applicable) (1).

Fig. 38: Connector Secondary Terminal Lock
Courtesy of CHRYSLER GROUP, LLC

1 - Secondary Terminal Lock

5. Release the Secondary Terminal Lock, if required (1).

Fig. 39: Terminal Removal
Courtesy of CHRYSLER GROUP, LLC

1 - TYPICAL CONNECTOR 2 - PICK FROM TERMINAL REMOVER KIT 10300

3 - APEX CONNECTOR
4 - PICK FROM TERMINAL REMOVER KIT 10300
5 - AUGAT CONNECTOR
6 - ELECTRICAL TERMINAL REMOVAL TOOL
7 - MOLEX CONNECTOR
8 - PICK FROM TERMINAL REMOVER KIT 10300
9 - THOMAS AND BETTS CONNECTOR
10 - TERMINAL REMOVER
11 - CONNECTOR
12 - ELECTRICAL TERMINAL REMOVER

6. Position the connector locking finger away from the terminal using the proper special tool. Pull on the wire to remove the terminal from the connector.

INSTALLATION

CONNECTOR TERMINAL INSTALLATION

1. Select a wire from the terminal repair kit that best matches the color and gauge of the wire being repaired.
2. Cut the repair wire to the proper length and remove one-half (1/2) inch of insulation.
3. Splice the repair wire to the wire harness (see Wire Splicing procedure). Refer to **STANDARD PROCEDURE**.
4. Insert the repaired wire into the connector.
5. Install the connector locking wedge, if required, and reconnect the connector to its mating half/component.
6. Re-tape the wire harness starting at 1-1/2 inches behind the connector and 2 inches past the repair.
7. Connect battery and test all affected systems.

2014 GENERAL INFORMATION

Circuit Testing Procedures - Non-DTC-Based Diagnostics - Cherokee

WARNING

GENERAL WARNINGS

WARNINGS provide information to prevent personal injury and vehicle damage. Below is a list of general warnings that should be followed any time a vehicle is being serviced.

WARNING: **Always wear safety glasses for eye protection.**

WARNING: **Use safety stands anytime a procedure requires being under a vehicle.**

WARNING: **Be sure that the ignition switch is always in the off position, unless the procedure requires it to be on.**

WARNING: **Set the parking brake when working on any vehicle. An automatic transmission should be in park. A manual transmission should be in neutral.**

WARNING: **Operate the engine only in a well-ventilated area.**

WARNING: **Keep away from moving parts when the engine is running, especially the fan and belts.**

WARNING: **To prevent serious burns, avoid contact with hot parts such as the radiator, exhaust manifold(s), tail pipe, catalytic converter and muffler.**

WARNING: **Do not allow flame or sparks near the battery. Gases are always present in and around the battery.**

WARNING: **Always remove rings, watches, loose hanging jewelry and avoid loose clothing.**

DESCRIPTION

CIRCUIT FUNCTIONS

All circuits in the wiring diagrams use an alpha/numeric code to identify the wire and its function. To identify which circuit code applies to a system, refer to the Circuit Identification Code Chart.

NOTE: This chart shows the main circuits only and does not show the secondary codes that may apply to some models.

CIRCUIT IDENTIFICATION CODE CHART

CIRCUIT CODE	FUNCTION
A	BATTERY FEED
B	BRAKE CONTROLS
C	CLIMATE CONTROLS
D	DIAGNOSTIC CIRCUITS
E	DIMMING ILLUMINATION CIRCUITS
F	FUSED CIRCUITS
G	MONITORING CIRCUITS (GAUGES)
H	MULTIPLE
I	NOT USED
J	OPEN
K	POWERTRAIN CONTROL MODULE
L	EXTERIOR LIGHTING
M	INTERIOR LIGHTING
N	MULTIPLE
O	NOT USED
P	POWER OPTION (BATTERY FEED)
Q	POWER OPTIONS (IGNITION FEED)
R	PASSIVE RESTRAINT
S	SUSPENSION/STEERING
T	TRANSMISSION/TRANSAXLE/ TRANSFER CASE
U	OPEN
V	SPEED CONTROL, WIPER/WASHER
W	WIPERS
X	AUDIO SYSTEMS
Y	TEMPORARY
Z	GROUNDS

CIRCUIT INFORMATION

Each wire shown in the wiring diagrams contains a code which identifies the main circuit, a specific portion of the main circuit, gauge of wire, and color.

As an example, circuit **A 2 18 LB/YL** is decoded in the following manner:

Circuit Type:	**A** (Battery Feed Circuit)
Circuit Level:	**2** (Level Two)
Wire Size:	**18** (Eighteen Gauge Wire)
Wire Color:	**LB/YL** (Light Blue with Yellow Tracer)

WIRE COLOR CODE CHART

COLOR CODE	COLOR
BL	BLUE
BK	BLACK
BR	BROWN
DB	DARK BLUE
DG	DARK GREEN
GY	GRAY
LB	LIGHT BLUE
LG	LIGHT GREEN
OR	ORANGE
PK	PINK
RD	RED
TN	TAN
VT	VIOLET
WT	WHITE
YL	YELLOW
*	WITH TRACER

DIAGNOSIS AND TESTING

WIRING HARNESS TESTING

TROUBLESHOOTING TOOLS

When diagnosing a problem in an electrical circuit there are several common tools necessary. These tools are listed and explained below:

Voltmeter

The voltmeter is used to measure the electrical pressure or the voltage difference between two points. A voltmeter reads available voltages such as battery voltage, generator output voltage, and voltage drop across a component or conductor. A high voltage drop may indicate a high resistance in the circuit. The voltmeter can be used to locate an open circuit and circuits with an unintentional ground. Observing polarity, always connect a voltmeter in parallel to the existing circuit. If the leads are reversed on a digital multimeter, a minus sign

appears in the display.

CAUTION: Most of the electrical components used in today's vehicles are Solid State. When checking voltages in these circuits, use a meter with a 10 - megohm or greater impedance rating.

Ohmmeter

The ohmmeter is used to measure the resistance of a component or the resistance between two points in a circuit in ohms, and to check a portion of the circuit for continuity. Some meters have a built-in tone to indicate that the circuit has continuity. No resistance indicates a short circuit or unintentional ground whereas resistance that is higher than specification indicates a high resistance in the circuit such as a loose, dirty or corroded connection, or a defective component. An "OL" reading means that the circuit or component had infinite resistance; an open circuit or defective component is indicated. Ohmmeters have an internal battery and must never be connected to a power circuit. Connecting an ohmmeter to a powered circuit causes the meter fuse to blow and can damage its dry cell battery. Ohmmeters can be connected into a circuit without regard to polarity, unless the circuit contains a diode. When using an ohmmeter, the component or portion of the circuit must be isolated from other components or branches to avoid false readings.

CAUTION: Most of the electrical components used in today's vehicles are Solid State. When checking resistance in these circuits use a meter with a 10 - megohm or greater impedance rating. In addition, make sure the power is disconnected from the circuit. Circuits that are powered up by the vehicle's electrical system can cause damage to the equipment and provide false readings.

Ammeter

Amperage or current is the measure of the rate of electron "flow" in a circuit. It is measured in the unit of the Ampere, simply called an Amp (A). In order to measure current in a circuit, the circuit must be broken or opened, and an ammeter must be inserted in series (in-line) with the circuit so that all the current that flows through the circuit will have to go through the meter. When measuring current in this manner, it requires the meter be made part of the circuit, this type of measurement is more difficult than measuring either voltage or resistance.

When an ammeter is placed in series with a circuit, it ideally drops no voltage as current goes through it. In other words, it acts very much like a piece of wire, with very little resistance from one test probe to the other. Consequently, an ammeter will act as a short circuit if placed in parallel (across the terminals of) a substantial source of voltage. If this is done, a surge in current will result, potentially damaging the meter. Ammeters are generally protected from excessive current by means of a small fuse located inside the meter housing. If the ammeter is accidently connected across a substantial voltage source, the resultant surge in current will "blow" the fuse and render the meter incapable of measuring current until the fuse is replaced.

Consult the owner's manual of the particular model of meter you own for details on measuring current.

CAUTION: Do not crank the engine or turn on any accessories that may draw more

than 10 Amps. You may open the protective fuse in the multimeter.

12-Volt Test Light

The 12-Volt test light when properly used, is one of the best and quickest pieces of test equipment available for troubleshooting 12-volt power systems. It's especially good for times when there are only two voltages, battery voltage and no voltage. For example, if you're checking to see if you have 12-volts on the Battery(+), the test light will immediately tell you if voltage is present or not.

With any test equipment, you should confirm that it's in good working order before you begin testing. For a test light, you have to have a voltage source. Connect the test light's ground clip to a good ground and touch it to a point where you believe that there is 12-volt supply. If the light doesn't light up, check the light by connecting it directly across the battery. Initially, make sure that you have the ground clip on the negative battery terminal. If you touch the probe to the positive terminal, the test light should light up. If it doesn't and the battery is not completely dead, the test light isn't working properly. The test light must be in proper working order before any circuit testing can occur.

Jumper Wire

The sole purpose of the jumper wire is to complete a circuit. It is nothing more than a suitable length of insulated wire with terminals or connectors on each end. Jumper wires may be bought or made with various sizes of wire and styles of terminals including alligator clips, spade lugs and pin plugs, and should include a fuse device of some type for circuit and component protection. A jumper wire is used to verify a faulty conductor by substituting a known good one. It is jumped across a suspicious conductor in the circuit. If the circuit works with the jumper, but not without, there is an open somewhere in the area being jumped. A jumper wire is ONLY used to bypass a faulty conductor (including switches and connectors). NEVER bypass a load device with a jumper wire. The circuit needs the resistance from the load device and shorting across it causes high current flow, which could damage other components.

WARNING: **Never use a jumper wire across a load, such as a motor, connected between a battery feed and ground.**

Fig. 1: Probing Tool
Courtesy of CHRYSLER GROUP, LLC

1 - SPECIAL TOOL 6801
2 - PROBING END

Probing Tools

These tools are used for probing terminals in connectors. Select the proper size tool from Special Tool Package (special tool #6807, Terminal Tools), and insert the probing end (2) into the terminal being tested. Use the other end of the tool (1) to insert the meter probe.

INTERMITTENT AND POOR CONNECTIONS

Most intermittent electrical problems are caused by faulty electrical connections or wiring. It is also possible for a sticking component or relay to cause a problem.

Before condemning a component or wiring assembly, check the following items:

- Connectors are fully seated
- Spread terminals, or terminal push out
- Terminals in the wiring assembly are fully seated into the connector/component and locked into position
- Dirt or corrosion on the terminals. Any amount of corrosion or dirt could cause an intermittent problem
- Damaged connector/component casing exposing the item to dirt or moisture
- Wire insulation that has rubbed through causing a short to ground
- Some or all of the wiring strands broken inside of the insulation
- Wiring broken inside of the insulation

TROUBLESHOOTING WIRING PROBLEMS

When troubleshooting wiring problems there are six steps which can aid in the procedure. The steps are listed and explained below. Always check for non-factory items added to the vehicle before doing any diagnosis. If the vehicle is equipped with these items, disconnect them to verify these add-on items are not the cause of the problem.

Perform the following Six Step Diagnosis Process:

1. Verify the problem.
2. Verify any related symptoms. Do this by performing operational checks on components that are in the same circuit. Refer to **SYSTEM WIRING DIAGRAMS** .
3. Analyze the symptoms. Use the wiring diagrams to determine what the circuit is doing, where the problem most likely is occurring and where the diagnosis will continue.
4. Isolate the problem area.
5. Repair the problem area.

6. Verify the proper operation. For this step, check for proper operation of all items on the repaired circuit. Refer to **SYSTEM WIRING DIAGRAMS** .

NOTE: **The Six Step Diagnosis Process used by Chrysler is a time proven process. The basic concepts of this process have been used by others for problem solving for many years. The successful application of this process requires a solid understanding of the conditions that affect each step, and when its time to advance to the next step. These conditions based on experience formulate what is known as "Best Practices".**

STANDARD PROCEDURE

CHECK A 12-VOLT FUSED BATTERY B(+) CIRCUIT FOR VOLTAGE

THEORY OF OPERATION

Fig. 2: Checking 12-Volt Fused Battery B(+) Circuit For Voltage
Courtesy of CHRYSLER GROUP, LLC

The purpose of the following procedure(s) is to demonstrate how to check the voltage of a 12-volt fused battery B(+) circuit with a test light or voltmeter.

NOTE: **The circuit shown is an example, and is intended for demonstrational purpose only.**

The following are circuit tests covered in this procedure:

- Testing 12-Volt Fused Battery B(+) Circuit Voltage With A Test Light
- Testing 12-Volt Fused Battery B(+) Circuit Voltage With A Voltmeter

NOTE: Perform the following test using a known good test light or functioning multimeter.

Below is a list of possible causes that could be related to a No Voltage condition.

Possible Causes
OPEN CIRCUIT (CHAFED, PIERCED, PINCHED OR BROKEN WIRES)
OPEN FUSE
OPEN IN-LINE CONNECTOR (BENT, PUSHED OUT OR CORRODED TERMINALS)

DIAGNOSTIC TEST

1. **TESTING 12-VOLT FUSED BATTERY B(+) CIRCUIT VOLTAGE WITH A TEST LIGHT**

Fig. 3: Checking 12-Volt Fused Battery B(+) Circuit Voltage With A Test Light
Courtesy of CHRYSLER GROUP, LLC

NOTE: Before testing any circuits, first verify the 12-volt test light is operating properly. Connect the 12-volt test light to battery ground or to any other known good ground. Touch the lead of the test light to Battery(+). If the test light is operational, it should illuminate brightly.

1. Turn the ignition off.
2. Disconnect the wire harness connector from the component that is being tested.

NOTE: Check connectors - Clean/repair as necessary.

3. At this time, leave all in-line connectors connected.
4. Connect the 12-volt test light to a known good ground.

5. Use the test light lead to carefully probe the Battery or Ignition voltage circuit in the harness connector.
6. First check with the ignition off, next check with the ignition on, and lastly check while cranking the engine.

   Does the test light illuminate brightly?

   Yes

   - The circuit is not open at this time or the condition that originally caused the open may not be present at this time. Continue to monitor the test light and wiggle the wire harness and connectors to check for an intermittent open or excessive resistance condition.
   - Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors where the open could occur intermittently.
   - Look for any chafed, pierced, pinched, or partially broken wires.
   - Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the related wire harness connectors.
   - Perform any Technical Service Bulletins (TSBs) that may apply.

   No

   - Repair the open in the circuit. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors where the open could occur.
   - One method to help isolate the open is to disconnect any in-line connectors and measure the resistance from one side of the in-line connector to the matching component harness connector. If the open goes away, the open is on the other side of the in-line connector.
   - If this is a fused circuit, make sure to inspect the fuse. If the fuse is open, check the circuit for a short to ground before installing a new fuse. The circuit may have a short to ground causing the fuse to open. This short to ground could be in the wire harness or in one of the components the circuit is supplying voltage to.

2. **TESTING 12-VOLT FUSED BATTERY B(+) CIRCUIT VOLTAGE WITH A VOLTMETER**

Fig. 4: Checking Testing 12-Volt Fused Battery B(+) Circuit Voltage With A Voltmeter
Courtesy of CHRYSLER GROUP, LLC

NOTE: The connector displayed in the graphics are only an example.

1. Turn the ignition off.
2. Disconnect the wire harness connector from the component that is being tested.

NOTE: Check connectors - Clean/repair as necessary.

3. At this time leave all in-line connectors connected.
4. Use a multimeter set to measure DC voltage.
5. Connect the ground lead of the meter to a known good ground.
6. Use the positive lead of the multimeter and probe the circuit that is being checked for voltage.
7. Ignition on, engine not running.

Is the voltage within specifications for this circuit?

Yes

- The circuit is functioning properly or the condition that originally caused the open or short may not be present at this time. Continue to measure the voltage and wiggle the wire harness and connectors while checking for an intermittent open or short.
- Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors where the short could occur intermittently.
- Look for any chafed, pierced, pinched, or partially broken wires.
- Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the related wire harness connectors.

- Perform any Technical Service Bulletins (TSBs) that may apply.

No

- Repair the open or short to ground in the circuit. Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors where the short could occur.
- One method to help isolate the open or short is to disconnect any in-line connectors that the circuit being checked runs through and check for the voltage again. If the voltage is present, the open or short is on the other side of the in-line connector.

CHECK A 12-VOLT SWITCHED BATTERY B(+) CIRCUIT FOR VOLTAGE

THEORY OF OPERATION

Fig. 5: Checking 12-Volt Switched Battery B(+) Circuit For Voltage
Courtesy of CHRYSLER GROUP, LLC

The purpose of the following procedure is to demonstrate how to check the voltage of a 12-Volt switched battery B(+) circuit with a test light or voltmeter.

NOTE: The circuit shown is an example, and is intended for demonstrational purpose only.

The following are circuit tests covered in this procedure:

- Testing 12-Volt Switched Battery B(+) Circuit Voltage With A Test Light
- Testing 12-Volt Switched Battery B(+) Circuit Voltage With A Voltmeter

NOTE: Perform the following test using a known good test light or functioning multimeter.

Below is a list of possible causes that could be related to a No Voltage condition.

Possible Causes
OPEN CIRCUIT (CHAFED, PIERCED, PINCHED OR BROKEN WIRES)
OPEN FUSE
OPEN IN-LINE CONNECTOR (BENT, PUSHED OUT OR CORRODED TERMINALS)

DIAGNOSTIC TEST

1. **TESTING 12-VOLT SWITCHED BATTERY B(+) CIRCUIT VOLTAGE WITH A TEST LIGHT**

Fig. 6: Testing 12-Volt Switched Battery B(+) Circuit Voltage With A Test Light
Courtesy of CHRYSLER GROUP, LLC

NOTE: Before testing any circuits, first verify the 12-volt test light is operating properly. Connect the 12-volt test light to battery ground or to any other known good ground. Touch the lead of the test light to Battery(+). If the test light is operational, it should illuminate brightly.

1. Turn the ignition off.
2. Disconnect the wire harness connector from the component that is being tested.

NOTE: Check connectors - Clean/repair as necessary.

3. At this time, leave all in-line connectors connected.
4. Connect the 12-volt test light to a known good ground.
5. Use the test light lead to carefully probe the Battery or Ignition voltage circuit in the harness connector.
6. First check with the ignition off, next check with the ignition on, and lastly check while cranking

the engine.

Does the test light illuminate brightly?

Yes

- The circuit is not open at this time or the condition that originally caused the open may not be present at this time. Continue to monitor the test light and wiggle the wire harness and connectors to check for an intermittent open or excessive resistance condition.
- Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors where the open could occur intermittently.
- Look for any chafed, pierced, pinched, or partially broken wires.
- Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the related wire harness connectors.
- Perform any Technical Service Bulletins (TSBs) that may apply.

No

- Repair the open in the circuit. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors where the open could occur.
- One method to help isolate the open is to disconnect any in-line connectors and measure the resistance from one side of the in-line connector to the matching component harness connector. If the open goes away, the open is on the other side of the in-line connector.
- If this is a fused circuit, make sure to inspect the fuse. If the fuse is open, check the circuit for a short to ground before installing a new fuse. The circuit may have a short to ground causing the fuse to open. This short to ground could be in the wire harness or in one of the components the circuit is supplying voltage to.

2. **TESTING 12-VOLT SWITCHED BATTERY B(+) CIRCUIT VOLTAGE WITH A VOLTMETER**

Fig. 7: Testing 12-Volt Switched Battery B(+) Circuit Voltage With A Voltmeter
Courtesy of CHRYSLER GROUP, LLC

NOTE: The connector displayed in the graphics are only an example.

1. Turn the ignition off.
2. Disconnect the wire harness connector from the component that is being tested.

NOTE: Check connectors - Clean/repair as necessary.

3. At this time leave all in-line connectors connected.
4. Use a multimeter set to measure DC voltage.
5. Connect the ground lead of the meter to a known good ground.
6. Use the positive lead of the multimeter and probe the circuit that is being checked for voltage.
7. Ignition on, engine not running.

Is the voltage within specifications for this circuit?

Yes

- The circuit is functioning properly or the condition that originally caused the open or short may not be present at this time. Continue to measure the voltage and wiggle the wire harness and connectors while checking for an intermittent open or short.
- Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors where the short could occur intermittently.
- Look for any chafed, pierced, pinched, or partially broken wires.
- Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the related wire harness connectors.
- Perform any Technical Service Bulletins (TSBs) that may apply.

No

- Repair the open or short to ground in the circuit. Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors where the short could occur.
- One method to help isolate the open or short is to disconnect any in-line connectors that the circuit being checked runs through and check for the voltage again. If the voltage is present, the open or short is on the other side of the in-line connector.

CHECK A 5-VOLT SUPPLY CIRCUIT FOR VOLTAGE

THEORY OF OPERATION

Fig. 8: Checking 5-Volt Supply Circuit For Voltage
Courtesy of CHRYSLER GROUP, LLC

The purpose of the following procedure is to demonstrate how to check the voltage of a 5-Volt supply circuit with a voltmeter.

NOTE: The circuit shown is an example, and is intended for demonstrational purpose only.

The following are circuit tests covered in this procedure:

- Testing A 5-Volt Supply Circuit For Voltage
- Testing A 5-Volt Supply Circuit And Sensor Ground Circuit

NOTE: Perform the following test using a known good multimeter.

Below is a list of possible causes that could be related to a No Voltage condition.

Possible Causes
OPEN CIRCUIT (CHAFED, PIERCED, PINCHED OR BROKEN WIRES)
OPEN IN-LINE CONNECTOR (BENT, PUSHED OUT OR CORRODED TERMINALS)
ELECTRONIC CONTROL MODULE (5-VOLT SUPPLY OUTPUT)

DIAGNOSTIC TEST

1. **TESTING A 5-VOLT SUPPLY CIRCUIT FOR VOLTAGE**

Fig. 9: Checking 5-Volt Supply Circuit For Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the sensor harness connector.

NOTE: Check connectors - Clean/repair as necessary.

3. Turn the ignition on.
4. Set the multimeter to measure DC voltage.
5. Connect the negative lead of the multimeter to a known good ground.
6. With the positive lead of the multimeter, carefully probe the 5-volt supply circuit.

Is the voltage between 4.7 and 5.2 volts?

Yes

- Go To 2

No

- Check the 5-volt supply circuit for an open or short to ground. For further assistance, perform the appropriate Sensor Reference Voltage DTC diagnostic procedure.

2. **TESTING A 5-VOLT SUPPLY CIRCUIT AND SENSOR GROUND CIRCUIT**

Fig. 10: Checking 5-Volt Supply Circuit And Sensor Ground Circuit
Courtesy of CHRYSLER GROUP, LLC

1. With the multimeter set to measure DC voltage.
2. Move the negative lead of the multimeter to carefully probe the sensor ground or sensor return circuit in the harness connector.
3. With the positive lead of the multimeter, carefully probe the 5-volt supply circuit.

   Is the voltage between 4.7 and 5.2 volts?

   Yes

   - At this time the 5-volt supply and sensor ground circuit are working properly. Continue to measure the voltage between the wires, wiggle the wire harness and connectors while checking for an intermittent condition.
   - Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors where the open could occur intermittently.
   - Look for any chafed, pierced, pinched, or partially broken wires.
   - Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the related wire harness connectors.
   - Perform any Technical Service Bulletins (TSBs) that may apply.

   No

   - Repair the open or excessive resistance in the Sensor Ground (Sensor Return) circuit.

CHECK A CIRCUIT FOR A SHORT TO GROUND

THEORY OF OPERATION

Fig. 11: Checking Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

The purpose of the following procedure is to demonstrate how to check a circuit for a Short to Ground.

NOTE: The circuit shown is an example, and is intended for demonstrational purpose only.

The following are circuit tests covered in this procedure:

- Testing For A Short To Ground Using An Ohmmeter

NOTE: Perform the following test using a known good multimeter.

Below is a list of possible causes that could be related to a Short to Ground condition.

Possible Causes
SHORTED CIRCUIT (CHAFED, PIERCED OR PINCHED WIRES)
SHORTED IN-LINE CONNECTOR (BENT, PUSHED OUT OR CORRODED TERMINALS)

DIAGNOSTIC TEST

TESTING FOR A SHORT TO GROUND USING AN OHMMETER

Fig. 12: Checking For A Short To Ground Using An Ohmmeter
Courtesy of CHRYSLER GROUP, LLC

NOTE: Before measuring the resistance of any circuit, first measure the resistance between the two leads of the multimeter. Take this value and subtract it from the value recorded when measuring the resistance of the circuit being checked (The meter leads can add 0.5 ohm or more of total resistance).

1. Turn the ignition off.
2. Disconnect the wire harness connectors from the module and component for the suspected circuit being shorted to ground.

NOTE: Check connectors - Clean/repair as necessary.

3. With the component wire harness connectors disconnected, use a meter set to measure Ohms (?), and measure the resistance between the circuit and a known good ground.
4. Use the negative lead of the meter and touch a known good ground.
5. Use the positive lead of the meter and carefully probe the circuit suspected of having the short.

Is the resistance to ground below 10k ohms ?

Yes

- Repair the short to ground. Use the wiring diagram as a guide to follow the path of the circuit.
- One method to help isolate the short is to disconnect any in-line connectors that the circuit being tested runs through and measure for the short again. If the short goes away, the short is on the other side of the in-line connector.

No

- The circuit is not shorted to ground or the condition that originally caused the short may not be present at this time. Continue to measure the resistance, wiggle the wire harness and connectors while checking for an intermittent short.
- Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors where the short could occur intermittently.
- Look for any chafed, pierced, pinched, or partially broken wires.
- Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the related wire harness connectors.
- Perform any Technical Service Bulletins (TSBs) that may apply.

CHECK A CIRCUIT FOR A SHORT TO VOLTAGE

THEORY OF OPERATION

Fig. 13: Battery Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

The purpose of the following procedure is to demonstrate different methods of checking for a short to voltage in a circuit. When diagnosing a DTC it might be necessary to verify that proper voltage is on a circuit or that a circuit is not shorted high.

NOTE: The circuit shown is an example, and is intended for demonstrational purpose only.

The following are circuit tests covered in this procedure:

- Testing For A Short To Battery Voltage Using A Voltmeter
- Testing For A Short To Switched Battery Voltage Using A Voltmeter
- Testing For A Short To Battery Voltage Using A 12-Volt Test Light

- Testing For A Short To Switched Battery Voltage Using A 12-Volt Test Light

NOTE: Perform the following test using a known good test light or functioning multimeter.

Below is a list of possible causes that could be related to a Short To Voltage condition.

Possible Causes
SHORTED CIRCUIT (CHAFED, PIERCED OR PINCHED WIRES)
SHORTED IN-LINE CONNECTOR (BENT, PUSHED OUT OR CORRODED TERMINALS)

DIAGNOSTIC TEST

1. **TESTING FOR A SHORT TO BATTERY VOLTAGE USING A TEST LIGHT**

Fig. 14: Checking For A Short To Battery Voltage Using A Test Light
Courtesy of CHRYSLER GROUP, LLC

NOTE: Before testing any circuits, first verify the 12-volt test light is operating properly. Connect the 12-volt test light to battery ground or to any other known good ground. Touch the lead of the test light to Battery(+). If the test light is operational, it should illuminate brightly.

1. Turn the ignition off.
2. Disconnect the wire harness connectors of all components that contain the circuits that are suspected of having the short.

NOTE: Check connectors - Clean/repair as necessary.

3. At this time leave all in-line connectors connected.
4. Connect the 12-volt test light to a known good ground.
5. Use the lead of the test light and carefully probe the circuit suspected of having the short.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.

6. First, check with the ignition off, next with the ignition on, and lastly while cranking the engine.

   Does the test light illuminate brightly?

   Yes

   - Repair the short to voltage. Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors where the short could occur.
   - One method to help isolate the short is to disconnect any in-line connectors that the circuit being checked runs through and check for the short again. If the short goes away, the short is on the other side of the in-line connector.

   No

   - The circuit is not shorted to voltage or the condition that originally caused the short may not be present at this time. Continue to measure the resistance and wiggle the wire harness to check for an intermittent short.

NOTE: By disconnecting the wire harness connectors you may have eliminated the source of the voltage causing the short. Use the wiring diagram as a guide, check to see if there are any battery circuits in the same wire harness as the circuit you are testing. It is necessary to check for a short to those circuits using an ohmmeter. Refer to STANDARD PROCEDURE and perform the Check for a Short Between Multiple Circuits diagnostic procedure.

   - Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors where the short could occur intermittently.
   - Look for any chafed, pierced, pinched, or partially broken wires.
   - Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the related component and wire harness connectors.
   - Perform any Technical Service Bulletins (TSBs) that may apply.

2. **TESTING FOR A SHORT TO SWITCHED IGNITION VOLTAGE USING A TEST LIGHT**

Fig. 15: Checking For A Short To Switched Ignition Voltage Using A Test Light
Courtesy of CHRYSLER GROUP, LLC

NOTE: Before testing any circuits, first verify the 12-volt test light is operating properly. Connect the 12-volt test light to battery ground or to any other known good ground. Touch the lead of the test light to Battery(+). If the test light is operational, it should illuminate brightly.

1. Turn the ignition off.
2. Disconnect the wire harness connectors of all components that contain the circuits that are suspected of having the short.

NOTE: Check connectors - Clean/repair as necessary.

3. At this time leave all in-line connectors connected.
4. Connect the 12-volt test light to a known good ground.
5. Use the lead of the test light and carefully probe the circuit suspected of having the short.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.

6. First, check with the ignition off, next with the ignition on, and lastly while cranking the engine.

   Does the test light illuminate brightly?

   Yes

- Repair the short to voltage. Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors where the short could occur.
- One method to help isolate the short is to disconnect any in-line connectors that the circuit being checked runs through and check for the short again. If the short goes away, the short is on the other side of the in-line connector.

No

- The circuit is not shorted to voltage or the condition that originally caused the short may not be present at this time. Continue to measure the resistance and wiggle the wire harness to check for an intermittent short.

NOTE: **By disconnecting the wire harness connectors you may have eliminated the source of the voltage causing the short. Use the wiring diagram as a guide, check to see if there are any battery circuits in the same wire harness as the circuit you are testing. It is necessary to check for a short to those circuits using an ohmmeter. Refer to STANDARD PROCEDURE and perform the Check for a Short Between Multiple Circuits diagnostic procedure.**

- Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors where the short could occur intermittently.
- Look for any chafed, pierced, pinched, or partially broken wires.
- Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the related component and wire harness connectors.
- Perform any Technical Service Bulletins (TSBs) that may apply.

3. **TESTING FOR A SHORT TO BATTERY VOLTAGE USING A VOLTMETER**

Fig. 16: Checking For A Short To Battery Voltage Using A Voltmeter
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the wire harness connectors of the components that contain the circuit that is suspected as having a short.

NOTE: Check connectors - Clean/repair as necessary.

3. At this time leave all in-line connectors connected.
4. With all the component wire harness connectors disconnected, use a multimeter set to measure DC voltage.
5. Connect the ground lead of the meter to a known good ground.
6. Use the positive lead of the multimeter and probe the circuit that is being checked for a short.

Is there any voltage present?

Yes

- Repair the short to battery voltage. Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors where the short could occur.
- One method to help isolate the short is to disconnect any in-line connectors that the circuit being checked runs through and measure for the short again. If the short goes away, the short is on the other side of the in-line connector.

No

- The circuit is not shorted to voltage or the condition that originally caused the short may not be present at this time. Continue to measure the voltage and wiggle the wire harness to check for an intermittent short.

NOTE: By disconnecting the wire harness connectors you may have eliminated the source of the voltage causing the short. Use the wiring diagram as a guide, check to see if there are any battery circuits in the same wire harness as the circuit you are testing. It is necessary to check for a short to those circuits using an ohmmeter. Refer to STANDARD PROCEDURE and perform the Check for a Short Between Multiple Circuits diagnostic procedure.

- Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors where the short could occur intermittently.
- Look for any chafed, pierced, pinched, or partially broken wires.
- Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to

terminal contact in the related wire harness connectors.

- Perform any Technical Service Bulletins (TSBs) that may apply.

4. **TESTING FOR A SHORT TO SWITCHED IGNITION VOLTAGE USING A VOLTMETER**

Fig. 17: Checking For A Short To Switched Ignition Voltage Using A Voltmeter
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the wire harness connectors of all components that contain the circuits that are suspected as being shorted.

NOTE: Check connectors - Clean/repair as necessary.

3. At this time leave all in-line connectors connected.
4. With all the component wire harness connectors disconnected, use a multimeter set to measure DC voltage.
5. Connect the ground lead of the meter to a known good ground.
6. Use the positive lead of the multimeter and probe the circuit suspected of having the short.
7. Ignition on, engine not running.

Is any voltage present?

Yes

- Repair the short to ignition voltage. Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors where the short could occur.
- One method to help isolate the short is to disconnect any in-line connectors that the circuit being checked runs through and check for the short again. If the short goes away, the short is on the other side of the in-line connector.

No

- The circuit is not shorted to voltage or the condition that originally caused the short may not be present at this time. Continue to measure the voltage and wiggle the wire harness to check for an intermittent short.

NOTE: **By disconnecting the wire harness connectors you may have eliminated the source of the voltage causing the short. Use the wiring diagram as a guide, check to see if there are any battery circuits in the same wire harness as the circuit you are testing. It is necessary to check for a short to those circuits using an ohmmeter. Refer to STANDARD PROCEDURE and perform the Check for a Short Between Multiple Circuits diagnostic procedure.**

- Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors where the short could occur intermittently.
- Look for any chafed, pierced, pinched, or partially broken wires.
- Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the related wire harness connectors.
- Perform any Technical Service Bulletins (TSBs) that may apply.

CHECK FOR AN OPEN GROUND CIRCUIT

THEORY OF OPERATION

Fig. 18: Checking 12-Volt Switched Battery B(+) Circuit For Voltage
Courtesy of CHRYSLER GROUP, LLC

The purpose of the following procedure is to demonstrate how to check the operation of a generic ground circuit

with a test light.

NOTE: The circuit shown is an example, and is intended for demonstrational purpose only.

The following are circuit tests covered in this procedure:

- Testing Ground Circuit With Test Light

NOTE: Perform the following test using a known good test light.

Possible Causes
OPEN GROUND CIRCUIT (CHAFED, PIERCED, PINCHED OR BROKEN WIRE)
OPEN IN-LINE CONNECTOR (BENT, PUSHED OUT OR CORRODED TERMINALS)

DIAGNOSTIC TEST

TESTING GROUND CIRCUIT WITH TEST LIGHT

Fig. 19: Checking Ground Circuit With Test Light
Courtesy of CHRYSLER GROUP, LLC

NOTE: Before testing any circuits, first verify the 12-volt test light is operating properly. Connect the 12-volt test light to battery ground or to any other known good ground. Touch the lead of the test light to Battery(+). If the test light is operational, it should illuminate brightly.

1. Turn the ignition off.
2. Disconnect the wire harness connectors of the components that contain the ground circuit suspected of

containing excessive resistance.

NOTE: Check connectors - Clean/repair as necessary.

3. At this time leave all in-line connectors connected.
4. With all the component wire harness connectors disconnected, connect the 12-volt test light to Battery(+).
5. Use the test light lead to lightly probe the ground circuit in the harness connector.

Does the test light illuminate brightly?

Yes

- The suspected ground circuit is not open or the condition that originally caused the open or excessive resistance is not present at this time. Another way to check for an open would be to use an ohmmeter and measure the resistance of the ground circuit. While continuing to measure the resistance of the circuit, wiggle the wire harness and connectors to check for an intermittent open or poor connection.
- Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors where the open could occur intermittently.
- Look for any chafed, pierced, pinched, or partially broken wires.
- Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the related wire harness connectors.
- Perform any Technical Service Bulletins (TSBs) that may apply.

No

- Repair the open in the ground circuit. Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors where the open could occur.
- One method to help isolate the open is to disconnect any in-line connectors and measure the resistance from one side of the in-line connector to the matching component harness connector. If the open goes away, the open is on the other side of the in-line connector.

CHECK FOR A SHORT BETWEEN MULTIPLE CIRCUITS

THEORY OF OPERATION

Fig. 20: Battery Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

The purpose of the following procedure is to demonstrate how to check for a short circuit between multiple circuits.

NOTE: The circuit shown is an example, and is intended for demonstrational purpose only.

The following are circuit tests covered in this procedure:

- Testing For A Short Between Multiple Circuits

NOTE: Perform the following test using a known good multimeter.

Below is a list of possible causes that could be related to a Multiple Short condition.

Possible Causes
SHORTED CIRCUIT (CHAFED, PIERCED OR PINCHED WIRES)
SHORTED IN-LINE CONNECTOR (BENT, PUSHED OUT OR CORRODED TERMINALS)

DIAGNOSTIC TEST

TESTING FOR A SHORT BETWEEN MULTIPLE CIRCUITS

Fig. 21: Checking For A Short Between Multiple Circuits
Courtesy of CHRYSLER GROUP, LLC

NOTE: Before measuring the resistance of any circuit, first measure the resistance between the two leads of the multimeter. Take this value and subtract it from the value recorded when measuring the resistance of the circuit being checked (The meter leads can add 0.5 ohm or more of total resistance).

1. Turn the ignition off.
2. Disconnect the wire harness connectors of the components that contain the circuits that are suspected of being shorted together.

   NOTE: Check connectors - Clean/repair as necessary.

3. At this time leave all in-line connectors connected.
4. With all the component wire harness connectors disconnected, use a multimeter set to Ohms (?), and measure the resistance between the applicable circuits in one of the harness connectors.
5. Use one lead of the multimeter and carefully probe the circuit suspected of being shorted.
6. Use the other lead of the meter and one at a time, carefully probe the other circuits in the harness connector.

   Is the resistance below 10k ohms when probing any two circuits?

   Yes

   - Repair the short between the circuits. Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors where the short could occur.
   - One method to help isolate the short is to disconnect any in-line connectors that the circuit being tested runs through and measure for the short again. If the short goes away, the short is on the other

side of the in-line connector.

No

- The circuit is not shorted or the condition that originally caused the short may not be present at this time. Continue to measure the resistance and wiggle the wire harness and connectors while checking for an intermittent short.

NOTE: By disconnecting the wire harness connectors you may have eliminated the source that was causing the short.

- Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors where the short could occur intermittently.
- Look for any chafed, pierced, pinched, or partially broken wires.
- Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the related wire harness connectors.
- Perform any Technical Service Bulletins (TSBs) that may apply.

CHECK THE RESISTANCE OF A CIRCUIT USING AN OHMMETER

THEORY OF OPERATION

Fig. 22: Battery Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

The purpose of the following procedure is to demonstrate how to check the resistance of a circuit with an ohmmeter.

NOTE: The circuit shown is an example, and is intended for demonstrational purpose only.

The following are circuit tests covered in this procedure:

- Testing For An Open Circuit Using An Ohmmeter

NOTE: Perform the following test using a known good multimeter.

Below is a list of possible causes that could be related to an Open Circuit condition.

Possible Causes
OPEN CIRCUIT (CHAFED, PIERCED, PINCHED OR BROKEN WIRES)
OPEN IN-LINE CONNECTOR (BENT, PUSHED OUT OR CORRODED TERMINALS)

DIAGNOSTIC TEST

TESTING FOR AN OPEN CIRCUIT USING AN OHMMETER

Fig. 23: Checking For An Open Circuit Using An Ohmmeter
Courtesy of CHRYSLER GROUP, LLC

NOTE: Before measuring the resistance of any circuit, first measure the resistance between the two leads of the multimeter. Take this value and subtract it from the value recorded when measuring the resistance of the circuit being checked (The meter leads can add 0.5 ohm or more of total resistance).

1. Turn the ignition off.
2. Disconnect the wire harness connectors of the components that contain the circuit suspected of being open.

NOTE: Check connectors - Clean/repair as necessary.

3. At this time leave all in-line connectors connected.
4. With the component wire harness connectors disconnected, use a multimeter set to Ohms (?), and measure the resistance of the circuit.
5. Use one lead of the meter and probe the circuit in one harness connector.
6. Use the other lead of the meter and probe the same circuit in the other harness connector.

   Is the resistance in the circuit below 10k ohms?

   Yes

   - The circuit does not contain any excessive resistance or the condition that originally caused the excessive resistance may not be present at this time. Continue to measure the resistance of the circuit, wiggle the wire harness and connectors to check for an intermittent open or poor connection.
   - Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors where the open could occur intermittently.
   - Look for any chafed, pierced, pinched, or partially broken wires.
   - Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the related wire harness connectors.
   - Perform any Technical Service Bulletins (TSBs) that may apply.

   No

   - Repair the excessive resistance in the circuit between the two wire harness connectors. Using the wiring diagram as a guide, trace the circuit and check for any in-line connectors where the open or excessive resistance could occur.
   - One method to help isolate the open is to disconnect any in-line connectors and measure the resistance from one side of the in-line connector to the matching component harness connector. If the open or excessive resistance is not present, the open or excessive resistance is on the other side of the in-line connector.

CHECK FOR EXCESSIVE CURRENT DRAW

THEORY OF OPERATION

What is current draw?

Current draw, or parasitic draw is an electrical load that draws current from the battery when the ignition is turned off. Some are considered normal, some above normal. Normal draw comes from various electronic devices connected to battery positive at all times. Many vehicle modules draw a few mA (milliamps) as a means to "Keep Alive Memory". Whether it's the clock in the radio or the last known position of the memory mirrors, these tiny amounts of current typically will only add up to 20 or 30 mA. The vehicle can sit parked for days, even a few weeks without any problems of excessive battery drain that might prevent starting. As long as the vehicle is driven periodically in order for the alternator to recharge the battery there is no problem. A problem may occur, in situations such as new vehicles in dealer stock or long term airport parking situations.

Below are some examples of modules and components that require keep alive memory:

- Powertrain Control Module (PCM)
- Body Control Module (BCM)
- Memory Seat Module (MSM)
- Radio

What is excessive current draw?

Excessive current draw can be determined by an ammeter reading in excess of 50 mA. The typical "normal" current draw will not exceed 20 or 30 mA.

How to locate the problem?

Locating the problem involves a process of elimination. If the problem is not obvious, like the trunk light staying on, you will have to start troubleshooting:

- Start by removing one fuse at a time until you see the reading on the meter drop off (be careful to reinstall the fuses in their proper location).
- Once you've determined the high-draw circuit, there still may be a half-dozen loads, each individually drawing current from the battery.
- To zero in on that circuit or circuits, use the schematic diagram and disconnect each device on the circuit one-at-a-time and check the meter.
- When the milliamp reading drops off significantly, you've found the problem.

Perform the following test to determine where the cause of the draw is located.

Possible Causes
INSTALLED AFTERMARKET ACCESSORIES (AUDIO SYSTEMS, VEHICLE ALARMS, ETC.)
COURTESY LIGHTS REMAINING ON (INTERIOR, TRUNK, HOOD, ETC.)
BATTERY CHARGERS PLUGGED INTO THE CIGARETTE LIGHTER/POWER OUTLETS

DIAGNOSTIC TEST

TESTING FOR PARASITIC DRAW

NOTE: **For a more accurate current draw reading, wait 20 minutes to make sure all modules have powered down before continuing. Some modules may stay powered up longer than others.**

2923014738

Fig. 24: Checking For Parasitic Draw Using Multimeter
Courtesy of CHRYSLER GROUP, LLC

Turn the ignition off.

1. Disconnect the Negative battery cable (ground).
2. Using a multimeter, set the multimeter leads up to properly measure Amperage.
3. Connect the ground lead that is plugged into the COM port of the multimeter to the Negative battery post/terminal.
4. Connect the other lead of the multimeter that is plugged into the Amp port of the multimeter to the Negative battery cable.

CAUTION: Do not crank the engine or turn on any accessories that may draw more than 10 Amps. You may open the protective fuse in the multimeter.

5. While monitoring the amperage reading on the multimeter, begin to remove fuses (one at a time) from each fuse location on the vehicle and see if the amperage drops.

NOTE:

- **Only remove one fuse at a time until the cause of the voltage draw is determined.**
- **Many vehicles have multiple fuse locations on the vehicle.**

6. If the amperage does not drop, install the fuse you just removed and remove the next fuse.

   Does the amperage drop to between 0.02 to 0.04 of an Amp when removing any fuses?

   Yes

- Use the wiring diagram as a guide to help indicate what components or modules are powered by the fuse.
- At this point you can install the fuse and begin disconnecting the components powered by the fuse.
  - When the amperage drops after disconnecting a component this will indicate which component is at fault.
  - It is important to know how long some modules are designed to remain awake.
  - You don't want to replace a component that is operating normally.
  - The condition that originally caused the draw may not be present at this time.

No

- The condition that originally caused the draw may not be present at this time.
- Look for any chafed, pierced, pinched, or partially broken wires.
- Look for broken, bent, pushed out or corroded ground terminals.
- Perform any Technical Service Bulletins (TSBs) that may apply.

CIRCUIT LOAD TESTING PROCEDURE

THEORY OF OPERATION

A circuit load test can be performed to test the ability of a circuit to carry the current required to operate a connected device. A circuit load test should be performed after a circuit has passed a resistance test using a DVOM and the circuit is still suspected of a failure.

- A single copper wire strand will carry enough current to light a test light bulb, while showing very low resistance using a DVOM.
- Some test lights are insufficient for load testing because of the very low resistance bulb being used.
- The Load Test tool listed below will require higher current flow to power the bulb; and this will test the ability of the circuit to carry a load.
- This test will indicate if the circuit being tested can carry the current required to operate a connected device.

WARNING: To avoid possible serious or fatal injury, DO NOT load test any air bag/restraint system components or circuits using the procedures listed here. Refer to RESTRAINTS - SERVICE INFORMATION for proper air bag/restraint system testing procedures.

CAUTION: Do not load test any circuits with components still connected to the circuit.

NOTE: Depending upon the location of the circuit in question, this test may require jumper wires.

NOTE: **Use the wiring diagrams as a guide to trace the circuits and look for any in-line connectors where the circuit failure could occur intermittently. Look for any chafed, pierced, pinched, or partially broken wires. Look for broken, bent, pushed out or corroded terminals - clean/repair as necessary. Verify that there is good pin to terminal contact in the related wire harness connectors.**

Fig. 25: Load Test Tool
Courtesy of CHRYSLER GROUP, LLC

Here is an example of a simple tool you can build to test a circuit`s ability to carry a load.

Fig. 26: Load Test Tool Components

Courtesy of CHRYSLER GROUP, LLC

The following is a list of components required to build a load test tool:

1. 3156 Bulb
2. 3156 Bulb socket
3. Negative alligator clip with covers
4. Positive alligator clip with covers
5. 2 Amp mini fuse
6. Mini fuse holder
7. 2' to 4' of Black 16ga wire
8. 2' to 4' of Red 16ga wire
9. Approved back probe tool
10. Shrink tubing
11. Solder

LOAD TESTING A GROUND CIRCUIT

DIAGNOSTIC LOAD TEST (GROUND CIRCUIT)

Fig. 27: Performing Diagnostic Load Test (Ground Circuit)
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the connector from the device(s) to gain access and isolate the terminal for the circuit being tested.
2. Connect the positive lead of the load test tool to the positive side of the battery.
3. Using an approved connector back probe tool, connect the negative lead of the load test tool to the circuit

being tested at point (A).

CAUTION: Use only approved connector back probe tools when back probing a connector so as not to cause damage to the terminals or insulation of the connector. Damage to the terminals can cause poor terminal contact or retention. Damage to the insulation can introduce corrosion due to water infiltration.

Does the bulb light bright, when compared to a direct battery connection?

Yes

- The circuit being tested can carry a load, check other circuits, connectors and terminals for concerns.

No

- Repair the circuit, connector or terminal that has an open or excessive resistance.
- Perform any related Recalls or Technical Service Bulletins (TSBs) that may apply.

LOAD TESTING A BATTERY OR IGNITION FEED CIRCUIT

DIAGNOSTIC LOAD TEST (BATTERY/IGNITION FEED CIRCUIT)

Fig. 28: Performing Diagnostic Load Test (Battery/Ignition Feed Circuit)
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the connector from the device(s) to gain access and isolate the terminal for the circuit being tested.

2. Using an approved connector back probe tool, connect the positive lead of the load test tool to the circuit being tested at point (A).
3. Connect the negative lead of the load test tool to the negative side of the battery or ground.

CAUTION: Use only approved connector back probe tools when back probing a connector so as not to cause damage to the terminals or insulation of the connector. Damage to the terminals can cause poor terminal contact or retention. Damage to the insulation can introduce corrosion due to water infiltration.

Does the bulb light bright, when compared to a direct battery connection?

Yes

- The circuit being tested can carry a load, check other circuits, connectors and terminals for concerns.

No

- Repair the circuit, connector or terminal that has an open or excessive resistance.
- Perform any related Recalls or Technical Service Bulletins (TSBs) that may apply.

LOAD TESTING A BATTERY OR IGNITION FEED CIRCUIT AND GROUND CIRCUIT

DIAGNOSTIC LOAD TEST (BATTERY FEED & GROUND CIRCUIT)

Fig. 29: Performing Diagnostic Load Test (Battery Feed & Ground Circuit)
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the connector from the device(s) to gain access and isolate the terminal for the circuit being tested.
2. Using an approved connector back probe tool, connect the positive lead of the load test tool to the circuit being tested at point (A).
3. Using an approved connector back probe tool, connect the negative lead of the load test tool to the circuit being tested at point (B).

CAUTION: Use only approved connector back probe tools when back probing a connector so as not to cause damage to the terminals or insulation of the connector. Damage to the terminals can cause poor terminal contact or retention. Damage to the insulation can introduce corrosion due to water infiltration.

Does the bulb light bright, when compared to a direct battery connection?

Yes

- The circuit being tested can carry a load, check other circuits, connectors and terminals for concerns.

No

- Test the circuits individually to determine which circuit is the cause of the test failure.
- Repair the circuit, connector or terminal that has an open or excessive resistance.
- Perform any related Recalls or Technical Service Bulletins (TSBs) that may apply.

LOAD TESTING A CIRCUIT FOR AN OPEN OR HIGH RESISTANCE

DIAGNOSTIC LOAD TEST (OPEN/HIGH RESISTANCE CIRCUIT)

Fig. 30: Performing Diagnostic Load Test (Open/High Resistance Circuit)
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect all components from the circuit being tested.
2. Connect the positive lead of the load test tool to the positive side of the battery (A).
3. Using an approved connector back probe tool, connect the negative lead of the load test tool to the circuit being tested at point (B).
4. Using an approved connector back probe tool, connect a jumper wire to the circuit being tested at point (C).
5. Then connect the other end of the jumper wire to the negative side of the battery or ground (D).

CAUTION: Use only approved connector back probe tools when back probing a connector so as not to cause damage to the terminals or insulation of the connector. Damage to the terminals can cause poor terminal contact or retention. Damage to the insulation can introduce corrosion due to water infiltration.

Does the bulb light bright, when compared to a direct battery connection?

Yes

- The circuit being tested can carry a load, check other circuits, connectors and terminals for concerns.

No

- Repair the circuit, connector or terminal that has an open or excessive resistance.
- Perform any related Recalls or Technical Service Bulletins (TSBs) that may apply.

VOLTAGE DROP TEST PROCEDURE

THEORY OF OPERATION

Voltage drop is the reduction in voltage in an electrical circuit between the voltage source and load components. The wires and connectors of a circuit should contain almost no resistance and **all** the voltage should be consumed through the load. The "load" is the component using the power, such as a light, starter, or blower motor. If a circuit has excessive resistance, it prevents the wire from carrying sufficient current under high load conditions. A voltage drop test is an effective way to locate excessive resistance in connections and circuits.

To perform a voltage drop test, a Digital Volt Ohm Meter (DVOM) is used to measure the voltage drop across a live circuit or connection while it is under the load. If the circuit or connection being tested has excessive resistance, the DVOM will measure the voltage that the resistance is using. **Little or no voltage drop should be read, ideally less than 0.2 of a volt** , anything greater indicates excessive resistance and the circuit or connection should be inspected for cleaning or repair.

Possible Causes
EXCESSIVE CIRCUIT RESISTANCE (CHAFED, PIERCED OR CORRODED WIRES)
HIGH RESISTANCE WITH IN-LINE CONNECTOR (BENT, PUSHED OUT OR CORRODED TERMINALS)

DIAGNOSTIC TEST

TESTING FOR VOLTAGE DROP

Fig. 31: Testing for Voltage Drop
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Use the wiring diagram as a guide, trace the circuit being tested and locate the components related to the circuit.

3. Set the multimeter to measure DC voltage.
4. Carefully back probe the two component harness connectors of the circuit being tested.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts or fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.

NOTE: If you are testing the starting circuit, disable the engine so the engine does not start.

5. Crank the engine for five seconds if you are testing the starting circuit and monitor the multimeter voltage reading.
6. For circuits that don't require the engine running, turn the ignition on.
7. For circuits that require the engine running, start the engine.

NOTE: If the circuit you are checking needs to be operating, such as the Blower Motor or a Lamp, do so now.

8. Monitor the voltage reading.
9. The voltmeter will show the difference in voltage between the two points.

Is the voltage less than 0.2 of a Volt?

Yes

- At this time the circuit is functioning properly. Continue to measure the voltage between the components and wiggle the wire harness and connectors while checking for an intermittent condition.
- Use the wiring diagram as a guide to trace the circuits and look for any in-line connectors where the excessive resistance could occur intermittently.
- Look for any chafed, pierced, pinched, or partially broken wires.
- Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the related wire harness connectors.
- Perform any Technical Service Bulletins (TSBs) that may apply.

No

- Repair the excessive resistance in the circuit.
- Use the wiring diagram as a guide to trace the circuit and look for any in-line connectors where the excessive resistance may occur.
- Look for any chafed, pierced, pinched, or partially broken wires.

- Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the related wire harness connectors.
- Perform any Technical Service Bulletins (TSBs) that may apply.

ELECTROSTATIC DISCHARGE (ESD) SENSITIVE DEVICES

Fig. 32: Electrostatic Discharge Symbol
Courtesy of CHRYSLER GROUP, LLC

All ESD sensitive components are solid state and a symbol is used to indicate this. When handling any component with this symbol, comply with the following procedures to reduce the possibility of electrostatic charge build up on the body and inadvertent discharge into the component. If it is not known whether the component is ESD sensitive, assume that it is.

Perform the following procedure when handling ESD sensitive components:

1. Always touch a known good ground before handling the component. This should be repeated while handling the component and more frequently after sliding across a seat, sitting down from a standing position, or walking a distance.
2. Avoid touching electrical terminals of the component, unless instructed to do so by a written procedure.
3. When using a voltmeter, be sure to connect the ground lead first.
4. Do not remove the component from its protective packing until it is time to install the component.
5. Before removing the component from its package, ground the package to a known good ground on the vehicle.

WIRE SPLICING

YouTube	A multimedia supplement to the instructions contained in this article is available. To view the multimedia example of the condition described go to; **http://www.youtube.com/user/Mitchell1Tips** **then type "A00641526.vid1" into the "Search Channel" box.**

CAUTION: If additional wire is needed when making a splice repair to any wire, it is important that the same or next larger size wire gauge be used. Refer to SYSTEM WIRING DIAGRAMS for the original wire gauge size.

Fig. 33: Splice Band
Courtesy of CHRYSLER GROUP, LLC

1. Remove 13 millimeters (0.50 inch) of insulation from each wire that needs to be spliced.
2. Place a piece of adhesive sealant-lined heat shrink tubing (Part Number 04778570 or equivalent) over the wire on one side of the splice. Be certain the length of tubing will be sufficient to cover and seal the entire repair area.
3. Place the strands of the wires being spliced so that they are overlapping each other within the splice band (1).

Fig. 34: Crimping Tool
Courtesy of CHRYSLER GROUP, LLC

4. Using a crimping tool (1) (MOPAR Part Number 05019912AA, Miller Special Tool Number (special tool #10042, Crimper, Wire/Terminal) or equivalent) crimp the splice band and wires together securely.

Fig. 35: Solder Splice
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Never use acid core solder for electrical wiring repairs.

5. Using Rosin Core type solder (1) only and a suitable soldering iron (3), solder the wire and splice band connection (2) together.

Fig. 36: Heat Shrink Tube
Courtesy of CHRYSLER GROUP, LLC

6. Center the heat shrink tubing (2) over the splice joint repair and heat using a suitable heat gun. Heat the joint until the tubing is tightly sealed and sealant (1) begins to ooze out of both ends of the tubing.

REMOVAL

CONNECTOR TERMINAL REMOVAL

Fig. 37: Removal Of Dress Cover
Courtesy of CHRYSLER GROUP, LLC

1 - DRESS COVER
2 - CONNECTOR LOCK
3 - CONNECTOR

1. Disconnect battery.

2. Release Connector Lock (2).
3. Disconnect the connector (3) being repaired from its mating half/component.
4. Remove the dress cover (if applicable) (1).

Fig. 38: Connector Secondary Terminal Lock
Courtesy of CHRYSLER GROUP, LLC

1 - Secondary Terminal Lock

5. Release the Secondary Terminal Lock, if required (1).

Fig. 39: Terminal Removal
Courtesy of CHRYSLER GROUP, LLC

1 - TYPICAL CONNECTOR
2 - PICK FROM TERMINAL REMOVER KIT 10300
3 - APEX CONNECTOR
4 - PICK FROM TERMINAL REMOVER KIT 10300
5 - AUGAT CONNECTOR
6 - ELECTRICAL TERMINAL REMOVAL TOOL
7 - MOLEX CONNECTOR
8 - PICK FROM TERMINAL REMOVER KIT 10300
9 - THOMAS AND BETTS CONNECTOR
10 - TERMINAL REMOVER
11 - CONNECTOR
12 - ELECTRICAL TERMINAL REMOVER

6. Position the connector locking finger away from the terminal using the proper special tool. Pull on the wire to remove the terminal from the connector.

INSTALLATION

CONNECTOR TERMINAL INSTALLATION

1. Select a wire from the terminal repair kit that best matches the color and gauge of the wire being repaired.
2. Cut the repair wire to the proper length and remove one-half (1/2) inch of insulation.
3. Splice the repair wire to the wire harness (see Wire Splicing procedure). Refer to **STANDARD PROCEDURE**.
4. Insert the repaired wire into the connector.
5. Install the connector locking wedge, if required, and reconnect the connector to its mating half/component.
6. Re-tape the wire harness starting at 1-1/2 inches behind the connector and 2 inches past the repair.
7. Connect battery and test all affected systems.

ENGINE COMPARTMENT

Fig. 4: International Symbols
Courtesy of CHRYSLER GROUP, LLC

The graphic symbols illustrated are used to identify engine compartment lubricant and fluid inspection and fill locations. The symbols correspond to the caps located within the engine compartment.

LABEL, VEHICLE EMISSION CERTIFICATION INFORMATION (VECI)

DESCRIPTION

DESCRIPTION

NOTE: **The Vehicle Emission Control Information (VECI) label(s) must be in place for the life of the vehicle. When replacing the component in which the VECI label is adhered, a new VECI label must also be adhered to the new component.**

All models have a VECI Label. Chrysler permanently attaches the label in the engine compartment. It cannot be removed without defacing information and destroying the label.

The label contains the vehicle's emission specifications and vacuum hose routings. All hoses must be connected and routed according to the label.

VEHICLE CERTIFICATION LABEL

DESCRIPTION

DESCRIPTION

Fig. 5: Vehicle Certification Label - Typical
Courtesy of CHRYSLER GROUP, LLC

A vehicle certification label is attached to every Chrysler LLC vehicle. The label certifies that the vehicle conforms to all applicable Federal Motor Vehicle Standards. The label also lists:

- Month and year of vehicle manufacture.
- Gross Vehicle Weight Rating (GVWR). The gross front and rear axle weight ratings (GAWR's) are based on a minimum rim size and maximum cold tire inflation pressure.
- Vehicle Identification Number (VIN).
- Type of vehicle.
- Type of rear wheels.
- Bar code.
- Month, Day and Hour (MDH) of final assembly.
- Paint and Trim codes.
- Country of origin.

The label is located on the driver-side door shut-face.

VEHICLE IDENTIFICATION NUMBER

DESCRIPTION

DESCRIPTION

Fig. 6: Vehicle Identification Number (VIN) Label
Courtesy of CHRYSLER GROUP, LLC

The Vehicle Identification Number (VIN) label (1) can be viewed through the windshield at the upper left corner of the instrument panel, near the left windshield pillar. The VIN consists of 17 characters in a combination of letters and numbers that provide specific information about the vehicle. Refer to the charts below for decoding information.

To protect the consumer from theft and possible fraud the manufacturer is required to include a Check Digit at the ninth position of the vehicle identification number. The check digit is used by the manufacturer and government agencies to verify the authenticity of the vehicle and official documentation. The formula to use the check digit is not released to the general public.

POSITIONS 1 - 3: WORLD MANUFACTURER IDENTIFIER

Vehicle Quick Reference - Cherokee

CAPACITIES AND RECOMMENDED FLUIDS

DESCRIPTION

FLUID TYPES

When service is required, Chrysler Group LLC recommends that only Mopar® brand parts, lubricants and chemicals be used. Mopar® provides the best engineered products for servicing Chrysler Group LLC vehicles.

Only lubricants bearing designations defined by the following organization should be used to service a Chrysler Group LLC vehicle:

- Society of Automotive Engineers (SAE)
- American Petroleum Institute (API)
- National Lubricating Grease Institute (NLGI)
- European Automobile Manufacturers Association (ACEA)

API QUALITY CLASSIFICATION

Fig. 1: API Symbol
Courtesy of CHRYSLER GROUP, LLC

This symbol on the front of an oil container means that the oil has been certified by the American Petroleum Institute (API) to meet all the lubrication requirements specified by Chrysler Group LLC.

GEAR LUBRICANTS

SAE ratings also apply to multigrade gear lubricants. In addition, API classification defines the lubricant's usage, such as API GL-5 and SAE 75W-90.

LUBRICANT RECOMMENDATIONS

CHASSIS

COMPONENT	FLUID, LUBRICANT, OR GENUINE PART
Steering Gear AND Linkage, Ball Joints, Prop Shafts AND Yokes, Wheel Bearings	Mopar® Multi-Purpose Lubricant NLGI Grade 2 EP, GC-LB

BODY

COMPONENT	FLUID, LUBRICANT, AND GENUINE PART
Hinges:	
Door AND Hood	Mopar® Engine Oil
Swing Gate	Mopar® Multi-Purpose Lube NLGI Grade 2 EP, GC-LB
Latches: Door, Hood/Safety Catch, Swing Gate	Mopar® Multi-Purpose Lube NLGI Grade 2 EP, GC-LB
Seat Regulator AND Track	Mopar® Multi-Purpose Lube NLGI Grade 2 EP, GC-LB
Lock Cylinders	Mopar® Lock Cylinder Lube

ENGINE OIL

WARNING: **New or used engine oil can be irritating to the skin. Avoid prolonged or repeated skin contact with engine oil. Contaminants in used engine oil, caused by internal combustion, can be hazardous to your health. Thoroughly wash exposed skin with soap and water. Do not wash skin with gasoline, diesel fuel, thinner, or solvents, health problems can result. Do not pollute, dispose of used engine oil properly. Contact your government agency for location of collection center in your area.**

When service is required, Chrysler Corporation recommends that only Mopar® brand parts, lubricants and chemicals be used. Mopar® provides the best engineered products for servicing Chrysler Corporation vehicles.

Only lubricants bearing designations defined by the following organization should be used:

- Society of Automotive Engineers (SAE)
- American Petroleum Institute (API)
- National Lubricating Grease Institute (NLGI)
- Association des Constructeurs Europ e ens d' Automobiles (European Automobile Manufacturers Association) (ACEA)

API CERTIFICATION AND LICENSE SYMBOL

091174654

Fig. 2: API Certification Mark
Courtesy of CHRYSLER GROUP, LLC

Use an engine oil that is API Certified and Licensed to display the certification mark. MOPAR® provides engine oils that meet or exceed, Material Standard MS-6395 requirement.

SAE VISCOSITY

These engine oils are designed to improve low temperature starting and vehicle fuel economy. Refer to the engine oil filler cap for the preferred engine oil viscosity grade for each vehicle. The viscosity grade is also listed in the vehicle quick reference specifications. Refer to **CAPACITIES AND RECOMMENDED FLUIDS, SPECIFICATIONS**. SAE viscosity grades are used to specify the correct viscosity oil for an engine. Use only Multi-Viscosity oils. These are specified with a dual SAE viscosity grade which indicates the cold to hot temperature performance range of the oil.

CONTAINER IDENTIFICATION

Fig. 3: API Certification Mark
Courtesy of CHRYSLER GROUP, LLC

The Engine Oil Certification Mark was developed and trademarked by the API to refer customers to those engine oils preferred by the automobile manufacturers. This symbol means that the oil has been certified and licensed by the American Petroleum Institute (API). This certification mark will only be found on the front of the oil containers. Those oils that do not display the "Mark" on the front of the container should not be used.

Chrysler only recommends API Certified engine oils that meet the requirements of Material Standard MS-6395. Use Mopar or an equivalent oil meeting the specification MS-6395.

SYNTHETIC ENGINE OILS

There are a number of engine oils being promoted as either synthetic or semi-synthetic. If you choose to use such a product, use **only** those oils that are certified by the American Petroleum Institute (API) to display the "Certification Mark" and show SAE viscosity grade recommended for each vehicle. Follow the service schedule that describes your driving type.

ENGINE OIL ADDITIVES/SUPPLEMENTS

The manufacturer **does not recommend** the addition of any engine oil additives/supplements to the specified engine oil. Engine oil additives/supplements should not be used to enhance engine oil performance. Engine oil additives/supplements should not be used to extend engine oil change intervals. No additive is known to be safe for engine durability and can degrade emission components. Additives can contain undesirable materials that harm the long term durability of engines and emission systems by:

- Increasing the level of Phosphorus and Sulfur in the engine oil. The API Certified Engine Oils control the Phosphorus and Sulfur contents of the oil to levels that reduce the contamination effect on the vehicle's emission control system.
- Altering the viscosity characteristics of the engine oil so that it no longer meets the requirements of the specified viscosity grade.

- Creating potential for an undesirable additive compatibility interaction in the engine crankcase. The engine oils contain a performance additive system carefully developed to optimize the oil's performance in the engine. The addition of supplements may cause the oil to thicken prematurely, cause excessive deposit build-up and potentially shorten engine life.

ENGINE COOLANT

WARNING: Antifreeze is an ethylene-glycol base coolant and is harmful if swallowed or inhaled. If swallowed, drink two glasses of water and induce vomiting. If inhaled, move to fresh air area. Seek medical attention immediately. Do not store in open or unmarked containers. Wash skin and clothing thoroughly after coming in contact with ethylene-glycol. Keep out of reach of children. Dispose of glycol base coolant properly, contact your dealer or government agency for location of collection center in your area. Do not open a cooling system when the engine is at operating temperature or hot under pressure, personal injury can result. Avoid radiator cooling fan when engine compartment related service is performed, personal injury can result.

CAUTION: Mixing of engine coolant (antifreeze) other than specified Organic Additive Technology (OAT) engine coolant (antifreeze), may result in engine damage and may decrease corrosion protection. Organic Additive Technology (OAT) engine coolant is different and should not be mixed with Hybrid Organic Additive Technology (HOAT) engine coolant (antifreeze). If a non-OAT engine coolant (antifreeze) is introduced into the cooling system in an emergency, it should be replaced with the specified engine coolant (antifreeze) as soon as possible.

YouTube	A multimedia supplement to the instructions contained in this article is available. To view the multimedia example of the condition described go to; **http://www.youtube.com/user/Mitchell1Tips** **then type, "A00641391.vid1" into the "Search Channel" box.**

The cooling system is designed around the coolant. The coolant must accept heat from engine metal, in the cylinder head area near the exhaust valves and engine block. Then coolant carries the heat to the radiator where the tube/fin radiator can transfer the heat to the air.

The use of aluminum cylinder blocks, cylinder heads, and water pumps requires special corrosion protection. Mopar® Antifreeze/Coolant, or the equivalent ethylene-glycol base coolant with organic corrosion inhibitors (called OAT, for Organic Additive Technology) is recommended. This coolant offers the best engine cooling without corrosion when mixed with 50% ethylene-glycol and 50% distilled water to obtain a freeze point of -37°C (-35°F). If it loses color or becomes contaminated, drain, flush, and replace with fresh properly mixed coolant solution.

COOLANT PERFORMANCE

The required ethylene-glycol and water mixture depends upon climate and vehicle operating conditions. The coolant performance of various mixtures follows:

Pure Water- Water can absorb more heat than a mixture of water and ethylene-glycol. This is for purpose of heat transfer only. Water also freezes at a higher temperature and allows corrosion.

100 percent Ethylene-Glycol - The corrosion inhibiting additives in ethylene-glycol need the presence of water to dissolve. Without water, additives form deposits in system. These act as insulation causing temperature to rise to as high as 149°C (300°F). This temperature is hot enough to melt plastic. The increased temperature can result in sever engine damage. In addition, 100 percent ethylene-glycol freezes at -22°C (-8°F).

50/50 Ethylene-Glycol and Water - Is the recommended mixture, it provides protection against freezing to -37°C (-34°F). The antifreeze concentration **must always** be a minimum of 44 percent, year-round in all climates. If percentage is lower, engine parts may be eroded by cavitation. Maximum protection against freezing is provided with a 68 percent antifreeze concentration, which prevents freezing down to -67.7°C (-90° F). A higher percentage will freeze at a warmer temperature. Also, a higher percentage of antifreeze can cause the engine to overheat because specific heat of antifreeze is lower than that of water.

OAT coolant is purple in color. It cannot be mixed with other types of coolant including Chrysler's existing HOAT coolant and only should only be mixed with approved OAT coolant of the same color. Maintenance of the cooling system is not required unless a repair has been made with loss of coolant or the coolant has been contaminated.

CAUTION: Richer antifreeze mixtures cannot be measured with normal field equipment and can cause problems associated with 100 percent ethylene-glycol.

COOLANT SELECTION AND ADDITIVES

The use of aluminum cylinder blocks, cylinder heads and water pumps requires special corrosion protection. Only Mopar® Antifreeze/Coolant (glycol base coolant with corrosion inhibitors called OAT, for Organic Additive Technology) is recommended. This coolant offers the best engine cooling without corrosion when mixed with 50% distilled water to obtain to obtain a freeze point of -37°C (-35°F). If it loses color or becomes contaminated, drain, flush, and replace with fresh properly mixed coolant solution.

CAUTION: Do not use coolant additives that are claimed to improve engine cooling.

FLEXIBLE FUEL VEHICLES

The following information is for Flexible Fuel Vehicles (FFV) only. These vehicles can be identified by the unique Fuel Filler Door Label that states **Ethanol (E-85) or Unleaded Gasoline Only.** This Service Information only covers those subjects that are unique to these vehicles. Please refer to appropriate Service Information for information on features that are common between Flexible Fuel and gasoline only powered vehicles.

CAUTION: Only vehicles with the E-85 fuel filler door label can operate on E-85.

ETHANOL FUEL (E-85)

E-85 is a mixture of approximately 85% fuel ethanol and 15% unleaded gasoline.

WARNING: Ethanol vapors are extremely flammable and could cause serious personal injury. Never have any smoking materials lit in or near the vehicle when removing the fuel filler tube cap (gas cap) or filling the tank. Do not use E-85 as a cleaning agent and never use it near an open flame.

FUEL REQUIREMENTS

The vehicle will operate on both unleaded gasoline with an octane rating of 87, or E-85 fuel, or any mixture of these two.

For best results, a refueling pattern that alternates between E-85 and unleaded gasoline should be avoided. When you do switch fuels, it is recommended that

- you do not switch when the fuel gauge indicates less than 1/4 full
- you do not add less than 5 gallons when refueling
- you operate the vehicle immediately after refueling for a period of at least 5 minutes

Observing these precautions will avoid possible hard starting and/or significant deterioration in driveability during warm up.

NOTE: When the ambient temperature is above 90°F (32C), you may experience hard starting and rough idle following start up even if the above recommendations are followed.

ENGINE OIL SELECTION FOR OPERATING ON E-85

If vehicle operates on E-85 fuel either full or part-time, use only Mopar® Flexible Fuel 5W-30 engine oil or an equivalent that meets Chrysler Standard MS-9214. Equivalent commercial Flexible Fuel engine oils may be labeled as Multi-Fuel, Variable Fuel, Flexible Fuel, etc. These engine oils may be satisfactory if they meet the Chrysler Standard.

SAE 5W-30 engine oil is preferred for use in Flexible Fuel engines.

CAUTION: If Flexible Fuel engine oil is not used when using E-85 fuel, engine wear or damage may result.

ENGINE OIL SELECTION FOR OPERATING ON GASOLINE

If you operate the vehicle on regular unleaded gasoline **ONLY,** use Mopar® oil or an equivalent that meets certified API (American Petroleum Institute) quality.

STARTING

The characteristics of E-85 fuel make it unsuitable for use when ambient temperatures fall below 0°F (-17°C). In the range of 0°F (-17°C) to 32°F (0°C), you may experience an increase in the time it takes for your engine to start, and a deterioration in driveability (sags and/or hesitations) until the engine is fully warmed up.

CRUISING RANGE

Because E-85 fuel contains less energy per gallon than gasoline, you will experience an increase in fuel consumption. You can expect your MPG and your driving range to decrease by about 30% compared to gasoline operation.

REPLACEMENT PARTS

Many components in your Flexible Fuel Vehicle (FFV) are designed to be compatible with ethanol. Always be sure that your vehicle is serviced with correct ethanol compatible parts.

CAUTION: Replacing fuel system components with non-ethanol compatible components can damage your vehicle and may void the warranty.

MAINTENANCE

If you operate the vehicle using E-85 fuel, follow Schedule "B".

AUTOMATIC TRANSAXLE FLUID

MOPAR® ZF 8&9 Speed ATF™ Automatic Transmission Fluid, Shell L12108 Transmission Fluid, or equivalent is required in the transmission. Failure to use the correct fluid may affect the function or performance of the transmission.

FLUID ADDITIVES

Chrysler strongly recommends against the addition of any fluids to the transmission, other than those automatic transmission fluids listed above. Exceptions to this policy are the use of special dyes to aid in detecting fluid leaks.

Various "special" additives and supplements exist that claim to improve shift feel and/or quality. These additives and others also claim to improve converter clutch operation and inhibit overheating, oxidation, varnish, and sludge. These claims have not been supported to the satisfaction of Chrysler and these additives **must not be used.** The use of transmission "sealers" should also be avoided, since they may adversely affect the integrity of transmission seals.

FUEL REQUIREMENTS

Your engine is designed to meet all emissions regulations and provide excellent fuel economy and performance when using high quality unleaded gasoline having an octane rating of 87. The use of premium gasoline is not recommended. The use of premium gasoline will provide no benefit over high quality regular gasoline, and in some circumstances may result in poorer performance.

Light spark knock at low engine speeds is not harmful to your engine. However, continued heavy spark knock at high speeds can cause damage and immediate service is required. Engine damage resulting from operation with a heavy spark knock may not be covered by the new vehicle warranty.

Poor quality gasoline can cause problems such as hard starting, stalling and hesitations. If you experience these symptoms, try another brand of gasoline before considering service for the vehicle.

Over 40 auto manufacturers world-wide have issued and endorsed consistent gasoline specifications (the Worldwide Fuel Charter, WWFC) to define fuel properties necessary to deliver enhanced emissions, performance and durability for your vehicle. Chrysler recommends the use of gasolines that meet the WWFC specifications if they are available.

REFORMULATED GASOLINE

Many areas of the country require the use of cleaner burning gasoline referred to as "reformulated" gasoline. Reformulated gasoline contain oxygenates, and are specifically blended to reduce vehicle emissions and improve air quality.

Chrysler strongly supports the use of reformulated gasoline. Properly blended reformulated gasoline will provide excellent performance and durability for the engine and fuel system components.

GASOLINE/OXYGENATE BLENDS

Some fuel suppliers blend unleaded gasoline with oxygenates such as 10% ethanol, MTBE, and ETBE. Oxygenates are required in some areas of the country during the winter months to reduce carbon monoxide emissions. Fuels blended with these oxygenates may be used in your vehicle.

CAUTION: DO NOT use gasoline containing METHANOL. Gasoline containing methanol may damage critical fuel system components.

MMT IN GASOLINE

MMT is a manganese-containing metallic additive that is blended into some gasoline to increase octane. Gasoline blended with MMT provide no performance advantage beyond gasoline of the same octane number without MMT. Gasoline blended with MMT reduce spark plug life and reduce emission system performance in some vehicles. Chrysler recommends that gasoline free of MMT be used in your vehicle. The MMT content of gasoline may not be indicated on the gasoline pump; therefore, you should ask your gasoline retailer whether or not his/her gasoline contains MMT.

It is even more important to look for gasoline without MMT in Canada because MMT can be used at levels higher than allowed in the United States. MMT is prohibited in Federal and California reformulated gasoline.

SULFUR IN GASOLINE

If you live in the northeast United States, your vehicle may have been designed to meet California low emission standards with Cleaner-Burning California reformulated gasoline with low sulfur. If such fuels are not available in states adopting California emission standards, your vehicles will operate satisfactorily on fuels meeting federal specifications, but emission control system performance may be adversely affected. Gasoline sold outside of California is permitted to have higher sulfur levels which may affect the performance of the vehicle's catalytic converter. This may cause the Malfunction Indicator Lamp (MIL), Check Engine or Service Engine Soon light to illuminate. Chrysler recommends that you try a different brand of unleaded gasoline having lower sulfur to determine if the problem is fuel related prior to returning your vehicle to an authorized dealer for service.

CAUTION: If the Malfunction Indicator Lamp (MIL), Check Engine or Service Engine Soon light is flashing, immediate service is required; see appropriate ELECTRICAL DIAGNOSTICS article.

MATERIALS ADDED TO FUEL

All gasoline sold in the United States and Canada are required to contain effective detergent additives. Use of additional detergents or other additives is not needed under normal conditions.

FUEL SYSTEM CAUTIONS

CAUTION: Follow these guidelines to maintain your vehicle's performance:

- The use of leaded gas is prohibited by Federal law. Using leaded gasoline can impair engine performance, damage the emission control system, and could result in loss of warranty coverage.
- An out-of-tune engine, or certain fuel or ignition malfunctions, can cause the catalytic converter to overheat. If you notice a pungent burning odor or some light smoke, your engine may be out of tune or malfunctioning and may require immediate service.
- When pulling a heavy load or driving a fully loaded vehicle when the humidity is low and the temperature is high, use a premium unleaded fuel to help prevent spark knock. If spark knock persists, lighten the load, or engine piston damage may result.
- The use of fuel additives which are now being sold as octane enhancers is not recommended. Most of these products contain high concentrations of methanol. Fuel system damage or vehicle performance problems resulting from the use of such fuels or additives is not the responsibility of Chrysler Corporation and may not be covered under the new vehicle warranty.

NOTE: Intentional tampering with emissions control systems can result in civil penalties being assessed against you.

BRAKE FLUID

The brake fluid used in this vehicle must conform to DOT 3 specifications and SAE J1703 standards. No other

type of brake fluid is recommended or approved for usage in the vehicle brake system. Use only Mopar® Brake Fluid or equivalent from a tightly sealed container.

CAUTION: Never use reclaimed brake fluid or fluid from a container which has been left open. An open container of brake fluid will absorb moisture from the air and contaminate the fluid.

CAUTION: Never use any type of a petroleum-based fluid in the brake hydraulic system. Use of such type fluids will result in seal damage of the vehicle brake hydraulic system causing a failure of the vehicle brake system. Petroleum based fluids would be items such as engine oil, transmission fluid, power steering fluid, etc.

A/C REFRIGERANT

The refrigerant used in this air conditioning system is a R-1234yf.

The A/C refrigerant system is filled-for-life at the factory and requires no regular maintenance. Although not required at specific intervals, the charge level should be checked if system performance deteriorates or if a noise or leak is suspected. Refer to **DIAGNOSIS AND TESTING** .

HOISTING

STANDARD PROCEDURE

STANDARD PROCEDURE - HOISTING

Fig. 6: Jeep Cherokee Lifting Points
Courtesy of CHRYSLER GROUP, LLC

1 - FRAME CONTACT LIFT (SINGLE POST)
1 - CHASSIS LIFT (DUAL LIFT)
1 - OUTBOARD LIFT (DUAL LIFT)
2 - ALTERNATE LIFTING LOCATIONS
2 - FLOOR JACK
3 - DRIVE ON HOIST

WARNING: The hoisting and jack lifting points provided are for a complete vehicle. When the engine or rear suspension is removed from a vehicle, the center of gravity is altered making some hoisting conditions unstable. Properly support or secure vehicle to hoisting device when these conditions exist. Failure to follow these instructions may result in serious or fatal injury.

CAUTION: Do not position hoisting device on any suspension component, including the front or rear suspension crossmembers. Do not hoist on the front and rear bumpers, the lower radiator crossmember, or the front engine mount.

Do not attempt to raise one entire side of the vehicle by placing a floor jack midway between the front and rear wheels. This practice may result in permanent damage to the body.

CAUTION: Due to variations in hoist design it may be necessary to use the secondary lift points to avoid damage to the body or trim parts.

Refer to Owner's Manual provided with vehicle for proper emergency jacking procedures.

Fig. 7: Front Lifting Locations
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The following highlighted locations are provided to identify safe and effective lifting areas for the KL. In the event that the standard SAE lift pads and/or appropriate lift arm lengths are not available to meet the sill molding openings for flange lifting (1), the alternate lift point locations shown in illustration (2) should be utilized.**

Fig. 8: Rear Lifting Locations
Courtesy of CHRYSLER GROUP, LLC

A hoist with asymmetrical hoist arms can not be adjusted to a position which will allow the hoist adapters to engage the service hoisting locations on the down standing weld flange on the sill at both the rear and the front of the vehicle. Therefore, the secondary service hoisting location will need to be used at the front of the vehicle. The secondary front service hoisting location is the front torque box.

When properly positioned, a floor jack can be used to lift the vehicle and support the raised vehicle with jack stands.

A floor jack or any lifting device must never be used on any part of the underbody other than the described areas.

There are SAE approved triangles in the body indicating where the lifting points are for the vehicle.

JUMP STARTING

STANDARD PROCEDURE

STANDARD PROCEDURE - JUMP STARTING

WARNING: REVIEW ALL SAFETY PRECAUTIONS AND WARNINGS.

WARNING: DO NOT JUMP START A FROZEN BATTERY, PERSONAL INJURY CAN RESULT.

WARNING: DO NOT JUMP START WHEN MAINTENANCE FREE BATTERY INDICATOR DOT IS BRIGHT COLOR.

WARNING: DO NOT ALLOW JUMPER CABLE CLAMPS TO TOUCH EACH OTHER WHEN CONNECTED TO A BOOSTER SOURCE.

WARNING: DO NOT USE OPEN FLAME NEAR BATTERY

WARNING: REMOVE METALLIC JEWELRY WORN ON HANDS OR WRISTS TO AVOID INJURY BY ACCIDENTAL ARCING OF BATTERY CURRENT.

WARNING: WHEN USING A HIGH OUTPUT BOOSTING DEVICE, DO NOT ALLOW BATTERY VOLTAGE TO EXCEED 16 VOLTS.

WARNING: REFER TO INSTRUCTIONS PROVIDED WITH DEVICE BEING USED.

CAUTION: DO NOT ATTEMPT TO PUSH OR TOW THE VEHICLE TO START IT. THE VEHICLE CANNOT BE STARTED THIS WAY. PUSHING WITH ANOTHER VEHICLE MAY DAMAGE THE TRANSAXLE OR THE REAR OF THE VEHICLE.

TO JUMP START A DISABLED VEHICLE:

Fig. 9: Jumper Cable RED clamp & Battery Positive Terminal
Courtesy of CHRYSLER GROUP, LLC

1.
   - Inspect the battery cable terminal clamps for damage. Replace any battery cable that has a damaged or deformed terminal clamp.
   - Inspect the battery tray and battery hold down hardware for damage. Replace any damaged parts.
   - Slide the thermal guard off of the battery case, if equipped. Inspect the battery case for cracks or other damage that could result in electrolyte leaks. Also, check the battery terminal posts for looseness. Batteries with damaged cases or loose terminal posts must be replaced.
   - Inspect the battery thermal guard for tears, cracks, deformation or other damage. Replace any battery thermal guard that has been damaged.
   - Inspect the battery built-in test indicator sight glass (if equipped) for an indication of the battery condition. If the battery is discharged, charge as required. Refer to **BATTERY, STANDARD PROCEDURE** .
2. Raise hood on disabled vehicle and visually inspect engine compartment for:
   - Generator drive belt condition and tension.

CAUTION: If the cause of starting problem on disabled vehicle is severe, damage to booster vehicle charging system can result.

3. When using another vehicle as a booster source, park the booster vehicle within cable reach. Turn off all accessories, set the parking brake, place the automatic transmission in PARK or the manual transmission in NEUTRAL and turn the ignition OFF.
4. On disabled vehicle, place gear selector in park or neutral and set park brake. Turn off all accessories.
5. Connect jumper cables to booster battery. RED clamp to positive terminal (+). BLACK clamp to negative terminal (-). DO NOT allow clamps at opposite end of cables to touch, electrical arc will result. Review all warnings in this procedure.
6. On disabled vehicle, connect RED jumper cable clamp (1) to positive (+) terminal (2). Connect BLACK jumper cable clamp to engine ground.
7. Start the engine in the vehicle which has the booster battery, let the engine idle a few minutes, then start the engine in the vehicle with the discharged battery.

CAUTION: Do not crank starter motor on disabled vehicle for more than 15 seconds, starter will overheat and could fail.

8. Allow battery in disabled vehicle to charge to at least 12.4 volts (75% charge) before attempting to start engine. If engine does not start within 15 seconds, stop cranking engine and allow starter to cool (15 min.), before cranking again.

DISCONNECT CABLE CLAMPS AS FOLLOWS:

- Disconnect BLACK cable clamp from engine ground on disabled vehicle.
- When using a Booster vehicle, disconnect BLACK cable clamp from battery negative terminal. Disconnect RED cable clamp from battery positive terminal.
- Disconnect RED cable clamp from battery positive terminal on disabled vehicle.

MAINTENANCE SCHEDULES

DESCRIPTION

NAFTA AND PUERTO RICO

OIL CHANGE INDICATOR SYSTEM

The Scheduled Maintenance services listed in this Service Information must be done at the times or mileages specified to protect your vehicle warranty and ensure the best vehicle performance and reliability. More frequent maintenance may be needed for vehicles in severe operating conditions, such as dusty areas and very short trip driving. Inspection and service should also be done anytime a malfunction is suspected.

The vehicle is equipped with an automatic oil change indicator system. The oil change indicator system will remind you that it is time to take your vehicle in for scheduled maintenance.

Based on engine operation conditions, the oil change indicator message will illuminate. This means that service

is required for your vehicle. Operating conditions such as frequent short-trips, trailer tow, extremely hot or cold ambient temperatures, and E85 fuel usage will influence when the "Change Oil" or "Oil Change Required" message is displayed. Severe Operating Conditions can cause the change oil message to illuminate as early as 3, 500 miles (5, 600 km) since last reset. Have your vehicle serviced as soon as possible, within the next 500 miles (805 km).

On Electronic Vehicle Information Center (EVIC) equipped vehicles, "Oil Change Required" will be displayed in the EVIC and a single chime will sound, indicating that an oil change is necessary.

On Non-EVIC equipped vehicles, "Change Oil" will flash in the instrument cluster odometer and a single chime will sound, indicating that an oil change is necessary.

NOTE: Under no circumstances should oil change intervals exceed 10, 000 miles (16, 000 km) or twelve months, whichever comes first.

OIL CHANGE INDICATOR - RESET

The vehicle is equipped with an engine oil change indicator system. The "Oil Change Required" message flashes in the EVIC display for approximately ten seconds after a single chime has sounded, to indicate the next scheduled oil change interval. The engine oil change indicator system is duty cycle based, which means the engine oil change interval may fluctuate depending upon your personal driving style.

Unless reset, this message continues to display each time you turn the ignition switch to the ON/RUN position. To turn off the message temporarily, press and release the Menu button. To reset the oil change indicator system (after performing the scheduled maintenance) perform the following procedure:

1. Turn the ignition switch to the "ON" position. Do not start the engine.
2. Fully press the accelerator pedal slowly three times within ten seconds.
3. Turn the ignition switch to the "LOCK" position.

NOTE: If the indicator message illuminates when you start the vehicle, the oil change indicator system did not reset. If necessary, repeat this procedure.

ONCE A MONTH OR BEFORE A LONG TRIP

- Check engine oil level
- Check windshield washer fluid level
- Check tire pressure and look for unusual wear or damage.
- Check the fluid levels of coolant reservoir and brake master cylinder, fill as needed.
- Check function of all interior and exterior lights

CAUTION: Failure to perform the required maintenance items may result in damage to the vehicle.

REQUIRED MAINTENANCE INTERVALS

At Every Oil Change Interval As Indicated By Oil Change Indicator System:
Change oil and filter
Rotate the tires. **Rotate at the first sign of irregular wear, even if it occurs before the oil indicator system turns on.**
Inspect battery and clean and tighten terminals as required
Inspect brake pads, shoes, rotors, drums, hoses and park brake
Inspect engine cooling system protection and hoses
Inspect exhaust system
Inspect engine air cleaner if using in dusty or off-road conditions

Maintenance Chart

Mileage or time passed (whichever comes first)	20, 000	30, 000	40, 000	50, 000	60, 000	70, 000	80, 000	90, 000	100, 000	110, 000	120, 000	130, 000	140, 000	150, 000

Replace cabin/air conditioning filter.	X		X		X		X		X		X		X	
Replace spark plugs (2.4L Engine). **									X					
Replace spark plugs (3.2L Engine). **									X					
Flush and replace the engine coolant at 10 years or 150, 000 miles (240, 000 km) whichever comes									X					X

first.														
Inspect and replace PCV valve if necessary									X					

** The spark plug change interval is mileage based only, monthly intervals do not apply.

WARNING:

- **You can be badly injured working on or around a motor vehicle. Do only service work for which you have the knowledge and the right equipment. If you have any doubt about your ability to perform a service job, take your vehicle to a competent mechanic.**
- **Failure to properly inspect and maintain your vehicle could result in a component malfunction and effect vehicle handling and performance. This could cause an accident**

Failure to follow these instructions may result in possible serious or fatal injury.

EUROPE/UK - GAS ENGINE

OIL CHANGE INDICATOR SYSTEM

The Scheduled Maintenance services listed in this Service Information must be done at the times or mileages specified to protect your vehicle warranty and ensure the best vehicle performance and reliability. More frequent maintenance may be needed for vehicles in severe operating conditions, such as dusty areas and very short trip driving. Inspection and service should also be done anytime a malfunction is suspected.

The oil change indicator system will remind you that it is time to take your vehicle in for scheduled maintenance.

On Electronic Vehicle Information Center (EVIC) equipped vehicles "Oil Change Required" will be displayed in the EVIC and a single chime will sound, indicating that an oil change is necessary.

The oil change indicator message will illuminate approximately 7, 000 miles (11, 200 km) after the most recent oil change was performed. Have your vehicle serviced as soon as possible, within 500 miles (800 km).

NOTE:

- **The oil change indicator message will not monitor the time since the last oil change. Change the vehicle oil if it has been twelve months since your last oil change even if the oil change indicator message is NOT illuminated.**
- **Change your engine oil more often if you drive your vehicle off-road for an extended period of time.**
- **Under no circumstances should oil change intervals exceed 7, 500 miles (12 000 km) or 12 months, whichever comes first.**

OIL CHANGE INDICATOR - RESET

The vehicle is equipped with an engine oil change indicator system. The "Oil Change Required" message flashes in the EVIC display for approximately ten seconds after a single chime has sounded, to indicate the next scheduled oil change interval.

Unless reset, this message continues to display each time you turn the ignition switch to the ON/RUN position. To turn off the message temporarily, press and release the Menu button. To reset the oil change indicator system (after performing the scheduled maintenance) perform the following procedure:

1. Turn the ignition switch to the "ON" position. Do not start the engine.
2. Fully press the accelerator pedal slowly three times within ten seconds.
3. Turn the ignition switch to the "LOCK" position.

NOTE: If the indicator message illuminates when you start the vehicle, the oil change indicator system did not reset. If necessary, repeat this procedure.

REQUIRED MAINTENANCE INTERVALS

At Each Stop for Fuel

- Check the engine oil level about 5 minutes after a fully warmed engine is shut off. Checking the oil level while the vehicle is on level ground will improve the accuracy of the oil level reading. Add oil only when the level is at or below the ADD or MIN mark.
- Check the windshield washer solvent and add if required.

Once a Month

- Check tire pressure and look for unusual wear or damage.
- Inspect the battery and clean and tighten the terminals as required.
- Check the fluid levels of the coolant reservoir, brake master cylinder, and add fluid as needed.
- Check all lights and other electrical items for correct operation.

At Each Oil Change

- Change the engine oil filter.
- Inspect the brake hoses and lines.

WARNING:

- **You can be badly injured working on or around a motor vehicle. Do only service work for which you have the knowledge and the right equipment. If you have any doubt about your ability to perform a service job, take your vehicle to a competent mechanic.**
- **Failure to properly inspect and maintain your vehicle could result in a component malfunction and effect vehicle handling and**

performance. This could cause an accident

Failure to follow these instructions may result in possible serious or fatal injury.

Perform Maintenance Every (Where time and mileage are listed, follow the interval that occurs first.)			Maintenance Items
Miles	Kilometers	Months	
7500	12000	12	• Change the engine oil and engine oil filter. • Rotate tires. • Inspect the CV joints. • Inspect the front suspension, tie rod ends and boot seals; replace if necessary. • Inspect the brake linings, replace if necessary. • Inspect parking brake function. • Replace the air conditioning/cabin air filter.
15000	24000	24	• Change the engine oil and engine oil filter. • Rotate tires.
22500	36000	36	• Change the engine oil and engine oil filter. • Rotate tires. • Inspect the CV joints. • Inspect the front suspension, tie rod ends and boot seals; replace if necessary. • Inspect the brake linings, replace if necessary. • Inspect parking brake function. • Replace the air conditioning/cabin air filter.
30000	48000	48	• Change the engine oil and engine oil filter. • Rotate tires. • Replace the engine air cleaner filter.
37500	60000	60	• Change the engine oil and engine oil filter. • Rotate tires. • Inspect the CV joints. • Inspect the front suspension, tie rod ends and boot seals; replace if necessary. • Inspect the brake linings, replace if necessary. • Inspect parking brake function. • Replace the air conditioning/cabin air filter.

45000	72000	72	• Change the engine oil and engine oil filter. • Rotate tires.
52500	84000	84	• Change the engine oil and engine oil filter. • Rotate tires. • Inspect the CV joints. • Inspect the front suspension, tie rod ends and boot seals; replace if necessary. • Inspect the brake linings, replace if necessary. • Inspect parking brake function. • Replace the air conditioning/cabin air filter.
60000	96000	96	• Change the engine oil and engine oil filter. • Rotate tires. • Replace the engine air cleaner filter.
67500	108000	108	• Change the engine oil and engine oil filter. • Rotate tires. • Inspect the CV joints. • Inspect the front suspension, tie rod ends and boot seals; replace if necessary. • Inspect the brake linings, replace if necessary. • Inspect parking brake function. • Replace the air conditioning/cabin air filter. • Replace the spark plugs (2.4L & 3.2L Engines).* * The spark plug change interval is mileage based only, monthly intervals do not apply.
75000	120000	120	• Change the engine oil and engine oil filter. • Rotate tires. • Flush and replace the engine coolant at 120 months or 150, 000 miles (240, 000 km) whichever comes first.
82500	132000	132	• Change the engine oil and engine oil filter. • Rotate tires. • Inspect the CV joints. • Inspect the front suspension, tie rod ends and boot seals; replace if necessary. • Inspect the brake linings, replace if necessary. • Inspect parking brake function. • Replace the air conditioning/cabin air filter.

90000	144000	144	• Change the engine oil and engine oil filter. • Rotate tires. • Replace the engine air cleaner filter.
97500	156000	156	• Change the engine oil and engine oil filter. • Rotate tires. • Inspect the CV joints. • Inspect the front suspension, tie rod ends and boot seals; replace if necessary. • Inspect the brake linings, replace if necessary. • Inspect parking brake function. • Replace the air conditioning/cabin air filter. • Inspect and replace PCV valve if necessary.
105000	168000	168	• Change the engine oil and engine oil filter. • Rotate tires.
112500	180000	180	• Change the engine oil and engine oil filter. • Rotate tires. • Inspect the CV joints. • Inspect the front suspension, tie rod ends and boot seals; replace if necessary. • Inspect the brake linings, replace if necessary. • Inspect parking brake function. • Replace the air conditioning/cabin air filter.
120000	192000	192	• Change the engine oil and engine oil filter. • Rotate tires. • Replace the engine air cleaner filter.
127500	204000	204	• Change the engine oil and engine oil filter. • Rotate tires. • Inspect the CV joints. • Inspect the front suspension, tie rod ends and boot seals; replace if necessary. • Inspect the brake linings, replace if necessary. • Inspect parking brake function. • Replace the air conditioning/cabin air filter.
135000	216000	216	• Change the engine oil and engine oil filter. • Rotate tires. • Replace the spark plugs (2.4L & 3.2L Engines).*

			* The spark plug change interval is mileage based only, monthly intervals do not apply.
142500	228000	228	• Change the engine oil and engine oil filter. • Rotate tires. • Inspect the CV joints. • Inspect the front suspension, tie rod ends and boot seals; replace if necessary. • Inspect the brake linings, replace if necessary. • Inspect parking brake function. • Replace the air conditioning/cabin air filter.
150000	240000	240	• Change the engine oil and engine oil filter. • Rotate tires. • Replace the engine air cleaner filter. • Flush and replace the engine coolant at 120 months or 150, 000 miles (240, 000 km) whichever comes first.

EUROPE/UK - DIESEL ENGINE

The maintenance intervals shown in chart below should be performed as indicated in this Service Information.

NOTE:

- **Under no circumstances should oil change intervals exceed 12, 500 miles (20 000 km) or 12 months, whichever comes first.**
- **Flush and replace the engine coolant at 120 months or 150, 000 miles (240, 000 km) whichever comes first.**

At Each Stop for Fuel

- Check the engine oil level about 15 minutes after a fully warmed engine is shut off. Checking the oil level while the vehicle is on level ground will improve the accuracy of the oil level reading. Add oil only when the level is at or below the ADD or MIN mark.
- Check the windshield washer solvent and add if required.

Once a Month

- Check tire pressure and look for unusual wear or damage.
- Inspect the battery and clean and tighten the terminals as required.
- Check the fluid levels of the coolant reservoir, brake master cylinder, and add fluid as needed.
- Check all lights and other electrical items for correct operation.

At Each Oil Change

- Change the engine oil filter.
- Inspect the brake hoses and lines.
- Inspect for the presence of water in the fuel filter/water separator unit.

Perform Maintenance Every (Where time and mileage are listed, follow the interval that occurs first.)			Maintenance Items
Miles	Kilometers	Months	
12500	20000	12	• Change the engine oil and engine oil filter. • Rotate tires. • Inspect the CV joints. • Inspect the front suspension, tie rod ends and boot seals; replace if necessary. • Inspect the brake linings, replace if necessary. • Inspect parking brake function. • Replace the air conditioning/cabin air filter.
25000	40000	24	• Change the engine oil and engine oil filter. • Replace the engine air cleaner filter. • Rotate tires. • Replace the engine fuel filter.
37500	60000	36	• Change the engine oil and engine oil filter. • Rotate tires. • Inspect the CV joints. • Inspect the front suspension, tie rod ends and boot seals; replace if necessary. • Inspect the brake linings, replace if necessary. • Inspect parking brake function. • Replace the air conditioning/cabin air filter.
50000	80000	48	• Change the engine oil and engine oil filter. • Replace the engine air cleaner filter. • Rotate tires. • Replace the engine fuel filter. • Change the manual transmission fluid if using your vehicle for any of the following: trailer towing, heavy loading, taxi, police, delivery service (commercial service), off-road, desert operation or more than 50% of your driving is at sustained speeds during hot weather, above 90°F (32°C).
62500	100000	60	

			• Change the engine oil and engine oil filter. • Rotate tires. • Inspect the CV joints. • Inspect the front suspension, tie rod ends and boot seals; replace if necessary. • Inspect the brake linings, replace if necessary. • Inspect parking brake function. • Replace the air conditioning/cabin air filter.
75000	120000	72	• Change the engine oil and engine oil filter. • Replace the engine air cleaner filter. • Rotate tires. • Replace the engine fuel filter.
87500	140000	84	• Change the engine oil and engine oil filter. • Rotate tires. • Inspect the CV joints. • Inspect the front suspension, tie rod ends and boot seals; replace if necessary. • Inspect the brake linings, replace if necessary. • Inspect parking brake function. • Replace the air conditioning/cabin air filter.
100000	160000	96	• Change the engine oil and engine oil filter. • Replace the engine air cleaner filter. • Rotate tires. • Replace the engine fuel filter. • Change the manual transmission fluid if using your vehicle for any of the following: trailer towing, heavy loading, taxi, police, delivery service (commercial service), off-road, desert operation or more than 50% of your driving is at sustained speeds during hot weather, above 90°F (32°C).

LATIN AMERICA - GAS ENGINE

OIL CHANGE INDICATOR SYSTEM

The Scheduled Maintenance services listed in this Service Information must be done at the times or mileages specified to protect your vehicle warranty and ensure the best vehicle performance and reliability. More frequent maintenance may be needed for vehicles in severe operating conditions, such as dusty areas and very short trip driving. Inspection and service should also be done anytime a malfunction is suspected.

The oil change indicator system will remind you that it is time to take your vehicle in for scheduled maintenance.

On Electronic Vehicle Information Center (EVIC) equipped vehicles "Oil Change Required" will be displayed in the EVIC and a single chime will sound, indicating that an oil change is necessary.

The oil change indicator message will illuminate approximately 7, 000 miles (11, 200 km) after the most recent oil change was performed. Have your vehicle serviced as soon as possible, within 500 miles (800 km).

NOTE:

- **The oil change indicator message will not monitor the time since the last oil change. Change the vehicle oil if it has been 6 months since your last oil change even if the oil change indicator message is NOT illuminated.**
- **Change your engine oil more often if you drive your vehicle off-road for an extended period of time.**
- **Under no circumstances should oil change intervals exceed 7, 500 miles (12 000 km) or 6 months, whichever comes first.**

OIL CHANGE INDICATOR - RESET

The vehicle is equipped with an engine oil change indicator system. The "Oil Change Required" message flashes in the EVIC display for approximately ten seconds after a single chime has sounded, to indicate the next scheduled oil change interval.

Unless reset, this message continues to display each time you turn the ignition switch to the ON/RUN position. To turn off the message temporarily, press and release the Menu button. To reset the oil change indicator system (after performing the scheduled maintenance) perform the following procedure:

1. Turn the ignition switch to the "ON" position. Do not start the engine.
2. Fully press the accelerator pedal slowly three times within ten seconds.
3. Turn the ignition switch to the "LOCK" position.

NOTE: **If the indicator message illuminates when you start the vehicle, the oil change indicator system did not reset. If necessary, repeat this procedure.**

REQUIRED MAINTENANCE INTERVALS

At Each Stop for Fuel

- Check the engine oil level about 5 minutes after a fully warmed engine is shut off. Checking the oil level while the vehicle is on level ground will improve the accuracy of the oil level reading. Add oil only when the level is at or below the ADD or MIN mark.
- Check the windshield washer solvent and add if required.

Once a Month

- Check tire pressure and look for unusual wear or damage.
- Inspect the battery and clean and tighten the terminals as required.
- Check the fluid levels of the coolant reservoir, brake master cylinder, and add fluid as needed.
- Check all lights and other electrical items for correct operation.

At Each Oil Change

- Change the engine oil filter.
- Inspect the brake hoses and lines.

WARNING:

- **You can be badly injured working on or around a motor vehicle. Do only service work for which you have the knowledge and the right equipment. If you have any doubt about your ability to perform a service job, take your vehicle to a competent mechanic.**
- **Failure to properly inspect and maintain your vehicle could result in a component malfunction and effect vehicle handling and performance. This could cause an accident**

Failure to follow these instructions may result in possible serious or fatal injury.

INSPECTION

INSPECTION

The following steps outline the dealer inspection procedure required every 5 years for vehicles covered under the terms of the Lifetime Powertrain Warranty. Refer to the appropriate warranty information for additional terms and coverages applicable to the Lifetime Powertrain Warranty.

1. Lift the vehicle on a suitable hoist.
2. Check all Powertrain components for leaks or physical damage. Note any concerns.
3. Lower the vehicle and check the level and condition of the engine oil.
4. Connect a diagnostic scan tool and check for any active Powertrain Diagnostic Trouble Codes (DTC).

NEW VEHICLE PREPARATION INSTRUCTIONS

STANDARD PROCEDURE

STANDARD PROCEDURE - NEW VEHICLE PREPARATION

NEW VEHICLE PREP INSTRUCTIONS - VEHICLE READINESS

DESCRIPTION	ACTION
Keep All Protective Transit Film and Wheel Covers & Films on vehicle until sold, or up to 180 Days	Keep All Protective Transit Film and Wheel Covers & Films on vehicle until sold, or up to 180 Days.

Install Ignition Off Draw (IOD) Fuse	Locate and install/connect Ignition Off Draw fuse or connector.
Place vehicle into Customer Mode (if no IOD fuse)	With the key in the on position, turn on the hazard lamps, then press and hold the up arrow on the steering wheel for 5 seconds. The EVIC display will update once the vehicle goes into customer mode. Once the mode has been changed, turn off the hazard lamps.
Inflate tire pressure to maximum side wall pressure (except heavy duty trucks)	Increase the tire pressure to maximum sidewall pressure if vehicle is going into lot storage.
Install all "Shipped Loose" items	Install all "Shipped Loose" items
Install Front License Plate Bracket (if required)	Install Front License Plate Bracket
Install Roof Rack	Install Roof Rack
Install Antenna	Install Antenna
Install Wheel Center Caps	Install Wheel Center Caps
Reset Tire Pressure Light Load Switch (if equipped)	If vehicle is going into storage and tire pressure is being set to maximum, switch the tire pressure light load setting to "maximum load" using the button on the instrument panel.

NEW VEHICLE PREP INSTRUCTIONS - UNDERHOOD

DESCRIPTION	ACTION
Hood Latch and Safety Catch - Adjust as Needed	Verify the operation of the hood release system including the inside hood release lever and the outside hood secondary safety catch. Adjust if necessary. The safety catch prevents the hood from going to the full open position until it is manually released. To test the safety catch, unlatch the hood with the interior hood release lever and attempt to raise the hood without operating the safety catch.
Battery State-of-Charge - document voltage	Check the battery state of charge by connecting a digital voltmeter at the jump-start locations. The battery voltage should be at least 12.4 volts. If charging is necessary, follow the Service Information procedures and recharge the battery. Record voltage on New Vehicle Prep (NVP) form.
Loose Attachments, Routing and Clearance	Inspect the following for routing, loose attachments, connections, and clearance. Reroute and tighten as required: Brake Lines, Fuel Lines, Power Steering Hoses, Vacuum Hoses, Clutch Lines, Refrigerant Lines, Wiring, Belts.
All Fluid Levels	Refer to the Owner's Manual or service information for proper fluid level inspection locations.

No Fluid Leaks present	Visually inspect the underhood area to make sure absence of fluid leaks. Check clamps for tightness an full engagement.

NEW VEHICLE PREP INSTRUCTIONS - UNDER VEHICLE

DESCRIPTION	ACTION
No Fluid Leaks present	Raise the vehicle on an appropriate hoist and check the following: Loose Attachments, Routing Clearance and Damage, Absence of Fluid Leaks. Refer to Service Information for proper lift points. Check clamps for tightness and full engagement.
Loose Attachments, Routing, Clearance, Damage	Raise the vehicle on an appropriate hoist and check the following: Loose Attachments, Routing Clearance and Damage, Absence of Fluid Leaks. Refer to Service Information for proper lift points. Check clamps for tightness and full engagement.

NEW VEHICLE PREP INSTRUCTIONS - ROAD TEST

DESCRIPTION	ACTION
Perform Road Test, Mileage: Before _____ After _____	Record mileage before and after road test.
Engine Starts with All Keys	Start vehicle with all sets of keys.
All Warning Lights and Gauges / No DTCs	Verify all warning lights and gauges are operating properly, and no fault codes exist.
Keyless Go	Make sure vehicle starts with push button, when key is inside vehicle.
Engine Starts Only in Park & Neutral	Verify engine will only start while automatic transmission is in park or neutral.
Engine Starts Only with Clutch Depressed	Verify engine will only start when clutch is depressed on manual transmission vehicles.
Service and Parking Brakes	Apply the service brakes while the car is in motion. Be sure the brake operation is smooth and positive. Make sure the vehicle stops in a straight line and without pulling to one side. Make sure there is no shudder or vibration when braking. Make sure that the parking brake is easy to operate. Make sure the parking brake does not drag.
Brake Transmission Shift Interlock	Make sure that the vehicle will only start when the brake is depressed on vehicles with automatic transmission.
Clutch / Manual Transmission Shifting	Check for smooth shifting. Make sure shift lever operates easily and smoothly. Check for proper synchronization. The gears should not grind.
	Make sure that the park lock mechanism holds the

Automatic Transmission Shifting	vehicle. With the vehicle on a grade, put the automatic transmission in park and slowly release the service brake to check the operation of the park mechanism. Make sure the shift lever operates easily and smoothly. Check for smooth shifting. Check for proper upshifting and downshifting.
Autostick	Verify that Autostick feature allows proper shifting through the gears.

NEW VEHICLE PREP INSTRUCTIONS - ROAD TEST

DESCRIPTION	ACTION
Engine Performance - Cold	The engine should: start properly, idle smoothly and at proper speed, be free from stumbling or hesitation, produce sufficient power, be free of unusual noises, operate within the proper temperature range, and stop when the ignition key is shut off or stop button is depressed.
Engine Performance - Warm	The engine should: start properly, idle smoothly and at proper speed, be free from stumbling or hesitation, produce sufficient power, be free of unusual noises, operate within the proper temperature range, and stop when the ignition key is shut off or stop button is depressed.
Steering and Handling	Check that the power assist works properly. Make sure that the steering wheel does not vibrate abnormally at idle or road speed. Make sure that the steering wheel is centered when traveling in a straight line. Check that the vehicle does not drift to either side on flat road surfaces. Make sure that the vehicle does not vibrate or shake abnormally.
Noise, Vibration, Squeaks, or Rattles	Check that the vehicle is free of noise, vibrations, squeaks, or rattles. Tighten any loose fasteners.
Heater / Defrost - Front	Check the heater operation after the vehicle has reached operating temperature. Operate blower motor at all speeds. Operate the system in all modes. Check for hot air at all appropriate outlets. Check for temperature control operation.
Air Conditioning	Make sure that the A/C system cools properly. Operate blower motor at all speeds. Check for cool air at all temperature outlets. Operate the system in all modes.
Rear Heater and Air Conditioning	Check the rear heater and A/C for proper operation.
Defrost - Rear	Make sure that the electric heated rear defroster operates correctly. Turn on and feel for warmth.
	While on road test, verify that the visual warning

Blindspot Monitoring System (if equipped)	indicators located on the side view mirrors are operating properly when an object is within the detection zone.
Cruise Control (if equipped)	Check the "on/off" switch. Check the "set" operation. Check the "resume" function. Check the "accelerate" and "decelerate" function. Check the "cancel" button. Check the brake/clutch release function. If equipped, verify operation of Adaptive Cruise Control function.
Set Compass Variance / Calculation (if equipped)	Refer to the service information on TechCONNECT for information regarding compass setting procedures.

