   4. Measure the resistance of the (R278) Driver Seat Belt Retractor Tensioner Line 1 circuit between the Driver Seat Belt Retractor Tensioner connector cavity 2 and the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) connector C1B cavity 48.

      Is the resistance within 5.4 - 10.0 Ohms?

      Yes

      - Go To 4

      No

      - Repair the open (R278) Driver Seat Belt Retractor Tensioner Line 1 circuit.
      - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK THE (R277) DRIVER SEAT BELT RETRACTOR TENSONER LINE 2 CIRCUIT FOR AN OPEN**
   1. Measure the resistance of the (R277) Driver Seat Belt Retractor Tensioner Line 2 circuit between the Driver Seat Belt Retractor Tensioner connector cavity 1 and the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) connector C1B cavity 12.

      Is the resistance within 5.4 - 10.0 Ohms?

      Yes

      WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to follow these instructions may result in possible serious or fatal injury.

- Replace the ORC in accordance with Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Repair the open (R277) Driver Seat Belt Retractor Tensioner Line 2 circuit.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B007E-2B-DRIVER SEATBELT RETRACTOR PRETENSIONER DEPLOYMENT CONTROL - WIRES SHORTED TOGETHER

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 23: Driver Seatbelt Retractor Pretensioner Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The location of the retractor tensioner (driver sill end pretensioner) is within the plastic trim of the B-pillar. The anchor buckle tensioner is an internal part of the seat belt retractor. When powered, the Occupant Restraint Controller (ORC) sends a test current to the squibs to verify the integrity of the squib and wiring. These circuits are maintained in a "floating" configuration at the ORC (connected to neither power nor ground) as protection against inadvertent deployment. Use of the (special tool #8443A, SRS Load Tool) in the tests below substitutes a suspect squib with a known good component. The (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) provides a test point as well as a method for opening the shorting bar connections within the

ORC harness connector. The retractor tensioners can not be repaired and if ineffective or damaged the entire retractor tensioner unit is to be replaced. Following any front airbag deployment the retractor tensioners will also be replaced. A growling or grinding sound while attempting to operate the seat belt retractor is a sure sign the retractor tensioner has been deployed and needs to be replaced.

WHEN MONITORED

With the ignition on.

SET CONDITION

The Occupant Restraint Controller (ORC) monitors the resistance of the Driver Seat Belt Retractor Tensioner C1 circuits. The ORC will set this DTC if it detects low resistance on the Driver Seat Belt Retractor Tensioner C1 circuits for 2.6 seconds. The DTC will change from active to stored when the ORC monitoring shows the shorted together fault is gone for 2.6 seconds.

POSSIBLE CAUSES

Possible Causes
(R277) DRIVER SEAT BELT RETRACTOR TENSIONER LINE 1 CIRCUIT SHORTED TO THE (R278) DRIVER SEAT BELT RETRACTOR TENSIONER LINE 2 CIRCUIT
DRIVER SEAT BELT RETRACTOR TENSIONER C1
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **SELECT ACTIVE OR STORED DTC**

   NOTE: Make sure that the battery is fully charged.

   NOTE: The scan tool, (special tool #8443A, SRS Load Tool), and DVOM are required to perform the following test.

   1. Turn the ignition on.

      Select ACTIVE or STORED DTC:

      ACTIVE DTC

      - Go To 2

      STORED DTC

- Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK FOR SHORTED DRIVER SEAT BELT RETRACTOR TENSIONER**

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the Driver Seat Belt Retractor Tensioner C1 harness connector.

NOTE: Check connectors - Clean and repair as necessary.

2. Connect the (special tool #8443A, SRS Load Tool)and the (special tool #8443-8, Jumper, SRS Load)to the Driver Seat Belt Retractor Tensioner C1 harness connector.
3. If equipped with the standard key ignition, use this ignition on warning.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

4. If equipped with the keyless ignition, use this ignition on warning.

WARNING: Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

5. With the scan tool, read the active ORC DTCs.

Does the scan tool display: B007E-2B-DRIVER SEATBELT RETRACTOR PRETENSIONER DEPLOYMENT CONTROL - WIRES SHORTED TOGETHER?

Yes

- Go To 3

No

- Replace the Driver Seat Belt Retractor Tensioner in accordance with the Service Information. Refer to **RETRACTOR, SEAT BELT, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (R277) DRIVER SEAT BELT RETRACTOR TENSIONER LINE 1 CIRCUIT FOR A SHORT TO THE (R278) DRIVER SEAT BELT RETRACTOR TENSIONER LINE 2 CIRCUIT**

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the (special tool #8443A, SRS Load Tool)and (special tool #8443-8, Jumper, SRS Load)from the Driver Seat Belt Retractor Tensioner C1 harness connector.
2. Disconnect the ORC harness connectors.

NOTE: Check connectors - Clean and repair as necessary.

3. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) to the ORC harness connector.
4. Measure the resistance between the (R277) Driver Seat Belt Retractor Tensioner Line 1 circuit connector C1B cavity 12 and the (R278) Driver Seat Belt Retractor Tensioner Line 2 circuit connector C1B cavity 48 at the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool).

   Is the resistance below or within 1.5 - 2.18 Ohms?

   Yes

   - Repair the (R277) Driver Seat Belt Retractor Tensioner Line 1 circuit for a short to the (R278) Driver Seat Belt Retractor Tensioner Line 2 circuit.
   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to follow these instructions may result in possible serious or fatal injury.

   - Replace the ORC in accordance with Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B007F-11-PASSENGER SEATBELT RETRACTOR PRETENSIONER DEPLOYMENT CONTROL - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 24: Passenger Seatbelt Retractor Pretensioner Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The location of the retractor tensioner (passenger sill end pretensioner) is within the plastic trim of the B-pillar. The anchor buckle tensioner is an internal part of the seat belt retractor. When powered, the Occupant Restraint Controller (ORC) sends a test current to the squibs to verify the integrity of the squib and wiring. These circuits are maintained in a "floating" configuration at the ORC (connected to neither power nor ground) as protection against inadvertent deployment. Use of the Supplemental Restraints System (special tool #8443A, SRS Load Tool) in the tests below substitutes a suspect squib with a known good component. The (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) provides a test point as well as a method for opening the shorting bar connections within the ORC harness connector. The retractor tensioners can not be repaired and if ineffective or damaged the entire retractor tensioner unit is to be replaced. Following any front airbag

deployment the retractor tensioners will also be replaced. A growling or grinding sound while attempting to operate the seat belt retractor is a sure sign the retractor tensioner has been deployed and needs to be replaced.

WHEN MONITORED

With the ignition on.

SET CONDITION

The Occupant Restraint Controller (ORC) monitors the resistance of the Passenger Seat Belt Retractor Tensioner C2 circuits. The ORC will set this DTC if it detects low resistance on the Passenger Seat Belt Retractor Tensioner C2 circuits for 2.6 seconds. The DTC will change from active to stored when the ORC monitoring shows the short to ground circuit fault is gone for 2.6 seconds.

POSSIBLE CAUSES

Possible Causes
(R280) PASSENGER SEAT BELT RETRACTOR TENSIONER LINE 1 CIRCUIT SHORTED TO GROUND
(R279) PASSENGER SEAT BELT RETRACTOR TENSIONER LINE 2 CIRCUIT SHORTED TO GROUND
PASSENGER SEAT BELT RETRACTOR TENSIONER C2
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

   NOTE: Make sure that the battery is fully charged.

   NOTE: The scan tool, (special tool #8443A, SRS Load Tool), and DVOM are required to perform the following test.

   1. Turn the ignition on.

      Select ACTIVE or STORED DTC:

      ACTIVE DTC

      - Go To 2

      STORED DTC

- Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK FOR SHORTED PASSENGER SEAT BELT TENSIONER**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the Passenger Seat Belt RetractorTensioner C2 harness connector.

NOTE: Check connectors - Clean and repair as necessary.

2. Connect the (special tool #8443A, SRS Load Tool)and the (special tool #8443-8, Jumper, SRS Load) to the Passenger Seat Belt Retractor Tensioner C2 harness connector.
3. If equipped with the standard key ignition, use this ignition on warning.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

4. If equipped with the keyless ignition, use this ignition on warning.

WARNING: Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

5. With the scan tool, read the active ORC DTCs.

Does the scan tool display: B007F-11-PASSENGER SEATBELT RETRACTOR PRETENSIONER DEPLOYMENT CONTROL - CIRCUIT SHORT TO GROUND?

Yes

- Go To 3

No

- Replace the Passenger Seat Belt Retractor Tensioner in accordance with the Service Information. Refer to **RETRACTOR, SEAT BELT, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (R280) PASSENGER SEAT BELT RETRACTOR TENSIONER LINE 1 CIRCUIT AND THE (R279) PASSENGER SEAT BELT RESTRACTOR TENSIONER LINE 2 CIRCUIT FOR A SHORT TO GROUND**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) from the Passenger Seat Belt Retractor Tensioner C2 harness connector.
2. Disconnect the ORC harness connectors.

NOTE: Check connectors - Clean and repair as necessary.

3. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) to the ORC harness connector.
4. Measure the resistance of the (R280) Passenger Seat Belt Retractor Tensioner Line 1 circuit between ground and the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) connector C1B cavity 11.
5. Measure the resistance of the (R279) Passenger Seat Belt Retractor Tensioner Line 2 circuit between ground and the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) connector C1B cavity 47.

Is the resistance below 10k Ohms on either circuit?

Yes

- Repair the Passenger Seat Belt Retractor Tensioner C2 circuits with resistance below 10k Ohms for a short to ground.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

- Replace the ORC in accordance with Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B007F-12-PASSENGER SEATBELT RETRACTOR PRETENSIONER DEPLOYMENT CONTROL -

CIRCUIT RESISTANCE SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 25: Passenger Seatbelt Retractor Pretensioner Circuit Diagram

THEORY OF OPERATION

The location of the retractor tensioner (passenger sill end pretensioner) is within the plastic trim of the B-pillar. The anchor buckle tensioner is an internal part of the seat belt retractor. When powered, the Occupant Restraint Controller (ORC) sends a test current to the squibs to verify the integrity of the squib and wiring. These circuits are maintained in a "floating" configuration at the ORC (connected to neither power nor ground) as protection against inadvertent deployment. Use of the (special tool #8443A, SRS Load Tool) in the tests below substitutes

a suspect squib with a known good component. The (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) provides a test point as well as a method for opening the shorting bar connections within the ORC harness connector. The retractor tensioners can not be repaired and if ineffective or damaged the entire retractor tensioner unit is to be replaced. Following any front airbag deployment the retractor tensioners will also be replaced. A growling or grinding sound while attempting to operate the seat belt retractor is a sure sign the retractor tensioner has been deployed and needs to be replaced.

WHEN MONITORED

With the ignition on.

SET CONDITION

The Occupant Restraint Controller (ORC) monitors the resistance of the Passenger Seat Belt Retractor Tensioner C1 circuits. The ORC will set this DTC if it detects voltage on the Passenger Seat Belt Retractor Tensioner C1 circuits for 2.6 seconds. The DTC will change from active to stored when the ORC monitoring shows the short to voltage circuit fault is gone for 2.6 seconds.

POSSIBLE CAUSES

Possible Causes
(R280) PASSENGER SEAT BELT RETRACTOR TENSIONER LINE 1 CIRCUIT SHORTED TO VOLTAGE
(R279) PASSENGER SEAT BELT RETRACTOR TENSIONER LINE 2 CIRCUIT SHORTED TO VOLTAGE
PASSENGER SEAT BELT RETRACTOR TENSIONER
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

   NOTE: Make sure that the battery is fully charged.

   NOTE: The scan tool, (special tool #8443A, SRS Load Tool), and DVOM are required to perform the following test.

   1. Turn the ignition on.

      Select ACTIVE or STORED DTC:

      ACTIVE DTC

- Go To 2

STORED DTC

- Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK FOR SHORTED PASSENGER SEAT BELT RETRACTOR TENSIONER**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the Passenger Seat Belt Retractor Tensioner C1 harness connector.

NOTE: Check connectors - Clean and repair as necessary.

2. Connect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) to the Passenger Seat Belt Retractor Tensioner C1 harness connector.
3. If equipped with the standard key ignition, use this ignition on warning.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

4. If equipped with the keyless ignition, use this ignition on warning.

WARNING: Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

5. With the scan tool, read the active ORC DTCs.

Does the scan tool display: B007F-12-PASSENGER SEATBELT RETRACTOR PRETENSIONER DEPLOYMENT CONTROL - CIRCUIT RESISTANCE SHORT TO BATTERY?

Yes

- Go To 3

No

- Replace the Passenger Seat Belt Retractor Tensioner in accordance with the Service Information. Refer to **RETRACTOR, SEAT BELT, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (R280) PASSENGER SEAT BELT RETRACTOR TENSIONER LINE 1 CIRCUIT AND THE (R279) PASSENGER SEAT BELT RETRACTOR TENSIONER LINE 2 CIRCUIT FOR A SHORT TO BATTERY**

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load)from the Passenger Seat Belt Retractor Tensioner C1 harness connector.
2. Disconnect the ORC harness connectors.

NOTE: Check connectors - Clean and repair as necessary.

3. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)to the ORC harness connector.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

4. Measure the voltage of the (R280) Passenger Seat Belt Retractor Tensioner Line 1 circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) connector C1B cavity 11 and ground.
5. Measure the voltage of the (R279) Passenger Seat Belt Retractor Tensioner Line 2 circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) connector C1B cavity 47 and ground.

Is there any voltage present on either circuit?

Yes

- Repair the Passenger Seat Belt Retractor Tensioner C1 circuits with voltage present for a short to battery.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment. Failure to follow these instructions may result in possible serious or fatal injury.

- Replace the ORC in accordance with Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B007F-13-PASSENGER SEATBELT RETRACTOR PRETENSIONER DEPLOYMENT CONTROL - CIRCUIT OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 26: Passenger Seatbelt Retractor Pretensioner Circuit Diagram

THEORY OF OPERATION

The location of the retractor tensioner (passenger sill end pretensioner) is within the plastic trim of the B-pillar. The anchor buckle tensioner is an internal part of the seat belt retractor. When powered, the Occupant Restraint Controller (ORC) sends a test current to the squibs to verify the integrity of the squib and wiring. These circuits are maintained in a "floating" configuration at the ORC (connected to neither power nor ground) as protection against inadvertent deployment. Use of the (special tool #8443A, SRS Load Tool) in the tests below substitutes a suspect squib with a known good component. The (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) provides a test point as well as a method for opening the shorting bar connections within the ORC harness connector. The retractor tensioners can not be repaired and if ineffective or damaged the entire retractor tensioner unit is to be replaced. Following any front airbag deployment the retractor tensioners will

also be replaced. A growling or grinding sound while attempting to operate the seat belt retractor is a sure sign the retractor tensioner has been deployed and needs to be replaced.

WHEN MONITORED

With the ignition on.

SET CONDITION

The Occupant Restraint Controller (ORC) monitors the resistance of the Passenger Seat Belt Retractor Tensioner C1circuits. The ORC will set this DTC if it detects high resistance on the Passenger Seat Belt Retractor Tensioner C1 circuits for 2.6 seconds. The DTC will change from active to stored when the ORC monitoring shows the open circuit fault is gone for 2.6 seconds.

POSSIBLE CAUSES

Possible Causes
(R280) PASSENGER SEAT BELT RETRACTOR TENSIONER LINE 1 CIRCUIT SHORTED TO OPEN
(R279) PASSENGER SEAT BELT RETRACTOR TENSIONER LINE 2 CIRCUIT SHORTED TO OPEN
PASSENGER SEAT BELT RETRACTOR TENSIONER C1
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

   NOTE: Make sure that the battery is fully charged.

   NOTE: The scan tool, (special tool #8443A, SRS Load Tool), and DVOM are required to perform the following test.

   1. Turn the ignition on.

      Select ACTIVE or STORED DTC:

      ACTIVE DTC

      - Go To 2

      STORED DTC

- Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK FOR AN OPEN PASSENGER SEAT BELT TENSIONER**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the Passenger Seat Belt Retractor Tensioner C1 harness connector.

NOTE: Check connectors - Clean and repair as necessary.

2. Connect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) to the Passenger Seat Belt Retractor Tensioner C1 harness connector.
3. If equipped with the standard key ignition, use this ignition on warning.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

4. If equipped with the keyless ignition, use this ignition on warning.

WARNING: Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

5. With the scan tool, read the active ORC DTCs.

Does the scan tool display: B007F-13-PASSENGER SEATBELT RETRACTOR PRETENSIONER DEPLOYMENT CONTROL - CIRCUIT OPEN?

Yes

- Go To 3

No

- Replace the Passenger Seat Belt Retractor Tensioner in accordance with the Service Information. Refer to **RETRACTOR, SEAT BELT, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (R280) PASSENGER SEAT BELT RETRACTOR TENSIONER LINE 1 CIRCUIT FOR AN OPEN**

   WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

   1. Disconnect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) from the Passenger Seat Belt Retractor Tensioner C1 harness connector.
   2. Disconnect the ORC harness connectors.

      NOTE: Check connectors - Clean and repair as necessary.

   3. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) to the ORC harness connector.
   4. Measure the resistance of the (R280) Passenger Seat Belt Retractor Tensioner Line 1 circuit between the Passenger Seat Belt Retractor Tensioner C1 connector cavity 2 and the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) connector C1B cavity 11.

      Is the resistance within 5.4 - 10.0 Ohms?

      Yes

      - Go To 4

      No

      - Repair the (R280) Passenger Seat Belt Retractor Tensioner Line 1 circuit for an open.
      - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK THE (R279) PASSENGER SEAT BELT RETRACTOR TENSIONER LINE 2 CIRCUIT FOR AN OPEN**
   1. Measure the resistance of the (R279) Passenger Seat Belt Retractor Tensioner Line 2 circuit between the Passenger Seat Belt Retractor Tensioner C1 connector cavity 1 and the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) connector C1B cavity 47.

      Is the resistance within 5.4 - 10.0 Ohms?

      Yes

      WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to follow these instructions may result in possible serious or fatal injury.

- Replace the ORC in accordance with Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Repair the (R279) Passenger Seat Belt Retractor Tensioner Line 2 circuit for an open.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B007F-2B-PASSENGER SEATBELT RETRACTOR PRETENSIONER DEPLOYMENT CONTROL - WIRES SHORTED TOGETHER

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 27: Passenger Seatbelt Retractor Pretensioner Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The location of the retractor tensioner (passenger sill end pretensioner) is within the plastic trim of the B-pillar. The anchor buckle tensioner is an internal part of the seat belt retractor. When powered, the Occupant Restraint Controller (ORC) sends a test current to the squibs to verify the integrity of the squib and wiring. These circuits are maintained in a "floating" configuration at the ORC (connected to neither power nor ground) as protection against inadvertent deployment. Use of the (special tool #8443A, SRS Load Tool) in the tests below substitutes a suspect squib with a known good component. The (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) provides a test point as well as a method for opening the shorting bar connections within the ORC harness connector. The retractor tensioners can not be repaired and if ineffective or damaged the entire retractor tensioner unit is to be replaced. Following any front airbag deployment the retractor tensioners will

also be replaced. A growling or grinding sound while attempting to operate the seat belt retractor is a sure sign the retractor tensioner has been deployed and needs to be replaced.

WHEN MONITORED

With the ignition on.

SET CONDITION

The Occupant Restraint Controller (ORC) monitors the resistance of the Passenger Seat Belt Retractor Tensioner C1 circuits. The ORC will set this DTC if it detects low resistance on the Passenger Seat Belt Retractor Tensioner C1 circuits for 2.6 seconds. The DTC will change from active to stored when the ORC monitoring shows the shorted together circuit fault is gone for 2.6 seconds.

POSSIBLE CAUSES

Possible Causes
(R280) PASSENGER SEAT BELT RETRACTOR TENSIONER LINE 1 CIRCUIT SHORTED TO THE (R279) PASSENGER SEAT BELT RETRACTOR TENSIONER LINE 2 CIRCUIT
PASSENGER SEAT BELT RETRACTOR TENSIONER C1
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

   NOTE: Make sure that the battery is fully charged.

   NOTE: The scan tool, (special tool #8443A, SRS Load Tool), and DVOM are required to perform the following test.

   1. Turn the ignition on.

      Select ACTIVE or STORED DTC:

      ACTIVE DTC

      - Go To 2

      STORED DTC

      - Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD**

PROCEDURE .

2. **CHECK FOR SHORTED PASSENGER SEAT BELT RETRACTOR TENSIONER**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the Passenger Seat Belt Retractor Tensioner C1 harness connector.

NOTE: Check connectors - Clean and repair as necessary.

2. Connect the (special tool #8443A, SRS Load Tool)and the (special tool #8443-8, Jumper, SRS Load) to the Passenger Seat Belt Retractor Tensioner C1 harness connector.
3. If equipped with the standard key ignition, use this ignition on warning.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

4. If equipped with the keyless ignition, use this ignition on warning.

WARNING: Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

5. With the scan tool, read the active ORC DTCs.

Does the scan tool display: B007F-2B-PASSENGER SEATBELT RETRACTOR PRETENSIONER DEPLOYMENT CONTROL - WIRES SHORTED TOGETHER?

Yes

- Go To 3

No

- Replace the Passenger Seat Belt Retractor Tensioner in accordance with the Service Information. Refer to **RETRACTOR, SEAT BELT, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (R280) PASSENGER SEAT BELT RETRACTOR TENSIONER LINE 1 CIRCUIT**

FOR A SHORT TO THE (R279) PASSENGER SEAT BELT RETRACTOR TENSIONER LINE 2 CIRCUIT

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the (special tool #8443A, SRS Load Tool)and the (special tool #8443-8, Jumper, SRS Load) from the Passenger Seat Belt Retractor Tensioner C1 harness connector.
2. Disconnect the ORC harness connectors.

NOTE: Check connectors - Clean and repair as necessary.

3. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)to the ORC harness connector.
4. Measure the resistance between the (R280) Passenger Seat Belt Retractor Tensioner Line 1 circuit connector C1B cavity 11 and the (R279) Passenger Seat Belt Retractor Tensioner Line 2 circuit connector C1B cavity 47 at the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool).

   Is the resistance below or within 1.5 - 2.18 Ohms?

   Yes

   - Repair the (R280) Passenger Seat Belt Retractor Tensioner Line 1 circuit for a short to the (R279) Passenger Seat Belt RetractorTensioner Line 2 circuit.
   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment. Failure to follow these instructions may result in possible serious or fatal injury.