NEW VEHICLE PREP INSTRUCTIONS - ROAD TEST

DESCRIPTION	ACTION
Electronic Sway Bar Disconnect (if equipped)	With vehicle in four wheel drive, press the sway bar switch to activate the system. Verify that the "Sway Bar Indicator Light" is illuminated. **WARNING:** **Do not exceed 18 MPH / 29 KPH while the front sway bar is disconnected. Failure to follow these instructions may result in possible serious or fatal injury.**
Transfer Case (if equipped)	Shift the transfer case through all ranges to make sure all shifting is smooth and operates properly.
Load Leveling Air Suspension (if equipped)	Use the terrain select switch to change the ride height during normal driving conditions. Cycle through each selection and verify proper operation of the air suspension system.
Tire Pressure Monitoring System	Verify that Tire Pressure Monitoring Indicator Light is not illuminated when tires are above minimum inflation recommendations. Make sure that indicator lamp is not flashing/chiming.
Park Assist (if equipped)	Put vehicle in reverse and slowly back up toward an object. Verify that Park Assist warning icon, lights and chimes operate properly as object is approached.
Back-Up Camera (if equipped)	Put vehicle in reverse, verify that screen provides a clear and visible image from rear of vehicle.

NEW VEHICLE PREP INSTRUCTIONS - INTERIOR

DESCRIPTION	ACTION
	From the interior of the vehicle, open and close all doors to make sure ease of operation. Fully open

Visually Inspect Interior Parts for Damage, Fit, etc.	and close the glove box to make sure proper operation. Fully open and close the console door to make sure proper operation. Check interior panels for proper fit and free from damage.
All Interior Lamps and Horn	Operate and visually inspect all interior lights and switches, including: Dome/Map lamps, and if equipped the following: vanity mirror lamps, glove box lamps, ash tray lamp, cigar lighter lamp, radio lamps, door mounted lamps, illuminated entry system. Make sure that the horn operates properly.
Rear View Mirror	Check that the rearview mirror's day/night function Is operating properly.
Front and Rear Wipers and Washers	Activate front windshield wipers, and if equipped, rear window wipers and check for proper operation at all speeds. Activate the front and if equipped, the rear washer. Check the spray pattern for proper operation and aim. Check the intermittent wipe feature for proper operation.
All interior Door Locks including Child Locks	Check all interior door locks for proper operation, including rear child safety door locks if equipped. Place in the unlocked position.

NEW VEHICLE PREP INSTRUCTIONS - INTERIOR

DESCRIPTION	ACTION
Steering Wheel Mounted Controls	Check all steering wheel controls for proper operation.
Memory Mirror / Seat	Verify the proper operation of the memory mirror and seat system.
Cigar Lighter	Check cigar lighter for proper operation.
Power Windows and Window Lock Switch	Fully open and close all power windows to make sure proper operation and sealing. Make sure that the windows operate properly at each door. Verify that window lock button is operating properly.
Power Adjustable Pedals (if equipped)	Check the adjustable pedals for proper operation by pressing the switch on the steering column.
Outside Power Mirrors	Check power mirrors for proper operation.
Heated Mirrors (if equipped)	Check power heated mirrors for proper operation.
Power Folding Mirrors (if equipped)	Check power folding mirrors for proper operation.
Seats and Seat Belts - All Adjustments	Check for correct installation and operation of seat and shoulder belts, and retractors. Check that the restraint system safety labels regarding the use of seatbelts and airbags are in place. Fully cycle the seats for proper adjustments and verify that each seat is securely mounted. Fold down and latch the

	rear seats. Pull forward to check that the latches operate correctly. Check for proper head restraint operation.
Convertible Top (If equipped)	Cycle the convertible top. Check and adjust alignment as required. In cold weather, allow the top to reach room temperature before cycling.
FIAT Cabrio Top (if equipped)	Cycle the convertible top. Check and adjust alignment as required. In cold weather, allow the top to reach room temperature before cycling.
Skyslider (if equipped)	Cycle the Skyslider roof. Check and adjust alignment as required.
Power Sunroof (if equipped)	Cycle sunroof. Make sure that the sunroof opens and closes easily. Verify proper operation of one touch open/close feature if equipped.
Set Clock(s)	Set all clocks to correct time. Refer to Owner's Manual for information regarding clock setting procedures.
Audio System	Turn the radio on and check reception in both AM and FM modes. Check that the CD player operates properly. Check for good sound quality from all speakers.
Satellite Radio (if equipped)	Turn on satellite radio and verify reception.
Disable Front Seat Video (if equipped)	Use the scan tool to disable front seat video while vehicle not in park.
Video System (if equipped)	Test the DVD player to make sure that a DVD will load properly and display on the screen.
Satellite Streaming Video (if equipped)	Satellite Streaming Video.
Wireless Headphones / Video Remote (if equipped)	Check for proper operation of the Wireless Headphones / Video Remote.

NEW VEHICLE PREP INSTRUCTIONS - INTERIOR

DESCRIPTION	ACTION
Heated Steering Wheel (if equipped)	Verify that heated steering wheel is functioning properly.
Rear Sliding Window (if equipped)	Check for proper operation of the manual or power rear sliding window.
Power Outlet(s)	Check all power outlets for proper operation.
Integrated Child Seat / Belt	Check the child restraints and child seats for proper operation.
Place tire changing instruction sheet in left rear quarter panel storage compartment (RT only)	Place tire changing instruction sheet in left rear quarter panel storage compartment (RT only).
Storage bins properly seated around the spare tire (WK only)	Verify that storage bins are properly seated.
	Verify proper operation of power folding third row

Power folding Headrests (if equipped)	head restraints by pressing the power folding switch located on the instrument panel switch bank.
Heated Seats (if equipped)	Check for proper operation of heated seats on all power levels, on all equipped seats.
Power Cooled Seats (if equipped)	Check for proper operation of ventilated seats on all power levels, on all equipped seats.
Heated / Cooled Cup Holders (if equipped)	Check for proper operation of the heated and cooled and cooled cupholders.
Cargo Compartment Cover (if equipped)	Check the rear cargo compartment cover is operating properly.
Vinyl Floor Covering (if equipped)	Verify properly equipped.

NEW VEHICLE PREP INSTRUCTIONS - EXTERIOR

DESCRIPTION	ACTION
Inspect Body and Paint for Damage and Fit/ Finish	Inspect the body exterior for damage, loose or missing items. During the inspection, make sure that no vehicle damage occurred from the time the vehicle was received and the beginning of the New Vehicle Preparation.
Exterior Lamps - Headlamps, Turn Signals, Hazards, Park/Tail/License Plate, Trunk Lights, etc.	Operate and visually inspect the following: Headlamps (High/Low Beams), turn signals, hazard warning flashers, parking/tail/license plate lamps, reverse/back up lamps, fog lamps, stop lamps including center mounted stop lamp, daytime running lamps (if equipped), clearance lamps, cargo bed lamps, any other lamps.
Lock and Unlock all doors with all mechanical keys	Verify all doors lock and unlock with all mechanical keys.
Doors, Liftgate and Tailgate - Adjust Strikers as Needed	Open each door/liftgate/tailgate from the outside to check outside door handle operation. Check the door detent. Partially close all doors to check the open-door detent. Close all doors/liftgates/tailgates to check the operation of latches and strikers. Adjust strikers as required. Verify liftgate/tailgate ease of operation.
Power Liftgate - Inspect for fit and operation (if equipped)	Verify all modes of operation of the power liftgate, including operating the liftgate using the inside switches and the Remote Keyless Entry transmitter.
Power Sliding Door - Inspect for Fit and Operation (if equipped)	Verify all modes of operation of the power sliding door, including operating the sliding door using the inside switches and the Remote Keyless Entry transmitter.
Security Alarm Test (if equipped)	Lock doors using the Remote Keyless Entry Transmitter. Verify the operation of the Vehicle

	Security System warning lamp.
Passive Entry (if equipped)	Verify that the Keyless Enter-N-Go feature is operating properly, by grabbing the door handle of the locked vehicle, while the Remote Keyless Entry transmitter key is within 5 feet of the vehicle. The door should unlock automatically.
Remote Keyless Entry (if equipped)	Verify that doors unlock properly using all key FOBS.
Remote Start (if equipped)	Verify that engine starts with all keys when using Remote Keyless Entry Transmitter.
Top (Wrangler)	For Wrangler equipped with soft top, verify opening and closing operation. For Hard/Soft Top, verify top fits and is seated properly.

NEW VEHICLE PREP INSTRUCTIONS - VEHICLE STORAGE

DESCRIPTION	ACTION
Keep all protective transit film, wheel covers and films on vehicle until sold	Keep all protective transit film, wheel covers and films on vehicle until sold.
Inflate tire pressure to maximum side wall pressure	Inflate tire pressure to maximum side wall pressure (except heavy duty trucks.)
Put Vehicle into Ship Mode (if no IOD fuse)	Simultaneously press the "Front Defrost" and "List/Enter" buttons and hold for five (5) seconds. The EVIC display will update once the vehicle goes into ship mode.
Remove ignition off draw (IOD) Fuse	Remove fuse before storing vehicle to conserve battery.

NEW VEHICLE PREP INSTRUCTIONS - FINAL DETAIL & INSPECTION

DESCRIPTION	ACTION
Perform all incomplete recalls and RRTs	Perform all incomplete recalls and RRTs.
Remove interior and exterior Transportation Protective Covers	Remove exterior protective coatings/coverings from vehicle, remove interior protective covers, grease markings on door jambs, unnecessary labels, etc.
Inspect paint and body, touch up as needed	Make sure that the body is free from paint chips or scratches. Touch up any chips/scratches using thin layers of paint. Make sure that the body is free from dings and dents.
Install IOD Fuse or put vehicle into Customer Mode	Install fuse or place vehicle into customer mode prior to delivery.
Test and record battery state of charge	Check the battery state of charge by connecting a digital voltmeter at the jump-start locations. The battery voltage should be at least 12.4 volts. If charging is necessary, follow the service manual procedures and recharge the battery. Record voltage

	on New Vehicle Prep (NVP) form.
Adjust tire pressures including spare to door placard	Adjust tire pressures including spare to door placard.
Reset Tire Pressure Light Load Switch (if equipped)	Reset the Tire Pressure Light Load Switch back to the "Light Load" setting using the switch on the instrument panel.
Top off Diesel Exhaust Fluid reservoir	Fill the Diesel Exhaust Fluid Reservoir located behind the cab on the driver's side of truck (clearly marked in blue) with Mopar Diesel Exhaust Fluid prior to customer delivery.
Wash and clean vehicle exterior	Wash the entire vehicle. Clean the tire sidewalls and wheel/wheel covers (use non - acidic wheel cleaner). Clean exterior/interior glass surfaces.
Clean vehicle interior	Inspect the interior trim, seats, carpeting, and moldings. Clean as necessary.
Fill Fuel Tank with specified grade	Fill fuel tank with the specified grade of fuel. Refer to Owner's Manual or information tag behind the fuel filler.

TOWING

STANDARD PROCEDURE

STANDARD PROCEDURE - VEHICLE TOWING

WARNINGS AND PRECAUTIONS

WARNING: Do not allow towing attachment devices to contact the fuel tank or lines, fuel leakage can result. Do not lift or tow vehicle by front or rear bumper, or bumper energy absorber units. Do not venture under a lifted vehicle if not supported properly on safety stands. Do not allow passengers to ride in a towed vehicle. Use a safety chain that is independent from the towing attachment device. Failure to follow these instructions may result in personal injury or death.

CAUTION: Do not damage brake lines, exhaust system, shock absorbers, sway bars, or any other under vehicle components when attaching towing device to vehicle. Do not attach towing device to front or rear suspension components. Do not secure vehicle to towing device by the use of front or rear suspension or steering components. Remove or secure loose or protruding objects from a damaged vehicle before towing. Refer to state and local rules and regulations before towing a vehicle. Do not allow weight of towed vehicle to bear on lower fascia, air dams, or spoilers.

CAUTION: Do not flat tow any vehicle equipped with an automatic transmission.

Damage to the drivetrain will result. If these vehicles require towing, make sure all drive wheels are off the ground.

CAUTION: Towing this vehicle in violation of the above requirements can cause severe transmission damage. Damage from improper towing is not covered under the New Vehicle Limited Warranty.

RECOMMENDED TOWING EQUIPMENT

To avoid damage to bumper fascia and air dams use of a flat bed towing device or wheel lift is recommended. When using a wheel lift towing device, be sure the unlifted end of disabled vehicle has at least 100 mm (4 in.) ground clearance. If minimum ground clearance cannot be reached, use a towing dolly. If a flat bed device is used, the approach angle should not exceed 15 degrees.

Fig. 10: Recommended Towing Equipment
Courtesy of CHRYSLER GROUP, LLC

1 - WHEEL LIFT 2 - FLAT BED

GROUND CLEARANCE

CAUTION: If vehicle is towed with wheels removed, install lug nuts to retain brake drums or rotors.

A towed vehicle should be raised until the lifted wheels are a minimum 100 mm (4 in.) from the ground. Be sure there is at least 100 mm (4 in.) clearance between the tail pipe and the ground. If necessary, remove the wheels from the lifted end of the vehicle and lower the vehicle closer to the ground, to increase the ground clearance at the rear of the vehicle. Install lug nuts on wheel attaching studs to retain brake drums or rotors.

LOCKED VEHICLE TOWING

If a locked vehicle must be towed, a flat bed hauler is the only recommended method.

FLAT TOWING WITH TOW BAR

- Vehicles equipped with manual transmissions may be flat towed at any legal highway speed, for any distance, if the manual transmission is in NEUTRAL and the ignition switch is in the ACC position.
- Flat towing vehicles equipped with automatic transmissions is

  NOT ALLOWED

  .

  CAUTION: Do not flat tow any vehicle equipped with an automatic transmission. Damage to the drivetrain will result. If these vehicles require towing, make sure all drive wheels are off the ground.

FLAT BED TOWING TIE DOWNS

CAUTION: Do not tie vehicle down by attaching chains or cables to suspension components or engine mounts, damage to vehicle can result.

KL vehicles can be tied to a flat bed device using the reinforced loops located under the front and rear bumpers on the drivers side of the vehicle. There are also four reinforced elongated holes for T or R hooks located on the bottom of the front frame rail torque boxes behind the front wheels and forward of the rear wheels inboard of the rocker panel weld seam.

TOWING - FRONT WHEEL LIFT

Chrysler Corporation recommends that a vehicle be towed with the front end lifted, whenever possible. A 90 cm (36 in.) length of 4x4 wood beam can be placed between the wheel lift device and the bottom of the fascia to prevent damage to vehicle during the lifting operation. The beam can removed after lifting the front of the vehicle.

TOWING - REAR WHEEL LIFT

Towing a KL vehicle with the rear wheels lifted is **NOT ALLOWED** .

2014 GENERAL INFORMATION

Vehicle Quick Reference - Cherokee

CAPACITIES AND RECOMMENDED FLUIDS

DESCRIPTION

FLUID TYPES

When service is required, Chrysler Group LLC recommends that only Mopar® brand parts, lubricants and chemicals be used. Mopar® provides the best engineered products for servicing Chrysler Group LLC vehicles.

Only lubricants bearing designations defined by the following organization should be used to service a Chrysler Group LLC vehicle:

- Society of Automotive Engineers (SAE)
- American Petroleum Institute (API)
- National Lubricating Grease Institute (NLGI)
- European Automobile Manufacturers Association (ACEA)

API QUALITY CLASSIFICATION

9400-9

Fig. 1: API Symbol
Courtesy of CHRYSLER GROUP, LLC

This symbol on the front of an oil container means that the oil has been certified by the American Petroleum Institute (API) to meet all the lubrication requirements specified by Chrysler Group LLC.

GEAR LUBRICANTS

SAE ratings also apply to multigrade gear lubricants. In addition, API classification defines the lubricant's usage, such as API GL-5 and SAE 75W-90.

LUBRICANT RECOMMENDATIONS

CHASSIS

COMPONENT	FLUID, LUBRICANT, OR GENUINE PART
Steering Gear AND Linkage, Ball Joints, Prop Shafts AND Yokes, Wheel Bearings	Mopar® Multi-Purpose Lubricant NLGI Grade 2 EP, GC-LB

BODY

COMPONENT	FLUID, LUBRICANT, AND GENUINE PART
Hinges:	
Door AND Hood	Mopar® Engine Oil
Swing Gate	Mopar® Multi-Purpose Lube NLGI Grade 2 EP, GC-LB
Latches: Door, Hood/Safety Catch, Swing Gate	Mopar® Multi-Purpose Lube NLGI Grade 2 EP, GC-LB
Seat Regulator AND Track	Mopar® Multi-Purpose Lube NLGI Grade 2 EP, GC-LB
Lock Cylinders	Mopar® Lock Cylinder Lube

ENGINE OIL

WARNING: New or used engine oil can be irritating to the skin. Avoid prolonged or repeated skin contact with engine oil. Contaminants in used engine oil, caused by internal combustion, can be hazardous to your health. Thoroughly wash exposed skin with soap and water. Do not wash skin with gasoline, diesel fuel, thinner, or solvents, health problems can result. Do not pollute, dispose of used engine oil properly. Contact your government agency for location of collection center in your area.

When service is required, Chrysler Corporation recommends that only Mopar® brand parts, lubricants and chemicals be used. Mopar® provides the best engineered products for servicing Chrysler Corporation vehicles.

Only lubricants bearing designations defined by the following organization should be used:

- Society of Automotive Engineers (SAE)
- American Petroleum Institute (API)
- National Lubricating Grease Institute (NLGI)
- Association des Constructeurs Europ e ens d' Automobiles (European Automobile Manufacturers Association) (ACEA)

API CERTIFICATION AND LICENSE SYMBOL

9400-9

Fig. 2: API Certification Mark
Courtesy of CHRYSLER GROUP, LLC

Use an engine oil that is API Certified and Licensed to display the certification mark. MOPAR® provides engine oils that meet or exceed, Material Standard MS-6395 requirement.

SAE VISCOSITY

These engine oils are designed to improve low temperature starting and vehicle fuel economy. Refer to the engine oil filler cap for the preferred engine oil viscosity grade for each vehicle. The viscosity grade is also listed in the vehicle quick reference specifications. Refer to **CAPACITIES AND RECOMMENDED FLUIDS, SPECIFICATIONS**. SAE viscosity grades are used to specify the correct viscosity oil for an engine. Use only Multi-Viscosity oils. These are specified with a dual SAE viscosity grade which indicates the cold to hot temperature performance range of the oil.

CONTAINER IDENTIFICATION

9400-9

Fig. 3: API Certification Mark
Courtesy of CHRYSLER GROUP, LLC

The Engine Oil Certification Mark was developed and trademarked by the API to refer customers to those engine oils preferred by the automobile manufacturers. This symbol means that the oil has been certified and licensed by the American Petroleum Institute (API). This certification mark will only be found on the front of the oil containers. Those oils that do not display the "Mark" on the front of the container should not be used.

Chrysler only recommends API Certified engine oils that meet the requirements of Material Standard MS-6395. Use Mopar or an equivalent oil meeting the specification MS-6395.

SYNTHETIC ENGINE OILS

There are a number of engine oils being promoted as either synthetic or semi-synthetic. If you choose to use such a product, use **only** those oils that are certified by the American Petroleum Institute (API) to display the "Certification Mark" and show SAE viscosity grade recommended for each vehicle. Follow the service schedule that describes your driving type.

ENGINE OIL ADDITIVES/SUPPLEMENTS

The manufacturer **does not recommend** the addition of any engine oil additives/supplements to the specified engine oil. Engine oil additives/supplements should not be used to enhance engine oil performance. Engine oil additives/supplements should not be used to extend engine oil change intervals. No additive is known to be safe for engine durability and can degrade emission components. Additives can contain undesirable materials that harm the long term durability of engines and emission systems by:

- Increasing the level of Phosphorus and Sulfur in the engine oil. The API Certified Engine Oils control the Phosphorus and Sulfur contents of the oil to levels that reduce the contamination effect on the vehicle's emission control system.
- Altering the viscosity characteristics of the engine oil so that it no longer meets the requirements of the specified viscosity grade.
- Creating potential for an undesirable additive compatibility interaction in the engine crankcase. The engine oils contain a performance additive system carefully developed to optimize the oil's performance in the engine. The addition of supplements may cause the oil to thicken prematurely, cause excessive deposit build-up and potentially shorten engine life.

ENGINE COOLANT

WARNING: Antifreeze is an ethylene-glycol base coolant and is harmful if swallowed or inhaled. If swallowed, drink two glasses of water and induce vomiting. If inhaled, move to fresh air area. Seek medical attention immediately. Do not store in open or unmarked containers. Wash skin and clothing thoroughly after coming in contact with ethylene-glycol. Keep out of reach of children. Dispose of glycol base coolant properly, contact your dealer or government agency for location of collection center in your area. Do not open a cooling system when the engine is at operating temperature or hot under pressure, personal injury can result. Avoid radiator cooling fan when engine compartment related service is performed, personal injury can result.

CAUTION: Mixing of engine coolant (antifreeze) other than specified Organic Additive Technology (OAT) engine coolant (antifreeze), may result in engine damage and may decrease corrosion protection. Organic Additive Technology (OAT) engine coolant is different and should not be mixed with Hybrid Organic Additive Technology (HOAT) engine coolant (antifreeze). If a non-OAT engine coolant (antifreeze) is introduced into the cooling system in an emergency, it should be replaced with the specified engine coolant (antifreeze) as soon as possible.

YouTube	A multimedia supplement to the instructions contained in this article is available. To view the multimedia example of the condition described go to; **http://www.youtube.com/user/Mitchell1Tips** **then type, "A00641391.vid1" into the "Search Channel" box.**

The cooling system is designed around the coolant. The coolant must accept heat from engine metal, in the cylinder head area near the exhaust valves and engine block. Then coolant carries the heat to the radiator where the tube/fin radiator can transfer the heat to the air.

The use of aluminum cylinder blocks, cylinder heads, and water pumps requires special corrosion protection. Mopar® Antifreeze/Coolant, or the equivalent ethylene-glycol base coolant with organic corrosion inhibitors (called OAT, for Organic Additive Technology) is recommended. This coolant offers the best engine cooling without corrosion when mixed with 50% ethylene-glycol and 50% distilled water to obtain a freeze point of -37°C (-35°F). If it loses color or becomes contaminated, drain, flush, and replace with fresh properly mixed coolant solution.

COOLANT PERFORMANCE

The required ethylene-glycol and water mixture depends upon climate and vehicle operating conditions. The coolant performance of various mixtures follows:

Pure Water- Water can absorb more heat than a mixture of water and ethylene-glycol. This is for purpose of heat transfer only. Water also freezes at a higher temperature and allows corrosion.

100 percent Ethylene-Glycol - The corrosion inhibiting additives in ethylene-glycol need the presence of water to dissolve. Without water, additives form deposits in system. These act as insulation causing temperature to rise to as high as 149°C (300°F). This temperature is hot enough to melt plastic. The increased temperature can result in sever engine damage. In addition, 100 percent ethylene-glycol freezes at -22°C (-8°F).

50/50 Ethylene-Glycol and Water - Is the recommended mixture, it provides protection against freezing to -37°C (-34°F). The antifreeze concentration **must always** be a minimum of 44 percent, year-round in all climates. If percentage is lower, engine parts may be eroded by cavitation. Maximum protection against freezing is provided with a 68 percent antifreeze concentration, which prevents freezing down to -67.7°C (-90° F). A higher percentage will freeze at a warmer temperature. Also, a higher percentage of antifreeze can cause the engine to overheat because specific heat of antifreeze is lower than that of water.

OAT coolant is purple in color. It cannot be mixed with other types of coolant including Chrysler's existing HOAT coolant and only should only be mixed with approved OAT coolant of the same color. Maintenance of the cooling system is not required unless a repair has been made with loss of coolant or the coolant has been contaminated.

CAUTION: Richer antifreeze mixtures cannot be measured with normal field equipment and can cause problems associated with 100 percent ethylene-glycol.

COOLANT SELECTION AND ADDITIVES

The use of aluminum cylinder blocks, cylinder heads and water pumps requires special corrosion protection. Only Mopar® Antifreeze/Coolant (glycol base coolant with corrosion inhibitors called OAT, for Organic Additive Technology) is recommended. This coolant offers the best engine cooling without corrosion when mixed with 50% distilled water to obtain to obtain a freeze point of -37°C (-35°F). If it loses color or becomes contaminated, drain, flush, and replace with fresh properly mixed coolant solution.

CAUTION: Do not use coolant additives that are claimed to improve engine cooling.

FLEXIBLE FUEL VEHICLES

The following information is for Flexible Fuel Vehicles (FFV) only. These vehicles can be identified by the unique Fuel Filler Door Label that states **Ethanol (E-85) or Unleaded Gasoline Only.** This Service Information only covers those subjects that are unique to these vehicles. Please refer to appropriate Service Information for information on features that are common between Flexible Fuel and gasoline only powered vehicles.

CAUTION: Only vehicles with the E-85 fuel filler door label can operate on E-85.

ETHANOL FUEL (E-85)

E-85 is a mixture of approximately 85% fuel ethanol and 15% unleaded gasoline.

WARNING: Ethanol vapors are extremely flammable and could cause serious personal injury. Never have any smoking materials lit in or near the vehicle when removing the fuel filler tube cap (gas cap) or filling the tank. Do not use E-85 as a cleaning agent and never use it near an open flame.

FUEL REQUIREMENTS

The vehicle will operate on both unleaded gasoline with an octane rating of 87, or E-85 fuel, or any mixture of these two.

For best results, a refueling pattern that alternates between E-85 and unleaded gasoline should be avoided. When you do switch fuels, it is recommended that

- you do not switch when the fuel gauge indicates less than 1/4 full
- you do not add less than 5 gallons when refueling
- you operate the vehicle immediately after refueling for a period of at least 5 minutes

Observing these precautions will avoid possible hard starting and/or significant deterioration in driveability during warm up.

NOTE: When the ambient temperature is above 90°F (32C), you may experience hard starting and rough idle following start up even if the above recommendations are followed.

ENGINE OIL SELECTION FOR OPERATING ON E-85

If vehicle operates on E-85 fuel either full or part-time, use only Mopar® Flexible Fuel 5W-30 engine oil or an equivalent that meets Chrysler Standard MS-9214. Equivalent commercial Flexible Fuel engine oils may be labeled as Multi-Fuel, Variable Fuel, Flexible Fuel, etc. These engine oils may be satisfactory if they meet the Chrysler Standard.

SAE 5W-30 engine oil is preferred for use in Flexible Fuel engines.

CAUTION: If Flexible Fuel engine oil is not used when using E-85 fuel, engine wear or damage may result.

ENGINE OIL SELECTION FOR OPERATING ON GASOLINE

If you operate the vehicle on regular unleaded gasoline **ONLY,** use Mopar® oil or an equivalent that meets certified API (American Petroleum Institute) quality.

STARTING

The characteristics of E-85 fuel make it unsuitable for use when ambient temperatures fall below 0°F (-17°C). In the range of 0°F (-17°C) to 32°F (0°C), you may experience an increase in the time it takes for your engine to start, and a deterioration in driveability (sags and/or hesitations) until the engine is fully warmed up.

CRUISING RANGE

Because E-85 fuel contains less energy per gallon than gasoline, you will experience an increase in fuel consumption. You can expect your MPG and your driving range to decrease by about 30% compared to gasoline operation.

REPLACEMENT PARTS

Many components in your Flexible Fuel Vehicle (FFV) are designed to be compatible with ethanol. Always be sure that your vehicle is serviced with correct ethanol compatible parts.

CAUTION: Replacing fuel system components with non-ethanol compatible components can damage your vehicle and may void the warranty.

MAINTENANCE

If you operate the vehicle using E-85 fuel, follow Schedule "B".

AUTOMATIC TRANSAXLE FLUID

MOPAR® ZF 8&9 Speed ATF™ Automatic Transmission Fluid, Shell L12108 Transmission Fluid, or equivalent is required in the transmission. Failure to use the correct fluid may affect the function or performance of the transmission.

FLUID ADDITIVES

Chrysler strongly recommends against the addition of any fluids to the transmission, other than those automatic transmission fluids listed above. Exceptions to this policy are the use of special dyes to aid in detecting fluid leaks.

Various "special" additives and supplements exist that claim to improve shift feel and/or quality. These additives and others also claim to improve converter clutch operation and inhibit overheating, oxidation, varnish, and sludge. These claims have not been supported to the satisfaction of Chrysler and these additives **must not be used.** The use of transmission "sealers" should also be avoided, since they may adversely affect the integrity of transmission seals.

FUEL REQUIREMENTS

Your engine is designed to meet all emissions regulations and provide excellent fuel economy and performance when using high quality unleaded gasoline having an octane rating of 87. The use of premium gasoline is not recommended. The use of premium gasoline will provide no benefit over high quality regular gasoline, and in some circumstances may result in poorer performance.

Light spark knock at low engine speeds is not harmful to your engine. However, continued heavy spark knock at high speeds can cause damage and immediate service is required. Engine damage resulting from operation with a heavy spark knock may not be covered by the new vehicle warranty.

Poor quality gasoline can cause problems such as hard starting, stalling and hesitations. If you experience these symptoms, try another brand of gasoline before considering service for the vehicle.

Over 40 auto manufacturers world-wide have issued and endorsed consistent gasoline specifications (the Worldwide Fuel Charter, WWFC) to define fuel properties necessary to deliver enhanced emissions, performance and durability for your vehicle. Chrysler recommends the use of gasolines that meet the WWFC specifications if they are available.

REFORMULATED GASOLINE

Many areas of the country require the use of cleaner burning gasoline referred to as "reformulated" gasoline. Reformulated gasoline contain oxygenates, and are specifically blended to reduce vehicle emissions and improve air quality.

Chrysler strongly supports the use of reformulated gasoline. Properly blended reformulated gasoline will provide excellent performance and durability for the engine and fuel system components.

GASOLINE/OXYGENATE BLENDS

Some fuel suppliers blend unleaded gasoline with oxygenates such as 10% ethanol, MTBE, and ETBE.

Oxygenates are required in some areas of the country during the winter months to reduce carbon monoxide emissions. Fuels blended with these oxygenates may be used in your vehicle.

CAUTION: DO NOT use gasoline containing METHANOL. Gasoline containing methanol may damage critical fuel system components.

MMT IN GASOLINE

MMT is a manganese-containing metallic additive that is blended into some gasoline to increase octane. Gasoline blended with MMT provide no performance advantage beyond gasoline of the same octane number without MMT. Gasoline blended with MMT reduce spark plug life and reduce emission system performance in some vehicles. Chrysler recommends that gasoline free of MMT be used in your vehicle. The MMT content of gasoline may not be indicated on the gasoline pump; therefore, you should ask your gasoline retailer whether or not his/her gasoline contains MMT.

It is even more important to look for gasoline without MMT in Canada because MMT can be used at levels higher than allowed in the United States. MMT is prohibited in Federal and California reformulated gasoline.

SULFUR IN GASOLINE

If you live in the northeast United States, your vehicle may have been designed to meet California low emission standards with Cleaner-Burning California reformulated gasoline with low sulfur. If such fuels are not available in states adopting California emission standards, your vehicles will operate satisfactorily on fuels meeting federal specifications, but emission control system performance may be adversely affected. Gasoline sold outside of California is permitted to have higher sulfur levels which may affect the performance of the vehicle's catalytic converter. This may cause the Malfunction Indicator Lamp (MIL), Check Engine or Service Engine Soon light to illuminate. Chrysler recommends that you try a different brand of unleaded gasoline having lower sulfur to determine if the problem is fuel related prior to returning your vehicle to an authorized dealer for service.

CAUTION: If the Malfunction Indicator Lamp (MIL), Check Engine or Service Engine Soon light is flashing, immediate service is required; see appropriate ELECTRICAL DIAGNOSTICS article.

MATERIALS ADDED TO FUEL

All gasoline sold in the United States and Canada are required to contain effective detergent additives. Use of additional detergents or other additives is not needed under normal conditions.

FUEL SYSTEM CAUTIONS

CAUTION: Follow these guidelines to maintain your vehicle's performance:

- The use of leaded gas is prohibited by Federal law. Using leaded gasoline can impair engine performance, damage the emission control system, and could result in loss of warranty coverage.

- An out-of-tune engine, or certain fuel or ignition malfunctions, can cause the catalytic converter to overheat. If you notice a pungent burning odor or some light smoke, your engine may be out of tune or malfunctioning and may require immediate service.
- When pulling a heavy load or driving a fully loaded vehicle when the humidity is low and the temperature is high, use a premium unleaded fuel to help prevent spark knock. If spark knock persists, lighten the load, or engine piston damage may result.
- The use of fuel additives which are now being sold as octane enhancers is not recommended. Most of these products contain high concentrations of methanol. Fuel system damage or vehicle performance problems resulting from the use of such fuels or additives is not the responsibility of Chrysler Corporation and may not be covered under the new vehicle warranty.

NOTE: Intentional tampering with emissions control systems can result in civil penalties being assessed against you.

BRAKE FLUID

The brake fluid used in this vehicle must conform to DOT 3 specifications and SAE J1703 standards. No other type of brake fluid is recommended or approved for usage in the vehicle brake system. Use only Mopar® Brake Fluid or equivalent from a tightly sealed container.

CAUTION: Never use reclaimed brake fluid or fluid from a container which has been left open. An open container of brake fluid will absorb moisture from the air and contaminate the fluid.

CAUTION: Never use any type of a petroleum-based fluid in the brake hydraulic system. Use of such type fluids will result in seal damage of the vehicle brake hydraulic system causing a failure of the vehicle brake system. Petroleum based fluids would be items such as engine oil, transmission fluid, power steering fluid, etc.

A/C REFRIGERANT

The refrigerant used in this air conditioning system is a R-1234yf.

The A/C refrigerant system is filled-for-life at the factory and requires no regular maintenance. Although not required at specific intervals, the charge level should be checked if system performance deteriorates or if a noise or leak is suspected. Refer to **DIAGNOSIS AND TESTING** .

SPECIFICATIONS

ENGINE

Description	Type	Part Number	Capacities	
			U.S.	Metric

Cooling System				
? Engine Coolant (2.4L Engine)	MOPAR® Antifreeze/Coolant 10 Year/150, 000 Mile Formula OAT (Organic Additive Technology) meeting the requirements of Chrysler Material Standard MS-12106	1 Gallon - 68163848AA (concentrate) 68163849AA (50/50)	7.0 Quarts	6.6 Liters
? Engine Coolant (3.2L Engine)	MOPAR® Antifreeze/Coolant 10 Year/150, 000 Mile Formula OAT (Organic Additive Technology) meeting the requirements of Chrysler Material Standard MS-12106	1 Gallon - 68163848AA (concentrate) 68163849AA (50/50)	9.7 Quarts	9.2 Liters
? Engine Coolant (2.0L Diesel Engine)	MOPAR® Antifreeze/Coolant 10 Year/150, 000 Mile Formula OAT (Organic Additive Technology) meeting the requirements of Chrysler Material Standard MS-12106	1 Gallon - 68163848AA (concentrate) 68163849AA (50/50)	7.2 Quarts	6.8 Liters
Engine Oil with Filter				
?? Engine Oil - Non ACEA Categories (2.4L Engine)	We recommend you use SAE 0W-20 API Certified Engine Oil, meeting the requirements of Chrysler Material Standard MS-6395 or Fiat 9.55535-CR1. Refer to your engine oil filler cap for correct SAE grade.	68152004PA	5.5 Quarts	5.2 Liters
?? Engine Oil - ACEA Categories (2.4L Engine)	For countries that use ACEA European Oil Categories for Service Fill Oils, we recommend you use 0W-20 engine oils meeting the requirements of ACEA C3, and approved to Chrysler MS-6395 or Fiat 9.55535-CR1.	68152004PA	5.5 Quarts	5.2 Liters
	We recommend you use			

??? Engine Oil - Non ACEA Categories (3.2L Engine)	SAE 5W-20 API Certified Engine Oil, meeting the requirements of Chrysler Material Standard MS-6395 or Fiat 9.55535-CR1. Refer to your engine oil filler cap for correct SAE grade.	1 Quart - 4761872MB	6.0 Quarts	5.6 Liters
??? Engine Oil - ACEA Categories (3.2L Engine)	For countries that use ACEA European Oil Categories for Service Fill Oils, we recommend you use 5W-20 engine oils meeting the requirements of ACEA C3, and approved to Chrysler MS-6395 or Fiat 9.55535-CR1.	1 Quart - 4761872MB	6.0 Quarts	5.6 Liters
Engine Oil (2.0L Diesel Engine)	SAE Grade 5W-30 fully synthetic engine oil that meets Fiat classification 9.55535-S1	1 Quart -	4.5 Quarts	4.3 Liters
Engine Oil Filter (2.4L Engine)	MOPAR® Engine Oil Filter	68197769AA	N/A	N/A
Engine Oil Filter (3.2L Engine)	MOPAR® Engine Oil Filter	68191349AA	N/A	N/A
Fuel (approximate)				
Fuel Selection (2.4L Engine)	87 Octane Unleaded (R+M/2) 91 Research Octane Number (RON)	N/A	15.8 Gallons	60.0 Liters
Fuel Selection (3.2L Engines)	87-89 Octane Unleaded (R+M/2) 91-93 Research Octane Number (RON)	N/A	15.8 Gallons	60.0 Liters
Fuel Selection (2.0L Diesel Engines)	50 Cetane or higher (Less than 15 ppm Sulfur)	N/A	15.8 Gallons	60.0 Liters
A/C Refrigerant System				
Refrigerant	R-1234yf	-	1.125 Pounds	0.510 Kilograms
Refrigerant	R-134a	-	1.19 Pounds	.539 Kilograms
? System fill capacity includes heater and coolant recovery bottle filled to MAX level.				
?? SAE 5W-20 engine oil approved to MS-6395 or Fiat 9.55535-CR1 may be used when SAE 0W-20 engine oil is not available. Please ensure that you switch back to 0W-20 for the next oil change, as indicated by your vehicles automatic oil change indicator.				
??? SAE 5W-30 engine oil approved to MS-6395 or Fiat 9.55535-CR1 may be used when SAE 5W-20				

engine oil is not available.

CAUTION:

Nominal refill capacities are shown in this table. A variation may be observed from vehicle to vehicle due to manufacturing tolerance and refill procedure.

SPARK PLUGS

Description	Part Number	Gap	
		U.S.	Metric
Spark Plugs (2.4L Engine)	SP148183AB	0.047 in	1.20 mm
Spark Plugs (3.2L Engine)	SP149125AD	0.043 in	1.10 mm

TRANSAXLE

Description	Type	Part Number	Capacity
948TE Automatic Transaxle	Use only MOPAR® ZF 8&9 Speed ATF™ Automatic Transmission Fluid, or equivalent. Failure to use the correct fluid may affect the function or performance of your transmission.	Refer to **Star Parts** for the part number.	6.0 L (6.35 Quarts)
C635 Manual Transaxle	We recommend you use MOPAR® C635 DDCT/MTX Transmission Fluid.	Refer to **Star Parts** for the part number.	1.7 Liter (1.8 Quarts)

CHASSIS

Description	Type	Part Number	Capacities	
			U.S.	Metric
? Brake Master Cylinder	MOPAR® Brake Fluid DOT 3, SAE J1703.	12 oz. Bottle - 04318080AB	N/A	N/A

HOISTING

STANDARD PROCEDURE

STANDARD PROCEDURE - HOISTING

Fig. 6: Jeep Cherokee Lifting Points
Courtesy of CHRYSLER GROUP, LLC

1 - FRAME CONTACT LIFT (SINGLE POST)
1 - CHASSIS LIFT (DUAL LIFT)
1 - OUTBOARD LIFT (DUAL LIFT)
2 - ALTERNATE LIFTING LOCATIONS
2 - FLOOR JACK
3 - DRIVE ON HOIST

WARNING: The hoisting and jack lifting points provided are for a complete vehicle. When the engine or rear suspension is removed from a vehicle, the center of gravity is altered making some hoisting conditions unstable. Properly support or secure vehicle to hoisting device when these conditions exist. Failure to follow these instructions may result in serious or fatal injury.

CAUTION: Do not position hoisting device on any suspension component, including the front or rear suspension crossmembers. Do not hoist on the front and rear bumpers, the lower radiator crossmember, or the front engine mount.

Do not attempt to raise one entire side of the vehicle by placing a floor jack midway between the front and rear wheels. This practice may result in

permanent damage to the body.

CAUTION: Due to variations in hoist design it may be necessary to use the secondary lift points to avoid damage to the body or trim parts.

Refer to Owner's Manual provided with vehicle for proper emergency jacking procedures.

Fig. 7: Front Lifting Locations
Courtesy of CHRYSLER GROUP, LLC

NOTE: The following highlighted locations are provided to identify safe and effective lifting areas for the KL. In the event that the standard SAE lift pads and/or appropriate lift arm lengths are not available to meet the sill molding openings for flange lifting (1), the alternate lift point locations shown in illustration (2) should be utilized.

Fig. 8: Rear Lifting Locations
Courtesy of CHRYSLER GROUP, LLC

A hoist with asymmetrical hoist arms can not be adjusted to a position which will allow the hoist adapters to engage the service hoisting locations on the down standing weld flange on the sill at both the rear and the front of the vehicle. Therefore, the secondary service hoisting location will need to be used at the front of the vehicle. The secondary front service hoisting location is the front torque box.

When properly positioned, a floor jack can be used to lift the vehicle and support the raised vehicle with jack stands.

A floor jack or any lifting device must never be used on any part of the underbody other than the described areas.

There are SAE approved triangles in the body indicating where the lifting points are for the vehicle.

JUMP STARTING

STANDARD PROCEDURE

STANDARD PROCEDURE - JUMP STARTING

WARNING: REVIEW ALL SAFETY PRECAUTIONS AND WARNINGS.

WARNING: DO NOT JUMP START A FROZEN BATTERY, PERSONAL INJURY CAN RESULT.

WARNING: DO NOT JUMP START WHEN MAINTENANCE FREE BATTERY INDICATOR DOT IS BRIGHT COLOR.

WARNING: DO NOT ALLOW JUMPER CABLE CLAMPS TO TOUCH EACH OTHER WHEN CONNECTED TO A BOOSTER SOURCE.

WARNING: DO NOT USE OPEN FLAME NEAR BATTERY

WARNING: REMOVE METALLIC JEWELRY WORN ON HANDS OR WRISTS TO AVOID INJURY BY ACCIDENTAL ARCING OF BATTERY CURRENT.

WARNING: WHEN USING A HIGH OUTPUT BOOSTING DEVICE, DO NOT ALLOW BATTERY VOLTAGE TO EXCEED 16 VOLTS.

WARNING: REFER TO INSTRUCTIONS PROVIDED WITH DEVICE BEING USED.

CAUTION: DO NOT ATTEMPT TO PUSH OR TOW THE VEHICLE TO START IT. THE VEHICLE CANNOT BE STARTED THIS WAY. PUSHING WITH ANOTHER VEHICLE MAY DAMAGE THE TRANSAXLE OR THE REAR OF THE VEHICLE.

TO JUMP START A DISABLED VEHICLE:

Fig. 9: Jumper Cable RED clamp & Battery Positive Terminal

Courtesy of CHRYSLER GROUP, LLC

1.
    - Inspect the battery cable terminal clamps for damage. Replace any battery cable that has a damaged or deformed terminal clamp.
    - Inspect the battery tray and battery hold down hardware for damage. Replace any damaged parts.
    - Slide the thermal guard off of the battery case, if equipped. Inspect the battery case for cracks or other damage that could result in electrolyte leaks. Also, check the battery terminal posts for looseness. Batteries with damaged cases or loose terminal posts must be replaced.
    - Inspect the battery thermal guard for tears, cracks, deformation or other damage. Replace any battery thermal guard that has been damaged.
    - Inspect the battery built-in test indicator sight glass (if equipped) for an indication of the battery condition. If the battery is discharged, charge as required. Refer to **BATTERY, STANDARD PROCEDURE** .
2. Raise hood on disabled vehicle and visually inspect engine compartment for:
    - Generator drive belt condition and tension.

CAUTION: If the cause of starting problem on disabled vehicle is severe, damage to booster vehicle charging system can result.

3. When using another vehicle as a booster source, park the booster vehicle within cable reach. Turn off all accessories, set the parking brake, place the automatic transmission in PARK or the manual transmission in NEUTRAL and turn the ignition OFF.
4. On disabled vehicle, place gear selector in park or neutral and set park brake. Turn off all accessories.
5. Connect jumper cables to booster battery. RED clamp to positive terminal (+). BLACK clamp to negative terminal (-). DO NOT allow clamps at opposite end of cables to touch, electrical arc will result. Review all warnings in this procedure.
6. On disabled vehicle, connect RED jumper cable clamp (1) to positive (+) terminal (2). Connect BLACK jumper cable clamp to engine ground.
7. Start the engine in the vehicle which has the booster battery, let the engine idle a few minutes, then start the engine in the vehicle with the discharged battery.

CAUTION: Do not crank starter motor on disabled vehicle for more than 15 seconds, starter will overheat and could fail.

8. Allow battery in disabled vehicle to charge to at least 12.4 volts (75% charge) before attempting to start engine. If engine does not start within 15 seconds, stop cranking engine and allow starter to cool (15 min.), before cranking again.

DISCONNECT CABLE CLAMPS AS FOLLOWS:

- Disconnect BLACK cable clamp from engine ground on disabled vehicle.

- When using a Booster vehicle, disconnect BLACK cable clamp from battery negative terminal. Disconnect RED cable clamp from battery positive terminal.
- Disconnect RED cable clamp from battery positive terminal on disabled vehicle.

MAINTENANCE SCHEDULES

DESCRIPTION

NAFTA AND PUERTO RICO

OIL CHANGE INDICATOR SYSTEM

The Scheduled Maintenance services listed in this Service Information must be done at the times or mileages specified to protect your vehicle warranty and ensure the best vehicle performance and reliability. More frequent maintenance may be needed for vehicles in severe operating conditions, such as dusty areas and very short trip driving. Inspection and service should also be done anytime a malfunction is suspected.

The vehicle is equipped with an automatic oil change indicator system. The oil change indicator system will remind you that it is time to take your vehicle in for scheduled maintenance.

Based on engine operation conditions, the oil change indicator message will illuminate. This means that service is required for your vehicle. Operating conditions such as frequent short-trips, trailer tow, extremely hot or cold ambient temperatures, and E85 fuel usage will influence when the "Change Oil" or "Oil Change Required" message is displayed. Severe Operating Conditions can cause the change oil message to illuminate as early as 3, 500 miles (5, 600 km) since last reset. Have your vehicle serviced as soon as possible, within the next 500 miles (805 km).

On Electronic Vehicle Information Center (EVIC) equipped vehicles, "Oil Change Required" will be displayed in the EVIC and a single chime will sound, indicating that an oil change is necessary.

On Non-EVIC equipped vehicles, "Change Oil" will flash in the instrument cluster odometer and a single chime will sound, indicating that an oil change is necessary.

NOTE: Under no circumstances should oil change intervals exceed 10, 000 miles (16, 000 km) or twelve months, whichever comes first.

OIL CHANGE INDICATOR - RESET

The vehicle is equipped with an engine oil change indicator system. The "Oil Change Required" message flashes in the EVIC display for approximately ten seconds after a single chime has sounded, to indicate the next scheduled oil change interval. The engine oil change indicator system is duty cycle based, which means the engine oil change interval may fluctuate depending upon your personal driving style.

Unless reset, this message continues to display each time you turn the ignition switch to the ON/RUN position. To turn off the message temporarily, press and release the Menu button. To reset the oil change indicator system (after performing the scheduled maintenance) perform the following procedure:

1. Turn the ignition switch to the "ON" position. Do not start the engine.
2. Fully press the accelerator pedal slowly three times within ten seconds.
3. Turn the ignition switch to the "LOCK" position.

NOTE: If the indicator message illuminates when you start the vehicle, the oil change indicator system did not reset. If necessary, repeat this procedure.

ONCE A MONTH OR BEFORE A LONG TRIP

- Check engine oil level
- Check windshield washer fluid level
- Check tire pressure and look for unusual wear or damage.
- Check the fluid levels of coolant reservoir and brake master cylinder, fill as needed.
- Check function of all interior and exterior lights

CAUTION: Failure to perform the required maintenance items may result in damage to the vehicle.

REQUIRED MAINTENANCE INTERVALS

At Every Oil Change Interval As Indicated By Oil Change Indicator System:
Change oil and filter
Rotate the tires. **Rotate at the first sign of irregular wear, even if it occurs before the oil indicator system turns on.**
Inspect battery and clean and tighten terminals as required
Inspect brake pads, shoes, rotors, drums, hoses and park brake
Inspect engine cooling system protection and hoses
Inspect exhaust system
Inspect engine air cleaner if using in dusty or off-road conditions

Maintenance Chart

Mileage or time passed (whichever comes first)	20,000	30,000	40,000	50,000	60,000	70,000	80,000	90,000	100,000	110,000	120,000	130,000	140,000	150,000

Replace spark plugs (2.4L Engine). **									X					
Replace spark plugs (3.2L Engine). **									X					
Flush and replace the engine coolant at 10 years or 150, 000 miles (240, 000 km) whichever comes first.									X					X
Inspect and replace PCV valve if necessary									X					

** The spark plug change interval is mileage based only, monthly intervals do not apply.

WARNING:

- **You can be badly injured working on or around a motor vehicle. Do only service work for which you have the knowledge and the right equipment. If you have any doubt about your ability to perform a service job, take your vehicle to a competent mechanic.**
- **Failure to properly inspect and maintain your vehicle could result in a component malfunction and effect vehicle handling and performance. This could cause an accident**

Failure to follow these instructions may result in possible serious or fatal injury.

EUROPE/UK - GAS ENGINE

OIL CHANGE INDICATOR SYSTEM

The Scheduled Maintenance services listed in this Service Information must be done at the times or mileages specified to protect your vehicle warranty and ensure the best vehicle performance and reliability. More frequent maintenance may be needed for vehicles in severe operating conditions, such as dusty areas and very

short trip driving. Inspection and service should also be done anytime a malfunction is suspected.

The oil change indicator system will remind you that it is time to take your vehicle in for scheduled maintenance.

On Electronic Vehicle Information Center (EVIC) equipped vehicles "Oil Change Required" will be displayed in the EVIC and a single chime will sound, indicating that an oil change is necessary.

The oil change indicator message will illuminate approximately 7, 000 miles (11, 200 km) after the most recent oil change was performed. Have your vehicle serviced as soon as possible, within 500 miles (800 km).

NOTE:

- **The oil change indicator message will not monitor the time since the last oil change. Change the vehicle oil if it has been twelve months since your last oil change even if the oil change indicator message is NOT illuminated.**
- **Change your engine oil more often if you drive your vehicle off-road for an extended period of time.**
- **Under no circumstances should oil change intervals exceed 7, 500 miles (12 000 km) or 12 months, whichever comes first.**

OIL CHANGE INDICATOR - RESET

The vehicle is equipped with an engine oil change indicator system. The "Oil Change Required" message flashes in the EVIC display for approximately ten seconds after a single chime has sounded, to indicate the next scheduled oil change interval.

Unless reset, this message continues to display each time you turn the ignition switch to the ON/RUN position. To turn off the message temporarily, press and release the Menu button. To reset the oil change indicator system (after performing the scheduled maintenance) perform the following procedure:

1. Turn the ignition switch to the "ON" position. Do not start the engine.
2. Fully press the accelerator pedal slowly three times within ten seconds.
3. Turn the ignition switch to the "LOCK" position.

NOTE: **If the indicator message illuminates when you start the vehicle, the oil change indicator system did not reset. If necessary, repeat this procedure.**

REQUIRED MAINTENANCE INTERVALS

At Each Stop for Fuel

- Check the engine oil level about 5 minutes after a fully warmed engine is shut off. Checking the oil level while the vehicle is on level ground will improve the accuracy of the oil level reading. Add oil only when the level is at or below the ADD or MIN mark.
- Check the windshield washer solvent and add if required.

Once a Month

- Check tire pressure and look for unusual wear or damage.
- Inspect the battery and clean and tighten the terminals as required.
- Check the fluid levels of the coolant reservoir, brake master cylinder, and add fluid as needed.
- Check all lights and other electrical items for correct operation.

At Each Oil Change

- Change the engine oil filter.
- Inspect the brake hoses and lines.

WARNING:

- **You can be badly injured working on or around a motor vehicle. Do only service work for which you have the knowledge and the right equipment. If you have any doubt about your ability to perform a service job, take your vehicle to a competent mechanic.**
- **Failure to properly inspect and maintain your vehicle could result in a component malfunction and effect vehicle handling and performance. This could cause an accident**

Failure to follow these instructions may result in possible serious or fatal injury.

Perform Maintenance Every (Where time and mileage are listed, follow the interval that occurs first.)			Maintenance Items
Miles	Kilometers	Months	
7500	12000	12	• Change the engine oil and engine oil filter. • Rotate tires. • Inspect the CV joints. • Inspect the front suspension, tie rod ends and boot seals; replace if necessary. • Inspect the brake linings, replace if necessary. • Inspect parking brake function. • Replace the air conditioning/cabin air filter.
15000	24000	24	• Change the engine oil and engine oil filter. • Rotate tires.
22500	36000	36	• Change the engine oil and engine oil filter. • Rotate tires. • Inspect the CV joints.

			• Inspect the front suspension, tie rod ends and boot seals; replace if necessary. • Inspect the brake linings, replace if necessary. • Inspect parking brake function. • Replace the air conditioning/cabin air filter.
30000	48000	48	• Change the engine oil and engine oil filter. • Rotate tires. • Replace the engine air cleaner filter.
37500	60000	60	• Change the engine oil and engine oil filter. • Rotate tires. • Inspect the CV joints. • Inspect the front suspension, tie rod ends and boot seals; replace if necessary. • Inspect the brake linings, replace if necessary. • Inspect parking brake function. • Replace the air conditioning/cabin air filter.
45000	72000	72	• Change the engine oil and engine oil filter. • Rotate tires.
52500	84000	84	• Change the engine oil and engine oil filter. • Rotate tires. • Inspect the CV joints. • Inspect the front suspension, tie rod ends and boot seals; replace if necessary. • Inspect the brake linings, replace if necessary. • Inspect parking brake function. • Replace the air conditioning/cabin air filter.
60000	96000	96	• Change the engine oil and engine oil filter. • Rotate tires. • Replace the engine air cleaner filter.
67500	108000	108	• Change the engine oil and engine oil filter. • Rotate tires. • Inspect the CV joints. • Inspect the front suspension, tie rod ends and boot seals; replace if necessary. • Inspect the brake linings, replace if necessary. • Inspect parking brake function. • Replace the air conditioning/cabin air filter.

			• Replace the spark plugs (2.4L & 3.2L Engines).* * The spark plug change interval is mileage based only, monthly intervals do not apply.
75000	120000	120	• Change the engine oil and engine oil filter. • Rotate tires. • Flush and replace the engine coolant at 120 months or 150, 000 miles (240, 000 km) whichever comes first.
82500	132000	132	• Change the engine oil and engine oil filter. • Rotate tires. • Inspect the CV joints. • Inspect the front suspension, tie rod ends and boot seals; replace if necessary. • Inspect the brake linings, replace if necessary. • Inspect parking brake function. • Replace the air conditioning/cabin air filter.
90000	144000	144	• Change the engine oil and engine oil filter. • Rotate tires. • Replace the engine air cleaner filter.
97500	156000	156	• Change the engine oil and engine oil filter. • Rotate tires. • Inspect the CV joints. • Inspect the front suspension, tie rod ends and boot seals; replace if necessary. • Inspect the brake linings, replace if necessary. • Inspect parking brake function. • Replace the air conditioning/cabin air filter. • Inspect and replace PCV valve if necessary.
105000	168000	168	• Change the engine oil and engine oil filter. • Rotate tires.
112500	180000	180	• Change the engine oil and engine oil filter. • Rotate tires. • Inspect the CV joints. • Inspect the front suspension, tie rod ends and boot seals; replace if necessary. • Inspect the brake linings, replace if necessary. • Inspect parking brake function.

			• Replace the air conditioning/cabin air filter.
120000	192000	192	• Change the engine oil and engine oil filter. • Rotate tires. • Replace the engine air cleaner filter.
127500	204000	204	• Change the engine oil and engine oil filter. • Rotate tires. • Inspect the CV joints. • Inspect the front suspension, tie rod ends and boot seals; replace if necessary. • Inspect the brake linings, replace if necessary. • Inspect parking brake function. • Replace the air conditioning/cabin air filter.
135000	216000	216	• Change the engine oil and engine oil filter. • Rotate tires. • Replace the spark plugs (2.4L & 3.2L Engines).* * The spark plug change interval is mileage based only, monthly intervals do not apply.
142500	228000	228	• Change the engine oil and engine oil filter. • Rotate tires. • Inspect the CV joints. • Inspect the front suspension, tie rod ends and boot seals; replace if necessary. • Inspect the brake linings, replace if necessary. • Inspect parking brake function. • Replace the air conditioning/cabin air filter.
150000	240000	240	• Change the engine oil and engine oil filter. • Rotate tires. • Replace the engine air cleaner filter. • Flush and replace the engine coolant at 120 months or 150, 000 miles (240, 000 km) whichever comes first.

EUROPE/UK - DIESEL ENGINE

The maintenance intervals shown in chart below should be performed as indicated in this Service Information.

NOTE:

- **Under no circumstances should oil change intervals exceed 12, 500 miles (20 000 km) or 12 months, whichever comes first.**

- **Flush and replace the engine coolant at 120 months or 150, 000 miles (240, 000 km) whichever comes first.**

At Each Stop for Fuel

- Check the engine oil level about 15 minutes after a fully warmed engine is shut off. Checking the oil level while the vehicle is on level ground will improve the accuracy of the oil level reading. Add oil only when the level is at or below the ADD or MIN mark.
- Check the windshield washer solvent and add if required.

Once a Month

- Check tire pressure and look for unusual wear or damage.
- Inspect the battery and clean and tighten the terminals as required.
- Check the fluid levels of the coolant reservoir, brake master cylinder, and add fluid as needed.
- Check all lights and other electrical items for correct operation.

At Each Oil Change

- Change the engine oil filter.
- Inspect the brake hoses and lines.
- Inspect for the presence of water in the fuel filter/water separator unit.

Perform Maintenance Every (Where time and mileage are listed, follow the interval that occurs first.)			Maintenance Items
Miles	Kilometers	Months	
12500	20000	12	• Change the engine oil and engine oil filter. • Rotate tires. • Inspect the CV joints. • Inspect the front suspension, tie rod ends and boot seals; replace if necessary. • Inspect the brake linings, replace if necessary. • Inspect parking brake function. • Replace the air conditioning/cabin air filter.
25000	40000	24	• Change the engine oil and engine oil filter. • Replace the engine air cleaner filter. • Rotate tires. • Replace the engine fuel filter.
37500	60000	36	• Change the engine oil and engine oil filter.

			• Rotate tires. • Inspect the CV joints. • Inspect the front suspension, tie rod ends and boot seals; replace if necessary. • Inspect the brake linings, replace if necessary. • Inspect parking brake function. • Replace the air conditioning/cabin air filter.
50000	80000	48	• Change the engine oil and engine oil filter. • Replace the engine air cleaner filter. • Rotate tires. • Replace the engine fuel filter. • Change the manual transmission fluid if using your vehicle for any of the following: trailer towing, heavy loading, taxi, police, delivery service (commercial service), off-road, desert operation or more than 50% of your driving is at sustained speeds during hot weather, above 90°F (32°C).
62500	100000	60	• Change the engine oil and engine oil filter. • Rotate tires. • Inspect the CV joints. • Inspect the front suspension, tie rod ends and boot seals; replace if necessary. • Inspect the brake linings, replace if necessary. • Inspect parking brake function. • Replace the air conditioning/cabin air filter.
75000	120000	72	• Change the engine oil and engine oil filter. • Replace the engine air cleaner filter. • Rotate tires. • Replace the engine fuel filter.
87500	140000	84	• Change the engine oil and engine oil filter. • Rotate tires. • Inspect the CV joints. • Inspect the front suspension, tie rod ends and boot seals; replace if necessary. • Inspect the brake linings, replace if necessary. • Inspect parking brake function. • Replace the air conditioning/cabin air filter.
100000	160000	96	• Change the engine oil and engine oil filter.

			• Replace the engine air cleaner filter. • Rotate tires. • Replace the engine fuel filter. • Change the manual transmission fluid if using your vehicle for any of the following: trailer towing, heavy loading, taxi, police, delivery service (commercial service), off-road, desert operation or more than 50% of your driving is at sustained speeds during hot weather, above 90°F (32°C).

LATIN AMERICA - GAS ENGINE

OIL CHANGE INDICATOR SYSTEM

The Scheduled Maintenance services listed in this Service Information must be done at the times or mileages specified to protect your vehicle warranty and ensure the best vehicle performance and reliability. More frequent maintenance may be needed for vehicles in severe operating conditions, such as dusty areas and very short trip driving. Inspection and service should also be done anytime a malfunction is suspected.

The oil change indicator system will remind you that it is time to take your vehicle in for scheduled maintenance.

On Electronic Vehicle Information Center (EVIC) equipped vehicles "Oil Change Required" will be displayed in the EVIC and a single chime will sound, indicating that an oil change is necessary.

The oil change indicator message will illuminate approximately 7, 000 miles (11, 200 km) after the most recent oil change was performed. Have your vehicle serviced as soon as possible, within 500 miles (800 km).

NOTE:

- **The oil change indicator message will not monitor the time since the last oil change. Change the vehicle oil if it has been 6 months since your last oil change even if the oil change indicator message is NOT illuminated.**
- **Change your engine oil more often if you drive your vehicle off-road for an extended period of time.**
- **Under no circumstances should oil change intervals exceed 7, 500 miles (12 000 km) or 6 months, whichever comes first.**

OIL CHANGE INDICATOR - RESET

The vehicle is equipped with an engine oil change indicator system. The "Oil Change Required" message flashes in the EVIC display for approximately ten seconds after a single chime has sounded, to indicate the next scheduled oil change interval.

Unless reset, this message continues to display each time you turn the ignition switch to the ON/RUN position. To turn off the message temporarily, press and release the Menu button. To reset the oil change indicator system (after performing the scheduled maintenance) perform the following procedure:

1. Turn the ignition switch to the "ON" position. Do not start the engine.
2. Fully press the accelerator pedal slowly three times within ten seconds.
3. Turn the ignition switch to the "LOCK" position.

NOTE: **If the indicator message illuminates when you start the vehicle, the oil change indicator system did not reset. If necessary, repeat this procedure.**

REQUIRED MAINTENANCE INTERVALS

At Each Stop for Fuel

- Check the engine oil level about 5 minutes after a fully warmed engine is shut off. Checking the oil level while the vehicle is on level ground will improve the accuracy of the oil level reading. Add oil only when the level is at or below the ADD or MIN mark.
- Check the windshield washer solvent and add if required.

Once a Month

- Check tire pressure and look for unusual wear or damage.
- Inspect the battery and clean and tighten the terminals as required.
- Check the fluid levels of the coolant reservoir, brake master cylinder, and add fluid as needed.
- Check all lights and other electrical items for correct operation.

At Each Oil Change

- Change the engine oil filter.
- Inspect the brake hoses and lines.

WARNING:

- **You can be badly injured working on or around a motor vehicle. Do only service work for which you have the knowledge and the right equipment. If you have any doubt about your ability to perform a service job, take your vehicle to a competent mechanic.**
- **Failure to properly inspect and maintain your vehicle could result in a component malfunction and effect vehicle handling and performance. This could cause an accident**

Failure to follow these instructions may result in possible serious or fatal injury.

INSPECTION

INSPECTION

The following steps outline the dealer inspection procedure required every 5 years for vehicles covered under the terms of the Lifetime Powertrain Warranty. Refer to the appropriate warranty information for additional

terms and coverages applicable to the Lifetime Powertrain Warranty.

1. Lift the vehicle on a suitable hoist.
2. Check all Powertrain components for leaks or physical damage. Note any concerns.
3. Lower the vehicle and check the level and condition of the engine oil.
4. Connect a diagnostic scan tool and check for any active Powertrain Diagnostic Trouble Codes (DTC).

NEW VEHICLE PREPARATION INSTRUCTIONS

STANDARD PROCEDURE

STANDARD PROCEDURE - NEW VEHICLE PREPARATION

NEW VEHICLE PREP INSTRUCTIONS - VEHICLE READINESS

DESCRIPTION	ACTION
Keep All Protective Transit Film and Wheel Covers & Films on vehicle until sold, or up to 180 Days	Keep All Protective Transit Film and Wheel Covers & Films on vehicle until sold, or up to 180 Days.
Install Ignition Off Draw (IOD) Fuse	Locate and install/connect Ignition Off Draw fuse or connector.
Place vehicle into Customer Mode (if no IOD fuse)	With the key in the on position, turn on the hazard lamps, then press and hold the up arrow on the steering wheel for 5 seconds. The EVIC display will update once the vehicle goes into customer mode. Once the mode has been changed, turn off the hazard lamps.
Inflate tire pressure to maximum side wall pressure (except heavy duty trucks)	Increase the tire pressure to maximum sidewall pressure if vehicle is going into lot storage.
Install all "Shipped Loose" items	Install all "Shipped Loose" items
Install Front License Plate Bracket (if required)	Install Front License Plate Bracket
Install Roof Rack	Install Roof Rack
Install Antenna	Install Antenna
Install Wheel Center Caps	Install Wheel Center Caps
Reset Tire Pressure Light Load Switch (if equipped)	If vehicle is going into storage and tire pressure is being set to maximum, switch the tire pressure light load setting to "maximum load" using the button on the instrument panel.

NEW VEHICLE PREP INSTRUCTIONS - UNDERHOOD

DESCRIPTION	ACTION
	Verify the operation of the hood release system including the inside hood release lever and the outside hood secondary safety catch. Adjust if necessary. The safety catch prevents the hood

Hood Latch and Safety Catch - Adjust as Needed	from going to the full open position until it is manually released. To test the safety catch, unlatch the hood with the interior hood release lever and attempt to raise the hood without operating the safety catch.
Battery State-of-Charge - document voltage	Check the battery state of charge by connecting a digital voltmeter at the jump-start locations. The battery voltage should be at least 12.4 volts. If charging is necessary, follow the Service Information procedures and recharge the battery. Record voltage on New Vehicle Prep (NVP) form.
Loose Attachments, Routing and Clearance	Inspect the following for routing, loose attachments, connections, and clearance. Reroute and tighten as required: Brake Lines, Fuel Lines, Power Steering Hoses, Vacuum Hoses, Clutch Lines, Refrigerant Lines, Wiring, Belts.
All Fluid Levels	Refer to the Owner's Manual or service information for proper fluid level inspection locations.
No Fluid Leaks present	Visually inspect the underhood area to make sure absence of fluid leaks. Check clamps for tightness an full engagement.

NEW VEHICLE PREP INSTRUCTIONS - UNDER VEHICLE

DESCRIPTION	ACTION
No Fluid Leaks present	Raise the vehicle on an appropriate hoist and check the following: Loose Attachments, Routing Clearance and Damage, Absence of Fluid Leaks. Refer to Service Information for proper lift points. Check clamps for tightness and full engagement.
Loose Attachments, Routing, Clearance, Damage	Raise the vehicle on an appropriate hoist and check the following: Loose Attachments, Routing Clearance and Damage, Absence of Fluid Leaks. Refer to Service Information for proper lift points. Check clamps for tightness and full engagement.

NEW VEHICLE PREP INSTRUCTIONS - ROAD TEST

DESCRIPTION	ACTION
Perform Road Test, Mileage: Before _____ After _____	Record mileage before and after road test.
Engine Starts with All Keys	Start vehicle with all sets of keys.
All Warning Lights and Gauges / No DTCs	Verify all warning lights and gauges are operating properly, and no fault codes exist.
Keyless Go	Make sure vehicle starts with push button, when key is inside vehicle.

Engine Starts Only in Park & Neutral	Verify engine will only start while automatic transmission is in park or neutral.
Engine Starts Only with Clutch Depressed	Verify engine will only start when clutch is depressed on manual transmission vehicles.
Service and Parking Brakes	Apply the service brakes while the car is in motion. Be sure the brake operation is smooth and positive. Make sure the vehicle stops in a straight line and without pulling to one side. Make sure there is no shudder or vibration when braking. Make sure that the parking brake is easy to operate. Make sure the parking brake does not drag.
Brake Transmission Shift Interlock	Make sure that the vehicle will only start when the brake is depressed on vehicles with automatic transmission.
Clutch / Manual Transmission Shifting	Check for smooth shifting. Make sure shift lever operates easily and smoothly. Check for proper synchronization. The gears should not grind.
Automatic Transmission Shifting	Make sure that the park lock mechanism holds the vehicle. With the vehicle on a grade, put the automatic transmission in park and slowly release the service brake to check the operation of the park mechanism. Make sure the shift lever operates easily and smoothly. Check for smooth shifting. Check for proper upshifting and downshifting.
Autostick	Verify that Autostick feature allows proper shifting through the gears.

NEW VEHICLE PREP INSTRUCTIONS - ROAD TEST

DESCRIPTION	ACTION
Engine Performance - Cold	The engine should: start properly, idle smoothly and at proper speed, be free from stumbling or hesitation, produce sufficient power, be free of unusual noises, operate within the proper temperature range, and stop when the ignition key is shut off or stop button is depressed.
Engine Performance - Warm	The engine should: start properly, idle smoothly and at proper speed, be free from stumbling or hesitation, produce sufficient power, be free of unusual noises, operate within the proper temperature range, and stop when the ignition key is shut off or stop button is depressed.
Steering and Handling	Check that the power assist works properly. Make sure that the steering wheel does not vibrate abnormally at idle or road speed. Make sure that the steering wheel is centered when traveling in a

	straight line. Check that the vehicle does not drift to either side on flat road surfaces. Make sure that the vehicle does not vibrate or shake abnormally.
Noise, Vibration, Squeaks, or Rattles	Check that the vehicle is free of noise, vibrations, squeaks, or rattles. Tighten any loose fasteners.
Heater / Defrost - Front	Check the heater operation after the vehicle has reached operating temperature. Operate blower motor at all speeds. Operate the system in all modes. Check for hot air at all appropriate outlets. Check for temperature control operation.
Air Conditioning	Make sure that the A/C system cools properly. Operate blower motor at all speeds. Check for cool air at all temperature outlets. Operate the system in all modes.
Rear Heater and Air Conditioning	Check the rear heater and A/C for proper operation.
Defrost - Rear	Make sure that the electric heated rear defroster operates correctly. Turn on and feel for warmth.
Blindspot Monitoring System (if equipped)	While on road test, verify that the visual warning indicators located on the side view mirrors are operating properly when an object is within the detection zone.
Cruise Control (if equipped)	Check the "on/off" switch. Check the "set" operation. Check the "resume" function. Check the "accelerate" and "decelerate" function. Check the "cancel" button. Check the brake/clutch release function. If equipped, verify operation of Adaptive Cruise Control function.
Set Compass Variance / Calculation (if equipped)	Refer to the service information on TechCONNECT for information regarding compass setting procedures.

NEW VEHICLE PREP INSTRUCTIONS - ROAD TEST

DESCRIPTION	ACTION
Electronic Sway Bar Disconnect (if equipped)	With vehicle in four wheel drive, press the sway bar switch to activate the system. Verify that the "Sway Bar Indicator Light" is illuminated. **WARNING:** **Do not exceed 18 MPH / 29 KPH while the front sway bar is disconnected. Failure to follow these instructions may result in possible serious or fatal injury.**
Transfer Case (if equipped)	Shift the transfer case through all ranges to make sure all shifting is smooth and operates properly.
	Use the terrain select switch to change the ride

Load Leveling Air Suspension (if equipped)	height during normal driving conditions. Cycle through each selection and verify proper operation of the air suspension system.
Tire Pressure Monitoring System	Verify that Tire Pressure Monitoring Indicator Light is not illuminated when tires are above minimum inflation recommendations. Make sure that indicator lamp is not flashing/chiming.
Park Assist (if equipped)	Put vehicle in reverse and slowly back up toward an object. Verify that Park Assist warning icon, lights and chimes operate properly as object is approached.
Back-Up Camera (if equipped)	Put vehicle in reverse, verify that screen provides a clear and visible image from rear of vehicle.

NEW VEHICLE PREP INSTRUCTIONS - INTERIOR

DESCRIPTION	ACTION
Visually Inspect Interior Parts for Damage, Fit, etc.	From the interior of the vehicle, open and close all doors to make sure ease of operation. Fully open and close the glove box to make sure proper operation. Fully open and close the console door to make sure proper operation. Check interior panels for proper fit and free from damage.
All Interior Lamps and Horn	Operate and visually inspect all interior lights and switches, including: Dome/Map lamps, and if equipped the following: vanity mirror lamps, glove box lamps, ash tray lamp, cigar lighter lamp, radio lamps, door mounted lamps, illuminated entry system. Make sure that the horn operates properly.
Rear View Mirror	Check that the rearview mirror's day/night function Is operating properly.
Front and Rear Wipers and Washers	Activate front windshield wipers, and if equipped, rear window wipers and check for proper operation at all speeds. Activate the front and if equipped, the rear washer. Check the spray pattern for proper operation and aim. Check the intermittent wipe feature for proper operation.
All interior Door Locks including Child Locks	Check all interior door locks for proper operation, including rear child safety door locks if equipped. Place in the unlocked position.

NEW VEHICLE PREP INSTRUCTIONS - INTERIOR

DESCRIPTION	ACTION
Steering Wheel Mounted Controls	Check all steering wheel controls for proper operation.

Memory Mirror / Seat	Verify the proper operation of the memory mirror and seat system.
Cigar Lighter	Check cigar lighter for proper operation.
Power Windows and Window Lock Switch	Fully open and close all power windows to make sure proper operation and sealing. Make sure that the windows operate properly at each door. Verify that window lock button is operating properly.
Power Adjustable Pedals (if equipped)	Check the adjustable pedals for proper operation by pressing the switch on the steering column.
Outside Power Mirrors	Check power mirrors for proper operation.
Heated Mirrors (if equipped)	Check power heated mirrors for proper operation.
Power Folding Mirrors (if equipped)	Check power folding mirrors for proper operation.
Seats and Seat Belts - All Adjustments	Check for correct installation and operation of seat and shoulder belts, and retractors. Check that the restraint system safety labels regarding the use of seatbelts and airbags are in place. Fully cycle the seats for proper adjustments and verify that each seat is securely mounted. Fold down and latch the rear seats. Pull forward to check that the latches operate correctly. Check for proper head restraint operation.
Convertible Top (If equipped)	Cycle the convertible top. Check and adjust alignment as required. In cold weather, allow the top to reach room temperature before cycling.
FIAT Cabrio Top (if equipped)	Cycle the convertible top. Check and adjust alignment as required. In cold weather, allow the top to reach room temperature before cycling.
Skyslider (if equipped)	Cycle the Skyslider roof. Check and adjust alignment as required.
Power Sunroof (if equipped)	Cycle sunroof. Make sure that the sunroof opens and closes easily. Verify proper operation of one touch open/close feature if equipped.
Set Clock(s)	Set all clocks to correct time. Refer to Owner's Manual for information regarding clock setting procedures.
Audio System	Turn the radio on and check reception in both AM and FM modes. Check that the CD player operates properly. Check for good sound quality from all speakers.
Satellite Radio (if equipped)	Turn on satellite radio and verify reception.
Disable Front Seat Video (if equipped)	Use the scan tool to disable front seat video while vehicle not in park.
Video System (if equipped)	Test the DVD player to make sure that a DVD will load properly and display on the screen.

Satellite Streaming Video (if equipped)	Satellite Streaming Video.
Wireless Headphones / Video Remote (if equipped)	Check for proper operation of the Wireless Headphones / Video Remote.

NEW VEHICLE PREP INSTRUCTIONS - INTERIOR

DESCRIPTION	ACTION
Heated Steering Wheel (if equipped)	Verify that heated steering wheel is functioning properly.
Rear Sliding Window (if equipped)	Check for proper operation of the manual or power rear sliding window.
Power Outlet(s)	Check all power outlets for proper operation.
Integrated Child Seat / Belt	Check the child restraints and child seats for proper operation.
Place tire changing instruction sheet in left rear quarter panel storage compartment (RT only)	Place tire changing instruction sheet in left rear quarter panel storage compartment (RT only).
Storage bins properly seated around the spare tire (WK only)	Verify that storage bins are properly seated.
Power folding Headrests (if equipped)	Verify proper operation of power folding third row head restraints by pressing the power folding switch located on the instrument panel switch bank.
Heated Seats (if equipped)	Check for proper operation of heated seats on all power levels, on all equipped seats.
Power Cooled Seats (if equipped)	Check for proper operation of ventilated seats on all power levels, on all equipped seats.
Heated / Cooled Cup Holders (if equipped)	Check for proper operation of the heated and cooled and cooled cupholders.
Cargo Compartment Cover (if equipped)	Check the rear cargo compartment cover is operating properly.
Vinyl Floor Covering (if equipped)	Verify properly equipped.

NEW VEHICLE PREP INSTRUCTIONS - EXTERIOR

DESCRIPTION	ACTION
Inspect Body and Paint for Damage and Fit/ Finish	Inspect the body exterior for damage, loose or missing items. During the inspection, make sure that no vehicle damage occurred from the time the vehicle was received and the beginning of the New Vehicle Preparation.
Exterior Lamps - Headlamps, Turn Signals, Hazards, Park/Tail/License Plate, Trunk Lights, etc.	Operate and visually inspect the following: Headlamps (High/Low Beams), turn signals, hazard warning flashers, parking/tail/license plate lamps, reverse/back up lamps, fog lamps, stop lamps including center mounted stop lamp, daytime running lamps (if equipped), clearance lamps, cargo bed

	lamps, any other lamps.
Lock and Unlock all doors with all mechanical keys	Verify all doors lock and unlock with all mechanical keys.
Doors, Liftgate and Tailgate - Adjust Strikers as Needed	Open each door/liftgate/tailgate from the outside to check outside door handle operation. Check the door detent. Partially close all doors to check the open-door detent. Close all doors/liftgates/tailgates to check the operation of latches and strikers. Adjust strikers as required. Verify liftgate/tailgate ease of operation.
Power Liftgate - Inspect for fit and operation (if equipped)	Verify all modes of operation of the power liftgate, including operating the liftgate using the inside switches and the Remote Keyless Entry transmitter.
Power Sliding Door - Inspect for Fit and Operation (if equipped)	Verify all modes of operation of the power sliding door, including operating the sliding door using the inside switches and the Remote Keyless Entry transmitter.
Security Alarm Test (if equipped)	Lock doors using the Remote Keyless Entry Transmitter. Verify the operation of the Vehicle Security System warning lamp.
Passive Entry (if equipped)	Verify that the Keyless Enter-N-Go feature is operating properly, by grabbing the door handle of the locked vehicle, while the Remote Keyless Entry transmitter key is within 5 feet of the vehicle. The door should unlock automatically.
Remote Keyless Entry (if equipped)	Verify that doors unlock properly using all key FOBS.
Remote Start (if equipped)	Verify that engine starts with all keys when using Remote Keyless Entry Transmitter.
Top (Wrangler)	For Wrangler equipped with soft top, verify opening and closing operation. For Hard/Soft Top, verify top fits and is seated properly.

NEW VEHICLE PREP INSTRUCTIONS - VEHICLE STORAGE

DESCRIPTION	ACTION
Keep all protective transit film, wheel covers and films on vehicle until sold	Keep all protective transit film, wheel covers and films on vehicle until sold.
Inflate tire pressure to maximum side wall pressure	Inflate tire pressure to maximum side wall pressure (except heavy duty trucks.)
Put Vehicle into Ship Mode (if no IOD fuse)	Simultaneously press the "Front Defrost" and "List/Enter" buttons and hold for five (5) seconds. The EVIC display will update once the vehicle goes into ship mode.
Remove ignition off draw (IOD) Fuse	Remove fuse before storing vehicle to conserve battery.

NEW VEHICLE PREP INSTRUCTIONS - FINAL DETAIL & INSPECTION

DESCRIPTION	ACTION
Perform all incomplete recalls and RRTs	Perform all incomplete recalls and RRTs.
Remove interior and exterior Transportation Protective Covers	Remove exterior protective coatings/coverings from vehicle, remove interior protective covers, grease markings on door jambs, unnecessary labels, etc.
Inspect paint and body, touch up as needed	Make sure that the body is free from paint chips or scratches. Touch up any chips/scratches using thin layers of paint. Make sure that the body is free from dings and dents.
Install IOD Fuse or put vehicle into Customer Mode	Install fuse or place vehicle into customer mode prior to delivery.
Test and record battery state of charge	Check the battery state of charge by connecting a digital voltmeter at the jump-start locations. The battery voltage should be at least 12.4 volts. If charging is necessary, follow the service manual procedures and recharge the battery. Record voltage on New Vehicle Prep (NVP) form.
Adjust tire pressures including spare to door placard	Adjust tire pressures including spare to door placard.
Reset Tire Pressure Light Load Switch (if equipped)	Reset the Tire Pressure Light Load Switch back to the "Light Load" setting using the switch on the instrument panel.
Top off Diesel Exhaust Fluid reservoir	Fill the Diesel Exhaust Fluid Reservoir located behind the cab on the driver's side of truck (clearly marked in blue) with Mopar Diesel Exhaust Fluid prior to customer delivery.
Wash and clean vehicle exterior	Wash the entire vehicle. Clean the tire sidewalls and wheel/wheel covers (use non - acidic wheel cleaner). Clean exterior/interior glass surfaces.
Clean vehicle interior	Inspect the interior trim, seats, carpeting, and moldings. Clean as necessary.
Fill Fuel Tank with specified grade	Fill fuel tank with the specified grade of fuel. Refer to Owner's Manual or information tag behind the fuel filler.

TOWING

STANDARD PROCEDURE

STANDARD PROCEDURE - VEHICLE TOWING

WARNINGS AND PRECAUTIONS

WARNING: Do not allow towing attachment devices to contact the fuel tank or lines,

fuel leakage can result. Do not lift or tow vehicle by front or rear bumper, or bumper energy absorber units. Do not venture under a lifted vehicle if not supported properly on safety stands. Do not allow passengers to ride in a towed vehicle. Use a safety chain that is independent from the towing attachment device. Failure to follow these instructions may result in personal injury or death.

CAUTION: Do not damage brake lines, exhaust system, shock absorbers, sway bars, or any other under vehicle components when attaching towing device to vehicle. Do not attach towing device to front or rear suspension components. Do not secure vehicle to towing device by the use of front or rear suspension or steering components. Remove or secure loose or protruding objects from a damaged vehicle before towing. Refer to state and local rules and regulations before towing a vehicle. Do not allow weight of towed vehicle to bear on lower fascia, air dams, or spoilers.

CAUTION: Do not flat tow any vehicle equipped with an automatic transmission. Damage to the drivetrain will result. If these vehicles require towing, make sure all drive wheels are off the ground.

CAUTION: Towing this vehicle in violation of the above requirements can cause severe transmission damage. Damage from improper towing is not covered under the New Vehicle Limited Warranty.

RECOMMENDED TOWING EQUIPMENT

To avoid damage to bumper fascia and air dams use of a flat bed towing device or wheel lift is recommended. When using a wheel lift towing device, be sure the unlifted end of disabled vehicle has at least 100 mm (4 in.) ground clearance. If minimum ground clearance cannot be reached, use a towing dolly. If a flat bed device is used, the approach angle should not exceed 15 degrees.

Fig. 10: Recommended Towing Equipment
Courtesy of CHRYSLER GROUP, LLC

1 - WHEEL LIFT

2 - FLAT BED

GROUND CLEARANCE

CAUTION: If vehicle is towed with wheels removed, install lug nuts to retain brake drums or rotors.

A towed vehicle should be raised until the lifted wheels are a minimum 100 mm (4 in.) from the ground. Be sure there is at least 100 mm (4 in.) clearance between the tail pipe and the ground. If necessary, remove the wheels from the lifted end of the vehicle and lower the vehicle closer to the ground, to increase the ground clearance at the rear of the vehicle. Install lug nuts on wheel attaching studs to retain brake drums or rotors.

LOCKED VEHICLE TOWING

If a locked vehicle must be towed, a flat bed hauler is the only recommended method.

FLAT TOWING WITH TOW BAR

- Vehicles equipped with manual transmissions may be flat towed at any legal highway speed, for any distance, if the manual transmission is in NEUTRAL and the ignition switch is in the ACC position.
- Flat towing vehicles equipped with automatic transmissions is

  NOT ALLOWED

  .

CAUTION: Do not flat tow any vehicle equipped with an automatic transmission. Damage to the drivetrain will result. If these vehicles require towing, make sure all drive wheels are off the ground.

FLAT BED TOWING TIE DOWNS

CAUTION: Do not tie vehicle down by attaching chains or cables to suspension components or engine mounts, damage to vehicle can result.

KL vehicles can be tied to a flat bed device using the reinforced loops located under the front and rear bumpers on the drivers side of the vehicle. There are also four reinforced elongated holes for T or R hooks located on the bottom of the front frame rail torque boxes behind the front wheels and forward of the rear wheels inboard of the rocker panel weld seam.

TOWING - FRONT WHEEL LIFT

Chrysler Corporation recommends that a vehicle be towed with the front end lifted, whenever possible. A 90 cm (36 in.) length of 4x4 wood beam can be placed between the wheel lift device and the bottom of the fascia to prevent damage to vehicle during the lifting operation. The beam can removed after lifting the front of the

vehicle.

TOWING - REAR WHEEL LIFT

Towing a KL vehicle with the rear wheels lifted is **NOT ALLOWED** .

2014 HVAC

Heating & Air Conditioning (ATC) - Electrical Diagnostics - Cherokee

DIAGNOSIS AND TESTING

B1000-92-A/C SWITCH REQUEST INPUT - PERFORMANCE OR INCORRECT OPERATION

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The HVAC A/C Heater Control contains various switches and knobs that are used to change the systems operation. There are currently three types of switches used depending on the configuration of the system. Push button momentary switches which are normally open or in the Off position. Multifunction or rotary switches which have several distinct positions and potentiometers which are a rotary variable resistor that is used for a more precise control. An active Diagnostic Trouble Code (DTC) indicates that either a control switch or

potentiometer is stuck in an On position or out of a calibrated range. A stored DTC indicates that control switch or potentiometer was stuck On or out of calibration but has since returned to its normal state. For further information. Refer to **CONTROL, A/C AND HEATER, DESCRIPTION** .

WHEN MONITORED

With the ignition on.

SET CONDITION

If the A/C On/Off Control Switch is stuck in an On position for more than 30 seconds. This DTC has a de-maturing time of one second. If the DTCs status changes from active to stored, the DTC will stay in memory for 100 ignition cycles.

POSSIBLE CAUSES

Possible Causes
OBJECT HOLDING SWITCH IN AN ON POSITION A/C HEATER CONTROL

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **INSPECT FOR OBJECT HOLDING SWITCH IN AN ON POSITION**
    1. Inspect the A/C Heater Control for an object or debris holding the A/C On/Off Control Switch in an On position.

    NOTE: Using the scan tool you can read the On/Off status of the control switch.

    Is the A/C On/Off Control Switch being held in or stuck On?

    Yes

    - The A/C Heater control cannot be repaired or adjusted and must be replaced if inoperative or damaged but it might be cleanable if external debris is inhibiting the proper operation of the control switch or knob. If you are unable to clean the control to where it can function properly, replace and program the A/C Heater Control in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .
    - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Go To 2

2. **A/C HEATER CONTROL**
    1. Turn the ignition on.
    2. Using the scan tool, erase HVAC DTCs.
    3. Turn the ignition off for 10 seconds, and then turn the ignition on and wait a minimum of 30 seconds.
    4. Using the scan tool, read HVAC DTCs.

    Does the scan tool display this DTC as Active or is the status of the switch reading On?

    Yes

    - Replace and program the A/C Heater Control in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .
    - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Test complete.
    - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

B1009-92-RECIRCULATION SWITCH REQUEST INPUT - PERFORMANCE OR INCORRECT OPERATION

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The HVAC A/C Heater Control contains various switches and knobs that are used to change the systems operation. There are currently three types of switches used depending on the configuration of the system. Push button momentary switches which are normally open or in the Off position. Multifunction or rotary switches which have several distinct positions and potentiometers which are a rotary variable resistor that is used for a more precise control. An active Diagnostic Trouble Code (DTC) indicates that either a control switch or potentiometer is stuck in an On position or out of a calibrated range. A stored DTC indicates that control switch or potentiometer was stuck On or out of calibration but has since returned to its normal state. For further information. Refer to **CONTROL, A/C AND HEATER, DESCRIPTION** .

WHEN MONITORED

With the ignition on.

SET CONDITION

If the Recirculation Mode Switch is stuck in a On position for more than 30 seconds. This DTC has a de-maturing time of one second. If the DTCs status changes from active to stored, the DTC will stay in memory for 100 ignition cycles.

POSSIBLE CAUSES

Possible Causes
OBJECT HOLDING SWITCH IN AN ON POSITION A/C HEATER CONTROL

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **INSPECT FOR OBJECT HOLDING SWITCH IN AN ON POSITION**
   1. Inspect the A/C Heater Control for an object or debris holding the Recirculation Mode Switch in an On position.

      NOTE: Using the scan tool you can read the On/Off status of the control switch.

      Is the Recirculation Mode Switch being held in or stuck On?

      Yes

      - The A/C Heater control cannot be repaired or adjusted and must be replaced if inoperative or damaged but it might be cleanable if external debris is inhibiting the proper operation of the control switch or knob. If you are unable to clean the control to where it can function properly, replace and program the A/C Heater Control in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .
      - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Go To 2
2. **A/C HEATER CONTROL**
   1. Turn the ignition on.
   2. Using the scan tool, erase HVAC DTCs.
   3. Turn the ignition off for 10 seconds, and then turn the ignition on and wait a minimum of 30 seconds.
   4. Using the scan tool, read HVAC DTCs.

      Does the scan tool display this DTC as Active or is the status of the switch reading On?

      Yes

      - Replace and program the A/C Heater Control in accordance with the Service Information.

Refer to **MODULE, HVAC, REMOVAL** .

- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete.
- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

B1015-92-EBL REAR DEFROST SWITCH REQUEST INPUT - PERFORMANCE OR INCORRECT OPERATION

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The HVAC A/C Heater Control contains various switches and knobs that are used to change the systems operation. There are currently three types of switches used depending on the configuration of the system. Push button momentary switches which are normally open or in the Off position. Multifunction or rotary switches which have several distinct positions and potentiometers which are a rotary variable resistor that is used for a more precise control. An active Diagnostic Trouble Code (DTC) indicates that either a control switch or potentiometer is stuck in an On position or out of a calibrated range. A stored DTC indicates that control switch or potentiometer was stuck On or out of calibration but has since returned to its normal state. For further information. Refer to **CONTROL, A/C AND HEATER, DESCRIPTION** .

WHEN MONITORED

With the ignition on.

SET CONDITION

If the Electric Back light (EBL) Electronic Rear Defrost Switch is stuck in an On position for more than 30 seconds. This DTC has a de-maturing time of one second. If the DTCs status changes from active to stored, the DTC will stay in memory for 100 ignition cycles.

POSSIBLE CAUSES

Possible Causes
OBJECT HOLDING SWITCH IN AN ON POSITION A/C HEATER CONTROL

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **INSPECT FOR OBJECT HOLDING SWITCH IN AN ON POSITION**

1. Inspect the A/C Heater Control for an object or debris holding the (EBL) Electronic Rear Defrost Switch in an On position.

   NOTE: Using the scan tool you can read the On/Off status of the control switch.

   Is the (EBL) Electronic Rear Defrost Switch being held in or stuck in an On?

   Yes

   - The A/C Heater control cannot be repaired or adjusted and must be replaced if inoperative or damaged but it might be cleanable if external debris is inhibiting the proper operation of the control switch or knob. If you are unable to clean the control to where it can function properly, replace and program the A/C Heater Control in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 2

2. **A/C HEATER CONTROL**
   1. Turn the ignition on.
   2. Using the scan tool, erase HVAC DTCs.
   3. Turn the ignition off for 10 seconds, and then turn the ignition on and wait a minimum of 30 seconds.
   4. Using the scan tool, read HVAC DTCs.

   Does the scan tool display this DTC as Active or is the status of the switch reading On?

   Yes

   - Replace and program the A/C Heater Control in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

B1030-11-EVAPORATOR TEMPERATURE SENSOR - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 1: A/C Evaporator Temperature Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The HVAC A/C heater control uses a variety of sensors to adjust HVAC operation to obtain optimal performance. These sensors are continuously monitored by the A/C heater control to assure that they are in range. An active Diagnostic trouble Code (DTC) indicates that a sensor is out of range. A stored DTC indicates that the sensor was out of range but is currently within range.

The evaporator temperature sensor monitors the surface temperature of the A/C evaporator and supplies an input signal to the A/C heater control. The input signal value is used to optimize the A/C system performance and to protect the A/C evaporator from freezing. The evaporator temperature sensor resistance value will

change in response to the surface temperature of A/C evaporator. The resistance value is electronically transferred to the A/C heater control using a sensor ground circuit and a 5-volt reference signal circuit. Normal operation of the sensor the resistive value decreases when the A/C evaporator temperature decreases and the sensor resistive value increases when the A/C evaporator temperature increases.

WHEN MONITORED

With the ignition on.

SET CONDITION

The A/C Heater Control detects a short to ground on the Evaporator Temperature Sensor Signal voltage input to the controller. If the A/C Heater Control detects a valid voltage, the DTC will change from active to stored and will stay stored for 100 ignition cycles.

POSSIBLE CAUSES

Possible Causes
EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO THE SENSOR GROUND CIRCUIT
EVAPORATOR TEMPERATURE SENSOR
A/C HEATER CONTROL

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK IF THE DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. Using the scan tool, read HVAC DTCs.

    Is this DTC active?

    Yes

    - Go To 2

    No

    - Go To 5
2. **CHECK (C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND**
    1. Turn the ignition off to the lock position.

2. Disconnect the A/C Heater Control C1 harness connector.
3. Disconnect the Evaporator Temperature Sensor harness connector.
4. Measure the resistance between ground and the (C21) Evaporator Temperature Sensor Signal circuit.

   Is the resistance below 100k Ohms?

   Yes

   - Repair the (C21) Evaporator Temperature Sensor Signal circuit for a short to ground.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 3

3. **CHECK (C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO THE (C131) SENSOR GROUND CIRCUIT**
   1. Measure the resistance between the (C21) Evaporator Temperature Sensor Signal circuit and the (C131) Sensor Ground circuit.

      Is the resistance below 100k Ohms?

      Yes

      - Repair the (C21) Evaporator Temperature Sensor Signal circuit for a short to the (C131) Sensor Ground circuit.
      - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Go To 4

4. **CHECK THE EVAPORATOR TEMPERATURE SENSOR**
   1. Replace the Evaporator Temperature Sensor in Accordance with the Service Information. Refer to **SENSOR, EVAPORATOR TEMPERATURE, REMOVAL** .
   2. Cycle the ignition off for 30 seconds then back on.
   3. With the scan tool, read HVAC DTCs.

      Does this DTC reset?

      Yes

      - Replace and program the A/C Heater Control in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .

- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete.
- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

5. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
   3. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Wiggle the wiring and connectors while checking for shorted and open circuits.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

B1030-15-EVAPORATOR TEMPERATURE SENSOR - CIRCUIT SHORT TO BATTERY OR OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 2: A/C Evaporator Temperature Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The HVAC A/C heater control uses a variety of sensors to adjust HVAC operation to obtain optimal performance. These sensors are continuously monitored by the A/C heater control to assure that they are in range. An active Diagnostic trouble Code (DTC) indicates that a sensor is out of range. A stored DTC indicates that the sensor was out of range but is currently within range.

The evaporator temperature sensor monitors the surface temperature of the A/C evaporator and supplies an input signal to the A/C heater control. The input signal value is used to optimize the A/C system performance and to protect the A/C evaporator from freezing. The evaporator temperature sensor resistance value will

change in response to the surface temperature of A/C evaporator. The resistance value is electronically transferred to the A/C heater control using a sensor ground circuit and a 5-volt reference signal circuit. Normal operation of the sensor the resistive value decreases when the A/C evaporator temperature decreases and the sensor resistive value increases when the A/C evaporator temperature increases.

WHEN MONITORED

With the ignition on.

SET CONDITION

The A/C Heater Module detects greater than 4.8 volts on the Evaporator Temperature Sensor Signal circuit for a period of two seconds or more. If the A/C Heater Module detects a valid voltage, the DTC will change from active to stored and will stay stored for 100 ignition cycles.

POSSIBLE CAUSES

Possible Causes
EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
EVAPORATOR TEMPERATURE SENSOR
A/C HEATER MODULE

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK IF DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. With the scan tool, read HVAC DTCs.

    Is this DTC active?

    Yes

    - Go To 2

    No

    - Go To 6
2. **CHECK (C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT VOLTAGE**
    1. Turn the ignition off to the lock position.
    2. Disconnect the Evaporator Temperature Sensor harness connector.

NOTE: Due to the small terminal and pin size of the Evaporator Temperature Sensor and harness connector, make sure to not damage the terminals in this process.

3. Connect a jumper wire between the (C21) Evaporator Temperature Sensor Signal circuit and the (C131) Sensor Ground circuit in the Evaporator Temperature Sensor harness connector.
4. Ignition on, engine not running.
5. With the scan tool, read the Evaporator Temperature Sensor voltage.

   Is the voltage below 0.2 of a volt?

   Yes

   - Replace the Evaporator Temperature Sensor in accordance with the Service Information. Refer to **SENSOR, EVAPORATOR TEMPERATURE, REMOVAL** .
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 3

3. **CHECK THE (C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**
   1. Turn the ignition off to the lock position.
   2. Disconnect the jumper wire from the previous step.
   3. Disconnect the A/C Heater Module C1 harness connector.
   4. Ignition on, engine not running.
   5. Measure the voltage of the (C21) Evaporator Temperature Sensor Signal circuit.

      Is voltage above 0.2 of a volt?

      Yes

      - Repair the (C21) Evaporator Temperature Sensor Signal circuit for a short to voltage.
      - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Go To 4

4. **CHECK THE (C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT FOR AN OPEN**
   1. Turn the ignition off to the lock position.
   2. Measure the resistance of the (C21) Evaporator Temperature Sensor Signal circuit between the A/C Heater Module C1 harness connector and the Evaporator Temperature Sensor harness connector.

Is the resistance above 1.0 Ohm?

Yes

- Repair the (C21) Evaporator Temperature Sensor Signal circuit for an open.
- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 5

5. **CHECK THE (C131) SENSOR GROUND CIRCUIT FOR AN OPEN**
   1. Measure the resistance of the (C131) Sensor Ground circuit between the A/C Heater Module C1 harness connector and the Evaporator Temperature Sensor harness connector.

      Is the resistance above 1.0 Ohm?

      Yes

      - Repair the (C131) Sensor Ground circuit for an open.
      - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Replace and program the A/C Heater Module in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .
      - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

6. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. With the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
   3. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Wiggle the wiring and connectors while checking for shorted and open circuits.

      Were there any problems found?

      Yes

      - Repair as necessary.
      - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Test complete.

B1058-11-RECIRCULATION DOOR CONTROL - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 3: Actuator Blend/Mode Doors Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

After the initial installation of the A/C Heater Control, the controller is calibrated to each individual blend/mode door actuator. These calibrations are stored as in the number of pulses it takes to move the door from one stop to another. The A/C Heater Control drives the Door Actuators by the use of Door Driver circuit and a Common

Door Driver circuit and monitors all door actuator pulses to detect door movement in both directions. Most of the door actuators share a common door driver circuit but each door actuator has its own unique driver circuit. Due to shared circuitry, similar Diagnostic Trouble Codes (DTCs) can set at the same time for multiple actuators depending upon the type of circuit malfunction, its location, and the direction the actuator is moving when the malfunction is present. For further information. Refer to **DESCRIPTION** .

WHEN MONITORED

Continuously with the ignition on.

SET CONDITION

The A/C Heater Control detects a short to ground on the Recirculation Door Driver circuit. If the A/C Heater Control detects a valid current draw, the DTC will change from Active to Stored and will stay in the controllers memory for 100 ignition cycles.

POSSIBLE CAUSES

Possible Causes
RECIRCULATION DOOR DRIVER CIRCUIT SHORTED TO GROUND
COMMON DOOR DRIVER CIRCUIT SHORTED TO GROUND
RECIRCULATION DOOR ACTUATOR
A/C HEATER CONTROL

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK IF DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. With the scan tool, read HVAC DTCs.

    Is this DTC active?

    Yes

    - Go To 3

    No

    - Go To 2
2. **PERFORM HVAC ACTUATOR CALIBRATION TEST**
    1. With the scan tool, perform the HVAC Actuator Calibration Test.

Did this DTC change from Stored to Active while performing the HVAC Actuator Calibration Test?

Yes

- Go To 3

No

- Go To 6

3. **CHECK THE (C32) RECIRCULATION DOOR SIGNAL CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off to the lock position.
   2. Disconnect the A/C Heater Control C1 harness connector.
   3. Disconnect the Recirculation Door Actuator harness connector.
   4. Measure the resistance between ground and the (C32) Recirculation Door Signal circuit.

   Is the resistance below 100k Ohms?

   Yes

   - Repair the (C32) Recirculation Door Signal circuit for a short to ground.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 4
4. **CHECK THE REFERENCE VOLTAGE CIRCUIT (C26) FOR A SHORT TO GROUND**
   1. Measure the resistance between ground and the Reference Voltage circuit (C26).

   Is the resistance below 100k Ohms?

   Yes

   - Repair the Reference Voltage circuit (C26) for a short to ground.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 5
5. **CHECK THE RECIRCULATION DOOR ACTUATOR**
   1. Replace the Recirculation Door Actuator in accordance with the Service Information. Refer to **ACTUATOR, RECIRCULATION DOOR, REMOVAL** .

2. With the scan tool, erase HVAC DTCs and perform the HVAC Actuator Calibration Test.

   Did this DTC reset?

   Yes

   - Replace and program the A/C Heater Control in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

6. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. With the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
   3. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Wiggle the wiring and connectors while checking for shorted and open circuits.

      Were there any problems found?

      Yes

      - Repair as necessary.
      - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Test complete.

B1058-12-RECIRCULATION DOOR CONTROL-CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 4: Actuator Blend/Mode Doors Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

   No

   - Test complete.

B1058-92-RECIRCULATION DOOR CONTROL - PERFORMANCE OR INCORECT OPERATION

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 6: Actuator Blend/Mode Doors Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

After the initial installation of the A/C Heater Control, the controller is calibrated to each individual blend/mode door actuator. These calibrations are stored as in the number of pulses it takes to move the door from one stop to another. The A/C Heater Control drives the Door Actuators by the use of Door Driver circuit and a Common Door Driver circuit and monitors all door actuator pulses to detect door movement in both directions. Most of the door actuators share a common door driver circuit but each door actuator has its own unique driver circuit. Due to shared circuitry, similar Diagnostic Trouble Codes (DTCs) can set at the same time for multiple actuators depending upon the type of circuit malfunction, its location, and the direction the actuator is moving

when the malfunction is present. For further information. Refer to **DESCRIPTION** .

WHEN MONITORED

Continuously with the ignition on.

SET CONDITION

If the A/C Heater Control detects a overheat condition of the Integrated Circuit (IC) that controls the Recirculation Door Driver circuit. If the A/C Heater Control detects a valid temperature the DTC will change from Active to Stored and will stay in the controllers memory for 100 ignition cycles.

POSSIBLE CAUSES

Possible Causes
A/C HEATER CONTROL

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK IF DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. Using the scan tool, read HVAC DTCs.

    Is this DTC active?

    Yes

    - Allow the A/C Heater Control to cool down for five minutes then Go To 2

    No

    - Go To 3
2. **PERFORM HVAC ACTUATOR CALIBRATION TEST**
    1. Using the scan tool, perform the HVAC Actuator Calibration Test.

    Did this DTC reset?

    Yes

    - Replace and program the A/C Heater Control in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .
    - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 3

3. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
   3. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Wiggle the wiring and connectors while checking for shorted and open circuits.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

B105C-00-RECIRCULATION DOOR-TRAVEL RANGE TOO SMALL

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 7: Actuator Blend/Mode Doors Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

After the initial installation of the A/C Heater Control, the controller is calibrated to each individual blend/mode door actuator. These calibrations are stored as in the number of pulses it takes to move the door from one stop to another. The A/C Heater Control drives the Door Actuators by the use of Door Driver circuit and a Common Door Driver circuit and monitors all door actuator pulses to detect door movement in both directions. Most of the door actuators share a common door driver circuit but each door actuator has its own unique driver circuit. Due to shared circuitry, similar Diagnostic Trouble Codes (DTCs) can set at the same time for multiple actuators depending upon the type of circuit malfunction, its location, and the direction the actuator is moving

when the malfunction is present. For further information. Refer to **DESCRIPTION** .

WHEN MONITORED

When ever an Actuator Calibration Test is performed.

SET CONDITION

The A/C Heater Control uses a pulse feedback to the controller to detect the total door movement range. If the amount of pulses required to move the door completely in both directions is less than what the controller has stored in its memory, this DTC will set. If an Actuator Calibration Test is performed and the A/C Heater Control detects a valid range of the door movement span in both directions, the DTC will change from Active to Stored and will stay in the controllers memory for 100 ignition cycles.

POSSIBLE CAUSES

Possible Causes
RELATED DTCS PRESENT
RECIRCULATION DOOR BINDING
RECIRCULATION DOOR ACTUATOR
A/C HEATER CONTROL

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK FOR RELATED DTCS**
    1. Ignition on, engine not running.
    2. Using the scan tool, read HVAC DTCs.

    Are there any Door Control Circuit Open, Performance, or Short to Ground, Voltage, or Together DTCs present?

    Yes

    - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

    No

    - Go To 2
2. **CHECK IF DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. Using the scan tool, read HVAC DTCs.

Is this DTC active?

Yes

- Go To 4

No

- Go To 3

3. **PERFORM HVAC ACTUATOR CALIBRATION TEST**
   1. Using the scan tool, perform the HVAC Actuator Calibration Test.

      Did this DTC change from Stored to Active while performing the HVAC Actuator Calibration Test?

      Yes

      - Go To 4

      No

      - Go To 6
4. **CHECK THE RECIRCULATION DOOR**
   1. Remove the Recirculation Door Actuator and check the Recirculation Door for binding and full travel. Refer to **ACTUATOR, RECIRCULATION DOOR, REMOVAL** .

      Were there any problems found?

      Yes

      - Repair or replace the Recirculation Door as necessary in accordance with the Service Information. Refer to **HOUSING, HVAC, REMOVAL** .
      - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Go To 5
5. **CHECK THE RECIRCULATION DOOR ACTUATOR**
   1. Replace the Recirculation Door Actuator in accordance with the Service Information. Refer to **ACTUATOR, RECIRCULATION DOOR, REMOVAL** .
   2. Using the scan tool, erase HVAC DTCs.
   3. Using the scan tool, perform the HVAC Actuator Calibration Test.

      Did this DTC reset during HVAC Actuator Calibration Test?

Yes

- Replace and program the A/C Heater Control in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .
- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete.
- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

6. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
   3. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Wiggle the wiring and connectors while checking for shorted and open circuits.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

B105D-00-RECIRCULATION DOOR TRAVEL - RANGE TOO LARGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 8: Actuator Blend/Mode Doors Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

After the initial installation of the A/C Heater Control, the controller is calibrated to each individual blend/mode door actuator. These calibrations are stored as in the number of pulses it takes to move the door from one stop to another. The A/C Heater Control drives the Door Actuators by the use of Door Driver circuit and a Common Door Driver circuit and monitors all door actuator pulses to detect door movement in both directions. Most of the door actuators share a common door driver circuit but each door actuator has its own unique driver circuit. Due to shared circuitry, similar Diagnostic Trouble Codes (DTCs) can set at the same time for multiple actuators depending upon the type of circuit malfunction, its location, and the direction the actuator is moving

when the malfunction is present. For further information. Refer to **DESCRIPTION** .

WHEN MONITORED

When ever an Actuator Calibration Test is performed.

SET CONDITION

The A/C Heater Control uses a pulse feedback to the controller to detect the total door movement range. If the amount of pulses required to move the door completely in both directions is greater than what the controller has stored in its memory, this DTC will set. If an Actuator Calibration Test is performed or during normal operation and the A/C Heater Control detects a valid range of the door movement span in both directions, the DTC will change from Active to Stored and will stay in the controllers memory for 100 ignition cycles.

POSSIBLE CAUSES

Possible Causes
RELATED DTCS PRESENT
RECIRCULATION DOOR STOPS
RECIRCULATION DOOR
RECIRCULATION DOOR ACTUATOR
A/C HEATER CONTROL

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK FOR RELATED DTCS**
    1. Ignition on, engine not running.
    2. With the scan tool, read HVAC DTCs.

    Are there any Door Control Circuit Short to Voltage, Short to Ground or Open DTCs present?

    Yes

    - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

    No

    - Go To 2
2. **CHECK IF DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. With the scan tool, read HVAC DTCs.

Is this DTC active?

Yes

- Go To 4

No

- Go To 3

3. **PERFORM HVAC ACTUATOR CALIBRATION TEST**
   1. With the scan tool, perform the HVAC Actuator Calibration Test.

      Did this DTC change from Stored to Active while performing the HVAC Actuator Calibration Test?

      Yes

      - Go To 4

      No

      - Go To 6
4. **CHECK THE RECIRCULATION DOOR**
   1. Remove the Recirculation Door Actuator and check the Recirculation Door stops, linkage (stripped or cracked) and door. Refer to **ACTUATOR, RECIRCULATION DOOR, REMOVAL** .

      Were there any problems found?

      Yes

      - Repair or replace the Recirculation Door as necessary in accordance with the Service Information. Refer to **HOUSING, HVAC, REMOVAL** .
      - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Go To 5
5. **CHECK THE RECIRCULATION DOOR ACTUATOR**
   1. Replace the Recirculation Door Actuator in accordance with the Service Information. Refer to **ACTUATOR, RECIRCULATION DOOR, REMOVAL** .
   2. With the scan tool, erase HVAC DTCs and perform the HVAC Actuator Calibration Test.

      Did this DTC reset?

Yes

- Replace and program the A/C Heater Control in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .
- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete.
- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

6. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. With the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
   3. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Wiggle the wiring and connectors while checking for shorted and open circuits.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

B10B2-00-A/C COOL - DOWN TEST PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The A/C Heater Controller has software to enable it to perform an A/C Cool Down Test by a command using a scan tool. This test checks for evaporator temperature drop over a predetermined time. If the test fails, this DTC will set. However, certain test conditions are required to perform this test. Failure to run this test within those parameters can result in failure of the test.

WHEN MONITORED

With ever an A/C Cooldown Test is performed.

SET CONDITION

This DTC is set whenever the A/C Cooldown Test is performed and the desired temperature drop is not achieved by the system. The DTC will go to stored after a successful A/C Cooldown Test.

POSSIBLE CAUSES

Possible Causes
A/C SYSTEM WORKING IMPROPERLY

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

CONDITIONS FOR A/C COOLDOWN TEST

1. The following condition must be met before running the A/C Cooldown test.
   - No Powertrain Control Module (PCM) DTCs present.
   - No Communication DTCs present.
   - Condenser cooling fan working properly.
   - No active HVAC evaporator temperature sensor, sun sensor, recirculation, mode, or blend door actuator DTCs present.
   - The refrigerant system must be fully charged.
   - The blower motor must operate correctly in all speeds.
   - The evaporator temperature must be above 12.7° C (55° F).
   - The A/C compressor must be turned off.
   - Blower must be on high.

   Are all of the above conditions met before running the A/C Cooldown Test?

   Yes

   - Go to the Service Information for additional Cooldown Test related diagnostic information and testing procedures and repair as necessary. Refer to **HVAC SYSTEM TESTDIAGNOSIS AND TESTING** .

     NOTE: Run the Cooldown Test again after any repairs are performed.

   - If the Cooldown Test passes, testing is complete.

   No

   - Run the A/C Cooldown test again with the above test conditions.

B10B3-11-CABIN HEATER 1 CONTROL - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 9: Cabin Heater Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the ignition on, the Cabin Heater Relay 1 commanded on.

SET CONDITION

If the A/C Heater Control Module detects the Cabin Heater Relay 1 Control circuit is shorted to ground.

POSSIBLE CAUSES

Possible Causes
CABIN HEATER RELAY 1 CONTROL CIRCUIT SHORTED TO GROUND
CABIN HEATER 1 RELAY
A/C HEATER CONTROL MODULE

DIAGNOSTIC TEST

1. **VERIFY THAT THE DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, erase DTCs.
    3. With the scan tool, actuate the Cabin Heater 1 Relay.
    4. Monitor the scan tool for at least two minutes.
    5. With the scan tool, read DTCs.

    Is this DTC active?

    Yes

    - Go To 2

    No

    - The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.
    - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
2. **CHECK CABIN HEATER RELAY 1 OUTPUT CIRCUIT FOR SHORT TO GROUND**
    1. Turn the ignition off.
    2. Disconnect the A/C Heater Control C1 harness connector.
    3. Remove the Cabin Heater Relay 1.
    4. Using an ohm meter measure the resistance between the Cabin Heater Relay 1 Output circuit and ground.

    Does the ohm meter read open circuit?

    Yes

    - Go To 3

No

- Repair the Cabin Heater Relay 1 Output circuit for a short to ground.
- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

3. **A/C HEATER CONTROL MODULE**
   1. Turn the ignition on.
   2. With the scan tool, erase DTCs.
   3. With the scan tool, actuate the Cabin Heater 1 Relay.
   4. Monitor the scan tool for at least two minutes.
   5. With the scan tool, read DTCs.

   Does the scan tool display active: B10B3-11-CABIN HEATER 1 CONTROL CIRCUIT SHORT TO GROUND?

   Yes

   - Replace the A/C Heater Control Module in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Replace the Cabin Heater Relay 1 in accordance with the Service Information.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

B10B3-13-CABIN HEATER 1 CONTROL - CIRCUIT OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 10: Cabin Heater Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the ignition on, the Cabin Heater Relay 1 commanded on.

SET CONDITION

If the A/C Heater Control Module detects the Cabin Heater Relay 1 Control circuit is Open.

POSSIBLE CAUSES

Possible Causes
CABIN HEATER RELAY 1 CONTROL CIRCUIT OPEN
A/C HEATER CONTROL MODULE

DIAGNOSTIC TEST

1. **VERIFY THAT THE DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, erase DTCs.
    3. With the scan tool, actuate the Cabin Heater 1 Relay.
    4. Monitor the scan tool for at least two minutes.
    5. With the scan tool, read DTCs.

    Is this DTC active?

    Yes

    - Go To 2

    No

    - The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.
    - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
2. **CHECK THE CABIN HEATER RELAY 1 CONTROL CIRCUIT FOR AN OPEN**
    1. Turn the ignition off.
    2. Disconnect the A/C Heater Control Module C1 harness connector.
    3. Remove the Cabin Heater Relay 1 from the Power Distribution Center.
    4. Turn the ignition on.
    5. Measure the resistance of the Cabin Heater Relay 1 Control circuit between the A/C Heater Control C1 harness connector and the Power Distribution Center.

    Is the resistance above 1.0 Ohm?

    Yes

    - Repair the open on the Cabin Heater Relay 1 Control circuit.
    - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To3

3. **A/C HEATER CONTROL MODULE**
    1. Turn the ignition on.
    2. With the scan tool, erase DTCs.
    3. With the scan tool, actuate the Cabin Heater 1 Relay.
    4. Monitor the scan tool for at least two minutes.
    5. With the scan tool, read DTCs.

    Does the scan tool display active: B10B3-13-CABIN HEATER 1 CONTROL CIRCUIT OPEN?

    Yes

    - Replace the A/C Heater Control Module in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .
    - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Replace the Cabin Heater Relay 1 in accordance with the Service Information.
    - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

B10B7-11-CABIN HEATER 2 CONTROL - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 11: Cabin Heater Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the ignition on, the Cabin Heater Relay 2 commanded on.

SET CONDITION

If the A/C Heater Control Module detects the Cabin Heater Relay 2 Control circuit is shorted to ground.

POSSIBLE CAUSES

Possible Causes
CABIN HEATER RELAY 2 CONTROL CIRCUIT SHORTED TO GROUND
CABIN HEATER 2 RELAY
A/C HEATER CONTROL MODULE

DIAGNOSTIC TEST

1. **VERIFY THAT THE DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, erase DTCs.
    3. With the scan tool, actuate the Cabin Heater 2 Relay.
    4. Monitor the scan tool for at least two minutes.
    5. With the scan tool, read DTCs.

    Is this DTC active?

    Yes

    - Go To 2

    No

    - The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.
    - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
2. **CHECK CABIN HEATER RELAY 2 OUTPUT CIRCUIT FOR SHORT TO GROUND**
    1. Turn the ignition off.
    2. Disconnect the A/C Heater Control C1 harness connector.
    3. Remove the Cabin Heater Relay 2.
    4. Using an ohm meter measure the resistance between the Cabin Heater Relay 2 Output circuit and ground.

    Does the ohm meter read open circuit?

    Yes

    - Go To 3

    No

- Repair the Cabin Heater Relay 2 Output circuit for a short to ground.
- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

3. **A/C HEATER CONTROL MODULE**
   1. Turn the ignition on.
   2. With the scan tool, erase DTCs.
   3. With the scan tool, actuate the Cabin Heater 2 Relay.
   4. Monitor the scan tool for at least two minutes.
   5. With the scan tool, read DTCs.

   Does the scan tool display active: B10B7-11-CABIN HEATER 2 CONTROL CIRCUIT SHORT TO GROUND?

   Yes

   - Replace the A/C Heater Control Module in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Replace the Cabin Heater Relay 2 in accordance with the Service Information.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

B10B7-13-CABIN HEATER 2 CONTROL - CIRCUIT OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 12: Cabin Heater Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the ignition on, the Cabin Heater Relay 2 commanded on.

SET CONDITION

If the A/C Heater Control Module detects the Cabin Heater Relay 2 Control circuit is Open.

POSSIBLE CAUSES

Possible Causes
CABIN HEATER RELAY 2 CONTROL CIRCUIT OPEN
A/C HEATER CONTROL MODULE

DIAGNOSTIC TEST

1. **VERIFY THAT THE DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, erase DTCs.
    3. With the scan tool, actuate the Cabin Heater 2 Relay.
    4. Monitor the scan tool for at least two minutes.
    5. With the scan tool, read DTCs.

    Is this DTC active?

    Yes

    - Go To 2

    No

    - The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.
    - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
2. **CHECK THE CABIN HEATER RELAY 2 CONTROL CIRCUIT FOR AN OPEN**
    1. Turn the ignition off.
    2. Disconnect the A/C Heater Control Module C1 harness connector.
    3. Remove the Cabin Heater Relay 2 from the Power Distribution Center.
    4. Turn the ignition on.
    5. Measure the resistance of the Cabin Heater Relay 2 Control circuit between the A/C Heater Control C1 harness connector and the Power Distribution Center.

    Is the resistance above 1.0 Ohm?

    Yes

    - Repair the open on the Cabin Heater Relay 2 Control circuit.
    - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To3

3. **A/C HEATER CONTROL MODULE**
   1. Turn the ignition on.
   2. With the scan tool, erase DTCs.
   3. With the scan tool, actuate the Cabin Heater 2 Relay.
   4. Monitor the scan tool for at least two minutes.
   5. With the scan tool, read DTCs.

   Does the scan tool display active: B10B7-13-CABIN HEATER 2 CONTROL CIRCUIT OPEN?

   Yes

   - Replace the A/C Heater Control Module in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Replace the Cabin Heater Relay 2 in accordance with the Service Information.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

B10E8-11-BLOWER MOTOR CONTROL - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 13: Blower Motor Control Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

A Blower Motor Power Module allows the microprocessor-based A/C Heater Control to calculate and provide infinitely variable blower motor speeds based upon either manual blower switch input or the ATC programming. The ATC blower motor control system uses a Pulse Width Modulated (PWM) circuit strategy. PWM voltage is applied to a comparator circuit which compares the PWM signal voltage to the blower motor feedback voltage. The resulting output drives the power module circuitry, which provides a linear output voltage to change or maintain the desired blower speed.

WHEN MONITORED

With the ignition on.

SET CONDITION

If the A/C Heater Control detects a short to ground on the Blower Motor Control circuit. If a valid voltage is detected the DTC will change from active to stored and stay in the controllers memory for 100 consecutive ignition cycles.

POSSIBLE CAUSES

Possible Causes
BLOWER MOTOR SUPPLY CIRCUIT SHORTED TO GROUND
BLOWER MOTOR GROUND CIRCUIT SHORTED TO GROUND
BLOWER MOTOR POWER MODULE
A/C HEATER CONTROL

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. With the scan tool, read HVAC DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Go To 5
2. **CHECK THE (C7) BLOWER MOTOR SUPPLY CIRCUIT FOR A SHORT TO GROUND**
    1. Turn the ignition off to the lock position.
    2. Disconnect the A/C Heater Control harness connector.
    3. Disconnect the Blower Motor Power Module C1 harness connector.
    4. Measure the resistance between ground and the (C7) Blower Motor Supply circuit.

    Is the resistance below 100k Ohms?

Yes

- Repair the (C7) Blower Motor Supply circuit for a short to ground.
- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 3

3. **CHECK THE BLOWER MOTOR GROUND SIGNAL CIRCUIT FOR A SHORT TO GROUND**
   1. Measure the resistance between ground and the Blower Motor Ground Signal circuit.

      Is the resistance below 100k Ohms?

      Yes

      - Repair the Blower Motor Ground Signal circuit for a short to ground.
      - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Go To 4

4. **CHECK THE BLOWER MOTOR POWER MODULE**
   1. Turn the ignition off to the lock position.
   2. Replace the Blower Motor Power Module in accordance to the Service Information. Refer to **MODULE, POWER, BLOWER MOTOR, REMOVAL** .
   3. Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      Did this DTC reset performing the HVAC Verification Test?

      Yes

      - Replace and program the A/C Heater Control in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .
      - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Test complete.

5. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. With the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
   3. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water

intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

4. Wiggle the wiring and connectors while checking for shorted and open circuits.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

B10E8-12-BLOWER MOTOR CONTROL - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 14: Blower Motor Control Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

A Blower Motor Power Module allows the microprocessor-based A/C Heater Control to calculate and provide infinitely variable blower motor speeds based upon either manual blower switch input or the ATC programming. The ATC blower motor control system uses a Pulse Width Modulated (PWM) circuit strategy. PWM voltage is applied to a comparator circuit which compares the PWM signal voltage to the blower motor feedback voltage. The resulting output drives the power module circuitry, which provides a linear output voltage to change or maintain the desired blower speed.

WHEN MONITORED

With the ignition on.

SET CONDITION

If the A/C Heater Control detects a short to voltage or open on the Blower Motor Control circuit. If a valid voltage is detected the DTC will change from active to stored and stay in the controllers memory for 100 consecutive ignition cycles.

POSSIBLE CAUSES

Possible Causes
BLOWER MOTOR POWER MODULE SUPPLY SIGNAL CIRCUIT SHORTED TO VOLTAGE
BLOWER MOTOR POWER MODULE SUPPLY CIRCUIT OPEN
BLOWER MOTOR GROUND CIRCUIT OPEN
BLOWER MOTOR POWER MODULE
A/C HEATER CONTROL

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK IF DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. With the scan tool, read HVAC DTCs.

    Is this DTC active?

    Yes

    - Go To 2

    No

    - Go To 6
2. **CHECK THE (C56) BLOWER MOTOR POWER MODULE SUPPLY CIRCUIT FOR A SHORT TO VOLTAGE**
    1. Turn the ignition off to the lock position.
    2. Disconnect the Blower Motor Power Module harness connector.
    3. Disconnect the A/C Heater Control harness connector.

NOTE: Check connectors - Clean/repair as necessary.

4. Ignition on, engine not running.
5. Check the voltage of the (C56) Blower Motor Power Module Supply Signal circuit.

   Is there any voltage present?

   Yes

   - Repair the (C56) Blower Motor Power Module Supply Signal circuit for an short to voltage.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 3

3. **CHECK THE (C56) BLOWER MOTOR POWER MODULE SUPPLY CIRCUIT FOR AN OPEN**
   1. Turn the ignition off to the lock position.
   2. Measure the resistance of the (C56) Blower Motor Power Module Supply Signal circuit between the A/C Heater Control harness connector and the Blower Motor Power Module harness connector.

      Is the resistance above 1.0 Ohm?

      Yes

      - Repair the (C56) Blower Motor Power Module Supply Signal circuit for an open.
      - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Go To 4

4. **CHECK THE BLOWER MOTOR GROUND SIGNAL CIRCUIT FOR AN OPEN**
   1. Measure the resistance of the Blower Motor Ground Signal circuit between the A/C Heater Control harness connector and the Blower Motor Power Module harness connector.

      Is the resistance above 1.0 Ohm?

      Yes

      - Repair the Blower Motor Ground Signal circuit for an open.
      - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Go To 5

5. **CHECK THE BLOWER MOTOR POWER MODULE**

1. Turn the ignition off to the lock position.
2. Replace the Blower Motor Power Module in accordance to the Service Information. Refer to **MODULE, POWER, BLOWER MOTOR, REMOVAL** .
3. Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   Did the DTC reset during or after the HVAC Verification Test?

   Yes

   - Replace and program the A/C Heater Control in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

6. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. With the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
   3. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Wiggle the wiring and connectors while checking for shorted and open circuits.

      Were there any problems found?

      Yes

      - Repair as necessary.
      - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Test complete.

B10E8-16-BLOWER MOTOR CONTROL - CIRCUIT VOLTAGE BELOW THRESHOLD

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 15: Blower Motor Control Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

A Blower Motor Power Module allows the microprocessor-based A/C Heater Control to calculate and provide infinitely variable blower motor speeds based upon either manual blower switch input or the ATC programming. The ATC blower motor control system uses a Pulse Width Modulated (PWM) circuit strategy. PWM voltage is applied to a comparator circuit which compares the PWM signal voltage to the blower motor feedback voltage. The resulting output drives the power module circuitry, which provides a linear output voltage to change or maintain the desired blower speed.

WHEN MONITORED

With the ignition on.

SET CONDITION

If the A/C Heater Control detects a short to ground on the Blower Motor Control circuit. If a valid voltage is detected the DTC will change from active to stored and stay in the controllers memory for 100 consecutive ignition cycles.

POSSIBLE CAUSES

Possible Causes
BLOWER MOTOR POWER MODULE SUPPLY CIRCUIT SHORTED TO GROUND
BLOWER MOTOR GROUND CIRCUIT SHORTED TO GROUND
BLOWER MOTOR POWER MODULE
A/C HEATER CONTROL

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
   1. Ignition on, engine not running.
   2. With the scan tool, read HVAC DTCs.

      Does the scan tool display this DTC as active?

      Yes

      - Go To 2

      No

      - Go To 5
2. **CHECK THE (C56) BLOWER MOTOR POWER MODULE SUPPLY SIGNAL CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off to the lock position.
   2. Disconnect the A/C Heater Control harness connector.
   3. Disconnect the Blower Motor Power Module C1 harness connector.
   4. Measure the resistance between ground and the (C56) Blower Motor Power Module Supply Signal circuit.

Is the resistance below 100k Ohms?

Yes

- Repair the (C56) Blower Motor Power Module Supply Signal circuit for a short to ground.
- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 3

3. **CHECK THE BLOWER MOTOR GROUND CIRCUIT FOR A SHORT TO GROUND**
   1. Measure the resistance between ground and the Blower Motor Ground circuit.

   Is the resistance below 100k Ohms?

   Yes

   - Repair the Blower Motor Ground circuit for a short to ground.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 4

4. **CHECK THE BLOWER MOTOR POWER MODULE**
   1. Turn the ignition off to the lock position.
   2. Replace the Blower Motor Power Module in accordance to the Service Information. Refer to **MODULE, POWER, BLOWER MOTOR, REMOVAL** .
   3. Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   Did this DTC reset performing the HVAC Verification Test?

   Yes

   - Replace and program the A/C Heater Control in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

5. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. With the scan tool, check the Environmental Data to help identify the conditions in which the DTC

was set.

3. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
4. Wiggle the wiring and connectors while checking for shorted and open circuits.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

B10E8-17-BLOWER MOTOR CONTROL - CIRCUIT VOLTAGE ABOVE THRESHOLD

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 16: Blower Motor Control Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

A Blower Motor Power Module allows the microprocessor-based A/C Heater Control to calculate and provide infinitely variable blower motor speeds based upon either manual blower switch input or the ATC programming. The ATC blower motor control system uses a Pulse Width Modulated (PWM) circuit strategy. PWM voltage is applied to a comparator circuit which compares the PWM signal voltage to the blower motor feedback voltage. The resulting output drives the power module circuitry, which provides a linear output voltage to change or maintain the desired blower speed.

WHEN MONITORED

With the ignition on.

SET CONDITION

If the A/C Heater Control detects a short to voltage or open on the Blower Motor Control circuit. If a valid voltage is detected the DTC will change from active to stored and stay in the controllers memory for 100 consecutive ignition cycles.

POSSIBLE CAUSES

Possible Causes
BLOWER MOTOR POWER MODULE SUPPLY SIGNAL CIRCUIT SHORTED TO VOLTAGE
BLOWER MOTOR POWER MODULE SUPPLY SIGNAL CIRCUIT OPEN
BLOWER MOTOR GROUND CIRCUIT OPEN
BLOWER MOTOR POWER MODULE
A/C HEATER CONTROL

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK IF DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. With the scan tool, read HVAC DTCs.

    Is this DTC active?

    Yes

    - Go To 2

    No

    - Go To 6
2. **CHECK THE (C56) BLOWER MOTOR CONTROL CIRCUIT FOR A SHORT TO VOLTAGE**
    1. Turn the ignition off to the lock position.
    2. Disconnect the Blower Motor Power Module harness connector.
    3. Disconnect the A/C Heater Control harness connector.

    NOTE: Check connectors - Clean/repair as necessary.

4. Ignition on, engine not running.
5. Check the voltage of the (C56) Blower Motor Control circuit.

   Is there any voltage present?

   Yes

   - Repair the (C56) Blower Motor Control circuit for an short to voltage.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 3

3. **CHECK THE (C56) BLOWER MOTOR CONTROL CIRCUIT FOR AN OPEN**
   1. Turn the ignition off to the lock position.
   2. Measure the resistance of the (C56) Blower Motor Control circuit between the A/C Heater Control harness connector and the Blower Motor Power Module harness connector.

      Is the resistance above 1.0 Ohm?

      Yes

      - Repair the (C56) Blower Motor Control circuit for an open.
      - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Go To 4

4. **CHECK THE BLOWER MOTOR GROUND CIRCUIT FOR AN OPEN**
   1. Measure the resistance of the Blower Motor Ground circuit between the A/C Heater Control harness connector and the Blower Motor Power Module harness connector.

      Is the resistance above 1.0 Ohm?

      Yes

      - Repair the Blower Motor Ground circuit for an open.
      - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Go To 5

5. **CHECK THE BLOWER MOTOR POWER MODULE**

1. Turn the ignition off to the lock position.
2. Replace the Blower Motor Power Module in accordance to the Service Information. Refer to **MODULE, POWER, BLOWER MOTOR, REMOVAL** .
3. Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   Did the DTC reset during or after the HVAC Verification Test?

   Yes

   - Replace and program the A/C Heater Control in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

6. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. With the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
   3. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Wiggle the wiring and connectors while checking for shorted and open circuits.

      Were there any problems found?

      Yes

      - Repair as necessary.
      - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Test complete.

B1107-11-CABIN TEMPERATURE SENSOR 1-CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 17: Cabin Temperature Sensor Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The HVAC A/C Heater Module uses a variety of sensors to adjust HVAC operation to obtain optimal performance. These sensors are continuously monitored by the A/C Heater Module to assure that they are in range. An active Diagnostic trouble Code (DTC) indicates that a sensor is out of range. A stored DTC indicates that the sensor was out of range but is currently within range.

The In-Car Temperature Sensor uses a temperature thermistor which changes in its resistive value with

differences in air temperature of the interior cabin. Air is drawn from the passenger compartment by an aspirator (small fan driven by a 12-volt electric motor) which circulates air over the temperature thermistor. The A/C Heater Module receives the resistance value over a two wire circuit that is used to calculate the temperature and make any adjustments to maintain the optimum passenger compartment comfort. The In-Car Temperature Sensor cannot be adjusted or repaired and must be replaced if inoperative or damaged.

WHEN MONITORED

With the ignition on.

SET CONDITION

When the In-Car Temperature Sensor signal to the A/C Heater Module is less than 0.5 volt for a continuous period of 1200 msec. or more. If the A/C Heater Module detects a valid signal, the DTC will change from active to stored and will stay stored for 100 ignition cycles.

POSSIBLE CAUSES

Possible Causes
IN-CAR TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
IN-CAR TEMPERATURE SENSOR
A/C HEATER MODULE

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK IF DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. With the scan tool, read HVAC DTCs.

    Is this DTC active?

    Yes

    - Go To 2

    No

    - Go To 5
2. **CHECK IF THE IN-CAR TEMPERATURE SENSOR IS PROPERLY CONNECTED**
    1. Turn the ignition off to the lock position.
    2. Check the connector to In-Car Temperature Sensor for proper connection and the terminals for damage or corrosion.

Is the In-Car Temperature Sensor connector properly connected and terminals undamaged or corroded?

Yes

- Go To 3

No

- Repair connector and terminals as necessary.
- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

3. **CHECK THE (C36) IN-CAR TEMPERATURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off to the lock position.
   2. Disconnect the A/C Heater Module harness connector.
   3. Disconnect the In-Car Temperature Sensor harness connector.
   4. Measure the resistance between ground and the (C36) In-Car Temperature Sensor Signal circuit.

   Is the resistance less than 100k Ohms?

   Yes

   - Repair the (C36) In-Car Temperature Sensor Signal circuit for a short to ground.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 4
4. **CHECK THE IN-CAR TEMPERATURE SENSOR**
   1. Remove the In-Car Temperature Sensor.
   2. Measure the resistance of the In-Car Temperature Sensor and compare the resistance to the In-Car Temperature Sensor Resistance Chart in the Service Information.

   Is the In-Car Temperature Sensor within the specified limits of In-Car Temperature Sensor Resistance Chart?

   Yes

   - Replace and program the A/C Heater Module in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

- Replace the In-Car Temperature Sensor in accordance to the Service Information.
- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

5. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. With the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
   3. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Wiggle the wiring and connectors while checking for shorted and open circuits.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

B1107-15-CABIN TEMPERATURE SENSOR 1CIRCUIT SHORT TO BATTERY OR OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 18: Cabin Temperature Sensor Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The HVAC A/C Heater Module uses a variety of sensors to adjust HVAC operation to obtain optimal performance. These sensors are continuously monitored by the A/C Heater Module to assure that they are in range. An active Diagnostic trouble Code (DTC) indicates that a sensor is out of range. A stored DTC indicates that the sensor was out of range but is currently within range.

The In-Car Temperature Sensor uses a temperature thermistor which changes in its resistive value with

differences in air temperature of the interior cabin. Air is drawn from the passenger compartment by an aspirator (small fan driven by a 12-volt electric motor) which circulates air over the temperature thermistor. The A/C Heater Module receives the resistance value over a two wire circuit that is used to calculate the temperature and make any adjustments to maintain the optimum passenger compartment comfort. The In-Car Temperature Sensor cannot be adjusted or repaired and must be replaced if inoperative or damaged.

WHEN MONITORED

With the ignition on.

SET CONDITION

When the In-Car Temperature Sensor signal to the A/C Heater Module is greater than 4.9 volts for a continuous period of 1200 msec. or more. If the A/C Heater Module detects a valid signal, the DTC will change from active to stored and will stay stored for 100 ignition cycles.

POSSIBLE CAUSES

Possible Causes
IN-CAR TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
IN-CAR TEMPERATURE SENSOR
A/C HEATER MODULE

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK IF DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. With the scan tool, read HVAC DTCs.

    Is this DTC active?

    Yes

    - Go To 2

    No

    - Go To 6
2. **CHECK IF THE IN-CAR TEMPERATURE SENSOR IS PROPERLY CONNECTED**
    1. Turn the ignition off to the lock position.
    2. Check the connector to In-Car Temperature Sensor for proper connection and the terminals for damage or corrosion.

Is the In-Car Temperature Sensor connector properly connected and terminals undamaged or corroded?

Yes

- Go To 3

No

- Repair connector and terminals as necessary.
- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

3. **CHECK THE (C36) IN-CAR TEMPERATURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**
   1. Turn the ignition off to the lock position.
   2. Disconnect the A/C Heater Module C1 harness connector.
   3. Disconnect the In-Car Temperature Sensor harness connector.
   4. Ignition on, engine not running.
   5. Measure the voltage of the (C36) In-Car Temperature Sensor Signal circuit.

   Is there any voltage present?

   Yes

   - Repair the (C36) In-Car Temperature Sensor Signal circuit for a short to voltage.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To4
4. **CHECK THE (C36) IN-CAR TEMPERATURE SENSOR SIGNAL CIRCUIT FOR AN OPEN**
   1. Turn the ignition off to the lock position.
   2. Measure the resistance of the (C36) In-Car Temperature Sensor Signal circuit between the A/C Heater Module C1 harness connector and the In-Car Temperature Sensor harness connector.

   Is the resistance above 1.0 Ohm?

   Yes

   - Repair the (C36) In-Car Temperature Sensor Signal circuit for an open or high resistance.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

- Go To5

5. **CHECK THE IN-CAR TEMPERATURE SENSOR**
   1. Remove the In-Car Temperature Sensor.
   2. Measure the resistance of the In-Car Temperature Sensor and compare the resistance to the In-Car Temperature Sensor Resistance Chart in the Service Information.

      Is the In-Car Temperature Sensor within the specified limits of In-Car Temperature Sensor Resistance Chart?

      Yes

      - Replace and program the A/C Heater Module in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .
      - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Replace the In-Car Temperature Sensor in accordance to the Service Information.
      - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
6. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. With the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
   3. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Wiggle the wiring and connectors while checking for shorted and open circuits.

      Were there any problems found?

      Yes

      - Repair as necessary.
      - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Test complete.

B1137-11-CABIN HEATER 3 CONTROL - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 19: Cabin Heater Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the ignition on, the Cabin Heater Relay 3 commanded on.

SET CONDITION

If the A/C Heater Control Module detects the Cabin Heater Relay 3 Control circuit is shorted to ground.

POSSIBLE CAUSES

Possible Causes
CABIN HEATER RELAY 3 CONTROL CIRCUIT SHORTED TO GROUND
CABIN HEATER 3 RELAY
A/C HEATER CONTROL MODULE

DIAGNOSTIC TEST

1. **VERIFY THAT THE DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, erase DTCs.
    3. With the scan tool, actuate the Cabin Heater 3 Relay.
    4. Monitor the scan tool for at least two minutes.
    5. With the scan tool, read DTCs.

    Is this DTC active?

    Yes

    - Go To 2

    No

    - The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.
    - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
2. **CHECK CABIN HEATER RELAY 3 OUTPUT CIRCUIT FOR SHORT TO GROUND**
    1. Turn the ignition off.
    2. Disconnect the A/C Heater Control C1 harness connector.
    3. Remove the Cabin Heater Relay 3.
    4. Using an ohm meter measure the resistance between the Cabin Heater Relay 3 Output circuit and ground.

    Does the ohm meter read open circuit?

    Yes

    - Go To 3

    No

- Repair the Cabin Heater Relay 3 Output circuit for a short to ground.
- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

3. **A/C HEATER CONTROL MODULE**
   1. Turn the ignition on.
   2. With the scan tool, erase DTCs.
   3. With the scan tool, actuate the Cabin Heater 3 Relay.
   4. Monitor the scan tool for at least two minutes.
   5. With the scan tool, read DTCs.

   Does the scan tool display active: B1137-11-CABIN HEATER 3 CONTROL CIRCUIT SHORT TO GROUND?

   Yes

   - Replace the A/C Heater Control Module in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Replace the Cabin Heater Relay 3 in accordance with the Service Information.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

B1137-13-CABIN HEATER 3 CONTROL - CIRCUIT OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 20: Cabin Heater Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the ignition on, the Cabin Heater Relay 3 commanded on.

SET CONDITION

If the A/C Heater Control Module detects the Cabin Heater Relay 3 Control circuit is Open.

POSSIBLE CAUSES

Possible Causes
CABIN HEATER RELAY 3 CONTROL CIRCUIT OPEN
A/C HEATER CONTROL MODULE

DIAGNOSTIC TEST

1. **VERIFY THAT THE DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, erase DTCs.
    3. With the scan tool, actuate the Cabin Heater 3 Relay.
    4. Monitor the scan tool for at least two minutes.
    5. With the scan tool, read DTCs.

    Is this DTC active?

    Yes

    - Go To 2

    No

    - The condition that caused this symptom is currently not present. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary.
    - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
2. **CHECK THE CABIN HEATER RELAY 3 CONTROL CIRCUIT FOR AN OPEN**
    1. Turn the ignition off.
    2. Disconnect the A/C Heater Control Module C1 harness connector.
    3. Remove the Cabin Heater Relay 3 from the Power Distribution Center.
    4. Turn the ignition on.
    5. Measure the resistance of the Cabin Heater Relay 3 Control circuit between the A/C Heater Control C1 harness connector and the Power Distribution Center.

    Is the resistance above 1.0 Ohm?

    Yes

    - Repair the open on the Cabin Heater Relay 3 Control circuit.
    - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To3

3. **A/C HEATER CONTROL MODULE**
   1. Turn the ignition on.
   2. With the scan tool, erase DTCs.
   3. With the scan tool, actuate the Cabin Heater 3 Relay.
   4. Monitor the scan tool for at least two minutes.
   5. With the scan tool, read DTCs.

   Does the scan tool display active: B1137-13-CABIN HEATER 3 CONTROL CIRCUIT OPEN?

   Yes

   - Replace the A/C Heater Control Module in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Replace the Cabin Heater Relay 3 in accordance with the Service Information.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

B11C2-11-FRONT MODE DOOR 1 CONTROL - CIRCUIT SHORTED TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 21: Actuator Blend/Mode Doors Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

After the initial installation of the A/C Heater Control, the controller is calibrated to each individual blend/mode door actuator. These calibrations are stored as in the number of pulses it takes to move the door from one stop to another. The A/C Heater Control drives the Door Actuators by the use of Door Driver circuit and a Common Door Driver circuit and monitors all door actuator pulses to detect door movement in both directions. Most of the door actuators share a common door driver circuit but each door actuator has its own unique driver circuit. Due to shared circuitry, similar Diagnostic Trouble Codes (DTCs) can set at the same time for multiple actuators depending upon the type of circuit malfunction, its location, and the direction the actuator is moving

when the malfunction is present. For further information. Refer to **DESCRIPTION** .

WHEN MONITORED

Continuously with the ignition on.

SET CONDITION

The A/C Heater Control detects a short to ground on the Mode Door control circuit. If the A/C Heater Control detects a valid current draw, the DTC will change from Active to Stored and will stay in the controllers memory for 100 ignition cycles.

POSSIBLE CAUSES

Possible Causes
MODE DOOR DRIVER CIRCUIT SHORTED TO GROUND
COMMON DOOR DRIVER 2 CIRCUIT SHORTED TO GROUND
MODE DOOR ACTUATOR
A/C HEATER CONTROL

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK IF DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. With the scan tool, read HVAC DTCs.

    Is this DTC active?

    Yes

    - Go To 3

    No

    - Go To 2
2. **PERFORM HVAC ACTUATOR CALIBRATION TEST**
    1. With the scan tool, perform the HVAC Actuator Calibration Test.

    Did this DTC change from Stored to Active while performing the HVAC Actuator Calibration Test?

    Yes

- Go To 3

No

- Go To 6

3. **CHECK THE (C235) MODE DOOR SIGNAL CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off to the lock position.
   2. Disconnect the A/C Heater Control C1 harness connector.
   3. Disconnect the Mode Door Actuator harness connector.
   4. Measure the resistance between ground and the (C235) Mode Door Signal circuit.

   Is the resistance below 100k Ohms?

   Yes

   - Repair the (C235) Mode Door Signal circuit for a short to ground.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 4

4. **CHECK THE REFERENCE VOLTAGE CIRCUIT (C26) FOR A SHORT TO GROUND**
   1. Measure the resistance between ground and the Reference Voltage circuit (C26).

   Is the resistance below 100k Ohms?

   Yes

   - Repair the Reference Voltage circuit (C26) for a short to ground.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 5

5. **CHECK THE MODE DOOR ACTUATOR**
   1. Replace the Mode Door Actuator in accordance with the Service Information. Refer to **ACTUATOR, MODE DOOR, REMOVAL** .
   2. With the scan tool, erase HVAC DTCs and perform the HVAC Actuator Calibration Test.

   Did this DTC reset?

   Yes

- Replace and program the A/C Heater Control in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .
- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete.
- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

6. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. With the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
   3. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Wiggle the wiring and connectors while checking for shorted and open circuits.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

No

- Go To 6

3. **CHECK THE (C235) MODE DOOR SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**
   1. Turn the ignition off to the lock position.
   2. Disconnect the A/C Heater Control C1 harness connector.
   3. Disconnect the Mode Door Actuator harness connector.
   4. Ignition on, engine not running.
   5. Measure the voltage of the (C235) Mode Door Signal circuit.

   Is there any voltage present?

   Yes

   - Repair the (C235) Mode Door Signal circuit for a short to voltage.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 4

4. **CHECK THE REFERENCE VOLTAGE CIRCUIT (C26) FOR A SHORT TO VOLTAGE**
   1. Measure the voltage of the Reference Voltage circuit (C26).

   Is there any voltage present?

   Yes

   - Repair the Reference Voltage circuit (C26) for a short to voltage.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 5

5. **CHECK THE MODE DOOR ACTUATOR**
   1. Turn the ignition off to the lock position.
   2. Replace the Mode Door Actuator in accordance with the Service Information. Refer to **ACTUATOR, MODE DOOR, REMOVAL** .
   3. With the scan tool, erase HVAC DTCs and perform the HVAC Actuator Calibration Test.

   Did this DTC reset?

Yes

- Replace and program the A/C Heater Control in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .
- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete.
- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

6. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. With the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
   3. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Wiggle the wiring and connectors while checking for shorted and open circuits.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

B11C2-13-FRONT MODE DOOR 1 CONTROL - CIRCUIT OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 23: Actuator Blend/Mode Doors Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

After the initial installation of the A/C Heater Control, the controller is calibrated to each individual blend/mode door actuator. These calibrations are stored as in the number of pulses it takes to move the door from one stop to another. The A/C Heater Control drives the Door Actuators by the use of Door Driver circuit and a Common Door Driver circuit and monitors all door actuator pulses to detect door movement in both directions. Most of the door actuators share a common door driver circuit but each door actuator has its own unique driver circuit. Due to shared circuitry, similar Diagnostic Trouble Codes (DTCs) can set at the same time for multiple actuators depending upon the type of circuit malfunction, its location, and the direction the actuator is moving

when the malfunction is present. For further information. Refer to **DESCRIPTION** .

WHEN MONITORED

Continuously with the ignition on.

SET CONDITION

The A/C Heater Control detects an open in the Mode Door control circuit. If the A/C Heater Control detects a valid current draw, the DTC will change from Active to Stored and will stay in the controllers memory for 100 ignition cycles.

POSSIBLE CAUSES

Possible Causes
MODE DOOR DRIVER CIRCUIT OPEN
COMMON DOOR DRIVER CIRCUIT OPEN
MODE DOOR ACTUATOR
A/C HEATER CONTROL

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK IF DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. With the scan tool, read HVAC DTCs.

    Is this DTC active?

    Yes

    - Go To 3

    No

    - Go To 2
2. **PERFORM HVAC ACTUATOR CALIBRATION TEST**
    1. With the scan tool, perform the HVAC Actuator Calibration Test.

    Did this DTC change from Stored to Active while performing the HVAC Actuator Calibration Test?

    Yes

- Go To 3

No

- Go To 6

3. **CHECK THE (C235) MODE DOOR SIGNAL CIRCUIT FOR AN OPEN**
   1. Turn the ignition off to the lock position.
   2. Disconnect the A/C Heater Control C1 harness connector.
   3. Disconnect the Mode Door Actuator harness connector.
   4. Measure the resistance of the (C235) Mode Door Signal circuit between the A/C Heater Control C1 harness connector and the Mode Door Actuator harness connector.

      Is the resistance above 1.0 Ohm?

      Yes

      - Repair the (C235) Mode Door Signal circuit for an open or high resistance.
      - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Go To 4

4. **CHECK THE REFERENCE VOLTAGE CIRCUIT (C26) FOR AN OPEN**
   1. Measure the resistance of the Reference Voltage circuit (C26) between the A/C Heater Module C2 harness connector and the Mode Door Actuator harness connector.

      Is the resistance above 1.0 Ohm?

      Yes

      - Repair the Reference Voltage circuit (C26) for an open or high resistance.
      - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Go To 5

5. **CHECK THE MODE DOOR ACTUATOR**
   1. Replace the Mode Door Actuator in accordance with the Service Information. Refer to **ACTUATOR, MODE DOOR, REMOVAL** .
   2. With the scan tool, erase HVAC DTCs and perform the HVAC Actuator Calibration Test.

      Did this DTC reset?

Yes

- Replace and program the A/C Heater Control in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .
- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete.
- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

6. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. With the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
   3. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Wiggle the wiring and connectors while checking for shorted and open circuits.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

B11C2-92-FRONT MODE DOOR 1 CONTROL-PERFORMANCE OR INCORECT OPERATION

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 24: Actuator Blend/Mode Doors Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

After the initial installation of the A/C Heater Control, the controller is calibrated to each individual blend/mode door actuator. These calibrations are stored as in the number of pulses it takes to move the door from one stop to another. The A/C Heater Control drives the Door Actuators by the use of Door Driver circuit and a Common Door Driver circuit and monitors all door actuator pulses to detect door movement in both directions. Most of the door actuators share a common door driver circuit but each door actuator has its own unique driver circuit. Due to shared circuitry, similar Diagnostic Trouble Codes (DTCs) can set at the same time for multiple actuators depending upon the type of circuit malfunction, its location, and the direction the actuator is moving

when the malfunction is present. For further information. Refer to **DESCRIPTION** .

WHEN MONITORED

Continuously with the ignition on.

SET CONDITION

If the A/C Heater Control detects a overheat condition of the Integrated Circuit (IC) that controls the Mode Door Driver circuit. If the A/C Heater Control detects a valid temperature the DTC will change from Active to Stored and will stay in the controllers memory for 100 ignition cycles.

POSSIBLE CAUSES

Possible Causes
A/C HEATER CONTROL

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK IF DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. Using the scan tool, read HVAC DTCs.

    Is this DTC active?

    Yes

    - Allow the A/C Heater Control to cool down for five minutes then Go To 2

    No

    - Go To 9
2. **PERFORM HVAC ACTUATOR CALIBRATION TEST**
    1. Using the scan tool, perform the HVAC Actuator Calibration Test.

    Did this DTC reset?

    Yes

    - Replace and program the A/C Heater Control in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .
    - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 3

3. **CHECK THE MODE DOOR DRIVER CIRCUIT FOR A SHORT TO VOLTAGE**
   1. Turn the ignition off to the lock position.
   2. Disconnect the A/C Heater Module C2 harness connector.
   3. Disconnect the Mode Door Actuator harness connector.
   4. Ignition on, engine not running.
   5. Measure the voltage of the Mode Door Signal circuit (C235).

   Is there any voltage present?

   Yes

   - Repair the Mode Door Signal circuit (C235) for a short to voltage.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 4

4. **CHECK THE REFERENCE VOLTAGE CIRCUIT (C26) FOR A SHORT TO VOLTAGE**
   1. Measure the voltage of the Reference Voltage circuit (C26).

   Is there any voltage present?

   Yes

   - Repair the Reference Voltage circuit (C26) circuit for a short to voltage.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 5

5. **CHECK THE MODE DOOR SIGNAL CIRCUIT (C235) FOR A SHORT TO GROUND**
   1. Turn the ignition off to the lock position.
   2. Measure the resistance between ground and the Mode Door Signal circuit (C235).

   Is the resistance below 100k Ohms?

   Yes

   - Repair the Mode Door Signal circuit (C235) for a short to ground.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 6

6. **CHECK THE REFERENCE VOLTAGE CIRCUIT (C26) FOR A SHORT TO GROUND**
   1. Measure the resistance between ground and the Reference Voltage circuit (C26).

      Is the resistance below 100k Ohms?

      Yes

      - Repair the Reference Voltage circuit (C26) for a short to ground.
      - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Go To 7

7. **CHECK THE MODE DOOR**
   1. Remove the Mode Door Actuator and check the Mode Door for binding and full travel. Refer to **ACTUATOR, MODE DOOR, REMOVAL** .

      Were there any problems found?

      Yes

      - Repair or replace the Mode Door as necessary in accordance with the Service Information. Refer to **HOUSING, HVAC, REMOVAL** .
      - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Go To 8

8. **CHECK THE MODE DOOR ACTUATOR**
   1. Replace the Mode Door Actuator in accordance with the Service Information. Refer to **ACTUATOR, MODE DOOR, REMOVAL** .
   2. Using the scan tool, erase HVAC DTCs and perform the HVAC Actuator Calibration Test.

      Did this DTC reset?

      Yes

      - Replace and program the A/C Heater Module in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .
      - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete.
- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

9. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
   3. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Wiggle the wiring and connectors while checking for shorted and open circuits.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

B11C3-00-FRONT MODE DOOR 1 TRAVEL - RANGE TOO SMALL

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 25: Actuator Blend/Mode Doors Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

After the initial installation of the A/C Heater Control, the controller is calibrated to each individual blend/mode door actuator. These calibrations are stored as in the number of pulses it takes to move the door from one stop to another. The A/C Heater Control drives the Door Actuators by the use of Door Driver circuit and a Common Door Driver circuit and monitors all door actuator pulses to detect door movement in both directions. Most of the door actuators share a common door driver circuit but each door actuator has its own unique driver circuit. Due to shared circuitry, similar Diagnostic Trouble Codes (DTCs) can set at the same time for multiple actuators depending upon the type of circuit malfunction, its location, and the direction the actuator is moving

when the malfunction is present. For further information. Refer to **DESCRIPTION** .

WHEN MONITORED

When ever an Actuator Calibration Test is performed.

SET CONDITION

The A/C Heater Control uses a pulse feedback to the controller to detect the total door movement range. If the amount of pulses required to move the door completely in both directions is less than what the controller has stored in its memory, this DTC will set. If an Actuator Calibration Test is performed and the A/C Heater Control detects a valid range of the door movement span in both directions, the DTC will change from Active to Stored and will stay in the controllers memory for 100 ignition cycles.

POSSIBLE CAUSES

Possible Causes
RELATED DTCS PRESENT
MODE DOOR BINDING
MODE DOOR ACTUATOR
A/C HEATER CONTROL

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK FOR RELATED DTCS**
    1. Ignition on, engine not running.
    2. Using the scan tool, read HVAC DTCs.

    Are there any Door Control Circuit Open, Performance, or Short to Ground, Voltage, or Together DTCs present?

    Yes

    - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

    No

    - Go To 2
2. **CHECK IF DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. Using the scan tool, read HVAC DTCs.

Is this DTC active?

Yes

- Go To 4

No

- Go To 3

3. **PERFORM HVAC ACTUATOR CALIBRATION TEST**
   1. Using the scan tool, perform the HVAC Actuator Calibration Test.

      Did this DTC change from Stored to Active while performing the HVAC Actuator Calibration Test?

      Yes

      - Go To 4

      No

      - Go To 6
4. **CHECK THE MODE DOOR**
   1. Remove the Mode Door Actuator and check the Mode Door for binding and full travel. Refer to **ACTUATOR, MODE DOOR, REMOVAL** .

      Were there any problems found?

      Yes

      - Repair or replace the Mode Door as necessary in accordance with the Service Information.
      - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Go To 5
5. **CHECK THE MODE DOOR ACTUATOR**
   1. Replace the Mode Door Actuator in accordance with the Service Information. Refer to **ACTUATOR, MODE DOOR, REMOVAL** .
   2. Using the scan tool, erase HVAC DTCs.
   3. Using the scan tool, perform the HVAC Actuator Calibration Test.

      Did this DTC reset during HVAC Actuator Calibration Test?

Yes

- Replace and program the A/C Heater Control in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .
- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete.

6. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
   3. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Wiggle the wiring and connectors while checking for shorted and open circuits.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

B11C4-00-FRONT MODE DOOR 1 TRAVEL - RANGE TOO LARGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 26: Actuator Blend/Mode Doors Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

After the initial installation of the A/C Heater Control, the controller is calibrated to each individual blend/mode door actuator. These calibrations are stored as in the number of pulses it takes to move the door from one stop to another. The A/C Heater Control drives the Door Actuators by the use of Door Driver circuit and a Common Door Driver circuit and monitors all door actuator pulses to detect door movement in both directions. Most of the door actuators share a common door driver circuit but each door actuator has its own unique driver circuit. Due to shared circuitry, similar Diagnostic Trouble Codes (DTCs) can set at the same time for multiple actuators depending upon the type of circuit malfunction, its location, and the direction the actuator is moving

    Did this DTC change from Stored to Active while performing the HVAC Actuator Calibration Test?

    Yes

    - Go To 3

No

- Go To 6

3. **CHECK THE PASSENGER BLEND DOOR SIGNAL CIRCUIT (C224) FOR A SHORT TO GROUND**
   1. Turn the ignition off to the lock position.
   2. Disconnect the A/C Heater Module C1 harness connector.
   3. Disconnect the Passenger Blend Door Actuator harness connector.
   4. Measure the resistance between ground and the Passenger Blend Door Signal circuit (C224)

   Is the resistance below 100k Ohms?

   Yes

   - Repair the Passenger Blend Door Signal circuit (C224) for a short to ground.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 4

4. **CHECK THE BLEND DOOR DRIVER CIRCUIT (C136, C138) FOR A SHORT TO GROUND**
   1. Measure the resistance between ground and the Blend Door Driver circuit (C136, C138).

   Is the resistance below 100k Ohms?

   Yes

   - Repair the Blend Door Driver circuit (C136, C138) for a short to ground.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 5

5. **CHECK THE PASSENGER BLEND DOOR ACTUATOR**
   1. Replace the Passenger Blend Door Actuator in accordance with the Service Information. Refer to **ACTUATOR, MODE DOOR, REMOVAL** .
   2. Using the scan tool, erase HVAC DTCs and perform the HVAC Actuator Calibration Test.

   Did this DTC reset?

   Yes

   - Replace and program the A/C Heater Control in accordance with the Service Information.

Refer to **MODULE, HVAC, REMOVAL** .

- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete.
- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

6. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
   3. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Wiggle the wiring and connectors while checking for shorted and open circuits.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

B11C8-12-RIGHT TEMPERATURE DOOR CONTROL-CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 28: Actuator Blend Door Wiring Diagram

POSSIBLE CAUSES

Possible Causes
PASSENGER BLEND DOOR DRIVER CIRCUIT SHORTED TO VOLTAGE
COMMON DOOR DRIVER 2 CIRCUIT SHORTED TO VOLTAGE
PASSENGER BLEND DOOR ACTUATOR
A/C HEATER CONTROL

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK IF DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. Using the scan tool, read HVAC DTCs.

       Is this DTC active?

       Yes

       - Go To 3

       No

       - Go To 2
2. **PERFORM HVAC ACTUATOR CALIBRATION TEST**
    1. Using the scan tool, perform the HVAC Actuator Calibration Test.

       Did this DTC change from Stored to Active while performing the HVAC Actuator Calibration Test?

       Yes

       - Go To 3

No

- Go To 6

3. **CHECK THE PASSENGER BLEND DOOR SIGNAL CIRCUIT (C224) FOR A SHORT TO VOLTAGE**
   1. Turn the ignition off to the lock position.
   2. Disconnect the A/C Heater Module C1 harness connector.
   3. Disconnect the Passenger Blend Door Actuator harness connector.
   4. Ignition on, engine not running.
   5. Measure the voltage of the Passenger Blend Door Signal circuit (C224)

   Is there any voltage present?

   Yes

   - Repair the Passenger Blend Door Signal circuit (C224) for a short to voltage.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 4

4. **CHECK THE BLEND DOOR DRIVER CIRCUIT (C136, C138) FOR A SHORT TO VOLTAGE**
   1. Measure the voltage of the Blend Door Driver circuit (C136, C138).

   Is there any voltage present?

   Yes

   - Repair the Blend Door Driver circuit (C136, C138) for a short to voltage.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 5

5. **CHECK THE PASSENGER BLEND DOOR ACTUATOR**
   1. Replace the Passenger Blend Door Actuator in accordance with the Service Information. Refer to **ACTUATOR, MODE DOOR, REMOVAL** .
   2. With the scan tool, erase HVAC DTCs and perform the HVAC Actuator Calibration Test.

   Did this DTC reset?

   Yes

- Replace and program the A/C Heater Control in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .
- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete.
- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

6. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. With the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
   3. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Wiggle the wiring and connectors while checking for shorted and open circuits.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

B11C8-13-RIGHT TEMPERATURE DOOR CONTROL - CIRCUIT OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 29: Actuator Blend Door Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

After the initial installation of the A/C Heater Control, the controller is calibrated to each individual blend/mode door actuator. These calibrations are stored as in the number of pulses it takes to move the door from one stop to another. The A/C Heater Control drives the Door Actuators by the use of Door Driver circuit and a Common Door Driver circuit and monitors all door actuator pulses to detect door movement in both directions. Most of the door actuators share a common door driver circuit but each door actuator has its own unique driver circuit. Due to shared circuitry, similar Diagnostic Trouble Codes (DTCs) can set at the same time for multiple actuators depending upon the type of circuit malfunction, its location, and the direction the actuator is moving when the malfunction is present. For further information. Refer to **DESCRIPTION** .

WHEN MONITORED

Continuously with the ignition on.

SET CONDITION

The A/C Heater Control detects an open in the Passenger Blend Door control circuit. If the A/C Heater Control detects a valid current draw, the DTC will change from Active to Stored and will stay in the controllers memory for 100 ignition cycles.

POSSIBLE CAUSES

Possible Causes
PASSENGER BLEND DOOR DRIVER CIRCUIT OPEN
COMMON DOOR DRIVER 2 CIRCUIT OPEN
PASSENGER BLEND DOOR ACTUATOR
A/C HEATER CONTROL

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK IF DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. Using the scan tool, read HVAC DTCs.

    Is this DTC active?

    Yes

    - Go To 3

    No

    - Go To 2
2. **PERFORM HVAC ACTUATOR CALIBRATION TEST**
    1. Using the scan tool, perform the HVAC Actuator Calibration Test.

    Did this DTC change from Stored to Active while performing the HVAC Actuator Calibration Test?

    Yes

    - Go To 3

No

- Go To 6

3. **CHECK THE PASSENGER BLEND DOOR SIGNAL CIRCUIT (C224) FOR AN OPEN**
   1. Turn the ignition off to the lock position.
   2. Disconnect the A/C Heater Module C1 harness connector.
   3. Disconnect the Passenger Blend Door Actuator harness connector.
   4. Measure the resistance of the Passenger Blend Door Signal circuit (C224) between the A/C Heater Module C1 harness connector and the Passenger Blend Door Actuator harness connector.

   Is the resistance above 1.0 Ohm?

   Yes

   - Repair the Passenger Blend Door Signal circuit (C224) for an open or high resistance.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 4

4. **CHECK THE BLEND DOOR DRIVER CIRCUIT (C136, C138) FOR AN OPEN**
   1. Measure the resistance of the Blend Door Driver circuit (C136, C138) between the A/C Heater Module C1 harness connector and the Passenger Blend Door Actuator harness connector.

   Is the resistance above 1.0 Ohm?

   Yes

   - Repair the Blend Door Driver circuit (C136, C138) for an open or high resistance.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 5

5. **CHECK THE PASSENGER BLEND DOOR ACTUATOR**
   1. Replace the Passenger Blend Door Actuator in accordance with the Service Information. Refer to **ACTUATOR, MODE DOOR, REMOVAL** .
   2. With the scan tool, erase HVAC DTCs and perform the HVAC Actuator Calibration Test.

   Did this DTC reset?

   Yes

- Replace and program the A/C Heater Control in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .
- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete.
- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

6. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
   3. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Wiggle the wiring and connectors while checking for shorted and open circuits.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

B11C8-92-RIGHT TEMPERATURE DOOR CONTROL - PERFORMANCE OR INCORECT OPERATION

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 30: Actuator Blend Door Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

After the initial installation of the A/C Heater Control, the controller is calibrated to each individual blend/mode door actuator. These calibrations are stored as in the number of pulses it takes to move the door from one stop to another. The A/C Heater Control drives the Door Actuators by the use of Door Driver circuit and a Common Door Driver circuit and monitors all door actuator pulses to detect door movement in both directions. Most of the door actuators share a common door driver circuit but each door actuator has its own unique driver circuit. Due to shared circuitry, similar Diagnostic Trouble Codes (DTCs) can set at the same time for multiple actuators depending upon the type of circuit malfunction, its location, and the direction the actuator is moving when the malfunction is present. For further information. Refer to **DESCRIPTION** .

WHEN MONITORED

Continuously with the ignition on.

SET CONDITION

If the A/C Heater Control detects a overheat condition of the Integrated Circuit (IC) that controls the Passenger Blend Door Driver circuit. If the A/C Heater Control detects a valid temperature the DTC will change from Active to Stored and will stay in the controllers memory for 100 ignition cycles.

POSSIBLE CAUSES

Possible Causes
A/C HEATER CONTROL

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK IF DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. Using the scan tool, read HVAC DTCs.

    Is this DTC active?

    Yes

    - Allow the A/C Heater Control to cool down for five minutes then Go To 2

    No

    - Go To 3
2. **PERFORM HVAC ACTUATOR CALIBRATION TEST**
    1. Using the scan tool, perform the HVAC Actuator Calibration Test.

    Did this DTC reset?

    Yes

    - Replace and program the A/C Heater Control in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .
    - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

- Go To 3

3. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
   3. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Wiggle the wiring and connectors while checking for shorted and open circuits.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

B11C9-00-RIGHT TEMPERATURE DOOR - TRAVEL TOO SMALL

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 31: Actuator Blend Door Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

After the initial installation of the A/C Heater Control, the controller is calibrated to each individual blend/mode door actuator. These calibrations are stored as in the number of pulses it takes to move the door from one stop to another. The A/C Heater Control drives the Door Actuators by the use of Door Driver circuit and a Common Door Driver circuit and monitors all door actuator pulses to detect door movement in both directions. Most of the door actuators share a common door driver circuit but each door actuator has its own unique driver circuit. Due to shared circuitry, similar Diagnostic Trouble Codes (DTCs) can set at the same time for multiple actuators depending upon the type of circuit malfunction, its location, and the direction the actuator is moving when the malfunction is present. For further information. Refer to **DESCRIPTION** .

WHEN MONITORED

When ever an Actuator Calibration Test is performed.

SET CONDITION

The A/C Heater Control uses a pulse feedback to the controller to detect the total door movement range. If the amount of pulses required to move the door completely in both directions is less than what the controller has stored in its memory, this DTC will set. If an Actuator Calibration Test is performed and the A/C Heater Control detects a valid range of the door movement span in both directions, the DTC will change from Active to Stored and will stay in the controllers memory for 100 ignition cycles.

POSSIBLE CAUSES

Possible Causes
RELATED DTCS PRESENT
PASSENGER BLEND DOOR BINDING
PASSENGER BLEND DOOR ACTUATOR
A/C HEATER CONTROL

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK FOR RELATED DTCS**
    1. Ignition on, engine not running.
    2. With the scan tool, read HVAC DTCs.

    Are there any Door Control Circuit Open, Performance, or Short to Ground, Voltage, or Together DTCs present?

    Yes

    - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

    No

    - Go To 2
2. **CHECK IF DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. With the scan tool, read HVAC DTCs.

    Is this DTC active?

Yes

- Go To 4

No

- Go To 3

3. **PERFORM HVAC ACTUATOR CALIBRATION TEST**
   1. With the scan tool, perform the HVAC Actuator Calibration Test.

      Did this DTC change from Stored to Active while performing the HVAC Actuator Calibration Test?

      Yes

      - Go To 4

      No

      - Go To 6
4. **CHECK THE PASSENGER BLEND DOOR**
   1. Remove the Passenger Blend Door Actuator and check the Passenger Blend Door for binding and full travel. Refer to **ACTUATOR, BLEND DOOR, REMOVAL** .

      Were there any problems found?

      Yes

      - Repair or replace the Passenger Blend Door as necessary in accordance with the Service Information. Refer to **HOUSING, HVAC, REMOVAL** .
      - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Go To 5
5. **CHECK THE PASSENGER BLEND DOOR ACTUATOR**
   1. Replace the Passenger Blend Door Actuator in accordance with the Service Information. Refer to **ACTUATOR, BLEND DOOR, REMOVAL** .
   2. With the scan tool, erase HVAC DTCs.
   3. With the scan tool, perform the HVAC Actuator Calibration Test.

      Did this DTC reset during HVAC Actuator Calibration Test?

      Yes

- Replace and program the A/C Heater Control in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .
- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete.
- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

6. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. With the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
   3. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Wiggle the wiring and connectors while checking for shorted and open circuits.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

B11CA-00-RIGHT TEMPERATURE DOOR - TRAVEL TOO LARGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 32: Actuator Blend Door Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

After the initial installation of the A/C Heater Control, the controller is calibrated to each individual blend/mode door actuator. These calibrations are stored as in the number of pulses it takes to move the door from one stop to another. The A/C Heater Control drives the Door Actuators by the use of Door Driver circuit and a Common Door Driver circuit and monitors all door actuator pulses to detect door movement in both directions. Most of the door actuators share a common door driver circuit but each door actuator has its own unique driver circuit. Due to shared circuitry, similar Diagnostic Trouble Codes (DTCs) can set at the same time for multiple actuators depending upon the type of circuit malfunction, its location, and the direction the actuator is moving when the malfunction is present. For further information. Refer to **DESCRIPTION** .

WHEN MONITORED

When ever an Actuator Calibration Test is performed.

SET CONDITION

The A/C Heater Control uses a pulse feedback to the controller to detect the total door movement range. If the amount of pulses required to move the door completely in both directions is greater than what the controller has stored in its memory, this DTC will set. If an Actuator Calibration Test is performed or during normal operation and the A/C Heater Control detects a valid range of the door movement span in both directions, the DTC will change from Active to Stored and will stay in the controllers memory for 100 ignition cycles.

POSSIBLE CAUSES

Possible Causes
RELATED DTCS PRESENT
PASSENGER BLEND DOOR STOPS
PASSENGER BLEND DOOR
PASSENGER BLEND DOOR ACTUATOR
A/C HEATER CONTROL

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK FOR RELATED DTCS**
    1. Ignition on, engine not running.
    2. With the scan tool, read HVAC DTCs.

    Are there any Door Control Circuit Open, Performance, or Short to Ground, Voltage, or Together DTCs present?

    Yes

    - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

    No

    - Go To 2
2. **CHECK IF DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. With the scan tool, read HVAC DTCs.

    Is this DTC active?

Yes

- Go To 4

No

- Go To 3

3. **PERFORM HVAC ACTUATOR CALIBRATION TEST**
   1. With the scan tool, perform the HVAC Actuator Calibration Test.

      Did this DTC change from Stored to Active while performing the HVAC System Test?

      Yes

      - Go To 4

      No

      - Go To 6

4. **CHECK THE PASSENGER BLEND DOOR**
   1. Remove the Passenger Blend Door Actuator and check the Passenger Blend Door stops, linkage (stripped or cracked) and door. Refer to **ACTUATOR, BLEND DOOR, REMOVAL** .

      Were there any problems found?

      Yes

      - Repair or replace the Passenger Blend Door as necessary in accordance with the Service Information. Refer to **HOUSING, HVAC, REMOVAL** .
      - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Go To 5

5. **CHECK THE PASSENGER BLEND DOOR ACTUATOR**
   1. Replace the Passenger Blend Door Actuator in accordance with the Service Information. Refer to **ACTUATOR, BLEND DOOR, REMOVAL** .
   2. With the scan tool, erase HVAC DTCs and perform the HVAC Actuator Calibration Test.

      Did this DTC reset?

      Yes

      - Replace and program the A/C Heater Control in accordance with the Service Information.

Refer to **MODULE, HVAC, REMOVAL** .

- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete.
- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

6. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. With the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
   3. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Wiggle the wiring and connectors while checking for shorted and open circuits.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

B11CB-11-MAIN/LEFT TEMPERATURE DOOR CONTROL - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 33: Actuator Blend Door Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

After the initial installation of the A/C Heater Control, the controller is calibrated to each individual blend/mode door actuator. These calibrations are stored as in the number of pulses it takes to move the door from one stop to another. The A/C Heater Control drives the Door Actuators by the use of Door Driver circuit and a Common Door Driver circuit and monitors all door actuator pulses to detect door movement in both directions. Most of the door actuators share a common door driver circuit but each door actuator has its own unique driver circuit. Due to shared circuitry, similar Diagnostic Trouble Codes (DTCs) can set at the same time for multiple actuators depending upon the type of circuit malfunction, its location, and the direction the actuator is moving when the malfunction is present. For further information. Refer to **DESCRIPTION** .

WHEN MONITORED

Continuously with the ignition on.

SET CONDITION

The A/C Heater Control detects a short to ground on the Left Blend Door control circuit. If the A/C Heater Control detects valid current draw, the DTC will change from Active to Stored and will stay in the controllers memory for 100 ignition cycles.

POSSIBLE CAUSES

Possible Causes
LEFT BLEND DOOR DRIVER CIRCUIT SHORTED TO GROUND
5 VOLT REFERENCE CIRCUIT SHORTED TO GROUND
LEFT BLEND DOOR ACTUATOR
A/C HEATER CONTROL

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK IF DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. Using the scan tool, read HVAC DTCs.

    Is this DTC active?

    Yes

    - Go To 3

    No

    - Go To 2
2. **PERFORM HVAC ACTUATOR CALIBRATION TEST**
    1. Using the scan tool, perform the HVAC Actuator Calibration Test.

    Did this DTC change from Stored to Active while performing the HVAC Actuator Calibration Test?

    Yes

    - Go To 3

No

- Go To 6

3. **CHECK THE DRIVER BLEND DOOR SIGNAL CIRCUIT (C233) FOR A SHORT TO GROUND**
   1. Turn the ignition off to the lock position.
   2. Disconnect the A/C Heater Module C1 harness connector.
   3. Disconnect the Driver Blend Door Actuator harness connector.
   4. Measure the resistance between ground and the Driver Blend Door Signal circuit (C233).

   Is the resistance below 100k Ohms?

   Yes

   - Repair the Driver Blend Door Signal circuit (C233) for a short to ground.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 5

4. **CHECK THE BLEND DOOR DRIVER CIRCUIT (C137, C139) FOR A SHORT TO GROUND**
   1. Measure the resistance between ground and the Blend Door Driver circuit (C137, C139).

   Is the resistance below 100k Ohms?

   Yes

   - Repair the Blend Door Driver circuit (C137, C139) for a short to ground.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 5

5. **CHECK THE LEFT BLEND DOOR ACTUATOR**
   1. Replace the Left Blend Door Actuator in accordance with the Service Information. Refer to **ACTUATOR, MODE DOOR, REMOVAL** .
   2. Using the scan tool, erase HVAC DTCs and perform the HVAC Actuator Calibration Test.

   Did this DTC reset?

   Yes

   - Replace and program the A/C Heater Control in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .

- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete.
- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

6. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
   3. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Wiggle the wiring and connectors while checking for shorted and open circuits.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

B11CB-12-MAIN/LEFT TEMPERATURE DOOR 1 CONTROL - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 34: Actuator Blend Door Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

After the initial installation of the A/C Heater Control, the controller is calibrated to each individual blend/mode door actuator. These calibrations are stored as in the number of pulses it takes to move the door from one stop to another. The A/C Heater Control drives the Door Actuators by the use of Door Driver circuit and a Common Door Driver circuit and monitors all door actuator pulses to detect door movement in both directions. Most of the door actuators share a common door driver circuit but each door actuator has its own unique driver circuit. Due to shared circuitry, similar Diagnostic Trouble Codes (DTCs) can set at the same time for multiple actuators depending upon the type of circuit malfunction, its location, and the direction the actuator is moving when the malfunction is present. For further information. Refer to **DESCRIPTION** .

WHEN MONITORED

Continuously with the ignition on.

SET CONDITION

The A/C Heater Control detects a short voltage on the Driver Blend Door control circuit. If the A/C Heater Control detects a valid voltage, the DTC will change from Active to Stored and will stay in the controllers memory for 100 ignition cycles.

POSSIBLE CAUSES

Possible Causes
LEFT BLEND DOOR DRIVER CIRCUIT SHORTED TO VOLTAGE
5 VOLT REFERENCE CIRCUIT SHORTED TO VOLTAGE
LEFT BLEND DOOR ACTUATOR
A/C HEATER CONTROL

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK IF DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. Using the scan tool, read HVAC DTCs.

    Is this DTC active?

    Yes

    - Go To 3

    No

    - Go To 2
2. **PERFORM HVAC ACTUATOR CALIBRATION TEST**
    1. Using the scan tool, perform the HVAC Actuator Calibration Test.

    Did this DTC change from Stored to Active while performing the HVAC Actuator Calibration Test?

    Yes

    - Go To 3

No

- Go To 6

3. **CHECK THE DRIVER BLEND DOOR SIGNAL CIRCUIT (C233) FOR A SHORT TO VOLTAGE**
   1. Turn the ignition off to the lock position.
   2. Disconnect the A/C Heater Module C1 harness connector.
   3. Disconnect the Driver Blend Door Actuator harness connector.
   4. Ignition on, engine not running.
   5. Measure the voltage of the Driver Blend Door Signal circuit (C233).

   Is there any voltage present?

   Yes

   - Repair the Driver Blend Door Signal circuit (C233) for a short to voltage.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 4

4. **CHECK THE BLEND DOOR DRIVER CIRCUIT (C137, C139) FOR A SHORT TO VOLTAGE**
   1. Measure the voltage of the Blend Door Driver circuit (C137, C139).

   Is there any voltage present?

   Yes

   - Repair the Blend Door Driver circuit (C137, C139) for a short to voltage.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 5

5. **CHECK THE LEFT BLEND DOOR ACTUATOR**
   1. Replace the Left Blend Door Actuator in accordance with the Service Information. Refer to **ACTUATOR, MODE DOOR, REMOVAL** .
   2. With the scan tool, erase HVAC DTCs and perform the HVAC Actuator Calibration Test.

   Did this DTC reset?

   Yes

- Replace and program the A/C Heater Control in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .
- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete.
- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

6. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. With the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
   3. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Wiggle the wiring and connectors while checking for shorted and open circuits.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

B11CB-13-MAIN/LEFT TEMPERATURE DOOR 1 CONTROL - CIRCUIT OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 35: Actuator Blend Door Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

After the initial installation of the A/C Heater Control, the controller is calibrated to each individual blend/mode door actuator. These calibrations are stored as in the number of pulses it takes to move the door from one stop to another. The A/C Heater Control drives the Door Actuators by the use of Door Driver circuit and a Common Door Driver circuit and monitors all door actuator pulses to detect door movement in both directions. Most of the door actuators share a common door driver circuit but each door actuator has its own unique driver circuit. Due to shared circuitry, similar Diagnostic Trouble Codes (DTCs) can set at the same time for multiple actuators depending upon the type of circuit malfunction, its location, and the direction the actuator is moving when the malfunction is present. For further information. Refer to **DESCRIPTION** .

WHEN MONITORED

Continuously with the ignition on.

SET CONDITION

The A/C Heater Control detects an open in the Driver Blend Door control circuit. If the A/C Heater Control detects a valid current draw, the DTC will change from Active to Stored and will stay in the controllers memory for 100 ignition cycles.

POSSIBLE CAUSES

Possible Causes
LEFT BLEND DOOR DRIVER CIRCUIT OPEN
5 VOLT REFERENCE CIRCUIT OPEN
LEFT BLEND DOOR ACTUATOR
A/C HEATER CONTROL

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK IF DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. Using the scan tool, read HVAC DTCs.

       Is this DTC active?

       Yes

       - Go To 3

       No

       - Go To 2
2. **PERFORM HVAC ACTUATOR CALIBRATION TEST**
    1. Using the scan tool, perform the HVAC Actuator Calibration Test.

       Did this DTC change from Stored to Active while performing the HVAC Actuator Calibration Test?

       Yes

       - Go To 3

No

- Go To 6

3. **CHECK THE DRIVER BLEND DOOR SIGNAL CIRCUIT (C233) FOR AN OPEN**
   1. Turn the ignition off to the lock position.
   2. Disconnect the A/C Heater Module C1 harness connector.
   3. Disconnect the Driver Blend Door Actuator harness connector.
   4. Measure the resistance of the Driver Blend Door Signal circuit (C233) between the A/C Heater Module C1 harness connector and the Driver Blend Door Actuator harness connector.

   Is the resistance above 1.0 Ohm?

   Yes

   - Repair the Driver Blend Door Signal circuit (C233) for an open or high resistance.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 4

4. **CHECK THE BLEND DOOR DRIVER CIRCUIT (C137, C139) FOR AN OPEN**
   1. Measure the resistance of the Blend Door Driver circuit (C137, C139) between the A/C Heater Module C1 harness connector and the Driver Blend Door Actuator harness connector.

   Is the resistance above 1.0 Ohm?

   Yes

   - Repair the Blend Door Driver circuit (C137, C139) for an open or high resistance.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 5

5. **CHECK THE LEFT BLEND DOOR ACTUATOR**
   1. Replace the Left Blend Door Actuator in accordance with the Service Information. Refer to **ACTUATOR, MODE DOOR, REMOVAL** .
   2. Using the scan tool, erase HVAC DTCs and perform the HVAC Actuator Calibration Test.

   Did this DTC reset?

   Yes

- Replace and program the A/C Heater Control in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .
- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete.
- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

6. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
   3. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Wiggle the wiring and connectors while checking for shorted and open circuits.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

B11CB-92-MAIN/LEFT TEMPERATURE DOOR1 CONTROL - PERFORMANCE OR INCORRECT OPERATION

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 36: Actuator Blend Door Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

After the initial installation of the A/C Heater Control, the controller is calibrated to each individual blend/mode door actuator. These calibrations are stored as in the number of pulses it takes to move the door from one stop to another. The A/C Heater Control drives the Door Actuators by the use of Door Driver circuit and a Common Door Driver circuit and monitors all door actuator pulses to detect door movement in both directions. Most of the door actuators share a common door driver circuit but each door actuator has its own unique driver circuit. Due to shared circuitry, similar Diagnostic Trouble Codes (DTCs) can set at the same time for multiple actuators depending upon the type of circuit malfunction, its location, and the direction the actuator is moving when the malfunction is present. For further information. Refer to **DESCRIPTION** .

WHEN MONITORED

Continuously with the ignition on.

SET CONDITION

If the A/C Heater Control detects a overheat condition of the Integrated Circuit (IC) that controls the Left Blend Door Driver circuit. If the A/C Heater Control detects a valid temperature the DTC will change from Active to Stored and will stay in the controllers memory for 100 ignition cycles.

POSSIBLE CAUSES

Possible Causes
A/C HEATER CONTROL

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK IF DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. Using the scan tool, read HVAC DTCs.

    Is this DTC active?

    Yes

    - Allow the A/C Heater Control to cool down for five minutes then Go To 2

    No

    - Go To 3
2. **PERFORM HVAC ACTUATOR CALIBRATION TEST**
    1. Using the scan tool, perform the HVAC Actuator Calibration Test.

    Did this DTC reset?

    Yes

    - Replace and program the A/C Heater Control in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .
    - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

- Go To 3

3. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
   3. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Wiggle the wiring and connectors while checking for shorted and open circuits.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

B11CC-00-MAIN/LEFT TEMPERATURE DOOR 1 - TRAVEL TOO SMALL

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 37: Actuator Blend Door Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

After the initial installation of the A/C Heater Control, the controller is calibrated to each individual blend/mode door actuator. These calibrations are stored as in the number of pulses it takes to move the door from one stop to another. The A/C Heater Control drives the Door Actuators by the use of Door Driver circuit and a Common Door Driver circuit and monitors all door actuator pulses to detect door movement in both directions. Most of the door actuators share a common door driver circuit but each door actuator has its own unique driver circuit. Due to shared circuitry, similar Diagnostic Trouble Codes (DTCs) can set at the same time for multiple actuators depending upon the type of circuit malfunction, its location, and the direction the actuator is moving when the malfunction is present. For further information. Refer to **DESCRIPTION** .

WHEN MONITORED

When ever an Actuator Calibration Test is performed.

SET CONDITION

The A/C Heater Control uses a pulse feedback to the controller to detect the total door movement range. If the amount of pulses required to move the door completely in both directions is less than what the controller has stored in its memory, this DTC will set. If an Actuator Calibration Test is performed and the A/C Heater Control detects a valid range of the door movement span in both directions, the DTC will change from Active to Stored and will stay in the controllers memory for 100 ignition cycles.

POSSIBLE CAUSES

Possible Causes
RELATED DTCS PRESENT
LEFT BLEND DOOR BINDING
LEFT BLEND DOOR ACTUATOR
A/C HEATER CONTROL

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK FOR RELATED DTCS**
    1. Ignition on, engine not running.
    2. With the scan tool, read HVAC DTCs.

    Are there any Door Control Circuit Open, Performance, or Short to Ground, Voltage, or Together DTCs present?

    Yes

    - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

    No

    - Go To 2
2. **CHECK IF DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. With the scan tool, read HVAC DTCs.

    Is this DTC active?

Yes

- Go To 4

No

- Go To 3

3. **PERFORM HVAC ACTUATOR CALIBRATION TEST**
   1. With the scan tool, perform the HVAC Actuator Calibration Test.

      Did this DTC change from Stored to Active while performing the HVAC Actuator Calibration Test?

      Yes

      - Go To 4

      No

      - Go To 6
4. **CHECK THE LEFT BLEND DOOR**
   1. Remove the Left Blend Door Actuator and check the Driver Blend Door for binding and full travel. Refer to **ACTUATOR, BLEND DOOR, REMOVAL** .

      Were there any problems found?

      Yes

      - Repair or replace the Left Blend Door as necessary in accordance with the Service Information. Refer to **HOUSING, HVAC, REMOVAL** .
      - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Go To 5
5. **CHECK THE LEFT BLEND DOOR ACTUATOR**
   1. Replace the Left Blend Door Actuator in accordance with the Service Information. Refer to **ACTUATOR, BLEND DOOR, REMOVAL** .
   2. With the scan tool, erase HVAC DTCs.
   3. With the scan tool, perform the HVAC Actuator Calibration Test.

      Did this DTC reset during HVAC Actuator Calibration Test?

      Yes

- Replace and program the A/C Heater Control in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .
- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete.
- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

6. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. With the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
   3. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Wiggle the wiring and connectors while checking for shorted and open circuits.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

B11CD-00-MAIN/LEFT TEMPERATURE DOOR 1-TRAVEL TOO LARGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 38: Actuator Blend Door Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

After the initial installation of the A/C Heater Control, the controller is calibrated to each individual blend/mode door actuator. These calibrations are stored as in the number of pulses it takes to move the door from one stop to another. The A/C Heater Control drives the Door Actuators by the use of Door Driver circuit and a Common Door Driver circuit and monitors all door actuator pulses to detect door movement in both directions. Most of the door actuators share a common door driver circuit but each door actuator has its own unique driver circuit. WHEN MONITORED

When ever an Actuator Calibration Test is performed.

SET CONDITION

The A/C Heater Control uses a pulse feedback to the controller to detect the total door movement range. If the amount of pulses required to move the door completely in both directions is greater than what the controller has stored in its memory, this DTC will set. If an Actuator Calibration Test is performed or during normal operation and the A/C Heater Control detects a valid range of the door movement span in both directions, the DTC will change from Active to Stored and will stay in the controllers memory for 100 ignition cycles.

POSSIBLE CAUSES

Possible Causes
RELATED DTCS PRESENT
LEFT BLEND DOOR STOPS
LEFT BLEND DOOR
LEFT BLEND DOOR ACTUATOR
A/C HEATER CONTROL

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK FOR RELATED DTCS**
    1. Ignition on, engine not running.
    2. With the scan tool, read HVAC DTCs.

    Are there any Door Control Circuit Open, Performance, or Short to Ground, Voltage, or Together DTCs present?

    Yes

    - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

    No

    - Go To 2
2. **CHECK IF DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. With the scan tool, read HVAC DTCs.

    Is this DTC active?

Yes

- Go To 4

No

- Go To 3

3. **PERFORM HVAC ACTUATOR CALIBRATION TEST**
   1. With the scan tool, perform the HVAC Actuator Calibration Test.

      Did this DTC change from Stored to Active while performing the HVAC System Test?

      Yes

      - Go To 4

      No

      - Go To 6

4. **CHECK THE LEFT BLEND DOOR**
   1. Remove the Left Blend Door Actuator and check the Left Blend Door stops, linkage (stripped or cracked) and door. Refer to **ACTUATOR, BLEND DOOR, REMOVAL** .

      Were there any problems found?

      Yes

      - Repair or replace the Left Blend Door as necessary in accordance with the Service Information. Refer to **HOUSING, HVAC, REMOVAL** .
      - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Go To 5

5. **CHECK THE LEFT BLEND DOOR ACTUATOR**
   1. Replace the Left Blend Door Actuator in accordance with the Service Information. Refer to **ACTUATOR, BLEND DOOR, REMOVAL** .
   2. With the scan tool, erase HVAC DTCs and perform the HVAC Actuator Calibration Test.

      Did this DTC reset?

      Yes

      - Replace and program the A/C Heater Control in accordance with the Service Information.

Refer to **MODULE, HVAC, REMOVAL** .
- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete.
- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

6. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. With the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
   3. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Wiggle the wiring and connectors while checking for shorted and open circuits.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

B11D3-00-A/C COOL DOWN TEST PERFORMANCE - COMPRESSOR CLUTCH NOT ENGAGED

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Whenever a Cooldown Test is performed.

SET CONDITION

The A/C Heater Control receives a BUS message from the Powertrain Control Module (PCM) that the compressor is not engaged when it is requested.

POSSIBLE CAUSES

Possible Causes
LOSS OF COMMUNICATION WITH THE PCM OR MULTIPLE BUS PROBLEMS
A/C HEATER CONTROL

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK FOR ACTIVE BUS COMMUNICATION DTCS**

   NOTE: Make sure the IOD fuse is installed and the battery is fully charged before proceeding.

   1. Ignition on, engine not running.
   2. Using the scan tool, read DTCs.

   Are there any Active BUS Communication DTCs present?

   Yes

   - Refer to **BODY CONTROL MODULE (BCM) - DIAGNOSTIC CODE INDEX** and perform the appropriate diagnostic procedure.

   No

   - Go To 2
2. **CHECK FOR STORED BUS COMMUNICATION DTCS**
   1. Ignition on, engine not running.
   2. Using the scan tool, read DTCs.

   Are there any inactive or stored BUS Communication DTCs present?

   Yes

   - Refer to **DIAGNOSIS AND TESTING** and perform the Stored Lost Communication DTCs diagnostic procedure.

   No

   - Go To 3
3. **CHECK FOR PCM A/C COMPRESSOR DTCS**
   1. Ignition on, engine not running.
   2. Using the scan tool, read PCM DTCs.

   Are there any PCM A/C Compressor DTCs present?

   Yes

- Refer to the **DTC INDEX** article and perform the appropriate diagnostic procedure.
- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 4

4. **CHECK FOR BODY CONTROL MODULE (BCM) DTCS**
   1. Using the scan tool, read BCM DTCs.

      Are there any BCM DTCs present?

      Yes

      - Refer to the **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

      No

      - Go To 5

5. **CHECK THE A/C COMPRESSOR**
   1. Ignition on, engine running.
   2. Using the A/C heater Control, request A/C maximum cool.

      Does the A/C Compressor Clutch engage?

      Yes

      - Go To 6

      No

      - Refer to **COMPRESSOR, A/C, DIAGNOSIS AND TESTING** .

6. **CHECK IF THE DTC RESETS**
   1. Turn the ignition off to the lock position.
   2. Ignition on, engine not running.
   3. Using the scan tool, erase HVAC DTCs.
   4. Turn the ignition off to the lock position.
   5. Ignition on, engine not running.
   6. Using the scan tool, perform the A/C Cooldown Test. Follow the instructions on the scan tool.
   7. Using the scan tool, read HVAC DTCs.

      Does this DTC reset?

Yes

- Replace and program the A/C Heater Control in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .
- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Refer to 7.

7. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
   3. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Wiggle the wiring and connectors while checking for shorted and open circuits.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

B11D5-00-A/C COOL DOWN TEST PERFORMANCE - EVAP TEMP SENSOR ERROR

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Whenever a Cool down Test is performed.

SET CONDITION

The A/C Heater Control detects a circuit malfunction with the Evaporator Temperature Sensor during a Cool down Test.

POSSIBLE CAUSES

Possible Causes

EVAPORATOR TEMPERATURE SENSOR DTC PRESENT
EVAPORATOR TEMPERATURE SENSOR
A/C HEATER CONTROL

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK IF DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. Using the scan tool, perform an A/C Cooldown Test.
    3. Using the scan tool, read HVAC DTCs.

    Is this DTC active?

    Yes

    - Go To 2

    No

    - Go To 4
2. **PERFORM HVAC ACTUATOR CALIBRATION TEST**
    1. Using the scan tool, perform the HVAC Actuator Calibration Test.

    Did any other HVAC DTCs set while performing the Actuator Calibration Test?

    Yes

    - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

    No

    - Go To3
3. **CHECK THE EVAPORATOR TEMPERATURE SENSOR**
    1. Replace the Evaporator Temperature Sensor in Accordance with the Service Information. Refer to **SENSOR, EVAPORATOR TEMPERATURE, REMOVAL** .
    2. Using the scan tool, erase HVAC DTCs.
    3. Cycle the ignition off for 30 seconds then back on.
    4. Using the scan tool, perform an A/C Cooldown Test.
    5. With the scan tool, read HVAC DTCs.

Does this DTC reset?

Yes

- Replace and program the HVAC Module in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .
- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete.
- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

4. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
   3. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Wiggle the wiring and connectors while checking for shorted and open circuits.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

B11D9-92-BLOWER SPEED KNOB REQUEST INPUT - PERFORMANCE OR INCORRECT OPERATION

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The HVAC A/C Heater Control contains various switches and knobs that are used to change the systems operation. There are currently three types of switches used depending on the configuration of the system. Push button momentary switches which are normally open or in the Off position. Multifunction or rotary switches which have several distinct positions and potentiometers which are a rotary variable resistor that is used for a more precise control. An active Diagnostic Trouble Code (DTC) indicates that either a control switch or potentiometer is stuck in an On position or out of a calibrated range. A stored DTC indicates that control switch or potentiometer was stuck On or out of calibration but has since returned to its normal state. For further

information. Refer to **CONTROL, A/C AND HEATER, DESCRIPTION** .

WHEN MONITORED

With the ignition on.

SET CONDITION

If the Blower Motor Control has a mechanical or electrical failure for more than 30 seconds. This DTC has a de-maturing time of one second. If the DTCs status changes from active to stored, the DTC will stay in memory for 100 ignition cycles.

POSSIBLE CAUSES

Possible Causes
A/C HEATER CONTROL

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK THE A/C HEATER CONTROL**
    1. Turn the ignition on.
    2. Using the scan tool, erase HVAC DTCs.
    3. Turn the ignition off for 10 seconds, and then turn the ignition on.
    4. Slowly Turn the Blower Speed Control knob from Low to High multiple times for a minimum of 30 seconds.
    5. Using the scan tool, read HVAC DTCs.

    Did this DTC reset?

    Yes

    - Replace and program the HVAC Module in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .
    - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Go To 2
2. **CHECK THE WIRING AND CONNECTORS**
    1. The conditions necessary to set the DTC are not present at this time.
    2. Using the scan tool, check the Environmental Data to help identify the conditions in which the

DTC was set.

3. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
4. Wiggle the wiring and connectors while checking for shorted and open circuits.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

B11DB-92-MODE SWITCH REQUEST INPUT - PERFORMANCE OR INCORRECT OPERATION

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The HVAC A/C Heater Control contains various switches and knobs that are used to change the systems operation. There are currently three types of switches used depending on the configuration of the system. Push button momentary switches which are normally open or in the Off position. Multifunction or rotary switches which have several distinct positions and potentiometers which are a rotary variable resistor that is used for a more precise control. An active Diagnostic Trouble Code (DTC) indicates that either a control switch or potentiometer is stuck in an On position or out of a calibrated range. A stored DTC indicates that control switch or potentiometer was stuck On or out of calibration but has since returned to its normal state. For further information. Refer to **CONTROL, A/C AND HEATER, DESCRIPTION** .

WHEN MONITORED

With the ignition on.

SET CONDITION

If the Mode Switch Control has a mechanical or electrical failure for more than 30 seconds. This DTC has a de-maturing time of one second. If the DTCs status changes from active to stored, the DTC will stay in memory for 100 ignition cycles.

POSSIBLE CAUSES

Possible Causes
OBJECT HOLDING SWITCH IN AN ON POSITION A/C HEATER CONTROL

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **INSPECT FOR OBJECT HOLDING SWITCH IN AN ON POSITION**
   1. Inspect the A/C Heater Control for an object or debris holding the Mode Switch in an On position.

      NOTE: Using the scan tool you can read the On/Off status of the control switch.

      Is the Mode Switch being held in or stuck On?

      Yes

      - The A/C Heater control cannot be repaired or adjusted and must be replaced if inoperative or damaged but it might be cleanable if external debris is inhibiting the proper operation of the control switch or knob. If you are unable to clean the control to where it can function properly, replace and program the HVAC Module in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .
      - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Go To 2
2. **A/C HEATER CONTROL**
   1. Turn the ignition on.
   2. Using the scan tool, erase HVAC DTCs.
   3. Turn the ignition off for 10 seconds, and then turn the ignition on and wait a minimum of 30 seconds.
   4. Using the scan tool, read HVAC DTCs.

      Does the scan tool display this DTC as Active or is the status of the switch reading On?

      Yes

      - Replace and program the HVAC Module in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .
      - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Test complete.
      - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

B11E9-92-LEFT TEMPERATURE KNOB REQUEST INPUT-PERFORMANCE OR INCORRECT OPERATION

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The HVAC A/C Heater Control contains various switches and knobs that are used to change the systems operation. There are currently three types of switches used depending on the configuration of the system. Push button momentary switches which are normally open or in the Off position. Multifunction or rotary switches which have several distinct positions and potentiometers which are a rotary variable resistor that is used for a more precise control. WHEN MONITORED

With the ignition on.

SET CONDITION

If the Left Temperature Control has a mechanical or electrical failure for more than 30 seconds. This DTC has a de-maturing time of one second. If the DTCs status changes from active to stored, the DTC will stay in memory for 100 ignition cycles.

POSSIBLE CAUSES

Possible Causes
A/C HEATER CONTROL

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **A/C HEATER CONTROL**
    1. Turn the ignition on.
    2. Using the scan tool, erase HVAC DTCs.
    3. Turn the ignition off for 10 seconds, and then turn the ignition on.
    4. Slowly Turn the Left Temperature Control from full cold to full hot several times for a minimum of 30 seconds.
    5. Using the scan tool, read HVAC DTCs.

    Did this DTC reset?

Yes

- Replace and program the HVAC Module in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .
- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 2

2. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
   3. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Wiggle the wiring and connectors while checking for shorted and open circuits.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

B11F0-11-LEFT FLOOR DUCT TEMPERATURE SENSOR-CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 39: Panel & Floor Duct Temperature Sensor Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The HVAC A/C heater control (HVAC Module) uses a variety of sensors to adjust HVAC operation to obtain optimal performance. These sensors are continuously monitored by the A/C heater control to assure that they are in range. An active Diagnostic trouble Code (DTC) indicates that a sensor is out of range. A stored DTC indicates that the sensor was out of range but is currently within range.

The Duct temperature sensors monitor the air temperature of the A/C air distribution duct work and supplies an input signal to the A/C heater control. The input signal value is used to optimize the A/C system performance. The Duct temperature sensor resistance value will change in response to the air temperature output of the air distribution duct work. The resistance value is electronically transferred to the A/C heater control using a sensor ground circuit and a 5-volt reference signal circuit. Normal operation of the sensor: the resistive value decreases

when the duct work air temperature decreases and the sensor resistive value increases when the duct work air temperature increases.

WHEN MONITORED

With the ignition on.

SET CONDITION

The A/C Heater Module detects less than 0.09 volts on the Left Floor Duct Temperature Sensor Signal circuit for a period of three seconds or more. If the A/C Heater Module detects a valid voltage, the DTC will change from active to stored and will stay stored for 100 ignition cycles.

POSSIBLE CAUSES

Possible Causes
LEFT FLOOR DUCT TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
LEFT FLOOR DUCT TEMPERATURE SENSOR
A/C HEATER MODULE

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK IF THE DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. Using the scan tool, read HVAC DTCs.

    Is this DTC active?

    Yes

    - Go To 2

    No

    - Go To 5
2. **CHECK (C164) LEFT FLOOR DUCT TEMPERATURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND**
    1. Turn the ignition off to the lock position.
    2. Disconnect the A/C Heater Module C1 harness connector.
    3. Disconnect the Left Floor Duct Temperature Sensor harness connector.
    4. Measure the resistance between ground and the (C164) Left Floor Duct Temperature Sensor Signal

circuit.

Is the resistance below 100k Ohms?

Yes

- Repair the(C164) Left Floor Duct Temperature Sensor Signal circuit for a short to ground.
- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 3

3. **CHECK (C164) LEFT FLOOR DUCT TEMPERATURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO THE SENSOR GROUND CIRCUIT**
   1. Measure the resistance between the (C164) Left Floor Duct Temperature Sensor Signal circuit and the Sensor Ground circuit.

   Is the resistance below 100k Ohms?

   Yes

   - Repair the (C164) Left Floor Duct Temperature Sensor Signal circuit and the Sensor Ground circuit.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 4

4. **CHECK THE LEFT FLOOR DUCT TEMPERATURE SENSOR**
   1. Replace the Left Floor Duct Temperature Sensor in Accordance with the Service Information. Refer to **SENSOR, EVAPORATOR TEMPERATURE, REMOVAL** .
   2. Cycle the ignition off for 30 seconds then back on.
   3. With the scan tool, read HVAC DTCs.

   Does this DTC reset?

   Yes

   - Replace and program the HVAC Module in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

- Test complete.
- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

5. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
   3. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Wiggle the wiring and connectors while checking for shorted and open circuits.

      Were there any problems found?

      Yes

      - Repair as necessary.
      - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Test complete.

B11F0-15-LEFT FLOOR DUCT TEMPERATURE SENSOR - CIRCUIT SHORT TO BATTERY OR OPEN

THEORY OF OPERATION

The HVAC A/C heater control (HVAC Module) uses a variety of sensors to adjust HVAC operation to obtain optimal performance. These sensors are continuously monitored by the A/C heater control to assure that they are in range. An active Diagnostic trouble Code (DTC) indicates that a sensor is out of range. A stored DTC indicates that the sensor was out of range but is currently within range.

The Duct temperature sensors monitor the air temperature of the A/C air distribution duct work and supplies an input signal to the A/C heater control. The input signal value is used to optimize the A/C system performance. The Duct temperature sensor resistance value will change in response to the air temperature output of the air distribution duct work. The resistance value is electronically transferred to the A/C heater control using a sensor ground circuit and a 5-volt reference signal circuit. Normal operation of the sensor: the resistive value decreases

when the duct work air temperature decreases and the sensor resistive value increases when the duct work air temperature increases.

WHEN MONITORED

With the ignition on.

SET CONDITION

The A/C Heater Module detects greater than 4.8 volts on the Left Floor Duct Temperature Sensor Signal circuit for a period of three seconds or more. If the A/C Heater Module detects a valid voltage, the DTC will change from active to stored and will stay stored for 100 ignition cycles.

POSSIBLE CAUSES

Possible Causes
LEFT FLOOR DUCT TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
LEFT FLOOR DUCT TEMPERATURE SENSOR SIGNAL CIRCUIT OPEN
SENSOR GROUND CIRCUIT OPEN
LEFT FLOOR DUCT TEMPERATURE SENSOR
A/C HEATER MODULE

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK IF DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. With the scan tool, read HVAC DTCs.

    Is this DTC active?

    Yes

    - Go To 2

    No

    - Go To 6
2. **CHECK THE LEFT FLOOR DUCT TEMPERATURE SENSOR**
    1. Turn the ignition off to the lock position.
    2. Disconnect the Left Floor Duct Temperature Sensor harness connector.

NOTE: Due to the small terminal and pin size of the Left Floor Duct Temperature Sensor and harness connector, make sure to not damage the terminals in this process.

3. Connect a jumper wire between the Left Floor Duct Temperature Sensor Signal circuit and the Sensor Ground circuit in the Left Floor Duct Temperature Sensor harness connector.
4. Ignition on, engine not running.
5. With the scan tool, read the Left Floor Duct Temperature Sensor voltage.

   Is the voltage below 0.2 of a volt?

   Yes

   - Replace the Left Floor Duct Temperature Sensor in accordance with the Service Information.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 3

3. **CHECK THE (C164) LEFT FLOOR DUCT TEMPERATURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**
   1. Turn the ignition off to the lock position.
   2. Disconnect the jumper wire from the previous step.
   3. Disconnect the A/C Heater Module C1 harness connector.
   4. Ignition on, engine not running.
   5. Measure the voltage of the (C164) Left Floor Duct Temperature Sensor Signal circuit.

      Is voltage above 0.2 of a volt?

      Yes

      - Repair the (C164) Left Floor Duct Temperature Sensor Signal circuit for a short to voltage.
      - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Go To 4

4. **CHECK THE (C164) LEFT FLOOR DUCT TEMPERATURE SENSOR SIGNAL CIRCUIT FOR AN OPEN**
   1. Turn the ignition off to the lock position.
   2. Measure the resistance of the (C164) Left Floor Duct Temperature Sensor Signal circuit between the A/C Heater Module C1 harness connector and the Left Floor Duct Temperature Sensor harness connector.

Is the resistance above 1.0 Ohm?

Yes

- Repair the (C164) Left Floor Duct Temperature Sensor Signal circuit for an open.
- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 5

5. **CHECK THE (C131) SENSOR GROUND CIRCUIT FOR AN OPEN**
   1. Measure the resistance of the (C131) Sensor Ground circuit between the A/C Heater Module C1 harness connector and the Left Floor Duct Temperature Sensor harness connector.

   Is the resistance above 1.0 Ohm?

   Yes

   - Repair the (C131) Sensor Ground circuit for an open.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Replace and program the HVAC Module in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

6. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. With the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
   3. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Wiggle the wiring and connectors while checking for shorted and open circuits.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

The Duct temperature sensors monitor the air temperature of the A/C air distribution duct work and supplies an

input signal to the A/C heater control. The input signal value is used to optimize the A/C system performance. The Duct temperature sensor resistance value will change in response to the air temperature output of the air distribution duct work. The resistance value is electronically transferred to the A/C heater control using a sensor ground circuit and a 5-volt reference signal circuit. Normal operation of the sensor: the resistive value decreases when the duct work air temperature decreases and the sensor resistive value increases when the duct work air temperature increases.

WHEN MONITORED

With the ignition on.

SET CONDITION

The A/C Heater Module detects less than 0.09 volts on the Right Panel Duct Temperature Sensor Signal circuit for a period of three seconds or more. If the A/C Heater Module detects a valid voltage, the DTC will change from active to stored and will stay stored for 100 ignition cycles.

POSSIBLE CAUSES

Possible Causes
RIGHT PANEL DUCT TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
RIGHT PANEL DUCT TEMPERATURE SENSOR
A/C HEATER MODULE

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK IF THE DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. Using the scan tool, read HVAC DTCs.

    Is this DTC active?

    Yes

    - Go To 2

    No

    - Go To 5
2. **CHECK (C134) RIGHT PANEL DUCT TEMPERATURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND**
    1. Turn the ignition off to the lock position.

2. Disconnect the A/C Heater Module C1 harness connector.
3. Disconnect the Right Panel Duct Temperature Sensor harness connector.
4. Measure the resistance between ground and the (C134) Right Panel Duct Temperature Sensor Signal circuit.

   Is the resistance below 100k Ohms?

   Yes

   - Repair the (C134) Right Panel Duct Temperature Sensor Signal circuit for a short to ground.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 3

3. **CHECK (C134) RIGHT PANEL DUCT TEMPERATURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO THE (C131) SENSOR GROUND CIRCUIT**
   1. Measure the resistance between the (C134) Right Panel Duct Temperature Sensor Signal circuit and the (C131) Sensor Ground circuit.

      Is the resistance below 100k Ohms?

      Yes

      - Repair the (C134) Right Panel Duct Temperature Sensor Signal circuit for a short to the (C131) Sensor Ground circuit.
      - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Go To 4

4. **CHECK THE RIGHT PANEL DUCT TEMPERATURE SENSOR**
   1. Replace the Right Panel Duct Temperature Sensor in Accordance with the Service Information.
   2. Cycle the ignition off for 30 seconds then back on.
   3. With the scan tool, read HVAC DTCs.

      Does this DTC reset?

      Yes

      - Replace and program the HVAC Module in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .
      - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete.
- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

5. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
   3. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Wiggle the wiring and connectors while checking for shorted and open circuits.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

B11F3-15-RIGHT PANEL DUCT TEMPERATURE SENSOR - CIRCUIT SHORT TO BATTERY OR OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 46: Panel & Floor Duct Temperature Sensor Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The HVAC A/C heater control (HVAC Module) uses a variety of sensors to adjust HVAC operation to obtain optimal performance. These sensors are continuously monitored by the A/C heater control to assure that they are in range. An active Diagnostic trouble Code (DTC) indicates that a sensor is out of range. A stored DTC indicates that the sensor was out of range but is currently within range.

The Duct temperature sensors monitor the air temperature of the A/C air distribution duct work and supplies an input signal to the A/C heater control. The input signal value is used to optimize the A/C system performance. The Duct temperature sensor resistance value will change in response to the air temperature output of the air distribution duct work. The resistance value is electronically transferred to the A/C heater control using a sensor ground circuit and a 5-volt reference signal circuit. Normal operation of the sensor: the resistive value decreases

when the duct work air temperature decreases and the sensor resistive value increases when the duct work air temperature increases.

WHEN MONITORED

With the ignition on.

SET CONDITION

The A/C Heater Module detects greater than 4.8 volts on the Right Panel Duct Temperature Sensor Signal circuit for a period of three seconds or more. If the A/C Heater Module detects a valid voltage, the DTC will change from active to stored and will stay stored for 100 ignition cycles.

POSSIBLE CAUSES

Possible Causes
RIGHT PANEL DUCT TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
RIGHT PANEL DUCT TEMPERATURE SENSOR SIGNAL CIRCUIT OPEN
SENSOR GROUND CIRCUIT OPEN
RIGHT PANEL DUCT TEMPERATURE SENSOR
A/C HEATER MODULE

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK IF THE DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. With the scan tool, read HVAC DTCs.

    Is this DTC active?

    Yes

    - Go To 2

    No

    - Go To 6
2. **CHECK THE RIGHT PANEL DUCT TEMPERATURE SENSOR**
    1. Turn the ignition off to the lock position.
    2. Disconnect the Right Panel Duct Temperature Sensor harness connector.

NOTE: Due to the small terminal and pin size of the Right Panel Duct Temperature Sensor and harness connector, make sure to not damage the terminals in this process.

3. Connect a jumper wire between the (C134) Right Panel Duct Temperature Sensor Signal circuit and the (C131) Sensor Ground circuit in the Right Panel Duct Temperature Sensor harness connector.
4. Ignition on, engine not running.
5. With the scan tool, read the Right Panel Duct Temperature Sensor voltage.

   Is the voltage below 0.2 of a volt?

   Yes

   - Replace the Right Panel Duct Temperature Sensor in accordance with the Service Information.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 3

3. **CHECK THE (C134) RIGHT PANEL DUCT TEMPERATURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**
   1. Turn the ignition off to the lock position.
   2. Disconnect the jumper wire from the previous step.
   3. Disconnect the A/C Heater Module C1 harness connector.
   4. Ignition on, engine not running.
   5. Measure the voltage of the (C134) Right Panel Duct Temperature Sensor Signal circuit.

      Is voltage above 0.2 of a volt?

      Yes

      - Repair the (C134) Right Panel Duct Temperature Sensor Signal circuit for a short to voltage.
      - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Go To 4

4. **CHECK THE (C134) RIGHT PANEL DUCT TEMPERATURE SENSOR SIGNAL CIRCUIT FOR AN OPEN**
   1. Turn the ignition off to the lock position.
   2. Measure the resistance of the (C134) Right Panel Duct Temperature Sensor Signal circuit between

the A/C Heater Module C1 harness connector and the Right Panel Duct Temperature Sensor harness connector.

Is the resistance above 1.0 Ohm?

Yes

- Repair the (C134) Right Panel Duct Temperature Sensor Signal circuit for an open.
- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 5

5. **CHECK THE (C131) SENSOR GROUND CIRCUIT FOR AN OPEN**
   1. Measure the resistance of the (C131) Sensor Ground circuit between the A/C Heater Module C1 harness connector and the Right Panel Duct Temperature Sensor harness connector.

      Is the resistance above 1.0 Ohm?

      Yes

      - Repair the (C131) Sensor Ground circuit for an open.
      - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Replace and program the HVAC Module in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .
      - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

6. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. With the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
   3. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Wiggle the wiring and connectors while checking for shorted and open circuits.

      Were there any problems found?

      Yes

      - Repair as necessary.
      - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete.

B11F4-11-MODE/TEMPERATURE DOOR FEEDBACK VOLTAGE REFERENCE - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously with the ignition on.

SET CONDITION

The A/C Heater Module detects a short to ground on the 5 Volt Supply circuit. If the A/C Heater Module detects a valid current draw, the DTC will change from Active to Stored and will stay in the controllers memory for 100 ignition cycles.

POSSIBLE CAUSES

Possible Causes
REFERENCE VOLTAGE CIRCUIT SHORTED TO GROUND
A/C HEATER MODULE

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK IF DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. With the scan tool, read HVAC DTCs.

    Is this DTC active?

    Yes

    - Go To 2

    No

    - Go To 3
2. **CHECK THE (C26) REFERENCE VOLTAGE CIRCUIT FOR A SHORT TO GROUND**
    1. Turn the ignition off to the lock position.

2. Disconnect the A/C Heater Control C1 harness connector.
3. Disconnect the Mode and Blend Door Actuator harness connectors.
4. Measure the resistance between ground and the (C26) Reference Voltage circuit.

   Is the resistance below 100k Ohms?

   Yes

   - Repair the (C26) Reference Voltage circuit for a short to ground.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Replace and program the HVAC Module in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

3. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. With the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
   3. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Wiggle the wiring and connectors while checking for shorted and open circuits.

      Were there any problems found?

      Yes

      - Repair as necessary.
      - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Test complete.

B11F4-12-MODE/TEMPERATURE DOOR FEEDBACK VOLTAGE REFERENCE - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously with the ignition on.

SET CONDITION

The A/C Heater Control detects a short to voltage on the 5 Volt Supply circuit. If the A/C Heater Control detects a valid voltage, the DTC will change from Active to Stored and will stay in the controllers memory for 100 ignition cycles.

POSSIBLE CAUSES

Possible Causes
REFERENCE VOLTAGE CIRCUIT SHORTED TO VOLTAGE
A/C HEATER CONTROL

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK IF DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. With the scan tool, read HVAC DTCs.

    Is this DTC active?

    Yes

    - Go To 2

    No

    - Go To 3
2. **CHECK THE (C26) REFERENCE VOLTAGE CIRCUIT FOR A SHORT TO VOLTAGE**
    1. Turn the ignition off to the lock position.
    2. Disconnect the A/C Heater Control harness connector.
    3. Disconnect the Mode Door and Blend Door Actuator harness connectors.
    4. Ignition on, engine not running.
    5. Measure the voltage of the (C26) Reference Voltage circuit.

    Is there any voltage present?

    Yes

    - Repair the (C26) Reference Voltage circuit for a short to voltage.
    - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Replace and program the HVAC Module in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .
- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

3. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. With the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
   3. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Wiggle the wiring and connectors while checking for shorted and open circuits.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

B11FE-11-VARIABLE A/C COMPRESSOR CONTROL - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Ignition on and HVAC activated.

SET CONDITION

The HVAC Module detects a short to ground on the Variable A/C compressor control circuit. If the A/C Heater Module detects a valid current draw, the DTC will change from Active to Stored and will stay in the controllers memory for 100 ignition cycles.

POSSIBLE CAUSES

Possible Causes
VARIABLE A/C COMPRESSOR CONTROL CIRCUIT SHORTED TO GROUND
VARIABLE A/C COMPRESSOR
A/C HEATER MODULE

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK IF DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. Using the scan tool, read HVAC DTCs.

    Is this DTC active?

    Yes

    - Go To 3

    No

    - Go To 2
2. **PERFORM HVAC ACTUATOR CALIBRATION TEST**
    1. Using the scan tool, perform the HVAC Actuator Calibration Test.

    Did this DTC change from Stored to Active while performing the HVAC Actuator Calibration Test?

    Yes

    - Go To 3

    No

    - Go To 5
3. **CHECK THE (C27) VARIABLE A/C CONTROL CIRCUIT FOR A SHORT TO GROUND**
    1. Turn the ignition off to the lock position.
    2. Disconnect the A/C Heater Module C1 harness connector.
    3. Disconnect the Variable A/C Compressor harness connector.
    4. Measure the resistance between ground and the (C27) Variable A/C Compressor control circuit.

    Is the resistance below 10k Ohms?

    Yes

    - Repair the (C27) Variable A/C Compressor control circuit for a short to ground.
    - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 4

4. **CHECK THE VARIABLE A/C COMPRESSOR**
   1. Diagnose the Variable A/C Compressor in accordance with the Service Information. Refer to **DIAGNOSIS AND TESTING** .
   2. Using the scan tool, erase HVAC DTCs and perform the HVAC Actuator Calibration Test.

      Did this DTC reset?

      Yes

      - Replace and program the A/C Heater Module in accordance with the Service Information. (Refer to 08 - Electrical/8E - Electronic Control Modules/MODULE, A/C and Heater/Installation).
      - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Test complete.
      - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
5. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
   3. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Wiggle the wiring and connectors while checking for shorted and open circuits.

      Were there any problems found?

      Yes

      - Repair as necessary.
      - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Test complete.

B11FE-12-VARIABLE A/C COMPRESSOR CONTROL - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on and the HVAC on.

SET CONDITION

The HVAC Module detects a short voltage on the Variable A/C Compressor control circuit. If the A/C Heater Module detects a valid voltage, the DTC will change from Active to Stored and will stay in the controllers memory for 100 ignition cycles.

POSSIBLE CAUSES

Possible Causes
VARIABLE A/C COMPRESSOR CONTROL CIRCUIT SHORTED TO VOLTAGE
VARIABLE A/C COMPRESSOR
A/C HEATER MODULE

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK IF DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. Using the scan tool, read HVAC DTCs.

    Is this DTC active?

    Yes

    - Go To 3

    No

    - Go To 2
2. **PERFORM HVAC ACTUATOR CALIBRATION TEST**
    1. Using the scan tool, perform the HVAC Actuator Calibration Test.

    Did this DTC change from Stored to Active while performing the HVAC Actuator Calibration Test?

    Yes

    - Go To 3

No

- Go To 5

3. **CHECK THE (C27) VARIABLE A/C COMPRESSOR CONTROL CIRCUIT FOR A SHORT TO VOLTAGE**
   1. Turn the ignition off to the lock position.
   2. Disconnect the A/C Heater Module C1 harness connector.
   3. Disconnect the Variable A/C Compressor harness connector.
   4. Ignition on, engine not running.
   5. Measure the voltage of the (C27) Variable A/C Compressor control circuit.

   Is there any voltage present?

   Yes

   - Repair the (C27) Variable A/C Compressor control circuit for a short to voltage.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 4

4. **CHECK THE VARIABLE A/C COMPRESSOR**
   1. Diagnose the Variable A/C Compressor in accordance with the Service Information. Refer to **DIAGNOSIS AND TESTING** .
   2. With the scan tool, erase HVAC DTCs and perform the HVAC Actuator Calibration Test.

   Did this DTC reset?

   Yes

   - Replace and program the A/C Heater Module in accordance with the Service Information. (Refer to 08 - Electrical/8E - Electronic Control Modules/MODULE, A/C and Heater/Installation).
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

5. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. With the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.

3. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
4. Wiggle the wiring and connectors while checking for shorted and open circuits.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

B11FE-13-VARIABLE A/C COMPRESSOR CONTROL - CIRCUIT OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on and the HVAC off.

SET CONDITION

The A/C Heater Module detects an open in the Variable A/C Compressor control circuit. If the A/C Heater Module detects a valid current draw, the DTC will change from Active to Stored and will stay in the controllers memory for 100 ignition cycles.

POSSIBLE CAUSES

Possible Causes
VARIABLE A/C COMPRESSOR CONTROL CIRCUIT OPEN
VARIABLE A/C COMPRESSOR
A/C HEATER MODULE

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK IF DTC IS ACTIVE**
   1. Ignition on, engine not running.
   2. Using the scan tool, read HVAC DTCs.

Is this DTC active?

Yes

- Go To 3

No

- Go To 2

2. **PERFORM HVAC ACTUATOR CALIBRATION TEST**
   1. Using the scan tool, perform the HVAC Actuator Calibration Test.

      Did this DTC change from Stored to Active while performing the HVAC Actuator Calibration Test?