   - Replace the ORC in accordance with Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B0080-11-DRIVER SEATBELT LOAD LIMITER DEPLOYMENT CONTROL - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 28: Driver Seatbelt Retractor Pretensioner Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) sends a test current to the squibs to verify the integrity of the squib and wiring. These circuits are maintained in a "floating" configuration at the ORC (connected to neither power nor ground) as protection against inadvertent deployment. Use of the in the tests below substitutes a suspect squib with a known good component. The use of the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) provides a test point as well as a method for opening the shorting bar connections within the ORC harness connector. The adaptive load limiter on the driver side front retractor is activated only after both the retractor and anchor buckle tensioners. The ORC uses the adaptive load

limiter to adjust the belt resistance based upon impact data, to reduce the force of the tightened seat belt on the chest of the front driver seat occupant, reducing the potential for injuries. The adaptive load limiter cannot be repaired and, if ineffective or damaged, the entire front seat belt and retractor unit must be replaced. If the front airbags have been deployed, the adaptive load limiter has also been deployed. An adaptive load-limiting device is integral to the front driver seat belt retractor to supplement the anchor buckle and retractor tensioners. The adaptive load limiter is controlled by the Occupant Restraint Controller (ORC). The front driver retractor has a two pyrotechnic initiators, one for the adaptive load limiter and one for the tensioner. The adaptive load limiter initiator is connected to the vehicle electrical system through a dedicated take out of the body wire harness by a keyed and latching yellow molded plastic connector insulator to ensure a secure connection. The adaptive load limiter is not intended for reuse and must be replaced following any front airbag deployment. Refer to **RETRACTOR, SEAT BELT, REMOVAL** .

WHEN MONITORED

With the ignition on.

SET CONDITION

The Occupant Restraint Controller (ORC) monitors the resistance of the Driver Load Limiter circuits. The ORC will set this DTC if it detects low resistance on the Driver Load Limiter circuits for 2.6 seconds. This DTC transitions from active to stored when the module sees a recovery from the shorted to ground condition for greater than 2.6 seconds.

POSSIBLE CAUSES

Possible Causes
(R77) DRIVER LOAD LIMITER LINE 1 CIRCUIT SHORTED TO GROUND
(R75) DRIVER LOAD LIMITER LINE 2 CIRCUIT SHORTED TO GROUND
DRIVER SEAT BELT RETRACTOR TENSIONER C2
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

NOTE: Make sure that the battery is fully charged.

NOTE: The scan tool, (special tool #8443A, SRS Load Tool), and DVOM are required to perform the following test.

1. Turn the ignition on.

Select ACTIVE or STORED DTC:

ACTIVE DTC

- Go To 2

STORED DTC

- Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK FOR SHORTED DRIVER LOAD LIMITER CIRCUITS**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the Driver Seat Belt Retractor Tensioner C2 harness connector.

NOTE: Check connectors - Clean and repair as necessary.

2. Connect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) to the Driver Seat Belt Retractor Tensioner C2 harness connector.
3. If equipped with the standard key ignition, use this ignition on warning.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

4. If equipped with the keyless ignition, use this ignition on warning.

WARNING: Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

5. With the scan tool, read the active ORC DTCs.

Does the scan tool display: B0080-11-DRIVER SEATBELT LOAD LIMITER DEPLOYMENT CONTROL - CIRCUIT SHORT TO GROUND - DTC?

Yes

- Go To 3

No

- Replace the Driver Seat Belt Retractor Tensioner in accordance with the Service Information. Refer to **RETRACTOR, SEAT BELT, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (R77) DRIVER LOAD LIMITER LINE 1 CIRCUIT AND THE (R75) DRIVER LOAD LIMITER LINE 2 CIRCUIT FOR A SHORT TO GROUND**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) from the Driver Seat Belt Retractor Tensioner C2 harness connector.
2. Disconnect the ORC harness connectors.

NOTE: Check connectors - Clean and repair as necessary.

3. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) to the ORC harness connector.
4. Measure the resistance of the (R77) Driver Load Limiter Line 1 circuit between ground and the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) connector C1B cavity 42.
5. Measure the resistance of the (R75) Driver Load Limiter Line 2 circuit between ground and the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) connector C1B cavity 6.

Is the resistance below 10k Ohms on either circuit?

Yes

- Repair the Driver Load Limiter circuits with resistance below 10k Ohms for a short to ground.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

- Replace the ORC in accordance with Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD**

PROCEDURE .

B0080-12-DRIVER SEATBELT LOAD LIMITER DEPLOYMENT CONTROL - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) sends a test current to the squibs to verify the integrity of the squib and wiring. These circuits are maintained in a "floating" configuration at the ORC (connected to neither power nor ground) as protection against inadvertent deployment. Use of the in the tests below substitutes a suspect squib with a known good component. The use of the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) provides a test point as well as a method for opening the shorting bar connections within the ORC harness connector. The adaptive load limiter on the driver side front retractor is activated only after both the retractor and anchor buckle tensioners. The ORC uses the adaptive load limiter to adjust the belt resistance based upon impact data, to reduce the force of the tightened seat belt on the chest of the front driver seat occupant, reducing the potential for injuries. The adaptive load limiter cannot be repaired and, if ineffective or damaged, the entire front seat belt and retractor unit must be replaced. If the front airbags have been deployed, the adaptive load limiter has also been deployed. An adaptive load-limiting device is integral to the front driver seat belt retractor to supplement the anchor buckle and retractor tensioners. The adaptive load limiter is controlled by the Occupant Restraint Controller (ORC). The front driver retractor has a two pyrotechnic initiators, one for the adaptive load limiter and one for the tensioner. The adaptive load limiter initiator is connected to the vehicle electrical system through a dedicated take out of the body wire harness by a keyed and latching yellow molded plastic connector insulator to ensure a secure connection. The adaptive load limiter is not intended for reuse and must be replaced following any front airbag deployment. Refer to **RETRACTOR, SEAT BELT, REMOVAL** .

WHEN MONITORED

With the ignition on.

SET CONDITION

The Occupant Restraint Controller (ORC) monitors the voltage on the Driver Load Limiter circuits. The ORC will set this DTC if it detects voltage on the Driver Load Limiter circuits for 2.6 seconds. This DTC transitions from active to stored when the module sees a recovery from the shorted to voltage condition for greater than 2.6 seconds.

POSSIBLE CAUSES

Possible Causes
(R77) DRIVER LOAD LIMITER LINE 1 CIRCUIT SHORTED TO VOLTAGE
(R75) DRIVER LOAD LIMITER LINE 2 CIRCUIT SHORTED TO VOLTAGE
DRIVER SEAT BELT RETRACTOR TENSIONER C2
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

NOTE: Make sure that the battery is fully charged.

NOTE: The scan tool, (special tool #8443A, SRS Load Tool), and DVOM are required to perform the following test.

1. Turn the ignition on.

   Select ACTIVE or STORED DTC:

   ACTIVE DTC

   - Go To 2

   STORED DTC

   - Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK FOR SHORTED DRIVER LOAD LIMITER CIRCUITS**

   WARNING: **Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

   1. Disconnect the Driver Seat Belt Retractor Tensioner C2 harness connector.

      NOTE: Check connectors - Clean and repair as necessary.

   2. Connect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) to the Driver Seat Belt Retractor Tensioner C2 harness connector.
   3. If equipped with the standard key ignition, use this ignition on warning.

      WARNING: **Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

   4. If equipped with the keyless ignition, use this ignition on warning.

      WARNING: **Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

   5. With the scan tool, read the active ORC DTCs.

Does the scan tool display: B0080-12-DRIVER SEATBELT LOAD LIMITER DEPLOYMENT CONTROL - CIRCUIT SHORT TO BATTERY - DTC?

Yes

- Go To 3

No

- Replace the Driver Seat Belt Retractor Tensioner in accordance with the Service Information. Refer to **RETRACTOR, SEAT BELT, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (R77) DRIVER LOAD LIMITER LINE 1 CIRCUIT AND THE (R75) DRIVER LOAD LIMITER LINE 2 CIRCUIT FOR A SHORT TO BATTERY**

WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

1. Disconnect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) from the Driver Seat Belt Retractor Tensioner C2 harness connector.
2. Disconnect the ORC harness connectors.

NOTE: Check connectors - Clean and repair as necessary.

3. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) to the ORC harness connector.
4. If equipped with the standard key ignition, use this ignition on warning.

WARNING: **Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

5. If equipped with the keyless ignition, use this ignition on warning.

WARNING: **Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

6. Measure the voltage of the (R77) Driver Adaptive Load Limiter Line 1 circuit between the (special

tool #8443-57, Adapter, Supplemental Restraint System Load Tool) connector C1B cavity 42 and ground.

7. Measure the voltage of the (R75) Driver Adaptive Load Limiter Line 2 circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) connector C1B cavity 6 and ground.

   Is there any voltage present on either circuit?

   Yes

   - Repair the Driver Load Limiter circuits with voltage present for a short to battery.
   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

   WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment. Failure to follow these instructions may result in possible serious or fatal injury.

   - Replace the ORC in accordance with Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B0080-13-DRIVER SEATBELT LOAD LIMITER DEPLOYMENT CONTROL - CIRCUIT OPEN

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

NOTE: Make sure that the battery is fully charged.

NOTE: The scan tool, (special tool #8443A, SRS Load Tool), and DVOM are required to perform the following test.

1. Turn the ignition on.

Select ACTIVE or STORED DTC:

ACTIVE DTC

- Go To 2

STORED DTC

- Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK FOR AN OPEN DRIVER LOAD LIMITER CIRCUITS**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the Driver Seat Belt Retractor Tensioner C2 harness connector.

NOTE: Check connectors - Clean and repair as necessary.

2. Connect the (special tool #8443A, SRS Load Tool)and the (special tool #8443-8, Jumper, SRS Load)to the Driver Seat Belt Retractor Tensioner C2 harness connector.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

3. With the scan tool, read the active ORC DTCs.

Does the scan tool display: B0080-13-DRIVER SEATBELT LOAD LIMITER DEPLOYMENT CONTROL - CIRCUIT SHORT TO GROUND - DTC?

Yes

- Go To 3

No

- Replace the Driver Seat Belt Retractor Tensioner C2 in accordance with the Service Information. Refer to **RETRACTOR, SEAT BELT, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (R77) DRIVER LOAD LIMITER LINE 1 CIRCUIT FOR AN OPEN**

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may

result in possible serious or fatal injury.

1. Disconnect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) from the Driver Seat Belt Retractor Tensioner C2 harness connector.
2. Disconnect the ORC harness connectors.

NOTE: Check connectors - Clean and repair as necessary.

3. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) to the ORC harness connector.
4. Measure the resistance of the (R77) Driver Load Limiter Line 1 circuit between the Driver Seat Belt Retractor Tensioner C2 connector cavity 2 and the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) connector C1B cavity 42.

   Is the resistance below or within 5.4 - 10.0 Ohms?

   Yes

   - Go To 4

   No

   - Repair the (R77) Driver Load Limiter Line 1 circuit for an open.
   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK THE (R75) DRIVER LOAD LIMITER LINE 2 CIRCUIT FOR AN OPEN**
   1. Measure the resistance of the (R75) Driver Load Limiter Line 2 circuit between the Driver Seat Belt Retractor Tensioner C2 connector cavity 1 and the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) connector C1B cavity 6.

      Is the resistance below or within 5.4 - 10.0 Ohms?

      Yes

      WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to follow these instructions may result in possible serious or fatal injury.

      - Replace the ORC in accordance with Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
      - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

- Repair the (R75) Driver Load Limiter Line 2 circuit for an open.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B0080-2B-DRIVER SEATBELT LOAD LIMITER DEPLOYMENT CONTROL - WIRES SHORTED TOGETHER

WHEN MONITORED

With the ignition on.

SET CONDITION

The Occupant Restraint Controller (ORC) monitors the resistance of the Driver Load Limiter circuits. The ORC will set this DTC if it detects low resistance between the Driver Load Limiter circuits for 2.6 seconds. This DTC transitions from active to stored when the module sees a recovery from the wires shorted together condition for greater than 2.6 seconds.

POSSIBLE CAUSES

Possible Causes
(R77) DRIVER LOAD LIMITER LINE 1 CIRCUIT SHORTED TO THE (R75) DRIVER LOAD LIMITER LINE 2 CIRCUIT
DRIVER SEAT BELT RETRACTOR TENSIONER C2
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

NOTE: Make sure that the battery is fully charged.

NOTE: The scan tool, (special tool #8443A, SRS Load Tool), and DVOM are required to perform the following test.

1. Turn the ignition on.

   Select ACTIVE or STORED DTC:

   ACTIVE DTC

   - Go To 2

   STORED DTC

   - Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK FOR SHORTED DRIVER LOAD LIMITER CIRCUITS**

   WARNING: **Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

   1. Disconnect the Driver Seat Belt Retractor Tensioner C2 harness connector.

      NOTE: Check connectors - Clean and repair as necessary.

   2. Connect the (special tool #8443A, SRS Load Tool)and the (special tool #8443-8, Jumper, SRS Load)to the Driver Seat Belt Retractor Tensioner C2 harness connector.
   3. If equipped with the standard key ignition, use this ignition on warning.

      WARNING: **Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

   4. If equipped with the keyless ignition, use this ignition on warning.

      WARNING: **Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

5. With the scan tool, read the active ORC DTCs.

   Does the scan tool display: B0080-2B-DRIVER SEATBELT LOAD LIMITER DEPLOYMENT CONTROL - WIRES SHORTED TOGETHER - DTC?

   Yes

   - Go To 3

   No

   - Replace the Driver Seat Belt Retractor Tensioner C2 in accordance with the Service Information. Refer to **RETRACTOR, SEAT BELT, REMOVAL** .
   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (R77) DRIVER LOAD LIMITER LINE 1 CIRCUIT FOR A SHORT TO THE (R75) DRIVER LOAD LIMITER LINE 2 CIRCUIT**

   WARNING: **Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

   1. Disconnect the (special tool #8443A, SRS Load Tool)and the (special tool #8443-8, Jumper, SRS Load)from the Driver Seat Belt Retractor Tensioner C2 harness connector.
   2. Disconnect the ORC harness connectors.

      NOTE: Check connectors - Clean and repair as necessary.

   3. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) to the ORC harness connector.
   4. Measure the resistance between the (R77) Driver Load Limiter Line 1 circuit connector C1B cavity 42 and the (R75) Driver Load Limiter Line 2 circuit connector C1B cavity 42 at the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool).

      Is the resistance below or within 1.5 - 2.18 Ohms?

      Yes

      - Repair the (R77) Driver Load Limiter Line 1 circuit for a short to the (R75) Driver Load Limiter Line 2 circuit.
      - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment. Failure to follow these instructions may result in possible serious or fatal injury.

- Replace the ORC in accordance with Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B0082-11-PASSENGER SEATBELT LOAD LIMITER DEPLOYMENT CONTROL - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 32: Passenger Seatbelt Retractor Pretensioner Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) sends a test current to the squibs to verify the integrity of the squib and wiring. These circuits are maintained in a "floating" configuration at the ORC (connected to neither power nor ground) as protection against inadvertent deployment. Use of the (special tool #8443A, SRS Load Tool) in the tests below substitutes a suspect squib with a known good component. The use of the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) provides a test point as well as a method for opening the shorting bar connections within the ORC harness connector. The adaptive load limiter on the passenger side front retractor is activated only after both the retractor and anchor buckle tensioners. The ORC uses the adaptive load limiter to adjust the belt resistance based upon impact data, to reduce the force of the tightened seat belt on the chest of the front passenger seat occupant, reducing the

potential for injuries. The adaptive load limiter cannot be repaired and, if ineffective or damaged, the entire front seat belt and retractor unit must be replaced. If the front airbags have been deployed, the adaptive load limiter has also been deployed. An adaptive load-limiting device is integral to the front passenger seat belt retractor to supplement the anchor buckle and retractor tensioners. The adaptive load limiter is controlled by the Occupant Restraint Controller (ORC). The front passenger retractor has a two pyrotechnic initiators, one for the adaptive load limiter and one for the tensioner. The adaptive load limiter initiator is connected to the vehicle electrical system through a dedicated take out of the body wire harness by a keyed and latching yellow molded plastic connector insulator to ensure a secure connection. The adaptive load limiter is not intended for reuse and must be replaced following any front airbag deployment. Refer to **RETRACTOR, SEAT BELT, REMOVAL** .

WHEN MONITORED

With the ignition on.

SET CONDITION

The Occupant Restraint Controller (ORC) monitors the resistance of the Passenger Load Limiter circuits. The ORC will set this DTC if it detects low resistance on the Passenger Load Limiter circuits for 2.6 seconds. This DTC transitions from active to stored when the module sees a recovery from the shorted to ground condition for greater than 2.6 seconds.

POSSIBLE CAUSES

Possible Causes
(R78) PASSENGER LOAD LIMITER LINE 1 CIRCUIT SHORTED TO GROUND
(R76) PASSENGER LOAD LIMITER LINE 2 CIRCUIT SHORTED TO GROUND
PASSENGER SEAT BELT RETRACTOR TENSIONER C2
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

NOTE: Make sure that the battery is fully charged.

NOTE: The scan tool, (special tool #8443A, SRS Load Tool), and DVOM are required to perform the following test.

1. Turn the ignition on.

   Select ACTIVE or STORED DTC:

ACTIVE DTC

- Go To 2

STORED DTC

- Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK FOR SHORTED PASSENGER LOAD LIMITER CIRCUITS**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the Passenger Seat Belt Retractor Tensioner C2 harness connector.

NOTE: Check connectors - Clean and repair as necessary.

2. Connect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) to the Passenger Seat Belt Retractor Tensioner C2 harness connector.
3. If equipped with the standard key ignition, use this ignition on warning.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

4. If equipped with the keyless ignition, use this ignition on warning.

WARNING: Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

5. With the scan tool, read the active ORC DTCs.

Does the scan tool display: B0082-11-PASSENGER SEATBELT LOAD LIMITER DEPLOYMENT CONTROL - CIRCUIT SHORT TO GROUND- DTC?

Yes

- Go To 3

No

- Replace the Passenger Seat Belt Retractor Tensioner C2 in accordance with the Service Information. Refer to **RETRACTOR, SEAT BELT, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (R78) PASSENGER LOAD LIMITER LINE 1 CIRCUIT AND THE (R76) PASSENGER LOAD LIMITER LINE 2 CIRCUIT FOR A SHORT TO GROUND**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) from the Passenger Seat Belt Retractor Tensioner C2 harness connector.
2. Disconnect the ORC harness connectors.

NOTE: Check connectors - Clean and repair as necessary.

3. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) to the ORC harness connector.
4. Measure the resistance of the (R78) Passenger Load Limiter Line 1 circuit between ground and the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) connector C1B cavity 5.
5. Measure the resistance of the (R76) Passenger Load Limiter Line 2 circuit between ground and the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) connector C1B cavity 41.

Is the resistance below 10k Ohms on either circuit?

Yes

- Repair the Passenger Seat Belt Retractor Tensioner C2 circuits with resistance below 10k Ohms for a short to ground.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

- Replace the ORC in accordance with Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD**

PROCEDURE .

B0082-12-PASSENGER SEATBELT LOAD LIMITER DEPLOYMENT CONTROL - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 33: Passenger Seatbelt Retractor Pretensioner Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) sends a test current to the squibs to verify the integrity of the squib and wiring. These circuits are maintained in a "floating" configuration at the ORC

(connected to neither power nor ground) as protection against inadvertent deployment. Use of the (special tool #8443A, SRS Load Tool) in the tests below substitutes a suspect squib with a known good component. The use of the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) provides a test point as well as a method for opening the shorting bar connections within the ORC harness connector. The adaptive load limiter on the passenger side front retractor is activated only after both the retractor and anchor buckle tensioners. The ORC uses the adaptive load limiter to adjust the belt resistance based upon impact data, to reduce the force of the tightened seat belt on the chest of the front passenger seat occupant, reducing the potential for injuries. The adaptive load limiter cannot be repaired and, if ineffective or damaged, the entire front seat belt and retractor unit must be replaced. If the front airbags have been deployed, the adaptive load limiter has also been deployed. An adaptive load-limiting device is integral to the front passenger seat belt retractor to supplement the anchor buckle and retractor tensioners. The adaptive load limiter is controlled by the Occupant Restraint Controller (ORC). The front passenger retractor has a two pyrotechnic initiators, one for the adaptive load limiter and one for the tensioner. The adaptive load limiter initiator is connected to the vehicle electrical system through a dedicated take out of the body wire harness by a keyed and latching yellow molded plastic connector insulator to ensure a secure connection. The adaptive load limiter is not intended for reuse and must be replaced following any front airbag deployment. Refer to **RETRACTOR, SEAT BELT, REMOVAL** .

WHEN MONITORED

With the ignition on.

SET CONDITION

The Occupant Restraint Controller (ORC) monitors the voltage on the Passenger Load Limiter circuits. The ORC will set this DTC if it detects voltage on the Passenger Load Limiter circuits for 2.6 seconds. This DTC transitions from active to stored when the module sees a recovery from the shorted to voltage condition for greater than 2.6 seconds.

POSSIBLE CAUSES

Possible Causes
(R78) PASSENGER LOAD LIMITER LINE 1 CIRCUIT SHORTED TO VOLTAGE
(R76) PASSENGER LOAD LIMITER LINE 2 CIRCUIT SHORTED TO VOLTAGE
PASSENGER SEAT BELT RETRACTOR TENSIONER C2
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

NOTE: Make sure that the battery is fully charged.

NOTE: The scan tool, (special tool #8443A, SRS Load Tool), and DVOM are required to perform the following test.

1. Turn the ignition on.

   Select ACTIVE or STORED DTC:

   ACTIVE DTC

   - Go To 2

   STORED DTC

   - Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK FOR SHORTED PASSENGER LOAD LIMITER CIRCUITS**

   WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

   1. Disconnect the Passenger Seat Belt Retractor Tensioner C2 harness connector.

      NOTE: Check connectors - Clean and repair as necessary.

   2. Connect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) to the Passenger Seat Belt Retractor Tensioner C2 harness connector.
   3. If equipped with the standard key ignition, use this ignition on warning.

      WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

   4. If equipped with the keyless ignition, use this ignition on warning.

      WARNING: Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

   5. With the scan tool, read the active ORC DTCs.

Does the scan tool display: B0082-12-PASSENGER SEATBELT LOAD LIMITER DEPLOYMENT CONTROL - CIRCUIT SHORT TO BATTERY- DTC?

Yes

- Go To 3

No

- Replace the Passenger Seat Belt Retractor Tensioner C2 in accordance with the Service Information. Refer to **RETRACTOR, SEAT BELT, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (R78) PASSENGER LOAD LIMITER LINE 1 CIRCUIT AND THE (R76) PASSENGER LOAD LIMITER LINE 2 CIRCUIT FOR A SHORT TO GROUND**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) from the Passenger Seat Belt Retractor Tensioner C2 harness connector.
2. Disconnect the ORC harness connectors.