      Yes

      - Go To 3

      No

      - Go To 5

3. **CHECK THE (C27) VARIABLE A/C COMPRESSOR CONTROL CIRCUIT FOR AN OPEN**
   1. Turn the ignition off to the lock position.
   2. Disconnect the A/C Heater Module C1 harness connector.
   3. Disconnect the Variable A/C Compressor harness connector.
   4. Measure the resistance of the (C27) Variable A/C Compressor control circuit between the A/C Heater Module C1 harness connector and the Variable A/C Compressor harness connector.

      Is the resistance above 1.0 Ohm?

      Yes

      - Repair the (C27) Variable A/C Compressor control circuit for an open or high resistance.
      - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Go To 4

4. **CHECK THE VARIABLE A/C COMPRESSOR**
   1. Diagnose the Variable A/C Compressor in accordance with the Service Information. Refer to **DIAGNOSIS AND TESTING** .
   2. With the scan tool, erase HVAC DTCs and perform the HVAC Actuator Calibration Test.

Did this DTC reset?

Yes

- Replace and program the A/C Heater Module in accordance with the Service Information. (Refer to 08 - Electrical/8E - Electronic Control Modules/MODULE, A/C and Heater/Installation).
- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete.
- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

5. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
   3. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Wiggle the wiring and connectors while checking for shorted and open circuits.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

B1600-11-LEFT SOLAR SENSOR-CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 47: Sun Sensor Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The HVAC A/C Heater Module uses a variety of sensors to adjust HVAC operation to obtain optimal performance. These sensors are continuously monitored by the A/C Heater Module to assure that they are in range. If those sensors fall out of predetermined ranges a Diagnostic Trouble Code (DTC) will set. For further information. Refer to **SENSOR, SUN, OPERATION** .

WHEN MONITORED

Continuously with the ignition on.

SET CONDITION

If the A/C Heater Control detects a short to ground on Sun Sensor Signal 1 circuit.

POSSIBLE CAUSES

Possible Causes
SUN SENSOR 1 SIGNAL CIRCUIT SHORTED TO GROUND
SUN SENSOR
A/C HEATER CONTROL

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK IF THE DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. With the scan tool, read HVAC DTCs.

    Is this DTC active?

    Yes

    - Go To 2

    No

    - Go To 4
2. **CHECK (G39) SUN SENSOR SIGNAL 1 CIRCUIT FOR A SHORT TO GROUND**
    1. Turn the ignition off to the lock position.
    2. Disconnect the A/C Heater Control C1 harness connector.
    3. Measure the resistance between ground and the (G39) Sun Sensor Signal 1 circuit.

    Is the resistance below 100k Ohms?

    Yes

    - Repair the (G39) Sun Sensor 1 Signal circuit for a short to ground.
    - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

- Go To 3

3. **CHECK THE SUN SENSOR AND A/C HEATER CONTROL**
   1. Replace the Sun Sensor in accordance with the Service Information. Refer to **SENSOR, SUN, REMOVAL** .
   2. Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      Did this DTC reset while performing the HVAC Verification Test?

      Yes

      - Replace and program the HVAC Module in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .
      - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Test complete.
4. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
   3. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Wiggle the wiring and connectors while checking for shorted and open circuits.

      Were there any problems found?

      Yes

      - Repair as necessary.
      - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Test complete.

B1600-12-LEFT SOLAR SENSOR - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 48: Sun Sensor Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The HVAC A/C Heater Module uses a variety of sensors to adjust HVAC operation to obtain optimal performance. These sensors are continuously monitored by the A/C Heater Module to assure that they are in range. If those sensors fall out of predetermined ranges a Diagnostic Trouble Code (DTC) will set. For further information. Refer to **SENSOR, SUN, OPERATION** .

WHEN MONITORED

With the ignition on.

SET CONDITION

If the A/C Heater Control detects a short to voltage on Sun Sensor Signal 1 circuit.

POSSIBLE CAUSES

Possible Causes
SUN SENSOR SIGNAL 1 CIRCUIT SHORTED TO VOLTAGE
SUN SENSOR SIGNAL 1 CIRCUIT OPEN
SUN SENSOR RETURN CIRCUIT OPEN
SUN SENSOR
A/C HEATER CONTROL

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK IF DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. With the scan tool, read HVAC DTCs.

    Is this DTC active?

    Yes

    - Go To 2

    No

    - Go To 6
2. **CHECK THE (G39) SUN SENSOR SIGNAL 1 CIRCUIT FOR A SHORT TO VOLTAGE**
    1. Turn the ignition off to the lock position.
    2. Disconnect the Sun Sensor harness connector.
    3. Disconnect the A/C Heater Control harness connector.

    NOTE: Check connectors - Clean/repair as necessary.

    4. Ignition on, engine not running.
    5. Check the voltage of the (G39) Sun Sensor Signal 1 circuit.

Is there any voltage present?

Yes

- Repair the (G39) Sun Sensor Signal 1 circuit for an short to voltage.
- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 3

3. **CHECK THE (G39) SUN SENSOR SIGNAL 1 CIRCUIT FOR AN OPEN**
   1. Turn the ignition off to the lock position.
   2. Measure the resistance of the (G39) Sun Sensor Signal 1 circuit between the A/C Heater Control harness connector and the Sun Sensor harness connector.

   Is the resistance above 5.0 Ohms?

   Yes

   - Repair the (G39) Sun Sensor Signal 1 circuit for an open.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 4

4. **CHECK THE (G939) SUN SENSOR RETURN CIRCUIT FOR AN OPEN**
   1. Measure the resistance of the (G939) Sun Sensor Return circuit between the A/C Heater Control C1 harness connector and the Sun Sensor harness connector.

   Is the resistance above 5.0 Ohms?

   Yes

   - Repair the (G939) Sun Sensor Return circuit for an open.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 5

5. **CHECK THE SUN SENSOR AND A/C HEATER CONTROL**
   1. Turn the ignition off to the lock position.
   2. Replace the Sun Sensor in accordance with the Service Information. Refer to **SENSOR, SUN, REMOVAL** .

3. Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   Did the DTC reset during or after the HVAC Verification Test?

   Yes

   - Replace and program the HVAC Module in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

6. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
   3. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Wiggle the wiring and connectors while checking for shorted and open circuits.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

B1603-11-RIGHT SOLAR SENSOR - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 49: Sun Sensor Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The HVAC A/C Heater Module uses a variety of sensors to adjust HVAC operation to obtain optimal performance. These sensors are continuously monitored by the A/C Heater Module to assure that they are in range. If those sensors fall out of predetermined ranges a Diagnostic Trouble Code (DTC) will set. For further information. Refer to **SENSOR, SUN, OPERATION** .

WHEN MONITORED

With the ignition on.

SET CONDITION

If the A/C Heater Control detects a short to ground on Sun Sensor Signal 2 circuit.

POSSIBLE CAUSES

Possible Causes
SUN SENSOR SIGNAL 2 CIRCUIT SHORTED TO GROUND
SUN SENSOR
A/C HEATER CONTROL

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK IF THE DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. With the scan tool, read HVAC DTCs.

    Is this DTC active?

    Yes

    - Go To 2

    No

    - Go To 4
2. **CHECK (G139) SUN SENSOR SIGNAL 2 CIRCUIT FOR A SHORT TO GROUND**
    1. Turn the ignition off to the lock position.
    2. Disconnect the A/C Heater Control C1 harness connector.
    3. Disconnect the Sun Sensor harness connector.
    4. Measure the resistance between ground and the (G139) Sun Sensor Signal 2 circuit.

    Is the resistance below 100k Ohms?

    Yes

    - Repair the (G139) Sun Sensor Signal 2 circuit for a short to ground.
    - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 3

3. **CHECK THE SUN SENSOR AND A/C HEATER CONTROL**
   1. Replace the Sun Sensor in accordance with the Service Information. Refer to **SENSOR, SUN, REMOVAL** .
   2. Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   Did this DTC reset while performing the HVAC Verification Test?

   Yes

   - Replace and program the HVAC Module in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

4. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
   3. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Wiggle the wiring and connectors while checking for shorted and open circuits.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

B1603-12-RIGHT SOLAR SENSOR - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 50: Sun Sensor Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The HVAC A/C Heater Module uses a variety of sensors to adjust HVAC operation to obtain optimal performance. These sensors are continuously monitored by the A/C Heater Module to assure that they are in range. If those sensors fall out of predetermined ranges a Diagnostic Trouble Code (DTC) will set. For further information. Refer to **SENSOR, SUN, OPERATION** .

WHEN MONITORED

With the ignition on.

SET CONDITION

If the A/C Heater Control detects a short to voltage on Sun Sensor Signal 2 circuit.

POSSIBLE CAUSES

Possible Causes
SUN SENSOR SIGNAL 2 CIRCUIT SHORTED TO VOLTAGE
SUN SENSOR SIGNAL 2 CIRCUIT OPEN
SUN SENSOR RETURN CIRCUIT OPEN
SUN SENSOR
A/C HEATER CONTROL

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK IF DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. With the scan tool, read HVAC DTCs.

    Is this DTC active?

    Yes

    - Go To 2

    No

    - Go To 6
2. **CHECK THE (G139) SUN SENSOR 2 SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**
    1. Turn the ignition off to the lock position.
    2. Disconnect the Sun Sensor harness connector.
    3. Disconnect the A/C Heater Control harness connector.

    NOTE: Check connectors - Clean/repair as necessary.

    4. Ignition on, engine not running.
    5. Check the voltage of the (G139) Sun Sensor 2 Signal circuit.

Is there any voltage present?

Yes

- Repair the (G139) Sun Sensor 2 Signal circuit for an short to voltage.
- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 3

3. **CHECK THE (G139) SUN SENSOR 2 SIGNAL CIRCUIT FOR AN OPEN**
   1. Turn the ignition off to the lock position.
   2. Measure the resistance of the (G139) Sun Sensor 2 Signal circuit between the A/C Heater Control harness connector and the Sun Sensor harness connector.

   Is the resistance above 5.0 Ohms?

   Yes

   - Repair the (G139) Sun Sensor 2 Signal circuit for an open.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 4

4. **CHECK THE (G939) SUN SENSOR RETURN CIRCUIT FOR AN OPEN**
   1. Measure the resistance of the (G939) Sun Sensor Return circuit between the A/C Heater Control C1 harness connector and the Sun Sensor harness connector.

   Is the resistance above 5.0 Ohms?

   Yes

   - Repair the (G939) Sun Sensor Return circuit for an open.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 5

5. **CHECK THE SUN SENSOR AND A/C HEATER CONTROL**
   1. Turn the ignition off to the lock position.
   2. Replace the Sun Sensor in accordance with the Service Information. Refer to **SENSOR, SUN, REMOVAL** .

3. Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   Did the DTC reset during or after the HVAC Verification Test?

   Yes

   - Replace and program the HVAC Module in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

6. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
   3. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Wiggle the wiring and connectors while checking for shorted and open circuits.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

B160F-11-TWILIGHT/AMBIENT LIGHT SENSOR INPUT - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 51: Sun Sensor Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The HVAC A/C Heater Module uses a variety of sensors to adjust HVAC operation to obtain optimal performance. These sensors are continuously monitored by the A/C Heater Module to assure that they are in range. If those sensors fall out of predetermined ranges a Diagnostic Trouble Code (DTC) will set. For further information. Refer to **SENSOR, SUN, OPERATION** .

WHEN MONITORED

With the ignition on.

SET CONDITION

If the Twilight or Ambient Light Sensor input voltage is less than 1.05 volts for period of 1.2 seconds.

POSSIBLE CAUSES

Possible Causes
AUTO HEADLAMPS SIGNAL CIRCUIT SHORTED TO GROUND
SUN SENSOR
A/C HEATER CONTROL

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK IF THE DTC IS ACTIVE**
   1. Ignition on, engine not running.
   2. With the scan tool, read HVAC DTCs.

      Is this DTC active?

      Yes

      - Go To 2

      No

      - Go To 4
2. **CHECK (L24) AUTO HEADLAMPS SIGNAL CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off to the lock position.
   2. Disconnect the A/C Heater Control C1 harness connector.
   3. Disconnect the Sun Sensor harness connector.
   4. Measure the resistance between ground and the (L24) Auto Headlamps Signal circuit.

      Is the resistance below 100k Ohms?

      Yes

      - Repair the (L24) Auto Headlamps Signal circuit for a short to ground.
      - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 3

3. **CHECK THE SUN SENSOR AND A/C HEATER CONTROL**
   1. Replace the Sun Sensor in accordance with the Service Information. Refer to **SENSOR, SUN, REMOVAL** .
   2. Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   Did this DTC reset while performing the HVAC Verification Test?

   Yes

   - Replace and program the HVAC Module in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

4. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. With the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
   3. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Wiggle the wiring and connectors while checking for shorted and open circuits.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

B160F-12-TWILIGHT/AMBIENT LIGHT SENSOR INPUT-CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 52: Sun Sensor Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The HVAC A/C Heater Module uses a variety of sensors to adjust HVAC operation to obtain optimal performance. These sensors are continuously monitored by the A/C Heater Module to assure that they are in range. If those sensors fall out of predetermined ranges a Diagnostic Trouble Code (DTC) will set. For further information. Refer to **SENSOR, SUN, OPERATION** .

WHEN MONITORED

With the ignition on.

SET CONDITION

If the Twilight or Ambient Light Sensor input voltage is greater than 4.83 volts for period of 1.2 seconds.

POSSIBLE CAUSES

Possible Causes
AUTO HEADLAMPS SIGNAL CIRCUIT SHORTED TO VOLTAGE
AUTO HEADLAMPS SIGNAL CIRCUIT OPEN
SUN SENSOR RETURN CIRCUIT OPEN
SUN SENSOR
A/C HEATER CONTROL

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK IF THE DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. With the scan tool, read HVAC DTCs.

    Is this DTC active?

    Yes

    - Go To 2

    No

    - Go To 6
2. **CHECK THE (L24) AUTO HEADLAMPS SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**
    1. Turn the ignition off.
    2. Disconnect the A/C Heater Control C1 harness connector.
    3. Ignition on, engine not running.
    4. Measure the voltage of the (L24) Auto Headlamps Signal circuit.

    Is there any voltage present?

    Yes

    - Repair the (L24) Auto Headlamps Signal circuit for a short to voltage.

- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 3

3. **CHECK THE (L24) AUTO HEADLAMPS SIGNAL CIRCUIT FOR AN OPEN**
   1. Turn the ignition off to the lock position.
   2. Disconnect the Sun Sensor harness connector.
   3. Measure the resistance of the (L24) Auto Headlamps Signal circuit between the A/C Heater Control C1 harness connector and the Sun Sensor harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 4

      No

      - Repair the (L24) Auto Headlamps Signal circuit for an open.
      - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
4. **CHECK THE (G939) SUN SENSOR RETURN CIRCUIT FOR AN OPEN**
   1. Measure the resistance of the (G939) Sun Sensor Return circuit between the A/C Heater Control C1 harness connector and the Sun Sensor harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 5

      No

      - Repair the (G939) Sun Sensor Return circuit for an open.
      - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
5. **CHECK THE SUN SENSOR AND A/C HEATER CONTROL**
   1. Replace the Sun Sensor in accordance with the Service Information. Refer to **SENSOR, SUN, REMOVAL** .
   2. Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      Did this DTC reset while performing the HVAC Verification Test?

      Yes

- Replace and program the HVAC Module in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .
- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete.

6. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
   3. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Wiggle the wiring and connectors while checking for shorted and open circuits.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

B210D-84-BATTERY VOLTAGE LOW - SIGNAL BELOW ALLOWABLE RANGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The A/C Heater Control constantly monitors battery and ignition voltage as well as battery voltage derived from BUS communication to ensure proper operation. If the voltage to the controller is out of range, it could cause damage to the controller or its respective components. If the voltage of either circuit drops below or rises above a predetermined calibration a Diagnostic Trouble Code (DTC) will set.

WHEN MONITORED

With the ignition on.

SET CONDITION

If the controller battery voltage is less than or equal to 10.0 volts for period of five seconds.

POSSIBLE CAUSES

Possible Causes
RELATED CHARGING SYSTEM DTCS PRESENT
FUSED IGNITION SWITCH OUTPUT CIRCUIT OPEN
FUSED B(+) CIRCUIT OPEN
GROUND CIRCUIT OPEN
A/C HEATER CONTROL

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK FOR CHARGING SYSTEM DTCS**
    1. Using the scan tool, read PCM DTCs.

       Are there any charging system DTCs present in the Powertrain Control Module (PCM)?

       Yes

       - Refer to the **DTC INDEX** article and perform the appropriate diagnostic procedure.

       No

       - Go To 2
2. **CHECK FOR BODY CONTROL MODULE DTCS**
    1. Using the scan tool, read BCM DTCs.

       Are there any BCM DTCS present?

       Yes

       - Refer to the **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

       No

       - Go To 3
3. **CHECK IF THE DTC IS ACTIVE**
    1. Using the scan tool, read HVAC DTCs.

       Is this DTC active?

Yes

- Go To 4

No

- Go To 7

4. **CHECK THE (F949) FUSED IGNITION SWITCH OUTPUT CIRCUIT FOR AN OPEN**
   1. Ignition on, engine not running.
   2. While back probing, measure the voltage of the (F949) Fused Ignition Switch Output circuit in the A/C Heater Control C1 harness connector.

   Is the voltage 10.0 volts or below?

   Yes

   - Repair the (F949) Fused Ignition Switch Output circuit for an open or high resistance.

     NOTE: If the fuse is open, make sure to check for a short to ground on the (F949) Fused Ignition Switch Output circuit.

   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 5

5. **CHECK THE (A937) FUSED B(+) CIRCUIT FOR AN OPEN**
   1. Ignition on, engine not running.
   2. While back probing, measure the voltage of the (A937) Fused B (+) circuit in the A/C Heater Control C1 harness connector.

   Is the voltage 10.0 volts or below?

   Yes

   - Repair the (A937) Fused B (+) circuit for an open or high resistance.

     NOTE: Make sure to check if the IOD fuse is installed. If the fuse is open, make sure to check for a short to ground.

   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

- Go To 6

6. **CHECK THE (Z912) GROUND CIRCUIT FOR AN OPEN**
   1. Turn the ignition off to the lock position.
   2. Disconnect the A/C Heater Control C1 harness connector.
   3. Using a 12-volt test light connected to 12-volts, check the (Z912) Ground circuit.

   NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

   Does the test light illuminate brightly?

   Yes

   - Replace and program the HVAC Module in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Repair the (Z912) Ground circuit for an open.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

7. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
   3. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Wiggle the wiring and connectors while checking for shorted and open circuits.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

B210E-85-BATTERY VOLTAGE HIGH - SIGNAL ABOVE ALLOWABLE RANGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The A/C Heater Control constantly monitors battery and ignition voltage as well as battery voltage derived from BUS communication to ensure proper operation. If the voltage to the controller is out of range, it could cause damage to the controller or its respective components. If the voltage of either circuit drops below or rises above a predetermined calibration a Diagnostic Trouble Code (DTC) will set.

WHEN MONITORED

With the ignition on.

SET CONDITION

If the controller battery voltage is higher than 16.0 volts for period of one second.

POSSIBLE CAUSES

Possible Causes
RELATED CHARGING SYSTEM DTCS PRESENT
A/C HEATER CONTROL

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK FOR CHARGING SYSTEM DTCS**
    1. Using the scan tool, read PCM DTCs.

       Are there any charging system DTCs present in the Powertrain Control Module (PCM)?

       Yes

       - Refer to the **DTC INDEX** article and perform the appropriate diagnostic procedure.

       No

       - Go To 2
2. **CHECK FOR BODY CONTROL MODULE (BCM) DTCS**
    1. Using the scan tool, read BCM DTCs.

       Are there any BCM DTCs present?

       Yes

- Refer to the **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

  .

No

- Go To 3

3. **CHECK IF THE DTC IS ACTIVE**
   1. Using the scan tool, read HVAC DTCs.

      Is this DTC active?

      Yes

      - Go To 4

      No

      - Go To 5

4. **CHECK IF OTHER CONTROLLER ARE REPORTING AN OVER VOLTAGE CONDITION**
   1. Ignition on, engine not running.
   2. With the scan tool read DTCs.

      Are any other controllers reporting an over voltage condition?

      Yes

      - Go to DTC Based Diagnostics and perform the appropriate diagnostic procedure.

      No

      - Replace and program the HVAC Module in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .
      - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

5. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
   3. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Wiggle the wiring and connectors while checking for shorted and open circuits.

Were there any problems found?

Yes

- Repair as necessary.
- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete.

B2214-00-HVAC CLIMATE CONTROL - INTERNAL ERROR

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

If the A/C Heater Control has an internal fault. This Diagnostic Trouble Code (DTC) has a maturing time of five seconds and a de-maturing time of 10 seconds. If the DTCs status changes from active to stored it will stay in memory for 100 ignition cycles.

POSSIBLE CAUSES

Possible Causes
A/C HEATER CONTROL

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

CHECK THE A/C HEATER CONTROL

Repair

- Check for any controller software updates if applicable. If an update is available, reprogram the controller with the latest software. If no software updates are available, replace and program the A/C Heater Control in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .
- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

B222A-00-VEHICLE LINE MISMATCH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The A/C Heater Controller checks for vehicle configuration using communication over the BUS. If the stored configuration does not match the configuration stored in the controller this DTC will set.

WHEN MONITORED

With the ignition on.

SET CONDITION

If the stored configuration does not match the configuration stored in the controller.

POSSIBLE CAUSES

Possible Causes
VEHICLE CONFIGURATION NOT STORED IN THE BODY CONTROL MODULE (BCM)
CONTROL MODULE INSTALLED IN INCORRECT VEHICLE
A/C HEATER CONTROL

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

CHECK THE VEHICLE CONFIGURATION

NOTE: The DTC must be active and no BUS communication DTCs present before performing this test. If BUS communication DTCs are present, perform there respective test first. If the DTC is stored, erase the DTC and cycle the ignition. If the DTC resets and changes to active, then proceed.

1. With the scan tool, check the vehicle configuration stored in the Body Control Module (BCM).
2. With the scan tool, check the vehicle configuration stored in the A/C Heater Control (HVAC).

   Pick the answer that best describes your findings:

   BCM has wrong or no vehicle configuration

   - With the scan tool, program the proper vehicle configuration in the BCM.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   HVAC has wrong vehicle configuration but BCM has correct configuration.

- Replace and program the A/C Heater Control in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .
- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

HVAC and BCM have proper calibration and the DTC is active in the HVAC.

- Check if other modules such as the Powertrain Control Module (PCM) have the wrong configuration stored in the controller and reprogram or replace as necessary. If all other modules show the proper configuration, replace the A/C Heater Control in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .
- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

U0010-00-CAN INTERIOR BUS

Perform the COMMUNICATION PRE-DIAGNOSTIC PROCEDURE. Refer to **STANDARD PROCEDURE** .

U0011-00-CAN INTERIOR BUS OFF PERFORMANCE

Perform the COMMUNICATION PRE-DIAGNOSTIC PROCEDURE. Refer to **STANDARD PROCEDURE** .

U0140-00-LOST COMMUNICATION WITH BODY CONTROL MODULE

Perform the COMMUNICATION PRE-DIAGNOSTIC PROCEDURE. Refer to **STANDARD PROCEDURE** .

U0155-00-LOST COMMUNICATION WITH CLUSTER/CCN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously when the ignition is on.

Battery voltage between 10 and 16 volts.

Ignition Off Draw (IOD) fuse installed.

Body Control Module (BCM) is configured correctly.

SET CONDITION

Bus messages not received from the Instrument Cluster (CCN) for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN INTERIOR BUS (+) CIRCUIT SHORTED TO VOLTAGE
CAN INTERIOR BUS (-) CIRCUIT SHORTED TO GROUND
INSTRUMENT CLUSTER POWER AND GROUND
BCM NOT CONFIGURED CORRECTLY
INSTRUMENT CLUSTER (CCN)
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

VERIFY DTC IS ACTIVE

NOTE: Make sure the IOD fuse is installed and the battery is fully charged before proceeding.

1. Turn the ignition on.
2. With the scan tool, read active DTCs.

   Is this DTC active?

   Yes

   - Refer to **DIAGNOSIS AND TESTING** and perform the U0155-Lost Communication with Cluster/CCN - Missing Message diagnostic procedure.

   No

   - Refer to **DIAGNOSIS AND TESTING** and perform the Stored Lost Communication DTCs diagnostic procedure.

U0184-00-LOST COMMUNICATION WITH RADIO

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously when the ignition is on.

Battery voltage between 10 and 16 volts.

Body Control Module (BCM) is configured correctly.

SET CONDITION

Bus messages not received from the Radio for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN IHS BUS (125K) (+) CIRCUIT SHORTED TO VOLTAGE
CAN IHS BUS (125K) (-) CIRCUIT SHORTED TO GROUND
RADIO POWER AND GROUND
BCM NOT CONFIGURED CORRECTLY
RADIO
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

VERIFY DTC IS ACTIVE

NOTE: Make sure the battery is fully charged before proceeding.

1. Turn the ignition on.
2. With the scan tool, read the active DTCs.

   Does the scan tool display: U0184-00-LOST COMMUNICATION WITH RADIO?

   Yes

   - Refer to **DIAGNOSIS AND TESTING** and perform the U0184-87-Lost Communication with Radio diagnostic procedure.

   No

   - Refer to **DIAGNOSIS AND TESTING** and perform the Stored Lost Communication DTCs diagnostic procedure.

U0401-00-IMPLAUSABLE DATA RECIEVED FROM ECM/PCM

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

During any Keyless Go, Passive Entry or Engine Starting operations.

SET CONDITION

Incorrect data received from Powertrain Control Module (PCM).

POSSIBLE CAUSES

Possible Causes
NO COMMUNICATION WITH POWERTRAIN CONTROL MODULE (PCM)
ACTIVE DTCS IN THE PCM
ACTIVE COMMUNICATION DTCS IN THE BCM
POWERTRAIN CONTROL MODULE
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**

   NOTE: In this test, do not erase any DTCs until instructed to do so.

   1. Turn the ignition on.
   2. With the scan tool, read the active DTCs.

      Does the scan tool display this DTC as active?

      Yes

      - Go To 2

      No

      - Go To 6
2. **VERIFY PCM IS ACTIVE ON THE CAN BUS**
   1. With the scan tool, select ECU View.
   2. Verify that the PCM is active on the bus.

      Is the PCM active on the bus?

      Yes

      - Go To 3

      No

      - Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM PCM diagnostic procedure.
3. **VERIFY IF THIS DTC SET IN OTHER MODULES**
   1. With the scan tool, read all active DTCs from all modules.

      Are any other modules on the CAN BUS reporting; U0401-00-IMPLAUSIBLE DATA RECEIVED FROM ECM/PCM?

Yes

- Replace and PROXI the Powertrain Control Module (PCM) in accordance with the Service Information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
- Perform the PCM VERIFICATION TEST. Refer to appropriate VERIFICATION TEST in appropriate Testing & Diagnostics article under Engine Performance .

No

- Go To 4

4. **CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS**
   1. With the scan tool, read all active DTCs from all modules.

      NOTE: Check for any PROXI, CAN hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

      Does the scan tool display any active DTCs to the conditions listed above?

      Yes

      - Go to and perform the appropriate diagnostic procedure(s).

      No

      - Go To 5

5. **DTCS ACTIVE IN THE PCM**
   1. With the scan tool, read ACTIVE PCM DTCs.

      Are any DTCs active in the PCM?

      Yes

      - Refer to the **DTC INDEX** article and perform the appropriate diagnostic procedure.

      No

      - Replace the Radio Frequency Hub in accordance with the Service Information. Refer to **MODULE, RADIO FREQUENCY (RF HUB), REMOVAL** .
      - Perform the RADIO FREQUENCY HUB (RF-HUB) VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

6. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. With the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.

3. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
4. Wiggle the wiring and connectors while checking for shorted and open circuits.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 7

7. **CHECK VEHICLE HISTORY.**
   1. Check the repair history of this vehicle to see if this DTC was recorded previously in this module.

      Was this DTC present in this vehicle at a previous visit?

      Yes

      - Replace and PROXI the module that set this DTC in accordance with the Service Information. Perform its respective verification test.

      No

      - Record this information on the service order. Test complete.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U0422-00-IMPLAUSABLE DATA RECIEVED FROM BODY CONTROL MODULE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

At all times with Ignition in Run/Start.

SET CONDITION

Incorrect data received from the Body Control Module (BCM).

POSSIBLE CAUSES

Possible Causes
NO COMMUNICATION WITH THE BODY CONTROL MODULE (BCM)

DTCS STORED OR ACTIVE IN THE BCM
RADIO (RRM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
    1. Turn the ignition on.
    2. With the scan tool, read the active DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **VERIFY THE BCM IS ACTIVE ON THE CAN BUS**
    1. With the scan tool, select ECU View.
    2. Verify that the BCM is active on the bus.

    Is the BCM active on the bus?

    Yes

    - Replace the Radio (RRM) in accordance with the Service Information. Refer to **RADIO, REMOVAL** .
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

    No

    - Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM BCM diagnostic procedure.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U0423-00-IMPLAUSABLE DATA RECIEVED FROM THE CLUSTER/CCN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

Incorrect data received from the Instrument Panel Cluster (IPC).

POSSIBLE CAUSES

Possible Causes
NO COMMUNICATION WITH THE INSTRUMENT PANEL CLUSTER (IPC)
DTCS STORED OR ACTIVE IN THE IPC
INSTRUMENT PANEL CLUSTER (IPC)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**

   NOTE: Diagnose and repair any Instrument Cluster DTCs before proceeding with this diagnostic procedure.

   1. Turn the ignition on.
   2. With the scan tool, read active DTCs.

      Does the scan tool display this DTC as active?

      Yes

      - Go To 2

      No

      - The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **VERIFY THE IPC IS ACTIVE ON THE CAN BUS**
   1. With the scan tool, verify that the IPC is active on the bus.

      Is the IPC active on the bus?

      Yes

- Replace and program the Blind Spot Sensor in accordance with the Service Information. Refer to **SENSOR, BLIND SPOT, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM IPC diagnostic procedure.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U11B8-00-LOST COMMUNICATION WITH THE INTEGRATED CENTER STACK ICS

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously when the ignition is on.

The battery voltage is between 10 and 16 volts.

SET CONDITION

Bus messages not received from the Integrated Center Stack (ICS) for approximately ten seconds.

POSSIBLE CAUSES

Possible Causes
INTEGRATED CENTER STACK POWER AND GROUND
INTEGRATED CENTER STACK
CAN IHS BUS (+) CIRCUIT OPEN
CAN IHS BUS (-) CIRCUIT OPEN

DIAGNOSTIC TEST

VERIFY THE DTC IS ACTIVE

1. Turn the ignition on.
2. With the scan tool, read active DTCs.

   Is this DTC active?

   Yes

   - Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM ICS (INTEGRATED CENTER STACK) diagnostic procedure.

No

- Refer to **DIAGNOSIS AND TESTING** and perform the Stored Lost Communication DTCs diagnostic procedure.

STANDARD PROCEDURE

HVAC PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Perform the following steps prior to any diagnostic procedure(s).

- Testing should only be performed with the battery fully charged to avoid false diagnosis.
- With the scan tool, read Powertrain Control Module (PCM) Diagnostic Trouble Codes (DTCs). If PCM DTCs are present, and perform the appropriate diagnostic procedure(s) before proceeding. Refer to the **DTC INDEX** article. .
- Depending on the vehicle configuration, with the scan tool, read Totally Integrated Power Module (TIPM) DTCs. If TIPM DTCs are present, Or read Body Control Module (BCM) DTCs. If BCM DTCs are present, and perform the appropriate diagnostic procedure(s) before proceeding.
- With the scan tool, read HVAC DTCs. Record all Stored, Active, and Pending DTC information.
- With the scan tool, read the Environmental Data. Use this data to help identify the conditions in which the DTC was set.
- Refer to the When Monitored and Set Conditions for this DTC. DTCs can set at ignition on, at start up, or operating under specific conditions.
- Using the wiring diagram as a guide, inspect the wiring and connectors related to this circuit and clean/repair as necessary.
- Check for controller software updates if applicable. Some conditions can be corrected by upgrading the controller software.

NOTE: If the controller is updated with new software, with the scan tool, perform a HVAC Actuator Calibration Test.

- Check for Service Information Tune-ups or Service Bulletins for any possible causes that may apply.

Did any of the above procedures repair the vehicle?

Yes

- Testing is complete.
- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

HVAC SYSTEM TEST

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The HVAC System Test provides a starting point in the diagnostic process by identifying the appropriate diagnostic procedure or system test to perform when diagnosing a given symptom, condition, or Diagnostic Trouble Code (DTC). It also provides a means for testing the entire HVAC system by utilizing the A/C Heater Control's On-Board System Tests. The HVAC System Tests can also assist in diagnosing stored DTCs.

DIAGNOSTIC TEST

1. **HVAC SYSTEM TEST**

   NOTE: Diagnose and repair all active DTCs before diagnosing and repairing stored DTCs. If active DTCs are present, see the DTC INDEX article and perform the appropriate diagnostic procedure.

   Make a selection based on the symptom, condition, or DTC that you want to diagnose.

   scan tool Indicates HVAC Not Active On Bus

   - Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM HVAC diagnostic procedure.

   Blower Motor Inoperative

   - Refer to **MOTOR, BLOWER, DIAGNOSIS AND TESTING** for Blower Motor diagnostic procedures.

   Actuator Calibration Test

   - Go To 4

   A/C System Performance (Cooldown) Test

   - Go To 2
2. **A/C COOLDOWN TEST**
   1. **The following are prerequisites of the A/C Cooldown Test. Verify that the:**
      - Refrigerant system has an adequate charge. Check and repair as necessary before proceeding in accordance with the Service Information. Refer to **DIAGNOSIS AND TESTING** .
      - Blower motor operates correctly in all speeds. Diagnose and repair all blower related faults

before proceeding.

- Work area ambient temperature is above 16° C (60° F) before proceeding. Move the vehicle to a warmer work area if necessary.
- Evaporator temperature is above 13° C (55° F) before proceeding.
- A/C compressor is not running. If the compressor is running, turn the A/C off and allow the evaporator to warm up before proceeding.

NOTE: Running the AC Cooldown test will cause the A/C status indicator to flash. One or more status messages will display on the scan tool after running the Cooldown Test. These messages will clear after paging back out of this test function. Therefore, it is important to note all messages before doing so.

2. Start the engine.
3. Turn the Blower control to the high speed position.
4. With the scan tool in HVAC, select System Tests and then select Cooldown test. Allow the test to run to completion.

   Does the scan tool display a status message that indicates a fault has occurred?

   Yes

   - See the **DIAGNOSTIC CODE INDEX** and perform the appropriate diagnostic procedure based on vehicle HVAC system.

   No

   - Go To 3

3. **MODE SWITCH AND DOOR ACTUATOR CIRCUIT TEST**

NOTE: If at anytime a DTC becomes active during this test, proceed to the conclusion question. If multiple DTCs are active, diagnose those that relate to a short circuit first.

1. Start the engine and turn the Blower control to the low speed position.
2. Set the Blend control (single-zone) or Driver and Passenger Blend control (dual-zone) to the full cold position.
3. Monitor the scan tool for active HVAC DTCs while performing the following test steps.
   - If equipped, press the A/C mode switch on, wait 30 seconds, and then press it off.
   - On Dual-Zone systems, press the Recirculation mode switch on, wait 30 seconds, and then press it off.
   - If equipped, press the EBL mode switch on, wait 30 seconds, and then press it off.
   - Move the Blend control (single-zone) or Driver Blend control (dual-zone) from full cold to

full hot, wait 30 seconds, and then move it back to full cold.
- If equipped, move the Passenger Blend control from full cold to full hot, wait 30 seconds, and then moved it back to full cold.
- Turn the Mode select control to the defrost position, wait 30 seconds, and then turn it to the panel position (dual-zone) or panel / recirculation position (single-zone). Wait 30 seconds before proceeding.

Does the scan tool display any active DTCs?

Yes

- See the **DIAGNOSTIC CODE INDEX** and perform the appropriate diagnostic procedure based on vehicle HVAC system.

No

- Go To 4

4. **ACTUATOR CALIBRATION TEST**
   1. Ignition on, engine not running.
   2. Using the scan tool, select Actuator Calibration Test. When the test is complete, read HVAC DTCs.

   Does the scan tool display any DTCs?

   Yes

   - See the **DIAGNOSTIC CODE INDEX** and perform the appropriate diagnostic procedure based on vehicle HVAC system.

   No

   - Test Complete.

HVAC VERIFICATION TEST

Perform the following procedures to verify that the repair(s) are valid.

1. Make sure that all accessories are turned off.
2. Make sure that the battery is fully charged.
3. Turn the ignition off to the lock position.
4. Disconnect all jumper wires and reconnect all previously disconnected components and connectors.
5. With the scan tool, record and erase all Diagnostic Trouble Codes (DTCs) from ALL modules.
6. Turn the ignition off, remove the scan tool from the DLC (Data Link Connector). Open the door and close the door. Wait a minimum 30 seconds, then turn the ignition on. Reconnect the scan tool.

NOTE: Disconnecting the scan tool and opening and closing the door will allow the controller to enter into sleep mode.

7. With the scan tool perform the HVAC Actuator Calibration Test.
8. Start and run the engine for two minutes while operating all functions of the system that caused the original concern.
9. With the scan tool, check for DTCs in all modules.

Is the original condition still present or are there any other HVAC DTCs present?

Yes

- Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

No

- Repair is complete.

2014 HVAC

Heating & Air Conditioning - Service Information - Cherokee

DESCRIPTION

DESCRIPTION

The HVAC housing is mounted longitudinally in the vehicle, which means it doesn't follow the line of the bulkhead, but protrudes into the passenger compartment. The assembly is available in a single or dual zone configuration, and has a cabin compartment filter on all applications. See the Controls information for more information.

Fig. 1: HVAC Housing Assembly
Courtesy of CHRYSLER GROUP, LLC

All vehicles use an HVAC housing (4) that combines heating, ventilating and A/C capabilities into a single housing. Based upon the mode selected, conditioned air can exit the HVAC housing through one, or a combination of, the panel (2), defrost (1) and floor (5 and 3) outlets. Once the conditioned air exits the HVAC housing, it is further directed through molded plastic ducts to the air outlets within the vehicle interior. See the Distribution information for more information.

The A/C system uses a variable displacement compressor, and an A/C expansion valve to meter the flow of refrigerant to the A/C evaporator. See the Plumbing information for more information.

To maintain the performance level of the HVAC system, the engine cooling system must be properly maintained. The use of a bug screen is not recommended. Any obstructions in front of the radiator or A/C condenser will reduce the performance of the A/C and engine cooling systems. The engine cooling system includes the radiator, thermostat, radiator hoses and the engine coolant pump. See **ENGINE COOLING SYSTEM** for more information.

OPERATION

OPERATION

NOTE: Typical blend-air type HVAC system shown in illustration.

Fig. 2: Blend Air System Schematic
Courtesy of CHRYSLER GROUP, LLC

The heating and A/C systems used in this vehicle are a single zone, blend-air type system. In this blend-air heating and A/C system, two blend-air doors (3) control the amount of conditioned air that is allowed to flow through, or around the heater core (2).

The system pulls outside (ambient) air through the fresh air intake (4) located at the cowl panel at the right side base of the windshield and into the air inlet housing, inside the passenger compartment. From there, the ambient air passes through the A/C evaporator (7) and is then directed either through or around the heater core. This is done by adjusting the position of the blend-air doors with the temperature control located on the A/C heater control in the instrument panel. Air flow is then directed out the floor outlets (8), instrument panel outlets (10) or the defroster outlets (1) in various combinations by adjusting the position of the mode-air doors (9 and 11) using the mode control located on the A/C heater control. The Automatic Temperature Control (ATC) system uses electric actuators to operate the blend and mode air doors. The Manual Temperature Control (MTC) system uses cables to operate the blend and mode air doors.

The velocity of the air flow out of the outlets can be adjusted with the blower speed control located on the A/C heater control.

The fresh air intake can be shut off by the Recirculation control, located on the A/C heater control. This will operate the electrically actuated recirculation-air door (5), which closes off the fresh air intake. With the fresh air intake closed, the conditioned air within the vehicle is pulled back into the HVAC housing through the recirculation air intake (6), located within the passenger compartment.

NOTE: **It is important to keep the fresh air intake opening clear of debris. Leaf particles and other debris that is small enough to pass through the cowl opening screen can accumulate within the HVAC housing. The closed, warm, damp and dark environment created within the housing is ideal for the growth of certain molds, mildews and other fungi. Any accumulation of decaying plant matter that enters the housing with the fresh ambient air provides an additional food source for the fungal spores. If the air intake opening is not kept clear of debris, objectionable odors created by growing fungi and decaying plant matter, as well as excess debris, can be discharged into the passenger compartment during heater and A/C operation.**

The A/C compressor can be engaged by pressing A/C (snowflake) button on the A/C heater control. When equipped, the A/C compressor will automatically engage when the mode control is set in any Mix to Defrost position. This will remove heat and humidity from the air before it is directed through or around the heater core.

DIAGNOSIS AND TESTING

A/C PERFORMANCE

The A/C system is designed to provide the passenger compartment with low temperature and low humidity air. The A/C evaporator, located in the HVAC housing is cooled to temperatures near the freezing point. As warm damp air passes over the fins of the A/C evaporator, the air transfers its heat to the refrigerant in the evaporator coils and the moisture in the air condenses on the evaporator fins. During periods of high heat and humidity, an A/C system will be more effective in the Recirculation mode (max-A/C). With the system in the Recirculation mode, only air from the passenger compartment passes through the A/C evaporator. As the passenger compartment air dehumidifies, the A/C system performance levels rise.

Humidity has an important bearing on the temperature of the air delivered to the interior of the vehicle. It is important to understand the effect that humidity has on the performance of the A/C system. When humidity is high, the A/C evaporator has to perform a double duty. It must lower the air temperature, and it must lower the temperature of the moisture in the air that condenses on the evaporator fins. Condensing the moisture in the air transfers heat energy into the evaporator fins and coils. This reduces the amount of heat the A/C evaporator can absorb from the air. High humidity greatly reduces the ability of the A/C evaporator to lower the temperature of the air.

However, evaporator capacity used to reduce the amount of moisture in the air is not wasted. Wringing some of the moisture out of the air entering the vehicle adds to the comfort of the passengers. Although, an owner may expect too much from their A/C system on humid days. A performance test is the best way to determine whether the system is performing up to design standards. This test also provides valuable clues as to the possible cause of trouble with the A/C system.

A/C PERFORMANCE TEST

WARNING: **Review the warnings and cautions for this system before performing the procedure. Failure to follow these instructions may result in serious injury or death.**

1. Make sure the following conditions are met in the area where this test is to be performed:
   - Maximum ambient temperature: 43.3°C (110°F)
   - Minimum ambient temperature: 15.5°C (60°F)
   - Maximum relative humidity: 90%
   - Minimum relative humidity: 20%
2. Using a scan tool, check for Diagnostic Trouble Codes (DTCs) related to the Controller Area Network (CAN) data bus, HVAC module, Body Control Module (BCM) and Powertrain Control Module (PCM). If no DTCs are found, go to Step 3. If any DTCs are found, repair as required, then proceed to **Step 3** .
3. Operate the heating and A/C system under the following conditions.
   - Engine at normal operating temperature
   - Engine at normal idle speed
   - No sun-load in the cabin of the vehicle
   - Vehicle doors and windows closed
   - Transmission in Park or Neutral with the park brake On.
   - A/C heater controls set to Recirculation mode, full cool, panel mode, high blower and with A/C compressor engaged. If the A/C compressor does not engage, see the **A/C SYSTEM DIAGNOSIS** .
   - All panel outlet vanes open and positioned straight rearward

NOTE: **If the following step is not performed, the results of this test will not be accurate.**

4. Using a scan tool, operate the engine cooling fans at high speed from the PCM View>Actuators.
5. Insert a thermometer in the driver side center panel air outlet and operate the A/C system until the thermometer temperature stabilizes or a minimum of five minutes.

NOTE: **This procedure requires you to know what the temperature and relative humidity is in your location at the time of the test.**

6. With the A/C clutch engaged, compare the observed panel outlet air temperature along with the ambient temperature of the work area and the relative humidity to the Maximum Panel Outlet Temperature chart.
7. If the air outlet temperature fails to meet the specifications shown in the Maximum Panel Outlet Temperature chart (see **Fig. 3**), refer to the A/C System Diagnosis table below.

Fig. 3: Maximum Panel Outlet Temperature
Courtesy of CHRYSLER GROUP, LLC

A/C SYSTEM DIAGNOSIS

Condition	Possible Causes	Correction
Rapid A/C clutch cycling (ten or more cycles per minute).	1. Low refrigerant system charge.	1. See Refrigerant System Leaks. Refer to **PLUMBING, DIAGNOSIS AND TESTING**. Test the refrigerant system for leaks. Repair, evacuate and charge the refrigerant system, if required.
Equal pressures, but the A/C clutch does not engage.	1. No refrigerant in the refrigerant system.	1. See Refrigerant System Leaks. Refer to **PLUMBING, DIAGNOSIS AND TESTING**. Test the refrigerant system for leaks. Repair, evacuate and charge the refrigerant system, if required.
	2. Open fuse.	2. See appropriate Wiring Information. Check the fuses in the Power Distribution Center (PDC). Repair the shorted circuit or component and replace the fuse(s), if required.
	3. Inoperative A/C clutch.	3. See **COMPRESSOR, A/C** . Test the A/C clutch and coil and replace, if required.
	4. Improperly installed or inoperative evaporator temperature sensor.	4. See **SENSOR, EVAPORATOR TEMPERATURE** . Test the sensor and replace, if required.
	5. Inoperative A/C pressure transducer.	5. See **TRANSDUCER, A/C PRESSURE** . Test the sensor and replace, if required.
	6. Inoperative control module, CAN bus or wiring.	6. See the appropriate Electrical Diagnostic Procedures for testing of the modules and CAN bus, and see Wiring Information for

		compressor control circuit repair, if required.
Normal pressures, but A/C Performance Test air temperatures at center panel outlet are too high.	1. Excessive refrigerant oil in system.	1. See **OIL, REFRIGERANT, STANDARD PROCEDURE** . Recover the refrigerant from the refrigerant system and inspect the refrigerant oil content. Restore the refrigerant oil to the proper level, if required.
	2. Blend door actuator(s) improperly installed or inoperative.	2. See **ACTUATOR, BLEND DOOR** . Inspect the actuator(s) for proper operation and replace, if required.
	3. Blend-air door(s) inoperative or sealing improperly.	3. See **HOUSING, HVAC** . Inspect the blend-air door(s) for proper operation and sealing. Repair if required.
The low side pressure is normal or slightly low, and the high side pressure is too low.	1. Low refrigerant system charge.	1. See Refrigerant System Leaks. Refer to **PLUMBING, DIAGNOSIS AND TESTING**. Test the refrigerant system for leaks. Repair, evacuate and charge the refrigerant system, if required.
	2. Refrigerant flow through the A/C evaporator is restricted.	2. See **EVAPORATOR, A/C** . Replace the restricted A/C evaporator, if required.
	3. Inoperative A/C compressor.	3. See **COMPRESSOR, A/C** . Replace the A/C compressor, if required.
The low side pressure is normal or slightly high, and the high side pressure is too high.	1. A/C condenser air flow restricted.	1. See **CONDENSER, A/C** . Check the A/C condenser for damaged fins, foreign objects obstructing air flow through the condenser fins, and missing or improperly installed air seals. Clean, repair, or replace components as required.
	2. Refrigerant flow through the A/C receiver/drier is restricted.	2. See **DRIER, A/C RECEIVER** . Replace the restricted A/C receiver/drier, if required.
	3. Inoperative radiator cooling fan.	3. See **ENGINE COOLING SYSTEM** . Test the radiator cooling fan and replace, if required.
	4. Refrigerant system overcharged.	4. See **R-134A REFRIGERANT SYSTEM CHARGE** . Recover the refrigerant from the refrigerant system. Charge the refrigerant system to the proper level, if required.
	5. Air in the refrigerant system.	5. See Refrigerant System Leaks. Refer to **PLUMBING, DIAGNOSIS AND TESTING**. Test the refrigerant system for leaks. Repair, evacuate and charge the refrigerant system, if required.
	6. Engine overheating.	6. See **ENGINE COOLING SYSTEM** .

		Test the engine cooling system and repair, if required.
The low side pressure is too high, and the high side pressure is too low.	1. Accessory drive belt slipping.	1. See **ENGINE COOLING SYSTEM** . Inspect the accessory drive belt condition and tension. Repair as required.
	2. Inoperative A/C expansion valve.	2. See **VALVE, A/C EXPANSION** . Replace the valve, if required.
	3. Inoperative A/C compressor.	3. See **COMPRESSOR, A/C** . Replace the A/C compressor, if required.
The low side pressure is too low, and the high side pressure is too high.	1. Restricted refrigerant flow through the refrigerant lines.	1. See Liquid Line, Suction Line and Discharge Line. Refer to appropriate procedure in **STANDARD PROCEDURE** . Inspect the refrigerant lines for kinks, tight bends or improper routing. Correct the routing or replace the refrigerant line, if required.
	2. Restricted refrigerant flow through the A/C expansion valve.	2. See **VALVE, A/C EXPANSION** . Replace the valve, if required.
	3. Restricted refrigerant flow through the A/C condenser.	3. See **CONDENSER, A/C** . Replace the restricted A/C condenser, if required.

HEATER PERFORMANCE

Before performing the following tests, refer to **ENGINE COOLING SYSTEM** for the procedures to check the engine coolant level and flow, engine coolant reserve/recovery system operation, accessory drive belt condition and tension, radiator air flow and the fan drive operation.

WARNING: **Do not remove radiator cap when engine is hot. Failure to follow this instruction may result in serious injury.**

If vehicle has been run recently, wait 15 minutes before removing the radiator cap. Place a rag over the cap and turn it to the first safety stop. Allow pressure to escape through the overflow tube. When the system pressure stabilizes, remove the cap completely.

MAXIMUM HEATER OUTPUT

Engine coolant is delivered to and from the heater core through two heater hoses. With the engine idling at normal operating temperature, set the temperature control to the full hot position, the mode control to the floor position, and the blower motor control to the highest speed position. Using a test thermometer, check the temperature of the air being discharged at the front floor outlets. Compare the test thermometer reading to the Heater Temperature Reference chart.

HEATER TEMPERATURE REFERENCE

Ambient Temperature	Minimum Floor Outlet Temperature

Celsius	Fahrenheit	Celsius	Fahrenheit
16°	60°	54°	130°
21°	70°	56°	132°
26°	80°	57°	134°
32°	90°	58°	136°

If the heater outlet air temperature is below the minimum specification, refer to Group 7 - Cooling. Both of the heater hoses should be hot to the touch. The coolant return heater hose should be slightly cooler than the coolant supply heater hose. If the return hose is much cooler than the supply hose, locate and repair the engine coolant flow obstruction in the cooling system. Refer to Group 7 - Cooling for more information.

OBSTRUCTED COOLANT FLOW

Possible locations or causes of obstructed coolant flow are as follows:

- Low coolant level
- Inoperative water pump
- Inoperative thermostat
- Pinched or kinked heater hoses
- Improper heater hose routing
- Plugged heater hoses or supply and return ports at the cooling system connections
- Plugged heater core

If proper coolant flow through the cooling system is verified, and heater outlet air temperature is low, a mechanical problem may exist.

MECHANICAL PROBLEMS

Possible causes of insufficient heat due to mechanical problems are as follows:

- Restricted cabin air filter
- Obstructed cowl air intake
- Obstructed heater system outlets
- Inoperative engine thermostat
- Inoperative blower motor system
- Inoperative A/C-heater control
- Inoperative blend door actuator
- Inoperative, obstructed or improperly installed blend-air door

TEMPERATURE CONTROL

If the heater outlet air temperature cannot be adjusted with the temperature control on the A/C-heater control, the following could require service:

- Inoperative A/C-heater control
- Inoperative blend door actuator
- Inoperative, obstructed or improperly installed blend-air door
- Improper engine coolant temperature

STANDARD PROCEDURE

STANDARD PROCEDURE - A/C EVAPORATOR CLEANING

Some vehicle operators may experience a musty odor from the A/C system, primarily at start up in hot and humid climates. This odor may be the result of microbial growth on the cooling coil. During normal A/C system operation, condensation forms in and around the A/C cooling coil. When airborne pollutants mix with this condensation, bacteria and fungi growth begins and odor may result.

If the vehicle operator experiences a musty odor when operating the A/C system, perform the following procedure.

> WARNING: **Always use eye protection, rubber gloves and protective clothing when performing the following procedure. Avoid continuous breathing of vapors from evaporator coil cleaning and sealing fluids. Avoid contact with skin and eyes. Failure to follow these instruction may result in possible serious or fatal injury.**

1. On models equipped with a cabin air filter, remove the filter and inspect for dirt and debris. Refer to **FILTER, CABIN AIR, REMOVAL**. Discard the used cabin filter if required.
2. Remove the cowl panel cover. Refer to **COVER, COWL PANEL** for more information.
3. Clean any dirt and debris that may be present at the HVAC fresh air inlet screen and at the top of the cowl panel.
4. Install the cowl panel cover.
5. Raise and support the vehicle.
6. Inspect the evaporator drain hose or tube (depending on application) for foreign material that may be blocking the drain and repair as necessary.
7. Once drain operation has been verified;
   - when equipped with a rubber drain hose, temporarily pinch the drain hose closed using an appropriate pair of heater hose pliers.
   - when equipped with a solid plastic drain tube, obtain an appropriate size rubber or plastic cap or plug and temporarily cap or plug the drain tube.
8. Lower the vehicle.
9. Place a protective cover over the front passenger side floor and seat area.
10. Remove the blower motor. Refer to **MOTOR, BLOWER, REMOVAL**.
11. Remove the blower motor power module. Refer to **MODULE, POWER, BLOWER MOTOR, REMOVAL**.

12. Clean any dirt and debris that may be present inside the HVAC blower motor housing and all readily accessible areas inside the HVAC housing. If necessary, use a vacuum with a small flexible hose, and take caution not to damage the evaporator core fins.
13. Using PSE Flex Spray Delivery Tool 534-62637 or equivalent, completely coat the entire surface of A/C evaporator with three bottles of Mopar® Cooling Coil Cleaner through the blower motor and power module or resistor openings. Be sure to use all of the coil cleaner in each container.
14. Allow the vehicle to sit for 30 minutes.
15. Raise and support the vehicle.

WARNING: **Excess cooling coil cleaner will drain from the evaporator housing when the clamp, cap or plug is removed from the evaporator drain hose or tube. Always use eye protection, rubber gloves and protective clothing. Avoid continuous breathing of vapors from evaporator coil cleaning fluid. Avoid contact with skin and eyes. Failure to follow these instruction may result in possible serious or fatal injury.**

16. Remove the previously installed clamp, cap or plug from the evaporator drain hose or tube and allow excess coil cleaner to drain from the HVAC housing.
17. Lower the vehicle.
18. Refill the three empty coil cleaner bottles with clean tap water.
19. Using PSE Flex Spray Delivery Tool 534-62637 or equivalent, completely rinse the entire surface of A/C evaporator with the three bottles of clean tap water through the blower motor and power module or resistor openings. Be sure to use all of the water in each container.
20. Install the blower motor. Refer to **MOTOR, BLOWER, INSTALLATION**.
21. Install the blower motor power module. Refer to **MODULE, POWER, BLOWER MOTOR, INSTALLATION**.
22. Disconnect the wire harness connector from the A/C compressor to disable compressor operation. Refer to **COMPRESSOR, A/C, REMOVAL**.
23. Start the engine
24. Adjust all the windows so they are open approximately 8 mm (0.5 in.).
25. Set the A/C-heater controls to the following:
    - air distribution to Panel and Recirculation mode
    - temperature to full heat
26. Allow the vehicle to run for 20 minutes.
27. Turn the engine off.
28. Raise and support the vehicle.
29. Inspect the evaporator drain hose or tube (depending on application) for foreign material that may have blocked the drain during evaporator coil cleaning and repair as necessary.
30. Once drain operation has been verified;
    - when equipped with a rubber drain hose, temporarily pinch the drain hose closed using an

appropriate pair of heater hose pliers.
- when equipped with a solid plastic drain tube, obtain an appropriate size rubber or plastic cap or plug and temporarily cap or plug the drain tube.

31. Lower the vehicle.
32. Remove the blower motor. Refer to **MOTOR, BLOWER, REMOVAL**.
33. Remove the blower motor power module. Refer to **MODULE, POWER, BLOWER MOTOR, REMOVAL**.
34. Using PSE Flex Spray Delivery Tool 534-62637 or equivalent, completely coat the entire surface of A/C evaporator with one bottle of Mopar® Cooling Coil Coating through the blower motor and power module or resistor openings. Be sure to use all of the coil coating in the container.

NOTE: Be sure to thoroughly clean out the spray delivery tool with warm water once coil coating is complete to prevent damage to the tool.

35. Refill the empty bottles with clean warm tap water and completely rinse out the PSE Flex Spray Delivery Tool 534-62637, or equivalent.
36. Allow the vehicle to sit for 30 minutes.
37. Install the blower motor. Refer to **MOTOR, BLOWER, INSTALLATION**.
38. Install the blower motor power module. Refer to **MODULE, POWER, BLOWER MOTOR, INSTALLATION**.
39. Raise and support the vehicle.

WARNING: Excess cooling coil coating will drain from the evaporator housing when the clamp, cap or plug is removed from the evaporator drain hose or tube. Always use eye protection, rubber gloves and protective clothing. Avoid continuous breathing of vapors from evaporator coil sealing fluid. Avoid contact with skin and eyes. Failure to follow these instruction may result in possible serious or fatal injury.

40. Remove the previously installed clamp, cap or plug from the evaporator drain hose or tube and allow excess coil coating to drain from the HVAC housing.
41. Lower the vehicle.
42. Start the engine
43. Adjust all the windows so they are open approximately 8 mm (0.5 in.).
44. Set the A/C-heater controls to the following:
    - air distribution to Panel and Recirculation mode
    - temperature to full heat
45. Allow the vehicle to run for 20 minutes.
46. Turn vehicle off.
47. Remove protective cover from front passenger side floor and seat area.

48. On models equipped with a cabin air filter, install the filter. Refer to **FILTER, CABIN AIR, INSTALLATION**.
49. Connect the wire harness connector to the A/C compressor. Refer to **COMPRESSOR, A/C, INSTALLATION**.
50. Verify proper A/C-heater system operation.

CONTROLS

ACTUATOR, BLEND DOOR

DESCRIPTION

DESCRIPTION

Fig. 4: Connector, Blend Door Actuator, Mounting Tabs & Gears
Courtesy of CHRYSLER GROUP, LLC

The blend door actuator (2) used in the Automatic Temperature Control (ATC) heating and A/C system, is a reversible, 12 volt Direct Current (DC) servo motor, that is mechanically connected to the two blend-air doors. There is a blend door actuator located on both sides of the HVAC housing.

The blend door actuator is contained within a black molded plastic housing with an integral wire connector receptacle (1). An output shaft with gears (4) connect it to the blend door linkage and integral mounting tabs (3) allow the actuator to be secured to the HVAC housing. The blend door actuator requires mechanical indexing to the blend door linkage and is electronically calibrated by the A/C heater control.

The A/C heater control must be recalibrated each time an actuator motor is replaced. Refer to **STANDARD PROCEDURE** .

OPERATION

OPERATION

The blend door actuator used in the Automatic Temperature Control (ATC) heating and A/C system is connected to the A/C heater control by a dedicated five-wire lead and connector of the HVAC wire harness. The blend door actuator can move the blend-air doors in two directions. When the A/C heater control pulls the voltage on one side of the motor connection high and the other connection low, the blend door actuator will move in one direction. When the A/C heater control reverses the polarity of the voltage to the motor, the blend door actuator moves in the opposite direction. Once the A/C heater control makes the voltage to both connections high or both connections low, the blend door actuator stops and will not move.

The blend door actuator contains a potentiometer, which the ATC A/C heater control uses to monitor the relative position of the blend-air doors. The A/C heater control learns the blend-air door stop positions during the calibration procedure and will store a diagnostic trouble code (DTC) for any problems it detects in the blend door actuator circuits. Refer to **DIAGNOSIS AND TESTING** .

The blend door actuator cannot be adjusted or repaired and must be replaced if inoperative or damaged.

REMOVAL

REMOVAL

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions may result in accidental airbag deployment and possible serious or fatal injury.

NOTE: The Dual Zone heating and A/C system has two blend door actuators, one for the driver side and one for the passenger side.

LEFT SIDE

1. Disconnect and isolate the negative battery cable.
2. Remove the left side instrument panel silencer. Refer to **PANEL, SILENCER, LOWER, REMOVAL** .

3. Remove the left side center console closeout. Refer to **CONSOLE, FLOOR, REMOVAL** .

Fig. 5: Blend Door Actuator - Left Side
Courtesy of CHRYSLER GROUP, LLC

4. Disconnect the electrical connector (2) from the blend door actuator.
5. Remove the two screws (1) that secure the blend door actuator to the left side of the HVAC housing.
6. Remove the blend door actuator from the HVAC housing.

RIGHT SIDE

1. Disconnect and isolate the negative battery cable.
2. Remove the right side instrument panel silencer. Refer to **PANEL, SILENCER, LOWER, REMOVAL** .
3. Remove the right side center console closeout. Refer to **CONSOLE, FLOOR, REMOVAL** .

Fig. 6: Blend Door Actuator - Right Side
Courtesy of CHRYSLER GROUP, LLC

4. Remove the two screws (1) that secure the blend door actuator to the right side of the HVAC housing.
5. Disconnect the HVAC wire harness connector (2) form the blend door actuator.
6. Remove the blend door actuator from the HVAC housing.

INSTALLATION

INSTALLATION

NOTE: The Dual Zone heating and A/C system has two blend door actuators, one for the driver side and one for the passenger side.

LEFT SIDE

Fig. 7: Blend Door Actuator - Left Side
Courtesy of CHRYSLER GROUP, LLC

1. Install the blend door actuator onto the left side of the HVAC housing. If necessary, rotate the actuator slightly to align the teeth on the actuator output shaft with those on the blend door cam.
2. Install the two screws (1) that secure the blend door actuator to the HVAC housing and tighten to the proper. Refer to **SPECIFICATIONS**.
3. Connect the HVAC wire harness connector (2) to the blend door actuator.
4. Install the left side center console closeout. Refer to **CONSOLE, FLOOR, INSTALLATION** .
5. Install the left side instrument panel silencer. Refer to **PANEL, SILENCER, LOWER, INSTALLATION** .
6. Connect the negative battery cable.
7. Initiate the Actuator Calibration function using a scan tool. Refer to **STANDARD PROCEDURE** .

RIGHT SIDE

Fig. 8: Blend Door Actuator - Right Side
Courtesy of CHRYSLER GROUP, LLC

1. Install the blend door actuator onto the right side of the HVAC housing. If necessary, rotate the actuator slightly to align the teeth on the actuator output shaft with those on the blend door cam.

   Install the two screws (1) that secure the blend door actuator to the HVAC housing and tighten to the proper. Refer to **SPECIFICATIONS**.

2. Connect the HVAC wire harness connector (2) to the blend door actuator.
3. Install the center console closeout. Refer to **CONSOLE, FLOOR, INSTALLATION** .
4. Install the right side instrument panel silencer. Refer to **PANEL, SILENCER, LOWER, INSTALLATION** .
5. Connect the negative battery cable.
6. Initiate the Actuator Calibration function using a scan tool. Refer to **STANDARD PROCEDURE** .

ACTUATOR, MODE DOOR

DESCRIPTION

DESCRIPTION

Fig. 9: Actuator Components
Courtesy of CHRYSLER GROUP, LLC

The mode door actuator (1) used in the Automatic Temperature Control (ATC) heating and A/C system, is a reversible, 12 volt Direct Current (DC) servo motor, that is mechanically connected to the three mode-air doors. The mode door actuator is located on the upper left side of the HVAC housing.

The mode door actuator is contained within a black molded plastic housing with an integral wire connector receptacle (3). An output shaft (2) with splines connect it to the mode door linkage and integral mounting tabs (3) allow the actuator to be secured to the HVAC housing. The mode door actuator requires mechanical indexing to the mode door linkage and is electronically calibrated by the HVAC module.

The HVAC module must be calibrated each time an actuator motor is replaced. Refer to **STANDARD PROCEDURE** .

The mode door actuator is interchangeable with the actuator for the blend-air doors.

OPERATION

OPERATION

The mode door actuator used in the Automatic Temperature Control (ATC) heating and A/C system is connected to the A/C heater control by a dedicated five-wire lead and connector of the HVAC wire harness. The mode door actuator can move the mode-air doors in two directions. When the A/C heater control pulls the voltage on one side of the motor connection high and the other connection low, the mode door actuator will move in one direction. When the A/C heater control reverses the polarity of the voltage to the motor, the mode door actuator moves in the opposite direction. Once the A/C heater control makes the voltage to both connections high or both connections low, the mode door actuator stops and will not move.

The mode door actuator contains a potentiometer, which the ATC A/C heater control uses to monitor the relative position of the mode-air doors. The A/C heater control learns the mode-air door stop positions during

the calibration procedure and will store a diagnostic trouble code (DTC) for any problems it detects in the mode door actuator circuits. Refer to **DIAGNOSIS AND TESTING** .

The mode door actuator cannot be adjusted or repaired and must be replaced if inoperative or damaged.

REMOVAL

REMOVAL

WARNING: Disable the airbag system before attempting any steering wheel, steering column or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.

NOTE: Illustration shown with instrument panel cut away for clarity.

1. Disconnect and isolate the negative battery cable.
2. Remove the power inverter module. Refer to **MODULE, POWER INVERTER, REMOVAL** .

Fig. 10: View Of Mode Door Actuator At Air Distribution Housing

1. Position the mode door actuator to the left side of the air distribution housing.
2. Install the two screws (1) that secure the mode door actuator to the air distribution housing. Tighten the screws to 0.8 N.m (7 in. lbs.).
3. Connect the wire harness connector (2) to the mode door actuator.
4. Install the power inverter module. Refer to **MODULE, POWER INVERTER, INSTALLATION** .
5. Connect the negative battery cable.
6. Initiate the Actuator Calibration function using a scan tool. Refer to **STANDARD PROCEDURE** .

ACTUATOR, RECIRCULATION DOOR

DESCRIPTION

DESCRIPTION

Fig. 12: Actuator Components
Courtesy of CHRYSLER GROUP, LLC

The recirculation door actuator (1) is a reversible 12 volt Direct Current (DC) servo motor. The recirculation door actuator is located on the bottom of the HVAC air inlet housing, behind the instrument panel.

The recirculation door actuator is contained within a black molded plastic housing with an integral wire connector receptacle (4). Three mounting tabs (3) allow the actuator to be secured to the housing and output shaft (2) connects it to the recirculation air door.

The recirculation door actuator requires mechanical indexing to the recirculation air door.

OPERATION

OPERATION

The recirculation door actuator is connected to the A/C heater control or module (depending on heating and A/C system application) by a dedicated two-wire lead and connector of the HVAC wire harness. The recirculation door actuator can move the recirculation air door in two directions. When the A/C heater control or module pulls the voltage on one side of the motor connection high and the other connection low, the recirculation air door will move in one direction. When the A/C heater control or module reverses the voltage, the recirculation air door will move in the other direction. When the recirculation air door reaches its travel limit, the A/C heater control or module turns the voltage off.

The recirculation door actuator is diagnosed using a scan tool. Refer to **DIAGNOSIS AND TESTING** .

The recirculation door actuator cannot be adjusted or repaired and must be replaced if inoperative or damaged.

REMOVAL

REMOVAL

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.

1. Disconnect and isolate the negative battery cable.
2. Remove the steering column. Refer to **COLUMN, REMOVAL** .
3. Remove the pedal assembly. Refer to **PEDAL(S), BRAKE AND/OR ACCELERATOR, REMOVAL** .

NOTE: Illustration shown with instrument panel removed for clarity

Fig. 13: View Of Recirculation Door Actuator At Air Inlet Housing
Courtesy of CHRYSLER GROUP, LLC

4. Disconnect the HVAC wiring harness connector and position to the side to gain additional clearance.
5. Disconnect the wire harness connector (1) from the recirculation door actuator.
6. Remove the screw (2) that secures the recirculation door actuator to the air inlet housing.
7. Rotate the recirculation door actuator to disengage it from the retaining clip (3) on the air inlet housing.
8. Separate the recirculation door actuator from the linkage.

INSTALLATION

INSTALLATION

0911034888

Fig. 14: View Of Recirculation Door Actuator At Air Inlet Housing
Courtesy of CHRYSLER GROUP, LLC

1. Position the recirculation door actuator to the air inlet housing and align the actuator output shaft with the splines of the recirculation door linkage.
2. Rotate the recirculation door actuator to engage the retaining clip (3) on the air inlet housing.
3. Install the recirculation door actuator retaining screw (2) and tighten to the proper. Refer to **SPECIFICATIONS**.
4. Connect the wire harness connector to the recirculation door actuator (1).
5. Connect the HVAC wiring harness connector.
6. Install the pedal assembly. Refer to **PEDAL(S), BRAKE AND/OR ACCELERATOR, INSTALLATION** .
7. Install the steering column. Refer to **COLUMN, INSTALLATION** .
8. Connect the negative battery cable.
9. Initiate the Actuator Calibration function using a scan tool. Refer to **STANDARD PROCEDURE** .

CONTROL, A/C AND HEATER

DESCRIPTION

AUTOMATIC TEMPERATURE CONTROL (ATC)

Fig. 15: Automatic Temperature Control (ATC) Panel
Courtesy of CHRYSLER GROUP, LLC

The Automatic Temperature Control (ATC) heating and A/C system maintains the interior comfort level desired by the vehicle operator. This is accomplished by use of air duct temperature sensors, located in the HVAC housing, that measure the temperature of the conditioned air leaving the HVAC housing and an in-car temperature sensor, that measures the temperature of the conditioned air within the vehicle. Based on the sensors inputs, the ATC system automatically adjusts the air temperature, airflow volume, airflow distribution and amount of inside air recirculation to maintain occupant comfort, even under changing outside weather conditions. All controls are identified by International Standards Organization (ISO) graphic symbols.

The ATC heating and A/C system uses electrically operated controls. These controls provide the vehicle operator with a number of setting options to help control the climate and comfort within the vehicle and offers several manual override features such as fan speed and airflow distribution. When the outside air contains smoke, odors, high humidity, or if rapid cooling is desired, the interior conditioned air can be recirculated within the vehicle.

Prior to replacing the A/C heater control, check for any Diagnostic Trouble Codes (DTCs) related to the heating and A/C system, and run the Actuator Calibration function using a scan tool to verify that the concern is not an air door calibration issue. Refer to **STANDARD PROCEDURE** .

The A/C heater control cannot be adjusted or repaired and must be replaced if inoperative or damaged.

MANUAL TEMPERATURE CONTROL (MTC)

Fig. 16: Manual Temperature Control (MTC) Panel
Courtesy of CHRYSLER GROUP, LLC

The A/C heater control for the Manual Temperature Control (MTC) heating and A/C system allows one temperature setting for the entire vehicle. The MTC heating and A/C system uses electronically operated controls to provide the vehicle operator with a number of setting options to help control the climate and comfort within the vehicle. All controls are identified by International Standards Organization (ISO) graphic symbols.

The MTC A/C heater control is located in center of the instrument panel.

The A/C heater control cannot be adjusted or repaired and must be replaced if inoperative or damaged.

REMOVAL

REMOVAL

WARNING: **Disable the airbag system before attempting any steering wheel, steering column or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.**

1. Disconnect and isolate the negative battery cable.

Fig. 17: Connector, Retaining Tabs, A/C Heater Control & Instrument Panel
Courtesy of CHRYSLER GROUP, LLC

2. Using Trim Stick (special tool #C-4755, Trim Stick) or equivalent, disengage the retaining tabs (2) that secure the A/C heater control (3) and remove the A/C heater control from the instrument panel (4).
3. Disconnect the HVAC wire harness connector (2) from the A/C heater control and remove the control.

INSTALLATION

INSTALLATION

Fig. 18: Connector, Retaining Tabs, A/C Heater Control & Instrument Panel
Courtesy of CHRYSLER GROUP, LLC

1. Position the A/C heater control (3) to the instrument panel (4) and connect the HVAC wire harness connector (1).

2. Position the A/C heater control to the instrument panel and engage the retaining tabs (2). Make sure the retaining tabs are fully engaged into the instrument panel.
3. Reconnect the negative battery cable.
4. Initiate the Actuator Calibration function using a scan tool. Refer to **STANDARD PROCEDURE** .

MODULE, POWER, BLOWER MOTOR

DESCRIPTION

DESCRIPTION

Fig. 19: Blower Motor Power Module
Courtesy of CHRYSLER GROUP, LLC

The blower motor power module consists of a molded plastic housing with integral wire connector receptacles (2) and mounting provisions. Concealed behind the housing is the power module electronic circuitry and a finned aluminum heat sink (1). The blower motor power module is located on the passenger side of the HVAC housing and is serviceable without removal of the HVAC housing.

OPERATION

OPERATION

A blower motor power module is used on the Automatic Temperature Control (ATC) system, and allows the microprocessor-based A/C heater control to calculate and provide infinitely variable blower motor speeds based upon either manual blower switch input or the ATC programming.

The ATC blower motor control system uses a Pulse Width Modulated (PWM) circuit strategy. PWM voltage is applied to a comparator circuit which compares the PWM signal voltage to the blower motor feedback voltage. The resulting output drives the power module circuitry, which provides a linear output voltage to change or

maintain the desired blower speed.

The blower motor power module is diagnosed using a scan tool. Refer to **DIAGNOSIS AND TESTING** .

The blower motor power module cannot be adjusted or repaired must be replaced if inoperative or damaged.

REMOVAL

REMOVAL

WARNING: Disable the airbag system before attempting any steering wheel, steering column or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable. Wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in possible serious or fatal injury.

WARNING: The blower motor power module may get very hot during normal operation. If the blower motor was turned on prior to servicing the power module, wait at least five minutes to allow the module heat sink to cool before performing diagnosis or service. Failure to take this precaution may result in possible serious injury.

1. Disconnect and isolate the negative battery cable.
2. Remove the passenger side silencer panel. Refer to **PANEL, SILENCER, LOWER, REMOVAL** .
3. Remove the passenger side console closeout.

Fig. 20: Blower Motor Power Module And Blower Motor Wiring Harness Connectors
Courtesy of CHRYSLER GROUP, LLC

4. Disconnect the wire harness connectors (1) from the blower motor power module and blower motor.

0911034888

5. Remove the screws (1) that secures the blower motor power module to the blower motor and remove the power module.

INSTALLATION

INSTALLATION

1. Install the blower motor power module to the blower motor and install the retaining screws. Tighten the screw to 0.8 N.m (7 in. lbs.).
2. Connect the wire harness connectors to the blower motor power module.
3. Install the passenger side console closeout cover.
4. Install the passenger side silencer panel. Refer to **PANEL, SILENCER, LOWER, INSTALLATION** .
5. Connect the negative battery cable.

SENSOR, AMBIENT TEMPERATURE

DESCRIPTION

DESCRIPTION

Fig. 22: Identifying Ambient Air Temperature Sensor
Courtesy of CHRYSLER GROUP, LLC

The ambient air temperature sensor is a variable resistor that monitors the air temperature outside of the vehicle. The Automatic Temperature Control (ATC) heating and A/C system uses the ambient air temperature sensor data to help maintain optimum passenger compartment temperature levels. The ambient air temperature sensor is mounted behind the grille on the left side.

OPERATION

OPERATION

The ambient air temperature sensor is a variable resistor that operates on a 5 volt Direct Current (DC) reference signal sent by the Body Control Module (BCM). The ambient air temperature sensor is connected to the BCM through a two-wire lead and connector of the vehicle wire harness. The ambient air temperature sensor changes its internal resistance in response to changes in the outside air temperature, which either increases or decreases the reference signal voltage read by the BCM. The BCM converts and broadcasts the sensor data over the Controller Area Network (CAN) data bus, where it is read by the Automatic Temperature Control (ATC) A/C heater module and other vehicle control modules.

The ambient air temperature sensor is diagnosed using a scan tool. Refer to **DIAGNOSIS AND TESTING** .

The ambient air temperature sensor cannot be adjusted or repaired and must be replaced if inoperative or damaged.

REMOVAL

REMOVAL

Fig. 23: Ambient Temperature Sensor, Connector & Push Pin
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Disconnect the wire harness connector (3) from the ambient air temperature sensor (2).
3. Remove the push pin (1) that secures the ambient air temperature sensor and remove the sensor.

INSTALLATION

INSTALLATION

Fig. 24: Ambient Temperature Sensor, Connector & Push Pin
Courtesy of CHRYSLER GROUP, LLC

1. Install the push pin (1) that secures the ambient air temperature sensor to the vehicle.
2. Connect the wire harness connector (3) to the ambient air temperature sensor (2).
3. Connect the negative battery cable.

SENSOR, EVAPORATOR TEMPERATURE

DESCRIPTION

DESCRIPTION

0911034888

Fig. 25: Connector, Bracket & Electrical Thermistor
Courtesy of CHRYSLER GROUP, LLC

The evaporator temperature sensor measures the temperature of the conditioned air downstream of the A/C evaporator. The evaporator temperature sensor is an electrical thermistor (3) mounted on a molded plastic bracket (2) that is inserted into the A/C evaporator, near its coldest point. The evaporator temperature sensor is connected to the vehicle electrical system by use of a two wire lead and connector (1).

OPERATION

OPERATION

The evaporator temperature sensor monitors the surface temperature of A/C evaporator and supplies an input signal to the A/C heater module. The A/C heater module uses the evaporator temperature sensor input signal to optimize A/C system performance and to protect the A/C system from evaporator freezing. The evaporator temperature sensor will change its internal resistance in response to the temperatures it monitors and is connected to the A/C heater module through a sensor ground circuit and a 5 volt Direct Current (DC) reference signal circuit. As the temperature of the A/C evaporator decreases, the internal resistance of the evaporator temperature sensor decreases.

The A/C heater module uses the monitored voltage reading as an indication of evaporator temperature. The A/C heater module is programmed to respond to this input by requesting the Powertrain Control Module (PCM) to cycle the A/C clutch as necessary to optimize A/C system performance and to protect the A/C system from evaporator freezing.

When equipped with Automatic Temperature Control (ATC), the evaporator temperature sensor is diagnosed using a scan tool. Refer to the **DIAGNOSTIC CODE INDEX** .

When equipped with Manual Temperature Control System (MTC), the evaporator temperature sensor is diagnosed using a scan tool. Refer to appropriate DIAGNOSIS AND TESTING.

The evaporator temperature sensor cannot be adjusted or repaired and must be replaced if inoperative or damaged.

REMOVAL

REMOVAL

WARNING: **Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible serious or fatal injury.**

1. Disconnect and isolate the negative battery cable.
2. Remove the right side silencer panel. Refer to **PANEL, SILENCER, LOWER, REMOVAL** .
3. Remove the right side console closeout cover.

Fig. 26: Evaporator Temperature Sensor Location

4. Rotate the evaporator temperature sensor (1) forty five degrees to disengage from the HVAC housing.

Fig. 27: View Of Evaporator Temperature Sensor
Courtesy of CHRYSLER GROUP, LLC

5. Remove the evaporator temperature sensor (3) from the HVAC housing (1).
6. Disconnect the wire harness connector (2) from the evaporator temperature sensor.

INSTALLATION

INSTALLATION

Fig. 28: View Of Evaporator Temperature Sensor
Courtesy of CHRYSLER GROUP, LLC

1. Connect the wire harness connector (2) to the evaporator temperature sensor (3).
2. Position the evaporator temperature sensor into the HVAC housing (1).

Fig. 29: Evaporator Temperature Sensor Location
Courtesy of CHRYSLER GROUP, LLC

3. Rotate the evaporator temperature sensor forty five degrees to engage the locking tab (1) to the HVAC housing.
4. Position the right side console closeout cover, and engage the retaining tabs.
5. Install the right side silencer panel. Refer to **PANEL, SILENCER, LOWER, INSTALLATION** .
6. Connect the negative battery cable.

SENSOR, HUMIDITY

DESCRIPTION

DESCRIPTION

Fig. 30: Humidity Sensor, Bracket, Retaining Clip & Plastic Tabs
Courtesy of CHRYSLER GROUP, LLC

A humidity sensor (1) is used on Automatic Temperature Control (ATC) models to detect humidity levels inside the vehicle to optimize the dehumidifying effect of the A/C system. The humidity sensor is attached to a plastic bracket (3) by a metal retaining clip (2). The sensor bracket is attached to the inside of the windshield by an adhesive. A cover is attached to the sensor bracket by four plastic tabs (4). The humidity sensor is connected to the Body Control Module (BCM) by a dedicated three wire lead and connector that protrudes out from under the front of the headliner.

CAUTION: Use care when servicing the humidity sensor. The humidity sensor bracket cannot be serviced separately from the windshield. If the sensor bracket becomes damaged, the windshield will need to be replaced.

The humidity sensor can be serviced without the use of any special tools.

OPERATION

OPERATION

The humidity sensor detects humidity, dew point and windshield glass temperature, and sends this information to the Body Control Module (BCM) over a Local Interconnect Network (LIN) data bus connection. The BCM then broadcasts the message over the Controller Area Network (CAN) data bus to the A/C heater module. The A/C heater module automatically adjusts A/C clutch operation, amount of recirculated air, blower motor speeds and outlet modes to prevent fogging on the inside of the windshield glass. If the humidity sensor message is not received by the A/C heater module, a Diagnostic Trouble Code (DTC) will set. The information the A/C heater module receives from the humidity sensor can be viewed using a scan tool.

The humidity sensor is diagnosed using a scan tool. Refer to **DIAGNOSIS AND TESTING** .

The humidity sensor cannot be adjusted or repaired and must be replaced if inoperative or damaged.

REMOVAL

REMOVAL

Fig. 31: Humidity Sensor Cover, Sensor Bracket & Retaining Tabs
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable

CAUTION: Use care when removing the humidity sensor cover. The humidity sensor bracket cannot be serviced separately from the windshield. If the sensor bracket becomes damaged, the windshield will need to be replaced.

2. Carefully disengage the four retaining tabs (2 and 4) that secure the cover (3) to the humidity sensor bracket (1) by pressing in on the right side of the cover, while rocking the left side of the cover off the bracket.

Fig. 32: Wire Harness Connector, Humidity Sensor, Bracket & Clip
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Use care when removing the humidity sensor. The humidity sensor bracket cannot be serviced separately from the windshield. If the sensor bracket becomes damaged, the windshield will need to be replaced.

3. Using a small screwdriver or similar tool, carefully disengage the metal retaining clip (3) from the sensor bracket (2) and remove the humidity sensor (4) and the clip as an assembly.
4. Disconnect the wire harness connector (1) from the humidity sensor.
5. If the humidity sensor bracket is damaged and cannot be reused, replace the windshield. Refer to **WINDSHIELD, REMOVAL** .

INSTALLATION

INSTALLATION

Fig. 33: Wire Harness Connector, Humidity Sensor, Bracket & Clip
Courtesy of CHRYSLER GROUP, LLC

1. If the humidity sensor bracket (1) is damaged and cannot be reused, install a new windshield. Refer to **WINDSHIELD, INSTALLATION** .
2. Connect the wire harness connector (1) to the humidity sensor (4).

CAUTION: Use care when installing the humidity sensor. The humidity sensor bracket cannot be serviced separately from the windshield. If the sensor bracket becomes damaged, the windshield will need to be replaced.

3. Position the humidity sensor to the sensor bracket (2) and engage the metal retaining clip (3) to the bracket. Make sure both sides of the retaining clip are fully engaged to the bracket.

Fig. 34: Humidity Sensor Cover, Sensor Bracket & Retaining Tabs
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Use care when install the humidity sensor cover. The humidity sensor bracket cannot be serviced separately from the windshield. If the sensor bracket becomes damaged, the windshield will need to be replaced.

4. Carefully install the humidity sensor cover (3) onto the sensor bracket (1). Make sure the four retaining tabs (2 and 4) are fully engaged to the bracket
5. Reconnect the negative battery cable.

SENSOR, SUN

DESCRIPTION

DESCRIPTION

Fig. 35: Sun Sensor
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical sun sensor assembly shown in illustration.

The Automatic Temperature Control (ATC) heating and A/C system uses a sun sensor assembly (1) to measure sun light intensity. The sun sensor assembly incorporates three sun sensors (2) within a molded plastic case with a clear lens (3), that protrudes through the center of the defroster grille. The wire harness receptacle (4) connects the sun sensors to the vehicle electrical system through a wire lead and connector of the instrument panel wire harness.

OPERATION

OPERATION

The Automatic Temperature Control (ATC) Dual Zone heating and A/C system uses two sun sensors to balance the system in response to side-to-side variations of sun light intensity. Passengers in sun and shadow require different functional settings because they experience very different temperatures. The sun sensor assembly provides data to the A/C heater module to help determine proper mode and blend-air door positions and blower motor speeds. The sun sensors are not thermistor type sensors, but rather photo diodes. For this reason the sun sensors responds to sun light intensity rather than temperature. The sun sensor assembly is also used to sense day and night conditions for automatic headlight control, if equipped.

The sun sensor is diagnosed using a scan tool. Refer to **DIAGNOSIS AND TESTING** .

The sun sensor assembly cannot be adjusted or repaired and must be replaced if inoperative or damaged.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - SUN SENSOR

WARNING: **Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable. Wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in possible serious or fatal injury.**

The sun sensor assembly is located so that the sun rays will hit the sensors in the same way that it will hit the driver and the passenger. It is important that the area in front of the sun sensor assembly be unobstructed. If the vehicle exhibits a lack of passenger comfort in sunny weather such as in the early afternoon, check for the following:

- Any items laying on top of the instrument panel are not covering the sun sensor.
- Any stickers on the windshield are not directly in front of the sun sensor.
- Confirm that the windshield wipers are properly adjusted.
- Confirm that the sun sensor is properly installed. Refer to **SENSOR, SUN, INSTALLATION**.
- Confirm that the defroster grille is properly installed. Refer to **GRILLE, DEFROSTER, INSTALLATION** .

The A/C heater module continually monitors the sun sensor circuits and will store Diagnostic Trouble Codes (DTCs) for any problem it detects. The sun sensor can be tested in the vehicle with a scan tool. Refer to **DIAGNOSIS AND TESTING** .

REMOVAL

REMOVAL

WARNING: **Disable the airbag system before attempting any steering wheel, steering**

column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable. Wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in possible serious or fatal injury.

Fig. 36: Sun Sensor & Defroster Grille
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Using Trim Stick (special tool #C-4755, Trim Stick) or equivalent, remove the sun sensor (1) from the defroster grille (2).

Fig. 37: Sun Sensor & Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

3. Disconnect the wire harness connector (2) from the sun sensor (1) and remove the sensor.

INSTALLATION

INSTALLATION

Fig. 38: Sun Sensor & Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

1. Position the sun sensor (1) to the top of the instrument panel and connect the wire harness connector (2) to the sensor.

Fig. 39: Sun Sensor & Defroster Grille

Courtesy of CHRYSLER GROUP, LLC

2. Align the tab on the sun sensor (1) with the slot in the opening in the defroster grille (2) and install the sensor onto the grille. Make sure that the sensor is fully engaged to the defroster grille.
3. Reconnect the negative battery cable.

SENSOR, TEMPERATURE, AIR OUTLET

DESCRIPTION

DESCRIPTION

Four air outlet temperature sensors are used in the Automatic Temperature Control (ATC) heating and A/C system to measure the temperature of the conditioned air leaving the HVAC housing. Each air outlet temperature sensor is an electrical thermistor located within a molded plastic case.

Fig. 40: Mode Case & Air Outlet Temperature Sensor
Courtesy of CHRYSLER GROUP, LLC

Each air outlet temperature sensor (2) is inserted into the mode case (1) near the top of the HVAC housing.

Each air outlet temperature sensor is connected to the vehicle electrical system through a separate wire lead and connector of the HVAC wire harness. The external location of the air outlet temperature sensors allow them to be removed or installed without removing the HVAC housing from the vehicle.

OPERATION

OPERATION

The air duct temperature sensors monitor the temperature of the conditioned air leaving the HVAC housing and supplies an input signal to the A/C heater control, when equipped with the Automatic Temperature Control (ATC) heating and A/C system. The air duct temperature sensors change their internal resistance in response to

the temperatures they monitor. The air duct temperature sensors are connected to the ATC A/C heater control through a sensor ground circuit and a 5 volt Direct Current (DC) reference signal circuit. As the temperature of the conditioned air leaving the HVAC housing decreases, the internal resistance of the temperature sensor increases. As the temperature of the conditioned air leaving the HVAC housing increases, the internal resistance of the temperature sensor decreases.

The ATC A/C heater control uses the monitored voltage readings as an indication of air outlet temperature. The A/C heater control is programmed to respond to this and other inputs by adjusting the blend and the mode air door positions, and by cycling the A/C clutch on and off as necessary in order to automatically adjust the heating and A/C system to the operator temperature preference setting.

The air duct temperature sensors are diagnosed using a scan tool. Refer to **DIAGNOSIS AND TESTING** .

The air duct temperature sensors cannot be adjusted or repaired and must be replaced if inoperative or damaged.

REMOVAL

REMOVAL

WARNING: Disable the airbag system before attempting any steering wheel, steering column or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.

NOTE: The Automatic Temperature Control (ATC) heating and A/C system uses four air outlet temperature sensors, that are mounted on both sides and on top of the air distribution housing. Two are for the instrument panel outlets and the other two for the floor outlets.

1. Disconnect and isolate the negative battery cable.
2. Remove the radio. Refer to **RADIO, REMOVAL** .

Fig. 41: Connector, Air Outlet Temperature Sensor & HVAC Housing
Courtesy of CHRYSLER GROUP, LLC

3. Disconnect the HVAC wire harness (1) from the air outlet temperature sensor (2).

Fig. 42: Air Outlet Temperature Sensor & HVAC Housing
Courtesy of CHRYSLER GROUP, LLC

4. Rotate the air outlet temperature sensor (1) counterclockwise and remove from the HVAC housing (2).

INSTALLATION

INSTALLATION

NOTE: **The Automatic Temperature Control (ATC) heating and A/C system uses four air outlet temperature sensors, that are mounted on both sides and on top of the**

air distribution housing. Two are for the instrument panel outlets and the other two are for the floor outlets.

Fig. 43: Air Outlet Temperature Sensor & HVAC Housing
Courtesy of CHRYSLER GROUP, LLC

1. Install the air duct temperature sensor (1) into the air distribution housing (2). Turn the air duct temperature sensor clockwise to engage the sensor into the air distribution housing.

Fig. 44: Connector, Air Outlet Temperature Sensor & HVAC Housing
Courtesy of CHRYSLER GROUP, LLC

2. Connect the HVAC wire harness (1) to the air duct temperature sensor (2).
3. Install the radio. Refer to **RADIO, INSTALLATION** .

4. Connect the negative battery cable.

SENSOR, TEMPERATURE, IN-CAR

DESCRIPTION

DESCRIPTION

Fig. 45: In-Car Temperature Sensor, Aspirator Motor & Thermistor
Courtesy of CHRYSLER GROUP, LLC

The in-car temperature sensor (1) is used in the Automatic Temperature Control (ATC) heating and A/C system only. The in-car temperature sensor consists of an aspirator motor (2) and a temperature thermistor (3). The in-car temperature sensor sends a resistance signal to the ATC A/C heater module and is attached to the instrument panel, below the steering column.

OPERATION

OPERATION

Air is drawn from the passenger compartment by the aspirator motor and flows over the temperature thermistor. The thermistor changes resistance with air temperature. The Automatic Temperature Control (ATC) A/C-heater control receives the resistance signal over hard-wired circuits and calculates the temperature of the air in the passenger compartment. The ATC system then automatically makes adjustments to maintain the optimum passenger compartment comfort.

The in-car temperature sensor cannot be adjusted or repaired and must be replaced if inoperative or damaged.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - IN-CAR TEMPERATURE SENSOR

NOTE: **For complete circuit diagrams, see Wiring Information. Wiring Information includes wiring diagrams, connector pin-out and location views, details of wire harness routing and retention, splice and ground locations and proper wire and connector repair procedures.**

Using a scan tool, check for Diagnostic Trouble Codes (DTCs) related to the in-car temperature sensor and the A/C-heater control. If any DTCs are found, repair as necessary. Refer to **DIAGNOSIS AND TESTING** . If no DTCs are found, perform the two following tests. Replace the in-car temperature sensor if the sensor fails either test.

ASPIRATOR MOTOR TEST

The in-car temperature sensor uses an aspirator motor to draw air from the passenger compartment and flow the air over the temperature thermistor. Test the motor as follows.

Fig. 46: Opening Grille & Opening Cover
Courtesy of CHRYSLER GROUP, LLC

1. Place the ignition in the Run position.
2. Place a small piece of newspaper in front of the aspirator motor opening grille (1), located on the steering column opening cover (2). If the paper sticks to the grille, the aspirator motor is operating properly. The piece of paper should be only large enough to cover the opening.
3. If the paper does not stick to the grille, check the in-car temperature sensor electrical connections and wiring. If connections and wiring are OK, replace the in-car temperature sensor.

TEMPERATURE THERMISTOR TEST

The in-car temperature sensor uses a temperature thermistor to provide resistance values that correlate with temperature change. Test the thermistor as follows.

1. Remove the in-car temperature sensor and place it on a workbench. Refer to **SENSOR,**

TEMPERATURE, IN-CAR, REMOVAL.

2. Note the current ambient air temperature of the work area.
3. Use an ohm meter and check the resistance between pins 1 and 2 of the in-car temperature sensor. Compare the temperature of the work area to the found resistance value. The resistance should be within specifications as listed in the **Resistance and Temperature** chart below. If not OK, replace the in-car temperature sensor.

RESISTANCE AND TEMPERATURE

Air Temperature Range	Low Resistance Range (kohm)	High Resistance Range (kohm)
-21° to -15°C (-5° to 5°F)	292 ± 1.0	223 ± 0.9
-14° to -9°C (6° to 15°F)	198 ± 0.9	161 ± 0.8
-8° to -4°C (16° to 25°F)	144 ± 0.8	123 ± 0.8
-3° to 1°C (26° to 35°F)	111 ± 0.7	95 ± 0.7
2 to 7°C (36° to 45°F)	86 ± 0.7	70 ± 0.6
8 to 12°C (46° to 55°F)	64 ± 0.6	55 ± 0.5
13° to 18°C (56° to 65°F)	51 ± 0.5	42 ± 0.4
19° to 23°C (66° to 75°F)	39 ± 0.4	33 ± 0.3
24° to 29°C (76° to 85°F)	31 ± 0.3	26 ± 0.3
30° to 35°C (86° to 95°F)	24 ± 0.3	20 ± 0.3
36° to 40°C (96° to 105°F)	18 ± 0.3	16 ± 0.3
41° to 46°C (106° to 115°F)	15 ± 0.3	13 ± 0.3

REMOVAL

REMOVAL

WARNING: Disable the airbag system before attempting any steering wheel, steering column or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.

NOTE: Take the proper precautions to protect the face of the steering column opening cover from cosmetic damage while performing this procedure.

1. Disconnect and isolate the negative battery cable.
2. Remove the steering column opening cover. Refer to **COVER, STEERING COLUMN OPENING, REMOVAL** .

Fig. 47: In-Car Temperature Sensor & Fasteners
Courtesy of CHRYSLER GROUP, LLC

3. Remove the two screws (2) that secure the in-car temperature sensor (1) to the steering column opening cover and remove the sensor.

INSTALLATION

INSTALLATION

NOTE: Take the proper precautions to protect the face of the steering column opening cover from cosmetic damage while performing this procedure.

Fig. 48: In-Car Temperature Sensor & Fasteners
Courtesy of CHRYSLER GROUP, LLC

1. Position the in-car temperature sensor (1) onto the steering column opening cover.
2. Install the two screws (2) that secure the in-car temperature sensor to the steering column opening cover. Tighten the screws securely.
3. Install the steering column opening cover. Refer to **COVER, STEERING COLUMN OPENING, INSTALLATION** .
4. Connect the negative battery cable.

TRANSDUCER, A/C PRESSURE

DESCRIPTION

DESCRIPTION

Fig. 49: A/C Pressure Transducer
Courtesy of CHRYSLER GROUP, LLC

The A/C pressure transducer (1) is a switch that is installed on a fitting located on the A/C liquid line. The A/C liquid line fitting has an external O-ring seal and uses a Schrader-type valve that allows the A/C pressure transducer to be removed without recovering the refrigerant system. The A/C pressure transducer is connected to the vehicle electrical system by a molded plastic connector with three terminals.

OPERATION

OPERATION

The internal resistance in the A/C pressure transducer changes in response to the pressures in the high side of the A/C refrigerant system. The Powertrain Control Module (PCM) provides a five volt reference signal and a sensor ground to the A/C pressure transducer, and uses the output voltage of the transducer to determine refrigerant high-side pressure. The PCM is programmed to respond to this and other sensor inputs by controlling the operation of the A/C clutch and the radiator cooling fan to help optimize A/C system performance and to protect refrigerant system components from damage.

The A/C pressure transducer is diagnosed using a scan tool. Refer to the **DTC INDEX** article .

The A/C pressure transducer cannot be adjusted or repaired and must be replaced if inoperative or damaged.

REMOVAL

REMOVAL

NOTE: It is not necessary to discharge the refrigerant system to replace the A/C pressure transducer.

Fig. 50: Removing/Installing A/C Pressure Transducer
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical A/C pressure transducer shown in illustration.

1. Disconnect and isolate the negative battery cable.
2. Disconnect the wire harness connector (1) from the A/C pressure transducer (2) on the A/C discharge line (3).
3. Remove the A/C pressure transducer from the A/C discharge line and remove and discard the O-ring seal (4).

INSTALLATION

INSTALLATION

NOTE: Use only the specified O-ring as it is made of special material for R-134a. Use only refrigerant oil of the type required for the A/C compressor.

Fig. 51: Removing/Installing A/C Pressure Transducer
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical A/C pressure transducer shown in illustration.

1. Lubricate a new rubber O-ring seal (4) with clean refrigerant oil and install it onto the A/C discharge line (3).
2. Install the A/C pressure transducer (2) onto the A/C discharge line. Tighten the A/C pressure transducer securely.
3. Connect the wire harness connector (1) to the A/C pressure transducer.
4. Reconnect the negative battery cable.

DISTRIBUTION

DUCT, DEFROSTER

DESCRIPTION

DESCRIPTION

Fig. 52: Defroster Duct
Courtesy of CHRYSLER GROUP, LLC

The defroster outlets receive airflow from the HVAC housing through a molded plastic defroster duct (1) that is attached to the underside of the instrument panel cover.

The defroster duct is integral to the instrument panel cover and is not serviced separately.

DUCT, FLOOR DISTRIBUTION

REMOVAL

REMOVAL

WARNING: Disable the airbag system before attempting any steering wheel, steering column or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable. Wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in possible serious or fatal injury.

NOTE: Driver side shown in illustration, passenger side typical.

1. Remove the front and rear floor carpet. Refer to **CARPET, FLOOR, REMOVAL** .

Fig. 53: Floor Duct Retaining Tabs
Courtesy of CHRYSLER GROUP, LLC

2. Using a small Flathead screwdriver or equivalent, disengage the retaining tabs securing the floor duct (1) at the HVAC housing.

Fig. 54: Floor Duct
Courtesy of CHRYSLER GROUP, LLC

3. Detach/remove the floor duct retainer from the stud in the floorpan.
4. Remove the floor duct (1).

INSTALLATION

INSTALLATION

NOTE: Driver side shown in illustration, passenger side typical.

Fig. 55: Floor Duct
Courtesy of CHRYSLER GROUP, LLC

1. Position the floor duct (1) into the vehicle.
2. Attach/install the floor duct retainer to the stud in the floorpan.

Fig. 56: Floor Duct Retaining Tabs
Courtesy of CHRYSLER GROUP, LLC

3. Push the duct up to engage the retaining tabs securing the floor duct (1) at the HVAC housing.
4. Install the front and rear floor carpet. Refer to **CARPET, FLOOR, INSTALLATION** .

OUTLET, AIR

REMOVAL

FRONT OUTER AIR OUTLETS

WARNING: Disable the airbag system before attempting any steering wheel, steering column or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable and wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.

1. Remove the Instrument Panel End Cap. Refer to **CAP, INSTRUMENT PANEL END, REMOVAL** .
2. Remove the lower trim panel in order to access the retaining screw.
3. Using trim stick or equivalent, carefully disengage the retaining tabs that secure the air outlet to the instrument panel.
4. After the retaining tabs have been disengaged, gently pull the top of the air outlet first and remove the air outlet from the instrument panel.

FRONT CENTER AIR OUTLETS

WARNING: Disable the airbag system before attempting any steering wheel, steering column or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable and wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.

NOTE: Take the proper precautions to protect the front face of the center bezel from cosmetic damage during this procedure.

1. Disconnect and isolate the negative battery cable.
2. Remove the center bezel (1) from the instrument panel and place it on a workbench. Refer to **INSTRUMENT PANEL** for information.

Fig. 57: Center Bezel & Front Center Air Outlets
Courtesy of CHRYSLER GROUP, LLC

3. Using Trim Stick (special tool #C-4755, Trim Stick) or equivalent, carefully disengage the plastic retaining clips (1) that secure each air outlet to the center bezel.

INSTALLATION

FRONT OUTER AIR OUTLETS

1. Position the air outlet to the opening in the instrument panel and align the outlet to the instrument panel duct.
2. Engage the retaining tabs that secure each air outlet to the instrument panel. Make sure the retaining tabs are fully engaged.
3. Install the retaining screw.
4. Install the lower trim panel.
5. Install the Instrument Panel End Cap. Refer to **CAP, INSTRUMENT PANEL END, INSTALLATION** .

FRONT CENTER AIR OUTLETS

NOTE: Take the proper precautions to protect the front face of the center bezel from cosmetic damage during this procedure.

Fig. 58: Center Bezel & Front Center Air Outlets
Courtesy of CHRYSLER GROUP, LLC

1. Position the center air oultet(s) to the back of the instrument panel center bezel and engage the outlet to the center bezel.
2. Carefully engage the plastic retaining clips (1) that secure each air outlet to the center bezel. Make sure the retaining clips are fully engaged.
3. Install the instrument panel center bezel. Refer to **INSTRUMENT PANEL** for information.
4. Connect the negative battery cable.

FILTER, CABIN AIR

DESCRIPTION

DESCRIPTION

Fig. 59: Label & Cabin Air Filter
Courtesy of CHRYSLER GROUP, LLC

All models are equipped with a cabin air filter (2) that helps purify the outside air entering the HVAC housing. The filter is mounted in the passenger compartment, on the right side of the HVAC housing.

The filter should be replaced at least once a year or every 24, 000 km (15, 000 miles) and checked if heating or A/C system performance seems lower than expected. The cabin air filter is labeled (1) to indicate the proper installation position.

REMOVAL

REMOVAL

WARNING: Disable the airbag system before attempting any steering wheel, steering column or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.

1. Disconnect and isolate the negative battery cable.
2. Remove the passenger side silencer panel. Refer to **PANEL, SILENCER, LOWER, REMOVAL** .
3. Remove the passenger side console closeout.

Fig. 60: Filter Cover & Retaining Tab
Courtesy of CHRYSLER GROUP, LLC

4. Disengage the retaining tab (2) and remove the filter cover (1).

Fig. 61: Air Filter Position Indicators, Cabin Air Filter & HVAC Housing
Courtesy of CHRYSLER GROUP, LLC

5. Remove the cabin air filter (2) from the right side of the HVAC housing (3) by pulling the filter element straight out of the housing. Take note of the air filter position indicators (1).

INSTALLATION

INSTALLATION

NOTE: **The cabin air filter is labeled with an arrow to indicate proper filter position. Make sure to properly install the cabin air filter. Failure to properly install the filter will result in the need to replace the filter sooner than required by design.**

Fig. 62: Air Filter Position Indicators, Cabin Air Filter & HVAC Housing
Courtesy of CHRYSLER GROUP, LLC

1. Install the cabin air filter (2) into the right side of the HVAC housing (3). Make note of the air filter position indicators (1).

Fig. 63: Filter Cover & Retaining Tab
Courtesy of CHRYSLER GROUP, LLC

2. Install the cabin air filter cover (1) onto the right side of the HVAC housing.
3. Engage the retaining tab (2) into the HVAC housing.
4. Install the passenger side console closeout.
5. Install the passenger side silencer panel. Refer to **PANEL, SILENCER, LOWER, INSTALLATION** .
6. Connect the negative battery cable.

HOUSING, HVAC

REMOVAL

HOUSING-AIR DISTRIBUTION

WARNING: Disable the airbag system before attempting any steering wheel, steering column or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.

WARNING: Review the warnings and cautions for this system before performing the procedure. Failure to follow these instructions may result in serious injury or death.

NOTE: The air distribution housing must be removed from the HVAC housing and disassembled for service of the blend-air and mode-air doors.

1. Remove the HVAC housing assembly and place it on a workbench. Refer to **HOUSING, HVAC, REMOVAL**.

Fig. 64: Screws, Air Distribution Housing & HVAC Housing
Courtesy of CHRYSLER GROUP, LLC

2. Remove the seven screws (1) that secure the air distribution housing to the top of the HVAC housing (3).
3. Disconnect wiring harness connectors.

Fig. 65: Retaining Clips & Air Distribution Housing
Courtesy of CHRYSLER GROUP, LLC

4. Release the two retaining clips (1) that secure the bottom of air distribution housing (2) to the HVAC housing.
5. Remove the air distribution housing from the top of the HVAC housing.
6. If required, disassemble the air distribution housing. Refer to **HOUSING, HVAC, DISASSEMBLY**.

HOUSING-AIR INLET

WARNING: Review the warnings and cautions for this system before performing the procedure. Failure to follow these instructions may result in serious injury or death.

WARNING: Disable the airbag system before attempting any steering wheel, steering column or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.

NOTE: The air inlet housing must be removed from HVAC housing and disassembled for service of the recirculation-air door.

1. Remove the HVAC housing assembly and place it on a workbench. Refer to **HOUSING, HVAC, REMOVAL**.

9. Disengage the plastic retaining tabs (2) and remove the levers (1) from the air distribution housing.

HOUSING-AIR INLET

1. Remove the air inlet housing from the HVAC housing. Refer to **HOUSING, HVAC, REMOVAL**.

Fig. 74: Air Inlet Housing, Foam Seal, Recirculation Air Door, Recirculation Door Actuator & Air Inlet Screen
Courtesy of CHRYSLER GROUP, LLC

2. Remove the screw that secures the recirculation door actuator (4) to the air inlet housing (1) and remove the actuator.
3. Remove air inlet screen (5) from air inlet housing.
4. The recirculation air door (3) is serviced as an assembly with the air inlet housing.

NOTE: If the foam seal (2) on the air inlet housing is deformed or damaged, the seal must be replaced.

HOUSING-HVAC

NOTE: The HVAC housing must be removed from the vehicle and disassembled for service of the A/C evaporator and heater core.

1. Remove the HVAC housing assembly and place it on a workbench. Refer to **HOUSING, HVAC, REMOVAL**.
2. Remove the blower motor power module. Refer to **MODULE, POWER, BLOWER MOTOR, REMOVAL**.
3. Remove the evaporator temperature sensor. Refer to **SENSOR, EVAPORATOR TEMPERATURE, REMOVAL**.
4. Remove the HVAC wiring harness (1).
5. Remove the A/C evaporator. Refer to **EVAPORATOR, A/C, REMOVAL**.

ASSEMBLY

HOUSING-AIR DISTRIBUTION

Fig. 75: Levers & Retaining Tabs
Courtesy of CHRYSLER GROUP, LLC

1. Install the two mode door levers (1) onto the air distribution housing. Make sure the lever retaining tabs (2) are fully engaged.

Fig. 76: Left & Right Mode Door Levers
Courtesy of CHRYSLER GROUP, LLC

2. Align the two mode door levers, the left lever (1) must be fully rotated clockwise and the right lever (2) must be fully rotated counterclockwise, gravity will allow them to stay in this position.

Fig. 77: Cam Lobe, Windows & Rib On Shaft
Courtesy of CHRYSLER GROUP, LLC

3. With the levers in position, the cam should be oriented with the lobe up (1), rib on shaft pointing to seven

O'clock (3), then pressed into place. There are windows (2) in the cam to help see the pins on the levers.

Fig. 78: Cam & Heater Link
Courtesy of CHRYSLER GROUP, LLC

4. To place the bracket on the top of the cam (1), push heater link (2) all the way to the left, move the lever counter clockwise and assembly to the heater link (3), press bracket onto cam.

Fig. 79: Mounting Bracket, Screws & Air Distribution Housing
Courtesy of CHRYSLER GROUP, LLC

5. Install the three screws (2) that secure the mounting bracket (1) to the air distribution housing (3). Tighten the screws to 2 N.m (17 in. lbs.).

Fig. 80: Screws, Connector, Air Distribution Housing & Mode Door Actuator
Courtesy of CHRYSLER GROUP, LLC

6. Position the blend door actuator (4) onto the air distribution housing (3).
7. Install the two screws (1) securing the mode door actuator. Tighten the screws to 2 N.m (17 in. lbs.).
8. Connect the wiring harness connector (3) to the blend door actuator.
9. Install the air temperature sensors. Refer to **SENSOR, TEMPERATURE, AIR OUTLET, INSTALLATION**.
10. Install the air distribution housing onto the HVAC housing (1). Refer to **HOUSING, HVAC, INSTALLATION**.
11. Install the HVAC housing assembly. Refer to **HOUSING, HVAC, INSTALLATION**.

HOUSING-AIR INLET

Fig. 81: Air Inlet Housing, Foam Seal, Recirculation Air Door, Recirculation Door Actuator & Air Inlet Screen
Courtesy of CHRYSLER GROUP, LLC

1. Install the recirculation door actuator (4) onto the air inlet housing. If necessary, rotate the actuator slightly to align the splines of the actuator output shaft with those on the recirculation door pivot shaft adapter.
2. Install the retaining screw securing the recirculation door actuator to the housing. Tighten the screw to 2 N.m (17 in. lbs.).
3. Install the air inlet screen (5) onto the air inlet housing.
4. Install the air inlet housing onto the HVAC housing. Refer to **HOUSING, HVAC, INSTALLATION**.

NOTE: If the foam seal (2) on the air inlet housing is deformed or damaged, the seal must be replaced.

HOUSING-HVAC

CAUTION: Be certain to adjust the refrigerant oil level when servicing the A/C refrigerant system. Failure to properly adjust the refrigerant oil level will prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

NOTE: When replacing multiple A/C system components, see the Refrigerant Oil Capacities chart to determine how much oil should be added to the refrigerant system. Refer to OIL, REFRIGERANT, STANDARD PROCEDURE.

1. Install the A/C evaporator. Refer to **EVAPORATOR, A/C, INSTALLATION**.
2. Install the HVAC wiring harness. Make sure the harness is routed through all wiring retainers.

3. Install the evaporator temperature sensor. Refer to **SENSOR, EVAPORATOR TEMPERATURE, INSTALLATION**.
4. Install the blower motor power module. Refer to **MODULE, POWER, BLOWER MOTOR, INSTALLATION**.
5. Install the HVAC housing assembly. Refer to **HOUSING, HVAC, INSTALLATION**.