NOTE: Check connectors - Clean and repair as necessary.

3. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) to the ORC harness connector.
4. Measure the voltage of the (R78) Passenger Load Limiter Line 1 circuit between ground and the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) connector C1B cavity 5.
5. Measure the voltage of the (R76) Passenger Load Limiter Line 2 circuit between ground and the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) connector C1B cavity 41.

Is there any voltage present on either circuit?

Yes

- Repair the Passenger Seat Belt Retractor Tensioner C2 circuits with voltage present for a short to battery.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

- Replace the ORC in accordance with Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B0082-13-PASSENGER SEATBELT LOAD LIMITER DEPLOYMENT CONTROL - CIRCUIT OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 34: Passenger Seatbelt Retractor Pretensioner Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) sends a test current to the squibs to verify the integrity of the squib and wiring. These circuits are maintained in a "floating" configuration at the ORC (connected to neither power nor ground) as protection against inadvertent deployment. Use of the (special tool #8443A, SRS Load Tool) in the tests below substitutes a suspect squib with a known good component. The use of the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) provides a test point as well as a method for opening the shorting bar connections within the ORC harness connector. The adaptive load limiter on the passenger side front retractor is activated only after both the retractor and anchor buckle tensioners. The ORC uses the adaptive load limiter to adjust the belt resistance based upon impact data, to reduce the force of the tightened seat belt on the chest of the front passenger seat occupant, reducing the

potential for injuries. The adaptive load limiter cannot be repaired and, if ineffective or damaged, the entire front seat belt and retractor unit must be replaced. If the front airbags have been deployed, the adaptive load limiter has also been deployed. An adaptive load-limiting device is integral to the front passenger seat belt retractor to supplement the anchor buckle and retractor tensioners. The adaptive load limiter is controlled by the Occupant Restraint Controller (ORC). The front passenger retractor has a two pyrotechnic initiators, one for the adaptive load limiter and one for the tensioner. The adaptive load limiter initiator is connected to the vehicle electrical system through a dedicated take out of the body wire harness by a keyed and latching yellow molded plastic connector insulator to ensure a secure connection. The adaptive load limiter is not intended for reuse and must be replaced following any front airbag deployment. Refer to **RETRACTOR, SEAT BELT, REMOVAL** .

WHEN MONITORED

With the ignition on.

SET CONDITION

The Occupant Restraint Controller (ORC) monitors the resistance of the Passenger Load Limiter circuits. The ORC will set this DTC if it detects an open or high resistance on the Passenger Load Limiter circuits for 2.6 seconds. This DTC transitions from active to stored when the module sees a recovery from the open condition for greater than 2.6 seconds.

POSSIBLE CAUSES

Possible Causes
(R78) PASSENGER LOAD LIMITER LINE 1 CIRCUIT OPEN
(R76) PASSENGER LOAD LIMITER LINE 2 CIRCUIT OPEN
PASSENGER SEAT BELT RETRACTOR TENSIONER C2
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

NOTE: Make sure that the battery is fully charged.

NOTE: The scan tool, (special tool #8443A, SRS Load Tool), and DVOM are required to perform the following test.

1. Turn the ignition on.

   Select ACTIVE or STORED DTC:

ACTIVE DTC

- Go To 2

STORED DTC

- Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK FOR AN OPEN PASSENGER LOAD LIMITER CIRCUITS**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the Passenger Seat Belt Retractor Tensioner C2 connector.

NOTE: Check connectors - Clean and repair as necessary.

2. Connect the (special tool #8443A, SRS Load Tool)and the (special tool #8443-8, Jumper, SRS Load) to the Passenger Seat Belt Retractor Tensioner C2 harness connector.
3. If equipped with the standard key ignition, use this ignition on warning.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

4. If equipped with the keyless ignition, use this ignition on warning.

WARNING: Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

5. With the scan tool, read the active ORC DTCs.

Does the scan tool display: B0082-13-PASSENGER SEATBELT LOAD LIMITER DEPLOYMENT CONTROL - CIRCUIT OPEN - DTC?

Yes

- Go To 3

No

- Replace the Passenger Seat Belt Retractor Tensioner C2 in accordance with the Service Information. Refer to **RETRACTOR, SEAT BELT, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (R78) PASSENGER LOAD LIMITER LINE 1 CIRCUIT FOR AN OPEN**

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the (special tool #8443A, SRS Load Tool) and the (special tool #8443-8, Jumper, SRS Load) from the Passenger Seat Belt Retractor Tensioner C2 harness connector.
2. Disconnect the ORC harness connectors.

NOTE: Check connectors - Clean and repair as necessary.

3. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) to the ORC harness connector.
4. Measure the resistance of the (R78) Passenger Load Limiter Line 1 circuit between the Passenger Seat Belt Retractor Tensioner C2 connector cavity 2 and the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) connector C1B cavity 5.

Is the resistance less than or within 1.5 - 2.18 Ohms?

Yes

- Go To 4

No

- Repair the (R78) Passenger Load Limiter Line 1 circuit for an open.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK THE (R76) PASSENGER LOAD LIMITER LINE 2 CIRCUIT FOR AN OPEN**

1. Measure the resistance of the (R76) Passenger Load Limiter Line 2 circuit between the Passenger Seat Belt Retractor Tensioner C2 connector cavity 1 and the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) connector C1B cavity 41.

Is the resistance less than or within 1.5 - 2.18 Ohms?

Yes

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any

time, it must be replaced. Failure to follow these instructions may result in possible serious or fatal injury.

- Replace the ORC in accordance with Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Repair the (R76) Passenger Load Limiter Line 2 circuit for an open.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B0082-2B-PASSENGER SEATBELT LOAD LIMITER DEPLOYMENT CONTROL - WIRES SHORTED TOGETHER

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 35: Passenger Seatbelt Retractor Pretensioner Circuit Diagram

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) sends a test current to the squibs to verify the integrity of the squib and wiring. These circuits are maintained in a "floating" configuration at the ORC (connected to neither power nor ground) as protection against inadvertent deployment. Use of the (special tool #8443A, SRS Load Tool)in the tests below substitutes a suspect squib with a known good component. The use of the(special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) provides a test point as well as a method for opening the shorting bar connections within the ORC harness connector. The adaptive load limiter on the passenger side front retractor is activated only after both the retractor and anchor buckle tensioners. The ORC uses the adaptive load limiter to adjust the belt resistance based upon impact data, to reduce the force of the tightened seat belt on the chest of the front passenger seat occupant, reducing the

potential for injuries. The adaptive load limiter cannot be repaired and, if ineffective or damaged, the entire front seat belt and retractor unit must be replaced. If the front airbags have been deployed, the adaptive load limiter has also been deployed. An adaptive load-limiting device is integral to the front passenger seat belt retractor to supplement the anchor buckle and retractor tensioners. The adaptive load limiter is controlled by the Occupant Restraint Controller (ORC). The front passenger retractor has a two pyrotechnic initiators, one for the adaptive load limiter and one for the tensioner. The adaptive load limiter initiator is connected to the vehicle electrical system through a dedicated take out of the body wire harness by a keyed and latching yellow molded plastic connector insulator to ensure a secure connection. The adaptive load limiter is not intended for reuse and must be replaced following any front airbag deployment. Refer to **RETRACTOR, SEAT BELT, REMOVAL** .

WHEN MONITORED

With the ignition on.

SET CONDITION

The Occupant Restraint Controller (ORC) monitors the resistance of the Passenger Load Limiter circuits. The ORC will set this DTC if it detects low resistance between the Passenger Load Limiter circuits for 2.6 seconds. This DTC transitions from active to stored when the module sees a recovery from the wires shorted together condition for greater than 2.6 seconds.

POSSIBLE CAUSES

Possible Causes
(R78) PASSENGER LOAD LIMITER LINE 1 CIRCUIT SHORTED TO THE (R76) PASSENGER LOAD LIMITER LINE 2 CIRCUIT
PASSENGER SEAT BELT RETRACTORTENSIONER C2
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

   NOTE: Make sure that the battery is fully charged.

   NOTE: The scan tool, (special tool #8443A, SRS Load Tool), and DVOM are required to perform the following test.

   1. Turn the ignition on.

      Select ACTIVE or STORED DTC:

ACTIVE DTC

- Go To 2

STORED DTC

- Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK FOR SHORTED PASSENGER LOAD LIMITER CIRCUITS**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the Passenger Seat Belt Retractor Tensioner C2 harness connector.

NOTE: Check connectors - Clean and repair as necessary.

2. Connect the (special tool #8443A, SRS Load Tool)and the (special tool #8443-8, Jumper, SRS Load)to the Passenger Seat Belt Retractor Tensioner C2 harness connector.
3. If equipped with the standard key ignition, use this ignition on warning.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

4. If equipped with the keyless ignition, use this ignition on warning.

WARNING: Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

5. With the scan tool, read the active ORC DTCs.

Does the scan tool display: B0082-2B-PASSENGER SEATBELT LOAD LIMITER DEPLOYMENT CONTROL - WIRES SHORTED TOGETHER - DTC?

Yes

- Go To 3

No

- Replace the Passenger Seat Belt Retractor Tensioner C2 in accordance with the Service Information. Refer to **RETRACTOR, SEAT BELT, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (R78) PASSENGER LOAD LIMITER LINE 1 CIRCUIT FOR A SHORT TO THE (R76) PASSENGER LOAD LIMITER LINE 2 CIRCUIT**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the (special tool #8443A, SRS Load Tool)and the (special tool #8443-8, Jumper, SRS Load)from the Passenger Seat Belt Retractor Tensioner C2 harness connector.
2. Disconnect the ORC harness connectors.

NOTE: Check connectors - Clean and repair as necessary.

3. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) to the ORC harness connector.
4. Measure the resistance between the (R78) Passenger Load Limiter Line 1 circuit connector C1B cavity 5 and the (R76) Passenger Load Limiter Line 2 circuit connector C1B cavity 41 at the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool).

Is the resistance below or within 1.5 - 2.18 Ohms?

Yes

- Repair the (R78) Passenger Load Limiter Line 1 circuit for a short to the (R76) Passenger Load Limiter Line 2 circuit.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment. Failure to follow these instructions may result in possible serious or fatal injury.

- Replace the ORC in accordance with Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B0095-49-RIGHT FRONT ACCELERATION SENSOR - INTERNAL ELECTRONIC FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 36: Front Impact Sensor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Right Front Impact Sensor is mounted in the engine compartment behind the front lamp unit. Refer to **DESCRIPTION** . The Right Front Impact Sensor is directly hard wired to the Occupant Restraint Controller (ORC) Module. The impact sensors perform their own self test using power supplied by the Occupant Restraint Controller (ORC) then communicate this status back to the ORC with periodic updates. The repair of this fault condition involves verifying the integrity of the wiring between the ORC and the sensor.

WHEN MONITORED

With the ignition on, the Right Front Impact Sensor is equipped with on board diagnostics to monitor to the sensor's circuits. If a problem is identified, the sensor sends the Right Front Impact Sensor Internal message to the Occupant Restraint Controller (ORC).

SET CONDITION

This code will set, if the ORC and the Right Front Impact Sensor do not establish and maintain valid data communications. The DTC will become Active after the fault has set for a minimum of 100 milliseconds (ms). The DTC will go to Stored after the ORC Right Front Impact Sensor communication fault has been removed or the suspect front impact sensor has been replaced. The clearing of this fault is immediate upon the suspect internal error being removed or the suspect sensor replaced. The Airbag Warning Lamp (AWL) will set in the instrument cluster.

POSSIBLE CAUSES

Possible Causes
INTERMITTENT CONNECTION (WIRING/CONNECTORS)
RIGHT FRONT IMPACT SENSOR
OCCUPANT RESTRAINT CONTROLLER (ORC)

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED FAULT CODE**
    1. Turn the ignition on.

       NOTE: Make sure the battery is fully charged.

    2. With the scan tool, read the active ORC DTCs.

       Is the DTC: B0095-49-RIGHT FRONTAL ACCELERATION SENSOR - INTERNAL ELECTRONIC FAILURE active?

       Yes

       WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

       NOTE: Inspect the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary. Then Recheck for the active DTC B0095-49-RIGHT FRONTAL ACCELERATION SENSOR - INTERNAL

ELECTRONIC FAILURE. If active go to 2. If code is now stored perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to STANDARD PROCEDURE .

No

- Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **VERIFY OPERATION OF THE RIGHT FRONT IMPACT SENSOR**

WARNING: **Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

1. Replace the Right Front Impact Sensor in accordance with the Service Information. Refer to **SENSOR, IMPACT, REMOVAL** . Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. Reconnect the vehicle wire harness to the sensor.
3. Remove any special tools or jumper wires and reconnect all previously disconnected components - except the Battery.
4. If equipped with the standard key ignition, use this ignition on warning.

WARNING: **Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

5. If equipped with the keyless ignition, use this ignition on warning.

WARNING: **Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

6. Use the scan tool and erase the stored codes in all airbag system modules.
7. Turn the Ignition Off, and wait 15 seconds before turning the Ignition On.
8. Wait one minute, and read active codes.

Did the active DTC: B0095-49-RIGHT FRONTAL ACCELERATION SENSOR - INTERNAL ELECTRONIC FAILURE return?

Yes

- Go To 3

No

- Repair is complete.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **REPLACE THE OCCUPANT RESTRAINT CONTROLLER**

WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

WARNING: **If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment. Failure to follow these instructions may result in possible serious or fatal injury.**

If there are no possible causes remaining, view repair.

Repair

- Replace the ORC in accordance with Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B0099-96-ROLL OVER SENSOR - COMPONENT INTERNAL FAILURE

WHEN MONITORED

The ORC checks the status of the internal roll over sensor continuously through the ignition cycle.

SET CONDITION

This DTC sets when the ORC detects corruption in the data and circuitry related to the internal roll over sensor. Once set, this DTC is latched for the entire ignition cycle. If the failure is detected in two consecutive power cycles, the DTC is set indefinitely.

POSSIBLE CAUSES

Possible Causes
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD

PROCEDURE .

DIAGNOSTIC TEST

NOTE: Make sure the battery is fully charged.

1. Turn the ignition on.
2. With the scan tool, read ORC DTCs.

   Is the DTC active or stored?

   ORC - ACTIVE DTC

   NOTE: Make sure the part number of the replacement module is the correct part number for the vehicle.

   WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment. Failure to follow these instructions may result in possible serious or fatal injury.

   WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

   - Replace the ORC in accordance with the Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   ORC - STORED DTC

   - Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

B00A0-81-OCCUPANT CLASSIFICATION SYSTEM - INVALID SERIAL DATA RECEIVED

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

While the IGN status is in the RUN position or the signal is not available, while the CAN bus system voltage is between 10 and 16 volts.

SET CONDITION

This DTC will set if the Occupant Restraint Controller (ORC) detects an Occupant Classification Module (OCM) an internal failure.

POSSIBLE CAUSES

Possible Causes
OCCUPANT CLASSIFICATION MODULE (OCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

Replace the Occupant Classification Module (OCM)

1. Make sure the battery is fully charged.
2. Turn the ignition off, wait ten seconds and turn ignition on.
3. With the scan tool, read the OCM DTC.

   Did the scan tool display active or stored DTC?

   Yes

   - Replace the OCCUPANT CLASSIFICATION MODULE (OCM).

     .

   - Perform the OCCUPANT CLASSIFICATION MODULE (OCM) VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Perform the OCCUPANT CLASSIFICATION MODULE (OCM) VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B00A0-96-OCCUPANT CLASSIFICATION SYSTEM - COMPONENT INTERNAL FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

While the IGN status is in the RUN position or the signal is not available, while the CAN bus system voltage is between 10 and 16 volts.

SET CONDITION

This DTC will set if the Occupant Restraint Controller (ORC) detects an Occupant Classification Module (OCM) an internal failure.

POSSIBLE CAUSES

Possible Causes
OCCUPANT CLASSIFICATION MODULE (OCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

Replace the Occupant Classification Module (OCM)

1. Make sure the battery is fully charged.
2. Turn the ignition off, wait ten seconds and turn ignition on.
3. With the scan tool, read the OCM DTC.

   Did the scan tool display active or stored DTC?

   Yes

   - Check and repair OCCUPANT CLASSIFICATION MODULE (OCM) codes.

     .

   - Perform the OCCUPANT CLASSIFICATION MODULE (OCM) VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Perform the OCCUPANT CLASSIFICATION MODULE (OCM) VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B00B5-11-DRIVER SEAT TRACK POSITION SENSOR - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 37: Driver Seatbelt & Seat Track Position Sensor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) sends a test current to the seat track position sensors to verify the integrity of the sensor and wiring. The use of the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)in the tests below provides a test point in place of the module. The Seat Track Position Sensor will default to the full forward position for the short to ground fault.

WHEN MONITORED

While the CAN bus ignition status is in IGN_RUN and the module is configured for a Driver Seat Track Position Sensor, the module checks the sensor input current ranges.

SET CONDITION

If the module detects that the sensor input is greater than or equal to 20.5 mA for greater than 3 seconds the DTC will set. This DTC may set when the current is between 17 mA and 20.5 mA. This DTC transitions from active to stored when the module sees a recovery from the shorted to ground condition for greater then 5 seconds. The multifunction indicator lamp (MIL) will set in the instrument cluster.

POSSIBLE CAUSES

Possible Causes
DRIVER SEAT HARNESS IMPROPERLY ROUTED
DRIVER SEAT HARNESS WIRES CHAFED, PIERCED, PINCHED, PARTIALLY BROKEN
DRIVER SEAT HARNESS CONNECTOR TERMINALS BROKEN, BENT, PUSHED OUT, SPREAD, CORRODED, CONTAMINATED
(R729) DRIVER SEAT DETECTION RETURN CIRCUIT SHORTED TO GROUND
(R263) DRIVER SEAT POSITION SENSOR VOLTAGE CIRCUIT SHORTED TO GROUND
(R729) DRIVER SEAT DETECTION RETURN CIRCUIT OPEN
(R263) DRIVER SEAT POSITION SENSOR VOLTAGE CIRCUIT OPEN
DRIVER SEAT TRACK POSITION SENSOR
OCCUPANT RESTRAINT CONTROLLER (ORC)

DIAGNOSTIC TEST

1. **IDENTIFYING VEHICLE EQUIPMENT**

   NOTE: Make sure the battery is fully charged.

   1. Turn the ignition on.
   2. With the scan tool, read ORC active DTCs.

      Does the scan tool display active DTC: B00B5-11-DRIVER SEAT TRACK POSITION SENSOR - CIRCUIT SHORT TO GROUND?

      Yes

      - Go To 2

      No

      - Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK FOR ACTIVE INTERNAL FAULTS, IGNITION FAULTS, AND BATTERY FAULTS IN THE OCCUPANT RESTRAINT CONTROLLER (ORC)**
   1. With the scan tool, read Occupant restraint Controller (ORC) DTCs.

      Does the scan tool display any active DTCs relating to internal faults, ignition faults, or battery faults?

      Yes

      - Refer to the **DIAGNOSTIC CODE INDEX** and perform the appropriate diagnostic procedure.

      No

      - Go To 3
3. **INSPECT DRIVER SEAT HARNESS WIRES AND CONNECTORS**

   WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

   1. Using the wiring diagram/schematic as a guide, inspect the driver seat harness wiring and connectors. Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

      Are any of these conditions present?

      Yes

      NOTE: Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.

      - Replace the driver seat harness in accordance with the Service Information.
      - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 4
4. **VERIFY THAT DRIVER SEAT HARNESS IS ROUTED CORRECTLY**
   1. Verify that the driver seat harness is routed correctly.

      Is the Driver Seat Harness routed correctly?

Yes

- Go To 5

No

- Reroute the driver seat harness as necessary.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **CHECK (R729) DRIVER SEAT DETECTION RETURN CIRCUIT AND (R263) DRIVER SEAT POSITION SENSOR VOLTAGE CIRCUIT FOR A SHORT TO GROUND**
   1. Measure the resistance between ground and the (R729) Driver Seat Detection Return circuit cavity 1.
   2. Measure the resistance between ground and the (R263) Driver Seat Position Sensor Voltage circuit cavity 2.

   Is the resistance below 10k Ohms on either circuit?

   Yes

   NOTE: Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.

   - Replace the Driver Seat Harness in accordance with the service information.
   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 6

6. **CHECK (R729) DRIVER SEAT DETECTION RETURN CIRCUIT AND (R263) DRIVER SEAT POSITION SENSOR VOLTAGE CIRCUIT FOR AN OPEN**
   1. Disconnect the ORC harness connectors.

   NOTE: Check connectors - Clean and repair as necessary.

   NOTE: After disconnecting the ORC module and the ORC module body harness connector, check the ORC module body harness connector shorting bar pin location. The shorting bar pin location should be down and not visible through the larger center holes of the ORC module body harness connector.

   2. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) to the

ORC harness connector.

3. Measure the resistance of the (R729) Driver Seat Detection Return circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)cavity 36 and the Driver Seat Track Position Sensor harness connector cavity 1.
4. Measure the resistance of the (R263) Driver Seat Position Sensor Voltage circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)cavity 30 and the Driver Seat Track Position Sensor harness connector cavity 2.

Is the resistance of either circuit above 5.0 Ohms?

Yes

NOTE: Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.

- Replace the Driver Seat Harness in accordance with the Service Information.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment. Failure to follow these instructions may result in possible serious or fatal injury.

- Replace the Occupant Restraint Controller (ORC) in accordance with the service information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B00B5-12-DRIVER SEAT TRACK POSITION SENSOR - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 38: Driver Seatbelt & Seat Track Position Sensor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) sends a test current to the seat track position sensors to verify the integrity of the sensor and wiring. The use of the ORC connector adapter tool in the tests below provides a test point in place of the module. The Seat Track Position Sensor will default to the full forward position for the short to battery fault.

WHEN MONITORED

While the CAN bus ignition status is in IGN_RUN and the module is configured for a Driver Seat Track Position Sensor, the module checks the sensor input current ranges.

SET CONDITION

If the module detects that the sensor input is greater than or equal to 8 volts. This DTC will set if the module detects the seat track position sensor circuits have become shorted to voltage for greater than 2.5 seconds. This DTC transitions from active to stored when the module sees a recovery from the shorted to voltage condition for greater then 5 seconds. The multifunction indicator lamp (MIL) will set in the instrument cluster.