INSTALLATION

HOUSING-AIR DISTRIBUTION

Fig. 82: Retaining Clips & Air Distribution Housing
Courtesy of CHRYSLER GROUP, LLC

1. Position the air distribution housing (2) onto the top of the top of HVAC housing.
2. Fasten the retaining clips (1) that secure the bottom of the air distribution housing to the HVAC housing.
3. Fasten the wiring harness connectors.

Fig. 83: Screws, Air Distribution Housing & HVAC Housing
Courtesy of CHRYSLER GROUP, LLC

4. Install the seven screws (1) that secure the air distribution housing (2) to the HVAC housing (3). Tighten the screws to 1.2 N.m (10 in. lbs.).
5. Install the HVAC housing assembly. Refer to **HOUSING, HVAC, INSTALLATION**.

HOUSING-AIR INLET

Fig. 84: Screws, Inlet Housing, Recirculation Door Actuator & HVAC Housing
Courtesy of CHRYSLER GROUP, LLC

1. Position the air inlet housing (1) to the left side of the HVAC housing (4).

2. Install the 3 screws (1) that secure the air inlet housing to the HVAC housing. Tighten the screws to 2.2 N.m (20 in. lbs.).
3. Connect the wire harness connector to the recirculation door actuator (3).
4. Install the HVAC housing assembly. Refer to **HOUSING, HVAC, INSTALLATION**.

HOUSING-HVAC

Fig. 85: Nuts, Bolts, Instrument Panel Support & HVAC Housing Assembly
Courtesy of CHRYSLER GROUP, LLC

1. Position the HVAC housing assembly (3) into the instrument panel support (1).
2. Install the 2 nuts (1) and the 2 bolts (4) that secure the HVAC housing assembly to the center of instrument panel support. Tighten to 4 N.m (35 in. lbs.).
3. Connect the instrument panel wire harness connectors to the HVAC wiring harness.

NOTE: If the foam seal on the top of the HVAC housing is deformed or damaged, the seal must be replaced.

4. Install the instrument panel. Refer to **PANEL, INSTRUMENT, INSTALLATION** .

SCREEN-AIR INLET

Fig. 86: Air Inlet Screen & Plastic Nuts
Courtesy of CHRYSLER GROUP, LLC

1. Position the air inlet screen (1) to the cowl panel (3).
2. Install the two plastic nuts (2 and 4) that secure the air inlet screen to the cowl panel. Tighten the nuts securely.
3. Install the cowl panel cover. Refer to **COVER, COWL PANEL, INSTALLATION** .

MOTOR, BLOWER

DESCRIPTION

DESCRIPTION

Fig. 87: Blower Motor
Courtesy of CHRYSLER GROUP, LLC

The blower motor (4) is used to control the velocity of air moving through the HVAC housing by spinning the blower wheel (1) within the HVAC air inlet housing at the selected speed.

The blower motor is a 12-volt, direct current (DC) motor mounted within a plastic housing with an integral wire harness connector (3) and three mounting tabs (2). The squirrel cage-type blower wheel is secured to the blower motor shaft and is positioned within the air inlet housing on the passenger side of the HVAC housing.

OPERATION

OPERATION

The blower motor controls the velocity of air moving through the HVAC housing by spinning the blower wheel within the HVAC air inlet housing at the selected speed.

Both the Manual Temperature Control (MTC) heating-A/C system and the Automatic Temperature Control (ATC) heating-A/C system have an electronic blower motor power module to control blower motor speed. The power module uses a Pulse Width Modulated (PWM) input from the A/C-heater control and a feedback signal from the blower motor to regulate the blower motor ground path. On both systems, the blower motor receives battery current through the Power Distribution Center (PDC) whenever the ignition switch is in the Run position, and the blower motor control is in any position except Off.

The blower motor control system is diagnosed using a scan tool. Refer to **STANDARD PROCEDURE** .

The blower motor and blower motor wheel are factory balanced as an assembly and cannot be adjusted or repaired and must be replaced if inoperative or damaged.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - BLOWER MOTOR

WARNING: Disable the airbag system before attempting any steering wheel, steering column or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable and wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.

To determine if an open condition exists within the blower motor circuit wiring, it is necessary to disconnect the negative battery cable and check for continuity within the blower motor circuits using an ohmmeter. See Wiring Information for circuit descriptions and diagrams.

REMOVAL

REMOVAL

1. Disconnect and isolate the negative battery cable.
2. Remove the passenger side silencer panel. Refer to **PANEL, SILENCER, LOWER, REMOVAL** .
3. Remove the passenger side center console close out.
4. Remove the blower motor power module

   Refer to **MODULE, POWER, BLOWER MOTOR, REMOVAL**.

Fig. 88: Blower Motor To HVAC Housing & Fasteners
Courtesy of CHRYSLER GROUP, LLC

5. Remove the three screws (1) that secure the blower motor.

6. Remove the blower motor from the passenger side of the HVAC housing.

INSTALLATION

INSTALLATION

1. Position the blower motor into the passenger side of the HVAC housing.
2. Install the three screws that secure the blower motor. Tighten the screws to 1.2 N.m (10 in. lbs.).
3. Connect the wire harness connector.
4. Install the blower motor power module

   Refer to **MODULE, POWER, BLOWER MOTOR, INSTALLATION**.

5. Install the center console close out.
6. Install the passenger side silencer panel. Refer to **PANEL, SILENCER, LOWER, INSTALLATION** .
7. Connect the negative battery cable.

PLUMBING

WARNING

WARNING

WARNING: **The A/C system contains refrigerant under high pressure. Repairs should only be performed by qualified service personnel. Serious or fatal injury may result from improper service procedures.**

WARNING: **Avoid breathing the refrigerant and refrigerant oil vapor or mist. Exposure may irritate the eyes, nose, and/or throat. Wear eye protection when servicing the A/C refrigerant system. Serious eye injury can result from direct contact with the refrigerant. If eye contact occurs, seek medical attention immediately.**

WARNING: **Do not expose the refrigerant to open flame. Poisonous gas is created when refrigerant is burned. An electronic leak detector is recommended. Serious or fatal injury may result from improper service procedures.**

WARNING: **If accidental A/C system discharge occurs, ventilate the work area before resuming service. Large amounts of refrigerant released in a closed work area will displace the oxygen and cause suffocation and serious or fatal injury.**

WARNING: **The engine cooling system is designed to develop internal pressures up**

to 145 kPa (21 psi). Do not remove or loosen the coolant pressure cap, cylinder block drain plugs, radiator drain, radiator hoses, heater hoses, or hose clamps while the engine cooling system is hot and under pressure. Allow the vehicle to cool for a minimum of 15 minutes before opening the cooling system for service. Failure to observe this warning can result in serious burns from the heated engine coolant.

CAUTION

CAUTION

CAUTION: The use of A/C system sealers may result in damage to A/C refrigerant recovery/evacuation/recharging equipment and/or A/C system. Many federal, state/provincial and local regulations prohibit the recharge of A/C systems with known leaks. Chrysler LLC recommends the detection of A/C system leaks through the use of approved leak detectors and fluorescent leak detection dyes. Vehicles found with A/C system sealers should be treated as contaminated and replacement of the entire A/C refrigerant system is recommended. A/C systems found to be contaminated with A/C system sealers, A/C stop-leak products or seal conditioners voids the warranty for the A/C system.

CAUTION: Recover the refrigerant before opening any fitting or connection. Open the fittings with caution, even after the system has been discharged. Never open or loosen a connection before recovering the refrigerant.

CAUTION: If equipped, do not remove the secondary retention clip from any spring-lock coupler connection while the refrigerant system is under pressure. Recover the refrigerant before removing the secondary retention clip. Open the fittings with caution, even after the system has been discharged. Never open or loosen a connection before recovering the refrigerant.

CAUTION: The internal parts of the A/C system will remain stable as long as moisture-free refrigerant and refrigerant oil is used. Abnormal amounts of dirt, moisture or air can upset the chemical stability. This may cause operational troubles or even serious damage if present in more than very small quantities. Before disconnecting a component, clean the outside of the fittings thoroughly to prevent contamination from entering the refrigerant system. Keep service tools and the work area clean. Do not open the refrigerant system or uncap a replacement component until you are ready to service the system. Immediately after disconnecting a component from the refrigerant system, seal the open fittings with a cap or plug. This will prevent contamination from entering the A/C system.

CAUTION: Refrigerant oil will absorb moisture from the atmosphere if left uncapped.

Do not open a container of refrigerant oil until you are ready to use it. Replace the cap on the oil container immediately after using. Store refrigerant oil only in a clean, airtight, and moisture-free container.

CAUTION: Do not overcharge the refrigerant system. Overcharging will cause excessive compressor head pressure and can cause compressor noise and A/C system failure.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - REFRIGERANT SYSTEM LEAKS

WARNING: Review the safety precautions and warnings in this information before performing this procedure. Failure to follow these instructions may result in serious injury or death.

WARNING: Do not expose the refrigerant to open flame. Poisonous gas is created when refrigerant is burned. An electronic leak detector is recommended. Serious or fatal injury may result from improper service procedures.

WARNING: Use extreme care when working around a running engine. Keep hands and fingers clear of the radiator fan, accessory drive belt and all other moving components. Keep away when wearing loose clothing, jewelry or long hair that is not properly secured. Underhood components may become hot to the touch. Be careful not to come into contact with hot engine, A/C and engine cooling system components. Failure to follow these instructions may result in serious or fatal injury.

NOTE: Always conduct the A/C Performance Test as outlined in this group prior to searching for an A/C refrigerant leak. Refer to DIAGNOSIS AND TESTING.

NOTE: The A/C system in this vehicle comes equipped from the factory with fluorescent refrigerant leak detection dye installed in the refrigerant system.

When searching for a refrigerant leak in the A/C system, use an Ultra Violet (UV) light and an electronic leak detector that is designed for refrigerant used on this vehicle. It is important to use only high-quality refrigerant leak detection equipment to properly locate refrigerant system leaks, such as the equipment listed in the team PSE Service Equipment Catalog. When the use of additional leak detection dye is required, use only Chrysler LLC approved refrigerant leak detection dye, available through Mopar®.

LEAK TEST

1. Begin searching for refrigerant leaks using a high quality UV light to detect the fluorescent refrigerant leak detection dye.

- Inspect all connections, plumbing fittings, brazed joints, hoses, hose crimps, service ports, compressor housing, pressure relief valve and A/C condenser for dye
- Inspect the evaporator drain tube and condensate for presence of dye, which indicates a leak from the A/C evaporator
- If equipped with rear A/C, inspect the underbody refrigerant lines, fittings, rear evaporator drain tube and condensate for presence of dye, which indicates a leak from the rear evaporator
- If no leaks are found using a UV light, proceed to **step #2** .

2. If a leak is not found with the leak detection dye, operate the heating and A/C system with the engine at idle under the following conditions for at least 15 minutes, then proceed to **step #3** .
   - Doors or windows open
   - Transmission in Park or Neutral with the parking brake set (depending on transmission application)
   - A/C and heater controls set to outside air, full cool, panel mode, high blower and A/C compressor engaged (If the A/C compressor does not engage, go to **LOW OR EMPTY REFRIGERANT SYSTEM**.
   - If equipped with rear A/C, set rear controls to full cool and high blower
3. Shut the vehicle off and wait at least 5 minutes.
4. Insert the leak detector into the evaporator drain tube and the instrument panel air outlets, to check for evaporator leaks. Check the evaporator tubes at the A/C expansion valve, for leaks not visible behind the expansion valve. Check around the front of the A/C compressor, for compressor shaft seal leaks. Check between the A/C condenser and radiator for condenser leaks not previously visible.
5. If equipped with rear A/C, insert the leak detector into the rear evaporator drain tube and rear air outlets. Check the underbody A/C lines and fittings, evaporator tubes and rear A/C expansion valve.

LOW OR EMPTY REFRIGERANT SYSTEM

NOTE: This procedure should only be done after an A/C Performance Test has been conducted and a refrigerant system leak has NOT been found using the factory installed leak detection dye.

Do the following if the A/C compressor will not engage and a refrigerant leak in the A/C system is suspected. but cannot be found using the factory installed leak detection dye.

1. Recover, evacuate and recharge the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.
2. Operate the heating and A/C system with the engine at idle under the following conditions for at least 15 minutes.
   - Doors or windows open
   - Transmission in Park or Neutral with the parking brake set (depending on transmission application)
   - A/C and heater controls set to outside air, full cool, panel mode, high blower and A/C compressor engaged
   - If equipped with rear A/C, set rear controls to full cool and high blower
3. Shut the vehicle off and return to. Refer to **LEAK TEST**.

STANDARD PROCEDURE

R-134A REFRIGERANT SYSTEM RECOVERY

Fig. 89: Identifying R-134a Refrigerant Recovery/Recycling/Charging Station
Courtesy of CHRYSLER GROUP, LLC

The R-134a refrigerant must be recovered from the A/C system prior to performing any repairs that require disconnection of an A/C refrigerant line.

When recovering the A/C refrigerant system, use an R-134a refrigerant recovery/recycling/charging station (1) that meets SAE standard J2788. Per SAE standard J2788, refrigerant recovery stations must recover 95% of the refrigerant system within 30 minutes at 21.1° C (70° F) and be able to measure the amount of refrigerant removed from the system to an accuracy of 28 grams (1 oz.). See the operating instructions supplied by the equipment manufacturer for proper care and use of this equipment.

NOTE: **A/C system should be tested prior to refrigerant recovery if the use of A/C system sealants are suspected. These sealants have the potential to clog refrigerant recovery equipment and cause vehicle A/C component damage. Various tool manufacturers make tool kits that detect A/C system sealants. See the operating instructions supplied by the equipment manufacturer for proper care and use of this equipment.**

If sealants are detected in an A/C system, the system should be treated as contaminated and replacement of the entire A/C refrigerant system is recommended. A/C systems found to be contaminated with A/C system sealers, A/C stop-leak products or seal conditioners void the warranty for the A/C system.

RECOVERY PROCEDURE

WARNING: Review the safety precautions and warnings in this information before

performing this procedure. Failure to follow these instructions may result in serious injury or death.

CAUTION: Various aftermarket manufacturers produce A/C system sealants that are designed to stop A/C refrigerant system leaks. The use of A/C system sealants may result in damage to A/C refrigerant recovery/evacuation/recharging equipment and/or the vehicle A/C system and are not recommended for use by Chrysler LLC.

CAUTION: A small amount of refrigerant oil is removed from the A/C system each time the refrigerant system is recovered and evacuated. Before charging the A/C system, you MUST replenish any oil lost during the recovery process. See the equipment manufacturer instructions for more information.

1. If use of aftermarket A/C system sealant is suspected, the A/C system should be tested for sealant prior to refrigerant system recovery. See the operating instructions supplied by the equipment manufacturer for proper use and care of this equipment.
2. Connect an R-134a refrigerant recovery/recycling/charging station that meets SAE standard J2788 to the refrigerant system.
3. Recover the A/C refrigerant system following the operating instructions supplied by the recovery/recycling/charging station manufacturer.
4. Disconnect the refrigerant recovery/recycling/charging station from the refrigerant system service ports.
5. Reinstall the caps onto the refrigerant system service ports.

R-1234YF REFRIGERANT SYSTEM RECOVERY

WARNING: Review the safety precautions and warnings in this information before performing this procedure. Failure to follow these instructions may result in serious injury or death.

CAUTION: Various aftermarket manufacturers produce A/C system sealants that are designed to stop A/C refrigerant system leaks. The use of A/C system sealants may result in damage to A/C refrigerant recovery/evacuation/recharging equipment and/or the vehicle A/C system and are not recommended for use by Chrysler LLC.

Fig. 90: R-1234YF Refrigerant Recovery/Recycling/Charging Station
Courtesy of CHRYSLER GROUP, LLC

When servicing the A/C system, an R-1234YF refrigerant recovery/recycling/charging station that meets SAE standard must be used. Per SAE standard, refrigerant recovery stations must recover 95% of the refrigerant system within 30 minutes at 21.1° C (70° F) and be able to measure the amount of refrigerant removed from the system to an accuracy of 28 grams (1 oz.). See the operating instructions supplied by the equipment manufacturer for proper care and use of this equipment.

NOTE: **A/C system should be tested prior to refrigerant recovery if the use of A/C system sealants are suspected. These sealants have the potential to clog refrigerant recovery equipment and cause vehicle A/C component damage. Various tool manufacturers make tool kits that detect A/C system sealants. See the operating instructions supplied by the equipment manufacturer for proper care and use of this equipment.**

If sealants are detected in an A/C system, the system should be treated as contaminated and replacement of the entire A/C refrigerant system is recommended. A/C systems found to be contaminated with A/C system sealers, A/C stop-leak products or seal conditioners void the warranty for the A/C system.

RECOVERY PROCEDURE

WARNING: **Review the safety precautions and warnings in this information before performing this procedure. Failure to follow these instructions may result in serious injury or death.**

CAUTION: **Various aftermarket manufacturers produce A/C system sealants that are designed to stop A/C refrigerant system leaks. The use of A/C system sealants may result in damage to A/C refrigerant recovery/evacuation/recharging equipment and/or the vehicle A/C system and are not recommended for use by Chrysler LLC.**

CAUTION: A small amount of refrigerant oil is removed from the A/C system each time the refrigerant system is recovered and evacuated. Before charging the A/C system, you MUST replenish any oil lost during the recovery process. See the equipment manufacturer instructions for more information.

1. If use of aftermarket A/C system sealant is suspected, the A/C system should be tested for sealant prior to refrigerant system recovery. See the operating instructions supplied by the equipment manufacturer for proper use and care of this equipment.
2. Connect an R-1234YF refrigerant recovery/recycling/charging station that meets SAE standard to the refrigerant system.
3. Recover the A/C refrigerant system following the operating instructions supplied by the recovery/recycling/charging station manufacturer.
4. Disconnect the refrigerant recovery/recycling/charging station from the refrigerant system service ports.
5. Reinstall the caps onto the refrigerant system service ports.

R-134A REFRIGERANT SYSTEM EVACUATE

Fig. 91: Identifying R-134a Refrigerant Recovery/Recycling/Charging Station
Courtesy of CHRYSLER GROUP, LLC

If the A/C refrigerant system has been open to the atmosphere, it must be evacuated before the A/C system can be recharged with R-134a refrigerant.

NOTE: Special effort must be used to prevent moisture from entering the A/C system oil. Moisture in the oil is very difficult to remove and will cause a reliability problem with the A/C compressor.

Moisture and air in the A/C refrigerant system will raise the compressor head pressure above acceptable operating levels. This will reduce the performance of the A/C system and damage the A/C compressor. Moisture will boil at near room temperature when exposed to vacuum. Always use an R-134a refrigerant recovery/recycling/charging station with a vacuum pump (1) that meets SAE standard J2788, or an R-134a compatible manifold gauge set and a stand-alone vacuum pump.

If an A/C compressor is left open to the atmosphere for an extended period of time, it is recommended that the refrigerant oil in the compressor be drained and replaced with new refrigerant oil to reduce the possibility of contaminating the refrigerant system. Refer to **OIL, REFRIGERANT, STANDARD PROCEDURE**.

R-134A EVACUATION PROCEDURE

WARNING: Review the safety precautions and warnings in this information before performing this procedure. Failure to follow these instructions may result in serious injury or death.

CAUTION: A small amount of refrigerant oil is removed from the A/C system each time the refrigerant system is recovered and evacuated. Before charging the A/C system, you MUST replenish any oil lost during the recovery process. See the equipment manufacturer instructions for more information.

1. Recover the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.

NOTE: When connecting service equipment couplers to refrigerant line service ports, verify that the valve of each coupler is fully closed prior to connecting. This will reduce the amount of effort required to make the connections.

2. Connect an R-134a refrigerant recovery/recycling/charging station with a vacuum pump that meets SAE standard J2788 to the refrigerant system, or an R-134a compatible manifold gauge set and a stand-alone vacuum pump (depending on available equipment).
3. Open the refrigerant recovery/recycling/charging station or manifold gauge set valves and start the vacuum pump. The vacuum pump should run a minimum of 45 minutes prior to recharge to eliminate all moisture in system. When the low-side gauge reads to the lowest degree of vacuum possible (approximately -88 kPa (-26 in. Hg) or greater) for 30 minutes, close all valves and turn off vacuum pump. If the refrigerant system fails to reach specified vacuum, the refrigerant system likely has a leak that must be corrected. If the refrigerant system maintains specified vacuum for at least 30 minutes, start the vacuum pump, open the valves and allow the refrigerant system to evacuate an additional 10 minutes.
4. Close the refrigerant recovery/recycling/charging station or manifold gauge set valves. Turn off and disconnect the vacuum pump.
5. Disconnect the refrigerant recovery/recycling/charging station or manifold gauge set from the refrigerant system service ports.
6. Install the caps onto the refrigerant system service ports.

R-1234YF REFRIGERANT SYSTEM EVACUATE

Fig. 92: R-1234YF Refrigerant Recovery/Recycling/Charging Station
Courtesy of CHRYSLER GROUP, LLC

If the A/C refrigerant system has been open to the atmosphere, it must be evacuated before the A/C system can be recharged with R-1234YF refrigerant.

NOTE: Special effort must be used to prevent moisture from entering the A/C system oil. Moisture in the oil is very difficult to remove and will cause a reliability problem with the A/C compressor.

Moisture and air in the A/C refrigerant system will raise the compressor head pressure above acceptable operating levels. This will reduce the performance of the A/C system and damage the A/C compressor. Moisture will boil at near room temperature when exposed to vacuum. Always use an R-1234YF refrigerant recovery/recycling/charging station with a vacuum pump that meets SAE standard, or an R-1234YF compatible manifold gauge set and a stand-alone vacuum pump.

If an A/C compressor is left open to the atmosphere for an extended period of time, it is recommended that the refrigerant oil in the compressor be drained and replaced with new refrigerant oil to reduce the possibility of contaminating the refrigerant system. Refer to **OIL, REFRIGERANT, STANDARD PROCEDURE**.

EVACUATION PROCEDURE

WARNING: Review the safety precautions and warnings in this information before performing this procedure. Failure to follow these instructions may result in serious injury or death.

CAUTION: A small amount of refrigerant oil is removed from the A/C system each

time the refrigerant system is recovered and evacuated. Before charging the A/C system, you MUST replenish any oil lost during the recovery process. See the equipment manufacturer instructions for more information.

1. Recover the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.

NOTE: **When connecting service equipment couplers to refrigerant line service ports, verify that the valve of each coupler is fully closed prior to connecting. This will reduce the amount of effort required to make the connections.**

2. Connect an R-1234YF refrigerant recovery/recycling/charging station with a vacuum pump that meets SAE standard to the refrigerant system, or an R-1234YF compatible manifold gauge set and a stand-alone vacuum pump (depending on available equipment).
3. Open the refrigerant recovery/recycling/charging station or manifold gauge set valves and start the vacuum pump. The vacuum pump should run a minimum of 45 minutes prior to recharge to eliminate all moisture in system. When the low-side gauge reads to the lowest degree of vacuum possible (approximately -88 kPa (-26 in. Hg) or greater) for 30 minutes, close all valves and turn off vacuum pump. If the refrigerant system fails to reach specified vacuum, the refrigerant system likely has a leak that must be corrected. If the refrigerant system maintains specified vacuum for at least 30 minutes, start the vacuum pump, open the valves and allow the refrigerant system to evacuate an additional 10 minutes.
4. Close the refrigerant recovery/recycling/charging station or manifold gauge set valves. Turn off and disconnect the vacuum pump.
5. Disconnect the refrigerant recovery/recycling/charging station or manifold gauge set from the refrigerant system service ports.
6. Install the caps onto the refrigerant system service ports.

R-134A REFRIGERANT SYSTEM CHARGE

Fig. 93: Identifying R-134a Refrigerant Recovery/Recycling/Charging Station
Courtesy of CHRYSLER GROUP, LLC

After all A/C refrigerant system repairs have been completed and the refrigerant system has been evacuated, the A/C system can be recharged with R-134a refrigerant.

When charging the A/C system, use an R-134a refrigerant recovery/recycling/charging station (1) that meets SAE standard J2788. Per SAE standard J2788, refrigerant recovery stations must charge the system to an accuracy of 14 grams (0.5 oz.). See the operating instructions supplied by the equipment manufacturer for proper care and use of this equipment.

R-134A CHARGING PROCEDURE

WARNING: Review the safety precautions and warnings in this information before performing this procedure. Failure to follow these instructions may result in serious injury or death.

CAUTION: A small amount of refrigerant oil is removed from the A/C system each time the refrigerant system is recovered and evacuated. Before charging the A/C system, you MUST replenish any oil lost during the recovery process. See the equipment manufacturer instructions for more information.

1. Recover and evacuate the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.
2. Connect an R-134a refrigerant recovery/recycling/charging station that meets SAE standard J2788 to the refrigerant system.
3. When required, adjust the refrigerant oil level. Refer to **OIL, REFRIGERANT, STANDARD PROCEDURE**.

NOTE: A/C system refrigerant capacity can be found on the HVAC Specification Label, located in the engine compartment.

4. Measure the proper amount of refrigerant and heat it to 52° C (125° F) with the charging station. Refer to **REFRIGERANT, SPECIFICATIONS**. See the operating instructions supplied by the equipment manufacturer for proper use of this equipment.
5. Open both the low and high side valves, then open the charge valve to allow the heated refrigerant to flow into the refrigerant system.
6. When the transfer of refrigerant has stopped, close the valves.

WARNING: Take care not to open the high side (high pressure) valve while performing Step 7. Failure to follow these instructions may result in possible serious or fatal injury.

7. Perform the following if all of the refrigerant charge did not transfer from the dispensing device.
   - Open all of the windows in the vehicle.
   - Set the heating and A/C system so that the A/C compressor is operating and the blower motor is operating at its lowest speed setting.
   - Run the engine at a steady high idle (about 1400 RPM).
   - If the A/C compressor does not operate, test the compressor control circuits and repair as required.
   - Open the low side valve and the charge valve to allow the remaining refrigerant to flow into the refrigerant system.
   - When the transfer of refrigerant has stopped, close the valves.
8. Disconnect the refrigerant recovery/recycling/charging station from the refrigerant system service ports.
9. Reinstall the caps onto the refrigerant system service ports.

R-1234YF REFRIGERANT SYSTEM CHARGE

WARNING: Review the warnings and cautions for this system before performing the procedure. Failure to follow these instructions may result in serious injury or death.

NOTE: The Underhood HVAC Specification Label contains the refrigerant fill specification of the vehicle being serviced.

Fig. 94: R-1234YF Refrigerant Recovery/Recycling/Charging Station
Courtesy of CHRYSLER GROUP, LLC

After all refrigerant system leaks have been repaired and the refrigerant system has been evacuated, a refrigerant charge can be injected into the system. Refer to **PLUMBING, STANDARD PROCEDURE**.

When charging the A/C system, use an R-1234YF refrigerant recovery/recycling/charging station that meets SAE standard. Per SAE standard, refrigerant recovery stations must charge the system to an accuracy of 14 grams (0.5 oz.). See the operating instructions supplied by the equipment manufacturer for proper care and use of this equipment.

CHARGING PROCEDURE

WARNING: Review the safety precautions and warnings in this information before performing this procedure. Failure to follow these instructions may result in serious injury or death.

CAUTION: A small amount of refrigerant oil is removed from the A/C system each time the refrigerant system is recovered and evacuated. Before charging the A/C system, you MUST replenish any oil lost during the recovery process. See the equipment manufacturer instructions for more information.

1. Recover and evacuate the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.
2. Connect an R-1234YF refrigerant recovery/recycling/charging station that meets SAE standard to the refrigerant system.
3. When required, adjust the refrigerant oil level. Refer to **OIL, REFRIGERANT, STANDARD PROCEDURE**.

NOTE: A/C system refrigerant capacity can be found on the HVAC Specification Label, located in the engine compartment.

4. Open both the low and high side valves, then open the charge valve to allow the refrigerant to flow into the refrigerant system.
5. When the transfer of refrigerant has stopped, close the valves.

WARNING: Take care not to open the high side (high pressure) valve while performing Step 7. Failure to follow these instructions may result in possible serious or fatal injury.

6. Perform the following if all of the refrigerant charge did not transfer from the dispensing device.
   - Open all of the windows in the vehicle.
   - Set the heating and A/C system so that the A/C compressor is operating and the blower motor is operating at its lowest speed setting.
   - Run the engine at a steady high idle (about 1400 RPM).
   - If the A/C compressor does not operate, test the compressor control circuits and repair as required.
   - Open the low side valve and the charge valve to allow the remaining refrigerant to flow into the refrigerant system.
   - When the transfer of refrigerant has stopped, close the valves.
7. Disconnect the refrigerant recovery/recycling/charging station from the refrigerant system service ports.
8. Install the caps onto the refrigerant system service ports.

DRIER, A/C RECEIVER

DESCRIPTION

DESCRIPTION

Fig. 95: A/C Condenser & A/C Receiver/Drier
Courtesy of CHRYSLER GROUP, LLC

The A/C receiver/drier (3) is mounted to the left side of the A/C condenser (2) and is on the high-side of the A/C system. The A/C receiver/drier helps remove moisture from the refrigerant, filters the refrigerant, stores any unnecessary refrigerant and retains any refrigerant vapor that may leave the A/C condenser, until it becomes a liquid.

The A/C receiver/drier is integral to the A/C condenser and must be replaced with the condenser as an assembly.

OPERATION

OPERATION

The A/C receiver/drier performs a filtering action to prevent foreign material that may be in the refrigerant from contaminating the A/C expansion valve and the A/C compressor. Refrigerant enters the A/C receiver/drier as a high-pressure, low temperature liquid. Desiccant inside the A/C receiver/drier absorbs any moisture which may have entered and become trapped within the refrigerant system. In addition, during periods of high demand operation of the A/C system, the A/C receiver/drier acts as a reservoir to store surplus refrigerant.

The A/C receiver/drier is integral to the A/C condenser and has no serviceable parts.

CAUTION: The A/C condenser and receiver/drier must be replaced as an assembly if an internal failure of the A/C compressor has occurred. Failure to replace the A/C condenser and receiver/drier can cause serious damage to the replacement A/C compressor.

The A/C receiver/drier cannot be repaired and the A/C condenser and receiver/drier must be replaced as an assembly, if the receiver/drier is leaking or damaged, or if an internal failure of the A/C compressor has

occurred.

COMPRESSOR, A/C

DESCRIPTION

VARIABLE DISPLACEMENT A/C COMPRESSOR

Fig. 96: A/C Compressor, Control Valve & High Pressure Relief Valve
Courtesy of CHRYSLER GROUP, LLC

This A/C compressor has a total displacement of 170 cubic centimeters (10.37 cubic inches) and a control valve (2) and a high pressure relief valve (3) located on the back cover. The A/C compressor is secured to the engine with three bolts.

A label identifying the type of refrigerant and oil is located on the A/C compressor.

OPERATION

A/C CLUTCH

The A/C compressor clutch components provide the means to engage and disengage the A/C compressor from the engine accessory drive belt. When the electromagnetic A/C clutch coil is energized, it magnetically draws the clutch plate into contact with the clutch pulley and drives the compressor shaft. When the coil is not energized, the pulley freewheels on the clutch hub bearing, which is part of the pulley assembly.

A/C compressor clutch engagement is controlled by the Powertrain Control Module (PCM). Refer to the **DTC INDEX** article .

VARIABLE DISPLACEMENT A/C COMPRESSOR

Fig. 97: Cutaway View Of Variable Displacement A/C Compressor (Typical)
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical variable displacement A/C compressor shown in illustration.

The Denso 7SBH17C A/C compressor is a Variable Displacement Compressor (VDC) which is driven by the engine through a LE40 Clutch (1) and pulley (2). This compressor uses an integral control solenoid (3) to reduce or increase the stroke of the pistons (4) within the compressor by automatically adjusting the angle of the swashplate (5).

The A/C compressor draws in low-pressure refrigerant vapor from the A/C evaporator through its suction port. It then compresses the refrigerant into a high-pressure, high-temperature refrigerant vapor, which is then pumped to the A/C condenser through the compressor discharge port. The A/C compressor is lubricated by refrigerant oil that is circulated throughout the refrigerant system with the refrigerant. Refer to **OIL, REFRIGERANT, STANDARD PROCEDURE**.

The A/C compressor is controlled by the HVAC module. The HVAC module calculates compressor displacement required by A/C system load and demand by monitoring vehicle speed, A/C high side pressure, engine speed, evaporator temperature, accelerator pedal position, ambient temperature and A/C-heater request signals. The HVAC module then sends a Pulse Width Modulated (PWM) signal to the A/C compressor control solenoid to increase or decrease refrigerant flow. The amount of refrigerant allowed to pass through the compressor determines the head pressure which controls the angle of the swashplate, which in turn, determines the amount of compressor displacement. When there is no demand for A/C, the swashplate is adjusted to nearly a zero degree angle, which removes compressor torque drag from the engine.

This A/C compressor will reduce the displacement of the compressor based on ambient air temperature. For example; as the outside temperature falls from 27° C (80° F) to 19° C (66° F), the amount of refrigerant flow required through the A/C orifice tube to keep the A/C evaporator cool becomes less, and the swashplate is adjusted to a lower angle, which reduces compressor displacement. However, due to the lower outside air temperature, panel air outlet temperature will not noticeably change.

The A/C compressor control system is diagnosed using a scan tool. Refer to **DIAGNOSIS AND TESTING**.

CAUTION: Do NOT run the engine with a vacuum pump in operation or with a vacuum present within the A/C system when equipped with a variable displacement A/C compressor. Failure to follow this caution will result in serious A/C compressor damage.

CAUTION: Be certain to adjust the refrigerant system oil level when replacing an A/C compressor. Failure to properly adjust the refrigerant oil level can prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

DIAGNOSIS AND TESTING

A/C CLUTCH COIL

The A/C clutch coil electrical circuit is controlled by the Powertrain Control Module (PCM), through the Power Distribution Center (PDC). See Wiring Information for complete HVAC wiring diagrams. Begin testing of a suspected A/C clutch coil problem by performing the preliminary checks.

PRELIMINARY CHECKS

1. Using a scan tool, check for any Diagnostic Trouble Codes (DTCs). If no DTCs are found, go to Step 2. If any DTCs are found, repair as required.
2. If the A/C clutch still will not engage, verify the refrigerant charge level by conducting the A/C Performance test. Refer to **DIAGNOSIS AND TESTING**. If the refrigerant charge level is OK, go to **COIL RESISTANCE TEST** and **COIL CURRENT DRAW TEST**. If the refrigerant charge level is not OK, adjust the refrigerant charge as required.

COIL RESISTANCE TEST

1. Disconnect and isolate the negative battery cable.
2. Disconnect the wire harness connector from the A/C clutch coil connector.
3. Use an ohm meter and Back Probe Tool (special tool #6801, Terminal Probe) and measure the resistance of the A/C clutch coil at the coil connector terminals.
4. See A/C Clutch Coil Specifications table for acceptable A/C clutch coil resistance. Specifications apply for a work area temperature of 21° C (70° F).
   a. If the A/C clutch coil reading is below specifications, the coil is shorted and must be replaced.
   b. If the A/C clutch coil reading is above specifications, the coil is open and must be replaced.

COIL CURRENT DRAW TEST

1. Verify the battery state of charge. Refer to **BATTERY, DIAGNOSIS AND TESTING** .
2. Connect an ammeter (0 to 10 ampere scale selected) in series with the A/C clutch coil feed terminal using Back Probe Tool (special tool #6801, Terminal Probe). Connect a voltmeter (0 to 20 volt scale selected)

to measure voltage across the battery and the A/C clutch coil.

3. With the A/C heater control in the A/C mode and the blower motor at low speed, start the engine and allow it to run at a normal idle speed.
4. The A/C clutch should engage immediately and the clutch coil supply voltage should be within two volts of the battery voltage. If the clutch coil supply voltage is OK, go to 5. If the coil supply voltage is not within two volts of battery voltage, test the clutch coil feed circuit for excessive voltage drop and repair as necessary.
5. See **A/C CLUTCH COIL SPECIFICATIONS** for acceptable A/C clutch coil current draw. Specifications apply for a work area temperature of 21° C (70° F). If voltage is more than 12.5 volts, add electrical loads by turning on electrical accessories until voltage reads below 12.5 volts.
   a. If the A/C clutch coil current reading is zero, the coil is open and must be replaced.
   b. If the A/C clutch coil current reading is above specifications, the coil is shorted and must be replaced.

PRELIMINARY-CHECKS

A/C CLUTCH COIL SPECIFICATIONS

Coil Resistance	Coil Current Draw
4.0 ± 0.2 ohms	2.0 amps Max @ 12V ± 0.5V @ 21° C (70° F)

A/C SYSTEM NOISE

CAUTION: The A/C condenser and receiver/drier must be replaced as an assembly if an internal failure of the A/C compressor has occurred. Failure to replace the A/C condenser and receiver/drier can cause serious damage to the replacement A/C compressor.

When investigating an A/C system related noise, you must first know the conditions under which the noise occurs. These conditions include: weather, vehicle speed, transmission in gear or neutral, engine speed, engine temperature, and any other special conditions. Noises that develop during A/C operation can often be misleading. For example: What sounds like a failed front engine bearing or connecting rod, may be caused by loose bolts, nuts, mounting brackets or a loose compressor clutch assembly.

Drive belts are speed sensitive. At different engine speeds and depending upon drive belt tension, drive belts can develop noises that are mistaken for an A/C compressor noise. Improper drive belt tension can cause a misleading noise when the compressor clutch is engaged, which may not occur when the compressor clutch is disengaged. Check the accessory drive belt condition and tension as described in Cooling before beginning this procedure.

1. Select a quiet area for testing. Duplicate the complaint conditions as much as possible. Turn the A/C compressor On and Off several times to clearly identify the compressor noise.
2. Loosen all of the compressor mounting hardware and retighten. Check the A/C clutch. Be certain that the clutch coil, clutch plate and pulley are mounted securely to the A/C compressor, and that the clutch plate and pulley are properly aligned and have the correct air gap.
3. To duplicate high-ambient temperature conditions (high head pressure), restrict the air flow through the

A/C condenser. Install a manifold gauge set or a scan tool to be certain that the high side pressure does not exceed 3.53 Mpa (512 psi).

4. Check the refrigerant system plumbing for incorrect routing, rubbing or interference, which can cause unusual noises. Also check the refrigerant lines and hoses for kinks or sharp bends that will restrict refrigerant flow, which can cause noises.
5. Listen to the A/C compressor while the clutch is engaged and disengaged. Probe the A/C compressor with an engine stethoscope or a long screwdriver with the handle held to your ear to better localize the source of the noise. If the noise is from the A/C compressor, conduct the A/C Performance test and verify refrigerant charge level. Refer to **DIAGNOSIS AND TESTING**.
6. If the A/C clutch and refrigerant charge level is OK, but the noise persists, replace the A/C compressor. Refer to **COMPRESSOR, A/C, REMOVAL**.

STANDARD PROCEDURE

STANDARD PROCEDURE - A/C CLUTCH INSPECTION

Fig. 98: Identifying Compressor Shaft, Clutch Plate & Shim
Courtesy of CHRYSLER GROUP, LLC

Examine the friction surfaces of the pulley and clutch plate (2) for wear. The pulley and clutch plate should be replaced if excessive wear or scoring is found.

If the friction surfaces are oily, inspect the shaft and nose area of the A/C compressor (1) for refrigerant oil. If refrigerant oil is found, the compressor shaft seal is leaking and the A/C compressor must be replaced.

Check the pulley bearing for roughness or excessive leakage of grease. Replace the pulley and bearing assembly, if required.

REMOVAL

2.0L, 2.4L ENGINE

WARNING: Review the warnings and cautions for this system before performing the procedure. Failure to follow these instructions may result in serious injury or death.

CAUTION: The A/C condenser and receiver/drier must be replaced as an assembly if an internal failure of the A/C compressor has occurred. Failure to replace the A/C condenser and receiver/drier can cause serious damage to the replacement A/C compressor.

NOTE: The A/C compressor may be removed and repositioned without disconnecting the refrigerant lines or discharging the refrigerant system. Discharging is not necessary if servicing the A/C clutch, clutch coil or engine.

1. Disconnect and isolate the negative battery cable.
2. Recover the refrigerant from the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.
3. Remove the accessory drive belt. Refer to **BELT, SERPENTINE, REMOVAL** .

Fig. 99: A/C Discharge Line/Suction Line Manifold & Nut
Courtesy of CHRYSLER GROUP, LLC

4. Remove nut (2) and the A/C discharge line/suction line manifold (1) from the A/C compressor.
5. Remove and discard the O-ring seals.
6. Install tape or plugs into the opened refrigerant line fittings and the compressor ports.

Fig. 100: A/C Compressor High Pressure Switch Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

7. Disconnect the A/C compressor high pressure switch wire harness connector (1).

Fig. 101: A/C Compressor Clutch Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

8. Disconnect the A/C compressor clutch wire harness connector (1) and detach the wire harness from the A/C compressor.

Fig. 102: Bolts & A/C Compressor
Courtesy of CHRYSLER GROUP, LLC

9. Remove the bolts (1) and the A/C compressor (2).

3.2L ENGINE

WARNING: Review the warnings and cautions for this system before performing the procedure. Failure to follow these instructions may result in serious injury or death.

NOTE: The A/C condenser must be replaced if an internal failure of the A/C compressor has occurred. Refer to CONDENSER, A/C, REMOVAL.

NOTE: The A/C compressor may be removed and repositioned without disconnecting the refrigerant lines or discharging the refrigerant system. Discharging is not necessary if servicing the A/C clutch, clutch coil or engine.

1. Recover the refrigerant from the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.
2. Disconnect and isolate the negative battery cable.
3. Remove the accessory drive belt. Refer to **BELT, SERPENTINE, REMOVAL** .

Fig. 103: A/C Compressor, IHX Manifold Line & Fasteners
Courtesy of CHRYSLER GROUP, LLC

4. Remove the bolt (1) that secures the A/C suction line and A/C discharge lines (2) to the A/C compressor (3).
5. Disconnect the refrigerant lines from the A/C compressor and remove and discard the seals.
6. Install plugs in, or tape over all of the opened refrigerant line fittings and the compressor ports.

Fig. 104: Removing/Installing A/C compressor
Courtesy of CHRYSLER GROUP, LLC

7. Disconnect the engine wire harness (1) from the A/C compressor (2).

8. Support the A/C compressor and remove the three bolts (3).
9. Remove the A/C compressor from the engine compartment.

A/C CLUTCH

Fig. 105: Compressor Shaft Bolt, Clutch Plate & A/C Compressor
Courtesy of CHRYSLER GROUP, LLC

1. Remove the A/C compressor (3) and place it on a workbench. Refer to **COMPRESSOR, A/C, REMOVAL**.
2. Remove the compressor shaft bolt (1). A band-type oil filter wrench or a strap wrench may be used to hold the clutch plate (2) from rotating during bolt removal.

Fig. 106: Identifying Compressor Shaft, Clutch Plate & Shim
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not pry between the clutch plate and the pulley and bearing assembly to remove the clutch plate from the compressor shaft as this may damage the clutch plate.

NOTE: Use care not to misplace any clutch shim(s) during removal of the clutch plate, as they may be reused during the clutch plate installation process.

3. Tap the clutch plate (2) lightly with a plastic mallet to release it from the splines on the compressor shaft (1) and remove the clutch plate and shim(s) (3).

Fig. 107: Compressor Pulley Snap Ring, Pulley And Bearing Assembly & A/C Compressor
Courtesy of CHRYSLER GROUP, LLC

4. Using snap ring pliers, remove the snap ring (1) that secures the pulley and bearing assembly (2) to the A/C compressor (3) and remove the pulley and bearing assembly.

Fig. 108: Compressor Clutch Coil Snap Ring, A/C Clutch Coil & A/C Compressor
Courtesy of CHRYSLER GROUP, LLC

5. Using snap ring pliers, remove the snap ring (1) that secures the A/C clutch coil (2) to the A/C compressor (3) and remove the coil.

INSTALLATION

2.0L, 2.4L ENGINE

CAUTION: If the A/C compressor is being replaced, be certain to adjust the refrigerant system oil level. Failure to properly adjust the refrigerant oil level will prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

CAUTION: The A/C condenser and receiver/drier must be replaced as an assembly if an internal failure of the A/C compressor has occurred. Failure to replace the A/C condenser and receiver/drier can cause serious damage to the replacement A/C compressor.

CAUTION: The A/C condenser and receiver/drier must be replaced as an assembly if an internal failure of the A/C compressor has occurred. Failure to replace the A/C condenser and receiver/drier can cause serious damage to the replacement A/C compressor.

Fig. 109: Bolts & A/C Compressor
Courtesy of CHRYSLER GROUP, LLC

NOTE: **When replacing multiple A/C system components, see the Refrigerant Oil Capacities chart to determine how much oil should be removed from the new A/C compressor. Refer to OIL, REFRIGERANT, STANDARD PROCEDURE.**

NOTE: **Replacement of the refrigerant line O-ring seals is required anytime a refrigerant line is disconnected from the A/C compressor. Failure to replace the rubber O-ring seals may result in a refrigerant system leak.**

1. If the A/C compressor (1) is being replaced, the refrigerant oil in the old compressor must be first drained and measured. Then the oil in the new A/C compressor must be drained. Finally, the new compressor must be refilled with the same amount of new refrigerant oil that was drained out of the old compressor. When replacing multiple A/C system components, see the Refrigerant Oil Capacities chart to determine how much oil should be added to the refrigerant system. Refer to **OIL, REFRIGERANT, STANDARD PROCEDURE**. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
2. Install the A/C compressor (2) and tighten the bolts (1) to the proper. Refer to **SPECIFICATIONS**.

Fig. 110: A/C Compressor Clutch Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

3. Attach the A/C wire harness to the compressor and connect the A/C compressor clutch wire harness connector (1).

Fig. 111: A/C Compressor High Pressure Switch Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

4. Connect the A/C compressor high pressure switch wire harness connector (1).

Fig. 112: A/C Discharge Line/Suction Line Manifold & Nut
Courtesy of CHRYSLER GROUP, LLC

5. Remove the tape or plugs from the opened refrigerant line fittings and the compressor ports.
6. Lubricate new O-ring seals with clean refrigerant oil and install them onto the refrigerant line fittings. Use only the specified O-ring seals as they are made of a special material for the system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
7. Install the A/C discharge line/suction line manifold (1) to the A/C compressor (3) and tighten the nut (1) to the proper. Refer to **SPECIFICATIONS**.
8. Install the accessory drive belt. Refer to **BELT, SERPENTINE, INSTALLATION** .
9. Evacuate and charge the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.
10. Install the air cleaner resonator. Refer to **RESONATOR, AIR CLEANER, INSTALLATION** **RESONATOR, AIR CLEANER, INSTALLATION** .
11. Install the air cleaner body. Refer to **BODY, AIR CLEANER, INSTALLATION** **BODY, AIR CLEANER, INSTALLATION** **BODY, AIR CLEANER, INSTALLATION** .
12. Connect the negative battery cable.

3.2L ENGINE

CAUTION: If the A/C compressor is being replaced, be certain to adjust the refrigerant system oil level. Failure to properly adjust the refrigerant oil level will prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

NOTE: The A/C condenser must be replaced if an internal failure of the A/C compressor has occurred. Refer to CONDENSER, A/C, REMOVAL.

NOTE: **When replacing multiple A/C system components, see the Refrigerant Oil Capacities chart to determine how much oil should be removed from the new A/C compressor. Refer to OIL, REFRIGERANT, STANDARD PROCEDURE.**

NOTE: **Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is disconnected. Failure to replace the rubber O-ring seals and metal gaskets may result in a refrigerant system leak.**

1. If the A/C compressor (2) is being replaced, the refrigerant oil in the old compressor must be first drained and measured. Then the oil in the new A/C compressor must be drained. Finally, the new compressor must be refilled with the same amount of new refrigerant oil that was drained out of the old compressor. When replacing multiple A/C system components, see the Refrigerant Oil Capacities chart to determine how much oil should be added to the refrigerant system. Refer to **OIL, REFRIGERANT, STANDARD PROCEDURE**. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

Fig. 113: Removing/Installing A/C compressor
Courtesy of CHRYSLER GROUP, LLC

2. Position the A/C compressor (2) to the engine and loosely install the three bolts (3) that secure the A/C compressor to the engine.
3. Tighten the A/C compressor retaining bolts to the proper. Refer to **SPECIFICATIONS**.
4. Connect the engine wire harness (1) to the A/C compressor.

Fig. 114: A/C Compressor, IHX Manifold Line & Fasteners
Courtesy of CHRYSLER GROUP, LLC

5. Remove the tape or plugs from the opened refrigerant line fittings and the A/C compressor ports.
6. Lubricate new seals with clean refrigerant oil and install them onto the refrigerant line fittings. Use only the specified seals as they are made of a special material for the system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
7. Install the A/C suction line and the A/C discharge line (2) onto the A/C compressor (3).
8. Install the bolt (1) that secures the refrigerant lines to the A/C compressor and tighten the bolt to the proper. Refer to **SPECIFICATIONS**.
9. Install the accessory drive belt. Refer to **BELT, SERPENTINE, INSTALLATION** .

NOTE: The A/C condenser must be replaced if an internal failure of the A/C compressor has occurred. Refer to CONDENSER, A/C, REMOVAL.

10. Connect the negative battery cable.
11. Evacuate and charge the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.

A/C CLUTCH

Fig. 115: Compressor Clutch Coil Snap Ring, A/C Clutch Coil & A/C Compressor
Courtesy of CHRYSLER GROUP, LLC

1. Align the dowel pin on the back of the A/C clutch coil (2) with the hole in the front of the A/C compressor (3) and install the coil onto the compressor.

CAUTION: The snap ring must be fully and properly seated in the groove or it may vibrate out, resulting in a clutch failure and severe damage to the A/C compressor.

2. Using snap ring pliers, install the snap ring (1) that secures the A/C clutch coil (2) to the A/C compressor (3). Be certain that the snap ring is fully and properly seated in the groove.

Fig. 116: Compressor Pulley Snap Ring, Pulley And Bearing Assembly & A/C Compressor
Courtesy of CHRYSLER GROUP, LLC

CAUTION: When installing the pulley and bearing assembly, DO NOT mar the friction surfaces of the pulley or premature failure of the A/C clutch may result.

3. Install the pulley and bearing assembly (2) onto the A/C compressor (3). If necessary, gently tap the pulley onto the compressor using a block of wood placed on the pulley friction surface.
4. Using snap ring pliers, install the snap ring (1) that secures the pulley and bearing assembly to the A/C compressor. Be certain that the snap ring is fully and properly seated in the groove.

Fig. 117: Identifying Compressor Shaft, Clutch Plate & Shim
Courtesy of CHRYSLER GROUP, LLC

5. If the original clutch plate (2) and pulley and bearing assembly are to be reused, reinstall the original shim (s) (3) onto the compressor shaft (1). If a new clutch plate and pulley and bearing assembly are being used, install a trial stack of shims 2.54 mm (0.010 in.) thick onto the compressor shaft.

Fig. 118: Compressor Shaft Bolt, Clutch Plate & A/C Compressor
Courtesy of CHRYSLER GROUP, LLC

6. Install the clutch plate (2) onto the A/C compressor (3).
7. Install the compressor shaft bolt (1) and tighten to the proper. Refer to **SPECIFICATIONS**.

NOTE: **The shims may compress after tightening the shaft bolt. Check the air gap in four or more places to verify the air gap is correct. Spin the pulley before performing a final check of the air gap.**

8. With the clutch plate assembled tight against the shim(s), measure the air gap between the clutch plate and the pulley and bearing assembly. If the air gap is not within, add or subtract shims as needed until the correct air gap is obtained. Refer to **SPECIFICATIONS**.
9. Install the A/C compressor. Refer to **COMPRESSOR, A/C, INSTALLATION**.

CONDENSER, A/C

DESCRIPTION

DESCRIPTION

Fig. 119: A/C Condenser & A/C Receiver/Drier
Courtesy of CHRYSLER GROUP, LLC

The A/C condenser is located in the front of the engine compartment behind the front fascia. The A/C condenser is a heat exchanger that allows the high-pressure refrigerant gas being discharged by the A/C compressor to give up its heat to the air passing over the condenser fins (2), which causes the refrigerant to cool and change to a liquid state.

The A/C condenser is equipped with tapping blocks for the A/C refrigerant lines (1). The A/C condenser has an integral A/C receiver/drier (3).

OPERATION

OPERATION

When air passes through the fins of the A/C condenser, the high-pressure refrigerant gas within the A/C condenser gives up its heat. The refrigerant then condenses as it leaves the A/C condenser and becomes a high-pressure liquid. The volume of air flowing over the condenser fins is critical to the proper cooling performance of the A/C system. Therefore, it is important that there are no objects placed in front of the radiator grille openings at the front of the vehicle or foreign material on the condenser fins that might obstruct proper air flow. Also, any factory-installed air seals or shrouds must be properly reinstalled following radiator or A/C condenser service.

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is disconnected. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.

The A/C condenser has no serviceable parts except for the O-ring seals and gaskets. The O-ring seals used on the connections are made from a special type of rubber not affected by R-1234YF refrigerant. The O-ring seals and gaskets must be replaced whenever a refrigerant line is disconnected from the A/C condenser.

The A/C condenser cannot be repaired and must be replaced if leaking or damaged.

REMOVAL

REMOVAL

WARNING: Review the warnings and cautions for this system before performing the procedure. Failure to follow these instructions may result in serious injury or death.

CAUTION: Before removing the A/C condenser, note the location of each of the radiator/condenser air seals. These air seals are used to direct air through the A/C condenser and radiator. The air seals must be reinstalled in their proper locations in order for the A/C and engine cooling systems to perform as designed.

1. Recover the refrigerant from the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.
2. Disconnect and isolate the negative battery cable.
3. Partially remove the radiator. Refer to **RADIATOR, ENGINE COOLING, REMOVAL** .

Fig. 120: Transmission Oil Cooler
Courtesy of CHRYSLER GROUP, LLC

4. Unbolt the transmission oil cooler (2) if equipped and move to the side. Refer to **COOLER, TRANSMISSION OIL, REMOVAL** .

Fig. 121: A/C Condenser, Liquid Line, Discharge Line & Fasteners
Courtesy of CHRYSLER GROUP, LLC

5. Disconnect the liquid line (3) and the discharge line (2) from the condenser.
6. Remove and discard the O-ring seals and gasket and install plugs in, or tape over the opened refrigerant line fittings and ports.
7. Remove the condenser from the vehicle.

INSTALLATION

INSTALLATION

CAUTION: Be certain to adjust the refrigerant oil level when servicing the A/C refrigerant system. Failure to properly adjust the refrigerant oil level will prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

NOTE: When replacing multiple A/C system components, see the Refrigerant Oil Capacities chart to determine how much oil should be added to the refrigerant system. Refer to OIL, REFRIGERANT, STANDARD PROCEDURE.

NOTE: If only the A/C condenser is being replaced, add 20 milliliters (0.7 fluid ounce) of refrigerant oil to the refrigerant system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is disconnected. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.

1. Position the condenser in the vehicle.

2. Install the radiator. Refer to **RADIATOR, ENGINE COOLING, INSTALLATION** .

Fig. 122: A/C Condenser, Liquid Line, Discharge Line & Fasteners
Courtesy of CHRYSLER GROUP, LLC

3. Remove the tape or plugs from the opened refrigerant line fittings and ports.
4. Connect the liquid line (3) and discharge line (2) to the condenser and tighten the bolts to the proper. Refer to **SPECIFICATIONS**.

Fig. 123: Transmission Oil Cooler
Courtesy of CHRYSLER GROUP, LLC

5. Install the transmission oil cooler (2) if equipped. Refer to **COOLER, TRANSMISSION OIL, INSTALLATION** .
6. Connect the negative battery cable.

7. Evacuate the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.
8. If the condenser is being replaced, add 20 milliliters (0.7 fluid once) of refrigerant oil to the refrigerant system. When replacing multiple components, see the Refrigerant Oil Capacities chart to determine how much oil should be added to the refrigerant system. Refer to **OIL, REFRIGERANT, STANDARD PROCEDURE**.
9. Charge the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.

CORE, HEATER

DESCRIPTION

DESCRIPTION

Fig. 124: Heater Core
Courtesy of CHRYSLER GROUP, LLC

The heater core is mounted in the HVAC housing, which is located behind the instrument panel. The heater core is a heat exchanger made of rows of aluminum tubes and fins (1). The heater core is positioned within the HVAC housing so that only the selected amount of air entering the housing passes through the heater core, before being distributed through the heating and A/C system ducts and outlets. One end of the heater core is fitted with a tank that includes the fittings for the heater core tubes (2).

The HVAC housing must be removed from the vehicle for service of the heater core.

OPERATION

OPERATION

Engine coolant is circulated through the heater hoses to the heater core at all times. As the coolant flows through the heater core, heat is removed from the engine and is transferred to the heater core tubes and fins. Air

directed through the heater core picks up the heat from the heater core fins. The blend-air door allows control of the heater output air temperature by regulating the amount of air flowing through the heater core. The blower motor speed controls the volume of air flowing through the HVAC housing.

The heater core cannot be repaired and it must be replaced if inoperative, leaking or damaged.

REMOVAL

REMOVAL

NOTE: The HVAC housing assembly must be removed from vehicle for service of the heater core.

1. Remove the HVAC housing assembly and place it on a workbench. Refer to **HOUSING, HVAC, REMOVAL**.

Fig. 125: Removing/Installing Heater Core Tubing Cover
Courtesy of CHRYSLER GROUP, LLC

2. Remove the wire harness from the retaining clips (2) on the heater core cover.
3. Remove the retaining screws (1) from the heater core tubing cover and remove the heater core tubing cover from the left side of HVAC housing.

Fig. 126: Removing/Installing Heater Core
Courtesy of CHRYSLER GROUP, LLC

4. Remove heater core (1) from the left side of HVAC housing (2).

INSTALLATION

INSTALLATION

Fig. 127: Removing/Installing Heater Core
Courtesy of CHRYSLER GROUP, LLC

1. Install heater core (1) into the left side of the HVAC housing (2).

Fig. 128: Removing/Installing Heater Core Tubing Cover
Courtesy of CHRYSLER GROUP, LLC

2. Position the heater core tubing cover onto the left side of the HVAC housing and tighten the screws (1) to the proper. Refer to **SPECIFICATIONS**.
3. Fasten the wire harness into the retaining clips (2) on the tubing cover.
4. Install the HVAC housing assembly. Refer to **HOUSING, HVAC, INSTALLATION**.

CORE, SERVICE PORT VALVE

DESCRIPTION

DESCRIPTION

Refrigerant system service ports are used to recover, recycle, evacuate, charge and test the A/C refrigerant system. Unique sizes are used on the two service ports depending on the type of refrigerant system used to ensure the system is not accidentally contaminated with the wrong refrigerant or by service equipment used for another refrigerant.

- On the 2.0L and 2.4L engine, the high side service port is located on the A/C suction/distribution line in front of the engine by the A/C compressor.
- On the 2.0L and 2.4L engine, the low side service port is located on the Internal Heat Exchanger (IHX).
- On the 3.2L engine, the high side service port is located on the A/C suction line.
- On the 3.2L engine, the low side service port is located on the IHX.

Both the high side and low side A/C service port valve cores are serviceable.

NOTE: The protective cap aids in service port sealing and helps protect the refrigerant system from contamination. Remember to always reinstall the protective cap onto the service port when refrigerant system service is complete.

Each of the service ports has a threaded plastic protective cap installed over it from the factory. The service port caps are serviceable items.

REMOVAL

REMOVAL

WARNING: Review the warnings and cautions for this system before performing the procedure. Failure to follow these instructions may result in serious injury or death.

Fig. 129: Identifying A/C Service Port Components
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical A/C service port shown in illustration.

1. Remove the protective cap (1) from the service port (2).
2. Recover the refrigerant from the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.
3. Using a Schrader-type valve core tool, remove the valve core (3) from the service port.
4. Install a plug in, or tape over the opened service port(s).

INSTALLATION

INSTALLATION

Fig. 130: Identifying A/C Service Port Components
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical A/C service port shown in illustration.

1. Lubricate the valve core (3) with clean refrigerant oil prior to installation. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
2. Remove the tape or plug from the service port (2).

CAUTION: A valve core that is not fully seated in the A/C service port can result in damage to the valve during refrigerant system evacuation and charge. Such damage may result in a loss of system refrigerant while uncoupling the charge adapters.

3. Using a Schrader-type valve core tool, install and tighten the valve core into the service port(s).

CAUTION: Do NOT run the engine with a vacuum pump in operation or with a vacuum present within the A/C system. Failure to follow this caution will result in serious A/C compressor damage.

4. Evacuate the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.
5. Charge the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.

NOTE: The protective cap helps aid in service port sealing and helps protect the refrigerant system from contamination. Remember to always reinstall the protective cap onto the service port when refrigerant system service is complete.

6. Install the protective cap (1) onto the service port.

EVAPORATOR, A/C

DESCRIPTION

DESCRIPTION

Fig. 131: Tapping Block, Evaporator Fins, A/C Evaporator & A/C Evaporator Tubes
Courtesy of CHRYSLER GROUP, LLC

The A/C evaporator (3) for the heating-A/C system is mounted in the HVAC housing, which is located behind the instrument panel. The A/C evaporator and its insulator are positioned within the HVAC housing so that all air entering the housing must pass over the evaporator fins (2) before it is distributed through the heating-A/C system ducts and outlets.

A tapping block (1) and O-ring seals are used to connect and seal the A/C evaporator tubes (4) to the underhood refrigerant lines.

The A/C evaporator can only be serviced by removing and disassembling the HVAC housing assembly.

OPERATION

OPERATION

Refrigerant enters the A/C evaporator from the A/C expansion valve as a low-temperature, low-pressure mixture of liquid and gas. As air flows over the fins of the A/C evaporator, the humidity in the air condenses on the fins, and the heat from the air is absorbed by the refrigerant. Heat absorption causes the refrigerant to boil and vaporize. The refrigerant becomes a low-pressure gas when it leaves the A/C evaporator.

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is disconnected. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.

The A/C evaporator has no serviceable parts except for the O-ring seals. The O-ring seals used on the connections are made from a special type of rubber not affected by R-1234YF refrigerant.

The A/C evaporator cannot be repaired and must be replaced if leaking or damaged.

REMOVAL

REMOVAL

NOTE: The HVAC housing assembly must be removed from vehicle and disassembled for service of the A/C evaporator.

1. Remove the HVAC housing and place it on a workbench. Refer to **HOUSING, HVAC, REMOVAL**.
2. Remove the air inlet housing. Refer to **HOUSING, HVAC, REMOVAL**.
3. Remove the heater core. Refer to **CORE, HEATER, REMOVAL**.
4. Remove the blower motor. Refer to **MOTOR, BLOWER, REMOVAL**.
5. Remove the air distribution housing. Refer to **HOUSING, HVAC, REMOVAL**.
6. Remove the HVAC wiring harness.

Fig. 132: HVAC Housing & Fasteners
Courtesy of CHRYSLER GROUP, LLC

7. Remove the eight screws (1 and 3) that secure the left side of the HVAC housing to the right side of the HVAC housing (2) and remove the right side of the housing.

Fig. 133: HVAC Housing & Case Separator
Courtesy of CHRYSLER GROUP, LLC

8. Remove the case separator (1) from the HVAC housing (2).

Fig. 134: A/C Evaporator, HVAC Housing & Tubing Cover
Courtesy of CHRYSLER GROUP, LLC

9. Remove the tubing cover (3) from the A/C evaporator tubing.
10. Carefully lift the A/C evaporator (1) out of the left side of the HVAC housing (2).

INSTALLATION

INSTALLATION

CAUTION: Be certain to adjust the refrigerant oil level when servicing the A/C refrigerant system. Failure to properly adjust the refrigerant oil level will prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

NOTE: When replacing multiple A/C system components, see the Refrigerant Oil Capacities chart to determine how much oil should be added to the refrigerant system. Refer to OIL, REFRIGERANT, STANDARD PROCEDURE.

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is disconnected. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.

Fig. 135: A/C Evaporator, HVAC Housing & Tubing Cover
Courtesy of CHRYSLER GROUP, LLC

1. Install the A/C evaporator (1) into the left side of the HVAC housing (2). Make sure that the evaporator drain within the HVAC housing is clean and unrestricted and that the insulator around the A/C evaporator is properly installed.
2. Install the cover (3) onto the A/C evaporator tubing.

Fig. 136: HVAC Housing & Case Separator
Courtesy of CHRYSLER GROUP, LLC

3. Install the case separator (1) into the HVAC housing (2).

Fig. 137: HVAC Housing & Fasteners
Courtesy of CHRYSLER GROUP, LLC

4. Position the right side of the HVAC housing (2) onto the left side of the HVAC housing and install the eight screws (1 and 3) that secure the left and the right side of the HVAC housing together. Tighten the screws to 2.2 N.m (20 in lbs.).

5. Install the HVAC wiring harness. Make sure the harness is routed through all wiring retainers.
6. Install the air distribution housing. Refer to **HOUSING, HVAC, INSTALLATION**.
7. Install the blower motor. Refer to **MOTOR, BLOWER, INSTALLATION**.
8. Install the heater core. Refer to **CORE, HEATER, INSTALLATION**.
9. Install the cabin air filter. Refer to **FILTER, CABIN AIR, INSTALLATION**.
10. Install the air inlet housing. Refer to **HOUSING, HVAC, INSTALLATION**.
11. Install the HVAC housing. Refer to **HOUSING, HVAC, INSTALLATION**.
12. If the A/C evaporator is being replaced, add 20 milliliters (0.7 fluid ounce) of refrigerant oil to the refrigerant system. When replacing multiple A/C system components, see the Refrigerant Oil Capacities chart to determine how much oil should be added to the refrigerant system. Refer to **OIL, REFRIGERANT, STANDARD PROCEDURE**. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

LINE, A/C DISCHARGE

REMOVAL

2.0L, 2.4L ENGINE

WARNING: Review the safety precautions and warnings in this information before performing this procedure. Failure to follow these instructions may result in serious injury or death.

NOTE: The lower portion of the A/C suction line is only serviced as an assembly with the A/C discharge line.

1. Disconnect and isolate the negative battery cable.
2. Remove the air cleaner body. Refer to **BODY, AIR CLEANER, REMOVAL** **BODY, AIR CLEANER, REMOVAL** **BODY, AIR CLEANER, REMOVAL** .
3. Remove the air cleaner resonator. Refer to **RESONATOR, AIR CLEANER, REMOVAL** **RESONATOR, AIR CLEANER, REMOVAL** .
4. Recover the refrigerant from the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.

Fig. 138: A/C Suction/Liquid Line Manifold & Nut
Courtesy of CHRYSLER GROUP, LLC

5. Remove nut (3) and the A/C suction/liquid line manifold (2) from the A/C condenser.

Fig. 139: Seal, Discharge Line & Manifold
Courtesy of CHRYSLER GROUP, LLC

6. Detach the suction line (2) from manifold (3). Remove and discard the seals (1).
7. Install plugs in, or tape over the opened refrigerant line fittings and the condenser and suction line ports.
8. Remove the splash shield from the right side frame rail. Refer to **SHIELD, SPLASH, FRONT WHEELHOUSE, REMOVAL** **SHIELD, SPLASH, REAR WHEELHOUSE, REMOVAL** .
9. Remove nut (3) and disconnect the lower suction line (4). Remove and discard the seal (1).
10. Install plugs in, or tape over the opened refrigerant line fittings and the condenser and suction line ports.

Fig. 140: A/C Discharge Line/Suction Line Manifold & Nut
Courtesy of CHRYSLER GROUP, LLC

11. Remove the nut (2) and the A/C suction and discharge line (2) from the A/C compressor. Discard the O-ring seal and gasket.
12. Install plugs in, or tape over the opened discharge line fitting and the compressor port.

3.2L ENGINE

WARNING: Review the safety precautions and warnings in this information before performing this procedure. Failure to follow these instructions may result in serious injury or death.

1. Disconnect and isolate the negative battery cable.
2. Remove the air cleaner body. Refer to **BODY, AIR CLEANER, REMOVAL** **BODY, AIR CLEANER, REMOVAL** **BODY, AIR CLEANER, REMOVAL** .
3. Recover the refrigerant from the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.

Fig. 141: View Of Discharge Line, Liquid Line & Fasteners
Courtesy of CHRYSLER GROUP, LLC

4. Remove nuts (3) and separate the A/C discharge (1) and liquid line (2) manifolds from the Internal Heat Exchanger (IHX).
5. Remove and discard the seals.
6. Install plugs in, or tape over the opened refrigerant line fittings.
7. Remove the engine belly pan.
8. Remove the upper radiator close out panel.
9. Remove the right side radiator air deflector.

Fig. 142: A/C Condenser, Liquid Line, Discharge Line & Fasteners
Courtesy of CHRYSLER GROUP, LLC

10. Remove the line bracket bolt (1) from the radiator.
11. Remove the bolt (3) and disconnect the liquid line.
12. Remove the bolt (2) and disconnect the discharge line.
13. Remove and discard the seals.
14. Install plugs in, or tape over the opened refrigerant line fittings and ports.

Fig. 143: A/C Service Port & Bracket
Courtesy of CHRYSLER GROUP, LLC

15. Remove the bolt (2) that secures the service port (1).
16. Disconnect the electrical connector (3) from the pressure switch.
17. Remove the discharge/liquid line assembly from the engine compartment.

INSTALLATION

2.0L, 2.4L ENGINE

CAUTION: Be certain to adjust the refrigerant oil level when servicing the A/C refrigerant system. Failure to properly adjust the refrigerant oil level will prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

NOTE: When replacing multiple A/C system components, refer to the Refrigerant Oil Capacities chart to determine how much oil should be added to the refrigerant system. Refer to OIL, REFRIGERANT, STANDARD PROCEDURE.

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is opened. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.

Fig. 144: A/C Discharge Line/Suction Line Manifold & Nut
Courtesy of CHRYSLER GROUP, LLC

1. Remove the tape or plugs from the line fittings and the compressor ports.
2. Lubricate a new rubber seal with clean refrigerant oil and install it and a new seal onto the discharge line fitting. Use only the specified seals as it is made of a special material for the system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
3. Install the A/C suction and discharge line (1) to the A/C compressor and tighten the nut (2) to the proper. Refer to **SPECIFICATIONS**.
4. Remove the tape or plugs from the refrigerant line fittings.
5. Lubricate a new rubber seal with clean refrigerant oil and install it and a new seal onto the suction line fitting. Use only the specified seals as it is made of a special material for the system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
6. Connect the lower suction line and tighten the nut to the proper. Refer to **SPECIFICATIONS**.
7. Install the splash shield onto the right side frame rail. Refer to **SHIELD, SPLASH, FRONT WHEELHOUSE, INSTALLATION** **SHIELD, SPLASH, REAR WHEELHOUSE, INSTALLATION** .

Fig. 145: Seal, Discharge Line & Manifold
Courtesy of CHRYSLER GROUP, LLC

8. Remove the tape or plugs from the refrigerant line fittings and the condenser ports.
9. Lubricate a new seal (1) with clean refrigerant oil and install it and a new seals onto the discharge line fitting. Use only the specified seals as it is made of a special material for the system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
10. Attach the discharge line (2) to the liquid line manifold (3).

Fig. 146: A/C Suction/Liquid Line Manifold & Nut
Courtesy of CHRYSLER GROUP, LLC

11. Install the A/C discharge/liquid line manifold (2) to the A/C condenser and tighten the nut (3) to the

proper. Refer to **SPECIFICATIONS**.

12. Connect the negative battery cable.

CAUTION: Do NOT run the engine with a vacuum pump in operation or with a vacuum present within the A/C system. Failure to follow this caution will result in serious A/C compressor damage.

13. Evacuate the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.
14. Adjust the refrigerant oil level. Refer to **OIL, REFRIGERANT, STANDARD PROCEDURE**.
15. Charge the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.

3.2L ENGINE

CAUTION: Be certain to adjust the refrigerant oil level when servicing the A/C refrigerant system. Failure to properly adjust the refrigerant oil level will prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

NOTE: When replacing multiple A/C system components, refer to the Refrigerant Oil Capacities chart to determine how much oil should be added to the refrigerant system. Refer to OIL, REFRIGERANT, STANDARD PROCEDURE.

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is opened. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.

Fig. 147: A/C Service Port & Bracket
Courtesy of CHRYSLER GROUP, LLC

1. Position the discharge/liquid line assembly into the engine compartment.
2. Install the bolt (2) securing the service port (1) and tighten to the proper. Refer to **SPECIFICATIONS**.
3. Connect the electrical connector (3) to the pressure switch.

0909005842

Fig. 148: A/C Condenser, Liquid Line, Discharge Line & Fasteners

4. Remove the tape or plugs from the line fittings and ports.
5. Lubricate a new rubber seal with clean refrigerant oil and install. Use only the specified seals as it is made of a special material for the system. Use only refrigerant oil of the type recommended for the vehicle.
6. Install the bolt (2) securing the discharge line to the A/C condenser and tighten the bolt to the proper. Refer to **SPECIFICATIONS**.
7. Install the bolt (3) securing the liquid line to the A/C condenser and tighten the bolt to the proper. Refer to **SPECIFICATIONS**.
8. Install the line bracket bolt (1) and tighten the bolt to the proper. Refer to **SPECIFICATIONS**.
9. Install the right side radiator air deflector.
10. Install the upper radiator close out panel.
11. Install the engine belly pan.

Fig. 149: View Of Discharge Line, Liquid Line & Fasteners
Courtesy of CHRYSLER GROUP, LLC

12. Attach the discharge line (1) and liquid line (2) to the Internal Heat Exchanger (IHX) and tighten nuts (3) to the proper. Refer to **SPECIFICATIONS**.
13. Connect the negative battery cable.

CAUTION: Do NOT run the engine with a vacuum pump in operation or with a vacuum present within the A/C system. Failure to follow this caution will result in serious A/C compressor damage.

14. Evacuate the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.
15. Adjust the refrigerant oil level. Refer to **OIL, REFRIGERANT, STANDARD PROCEDURE**.
16. Charge the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.

LINE, A/C LIQUID

REMOVAL

2.0L, 2.4L ENGINE

WARNING: Review the safety precautions and warnings in this information before performing this procedure. Failure to follow these instructions may result in serious injury or death.

1. Disconnect and isolate the negative battery cable.
2. Remove the air cleaner body. Refer to **BODY, AIR CLEANER, REMOVAL** **BODY, AIR CLEANER, REMOVAL** **BODY, AIR CLEANER, REMOVAL** .
3. Remove the air cleaner resonator. Refer to **RESONATOR, AIR CLEANER, REMOVAL**

RESONATOR, AIR CLEANER, REMOVAL .

4. Recover the refrigerant from the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.

Fig. 150: A/C Suction/Liquid Line Manifold & Nut

8. Remove and discard the seals.
9. Install plugs in, or tape over the opened refrigerant line fittings.
10. Remove the suction/liquid line assembly from the engine compartment.

INSTALLATION

2.0L, 2.4L ENGINE

CAUTION: Be certain to adjust the refrigerant oil level when servicing the A/C refrigerant system. Failure to properly adjust the refrigerant oil level will prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

CAUTION: The A/C liquid line must be replaced if an internal failure of the A/C compressor has occurred. Failure to replace the A/C liquid line can prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

NOTE: When replacing multiple A/C system components, refer to the Refrigerant Oil Capacities chart to determine how much oil should be added to the refrigerant system. Refer to OIL, REFRIGERANT, STANDARD PROCEDURE.

NOTE: **Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is opened. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.**

Fig. 159: Refrigerant Lines, Heater Core Hoses & Fastener
Courtesy of CHRYSLER GROUP, LLC

1. Remove the tape or plugs from the refrigerant line fittings and the evaporator ports.
2. Lubricate the new seals with clean refrigerant oil and install the seals onto the liquid (1) and suction line (5) fittings. Use only the specified seals as they are made of special materials compatible to the system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
3. Position the A/C liquid (1) and suction line (5) assembly into the engine compartment.
4. Attach the A/C liquid and suction line assembly to the A/C evaporator (6) and tighten the nut (4) to the proper. Refer to **SPECIFICATIONS**.

Fig. 160: Nut, Liquid & Suction Line Bracket
Courtesy of CHRYSLER GROUP, LLC

5. Install the nut securing the liquid and suction line bracket (2) and tighten nut to the proper. Refer to **SPECIFICATIONS**.

Fig. 161: Pressure Transducer & Connector
Courtesy of CHRYSLER GROUP, LLC

6. If removed, inspect the O-ring seal and install the pressure transducer and securely tighten.
7. Connect the pressure transducer wire harness connector.

Fig. 162: Nut, Upper & Lower Suction Lines

8. Remove the tape or plugs from the refrigerant line fittings and the evaporator ports.
9. Lubricate the new seals with clean refrigerant oil and install the seals onto the suction line fitting. Use only the specified seals as they are made of special materials compatible to the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
10. Install the liquid and suction line bracket and tighten the nut (1) to the proper. Refer to **SPECIFICATIONS**.
11. Connect the lower suction line (4) to the upper suction line (2) assembly and install nut (3) and tighten the nut to the proper. Refer to **SPECIFICATIONS**.

Fig. 163: Nut & Liquid Line
Courtesy of CHRYSLER GROUP, LLC

12. Install the front liquid line (1) support bracket and tighten the nut to the proper. Refer to **SPECIFICATIONS**.

Fig. 164: Seal, Discharge Line & Manifold
Courtesy of CHRYSLER GROUP, LLC

13. Remove the tape or plugs from the suction and liquid line fitting and the condenser port.
14. Lubricate the new seals (1) with clean refrigerant oil and install it onto the suction and liquid line fitting.

Use only the specified O-ring as it is made of a special material for the system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

15. Attach the suction line (2) to the liquid manifold (3).

Fig. 165: A/C Suction/Liquid Line Manifold & Nut
Courtesy of CHRYSLER GROUP, LLC

16. Install the A/C suction (1) and liquid line manifold (2) to the A/C condenser and tighten the nut to the proper. Refer to **SPECIFICATIONS**.
17. Connect the negative battery cable.

CAUTION: Do NOT run the engine with a vacuum pump in operation or with a vacuum present within the A/C system. Failure to follow this caution will result in serious A/C compressor damage.

18. Evacuate the refrigerant system Refer to **PLUMBING, STANDARD PROCEDURE**.
19. Adjust the refrigerant oil level. Refer to **OIL, REFRIGERANT, STANDARD PROCEDURE**.
20. Charge the A/C system. Refer to **PLUMBING, STANDARD PROCEDURE**.
21. Install the air cleaner resonator. Refer to **RESONATOR, AIR CLEANER, INSTALLATION** .
22. Install the air cleaner body. Refer to **BODY, AIR CLEANER, INSTALLATION** and **BODY, AIR CLEANER, INSTALLATION** .

3.2L ENGINE

CAUTION: Be certain to adjust the refrigerant oil level when servicing the A/C refrigerant system. Failure to properly adjust the refrigerant oil level will prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

CAUTION: The A/C liquid line must be replaced if an internal failure of the A/C compressor has occurred. Failure to replace the A/C liquid line can prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

NOTE: When replacing multiple A/C system components, refer to the Refrigerant Oil Capacities chart to determine how much oil should be added to the refrigerant system. Refer to OIL, REFRIGERANT, STANDARD PROCEDURE.

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is opened. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.

Fig. 166: Suction/Liquid Line Manifold & Expansion Valve

15. Remove the fastener (1) securing the IHX manifold (2) to the A/C compressor (3) and detach the manifold from the compressor.
16. Remove and discard the seals and install plugs in, or tape over the opened line fittings and ports.

17. Remove the IHX from the engine compartment.

INSTALLATION

2.0L, 2.4L ENGINE

Fig. 178: A/C Discharge Line/Suction Line Manifold & Nut
Courtesy of CHRYSLER GROUP, LLC

1. Remove the tape or plugs from the suction line fitting and the compressor port.
2. Lubricate a new seal with clean refrigerant oil and install it and new seals onto the suction/discharge manifold. Use only the specified seals as it is made of a special material for the system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
3. Install the lower A/C suction/discharge manifold (1) to the A/C compressor and tighten the nut to the proper. Refer to **SPECIFICATIONS**.

Fig. 179: Nut, Upper & Lower Suction Lines
Courtesy of CHRYSLER GROUP, LLC

4. Remove the tape or plugs from the upper suction line fitting.
5. Lubricate a new seal with clean refrigerant oil and install it and new seal onto the suction line fitting. Use only the specified seal as it is made of a special material for the system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
6. Install the lower A/C lower suction line (4) to the upper A/C suction line (2) and tighten the nut (3) to the proper. Refer to **SPECIFICATIONS**.

Fig. 180: Seal, Discharge Line & Manifold
Courtesy of CHRYSLER GROUP, LLC

7. Remove the tape or plugs from the upper suction line fitting.
8. Lubricate a new seal with clean refrigerant oil and install it and new seal onto the suction line fitting. Use

only the specified seal as it is made of a special material for the system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

9. Attach the suction line (2) to the liquid line manifold (3).

0909005832

Fig. 181: A/C Suction/Liquid Line Manifold & Nut
Courtesy of CHRYSLER GROUP, LLC

10. Install the A/C discharge/liquid line manifold (2) from the A/C condenser and tighten the nut (3) to the proper. Refer to **SPECIFICATIONS**.
11. Connect the negative battery cable.

CAUTION: Do NOT run the engine with a vacuum pump in operation or with a vacuum present within the A/C system. Failure to follow this caution will result in serious A/C compressor damage.

12. Evacuate the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.
13. Adjust the refrigerant oil level. Refer to **OIL, REFRIGERANT, STANDARD PROCEDURE**.
14. Charge the A/C system. Refer to **PLUMBING, STANDARD PROCEDURE**.

3.2L ENGINE

1. Remove the tape or plugs from the Internal Heat Exchanger line fittings and ports.
2. Lubricate a new seal with clean refrigerant oil and install it and new seals onto the suction/discharge manifold. Use only the specified seals as it is made of a special material for the system. Use only refrigerant oil of the type recommended for the vehicle.

Fig. 182: A/C Compressor, IHX Manifold Line & Fasteners

9. Remove the tape or plugs from the line fittings and ports.
10. Lubricate a new seal with clean refrigerant oil and install it and new seal onto the suction line fitting. Use only the specified seal as it is made of a special material for the system. Use only refrigerant oil of the type recommended for the vehicle.
11. Install the discharge line (1) and liquid line (2) to the IHX and tighten the nuts (3) to the proper. Refer to **SPECIFICATIONS**.

Fig. 187: View Of IHX Manifold Bracket At Engine
Courtesy of CHRYSLER GROUP, LLC

12. Remove the tape or plugs from the upper suction line fitting.
13. Lubricate a new seal with clean refrigerant oil and install it and new seal onto the suction line fitting. Use only the specified seal as it is made of a special material for the system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
14. Install the bolt (1) securing the IHX manifold (2) bracket to the engine and securely tighten.
15. Attach the suction/discharge line to the IHX manifold (2) and tighten the nut to the proper. Refer to **SPECIFICATIONS**.
16. Install the powertrain control module. Refer to **MODULE, POWERTRAIN CONTROL, INSTALLATION** .
17. Evacuate the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.
18. Adjust the refrigerant oil level. Refer to **OIL, REFRIGERANT, STANDARD PROCEDURE**.
19. Charge the A/C system. Refer to **PLUMBING, STANDARD PROCEDURE**.
20. Install the engine cover.

OIL, REFRIGERANT

STANDARD PROCEDURE

STANDARD PROCEDURE - REFRIGERANT OIL LEVEL

When an A/C system is assembled at the factory, all components except the A/C compressor are refrigerant oil free. After the refrigerant system has been charged and operated, the refrigerant oil in the A/C compressor is dispersed throughout the refrigerant system. The A/C receiver/drier, A/C evaporator, A/C condenser and the A/C compressor will each retain a significant amount of the needed refrigerant oil.

It is important to have the correct amount of refrigerant oil in the A/C system. This ensures proper lubrication of the A/C compressor. Too little oil will result in damage to the A/C compressor, while too much oil will reduce the cooling capacity of the A/C system and consequently result in higher discharge air temperatures.

CAUTION: Be certain to adjust the refrigerant system oil level when replacing an A/C compressor. Drain the refrigerant oil from the A/C compressor using the procedures described below. Failure to properly drain the refrigerant oil from the A/C compressor can prevent the A/C system from operating as designed and cause serious compressor damage.

NOTE: Most reclaim/recycling equipment will measure the amount of refrigerant oil being removed during the recovery process. This amount of refrigerant oil should always be added back into the refrigerant system. Refer to the reclaim/recycling equipment manufacturers instructions.

It will not be necessary to check the oil level within the A/C refrigerant system or to add oil, unless there has been an oil loss. A refrigerant oil loss may occur due to component replacement or a rupture or leak from a refrigerant line, connector fitting, component or component seal. If a leak does occurs, add 30 milliliters (1 fluid ounce) of the recommended refrigerant oil to the refrigerant system after the repair has been made. Refrigerant

oil loss will be evident at the leak point by the presence of a wet, shiny surface around the leak.

Refrigerant oil must be added when an A/C accumulator, A/C evaporator or A/C condenser is replaced. See Refrigerant Oil Capacities charts below.

The refrigerant oil level in a new A/C compressor must first be adjusted prior to compressor installation. See COMPRESSOR OIL DRAIN PROCEDURES.

REFRIGERANT OIL CAPACITIES

Component	ml.	oz.
A/C Receiver/Dryer	30	1.0
A/C Condenser	30	1.0
A/C Evaporator	45	1.5
A/C Compressor - Denso 7SBH17C	130	4.6
	(See COMPRESSOR OIL DRAIN PROCEDURE -VARIABLE DISPLACEMENT)	

COMPRESSOR OIL DRAIN PROCEDURE

CAUTION: Be certain to adjust the refrigerant system oil level when replacing an A/C compressor. Failure to properly drain and measure the refrigerant oil from the A/C compressor can prevent the A/C system from operating as designed and cause serious compressor damage.

The A/C compressor is filled with refrigerant oil from the factory. Use the following procedure to drain and measure refrigerant oil from the A/C compressor.

1. Drain all of the refrigerant oil from the old A/C compressor into a clean measured container.
2. Drain all of the refrigerant oil from the new A/C compressor into a clean measured container.
3. Refill the new A/C compressor with the same amount of refrigerant oil that was drained out of the old compressor. Use only clean refrigerant oil of the type specified for the A/C compressor in the vehicle.
4. Install the new A/C compressor onto the engine. Refer to **COMPRESSOR, A/C, INSTALLATION**.

REFRIGERANT

VALVE, A/C EXPANSION

DESCRIPTION

DESCRIPTION

Fig. 188: H-Valve Type Body & Thermal Sensor
Courtesy of CHRYSLER GROUP, LLC

The A/C expansion valve controls the amount of refrigerant entering the A/C evaporator. The A/C expansion valve is of a thermostatic expansion valve (TXV) design and consists of an aluminum H-valve type body (1), with an integral thermal sensor (2). The A/C expansion valve is located at the dash panel between the A/C refrigerant lines and the A/C evaporator.

OPERATION

OPERATION

The A/C expansion valve controls the high-pressure, low temperature liquid refrigerant and converts it into a low-pressure, low-temperature mixture of liquid and gas, before it enters the A/C evaporator. A mechanical sensor in the A/C expansion valve monitors the temperature and pressure of the refrigerant leaving the A/C evaporator through the A/C suction line, and adjusts the orifice size at the liquid line port to let the proper amount of refrigerant into the evaporator to meet the vehicle A/C cooling requirements. Controlling the refrigerant flow through the A/C evaporator ensures that none of the refrigerant leaving the A/C evaporator is still in a liquid state, which could damage the A/C compressor.

NOTE: Replacement of the refrigerant line O-ring seals is required anytime a refrigerant line or A/C expansion valve is disconnected. Failure to replace the rubber O-ring seals may result in a refrigerant system leak.

The A/C expansion valve is factory calibrated and cannot be adjusted or repaired and must be replaced if inoperative or damaged.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - A/C EXPANSION VALVE

WARNING: Review the warnings and cautions for this system before performing the procedure. Failure to follow these instructions may result in serious injury or death.

NOTE: The A/C expansion valve should only be tested after performing the A/C performance test. Refer to DIAGNOSIS AND TESTING.

NOTE: Liquid CO^2 is required to test the A/C expansion valve. This material is available from most welding supply facilities. Liquid CO^2 is also available from companies which service and sell fire extinguishers.

When testing the A/C expansion valve, the work area and the vehicle temperature must be 21° to 27° C (70° to 85° F). To test the expansion valve:

1. Connect a charging station or manifold gauge set to the refrigerant system service ports.
2. Close all doors, windows and vents to the passenger compartment.
3. Set the A/C heater controls so that the A/C compressor is operating, the temperature control is in the highest temperature position, the mode air door is directing air output to the floor and the blower motor operating is operating at the highest speed.
4. Start the engine and allow it to idle. After the engine has reached normal operating temperature, allow the passenger compartment to heat up. This will create the need for maximum refrigerant flow into the A/C evaporator.
5. If the refrigerant charge is sufficient, the discharge (high pressure) gauge should read 827 kPa to 1655 kPa (120 psi to 240 psi). The suction (low pressure) gauge should read 207 kPa to 345 kPa (30 psi to 50 psi). If OK, go to 6. If not OK, replace the inoperative A/C expansion valve.

WARNING: Protect the skin and eyes from exposure to liquid CO^2 or personal injury can result.

6. If the suction (low pressure) gauge reads within the specified range, freeze the A/C expansion valve for 30 seconds using liquid CO^2 or another suitable super-cold material.**Do not spray refrigerant on the A/C expansion valve for this test.** The suction (low pressure) gauge reading should drop by 69 kPa (10 psi). If OK, go to 7. If not OK, replace the inoperative A/C expansion valve.
7. Allow the expansion valve control head to thaw. The suction (low pressure) gauge reading should stabilize at 207 kPa to 345 kPa (30 psi to 50 psi). If not OK, replace the inoperative A/C expansion valve.

REMOVAL

REMOVAL

WARNING: Review the warnings and cautions for this system before performing the procedure. Failure to follow these instructions may result in serious injury or death.

1. Disconnect and isolate the negative battery cable.
2. Remove the air cleaner resonator. Refer to **RESONATOR, AIR CLEANER, REMOVAL RESONATOR, AIR CLEANER, REMOVAL** .
3. Recover the refrigerant from the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.

Fig. 189: Refrigerant Lines, Heater Core Hoses & Fastener
Courtesy of CHRYSLER GROUP, LLC

4. Remove the nut (4) and the A/C liquid line (1) and A/C suction line (5) manifold from the A/C expansion valve.
5. Remove and discard the seals.

Fig. 190: Bolts & A/C Expansion Valve
Courtesy of CHRYSLER GROUP, LLC

6. Remove the two bolts (1) and the A/C expansion valve (2) from the evaporator.
7. Remove and discard the O-ring seals.
8. Install plugs in, or tape over, the opened refrigerant line fittings and evaporator ports.

Fig. 191: Expansion Valve & Insulating Foam
Courtesy of CHRYSLER GROUP, LLC

9. If necessary, remove the insulating foam (2) from the expansion valve (1).

INSTALLATION

INSTALLATION

CAUTION: Be certain to adjust the refrigerant oil level when servicing the A/C refrigerant system. Failure to properly adjust the refrigerant oil level will prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

NOTE: When replacing multiple A/C system components, see the Refrigerant Oil Capacities chart to determine how much oil should be added to the refrigerant system. Refer to OIL, REFRIGERANT, STANDARD PROCEDURE.

NOTE: Replacement of the O-ring seals is required anytime a refrigerant line or A/C expansion valve is disconnected. Failure to replace the O-ring seals may result in a refrigerant system leak.

Fig. 192: O-Ring Seals
Courtesy of CHRYSLER GROUP, LLC

1. Remove the tape or plugs from all the opened refrigerant line fittings and evaporator ports.
2. Lubricate new O-ring seals (1) with clean refrigerant oil and install them onto the evaporator tube fittings. Use only the specified O-ring seals as they are made of a special material for the system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

Fig. 193: Bolts & A/C Expansion Valve
Courtesy of CHRYSLER GROUP, LLC

3. Install the A/C expansion valve (2) onto the evaporator and tighten the bolts to the proper. Refer to **SPECIFICATIONS**.

Fig. 194: Refrigerant Lines, Heater Core Hoses & Fastener
Courtesy of CHRYSLER GROUP, LLC

4. Lubricate new O-ring seals with clean refrigerant oil and install them onto the refrigerant line fittings. Use only the specified seals as they are made of a special material for the system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

5. Install the A/C liquid line (1) and the A/C suction line manifold (5) to the A/C expansion and tighten the nut to the proper. Refer to **SPECIFICATIONS**.
6. Evacuate the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.
7. Adjust the refrigerant oil level. Refer to **OIL, REFRIGERANT, STANDARD PROCEDURE**.
8. Charge the refrigerant system. Refer to **OIL, REFRIGERANT, STANDARD PROCEDURE**.
9. Install the air cleaner resonator. Refer to **RESONATOR, AIR CLEANER, INSTALLATION** or **RESONATOR, AIR CLEANER, INSTALLATION** .
10. Connect the negative battery cable.

TUBE, CONDENSATION DRAIN

REMOVAL

REMOVAL

WARNING: Disable the airbag system before attempting any steering wheel, steering column or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.

1. Disconnect and isolate the negative battery cable.
2. Remove the right side center console closeout from the center console.

Fig. 195: HVAC Housing, Condensation Drain Tube, Floor Panel & Clamp
Courtesy of CHRYSLER GROUP, LLC

3. Disconnect clamp (4) and remove the condensation drain tube (2) from the HVAC housing (1).
4. Remove the condensation drain tube from the floor panel (3).

INSTALLATION

INSTALLATION

Fig. 196: HVAC Housing, Condensation Drain Tube, Floor Panel & Clamp
Courtesy of CHRYSLER GROUP, LLC

1. Install the condensation drain tube (2) into the floor panel (3).
2. Connect the condensation drain tube with clamp (4) to the HVAC housing (1).
3. Install the passenger side center console closeout.
4. Connect the negative battery cable.

2014 MANUAL TRANSMISSION

C635 - Service Information - Cherokee

DIAGNOSIS AND TESTING

COMMON PROBLEM CAUSES

NEUTRAL GEAR RATTLE: Neutral gear rattle is not an indication of an internal transaxle fault. Neutral gear rattle is caused by the clutch disc springs loading and unloading under the weight of the geartrain in the transaxle. Usually, after releasing the clutch with the engine at idle, the geartrain will rotate quietly. When the engine operating system makes an idle alteration the transaxle geartrain will bounce causing the clutch springs to compress. Afterward, the spring release flinging the geartrain faster then the engine idle. When the engine idle catches up with the geartrain and the spring compress and the process repeats over and over causing the geartrain to rattle. Neutral gear rattle is most audible in enclosed areas, such as a garage or between other parked vehicles.

PRE-DIAGNOSTIC INSPECTION:

- Verify that the transaxle fluid level is at the proper cold fill level.
- Inspect the exterior of the transaxle for evidence of fluid leaks.
- Inspect the exterior of the transaxle for mechanical issues, such as improper shift cable routing or loose mounting bolts.

NOTE: **If a fluid with anti-friction additive is used in a C-365 transaxle the synchronizers will fail, requiring synchronizer replacement.**

SYMPTOM	POSSIBLE CAUSE	REPAIR
Neutral gear rattle.	Weak clutch disc springs.	No trans repair required. If rattle is excessive when vehicle is in an open area replace the clutch disc.
Tip in tip out clunk. No gear whine.	1. Excessively strong clutch disc springs. 2. Loose front hub nuts	1. If the condition is excessive replace the clutch disc. 2. Replace hub nut and tighten to proper torque specification. Refer to **FRONT, SPECIFICATIONS** .
Bearing whine.	1. Low fluid level. 2. Improper fluid.	1. Repair cause of fluid loss and fill transaxle to cold fill level. 2. If doubt exists, replace the transaxle fluid. Refer to **CAPACITIES AND**

	3. Bearings in transaxle assembled to tight.	**RECOMMENDED FLUIDS, DESCRIPTION** . 3. Verify the turning torque of transaxle bearings with NEW bearings installed.
Growl in neutral.	1. Low fluid level. 2. Improper fluid. 3. Bearings in transaxle assembled to loose.	1. Repair cause of fluid loss and fill transaxle to cold fill level. 2. If doubt exists, replace the transaxle fluid. Refer to **CAPACITIES AND RECOMMENDED FLUIDS, DESCRIPTION** . 3. Verify the turning torque of transaxle bearings with NEW bearings installed.
Gear noise when driving in any gear range	1. Low fluid level. 2. Improper fluid. 3. Bearings in transaxle assembled to loose.	1. Repair cause of fluid loss and fill transaxle to cold fill level. 2. If doubt exists, replace the transaxle fluid. Refer to **CAPACITIES AND RECOMMENDED FLUIDS, DESCRIPTION** . 3. Verify the turning torque of transaxle bearings with NEW bearings installed.
Gear clash going into 1st or reverse from neutral with clutch depressed for 3+ seconds.	1. Improper fluid or additives in fluid. 2. Faulty synchronizers.	1. If doubt exists, replace the transaxle fluid. Refer to **CAPACITIES AND RECOMMENDED FLUIDS, DESCRIPTION** . 2. Disassemble transaxle to inspect. Replace synchronizers.
Fluid expelled from vent.	Transaxle is overfilled.	Adjust transaxle cold fill level.

HARD SHIFTING

Hard shifting may be caused by:

- Misadjusted crossover cable.
- If hard shifting is accompanied by gear clash, synchronizer drum, clutch stop rings or gear teeth may be worn or damaged.
- Mis-assembled synchronizer components also cause shifting problems.
- Incorrectly installed synchronizer sleeves, struts, or springs can cause shift problems.
- Worn, damaged, mis-assembled or leaking hydraulic clutch release system/components can also cause difficult shifting or gear clash.

NOISY OPERATION

Transaxle noise is most often a result of :

- Worn or damaged internal components.
- Chipped, broken gear or synchronizer teeth, and brinnelled, spalled bearings.
- Insufficient lubricant.
- Aftermarket additives can damage synchronizers.

SLIPS OUT OF GEAR

Transaxle disengagement may be caused by:

- Mis-aligned or damaged shift components.
- Worn teeth on the drive gears or synchronizer components.
- Incorrectly assembled geartrain.

LOW LUBRICANT LEVEL

Insufficient transaxle lubricant is usually the result of:

- Fluid leaks.
- Inaccurate fluid level check or refill method.
- Porosity in the transaxle castings.

NOTE: For leaks that are difficult to pinpoint, tracer dye can be added to the lubricant to aid in detecting the origin of the leak. Tracer dye becomes luminous under black light.

CLUTCH PROBLEMS

NEUTRAL GEAR RATTLE: Neutral gear rattle is not an indication of an internal transaxle fault. Neutral gear rattle is caused by the clutch disc springs loading and unloading under the weight of the geartrain in the transaxle. Usually, after releasing the clutch with the engine at idle, the geartrain will rotate quietly. When the engine operating system makes an idle alteration the transaxle geartrain will bounce causing the clutch springs to compress. Afterward, the spring release flinging the geartrain faster then the engine idle. When the engine

idle catches up with the geartrain and the spring compress and the process repeats over and over causing the geartrain to rattle. Neutral gear rattle is most audible in enclosed areas, such as a garage or between other parked vehicles.

SYMPTOM	POSSIBLE CAUSE	REPAIR
Gear clash shifting to reverse or neutral after clutch is depressed 3+ seconds.	Clutch disc hub spline seized to the transaxle input shaft.	Replace clutch disc and clean corrosion from input shaft.

ADJUSTMENTS

BEARING PRELOAD ADJUSTMENT

It is not necessary to reestablish preload shim thickness when new bearings are installed. It is only necessary to establish preload shim thickness when a transaxle housing component, gear shaft, or differential is replaced. This procedure is used to measure zero end play of the gear shafts and differential in the C635 (Manual or DDCT) Transaxle and establish the proper thickness of the select shims placed behind the bearing races in the transaxle housing to apply specific bearing preload to prevent bearing failure and gear rattle.

Transaxle Preparation

1. Clean the transaxle with suitable solvent.
2. Install new bearings on the gear shafts and the differential.

Fig. 1: Removing Preload Bearing Races
Courtesy of CHRYSLER GROUP, LLC

3. Remove the bearing races (2) from the transaxle housing using tools 9664 Remover (1) (special tool #9664, Remover, Bearing Cup) and C-637 Slide Hammer (special tool #C-637, Slide Hammer,

Universal).

4. Remove the factory installed select shims from the transaxle housing. Mark the shims to identify the bore that they were removed from.
5. From the circumference of the original bearing races, grind 0.18 mm (0.007 in) material from the races to allow them to slip-fit into the transaxle housing.

NOTE: To ensure a flat uniform surface on the outside diameter (OD) of the bearing races, chuck them on a suitable (brake) lathe and remove material from the OD with a suitable die grinder.

6. Insert the, reduced OD, differential bearing race into the transaxle housing.

NOTE: No select shim is required to measure the differential zero end play.

Fig. 2: Starter Shims & Plastigauge®
Courtesy of CHRYSLER GROUP, LLC

7. Insert an 0.80 mm (0.031 in), or suitable thickness, starter shims (2) in each gear shaft bearing race bore in the transaxle housing. This will create measurable gear shaft end play after the transaxle cases are assembled.

NOTE: If the original shims are greater than 1.32 mm (0.052 in) thick, use a 1 mm starter shim.

8. Use RED Plastigauge®, cut in 6 mm (1/4 in.) lengths (1), placed 120 degrees apart around the side surface of the select shims.

NOTE: If the gear shaft end play is less than the RED Plastigauge® can accurately

measure, use GREEN Plastigauge®.

9. Install the reduced diameter bearing races in the bores in the transaxle to capture the Plastigauge®.

Fig. 3: Differential Assembly In Bellhousing
Courtesy of CHRYSLER GROUP, LLC

10. Install the differential assembly in the bellhousing half of the transaxle housing.
11. Place the bearing race plate in position on the bellhousing half of the transaxle housing.
12. Install the bolts to hold the bearing race plate to the bellhousing. Tighten the bolts to torque specification.

Fig. 4: Three Gear Shafts In Bellhousing
Courtesy of CHRYSLER GROUP, LLC

13. Install the three gear shafts in the bellhousing half of the transaxle housing.

14. Install the transaxle housing onto the bellhousing.

NOTE: **If the reduced diameter bearing races slip out of the bearing bores, Door Ease® wax can be applied to the circumference of the race to adhere it to the bore.**

Fig. 5: Transaxle Housing To Bellhousing Bolts
Courtesy of CHRYSLER GROUP, LLC

15. Install four bolts (1) to hold the transaxle housing to the bellhousing around the differential side of the transaxle. Tighten the bolts to 50% of the torque specification.
16. Turn the transaxle on its side to gain access to the inside of the bellhousing.
17. Install seven bolts (2), four above and three below the gear shafts, to hold the transaxle case halves together, Tighten the bolts to 50% of the torque specification.
18. Turn transaxle, bellhousing downward, on the work surface.

Measuring Differential End Play

1. Install (special tool #C-4995A, Tool, Differential Bearing Torque) (1) into the differential side gear (2).

Fig. 6: Installing Special Tool To Differential Side Gear
Courtesy of CHRYSLER GROUP, LLC

2. Clamp a typical vise grip pliers (4) on tool C-4995A (2).
3. Attach dial indicator C-3339A (1) (special tool #C-3339A, Set, Dial Indicator) to transaxle housing with the plunger placed on the end of tool C-4995A (2).

Fig. 7: Measuring Differential End Play
Courtesy of CHRYSLER GROUP, LLC

4. Zero the indicator dial (1).
5. Use a large screw driver (3) to pry upward on tool C-4995A (2) to take up the bearing free play.

6. While holding tool C-4995A (2) upward read the dial indicator (1).
7. Add 0.15 mm (0.006 in.) to the dial indicator reading.
8. The sum is the proper thickness of the differential preload shim.

Measuring Gear Shaft End Play

1. Turn the transaxle on its side to gain access to the inside of the bellhousing.

Fig. 8: Transaxle Housing To Bellhousing Bolts
Courtesy of CHRYSLER GROUP, LLC

2. Remove the bolts (2) holding the bellhousing to the transaxle housing.
3. Turn transaxle, bellhousing downward, on the work surface.
4. Remove the remaining bolts (1) holding the bellhousing to the transaxle housing.
5. Place the transaxle housing on the work surface inside up.

Fig. 9: Bearing Race, Shim & Plastigauge®
Courtesy of CHRYSLER GROUP, LLC

6. Using a hook tool, remove the reduced size bearing races (4). Be careful not to damage the Plastigauge® (2).
7. Compare the thickness of the Plastigauge® (2) to the RANGE template on the Plastigauge® packaging (1).
8. Add the Plastigauge® RANGE thickness, plus 0.15 mm (0.006 in.) to the thickness of the starter shim used to create gear shaft end play.
9. The sum is the proper thickness to preload for each of the gear shaft bearings.
10. Install the closest thickness shims from the list provided by Mopar® Parts.

NOTE: **If the measured thickness falls between the shim thicknesses provided by Mopar® Parts, install the shim that is slightly thicker.**

After proper bearing preload is established, finish assembling the transaxle.

SPECIFICATIONS

SPECIFICATIONS

TORQUE SPECIFICATIONS

DESCRIPTION	N.m	Ft. Lbs.	In. Lbs.

REMOVAL

REMOVAL

1. Position the vehicle on a suitable hoist with the transmission in neutral. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Release the hood latch and open the hood.

3. Support the hood on the provided prop-rod.
4. Remove the engine cover.
5. Remove the upper radiator closeout panel.
6. Disengage the clips holding the wire harness to the battery tray.
7. Remove the battery and battery tray. Refer to **TRAY, BATTERY, REMOVAL** .
8. Remove the pinch bolt holding the steering column to the steering gear.
9. Raise the vehicle to gain access to the front wheels.
10. Remove the front wheels. Refer to **REMOVAL** .
11. Raise the vehicle to gain access to the belly pan.
12. Remove the belly pan. Refer to **BELLY PAN, REMOVAL** .
13. Release the clamp from the charge air outlet hose on the left side of the radiator support panel.
14. Remove the bolt holding the charge air hose to the side of the transmission.
15. Remove the left front fender splash shield. Refer to **SHIELD, SPLASH, FRONT WHEELHOUSE, REMOVAL** .
16. Remove the right front fender splash shield. Refer to **SHIELD, SPLASH, FRONT WHEELHOUSE, REMOVAL** .
17. Disconnect wire harness connector at the left side of the front fascia.
18. Release the retainer holding the wire harness to the front fascia.
19. Lower the vehicle to mid level.
20. Remove the front fascia. Refer to **FASCIA, FRONT, REMOVAL** .
21. Disconnect the charge air tube from the throttle body adapter.
22. Separate the charge air tube from the vehicle.
23. Raise the vehicle to gain access to the halfshafts.
24. Using a suitable punch tool, pry out the lock staking on the front hub nuts.
25. Install the front wheel bolts in the front brake rotor hub.
26. While holding a pry bar across the wheel bolts to prevent the wheel hub from rotating, remove the front wheel hub nuts.
27. Remove the front halfshafts. Refer to **REMOVAL** .
28. If equipped, remove the rear propeller shaft.
29. Remove the exhaust crossunder pipe.
30. Place a suitable drain pan under the transmission.
31. Remove the drain plug to allow the fluid to drain into the drain pan.
32. If equipped, remove the power transfer unit (PTU).
33. Lower vehicle to gain access to the shift cables.

Fig. 10: Prying Shift Cable End From Lever Ball Stud On Transmission
Courtesy of CHRYSLER GROUP, LLC

34. Using a suitable prying tool, pry the shift cable end from the lever ball stud on the transmission.

Fig. 11: Prying Select Cable End From Select Lever Ball Stud On Transmission
Courtesy of CHRYSLER GROUP, LLC

35. Using a suitable prying tool, pry the select cable end from the select lever ball stud on the transmission.
36. Release the clips holding the shift cables housing ends to the bracket on the transmission.
37. Remove the exhaust heat shield from the exhaust manifold.
38. Disconnect the wire connector from the exhaust temperature sensor.

39. Disconnect the wire connector from the oxygen sensor.
40. Remove the oxygen sensor. Refer to **SENSOR, OXYGEN, REMOVAL** .
41. Remove the exhaust clamp holding the turbo charger to the catalytic converter.

Fig. 12: Wire Harness Retainers
Courtesy of CHRYSLER GROUP, LLC

42. Disengage the wire harness retainers (1) along the top of the bellhousing.
43. Position the wire harness out of the way.

Fig. 13: Locating Bolts Holding Upper Bellhousing To Engine Block
Courtesy of CHRYSLER GROUP, LLC

44. Remove the bolts (1) holding the upper bellhousing to the engine block.
45. Position a floor jack under the transmission and lift the transmission enough to take tension off the upper transmission mount.

Fig. 14: Locating Bolts Holding Upper Mount To Adapter Spacer & Adapter Spacer To Transmission
Courtesy of CHRYSLER GROUP, LLC

46. Remove the bolts (1) holding the upper transmission mount to the transmission mount adapter spacer (4).
47. Remove the bolts (3), (2= hidden) holding the transmission mount adapter spacer (4) to the transmission.

Fig. 15: Installing Block Of Wood Between Transmission & Left Load Beam

Courtesy of CHRYSLER GROUP, LLC

48. While holding a wood block (1) between the transmission and the left load beam, lower the transmission.
49. Remove the floor jack from under the vehicle.
50. Remove transmission mount spacer from the vehicle.
51. Raise the vehicle to gain access to the front suspension cradle.

Fig. 16: Positioning Transmission Jack, High Stand & Wood Block
Courtesy of CHRYSLER GROUP, LLC

52. Position a suitable transmission jack (1) under the transmission in a stable fashion and secure the transmission to the transmission jack cradle with a safety chain or strap.
53. Position a high stand (2) under the engine oil pan, use a wood block (3) to protect the oil pan.

Fig. 17: Locating Nut Holding Ground Cable To Transmission
Courtesy of CHRYSLER GROUP, LLC

54. Remove the nut (1) holding the ground cable to the transmission from above the left load beam.
55. Separate the ground cable from the transmission.

Fig. 18: Clutch Slave Cylinder Union & Nipple
Courtesy of CHRYSLER GROUP, LLC

56. Disengage the clutch hydraulic coupling (4) from the slave cylinder on the transmission.

57. Using a suitable cap-plug, seal the end of the hydraulic line to avoid loosing hydraulic fluid.
58. Remove the catalytic converter from the engine. Refer to **CONVERTER, CATALYTIC, REMOVAL** .
59. Remove the starter motor. Refer to **STARTER, REMOVAL** .
60. Remove the front suspension cradle and load beams.

Fig. 19: Backup Lamp Switch Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

61. Disconnect the wire harness connector (1) from the backup lamp switch.

Fig. 20: Locating Bolts Holding Engine To Bellhousing & Bellhousing To Oil Pan
Courtesy of CHRYSLER GROUP, LLC

62. On the backside of the engine, remove the bolt (1) holding engine to the bellhousing and the bolt (2) holding the bellhousing to the oil pan.

Fig. 21: Locating Bolts Holding Engine Block To Transmission Bellhousing & Bellhousing To Oil Pan
Courtesy of CHRYSLER GROUP, LLC

63. On the front of the engine, remove the bolts (1) holding the engine block to the transmission bellhousing and the bellhousing to the oil pan.

Fig. 22: Removing/Installing Transmission
Courtesy of CHRYSLER GROUP, LLC

64. Using a suitable pry bar, separate the transmission from the engine far enough for the clutch to clear the bellhousing (1).
65. Lower the transmission while avoiding obstacles and separate the transmission from the vehicle.

DISASSEMBLY

DISASSEMBLY

Fig. 23: Concentric Slave Cylinder Retention Tabs
Courtesy of CHRYSLER GROUP, LLC

1. Release the retention tabs from the Concentric Slave Cylinder (CSC) (1).

Fig. 24: CSC Bolts
Courtesy of CHRYSLER GROUP, LLC

2. Remove the CSC bolts (2).

Fig. 25: Retention Clip & Connection
Courtesy of CHRYSLER GROUP, LLC

3. Disconnect the hydraulic connection at the case. Release the retention clip (1) then separate the connection (2).

Fig. 26: Hydraulic Fitting & Plastic Retainer
Courtesy of CHRYSLER GROUP, LLC

4. Disconnect the hydraulic fitting (2) from the plastic retainer (1).
5. Remove the CSC.

Fig. 27: Mainshaft Oil Seal Plate
Courtesy of CHRYSLER GROUP, LLC

6. Remove the mainshaft oil seal plate (1).

Fig. 28: Gear Selector Assembly Bolts
Courtesy of CHRYSLER GROUP, LLC

7. Remove the gear selector assembly bolts (1).
8. Use a plastic hammer or the equivalent to loosen the assembly and remove from the case.

Fig. 29: Reverse Idler Gear Assembly Retaining Bolt
Courtesy of CHRYSLER GROUP, LLC

9. Remove the reverse idler gear assembly retaining bolt.
10. Remove the axle seals. Refer to **SEAL, AXLE DRIVE SHAFT, REMOVAL**.

Fig. 30: Long Case Bolts & Short Case Bolts
Courtesy of CHRYSLER GROUP, LLC

11. Remove the long case bolts (1) and the short case bolts (2).

Fig. 31: Studs
Courtesy of CHRYSLER GROUP, LLC

12. Remove the studs (1).

Fig. 32: Gear Side Half & Bell Housing Side Half
Courtesy of CHRYSLER GROUP, LLC

13. Separate the case halves by carefully prying on the gear side half (1) and the bell housing side half (2).

Fig. 33: Reverse Idler Gear Assembly
Courtesy of CHRYSLER GROUP, LLC

14. Remove the reverse idler gear assembly (1).
15. Using a hydraulic press, remove the pin from the reverse gear mounting bracket.
16. Separate the reverse idler gear and the needle bearing.

Fig. 34: Shifter Fork Pivot Pin
Courtesy of CHRYSLER GROUP, LLC

17. Remove the shifter fork pivot pin (1).
18. Remove the 3-4-reverse gear shifter fork assembly (2).

Fig. 35: Shifter Fork Pivot Pin & 1-2-5-6 Gear Shifter Fork Assembly
Courtesy of CHRYSLER GROUP, LLC

19. Remove the shifter fork pivot pin (1).
20. Remove the 1-2-5-6 gear shifter fork assembly (2).

Fig. 36: Output And Main Shafts
Courtesy of CHRYSLER GROUP, LLC

21. Remove the output and main shafts (1) as a group.

Fig. 37: Bearing Race Plate Bolts
Courtesy of CHRYSLER GROUP, LLC

22. Remove the bearing race plate bolts.

NOTE: **Use a screw drive or equivalent as an aid in releasing the plate from the locating bushings.**

Fig. 38: Bearing Race Plate
Courtesy of CHRYSLER GROUP, LLC

23. Remove the bearing race plate.

Fig. 39: Differential Assembly
Courtesy of CHRYSLER GROUP, LLC

24. Remove the differential assembly (1).
25. Remove the axle seals Refer to **SEAL, AXLE DRIVE SHAFT, REMOVAL**.

Fig. 40: Magnet
Courtesy of CHRYSLER GROUP, LLC

26. Remove the magnet.

Fig. 41: Removing Bell Housing Side Differential Bearing Race
Courtesy of CHRYSLER GROUP, LLC

27. Remove the bell housing side differential bearing race using (special tool #C-637, Slide Hammer, Universal) and (special tool #9664, Remover, Bearing Cup).

Fig. 42: Input Shaft Bearing Cup
Courtesy of CHRYSLER GROUP, LLC

28. Remove shaft bearing cup (2) using a press and (special tool #10302, Installer, Bearing Cup).
29. Remove the input shaft bearing cup (2) using (special tool #C-637, Slide Hammer, Universal) (special tool #9664, Remover, Bearing Cup).
30. Remove the output shaft bearing cup from the race mounting plate using a press and tools (special tool #D-111, Installer, Bearing Cup) (3), 10302.

Fig. 43: Removing Differential Bearing Race Cups & Shims
Courtesy of CHRYSLER GROUP, LLC

NOTE: Do not discard the shim as it will be utilized as the starting point for the bearing preload adjustment process.

31. Remove the case side differential bearing race cups and shims (1) using (special tool #C-637, Slide Hammer, Universal) (special tool #9664, Remover, Bearing Cup) (3).

Fig. 44: Removing Case Side Gear Shaft Bearing Race Cups & Shims
Courtesy of CHRYSLER GROUP, LLC

NOTE: Document the location of each shim as they will be utilized as the starting point for the bearing preload adjustment process.

32. Remove the case side gear shaft bearing race cups and shims (2) using a Slide Hammer (special tool #C-637, Slide Hammer, Universal) (special tool #9664, Remover, Bearing Cup) (1).

Fig. 45: Lubricating Duct
Courtesy of CHRYSLER GROUP, LLC

33. Remove the lubricating duct by pulling upward.

Fig. 46: Shaft Oil Ducts
Courtesy of CHRYSLER GROUP, LLC

NOTE: The oil ducts are staked to the case and may require some grinding before removal.

34. Remove the shaft oil ducts (1) from the case using a screwdriver or the equivalent.

CLEANING

CLEANING

Clean the gears, bearings, shafts, synchronizers, thrust washers, oil feeder, shift mechanism, gear case, and bellhousing. Do not use solvent to clean sealed bearings. Dry all parts except the bearings with compressed air. Allow the bearings to either air dry or wipe them dry with clean shop towels.

ASSEMBLY

ASSEMBLY

NOTE: It is not necessary to reestablish preload shim thickness when new bearings are installed. It is only necessary to establish preload shim thickness when a transaxle housing component, gear shaft, or differential is replaced. Refer to ADJUSTMENTS.

Fig. 47: Right And Left Side Differential Bearing Races And Universal Driver Handle
Courtesy of CHRYSLER GROUP, LLC

1. Install the right and left side differential bearing races using (special tool #8866, Installer, Bearing Cup) and (special tool #C-4171, Driver Handle, Universal).

Fig. 48: Special Tool #8866
Courtesy of CHRYSLER GROUP, LLC

Fig. 49: Special Tool #C-4171
Courtesy of CHRYSLER GROUP, LLC

Fig. 50: Differential Assembly
Courtesy of CHRYSLER GROUP, LLC

2. Install the differential.

Fig. 51: Magnet
Courtesy of CHRYSLER GROUP, LLC

3. Install the magnet.

Fig. 52: Bearing Race Plate Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

4. Install the bearing race plate and tighten the bolts in four steps using the sequence shown in illustration:
   - Step 1 - Tighten bolts 9-10-6-8-1 to 20 N.m (15 ft. lbs.) in order.
   - Step 2 - Tighten bolts 3-5-4 to 25 N.m (18 ft. lbs.) in order.
   - Step 3 - Tighten bolts 2-7 to 80 N.m (59 ft. lbs.) in order.
   - Step 4 - Tighten bolts 9-10-6-8-1 to 80 N.m (59 ft. lbs.) in order.

Fig. 53: Bearing Cup
Courtesy of CHRYSLER GROUP, LLC

NOTE: The following tools are to be used in conjunction with (special tool #C-4171, Driver Handle, Universal).

5. Install the new bearing races to the race plate using the following tools:
   - For the shaft bearing race use (special tool #10302, Installer, Bearing Cup) (2).
   - For the shaft bearing race use (special tool #D-111, Installer, Bearing Cup) (3).
   - For the main shaft bearing race use (special tool #C-4198, Installer, Axle Bearing) (1).

Fig. 54: Lubricating Duct
Courtesy of CHRYSLER GROUP, LLC

6. Install the lubricating duct (1).

Fig. 55: Oil Duct Locating Pin & Locating Hole
Courtesy of CHRYSLER GROUP, LLC

7. Ensure that the oil duct locating pin (1) is in the locating hole (2).

Fig. 56: Correct Shim
Courtesy of CHRYSLER GROUP, LLC

8. Install the correct shim (1) to the case.

Fig. 57: Output Shaft The Bearing Races To The Case Using Bearing Cup Installer
Courtesy of CHRYSLER GROUP, LLC

9. Install output shaft the bearing races to the case using (special tool #L-4520, Installer, Seal/Cup) and (special tool #6446, Installer, Bearing).

Courtesy of CHRYSLER GROUP, LLC

Fig. 63: Output And Main Shafts
Courtesy of CHRYSLER GROUP, LLC

13. Install the output and main shafts (1) as a group.

Fig. 64: Shifter Fork Pivot Pin
Courtesy of CHRYSLER GROUP, LLC

14. Install the 3-4-R gear shifter fork assembly.

Fig. 65: Shifter Fork Pivot Pin & 1-2-5-6 Gear Shifter Fork Assembly
Courtesy of CHRYSLER GROUP, LLC

15. Install the 1-2-5-6 gear shifter fork assembly.

Fig. 66: Reverse Idler Gear Assembly
Courtesy of CHRYSLER GROUP, LLC

16. Install the reverse idler gear and the needle bearing.
17. Using a hydraulic press, install the pin to the reverse gear mounting bracket.
18. Install the reverse idler gear assembly (1).

Fig. 67: Gear Side Case Half
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The case halves must be assembled within 15 minutes after the application of the anaerobic sealant. Do not allow transmission oil or any other lubricants to come in contact with the sealant for at least one hour after the case halves have been assembled.**

19. Apply a uniform bead of LOCTITE®509™ Sealer or equivalent to the sealing surface of the case.
20. Install the gear side case half (1) to the bellhousing case half (2).

Fig. 68: Long Case Bolts & Short Case Bolts
Courtesy of CHRYSLER GROUP, LLC

21. Install the long case bolts (1) and the short case bolts (2) and tighten to 25 N.m (18 ft. lbs.) using a cross

sequence.

Fig. 69: Reverse Idler Gear Assembly Retaining Bolt
Courtesy of CHRYSLER GROUP, LLC

22. Patch and install the reverse gear idler retaining bolt using the following process. Tighten to 10 N.m (89 in. lbs.).
    - Remove the remaining traces of the original locking patch with a wire brush or the equivalent.
    - Clean the threads with denatured alcohol and allow to dry.
    - Apply the locking patch using Mopar thread locker.

Fig. 70: Gear Selector Assembly Bolts
Courtesy of CHRYSLER GROUP, LLC

23. Apply a uniform bead of LOCTITE®509™ Sealer or equivalent to the sealing surface of the case.

24. Install the gear selector assembly, tighten the bolts to 20 N.m (15 ft. lbs.).

Fig. 71: Uniform Bead Of Mopar® RTV Sealer
Courtesy of CHRYSLER GROUP, LLC

25. Apply a uniform bead of Mopar® Threebond RTV Sealer or equivalent to the sealing surface of the **new** input shaft sealing ring.

Fig. 72: Sealing Ring To The Transmission
Courtesy of CHRYSLER GROUP, LLC

26. Install the sealing ring to the transmission.

Fig. 73: Concentric Slave Cylinder (CSC) and Bolts
Courtesy of CHRYSLER GROUP, LLC

27. Install the Concentric Slave Cylinder (CSC) and bolt to the transmission. Tighten the bolts to 10 N.m (89 in. lbs.) and engage the retention tabs.

Fig. 74: Hydraulic Fitting & Plastic Retainer
Courtesy of CHRYSLER GROUP, LLC

28. Connect the hydraulic fitting (2) to the plastic retainer (1).

Fig. 75: Retention Clip & Connection
Courtesy of CHRYSLER GROUP, LLC

29. Connect the hydraulic connection at the case.
30. Install the axle seals.

    Refer to **SEAL, AXLE DRIVE SHAFT, INSTALLATION**.

INSTALLATION

INSTALLATION

1. Raise the transmission while avoiding obstacles and until the transmission is in line with the engine.

Fig. 76: Removing/Installing Transmission
Courtesy of CHRYSLER GROUP, LLC

2. Push the transmission toward the engine far enough for the input shaft to engage the clutch.

Fig. 77: Locating Bolts Holding Engine To Bellhousing & Bellhousing To Oil Pan
Courtesy of CHRYSLER GROUP, LLC

3. On the backside of the engine, Install the bolt (1) to hold engine to the bellhousing and the bolt (2) to hold the bellhousing to the oil pan. Refer to **SPECIFICATIONS**.

Fig. 78: Locating Bolts Holding Engine Block To Transmission Bellhousing & Bellhousing To Oil Pan

Courtesy of CHRYSLER GROUP, LLC

4. On the front of the engine, remove the bolts (1) to hold the engine block to the transmission bellhousing and the bellhousing to the oil pan. Refer to **SPECIFICATIONS**.

Fig. 79: Backup Lamp Switch Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

5. Connect the wire harness connector (1) to the backup lamp switch.
6. Install the front suspension cradle and load beams.
7. Install the starter motor. Refer to **STARTER, INSTALLATION** .
8. Install the catalytic converter on the engine. Refer to **PIPE, EXHAUST CROSSUNDER, INSTALLATION** .

Fig. 80: Clutch Slave Cylinder Union & Nipple
Courtesy of CHRYSLER GROUP, LLC

9. If Used, remove the cap-plug sealing the end of the hydraulic line used to avoid loosing hydraulic fluid.
10. Engage the clutch hydraulic coupling (4) onto the slave cylinder on the transmission.

Fig. 81: Locating Nut Holding Ground Cable To Transmission
Courtesy of CHRYSLER GROUP, LLC

11. Place the ground cable in position on the transmission.

12. Install the nut (1) to hold the ground cable to the transmission. Refer to **SPECIFICATIONS**.

Fig. 82: Positioning Transmission Jack, High Stand & Wood Block
Courtesy of CHRYSLER GROUP, LLC

13. Remove the high stand (2) from under the engine oil pan.
14. Remove the safety chain or strap and lower transmission jack (1) from under the transmission.
15. Lower the vehicle.

Fig. 83: Locating Bolts Holding Upper Mount To Adapter Spacer & Adapter Spacer To Transmission
Courtesy of CHRYSLER GROUP, LLC

16. Place transmission mount spacer in position on the transmission.
17. Install the bolts (3),(2= hidden) to hold the transmission mount adapter spacer (4) to the transmission. Refer to **SPECIFICATIONS**.
18. Position a floor jack under the transmission and lift the transmission enough to start the bolts in the upper transmission mount.
19. Install the bolts (1) to hold the upper transmission mount to the transmission mount adapter spacer (4). Refer to **SPECIFICATIONS**.

Fig. 84: Locating Bolts Holding Upper Bellhousing To Engine Block
Courtesy of CHRYSLER GROUP, LLC

20. Install the bolts (1) to hold the upper bellhousing to the engine block. Refer to **SPECIFICATIONS**.

Fig. 85: Wire Harness Retainers
Courtesy of CHRYSLER GROUP, LLC

21. Route the wire harness in proper position.
22. Engage the wire harness retainers (1) onto the top of the bellhousing bolts.
23. Install the exhaust clamp to hold the turbo charger to the catalytic converter.
24. Install the oxygen sensor. Refer to **SENSOR, OXYGEN, INSTALLATION** .
25. Connect the wire connector onto the oxygen sensor.
26. Connect the wire connector onto the exhaust temperature sensor.
27. Install the exhaust heat shield in position on the exhaust manifold.
28. Engage the clips to hold the shift cables housing ends to the bracket on the transmission.
29. Snap the select cable end in position on the lever ball stud on the transmission.
30. Snap the shift cable end in position on the lever ball stud on the transmission.
31. Raise the vehicle to gain access to the power transfer unit (PTU).
32. If equipped, Install the PTU.
33. Remove the fill plug and fill the transmission with the proper quantity and type fluid. Refer to **CAPACITIES AND RECOMMENDED FLUIDS, SPECIFICATIONS** .
34. Install the fill plug.
35. Install the exhaust crossunder pipe. Refer to **PIPE, EXHAUST CROSSUNDER, INSTALLATION** .
36. If equipped, Install the rear propeller shaft. Refer to **INSTALLATION** .
37. Install the front halfshafts.
38. Install the front wheel bolts in the front brake rotor hub.
39. While holding a pry bar across the wheel bolts to prevent the wheel hub in position on rotating, Install the NEW front wheel hub nuts. Refer to **SPECIFICATIONS** .
40. Using tool (special tool #10287-1, Tool, Staking), stake the front hub nuts to lock them on the halfshaft

stub shaft.

41. Lower the vehicle to gain access engine compartment.
42. Place the charge air tube in position on the vehicle.
43. Connect the charge air tube to the throttle body adapter.
44. Install the front fascia. Refer to **FASCIA, FRONT, INSTALLATION** .
45. Engage the retainer to hold the wire harness to the front fascia.
46. Connect wire harness connector at the left side of the front fascia.
47. Install the right front fender splash shield. Refer to **SHIELD, SPLASH, FRONT WHEELHOUSE, INSTALLATION** .
48. Install the left front fender splash shield. Refer to **SHIELD, SPLASH, FRONT WHEELHOUSE, INSTALLATION** .
49. Install the bolt to hold the charge air hose to the side of the transmission.
50. Engage the clamp on the charge air outlet hose on the left side of the radiator support panel.
51. Install the belly pan. Refer to **BELLY PAN, INSTALLATION** .
52. Lower the vehicle to mid level.
53. Install the front wheels. Refer to **INSTALLATION** .
54. Lower the vehicle to gain access to the engine compartment.
55. Install the pinch bolt to hold the steering column to the steering gear.
56. Install the battery and battery tray. Refer to **INSTALLATION** .
57. Engage the clips to hold the wire harness to the battery tray.
58. Install the upper radiator closeout panel.
59. Install the engine cover.
60. Close and latch the hood.
61. Road test the vehicle to verify the repair.

SPECIAL TOOLS

SPECIAL TOOLS

	10302 - Installer, Bearing Cup
	10303 - Installer, Differential Oil Seal

	10305 - Installer, Differential Bearing Cup

1130 - Splitter, Bearing/Gear (Originally Shipped In Kit Number(s) 6745, 6947, 6949, 9202, 9202A-CAN, 9202CC, 9299.)

6341A - Remover, Seal
(Originally Shipped In Kit Number(s) 6671.)

6446 - Installer, Bearing
(Originally Shipped In Kit Number(s) 6440.)

8254 - Installer, Grommet
(Originally Shipped In Kit Number(s) 8283, 8283CC, 8527, 8527CC, 8575, 8575CC, 9975.)

8353 - Blocks, Adapter
(Originally Shipped In Kit Number(s) 8283CC, 8527CC.)

	8866 - Installer, Bearing Cup (Originally Shipped In Kit Number(s) 8998, 8998CC.)
	9664 - Remover, Bearing Cup (Originally Shipped In Kit Number(s) 9675, 9685, 9695.)

	9676 - Adapter Plug (Originally Shipped In Kit Number(s) 9675, 9685, 9695.)
	C-293-PA - Puller, Press (Originally Shipped In Kit Number(s) 8418, 8837, C-293-M.)
	C-3095-A - Installer, Bearing

C-4171 - Driver Handle, Universal
(Originally Shipped In Kit Number(s) 9202, 9202A-CAN, 9202CC, 9299, 9299CC, 9299CC, 9300A-CAN.)

C-4193A - Installer, Seal
(Originally Shipped In Kit Number(s) 6671.)

C-4198 - Installer, Axle Bearing (Originally Shipped In Kit Number(s) 8207.)

C-4340 - Installer, Bearing

	(Originally Shipped In Kit Number(s) 8418, 8659.)
	C-637 - Slide Hammer, Universal (Originally Shipped In Kit Number(s) 9202.)
	D-111 - Installer, Bearing Cup

	(Originally Shipped In Kit Number(s) 9925, 9926.)
	L-4520 - Installer, Seal/Cup (Originally Shipped In Kit Number(s) 6822.)

	
	MD998200 - Installer, Seal

	W-262 - Installer, Bearing (Originally Shipped In Kit Number(s) 8418.)

BOOT, GEARSHIFT

REMOVAL

REMOVAL

1. Remove the gear shift knob.
2. Disengage arrowhead fasteners holding lower shifter boot escutcheon to the floor console.
3. Pull boot upward to gain access to the reverse lockout cable.
4. Pull the reverse lock out cable housing upward and sideways to disengage the cable from the shifter base.
5. Disengage the cable end from the lockout lever.

Fig. 86: Gear Shift Boot
Courtesy of CHRYSLER GROUP, LLC

6. Separate the shifter boot from the vehicle.

INSTALLATION

INSTALLATION

061069628

Fig. 87: Shift Boot & Reverse Lockout Cable End
Courtesy of CHRYSLER GROUP, LLC

1. Engage reverse lockout cable end (1) into the slot in the pass through opening under the shift boot (2).

061069626

Fig. 88: Gear Shift Boot
Courtesy of CHRYSLER GROUP, LLC

2. Place the shifter boot in position over the shift lever.
3. While holding the reverse lockout cable end in place, align the flat guide in the pass through opening in the boot with the flat on the gear shift lever.
4. Push the boot downward until it seats on the gear shift lever.
5. Engage the lower lockout cable end into the lock lever on the shifter base.
6. Pull upward on the lockout cable housing while guiding the lockout cable core into the slot on the shifter base.
7. Insert the lockout cable housing into the retaining hole in the shifter base.
8. Engage arrowhead fasteners to hold lower shifter boot escutcheon to the floor console.
9. Install the gear shift knob.

KNOB, GEARSHIFT

REMOVAL

REMOVAL

NOTE: The upper hemisphere of the gearshift knob is fastened to the lower hemisphere with polyurethane adhesive. The upper hemisphere must be destroyed to remove it.

061069622

Fig. 89: Gear Shift Knob & Internal Nut
Courtesy of CHRYSLER GROUP, LLC

1. To remove the gearshift knob:

- Using a 15 mm (5/8 in.) hole saw or drill bit, drill a hole (3) in the crown of the upper hemisphere of the gear shift knob (1) to gain access to an internal nut (2).
- **Alternate method:**

  Using Channel-lock™ pliers, fracture the upper hemisphere and separate it from the gear shift knob lower hemisphere.

2. Using a suitable vacuum cleaner or regulated 3.4 kPa (50 psi) shop air, clean the access hole of debris.
3. Remove nut (2) holding the gear shift knob to the gear shift lever.
4. Separate the gear shift knob from the gear shift lever.

INSTALLATION

INSTALLATION

NOTE: The service replacement package should contain a small tube of adhesive.

1. Align the flat guide surface inside the center pass through hole in the lower hemisphere with the flat on the gearshift lever and push down until the gearshift knob seats.

Fig. 90: Gear Shift Knob & Nut
Courtesy of CHRYSLER GROUP, LLC

2. Install the nut (1) to hold the gearshift knob (2) to the gearshift lever.

061069624

Fig. 91: Gear Shift Knob & Adhesive Locations
Courtesy of CHRYSLER GROUP, LLC

3. Apply 6 mm (1/4 in.) dabs of adhesive in three locations (2) next to the elongated slots on the lower gear shift knob (1).

061069625

Fig. 92: Upper & Lower Hemisphere
Courtesy of CHRYSLER GROUP, LLC

4. Align the longest lock-tab on the upper hemisphere (1) to the longest slot on the lower hemisphere (2).
5. Push the upper hemisphere (1) downward until it locks in place.

CABLE, GEARSHIFT CONTROL

ADJUSTMENTS

ADJUSTMENT/SELECT CABLE

NOTE: The select cable adjustment device is located at the transaxle end of the select cable.

1. Release the hood latch and open the hood.
2. Support the hood on the provided prop-rod.
3. Remove the engine cover.
4. Remove the upper radiator closeout panel.
5. Disengage the clips holding the wire harness to the battery tray.
6. Remove the battery and battery tray. Refer to **TRAY, BATTERY, REMOVAL** .

Fig. 93: Prying Select Cable End From Select Lever Ball Stud On Transmission
Courtesy of CHRYSLER GROUP, LLC

7. Using a suitable prying tool, pry the select cable end from the select lever ball stud on the transaxle.
8. Manually hold the select lever into neutral/reverse position.
9. Using a suitable elastic strap, Push the shift handle to the right and fix the shift handle in the reverse/neutral location.

2102011231

Fig. 94: Disengaging Adjuster Slide Lock Button To Allow Select Cable End To Telescope
Courtesy of CHRYSLER GROUP, LLC

10. Disengage the adjuster slide (2) lock button (1) to allow the select cable end (3) to telescope.
11. Connect the select cable end on the select lever ball stud.

2102011232

Fig. 95: Engaging Adjuster Slide Lock Button To Set Select Cable End Length
Courtesy of CHRYSLER GROUP, LLC

12. Engage the adjuster slide (2) lock button (1) to set the select cable length.
13. Verify that the shifter operates properly.
14. Install the battery tray and battery.

15. Connect the wire harness retainers to the battery tray.
16. Install the upper radiator closeout panel.
17. Install the engine cover.
18. Close the hood.
19. Road test the vehicle to verify the repair.

REMOVAL

REMOVAL

NOTE: The transaxle shift cables are serviced as a set. The cable ends are too large to be drawn through the holes in the rubber floor plug.

1. Position the vehicle on a suitable hoist with the transaxle in neutral.
2. Remove the center console assembly. Refer to **CONSOLE, FLOOR, REMOVAL** .

Fig. 96: Disengaging/Engaging Retainers Holding Cable Housings To Shifter Base
Courtesy of CHRYSLER GROUP, LLC

3. Disengage retainers holding cable housings to shifter base.
4. Pull the cable housing from the shifter base.

Fig. 97: Neutral Gate Cable End & Shifter Pin
Courtesy of CHRYSLER GROUP, LLC

5. Pry select cable (3) end to the left toward the driver's seat to disengage the cable end from the select lever (2) pin.

Fig. 98: Fulcrum Ball, Cable End & Spring-Clip
Courtesy of CHRYSLER GROUP, LLC

6. Release spring-clip (3) holding cable end (2) to fulcrum ball (1) under the shifter handle and push the cable end upward to engage it.
7. Release the lock on the neutral sensor wire connector.
8. Separate the wire harness connector from the neutral sensor.
9. Unhook the wire harness retainer and position the harness out of the way.
10. Remove the nuts holding the shifter to the floor.
11. Separate the shifter from the vehicle.
12. Open the hood and support it on the prop-rod.
13. Remove the engine cover/air cleaner assembly to gain access to the top of the transaxle. Refer to **BODY, AIR CLEANER, REMOVAL** .

Fig. 99: Prying Shift Cable End From Lever Ball Stud On Transmission
Courtesy of CHRYSLER GROUP, LLC

14. Disengage retainer holding the shift cable to the transaxle bracket and lift the shift cable housing from the bracket.
15. Using a suitable pry bar (2), pry shift cable upward (1) to disengage it from the counterweighted gearshift lever ball stud.

Fig. 100: Prying Select Cable End From Select Lever Ball Stud On Transmission
Courtesy of CHRYSLER GROUP, LLC

16. Disengage retainer holding the select cable to the transaxle bracket and lift the cable housing from the bracket.
17. Using a suitable pry bar (1), pry select cable (2) end to the left (driver side) to disengage the select cable end from the select lever ball stud.
18. Remove the locking retainers from the shift cable housing ends to avoid breaking them during removal.
19. Raise the vehicle to gain access to the underside of the vehicle.

Fig. 101: Exhaust Heat Shield, Exhaust Pipe & Rear Drive Shaft
Courtesy of CHRYSLER GROUP, LLC

20. Remove the bolts holding the exhaust heat shield (3) to the floor above the exhaust pipe (4) and if equipped, the rear drive shaft (2).
21. Roll the heat shield (3) to the right (passenger side) of the vehicle and separate the heat shield (3) from the vehicle.

Fig. 102: Shift Cables, Rubber Floor Plug & Floor Opening
Courtesy of CHRYSLER GROUP, LLC

22. Using a suitable prying tool, pry the rubber floor plug (3) downward, taking care not to tear the plug.
23. Pull the shift cables (1) through the opening in the floor (4) and under the floor pan.

Fig. 103: Shift Cables, Rear Propeller Shaft & Front Stabilizer Bar

Courtesy of CHRYSLER GROUP, LLC

24. If equipped, guide the shift cables (1) over the top of the rear propeller shaft (2) to the left side of the vehicle.
25. Guide the cables (1) rearward until the upper cable ends (1) are visible above the front stabilizer bar (3).
26. One at a time, pull the cable ends (1) through the gap above the stabilizer bar (3).
27. Separate the cables from the vehicle.

INSTALLATION

INSTALLATION

NOTE: The transaxle shift cables are serviced as a set. The cable ends are to large to be drawn through the holes in the rubber floor plug.

1. Position the vehicle on a suitable hoist with the transaxle in neutral.
2. Raise the vehicle to gain access to the underside of the vehicle.

Fig. 104: Shift Cables, Rear Propeller Shaft & Front Stabilizer Bar
Courtesy of CHRYSLER GROUP, LLC

3. Place the cables in position on the vehicle.
4. One at a time, push the cable ends (1) through the gap above the stabilizer bar (3).
5. Guide the cables (1) forward until the upper cable ends (1) are in line with the retaining bracket on top of the transaxle.
6. If equipped, guide the shift cables (1) over the top of the rear propeller shaft (2) and in line with the opening in the floor.

Fig. 105: Shift Cables, Rubber Floor Plug & Floor Opening
Courtesy of CHRYSLER GROUP, LLC

7. Push the shift cables (1) through the opening in the floor.
8. Insert the rubber floor plug (3) upward until it seats properly.

Fig. 106: Exhaust Heat Shield, Exhaust Pipe & Rear Drive Shaft
Courtesy of CHRYSLER GROUP, LLC

9. Roll the heat shield (3) to the left in proper position on the vehicle.
10. Install the bolts to hold the exhaust heat shield (3) to the floor above the exhaust pipe (4) and if equipped, the rear propeller shaft (2).

11. Lower the vehicle to gain access to the top side of the vehicle.
12. Install the locking rings onto the shift cable housing ends.

Fig. 107: Prying Select Cable End From Select Lever Ball Stud On Transmission
Courtesy of CHRYSLER GROUP, LLC

13. Place the select cable end on the select lever ball stud and snap the select cable (2) end onto the ball stud.
14. Place the cable housing in position on the bracket and engage the retainer to hold the select cable to the transaxle bracket.

Fig. 108: Prying Shift Cable End From Lever Ball Stud On Transmission
Courtesy of CHRYSLER GROUP, LLC

15. Place the shift cable end on the shift lever ball stud and snap the shift cable (2) end onto the ball stud.
16. Place the cable housing in position on the bracket and engage the retainer to hold the select cable to the transaxle bracket.
17. Install the engine cover/air cleaner assembly. Refer to **BODY, AIR CLEANER, INSTALLATION** .
18. Place the shifter in position in the vehicle.
19. Install the nuts to hold the shifter to the floor.
20. Place the harness in proper position and hook the wire harness retainer to the shift mechanism.
21. Engage the wire harness connector into the neutral sensor lead connector.
22. Engage the lock on the neutral sensor wire connector.

Fig. 109: Fulcrum Ball, Cable End & Spring-Clip
Courtesy of CHRYSLER GROUP, LLC

23. Engage spring-clip (3) to hold cable end (2) to fulcrum ball (1) under the shifter handle and push the cable end upward to disengage it.

Fig. 110: Neutral Gate Cable End & Shifter Pin
Courtesy of CHRYSLER GROUP, LLC

24. Engage the cable (3) end onto the select lever (2) pin.

Fig. 111: Disengaging/Engaging Retainers Holding Cable Housings To Shifter Base
Courtesy of CHRYSLER GROUP, LLC

25. Engage retainers to hold the cable housings to shifter base (1).
26. If necessary, adjust the shift select cable.
27. Install the center console assembly.

28. Close the hood.
29. Road test the vehicle to verify the repair.

DIFFERENTIAL, TRANSAXLE

DISASSEMBLY

DISASSEMBLY

Fig. 112: Remove Pinion Side Bearing
Courtesy of CHRYSLER GROUP, LLC

NOTE: This procedure will require the removal of the bearing cage and rollers. New bearings must be used upon reassembly.

1. Using (special tool #C-293-PA, Puller, Press) (1), (special tool #8353, Blocks, Adapter) (2), and (special tool #9676, Adapter Plug) (3) remove the pinion side differential bearing.

Fig. 113: Remove Ring Gear Side Bearing
Courtesy of CHRYSLER GROUP, LLC

2. Using (special tool #C-293-PA, Puller, Press) (1), (special tool #8353, Blocks, Adapter) (2), and (special tool #9676, Adapter Plug), remove the ring gear side differential bearing.
3. Remove the ring gear bolts.
4. Remove the ring gear.

ASSEMBLY

ASSEMBLY

Fig. 114: Differential Bearing & Special Tool

Courtesy of CHRYSLER GROUP, LLC

1. Position the ring gear.
2. Install **new** ring gear bolts (1) and tighten to 83 N.m (61 ft. lbs.).
3. Install a **new** ring gear side differential bearing (1) using a suitable press and (special tool #C-4340, Installer, Bearing) (2).
4. Install a **new** Pinion gear side differential bearing using a suitable press and (special tool #C-4340, Installer, Bearing) (2).

FLUID

STANDARD PROCEDURE

FLUID DRAIN AND FILL

NOTE: It is acceptable to top-off fluid level in the case of fluid loss due to service of halfshaft, seal, etc.

- **Add fluid until it reaches the rolled lower edge of the sloped ramp 40 mm (1.5 in) inside the threshold of the fill hole next to the differential ring gear carrier. This surface is approximately 8 mm (0.3 in) below the bottom of the fill hole.**
- **The minimum acceptable fluid level is 23 mm (0.9 in) below the bottom of the fill hole.**

To fabricate a fluid level dipstick, cut a 15 mm (0.6 in) wide strip, length wise, from a common business card. At 30 mm (1.2 in) from one end, fold the strip to 90°. The short end of the strip is the dipstick and the long end is the handle. Insert the paper dipstick into the fill hole and press the handle end against the flattened threshold so the dipstick end turns downward into the sump near the differential carrier. Remove the paper dipstick and immediately measure the distance from the fold crease in the paper to the top of the fluid line. As time passes the paper will absorb the fluid and the witness mark the fluid left in the paper will become invalid. The distance from the fold to the fluid mark is the fluid level.

1. Raise vehicle on a suitable jack or hoist.
2. Remove the belly pan.
3. Place a suitable drain pan under transaxle.

Fig. 115: Transaxle & Drain Plug Hole
Courtesy of CHRYSLER GROUP, LLC

4. Remove transaxle drain plug to allow the fluid to flow (1) into the drain pan until transaxle (2) is empty.
5. Install the drain plug and tighten to 25 N.m (18 lbs. ft.).

Fig. 116: Transaxle & Fill Plug

Courtesy of CHRYSLER GROUP, LLC

6. Using regulated 344 kPa (50 psi) compressed shop air or stiff bristle brush, clean the area around the fill plug to avoid contaminating the transaxle during the filling operation.
7. Remove the rubber fill plug (1) from the transaxle (2), located rearward and above the left halfshaft.
8. Fill the **COLD** transaxle with 1.7 l (1.8 qt.) of the proper fluid type. Refer to **CAPACITIES AND RECOMMENDED FLUIDS, SPECIFICATIONS** .
9. Install the fill plug.
10. Install the belly pan.

FLUID LEVEL INSPECTION

NOTE: The threshold of the fill hole opening extends 40 mm (1.5 in) into the transaxle before turning downward into the sump near the differential ring gear carrier.

NOTE: It is acceptable to top-off fluid level in the case of fluid loss due to service of halfshaft, seal, etc.

- **Add fluid until it reaches the rolled lower edge of the sloped ramp 40 mm (1.5 in) inside the threshold of the fill hole next to the differential ring gear carrier. This surface is approximately 8 mm (0.3 in) below the bottom of the fill hole.**
- **The minimum acceptable fluid level is 23 mm (0.9 in) below the bottom of the fill hole.**

To fabricate a fluid level dipstick, cut a 15 mm (0.6 in) wide strip, length wise, from a common business card. At 30 mm (1.2 in) from one end, fold the strip to 90°. The short end of the strip is the dipstick and the long end is the handle. Insert the paper dipstick into the fill hole and press the handle end against the flattened threshold so the dipstick end turns downward into the sump near the differential carrier. Remove the paper dipstick and immediately measure the distance from the fold crease in the paper to the top of the fluid line. As time passes the paper will absorb the fluid and the witness mark the fluid left in the paper will become invalid. The distance from the fold to the fluid mark is the fluid level.

Fig. 117: Transaxle & Fill Plug
Courtesy of CHRYSLER GROUP, LLC

1. Hoist the vehicle on a suitable hoist so the vehicle stays in a level position.
2. Remove belly pan.
3. Using regulated 344 kPa (50 psi) compressed shop air or stiff bristle brush, clean the area around the fill plug to avoid contaminating the transaxle during the filling operation.
4. Remove the rubber fill plug (1) from the transaxle (2), located rearward and above the left halfshaft.
5. Fill the **COLD** transaxle to:
   - Add fluid until it reaches the rolled lower edge of the sloped ramp 40 mm (1.5 in) inside the threshold of the fill hole next to the differential ring gear carrier. This surface is approximately 8 mm (0.3 in) below the bottom of the fill hole. Refer to **CAPACITIES AND RECOMMENDED FLUIDS, SPECIFICATIONS** .
6. Install the fill plug.
7. Install the belly pan.

INPUT SHAFT, TRANSMISSION

DISASSEMBLY

DISASSEMBLY

Fig. 118: Snap Ring
Courtesy of CHRYSLER GROUP, LLC

1. Remove the **right hand** thread rear bearing retention bolt and discard.
2. Remove the snap ring (1) from the input shaft.

Fig. 119: Removing Front Bearing & Forth-Sixth Gear
Courtesy of CHRYSLER GROUP, LLC

3. Remove the front bearing (1) and the forth-sixth gear (2) using a press and (special tool #1130, Splitter, Bearing/Gear).

Fig. 120: Splitter, Bearing/Gear
Courtesy of CHRYSLER GROUP, LLC

Fig. 121: Sleeve & Third-Fifth Gears
Courtesy of CHRYSLER GROUP, LLC

4. Remove the sleeve (1) and the third-fifth gears (2) using a press and plates.

Fig. 122: Removing Rear Bearing
Courtesy of CHRYSLER GROUP, LLC

5. Remove the rear bearing (1) using (special tool #MD998200, Installer, Seal) and plates.

ASSEMBLY

ASSEMBLY

Fig. 123: Rear Bearing

Fig. 132: Special Tool #C-4193A
Courtesy of CHRYSLER GROUP, LLC

Fig. 133: Installing Front Bearing
Courtesy of CHRYSLER GROUP, LLC

6. Install the front bearing (1) using Seal Installer (special tool #C-4193A, Installer, Seal).

Fig. 134: Special Tool #C-4193A
Courtesy of CHRYSLER GROUP, LLC

Fig. 135: Snap Ring
Courtesy of CHRYSLER GROUP, LLC

7. Install the snap ring (1).
8. Install a **new** rear bearing retention bolt, tighten to 56 N.m (41 ft. lbs.).

MECHANISM, GEARSHIFT

REMOVAL

REMOVAL

1. Remove the center console assembly.

   Refer to **CONSOLE, FLOOR, REMOVAL** .

Fig. 136: Shifter Bracket, Cable Housing & Retainers
Courtesy of CHRYSLER GROUP, LLC

2. Disengage retainers (1) holding cable housings (4) to shifter base (2).
3. Pull the cable housing (4) from the shifter base (2).

Fig. 137: Neutral Gate Cable End & Shifter Pin

Courtesy of CHRYSLER GROUP, LLC

4. Pry select cable end (3) to the left toward drive seat to disengage the cable end (3) from the select lever pin (2).

Fig. 138: Fulcrum Ball, Cable End & Spring-Clip
Courtesy of CHRYSLER GROUP, LLC

5. Release spring-clip (3) holding the cable end (2) to fulcrum ball (1) under the shifter handle and push the cable end downward to disengage it.
6. Remove nuts holding the shifter to the floor.
7. Separate the shifter from the vehicle.

INSTALLATION

INSTALLATION

1. Place the shifter in position on the floor pan.

Fig. 139: Fulcrum Ball, Cable End & Spring-Clip
Courtesy of CHRYSLER GROUP, LLC

2. Align cable end (2) to fulcrum ball (1) under the shifter handle and push the cable end (2) upward to engage it.

Fig. 140: Neutral Gate Cable End & Shifter Pin
Courtesy of CHRYSLER GROUP, LLC

3. Align select cable end (3) to the engage select lever pin (2).

Fig. 141: Shifter Bracket, Cable Housing & Retainers
Courtesy of CHRYSLER GROUP, LLC

4. Insert the cable housing (4) into the shifter base (2) and push downward until the retainers (1) lock in position.
5. Install nuts to hold the shifter to the floor and tighten to 9 N.m (80 in lb.).
6. Install the center console assembly.

   Refer to **CONSOLE, FLOOR, REMOVAL** .

SEAL, AXLE DRIVE SHAFT

REMOVAL

REMOVAL

3375805

Fig. 142: Removing Axle Seal
Courtesy of CHRYSLER GROUP, LLC

NOTE: Left side is shown in illustration, right side is similar.

1. Remove the halfshaft. Refer to **REMOVAL** .
2. **For the left side** , remove the axle seal (3) using (special tool #6341A, Remover, Seal) (2) and (special tool #C-637, Slide Hammer, Universal)
3. **For the right side** , remove the axle seal (3) using (special tool #9664, Remover, Bearing Cup) (2) and (special tool #C-637, Slide Hammer, Universal)

INSTALLATION

INSTALLATION

Courtesy of CHRYSLER GROUP, LLC

1. Install the backup lamp switch (1) and tighten to 38 N.m (28 lbs. ft.).
2. Connect backup lamp switch connector (2).
3. Install the air cleaner body. Refer to **BODY, AIR CLEANER, INSTALLATION**
4. Connect battery negative cable.

2014 RESTRAINTS

Occupant Restraint Controller (ORC) - Electrical Diagnostics - Cherokee

DIAGNOSIS AND TESTING

B0001-11-DRIVER FRONTAL SQUIB 1 CONTROL - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 1: Driver Frontal Squib Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) sends a test current to the squibs to verify the integrity of the squib and wiring. These circuits are maintained in a "floating" configuration at the module (connected to neither power nor ground) as protection against inadvertent deployment. Use of the (special tool #8443A, SRS Load Tool) in the tests below substitutes a suspect squib with a known good component. The use of the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) provides a test point as well as a method for opening the shorting bar connections within the harness connector.

WHEN MONITORED

The ORC Module sends out a 40 mA diagnostic current on each squib voltage supply circuit at power up, and every 500 ms thereafter while the ignition is on.

SET CONDITION

This Diagnostic Trouble Code (DTC) sets when the ORC detects a short to ground on the driver airbag squib circuit for more than 2.6 seconds. This DTC transitions from active to stored when the ORC sees a recovery from a short to ground for greater than 2.6 seconds. The Airbag Warning Lamp (AWL) will set in the instrument cluster.

POSSIBLE CAUSES

Possible Causes
(R43) DRIVER SQUIB 1 LINE 2 CIRCUIT SHORTED TO GROUND
(R45) DRIVER SQUIB 1 LINE 1 CIRCUIT SHORTED TO GROUND
CLOCKSPRING
DRIVER AIRBAG
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

NOTE: **The use of a approved special tool or Digital Multimeter such as a Fluke Meter that will not apply more than 20 milliamperes to a circuit are the only measurement tools to be used.**

NOTE: **Make sure the battery is fully charged.**

NOTE: The scan tool, (special tool #8443A, SRS Load Tool), and DVOM are required to perform the following test.

1. Select Active or Stored DTC.

   Is the DTC active or stored?

   ORC - ACTIVE DTC

   - Go To 3

   ORC - STORED DTC

   - Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK FOR SHORTED SQUIB CIRCUITS IN DRIVER AIRBAG**

   WARNING: **Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

   1. Disconnect the Driver Airbag Squib harness connectors.

      WARNING: **Do not place an intact non-deployed airbag face down on a hard surface, the airbag propels into the air if accidentally deployed. Failure to follow these instructions may result in possible serious or fatal injury.**

      NOTE: Check the connectors - Clean and repair as necessary.

   2. Connect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) to the Driver Airbag Squib 1 and Squib 2 harness connectors.
   3. If equipped with the standard key ignition, use this ignition on warning.

      WARNING: **Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

   4. If equipped with the keyless ignition, use this ignition on warning.

      WARNING: **Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes**

before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

5. With the scan tool, read the active ORC DTCs.

   Does the scan tool display: B0001-11-DRIVER FRONTAL SQUIB 1 CONTROL - CIRCUIT SHORT TO GROUND?

   Yes

   - Go To 3

   No

   WARNING: **Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

   - Replace the Driver Airbag in accordance with the Service Information. Refer to **AIR BAG, DRIVER, REMOVAL** .

3. **CHECK CLOCKSPRING SQUIB CIRCUITS FOR A SHORT TO GROUND**

   WARNING: **Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

1. Disconnect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) from the Driver Airbag Squib harness connectors.
2. Disconnect the Steering Control Module C1 harness connector.

   NOTE: Check the connectors - Clean and repair as necessary.

3. If equipped with the standard key ignition, use this ignition on warning.

   WARNING: **Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

4. If equipped with the keyless ignition, use this ignition on warning.

   WARNING: **Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes**

before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

5. With the scan tool, read the active ORC DTCs.

   Does the scan tool display: B0001-11-DRIVER FRONTAL SQUIB 1 CONTROL - CIRCUIT SHORT TO GROUND?

   Yes

   - Go To 4

   No

   WARNING: **Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

   - Replace the clockspring in accordance with the Service Information. Refer to **CLOCKSPRING, REMOVAL** .
   - Perform the CLOCKSPRING CENTERING. Refer to **CLOCKSPRING, STANDARD PROCEDURE** . Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK (R43) DRIVER SQUIB 1 LINE 2 CIRCUIT AND (R45) DRIVER SQUIB 1 LINE 1 CIRCUIT FOR A SHORT TO GROUND**

   WARNING: **Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

   1. Disconnect the ORC connectors.

      NOTE: Check the connectors - Clean and repair as necessary.

   2. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) to the ORC C1 and ORC C2 harness connectors.
   3. Measure the resistance of the (R43) Driver Squib 1 Line 2 circuit between ground and the C1A cavity 5 of the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool).
   4. Measure the resistance of the (R45) Driver Squib 1 Line 1 circuit between ground and the C1A cavity 25 of the(special tool #8443-57, Adapter, Supplemental Restraint System Load Tool).

      Is the resistance below 10K Ohms for either measurement?

Yes

- Repair the Driver Squib 1 circuit(s) for a short to ground.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

WARNING: **If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment. Failure to follow these instructions may result in possible serious or fatal injury.**

- Replace the Occupant Restraint Controller Module in accordance with the Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B0001-12-DRIVER FRONTAL SQUIB 1 CONTROL - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

1. Select Active or Stored DTC.

   Is the DTC active or stored?

   ORC - ACTIVE DTC

   - Go To 2

   ORC - STORED DTC

- Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK FOR SHORTED SQUIB CIRCUITS IN DRIVER AIRBAG**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the Driver Airbag Squib harness connectors.

WARNING: Do not place an intact non-deployed airbag face down on a hard surface, the airbag propels into the air if accidentally deployed. Failure to follow these instructions may result in possible serious or fatal injury.

NOTE: Check the connectors - Clean and repair as necessary.

2. Connect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) to the Driver Airbag Squib 1 and Squib 2 harness connectors.
3. If equipped with the standard key ignition, use this ignition on warning.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

4. If equipped with the keyless ignition, use this ignition on warning.

WARNING: Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

5. With the scan tool, read the active ORC DTCs.

Does the scan tool display: B0001-12-DRIVER FRONTAL SQUIB 1 CONTROL - CIRCUIT SHORT TO BATTERY?

Yes

- Go To 3

No

- Replace the Driver Airbag in accordance with the Service Information. Refer to **AIR BAG, DRIVER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK CLOCKSPRING SQUIB CIRCUITS FOR A SHORT TO VOLTAGE**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) from the Driver Airbag Squib connectors.
2. Disconnect the SCM C1 harness connector.

NOTE: Check the connectors - Clean and repair as necessary.

3. If equipped with the standard key ignition, use this ignition on warning.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

4. If equipped with the keyless ignition, use this ignition on warning.

WARNING: Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

5. With the scan tool, read the active ORC DTCs.

Does the scan tool display: B0001-12-DRIVER FRONTAL SQUIB 1 CONTROL - CIRCUIT SHORT TO BATTERY?

Yes

- Go To 4

No

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions

may result in possible serious or fatal injury.

- Replace the clockspring in accordance with the Service Information. Refer to **CLOCKSPRING, REMOVAL** .
- Perform the CLOCKSPRING CENTERING. Refer to **CLOCKSPRING, STANDARD PROCEDURE** . Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK (R43) DRIVER SQUIB 1 LINE 2 CIRCUIT AND (R45) DRIVER SQUIB 1 LINE 1 CIRCUIT FOR A SHORT TO VOLTAGE**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the ORC harness connectors.

NOTE: Check the connectors - Clean and repair as necessary.

2. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) to the ORC C1 and ORC C2 harness connectors.
3. If equipped with the standard key ignition, use this ignition on warning.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

4. If equipped with the keyless ignition, use this ignition on warning.

WARNING: Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

5. Measure the voltage of the (R43) Driver Squib 1 Line 2 circuit between ground and the C1A cavity 5 of the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool).
6. Measure the voltage of the (R45) Driver Squib 1 Line 1 circuit between ground and the C1A cavity 25 of the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool).

Is there any voltage present for either measurement?

Yes

- Repair the Driver Squib 1 circuit(s) for a short to voltage.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

WARNING: **Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

WARNING: **If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment. Failure to follow these instructions may result in possible serious or fatal injury.**

Repair

- Replace the ORC in accordance with the Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B0001-13-DRIVER FRONTAL SQUIB 1 CONTROL - CIRCUIT OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 3: Driver Frontal Squib Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) sends a test current to the squibs to verify the integrity of the squib and wiring. These circuits are maintained in a "floating" configuration at the module (connected to neither power nor ground) as protection against inadvertent deployment. Use of the (special tool #8443A, SRS Load Tool) in the tests below substitutes a suspect squib with a known good component. The use of the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) provides a test point as well as a method for opening the shorting bar connections within the harness connector.

WHEN MONITORED

With the ignition on.

SET CONDITION

The Occupant Restraint Controller (ORC) monitors the resistance of the Driver Squib circuits. The ORC will set this DTC if it detects an open or high resistance on the Driver Squib 1 circuits for greater than 2.6 seconds. This DTC transitions from active to stored when the ORC sees a recovery from a open for greater than 2.6 seconds. The Airbag Warning Lamp (AWL) will set in the instrument cluster.

POSSIBLE CAUSES

Possible Causes
(R43) DRIVER SQUIB 1 LINE 2 CIRCUIT OPEN
(R45) DRIVER SQUIB 1 LINE 1 CIRCUIT OPEN
CLOCKSPRING
DRIVER AIRBAG
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

NOTE: **The use of a approved special tool or Digital Multimeter such as a Fluke Meter that will not apply more than 20 milliamperes to a circuit are the only measurement tools to be used.**

NOTE: **Make sure that the battery is fully charged.**

NOTE: **The scan tool, (special tool #8443A, SRS Load Tool) and DVOM are required to perform the following test.**

1. Turn the ignition on.

   Select ACTIVE or STORED DTC:

   ACTIVE DTC

   - Go To 2

   STORED DTC

- Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK FOR OPEN SQUIB CIRCUITS IN DRIVER AIRBAG**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the Driver Airbag Squib connectors.

WARNING: Do not place an intact non-deployed airbag face down on a hard surface, the airbag propels into the air if accidentally deployed. Failure to follow these instructions may result in possible serious or fatal injury.

NOTE: Check connectors - Clean and repair as necessary.

2. Connect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) to the Driver Airbag Squib 1 and Squib 2 connectors.
3. If equipped with the standard key ignition, use this ignition on warning.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

4. If equipped with the keyless ignition, use this ignition on warning.

WARNING: Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

5. With the scan tool, read the active ORC DTCs.

Does the scan tool display: B0001-13-DRIVER FRONTAL SQUIB 1 CONTROL - CIRCUIT OPEN?

Yes

- Go To 3

No

- Replace the Driver Airbag in accordance with the Service Information. Refer to **AIR BAG, DRIVER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK CLOCKSPRING SQUIB CIRCUITS FOR A SHORT TO VOLTAGE**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) from the Driver Airbag Squib connectors.
2. Disconnect the SCM C1 harness connector.

NOTE: Check the connectors - Clean and repair as necessary.

3. If equipped with the standard key ignition, use this ignition on warning.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

4. If equipped with the keyless ignition, use this ignition on warning.

WARNING: Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

5. Using a jumper wire connect terminals SCM C1 cavity 8 and SCM C1 cavity 9 but don't insert the jumper into the connector terminals.
6. While holding the jumper wire in place, with the scan tool, read the active ORC DTCs.

Does the scan tool display: B0001-13-DRIVER FRONTAL SQUIB 1 CONTROL - CIRCUIT OPEN?

Yes

- Go To 4

No

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

- Replace the clockspring in accordance with the Service Information. Refer to **CLOCKSPRING, REMOVAL** .
- Perform the CLOCKSPRING CENTERING. Refer to **CLOCKSPRING, STANDARD PROCEDURE** . Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK (R43) DRIVER SQUIB 1 LINE 2 CIRCUIT FOR AN OPEN**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the ORC connectors.

NOTE: Check connectors - Clean and repair as necessary.

2. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) to the ORC C1 and ORC C2 harness connectors.
3. Measure the resistance of the (R43) Driver Squib 1 Line 2 circuit between the SCM C1 connector cavity 8 and the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) connector C1A cavity 5.

   Is the resistance below or within the range of 5.4 - 10.0 Ohm?

   Yes

   - Go To 5

   No

   - Repair the R43 Driver Squib 1 Line 2 circuit for an open.
   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **CHECK (R45) DRIVER SQUIB 1 LINE 1 CIRCUIT FOR AN OPEN**
   1. Measure the resistance of the (R45) Driver Squib 1 Line 1 circuit between the SCM C1 connector cavity 9 and the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) connector C1A cavity 25.

      Is the resistance below or within the range of 5.4 - 10.0 Ohm?

Yes

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment. Failure to follow these instructions may result in possible serious or fatal injury.

- Replace the ORC in accordance with Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Repair the (R45) Driver Squib 1 Line 1 circuit for an open.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B0001-2B-DRIVER FRONTAL SQUIB 1 CONTROL - WIRES SHORTED TOGETHER

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 4: Driver Frontal Squib Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) sends a test current to the squibs to verify the integrity of the squib and wiring. These circuits are maintained in a "floating" configuration at the module (connected to neither power nor ground) as protection against inadvertent deployment. Use of the (special tool #8443A, SRS Load Tool) in the tests below substitutes a suspect squib with a known good component. To provide a test point and a method for opening the shorting bar connections within the harness connector, use the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool).

WHEN MONITORED

The ORC sends out a 40 mA diagnostic current on each squib voltage supply circuit at power up and every 500 ms thereafter while the ignition is on.

SET CONDITION

This Diagnostic Trouble Code (DTC) sets when the ORC detects both circuits of the same squib are shorted together for more than 2.6 seconds. This DTC transitions from active to stored when the ORC sees a recovery from a shorted together condition for greater than 2.6 seconds. The Airbag Warning Lamp (AWL) will set in the instrument cluster.

POSSIBLE CAUSES

Possible Causes
(R43) DRIVER SQUIB 1 LINE 2 CIRCUIT SHORTED TO THE (R45) DRIVER SQUIB 1 LINE 1 CIRCUIT
CLOCKSPRING
DRIVER AIRBAG
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

NOTE: **The use of a approved special tool or Digital Multimeter such as a Fluke Meter that will not apply more than 20 milliamperes to a circuit are the only measurement tools to be used.**

NOTE: **Make sure the battery is fully charged.**

NOTE: **The scan tool, (special tool #8443A, SRS Load Tool), and DVOM are required to perform the following test.**

1. Select Active or Stored DTC.

   Select ACTIVE or STORED DTC:

   ACTIVE DTC

   - Go To 2

STORED DTC

- Perform the RESTRAINTS SYSTEM INTERMITTENT SYSTEM. Refer to **STANDARD PROCEDURE** .

2. **CHECK FOR SHORTED SQUIB CIRCUITS IN DRIVER AIRBAG**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

WARNING: Do not place an intact non-deployed airbag face down on a hard surface, the airbag propels into the air if accidentally deployed. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the Driver Airbag Squib harness connectors.

NOTE: Check the connectors - Clean and repair as necessary.

2. Connect the (special tool #8443A, SRS Load Tool) and (special tool #8443-8, Jumper, SRS Load) to the Driver Airbag Squib 1 and Squib 2 harness connectors.
3. If equipped with the standard key ignition, use this ignition on warning.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

4. If equipped with the keyless ignition, use this ignition on warning.

WARNING: Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

5. With the scan tool, read the active ORC DTCs.

Does the scan tool display: B0001-2B-DRIVER FRONTAL SQUIB 1 CONTROL - WIRES SHORTED TOGETHER?

Yes

- Go To 3

No

- Replace the Driver Airbag in accordance with the Service Information. Refer to **AIR BAG, DRIVER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK CLOCKSPRING SQUIB CIRCUITS FOR A SHORT TOGETHER**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the (special tool #8443A, SRS Load Tool) and (special tool #8443-8, Jumper, SRS Load) from the Driver Airbag Squib harness connectors.
2. Disconnect the Steering Control Module (SCM) C1 harness connector.

NOTE: Check the connectors - Clean and repair as necessary.

3. If equipped with the standard key ignition, use this ignition on warning.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

4. If equipped with the keyless ignition, use this ignition on warning.

WARNING: Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

5. With the scan tool, read the active ORC DTCs.

Does the scan tool display: B0001-2B-DRIVER FRONTAL SQUIB 1 CONTROL - WIRES SHORTED TOGETHER?

Yes

- Go To 4

No

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

- Replace the clockspring in accordance with the Service Information. Refer to **CLOCKSPRING, REMOVAL** .
- Perform the CLOCKSPRING CENTERING. Refer to **CLOCKSPRING, STANDARD PROCEDURE** . Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK (R43) DRIVER SQUIB 1 LINE 2 CIRCUIT FOR A SHORT TO THE (R45) DRIVER SQUIB 1 LINE 1 CIRCUIT**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the ORC C1 and ORC C2 harness connectors.

NOTE: Check the connectors - Clean and repair as necessary.

2. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) to the ORC C1 and ORC C2 harness connector.
3. Measure the resistance between the (R43) Driver Squib 1 Line 2 circuit ORC connector C1A cavity 5 and the (R45) Driver Squib 1 Line 1 circuit ORC connector C1A cavity 25 at the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool).

   Is the resistance below 10k Ohms Ohms?

   Yes

   - Repair the (R43) Driver Squib 1 Line 2 circuit for a short to the (R45) Driver Squib 1 Line 1 circuit.
   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment. Failure to follow

these instructions may result in possible serious or fatal injury.

- Replace the ORC in accordance with the Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B0002-11-DRIVER FRONTAL SQUIB 2 CONTROL CIRCUIT - SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 5: Driver Frontal Squib Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) sends a test current to the squibs to verify the integrity of the squib and wiring. These circuits are maintained in a "floating" configuration at the module (connected to neither power nor ground) as protection against inadvertent deployment. Use of the (special tool #8443A, SRS Load Tool) in the tests below substitutes a suspect squib with a known good component. The use of the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) provides a test point as well as a method for opening the shorting bar connections within the harness connector.

WHEN MONITORED

The ORC Module sends out a 40 mA diagnostic current on each squib voltage supply circuit at power up, and every 500 ms thereafter while the ignition is on.

SET CONDITION

This Diagnostic Trouble Code (DTC) sets when the ORC detects a short to ground on the driver airbag squib circuit for more than 2.6 seconds. This DTC transitions from active to stored when the ORC sees a recovery from a short to ground for greater than 2.6 seconds. The Airbag Warning Lamp (AWL) will set in the instrument cluster.

POSSIBLE CAUSES

Possible Causes
(R63) DRIVER SQUIB 2 LINE 1 CIRCUIT OR THE (R61) DRIVER SQUIB 2 LINE 2 CIRCUIT SHORTED TO GROUND
CLOCKSPRING
DRIVER AIRBAG
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

NOTE: **The use of a approved special tool or Digital Multimeter such as a Fluke Meter that will not apply more than 20 milliamperes to a circuit are the only measurement tools to be used.**

NOTE: **Make sure that the battery is fully charged.**

NOTE: **The scan tool, (special tool #8443A, SRS Load Tool) and DVOM are required to perform the following test.**

1. Turn the ignition on.

   Select ACTIVE or STORED DTC:

   ACTIVE DTC

   - Go To 2

STORED DTC

- Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK FOR SHORTED SQUIB CIRCUITS IN DRIVER AIRBAG**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the Driver Airbag Squib connectors.

WARNING: Do not place an intact non-deployed airbag face down on a hard surface, the airbag propels into the air if accidentally deployed. Failure to follow these instructions may result in possible serious or fatal injury.

NOTE: Check connectors - Clean and repair as necessary.

2. Connect the SRS Load Tool Kit (special tool #8443A, SRS Load Tool) and (special tool #8443-8, Jumper, SRS Load) to the Driver Airbag Squib 1 and Squib 2 connectors.
3. If equipped with the standard key ignition, use this ignition on warning.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

4. If equipped with the keyless ignition, use this ignition on warning.

WARNING: Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

5. With the scan tool, read the active ORC DTCs.

Does the scan tool display: B0002-11-DRIVER FRONTAL SQUIB 2 CONTROL CIRCUIT - SHORT TO GROUND?

Yes

- Go To 3

No

- Replace the Driver Airbag in accordance with the Service Information. Refer to **AIR BAG, DRIVER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK CLOCKSPRING SQUIB CIRCUITS FOR A SHORT TO GROUND**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the (special tool #8443A, SRS Load Tool) and (special tool #8443-8, Jumper, SRS Load) from the Driver Airbag Squib harness connectors.
2. Disconnect the Steering Control Module C1 harness connector.

NOTE: Check the connectors - Clean and repair as necessary.

3. If equipped with the standard key ignition, use this ignition on warning.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

4. If equipped with the keyless ignition, use this ignition on warning.

WARNING: Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

5. With the scan tool, read the active ORC DTCs.

Does the scan tool display: B0002-11-DRIVER FRONTAL SQUIB 2 CONTROL CIRCUIT - SHORT TO GROUND?

Yes

- Go To 4

No

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

- Replace the clockspring in accordance with the Service Information. Refer to **CLOCKSPRING, REMOVAL** .
- Perform the CLOCKSPRING CENTERING. Refer to **CLOCKSPRING, STANDARD PROCEDURE** . Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK (R61) DRIVER SQUIB 2 LINE 2 CIRCUIT AND (R63) DRIVER SQUIB 2 LINE 1 CIRCUIT FOR A SHORT TO GROUND**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the ORC C1 and ORC C2 harness connectors.

NOTE: Check the connectors - Clean and repair as necessary.

2. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) to the ORC C1 and ORC C2 harness connectors.
3. Measure the resistance of the (R61) Driver Squib 2 Line 1 circuit between ground and the C1A cavity 7 of the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool).
4. Measure the resistance of the (R63) Driver Squib 2 Line 1 circuit between ground and the C1A cavity 27 of the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool).

Is the resistance below 10K Ohms for either measurement?

Yes

- Repair the Driver Squib 2 circuit(s) for a short to ground.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment. Failure to follow these instructions may result in possible serious or fatal injury.

Repair

- Replace the Occupant Restraint Controller Module in accordance with the Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B0002-12-DRIVER FRONTAL SQUIB 2 CONTROL CIRCUIT - SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 6: Driver Frontal Squib Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) sends a test current to the squibs to verify the integrity of the squib and wiring. These circuits are maintained in a "floating" configuration at the module (connected to neither power nor ground) as protection against inadvertent deployment. Use of the (special tool #8443A, SRS Load Tool) in the tests below substitutes a suspect squib with a known good component. The use of the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) provides a test point as well as a method for opening the shorting bar connections within the harness connector.

WHEN MONITORED

The ORC sends out a 40 mA diagnostic current on each squib voltage supply circuit at power up and every 500 ms thereafter while the ignition is on.

SET CONDITION

This Diagnostic Trouble Code (DTC) sets when the ORC detects a short to voltage on the squib circuit for more than 2.6 seconds. This DTC transitions from active to stored when the ORC sees a recovery from a short to voltage for greater than 2.6 seconds. The Airbag Warning Lamp (AWL) will set in the instrument cluster.

POSSIBLE CAUSES

Possible Causes
(R63) DRIVER SQUIB 2 LINE 1 CIRCUIT SHORTED TO VOLTAGE
(R61) DRIVER SQUIB 2 LINE 2 CIRCUIT SHORTED TO VOLTAGE
CLOCKSPRING
DRIVER AIRBAG
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

   NOTE: Make sure the battery is fully charged.

   NOTE: The scan tool, (special tool #8443A, SRS Load Tool), and DVOM are required to perform the following test.

   1. Select Active or Stored DTC.

      Is the DTC active or stored?

      ORC - ACTIVE DTC

      - Go To 2

      ORC - STORED DTC

      - Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK FOR SHORTED SQUIB CIRCUITS IN DRIVER AIRBAG**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the Driver Airbag Squib harness connectors.

WARNING: Do not place an intact non-deployed airbag face down on a hard surface, the airbag propels into the air if accidentally deployed. Failure to follow these instructions may result in possible serious or fatal injury.

NOTE: Check the connectors - Clean and repair as necessary.

2. Connect the (special tool #8443A, SRS Load Tool) and (special tool #8443-8, Jumper, SRS Load) to the Driver Airbag Squib 1 and Squib 2 harness connectors.
3. If equipped with the standard key ignition, use this ignition on warning.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

4. If equipped with the keyless ignition, use this ignition on warning.

WARNING: Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

5. With the scan tool, read the active ORC DTCs.

   Does the scan tool display: B0002-12-DRIVER FRONTAL SQUIB 2 CONTROL CIRCUIT - SHORT TO BATTERY?

   Yes

   - Go To 3

   No

   - Replace the Driver Airbag in accordance with the Service Information. Refer to **AIR BAG, DRIVER, REMOVAL** .
   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD**

PROCEDURE .

3. **CHECK CLOCKSPRING SQUIB CIRCUITS FOR A SHORT TO VOLTAGE**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) from the Driver Airbag Squib connectors.
2. Disconnect the SCM C1 harness connector.

NOTE: Check the connectors - Clean and repair as necessary.

3. If equipped with the standard key ignition, use this ignition on warning.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

4. If equipped with the keyless ignition, use this ignition on warning.

WARNING: Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

5. With the scan tool, read the active ORC DTCs.

   Does the scan tool display: B0002-12-DRIVER FRONTAL SQUIB 2 CONTROL CIRCUIT - SHORT TO BATTERY?

   Yes

   - Go To 4

   No

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

- Replace the clockspring in accordance with the Service Information. Refer to

CLOCKSPRING, REMOVAL .

- Perform the CLOCKSPRING CENTERING. Refer to **CLOCKSPRING, STANDARD PROCEDURE** . Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK (R63) DRIVER SQUIB 2 LINE 1 CIRCUIT AND (R61) DRIVER SQUIB 2 LINE 2 CIRCUIT FOR A SHORT TO VOLTAGE**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the ORC harness connectors.

NOTE: Check the connectors - Clean and repair as necessary.

2. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) to the ORC C1 and C2 harness connectors.
3. If equipped with the standard key ignition, use this ignition on warning.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

4. If equipped with the keyless ignition, use this ignition on warning.

WARNING: Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

5. Measure the voltage of the (R63) Driver Squib 2 Line 1 circuit between ground and the C1A cavity 27 of the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool).
6. Measure the voltage of the (R61) Driver Squib 2 Line 2 circuit between ground and the C1A cavity 7 of the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)

Is there any voltage present for either measurement?

Yes

- Repair the Driver Squib 2 circuit(s) for a short to voltage.

- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment. Failure to follow these instructions may result in possible serious or fatal injury.

Repair

- Replace the ORC in accordance with the Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B0002-13-DRIVER FRONTAL SQUIB 2 CONTROL - CIRCUIT OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 7: Driver Frontal Squib Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) sends a test current to the squibs to verify the integrity of the squib and wiring. These circuits are maintained in a "floating" configuration at the module (connected to neither power nor ground) as protection against inadvertent deployment. Use of the (special tool #8443A, SRS Load Tool) in the tests below substitutes a suspect squib with a known good component. The use of the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) provides a test point as well as a method for opening the shorting bar connections within the harness connector.

WHEN MONITORED

With the ignition on.

SET CONDITION

The Occupant Restraint Controller (ORC) monitors the resistance of the Driver Squib circuits. The ORC will set this DTC if it detects an open or high resistance on the Driver Squib 1 circuits for greater than 2.6 seconds. This DTC transitions from active to stored when the ORC sees a recovery from a open for greater than 2.6 seconds. The Airbag Warning Lamp (AWL) will set in the instrument cluster.

POSSIBLE CAUSES

Possible Causes
(R63) DRIVER SQUIB 2 LINE 1 CIRCUIT OPEN
(R61) DRIVER SQUIB 2 LINE 2 CIRCUIT OPEN
CLOCKSPRING
DRIVER AIRBAG
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

NOTE: The use of a approved special tool or Digital Multimeter such as a Fluke Meter that will not apply more than 20 milliamperes to a circuit are the only measurement tools to be used.

NOTE: Make sure the battery is fully charged.

NOTE: The scan tool, (special tool #8443A, SRS Load Tool), and DVOM are required to perform the following test.

1. Select Active or Stored DTC.

   Is the DTC active or stored?

   ORC - ACTIVE DTC

   - Go To 2

   ORC - STORED DTC

- Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK FOR OPEN SQUIB CIRCUITS IN DRIVER AIRBAG**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the Driver Airbag Squib harness connectors.

WARNING: Do not place an intact non-deployed airbag face down on a hard surface, the airbag propels into the air if accidentally deployed. Failure to follow these instructions may result in possible serious or fatal injury.

NOTE: Check the connectors - Clean and repair as necessary.

2. Connect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) to the Driver Airbag Squib 1 and Squib 2 harness connectors.
3. If equipped with the standard key ignition, use this ignition on warning.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

4. If equipped with the keyless ignition, use this ignition on warning.

WARNING: Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

5. With the scan tool, read the active ORC DTCs.

   Does the scan tool display: B0002-13-DRIVER FRONTAL SQUIB 2 CONTROL - CIRCUIT OPEN?

   Yes

   - Go To 3

   No

- Replace the Driver Airbag in accordance with the Service Information. Refer to **AIR BAG, DRIVER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK CLOCKSPRING SQUIB CIRCUITS FOR AN OPEN**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) from the Driver Airbag Squib harness connectors.
2. Disconnect the Steering Control Module (SCM) C1 harness connector.

NOTE: Check the connectors - Clean and repair as necessary.

3. If equipped with the standard key ignition, use this ignition on warning.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

4. If equipped with the keyless ignition, use this ignition on warning.

WARNING: Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

5. Using a jumper wire connect terminals SCM C1 cavity 10 and SCM C1 cavity 11 but don't insert the jumper into the connector terminals.
6. While holding the jumper wire in place, with the scan tool, read the active ORC DTCs.
7. With the scan tool, read the active ORC DTCs.

Does the scan tool display: B0002-13-DRIVER FRONTAL SQUIB 2 CONTROL - CIRCUIT OPEN?

Yes

- Go To 4

No

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

- Replace the clockspring in accordance with the Service Information. Refer to **CLOCKSPRING, REMOVAL** .
- Perform the CLOCKSPRING CENTERING. Refer to **CLOCKSPRING, STANDARD PROCEDURE** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

.

- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK (R63) DRIVER SQUIB 2 LINE 1 CIRCUIT AND (R61) DRIVER SQUIB 2 LINE 2 CIRCUIT FOR AN OPEN**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the ORC harness connectors.

NOTE: Check the connectors - Clean and repair as necessary.

2. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) to the ORC C1 and C2 harness connector.
3. Measure the resistance of the (R63) Driver Squib 2 Line 1 circuit between the SCM C1 connector cavity 11 and the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) connector C1A cavity 27.
4. Measure the resistance of the of the (R61) Driver Squib 2 Line 2 circuit between the SCM C1 connector cavity 10 and the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) connector C1A cavity 7.

Is the resistance below or within the range of 5.4 - 10.0 Ohm for both circuits?

Yes

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment. Failure to follow these instructions may result in possible serious or fatal injury.

- Replace the ORC in accordance with the Service Information. Refer to **MODULE,**

OCCUPANT RESTRAINT CONTROLLER, REMOVAL .

- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Repair the (R63) Driver Squib 2 Line 1 circuit or (R61) Driver Squib 2 Line 2 circuit for an open.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B0002-2B-DRIVER FRONTAL SQUIB 2 CONTROL - WIRES SHORTED TOGETHER

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 8: Driver Frontal Squib Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) sends a test current to the squibs to verify the integrity of the squib and wiring. These circuits are maintained in a "floating" configuration at the module (connected to neither power nor ground) as protection against inadvertent deployment. Use of the (special tool #8443A, SRS Load Tool) in the tests below substitutes a suspect squib with a known good component. The use of the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) provides a test point as well as a method for opening the shorting bar connections within the harness connector.

WHEN MONITORED

The ORC sends out a 40 mA diagnostic current on each squib voltage supply circuit at power up and every 500 ms thereafter while the ignition is on.

SET CONDITION

This Diagnostic Trouble Code (DTC) sets when the ORC detects both circuits of the same squib are shorted together for more than 2.6 seconds. This DTC transitions from active to stored when the ORC sees a recovery from a shorted together condition for greater than 2.6 seconds. The Airbag Warning Lamp (AWL) will set in the instrument cluster.

POSSIBLE CAUSES

Possible Causes
(R63) DRIVER SQUIB 2 LINE 1 CIRCUIT SHORTED TO THE (R61) DRIVER SQUIB 2 LINE 2 CIRCUIT
CLOCKSPRING
DRIVER AIRBAG
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

   NOTE: Make sure the battery is fully charged.

   NOTE: The scan tool, (special tool #8443A, SRS Load Tool) and DVOM are required to perform the following test.

   1. Select Active or Stored DTC.

      Is the DTC active or stored?

      ORC - ACTIVE DTC

      - Go To 2

      ORC - STORED DTC

      - Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK FOR SHORTED SQUIB CIRCUITS IN DRIVER AIRBAG**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

WARNING: Do not place an intact non-deployed airbag face down on a hard surface, the airbag propels into the air if accidentally deployed. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the Driver Airbag Squib harness connectors.

NOTE: Check connectors - Clean and repair as necessary.

2. Connect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) to the Driver Airbag Squib 1 and Squib 2 harness connectors.
3. If equipped with the standard key ignition, use this ignition on warning.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

4. If equipped with the keyless ignition, use this ignition on warning.

WARNING: Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

5. With the scan tool, read the active ORC DTCs.

Does the scan tool display: B0002-2B-DRIVER FRONTAL SQUIB 2 CONTROL - WIRES SHORTED TOGETHER?

Yes

- Go To 3

No

- Replace the Driver Airbag in accordance with the Service Information. Refer to **AIR BAG,**

DRIVER, REMOVAL .

- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK CLOCKSPRING SQUIB CIRCUITS FOR A SHORT TOGETHER**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the Steering Control Module (SCM) C1 harness connector.

NOTE: Check the connectors - Clean and repair as necessary.

2. If equipped with the standard key ignition, use this ignition on warning.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

3. If equipped with the keyless ignition, use this ignition on warning.

WARNING: Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

4. With the scan tool, read the active ORC DTCs.

Does the scan tool display: B0002-2B-DRIVER FRONTAL SQUIB 2 CONTROL - WIRES SHORTED TOGETHER?

Yes

- Go To 4

No

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

- Replace the clockspring in accordance with the Service Information. Refer to

CLOCKSPRING, REMOVAL .

- Perform the CLOCKSPRING CENTERING. Refer to **CLOCKSPRING, STANDARD PROCEDURE** . Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK (R63) DRIVER SQUIB 2 LINE 1 CIRCUIT FOR A SHORT TO THE (R61) DRIVER SQUIB 2 LINE 2 CIRCUIT**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the ORC harness connectors.

NOTE: Check the connectors - Clean and repair as necessary.

2. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) to the ORC C1 and C2 harness connector.
3. Measure the resistance between the (R63) Driver Squib 2 Line 1 circuit and the (R61) Driver Squib 2 Line 2 circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) C1A cavity 27 and C1A cavity 7.

Is the resistance below 10k Ohms?

Yes

- Repair the (R63) Driver Squib 2 Line 1 circuit for a short to the (R61) Driver Squib 2 Line 2 circuit.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment. Failure to follow these instructions may result in possible serious or fatal injury.

- Replace the ORC in accordance with the Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B0003-11-DRIVER FRONTAL SQUIB 3 CONTROL - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 9: Driver Frontal Squib Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) sends a test current to the squibs to verify the integrity of the squib and the wiring. These circuits are maintained in a "floating" configuration at the module,

(connected to neither power nor ground), as protection against inadvertent deployment. Use of the(special tool #8443A, SRS Load Tool) in the tests below substitutes a suspect squib with a known good component. The use of the SRS Load Tool (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) provides a test point, as well as a method for opening the shorting bar connections within the harness connector. The Front Driver Airbag is a three stage device with three electrical connectors. The first stage is deployed immediately during impact that requires airbag deployment. The timing of the second stage determines the output force of the airbag. The third stage triggers a tether cutter initiator, which releases the tether when a softer airbag is necessary.

WHEN MONITORED

The ORC Module sends out a 40 mA diagnostic current on each squib voltage supply circuit at power up, and every 500 ms thereafter while the ignition is on.

SET CONDITION

This Diagnostic Trouble Code (DTC) sets when the ORC detects a short to ground on the driver airbag squib circuit for more than 2.6 seconds. This DTC transitions from active to stored when the ORC sees a recovery from a short to ground for greater than 2.6 seconds. The Airbag Warning Lamp (AWL) will set in the instrument cluster.

POSSIBLE CAUSES

Possible Causes
(R69) DRIVER SQUIB 3 LINE 1 CIRCUIT SHORTED TO GROUND
(R67) DRIVER SQUIB 3 LINE 2 CIRCUIT SHORTED TO GROUND
CLOCKSPRING
DRIVER AIRBAG
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

NOTE: Make sure that the battery is fully charged.

NOTE: The scan tool, (special tool #8443A, SRS Load Tool), and DVOM are required to perform the following test.

1. Turn the ignition on.

Select ACTIVE or STORED DTC:

ACTIVE DTC

- Go To 2

STORED DTC

- Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK FOR SHORTED SQUIB CIRCUITS IN DRIVER AIRBAG**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the Driver Airbag Squib harness connectors.

WARNING: Do not place an intact non-deployed airbag face down on a hard surface, the airbag propels into the air if accidentally deployed. Failure to follow these instructions may result in possible serious or fatal injury.

NOTE: Check connectors - Clean and repair as necessary.

2. Connect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) to the Driver Airbag Squib 3 connector.
3. If equipped with the standard key ignition, use this ignition on warning.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

4. If equipped with the keyless ignition, use this ignition on warning.

WARNING: Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

5. With the scan tool, read the active ORC DTCs.

Does the scan tool display: B0003-11-DRIVER FRONTAL SQUIB 3 CONTROL - CIRCUIT SHORT TO GROUND?

Yes

- Go To 3

No

- Replace the Driver Airbag in accordance with the Service Information. Refer to **AIR BAG, PASSENGER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK CLOCKSPRING SQUIB CIRCUITS FOR A SHORT TO GROUND**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the Steering Control Module C1 harness connector.

NOTE: Check the connectors - Clean and repair as necessary.

2. If equipped with the standard key ignition, use this ignition on warning.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

3. If equipped with the keyless ignition, use this ignition on warning.

WARNING: Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

4. With the scan tool, read the active ORC DTCs.

Does the scan tool display: B0003-11-DRIVER FRONTAL SQUIB 3 CONTROL CIRCUIT - SHORT TO GROUND?

Yes

- Go To 4

No

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

- Replace the clockspring in accordance with the Service Information. Refer to **CLOCKSPRING, REMOVAL** .
- Perform the CLOCKSPRING CENTERING. Refer to **CLOCKSPRING, STANDARD PROCEDURE** . Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK THE (R69) DRIVER SQUIB 3 LINE 1 CIRCUIT AND THE (R67) DRIVER SQUIB 3 LINE 2 CIRCUIT FOR A SHORT TO GROUND**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the ORC harness connectors.

NOTE: Check connectors - Clean and repair as necessary.

2. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) to the ORC C1 and C2 harness connectors.
3. Measure the resistance of the (R69) Driver Squib 3 Line 1 circuit between the(special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) connector C1A cavity 29 and ground.
4. Measure the resistance of the (R67) Driver Squib 3 Line 2 circuit between the(special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) connector C1A cavity 9 and ground.

Is the resistance below 10k Ohms on either circuit?

Yes

- Repair the Driver Squib 3 circuits with resistance below 10k Ohms for a short to ground.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment. Failure to follow these instructions may result in possible serious or fatal injury.

- Replace the ORC in accordance with Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B0003-12-DRIVER FRONTAL SQUIB 3 CONTROL - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 10: Driver Frontal Squib Circuit Diagram

Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) sends a test current to the squibs to verify the integrity of the squib and the wiring. These circuits are maintained in a "floating" configuration at the module, (connected to neither power nor ground), as protection against inadvertent deployment. Use of the(special tool #8443A, SRS Load Tool) in the tests below substitutes a suspect squib with a known good component. The use of the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) provides a test point, as well as a method for opening the shorting bar connections within the harness connector. The Front Driver Airbag is a three stage device with three electrical connectors. The first stage is deployed immediately during impact that requires airbag deployment. The timing of the second stage determines the output force of the airbag. The third stage triggers a tether cutter initiator, which releases the tether when a softer airbag is necessary.

WHEN MONITORED

With the ignition on.

SET CONDITION

This Diagnostic Trouble Code (DTC) sets when the ORC detects a short to battery on the driver airbag squib circuit for more than 2.6 seconds.    No

   - Replace the Driver Airbag in accordance with the Service Information. Refer to **AIR BAG, PASSENGER, REMOVAL** .
   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK CLOCKSPRING SQUIB CIRCUITS FOR A SHORT TO BATTERY**

   WARNING: **Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

1. Disconnect the Steering Control Module C1 harness connector.

   NOTE: Check the connectors - Clean and repair as necessary.

2. If equipped with the standard key ignition, use this ignition on warning.

   WARNING: **Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

3. If equipped with the keyless ignition, use this ignition on warning.

   WARNING: **Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

4. With the scan tool, read the active ORC DTCs.

   Does the scan tool display: B0003-12-DRIVER FRONTAL SQUIB 3 CONTROL - CIRCUIT SHORT TO BATTERY?

Yes

- Go To 4

No

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

- Replace the clockspring in accordance with the Service Information. Refer to **CLOCKSPRING, REMOVAL** .
- Perform the CLOCKSPRING CENTERING. Refer to **CLOCKSPRING, STANDARD PROCEDURE** . Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK THE (R69) DRIVER SQUIB 3 LINE 1 CIRCUIT AND THE (R67) DRIVER SQUIB 3 LINE 2 CIRCUIT FOR A SHORT TO BATTERY**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the ORC connectors.

NOTE: Check connectors - Clean and repair as necessary.

2. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) to the ORC C1 and C2 harness connectors.
3. Measure the voltage of the (R69) Driver Squib 3 Line 1 circuit between the(special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) connector C1A cavity 29 and ground.
4. Measure the voltage of the (R67) Passenger Squib 3 Line 2 circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) connector C1A cavity 9 and ground.

Is there any voltage present on either circuit?

Yes

- Repair the Driver Squib 3 circuits with voltage present for a short to battery.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment. Failure to follow these instructions may result in possible serious or fatal injury.

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

- Replace the ORC in accordance with Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B0003-13-DRIVER FRONTAL SQUIB 3 CONTROL - CIRCUIT OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 11: Driver Frontal Squib Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) sends a test current to the squibs to verify the integrity of the squib and the wiring. These circuits are maintained in a "floating" configuration at the module, (connected to neither power nor ground), as protection against inadvertent deployment. Use of the(special tool #8443A, SRS Load Tool) in the tests below substitutes a suspect squib with a known good component. The use of the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) provides a test point, as well as a method for opening the shorting bar connections within the harness connector. The Front Driver Airbag is a

three stage device with three electrical connectors. The first stage is deployed immediately during impact that requires airbag deployment. The timing of the second stage determines the output force of the airbag. The third stage triggers a tether cutter initiator, which releases the tether when a softer airbag is necessary.

WHEN MONITORED

The ORC sends out a 40 mA diagnostic current on each squib voltage supply circuit at power up and every 500 ms thereafter while the ignition is on.

SET CONDITION

The Occupant Restraint Controller (ORC) monitors the resistance of the Driver Squib 3 circuits. The ORC will set this DTC if it detects an open or high resistance on the Driver Squib 3 circuits for greater than 2.6 seconds. This DTC transitions from active to stored when the ORC sees a recovery from a open for greater than 2.6 seconds. The Airbag Warning Lamp (AWL) will set in the instrument cluster.

POSSIBLE CAUSES

Possible Causes
(R69) DRIVER SQUIB 3 LINE 1 CIRCUIT OPEN
(R67) DRIVER SQUIB 3 LINE 2 CIRCUIT OPEN
CLOCKSPRING
DRIVER AIRBAG
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

   NOTE: Make sure that the battery is fully charged.

   NOTE: The scan tool, (special tool #8443A, SRS Load Tool), and DVOM are required to perform the following test.

   1. Turn the ignition on.

      Select ACTIVE or STORED DTC:

      ACTIVE DTC

      - Go To 2

STORED DTC

- Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK FOR OPEN SQUIB CIRCUITS IN DRIVER AIRBAG**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the Driver Airbag Squib harness connectors.

WARNING: Do not place an intact non-deployed airbag face down on a hard surface, the airbag propels into the air if accidentally deployed. Failure to follow these instructions may result in possible serious or fatal injury.

NOTE: Check connectors - Clean and repair as necessary.

2. Connect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) to the Driver Airbag Squib 3 connector.
3. If equipped with the standard key ignition, use this ignition on warning.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

4. If equipped with the keyless ignition, use this ignition on warning.

WARNING: Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

5. With the scan tool, read the active ORC DTCs.

Does the scan tool display: B0003-13-DRIVER FRONTAL SQUIB 3 CONTROL - CIRCUIT OPEN?

Yes

- Go To 3

No

- Replace the Driver Airbag in accordance with the Service Information. Refer to **AIR BAG, PASSENGER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK CLOCKSPRING SQUIB CIRCUITS FOR AN OPEN**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) from the Driver Airbag Squib harness connectors.
2. Disconnect the Steering Control Module (SCM) C1 harness connector.

NOTE: Check the connectors - Clean and repair as necessary.

3. If equipped with the standard key ignition, use this ignition on warning.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

4. If equipped with the keyless ignition, use this ignition on warning.

WARNING: Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

5. Using a jumper wire connect terminals SCM C1 cavity 10 and SCM C1 cavity 11 but don't insert the jumper into the connector terminals.
6. While holding the jumper wire in place, with the scan tool, read the active ORC DTCs.
7. With the scan tool, read the active ORC DTCs.

Does the scan tool display: B0003-13-DRIVER FRONTAL SQUIB 3 CONTROL - CIRCUIT OPEN?

Yes

- Go To 4

No

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

- Replace the clockspring in accordance with the Service Information. Refer to **CLOCKSPRING, REMOVAL** .
- Perform the CLOCKSPRING CENTERING. Refer to **CLOCKSPRING, STANDARD PROCEDURE** . Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK THE (R69) DRIVER SQUIB 3 LINE 1 CIRCUIT FOR AN OPEN**
   1. Disconnect the ORC harness connectors.

      NOTE: Check connectors - Clean and repair as necessary.

   2. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) to the ORC C1 and C2 harness connectors.
   3. Measure the resistance of the (R69) Driver Squib 3 Line 1 circuit between the SCM C1 harness connector cavity 13 and the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) connector C1A cavity 29.

      Is the resistance below 2.0 Ohm?

      Yes

      - Go To 5

      No

      - Repair the (R69) Driver Squib 3 Line 1 circuit for an open in accordance with the Service Information.
      - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **CHECK THE (R67) DRIVER SQUIB 3 LINE 2 CIRCUIT FOR AN OPEN**
   1. Measure the resistance of the (R67) Driver Squib 3 Line 2 circuit between the SCM C1 harness connector cavity 12 and the(special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) connector C1A cavity 9.

      Is the resistance below 2.0 Ohm?

      Yes

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

- Replace the ORC in accordance with the Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Repair the (R67) Driver Squib 3 Line 2 circuit for an open in accordance with the Service Information.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B0003-2B-DRIVER FRONTAL SQUIB 3 CONTROL - WIRES SHORTED TOGETHER

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 12: Driver Frontal Squib Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) sends a test current to the squibs to verify the integrity of the squib and wiring. These circuits are maintained in a "floating" configuration at the module (connected to neither power nor ground) as protection against inadvertent deployment. Use of the (special tool #8443A, SRS Load Tool) in the tests below substitutes a suspect squib with a known good component. The use of the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) provides a test point as well as a method for opening the shorting bar connections within the harness connector. The Front Driver Airbag is a

three stage device with three electrical connectors. The first stage is deployed immediately during impact that requires airbag deployment. The timing of the second stage determines the output force of the airbag. The third stage triggers a tether cutter initiator, which releases the tether when a softer airbag is necessary.

WHEN MONITORED

The ORC sends out a 40 mA diagnostic current on each squib voltage supply circuit at power up and every 500 ms thereafter while the ignition is on.

SET CONDITION

This Diagnostic Trouble Code (DTC) sets when the ORC detects both circuits of the same squib are shorted together for more than 2.6 seconds. This DTC transitions from active to stored when the ORC sees a recovery from a shorted together condition for greater than 2.6 seconds. The Airbag Warning Lamp (AWL) will set in the instrument cluster.

POSSIBLE CAUSES

Possible Causes
(R69) PASSENGER SQUIB 3 LINE 1 CIRCUIT SHORTED TO (R67) PASSENGER SQUIB 3 LINE 2 CIRCUIT
CLOCKSPRING
DRIVER AIRBAG
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

   NOTE: Make sure that the battery is fully charged.

   NOTE: The scan tool (special tool #8443A, SRS Load Tool), and DVOM are required to perform the following test.

   1. Turn the ignition on.

      Select ACTIVE or STORED DTC:

      ACTIVE DTC

      - Go To 2

STORED DTC

- Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK FOR SHORTED SQUIB CIRCUITS IN DRIVER AIRBAG**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the Driver Airbag Squib connectors.

WARNING: Do not place an intact non-deployed airbag face down on a hard surface, the airbag propels into the air if accidentally deployed. Failure to follow these instructions may result in possible serious or fatal injury.

NOTE: Check connectors - Clean and repair as necessary.

2. Connect the (special tool #8443A, SRS Load Tool) and (special tool #8443-8, Jumper, SRS Load) to the Driver Airbag Squib 3 connector.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

3. With the scan tool, read the active ORC DTCs.

Does the scan tool display: B0003-2B-DRIVER FRONTAL SQUIB 3 CONTROL - WIRES SHORTED TOGETHER?

Yes

- Go To 3

No

- Replace the Driver Airbag in accordance with the Service Information. Refer to **AIR BAG, PASSENGER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK CLOCKSPRING SQUIB CIRCUITS FOR A SHORT TOGETHER**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two

minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) from the Driver Airbag Squib harness connectors.
2. Disconnect the Steering Control Module (SCM) C1 harness connector.

NOTE: Check the connectors - Clean and repair as necessary.

3. If equipped with the standard key ignition, use this ignition on warning.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

4. If equipped with the keyless ignition, use this ignition on warning.

WARNING: Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

5. With the scan tool, read the active ORC DTCs.

Does the scan tool display: B0003-2B-DRIVER FRONTAL SQUIB 3 CONTROL - WIRES SHORTED TOGETHER?

Yes

- Go To 4

No

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

- Replace the clockspring in accordance with the Service Information. Refer to **CLOCKSPRING, REMOVAL** .
- Perform the CLOCKSPRING CENTERING. Refer to **CLOCKSPRING, STANDARD PROCEDURE** . Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK (R69) DRIVER SQUIB 3 LINE 1 CIRCUIT FOR A SHORT TO THE (R67) DRIVER SQUIB 3 LINE 2 CIRCUIT**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the ORC harness connectors.

NOTE: Check the connectors - Clean and repair as necessary.

2. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) to the ORC C1 and C2 harness connector.
3. Measure the resistance between the (R69) Driver Squib 3 Line 1 circuit and the (R67) Driver Squib 3 Line 2 circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) connector C1A cavity 29 and C1A cavity 9.

Is the resistance below 10k Ohms?

Yes

- Repair the (R69) Driver Squib 3 Line 1 circuit for a short to the (R67) Driver Squib 3 Line 2 circuit in accordance with the Service Information.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment. Failure to follow these instructions may result in possible serious or fatal injury.

- Replace the ORC in accordance with the Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B0004-11-DRIVER KNEE BOLSTER SQUIB CONTROL - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 13: Knee Blocker & Seat Belt Pretensioner Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) sends a test current to the squibs to verify the integrity of the squib and wiring. These circuits are maintained in a "floating" configuration at the module (connected to neither power nor ground) as protection against inadvertent deployment. Use of the (special tool #8443A, SRS Load Tool) in the tests below substitutes a suspect squib with a known good component. The use of the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) provides a test point as well as a method for opening the shorting bar connections within the harness connector. The knee blocker airbags are concealed below the lower edge of the instrument panel, just beneath the steering column opening cover on the driver side or just beneath the glove box door on the passenger side.

WHEN MONITORED

The ORC Module sends out a 40 mA diagnostic current on each squib voltage supply circuit at power up, and every 500 ms thereafter while the ignition is on.

SET CONDITION

This Diagnostic Trouble Code (DTC) sets when the ORC detects a short to ground on the driver knee bolster squib circuit for more than 2.6 seconds. This DTC transitions from active to stored when the ORC sees a recovery from a short to ground condition for greater than 2.6 seconds. The Airbag Warning Lamp (AWL) will set in the instrument cluster.

POSSIBLE CAUSES

Possible Causes
(R11) DRIVER KNEE BLOCKER SQUIB LINE 1 CIRCUIT SHORTED TO GROUND
(R9) DRIVER KNEE BLOCKER SQUIB LINE 2 CIRCUIT SHORTED TO GROUND
DRIVER KNEE BLOCKER AIRBAG
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

   NOTE: Make sure that the battery is fully charged.

   NOTE: The scan tool, (special tool #8443A, SRS Load Tool), and DVOM are required to perform the following test.

   1. Turn the ignition on.

      Select ACTIVE or STORED DTC:

      ACTIVE DTC

      - Go To 2

      STORED DTC

      - Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK FOR SHORTED DRIVER KNEE BLOCKER AIRBAG CIRCUITS**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the Driver Knee Blocker Airbag harness connector.

WARNING: Do not place an intact non-deployed airbag face down on a hard surface, the airbag propels into the air if accidentally deployed. Failure to follow these instructions may result in possible serious or fatal injury.

NOTE: Check connectors - Clean and repair as necessary.

2. Connect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) to the Driver Knee Blocker Airbag harness connector.
3. If equipped with the standard key ignition, use this ignition on warning.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

4. If equipped with the keyless ignition, use this ignition on warning.

WARNING: Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

5. With the scan tool, read the active ORC DTCs.

Does the scan tool display: B0004-11-DRIVER KNEE BOLSTER SQUIB CONTROL - CIRCUIT SHORT TO GROUND?

Yes

- Go To 3

No

- Replace the Driver Knee Blocker Airbag in accordance with the Service Information. Refer to **AIR BAG, KNEE BLOCKER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD**

PROCEDURE .

3. **CHECK (R11) DRIVER KNEE BLOCKER SQUIB LINE 1 CIRCUIT OR (R9) DRIVER KNEE BLOCKER SQUIB LINE 2 CIRCUIT FOR A SHORT TO GROUND**

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) from the Driver Knee Blocker Airbag harness connector.
2. Disconnect the ORC harness connectors.

NOTE: Check connectors - Clean and repair as necessary.

3. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) to the ORC C1 and C2 harness connectors.
4. Measure the resistance between ground and the (R11) Driver Knee Blocker Squib Line 1 circuit at connector C1A cavity 23 of the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool).
5. Measure the resistance between ground and the (R9) Driver Knee Blocker Squib Line 2 circuit at connector C1A cavity 3 of the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool).

Is the resistance below 10K Ohms on either circuit?

Yes

- Repair the (R11) Driver Knee Blocker Squib Line 1 or (R9) Driver Knee Blocker Squib Line 2 circuits for a short to ground in accordance with the Service Information.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment. Failure to follow these instructions may result in possible serious or fatal injury.

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

- Replace the ORC in accordance with Service Information. Refer to **MODULE,**

OCCUPANT RESTRAINT CONTROLLER, REMOVAL .

- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B0004-12-DRIVER KNEE BOLSTER SQUIB CONTROL - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 14: Knee Blocker & Seat Belt Pretensioner Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) sends a test current to the squibs to verify the

integrity of the squib and wiring. These circuits are maintained in a "floating" configuration at the module (connected to neither power nor ground) as protection against inadvertent deployment. Use of the (special tool #8443A, SRS Load Tool) in the tests below substitutes a suspect squib with a known good component. The use of the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) provides a test point as well as a method for opening the shorting bar connections within the harness connector. The knee blocker airbags are concealed below the lower edge of the instrument panel, just beneath the steering column opening cover on the driver side or just beneath the glove box door on the passenger side.

WHEN MONITORED

The ORC Module sends out a 40 mA diagnostic current on each squib voltage supply circuit at power up, and every 500 ms thereafter while the ignition is on.

SET CONDITION

This Diagnostic Trouble Code (DTC) sets when the ORC detects a short to voltage on the driver knee bolster squib circuit for more than 2.6 seconds. This DTC transitions from active to stored when the ORC sees a recovery from a short to ground for greater than 2.6 seconds. The Airbag Warning Lamp (AWL) will set in the instrument cluster.

POSSIBLE CAUSES

Possible Causes
(R11) DRIVER KNEE BLOCKER SQUIB LINE 1 CIRCUIT SHORTED TO VOLTAGE
(R9) DRIVER KNEE BLOCKER SQUIB LINE 2 CIRCUIT SHORTED TO VOLTAGE
DRIVER KNEE BLOCKER AIRBAG
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

   NOTE: Make sure that the battery is fully charged.

   NOTE: The scan tool, (special tool #8443A, SRS Load Tool), and DVOM are required to perform the following test.

   1. Turn the ignition on.

      Select ACTIVE or STORED DTC:

      ACTIVE DTC

- Go To 2

STORED DTC

- Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK FOR SHORTED DRIVER KNEE BLOCKER AIRBAG CIRCUITS**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the Driver Knee Blocker Airbag harness connector.

WARNING: Do not place an intact non-deployed airbag face down on a hard surface, the airbag propels into the air if accidentally deployed. Failure to follow these instructions may result in possible serious or fatal injury.

NOTE: Check connectors - Clean and repair as necessary.

2. Connect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) to the Driver Knee Blocker Airbag harness connector.
3. If equipped with the standard key ignition, use this ignition on warning.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

4. If equipped with the keyless ignition, use this ignition on warning.

WARNING: Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

5. With the scan tool, read the active ORC DTCs.

Does the scan tool display: B0004-12-DRIVER KNEE BOLSTER SQUIB CONTROL - CIRCUIT SHORT TO BATTERY?

Yes

- Go To 3

No

- Replace the Driver Knee Blocker Airbag in accordance with the Service Information. Refer to **AIR BAG, KNEE BLOCKER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK (R11) DRIVER KNEE BLOCKER SQUIB LINE 1 CIRCUIT OR (R9) DRIVER KNEE BLOCKER SQUIB LINE 2 CIRCUIT FOR A SHORT TO VOLTAGE**

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the (special tool #8443A, SRS Load Tool) from the (special tool #8443-8, Jumper, SRS Load) from the Driver Knee Blocker Airbag harness connector.
2. Disconnect the ORC harness connectors.

NOTE: Check connectors - Clean and repair as necessary.

3. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) to the ORC C1 and C2 harness connector.
4. If equipped with the standard key ignition, use this ignition on warning.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

5. If equipped with the keyless ignition, use this ignition on warning.

WARNING: Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

6. Measure the voltage of the (R11) Driver Knee Blocker Squib Line 1 circuit between connector C1A cavity 23 of the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) and ground.
7. Measure the voltage of the (R9) Driver Knee Blocker Squib Line 2 circuit between connector C1A cavity 3 of the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) and ground.

Is there any voltage present on either circuit?

Yes

- Repair the (R11) Driver Knee Blocker Squib Line 1 circuit or (R9) Driver Knee Blocker Squib Line 2 circuit with voltage present for a short to voltage in accordance with the Service Information.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

WARNING: **If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment. Failure to follow these instructions may result in possible serious or fatal injury.**

WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

- Replace the ORC in accordance with Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B0004-13-DRIVER KNEE BOLSTER SQUIB CONTROL - CIRCUIT OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

The ORC Module sends out a 40 mA diagnostic current on each squib voltage supply circuit at power up, and every 500 ms thereafter while the ignition is on.

SET CONDITION

This Diagnostic Trouble Code (DTC) sets when the ORC detects an open on the driver knee blocker squib circuit for more than 2.6 seconds. This DTC transitions from active to stored when the ORC sees a recovery from a open for greater than 2.6 seconds.

POSSIBLE CAUSES

Possible Causes
(R11) DRIVER KNEE BLOCKER SQUIB LINE 1 CIRCUIT OPEN
(R9) DRIVER KNEE BLOCKER SQUIB LINE 2 CIRCUIT OPEN
DRIVER KNEE BLOCKER AIRBAG
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

   NOTE: Make sure that the battery is fully charged.

   NOTE: The scan tool, (special tool #8443A, SRS Load Tool), and DVOM are required to perform the following test.

   1. Turn the ignition on.

      Select ACTIVE or STORED DTC:

      ACTIVE DTC

      - Go To 2

      STORED DTC

      - Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK FOR OPEN DRIVER KNEE BLOCKER AIRBAG CIRCUITS**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the Driver Knee Blocker Airbag harness connector.

WARNING: Do not place an intact non-deployed airbag face down on a hard surface, the airbag propels into the air if accidentally deployed. Failure to follow these instructions may result in possible serious or fatal injury.

NOTE: Check connectors - Clean and repair as necessary.

2. Connect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) to the Driver Knee Blocker Airbag harness connector.
3. If equipped with the standard key ignition, use this ignition on warning.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

4. If equipped with the keyless ignition, use this ignition on warning.

WARNING: Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

5. With the scan tool, read the active ORC DTCs.

   Does the scan tool display: B0004-13-DRIVER KNEE BOLSTER SQUIB CONTROL - CIRCUIT OPEN?

   Yes

   - Go To 3

   No

   - Replace the Driver Knee Blocker Airbag in accordance with the Service Information. Refer to **AIR BAG, KNEE BLOCKER, REMOVAL** .
   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD**

PROCEDURE .

3. **CHECK (R11) DRIVER KNEE BLOCKER SQUIB LINE 1 CIRCUIT FOR AN OPEN**

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the (special tool #8443A, SRS Load Tool) from the (special tool #8443-8, Jumper, SRS Load) from the Driver Knee Blocker Airbag harness connector.
2. Disconnect the ORC harness connectors.

NOTE: Check connectors - Clean and repair as necessary.

3. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) to the ORC C1 and C2 harness connectors.
4. Measure the resistance of the (R11) Driver Knee Blocker Squib Line 1 circuit between the Driver Knee Blocker Airbag harness connector cavity 2 and the(special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) terminal C1A cavity 23.

Is the resistance below or within the range of 5.4 - 10.0 Ohm?

Yes

- Go To 4

No

- Repair the (R11) Driver Knee Blocker Squib Line 1 circuit for an open in accordance with the Service Information.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK (R9) DRIVER KNEE BLOCKER SQUIB LINE 2 CIRCUIT FOR AN OPEN**

1. Measure the resistance of the (R9) Driver Knee Blocker Squib Line 2 circuit between the Driver Knee Blocker Airbag harness connector cavity 1 and the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) connector C1A cavity 3.

Is the resistance below or within the range of 5.4 - 10.0 Ohm?

Yes

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment. Failure to follow these instructions may result in possible serious or fatal injury.

- Replace the ORC in accordance with the Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Repair the (R9) Driver Knee Blocker Squib Line 2 circuit for an open in accordance with the Service Information.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B0004-2B-DRIVER KNEE BOLSTER SQUIB CONTROL - WIRES SHORTED TOGETHER

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 16: Knee Blocker & Seat Belt Pretensioner Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) sends a test current to the squibs to verify the integrity of the squib and wiring. These circuits are maintained in a "floating" configuration at the module (connected to neither power nor ground) as protection against inadvertent deployment. Use of the (special tool #8443A, SRS Load Tool) in the tests below substitutes a suspect squib with a known good component. The use of the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) provides a test point as well as a method for opening the shorting bar connections within the harness connector. The knee blocker airbags are concealed below the lower edge of the instrument panel, just beneath the steering column opening cover on the driver side or just beneath the glove box door on the passenger side.

WHEN MONITORED

The ORC Module sends out a 40 mA diagnostic current on each squib voltage supply circuit at power up, and every 500 ms thereafter while the ignition is on.

SET CONDITION

This Diagnostic Trouble Code (DTC) sets when the ORC detects a shorted together of the driver knee bolster squib line 1 and line 2 circuits for more than 2.6 seconds. This DTC transitions from active to stored when the ORC sees a recovery from the squib shorted together condition for greater than 2.6 seconds.

POSSIBLE CAUSES

Possible Causes
(R11) DRIVER KNEE BLOCKER SQUIB LINE 1 CIRCUIT SHORTED TO THE (R9) DRIVER KNEE BLOCKER SQUIB LINE 2 CIRCUIT
DRIVER KNEE BLOCKER AIRBAG
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

   NOTE: Make sure that the battery is fully charged.

   NOTE: The scan tool, (special tool #8443A, SRS Load Tool), and DVOM are required to perform the following test.

   1. Turn the ignition on.

      Select ACTIVE or STORED DTC:

      ACTIVE DTC

      - Go To 2

      STORED DTC

      - Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK FOR SHORTED DRIVER KNEE BLOCKER AIRBAG CIRCUITS**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the Driver Knee Blocker Airbag harness connector.

WARNING: Do not place an intact non-deployed airbag face down on a hard surface, the airbag propels into the air if accidentally deployed. Failure to follow these instructions may result in possible serious or fatal injury.

NOTE: Check connectors - Clean and repair as necessary.

2. Connect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) to the Driver Knee Blocker Airbag harness connector.
3. If equipped with the standard key ignition, use this ignition on warning.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

4. If equipped with the keyless ignition, use this ignition on warning.

WARNING: Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

5. With the scan tool, read the active ORC DTCs.

   Does the scan tool display: B0004-2B-DRIVER KNEE BOLSTER SQUIB CONTROL - WIRES SHORTED TOGETHER?

   Yes

   - Go To 3

   No

   - Replace the Driver Knee Blocker Airbag in accordance with the Service Information. Refer to **AIR BAG, KNEE BLOCKER, REMOVAL** .
   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD**

PROCEDURE .

3. **CHECK (R11) DRIVER KNEE BLOCKER SQUIB LINE 1 CIRCUIT FOR A SHORT TO THE (R9) DRIVER KNEE BLOCKER SQUIB LINE 2 CIRCUIT**

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the (special tool #8443-8, Jumper, SRS Load) from the Driver Knee Bolster Airbag harness connector.
2. Disconnect the ORC harness connectors.

NOTE: Check connectors - Clean and repair as necessary.

3. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) to the ORC C1 and C2 harness connector.
4. Measure the resistance between the (R11) Driver Knee Blocker Squib Line 1 circuit connector C1A cavity 23 and the (R9) Driver Knee Blocker Squib Line 2 circuit connector C1A cavity 3 of the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool).

Is the resistance below or within the range of 1.5 - 2.18 Ohms?

Yes

- Repair the (R11) Driver Knee Blocker Squib Line 1 circuit for a short to the (R9) Driver Knee Blocker Squib Line 2 circuit in accordance with the Service Information.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment. Failure to follow these instructions may result in possible serious or fatal injury.

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

- Replace the ORC in accordance with Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B0010-11-PASSENGER FRONTAL SQUIB 1 CONTROL - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 17: Passenger Frontal Squib Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) sends a test current to the squibs to verify the integrity of the squib and wiring. These circuits are maintained in a "floating" configuration at the module

(connected to neither power nor ground) as protection against inadvertent deployment. Use of the (special tool #8443A, SRS Load Tool) in the tests below substitutes a suspect squib with a known good component. The use of the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) provides a test point as well as a method for opening the shorting bar connections within the harness connector.

WHEN MONITORED

The ORC sends out a 40 mA diagnostic current on each squib voltage supply circuit at power up and every 500 ms thereafter while the ignition is on.

SET CONDITION

This Diagnostic Trouble Code (DTC) sets when the ORC detects a short to ground on the passenger airbag squib circuit for more than 2.6 seconds. This DTC transitions from active to stored when the ORC sees a recovery from a short to ground for greater than 2.6 seconds. The Airbag Warning Lamp (AWL) will set in the instrument cluster.

POSSIBLE CAUSES

Possible Causes
(R42) PASSENGER SQUIB 1 LINE 2 CIRCUIT SHORTED TO GROUND
(R44) PASSENGER SQUIB 1 LINE 1 CIRCUIT SHORTED TO GROUND
PASSENGER AIRBAG
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

   NOTE: Make sure the battery is fully charged.

   NOTE: The scan tool, (special tool #8443A, SRS Load Tool), and DVOM are required to perform the following test.

   1. Select Active or Stored DTC.

      Is the DTC active or stored?

      ORC - ACTIVE DTC

      - Go To 2

ORC - STORED DTC

- Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK FOR SHORTED SQUIB 1 CIRCUITS IN PASSENGER AIRBAG**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Gain access to the Passenger Airbag harness connectors.
2. Disconnect the Passenger Airbag Squib harness connectors.

WARNING: Do not place an intact non-deployed airbag face down on a hard surface, the airbag propels into the air if accidentally deployed. Failure to follow these instructions may result in possible serious or fatal injury.

NOTE: Check connectors - Clean and repair as necessary.