POSSIBLE CAUSES

Possible Causes
DRIVER SEAT HARNESS IMPROPERLY ROUTED
DRIVER SEAT HARNESS WIRES CHAFED, PIERCED, PINCHED, PARTIALLY BROKEN
DRIVER SEAT HARNESS CONNECTOR TERMINALS BROKEN, BENT, PUSHED OUT, SPREAD, CORRODED, CONTAMINATED
(R729) DRIVER SEAT DETECTION RETURN CIRCUIT SHORTED TO VOLTAGE
(R263) DRIVER SEAT POSITION SENSOR VOLTAGE CIRCUIT SHORTED TO VOLTAGE
(R729) DRIVER SEAT DETECTION RETURN CIRCUIT SHORTED TO THE (R263) DRIVER SEAT POSITION SENSOR VOLTAGE CIRCUIT
DRIVER SEAT TRACK POSITION SENSOR
OCCUPANT RESTRAINT CONTROLLER (ORC)

DIAGNOSTIC TEST

1. **IDENTIFYING VEHICLE EQUIPMENT**

   NOTE: Make sure the battery is fully charged.

   1. Turn the ignition on.
   2. With the scan tool, read ORC active DTCs.

      Does the scan tool display active DTC: B00B5-12-DRIVER SEAT TRACK POSITION SENSOR - CIRCUIT SHORT TO BATTERY?

      Yes

      - Go To 2

      No

      - Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK FOR ACTIVE INTERNAL FAULTS, IGNITION FAULTS, AND BATTERY FAULTS**

IN THE OCCUPANT RESTRAINT CONTROLLER (ORC)

1. With the scan tool, read Occupant Restraint Controller (ORC) DTCs.

   Does the scan tool display any active DTCs relating to internal faults, ignition faults, or battery faults?

   Yes

   - Refer to the **DIAGNOSTIC CODE INDEX** and perform the appropriate diagnostic procedure.

   No

   - Go To 3

3. **INSPECT DRIVER SEAT HARNESS WIRES AND CONNECTORS**

   WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

   1. Using the wiring diagram/schematic as a guide, inspect the driver seat harness wiring and connectors. Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

      Are any of these conditions present?

      Yes

      NOTE: **Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.**

      - Replace the driver seat harness in accordance with the Service Information.
      - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 4

4. **VERIFY THAT DRIVER SEAT HARNESS IS ROUTED CORRECTLY**

   1. Verify that the driver seat harness is routed correctly.

      Is the Driver Seat Harness routed correctly?

Yes

- Go To 5

No

- Reroute the driver seat harness as necessary.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **CHECK FOR DTC B00B5-12-DRIVER SEAT TRACK POSITION SENSOR - CIRCUIT SHORT TO BATTERY WITH DRIVER SEAT TRACK POSITION SENSOR DISCONNECTED**

   WARNING: **Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

   1. Disconnect the Driver Seat Track Position Sensor harness connector.

      WARNING: **Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

   2. Wait two minutes, and then with the scan tool, read ORC DTCs.

      Does the scan tool display: B00B5-12-DRIVER SEAT TRACK POSITION SENSOR - CIRCUIT SHORT TO BATTERY?

      Yes

      - Go To 6

      No

      WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

      - Replace the Driver Seat Track Position Sensor in accordance with the service information. Refer to **SENSOR, SEAT TRACK POSITION, REMOVAL** .
      - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

6. **CHECK (R729) DRIVE SEAT DETECTION RETURN CIRCUIT AND (R263) DRIVE SEAT POSITION SENSOR VOLTAGE CIRCUIT FOR A SHORT TO VOLTAGE**

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the ORC harness connectors.

NOTE: Check connectors - Clean and repair as necessary.

NOTE: After disconnecting the ORC module and the ORC module body harness connector, check the ORC module body harness connector shorting bar pin location. The shorting bar pin location should be down and not visible through the larger center holes of the ORC module body harness connector.

2. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) to the ORC harness connector.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

3. Measure the voltage of the (R729) Driver Seat Detection Return circuit at the Driver Seat Track Position Sensor harness connector cavity 1.
4. Measure the voltage of the (R263) Driver Seat Position Sensor Voltage circuit at the Driver Seat Track Position Sensor harness connector cavity 2.

Is the voltage above 0.2 of a volt on either circuit?

Yes

NOTE: Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

- Replace the Driver Seat Harness in accordance with the Service Information.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 7

7. **CHECK (R729) DRIVER SEAT DETECTION RETURN CIRCUIT FOR A SHORT TO (R263) DRIVER SEAT POSITION SENSOR VOLTAGE CIRCUIT**

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Measure the resistance between the (R729) Driver Seat Detection Return circuit cavity 1 and the (R263) Driver Seat Position Sensor Voltage circuit cavity 2 in the Driver Seat Track Position Sensor harness connector.

   Is the resistance below 10k Ohms?

   Yes

   NOTE: Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.

   - Replace the Driver Seat Harness in accordance with the service information.
   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the ORC in accordance with the Service information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B00B5-13-DRIVER SEAT TRACK POSITION SENSOR - CIRCUIT OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 39: Driver Seatbelt & Seat Track Position Sensor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) sends a test current to the seat track position sensors to verify the integrity of the sensor and wiring. The use of the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)in the tests below provides a test point in place of the module. The Seat Track Position Sensor will default to the full forward position for the open fault.

WHEN MONITORED

While the CAN bus ignition status is in IGN_RUN and the module is configured for a Seat Track Position Sensor, the module checks the sensor input current ranges.

SET CONDITION

This DTC may set when the module detects that the sensor input current is below.9 mA for greater than 2.5 seconds. This DTC transitions form active to stored when the ORC module sees a recovery from the open condition for greater than 5 seconds. The multifunction indicator lamp (MIL) will set in the instrument cluster.

POSSIBLE CAUSES

Possible Causes
DRIVER SEAT HARNESS IMPROPERLY ROUTED
DRIVER SEAT HARNESS WIRES CHAFED, PIERCED, PINCHED, PARTIALLY BROKEN
DRIVER SEAT HARNESS CONNECTOR TERMINALS BROKEN, BENT, PUSHED OUT, SPREAD, CORRODED, CONTAMINATED
(R729) DRIVER SEAT DETECTION RETURN CIRCUIT SHORTED TO VOLTAGE
(R263) DRIVER SEAT POSITION SENSOR VOLTAGE CIRCUIT SHORTED TO VOLTAGE
(R729) DRIVER SEAT DETECTION RETURN CIRCUIT SHORTED TO THE (R263) DRIVER SEAT POSITION SENSOR VOLTAGE CIRCUIT
DRIVER SEAT TRACK POSITION SENSOR
OCCUPANT RESTRAINT CONTROLLER (ORC)

DIAGNOSTIC TEST

1. **CHECK FOR ACTIVE INTERNAL FAULTS, IGNITION FAULTS, AND BATTERY FAULTS IN THE OCCUPANT RESTRAINT CONTROLLER (ORC)**
   1. With the scan tool, read Occupant Restraint Controller (ORC) DTCs.

      Does the scan tool display any active DTCs relating to internal faults, ignition faults, or battery faults?

      Yes

      - Refer to the **DIAGNOSTIC CODE INDEX** and perform the appropriate diagnostic procedure.

      No

      - Go To 2
2. **VERIFY THAT DTC B00B5-13-FRONT DRIVER SEAT TRACK POSITION SENSOR - CIRCUIT OPEN IS ACTIVE**

   Does the scan tool display active: B00B5-13-FRONT DRIVER SEAT TRACK POSITION SENSOR - CIRCUIT OPEN?

Yes

- Go To 3

No

- Go To 8

3. **INSPECT DRIVER SEAT HARNESS WIRES AND CONNECTORS**

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Using the wiring diagram/schematic as a guide, inspect the Driver Seat Harness wiring and connectors. Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

   Are any of these conditions present?

   Yes

   NOTE: Do not attempt to repair the Seat Harness. Replace the Seat Harness if any of these conditions exist

   - Replace the Driver Seat Harness in accordance with the Service Information.
   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 4

4. **VERIFY THAT DRIVER SEAT HARNESS IS ROUTED CORRECTLY**

1. Verify that the Driver Seat Harness is routed correctly.

   Is the Driver Seat Harness routed correctly?

   Yes

   - Go To 5

   No

   - Reroute the Driver Seat Harness as necessary.
   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD**

PROCEDURE .

5. **CHECK FOR DTC B00B5-13-FRONT DRIVER SEAT TRACK POSITION SENSOR - CIRCUIT OPEN WITH DRIVER SEAT TRACK POSITION SENSOR DISCONNECTED**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the Driver Seat Track Position Sensor harness connector.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

2. Wait two minutes, and then with the scan tool, read ORC DTCs.

Does the scan tool display: B00B5-13-FRONT DRIVER SEAT TRACK POSITION SENSOR - CIRCUIT OPEN?

Yes

- Go To 6

No

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

- Replace the Driver Seat Track Position Sensor in accordance with the service information. Refer to **SENSOR, SEAT TRACK POSITION, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

6. **CHECK (R729) DRIVER SEAT DETECTION RETURN CIRCUIT AND (R263) DRIVER SEAT POSITION SENSOR VOLTAGE CIRCUIT FOR A SHORT TO VOLTAGE**

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the ORC C1 harness connector.

NOTE: Check connectors - Clean and repair as necessary.

NOTE: **After disconnecting the ORC module and the ORC module body harness connector, check the ORC module body harness connector pin to shorting bar location. The pins location should be down and not visible through the larger center holes of the ORC module body harness connector.**

WARNING: **Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

2. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) to the ORC harness connector.
3. Measure the voltage of the (R729) Driver Seat Detection Return circuit between the Driver Seat Track Position Sensor harness connector and ground.
4. Measure the voltage of the (R263) Driver Seat Position Sensor Voltage circuit between the Driver Seat Track Position Sensor harness connector and ground.

Is the voltage above 0.2 of a volt on either circuit?

Yes

NOTE: **Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.**

WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

- Replace the Driver Seat Harness in accordance with the Service Information.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 7

7. **CHECK (R729) DRIVER SEAT DETECTION RETURN CIRCUIT FOR A SHORT TO (R263) DRIVER SEAT POSITION SENSOR VOLTAGE CIRCUIT**

WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

1. Measure the resistance between the (R729) Driver Seat Detection Return circuit and the (R263)

Driver Seat Position Sensor Voltage circuit in the Driver Seat Track Position Sensor harness connector.

Is the resistance below 10k Ohms?

Yes

NOTE: Do not attempt to repair the Seat Harness. Replace the Seat Harness if any of these conditions exist

- Replace the Driver Seat Harness in accordance with the service information.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace the ORC in accordance with the Service information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

8. **TEST FOR AN INTERMITTENT CONDITION**
   1. With the scan tool, record and erase all DTCs from the ORC.
   2. If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

      WARNING: **Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

   3. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
   4. Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.
   5. The following additional checks may assist you in identifying a possible intermittent problem.
   6. Reconnect any disconnected components and harness connector.

      WARNING: **Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

   7. With the scan tool monitor active codes as you work through the following steps.

      WARNING: **Maintain a safe distance from all airbags while performing the following steps. Failure to follow these instructions may result in possible serious or fatal injury.**

8. Wiggle the wiring harness and connectors of the related airbag circuit or component.
9. If only stored codes return continue the test until the problem area has been isolated.
10. In the previous steps you have attempted to recreate the conditions responsible for setting active DTC in question.

    Are any ACTIVE DTCs present?

    Yes

    - Refer to the **DIAGNOSTIC CODE INDEX** and perform the appropriate diagnostic procedure.

    No

    - No problem found at this time. Erase all codes before returning vehicle to customer.

B00B5-95-DRIVER SEAT TRACK POSITION SENSOR - INCORRECT ASSEMBLY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 40: Driver Seatbelt & Seat Track Position Sensor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) sends a test current to the seat track position sensors. During this test, the sensors discovered are checked for agreement with the pre-programmed configuration of components assigned to the module.

WHEN MONITORED

The ORC checks for the presence of seat position sensor circuits once during the initialization process.

SET CONDITION

This DTC sets when the ORC detects the presence of a seat position sensor circuit while the configuration of the module does not reflect a seat track position sensor should be present. Once set, this DTC is latched for the entire power cycle and requires the module to be re-initalized to set code.

POSSIBLE CAUSES

Possible Causes
SEAT POSITION SENSORS
WIRING
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK FOR ACTIVE INTERNAL FAULTS, IGNITION FAULTS, AND BATTERY FAULTS IN THE OCCUPANT RESTRAINT CONTROLLER (ORC)**

   NOTE: Make sure the battery is fully charged.

   1. With the scan tool, read Occupant Restraint Controller (ORC) DTCs.

      Does the scan tool display any active DTCs relating to internal faults, ignition faults, or battery faults?

      Yes

      - Diagnose and repair the DTCs. Refer to the **DIAGNOSTIC CODE INDEX** .

      No

      - Go To 2

2. **VERIFY THAT B00B5-95-DRIVER SEAT TRACK POSITION SENSOR - INCORRECT ASSEMBLY IS ACTIVE**
   1. With the scan tool, erase ORC DTCs.
   2. Turn the ignition off, wait 10 seconds and then turn the ignition on.
   3. Wait 2 minutes, and then with the scan tool, read ORC DTCs.

      Does the scan tool display active: B00B5-95-DRIVER SEAT TRACK POSITION SENSOR - INCORRECT ASSEMBLY?

      Yes

- Go To 3

No

- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **VERIFY WIRING**
   1. Turn the ignition off.
   2. Inspect the driver seat wiring for Seat Position Sensors.

   Are Seat Position Sensor(s) present?

   Yes

   WARNING: Turn the ignition off, disconnect the battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

   WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment.

   - Replace the ORC in accordance with the Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B00C5-11-PASSENGER SEAT TRACK POSITION SENSOR - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 41: Passenger Seatbelt, Seat Track Position & Occupant Detection Sensor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) sends a test current to the seat track position sensors to verify the integrity of the sensors and wiring.

WHEN MONITORED

While the CAN bus ignition status is in IGN_RUN with a minimum of 8.5 volts at startup and the module is

configured for a Passenger Seat Track Position Sensor, the module checks the sensor input current ranges.

SET CONDITION

If the module detects that the sensor resistance is greater than 5k Ohms for minimum of 2.5 seconds. This DTC will switch from an active to a stored status upon the short to ground fault clearing for longer than five seconds.

POSSIBLE CAUSES

Possible Causes
PASSENEGER SEAT HARNESS IMPROPERLY ROUTED
PASSENGER SEAT HARNESS WIRES CHAFED, PIERCED, PINCHED, PARTIALLY BROKEN
PASSENGER SEAT HARNESS CONNECTOR TERMINALS BROKEN, BENT, PUSHED OUT, SPREAD, CORRODED, CONTAMINATED
(R730) PASSENGER SEAT DETECTION RETURN CIRCUIT SHORTED TO VOLTAGE
(R264) PASSENGER SEAT POSITION SENSOR VOLTAGE CIRCUIT SHORTED TO VOLTAGE
(R730) PASSENGER SEAT DETECTION RETURN CIRCUIT SHORTED TO THE (R263) DRIVER SEAT POSITION SENSOR VOLTAGE CIRCUIT
PASSENGER SEAT TRACK POSITION SENSOR
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **IDENTIFYING VEHICLE EQUIPMENT**

NOTE: **Make sure the battery is fully charged.**

NOTE: **The use of a approved special tool or Digital Multimeter such as a Fluke Meter that will not apply more than 20 milliamperes to a circuit are the only measurement tools to be used.**

NOTE: **Probing of the circuit cavities at the ORC Module C1 or C2 body harness connectors is only to be done with a approved test lead from the (special tool #10159, Test Leads, Dedicated). Or a comparable test lead to prevent vehicle wiring harness connector damage during diagnostic procedures.**

1. Turn the ignition on.
2. With the scan tool, read ORC active DTCs.

   Does the scan tool display active DTC: B00C5-11-PASSENGER SEAT TRACK POSITION SENSOR - CIRCUIT SHORT TO GROUND?

Yes

- Go To 2.

No

- Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK FOR ACTIVE INTERNAL FAULTS, IGNITION FAULTS, AND BATTERY FAULTS IN THE OCCUPANT RESTRAINT CONTROLLER (ORC)**
   1. With the scan tool, read Occupant restraint Controller (ORC) DTCs.

      Does the scan tool display any active DTCs relating to internal faults, ignition faults, or battery faults?

      Yes

      - Diagnose and repair the DTCs. Refer to the **DIAGNOSTIC CODE INDEX** .

      No

      - Go To 3

3. **INSPECT PASSENGER SEAT HARNESS WIRES AND CONNECTORS**

   WARNING: Turn the ignition off, disconnect the battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

   1. Using the wiring diagram/schematic as a guide, inspect the passenger seat harness wiring and connectors. Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

      Are any of these conditions present?

      Yes

      NOTE: Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.

      - Replace the passenger seat harness in accordance with the Service Information.
      - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

- Go To 4

4. **VERIFY THAT PASSENGER SEAT HARNESS IS ROUTED CORRECTLY**
   1. Verify that the passenger seat harness is routed correctly.

      Is the Driver Seat Harness routed correctly?

      Yes

      - Go To 5

      No

      - Reroute the passenger seat harness as necessary.
      - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **CHECK (R730) PASSENGER SEAT DETECTION RETURN CIRCUIT AND (R264) PASSENGER SEAT POSITION SENSOR VOLTAGE CIRCUIT FOR A SHORT TO GROUND**
   1. Measure the resistance between ground and the (R730) Passenger Seat Detection Return circuit.
   2. Measure the resistance between ground and the (R264) Passenger Seat Position Sensor Voltage circuit.

      Is the resistance below 10k Ohms on either circuit?

      Yes

      NOTE: Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.

      - Replace the Passenger Seat Harness in accordance with the service information.
      - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 6

6. **CHECK (R730) PASSENGER SEAT DETECTION RETURN CIRCUIT AND (R264) PASSENGER SEAT POSITION SENSOR VOLTAGE CIRCUIT FOR AN OPEN**
   1. Disconnect the ORC harness connectors.
   2. Connect the test leads to the DVOM.
   3. Measure the resistance of the (R730) Passenger Seat Detection Return circuit between the ORC module body harness connector cavity C2 19 and the Passenger Seat Track Position Sensor connector cavity 1.

4. Measure the resistance of the (R264) Passenger Seat Position Sensor Voltage circuit between the ORC module body harness connector cavity C2 33 and the Passenger Seat Track Position Sensor connector cavity 2.

   Is the resistance of either circuit above 5.0k Ohms?

   Yes

   NOTE: Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.

   - Replace the Passenger Seat Harness in accordance with the Service Information.
   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   WARNING: Turn the ignition off, disconnect the battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

   WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment.

   - Replace the Occupant Restraint Controller (ORC) in accordance with the service information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B00C5-12-PASSENGER SEAT TRACK POSITION SENSOR - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 42: Passenger Seatbelt, Seat Track Position & Occupant Detection Sensor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) sends a test current to the seat track position sensors to verify the integrity of the sensors and wiring.

WHEN MONITORED

While the CAN bus ignition status is in IGN_RUN with a minimum of 8.5 volts at startup and the module is

configured for a Driver Seat Track Position Sensor, the module checks the sensor input current ranges.

SET CONDITION

If the module detects that the sensor input is greater than 5K Ohms for a minimum of 2.5 seconds.

POSSIBLE CAUSES

Possible Causes
PASSENEGER SEAT HARNESS IMPROPERLY ROUTED
PASSENGER SEAT HARNESS WIRES CHAFED, PIERCED, PINCHED, PARTIALLY BROKEN
PASSENGER SEAT HARNESS CONNECTOR TERMINALS BROKEN, BENT, PUSHED OUT, SPREAD, CORRODED, CONTAMINATED
(R264) PASSENGER SEAT POSITION SENSOR VOLTAGE CIRCUIT SHORTED TO VOLTAGE
PASSENGER SEAT TRACK POSITION SENSOR
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **IDENTIFYING VEHICLE EQUIPMENT**

   NOTE: Make sure the battery is fully charged.

   1. Turn the ignition on.
   2. With the scan tool, read ORC active DTCs.

      Does the scan tool display active DTC: B00C5-12-PASSENGER SEAT TRACK POSITION SENSOR - CIRCUIT SHORT TO BATTERY?

      Yes

      - Go To 2

      No

      - Perform the RESTRAINTS SYSTEM INTERMITTENT TEST Refer to **STANDARD PROCEDURE** .

2. **CHECK FOR ACTIVE INTERNAL FAULTS, IGNITION FAULTS, AND BATTERY FAULTS IN THE OCCUPANT RESTRAINT CONTROLLER (ORC)**
   1. With the scan tool, read Occupant Restraint Controller (ORC) DTCs.

Does the scan tool display any active DTCs relating to internal faults, ignition faults, or battery faults?

Yes

- Diagnose and repair the DTCs. Refer to the **DIAGNOSTIC CODE INDEX** for a complete list of symptoms.

No

- Go To 3

3. **INSPECT DRIVER SEAT HARNESS WIRES AND CONNECTORS**

WARNING: Turn the ignition off, disconnect the battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Using the wiring diagram/schematic as a guide, inspect the driver seat harness wiring and connectors. Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

   Are any of these conditions present?

   Yes

   NOTE: Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.

   - Replace the driver seat harness in accordance with the Service Information.
   - Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 4

4. **VERIFY THAT DRIVER SEAT HARNESS IS ROUTED CORRECTLY**

1. Verify that the driver seat harness is routed correctly.

   Is the Driver Seat Harness routed correctly?

   Yes

   - Go To 5

No

- Reroute the driver seat harness as necessary.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **CHECK FOR DTC B00C5-12-PASSENGER SEAT TRACK POSITION SENSOR - CIRCUIT SHORT TO BATTERY WITH DRIVER SEAT TRACK POSITION SENSOR DISCONNECTED**

WARNING: **Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

1. Disconnect the Driver Seat Track Position Sensor harness connector.
2. If the vehicle is equipped with the standard key ignition, follow this ignition on warning.

WARNING: **Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

3. If the vehicle is equipped with the keyless ignition, follow this ignition on warning.

WARNING: **Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

4. Wait two minutes, and then with the scan tool, read ORC DTCs.

   Does the scan tool display: B00C5-12-PASSENGER SEAT TRACK POSITION SENSOR - CIRCUIT SHORT TO BATTERY?

   Yes

   - Go To 6

   No

   WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

   - Replace the Driver Seat Track Position Sensor in accordance with the service information.

Refer to **SENSOR, SEAT TRACK POSITION, REMOVAL** .

- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

6. **CHECK (R730) PASSENGER SEAT DETECTION RETURN CIRCUIT AND (R264) PASSENGER SEAT POSITION SENSOR VOLTAGE CIRCUIT FOR A SHORT TO VOLTAGE**

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the ORC harness connectors.
2. If the vehicle is equipped with the standard key ignition, follow this ignition on warning.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

3. If the vehicle is equipped with the keyless ignition, follow this ignition on warning.

WARNING: Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

4. Measure the voltage of the (R730) Passenger Seat Detection Return circuit at the Passenger Seat Track Position Sensor connector cavity 1.
5. Measure the voltage of the (R264) Passenger Seat Position Sensor Voltage circuit at the Passenger Seat Track Position Sensor connector cavity 2.

Is the voltage above 0.2 volt on either circuit?

Yes

NOTE: Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.

WARNING: Turn the ignition off, disconnect the battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

- Replace the Driver Seat Harness in accordance with the Service Information.

- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

7. **CHECK (R730) PASSENGER SEAT DETECTION RETURN CIRCUIT FOR A SHORT TO THE (R264) PASSENGER SEAT POSITION SENSOR VOLTAGE CIRCUIT**

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Measure the resistance between the (R730) Passenger Seat Detection Return circuit cavity 1 and the (R264) Passenger Seat Position Sensor Voltage circuit cavity 2 in the Passenger Seat Track Position Sensor harness connector.

   Is the resistance below 10K Ohms?

   Yes

   NOTE: Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.

   - Replace the Driver Seat Harness in accordance with the service information.
   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the ORC in accordance with the Service information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B00C5-13-PASSENGER SEAT TRACK POSITION SENSOR - CIRCUIT OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 43: Passenger Seatbelt, Seat Track Position & Occupant Detection Sensor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) sends a test current to the seat track position sensors to verify the integrity of the sensor and wiring.

WHEN MONITORED

While the Controller Area Network (CAN) bus ignition status is in IGN_RUN and the module is configured for

a seat track position sensor, the module checks the sensor input current ranges.

SET CONDITION

This Diagnostic Trouble Code (DTC) may set when the module detects that the sensor input current is below 1 mA.

POSSIBLE CAUSES

Possible Causes
PASSENGER SEAT HARNESS IMPROPERLY ROUTED
PASSENGER SEAT HARNESS WIRES CHAFED, PIERCED, PINCHED, PARTIALLY BROKEN
PASSENGER SEAT HARNESS CONNECTOR TERMINALS BROKEN, BENT, PUSHED OUT, SPREAD, CORRODED, CONTAMINATED
(R730) PASSENGER SEAT DETECTION RETURN CIRCUIT SHORTED TO VOLTAGE
(R264) PASSENGER SEAT POSITION SENSOR VOLTAGE CIRCUIT SHORTED TO VOLTAGE
(R730) PASSENGER SEAT DETECTION RETURN CIRCUIT SHORTED TO THE (R263) DRIVER SEAT POSITION SENSOR VOLTAGE CIRCUIT
PASSENGER SEAT TRACK POSITION SENSOR
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK FOR ACTIVE INTERNAL FAULTS, IGNITION FAULTS, AND BATTERY FAULTS IN THE OCCUPANT RESTRAINT CONTROLLER (ORC)**
   1. Using a scan tool, read Occupant Restraint Controller (ORC) DTCs.

      Does the scan tool display any active DTCs relating to internal faults, ignition faults, or battery faults?

      Yes

      - Refer to the **DIAGNOSTIC CODE INDEX** and perform the appropriate diagnostic procedure.

      No

      - Go To 2
2. **VERIFY THAT DTC B00C5-13-PASSENGER SEAT TRACK POSITION SENSOR - CIRCUIT OPEN IS ACTIVE**

   Does the scan tool display active B00C5-13-PASSENGER SEAT TRACK POSITION SENSOR -

CIRCUIT OPEN?

Yes

- Go To 3

No

- Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

3. **INSPECT PASSENGER SEAT HARNESS WIRES AND CONNECTORS**

WARNING: Turn the ignition off, disconnect the battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Using the wiring diagram/schematic as a guide, inspect the passenger seat harness wiring and connectors. Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

   Are any of these conditions present?

   Yes

   NOTE: Do not attempt to repair the passenger seat harness. Replace the passenger seat harness if any of these conditions exist.

   - Replace the passenger seat harness according to the Service Information.
   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 4

4. **VERIFY THE PASSENGER SEAT HARNESS IS ROUTED CORRECTLY**

1. Verify the passenger seat harness is routed correctly.

   Is the passenger seat harness routed correctly?

   Yes

   - Go To 5

   No

- Reroute the passenger seat harness as necessary.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **CHECK FOR DTC B00C5-13-PASSENGER SEAT TRACK POSITION SENSOR - CIRCUIT OPEN WITH PASSENGER SEAT TRACK POSITION SENSOR DISCONNECTED**

WARNING: **Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

1. Disconnect the Passenger Seat Track Position Sensor connector.
2. If the vehicle is equipped with the standard key ignition, follow this ignition on warning.

WARNING: **Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

3. If the vehicle is equipped with the keyless ignition, follow this ignition on warning.

WARNING: **Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

4. Wait two minutes, then using a scan tool, read ORC DTCs.

   Does the scan tool display: B00C5-13-PASSENGER SEAT TRACK POSITION SENSOR - CIRCUIT OPEN?

   Yes

   - Go To 6

   No

WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

- Replace the passenger seat track position sensor according to the Service Information. Refer to **SENSOR, SEAT TRACK POSITION, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD**

PROCEDURE .

6. **CHECK (R730) PASSENGER SEAT DETECTION RETURN CIRCUIT AND (R264) PASSENGER SEAT POSITION SENSOR VOLTAGE CIRCUIT FOR A SHORT TO VOLTAGE**

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the ORC harness connector.
2. If the vehicle is equipped with the standard key ignition, follow this ignition on warning.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

3. If the vehicle is equipped with the keyless ignition, follow this ignition on warning.

WARNING: Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

4. Measure the voltage of the (R730) Passenger Seat Detection Return circuit between the passenger seat track position sensor connector and ground.
5. Measure the voltage of the (R264) Passenger Seat Position Sensor Voltage circuit between the passenger seat track position connector and ground.

Is the voltage above 0.2 of a Volt for either circuit?

Yes

NOTE: Do not attempt to repair the passenger seat harness. Replace the passenger seat harness if any of these conditions exist.

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

- Replace the passenger seat harness according to the Service Information.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 7

7. **CHECK (R730) PASSENGER SEAT DETECTION RETURN CIRCUIT FOR A SHORT TO THE (R264) PASSENGER SEAT POSITION SENSOR VOLTAGE CIRCUIT**

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Measure the resistance between the (R730) Passenger Seat Detection Return circuit and the (R264) Passenger Seat Position Sensor Voltage circuit in the Passenger Seat Track Position Sensor harness connector.

   Is the resistance below 10k Ohms?

   Yes

   NOTE: Do not attempt to repair the seat harness. Replace the seat harness if any of these conditions exist.

   - Replace the passenger seat harness according to the Service Information.
   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the ORC according to the Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B00C5-95-PASSENGER SEAT TRACK POSITION SENSOR - INCORRECT ASSEMBLY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 44: Passenger Seatbelt, Seat Track Position & Occupant Detection Sensor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) sends a test current to the seat track position sensors. During this test, the sensors discovered are checked for agreement with the pre-programmed configuration of components assigned to the module.

WHEN MONITORED

The ORC checks for the presence of seat position sensor circuits once during the initialization process.

SET CONDITION

This DTC sets when the ORC detects the presence of a seat position sensor circuit while the configuration of the module does not reflect a seat track position sensor should be present. Once set, this DTC is latched for the entire power cycle and requires the module to be re-initalized to set code.

POSSIBLE CAUSES

Possible Causes
SENSORS
WIRING
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK FOR ACTIVE INTERNAL FAULTS, IGNITION FAULTS, AND BATTERY FAULTS IN THE OCCUPANT RESTRAINT CONTROLLER (ORC)**

   NOTE: Make sure the battery is fully charged.

   1. With the scan tool, read Occupant Restraint Controller (ORC) DTCs.

      Does the scan tool display any active DTCs relating to internal faults, ignition faults, or battery faults?

      Yes

      - Diagnose and repair the DTCs. Refer to the **DIAGNOSTIC CODE INDEX** .

      No

      - Go To 2

2. **VERIFY THAT B00C5-95-PASSENGER SEAT TRACK POSITION SENSOR - INCORRECT ASSEMBLY IS ACTIVE**
   1. With the scan tool, erase ORC DTCs.
   2. Turn the ignition off, wait 10 seconds and then turn the ignition on.
   3. Wait 2 minutes, and then with the scan tool, read ORC DTCs.

      Does the scan tool display active: B00C5-95-PASSENGER SEAT TRACK POSITION SENSOR - INCORRECT ASSEMBLY?

Yes

- Go To 3

No

- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **VERIFY WIRING**
   1. Turn the ignition off.
   2. Inspect the passenger seat wiring for Seat Position Sensors.

   Are Seat Position Sensor(s) present?

   Yes

   WARNING: Turn the ignition off, disconnect the battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

   WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment.

   - Replace the ORC in accordance with the Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B0100-49-ECU INTERNAL ERRORS - INTERNAL ELECTRONIC FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) performs an internal self test. The repair of this fault condition does not involve any external circuitry and centers on verifying the integrity of the module's internal circuitry and software validity.

WHEN MONITORED

The ORC checks the status and validity of the internal operating hardware and software at power up during the initialization process, and continuously through the ignition cycle.

SET CONDITION

This Diagnostic Trouble Code (DTC) sets when a fault is detected internal to ORC hardware and/or software. Once set, this DTC is latched permanently and the module must be replaced.

POSSIBLE CAUSES

Possible Causes
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always Perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

REPLACE OCCUPANT RESTRAINT CONTROLLER (ORC)

NOTE: When this DTC is set, the module self test has discovered an internal fault that cannot be repaired and the module must be replaced regardless of DTC status.

When this code is set do not clear codes, view repair.

Repair

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment. Failure to follow these instructions may result in possible serious or fatal injury.

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

- Replace the ORC module according to the Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B0101-16-POWER SUPPLY - CIRCUIT VOLTAGE BELOW THRESHOLD

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 45: Occupant Restraint Controller (ORC) Power Supply Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Occupant Restraint Controller (ORC) module receives power from a single fused ignition 1 switch output run circuit from the Body Control Module (BCM). This circuit powers the ORC and the capacitors used to initiate the squib deployment circuits in the event of collision detection.

WHEN MONITORED

The Occupant Restraint Module (ORC) tests the single power feed circuit starting from 1 second after key on, and then continuously through the ignition cycle.

SET CONDITION

This code is set immediately after the Occupant Restraint Module (ORC) detects that voltage on the single power feed circuit is below 10 volts for greater than 15 seconds. The DTC will go from active to stored when the condition that set the code is not present for five seconds. The Multifunction Indicator Lamp (MIL) will set in the Instrument Cluster.

POSSIBLE CAUSES

Possible Causes
CHARGING SYSTEM VOLTAGE LOW
(F945) FUSED IGNITION RUN/START CIRCUIT OPEN OR SHORTED TO GROUND
BODY CONTROL MODULE (BCM)
OCCUPANT RESTRAINT CONTROLLER (ORC)

WARNING: **On vehicles equipped with the high voltage system, disconnecting the 12-volt battery negative cable alone will not power down the 12-volt system. You must perform the 12-volt Power Down procedure before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK PCM FOR CHARGING SYSTEM DTCS**

NOTE: Make sure the battery is fully charged.

1. With the scan tool, read Powertrain Control Module DTCs.

   Are there any Charging System DTCs set in the PCM?

   Yes

   - Perform the appropriate diagnostic procedure for the Charging System.

   No

- Go To 2

2. **DETERMINE ACTIVE OR STORED DTC**
   1. Turn the ignition on.
   2. With the scan tool, read all active ORC DTCs.

      Is the DTC active or stored?

      ORC - ACTIVE DTC

      - Go To 3

      ORC - STORED DTC

      - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK FOR A SHORT TO GROUND ON THE (F945) FUSED IGN RUN CIRCUIT WITH THE ORC CONNECTED**

   WARNING: **To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

   NOTE: Check the connectors - Clean and repair as necessary.

   1. Measure the resistance between the Body Control Module fused IGN run circuit output cavity C7 - 3 and ground.

      Is the resistance 100 Ohms or less?

      Yes

      - Go To 4

      No

      - Check and replace the BCM #50 7.5A fuse if blown.
      - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK FOR A SHORT TO GROUND ON THE (F945) FUSED IGN RUN CIRCUIT WITH THE ORC DISCONNECTED**
   1. Disconnect the ORC harness connector.

      NOTE: Check connectors - Clean and repair as necessary.

NOTE: **After disconnecting the ORC module and the ORC module body harness connector, check the ORC module body harness connector shorting bar pin location. The shorting bar pin location should be down and not visible through the larger center holes of the ORC module body harness connector.**

2. Connect the to the ORC harness connector.
3. Measure the resistance between the Body Control Module (F945) IGN run circuit output terminal C7 - 3 and ground.

   Is the resistance 100 Ohms or less on the IGN run circuit ?

   Yes

   - Go To 5

   No

   WARNING: **If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment. Failure to follow these instructions may result in possible serious or fatal injury.**

   - Replace the ORC in accordance with Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **CHECK FOR A SHORT TO GROUND ON THE (F945) FUSED IGN 1 RUN CIRCUIT WITH THE BODY CONTROL MODULE DISCONNECTED**
   1. Disconnect the feed circuit from the Body Control Module 60A Maxi Fuse.
   2. Measure the resistance between the Fused run circuit at the appropriate terminals of the connector and ground.

      Is the resistance 100 Ohms or less?

      Yes

      - Repair the Fuse circuit for a short to ground.

        Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors. Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

        Replace the Body Control Module 60A MAXI Fuse, then Go To 6.

- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace the Body Control Module and reinstall fuse in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

6. **CHECK FOR A SHORT TO GROUND ON THE (F945) FUSED IGN 1 RUN CIRCUIT WITH THE ORC CONNECTED**

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

NOTE: Check connectors - Clean and repair as necessary.

1. Measure the resistance between the Body Control Module (F945) Fused Ignition Switch Output (Run) Circuit BCM terminal cavity C7 - 3 and ground.

   Is the resistance 100 Ohms or less?

   Yes

   - Repair the Fuse circuit for a short to ground.

     Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors. Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

     Inspect and possibly replace the Body Control Module #50 7.5A fuse.

   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the Body Control Module #50 7.5A fuse.
   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B0101-17-POWER SUPPLY - CIRCUIT VOLTAGE ABOVE THRESHOLD

For a complete wiring diagram, **refer to Wiring Information** .

Fig. 46: Occupant Restraint Controller (ORC) Power Supply Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Occupant Restraint Controller (ORC) module receives power from a single fused ignition 1 switch output run circuit from the Body Control Module (BCM). This circuit powers the ORC and the capacitors used to initiate the squib deployment circuits in the event of collision detection.

WHEN MONITORED

The Occupant Restraint Module (ORC) tests the power feed circuit starting from 1 second after key on, and then continuously through the ignition cycle.

SET CONDITION

This code is set immediately after the Occupant Restraint Controller (ORC) Module detects that voltage on the power feed circuit is above 15 volts for greater than 15 seconds. The DTC will go from active to stored when the condition that set the code is not present for five seconds. The Multifunction Indicator Lamp (MIL) will set in the Instrument Cluster.

POSSIBLE CAUSES

Possible Causes
CHARGING SYSTEM VOLTAGE HIGH
(F945) FUSED IGNITION RUN SHORTED TO GROUND
BODY CONTROL MODULE (BCM)
OCCUPANT RESTRAINT CONTROLLER (ORC)

WARNING: **On vehicles equipped with the high voltage system, disconnecting the 12-volt battery negative cable alone will not power down the 12-volt system. You must perform the 12-volt Power Down procedure before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK FOR ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched and partially

broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded or contaminated terminals.

- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **VERIFY OPERATION OF THE VEHICLE CHARGING SYSTEM**

NOTE: Troubleshoot any PCM charging/cranking DTCs before proceeding.

NOTE: Make sure the battery is fully charged.

Are any charging system DTCs present?

Yes

- Refer to the **DTC INDEX** article and perform the appropriate charging system or battery diagnostic procedure.

No

- Replace the ORC in accordance with the Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1BA5-00-AIRBAG SQUIB CONFIGURATION MISMATCH

For a complete wiring diagram **Refer to the Wiring Information** .

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) sends a test current to the squibs to verify the integrity of the squib and wiring. The presence of this code indicates the ORC is not configured for the squib resistance or shorted squib circuits detected.

WHEN MONITORED

With the ignition on.

SET CONDITION

The ORC detects a squib load that the vehicle is not configured for.

POSSIBLE CAUSES

Possible Causes

ORC CONFIGURATION/PROXI
OCCUPANT RESTRAINT CONTROLLER (ORC)

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

   NOTE: Ensure the battery is fully charged.

   1. Turn the ignition on.
   2. With the scan tool, read ORC DTCs.

      Does the scan tool display active: B1BA5-00-AIRBAG SQUIB CONFIGURATION MISMATCH?

      Yes

      - Go To 2

      No

      - Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK ORC PART NUMBER WITH SCAN TOOL**
   1. With the scan tool, select ECU View, select ORC, select ECU Details, and read the ORC part number.

      Is the part number correct for the vehicle?

      Yes

      - Go To 3

      No

      - Using the scan tool, select Misc. Functions then Proxi Alignmen

        .

      - Perform the RESTRAINT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
3. **CHECK VIN WITH SCAN TOOL**
   1. With the scan tool, read the VIN.

Is the correct VIN displayed?

Yes

- Go To 4.

No

- Using the scan tool, select Misc. Functions then Proxi Alignmen

  .

- Perform the RESTRAINT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK WIRING AND CONNECTOR**
   1. Check wiring for shorted short to ground or battery and check the ORC connector corrosion and bent terminal at the rear seat airbag terminals.

      Is any problems found?

      Yes

      - Repair or replace wiring or connector in accordance with Service Information.
      - Perform the RESTRAINT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Replace the ORC in accordance with Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
      - Perform the RESTRAINT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1BAA-00-OCCUPANT CLASSIFICATION MODULE CONFIGURATION MISMATCH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) performs an internal self test. The repair of this fault centers on verifying ORC and Body Control Module (BCM) configuration.

WHEN MONITORED

The ORC checks its feature configuration for Occupant Classification Module (OCM) present on the BUS after initialization.

SET CONDITION

This DTC sets when the ORC detects a mismatch between the current and originally intended configuration of the module. Once set, this DTC is latched for the entire power cycle.

POSSIBLE CAUSES

Possible Causes
BODY CONTROL MODULE (BCM) CONFIGURATION
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

   NOTE: Make sure the battery is fully charged.

   1. Turn the ignition on.
   2. Wait 12 seconds, then with the scan tool, read all active ORC DTCs.

      Is the DTC active or stored?

      ORC - ACTIVE DTC

      - Go To 2

      ORC - STORED DTC

      - Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK BCM OCM PRESENT CONFIGURATION**
   1. With the scan tool, check for OCM present configuration.

      Does the Vehicle Configuration in the BCM match the Vehicle Configuration in the ORC?

      Yes

      WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and serious or fatal injury.

WARNING: To avoid serious or fatal injury, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

- Replace the ORC in accordance with Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Perform the ORC PROXII to configure the module in accordance with the service information.

NOTE: The ORC Reset Function must be performed after the repair to force the module to retest for this DTC. Access the Miscellaneous Function or Diagnostic Procedures menu from the ORC ECU Overview screen on the scan tool to perform this operation.

-

B1BB9-00-AIRBAG SQUIB CIRCUIT COUPLING

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) sends a test current to the squibs to verify the integrity of the squib and wiring. The presence of this code indicates that any two circuits, from two or more squibs, have become shorted or "coupled" together.

WHEN MONITORED

The ORC checks for the presence of coupled squib circuits once during the initialization process.

SET CONDITION

This DTC sets when the ORC detects that any two circuits, from two or more squibs, have become shorted or "coupled" together. Once set, this DTC is latched for the entire ignition cycle.

POSSIBLE CAUSES

Possible Causes
SQUIB CIRCUIT WIRING
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

   NOTE: Make sure the battery is fully charged.

   1. Turn the ignition on.
   2. Perform ORC module reset. Access the Miscellaneous Function menu from the ORC ECU Overview screen on the scan tool to perform this operation.
   3. With the scan tool, read ORC DTCs.

      Is the DTC active or stored?

      ORC - ACTIVE DTC

      - Go To 2

      ORC - STORED DTC

      - Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK FOR ADDITIONAL ACTIVE SQUIB DTCS**
   1. With the scan tool, read ORC DTCs.

      Are there squib specific DTCs set as active in addition to B1BB9-00-AIRBAG SQUIB CIRCUIT COUPLING?

      Yes

      - Repair all other active squib specific DTCs before repairing B1BB9-00-AIRBAG SQUIB CIRCUIT COUPLING. Refer to the **DIAGNOSTIC CODE INDEX** .

      No

      - Go To 3
3. **USE THE SCAN TOOL TO IDENTIFY THE COUPLED CIRCUITS**
   1. With the scan tool, identify the two or more Squib circuits that read SET.

      Are two or more Squib circuits SET?

      Yes

- Repair the two or more Squib circuits for a Squib Circuit Coupling condition.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2014 RESTRAINTS

Occupant Restraint Controller (ORC) - Electrical Diagnostics - Cherokee

DIAGNOSIS AND TESTING

B1BC7-00-DEPLOYMENT DATA RECORD FULL

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) performs an internal self test. The repair of this fault condition does not involve any external circuitry and centers on verifying the integrity of the module's internal memory.

WHEN MONITORED

The ORC checks its internal memory for the number of deployment events once at every power up, during the initialization process.

SET CONDITION

This DTC sets when the ORC detects that crash data memory space is full. Once set, this DTC is latched indefinitely.

POSSIBLE CAUSES

Possible Causes
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

CHECK FOR ACTIVE DTC

1. Turn the ignition on.
2. With the scan tool, read ORC DTCs.

   Is the Deployment Data Record Full DTC active?

   Yes

   - Replace the Occupant Restraint Controller (ORC) in accordance with the service information.

Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .

- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1C32-00-AIRBAG DEPLOYMENT DETECTED

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

After a deployment event the Occupant Restraint Controller (ORC) sets this DTC active will be set active and remain latched until cleared with the scan tool.

WHEN MONITORED

With the ignition on.

SET CONDITION

This DTC sets when the ORC detects a deployment event remain latched until cleared with the scan tool. This DTC will not set as a Stored Code.

POSSIBLE CAUSES

Possible Causes
AIRBAG DEPLOYMENT DETECTED

DIAGNOSTIC TEST

CHECK FOR ACTIVE DTCS

1. Turn the ignition on.
2. With the scan tool, read the Occupant Restraint Controller (ORC) DTCs.

   Is the active B1C32-00-AIRBAG DEPLOYMENT DETECTED DTCs present?