3. Connect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) to the Passenger Airbag Squib 1 and Squib 2 harness connector.
4. If equipped with the standard key ignition, use this ignition on warning.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

5. If equipped with the keyless ignition, use this ignition on warning.

WARNING: Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

6. With the scan tool, read the active ORC DTCs.

   Does the scan tool display: B0010-11-PASSENGER FRONTAL SQUIB 1 CONTROL - CIRCUIT SHORT TO GROUND?

   Yes

- Go To 3

No

- Replace the Passenger Airbag in accordance with the Service Information. Refer to **AIR BAG, PASSENGER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK (R42) PASSENGER SQUIB 1 LINE 2 CIRCUIT AND (R44) PASSENGER SQUIB 1 LINE 1 CIRCUIT FOR A SHORT TO GROUND**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) from the passenger airbag harness connectors.
2. Disconnect the ORC connectors.

NOTE: Check the connectors - Clean and repair as necessary.

3. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) to the ORC C1 and C2 harness connectors.
4. Measure the resistance of the (R42) Passenger Squib 1 Line 2 circuit between ground and C1A cavity 24 of the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool).
5. Measure the resistance of the (R44) Passenger Squib 1 line 1 circuit between ground and C1A cavity 4 of the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool).

Is the resistance below 10K Ohms on either circuit?

Yes

- Repair the Passenger Squib 1 circuit(s) for a short to ground.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment. Failure to follow these instructions may result in possible serious or fatal injury.

Repair

- Replace the Occupant Restraint Controller Module in accordance with the Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B0010-12-PASSENGER FRONTAL SQUIB 1 CONTROL - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 18: Passenger Frontal Squib Circuit Diagram

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) sends a test current to the squibs to verify the integrity of the squib and wiring. These circuits are maintained in a "floating" configuration at the module (connected to neither power nor ground) as protection against inadvertent deployment. Use of the (special tool #8443A, SRS Load Tool) in the tests below substitutes a suspect squib with a known good component. The use of the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) provides a test point as well as a method for opening the shorting bar connections within the harness connector.

WHEN MONITORED

The ORC sends out a 40 mA diagnostic current on each squib voltage supply circuit at power up and every 500 ms thereafter while the ignition is on.

SET CONDITION

This Diagnostic Trouble Code (DTC) sets when the ORC detects a short to voltage on the squib circuit for more than 2.6 seconds. This DTC transitions from active to stored when the ORC sees a recovery from a short to voltage for greater than 2.6 seconds. The Airbag Warning Lamp (AWL) will set in the instrument cluster.

POSSIBLE CAUSES

Possible Causes
(R42) PASSENGER SQUIB 1 LINE 2 CIRCUIT SHORTED TO VOLTAGE
(R44) PASSENGER SQUIB 1 LINE 1 CIRCUIT SHORTED TO VOLTAGE
PASSENGER AIRBAG
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

NOTE: Make sure the battery is fully charged.

NOTE: The scan tool, (special tool #8443A, SRS Load Tool), and DVOM are required to perform the following test.

1. Select Active or Stored DTC.

Is the DTC active or stored?

ORC - ACTIVE DTC

- Go To 2

ORC - STORED DTC

- Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK FOR SHORTED SQUIB CIRCUITS IN PASSENGER AIRBAG**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Gain access to the Passenger Airbag Squib harness connectors.
2. Disconnect the Passenger Airbag Squib harness connectors.

WARNING: Do not place an intact non-deployed airbag face down on a hard surface, the airbag propels into the air if accidentally deployed. Failure to follow these instructions may result in possible serious or fatal injury.

NOTE: Check the connectors - Clean and repair as necessary.

3. Connect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) to the Passenger Airbag Squib 1 and Squib 2 harness connectors.
4. If equipped with the standard key ignition, use this ignition on warning.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

5. If equipped with the keyless ignition, use this ignition on warning.

WARNING: Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

6. With the scan tool, read the active ORC DTCs.

Does the scan tool display: B0010-12-PASSENGER FRONTAL SQUIB 1 CONTROL - CIRCUIT

SHORT TO BATTERY?

Yes

- Go To 3

No

- Replace the Passenger Airbag in accordance with the Service Information. Refer to **AIR BAG, PASSENGER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK (R44) PASSENGER SQUIB 2 LINE 1 CIRCUIT AND (R42) PASSENGER SQUIB 2 LINE 2 CIRCUIT FOR A SHORT TO VOLTAGE**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) from the Passenger Airbag Squib harness connectors.
2. Disconnect the ORC harness connectors.

NOTE: Check the connectors - Clean and repair as necessary.

3. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) to the ORC C1 and C2 harness connectors.
4. If equipped with the standard key ignition, use this ignition on warning.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

5. If equipped with the keyless ignition, use this ignition on warning.

WARNING: Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

6. Measure the voltage of the (R44) Passenger Squib 1 Line 1 circuit between the connector C1A cavity 4 of the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) and

ground.

7. Measure the voltage of the (R42) Passenger Squib 1 Line 2 circuit between the connector C1A cavity 24 of the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) and ground.

   Is there any voltage present on either circuit?

   Yes

   - Repair the Passenger Squib 1 circuit(s) for a short to voltage in accordance with the Service Information.
   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   WARNING: **Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

   WARNING: **If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment. Failure to follow these instructions may result in possible serious or fatal injury.**

   - Replace the ORC in accordance with the Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B0010-13-PASSENGER FRONTAL SQUIB 1 CONTROL - CIRCUIT OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 19: Passenger Frontal Squib Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) sends a test current to the squibs to verify the integrity of the squib and wiring. These circuits are maintained in a "floating" configuration at the module (connected to neither power nor ground) as protection against inadvertent deployment. Use of the (special tool #8443A, SRS Load Tool) in the tests below substitutes a suspect squib with a known good component. The use of the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) provides a test point as well as a method for opening the shorting bar connections within the harness connector.

WHEN MONITORED

The ORC sends out a 40 mA diagnostic current on each squib voltage supply circuit at power up and every 500 ms thereafter while the ignition is on.

SET CONDITION

This Diagnostic Trouble Code (DTC) sets when the ORC detects a shorted together of the passenger frontal squib line 1 and line 2 circuits for more than 2.6 seconds. This DTC transitions from active to stored when the ORC sees a recovery from the squib shorted together condition for greater than 2.6 seconds.

POSSIBLE CAUSES

Possible Causes
(R42) PASSENGER SQUIB 1 LINE 2 CIRCUIT OPEN
(R44) PASSENGER SQUIB 1 LINE 1 CIRCUIT OPEN
PASSENGER AIRBAG
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

   NOTE: Make sure the battery is fully charged.

   NOTE: The scan tool, (special tool #8443A, SRS Load Tool), and DVOM are required to perform the following test.

   1. Select Active or Stored DTC.

      Is the DTC active or stored?

      ORC - ACTIVE DTC

      - Go To 2

      ORC - STORED DTC

      - Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK FOR OPEN SQUIB CIRCUITS IN PASSENGER AIRBAG**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the Passenger Airbag Squib 1 harness connector.

NOTE: Check the connectors - Clean and repair as necessary.

2. Connect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) to the Passenger Airbag Squib harness connector.
3. If equipped with the standard key ignition, use this ignition on warning.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

4. If equipped with the keyless ignition, use this ignition on warning.

WARNING: Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

5. With the scan tool, read the active ORC DTCs.

   Does the scan tool display: B0010-13-PASSENGER FRONTAL SQUIB 1 CONTROL - CIRCUIT OPEN?

   Yes

   - Go To 3

   No

   - Replace the Passenger Airbag Squib 1 in accordance with the Service Information. Refer to **AIR BAG, PASSENGER, REMOVAL** .
   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK (R42) PASSENGER SQUIB 1 LINE 2 CIRCUIT AND (R44) PASSENGER SQUIB 1 LINE 1 CIRCUIT FOR AN OPEN**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two

minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) from the Passenger Airbag Squib harness connector.
2. Disconnect the ORC connectors.

NOTE: Check the connectors - Clean and repair as necessary.

3. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) to the ORC harness connectors.
4. Measure the resistance of the (R42) Passenger Squib 1 Line 2 circuit between the Passenger Airbag Squib connector cavity 1 and connector C1A cavity 24 of the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool).
5. Measure the resistance of the (R44) Passenger Squib 1 Line 1 circuit between the Passenger Airbag Squib connector cavity 2 and connector C1A cavity 4 of the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool).

Is the resistance below or within the range of 5.4 - 10.0 Ohm for both circuits?

Yes

WARNING: **If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment. Failure to follow these instructions may result in possible serious or fatal injury.**

- Replace the ORC in accordance with the Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Repair the (R42) Passenger Squib 1 Line 2 circuit or (R44) Passenger Squib 1 Line 1 circuit for an open.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B0010-2B-PASSENGER FRONTAL SQUIB 1 CONTROL - WIRES SHORTED TOGETHER

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) sends a test current to the squibs to verify the integrity of the squib and wiring. These circuits are maintained in a "floating" configuration at the module (connected to neither power nor ground) as protection against inadvertent deployment. Use of the (special tool #8443A, SRS Load Tool) in the tests below substitutes a suspect squib with a known good component. The use of the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) provides a test point as well as a method for opening the shorting bar connections within the harness connector.

WHEN MONITORED

The ORC sends out a 40 mA diagnostic current on each squib voltage supply circuit at power up, and every 500 ms thereafter while the ignition is on.

SET CONDITION

This Diagnostic Trouble Code (DTC) sets when the ORC detects a shorted together of the passenger frontal squib line 1 and line 2 circuits for more than 2.6 seconds. This DTC transitions from active to stored when the ORC sees a recovery from the squib shorted together condition for greater than 2.6 seconds. The Airbag Warning Lamp (AWL) will set in the Instrument Cluster.

POSSIBLE CAUSES

Possible Causes
(R42) PASSENGER SQUIB 1 LINE 2 CIRCUIT SHORTED TO THE (R44) PASSENGER SQUIB 1 LINE 1 CIRCUIT
PASSENGER AIRBAG
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

   NOTE: Make sure the battery is fully charged.

   NOTE: The scan tool, (special tool #8443A, SRS Load Tool), and DVOM are required to perform the following test.

   1. Select Active or Stored DTC.

      Is the DTC active or stored?

      ORC - ACTIVE DTC

      - Go To 2

      ORC - STORED DTC

      - Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK FOR SHORTED SQUIB CIRCUITS IN PASSENGER AIRBAG**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Gain access to the Passenger Airbag Squib harness connectors.
2. Disconnect the Passenger Airbag Squib harness connectors.

NOTE: Check the connectors - Clean and repair as necessary.

3. Connect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) to the Passenger Airbag Squib 1 and Squib 2 harness connectors.
4. If equipped with the standard key ignition, use this ignition on warning.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

5. If equipped with the keyless ignition, use this ignition on warning.

WARNING: Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

6. With the scan tool, read the active ORC DTCs.

   Does the scan tool display: B0010-2B-PASSENGER FRONTAL SQUIB 1 CONTROL - WIRES SHORTED TOGETHER?

   Yes

   - Go To 3

   No

   - Replace the Passenger Airbag in accordance with the Service Information. Refer to **AIR BAG, PASSENGER, REMOVAL** .
   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK (R42) PASSENGER SQUIB 1 LINE 2 CIRCUIT FOR A SHORT TO THE (R44) PASSENGER SQUIB 1 LINE 1 CIRCUIT**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) from the Passenger Airbag Squib harness connectors.
2. Disconnect the ORC harness connectors.

NOTE: Check the connectors - Clean and repair as necessary.

3. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) to the ORC C1 and C2 harness connectors.
4. Measure the resistance between the (R42) Passenger Squib 1 Line 2 circuit connector C1A cavity 24 and the (R44) Passenger Squib 1 Line 1 circuit connector C1A cavity 4 of the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool).

   Is the resistance below 10K Ohm?

   Yes

   - Repair the (R42) Passenger Squib 1 Line 2 circuit for a short to the (R44) Passenger Squib 1 Line 1 circuit in accordance with the Service Information.
   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment. Failure to follow these instructions may result in possible serious or fatal injury.

   - Replace the ORC in accordance with the Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B0011-11-PASSENGER FRONTAL SQUIB 2 CONTROL - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 21: Passenger Frontal Squib Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) sends a test current to the squibs to verify the integrity of the squib and wiring. These circuits are maintained in a "floating" configuration at the module (connected to neither power nor ground) as protection against inadvertent deployment. Use of the (special tool #8443A, SRS Load Tool) in the tests below substitutes a suspect squib with a known good component. The use of the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) provides a test point as well as a method for opening the shorting bar connections within the harness connector.

WHEN MONITORED

The ORC sends out a 40 mA diagnostic current on each squib voltage supply circuit at power up and every 500 ms thereafter while the ignition is on.

SET CONDITION

This Diagnostic Trouble Code (DTC) sets when the ORC detects a short to ground on the passenger airbag squib circuit for more than 2.6 seconds. This DTC transitions from active to stored when the ORC sees a recovery from a short to ground for greater than 2.6 seconds. The Airbag Warning Lamp (AWL) will set in the instrument cluster.

POSSIBLE CAUSES

Possible Causes
(R64) PASSENGER SQUIB 2 LINE 1 CIRCUIT SHORTED TO GROUND
(R62) PASSENGER SQUIB 2 LINE 2 CIRCUIT SHORTED TO GROUND
PASSENGER AIRBAG
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

   NOTE: Make sure the battery is fully charged.

   NOTE: The scan tool, (special tool #8443A, SRS Load Tool), and DVOM are required to perform the following test.

   1. Select Active or Stored DTC.

      Is the DTC active or stored?

      ORC - ACTIVE DTC

      - Go To 2

      ORC - STORED DTC

      - Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK FOR SHORTED SQUIB CIRCUITS IN PASSENGER AIRBAG**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Gain access to the Passenger Airbag Squib harness connectors.
2. Disconnect the Passenger Airbag Squib harness connectors.

WARNING: Do not place an intact non-deployed airbag face down on a hard surface, the airbag propels into the air if accidentally deployed. Failure to follow these instructions may result in possible serious or fatal injury.

NOTE: Check connectors - Clean and repair as necessary.

3. Connect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) to the Passenger Airbag Squib 1 and Squib 2 harness connector.
4. If equipped with the standard key ignition, use this ignition on warning.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

5. If equipped with the keyless ignition, use this ignition on warning.

WARNING: Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

6. With the scan tool, read the active ORC DTCs.

   Does the scan tool display: B0011-11-PASSENGER FRONTAL SQUIB 2 CONTROL - CIRCUIT SHORT TO GROUND?

   Yes

   - Go To 3

   No

   - Replace the Passenger Airbag in accordance with the Service Information. Refer to **AIR BAG, PASSENGER, REMOVAL** .

- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK (R64) PASSENGER SQUIB 2 LINE 1 CIRCUIT AND (R62) PASSENGER SQUIB 2 LINE 2 CIRCUIT FOR A SHORT TO GROUND**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) from the Passenger Airbag Squib harness connectors.
2. Disconnect the ORC harness connectors.

NOTE: Check the connectors - Clean and repair as necessary.

3. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) to the ORC C1 and C2 harness connector.
4. Measure the resistance of the (R64) Passenger Squib 2 Line 1 circuit between ground and connector C1A cavity 6 of the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool).
5. Measure the resistance of the (R62) Passenger Squib 2 Line 2 circuit between ground and connector C1A cavity 26 of the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool).

Is the resistance below 10k Ohms on either circuit?

Yes

- Repair the Passenger Squib 2 circuit(s) for a short to ground in accordance with the Service Information.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment. Failure to follow these instructions may result in possible serious or fatal injury.

- Replace the ORC in accordance with the Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B0011-12-PASSENGER FRONTAL SQUIB 2 CONTROL - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 22: Passenger Frontal Squib Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) sends a test current to the squibs to verify the integrity of the squib and wiring. These circuits are maintained in a "floating" configuration at the module

(connected to neither power nor ground) as protection against inadvertent deployment. Use of the (special tool #8443A, SRS Load Tool) in the tests below substitutes a suspect squib with a known good component. The use of the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) provides a test point as well as a method for opening the shorting bar connections within the harness connector.

WHEN MONITORED

The ORC sends out a 40 mA diagnostic current on each squib voltage supply circuit at power up and every 500 ms thereafter while the ignition is on.

SET CONDITION

This Diagnostic Trouble Code (DTC) sets when the ORC detects a short to voltage on the squib circuit for more than 2.6 seconds. This DTC transitions from active to stored when the ORC sees a recovery from a short to voltage for greater than 2.6 seconds. The Airbag Warning Lamp (AWL) will set in the instrument cluster.

POSSIBLE CAUSES

Possible Causes
(R64) PASSENGER SQUIB 2 LINE 1 CIRCUIT SHORTED TO VOLTAGE
(R62) PASSENGER SQUIB 2 LINE 2 CIRCUIT SHORTED TO VOLTAGE
PASSENGER AIRBAG
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

   NOTE: Make sure the battery is fully charged.

   NOTE: The scan tool, (special tool #8443A, SRS Load Tool), and DVOM are required to perform the following test.

   1. Select Active or Stored DTC.

      Is the DTC active or stored?

      ORC - ACTIVE DTC

      - Go To 2

      ORC - STORED DTC

- Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK FOR SHORTED SQUIB CIRCUITS IN PASSENGER AIRBAG**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Gain access to the Passenger Airbag Squib harness connectors.
2. Disconnect the Passenger Airbag Squib harness connectors.

WARNING: Do not place an intact non-deployed airbag face down on a hard surface, the airbag propels into the air if accidentally deployed. Failure to follow these instructions may result in possible serious or fatal injury.

NOTE: Check the connectors - Clean and repair as necessary.

3. Connect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) to the Passenger Airbag Squib 1 and Squib 2 harness connectors.
4. If equipped with the standard key ignition, use this ignition on warning.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

5. If equipped with the keyless ignition, use this ignition on warning.

WARNING: Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

6. With the scan tool, read the active ORC DTCs.

   Does the scan tool display: B0011-12-PASSENGER FRONTAL SQUIB 2 CONTROL - CIRCUIT SHORT TO BATTERY?

   Yes

   - Go To 3

No

- Replace the Passenger Airbag in accordance with the Service Information. Refer to **AIR BAG, PASSENGER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK (R64) PASSENGER SQUIB 2 LINE 1 CIRCUIT AND (R62) PASSENGER SQUIB 2 LINE 2 CIRCUIT FOR A SHORT TO VOLTAGE**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the (special tool #8443A, SRS Load Tool) from the (special tool #8443-8, Jumper, SRS Load) from the Passenger Airbag Squib harness connectors.
2. Disconnect the ORC harness connectors.

NOTE: Check the connectors - Clean and repair as necessary.

3. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) to the ORC C1 and C2 harness connectors.
4. If equipped with the standard key ignition, use this ignition on warning.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

5. If equipped with the keyless ignition, use this ignition on warning.

WARNING: Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

6. Measure the voltage of the (R64) Passenger Squib 2 Line 1 circuit between connector C1A cavity 6 of the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) and ground.
7. Measure the voltage of the (R62) Passenger Squib 2 Line 2 circuit between connector C1A cavity 26 of the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) and ground.

Is there any voltage present on either circuit?

Yes

- Repair the Passenger Squib 2 circuit(s) for a short to voltage.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment. Failure to follow these instructions may result in possible serious or fatal injury.

- Replace the ORC in accordance with the Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B0011-13-PASSENGER FRONTAL SQUIB 2 CONTROL - CIRCUIT OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 23: Passenger Frontal Squib Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) sends a test current to the squibs to verify the integrity of the squib and wiring. These circuits are maintained in a "floating" configuration at the module (connected to neither power nor ground) as protection against inadvertent deployment. Use of the (special tool #8443A, SRS Load Tool) in the tests below substitutes a suspect squib with a known good component. The use of the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) provides a test point as well as a method for opening the shorting bar connections within the harness connector.

WHEN MONITORED

The ORC sends out a 40 mA diagnostic current on each squib voltage supply circuit at power up and every 500 ms thereafter while the ignition is on.

SET CONDITION

This Diagnostic Trouble Code (DTC) sets when the ORC detects an open on the passenger squib circuit for more than 2.6 seconds. This DTC transitions from active to stored when the ORC sees a recovery from a open for greater than 2.6 seconds.

POSSIBLE CAUSES

Possible Causes
(R64) PASSENGER SQUIB 2 LINE 1 CIRCUIT OPEN
(R62) PASSENGER SQUIB 2 LINE 2 CIRCUIT OPEN
PASSENGER AIRBAG
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

   NOTE: Make sure the battery is fully charged.

   NOTE: The scan tool, (special tool #8443A, SRS Load Tool), and DVOM are required to perform the following test.

   1. Select Active or Stored DTC.

      Is the DTC active or stored?

      ORC - ACTIVE DTC

      - Go To 2

      ORC - STORED DTC

      - Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK FOR OPEN SQUIB CIRCUITS IN PASSENGER AIRBAG**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Gain access to the Passenger Airbag Squib harness connectors.
2. Disconnect the Passenger Airbag Squib harness connectors.

WARNING: Do not place an intact non-deployed airbag face down on a hard surface, the airbag propels into the air if accidentally deployed. Failure to follow these instructions may result in possible serious or fatal injury.

NOTE: Check the connectors - Clean and repair as necessary.

3. Connect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) to the Passenger Airbag Squib 1 and Squib 2 harness connectors.
4. If equipped with the standard key ignition, use this ignition on warning.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

5. If equipped with the keyless ignition, use this ignition on warning.

WARNING: Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

6. With the scan tool, read the active ORC DTCs.

   Does the scan tool display: B0011-13-PASSENGER FRONTAL SQUIB 2 CONTROL - CIRCUIT OPEN?

   Yes

   - Go To 3

   No

   - Replace the Passenger Airbag in accordance with the Service Information. Refer to **AIR BAG, PASSENGER, REMOVAL** .

- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK (R62) PASSENGER SQUIB 2 LINE 2 CIRCUIT AND (R64) PASSENGER SQUIB 2 LINE 1 CIRCUIT FOR AN OPEN**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) from the Passenger Airbag Squib harness connectors.
2. Disconnect the ORC connectors.

NOTE: Check the connectors - Clean and repair as necessary.

3. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) to the ORC C1 and C2 harness connectors.
4. Measure the resistance of the (R62) Passenger Squib 2 Line 2 circuit between the Passenger Airbag Squib connector cavity 1 and connector C1A cavity 26 of the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool).
5. Measure the resistance of the (R64) Passenger Squib 2 Line 1 circuit between the Passenger Airbag Squib connector cavity 2 and connector C1A cavity 6 of the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool).

Is the resistance below or within the range of 5.4 - 10.0 Ohm for both circuits?

Yes

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment. Failure to follow these instructions may result in possible serious or fatal injury.

- Replace the ORC in accordance with the Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Repair the (R62) Passenger Squib 2 Line 2 circuit or (R64) Passenger Squib 2 Line 1 circuit for an open.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B0011-2B-PASSENGER FRONTAL SQUIB 2 CONTROL - WIRES SHORTED TOGETHER

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 24: Passenger Frontal Squib Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) sends a test current to the squibs to verify the integrity of the squib and wiring. These circuits are maintained in a "floating" configuration at the module

(connected to neither power nor ground) as protection against inadvertent deployment. Use of the (special tool #8443A, SRS Load Tool) in the tests below substitutes a suspect squib with a known good component. The use of the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) provides a test point as well as a method for opening the shorting bar connections within the harness connector.

WHEN MONITORED

The ORC sends out a 40 mA diagnostic current on each squib voltage supply circuit at power up, and every 500 ms thereafter while the ignition is on. circuits.

SET CONDITION

This Diagnostic Trouble Code (DTC) sets when the ORC detects a shorted together of the passenger frontal squib line 1 and line 2 circuits for more than 2.6 seconds. This DTC transitions from active to stored when the ORC sees a recovery from the squib shorted together condition for greater than 2.6 seconds. The Airbag Warning Lamp (AWL) will set in the Instrument Cluster.

POSSIBLE CAUSES

Possible Causes
(R64) PASSENGER SQUIB 2 LINE 1 CIRCUIT SHORTED TO THE (R62) PASSENGER SQUIB 2 LINE 2 CIRCUIT
PASSENGER AIRBAG
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

   NOTE: Make sure the battery is fully charged.

   NOTE: The scan tool, (special tool #8443A, SRS Load Tool), and DVOM are required to perform the following test.

   1. Select Active or Stored DTC.

      Is the DTC active or stored?

      ORC - ACTIVE DTC

      - Go To 2

ORC - STORED DTC

- Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK FOR SHORTED SQUIB CIRCUITS IN PASSENGER AIRBAG**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Gain access to the Passenger Airbag Squib harness connectors.
2. Disconnect the Passenger Airbag Squib harness connectors.

WARNING: Do not place an intact non-deployed airbag face down on a hard surface, the airbag propels into the air if accidentally deployed. Failure to follow these instructions may result in possible serious or fatal injury.

NOTE: Check the connectors - Clean and repair as necessary.

3. Connect the(special tool #8443A, SRS Load Tool) and (special tool #8443-8, Jumper, SRS Load) to the Passenger Airbag Squib 1 and Squib 2 harness connector.
4. If equipped with the standard key ignition, use this ignition on warning.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

5. If equipped with the keyless ignition, use this ignition on warning.

WARNING: Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

6. With the scan tool, read the active ORC DTCs.

   Does the scan tool display: B0011-2B-PASSENGER FRONTAL SQUIB 2 CONTROL - WIRES SHORTED TOGETHER?

   Yes

- Go To 3

No

- Replace the Passenger Airbag in accordance with the Service Information. Refer to **AIR BAG, PASSENGER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK (R64) PASSENGER SQUIB 2 LINE 1 CIRCUIT FOR A SHORT TO THE (R62) PASSENGER SQUIB 2 LINE 2 CIRCUIT**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the (special tool #8443A, SRS Load Tool) and (special tool #8443-8, Jumper, SRS Load) to the Passenger Airbag Squib harness connectors.
2. Disconnect the ORC harness connectors.

NOTE: Check the connectors - Clean and repair as necessary.

3. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) to the ORC C1 and C2 harness connectors.
4. Measure the resistance between the (R64) Passenger Squib 2 Line 1 circuit connector C1A cavity 6 and the (R62) Passenger Squib 2 Line 2 circuit connector C1A cavity 26 of the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool).

Is the resistance below 10K Ohm ?

Yes

- Repair the (R64) Passenger Squib 2 Line 1 circuit for a short to the (R62) Passenger Squib 2 Line 2 circuit.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment. Failure to follow these instructions may result in possible serious or fatal injury.

- Replace the ORC in accordance with the Service Information. Refer to **MODULE,**

OCCUPANT RESTRAINT CONTROLLER, REMOVAL .

- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B0012-11-PASSENGER FRONTAL SQUIB 3 CONTROL - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 25: Passenger Frontal Squib Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) sends a test current to the squibs to verify the integrity of the squib and the wiring. These circuits are maintained in a "floating" configuration at the module, (connected to neither power nor ground), as protection against inadvertent deployment. Use of the(special tool #8443A, SRS Load Tool) in the tests below substitutes a suspect squib with a known good component. The use of the SRS Load Tool (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) provides a test point, as well as a method for opening the shorting bar connections within the harness connector. The Front Passenger Airbag is a three stage device with three electrical connectors. The first stage is deployed immediately during impact that requires airbag deployment. The timing of the second stage determines the output force of the airbag. The third stage triggers a tether clip initiator, which releases the tether when a softer airbag is necessary.

WHEN MONITORED

The ORC Module sends out a 40 mA diagnostic current on each squib voltage supply circuit at power up, and every 500 ms thereafter while the ignition is on.

SET CONDITION

This Diagnostic Trouble Code (DTC) sets when the ORC detects a short to ground on the passenger airbag squib circuit for more than 2.6 seconds. This DTC transitions from active to stored when the ORC sees a recovery from a short to ground for greater than 2.6 seconds. The Airbag Warning Lamp (AWL) will set in the instrument cluster.

POSSIBLE CAUSES

Possible Causes
(R68) PASSENGER SQUIB 3 LINE 1 CIRCUIT SHORTED TO GROUND
(R66) PASSENGER SQUIB 3 LINE 2 CIRCUIT SHORTED TO GROUND
PASSENGER AIRBAG
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

NOTE: Make sure that the battery is fully charged.

NOTE: The scan tool, (special tool #8443A, SRS Load Tool), and DVOM are required to perform the following test.

1. Turn the ignition on.

Select ACTIVE or STORED DTC:

ACTIVE DTC

- Go To 2

STORED DTC

- Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK FOR SHORTED SQUIB CIRCUITS IN PASSENGER AIRBAG**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Gain access to the Passenger Airbag Squib harness connectors.
2. Disconnect the Passenger Airbag Squib harness connectors.

WARNING: Do not place an intact non-deployed airbag face down on a hard surface, the airbag propels into the air if accidentally deployed. Failure to follow these instructions may result in possible serious or fatal injury.

NOTE: Check connectors - Clean and repair as necessary.

3. Connect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) to the Passenger Airbag Squib 3 connector.
4. If equipped with the standard key ignition, use this ignition on warning.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

5. If equipped with the keyless ignition, use this ignition on warning.

WARNING: Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

6. With the scan tool, read the active ORC DTCs.

Does the scan tool display: B0012-11-PASSENGER FRONTAL SQUIB 3 CONTROL - CIRCUIT SHORTED TO GROUND?

Yes

- Go To 3

No

- Replace the Passenger Airbag in accordance with the Service Information. Refer to **AIR BAG, PASSENGER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (R68) PASSENGER SQUIB 3 LINE 1 CIRCUIT AND THE (R66) PASSENGER SQUIB 3 LINE 2 CIRCUIT FOR A SHORT TO GROUND**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) from the Passenger Airbag Squib 3 harness connectors.
2. Disconnect the ORC harness connectors.

NOTE: Check connectors - Clean and repair as necessary.

3. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) to the ORC C1 and C2 harness connectors.
4. Measure the resistance of the (R68) Passenger Squib 3 Line 1 circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) connector C1A cavity 8 and ground.
5. Measure the resistance of the (R66) Passenger Squib 3 Line 2 circuit between (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) connector C1A cavity 28 and ground.

Is the resistance below 10k Ohms on either circuit?

Yes

- Repair the Passenger Squib 3 circuits with resistance below 10k Ohms for a short to ground.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment. Failure to follow these instructions may result in possible serious or fatal injury.

- Replace the ORC in accordance with Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B0012-12-PASSENGER FRONTAL SQUIB 3 CONTROL - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 26: Passenger Frontal Squib Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) sends a test current to the squibs to verify the integrity of the squib and the wiring. These circuits are maintained in a "floating" configuration at the module, (connected to neither power nor ground), as protection against inadvertent deployment. Use of the(special tool #8443A, SRS Load Tool) in the tests below substitutes a suspect squib with a known good component. The use of the SRS Load Tool (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) provides a test point, as well as a method for opening the shorting bar connections within the harness connector. The 54

pin connector side of the 30/54 way ORC Module provides ground. The Front Passenger Airbag is a three stage device with three electrical connectors. The first stage is deployed immediately during impact that requires airbag deployment. The timing of the second stage determines the output force of the airbag. The third stage triggers a tether clip initiator, which releases the tether when a softer airbag is necessary.

WHEN MONITORED

The ORC Module sends out a 40 mA diagnostic current on each squib voltage supply circuit at power up, and every 500 ms thereafter while the ignition is on.

SET CONDITION

This Diagnostic Trouble Code (DTC) sets when the ORC detects a short to battery on the passenger airbag squib circuit for more than 2.6 seconds. This DTC transitions from active to stored when the ORC sees a recovery from a short to battery for greater than 2.6 seconds. The Airbag Warning Lamp (AWL) will set in the instrument cluster.

POSSIBLE CAUSES

Possible Causes
(R68) PASSENGER SQUIB 3 LINE 1 CIRCUIT SHORTED TO GROUND
(R66) PASSENGER SQUIB 3 LINE 2 CIRCUIT SHORTED TO GROUND
PASSENGER AIRBAG
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

   NOTE: Make sure that the battery is fully charged.

   NOTE: The scan tool, (special tool #8443A, SRS Load Tool), and DVOM are required to perform the following test.

   1. Turn the ignition on.

      Select ACTIVE or STORED DTC:

      ACTIVE DTC

      - Go To 2

STORED DTC

- Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK FOR SHORTED SQUIB CIRCUITS IN PASSENGER AIRBAG**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Gain access to the Passenger Airbag Squib connectors.
2. Disconnect the Passenger Airbag Squib connectors.

WARNING: Do not place an intact non-deployed airbag face down on a hard surface, the airbag propels into the air if accidentally deployed. Failure to follow these instructions may result in possible serious or fatal injury.

NOTE: Check connectors - Clean and repair as necessary.

3. Connect the(special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) to the Passenger Airbag Squib 3 connector.
4. If equipped with the standard key ignition, use this ignition on warning.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

5. If equipped with the keyless ignition, use this ignition on warning.

WARNING: Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

6. With the scan tool, read the active ORC DTCs.

   Does the scan tool display: B0012-12-PASSENGER FRONTAL SQUIB 3 CONTROL - CIRCUIT SHORT TO BATTERY?

   Yes

- Go To 3

No

- Replace the Passenger Airbag in accordance with the Service Information. Refer to **AIR BAG, PASSENGER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (R68) PASSENGER SQUIB 3 LINE 1 CIRCUIT AND THE (R66) PASSENGER SQUIB 3 LINE 2 CIRCUIT FOR A SHORT TO BATTERY**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) from the Passenger Airbag Squib connectors.
2. Disconnect the ORC connectors.

NOTE: Check connectors - Clean and repair as necessary.

3. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) to the ORC C1 and C2 harness connectors.
4. Measure the voltage of the (R68) Passenger Squib 3 Line 1 circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) connector C1A cavity 8 and ground.
5. Measure the voltage of the (R66) Passenger Squib 3 Line 2 circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) connector C1A cavity 28 and ground.

Is there any voltage present on either circuit?

Yes

- Repair the Passenger Squib 3 circuits with voltage present for a short to battery.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment. Failure to follow these instructions may result in possible serious or fatal injury.

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

- Replace the ORC in accordance with Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B0012-13-PASSENGER FRONTAL SQUIB 3 CONTROL - CIRCUIT OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 27: Passenger Frontal Squib Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) sends a test current to the squibs to verify the integrity of the squib and the wiring. These circuits are maintained in a "floating" configuration at the module, (connected to neither power nor ground), as protection against inadvertent deployment. Use of the(special tool #8443A, SRS Load Tool) in the tests below substitutes a suspect squib with a known good component. The use of the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) provides a test point, as well as a method for opening the shorting bar connections within the harness connector. The Front Passenger Airbag

is a three stage device with three electrical connectors. The first stage is deployed immediately during impact that requires airbag deployment. The timing of the second stage determines the output force of the airbag. The third stage triggers a tether clip initiator, which releases the tether when a softer airbag is necessary.

WHEN MONITORED

The ORC Module sends out a 40 mA diagnostic current on each squib voltage supply circuit at power up, and every 500 ms thereafter while the ignition is on.

SET CONDITION

This Diagnostic Trouble Code (DTC) sets when the ORC detects a open on the passenger airbag squib circuit for more than 2.6 seconds. This DTC transitions from active to stored when the ORC sees a recovery from a open for greater than 2.6 seconds. The Airbag Warning Lamp (AWL) will set in the instrument cluster.

POSSIBLE CAUSES

Possible Causes
(R68) PASSENGER SQUIB 3 LINE 1 CIRCUIT OPEN
(R66) PASSENGER SQUIB 3 LINE 2 CIRCUIT OPEN
PASSENGER AIRBAG
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

   NOTE: Make sure that the battery is fully charged.

   NOTE: The scan tool, (special tool #8443A, SRS Load Tool), and DVOM are required to perform the following test.

   1. Turn the ignition on.

      Select ACTIVE or STORED DTC:

      ACTIVE DTC

      - Go To 2

      STORED DTC

- Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK FOR OPEN SQUIB CIRCUITS IN PASSENGER AIRBAG**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Gain access to the Passenger Airbag harness connectors.
2. Disconnect the Passenger Airbag harness connectors.

WARNING: Do not place an intact non-deployed airbag face down on a hard surface, the airbag propels into the air if accidentally deployed. Failure to follow these instructions may result in possible serious or fatal injury.

NOTE: Check connectors - Clean and repair as necessary.

3. Connect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) to the Passenger Airbag Squib 3 harness connector.
4. If equipped with the standard key ignition, use this ignition on warning.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

5. If equipped with the keyless ignition, use this ignition on warning.

WARNING: Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

6. With the scan tool, read the active ORC DTCs.

   Does the scan tool display: B0012-13-PASSENGER FRONTAL SQUIB 3 CONTROL - CIRCUIT OPEN?

   Yes

   - Go To 3

No

- Replace the Passenger Airbag in accordance with the Service Information. Refer to **AIR BAG, PASSENGER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (R68) PASSENGER SQUIB 3 LINE 1 CIRCUIT FOR AN OPEN**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) from the Passenger Airbag Squib 3 harness connector.
2. Disconnect the ORC harness connectors.

NOTE: Check connectors - Clean and repair as necessary.

3. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) to the ORC C1 and 2 harness connectors.
4. Measure the resistance of the (R68) Passenger Squib 3 Line 1 circuit between the Passenger Airbag Squib 3 harness connector cavity 2 and the adaptor connector C1A cavity 8.

Is the resistance below 2.0 Ohm?

Yes

- Go To 4

No

- Repair the (R68) Passenger Squib 3 Line 1 circuit for an open.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK THE (R66) PASSENGER SQUIB 3 LINE 2 CIRCUIT FOR AN OPEN**

1. Measure the resistance of the (R66) Passenger Squib 3 Line 2 circuit between the Passenger Airbag Squib 3 harness connector cavity 1 and the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) connector C1A cavity 28.

Is the resistance below 2.0 Ohm?

Yes

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any

time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment. Failure to follow these instructions may result in possible serious or fatal injury.

- Replace the ORC in accordance with the Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Repair the (R66) Passenger Squib 3 Line 2 circuit for an open.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B0012-2B-PASSENGER FRONTAL SQUIB 3 CONTROL - WIRES SHORTED TOGETHER

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 28: Passenger Frontal Squib Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) sends a test current to the squibs to verify the integrity of the squib and the wiring. These circuits are maintained in a "floating" configuration at the module, (connected to neither power nor ground), as protection against inadvertent deployment. Use of the(special tool #8443A, SRS Load Tool) in the tests below substitutes a suspect squib with a known good component. The use of the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) provides a test point, as well as a method for opening the shorting bar connections within the harness connector. The Front Passenger Airbag

is a three stage device with three electrical connectors. The first stage is deployed immediately during impact that requires airbag deployment. The timing of the second stage determines the output force of the airbag. The third stage triggers a tether clip initiator, which releases the tether when a softer airbag is necessary.

WHEN MONITORED

The ORC Module sends out a 40 mA diagnostic current on each squib voltage supply circuit at power up, and every 500 ms thereafter while the ignition is on.

SET CONDITION

This Diagnostic Trouble Code (DTC) sets when the ORC detects both circuits of the same squib are shorted together for more than 2.6 seconds. This DTC transitions from active to stored when the ORC sees a recovery from a shorted together condition for greater than 2.6 seconds. The Airbag Warning Lamp (AWL) will set in the instrument cluster.

POSSIBLE CAUSES

Possible Causes
(R68) PASSENGER SQUIB 3 LINE 1 CIRCUIT SHORTED TO (R66) PASSENGER SQUIB 3 LINE 2 CIRCUIT
PASSENGER AIRBAG
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

   NOTE: Make sure that the battery is fully charged.

   NOTE: The scan tool, SRS Load Tool Kit (special tool #8443A, SRS Load Tool), and DVOM are required to perform the following test.

   1. Turn the ignition on.

      Select ACTIVE or STORED DTC:

      ACTIVE DTC

      - Go To 2

      STORED DTC

- Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK FOR SHORTED SQUIB CIRCUITS IN PASSENGER AIRBAG**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Gain access to the Passenger Airbag Squib connectors.
2. Disconnect the Passenger Airbag Squib connectors.

WARNING: Do not place an intact non-deployed airbag face down on a hard surface, the airbag propels into the air if accidentally deployed. Failure to follow these instructions may result in possible serious or fatal injury.

NOTE: Check connectors - Clean and repair as necessary.

3. Connect the (special tool #8443A, SRS Load Tool) and (special tool #8443-8, Jumper, SRS Load) to the Passenger Airbag Squib 3 connector.
4. If equipped with the standard key ignition, use this ignition on warning.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

5. If equipped with the keyless ignition, use this ignition on warning.

WARNING: Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

6. With the scan tool, read the active ORC DTCs.

   Does the scan tool display: B0012-2B-PASSENGER FRONTAL SQUIB 3 CONTROL - WIRES SHORTED TOGETHER?

   Yes

   - Go To 3

No

- Replace the Passenger Airbag in accordance with the Service Information. Refer to **AIR BAG, PASSENGER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (R68) PASSENGER SQUIB 3 LINE 1 CIRCUIT FOR A SHORT TO (R66) PASSENGER SQUIB 3 LINE 2 CIRCUIT**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the (special tool #8443A, SRS Load Tool) and (special tool #8443-8, Jumper, SRS Load) from the Passenger Airbag Squib 3 connectors.
2. Disconnect the ORC connectors.

NOTE: Check connectors - Clean and repair as necessary.

3. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) to the ORC C1 and C2 connectors.
4. Measure the resistance between the (R68) Passenger Squib 3 Line 1 circuit connector C1A cavity 8 and the (R66) Passenger Squib 3 Line 2 circuit connector C1A cavity 28 at the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool).

Is the resistance below 10K Ohm?

Yes

- Repair the (R68) Passenger Squib 3 Line 1 circuit for a short to the (R66) Passenger Squib 3 Line 2 circuit.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment. Failure to follow these instructions may result in possible serious or fatal injury.

- Replace the ORC in accordance with Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD**

PROCEDURE .

B0013-11-PASSENGER KNEE BOLSTER SQUIB CONTROL - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 29: Knee Blocker & Seat Belt Pretensioner Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) sends a test current to the squibs to verify the integrity of the squib and wiring. These circuits are maintained in a "floating" configuration at the module (connected to neither power nor ground) as protection against inadvertent deployment. Use of the (special tool

#8443A, SRS Load Tool) in the tests below substitutes a suspect squib with a known good component. The use of the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) provides a test point as well as a method for opening the shorting bar connections within the harness connector. The knee blocker airbags are concealed below the lower edge of the instrument panel, just beneath the steering column opening cover on the driver side or just beneath the glove box door on the passenger side.

WHEN MONITORED

The ORC Module sends out a 40 mA diagnostic current on each squib voltage supply circuit at power up, and every 500 ms thereafter while the ignition is on.

SET CONDITION

This Diagnostic Trouble Code (DTC) sets when the ORC detects a short to ground on the passenger knee bolster squib circuit for more than 2.6 seconds. This DTC transitions from active to stored when the ORC sees a recovery from a short to ground condition for greater than 2.6 seconds. The Airbag Warning Lamp (AWL) will set in the instrument cluster.

POSSIBLE CAUSES

Possible Causes
(R12) PASSENGER KNEE BLOCKER SQUIB LINE 1 CIRCUIT SHORTED TO GROUND
(R10) PASSENGER KNEE BLOCKER SQUIB LINE 2 CIRCUIT SHORTED TO GROUND
PASSENGER KNEE BOLSTER AIRBAG
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

   NOTE: Make sure that the battery is fully charged.

   NOTE: The scan tool, (special tool #8443A, SRS Load Tool), and DVOM are required to perform the following test.

   1. Turn the ignition on.

      Select ACTIVE or STORED DTC:

      ACTIVE DTC

      - Go To 2

STORED DTC

- Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK FOR SHORTED PASSENGER KNEE BLOCKER AIRBAG CIRCUITS**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the Passenger Knee Blocker Airbag harness connector.

WARNING: Do not place an intact non-deployed airbag face down on a hard surface, the airbag propels into the air if accidentally deployed. Failure to follow these instructions may result in possible serious or fatal injury.

NOTE: Check connectors - Clean and repair as necessary.

2. Connect the (special tool #8443A, SRS Load Tool) and the(special tool #8443-8, Jumper, SRS Load) to the Passenger Knee Blocker Airbag harness connector.
3. If equipped with the standard key ignition, use this ignition on warning.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

4. If equipped with the keyless ignition, use this ignition on warning.

WARNING: Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

5. With the scan tool, read the active ORC DTCs.

Does the scan tool display: B0013-11-FRONT PASSENGER KNEE BOLSTER SQUIB CONTROL - CIRCUIT SHORT TO GROUND?

Yes

- Go To 3

No

- Replace the Passenger Knee Blocker Airbag in accordance with the Service Information. Refer to **AIR BAG, KNEE BLOCKER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK (R12) PASSENGER KNEE BLOCKER SQUIB LINE 1 CIRCUIT OR (R10) PASSENGER KNEE BLOCKER SQUIB LINE 2 CIRCUIT FOR A SHORT TO GROUND**

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) from the Passenger Knee Blocker Airbag harness connector.
2. Disconnect the ORC harness connectors.

NOTE: Check connectors - Clean and repair as necessary.

3. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) to the ORC C1 and C2 harness connector.
4. Measure the resistance between ground and the (R12) Passenger Knee Blocker Squib Line 1 circuit at the connector C1A cavity 2 of the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool).
5. Measure the resistance between ground and the (R10) Passenger Knee Blocker Squib Line 2 circuit at the connector C1A cavity 22 of the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool).

Is the resistance below 10K Ohms on either circuit?

Yes

- Repair the (R12) Passenger Knee Blocker Squib Line 1 or (R10) Passenger Knee Blocker Squib Line 2 circuits for a short to ground in accordance with the Service Information.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment. Failure to follow these instructions may result in possible serious or fatal injury.

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

- Replace the ORC in accordance with Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B0013-12-PASSENGER KNEE BOLSTER SQUIB CONTROL - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) sends a test current to the squibs to verify the integrity of the squib and wiring. These circuits are maintained in a "floating" configuration at the module (connected to neither power nor ground) as protection against inadvertent deployment. Use of the (special tool #8443A, SRS Load Tool) in the tests below substitutes a suspect squib with a known good component. The use of the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) provides a test point as well as a method for opening the shorting bar connections within the harness connector. The knee blocker airbags are concealed below the lower edge of the instrument panel, just beneath the steering column opening cover on the driver side or just beneath the glove box door on the passenger side.

WHEN MONITORED

The ORC Module sends out a 40 mA diagnostic current on each squib voltage supply circuit at power up, and every 500 ms thereafter while the ignition is on.

SET CONDITION

This Diagnostic Trouble Code (DTC) sets when the ORC detects a short to voltage on the driver knee bolster squib circuit for more than 2.6 seconds. This DTC transitions from active to stored when the ORC sees a recovery from a short to ground for greater than 2.6 seconds. The Airbag Warning Lamp (AWL) will set in the instrument cluster.

POSSIBLE CAUSES

Possible Causes
(R12) PASSENGER KNEE BLOCKER SQUIB LINE 1 CIRCUIT SHORTED TO BATTERY
(R10) PASSENGER KNEE BLOCKER SQUIB LINE 2 CIRCUIT SHORTED TO BATTERY
PASSENGER KNEE BOLSTER AIRBAG
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

NOTE: **Make sure that the battery is fully charged.**

NOTE: **The scan tool, (special tool #8443A, SRS Load Tool), and DVOM are required to perform the following test.**

1. Turn the ignition on.

   Select ACTIVE or STORED DTC:

   ACTIVE DTC

   - Go To 2

   STORED DTC

   - Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK FOR SHORTED PASSENGER KNEE BLOCKER AIRBAG CIRCUITS**

   WARNING: **Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

   1. Disconnect the Passenger Knee Blocker Airbag harness connector.

      WARNING: **Do not place an intact non-deployed airbag face down on a hard surface, the airbag propels into the air if accidentally deployed. Failure to follow these instructions may result in possible serious or fatal injury.**

      NOTE: Check connectors - Clean and repair as necessary.

   2. Connect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) to the Passenger Knee Blocker Airbag harness connector.
   3. If equipped with the standard key ignition, use this ignition on warning.

      WARNING: **Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

   4. If equipped with the keyless ignition, use this ignition on warning.

      WARNING: **Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

5. With the scan tool, read the active ORC DTCs.

   Does the scan tool display: B0013-12-PASSENGER KNEE BOLSTER SQUIB CONTROL - CIRCUIT SHORT TO BATTERY?

   Yes

   - Go To 3

   No

   - Replace the Passenger Knee Blocker Airbag in accordance with the Service Information. Refer to **AIR BAG, KNEE BLOCKER, REMOVAL** .
   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK (R12) PASSENGER KNEE BLOCKER SQUIB LINE 1 CIRCUIT OR (R10) PASSENGER KNEE BLOCKER SQUIB LINE 2 CIRCUIT FOR A SHORT TO VOLTAGE**

   WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

   1. Disconnect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) from the Passenger Knee Blocker Airbag harness connector.
   2. Disconnect the ORC harness connectors.

      NOTE: Check connectors - Clean and repair as necessary.

   3. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) to the ORC C1 and C2 harness connector.
   4. Measure the voltage between ground and the (R12) Passenger Knee Blocker Squib Line 1 circuit at connector C1A cavity 2 of the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool).
   5. Measure the voltage between ground and the (R10) Passenger Knee Blocker Squib Line 2 circuit at connector C1A cavity 22 of the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool).

      Is there any voltage present on either circuit?

      Yes

      - Repair the (R12) Passenger Knee Blocker Squib Line 1 or (R10) Passenger Knee Blocker Squib Line 2 circuits for a short to voltage in accordance with the Service Information.
      - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD**

PROCEDURE .

No

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment. Failure to follow these instructions may result in possible serious or fatal injury.

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

- Replace the ORC in accordance with Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B0013-13-PASSENGER KNEE BOLSTER SQUIB CONTROL - CIRCUIT OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) sends a test current to the squibs to verify the integrity of the squib and wiring. These circuits are maintained in a "floating" configuration at the module (connected to neither power nor ground) as protection against inadvertent deployment. Use of the (special tool #8443A, SRS Load Tool) in the tests below substitutes a suspect squib with a known good component. The use of the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) provides a test point as well as a method for opening the shorting bar connections within the harness connector. The knee blocker airbags are concealed below the lower edge of the instrument panel, just beneath the steering column opening cover on the driver side or just beneath the glove box door on the passenger side.

WHEN MONITORED

The ORC Module sends out a 40 mA diagnostic current on each squib voltage supply circuit at power up, and every 500 ms thereafter while the ignition is on.

SET CONDITION

This Diagnostic Trouble Code (DTC) sets when the ORC detects an open on the passenger knee bolster squib circuit for more than 2.6 seconds. This DTC transitions from active to stored when the ORC sees a recovery from a open for greater than 2.6 seconds. The Airbag Warning Lamp (AWL) will set in the instrument cluster.

POSSIBLE CAUSES

Possible Causes
(R12) PASSENGER KNEE BLOCKER SQUIB LINE 1 CIRCUIT OPEN
(R10) PASSENGER KNEE BLOCKER SQUIB LINE 2 CIRCUIT OPEN
PASSENGER KNEE BLOCKER AIRBAG
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

   NOTE: Make sure that the battery is fully charged.

   NOTE: The scan tool, (special tool #8443A, SRS Load Tool), and DVOM are required to perform the following test.

   1. Turn the ignition on.

      Select ACTIVE or STORED DTC:

      ACTIVE DTC

      - Go To 2

      STORED DTC

      - Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK FOR OPEN PASSENGER KNEE BLOCKER AIRBAG CIRCUITS**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the Passenger Knee Blocker Airbag harness connector.

WARNING: Do not place an intact non-deployed airbag face down on a hard surface, the airbag propels into the air if accidentally deployed. Failure to follow these instructions may result in possible serious or fatal injury.

NOTE: Check connectors - Clean and repair as necessary.

2. Connect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) to the Passenger Knee Blocker Airbag harness connector.
3. If equipped with the standard key ignition, use this ignition on warning.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

4. If equipped with the keyless ignition, use this ignition on warning.

WARNING: Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

5. With the scan tool, read the active ORC DTCs.

   Does the scan tool display: B0013-13-PASSENGER KNEE BOLSTER SQUIB CONTROL - CIRCUIT OPEN?

   Yes

   - Go To 3

   No

   - Replace the Passenger Knee Blocker Airbag in accordance with the Service Information. Refer to **AIR BAG, KNEE BLOCKER, REMOVAL** .
   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD**

PROCEDURE .

3. **CHECK (R12) PASSENGER KNEE BLOCKER SQUIB LINE 1 CIRCUIT OR (R10) PASSENGER KNEE BLOCKER SQUIB LINE 2 CIRCUIT FOR AN OPEN**

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) from the Passenger Knee Blocker airbag harness connector.
2. Disconnect the ORC harness connectors.

NOTE: Check connectors - Clean and repair as necessary.

3. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) to the ORC C1 and C2 harness connector.
4. Measure the resistance between the (R12) Passenger Knee Blocker Squib Line 1 circuit at Passenger Knee Blocker Airbag connector cavity 2 and the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) C1A cavity 2.
5. Measure the resistance between the (R10) Passenger Knee Blocker Squib Line 2 circuit at connector Passenger Knee Blocker Airbag cavity 1 and the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) C1A cavity 22.

Is the resistance above 2.0 Ohms on either circuit?

Yes

- Repair the (R12) Passenger Knee Blocker Squib Line 1 or (R10) Passenger Knee Blocker Squib Line 2 circuits for an open in accordance with the Service Information.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment. Failure to follow these instructions may result in possible serious or fatal injury.

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

- Replace the ORC in accordance with Service Information. Refer to **MODULE,**

OCCUPANT RESTRAINT CONTROLLER, REMOVAL .

- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B0013-2B-PASSENGER KNEE BOLSTER SQUIB CONTROL - WIRES SHORTED TOGETHER

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 32: Knee Blocker & Seat Belt Pretensioner Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) sends a test current to the squibs to verify the

integrity of the squib and wiring. These circuits are maintained in a "floating" configuration at the module (connected to neither power nor ground) as protection against inadvertent deployment. Use of the (special tool #8443A, SRS Load Tool) in the tests below substitutes a suspect squib with a known good component. The use of the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) provides a test point as well as a method for opening the shorting bar connections within the harness connector. The knee blocker airbags are concealed below the lower edge of the instrument panel, just beneath the steering column opening cover on the driver side or just beneath the glove box door on the passenger side.

WHEN MONITORED

The ORC Module sends out a 40 mA diagnostic current on each squib voltage supply circuit at power up, and every 500 ms thereafter while the ignition is on.

SET CONDITION

This Diagnostic Trouble Code (DTC) sets when the ORC detects a shorted together of the passenger knee bolster squib line 1 and line 2 circuits for more than 2.6 seconds. This DTC transitions from active to stored when the ORC sees a recovery from the squib shorted together condition for greater than 2.6 seconds. The Airbag Warning Lamp (AWL) will set in the instrument cluster.

POSSIBLE CAUSES

Possible Causes
(R12) PASSENGER KNEE BLOCKER SQUIB LINE 1 CIRCUIT SHORTED TO THE (R10) PASSENGER KNEE BLOCKER SQUIB LINE 2 CIRCUIT
PASSENGER KNEE BLOCKER AIRBAG
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

NOTE: Make sure that the battery is fully charged.

NOTE: The scan tool, (special tool #8443A, SRS Load Tool), and DVOM are required to perform the following test.

1. Turn the ignition on.

   Select ACTIVE or STORED DTC:

   ACTIVE DTC

- Go To 2

STORED DTC

- Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK FOR SHORTED PASSENGER KNEE BLOCKER AIRBAG CIRCUITS**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the Passenger Knee Blocker Airbag harness connector.

WARNING: Do not place an intact non-deployed airbag face down on a hard surface, the airbag propels into the air if accidentally deployed. Failure to follow these instructions may result in possible serious or fatal injury.

NOTE: Check connectors - Clean and repair as necessary.

2. Connect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) to the Passenger Knee Blocker Airbag harness connector.
3. If equipped with the standard key ignition, use this ignition on warning.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

4. If equipped with the keyless ignition, use this ignition on warning.

WARNING: Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

5. With the scan tool, read the active ORC DTCs.

Does the scan tool display: B0013-2B-PASSENGER KNEE BOLSTER SQUIB CONTROL - WIRES SHORTED TOGETHER?

Yes

- Go To 3

No

- Replace the Passenger Knee Blocker Airbag in accordance with the Service Information. Refer to **AIR BAG, KNEE BLOCKER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK (R12) PASSENGER KNEE BLOCKER SQUIB LINE 1 CIRCUIT OR (R10) PASSENGER KNEE BLOCKER SQUIB LINE 2 CIRCUIT FOR A SHORT TO GROUND**

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) from the Passenger Knee Blocker airbag harness connector.
2. Disconnect the ORC harness connectors.

NOTE: Check connectors - Clean and repair as necessary.

3. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) to the ORC C1 and C2 harness connector.
4. Measure the resistance between the (R12) Passenger Knee Blocker Squib Line 1 circuit and the (R10) Passenger Knee Blocker Squib Line 2 circuit at the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) connector C1A cavity 2 and C1A cavity 22.

Is the resistance above 2.0 Ohms?

Yes

- Repair the (R12) Passenger Knee Blocker Squib Line 1 or (R10) Passenger Knee Blocker Squib Line 2 circuits for a shorted together in accordance with the Service Information.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment. Failure to follow these instructions may result in possible serious or fatal injury.

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait

two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

- Replace the ORC in accordance with Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B0020-11-LEFT SIDE SEAT DEPLOYMENT SQUIB 1 - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 33: Side, Thorax & Side Curtain Airbag Squib Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) sends a test current to the squibs to verify the integrity of the squib and wiring. These circuits are maintained in a "floating" configuration at the module (connected to neither power nor ground) as protection against inadvertent deployment. Use of the (special tool #8443A, SRS Load Tool) in the tests below substitutes a suspect squib with a known good component. The use of the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) provides a test point as well

as a method for opening the shorting bar connections within the harness connector. The thorax airbag is seat mounted on the outboard side of the seat back frame. The thorax airbag is a single stage device. The thorax side airbags and the side curtain airbags deploy together during an event separate of the front airbags.

WHEN MONITORED

With the ignition on.

SET CONDITION

The Occupant Restraint Controller (ORC) monitors the resistance of the Left Seat Airbag circuits. If low resistance is detected in the Left Seat Airbag circuits for 2.6 seconds or longer the ORC will set this DTC. The DTC will change from Active to Stored status if the fault condition is not detected for greater than 2.6 seconds. The Airbag Warning Lamp (AWL) will set in the instrument cluster.

POSSIBLE CAUSES

Possible Causes
(R5) LEFT SEAT THORAX SQUIB 1 LINE 2 CIRCUIT SHORTED TO GROUND
(R7) LEFT SEAT THORAX SQUIB 1 LINE 1 CIRCUIT SHORTED TO GROUND
LEFT SEAT THORAX AIRBAG
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

   NOTE: Make sure that the battery is fully charged.

   NOTE: The scan tool, (special tool #8443A, SRS Load Tool), and DVOM are required to perform the following test.

   1. Turn the ignition on.
   2. With the scan tool, read the active ORC DTC.

      Select ACTIVE or STORED DTC:

      ACTIVE DTC

      - Go To 2

      STORED DTC

- Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK FOR SHORTED SQUIB CIRCUITS AT THE LEFT SEAT THORAX SQUIB AIRBAG**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the Left Seat Thorax Airbag harness connector.

WARNING: To avoid serious or fatal injury, do not place an intact non-deployed Left Seat Squib Airbag face down on a hard surface, the airbag will propel into the air if accidentally deployed.

NOTE: Check connectors - Clean and repair as necessary.

2. Connect the (special tool #8443A, SRS Load Tool) and the(special tool #8443-8, Jumper, SRS Load) to the Left Seat Thorax Airbag harness connector.
3. If equipped with the standard key ignition, use this ignition on warning.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

4. If equipped with the keyless ignition, use this ignition on warning.

WARNING: Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

5. With the scan tool, read the active ORC DTC.

   Does the scan tool display: B0020-11-LEFT SIDE SEAT DEPLOYMENT SQUIB 1 - CIRCUIT SHORT TO GROUND?

   Yes

   - Go To 3

   No

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

- Replace the Left Side Thorax Airbag in accordance with the Service Information. Refer to **AIR BAG, SEAT, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK LEFT SEAT THORAX SQUIB CIRCUITS (R7) and (R5) FOR A SHORT TO GROUND**

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) from the Left Seat Thorax Airbag harness connector.
2. Disconnect the ORC harness connectors.

NOTE: Check connectors - Clean and repair as necessary.

3. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) to the ORC C1 and C2 harness connectors.
4. Measure the resistance of the (R5) Left Seat Thorax Squib 1 Line 2 circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) connector C1B cavity 10 and ground.
5. Measure the resistance of the (R7) Left Seat Thorax Squib 1 Line 2 circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) connector C1B cavity 46 and ground.

Is the resistance below 10k Ohms on either circuit?

Yes

- In accordance with Service Information repair or replace the Left Seat Thorax Squib 1 circuits shorted to ground.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to follow these instructions may result in possible serious or fatal injury.

- Replace the ORC in accordance with Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B0020-12-LEFT SIDE SEAT DEPLOYMENT SQUIB 1 - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 34: Side, Thorax & Side Curtain Airbag Squib Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) sends a test current to the squibs to verify the integrity of the squib and wiring. These circuits are maintained in a "floating" configuration at the module (connected to neither power nor ground) as protection against inadvertent deployment. Use of the (special tool #8443A, SRS Load Tool) in the tests below substitutes a suspect squib with a known good component. The use of the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) provides a test point as well as a method for opening the shorting bar connections within the harness connector. The thorax airbag is seat mounted on the outboard side of the seat back frame. The thorax airbag is a single stage device. The thorax side airbags and the side curtain airbags deploy together during an event separate of the front airbags.

WHEN MONITORED

With the ignition on.

SET CONDITION

The Occupant Restraint Controller (ORC) monitors the voltage on the Left Seat Thorax Airbag circuits. If voltage is detected on the Left Seat Thorax Airbag circuits for greater than 2.6 seconds the ORC will set this DTC. The DTC will change from Active to Stored status when the fault condition is not detected for greater than 2.6 seconds. The Airbag Warning Lamp (AWL) will set in the instrument cluster.

POSSIBLE CAUSES

Possible Causes
(R5) LEFT SEAT THORAX SQUIB 1 LINE 2 CIRCUIT SHORTED TO BATTERY
(R7) LEFT SEAT THORAX SQUIB 1 LINE 1 CIRCUIT SHORTED TO BATTERY
LEFT SEAT THORAX AIRBAG
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

NOTE: Make sure that the battery is fully charged.

NOTE: The scan tool, (special tool #8443A, SRS Load Tool), and DVOM are required to perform the following test.

1. Turn the ignition on.

Select ACTIVE or STORED DTC:

ACTIVE DTC

- Go To 2

STORED DTC

- Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK FOR SHORTED SQUIB CIRCUITS AT THE LEFT SEAT SQUIB AIRBAG**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the Left Seat Airbag harness connector.

WARNING: To avoid serious or fatal injury, do not place an intact non-deployed Left Seat Squib Airbag face down on a hard surface, the airbag will propel into the air if accidentally deployed.

NOTE: Check connectors - Clean and repair as necessary.

2. Connect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) to the Left Seat Thorax Airbag harness connector.
3. If equipped with the standard key ignition, use this ignition on warning.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

4. If equipped with the keyless ignition, use this ignition on warning.

WARNING: Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

5. With the scan tool, read the active ORC DTC.

Does the scan tool display: B0020-12-LEFT SIDE SEAT DEPLOYMENT SQUIB 1 - CIRCUIT

SHORT TO BATTERY?

Yes

- Go To 3

No

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

- Replace the Left Seat Thorax Airbag in accordance with the Service Information. Refer to **AIR BAG, SEAT, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK FOR SHORTED LEFT SEAT AIRBAG SQUIB CIRCUITS**

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) from the Left Seat Thorax Airbag harness connector.
2. Disconnect the ORC harness connectors.

NOTE: Check connectors - Clean and repair as necessary.

3. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) to the ORC C1 and C2 harness connectors.
4. If equipped with the standard key ignition, use this ignition on warning.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

5. If equipped with the keyless ignition, use this ignition on warning.

WARNING: Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

6. Measure the voltage of the (R5) Left Seat Thorax Squib 1 Line 2 circuit between the(special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) connector C1B cavity 10 and ground.
7. Measure the voltage of the (R7) Left Seat Thorax Squib 1 Line 1 circuit between the(special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) connector C1B cavity 46 and ground.

   Is there any voltage present on either circuit?

   Yes

   - In accordance with Service Information repair or replace the Left Seat Thorax Squib circuits.
   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

   WARNING: **If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment. Failure to follow these instructions may result in possible serious or fatal injury.**

   - Replace the ORC in accordance with Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B0020-13-LEFT SIDE SEAT DEPLOYMENT SQUIB 1 - CIRCUIT OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 35: Side, Thorax & Side Curtain Airbag Squib Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) sends a test current to the squibs to verify the integrity of the squib and wiring. These circuits are maintained in a "floating" configuration at the module (connected to neither power nor ground) as protection against inadvertent deployment. Use of the (special tool #8443A, SRS Load Tool) in the tests below substitutes a suspect squib with a known good component. The use of the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) provides a test point as well

as a method for opening the shorting bar connections within the harness connector. The thorax airbag is seat mounted on the outboard side of the seat back frame. The thorax airbag is a single stage device. The thorax side airbags and the side curtain airbags deploy together during an event separate of the front airbags.

WHEN MONITORED

With the ignition on.

SET CONDITION

The Occupant Restraint Controller (ORC) monitors the resistance of the Left Seat Thorax Airbag circuits. If high resistance is detected for greater than 2.6 seconds between the Left Seat Thorax Airbag circuits the ORC will set this DTC. The DTC will change from Active to Stored status if the fault condition is not detected for greater than 2.6 seconds. The Airbag Warning Lamp (AWL) will set in the instrument cluster.

POSSIBLE CAUSES

Possible Causes
(R5) LEFT SEAT THORAX SQUIB 1 LINE 2 CIRCUIT OPEN
(R7) LEFT SEAT THORAX SQUIB 1 LINE 1 CIRCUIT OPEN
LEFT SEAT THORAX AIRBAG
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

   NOTE: Make sure that the battery is fully charged.

   NOTE: The scan tool, (special tool #8443A, SRS Load Tool), and DVOM are required to perform the following test.

   1. Turn the ignition on.

      Select ACTIVE or STORED DTC:

      ACTIVE DTC

      - Go To 2

      STORED DTC

- Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK FOR OPEN LEFT SEAT THORAX AIRBAG SQUIB**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the Left Seat Thorax Airbag harness connector.

WARNING: Do not place an intact non-deployed Seat Squib Airbag face down on a hard surface, the airbag will propel into the air if accidentally deployed. Failure to follow these instructions may result in possible serious or fatal injury.

NOTE: Check connectors - Clean and repair as necessary.

2. Connect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) to the Left Seat Thorax Airbag harness connector.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

3. With the scan tool, read the active ORC DTCs.

Does the scan tool display: B0020-13-LEFT SIDE SEAT DEPLOYMENT SQUIB 1 - CIRCUIT OPEN?

Yes

- Go To 3

No

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

- Replace the Left Seat Thorax Airbag in accordance with the Service Information. Refer to **AIR BAG, DRIVER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK FOR OPEN (R5) LEFT SEAT SQUIB 1 LINE 2 CIRCUIT**

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the (special tool #8443A, SRS Load Tool) and the(special tool #8443-8, Jumper, SRS Load) from the Left Seat Thorax Airbag harness connector.
2. Disconnect the ORC harness connectors.

NOTE: Check connectors - Clean and repair as necessary.

3. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) to the ORC C1 and C2 harness connectors.
4. Measure the resistance of the (R5) Left Seat Thorax Squib 1 Line 2 circuit between the Left Seat Thorax Airbag harness connector cavity 1 and the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) connector C1B cavity 10.

   Is the resistance below 2.0 Ohm?

   Yes

   - Go To 4

   No

   - Repair or Replace the (R5) Left Seat Thorax Squib 1 Line 2 circuit for an open or high resistance in accordance with Service Information.
   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK FOR AN OPEN (R7) LEFT SEAT THORAX SQUIB 1 LINE 1 CIRCUIT**
   1. Measure the resistance of the (R7) Left Seat Thorax Squib 1 Line 1 circuit between the Left Seat Thorax Airbag harness connector cavity 2 and the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) connector C1B cavity 46.

      Is the resistance below 2.0 Ohm?

      Yes

      WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment. Failure to follow these instructions may result in possible serious or fatal injury.

      - Replace the ORC in accordance with Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .

- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Repair or Replace the (R7) Left Seat Thorax Squib 1 Line 1 circuit for an open or high resistance in accordance with Service Information.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B0020-2B-LEFT SIDE SEAT DEPLOYMENT SQUIB 1 - WIRES SHORTED TOGETHER

Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) sends a test current to the squibs to verify the integrity of the squib and wiring. These circuits are maintained in a "floating" configuration at the module (connected to neither power nor ground) as protection against inadvertent deployment. Use of the (special tool #8443A, SRS Load Tool) in the tests below substitutes a suspect squib with a known good component. The use of the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) provides a test point as well

as a method for opening the shorting bar connections within the harness connector. The thorax airbag is seat mounted on the outboard side of the seat back frame. The thorax airbag is a single stage device. The thorax side airbags and the side curtain airbags deploy together during an event separate of the front airbags.

WHEN MONITORED

With the ignition on.

SET CONDITION

The Occupant Restraint Controller (ORC) monitors the resistance of the Left Seat Thorax Airbag circuits. If low resistance is detected for greater than 2.6 seconds between the Left Seat Thorax Airbag circuits the ORC will set this DTC. The DTC will change from Active to Stored status if the fault condition is not detected for greater than 2.6 seconds. The Airbag Warning Lamp (AWL) will set in the instrument cluster.

POSSIBLE CAUSES

Possible Causes
(R5) LEFT SEAT THORAX SQUIB 1 LINE 2 CIRCUIT SHORTED TO THE (R7) LEFT SEAT THORAX SQUIB 1 LINE 1 CIRCUIT
LEFT SEAT THORAX AIRBAG
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

   NOTE: Make sure that the battery is fully charged.

   NOTE: The scan tool, (special tool #8443A, SRS Load Tool), and DVOM are required to perform the following test.

   1. Turn the ignition on.

      Select ACTIVE or STORED DTC:

      ACTIVE DTC

      - Go To 2

      STORED DTC

- Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK FOR SHORTED SQUIB CIRCUITS IN THE LEFT SEAT AIRBAG**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the Left Seat Airbag harness connector.

WARNING: Do not place an intact non-deployed Seat Squib Airbag face down on a hard surface, the airbag will propel into the air if accidentally deployed. Failure to follow these instructions may result in possible serious or fatal injury.

NOTE: Check connectors - Clean and repair as necessary.

2. Connect the (special tool #8443A, SRS Load Tool) and the(special tool #8443-8, Jumper, SRS Load) to the Left Seat Airbag harness connector.
3. If equipped with the standard key ignition, use this ignition on warning.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

4. If equipped with the keyless ignition, use this ignition on warning.

WARNING: Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

5. With the scan tool, read the active ORC DTC.

Does the scan tool display: B0020-2B-LEFT SIDE DEPLOYMENT SQUIB 1 - WIRES SHORTED TOGETHER?

Yes

- Go To 3

No

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

- Replace the Left Seat Airbag in accordance with the Service Information. Refer to **AIR BAG, DRIVER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK FOR LEFT SEAT AIRBAG SQUIB CIRCUITS SHORTED TOGETHER IN THE SEAT BACK**

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the Left Seat Airbag in-line harness connector (under Left Seat).

NOTE: Check connectors - Clean and repair as necessary.

2. Connect the (special tool #8443A, SRS Load Tool) and the(special tool #8443-8, Jumper, SRS Load) to the Left Seat Airbag in-line harness connector (Body Side).
3. If equipped with the standard key ignition, use this ignition on warning.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

4. If equipped with the keyless ignition, use this ignition on warning.

WARNING: Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

5. With the scan tool, read the active ORC DTC.

   Does the scan tool display: B0020-2B-LEFT SIDE SEAT DEPLOYMENT SQUIB 1 - WIRES SHORTED TOGETHER?

   Yes

   - Go To 4

No

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

- In accordance with the Service Information repair or replace the Left Seat Airbag wiring harness (Side Airbag Jumper). Circuits (R5) and (R7) are shorted together between the in-line connector and the Left Seat Airbag connector.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK (R5) LEFT SEAT SQUIB 1 LINE 2 CIRCUIT FOR A SHORT TO THE (R7) LEFT SEAT SQUIB 1 LINE 1 CIRCUIT**

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) from the Left Seat Airbag harness connector.
2. Disconnect the ORC harness connectors.

NOTE: Check connectors - Clean and repair as necessary.

3. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) to the ORC harness connectors.
4. Measure the resistance of the (R5) Left Seat Squib 1 line 2 circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) connector C1B cavity 10 and the (R7) Left Seat Squib 1 Line 1 circuit at (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) connector C1B cavity 46

Is the resistance below or within the range of 1.5 - 2.18 Ohms?

Yes

- In accordance with the Service Information repair or replace the Left Seat Airbag wiring harness. Circuits (R5) and (R7) shorted together between the in-line connector and the ORC C2 (32 way) connector.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any

time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment. Failure to follow these instructions may result in possible serious or fatal injury.

- Replace the ORC in accordance with Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B0021-11-LEFT CURTAIN DEPLOYMENT SQUIB 1 - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) sends a test current to the squibs to verify the integrity of the squib and wiring. These circuits are maintained in a "floating" configuration at the ORC (connected to neither power nor ground) as protection against inadvertent deployment. Use of the (special tool #8443A, SRS Load Tool) in the tests below substitutes a suspect squib with a known good component. The (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) provides a test point as well as a

method for opening the shorting bar connections within the ORC harness connector. The side curtain airbags are a single-stage device that upon sensor detected impact they deploy. They are located above the headliner and fastened to one of the roof side rails. They protect the area from the A-pillar to the rear of the vehicle. The side curtain airbags and the seat thorax side airbags are deployed simultaneously independent of the front airbags during an impact event.

WHEN MONITORED

With the ignition on.

SET CONDITION

The Occupant Restraint Controller (ORC) monitors the resistance of the Left Curtain Squib 1 circuits. The ORC will set this DTC if it detects low resistance of the Left Curtain Squib 1 circuits for greater than 2.6 seconds. The DTC will change from Active to Stored status when the fault condition is not detected for greater than 2.6 seconds. The Airbag Warning Lamp (AWL) will set in the instrument cluster.

POSSIBLE CAUSES

Possible Causes
(R3) LEFT CURTAIN SQUIB 1 LINE 1 CIRCUIT SHORTED TO GROUND
(R1) LEFT CURTAIN SQUIB 1 LINE 2 CIRCUIT SHORTED TO GROUND
LEFT SIDE CURTAIN AIRBAG
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

   NOTE: Make sure that the battery is fully charged.

   NOTE: The scan tool, (special tool #8443A, SRS Load Tool), and DVOM are required to perform the following test.

   1. Turn the ignition on.

      Select ACTIVE or STORED DTC:

      ACTIVE DTC

      - Go To 2

STORED DTC

- Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK FOR SHORTED SQUIB CIRCUITS IN LEFT SIDE CURTAIN AIRBAG**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the Left Side Curtain Airbag harness connector.

WARNING: Do not place an intact non-deployed curtain airbag face down on a hard surface, the airbag will propel into the air if accidentally deployed. Failure to follow these instructions may result in possible serious or fatal injury.

NOTE: Check connectors - Clean and repair as necessary.

2. Connect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) to the Left Side Curtain Airbag harness connector.
3. If equipped with the standard key ignition, use this ignition on warning.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

4. If equipped with the keyless ignition, use this ignition on warning.

WARNING: Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

5. With the scan tool, read the active ORC DTCs.

Does the scan tool display: B0021-11-LEFT CURTAIN DEPLOYMENT SQUIB 1 - CIRCUIT SHORT TO GROUND?

Yes

- Go To 3

No

- Replace the Left Side Curtain Airbag in accordance with the Service Information. Refer to **AIR BAG, SIDE CURTAIN, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (R3) LEFT CURTAIN SQUIB 1 LINE 1 CIRCUIT AND THE (R1) LEFT CURTAIN SQUIB 1 LINE 2 CIRCUIT FOR A SHORT TO GROUND**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) from the Left Side Curtain Airbag harness connector.
2. Disconnect the ORC harness connectors.

NOTE: Check connectors - Clean and repair as necessary.

3. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) to the ORC C1 and C2 harness connectors.
4. Measure the resistance of the (R3) Left Curtain Squib 1 Line 1 circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) connector C1B cavity 52 and ground.
5. Measure the resistance of the (R1) Left Curtain Squib 1 Line 2 circuit between the(special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) connector C1B cavity 16 and ground.

Is the resistance below 10k Ohms on either circuit?

Yes

- Repair the Left Curtain Squib 1 circuits with resistance below 10k Ohms for a short to ground in accordance with Service Information.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment. Failure to follow these instructions may result in possible serious or fatal injury.

- Replace the ORC in accordance with Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (R3) LEFT CURTAIN SQUIB 1 LINE 1 CIRCUIT AND THE (R1) LEFT CURTAIN SQUIB 1 LINE 2 CIRCUIT FOR A SHORT TO BATTERY**

   WARNING: **Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

   1. Disconnect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) from the Left Side Curtain Airbag harness connector.
   2. Disconnect the ORC harness connectors.

      NOTE: Check connectors - Clean and repair as necessary.

   3. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) to the ORC C1 and C2 harness connectors.
   4. If equipped with the standard key ignition, use this ignition on warning.

      WARNING: **Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

   5. If equipped with the keyless ignition, use this ignition on warning.

      WARNING: **Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

6. Measure the voltage of the (R3) Left Curtain Squib 1 Line 1 circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) connector C1B cavity 52 and ground.
7. Measure the voltage of the (R1) Left Curtain Squib 1 Line 2 circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) connector C1B cavity 16 and ground.

Is there any voltage present on either circuit?

Yes

- Repair the Left Curtain Squib 1 circuits with voltage present for a short to battery.
- Perform RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

WARNING: **If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment. Failure to follow these instructions may result in possible serious or fatal injury.**

WARNING: **Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

- Replace the ORC in accordance with Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the AIRBAG SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B0021-13-LEFT CURTAIN DEPLOYMENT SQUIB 1 - CIRCUIT OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 39: Side, Thorax & Side Curtain Airbag Squib Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) sends a test current to the squibs to verify the integrity of the squib and wiring. These circuits are maintained in a "floating" configuration at the ORC (connected to neither power nor ground) as protection against inadvertent deployment. Use of the (special tool #8443A, SRS Load Tool) in the tests below substitutes a suspect squib with a known good component. The (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) provides a test point as well as a

method for opening the shorting bar connections within the ORC harness connector. The side curtain airbags are a single-stage device that upon sensor detected impact they deploy. They are located above the headliner and fastened to one of the roof side rails. They protect the area from the A-pillar to the rear of the vehicle. The side curtain airbags and the seat thorax side airbags are deployed simultaneously independent of the front airbags during an impact event.

WHEN MONITORED

With the ignition on.

SET CONDITION

The Occupant Restraint Controller (ORC) monitors the resistance of the Left Curtain Squib 1 circuits. The ORC will set this DTC if it detects an open or high resistance on the Left Curtain Squib 1 circuits for 2.6 seconds. The fault will change from an active to stored status when the open or high resistance on the Left Curtain Squib 1 circuits is cleared for 2.6 seconds. The Airbag Warning Lamp (AWL) will set in the instrument cluster.

POSSIBLE CAUSES

Possible Causes
(R3) LEFT CURTAIN SQUIB 1 LINE 1 CIRCUIT OPEN
(R1) LEFT CURTAIN SQUIB 1 LINE 2 CIRCUIT OPEN
LEFT SIDE CURTAIN AIRBAG
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

   NOTE: Make sure that the battery is fully charged.

   NOTE: The scan tool, (special tool #8443A, SRS Load Tool), and DVOM are required to perform the following test.

   1. Turn the ignition on.

      Select ACTIVE or STORED DTC:

      ACTIVE DTC

      - Go To 2

STORED DTC

- Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK FOR OPEN SQUIB CIRCUITS IN LEFT SIDE CURTAIN AIRBAG**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the Left Side Curtain Airbag harness connector.

WARNING: Do not place an intact non-deployed curtain airbag face down on a hard surface, the airbag will propel into the air if accidentally deployed. Failure to follow these instructions may result in possible serious or fatal injury.

NOTE: Check connectors - Clean and repair as necessary.

2. Connect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) to the Left Side Curtain Airbag harness connector.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

3. With the scan tool, read the active ORC DTCs.

Does the scan tool display: B0021-13-LEFT CURTAIN DEPLOYMENT SQUIB 1 - CIRCUIT OPEN DTC?

Yes

- Go To 3

No

- Replace the Left Side Curtain Airbag in accordance with the Service Information. Refer to **AIR BAG, SIDE CURTAIN, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (R3) LEFT CURTAIN SQUIB 1 LINE 1 CIRCUIT FOR AN OPEN**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two

minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) from the Left Side Curtain Airbag harness connector.
2. Disconnect the ORC harness connectors.

NOTE: Check connectors - Clean and repair as necessary.

3. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) to the ORC C1 and C2 harness connectors.
4. Measure the resistance of the (R3) Left Curtain Squib 1 Line 1 circuit between the Left Side Curtain Airbag connector cavity 2 and the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) connector C1B cavity 52.

   Is the resistance below 2.0 Ohm?

   Yes

   - Go To 4

   No

   - Repair the (R3) Left Curtain Squib 1 Line 1 circuit for an open.
   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK THE (R1) LEFT CURTAIN SQUIB 1 LINE 2 CIRCUIT FOR AN OPEN**
   1. Measure the resistance of the (R1) Left Curtain Squib 1 Line 2 circuit between the Left Side Curtain Airbag harness connector cavity 1 and the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) connector C1B cavity 16.

      Is the resistance below 2.0 Ohm?

      Yes

      WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment. Failure to follow these instructions may result in possible serious or fatal injury.

      - Replace the ORC in accordance with Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
      - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Repair the (R1) Left Curtain Squib 1 Line 2 circuit for an open in accordance with Service Information.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B0021-2B-LEFT CURTAIN DEPLOYMENT SQUIB 1 - WIRES SHORTED TOGETHER

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 40: Side, Thorax & Side Curtain Airbag Squib Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) sends a test current to the squibs to verify the integrity of the squib and wiring. These circuits are maintained in a "floating" configuration at the ORC (connected to neither power nor ground) as protection against inadvertent deployment. Use of the (special tool #8443A, SRS Load Tool) in the tests below substitutes a suspect squib with a known good component. The (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) provides a test point as well as a

method for opening the shorting bar connections within the ORC harness connector. The side curtain airbags are a single-stage device that upon sensor detected impact they deploy. They are located above the headliner and fastened to one of the roof side rails. They protect the area from the A-pillar to the rear of the vehicle. The side curtain airbags and the seat thorax side airbags are deployed simultaneously independent of the front airbags during an impact event.

WHEN MONITORED

With the ignition on.

SET CONDITION

The Occupant Restraint Controller (ORC) monitors the resistance of the Left Curtain Squib 1 circuits. If low resistance is detected for greater than 2.6 seconds between the Left Curtain Squib 1 circuits the ORC will set this DTC. The DTC will change from Active to Stored status if the fault condition is not detected for greater than 2.6 seconds. The Airbag Warning Lamp (AWL) will set in the instrument cluster.

POSSIBLE CAUSES

Possible Causes
(R3) LEFT CURTAIN SQUIB 1 LINE 1 CIRCUIT SHORTED TO THE (R1) LEFT CURTAIN SQUIB 1 LINE 2 CIRCUIT
LEFT SIDE CURTAIN AIRBAG
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

   NOTE: Make sure that the battery is fully charged.

   NOTE: The scan tool, (special tool #8443A, SRS Load Tool), and DVOM are required to perform the following test.

   1. Turn the ignition on.

      Select ACTIVE or STORED DTC:

      ACTIVE DTC

      - Go To 2

STORED DTC

- Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK FOR SHORTED SQUIB CIRCUITS IN LEFT SIDE CURTAIN AIRBAG**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the Left Side Curtain Airbag harness connector.

WARNING: Do not place an intact non-deployed curtain airbag face down on a hard surface, the airbag will propel into the air if accidentally deployed. Failure to follow these instructions may result in possible serious or fatal injury.

NOTE: Check connectors - Clean and repair as necessary.

2. Connect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) to the Left Side Curtain Airbag harness connector.
3. If equipped with the standard key ignition, use this ignition on warning.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

4. If equipped with the keyless ignition, use this ignition on warning.

WARNING: Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

5. With the scan tool, read the active ORC DTCs.

Does the scan tool display: B0021-2B-LEFT CURTAIN DEPLOYMENT SQUIB 1 - WIRES SHORTED TOGETHER?

Yes

- Go To 3

No

- Replace the Left Side Curtain Airbag in accordance with the Service Information. Refer to **AIR BAG, SIDE CURTAIN, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (R3) LEFT CURTAIN SQUIB 1 LINE 1 CIRCUIT FOR A SHORT TO THE (R1) LEFT CURTAIN SQUIB 1 LINE 2 CIRCUIT**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) from the Left Side Curtain Airbag harness connector.
2. Disconnect the ORC harness connectors.

NOTE: Check connectors - Clean and repair as necessary.

3. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) to the ORC C1 and C2 harness connectors.
4. Measure the resistance between the (R3) Left Curtain Squib 1 Line 1 circuit connector C1B cavity 52 and the (R1) Left Curtain Squib 1 Line 2 circuit connector C1B cavity 16 at the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool).

Is the resistance above 2.0 Ohms?

Yes

- Repair the (R3) Left Curtain Squib 1 Line 1 circuit for a short to the (R1) Left Curtain Squib 1 Line 2 circuit.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment. Failure to follow these instructions may result in possible serious or fatal injury.

- Replace the ORC in accordance with Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD**

PROCEDURE .

B0028-11-RIGHT SIDE SEAT DEPLOYMENT SQUIB 1 - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 41: Side, Thorax & Side Curtain Airbag Squib Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) sends a test current to the squibs to verify the integrity of the squib and wiring. These circuits are maintained in a "floating" configuration at the module (connected to neither power nor ground) as protection against inadvertent deployment. Use of the (special tool #8443A, SRS Load Tool) in the tests below substitutes a suspect squib with a known good component. The use of the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) provides a test point as well as a method for opening the shorting bar connections within the harness connector. The rear seat airbags (also known as pelvic and thorax airbags) are completely concealed beneath the seat cushion trim cover on the lower outboard sides of the rear seat cushion. The thorax side airbag is a single stage device. The thorax side airbags and the side curtain airbags deploy together during an event separate of the front airbags.

WHEN MONITORED

With the ignition on.

SET CONDITION

The Occupant Restraint Controller (ORC) monitors the resistance of the Right Side Thorax Airbag circuits. If low resistance is detected in the Right Side Thorax Airbag circuits for 2.6 seconds or longer the ORC will set this DTC. The DTC will change from Active to Stored status if the fault condition is not detected for greater than 2.6 seconds. The Airbag Warning Lamp (AWL) will set in the instrument cluster.

POSSIBLE CAUSES

Possible Causes
(R6) RIGHT SEAT THORAX SQUIB 1 LINE 2 CIRCUIT SHORTED TO GROUND
(R8) RIGHT SEAT THORAX SQUIB 1 LINE 1 CIRCUIT SHORTED TO GROUND
RIGHT SIDE THORAX AIRBAG
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

NOTE: Make sure that the battery is fully charged.

NOTE: The scan tool, (special tool #8443A, SRS Load Tool), and DVOM are required to perform the following test.

1. Turn the ignition on.

Select ACTIVE or STORED DTC:

ACTIVE DTC

- Go To 2

STORED DTC

- Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK FOR SHORTED SQUIB CIRCUITS IN RIGHT SEAT AIRBAG**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the Right Seat Airbag harness connector.

WARNING: Do not place an intact non-deployed Seat Squib Airbag face down on a hard surface, the airbag will propel into the air if accidentally deployed. Failure to follow these instructions may result in possible serious or fatal injury.

NOTE: Check connectors - Clean and repair as necessary.

2. Connect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) to the Right Seat Airbag harness connector.
3. If equipped with the standard key ignition, use this ignition on warning.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

4. If equipped with the keyless ignition, use this ignition on warning.

WARNING: Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

5. With the scan tool, read the active ORC DTC.

Does the scan tool display: B0028-11-RIGHT SIDE SEAT DEPLOYMENT SQUIB 1 - CIRCUIT SHORT TO GROUND?

Yes

- Go To 3

No

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

- Replace the Right Side Thorax Airbag in accordance with the Service Information. Refer to **AIR BAG, SEAT, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK RIGHT SEAT SQUIB CIRCUITS FOR A SHORT TO GROUND**

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) from the Right Side Thorax Airbag harness connector.
2. Disconnect the ORC harness connectors.

NOTE: Check connectors - Clean and repair as necessary.

3. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) to the ORC harness connectors.
4. Measure the resistance of the (R6) Right Seat Thorax Squib 1 Line 2 circuit between the(special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) connector C1B cavity 45 and ground.
5. Measure the resistance of the (R8) Right Seat Thorax Squib 1 Line 1 circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) connector C1B cavity 9 and ground.

Is the resistance below 10k Ohms on either circuit?

Yes

- In accordance with the Service Information repair or replace the Right Seat Thorax Squib circuits shorted to ground.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to follow these instructions may result in possible serious or fatal injury.

- Replace the ORC in accordance with Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B0028-12-RIGHT SIDE SEAT DEPLOYMENT SQUIB 1 - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 42: Side, Thorax & Side Curtain Airbag Squib Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) sends a test current to the squibs to verify the integrity of the squib and wiring. These circuits are maintained in a "floating" configuration at the module (connected to neither power nor ground) as protection against inadvertent deployment. Use of the (special tool #8443A, SRS Load Tool) in the tests below substitutes a suspect squib with a known good component. The use of the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) provides a test point as well

as a method for opening the shorting bar connections within the harness connector. The rear seat airbags (also known as pelvic and thorax airbags) are completely concealed beneath the seat cushion trim cover on the lower outboard sides of the rear seat cushion. The thorax airbag is a single stage device. The thorax side airbags and the side curtain airbags deploy together during an event separate of the front airbags.

WHEN MONITORED

With the ignition on.

SET CONDITION

The Occupant Restraint Controller (ORC) monitors the voltage on the Right Seat Thorax Squib circuits. If voltage is detected for 2.6 seconds or longer on the Right Seat Thorax Squib circuits the ORC will set this DTC. The DTC will change from Active to Stored status if the fault condition is not detected for 2.6 seconds. The Airbag Warning Lamp (AWL) will set in the instrument cluster.

POSSIBLE CAUSES

Possible Causes
(R6) RIGHT SEAT THORAX SQUIB 1 LINE 2 CIRCUIT SHORTED TO VOLTAGE
(R8) RIGHT SEAT THORAX SQUIB 1 LINE 1 CIRCUIT SHORTED TO VOLTAGE
RIGHT SIDE THORAX AIRBAG
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

   NOTE: Make sure that the battery is fully charged.

   NOTE: The scan tool, (special tool #8443A, SRS Load Tool), and DVOM are required to perform the following test.

   1. Turn the ignition on.

      Select ACTIVE or STORED DTC:

      ACTIVE DTC

      - Go To 2

      STORED DTC

- Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK FOR SHORTED SQUIB CIRCUITS IN RIGHT SEAT SQUIB AIRBAG**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the Right Seat Thorax Airbag harness connector.

WARNING: To avoid serious or fatal injury, do not place an intact uncoupled Seat Squib Airbag face down on a hard surface, the airbag will propel into the air if accidentally deployed.

NOTE: Check connectors - Clean and repair as necessary.

2. Connect the (special tool #8443A, SRS Load Tool) and the(special tool #8443-8, Jumper, SRS Load) to the Right Seat Thorax Airbag connector.
3. If equipped with the standard key ignition, use this ignition on warning.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

4. If equipped with the keyless ignition, use this ignition on warning.

WARNING: Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

5. With the scan tool, read the active ORC DTC.

   Does the scan tool display: B0028-12-RIGHT SIDE SEAT DEPLOYMENT SQUIB 1 - CIRCUIT SHORT TO BATTERY?

   Yes

   - Go To 3

   No

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

- Replace the Right Seat Thorax Airbag in accordance with the Service Information. Refer to **AIR BAG, SEAT, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK (R6) RIGHT SEAT SQUIB 1 LINE 2 CIRCUIT AND (R8) RIGHT SEAT SQUIB 1 LINE 1 CIRCUIT FOR A SHORT TO BATTERY**

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) from the Right Seat Thorax Airbag connector.
2. Disconnect the ORC connectors.

NOTE: Check connectors - Clean and repair as necessary.

3. Connect the ORC test adapter to the ORC harness connectors.
4. If equipped with the standard key ignition, use this ignition on warning.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

5. If equipped with the keyless ignition, use this ignition on warning.

WARNING: Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

6. Measure the voltage of the (R6) Right Seat Thorax Squib 1 Line 2 circuit between the ORC test adapter and ground.
7. Measure the voltage of the (R8) Right Seat Thorax Squib 1 Line 1 circuit between the ORC test adapter and ground.

Is there any voltage present on either circuit?

Yes

- In accordance with Service Information repair or replace the Right Seat Thorax circuits shorted high.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

WARNING: **If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment. Failure to follow these instructions may result in possible serious or fatal injury.**

WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

- Replace the ORC in accordance with Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B0028-13-RIGHT SIDE SEAT DEPLOYMENT SQUIB 1 - CIRCUIT OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 43: Side, Thorax & Side Curtain Airbag Squib Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) sends a test current to the squibs to verify the integrity of the squib and wiring. These circuits are maintained in a "floating" configuration at the module (connected to neither power nor ground) as protection against inadvertent deployment. Use of the (special tool #8443A, SRS Load Tool) in the tests below substitutes a suspect squib with a known good component. The use of the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) provides a test point as well

as a method for opening the shorting bar connections within the harness connector. The rear seat airbags (also known as pelvic and thorax airbags) are completely concealed beneath the seat cushion trim cover on the lower outboard sides of the rear seat cushion. The thorax airbag is a single stage device. The thorax side airbags and the side curtain airbags deploy together during an event separate of the front airbags. The Airbag Warning Lamp (AWL) will set in the instrument cluster.

WHEN MONITORED

With the ignition on.

SET CONDITION

The Occupant Restraint Controller (ORC) monitors the resistance of the Right Seat Thorax Airbag Squib circuits. If an open or high resistance is detected on the Right Seat Thorax Squib circuits for 2.6 seconds the ORC will set this DTC. The DTC will change from Active to Stored status if the fault condition is not detected for 2.6 seconds. The Airbag Warning Lamp (AWL) will set in the instrument cluster.

POSSIBLE CAUSES

Possible Causes
(R6) RIGHT SEAT THORAX SQUIB 1 LINE 2 CIRCUIT OPEN
(R8) RIGHT SEAT THORAX SQUIB 1 LINE 1 CIRCUIT OPEN
RIGHT SIDE THORAX AIRBAG
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

   NOTE: Make sure that the battery is fully charged.

   NOTE: The scan tool, (special tool #8443A, SRS Load Tool), and DVOM are required to perform the following test.

   1. Turn the ignition on.

      Select ACTIVE or STORED DTC:

      ACTIVE DTC

      - Go To 2

STORED DTC

- Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK FOR OPEN SQUIB CIRCUITS IN RIGHT SEAT AIRBAG**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the Right Side Thorax Airbag harness connector.

WARNING: To avoid serious or fatal injury, do not place an intact uncoupled Seat Squib Airbag face down on a hard surface, the airbag will propel into the air if accidentally deployed.

NOTE: Check connectors - Clean and repair as necessary.

2. Connect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) to the Right Side Thorax Airbag harness connector.
3. If equipped with the standard key ignition, use this ignition on warning.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

4. If equipped with the keyless ignition, use this ignition on warning.

WARNING: Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

5. With the scan tool, read the active ORC DTC.

Does the scan tool display: B0028-13-RIGHT SIDE SEAT DEPLOYMENT SQUIB 1 - CIRCUIT OPEN?

Yes

- Go To 3

No

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

- Replace the Right Side Thorax Airbag in accordance with the Service Information. Refer to **AIR BAG, SEAT, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK (R8) RIGHT SEAT THORAX SQUIB 1 LINE 1 CIRCUIT FOR AN OPEN**

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the (special tool #8443A, SRS Load Tool) and (special tool #8443-8, Jumper, SRS Load) from the Right Side Thorax Airbag harness connector.
2. Disconnect the ORC harness connectors.

NOTE: Check connectors - Clean and repair as necessary.

3. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) to the ORC harness connectors.
4. Measure the resistance of the (R8) Right Seat Thorax Squib 1 Line 1 circuit between the Right Side Thorax Airbag connector cavity 2 and the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) connector C1B cavity 9.

Is the resistance below or within the range of 5.4 - 10.0 Ohm?

Yes

- Go To 4

No

- In accordance with the Service Information repair or replace the Right Seat Thorax Squib open circuit.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK (R6) RIGHT SEAT THORAX SQUIB 1 LINE 2 CIRCUIT FOR AN OPEN**
   1. Measure the resistance of the (R6) Right Seat Thorax Squib 1 Line 2 circuit between the Right Side Thorax Airbag connector cavity 1 and the(special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) connector C1B cavity 45.

Is the resistance below or within the range of 5.4 - 10.0 Ohm?

Yes

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment. Failure to follow these instructions may result in possible serious or fatal injury.

- Replace the ORC in accordance with Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- In accordance with the Service Information repair or replace the Right Seat Thorax Squib open circuit.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B0028-2B-RIGHT SIDE SEAT DEPLOYMENT SQUIB 1 - WIRES SHORTED TOGETHER

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 44: Side, Thorax & Side Curtain Airbag Squib Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) sends a test current to the squibs to verify the integrity of the squib and wiring. These circuits are maintained in a "floating" configuration at the module (connected to neither power nor ground) as protection against inadvertent deployment. Use of the (special tool #8443A, SRS Load Tool) in the tests below substitutes a suspect squib with a known good component. The use of the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) provides a test point as well

as a method for opening the shorting bar connections within the harness connector. The rear seat airbags (also known as pelvic and thorax airbags) are completely concealed beneath the seat cushion trim cover on the lower outboard sides of the rear seat cushion. The thorax airbag is a single stage device. The thorax side airbags and the side curtain airbags deploy together during an event separate of the front airbags. The Airbag Warning Lamp (AWL) will set in the instrument cluster.

WHEN MONITORED

With the ignition on.

SET CONDITION

The Occupant Restraint Controller (ORC) monitors the resistance of the Right Seat Thorax Squib 1 circuits. If low resistance is detected for 2.6 seconds or longer between the Right Seat Squib circuits the ORC will set this DTC. If the shorted together fault condition is not detected for 2.6 seconds the DTC will change from Active to Stored status. The Airbag Warning Lamp (AWL) will set in the instrument cluster.

POSSIBLE CAUSES

Possible Causes
(R6) RIGHT SEAT THORAX SQUIB 1 LINE 2 CIRCUIT SHORTED TO (R8) RIGHT SEAT THORAX SQUIB 1 LINE 1 CIRCUIT
RIGHT SIDE THORAX AIRBAG
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

   NOTE: Make sure that the battery is fully charged.

   NOTE: The scan tool, (special tool #8443A, SRS Load Tool), and DVOM are required to perform the following test.

   1. Turn the ignition on.

      Select ACTIVE or STORED DTC:

      ACTIVE DTC

      - Go To 2

STORED DTC

- Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK FOR SHORTED SQUIB CIRCUITS IN RIGHT SEAT AIRBAG**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the Right Seat Airbag harness connector.

WARNING: To avoid serious or fatal injury, do not place an intact uncoupled Right Seat Squib Airbag face down on a hard surface, the airbag will propel into the air if accidentally deployed.

NOTE: Check connectors - Clean and repair as necessary.

2. Connect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) to the Right Side Thorax Airbag harness connector.
3. If equipped with the standard key ignition, use this ignition on warning.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

4. If equipped with the keyless ignition, use this ignition on warning.

WARNING: Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

5. With the scan tool, read the active ORC DTC.

Does the scan tool display: B0028-2B-RIGHT SIDE SEAT DEPLOYMENT SQUIB 1 - WIRES SHORTED TOGETHER?

Yes

- Go To 3

No

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

- Replace the Right Side Thorax Airbag in accordance with the Service Information. Refer to **AIR BAG, SEAT, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK (R6) RIGHT SEAT THORAX SQUIB 1 LINE 2 CIRCUIT FOR A SHORT TO (R8) RIGHT SEAT THORAX SQUIB 1 LINE 1 CIRCUIT**

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) from the Right Side Thorax Airbag harness connector.
2. Disconnect the ORC harness connectors.

NOTE: Check connectors - Clean and repair as necessary.

3. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) to the ORC harness connectors.
4. Measure the resistance between the (R6) Right Seat Thorax Squib 1 Line 2 circuit connector C1B cavity 45 and the (R8) Right Seat Thorax Squib 1 Line 1 circuit connector C1B cavity 9 at the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool).

   Is the resistance below or within the range of 1.5 - 2.18 Ohm?

   Yes

   - In accordance with the Service Information repair or replace the Right Seat Thorax Squib circuits shorted together.
   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to follow these instructions may result in possible serious or fatal injury.

- Replace the ORC in accordance with Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B0029-11-RIGHT CURTAIN DEPLOYMENT SQUIB 1 - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 45: Side, Thorax & Side Curtain Airbag Squib Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) sends a test current to the squibs to verify the integrity of the squib and wiring. These circuits are maintained in a "floating" configuration at the ORC (connected to neither power nor ground) as protection against inadvertent deployment. Use of the (special tool #8443A, SRS Load Tool) in the tests below substitutes a suspect squib with a known good component. The (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) provides a test point as well as a method for opening the shorting bar connections within the ORC harness connector. The side curtain airbags are a single-stage device that upon sensor detected impact they deploy. They are located above the headliner and fastened to one of the roof side rails. They protect the area from the A-pillar to the rear of the vehicle. The side curtain airbags and the seat thorax side airbags are deployed simultaneously independent of the front airbags during an impact event.

WHEN MONITORED

With the ignition on.

SET CONDITION

The Occupant Restraint Controller (ORC) monitors the resistance of the Right Curtain Squib 1 circuits. The ORC will set this DTC if it detects low resistance of the Right Curtain Squib 1 circuits for greater than 2.6 seconds. The DTC will change from Active to Stored status when the fault condition is not detected for greater than 2.6 seconds. The Airbag Warning Lamp (AWL) will set in the instrument cluster.

POSSIBLE CAUSES

Possible Causes
(R4) RIGHT CURTAIN SQUIB 1 LINE 1 CIRCUIT SHORTED TO GROUND
(R2) RIGHT CURTAIN SQUIB 1 LINE 2 CIRCUIT SHORTED TO GROUND
RIGHT SIDE CURTAIN AIRBAG
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

NOTE: **Make sure that the battery is fully charged.**

NOTE: **The scan tool, (special tool #8443A, SRS Load Tool), and DVOM are required to perform the following test.**

1. Turn the ignition on.

   Select ACTIVE or STORED DTC:

   ACTIVE DTC

   - Go To 2

   STORED DTC

   - Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK FOR SHORTED SQUIB CIRCUITS IN RIGHT SIDE CURTAIN AIRBAG**

   WARNING: **Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

   1. Disconnect the Right Side Curtain Airbag harness connector.

      WARNING: **Do not place an intact non-deployed curtain airbag face down on a hard surface, the airbag will propel into the air if accidentally deployed. Failure to follow these instructions may result in possible serious or fatal injury.**

      NOTE: **Check connectors - Clean and repair as necessary.**

   2. Connect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) to the Right Side Curtain Airbag harness connector.
   3. If equipped with the standard key ignition, use this ignition on warning.

      WARNING: **Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

   4. If equipped with the keyless ignition, use this ignition on warning.

      WARNING: **Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

5. With the scan tool, read the active ORC DTCs.

   Does the scan tool display: B0029-11-RIGHT CURTAIN DEPLOYMENT SQUIB 1 - CIRCUIT SHORT TO GROUND?

   Yes

   - Go To 3

   No

   - Replace the Right Side Curtain Airbag in accordance with the Service Information. Refer to **AIR BAG, SIDE CURTAIN, REMOVAL** .
   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (R4) RIGHT CURTAIN SQUIB 1 LINE 1 CIRCUIT AND THE (R2) RIGHT CURTAIN SQUIB 1 LINE 2 CIRCUIT FOR A SHORT TO GROUND**

   WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

   1. Disconnect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) from the Right Side Curtain Airbag harness connector.
   2. Disconnect the ORC harness connectors.

      NOTE: Check connectors - Clean and repair as necessary.

   3. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) to the ORC harness connectors.
   4. Measure the resistance of the (R4) Right Curtain Squib 1 Line 1 circuit between (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) connector C1B cavity 15 and ground.
   5. Measure the resistance of the (R2) Right Curtain Squib 1 Line 2 circuit between (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) connector C1B cavity 51 and ground.

      Is the resistance below 10k Ohms on either circuit?

      Yes

      - Repair the Right Curtain Squib 1 circuits with resistance below 10k Ohms for a short to ground.
      - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD**

PROCEDURE .

No

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment. Failure to follow these instructions may result in possible serious or fatal injury.

- Replace the ORC in accordance with Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B0029-12-RIGHT CURTAIN DEPLOYMENT SQUIB 1 - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 46: Side, Thorax & Side Curtain Airbag Squib Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) sends a test current to the squibs to verify the integrity of the squib and wiring. These circuits are maintained in a "floating" configuration at the ORC (connected to neither power nor ground) as protection against inadvertent deployment. Use of the (special tool #8443A, SRS Load Tool) in the tests below substitutes a suspect squib with a known good component. The (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) provides a test point as well as a

method for opening the shorting bar connections within the ORC harness connector. The side curtain airbags are a single-stage device that upon sensor detected impact they deploy. They are located above the headliner and fastened to one of the roof side rails. They protect the area from the A-pillar to the rear of the vehicle. The side curtain airbags and the seat thorax side airbags are deployed simultaneously independent of the front airbags during an impact event.

WHEN MONITORED

With the ignition on.

SET CONDITION

The Occupant Restraint Controller (ORC) monitors the resistance of the Right Curtain Squib 1 circuits. The ORC will set this DTC if it detects low resistance of the Right Curtain Squib 1 circuits for greater than 2.6 seconds. The DTC will change from Active to Stored status when the fault condition is not detected for greater than 2.6 seconds. The Airbag Warning Lamp (AWL) will set in the instrument cluster.

POSSIBLE CAUSES

Possible Causes
(R4) RIGHT CURTAIN SQUIB 1 LINE 1 CIRCUIT SHORTED TO BATTERY
(R2) RIGHT CURTAIN SQUIB 1 LINE 2 CIRCUIT SHORTED TO BATTERY
RIGHT SIDE CURTAIN AIRBAG
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

   NOTE: Make sure that the battery is fully charged.

   NOTE: The scan tool, (special tool #8443A, SRS Load Tool), and DVOM are required to perform the following test.

   1. Turn the ignition on.

      Select ACTIVE or STORED DTC:

      ACTIVE DTC

      - Go To 2

STORED DTC

- Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK FOR SHORTED SQUIB CIRCUITS IN RIGHT SIDE CURTAIN AIRBAG**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the Right Side Curtain Airbag harness connector.

WARNING: Do not place an intact non-deployed curtain airbag face down on a hard surface, the airbag will propel into the air if accidentally deployed. Failure to follow these instructions may result in possible serious or fatal injury.

NOTE: Check connectors - Clean and repair as necessary.

2. Connect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) to the Right Side Curtain Airbag harness connector.
3. If equipped with the standard key ignition, use this ignition on warning.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

4. If equipped with the keyless ignition, use this ignition on warning.

WARNING: Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

5. With the scan tool, read the active ORC DTCs.

Does the scan tool display: B0029-12-RIGHT CURTAIN DEPLOYMENT SQUIB 1 - CIRCUIT SHORT TO BATTERY?

Yes

- Go To 3

No

- Replace the Right Side Curtain Airbag in accordance with the Service Information. Refer to **AIR BAG, SIDE CURTAIN, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (R4) RIGHT CURTAIN SQUIB 1 LINE 1 CIRCUIT AND THE (R2) RIGHT CURTAIN SQUIB 1 LINE 2 CIRCUIT FOR A SHORT TO BATTERY**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) from the Right Side Curtain Airbag harness connector.
2. Disconnect the ORC harness connectors.

NOTE: Check connectors - Clean and repair as necessary.

3. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) to the ORC harness connectors.
4. Measure the voltage of the (R4) Right Curtain Squib 1 Line 1 circuit between (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) connector C1B cavity 15 and ground.
5. Measure the voltage of the (R2) Right Curtain Squib 1 Line 2 circuit between (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) connector C1B cavity 51 and ground.

Is there any voltage present on either circuit?

Yes

- Repair the Right Curtain Squib 1 circuits with voltage present for a short to battery.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment. Failure to follow these instructions may result in possible serious or fatal injury.

- Replace the ORC in accordance with Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD**

PROCEDURE .

B0029-13-RIGHT CURTAIN DEPLOYMENT SQUIB 1 - CIRCUIT OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

RIGHT SIDE CURTAIN AIRBAG
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

NOTE: Make sure that the battery is fully charged.

NOTE: The scan tool, (special tool #8443A, SRS Load Tool), and DVOM are required to perform the following test.

1. Turn the ignition on.

Select ACTIVE or STORED DTC:

ACTIVE DTC

- Go To 2

STORED DTC

- Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK FOR OPEN SQUIB CIRCUITS IN RIGHT SIDE CURTAIN AIRBAG**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the Right Side Curtain Airbag harness connector.

WARNING: Do not place an intact non-deployed curtain airbag face down on a hard surface, the airbag will propel into the air if accidentally deployed. Failure to follow these instructions may result in possible serious or fatal injury.

NOTE: Check connectors - Clean and repair as necessary.

2. Connect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) to the Right Side Curtain Airbag harness connector.
3. If equipped with the standard key ignition, use this ignition on warning.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

4. If equipped with the keyless ignition, use this ignition on warning.

WARNING: Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

5. With the scan tool, read the active ORC DTCs.

Does the scan tool display: B0029-13-RIGHT CURTAIN DEPLOYMENT SQUIB 1 - CIRCUIT OPEN?

Yes

- Go To 3

No

- Replace the Right Side Curtain Airbag in accordance with the Service Information. Refer to **AIR BAG, SIDE CURTAIN, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (R4) RIGHT CURTAIN SQUIB 1 LINE 1 CIRCUIT FOR AN OPEN**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) from the Right Side Curtain Airbag harness connector.
2. Disconnect the ORC harness connectors.

NOTE: Check connectors - Clean and repair as necessary.

3. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) to the ORC harness connectors.
4. Measure the resistance of the (R4) Left Curtain Squib 1 Line 1 circuit between the Right Side Curtain Airbag connector cavity 2 and the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) connector C1B cavity 15.

Is the resistance below or within the range of 5.4 - 10.0 Ohm?

Yes

- Go To 4

No

- Repair the (R4) Right Curtain Squib 1 Line 1 circuit for an open.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK THE (R2) RIGHT CURTAIN SQUIB 1 LINE 2 CIRCUIT FOR AN OPEN**
   1. Measure the resistance of the (R2) Right Curtain Squib 1 Line 2 circuit between the Right Side

Curtain Airbag harness connector cavity 1 and the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) connector C1B cavity 51.