   Repair

   - With the scan tool erase the DTC.
   - Perform the RESTRAINT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B212C-13-IGNITION RUN/START INPUT - CIRCUIT OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 1: Occupant Restraint Controller Module (ORC) Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Occupant Restraint Controller module (ORC) receives power from both a Fused Ignition Switch Output (Run) and Ignition Run/Start Control Output Circuit from the Underhood Power Distribution Center. These circuits power the ORC and the capacitors used to initiate the squib deployment circuits in the event of collision detection.

WHEN MONITORED

With the ignition on.

SET CONDITION

If voltage on the Ignition Run/Start Control Output circuit drops below 6.0 volts and the voltage on the Fused Ignition Switch Output (RUN) circuit is greater then or equal to 9 volts for 15 seconds in the bussed ignition RUN position.

POSSIBLE CAUSES

Possible Causes
IGNITION RUN/START CONTROL OUTPUT CIRCUIT OPEN OR SHORTED TO GROUND
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK (F929) IGNITION RUN/START CONTROL OUTPUT CIRCUIT VOLTAGE AT THE ORC HARNESS CONNECTOR**

NOTE: **Using the wiring diagrams as a guide, check all appropriate fuses before proceeding with this diagnostic procedure. Repair as necessary.**

NOTE: **Probing of the circuit cavities at the ORC Module C1-A, C1-B, or C2-A body harness connectors is only to be done with a approved test lead from the (special tool #10159, Test Leads, Dedicated). Or a comparable test lead to prevent vehicle wiring harness connector damage during diagnostic procedures.**

WARNING: **Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

1. Disconnect the ORC harness connectors.
2. Turn the ignition on.
3. Using the appropriate test lead, measure the voltage of the (F929) Ignition Run/Start Control Output circuit between the ORC C1 harness connector and ground.

   Is the voltage above 6.5 volts?

   Yes

   - Replace the ORC in accordance with the Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Using the wiring diagrams as a guide, repair the (F929) Ignition Run/Start Control Output Circuit for an open or short to ground.
   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B212D-IGNITION RUN ONLY INPUT CIRCUIT OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 2: Occupant Restraint Controller Module (ORC) Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Occupant Restraint Controller module (ORC) receives power from both a Fused Ignition Switch Output (Run) and Ignition Run/Start Control Output Circuit from the Underhood Power Distribution Center. These circuits power the ORC and the capacitors used to initiate the squib deployment circuits in the event of collision detection.

WHEN MONITORED

With the ignition on.

SET CONDITION

If voltage on the Fused Ignition Switch Output (RUN) circuit drops below 6.0 volts and the voltage on the Ignition Run/Start Control Output circuit is greater then or equal to 9 volts for 15 seconds in the bussed ignition RUN position.

POSSIBLE CAUSES

Possible Causes
FUSED IGNITION SWITCH OUTPUT (RUN) CIRCUIT OPEN OR SHORTED TO GROUND
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
   1. Turn the ignition on.
   2. With the scan tool, read DTCs.

      Does the scan tool display this DTC as active?

      Yes

      - Go To 2

      No

      - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
      - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK (F945) FUSED IGNITION SWITCH OUTPUT (RUN) CIRCUIT VOLTAGE AT THE ORC HARNESS CONNECTOR**

   NOTE: Using the wiring diagrams as a guide, check all appropriate fuses before proceeding with this diagnostic procedure. Repair as necessary.

   NOTE: Probing of the circuit cavities at the ORC Module C1-A, C1-B, or C2-A body

harness connectors is only to be done with a approved test lead from the (special tool #10159, Test Leads, Dedicated). Or a comparable test lead to prevent vehicle wiring harness connector damage during diagnostic procedures.

WARNING: **Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

1. Disconnect the ORC harness connectors.
2. Turn the ignition on.
3. Using the appropriate test lead, measure the voltage of the (F945) Fused Ignition Switch Output (Run) circuit between the ORC C1 harness connector and ground.

   Is the voltage above 6.5 volts?

   Yes

   - Replace the ORC in accordance with the Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Using the wiring diagrams as a guide, repair the (F945) Fused Ignition Switch Output (Run) circuit for an open or short to ground.
   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B0101-16-POWER SUPPLY - CIRCUIT VOLTAGE BELOW THRESHOLD

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 3: Occupant Restraint Controller Module (ORC) Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the ignition on.

SET CONDITION

Vehicle System voltage less than 10.0 volts.

POSSIBLE CAUSES

Possible Causes
VEHICLE CHARGING SYSTEM MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

1. **CHECK FOR ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded or contaminated terminals.
    - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **VERIFY OPERATION OF THE VEHICLE CHARGING SYSTEM**

    NOTE: Troubleshoot any PCM charging/cranking DTCs before proceeding.

    NOTE: Make sure the battery is fully charged.

    Are any charging system DTCs present?

    Yes

    - Refer to the **DTC INDEX** article and perform the appropriate charging system or battery diagnostic procedure.

    No

    - Replace the ORC in accordance with the Service Information. Refer to **MODULE, OCCUPANT**

RESTRAINT CONTROLLER, REMOVAL .

- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B0101-17-POWER SUPPLY - CIRCUIT VOLTAGE ABOVE THRESHOLD

For a complete wiring diagram, **refer to Wiring Information** .

Fig. 4: Occupant Restraint Controller Module (ORC) Circuit Diagram

Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the ignition on.

SET CONDITION

Vehicle System voltage greater than 16.0 volts.

POSSIBLE CAUSES

Possible Causes
VEHICLE CHARGING SYSTEM MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

1. **CHECK FOR ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded or contaminated terminals.
    - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **VERIFY OPERATION OF THE VEHICLE CHARGING SYSTEM**

    NOTE: Troubleshoot any PCM charging/cranking DTCs before proceeding.

    NOTE: Make sure the battery is fully charged.

    Are any charging system DTCs present?

    Yes

- Refer to the **DTC INDEX** article and perform the appropriate charging system or battery diagnostic procedure.

No

- Replace the ORC in accordance with the Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B2204-00-ECU CONFIGURATION MISMATCH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

When powered, during flash programming of the Occupant Restraint Controller (ORC) experienced an interruption of the programming procedure due to a software or hardware failure. The repair of this fault centers on verifying the ORC completed successfully the flash programming process completely. The flash programming process is asked to run again in the diagnostics written to possibly clear the internal hardware or software failure.

WHEN MONITORED

Throughout the complete flash programming of the ORC module.

SET CONDITION

This DTC sets when the ORC detects a failure of the flash programming process in the bootloader mode not allowing the ORC module to enter the application mode. This DTC will not set as a Stored Code.

POSSIBLE CAUSES

Possible Causes
PROXI
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE DTC**

NOTE: Make sure the battery is fully charged.

1. Turn the ignition on.
2. Wait 12 seconds, then with the scan tool, read all active ORC DTCs.

   Is DTC B2204-00-ECU CONFIGURATION MISMATCH set?

   Yes

   - Go To 2

2. **PERFORM THE ORC MODULE FLASH PROGRAMMING PROCEDURE**

   NOTE: Make sure the battery is fully charged.

   NOTE: Service replacement ORC modules are shipped in a LOCKED OUT state and after installed will set a ORC UNLOCKED - ALL DEPLOYMENT DISABLED fault. Use a diagnostic scan tool to access the ORC module and go to the MISCELLANEOUS FUNCTIONS menu item to perform the MODULE INITIALIZATION procedure to erase the fault and initialize the new replacement ORC.

   1. Perform the ORC Module Flash Programming procedure.

      Did the ORC Module flash programming procedure run 100 percent completely?

      Yes

      - Perform the Restraints System Verification Test. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 3

3. **REPEAT THE ORC MODULE FLASH PROGRAMMING PROCEDURE**
   1. Perform the ORC Module Flash Programming procedure.

      Did the ORC Module flash programming procedure run 100 percent completely?

      Yes

      - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions

can result in accidental airbag deployment. Failure to follow these instructions may result in possible serious or fatal injury.

WARNING: **Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

- Replace the ORC in accordance with Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B2207-OCCUPANT RESTRAINT CONTROLLER INTERNAL 1

WHEN MONITORED

With the ignition on. The modules on board diagnostics continuously performs internal circuit tests.

SET CONDITION

This DTC will set if the module identifies an out of range internal circuit.

POSSIBLE CAUSES

Possible Causes
OCCUPANT RESTRAINT CONTROLLER (ORC)

DIAGNOSTIC TEST

REPLACE OCCUPANT RESTRAINT CONTROLLER

WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

WARNING: **If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to follow these instructions may result in possible serious or fatal injury.**

Repair

- Replace the ORC in accordance with Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the RESTRAINT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B2208-OCCUPANT RESTRAINT CONTROLLER INTERNAL 2

WHEN MONITORED

With the ignition on. The modules on board diagnostics continuously performs internal circuit tests.

SET CONDITION

This DTC will set if the module identifies an out of range internal circuit.

POSSIBLE CAUSES

Possible Causes
OCCUPANT RESTRAINT CONTROLLER (ORC)

DIAGNOSTIC TEST

REPLACE OCCUPANT RESTRAINT CONTROLLER

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to follow these instructions may result in possible serious or fatal injury.

Repair

- Replace the ORC in accordance with Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the RESTRAINT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B2209-OCCUPANT RESTRAINT CONTROLLER INTERNAL 3

WHEN MONITORED

With the ignition on. The modules on board diagnostics continuously performs internal circuit tests.

SET CONDITION

This DTC will set if the module identifies an out of range internal circuit.

POSSIBLE CAUSES

Possible Causes
OCCUPANT RESTRAINT CONTROLLER (ORC)

DIAGNOSTIC TEST

REPLACE OCCUPANT RESTRAINT CONTROLLER

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to follow these instructions may result in possible serious or fatal injury.

Repair

- Replace the ORC in accordance with Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the RESTRAINT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B220A-OCCUPANT RESTRAINT CONTROLLER INTERNAL 4

WHEN MONITORED

With the ignition on. The modules on board diagnostics continuously performs internal circuit tests.

SET CONDITION

This DTC will set if the module identifies an out of range internal circuit.

POSSIBLE CAUSES

Possible Causes
OCCUPANT RESTRAINT CONTROLLER (ORC)

DIAGNOSTIC TEST

REPLACE OCCUPANT RESTRAINT CONTROLLER

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to follow these instructions may result in possible serious or fatal injury.

Repair

- Replace the ORC in accordance with Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the RESTRAINT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B220B-OCCUPANT RESTRAINT CONTROLLER FIRING STORED ENERGY

WHEN MONITORED

With the ignition on. The modules on board diagnostics continuously performs internal circuit tests.

SET CONDITION

This DTC will set if the module identifies an out of range internal circuit.

POSSIBLE CAUSES

Possible Causes
OCCUPANT RESTRAINT CONTROLLER (ORC)

DIAGNOSTIC TEST

REPLACE OCCUPANT RESTRAINT CONTROLLER

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to follow these instructions may result in possible serious or fatal injury.

Repair

- Replace the ORC in accordance with Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the OCCUPANT CLASSIFICATION MODULE SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B222A-00-VEHICLE LINE MISMATCH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) performs an internal self test. The repair of this fault centers on verifying the ORC and Body Control Module (BCM) configuration.

WHEN MONITORED

The ORC checks its feature configuration for a stored Vehicle Line and Country Code continuously 12 seconds after initialization. The monitoring is continuous and repeats at a rate of every 500 ms.

SET CONDITION

This DTC sets when the ORC detects a mismatch between the Vehicle Configuration and the ORC configuration for four seconds. Once the code sets in this ignition cyle it stays active for this ignition cycle.

POSSIBLE CAUSES

Possible Causes
INCORRECT VEHICLE CONFIGURATION
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

   NOTE: Make sure the battery is fully charged.

   1. Turn the ignition on.
   2. Wait 12 seconds, then with the scan tool, read all active ORC DTCs.

      Is the DTC active or stored?

      ORC - ACTIVE DTC

      - Go To 2

      ORC - STORED DTC

      - Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK BCM COUNTRY CODE AND VEHICLE LINE**
   1. Using the scan tool, check for the correct Country Code, Vehicle Line, and Body Style.

      Does the Vehicle Configuration in the BCM match the Vehicle Configuration in the ORC?

      Yes

      WARNING: **If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment. Failure to follow these instructions may result in possible serious or fatal injury.**

      WARNING: **Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

      - Replace the ORC in accordance with Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
      - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B2255-00-OCCUPANT RESTRAINT CONTROLLER ROLL-OVER FEATURE DISABLE

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) performs an internal self test. The repair of this fault does not involve any external circuitry and centers on verifying the module is configured correctly for the vehicle's restraint system components.

WHEN MONITORED

This DTC occurrence sets upon receiving the message.

SET CONDITION

This DTC sets when the ORC detects the roll over feature has been disabled contrary to the correct vehicle configuration or has been disabled with the scan tool. This DTC can only be Active.

POSSIBLE CAUSES

Possible Causes
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

OCCUPANT RESTRAINT CONTROLLER ROLL OVER FEATURE DISABLED

1. Turn the ignition on.
2. With the scan tool read the ORC Roll Over Feature status Enabled or Disabled.

   Does the scan tool show Roll Over Feature Disabled?

   Repair

   - With the scan tool select Enable to clear the active B2255 DTC.
   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B2722-00-ORC UNLOCKED - ALL DEPLOYMENT DISABLED

THEORY OF OPERATION

All Occupant Restraint Controller (ORC) modules destined for service part usage are shipped in a state that inhibits the deployment of all supplemental restraint squib circuits (ORC unlocked) for safe, initial installation. Once the ORC initialization procedure is performed (ORC locked). The ORC enters a full state of readiness and can no longer transition to the unlocked status.

WHEN MONITORED

The ORC will detect the Deployment Disable Status (ORC LOCKED, ORC UNLOCKED or ORC IS RESPONDING WITH INCORRECT DATA) as soon as the ignition is turned on and the power is supplied to the new ORC.

SET CONDITION

This DTC will be set as active for all service replacement ORC modules prior to the initialization procedure (ORC locked). This DTC is Active within four to six seconds for the ORC unlocked state at start up. The DTC will change from Active to non Active state immediately upon the ORC state changing to locked. The ORC module will not show this DTC as Stored. It will just not show the DTC in a Stored state. Supply voltage range is 9 - 16 volts.

POSSIBLE CAUSES

Possible Causes
UNLOCKED OCCUPANT RESTRAINT CONTROLLER (ORC) Module

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK FOR ADDITIONAL ACTIVE ORC DTCS**

   NOTE: Make sure the battery is fully charged.

   1. Turn the ignition on.
   2. With the scan tool, read the active ORC DTC.

      Is B2722-ORC UNLOCKED - ALL DEPLOYMENT DISABLED the only active DTC?

      Yes

      - Go To 2

      No

      - Select the appropriate diagnostic procedure from the Table of Contents in this section. Refer to **DIAGNOSIS AND TESTING** .
2. **INITIALIZE ORC**
   1. With the scan tool, select Initialize ORC.
   2. The Scan Tool will display the current Deployment Disable Status (CURRENT STATUS)

      Select the CURRENT STATUS displayed on the Scan Tool.

      CURRENT STATUS

      - LOCKED
      - The ORC is in a full state of readiness.
      - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      CURRENT STATUS

      - UNLOCKED
      - Go To 3

      CURRENT STATUS

- ORC is Responding with incorrect Data
- With the scan tool, select MISC. FUNCTION and then ORC RESET.
- After the ORC RESET is complete: Restart this test at step 1.
- Go To 1

3. **CHANGE ORC STATUS**
   1. Follow the instruction on the screen to change the status to LOCKED.
   2. The Scan Tool will display the result of the initialization.

   Does the Scan Tool display: ORC LOCK Successful?

   Yes

   - CURRENT STATUS is ORC LOCK Successful
   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 4

4. **INCOMPLETE OR FAILED ORC INITIALIZATION**

   Does the Scan Tool display: ORC Initialization Failed?

   Yes

   - CURRENT STATUS is ORC Initialization Failed

     WARNING: **Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

     WARNING: **If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment. Failure to follow these instructions may result in possible serious or fatal injury.**

   -
   -
   - Replace the ORC in accordance with service information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

- CURRENT STATUS is Current and original VIN have not been learned by ORC
- With the scan tool, select MISC. FUNCTION and then ORC RESET.
- After the ORC RESET is complete: Restart this test at step 1.
- Go To 1

B2734-13-PASSENGER OCCUPANT DETECTION SENSOR - CIRCUIT OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 5: Passenger Seatbelt, Seat Track Position & Occupant Detection Sensor Circuit Diagram

Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Occupant Detection Sensor (ODS) is a electrical resistance mat with cells that is located in the front passenger seat. This sensor is only used for passenger seatbelt reminder. The seat sensor assumes a passenger is present when a minimum of 103 pounds (47kg) of weight is placed in the seat the resistance will show 214 ohms. When a package or no person is occupying the passenger seat the resistance range will be between 701 and 1.5k ohms. The resistance of the mat decreases, signaling to the ORC module that a passenger is present. The ORC then transmits this information to the instrument cluster over the CAN bus. The passenger is only reminded to buckle up if the passenger seat occupant minimum weight threshold determined by the ODS is surpassed and the seat belt buckle is still not latched. The ODS receives battery voltage and clean ground through dedicated sensor plus and minus circuits from the ORC. The ORC receives, processes, and continuously monitors (monitor rate of 500 ms) the analog signal from the ODS. The ODS component is not repairable, if determined inoperable, it would require to be replaced with a new component. The seatbelt warning lamp will not set for this fault.

WHEN MONITORED

The ORC receives, processes, and continuously monitors (monitor rate of 500 ms) the analog signal from the ODS.

SET CONDITION

The ORC detects High voltage on the (R283) Passenger Occupant Detector Sensor Signal circuit for 2.5 - 5 seconds. The DTC will not latch for the entire ignition cycle. The code goes from Active to Stored 2.5 - 5 seconds after the code setting criteria is gone. This code also covers the Open, and Short to Ground fault. The Occupant Detector Signal Circuit will default to a unoccupied status with the open or short to battery, and short to ground fault.

POSSIBLE CAUSES

Possible Causes
(R283) PASSENGER OCCUPANT DETECTOR SIGNAL CIRCUIT OPEN
(R283) PASSENGER OCCUPANT DETECTOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
(R283) PASSENGER SEAT OCCUPANT DETECTOR SIGNAL CIRCUIT SHORTED TO GROUND
PASSENGER SEAT OCCUPANT DETECTOR GROUND CIRCUIT OPEN
(R283) PASSENGER SEAT OCCUPANT DETECTOR SIGNAL CIRCUIT SHORTED TO THE PASSENGER SEAT OCCUPANT DETECTOR GROUND CIRCUIT
PASSENGER SEAT OCCUPANT DETECTION SENSOR
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always Perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **VERIFY ACTIVE DTC**

NOTE: **The seat belt warning lamp in the instrument cluster does not set to indicate a passenger seat belt reminder feature.**

NOTE: **The use of a approved special tool or Digital Multimeter such as a Fluke Meter that will not apply more than 20 milliamperes to a circuit are the only measurement tools to be used.**

1. **VERIFY ACTIVE DTC**

NOTE: **Make sure the battery is fully charged.**

2. Turn the ignition on.
3. With the scan tool, read the ORC DTCs

NOTE: **Diagnosing for the high code but also will be checking for an Open fault in both the (R283) signal and ground circuits.**

Does the scan tool display active B2734-13-PASSENGER OCCUPANT DETECTION SENSOR - CIRCUIT OPEN - DTC?

Yes

- Go To 2

No

- Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK THE (R283) PASSENGER OCCUPANT DETECTOR SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**

NOTE: **Repair of the wiring is only to be done on the seat body harness side of the connector. If the wiring fault is in the component side of the wiring harness routed into the seat cushion a ODS sensor replacement is to be performed.**

WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

1. Keep the Passenger Occupant Detector Sensor harness connector in the seat cushion connected.

2. Keep the passenger inline harness underseat connector connected.
3. Keep the Occupant Detection Sensor (ODS) in the passenger seat cushion connected.
4. Disconnect the ORC harness connectors.

NOTE: Check connectors - Clean and repair as necessary.

5. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)to the ORC harness connectors.
6. If equipped with the standard key ignition, use this ignition on warning.
7. If equipped with the keyless ignition, use this ignition on warning.

WARNING: Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

8. Measure the voltage of the (R283) Passenger Occupant Detection Signal circuit between the(special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) connector C1B cavity 27 and connector C1B cavity 19 R730 ground.

   Is there any voltage present?

   Yes

NOTE: The ODS sensor is to be replaced whenever a short to voltage fault has been found in the ODS harness even after the harness repair has been performed.

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

- Repair the (R283) Passenger Occupant Detector Signal circuit for a short to voltage.
- Replace the ODS sensor in accordance with the Service Information.
- Follow the WiTech Scan Tool Miscellaneous Function / Empty Seat Value Relearn and perform a Rezeroing of the OCM.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 3

3. **CHECK THE (R283) PASSENGER OCCUPANT DETECTOR SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE BETWEEN THE ORC AND THE PASSENGER INLINE UNDERSEAT CONNECTOR**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

NOTE: Check connectors - Clean/Repair as necessary.

1. Disconnect the passenger underseat harness connector.
2. If equipped with the standard key ignition, use this ignition on warning.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

3. If equipped with the keyless ignition, use this ignition on warning.

WARNING: Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

4. Measure the voltage between the common (R730) Ground circuit at connector C1B cavity 19 and the (R283) Passenger Occupant Detector Signal circuit at connector C1B cavity 27 of the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool).

   Is there voltage present?

   Yes

NOTE: The ODS sensor is to be replaced whenever a short to voltage fault has been found in the ODS harness even after the harness repair has been performed.

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

- Repair the short to voltage in the (R283) Passenger Occupant Detector Signal circuit located

between the ORC and the passenger underseat jumper harness connector.

- Replace the ODS Sensor in accordance with the Service Information.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 4

4. **CHECK THE (R283) PASSENGER OCCUPANT DETECTOR SENSOR SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE IN THE UNDERSEAT JUMPER HARNESS**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Connect the passenger seat underseat connector.

NOTE: Confirm the connector is seated firmly and the lock tab is fully seated.

2. Access the Passenger Occupant Detector Sensor (ODS) harness connector located at the passenger seat cushion.
3. Disconnect the Passenger Occupant Detector Sensor (ODS) harness connector.
4. If equipped with the standard key ignition, use this ignition on warning.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

5. If equipped with the keyless ignition, use this ignition on warning.

WARNING: Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

6. Measure the voltage between common (R730) Ground circuit at connector C1B cavity 19 and the (R283) Passenger Occupant Detector Signal circuit at connector C1B cavity 27 of the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool).

   Is there voltage present?

Yes

NOTE: The ODS sensor is to be replaced whenever a short to voltage fault has been found in the ODS harness even after the harness repair has been performed.

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

- Repair the short to voltage in the (R283) Passenger Occupant Detector Signal Circuit located between the passenger underseat connector and the Passenger Occupant Detector Sensor connector.
- Replace the ODS Sensor in accordance with the Service Information.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 5

5. **CHECK THE (R283) PASSENGER OCCUPANT DETECTOR SENSOR SIGNAL CIRCUIT AND (R730) ORC COMMON GROUND CIRCUIT FOR AN OPEN OR HIGH RESISTANCE BETWEEN THE ORC AND THE PASSENGER UNDERSEAT HARNESS CONNECTOR**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the passenger underseat harness connector.
2. Measure the resistance of the (R283) Occupant Detector Sensor Signal circuit from the inline underseat harness connector to the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) connector C1B cavity 27.
3. Measure the resistance of the (R730) Ground circuit from the inline underseat harness connector to the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) connector C1B cavity 19.

Is the resistance below 700 Ohms?

Yes

- Go To 6

No

- Repair the (R283) Occupant Detector Sensor Signal circuit or Ground circuit for an open or high resistance.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

6. **CHECK THE (R283) PASSENGER OCCUPANT DETECTOR SENSOR SIGNAL CIRCUIT AND (R730) PASSENGER OCCUPANT DETECTOR GROUND CIRCUIT FOR AN OPEN OR HIGH RESISTANCE IN THE SEATBACK JUMPER HARNESS**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Reconnect the underseat harness connector.

NOTE: Inspect terminal pins and verify the underseat harness connector is fully seated correctly and that the connector locking tab is correctly in place.

2. Access the Passenger Occupant Detector Sensor located in the passenger seat cushion.
3. Disconnect the Passenger Occupant Detector Sensor harness connector.
4. Measure the resistance of the (R283) Occupant Detector Sensor Signal circuit from cavity 1 of the ODS connector to the C1B connector (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)cavity 27.
5. Measure the resistance of the Occupant Detector Sensor (R730) Ground circuit from cavity 2 of the ODS connector to connector C1B cavity 19 of the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool).

Is the resistance below 700 Ohms?

Yes

- Go To 7

No

NOTE: Repair of the wiring is only to be done on the seat body harness side of the connector. If the wiring fault is in the component side of the wiring harness routed into the seat cushion a ODS sensor replacement is to be performed.

- Repair the (R283) Passenger Occupant Detector Signal circuit or R730 Ground circuit in the body harness for an open or high resistance.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

7. **CHECK THE (R283) PASSENGER OCCUPANT DETECTOR SENSOR SIGNAL CIRCUIT AND PASSENGER OCCUPANT DETECTOR SENSOR GROUND CIRCUIT FOR AN OPEN OR HIGH RESISTANCE WITH THE ODS HARNESS FULLY CONNECTED**

NOTE: Confirm the connector is seated firmly and the lock tab is fully seated.

1. Connect the Occupant Detector Sensor (ODS), verify all in-line connections are secure.
2. Measure the resistance of the (R283) Passenger Occupant Detector Signal circuit connector C1B cavity 27 to the (Z913) Ground circuit connector C1A cavity 30(special tool #8443-57, Adapter, Supplemental Restraint System Load Tool).

   Is the resistance below 700 Ohms?

   Yes

   WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

   - Turn the ignition Off and wait 15 seconds before turning the ignition On.
   - Wait one minute and read active codes.
   - If the B2734-13-PASSENGER OCCUPANT DETECTION SENSOR - CIRCUIT OPEN becomes active, replace the ORC in accordance with the Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .

   No

   - Go To 8

8. **CHECK OPERATION OF THE PASSENGER OCCUPANT DETECTOR SENSOR**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Replace the Passenger Occupant Detector Sensor in accordance with the Service Information.
2. Remove any special tools or jumper wires and reconnect all previously disconnected components - except the Battery.
3. If equipped with the standard key ignition, use this ignition on warning.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

4. If equipped with the keyless ignition, use this ignition on warning.

   WARNING: **Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

5. Connect the scan tool to the Data Link Connector - use the most current software available.
6. Use the scan tool and erase the ORC stored codes.
7. Turn the Ignition Off and wait 15 seconds before turning the Ignition On.
8. Wait one minute and read active codes and if there are none present read the stored codes.

   Does the scan tool display active B2734-13-PASSENGER OCCUPANT DETECTION SENSOR - CIRCUIT OPEN DTC?

   Yes

   WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

   WARNING: **If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to follow these instructions may result in possible serious or fatal injury.**

   - Replace the ORC in accordance with the Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Repair is complete.
   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B2734-95-PASSENGER OCCUPANT DETECTION SENSOR - INCORRECT ASSEMBLY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 6: Passenger Seatbelt, Seat Track Position & Occupant Detection Sensor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

When powered, the Occupant Restraint Controller (ORC) sends a test current to the passenger occupant detection sensor. During this test, the sensor discovered are checked for agreement with the pre-programmed configuration of components assigned to the module.

WHEN MONITORED

The ORC checks for the presence of occupant detection sensor circuits once during the initialization process.

SET CONDITION

This DTC sets when the ORC detects the presence of a occupant detection sensor circuit while the configuration of the module does not reflect a occupant detection sensor should be present. Once set, this DTC is latched for the entire power cycle and requires the module to be re-initalized to set code.

POSSIBLE CAUSES

Possible Causes
PASSENGER OCCUPANT DETECTION SENSOR
WIRING
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK FOR ACTIVE INTERNAL FAULTS, IGNITION FAULTS, AND BATTERY FAULTS IN THE OCCUPANT RESTRAINT CONTROLLER (ORC)**

   NOTE: Make sure the battery is fully charged.

   1. With the scan tool, read Occupant Restraint Controller (ORC) DTCs.

      Does the scan tool display any active DTCs relating to internal faults, ignition faults, or battery faults?

      Yes

      - Diagnose and repair the DTCs. Refer to **DIAGNOSIS AND TESTING** .

      No

      - Go To 2

2. **VERIFY THAT B2734-95-PASSENGER OCCUPANT DETECTION SENSOR - INCORRECT ASSEMBLY IS ACTIVE**
   1. With the scan tool, erase ORC DTCs.
   2. Turn the ignition off, wait 10 seconds and then turn the ignition on.
   3. Wait 2 minutes, and then with the scan tool, read ORC DTCs.

      Does the scan tool display active: B2734-95-PASSENGER OCCUPANT DETECTION SENSOR - INCORRECT ASSEMBLY?

Yes

- Go To 3

No

- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **VERIFY WIRING**
   1. Turn the ignition off.
   2. Inspect the passenger seat wiring for Passenger Occupant Detection Sensor.

   Is Passenger Occupant Detection Sensor present?

   Yes

   WARNING: Turn the ignition off, disconnect the battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

   WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment.

   - Replace the ORC in accordance with the Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B2761-96-LEFT B-PILLAR IMPACT ACCELERATION SENSOR - COMPONENT INTERNAL FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 7: Left Impact Sensor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Left Side Impact Sensor 1 is mounted near the base of the B-pillar. Refer to **DESCRIPTION** . Impact sensors perform their own self test using power supplied by the Occupant Restraint Controller (ORC) then communicate this status back to the module. The repair of this fault centers on verifying the integrity of the sensor's internal circuitry and software validity.

WHEN MONITORED

The Occupant Restraint Controller (ORC) continuously communicates with the Left Side Impact Sensor 1 over the sensor signal circuit. The sensor communication and on board diagnostics are powered by the ORC signal.

SET CONDITION

This code will set, if the ORC and the Left Side Impact Sensor 1 do not establish and maintain valid data communications. The DTC will become Active after the fault has set for a minimum of 100 milliseconds (ms). The DTC will go to Stored after the ORC Left Side r Impact Sensor 1 communication fault has been removed or the suspect sensor has been replaced. The clearing of this fault is immediate upon the suspect internal error being removed or the suspect sensor being replaced. The Airbag Warning Lamp (AWL) will set in the instrument cluster.

POSSIBLE CAUSES

Possible Causes
INTERMITTENT CONNECTION (WIRING/CONNECTORS)
LEFT SIDE IMPACT SENSOR 1
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always Perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED FAULT CODE**
   1. Turn the ignition on.

      NOTE: Make sure the battery is fully charged.

   2. With the scan tool, read the active ORC DTCs.

      Is the DTC: B2761-96-LEFT B-PILLAR IMPACT ACCELERATION SENSOR - COMPONENT INTERNAL FAILURE - Active?

      Yes

      WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

      NOTE: Inspect the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary. Recheck for active DTC B2761-96-LEFT B-PILLAR IMPACT ACCELERATION SENSOR - COMPONENT

INTERNAL FAILURE. If active go to 2 if stored then repair is complete.

- Perform the RESTRAINTS SYSTEM VERIFICATION TEST.

  Refer to **STANDARD PROCEDURE** .

No

- Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **VERIFY OPERATION OF THE LEFT SIDE IMPACT SENSOR 1**

WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

1. Replace the Left Side Impact Sensor 1 in accordance with the Service Information. Refer to **SENSOR, IMPACT, REMOVAL** .
2. Reconnect the vehicle wire harness to the sensor.
3. Remove any special tools or jumper wires and reconnect all previously disconnected components - except the Battery.
4. If equipped with the standard key ignition, use this ignition on warning.

WARNING: **Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

If equipped with the keyless ignition, use this ignition on warning.

WARNING: **Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

5. Use the scan tool and erase the stored codes in all airbag system modules.
6. Turn the Ignition Off, and wait 15 seconds before turning the Ignition On.
7. With the scan tool, read the active ORC DTCs.

   Did the active DTC: B2761-96-LEFT B-PILLAR IMPACT ACCELERATION SENSOR - COMPONENT INTERNAL FAILURE return?

Yes

- Go To 3

No

- Repair is complete.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **REPLACE THE OCCUPANT RESTRAINT CONTROLLER**

WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

WARNING: **If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment. Failure to follow these instructions may result in possible serious or fatal injury.**

If there are no possible causes remaining, view repair

Repair

- Replace the ORC in accordance with the Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B2762-96-LEFT C PILLAR IMPACT ACCELERATION SENSOR - COMPONENT INTERNAL FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 8: Left Impact Sensor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Left Side Impact Sensor 2 is mounted near the base of the C-pillar. Refer to **DESCRIPTION** . Impact sensors perform their own self test using power supplied by the Occupant Restraint Controller (ORC) then communicate this status back to the module. The repair of this fault centers on verifying the integrity of the sensor's internal circuitry and software validity.

WHEN MONITORED

The Occupant Restraint Controller (ORC) continuously communicates with the Left Side Impact Sensor 2 over the sensor signal circuit. The sensor communication and on board diagnostics are powered by the ORC signal.

SET CONDITION

This code will set, if the ORC and the Left Side Impact Sensor 2 do not establish and maintain valid data communications. The DTC will become Active after the fault has set for a minimum of 100 milliseconds (ms). The DTC will go to Stored after the ORC Left Side Impact Sensor 2 communication fault has been removed or the suspect sensor has been replaced. The clearing of this fault is immediate upon the suspect internal error being removed or the suspect sensor being replaced. The Airbag Warning Lamp (AWL) will set in the instrument cluster

POSSIBLE CAUSES

Possible Causes
INTERMITTENT CONNECTION (WIRING/CONNECTORS)
LEFT SIDE IMPACT SENSOR 2
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always Perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED FAULT CODE**
   1. Turn the ignition on.

      NOTE: Make sure the battery is fully charged.

   2. With the scan tool, read the active ORC DTCs.

      Is the DTC: B2762-96-LEFT C-PILLAR IMPACT ACCELERATION SENSOR - COMPONENT INTERNAL FAILURE- Active?

      Yes

      WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

      NOTE: Inspect the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary. Recheck for active DTC B2762-96-LEFT C-PILLAR IMPACT ACCELERATION SENSOR - COMPONENT

INTERNAL FAILURE. If active go to 2 if stored then repair is complete.

- Perform the RESTRAINTS SYSTEM VERIFICATION TEST.

  Refer to **STANDARD PROCEDURE** .

No

- Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **VERIFY OPERATION OF THE LEFT SIDE IMPACT SENSOR 2**

WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

1. Replace the Left Side Impact Sensor 2 in accordance with the Service Information. Refer to **SENSOR, IMPACT, REMOVAL** .
2. Reconnect the vehicle wire harness to the sensor.
3. Remove any special tools or jumper wires and reconnect all previously disconnected components - except the Battery.
4. If equipped with the standard key ignition, use this ignition on warning.

WARNING: **Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

5. If equipped with the keyless ignition, use this ignition on warning.

WARNING: **Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

6. Use the scan tool and erase the stored codes in all airbag system modules.
7. Turn the Ignition Off, and wait 15 seconds before turning the Ignition On.
8. With the scan tool, read the active ORC DTCs.

   Did the active DTC: B2762-96-LEFT C-PILLAR IMPACT ACCELERATION SENSOR - COMPONENT INTERNAL FAILURE return?

Yes

- Go To 3

No

- Repair is complete.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **REPLACE THE OCCUPANT RESTRAINT CONTROLLER**

WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

WARNING: **If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment. Failure to follow these instructions may result in possible serious or fatal injury.**

If there are no possible causes remaining, view repair

Repair

- Replace the ORC in accordance with the Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B2764-96-RIGHT B-PILLAR IMPACT ACCELERATION SENSOR - COMPONENT INTERNAL FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 9: Right Impact Sensor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Right Side Impact Sensor 1 (Right B-Pillar Impact Acceleration Sensor) is mounted near the base of the B-pillar. Refer to **DESCRIPTION** . Impact sensors perform their own self test using power supplied by the Occupant Restraint Controller (ORC) then communicate this status back to the module. The repair of this fault centers on verifying the integrity of the sensor's internal circuitry and software validity.

WHEN MONITORED

The Occupant Restraint Controller (ORC) continuously communicates with the Right Side Impact Sensor 1 over the sensor signal circuit. The sensor communication and on board diagnostics are powered by the ORC signal.

SET CONDITION

This code will set, if the ORC and the Right Side Impact Sensor 1 do not establish and maintain valid data communications. The DTC will become Active after the fault has set for a minimum of 100 milliseconds (ms). The DTC will go to Stored after the ORC Right Side Impact Sensor 12 communication fault has been removed or the suspect sensor has been replaced. The clearing of this fault is immediate upon the suspect internal error being removed or the suspect sensor being replaced. The Airbag Warning Lamp (AWL) will set in the instrument cluster.

POSSIBLE CAUSES

Possible Causes
INTERMITTENT CONNECTION (WIRING/CONNECTORS)
RIGHT SIDE IMPACT SENSOR 1
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always Perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED FAULT CODE**
   1. Turn the ignition on.

      NOTE: Make sure the battery is fully charged.

   2. With the scan tool, read the active ORC DTCs.

      Is the DTC: B2764-96-RIGHT B-PILLAR IMPACT ACCELERATION SENSOR - COMPONENT INTERNAL FAILURE active?

      Yes

      WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

      NOTE: Inspect the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary. Recheck for active DTC B2764-96-

RIGHT B-PILLAR IMPACT ACCELERATION SENSOR - COMPONENT INTERNAL FAILURE. If active go to 2 if stored then repair is complete. Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to STANDARD PROCEDURE .

No

- Go To Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **VERIFY OPERATION OF THE RIGHT SIDE IMPACT SENSOR 1**

WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

1. Replace the Right Side Impact Sensor 1 in accordance with the Service Information. Refer to **SENSOR, IMPACT, REMOVAL** .
2. Reconnect the vehicle wire harness to the sensor.
3. Remove any special tools or jumper wires and reconnect all previously disconnected components - except the Battery.
4. If equipped with the standard key ignition, use this ignition on warning.

WARNING: **Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

5. If equipped with the keyless ignition, use this ignition on warning.

WARNING: **Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

6. Use the scan tool and erase the stored codes in all airbag system modules.
7. Turn the Ignition Off, and wait 15 seconds before turning the Ignition On.
8. Wait one minute, and read active codes.

Did the active DTC: B2764-96-RIGHT B-PILLAR IMPACT ACCELERATION SENSOR - COMPONENT INTERNAL FAILURE return?

Yes

- Go To 3

No

- Repair is complete.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **REPLACE THE OCCUPANT RESTRAINT CONTROLLER**

WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

If there are no possible causes remaining, view repair

Repair

WARNING: **If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to follow these instructions may result in possible serious or fatal injury.**

- Replace the ORC in accordance with Service Instructions. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B2765-96-RIGHT C-PILLAR IMPACT ACCELERATION SENSOR - COMPONENT INTERNAL FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 10: Right Impact Sensor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Right Side Impact Sensor 2 is mounted near the base of the C-pillar. Refer to **DESCRIPTION** . Impact sensors perform their own self test using power supplied by the Occupant Restraint Controller (ORC) then communicate this status back to the module. The repair of this fault centers on verifying the integrity of the sensor's internal circuitry and software validity.

WHEN MONITORED

The Occupant Restraint Controller (ORC) continuously communicates with the Right Side Impact Sensor 2 over the sensor signal circuit. The sensor communication and on board diagnostics are powered by the ORC signal.

SET CONDITION

This code will set, if the ORC and the Right Side Impact Sensor 2 do not establish and maintain valid data communications. The DTC will become Active after the fault has set for a minimum of 100 milliseconds (ms). The DTC will go to Stored after the ORC Right Side Impact Sensor 2 communication fault has been removed or the suspect sensor has been replaced. The clearing of this fault is immediate upon the suspect internal error being removed or the suspect sensor being replaced. The Airbag Warning Lamp (AWL) will set in the instrument cluster

POSSIBLE CAUSES

Possible Causes
INTERMITTENT CONNECTION (WIRING/CONNECTORS)
RIGHT SIDE IMPACT SENSOR 2
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always Perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED FAULT CODE**
   1. Turn the ignition on.

      NOTE: Make sure the battery is fully charged.

   2. With the scan tool, read the active ORC DTCs.

      Is the DTC: B2765-96-RIGHT C-PILLAR IMPACT ACCELERATION SENSOR - COMPONENT INTERNAL FAILURE- Active?

      Yes

      WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

      NOTE: Inspect the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary. Recheck for active DTC B2765-96-

RIGHT C-PILLAR IMPACT ACCELERATION SENSOR - COMPONENT INTERNAL FAILURE. If active go to 2 if stored then repair is complete. Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to STANDARD PROCEDURE .

No

- Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **VERIFY OPERATION OF THE RIGHT SIDE IMPACT SENSOR 2**

WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

1. Replace the Right Side Impact Sensor 2 in accordance with the Service Information. Refer to **SENSOR, IMPACT, REMOVAL** .
2. Reconnect the vehicle wire harness to the sensor.
3. Remove any special tools or jumper wires and reconnect all previously disconnected components - except the Battery.
4. If equipped with the standard key ignition, use this ignition on warning.

WARNING: **Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

5. If equipped with the keyless ignition, use this ignition on warning.

WARNING: **Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

6. Use the scan tool and erase the stored codes in all airbag system modules.
7. Turn the Ignition Off, and wait 15 seconds before turning the Ignition On.
8. With the scan tool, read the active ORC DTCs.

Did the active DTC: B2765-96-RIGHT C-PILLAR IMPACT ACCELERATION SENSOR - COMPONENT INTERNAL FAILURE return?

Yes

- Go To 3

No

- Repair is complete.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **REPLACE THE OCCUPANT RESTRAINT CONTROLLER**

WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

WARNING: **If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment. Failure to follow these instructions may result in possible serious or fatal injury.**

If there are no possible causes remaining, view repair

Repair

- Replace the ORC in accordance with the Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B2767-96-LEFT IMPACT PRESSURE SENSOR - COMPONENT INTERNAL FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 11: Left Impact Sensor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The driver door pressure sensor is mounted to the driver inner door panel behind the door trim panel. Refer to **DESCRIPTION** . The impact sensors perform their own self test using power supplied by the Occupant Restraint Controller (ORC) then communicate this status back to the ORC with periodic updates. The repair of this fault condition involves verifying the integrity of the wiring between the ORC and the sensor.

WHEN MONITORED

The Occupant Restraint Controller (ORC) continuously communicates with the Driver Door Pressure Sensor over the sensor signal circuit. The sensor communication and on board diagnostics are powered by the ORC signal.

SET CONDITION

This code will set, if the ORC and the Driver Door Pressure Sensor (Satellite) do not establish and maintain valid data communications. The DTC will become Active after the fault has set for a minimum of 100 milliseconds (ms). The DTC will go to Stored after the ORC to Driver Door Pressure Sensor communication fault has been removed or the suspect pressure sensor has been replaced. The clearing of this fault is immediate upon the suspect internal error being removed or the suspect sensor replaced.

POSSIBLE CAUSES

Possible Causes
(R130) LEFT SIDE IMPACT PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
(R150) LEFT SIDE IMPACT PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
(R130), (R150) LEFT SIDE IMPACT PRESSURE SENSOR CIRCUITS SHORTED TOGETHER
(R150) LEFT SIDE IMPACT PRESSURE SENSOR GROUND CIRCUIT OPEN
(R130) LEFT SIDE IMPACT PRESSURE SENSOR SIGNAL CIRCUIT OPEN
OCCUPANT RESTRAINT CONTROLLER (ORC)

DIAGNOSTIC TEST

1. **VERIFY THAT DTC B2767-96-LEFT IMPACT PRESSURE SENSOR-COMPONENT INTERNAL FAILURE IS ACTIVE**

   NOTE: Make sure the battery is fully charged.

   1. Turn the ignition on.
   2. With the scan tool, read ORC DTCs.

      Does the scan tool display active: B2767-96-LEFT IMPACT PRESSURE SENSOR-COMPONENT INTERNAL FAILURE - DTC?

      Yes

      - Go To 2

      No

      - Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK THE (R130), (R150) LEFT SIDE IMPACT PRESSURE SENSOR SIGNAL AND GROUND CIRCUITS FOR A SHORT TO VOLTAGE**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the Left Side Impact Pressure Sensor harness connector.
2. Disconnect the ORC harness connectors.

NOTE: Check the connectors - Clean and repair as necessary.

3. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)to the ORC C1 and C2 harness connectors.
4. Measure the voltage of the (R130) Left Side Impact Pressure Sensor Signal circuit and (R150) Sensor Ground circuit between the(special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)cavity C1B-31, C1B-32 and ground.

   Is there any voltage present on either circuit?