Is the resistance below or within the range of 5.4 - 10.0 Ohm?

Yes

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment. Failure to follow these instructions may result in possible serious or fatal injury.

- Replace the ORC in accordance with Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Repair the (R2) Right Curtain Squib 1 Line 2 circuit for an open.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B0029-2B-RIGHT CURTAIN DEPLOYMENT SQUIB 1 - WIRES SHORTED TOGETHER

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 48: Side, Thorax & Side Curtain Airbag Squib Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) sends a test current to the squibs to verify the integrity of the squib and wiring. These circuits are maintained in a "floating" configuration at the ORC (connected to neither power nor ground) as protection against inadvertent deployment. Use of the (special tool #8443A, SRS Load Tool) in the tests below substitutes a suspect squib with a known good component. The (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) provides a test point as well as a

method for opening the shorting bar connections within the ORC harness connector. The side curtain airbags are a single-stage device that upon sensor detected impact they deploy. They are located above the headliner and fastened to one of the roof side rails. They protect the area from the A-pillar to the rear of the vehicle. The side curtain airbags and the seat thorax side airbags are deployed simultaneously independent of the front airbags during an impact event.

WHEN MONITORED

With the ignition on.

SET CONDITION

The Occupant Restraint Controller (ORC) monitors the resistance of the Right Curtain Squib 1 circuits. If low resistance is detected for greater than 2.6 seconds between the Right Curtain Squib 1 circuits the ORC will set this DTC. The DTC will change from Active to Stored status if the fault condition is not detected for greater than 2.6 seconds. The Airbag Warning Lamp (AWL) will set in the instrument cluster.

- Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK FOR SHORTED SQUIB CIRCUITS IN RIGHT SIDE CURTAIN AIRBAG**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the Right Side Curtain Airbag harness connector.

WARNING: Do not place an intact uncoupled curtain airbag face down on a hard surface, the airbag will propel into the air if accidentally deployed. Failure to follow these instructions may result in possible serious or fatal injury.

NOTE: Check connectors - Clean and repair as necessary.

2. Connect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) to the Right Side Curtain Airbag harness connector.
3. If equipped with the standard key ignition, use this ignition on warning.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

4. If equipped with the keyless ignition, use this ignition on warning.

WARNING: Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

5. With the scan tool, read the active ORC DTCs.

Does the scan tool display: B0029-2B-RIGHT CURTAIN DEPLOYMENT SQUIB 1 - WIRES SHORTED TOGETHER?

Yes

- Go To 3

No

- Replace the Right Side Curtain Airbag in accordance with the Service Information. Refer to **AIR BAG, SIDE CURTAIN, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (R4) RIGHT CURTAIN SQUIB 1 LINE 1 CIRCUIT FOR A SHORT TO THE (R2) RIGHT CURTAIN SQUIB 1 LINE 2 CIRCUIT**

WARNING: **Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

1. Disconnect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) from the Right Side Curtain Airbag harness connector.
2. Disconnect the ORC harness connectors.

NOTE: Check connectors - Clean and repair as necessary.

3. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) to the ORC harness connectors.
4. Measure the resistance between the (R4) Right Curtain Squib 1 Line 1 circuit connector C1B cavity 15 and the (R2) Right Curtain Squib 1 Line 2 circuit connector C1B cavity 51 at the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool).

Is the resistance below or within 1.5 - 2.18 Ohm?

Yes

- Repair the (R4) Right Curtain Squib 1 Line 1 circuit for a short to the (R2) Right Curtain Squib 1 Line 2 circuit.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

WARNING: **If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment. Failure to follow these instructions may result in possible serious or fatal injury.**

- Replace the ORC in accordance with Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD**

PROCEDURE .

B0030-11-SECOND ROW LEFT SIDE AIRBAG DEPLOYMENT CONTROL - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 49: Side, Thorax & Side Curtain Airbag Squib Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) sends a test current to the squibs to verify the integrity of the squib and wiring. These circuits are maintained in a "floating" configuration at the module (connected to neither power nor ground) as protection against inadvertent deployment. Use of the (special tool #8443A, SRS Load Tool) in the tests below substitutes a suspect squib with a known good component. The use of the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) provides a test point as well as a method for opening the shorting bar connections within the harness connector. The rear seat airbags (also known as pelvic and thorax airbags) are completely concealed beneath the seat cushion trim cover on the lower outboard sides of the rear seat cushion. The thorax airbag is a single stage device. The thorax side airbags and the side curtain airbags deploy together during an event separate of the front airbags.

WHEN MONITORED

With the ignition on.

SET CONDITION

The Occupant Restraint Controller (ORC) monitors the resistance of the Second Row Left Seat Airbag circuits. If low resistance is detected in the Second Row Left Seat Airbag circuits for 2.6 seconds or longer the ORC will set this DTC. The DTC will change from Active to Stored status if the fault condition is not detected for greater than 2.6 seconds. The Airbag Warning Lamp (AWL) will set in the instrument cluster.

POSSIBLE CAUSES

Possible Causes
(R47) SECOND ROW LEFT SEAT SQUIB 1 LINE 2 CIRCUIT SHORTED TO GROUND
(R49) SECOND ROW LEFT SEAT SQUIB 1 LINE 1 CIRCUIT SHORTED TO GROUND
SECOND ROW LEFT SEAT AIRBAG
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

NOTE: Make sure that the battery is fully charged.

NOTE: The scan tool, (special tool #8443A, SRS Load Tool), and DVOM are required to perform the following test.

1. Turn the ignition on.
2. With the scan tool, read the active ORC DTC.

Select ACTIVE or STORED DTC:

ACTIVE DTC

- Go To 2

STORED DTC

- Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK FOR SHORTED SQUIB CIRCUITS AT THE SECOND ROW LEFT SEAT AIRBAG**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the Second Row Left Seat Airbag harness connector.

WARNING: To avoid serious or fatal injury, do not place an intact non-deployed Left Seat Squib Airbag face down on a hard surface, the airbag will propel into the air if accidentally deployed.

NOTE: Check connectors - Clean and repair as necessary.

2. Connect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) to the Second Row Left Seat Airbag harness connector.
3. If equipped with the standard key ignition, use this ignition on warning.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

4. If equipped with the keyless ignition, use this ignition on warning.

WARNING: Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

5. With the scan tool, read the active ORC DTC.

Does the scan tool display: B0030-11-SECOND ROW LEFT SIDE AIRBAG DEPLOYMENT

CONTROL - CIRCUIT SHORT TO GROUND?

Yes

- Go To 3

No

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

- Replace the Second Row Left Seat Airbag in accordance with the Service Information. Refer to **AIR BAG, SEAT, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK SECOND ROW LEFT SEAT SQUIB CIRCUITS (R47) and (R49) FOR A SHORT TO GROUND**

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) from the in-line connector.
2. Disconnect the ORC harness connectors.

NOTE: Check connectors - Clean and repair as necessary.

3. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) to the ORC harness connectors.
4. Measure the resistance of the (R47) Second Row Left Seat Squib 1 Line 2 circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) connector C1B cavity 2 and ground.
5. Measure the resistance of the (R49) Second Row Left Seat Squib 1 Line 1 circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) connector C1B cavity 38 and ground.

Is the resistance below 10k Ohms on either circuit?

Yes

- In accordance with Service Information repair or replace the Left Seat Airbag Squib 1 circuits shorted to ground.

- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to follow these instructions may result in possible serious or fatal injury.

- Replace the ORC in accordance with Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B0030-12-SECOND ROW LEFT SIDE AIRBAG DEPLOYMENT CONTROL - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 50: Side, Thorax & Side Curtain Airbag Squib Circuit Diagram

OCCUPANT RESTRAINT CONTROLLER (ORC)

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

   NOTE: Make sure that the battery is fully charged.

   NOTE: The scan tool, (special tool #8443A, SRS Load Tool), and DVOM are required to perform the following test.

   1. Turn the ignition on.

      Select ACTIVE or STORED DTC:

      ACTIVE DTC

      - Go To 2

      STORED DTC

      - Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK FOR SHORTED SQUIB CIRCUITS AT THE SECOND ROW LEFT SEAT SQUIB AIRBAG**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the Second Row Left Seat Airbag harness connector.

WARNING: To avoid serious or fatal injury, do not place an intact non-deployed Left Seat Squib Airbag face down on a hard surface, the airbag will propel into the air if accidentally deployed.

NOTE: Check connectors - Clean and repair as necessary.

2. Connect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) to the Second Row Left Seat Airbag harness connector.
3. If equipped with the standard key ignition, use this ignition on warning.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

4. If equipped with the keyless ignition, use this ignition on warning.

WARNING: Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

5. With the scan tool, read the active ORC DTC.

Does the scan tool display: B0030-12-SECOND ROW LEFT SIDE AIRBAG DEPLOYMENT CONTROL - CIRCUIT SHORT TO BATTERY?

Yes

- Go To 3

No

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait

two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

- Replace the Second Row Left Seat Airbag in accordance with the Service Information. Refer to **AIR BAG, SEAT, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK SECOND ROW LEFT SEAT SQUIB CIRCUITS (R47) and (R49) FOR A SHORT TO BATTERY**

WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

1. Disconnect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) from the in-line connector.
2. Disconnect the ORC harness connectors.

NOTE: Check connectors - Clean and repair as necessary.

3. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) to the ORC harness connectors.
4. Measure the resistance of the (R47) Second Row Left Seat Squib 1 Line 2 circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) connector C1B cavity 2 and ground.
5. Measure the resistance of the (R49) Second Row Left Seat Squib 1 Line 1 circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) connector C1B cavity 38 and ground.

Is there voltage on either circuit?

Yes

- In accordance with Service Information repair or replace the Second Row Left Seat Airbag Squib 1 circuits shorted to battery.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

WARNING: **If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to follow these instructions may result in possible serious or fatal injury.**

- Replace the ORC in accordance with Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B0030-13-SECOND ROW LEFT SIDE AIRBAG DEPLOYMENT CONTROL - CIRCUIT OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 51: Side, Thorax & Side Curtain Airbag Squib Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) sends a test current to the squibs to verify the integrity of the squib and wiring. These circuits are maintained in a "floating" configuration at the module (connected to neither power nor ground) as protection against inadvertent deployment. Use of the (special tool #8443A, SRS Load Tool) in the tests below substitutes a suspect squib with a known good component. The use of the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) provides a test point as well as a method for opening the shorting bar connections within the harness connector. The rear seat airbags (also known as pelvic and thorax airbags) are completely concealed beneath the seat cushion trim cover on the lower outboard sides of the rear seat cushion. The thorax airbag is a single stage device. The thorax side airbags and the side curtain airbags deploy together during an event separate of the front airbags.

WHEN MONITORED

With the ignition on.

SET CONDITION

This Diagnostic Trouble Code (DTC) sets when the ORC detects a open on the Second Row Left Seat Airbag squib circuits for more than 2.6 seconds. This DTC transitions from active to stored when the ORC sees a recovery from a open for greater than 2.6 seconds. The Airbag Warning Lamp (AWL) will set in the instrument cluster.

POSSIBLE CAUSES

Possible Causes
(R47) SECOND ROW LEFT SEAT SQUIB 1 LINE 2 CIRCUIT OPEN
(R49) SECOND ROW LEFT SEAT SQUIB 1 LINE 1 CIRCUIT OPEN
SECOND ROW LEFT SEAT AIRBAG
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

NOTE: **Make sure that the battery is fully charged.**

NOTE: **The scan tool, (special tool #8443A, SRS Load Tool), and DVOM are required to perform the following test.**

1. Turn the ignition on.

   Select ACTIVE or STORED DTC:

   ACTIVE DTC

   - Go To 2

   STORED DTC

   - Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK FOR SHORTED SQUIB CIRCUITS IN THE SECOND ROW LEFT SEAT AIRBAG**

   WARNING: **Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

   1. Disconnect the Second Row Left Seat Airbag harness connector.

      WARNING: **To avoid serious or fatal injury, do not place an intact non-deployed Left Seat Squib Airbag face down on a hard surface, the airbag will propel into the air if accidentally deployed.**

      NOTE: Check connectors - Clean and repair as necessary.

   2. Connect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) to the Second Row Left Seat Airbag harness connector.
   3. If equipped with the standard key ignition, use this ignition on warning.

      WARNING: **Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

   4. If equipped with the keyless ignition, use this ignition on warning.

      WARNING: **Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

   5. With the scan tool, read the active ORC DTC.

Does the scan tool display: B0030-13-SECOND ROW LEFT SIDE AIRBAG DEPLOYMENT CONTROL - CIRCUIT OPEN?

Yes

- Go To 3

No

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

- Replace the Second Row Left Seat Airbag in accordance with the Service Information. Refer to **AIR BAG, SEAT, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK FOR OPEN (R47) SECOND ROW LEFT SEAT SQUIB 1 LINE 2 CIRCUIT**

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) from the second row left side seat in-line harness connector (body side).
2. Disconnect the ORC harness connectors.

NOTE: Check connectors - Clean and repair as necessary.

3. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) to the ORC harness connectors.
4. Measure the resistance of the (R47) Left Seat Squib 1 Line 2 circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) connector C1B cavity 2 and Second Row Left Seat Airbag connector 1.

Is the resistance below or within 5.4 - 10.0 Ohm?

Yes

- Go To 4

No

- Repair or Replace the (R47) Left Seat Squib 1 Line 2 circuit for an open or high resistance in

accordance with Service Information.

- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK FOR AN OPEN (R49) SECOND ROW LEFT SEAT SQUIB 1 LINE 1 CIRCUIT IN THE BODY HARNESS**
   1. Measure the resistance of the (R49) Left Seat Squib 1 Line 1 circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) connector C1B cavity 38 and Second Row Left Seat Airbag.

      Is the resistance below or within 5.4 - 10.0 Ohm?

      Yes

      WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment. Failure to follow these instructions may result in possible serious or fatal injury.

      - Replace the ORC in accordance with Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
      - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Repair or Replace the (R49) Left Seat Squib 1 Line 1 circuit for an open or high resistance in accordance with Service Information.
      - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B0030-2B-SECOND ROW LEFT SIDE AIRBAG DEPLOYMENT CONTROL - WIRES SHORTED TOGETHER

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 52: Side, Thorax & Side Curtain Airbag Squib Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) sends a test current to the squibs to verify the integrity of the squib and wiring. These circuits are maintained in a "floating" configuration at the module (connected to neither power nor ground) as protection against inadvertent deployment. Use of the (special tool #8443A, SRS Load Tool) in the tests below substitutes a suspect squib with a known good component. The use of the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) provides a test point as well

as a method for opening the shorting bar connections within the harness connector. The rear seat airbags (also known as pelvic and thorax airbags) are completely concealed beneath the seat cushion trim cover on the lower outboard sides of the rear seat cushion. The thorax airbag is a single stage device. The thorax side airbags and the side curtain airbags deploy together during an event separate of the front airbags.

WHEN MONITORED

With the ignition on.

SET CONDITION

The Occupant Restraint Controller (ORC) monitors the resistance of the Second Row Left Seat Airbag circuits. If low resistance is detected for greater than 2.6 seconds between the Second Row Left Seat Airbag circuits the ORC will set this DTC. The DTC will change from Active to Stored status if the fault condition is not detected for greater than 2.6 seconds. The Airbag Warning Lamp (AWL) will set in the instrument cluster.

POSSIBLE CAUSES

Possible Causes
(R47) SECOND ROW LEFT SEAT SQUIB 1 LINE 2 CIRCUIT SHORTED TO THE (R49) SECOND ROW LEFT SEAT SQUIB 1 LINE 1 CIRCUIT
SECOND ROW LEFT SEAT AIRBAG
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

   NOTE: Make sure that the battery is fully charged.

   NOTE: The scan tool, (special tool #8443A, SRS Load Tool), and DVOM are required to perform the following test.

   1. Turn the ignition on.

      Select ACTIVE or STORED DTC:

      ACTIVE DTC

      - Go To 2

      STORED DTC

- Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK FOR SHORTED SQUIB CIRCUITS IN THE SECOND ROW LEFT SEAT AIRBAG**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the Second Row Left Seat Airbag harness connector.

WARNING: Do not place an intact non-deployed Seat Squib Airbag face down on a hard surface, the airbag will propel into the air if accidentally deployed. Failure to follow these instructions may result in possible serious or fatal injury.

NOTE: Check connectors - Clean and repair as necessary.

2. Connect the (special tool #8443A, SRS Load Tool) and the(special tool #8443-8, Jumper, SRS Load) to the second row Left Seat Airbag harness connector.
3. If equipped with the standard key ignition, use this ignition on warning.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

4. If equipped with the keyless ignition, use this ignition on warning.

WARNING: Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

5. With the scan tool, read the active ORC DTC.

Does the scan tool display: B0030-2B-SECOND ROW LEFT SIDE AIRBAG DEPLOYMENT CONTROL - WIRES SHORTED TOGETHER?

Yes

- Go To 3

No

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

- Replace the Left Seat Airbag in accordance with the Service Information. Refer to **AIR BAG, DRIVER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK (R47) SECOND ROW LEFT SEAT SQUIB 1 LINE 2 CIRCUIT FOR A SHORT TO THE (R49) SECOND ROW LEFT SEAT SQUIB 1 LINE 1 CIRCUIT**

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) from the Second Row Left Seat Airbag harness connector.
2. Disconnect the ORC harness connectors.

NOTE: Check connectors - Clean and repair as necessary.

3. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) to the ORC harness connectors.
4. Measure the resistance of the (R47) Second Row Left Seat Squib 1 line 2 circuit between (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) connector C1B cavity 2 and the (R49) Second Row Left Seat Squib 1 Line 1 circuit at the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) connector C1B cavity 38.

Is the resistance below or within 1.5 - 2.18 Ohm?

Yes

- In accordance with the Service Information repair or replace the Second Row Left Seat Airbag Squib circuits shorted together.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment. Failure to follow these instructions may result in possible serious or fatal injury.

- Replace the ORC in accordance with Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B0038-11-SECOND ROW RIGHT SIDE AIRBAG DEPLOYMENT CONTROL - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 53: Side, Thorax & Side Curtain Airbag Squib Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) sends a test current to the squibs to verify the integrity of the squib and wiring. These circuits are maintained in a "floating" configuration at the module (connected to neither power nor ground) as protection against inadvertent deployment. Use of the (special tool #8443A, SRS Load Tool) in the tests below substitutes a suspect squib with a known good component. The use of the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) provides a test point as well

as a method for opening the shorting bar connections within the harness connector. The rear seat airbags (also known as pelvic and thorax airbags) are completely concealed beneath the seat cushion trim cover on the lower outboard sides of the rear seat cushion. The thorax airbag is a single stage device. The thorax side airbags and the side curtain airbags deploy together during an event separate of the front airbags.

WHEN MONITORED

With the ignition on.

SET CONDITION

The Occupant Restraint Controller (ORC) monitors the resistance of the Second Row Right Seat Airbag circuits. If low resistance is detected in the Second Row Right Seat Airbag squib circuits for 2.6 seconds or longer the ORC will set this DTC. The DTC will change from active to stored status if the fault condition is not detected for greater than 2.6 seconds. The Airbag Warning Lamp (AWL) will set in the instrument cluster.

POSSIBLE CAUSES

Possible Causes
(R46) SECOND ROW RIGHT SEAT SQUIB LINE 2 CIRCUIT SHORTED TO GROUND
(R48) SECOND ROW RIGHT SEAT SQUIB LINE 1 CIRCUIT SHORTED TO GROUND
SECOND ROW RIGHT SEAT AIRBAG
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

   NOTE: Make sure that the battery is fully charged.

   NOTE: The scan tool, (special tool #8443A, SRS Load Tool), and DVOM are required to perform the following test.

   1. Turn the ignition on.

      Select ACTIVE or STORED DTC:

      ACTIVE DTC

      - Go To 2

      STORED DTC

- Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK FOR SHORTED SQUIB CIRCUITS IN SECOND ROW RIGHT SEAT AIRBAG**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the Second Row Right Seat Airbag harness connector.

WARNING: Do not place an intact non-deployed Seat Squib Airbag face down on a hard surface, the airbag will propel into the air if accidentally deployed. Failure to follow these instructions may result in possible serious or fatal injury.

NOTE: Check connectors - Clean and repair as necessary.

2. Connect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) to the Second Row Right Seat Airbag harness connector.
3. If equipped with the standard key ignition, use this ignition on warning.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

4. If equipped with the keyless ignition, use this ignition on warning.

WARNING: Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

5. With the scan tool, read the active ORC DTC.

Does the scan tool display: B0038-11-SECOND ROW RIGHT SIDE AIRBAG DEPLOYMENT CONTROL - CIRCUIT SHORT TO GROUND?

Yes

- Go To 3

No

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

- Replace the Second Row Right Seat Airbag in accordance with the Service Information. Refer to **AIR BAG, SEAT, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK SECOND ROW RIGHT SEAT SQUIB CIRCUITS FOR A SHORT TO GROUND**

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the (special tool #8443A, SRS Load Tool) and the(special tool #8443-8, Jumper, SRS Load) from the Second Row Right Seat Airbag harness connector.
2. Disconnect the ORC harness connectors.

NOTE: Check connectors - Clean and repair as necessary.

3. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) to the ORC harness connectors.
4. Measure the resistance of the (R46) Second Row Right Seat Squib Line 2 circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) connector C1B cavity 39 and ground.
5. Measure the resistance of the (R48) Second Row Right Seat Squib Line 1 circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) connector C1B cavity 3 and ground.

Is the resistance below 10k Ohms on either circuit?

Yes

- In accordance with the Service Information repair or replace the Second Row Right Seat Airbag squib circuits shorted to ground.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to follow these instructions may result in possible serious or fatal injury.

- Replace the ORC in accordance with Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2014 RESTRAINTS

Occupant Restraint Controller (ORC) - Electrical Diagnostics - Cherokee

DIAGNOSIS AND TESTING

B0038-12-SECOND ROW RIGHT SIDE AIRBAG DEPLOYMENT CONTROL - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 1: Seat & Curtain Airbag Squib Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) sends a test current to the squibs to verify the integrity of the squib and wiring. These circuits are maintained in a "floating" configuration at the module (connected to neither power nor ground) as protection against inadvertent deployment. Use of the (special tool #8443A, SRS Load Tool) in the tests below substitutes a suspect squib with a known good component. The use of the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) provides a test point as well

as a method for opening the shorting bar connections within the harness connector. The rear seat airbags (also known as pelvic and thorax airbags) are completely concealed beneath the seat cushion trim cover on the lower outboard sides of the rear seat cushion. The thorax airbag is a single stage device. The thorax side airbags and the side curtain airbags deploy together during an event separate of the front airbags.

WHEN MONITORED

With the ignition on.

SET CONDITION

The Occupant Restraint Controller (ORC) monitors the voltage on the Second Row Right Seat Airbag circuits. If voltage is detected on the Second Row Right Seat Airbag circuits for greater than 2.6 seconds the ORC will set this DTC. The DTC will change from active to stored status when the fault condition is not detected for greater than 2.6 seconds. The Airbag Warning Lamp (AWL) will set in the instrument cluster.

POSSIBLE CAUSES

Possible Causes
(R46) SECOND ROW RIGHT SEAT SQUIB LINE 2 CIRCUIT SHORTED TO BATTERY
(R48) SECOND ROW RIGHT SEAT SQUIB LINE 1 CIRCUIT SHORTED TO BATTERY
SECOND ROW RIGHT SEAT AIRBAG
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

   NOTE: Make sure that the battery is fully charged.

   NOTE: The scan tool, (special tool #8443A, SRS Load Tool), and DVOM are required to perform the following test.

   1. Turn the ignition on.

      Select ACTIVE or STORED DTC:

      ACTIVE DTC

      - Go To 2

      STORED DTC

- Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK FOR SHORTED SQUIB CIRCUITS IN SECOND ROW RIGHT SEAT AIRBAG**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the Second Row Right Seat Airbag harness connector.

WARNING: Do not place an intact non-deployed Seat Squib Airbag face down on a hard surface, the airbag will propel into the air if accidentally deployed. Failure to follow these instructions may result in possible serious or fatal injury.

NOTE: Check connectors - Clean and repair as necessary.

2. Connect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) to the Second Row Right Seat Airbag harness connector.
3. If equipped with the standard key ignition, use this ignition on warning.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

4. If equipped with the keyless ignition, use this ignition on warning.

WARNING: Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

5. With the scan tool, read the active ORC DTC.

Does the scan tool display: B0038-12-SECOND ROW RIGHT SIDE AIRBAG DEPLOYMENT CONTROL - CIRCUIT SHORT TO BATTERY?

Yes

- Go To 3

No

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

- Replace the Second Row Right Seat Airbag in accordance with the Service Information. Refer to **AIR BAG, SEAT, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK SECOND ROW RIGHT SEAT SQUIB CIRCUITS FOR A SHORT TO BATTERY**

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the (special tool #8443A, SRS Load Tool) and the(special tool #8443-8, Jumper, SRS Load) from the Second Row Right Seat Airbag harness connector.
2. Disconnect the ORC harness connectors.

NOTE: Check connectors - Clean and repair as necessary.

3. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) to the ORC harness connectors.
4. Measure the voltage of the (R46) Second Row Right Seat Squib 1 Line 2 circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) connector C1B cavity 39 and ground.
5. Measure the voltage of the (R48) Second Row Right Seat Squib 1 Line 1 circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) connector C1B cavity 3 and ground.

Is there voltage on either circuit?

Yes

- In accordance with the Service Information repair or replace the Second Row Right Seat Airbag Squib circuits shorted to voltage.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to follow these instructions may result in possible serious or fatal injury.

- Replace the ORC in accordance with Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B0038-13-SECOND ROW RIGHT SIDE AIRBAG DEPLOYMENT CONTROL - CIRCUIT OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 2: Seat & Curtain Airbag Squib Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) sends a test current to the squibs to verify the integrity of the squib and wiring. These circuits are maintained in a "floating" configuration at the module (connected to neither power nor ground) as protection against inadvertent deployment. Use of the (special tool #8443A, SRS Load Tool) in the tests below substitutes a suspect squib with a known good component. The use of the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) provides a test point as well as a method for opening the shorting bar connections within the harness connector. The rear seat airbags (also known as pelvic and thorax airbags) are completely concealed beneath the seat cushion trim cover on the lower outboard sides of the rear seat cushion. The thorax airbag is a single stage device. The thorax side airbags and the side curtain airbags deploy together during an event separate of the front airbags.

WHEN MONITORED

With the ignition on.

SET CONDITION

This Diagnostic Trouble Code (DTC) sets when the ORC detects a open on the Second Row Right Seat Airbag squib circuits for more than 2.6 seconds. This DTC transitions from active to stored when the ORC sees a recovery from a open for greater than 2.6 seconds. The Airbag Warning Lamp (AWL) will set in the instrument cluster.

POSSIBLE CAUSES

Possible Causes
(R46) SECOND ROW RIGHT SEAT SQUIB LINE 2 CIRCUIT OPEN
(R48) SECOND ROW RIGHT SEAT SQUIB LINE 1 CIRCUIT OPEN
SECOND ROW RIGHT SEAT AIRBAG
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

NOTE: **Make sure that the battery is fully charged.**

NOTE: **The scan tool, (special tool #8443A, SRS Load Tool), and DVOM are required to perform the following test.**

1. Turn the ignition on.

   Select ACTIVE or STORED DTC:

   ACTIVE DTC

   - Go To 2

   STORED DTC

   - Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK FOR OPEN SQUIB CIRCUITS IN SECOND ROW RIGHT SEAT AIRBAG**

   WARNING: **Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

   1. Disconnect the Second Row Right Seat Airbag harness connector.

      WARNING: **To avoid serious or fatal injury, do not place an intact uncoupled Seat Squib Airbag face down on a hard surface, the airbag will propel into the air if accidentally deployed.**

      NOTE: **Check connectors - Clean and repair as necessary.**

   2. Connect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) to the Second Row Right Seat Airbag harness connector.
   3. If equipped with the standard key ignition, use this ignition on warning.

      WARNING: **Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

   4. If equipped with the keyless ignition, use this ignition on warning.

      WARNING: **Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

   5. With the scan tool, read the active ORC DTC.

Does the scan tool display: B0038-13-SECOND ROW RIGHT SIDE AIRBAG DEPLOYMENT CONTROL - CIRCUIT OPEN?

Yes

- Go To 3

No

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

- Replace the Second Row Right Seat Airbag in accordance with the Service Information. Refer to **AIR BAG, SEAT, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK (R48) SECOND ROW RIGHT SEAT SQUIB LINE 1 CIRCUIT FOR AN OPEN**

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the (special tool #8443A, SRS Load Tool) and (special tool #8443-8, Jumper, SRS Load) from the Second Row Right Seat Airbag harness connector.
2. Disconnect the ORC harness connectors.

NOTE: Check connectors - Clean and repair as necessary.

3. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) to the ORC harness connectors.
4. Measure the resistance of the (R48) Second Row Right Seat Squib Line 1 circuit between the Second Row Right Seat Airbag connector cavity 2 and the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)connector C1B cavity 3.

Is the resistance below or within 5.4 - 10.0 Ohm?

Yes

- Go To 4

No

- In accordance with the Service Information repair or replace the open Second Row Right

Seat Airbag Squib circuit.

- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK (R46) SECOND ROW RIGHT SEAT SQUIB LINE 2 CIRCUIT FOR AN OPEN**
   1. Measure the resistance of the (R46) Second Row Right Seat Squib Line 2 circuit between the Second Row Right Seat Squib Airbag connector cavity 1 and the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) connector C1B cavity 39.

      Is the resistance below or within 5.4 - 10.0 Ohm?

      Yes

      WARNING: **If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment. Failure to follow these instructions may result in possible serious or fatal injury.**

      - Replace the ORC in accordance with Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
      - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - In accordance with the Service Information repair or replace the open Second Row Right Seat Airbag Squib circuit.
      - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B0038-2B-SECOND ROW RIGHT SIDE AIRBAG DEPLOYMENT CONTROL - WIRES SHORTED TOGETHER

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 3: Seat & Curtain Airbag Squib Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) sends a test current to the squibs to verify the integrity of the squib and wiring. These circuits are maintained in a "floating" configuration at the module (connected to neither power nor ground) as protection against inadvertent deployment. Use of the (special tool #8443A, SRS Load Tool) in the tests below substitutes a suspect squib with a known good component. The use of the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) provides a test point as well

as a method for opening the shorting bar connections within the harness connector. The rear seat airbags (also known as pelvic and thorax airbags) are completely concealed beneath the seat cushion trim cover on the lower outboard sides of the rear seat cushion. The thorax airbag is a single stage device. The thorax side airbags and the side curtain airbags deploy together during an event separate of the front airbags.

WHEN MONITORED

With the ignition on.

SET CONDITION

The Occupant Restraint Controller (ORC) monitors the resistance of the Second Row Right Seat Airbag Squib 1 circuits. If low resistance is detected for 2.6 seconds or longer between the Second Row Right Seat Squib circuits the ORC will set this DTC. If the shorted together fault condition is not detected for 2.6 seconds the DTC will change from Active to Stored status. The Airbag Warning Lamp (AWL) will set in the instrument cluster.

POSSIBLE CAUSES

Possible Causes
(R46) SECOND ROW RIGHT SEAT SQUIB LINE 2 CIRCUIT SHORTED TO (R48) SECOND ROW RIGHT SEAT SQUIB LINE 1 CIRCUIT
SECOND ROW RIGHT SEAT AIRBAG
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

   NOTE: Make sure that the battery is fully charged.

   NOTE: The scan tool, (special tool #8443A, SRS Load Tool), and DVOM are required to perform the following test.

   1. Turn the ignition on.

      Select ACTIVE or STORED DTC:

      ACTIVE DTC

      - Go To 2

STORED DTC

- Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK FOR SHORTED SQUIB CIRCUITS IN SECOND ROW RIGHT SEAT AIRBAG**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the Second Row Right Seat Airbag harness connector.

WARNING: Do not place an intact non-deployed Seat Squib Airbag face down on a hard surface, the airbag will propel into the air if accidentally deployed. Failure to follow these instructions may result in possible serious or fatal injury.

NOTE: Check connectors - Clean and repair as necessary.

2. Connect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) to the Second Row Right Seat Airbag harness connector.
3. If equipped with the standard key ignition, use this ignition on warning.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

4. If equipped with the keyless ignition, use this ignition on warning.

WARNING: Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

5. With the scan tool, read the active ORC DTC.

Does the scan tool display: B0038-2B-SECOND ROW RIGHT SIDE AIRBAG DEPLOYMENT CONTROL - WIRES SHORTED TOGETHER?

Yes

- Go To 3

No

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

- Replace the Second Row Right Seat Airbag in accordance with the Service Information. Refer to **AIR BAG, SEAT, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK (R46) SECOND ROW RIGHT SEAT SQUIB 1 LINE 2 CIRCUIT FOR A SHORT TO (R48) SECOND ROW RIGHT SEAT SQUIB LINE 1 CIRCUIT**

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load)from the Second Row Right Seat Airbag harness connector.
2. Disconnect the ORC harness connectors.

NOTE: Check connectors - Clean and repair as necessary.

3. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) to the ORC harness connectors.
4. Measure the resistance between the (R46) Second Row Right Seat Squib Line 2 circuit connector C1B cavity 39 and the (R48) Second Row Right Seat Squib Line 1 circuit connector C1B cavity 3 at the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool).

Is the resistance below or within 1.5 - 2.18 Ohm?

Yes

- In accordance with the Service Information repair or replace the Second Row Right Seat Airbag Squib circuits (R46) and (R48) shorted together.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to follow these instructions may result in possible serious or fatal injury.

- Replace the ORC in accordance with Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B0050-11-DRIVER SEATBELT SENSOR - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 4: Driver Seatbelt & Seat Track Position Sensor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) sends a test current across the Driver Seat Belt Buckle Switch circuits to verify the integrity of the switch and wiring. The front seat belt switches cannot be adjusted or repaired and, if ineffective or damaged, the entire front seat belt buckle-half unit must be replaced. The seatbelt reminder lamp will display in the instrument cluster for this fault. The ORC obtains the buckle switch status of the driver and front passenger, as well as the status of the front passenger seat occupant detection mat. If the driver or front passenger is unbelted, the ORC sends a message to the IPC over the CAN-B bus to turn on the seatbelt reminder light. The light remains on until the front seatbelts are fastened. An audible alert triggers within 60 seconds of vehicle speed over 5 mph. The seatbelt reminder light remains illuminated until the front belts are fastened. The seatbelt buckle switch consists of a Hall-effect sensor assembly. The ORC determines the status of the seatbelt (buckled/unbuckled) based on the amount of current drawn by the sensor. When the seatbelt is unbuckled, the sensor draws a current of approximately 6.5 mA. When the seat is buckled, the sensor draws a current of approximately 15 mA.

WHEN MONITORED

While the ignition on and the Occupant Restraint Controller (ORC) is configured for a Driver Seat Belt Switch, the ORC checks the switch input current ranges. The ORC monitors the switch input current ranges at power up and continuously every 100ms.

SET CONDITION

If the ORC detects the driver seat belt buckle switch circuits have been shorted to ground or driver seat belt switch signal and common return circuits are shorted together for 2.5 seconds. This DTC transitions from active to stored when the module sees a recovery from the shorted to ground or shorted together condition for greater than five seconds.

POSSIBLE CAUSES

Possible Causes
(R57) DRIVER SEAT BELT SWITCH SENSE SHORTED TO GROUND
(R57) DRIVER SEAT BELT SWITCH SENSE CIRCUIT SHORTED TO (R729) FIRST ROW DRIVER SEAT DETECTION RETURN CIRCUIT
DRIVER SEAT BELT BUCKLE SWITCH
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **VERIFY ACTIVE DTC**

NOTE: Make sure the battery is fully charged.

1. Turn the ignition on.
2. With the scan tool, read ORC DTCs.

   Does the scan tool display active B0050-11-DRIVER SEATBELT SENSOR - CIRCUIT SHORT TO GROUND DTC?

   Yes

   - Go To 2

   No

   - Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK DRIVER SEAT BELT BUCKLE SWITCH CIRCUITS FOR A SHORT TO GROUND**

   WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

   1. Disconnect the Driver Seat Belt Buckle Switch harness connector.

      NOTE: Check connectors - Clean and repair as necessary.

   2. Measure the resistance of the (R57) Driver Seat Belt Buckle Switch Sense circuit between terminal 1 of the Driver Seat Belt Buckle Switch harness connector and ground.
   3. Measure the resistance of the (R729) First Row Driver Seat Detection Return circuit between terminal 2 of the Driver Seat Belt Switch harness connector and ground.

      Is the resistance below 10k Ohms on any of these circuits?

      Yes

      - Repair the (R57) or (R729) Driver Seat Belt Buckle Switch circuits for a short to ground in accordance with the Service Information.
      - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 3

3. **CHECK (R57) DRIVER SEAT BELT SWITCH SENSE CIRCUIT FOR A SHORT TO THE (R729) FIRST ROW DRIVER SEAT DETECTION RETURN CIRCUIT**
   1. Measure the resistance between the (R57) Driver Seat Belt Buckle Switch Sense circuit and (R729)

First Row Driver Seat Detection Return circuit at the appropriate terminals of the Driver Seat Belt Buckle Switch harness connector.

Is the resistance below 5k Ohms?

Yes

NOTE: If the short is found in the Seat Harness, do not attempt to repair the Seat Harness. Replace the Seat Harness in accordance with the Service Information.

- Repair the (R57) Driver Seat Belt Buckle Switch Sense circuit for a short to the (R729) First Row Driver Seat Detection Return circuit in accordance with the Service Information.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 4

4. **CHECK OPERATION OF THE DRIVER SEAT BELT BUCKLE SWITCH**
   1. Replace the Driver Seat Belt Buckle Switch in accordance with the Service Information. Refer to **BUCKLE, SEAT BELT, REMOVAL** .
   2. Reconnect the vehicle body harness connector to the Driver Seat Belt Buckle Switch.
   3. Remove any special tools or jumper wires and reconnect all previously disconnected components - except the Battery.
   4. If equipped with the standard key ignition, use this ignition on warning.

      WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

   5. If equipped with the keyless ignition, use this ignition on warning.

      WARNING: Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

   6. Connect the scan tool to the Data Link Connector - use the most current software available.
   7. Use the scan tool and erase the stored codes in all airbag system modules.
   8. Turn the Ignition OFF, and wait 15 seconds before turning the Ignition ON.

9. Wait one minute, and read active DTCs and if there are none present read the stored DTCs.

   Does the scan tool display active B0050-11-DRIVER SEATBELT SENSOR - CIRCUIT SHORT TO GROUND DTC?

   Yes

   WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

   WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to follow these instructions may result in possible serious or fatal injury.

   - Replace the Occupant Restrain Controller (ORC) in accordance with the Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Repair is complete.
   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B0050-12-DRIVER SEATBELT SENSOR - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 5: Driver Seatbelt & Seat Track Position Sensor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) sends a test current across the Driver Seat Belt Buckle Switch circuits to verify the integrity of the switch and wiring. The front seat belt switches cannot be adjusted or repaired and, if ineffective or damaged, the entire front seat belt buckle-half unit must be replaced. The seatbelt reminder lamp will display in the instrument cluster for this fault. The ORC obtains the buckle switch status of the driver and front passenger, as well as the status of the front passenger seat occupant detection mat. If the driver or front passenger is unbelted, the ORC sends a message to the IPC over the CAN-B bus to turn on the seatbelt reminder light. The light remains on until the front seatbelts are fastened. An audible

alert triggers within 60 seconds of vehicle speed over 5 mph. The seatbelt reminder light remains illuminated until the front belts are fastened. The seatbelt buckle switch consists of a Hall-effect sensor assembly. The ORC determines the status of the seatbelt (buckled/unbuckled) based on the amount of current drawn by the sensor. When the seatbelt is unbuckled, the sensor draws a current of approximately 6.5 mA. When the seat is buckled, the sensor draws a current of approximately 15 mA.

WHEN MONITORED

The ORC monitors the status of the seat belt switch circuits at power up and every 60 ms thereafter while the ignition is in on.

SET CONDITION

This DTC sets when the ORC detects the seat belt switch circuits have become shorted to voltage for more than 2.5 seconds. This DTC transitions from active to stored when the module sees a recovery from the shorted to voltage condition for greater than five seconds. The seatbelt reminder lamp will illuminate in the instrument cluster and an audible alert triggers within a 60 second cyle.

POSSIBLE CAUSES

Possible Causes
(R57) DRIVER SEAT BELT BUCKLE SWITCH SENSE CIRCUIT SHORTED TO VOLTAGE
(R729) FIRST ROW DRIVER SEAT DETECTION RETURN CIRCUIT SHORTED TO VOLTAGE
(R57) DRIVER SEAT BELT BUCKLE SWITCH SENSE CIRCUIT OPEN
(R729) FIRST ROW DRIVER SEAT DETECTION RETURN CIRCUIT OPEN
DRIVER SEAT BELT BUCKLE SWITCH
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **VERIFY ACTIVE DTC**

   NOTE: Make sure the battery is fully charged.

   1. Turn the ignition on.
   2. With the scan tool, read ORC DTC.

      Does the scan tool display active B0050-12-DRIVER SEATBELT SENSOR - CIRCUIT SHORT TO BATTERY DTC?

      Yes

- Go To 2

No

- Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **DRIVER SEAT BELT BUCKLE SWITCH SHORTED TO VOLTAGE**

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the Driver Seat Belt Buckle Switch harness connector.

NOTE: Check connectors - Clean and repair as necessary.

2. If equipped with the standard key ignition, use this ignition on warning.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

3. If equipped with the keyless ignition, use this ignition on warning.

WARNING: Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

4. Measure the voltage on the (R57) Driver Seat Belt Buckle Switch Sense circuit between cavity 1 of the Driver Seat Belt Buckle Switch harness connector and ground.
5. Measure the voltage on the (R729) First Row Driver Seat Detection Return Circuit between cavity 2 of the Driver Seat Belt Buckle Switch harness connector and ground.

Is there voltage on any of these circuits?

Yes

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

- Repair the (R57, R729) Driver Seat Belt Buckle Switch circuit for a short to voltage in accordance with the Service Information.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 3

3. **(R57) DRIVER SEAT BELT BUCKLE SWITCH SENSE CIRCUIT AND (R729) FIRST ROW DRIVER SEAT DETECTION RETURN CIRCUIT FOR AN OPEN**

WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

1. Disconnect the Driver Seat Belt Buckle Switch harness connector.
2. Disconnect the ORC harness connectors.

NOTE: Check connectors - Clean and repair as necessary.

3. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) to the ORC harness connector.
4. Measure the resistance of the (R57) Driver Seat Belt Buckle Switch Sense circuit between cavity 1 of the Driver Seat Belt Buckle Switch harness connector and connector C1B cavity 46 of the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool).
5. Measure the resistance of the (R729) First Row Driver Seat Detection Return Circuit between cavity 2 of the Driver Seat Belt Buckle Switch harness connector and connector C1B cavity 36 of the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool).

Is the resistance below or within the range of 5.4 - 10.0 Ohm?

Yes

- Repair the (R57, R729) Driver Seat Belt Buckle Switch circuits for an open in accordance with the Service Information.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 4

4. **CHECK OPERATION OF THE FIRST ROW DRIVER SEAT BELT SWITCH**

WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two**

minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Replace the Driver Seat Belt Buckle Switch in accordance with the Service Information. Refer to **BUCKLE, SEAT BELT, REMOVAL** .
2. Reconnect the vehicle body harness connector to the Driver Seat Belt Buckle Switch.
3. Remove any special tools or jumper wires and reconnect all previously disconnected components - except the Battery.
4. If equipped with the standard key ignition, use this ignition on warning.

   WARNING: **Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

5. If equipped with the keyless ignition, use this ignition on warning.

   WARNING: **Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

6. Connect the scan tool to the Data Link Connector - use the most current software available.
7. Use the scan tool and erase the stored DTCs.
8. Turn the Ignition OFF, and wait 15 seconds before turning the Ignition ON.
9. Wait one minute, and read active DTCs and if there are none present read the stored DTCs.

   Does the scan tool display active B0050-12-DRIVER SEATBELT SENSOR - CIRCUIT SHORT TO BATTERY DTC?

   Yes

   WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

   WARNING: **If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to follow these instructions may result in possible serious or fatal injury.**

   - Replace the Occupant Restrain Controller (ORC) in accordance with the Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .

- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Repair is complete.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B0050-13-DRIVER SEATBELT SENSOR - CIRCUIT OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 6: Driver Seatbelt & Seat Track Position Sensor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) sends a test current across the Driver Seat Belt Buckle Switch circuits to verify the integrity of the switch and wiring. The front seat belt switches cannot be adjusted or repaired and, if ineffective or damaged, the entire front seat belt buckle-half unit must be replaced. The seatbelt reminder lamp will display in the instrument cluster for this fault. The ORC obtains the buckle switch status of the driver and front passenger, as well as the status of the front passenger seat occupant detection mat. If the driver or front passenger is unbelted, the ORC sends a message to the IPC over the CAN-B bus to turn on the seatbelt reminder light. The light remains on until the front seatbelts are fastened. An audible

alert triggers within 60 seconds of vehicle speed over 5 mph. The seatbelt reminder light remains illuminated until the front belts are fastened. The seatbelt buckle switch consists of a Hall-effect sensor assembly. The ORC determines the status of the seatbelt (buckled/unbuckled) based on the amount of current drawn by the sensor. When the seatbelt is unbuckled, the sensor draws a current of approximately 6.5 mA. When the seat is buckled, the sensor draws a current of approximately 15 mA.

WHEN MONITORED

With the ignition on and the Occupant Restraint Controller (ORC) configured for a Driver Seat Belt Buckle Switch. The ORC monitors the switch input current ranges at power up and continuously every 100ms while the ignition is in on.

SET CONDITION

If the ORC detects the driver seat belt buckle switch circuits have been open for 2.5 seconds an active code sets. The active code will change to stored after the ORC verifies the dirver seat belt buckle switch sense circuit voltage has returned to normal voltage range for five (5) seconds. The seatbelt reminder lamp will illuminate in the instrument cluster and an audible alert triggers within a 60 second cycle.

POSSIBLE CAUSES

Possible Causes
(R57) DRIVER SEAT BELT BUCKLE SWITCH SENSE CIRCUIT OPEN
(R729) FIRST ROW DRIVER SEAT DETECTION RETURN CIRCUIT OPEN
DRIVER SEAT BELT BUCKLE SWITCH
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **VERIFY ACTIVE DTC**

   NOTE: Make sure the battery is fully charged.

   1. Turn the ignition on.
   2. With the scan tool, read ORC DTC.

      Does the scan tool display active B0050-13-DRIVER SEATBELT SENSOR - CIRCUIT OPEN DTC?

      Yes

      - Go To 2

No

- Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **(R57) DRIVER SEAT BELT BUCKLE SWITCH SENSE CIRCUIT AND (R729) FIRST ROW DRIVER SEAT DETECTION RETURN CIRCUIT FOR AN OPEN**

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the Driver Seat Belt Buckle Switch harness connector.
2. Disconnect the ORC harness connectors.

NOTE: Check connectors - Clean and repair as necessary.

3. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) to the ORC harness connector.
4. Measure the resistance of the (R57) Driver Seat Belt Buckle Switch Sense circuit between cavity 1 of the Driver Seat Belt Buckle Switch harness connector and connector C1B cavity 46 of the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool).
5. Measure the resistance of the (R729) First Row Driver Seat Detection Return Circuit between cavity 2 of the Driver Seat Belt Buckle Switch harness connector and connector C1B cavity 36 of the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool).

Is the current less than or equal to 0.9 Ma on any of these circuits?

Yes

- Repair the (R57, R729) Driver Seat Belt Buckle Switch circuits for an open in accordance with the Service Information.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 3

3. **CHECK OPERATION OF THE FIRST ROW DRIVER SEAT BELT BUCKLE SWITCH**
   1. Replace the Driver Seat Belt Buckle Switch in accordance with the Service Information. Refer to **BUCKLE, SEAT BELT, REMOVAL** .
   2. Reconnect the vehicle body harness connector to the Driver Seat Belt Buckle Switch.
   3. Remove any special tools or jumper wires and reconnect all previously disconnected components - except the Battery.

4. If equipped with the standard key ignition, use this ignition on warning.

   WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

5. If equipped with the keyless ignition, use this ignition on warning.

   WARNING: Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

6. Connect the scan tool to the Data Link Connector - use the most current software available.
7. Use the scan tool and erase the stored DTCs.
8. Turn the Ignition OFF, and wait 15 seconds before turning the Ignition ON.
9. Wait one minute, and read active DTCs and if there are none present read the stored DTCs.

   Does the scan tool display active B0050-13-DRIVER SEATBELT SENSOR - CIRCUIT OPEN DTC?

   Yes

   WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

   WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to follow these instructions may result in possible serious or fatal injury.

   - Replace the Occupant Restrain Controller (ORC) in accordance with the Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Repair is complete.
   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B0050-95-DRIVER SEATBELT SENSOR - INCORRECT ASSEMBLY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 7: Driver Seatbelt & Seat Track Position Sensor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) sends a test current to the Driver Seatbelt Buckle Switch. During this test, the sensors discovered are checked for agreement with the pre-programmed configuration of components assigned to the module.

WHEN MONITORED

The ORC checks for the presence of Seatbelt Buckle Switch circuits once during the initialization process. The initialization process takes 100ms.

SET CONDITION

This DTC sets when the ORC detects the presence of a Seatbelt Buckle Switch circuit while the configuration of the module does not reflect a Seatbelt Buckle Switch should be present. Once set, this DTC is latched for the entire power cycle and requires the module to be re-initalized to set code.

POSSIBLE CAUSES

Possible Causes
UNUSED SEATBELT BUCKLE SWITCH CIRCUITS SHORTED TO VOLTAGE, SHORTED TO GROUND, OR SHORTED TOGETHER
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

   NOTE: Make sure the battery is fully charged.

   1. Turn the ignition on.
   2. With the scan tool, read ORC DTCs.

      Is the DTC active or stored?

      ORC - ACTIVE DTC

      - Go To 2

      ORC - STORED DTC

      - Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK UNUSED SEATBELT BUCKLE SWITCH CIRCUITS FOR A SHORT TO VOLTAGE, SHORT TO GROUND, OR SHORT TOGETHER**
   1. Check any unused Seatbelt Buckle Switch circuits for possible short to voltage.
   2. Check any unused Seatbelt Buckle Switch circuits for possible short to ground.
   3. Check any unused Seatbelt Buckle Switch circuits for possible short together.

Are any of the unused Seatbelt Buckle Switch circuits shorted?

Yes

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

- Repair any unused Seatbelt Buckle Switch circuits that are shorted.
- Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

No

NOTE: Make sure the part number of the replacement module is the correct part number for the vehicle.

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment. Failure to follow these instructions may result in possible serious or fatal injury.

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

- Replace the ORC in accordance with the Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B0052-11-PASSENGER SEATBELT SENSOR - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 8: Passenger Seatbelt, Seat Track Position & Occupant Detection Sensor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) sends a test current across the Passenger Seat Belt Buckle Switch circuits to verify the integrity of the switch and wiring. The front seat belt switches cannot be adjusted or repaired and, if ineffective or damaged, the entire front seat belt buckle-half unit must be replaced. The seatbelt reminder lamp will display in the instrument cluster for this fault. The ORC obtains the buckle switch status of the driver and front passenger, as well as the status of the front passenger seat occupant detection mat. If the driver or front passenger is unbelted, the ORC sends a message to the IPC over the CAN-B

bus to turn on the seatbelt reminder light. The light remains on until the front seatbelts are fastened. An audible alert triggers within 60 seconds of vehicle speed over 5 mph. The seatbelt reminder light remains illuminated until the front belts are fastened. The seatbelt buckle switch consists of a Hall-effect sensor assembly. The ORC determines the status of the seatbelt (buckled/unbuckled) based on the amount of current drawn by the sensor. When the seatbelt is unbuckled, the sensor draws a current of approximately 6.5 mA. When the seat is buckled, the sensor draws a current of approximately 15 mA.

WHEN MONITORED

While the ignition on and the Occupant Restraint Controller (ORC) is configured for a Driver Seat Belt Switch, the ORC checks the switch input current ranges. The ORC monitors the switch input current ranges at power up and continuously every 100ms.

SET CONDITION

The ORC monitors the status of the seat belt switch circuits at power up and every 60 ms thereafter while the ignition is in on.

This DTC sets when the ORC detects the seat belt switch circuits have become shorted to ground for more than 2.5 seconds. This DTC transitions from active to stored when the module sees a recovery from the shorted to ground condition for greater than five seconds.

POSSIBLE CAUSES

Possible Causes
(R58) PASSENGER SEAT BELT SWITCH SENSE CIRCUIT SHORTED TO GROUND
(R58) PASSENGER SEAT BELT SWITCH SENSE CIRCUIT SHORTED TO (R730) FIRST ROW PASSENGER SEAT SENSORS COMMON RETURN CIRCUIT
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **VERIFY ACTIVE DTC**

   NOTE: Make sure the battery is fully charged.

   1. Turn the ignition on.
   2. With the scan tool, read the ORC DTCs.

      Does the scan tool display active B0052-11-PASSENGER SEATBELT SENSOR - CIRCUIT SHORT TO GROUND DTC?

      Yes

- Go To 2

No

- Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK PASSENGER SEAT BELT BUCKLE SWITCH CIRCUITS FOR A SHORT TO GROUND**

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the Passenger Seat Belt Buckle Switch harness connector.

NOTE: Check connectors - Clean and repair as necessary.

2. Measure the resistance of the (R58) Passenger Seat Belt Buckle Switch Sense circuit between terminal 1 of the Passenger Seat Belt Buckle Switch harness connector and ground.
3. Measure the resistance of the (R730) First Row Passenger Seat Sensors Common Return circuit between terminal 2 of the Passenger Seat Belt Switch harness connector and ground.

Is the resistance below 10k Ohms on any of these circuits?

Yes

- Repair the (R58) or (R730) Passenger Seat Belt Buckle Switch circuits for a short to ground in accordance with the Service Information.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 3

3. **CHECK (R58) PASSENGER SEAT BELT SWITCH SENSE CIRCUIT FOR A SHORT TO THE (R730) FIRST ROW PASSENGER SEAT SENSORS COMMON RETURN CIRCUIT**

1. Measure the resistance between the (R58) Passenger Seat Belt Buckle Switch Sense circuit connector and (R730) First Row Driver Seat Sensors Common Return circuit at the appropriate terminals of the Driver Seat Belt Buckle Switch harness connector.

Is the resistance below 5k Ohms?

Yes

NOTE: **If the short is found in the Seat Harness, do not attempt to repair the Seat Harness. Replace the Seat Harness in accordance with the Service Information.**

- Repair the (R58) Passenger Seat Belt Buckle Switch Sense circuit for a short to the (R730) First Row Passenger Seat Sensors Common Return circuit in accordance with the Service Information.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 4

4. **CHECK OPERATION OF THE PASSENGER SEAT BELT BUCKLE SWITCH**
   1. Replace the Passenger Seat Belt Buckle Switch in accordance with the Service Information. Refer to **BUCKLE, SEAT BELT, REMOVAL** .
   2. Reconnect the vehicle body harness connector to the Passenger Seat Belt Buckle Switch.
   3. Remove any special tools or jumper wires and reconnect all previously disconnected components - except the Battery.
   4. If equipped with the standard key ignition, use this ignition on warning.

      WARNING: **Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

   5. If equipped with the keyless ignition, use this ignition on warning.

      WARNING: **Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

   6. Connect the scan tool to the Data Link Connector - use the most current software available.
   7. Use the scan tool and erase the stored codes in all airbag system modules.
   8. Turn the Ignition OFF, and wait 15 seconds before turning the Ignition ON.
   9. Wait one minute, and read active DTCs and if there are none present read the stored DTCs.

      Does the scan tool display active B0052-11-PASSENGER SEATBELT SENSOR - CIRCUIT SHORT TO GROUND DTC?

      Yes

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to follow these instructions may result in possible serious or fatal injury.

- Replace the Occupant Restrain Controller (ORC) in accordance with the Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Repair is complete.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B0052-12-PASSENGER SEATBELT SENSOR - CIRCUIT SHORT TO BATTERY

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) sends a test current across the Passenger Seat Belt Buckle Switch circuits to verify the integrity of the switch and wiring. The front seat belt switches cannot be adjusted or repaired and, if ineffective or damaged, the entire front seat belt buckle-half unit must be replaced. The seatbelt reminder lamp will display in the instrument cluster for this fault. The ORC obtains the buckle switch status of the driver and front passenger, as well as the status of the front passenger seat occupant detection mat. If the driver or front passenger is unbelted, the ORC sends a message to the IPC over the CAN-B

bus to turn on the seatbelt reminder light. The light remains on until the front seatbelts are fastened. An audible alert triggers within 60 seconds of vehicle speed over 5 mph. The seatbelt reminder light remains illuminated until the front belts are fastened. The seatbelt buckle switch consists of a Hall-effect sensor assembly. The ORC determines the status of the seatbelt (buckled/unbuckled) based on the amount of current drawn by the sensor. When the seatbelt is unbuckled, the sensor draws a current of approximately 6.5 mA. When the seat is buckled, the sensor draws a current of approximately 15 mA.

WHEN MONITORED

The ORC monitors the status of the seat belt switch circuits at power up and every 60 ms thereafter while the ignition is in on.

SET CONDITION

This DTC sets when the ORC detects the seat belt switch circuits have become shorted to voltage for more than 2.5 seconds. This DTC transitions from active to stored when the module sees a recovery from the shorted to voltage condition for greater than five seconds. The seatbelt reminder lamp will illuminate in the instrument cluster and an audible alert triggers within a 60 second cyle.

POSSIBLE CAUSES

Possible Causes
(R58) PASSENGER SEAT BELT SWITCH SIGNAL CIRCUIT SHORTED TO VOLTAGE
(R730) FIRST ROW PASSENGER SEAT SENSORS COMMON RETURN CIRCUIT SHORTED TO VOLTAGE
(R58) PASSENGER SEAT BELT SWITCH SIGNAL CIRCUIT OPEN
(R730) FIRST ROW PASSENGER SEAT SENSORS COMMON RETURN CIRCUIT OPEN
PASSENGER SEAT BELT SWITCH
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **VERIFY ACTIVE DTC**

   NOTE: Make sure the battery is fully charged.

   1. Turn the ignition on.
   2. With the scan tool, read all ORC DTCs.

      Does the scan tool display active B0052-12-PASSENGER SEATBELT SENSOR - CIRCUIT SHORT TO BATTERY DTC?

Yes

- Go To 2

No

- Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **(R58) PASSENGER SEAT BELT SWITCH SIGNAL CIRCUIT SHORTED TO VOLTAGE**

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the Passenger Seat Belt Buckle Switch connector.
2. Disconnect the ORC harness connector.

NOTE: Check connectors - Clean and repair as necessary.

3. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) to the ORC harness connectors.
4. If equipped with the standard key ignition, use this ignition on warning.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

5. If equipped with the keyless ignition, use this ignition on warning.

WARNING: Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

6. Measure the voltage of the (R58) Passenger Seat Belt Switch Signal circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) connector C1B cavity 23 and ground.

   Is there any voltage present on the circuit?

   Yes

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

- Repair the (R58) Passenger Seat Belt Switch Signal circuit for a short to voltage.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 3

3. **(R730) FIRST ROW PASSENGER SEAT SENSORS COMMON RETURN CIRCUIT SHORTED TO VOLTAGE**
   1. Measure the voltage of the (R730) First Row Passenger Seat Sensors Common Return circuit between connector C1B cavity 19 of the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) and ground.

      Is there any voltage present on the circuit?

      Yes

      WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

      - Repair or replace the (R730) First Row Passenger Seat Sensors Common Return circuit for a short to voltage.
      - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 4

4. **(R58) PASSENGER SEAT BELT SWITCH SENSE CIRCUIT FOR AN OPEN**

   WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

   1. Measure the resistance of the (R58) Passenger Seat Belt Switch Signal circuit between the Passenger Seat Belt Buckle Switch harness connector cavity 1 and connector C1B cavity 23 of the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool).

      Is the resistance below or within the range of 5.4 - 10.0 Ohm?

Yes

- Go To 5

No

- Repair or replace the (R58) Passenger Seat Belt Switch Signal circuit for an open or high resistance.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **(R730) FIRST ROW DRIVER SEAT SENSORS COMMON RETURN CIRCUIT FOR AN OPEN**
   1. Measure the resistance of the (R730) First Row Passenger Seat Sensors Common Return circuit between the Passenger Seat Belt Buckle Switch harness connector cavity 2 and the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) connector C1B cavity.

      Is the resistance below or within the range of 5.4 - 10.0 Ohm?

      Yes

      - Go To 6

      No

      - Repair or replace the (R730) First Row Passenger Seat Sensors Common Return circuit for an open or high resistance.
      - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

6. **CHECK OPERATION OF THE FIRST ROW PASSENGER SEAT BELT SWITCH**

   WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

   1. Replace the Passenger Seat Belt Switch. Refer to **BUCKLE, SEAT BELT, REMOVAL** .
   2. Reconnect the vehicle body harness to the switch.
   3. If equipped with the standard key ignition, use this ignition on warning.

      WARNING: **Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

   4. If equipped with the keyless ignition, use this ignition on warning.

      WARNING: **Disconnect the 12-volt battery wait two minutes before**

proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

5. Connect the scan tool to the Data Link Connector - use the most current software available.
6. Use the scan tool and erase all codes in the ORC.
7. Turn the ignition off, and wait 15 seconds before turning the Ignition On.
8. Wait one minute, and read active codes.

Did the active B0052-12-PASSENGER SEATBELT SENSOR - CIRCUIT SHORT TO BATTERY DTC return?

Yes

WARNING: **If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment. Failure to follow these instructions may result in possible serious or fatal injury.**

WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

- Replace the ORC in accordance with the Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Repair is complete.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B0052-13-PASSENGER SEATBELT SENSOR - CIRCUIT OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 10: Passenger Seatbelt, Seat Track Position & Occupant Detection Sensor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) sends a test current across the Passenger Seat Belt Buckle Switch circuits to verify the integrity of the switch and wiring. The front seat belt switches cannot be adjusted or repaired and, if ineffective or damaged, the entire front seat belt buckle-half unit must be replaced. The seatbelt reminder lamp will display in the instrument cluster for this fault. The ORC obtains the buckle switch status of the driver and front passenger, as well as the status of the front passenger seat occupant detection mat. If the driver or front passenger is unbelted, the ORC sends a message to the IPC over the CAN-B

bus to turn on the seatbelt reminder light. The light remains on until the front seatbelts are fastened. An audible alert triggers within 60 seconds of vehicle speed over 5 mph. The seatbelt reminder light remains illuminated until the front belts are fastened. The seatbelt buckle switch consists of a Hall-effect sensor assembly. The ORC determines the status of the seatbelt (buckled/unbuckled) based on the amount of current drawn by the sensor. When the seatbelt is unbuckled, the sensor draws a current of approximately 6.5 mA. When the seat is buckled, the sensor draws a current of approximately 15 mA.

WHEN MONITORED

With the ignition on and the Occupant Restraint Controller (ORC) configured for a Passenger Seat Belt Buckle Switch. The ORC monitors the switch input current ranges at power up and continuously every 100ms with the ignition in on.

SET CONDITION

If the ORC detects the passenger seat belt buckle switch circuits have been open for 2.5 seconds. The active code will change to stored after the ORC verifies the passenger seat belt buckle switch sense circuit voltage has returned to normal voltage range for five seconds. The seatbelt reminder lamp will illuminate in the instrument cluster and an audible alert triggers within a 60 second cyle

POSSIBLE CAUSES

Possible Causes
(R58) PASSENGER SEAT BELT BUCKLE SWITCH SENSE CIRCUIT OPEN
(R730) FIRST ROW PASSENGER SEAT SENSORS COMMON RETURN CIRCUIT OPEN
PASSENGER SEAT BELT BUCKLE SWITCH
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **VERIFY ACTIVE DTC**

   NOTE: Make sure the battery is fully charged.

   1. Turn the ignition on.
   2. With the scan tool, read ORC DTC.

      Does the scan tool display active B0052-13-PASSENGER SEATBELT SENSOR - CIRCUIT OPEN DTC?

      Yes

      - Go To 2

No

- Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **(R58) PASSENGER SEAT BELT SWITCH SENSE CIRCUIT FOR AN OPEN**

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Measure the resistance of the (R58) Passenger Seat Belt Switch Signal circuit between the Passenger Seat Belt Buckle Switch harness connector cavity 1 and connector C1B cavity 23 of the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool).

   Is the current less than or equal to 0.9 Ma?

   Yes

   - Go To 3

   No

   - Repair or replace the (R58) Passenger Seat Belt Switch Signal circuit for an open or high resistance.
   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **(R730) FIRST ROW PASSENGER SEAT SENSORS COMMON RETURN CIRCUIT FOR AN OPEN**

1. Measure the resistance of the (R730) First Row Passenger Seat Sensors Common Return circuit between the Passenger Seat Belt Buckle Switch harness connector cavity 2 and the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) connector C1B cavity 19.

   Is the current less than or equal to 0.9 Ma?

   Yes

   - Repair or replace the (R730) First Row Passenger Seat Sensors Common Return circuit for an open or high resistance.
   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 4

4. **CHECK OPERATION OF THE FIRST ROW PASSENGER SEAT BELT BUCKLE SWITCH**

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Replace the Passenger Seat Belt Switch. Refer to **BUCKLE, SEAT BELT, REMOVAL** .
2. Reconnect the vehicle body harness to the switch.
3. If equipped with the standard key ignition, use this ignition on warning.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

4. If equipped with the keyless ignition, use this ignition on warning.

WARNING: Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

5. Connect the scan tool to the Data Link Connector - use the most current software available.
6. Use the scan tool and erase all codes in the ORC.
7. Turn the ignition off, and wait 15 seconds before turning the Ignition On.
8. Wait one minute, and read active codes.

Did the active B0052-13-PASSENGER SEATBELT SENSOR - CIRCUIT OPEN DTC return?

Yes

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment. Failure to follow these instructions may result in possible serious or fatal injury.

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

- Replace the ORC in accordance with the Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Repair is complete.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B0052-95-PASSENGER SEATBELT SENSOR - INCORRECT ASSEMBLY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 11: Passenger Seatbelt, Seat Track Position & Occupant Detection Sensor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) sends a test current to the Seat Belt Buckle sensors. During this test, the sensors discovered are checked for agreement with the pre-programmed configuration of components assigned to the module.

WHEN MONITORED

The ORC checks for the presence of Seat Belt Buckle sensor circuits once during the initialization process.

SET CONDITION

This DTC sets when the ORC detects the presence of a Seat Belt Buckle sensor circuit while the configuration of the module does not reflect a Seat Belt Buckle sensor should be present. Once set, this DTC is latched for the entire power cycle and requires the module to be re-initalized to set code.

POSSIBLE CAUSES

Possible Causes
UNUSED SEAT BELT BUCKLE SENSOR CIRCUITS SHORTED TO VOLTAGE, SHORTED TO GROUND, OR SHORTED TOGETHER
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

   NOTE: Make sure the battery is fully charged.

   1. Turn the ignition on.
   2. With the scan tool, read ORC DTCs.

      Is the DTC active or stored?

      ORC - ACTIVE DTC

      - Go To 2

      ORC - STORED DTC

- Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK UNUSED SEAT BELT BUCKLE SENSOR CIRCUITS FOR A SHORT TO VOLTAGE, SHORT TO GROUND, OR SHORT TOGETHER**
   1. Check any unused Seat Belt Buckle Sensor circuits for possible short to voltage.
   2. Check any unused Seat Belt Buckle Sensor circuits for possible short to ground.
   3. Check any unused Seat Belt Buckle Sensor circuits for possible short together.

   Are any of the unused Seat Position circuits shorted?

   Yes

   WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

   - Repair any unused Seat Belt Buckle Sensor circuits that are shorted.
   - Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

   No

   NOTE: Make sure the part number of the replacement module is the correct part number for the vehicle.

   WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment. Failure to follow these instructions may result in possible serious or fatal injury.

   WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

   - Replace the ORC in accordance with the Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B0079-11-DRIVER SEATBELT ANCHOR PRETENSIONER DEPLOYMENT CONTROL - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 12: Knee Blocker & Seat Belt Pretensioner Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The location of the anchor buckle tensioner is at the base of the B-pillar. The anchor buckle tensioner is an internal part of the seat belt retractor. When powered, the Occupant Restraint Controller (ORC) sends a test current to the squibs to verify the integrity of the squib and wiring. These circuits are maintained in a "floating" configuration at the ORC (connected to neither power nor ground) as protection against inadvertent deployment. Use of the (special tool #8443A, SRS Load Tool)in the tests below substitutes a suspect squib with a known good component. The (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) provides a test point as well as a method for opening the shorting bar connections within the ORC harness connector. The anchor buckle tensioners can not be repaired and if ineffective or damaged the entire anchor buckle unit is to be replaced. Following any front airbag deployment the anchor buckle tensioners will also be

replaced.

WHEN MONITORED

With the ignition on.

SET CONDITION

The Occupant Restraint Controller (ORC) monitors the resistance of the Driver Seat Belt Tensioner circuits. The ORC will set this DTC if it detects low resistance on the Driver Seat Belt Tensioner circuits for 2.6 seconds. The DTC will change from active to stored when the ORC monitoring shows the short to ground circuit fault is gone for 2.6 seconds. The airbag warning lamp (AWL) will set in the instrument cluster.

POSSIBLE CAUSES

Possible Causes
(R508) DRIVER SEAT BELT ANCHOR TENSIONER LINE 1 CIRCUIT SHORTED TO GROUND
(R507) DRIVER SEAT BELT ANCHOR TENSIONER LINE 2 CIRCUIT SHORTED TO GROUND
DRIVER SEAT BELT ANCHOR PRETENSIONER
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

   NOTE: Make sure that the battery is fully charged.

   NOTE: The scan tool, (special tool #8443A, SRS Load Tool), and DVOM are required to perform the following test.

   1. Turn the ignition on.

      Select ACTIVE or STORED DTC:

      ACTIVE DTC

      - Go To 2

      STORED DTC

      - Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK FOR SHORTED DRIVER SEAT BELT ANCHOR TENSIONER**

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the Driver Seat Belt Anchor Pretensioner harness connector.

NOTE: Check connectors - Clean and repair as necessary.

2. Connect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) to the Driver Seat Belt Anchor Pretensioner harness connector.
3. If equipped with the standard key ignition, use this ignition on warning.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

4. If equipped with the keyless ignition, use this ignition on warning.

WARNING: Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

5. With the scan tool, read the active ORC DTCs.

Does the scan tool display: B0079-11-DRIVER ANCHOR PRETENSIONER DEPLOYMENT CONTROL - CIRCUIT SHORT TO GROUND?

Yes

- Go To 3

No

- Replace the Driver Seat Belt Anchor Pretensioner in accordance with the Service Information. Refer to **RETRACTOR, SEAT BELT, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (R508) DRIVER SEAT BELT ANCHOR RETRACTOR LINE 1 CIRCUIT AND THE (R507) DRIVER SEAT BELT ANCHOR RETRACTOR LINE 2 CIRCUIT FOR A SHORT**

TO GROUND

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) from the Driver Seat Belt Anchor Pretensioner harness connector.
2. Disconnect the ORC harness connectors.

NOTE: Check connectors - Clean and repair as necessary.

3. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)to the ORC harness connector.
4. Measure the resistance between ground and the (R508) Driver Seat Belt Anchor Retractor Line 1 circuit at the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) connector C1B cavity 50.
5. Measure the resistance between ground and the (R507) Driver Seat Belt Anchor Retractor Line 2 circuit at the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) connector C1B cavity 14.

Is the resistance below 10k Ohms on either circuit?

Yes

- Repair the Driver Seat Belt Anchor Pretensioner circuits with resistance below 10k Ohms for a short to ground.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment. Failure to follow these instructions may result in possible serious or fatal injury.

- Replace the ORC in accordance with Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B0079-12-DRIVER SEATBELT ANCHOR PRETENSIONER DEPLOYMENT CONTROL - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 13: Knee Blocker & Seat Belt Pretensioner Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The location of the anchor buckle tensioner is at the base of the B-pillar. The anchor buckle tensioner is an internal part of the seat belt retractor. When powered, the Occupant Restraint Controller (ORC) sends a test current to the squibs to verify the integrity of the squib and wiring. These circuits are maintained in a "floating" configuration at the ORC (connected to neither power nor ground) as protection against inadvertent deployment. Use of the (special tool #8443A, SRS Load Tool) in the tests below substitutes a suspect squib with a known good component. The (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) provides a test point as well as a method for opening the shorting bar connections within the ORC harness

connector. The anchor buckle tensioners can not be repaired and if ineffective or damaged the entire anchor buckle unit is to be replaced. Following any front airbag deployment the anchor buckle tensioners will also be replaced.

WHEN MONITORED

With the ignition on.

SET CONDITION

The Occupant Restraint Controller (ORC) monitors the resistance of the Driver Seat Belt Tensioner circuits. The ORC will set this DTC if it detects voltage on the Driver Seat Belt Anchor Tensioner circuits for 2.6 seconds. The DTC will change from active to stored when the ORC monitoring shows the short to voltage circuit fault is gone for 2.6 seconds. The airbag warning lamp (AWL) will set in the instrument cluster.

POSSIBLE CAUSES

Possible Causes
(R508) DRIVER SEAT BELT ANCHOR TENSIONER LINE 1 CIRCUIT SHORTED TO VOLTAGE
(R507) DRIVER SEAT BELT ANCHOR TENSIONER LINE 2 CIRCUIT SHORTED TO VOLTAGE
DRIVER SEAT BELT ANCHOR PRETENSIONER (ANCHOR)
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

   NOTE: Make sure that the battery is fully charged.

   NOTE: The scan tool, SRS Load Tool Kit 8443A, (special tool #8443A, SRS Load Tool)and DVOM are required to perform the following test.

   1. Turn the ignition on.

      Select ACTIVE or STORED DTC:

      ACTIVE DTC

      - Go To 2

      STORED DTC

- Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK FOR SHORTED DRIVER SEAT BELT TENSIONER (ANCHOR)**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the Driver Seat Belt Tensioner harness connector.

NOTE: Check connectors - Clean and repair as necessary.

2. Connect the (special tool #8443A, SRS Load Tool) and (special tool #8443-8, Jumper, SRS Load) to the Driver Seat Belt Anchor Pretensioner harness connector.
3. If equipped with the standard key ignition, use this ignition on warning.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

4. If equipped with the keyless ignition, use this ignition on warning.

WARNING: Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

5. With the scan tool, read the active ORC DTCs.

Does the scan tool display: B0079-11-DRIVER ANCHOR PRETENSIONER DEPLOYMENT CONTROL - CIRCUIT SHORT TO BATTERY?

Yes

- Go To 3

No

- Replace the Driver Seat Belt Anchor Pretensioner in accordance with the Service Information. Refer to **RETRACTOR, SEAT BELT, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (R508) DRIVER SEAT BELT ANCHOR TENSIONER LINE 1 CIRCUIT AND THE (R507) DRIVER SEAT BELT ANCHOR TENSIONER LINE 2 CIRCUIT FOR A SHORT TO BATTERY**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the (special tool #8443A, SRS Load Tool) and (special tool #8443-8, Jumper, SRS Load) from the Driver Seat Belt Anchor Pretensioner harness connector.
2. Disconnect the ORC harness connectors.

NOTE: Check connectors - Clean and repair as necessary.

3. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)to the ORC harness connectors.
4. If equipped with the standard key ignition, use this ignition on warning.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

5. If equipped with the keyless ignition, use this ignition on warning.

WARNING: Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

6. Measure the voltage of the (R508) Driver Seat Belt Anchor Tensioner Line 1 circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) connector C1B cavity 50 and ground.
7. Measure the voltage of the (R507) Driver Seat Belt Anchor Tensioner Line 2 circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) connector C1B cavity 14 and ground.

Is there any voltage present on either circuit?

Yes

- Repair the Driver Seat Belt Anchor Tensioner circuits with voltage present for a short to battery.

- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment. Failure to follow these instructions may result in possible serious or fatal injury.

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

- Replace the ORC in accordance with Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B0079-13-DRIVER SEATBELT ANCHOR PRETENSIONER DEPLOYMENT CONTROL - CIRCUIT OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 14: Knee Blocker & Seat Belt Pretensioner Circuit Diagram

THEORY OF OPERATION

The location of the anchor buckle tensioner is at the base of the B-pillar. The anchor buckle tensioner is an internal part of the seat belt retractor. When powered, the Occupant Restraint Controller (ORC) sends a test current to the squibs to verify the integrity of the squib and wiring. These circuits are maintained in a "floating" configuration at the ORC (connected to neither power nor ground) as protection against inadvertent deployment. Use of the (special tool #8443A, SRS Load Tool) in the tests below substitutes a suspect squib with a known good component. The (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) provides a test point as well as a method for opening the shorting bar connections within the ORC harness connector. The anchor buckle tensioners can not be repaired and if ineffective or damaged the entire anchor buckle unit is to be replaced. Following any front airbag deployment the anchor buckle tensioners will also be

replaced.

WHEN MONITORED

With the ignition on.

SET CONDITION

The Occupant Restraint Controller (ORC) monitors the resistance of the Driver Seat Belt Tensioner circuits. The ORC will set this DTC if it detects high resistance on the Driver Seat Belt Anchor Tensioner circuits for 2.6 seconds. The DTC will change from active to stored when the ORC monitoring shows the open circuit fault is gone for 2.6 seconds. The airbag warning lamp (AWL) will set in the instrument cluster.

POSSIBLE CAUSES

Possible Causes
(R508) DRIVER SEAT BELT ANCHOR TENSIONER LINE 1 CIRCUIT OPEN
(R507) DRIVER SEAT BELT ANCHOR TENSIONER LINE 2 CIRCUIT OPEN
DRIVER SEAT BELT ANCHOR PRETENSIONER
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

   NOTE: Make sure that the battery is fully charged.

   NOTE: The scan tool, (special tool #8443A, SRS Load Tool), and DVOM are required to perform the following test.

   1. Turn the ignition on.

      SELECT ACTIVE or STORED DTC:

      ACTIVE DTC

      - Go To 2

      STORED DTC

      - Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK FOR OPEN DRIVER SEAT BELT ANCHOR PRETENSIONER**

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the Driver Seat Belt Anchor Pretensioner harness connector.

NOTE: Check connectors - Clean and repair as necessary.

2. Connect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) to the Driver Seat Belt Tensioner (Anchor) harness connector.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

3. With the scan tool, read the active ORC DTCs.

Does the scan tool display: B0079-13-DRIVER SEATBELT ANCHOR PRETENSIONER DEPLOYMENT CONTROL - CIRCUIT OPEN?

Yes

- Go To 3

No

- Replace the Driver Seat Belt Anchor Pretensioner in accordance with the Service Information. Refer to **RETRACTOR, SEAT BELT, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (R508) DRIVER SEAT BELT ANCHOR TENSIONER LINE 1 CIRCUIT FOR AN OPEN**

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) from the Driver Seat Belt Anchor Pretensioner harness connector.
2. Disconnect the ORC harness connectors.

NOTE: Check connectors - Clean and repair as necessary.

3. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) to the ORC harness connector.
4. Measure the resistance of the (R508) Driver Seat Belt Anchor Tensioner Line 1 circuit between the Driver Seat Belt Anchor Pretensioner harness connector cavity 2 and the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) connector C1B cavity 50.

   Is the resistance below or within 5.4 - 10.0 Ohms?

   Yes

   - Go To 4

   No

   - Repair the open (R508) Driver Seat Belt Anchor Tensioner Line 1 circuit.
   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK THE (R507) DRIVER SEAT BELT ANCHOR TENSIONER LINE 2 CIRCUIT FOR AN OPEN**
   1. Measure the resistance of the (R507) Driver Seat Belt Anchor Tensioner Line 2 circuit between the Driver Seat Belt Anchor Pretensioner harness connector cavity 1 and the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) connector C1B cavity 14.

      Is the resistance below or within 5.4 - 10.0 Ohms?

      Yes

      WARNING: **If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to follow these instructions may result in possible serious or fatal injury.**

      - Replace the ORC in accordance with Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
      - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Repair the open (R507) Driver Seat Belt Anchor Tensioner Line 2 circuit.
      - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B0079-2B-DRIVER SEATBELT ANCHOR PRETENSIONER DEPLOYMENT CONTROL - WIRES SHORTED TOGETHER

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 15: Knee Blocker & Seat Belt Pretensioner Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The location of the anchor buckle tensioner is at the base of the B-pillar. The anchor buckle tensioner is an internal part of the seat belt retractor. When powered, the Occupant Restraint Controller (ORC) sends a test current to the squibs to verify the integrity of the squib and wiring. These circuits are maintained in a "floating" configuration at the ORC (connected to neither power nor ground) as protection against inadvertent deployment. Use of the (special tool #8443A, SRS Load Tool) in the tests below substitutes a suspect squib with a known good component. The (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) provides a test point as well as a method for opening the shorting bar connections within the ORC harness

connector. The anchor buckle tensioners can not be repaired and if ineffective or damaged the entire anchor buckle unit is to be replaced. Following any front airbag deployment the anchor buckle tensioners will also be replaced.

WHEN MONITORED

With the ignition on.

SET CONDITION

The Occupant Restraint Controller (ORC) monitors the resistance of the Driver Seat Belt Anchor Pretensioner circuits. The ORC will set this DTC if it detects low resistance on the Driver Seat Belt Tensioner (Anchor) circuits for 2.6 seconds. The DTC will change from active to stored when the ORC monitoring shows the shorted together circuit fault is gone for 2.6 seconds. The airbag warning lamp (AWL) will set in the instrument cluster.

POSSIBLE CAUSES

Possible Causes
(R508) DRIVER SEAT BELT ANCHOR TENSIONER LINE 1 CIRCUIT SHORTED TO THE (R507) DRIVER SEAT BELT ANCHOR TENSIONER LINE 2 CIRCUIT
DRIVER SEAT BELT ANCHOR PRETENSIONER
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

   NOTE: Make sure that the battery is fully charged.

   NOTE: The scan tool, (special tool #8443A, SRS Load Tool), and DVOM are required to perform the following test.

   1. Turn the ignition on.

      Select ACTIVE or STORED DTC:

      ACTIVE DTC

      - Go To 2

      STORED DTC

- Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK FOR SHORTED DRIVER SEAT BELT PRETENSIONER**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the Driver Seat Belt Anchor Pretensioner harness connector.

NOTE: Check connectors - Clean and repair as necessary.

2. Connect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) to the Driver Seat Belt Anchor Pretensioner harness connector.
3. If equipped with the standard key ignition, use this ignition on warning.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

4. If equipped with the keyless ignition, use this ignition on warning.

WARNING: Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

5. With the scan tool, read the active ORC DTCs.

Does the scan tool display: B0079-2B-DRIVER SEATBELT ANCHOR PRETENSIONER DEPLOYMENT CONTROL- WIRES SHORTED TOGETHER?

Yes

- Go To 3

No

- Replace the Driver Seat Belt Anchor Pretensioner in accordance with the Service Information. Refer to **RETRACTOR, SEAT BELT, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (R508) DRIVER SEAT BELT ANCHOR TENSIONER LINE 1 CIRCUIT FOR A SHORT TO THE (R507) DRIVER SEAT BELT ANCHOR TENSIONER LINE 2 CIRCUIT**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the (special tool #8443A, SRS Load Tool)and the (special tool #8443-8, Jumper, SRS Load) from the Driver Seat Belt Anchor Pretensioner harness connector.
2. Disconnect the ORC harness connectors.

NOTE: Check connectors - Clean and repair as necessary.

3. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) to the ORC harness connector.
4. Measure the resistance between the (R508) Driver Seat Belt Anchor Tensioner Line 1 circuit connector C1B cavity 50 and the (R507) Driver Seat Belt Anchor Tensioner Line 2 circuit connector C1B cavity 14 at the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool).

Is the resistance below or within 1.5 - 2.18 Ohms?

Yes

- Repair the (R508) Driver Seat Belt Anchor Tensioner Line 1 circuit for a short to the (R507) Driver Seat Belt Anchor Tensioner Line 2 circuit.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment. Failure to follow these instructions may result in possible serious or fatal injury.

- Replace the ORC in accordance with Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B007A-11-PASSENGER SEATBELT ANCHOR PRETENSIONER DEPLOYMENT CONTROL - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 16: Knee Blocker & Seat Belt Pretensioner Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The location of the anchor buckle tensioner is at the base of the B-pillar. The anchor buckle tensioner is an internal part of the seat belt retractor. When powered, the Occupant Restraint Controller (ORC) sends a test current to the squibs to verify the integrity of the squib and wiring. These circuits are maintained in a "floating" configuration at the ORC (connected to neither power nor ground) as protection against inadvertent deployment. Use of the (special tool #8443A, SRS Load Tool) in the tests below substitutes a suspect squib with a known good component. The (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) provides a test point as well as a method for opening the shorting bar connections within the ORC harness

connector. The anchor buckle tensioners can not be repaired and if ineffective or damaged the entire anchor buckle unit is to be replaced. Following any front airbag deployment the anchor buckle tensioners will also be replaced.

WHEN MONITORED

With the ignition on.

SET CONDITION

The Occupant Restraint Controller (ORC) monitors the resistance of the Passenger Seat Belt Tensioner circuits. The ORC will set this DTC if it detects low resistance on the Passenger Seat Belt Anchor Pretensioner circuits for 2.6 seconds. The DTC will change from active to stored when the ORC monitoring shows the short to ground circuit fault is gone for 2.6 seconds.

POSSIBLE CAUSES

Possible Causes
(R509) PASSENGER SEAT BELT ANCHOR TENSIONER LINE 1 CIRCUIT SHORTED TO GROUND
(R510) PASSENGER SEAT BELT ANCHOR TENSIONER LINE 2 CIRCUIT SHORTED TO GROUND
PASSENGER SEAT BELT ANCHOR PRETENSIONER
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

   NOTE: Make sure that the battery is fully charged.

   NOTE: The scan tool, (special tool #8443A, SRS Load Tool), and DVOM are required to perform the following test.

   1. Turn the ignition on.

      Select ACTIVE or STORED DTC:

      ACTIVE DTC

      - Go To 2

STORED DTC

- Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK FOR SHORTED PASSENGER SEAT BELT TENSIONER (ANCHOR)**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the Passenger Seat Belt Anchor Pretensioner harness connector.

NOTE: Check connectors - Clean and repair as necessary.

2. Connect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) to the Passenger Seat Belt Anchor Pretensioner harness connector.
3. If equipped with the standard key ignition, use this ignition on warning.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

4. If equipped with the keyless ignition, use this ignition on warning.

WARNING: Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

5. With the scan tool, read the active ORC DTCs.

Does the scan tool display: B007A-11-FRONT PASSENGER SEATBELT ANCHOR PRETENSIONER DEPLOYMENT CONTROL - CIRCUIT SHORT TO GROUND?

Yes

- Go To 3

No

- Replace the Passenger Seat Belt Tensioner in accordance with the Service Information. Refer to **RETRACTOR, SEAT BELT, REMOVAL** .

- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (R510) PASSENGER SEAT BELT ANCHOR TENSIONER LINE 1 CIRCUIT AND THE (R509) PASSENGER SEAT BELT ANCHOR TENSIONER LINE 2 CIRCUIT FOR A SHORT TO GROUND**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the (special tool #8443A, SRS Load Tool)and the (special tool #8443-8, Jumper, SRS Load) from the Passenger Seat Belt Anchor Pretensioner harness connector.
2. Disconnect the ORC harness connectors.

NOTE: Check connectors - Clean and repair as necessary.

3. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) to the ORC harness connector.
4. Measure the resistance of the (R510) Passenger Seat Belt Anchor Tensioner Line 1 circuit between ground and the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) connector C1B cavity 13.
5. Measure the resistance of the (R509) Passenger Seat Belt Anchor Tensioner Line 2 circuit between ground and the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) connector C1B cavity 49.

Is the resistance below 10k Ohms on either circuit?

Yes

- Repair the Passenger Seat Belt Anchor Pretensioner circuits with resistance below 10k Ohms for a short to ground.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

- Replace the ORC in accordance with Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B007A-12-PASSENGER SEATBELT ANCHOR PRETENSIONER DEPLOYMENT CONTROL - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The location of the anchor buckle tensioner is at the base of the B-pillar. The anchor buckle tensioner is an internal part of the seat belt retractor. When powered, the Occupant Restraint Controller (ORC) sends a test current to the squibs to verify the integrity of the squib and wiring. These circuits are maintained in a "floating" configuration at the ORC (connected to neither power nor ground) as protection against inadvertent

deployment. Use of the (special tool #8443A, SRS Load Tool) in the tests below substitutes a suspect squib with a known good component. The (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) provides a test point as well as a method for opening the shorting bar connections within the ORC harness connector. The anchor buckle tensioners can not be repaired and if ineffective or damaged the entire anchor buckle unit is to be replaced. Following any front airbag deployment the anchor buckle tensioners will also be replaced.

WHEN MONITORED

With the ignition on.

SET CONDITION

The Occupant Restraint Controller (ORC) monitors the resistance of the Passenger Seat Belt Anchor Tensioner circuits. The ORC will set this DTC if it detects voltage on the Passenger Seat Belt Anchor Pretensioner circuits for 2.6 seconds. The DTC will change from active to stored when the ORC monitoring shows the short to voltage circuit fault is gone for 2.6 seconds.

POSSIBLE CAUSES

Possible Causes
(R510) PASSENGER SEAT BELT ANCHOR TENSIONER LINE 1 CIRCUIT SHORTED TO VOLTAGE
(R509) PASSENGER SEAT BELT ANCHOR TENSIONER LINE 2 CIRCUIT SHORTED TO VOLTAGE
PASSENGER SEAT BELT ANCHOR PRETENSIONER
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

   NOTE: Make sure that the battery is fully charged.

   NOTE: The scan tool, (special tool #8443A, SRS Load Tool), and DVOM are required to perform the following test.

   1. Turn the ignition on.

      Select ACTIVE or STORED DTC:

      ACTIVE DTC

- Go To 2

STORED DTC

- Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK FOR SHORTED PASSENGER SEAT BELT TENSIONER (ANCHOR)**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the Passenger Seat Belt Anchor Pretensioner harness connector.

NOTE: Check connectors - Clean and repair as necessary.

2. Connect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) to the Passenger Seat Belt Anchor Pretensioner harness connector.
3. If equipped with the standard key ignition, use this ignition on warning.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

4. If equipped with the keyless ignition, use this ignition on warning.

WARNING: Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

5. With the scan tool, read the active ORC DTCs.

Does the scan tool display: B007A-12-PASSENGER SEATBELT ANCHOR PRETENSIONER DEPLOYMENT CONTROL - CIRCUIT SHORT TO BATTERY?

Yes

- Go To 3

No

- Replace the Passenger Seat Belt Anchor Pretensioner in accordance with the Service Information. Refer to **RETRACTOR, SEAT BELT, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (R510) PASSENGER SEAT BELT ANCHOR TENSIONER LINE 1 CIRCUIT AND THE (R509) PASSENGER SEAT BELT ANCHOR TENSIONER LINE 2 CIRCUIT FOR A SHORT TO BATTERY**

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) from the Passenger Seat Belt Anchor Pretensioner harness connector.
2. Disconnect the ORC harness connectors.

NOTE: Check connectors - Clean and repair as necessary.

3. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) to the ORC harness connector.
4. If equipped with the standard key ignition, use this ignition on warning.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

5. If equipped with the keyless ignition, use this ignition on warning.

WARNING: Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

6. Measure the voltage of the (R510) Passenger Seat Belt Anchor Tensioner Line 1 circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) connector C1B cavity 13 and ground.
7. Measure the voltage of the (R509) Passenger Seat Belt Anchor Tensioner Line 2 circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) connector C1B cavity 49 and ground.

Is there any voltage present on either circuit?

Yes

- Repair the Passenger Seat Belt Anchor Tensioner circuits with voltage present for a short to battery.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

WARNING: **If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment. Failure to follow these instructions may result in possible serious or fatal injury.**

- Replace the ORC in accordance with Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B007A-13-PASSENGER SEATBELT ANCHOR PRETENSIONER DEPLOYMENT CONTROL - CIRCUIT OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 18: Knee Blocker & Seat Belt Pretensioner Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The location of the anchor buckle tensioner is at the base of the B-pillar. The anchor buckle tensioner is an internal part of the seat belt retractor. When powered, the Occupant Restraint Controller (ORC) sends a test current to the squibs to verify the integrity of the squib and wiring. These circuits are maintained in a "floating" configuration at the ORC (connected to neither power nor ground) as protection against inadvertent deployment. Use of the (special tool #8443A, SRS Load Tool) in the tests below substitutes a suspect squib with a known good component. The (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) provides a test point as well as a method for opening the shorting bar connections within the ORC harness connector. The anchor buckle tensioners can not be repaired and if ineffective or damaged the entire anchor buckle unit is to be replaced. Following any front airbag deployment the anchor buckle tensioners will also be

replaced.

WHEN MONITORED

With the ignition on.

SET CONDITION

The Occupant Restraint Controller (ORC) monitors the resistance of the Passenger Seat Belt Anchor Tensioner circuits. The ORC will set this DTC if it detects high resistance on the Passenger Seat Belt Anchor Tensioner circuits for 2.6 seconds. The DTC will change from active to stored when the ORC monitoring shows the open circuit fault is gone for 2.6 seconds.

POSSIBLE CAUSES

Possible Causes
(R510) PASSENGER SEAT BELT ANCHOR TENSIONER LINE 1 CIRCUIT OPEN
(R509) PASSENGER SEAT BELT ANCHOR TENSIONER LINE 2 CIRCUIT OPEN
PASSENGER SEAT BELT ANCHOR TENSIONER
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

   NOTE: Make sure that the battery is fully charged.

   NOTE: The scan tool, (special tool #8443A, SRS Load Tool), and DVOM are required to perform the following test.

   1. Turn the ignition on.

      Select ACTIVE or STORED DTC:

      ACTIVE DTC

      - Go To 2

      STORED DTC

      - Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK FOR AN OPEN PASSENGER SEAT BELT TENSIONER (ANCHOR)**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the Passenger Seat Belt Tensioner (Anchor) harness connector.

NOTE: Check connectors - Clean and repair as necessary.

2. Connect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) to the Passenger Seat Belt Abchor Pretensioner harness connector.
3. If equipped with the standard key ignition, use this ignition on warning.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

4. If equipped with the keyless ignition, use this ignition on warning.

WARNING: Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

5. With the scan tool, read the active ORC DTCs.

Does the scan tool display: B007A-13-PASSENGER SEATBELT ANCHOR PRETENSIONER DEPLOYMENT CONTROL - CIRCUIT OPEN?

Yes

- Go To 3

No

- Replace the Passenger Seat Belt Anchor Pretensioner in accordance with the Service Information. Refer to **RETRACTOR, SEAT BELT, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (R510) PASSENGER SEAT BELT ANCHOR TENSIONER LINE 1 CIRCUIT FOR AN OPEN**

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the (special tool #8443A, SRS Load Tool) and (special tool #8443-8, Jumper, SRS Load) from the Passenger Seat Belt Anchor Pretensioner harness connector.
2. Disconnect the ORC harness connectors.

NOTE: Check connectors - Clean and repair as necessary.

3. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) to the ORC harness connector.
4. Measure the resistance of the (R510) Passenger Seat Belt Anchor Tensioner Line 1 circuit between the Passenger Seat Belt Anchor Tensioner harness connector cavity 2 and the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) connector C1B cavity 13.

   Is the resistance within 5.4 - 10.0 Ohms?

   Yes

   - Go To 4

   No

   - Repair the (R510) Passenger Seat Belt Anchor Tensioner Line 1 circuit for an open.
   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK THE (R509) PASSENGER SEAT BELT ANCHOR TENSIONER LINE 2 CIRCUIT FOR AN OPEN**
   1. Measure the resistance of the (R509) Passenger Seat Belt Anchor Tensioner Line 2 circuit between the Passenger Seat Belt Anchor Tensioner connector cavity 1 and the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) connector C1B cavity 49.

      Is the resistance within 5.4 - 10.0 Ohms?

      Yes

      WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to follow these instructions may result in possible serious or fatal injury.

      - Replace the ORC in accordance with Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
      - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD**

PROCEDURE .

No

- Repair the (R509) Passenger Seat Belt Anchor Pretensioner Line 2 circuit for an open.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B007A-2B-PASSENGER SEATBELT ANCHOR PRETENSIONER DEPLOYMENT CONTROL - WIRES SHORTED TOGETHER

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 19: Knee Blocker & Seat Belt Pretensioner Circuit Diagram

Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The location of the anchor buckle tensioner is at the base of the B-pillar. The anchor buckle tensioner is an internal part of the seat belt retractor. When powered, the Occupant Restraint Controller (ORC) sends a test current to the squibs to verify the integrity of the squib and wiring. These circuits are maintained in a "floating" configuration at the ORC (connected to neither power nor ground) as protection against inadvertent deployment. Use of the (special tool #8443A, SRS Load Tool) in the tests below substitutes a suspect squib with a known good component. The (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) provides a test point as well as a method for opening the shorting bar connections within the ORC harness connector. The anchor buckle tensioners can not be repaired and if ineffective or damaged the entire anchor buckle unit is to be replaced. Following any front airbag deployment the anchor buckle tensioners will also be replaced.

WHEN MONITORED

With the ignition on.

SET CONDITION

The Occupant Restraint Controller (ORC) monitors the resistance of the Passenger Seat Belt Anchor Tensioner circuits. The ORC will set this DTC if it detects low resistance on the Passenger Seat Belt Anchor Tensioner circuits for 2.6 seconds. The DTC will change from active to stored when the ORC monitoring shows the shorted together circuit fault is gone for 2.6 seconds.

POSSIBLE CAUSES

Possible Causes
(R510) PASSENGER SEAT BELT ANCHOR TENSIONER LINE 1 CIRCUIT SHORTED TO THE (R509) PASSENGER SEAT BELT ANCHOR TENSIONER LINE 2 CIRCUIT
PASSENGER SEAT BELT ANCHOR PRETENSIONER
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

NOTE: **Make sure that the battery is fully charged.**

NOTE: **The scan tool, (special tool #8443A, SRS Load Tool), and DVOM are required to perform the following test.**

1. Turn the ignition on.

   Select ACTIVE or STORED DTC:

   ACTIVE DTC

   - Go To 2

   STORED DTC

   - Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK FOR SHORTED PASSENGER SEAT BELT PRETENSIONER**

   WARNING: **Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

   1. Disconnect the Passenger Seat Belt Anchor Pretensioner harness connector.

      NOTE: Check connectors - Clean and repair as necessary.

   2. Connect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) to the Passenger Seat Belt Anchor Pretensioner (Anchor) harness connector.
   3. If equipped with the standard key ignition, use this ignition on warning.

      WARNING: **Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

   4. If equipped with the keyless ignition, use this ignition on warning.

      WARNING: **Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

   5. With the scan tool, read the active ORC DTCs.

      Does the scan tool display: B007A-2B-PASSENGER SEATBELT ANCHOR PRETENSIONER DEPLOYMENT CONTROL- WIRES SHORTED TOGETHER?

Yes

- Go To 3

No

- Replace the Passenger Seat Belt Anchor Pretensioner in accordance with the Service Information. Refer to **RETRACTOR, SEAT BELT, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (R510) PASSENGER SEAT BELT ANCHOR TENSIONER LINE 1 CIRCUIT FOR A SHORT TO THE (R509) PASSENGER SEAT BELT ANCHOR TENSIONER LINE 2 CIRCUIT**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the (special tool #8443A, SRS Load Tool)and the (special tool #8443-8, Jumper, SRS Load) from the Passenger Seat Belt Anchor Pretensioner harness connector.
2. Disconnect the ORC harness connectors.

NOTE: Check connectors - Clean and repair as necessary.

3. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) to the ORC harness connector.
4. Measure the resistance between the (R510) Passenger Seat Belt Anchor Tensioner Line 1 circuit connector C1B cavity 13 and the (R509) Passenger Seat Belt Anchor Tensioner Line 2 circuit connector C1B cavity 49 at the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool).

   Is the resistance below or within 1.5 - 2.18 Ohms?

   Yes

   - Repair the (R510) Passenger Seat Belt Anchor Tensioner Line 1 circuit for a short to the (R509) Passenger Seat Belt Anchor Tensioner Line 2 circuit.
   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions

can result in accidental airbag deployment. Failure to follow these instructions may result in possible serious or fatal injury.

- Replace the ORC in accordance with Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B007E-11-DRIVER SEATBELT RETRACTOR PRETENSIONER DEPLOYMENT CONTROL - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 20: Driver Seatbelt Retractor Pretensioner Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The location of the retractor tensioner (driver sill end pretensioner) is within the plastic trim of the B-pillar. The anchor buckle tensioner is an internal part of the seat belt retractor. When powered, the Occupant Restraint Controller (ORC) sends a test current to the squibs to verify the integrity of the squib and wiring. These circuits are maintained in a "floating" configuration at the ORC (connected to neither power nor ground) as protection against inadvertent deployment. Use of the (special tool #8443A, SRS Load Tool) in the tests below substitutes a suspect squib with a known good component. The (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) provides a test point as well as a method for opening the shorting bar connections within the

ORC harness connector. The retractor tensioners can not be repaired and if ineffective or damaged the entire retractor tensioner unit is to be replaced. Following any front airbag deployment the retractor tensioners will also be replaced. A growling or grinding sound while attempting to operate the seat belt retractor is a sure sign the retractor tensioner has been deployed and needs to be replaced.

WHEN MONITORED

With the ignition on.

SET CONDITION

The Occupant Restraint Controller (ORC) monitors the resistance of the Driver Seat Belt Retractor Tensoner C1 circuits. The ORC will set this DTC if it detects low resistance on the Driver Seat Belt Retractor Tensioner C1 circuits for 2.6 seconds. The DTC will change from active to stored when the ORC monitoring shows the short to ground circuit fault is gone for 2.6 seconds.

POSSIBLE CAUSES

Possible Causes
(R278) DRIVER SEAT BELT RETRACTOR TENSIONER LINE 1 CIRCUIT OR (R277) DRIVER SEAT BELT RETRACTOR TENSIONER LINE 2 CIRCUIT SHORTED TO GROUND
DRIVER SEAT BELT RETRACTOR TENSIONER C1
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

   NOTE: Make sure that the battery is fully charged.

   NOTE: The scan tool, (special tool #8443A, SRS Load Tool), and DVOM are required to perform the following test.

   1. Turn the ignition on.

      Select ACTIVE or STORED DTC:

      ACTIVE DTC

      - Go To 2

      STORED DTC

- Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK FOR SHORTED DRIVER SEAT BELT RETRACTOR TENSIONER)**

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the Driver Seat Belt Retractor Tensioner harness connector.

NOTE: Check connectors - Clean and repair as necessary.

2. Connect the (special tool #8443A, SRS Load Tool)and the (special tool #8443-8, Jumper, SRS Load) to the Driver Seat Belt Retractor Tensioner C1 harness connector.
3. If equipped with the standard key ignition, use this ignition on warning.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

4. If equipped with the keyless ignition, use this ignition on warning.

WARNING: Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

5. With the scan tool, read the active ORC DTCs.

Does the scan tool display: B007E-11-DRIVER SEATBELT RETRACTOR PRETENSIONER DEPLOYMENT CONTROL - CIRCUIT SHORT TO GROUND?

Yes

- Go To 3

No

- Replace the Driver Seat Belt Retractor Tensioner in accordance with the Service Information. Refer to **RETRACTOR, SEAT BELT, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (R278) DRIVER SEAT BELT RETRACTOR TENSIONER LINE 1 CIRCUIT AND THE (R277) DRIVER SEAT BELT RETRACTOR TENSIONER LINE 2 CIRCUIT FOR A SHORT TO GROUND**

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the (special tool #8443A, SRS Load Tool)and the (special tool #8443-8, Jumper, SRS Load) from the Driver Seat Belt Retractor Tensioner C1 harness connector.
2. Disconnect the ORC harness connectors.

NOTE: Check connectors - Clean and repair as necessary.

3. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) to the ORC harness connector.
4. Measure the resistance of the (R278) Driver Seat Belt Retractor Tensioner Line 1 circuit between ground and the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) connector C1B cavity 48.
5. Measure the resistance of the (R277) Driver Seat Belt Retractor Tensioner Line 2 circuit between ground and the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) connector C1B cavity 12.

Is the resistance below 10k Ohms on either circuit?

Yes

- Repair the Driver Seat Belt Retractor Tensioner circuits with resistance below 10k Ohms for a short to ground.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment. Failure to follow these instructions may result in possible serious or fatal injury.

- Replace the ORC in accordance with Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B007E-11-DRIVER SEATBELT RETRACTOR PRETENSIONER DEPLOYMENT CONTROL - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 21: Driver Seatbelt Retractor Pretensioner Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The location of the retractor tensioner (driver sill end pretensioner) is within the plastic trim of the B-pillar. The anchor buckle tensioner is an internal part of the seat belt retractor. When powered, the Occupant Restraint

Controller (ORC) sends a test current to the squibs to verify the integrity of the squib and wiring. These circuits are maintained in a "floating" configuration at the ORC (connected to neither power nor ground) as protection against inadvertent deployment. Use of the (special tool #8443A, SRS Load Tool) in the tests below substitutes a suspect squib with a known good component. The (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) provides a test point as well as a method for opening the shorting bar connections within the ORC harness connector. The retractor tensioners can not be repaired and if ineffective or damaged the entire retractor tensioner unit is to be replaced. Following any front airbag deployment the retractor tensioners will also be replaced. A growling or grinding sound while attempting to operate the seat belt retractor is a sure sign the retractor tensioner has been deployed and needs to be replaced.

WHEN MONITORED

With the ignition on.

SET CONDITION

The Occupant Restraint Controller (ORC) monitors the resistance of the Driver Seat Belt Retractor Tensioner C1 circuits. The ORC will set this DTC if it detects voltage on the Driver Seat Belt Retractor Tensioner C1 circuits for 2.6 seconds. The DTC will change from active to stored when the ORC monitoring shows the short to voltage circuit fault is gone for 2.6 seconds.

POSSIBLE CAUSES

Possible Causes
(R277) DRIVER SEAT BELT RETRACTOR TENSIONER LINE 1 CIRCUIT SHORTED TO VOLTAGE
(R278) DRIVER SEAT BELT RETRACTOR TENSIONER LINE 2 CIRCUIT SHORTED TO VOLTAGE
DRIVER SEAT BELT RETRACTOR TENSIONER C1
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

NOTE: Make sure that the battery is fully charged.

NOTE: The scan tool, (special tool #8443A, SRS Load Tool), and DVOM are required to perform the following test.

1. Turn the ignition on.

Select ACTIVE or STORED DTC:

ACTIVE DTC

- Go To 2

STORED DTC

- Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK FOR SHORTED DRIVER SEAT BELT RETRACTOR TENSIONER**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the Driver Seat Belt Retractor Tensioner C1 harness connector.

NOTE: Check connectors - Clean and repair as necessary.

2. Connect the (special tool #8443A, SRS Load Tool)and the (special tool #8443-8, Jumper, SRS Load) to the Driver Seat Belt Retractor Tensioner C1 harness connector.
3. If equipped with the standard key ignition, use this ignition on warning.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

4. If equipped with the keyless ignition, use this ignition on warning.

WARNING: Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

5. With the scan tool, read the active ORC DTCs.

Does the scan tool display: B007E-11-DRIVER SEATBELT RETRACTOR PRETENSIONER DEPLOYMENT CONTROL - CIRCUIT SHORT TO BATTERY?

Yes

- Go To 3

No

- Replace the Driver Seat Belt Retractor Tensioner in accordance with the Service Information. Refer to **RETRACTOR, SEAT BELT, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (R278) DRIVER SEAT BELT RETRACTOR TENSIONER LINE 1 CIRCUIT AND THE (R277) DRIVER SEAT BELT RETRACTOR LINE 2 CIRCUIT TENSIONER FOR A SHORT TO BATTERY**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the (special tool #8443A, SRS Load Tool)and the (special tool #8443-8, Jumper, SRS Load)from the Driver Seat Belt Retractor Tensioner C1 harness connector.
2. Disconnect the ORC harness connectors.

NOTE: Check connectors - Clean and repair as necessary.

3. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) to the ORC harness connectors.
4. If equipped with the standard key ignition, use this ignition on warning.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

5. If equipped with the keyless ignition, use this ignition on warning.

WARNING: Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

6. Measure the voltage of the (R278) Driver Seat Belt Retractor Tensioner Line 1 circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) connector C1B cavity 48 and ground.
7. Measure the voltage of the (R277) Driver Seat Belt Retractor Line 2 circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) connector C1B cavity 12 and ground.

Is there any voltage present on either circuit?

Yes

- Repair the Driver Seat Belt Retractor Tensioner C1 circuits with voltage present for a short to battery.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

WARNING: **If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment. Failure to follow these instructions may result in possible serious or fatal injury.**

WARNING: **Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

- Replace the ORC in accordance with Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B007E-13-DRIVER SEATBELT RETRACTOR PRETENSIONER DEPLOYMENT CONTROL - CIRCUIT OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 22: Driver Seatbelt Retractor Pretensioner Circuit Diagram

THEORY OF OPERATION

The location of the retractor tensioner (driver sill end pretensioner) is within the plastic trim of the B-pillar. The anchor buckle tensioner is an internal part of the seat belt retractor. When powered, the Occupant Restraint Controller (ORC) sends a test current to the squibs to verify the integrity of the squib and wiring. These circuits are maintained in a "floating" configuration at the ORC (connected to neither power nor ground) as protection against inadvertent deployment. Use of the (special tool #8443A, SRS Load Tool) in the tests below substitutes a suspect squib with a known good component. The (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) provides a test point as well as a method for opening the shorting bar connections within the

ORC harness connector. The retractor tensioners can not be repaired and if ineffective or damaged the entire retractor tensioner unit is to be replaced. Following any front airbag deployment the retractor tensioners will also be replaced. A growling or grinding sound while attempting to operate the seat belt retractor is a sure sign the retractor tensioner has been deployed and needs to be replaced.

WHEN MONITORED

With the ignition on.

SET CONDITION

The Occupant Restraint Controller (ORC) monitors the resistance of the Driver Seat Belt Retractor Tensioner C1 circuits. The ORC will set this DTC if it detects high resistance on the Driver Seat Belt Retractor Tensioner C1 circuits for 2.6 seconds. The DTC will change from active to stored when the ORC monitoring shows the open circuit fault is gone for 2.6 seconds.

POSSIBLE CAUSES

Possible Causes
(R277) DRIVER SEAT BELT RETRACTOR TENSIONER LINE 1 CIRCUIT OPEN
(R278) DRIVER SEAT BELT RETRACTOR TENSIONER LINE 2 CIRCUIT OPEN
DRIVER SEAT BELT RETRACTOR TENSIONER C1
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

   NOTE: Make sure that the battery is fully charged.

   NOTE: The scan tool, (special tool #8443A, SRS Load Tool), and DVOM are required to perform the following test.

   1. Turn the ignition on.

      SELECT ACTIVE or STORED DTC:

      ACTIVE DTC

      - Go To 2

      STORED DTC

- Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK FOR OPEN DRIVER SEAT BELT RETRACTOR TENSIONER**

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the Driver Seat Belt Retrctor Tensioner C1 harness connector.

NOTE: Check connectors - Clean and repair as necessary.