   Yes

   - Repair the (R130), (R150) Left Side Impact Pressure Sensor circuits for a short to voltage.
   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 3

3. **CHECK THE (R130) LEFT SIDE IMPACT PRESSURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Measure the resistance of the (R130) Left Side Impact Pressure Sensor Signal circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)cavity C1B-31 and ground.

   Is the resistance below 20 Ohms?

   Yes

   - Repair the (R130) Left Side Impact Pressure Sensor Signal circuit for a short to ground.
   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 4

4. **CHECK THE (R150) LEFT SIDE IMPACT PRESSURE SENSOR GROUND CIRCUIT FOR A SHORT TO GROUND**

   WARNING: **Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

   1. Measure the resistance of the (R150) Left Side Impact Pressure Sensor Ground circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)cavity C1B-32 and ground.

      Is the resistance below 20 Ohms?

      Yes

      - Repair the (R150) Left Side Impact Pressure Sensor Groundl circuit for a short to ground.
      - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 5

5. **CHECK THE (R130), (R150) LEFT SIDE IMPACT PRESSURE SENSOR CIRCUITS FOR A SHORT TOGETHER**
   1. Measure the resistance between the (R130) Left Side Impact Pressure Sensor Signal circuit and the (R150) Sensor Ground circuits between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)cavity C1B- 31 and C1B-32.

      Is the resistance below 20 Ohms?

      Yes

      - Repair the (R130), (R150) Left Side Impact Pressure Sensor circuits shorted together.
      - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 6

6. **CHECK THE (R150) LEFT SIDE IMPACT PRESSURE SENSOR GROUND CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**

1. Measure the resistance of the (R150) Left Side Impact Pressure Sensor Ground circuit between terminal 2 of the Left Side Impact Pressure Sensor harness connector and the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)cavity C1B-32.

   Is the resistance below 1 Ohm?

   Yes

   - Go To 7

   No

   - Repair the (R150) Left Side Impact Pressure Sensor Ground circuit for an open or high resistance.
   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

7. **CHECK THE (R130) LEFT SIDE IMPACT PRESSURE SENSOR SIGNAL CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
   1. Measure the resistance of the (R130) Left Side Impact Pressure Sensor Ground circuit between terminal 1 of the Left Side Impact Pressure Sensor harness connector and the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)cavity C1B-31.

      Is the resistance below 1 Ohm?

      Yes

      - Go To 8

      No

      - Repair the (R130) Right Side Impact Pressure Sensor Signal circuit for an open or high resistance.
      - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

8. **CHECK OPERATION OF THE LEFT SIDE IMPACT PRESSURE SENSOR**
   1. Replace the Left Side Impact Pressure Sensor. Refer to **SENSOR, IMPACT, REMOVAL** .
   2. Reconnect the vehicle body harness to the impact pressure sensor.
   3. Remove any special tools or jumper wires and reconnect all previously disconnected components - except the Battery.

   WARNING: **Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

4. Connect the scan tool to the Data Link Connector - use the most current software available.
5. Use the scan tool and erase the stored codes in all airbag system modules.
6. Turn the Ignition Off, and wait five seconds before turning the Ignition On.
7. Wait one minute, and read active codes and if there are none present read the stored codes.

   Did the active: B2767-96-LEFT IMPACT PRESSURE SENSOR-COMPONENT INTERNAL FAILURE - DTC return?

   Yes

   WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

   WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment. Failure to follow these instructions may result in possible serious or fatal injury.

   - Replace the Occupant Restraint Controller (ORC) in accordance with the Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Repair is complete.
   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B2768-96-RIGHT IMPACT PRESSURE SENSOR - COMPONENT INTERNAL FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 12: Right Impact Sensor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The passenger door pressure sensor is mounted to the passenger inner door panel behind the door trim panel. Refer to **DESCRIPTION** . The impact sensors perform their own self test using power supplied by the Occupant Restraint Controller (ORC) then communicate this status back to the ORC with periodic updates. The repair of this fault condition involves verifying the integrity of the wiring between the ORC and the sensor. A short to voltage fault on the door pressure sensor wiring can cause a loss of comm side impact code to set and the possible replacement of a good side impact sensor. The door pressure sensor is hardwired to the side impact

sensor which is hard wired to the ORC creating a daisy chain circuit. The short to battery fault in a loss of comm or internal circuit failure of the door pressure sensor can cause the side impact sensor on the same side to set a loss of comm code.

WHEN MONITORED

The Occupant Restraint Controller (ORC) continuously communicates with the Passenger Door Pressure Sensor (Satellite) over the sensor signal circuit. The sensor communication and on board diagnostics are powered by the ORC signal.

SET CONDITION

This code will set, if the ORC and the Passenger Door Pressure Sensor (Satellite) do not establish and maintain valid data communications. The DTC will become Active after the fault has set for a minimum of 100 milliseconds (ms). The DTC will go to Stored after the ORC to Passenger Door Pressure Sensor (Satellite) communication fault has been removed or the suspect pressure sensor has been replaced. The clearing of this fault is immediate upon the suspect internal error being removed or the suspect sensor replaced. The Multifunction Indicator Lamp (MIL) will set in the instrument cluster.

POSSIBLE CAUSES

Possible Causes
(R140) RIGHT SIDE IMPACT PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
(R140) RIGHT SIDE IMPACT PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
(R140), (R160) RIGHT SIDE IMPACT PRESSURE SENSOR CIRCUITS SHORTED TOGETHER
(R160) RIGHT SIDE IMPACT PRESSURE SENSOR GROUND CIRCUIT OPEN
(R140) RIGHT SIDE IMPACT PRESSURE SENSOR SIGNAL CIRCUIT OPEN
OCCUPANT RESTRAINT CONTROLLER (ORC)

DIAGNOSTIC TEST

1. **VERIFY ACTIVE B2768-96-RIGHT IMPACT PRESSURE SENSOR-COMPONENT INTERNAL FAILURE- DTC**
    1. Turn the ignition on.
    2. With the scan tool, read ORC DTCs.

    NOTE: Make sure the battery is fully charged.

    Does the scan tool display an active: B2768-96-RIGHT IMPACT PRESSURE SENSOR-COMPONENT INTERNAL FAILURE - DTC?

    Yes

    - Go To 2

No

- Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK THE (R140), (R160) RIGHT SIDE IMPACT PRESSURE SENSOR SIGNAL AND GROUND CIRCUITS FOR A SHORT TO VOLTAGE**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the Right Door Pressure Sensor harness connector.
2. Disconnect the ORC harness connector.

NOTE: Check connectors - Clean and repair as necessary.

3. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)to the ORC C1 and C2 harness connectors.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

4. Measure the voltage of the (R140) Right Side Impact Pressure Sensor Signal circuit and (R160) Sensor Ground circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)C1B-34 and C1B-35 terminals and ground.

Is there any voltage present?

Yes

- Repair the (R140), (R160) Right Side Impact Pressure Sensor circuits for a short to voltage.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 3

3. **CHECK THE (R140) RIGHT SIDE IMPACT PRESSURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Measure the resistance of the (R140) Right Side Impact Pressure Sensor Signal circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)C1B-35 terminals and ground.

   Is the resistance below 20 Ohms?

   Yes

   - Repair the (R140) Right Side Impact Pressure Sensor Signal circuit for a short to ground.
   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 4

4. **CHECK THE (R140), (R160) RIGHT SIDE IMPACT PRESSURE SENSOR CIRCUITS FOR A SHORT TOGETHER**
   1. Measure the resistance between the (R140) Right Side Impact Pressure Sensor 4 Signal circuit and the (R160) Sensor Ground circuits between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)C1B-34 and C1B-35 terminals.

      Is the resistance below 20 Ohms?

      Yes

      - Repair the (R140), (R160) Right Side Impact Pressure Sensor circuits shorted together.
      - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 5

5. **CHECK THE (R140) RIGHT SIDE IMPACT PRESSURE SENSOR GROUND CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
   1. Measure the resistance of the (R140) Right Side Impact Pressure Sensor Ground circuit between terminal between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) C1B-34 terminal Right Side Impact Pressure Sensor harness connector terminal 2.

      Is the resistance below 1 Ohm?

      Yes

      - Go To 6

      No

- Repair the (R160) Right Side Impact Pressure Sensor Ground circuit for an open or high resistance.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

6. **CHECK THE (R140) RIGHT SIDE IMPACT PRESSURE SENSOR SIGNAL CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
   1. Measure the resistance of the (R160) Right Side Impact Pressure Sensor Signal circuit between terminal between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) C1B-35 terminal and Right Side Impact Pressure Sensor harness connector terminal 1.

      Is the resistance below 1 Ohm?

      Yes

      - Go To 7

      No

      - Repair the (R160) Right Side Impact Pressure Sensor Signal circuit for an open or high resistance.
      - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

7. **CHECK OPERATION OF THE PASSENGER DOOR PRESSURE SENSOR**
   1. Replace the Passenger Door Pressure Sensor. Refer to **SENSOR, IMPACT, REMOVAL** .
   2. Reconnect the vehicle body harness to the impact sensor.
   3. Remove any special tools or jumper wires and reconnect all previously disconnected components - except the Battery.

      WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

   4. Connect the scan tool to the Data Link Connector - use the most current software available.
   5. Use the scan tool and erase the stored codes in all airbag system modules.
   6. Turn the Ignition Off, and wait 15 seconds before turning the Ignition On.
   7. Wait one minute, and read active codes and if there are none present read the stored codes.

      Did the active B2768-96-RIGHT IMPACT PRESSURE SENSOR-COMPONENT INTERNAL FAILURE return?

      Yes

      - Go To 8

No

- Repair is complete.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

8. **REPLACE THE OCCUPANT RESTRAINT CONTROLLER**

WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

WARNING: **If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment. Failure to follow these instructions may result in possible serious or fatal injury.**

Repair

- Replace the Occupant Restraint Controller in accordance with Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B2771-00-IMPACT CALIBRATION MISSING

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on. The modules on board diagnostics continuously performs internal circuit tests.

SET CONDITION

This DTC will set if the module identifies the calibration missing.

POSSIBLE CAUSES

Possible Causes
OCCUPANT RESTRAINT CONTROLLER (ORC)

DIAGNOSTIC TEST

REPLACE OCCUPANT RESTRAINT CONTROLLER

WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes**

before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to follow these instructions may result in possible serious or fatal injury.

Repair

- Replace the ORC in accordance with the Service Information.
- Perform the RESTRAINT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

C10CC-49-ESC SENSORS - INTERNAL ELECTRONIC FAILURE

THEORY OF OPERATION

- The ESC (Dynamics Sensor) is located inside the Occupant Restraint Controller (ORC). The sensor measure side-to-side (Lateral) motion and vehicle rotational sensing (how fast the vehicle is turning - Yaw). The sensors output is sent to the Antilock Brake System (ABS) in a Can Bus message.

WHEN MONITORED

The Occupant Restraint Controller (ORC) checks the ESC Sensor at power up during the initialization process, and continuously through the ignition cycle.

SET CONDITION

This DTC sets when the ORC detects a ESC Sensor internal conditions that latches the fault for the ignitioncycle.

POSSIBLE CAUSES

Possible Causes
OCCUPANT RESTRAINT CONTROLLER (ORC)

DIAGNOSTIC TEST

VERIFY DIAGNOSTIC TROUBLE CODE (DTC) IS ACTIVE

NOTE: Make sure the battery voltage is between 10 and 16 volts before proceeding.

1. Turn the ignition on.
2. With the scan tool, read the active DTCs.

Does the scan tool display: C10CC-00-ESC SENSOR INTERNAL ELECTRONIC FAILURE?

Yes

NOTE: For the C10CC-00-ESC Sensor Internal Electronic Failure, use the C006A-54-Multi-Axis Acceleration Sensor-Missing Calibration.

- Perform the C006A-54-Multi-AXIS ACCERELERATION SENSOR-MISSING CALIBRATION procedure Refer to **DIAGNOSIS AND TESTING** .

No

- Perform the RESTRAINTS SYSTEM INTERMITTENT TEST Refer to **STANDARD PROCEDURE** .

C15B2-49-LEFT FRONT ACCELERATION SENSOR - INTERNAL ELECTRONIC FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 13: Front Impact Sensor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Left Front Impact Sensor is mounted in the engine compartment behind the front lamp unit. Refer to **DESCRIPTION** . The Left Front Impact Sensor is directly hard wired to the Occupant Restraint Controller (ORC) Module. The impact sensors perform their own self test using power supplied by the Occupant Restraint Controller (ORC) then communicate this status back to the ORC with periodic updates. The repair of this fault condition involves verifying the integrity of the wiring between the ORC and the sensor.

WHEN MONITORED

With the ignition on, the Left Front Impact Sensor is equipped with on board diagnostics to monitor the sensor's

internal circuits. If a problem is identified, the sensor sends the Left Front Impact Sensor Internal message to the Occupant Restraint Controller (ORC).

SET CONDITION

This code will set, if the ORC and the Left Front Impact Sensor do not establish and maintain valid data communications. The DTC will become Active after the fault has set for a minimum of 100 milliseconds (ms). The DTC will go to Stored after the ORC Left Front Impact Sensor communication fault has been removed or the suspect front impact sensor has been replaced. The clearing of this fault is immediate upon the suspect internal error being removed or the suspect sensor replaced. The Airbag Warning Lamp (AWL) will set in the instrument cluster.

POSSIBLE CAUSES

Possible Causes
INTERMITTENT CONNECTION (WIRING/CONNECTORS)
LEFT FRONT IMPACT SENSOR
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**
   1. Turn the ignition on.

      NOTE: Make sure the battery is fully charged.

   2. With the scan tool, read the active ORC DTCs.

      Is DTC C15B2-9-LEFT FRONT ACCELERATION SENSOR - INTERNAL ELECTRONIC FAILURE - active?

      Yes

      WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

      NOTE: Inspect the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals. Repair as necessary. Then Recheck for the active DTC C15B2-49-LEFT FRONT ACCELERATION SENSOR - INTERNAL

ELECTRONIC FAILURE. If active go to 2If code is now stored perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to STANDARD PROCEDURE .

No.

- Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **VERIFY OPERATION OF THE LEFT FRONT IMPACT SENSOR**

WARNING: **Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

1. Replace the Left Front Impact Sensor in accordance with the Service Information. Refer to **SENSOR, IMPACT, REMOVAL** .
2. Reconnect the vehicle body harness to the impact sensor.
3. Remove any special tools or jumper wires and reconnect all previously disconnected components - except the Battery.
4. If equipped with the standard key ignition, use this ignition on warning.

WARNING: **Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

5. If equipped with the keyless ignition, use this ignition on warning.

WARNING: **Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

6. Use the scan tool and erase the stored codes in all airbag system modules.
7. Turn the Ignition Off, and wait 15 seconds before turning the Ignition On.
8. Wait one minute, and read active codes.

Did the active DTC: C15B2-49-LEFT FRONT ACCELERATION SENSOR - INTERNAL ELECTRONIC FAILURE- return?

Yes

- Go To 3

No

- Repair is complete.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **REPLACE THE OCCUPANT RESTRAINT CONTROLLER**

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment. Failure to follow these instructions may result in possible serious or fatal injury.

If there are no possible causes remaining, view repair.

Repair

- Replace the ORC in accordance with Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U0001-00-CAN C BUS

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 14: Occupant Restraint Controller Module (ORC) Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

Continuously when the ignition is on.

Battery voltage between 10 and 16 volts.

SET CONDITION

The controller detects an open, short to ground or a short to voltage on the CAN C Bus circuit.

POSSIBLE CAUSES

Possible Causes
CAN C BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
BODY CONTROL MODULE (BCM) POWER AND GROUND
BODY CONTROL MODULE (BCM)
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

VERIFY DIAGNOSTIC TROUBLE CODE (DTC) IS ACTIVE

NOTE: Make sure the battery voltage is between 10 and 16 volts before proceeding.

1. Cycle the ignition on.
2. With the scan tool, read the active DTCs.

   Does the scan tool display: U0001-00-CAN C BUS?

   Yes

   - For the DTC U0001-00 Can C Bus, use the U0002-00 Can C Bus Off Performance diagnostic procedure.
   - Refer to **U0002-00-CAN C BUS OFF PERFORMANCE** and perform the U0002-CAN C Bus Off Performance diagnostic procedure.

   No

   - Perform the Stored Lost Communication DTCs diagnostic procedure. Refer to **STORED LOST COMMUNICATION DTCS** .

U0002-00-CAN C BUS OFF PERFORMANCE

For a complete wiring diagram **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 15: Occupant Restraint Controller Module (ORC) Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

The ORC checks for serial data message traffic at power up during the initialization process, and continuously through the ignition cycle.

SET CONDITION

This DTC sets when the ORC fails to detect serial data message traffic for more than 5 seconds. In the event the ORC detects serial data message traffic, this DTC will immediately transition to stored status.

POSSIBLE CAUSES

Possible Causes
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

   Is the DTC active or stored?

   ORC - ACTIVE DTC

   - Go To 2

   ORC - STORED DTC

   - Go To 3
2. **REPLACE OCCUPANT RESTRAINT CONTROLLER**

   When this code is set, view repair.

   Repair

   WARNING: **If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment. Failure to follow these instructions may result in possible serious or fatal injury.**

   WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

   - Replace the ORC in accordance with Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
3. **STORED ORC DTC**

1. With the scan tool, record and erase all DTC's from all Airbag System Modules.
2. If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

   WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

3. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
4. Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.
5. The following additional checks may assist you in identifying a possible intermittent problem.
6. Reconnect any disconnected components and harness connector.

   WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

7. With the scan tool monitor active codes as you work through the following steps.

   WARNING: Maintain a safe distance from all airbags while performing the following steps. Failure to follow these instructions may result in possible serious or fatal injury.

8. Wiggle the wiring harness and connectors of the related airbag circuit or component.
9. If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.
10. If only stored codes return continue the test until the problem area has been isolated.
11. In the previous steps you have attempted to recreate the conditions responsible for setting active DTC in question.

    Are any ACTIVE DTC's present?

    Yes

    - Select the appropriate diagnostic procedure . Refer to **OCCUPANT RESTRAINT CONTROLLER (ORC) - DIAGNOSTIC CODE INDEX** .

    No

    - No problem found at this time. Erase all codes before returning vehicle to customer.

U0100-00-LOST COMMUNICATION WITH ECM/PCM

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Ignition run time is greater than one second. Battery voltage between 9 and 16 volts. Engine run time greater than three seconds.

SET CONDITION

Bus messages not received from the Powertrain Control Module (ECM/PCM) for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
POWERTRAIN CONTROL MODULE POWER AND GROUND
BODY CONTROL MODULE (BCM) NOT CONFIGURED CORRECTLY
POWERTRAIN CONTROL MODULE (ECM/PCM)
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

VERIFY THE DIAGNOSTIC TROUBLE CODE (DTC) IS ACTIVE

NOTE: Make sure the battery is fully charged before proceeding.

1. Turn the ignition on.
2. Using the scan tool, read the active DTCs.

   Does the scan tool display: 100-00-LOST COMMUNICATION WITH ECM/PCM?

   Yes

   - Refer to **DIAGNOSTIC CODE INDEX** and perform the U0100-87-Lost Communication with ECM/PCM diagnostic procedure.

   No

   - Perform the Stored Lost Communication DTCs diagnostic procedure. Refer to the **STORED LOST COMMUNICATION DTCS** .

U0121-00-LOST COMMUNICATION WITH ANTI-LOCK BRAKE SYSTEM (ABS) CONTROL MODULE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously when the ignition is on and the battery voltage is between 10 and 16 volts.

Body Control Module (BCM) is configured correctly.

SET CONDITION

Bus messages not received from the Anti-lock Brake System (ABS) Module for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
BODY CONTROL MODULE (BCM) POWER AND GROUND
BCM NOT CONFIGURED CORRECTLY
BODY CONTROL MODULE (BCM)
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

VERIFY DTC IS ACTIVE

NOTE: Make sure the battery is fully charged before proceeding.

1. Turn the ignition on.
2. With the scan tool, read the active DTCs.

   Does the scan tool display: U0121-00-LOST COMMUNICATION WITH ANTI-LOCK BRAKE SYSTEM (ABS) CONTROL MODULE?

   Yes

   - Refer to **DIAGNOSTIC CODE INDEX** and perform the U0121-87-Lost Communication with Anti-lock Brake System (ABS) Control Module-Missing Messages diagnostic procedure.

   No

   - Perform the Stored Lost Communication DTCs diagnostic procedure. Refer to the **STORED LOST COMMUNICATION DTCS** .

U0131-00-LOST COMMUNICATION WITH POWER STEERING CONTROL MODULE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously when the ignition is on.

The battery voltage between 10 and 16 Volts.

Body Control Module (BCM) is configured correctly.

SET CONDITION

Bus messages not received from the Electric Power Steering (EPS) Module for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
ELECTRIC POWER STEERING (EPS) MODULE POWER AND GROUND
BCM NOT CONFIGURED CORRECTLY
ELECTRIC POWER STEERING (EPS) MODULE
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

VERIFY THE DIAGNOSTIC TROUBLE CODE (DTC) IS ACTIVE

NOTE: Make sure the battery is fully charged before proceeding.

1. Turn the ignition on.
2. With the scan tool, read the active DTCs.

   Does the scan tool display: U0131-00-LOST COMMUNICATION WITH ELECTRIC POWER STEERING CONTROL MODULE?

   Yes

   - Refer to **DIAGNOSTIC CODE INDEX** and perform the U0131-87-LOST COMMUNICATION WITH ELECTRIC POWER STEERING CONTROL MODULE-MISSING MESSAGE diagnostic procedure.

   No

- Perform the Stored Lost Communication DTCs diagnostic procedure. Refer to the **STORED LOST COMMUNICATION DTCS** .

U0140-00-LOST COMMUNICATION WITH BODY CONTROL MODULE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 16: Battery Voltage Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

Continuously when the ignition is on.

The battery voltage between 10.0 and 16.0 Volts.

Body Control Module (BCM) is configured correctly.

SET CONDITION

Bus messages not received from the Body Control Module (BCM) for 2.5 seconds.

POSSIBLE CAUSES

Possible Causes
CAN BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
BODY CONTROL MODULE POWER AND GROUND
BCM NOT CONFIGURED CORRECTLY
BODY CONTROL MODULE (BCM)
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

VERIFY DTC IS ACTIVE

1. Turn the ignition on.
2. With the scan tool, read the active DTCs.

   Does the scan tool display; U0140-00-LOST COMMUNICATION WITH BODY CONTROL MODULE as active?

   Yes

   - Refer to **DIAGNOSTIC CODE INDEX** and perform the NO RESPONSE FROM BCM (BODY CONTROL MODULE) diagnostic procedure.

   No

   - Perform the Stored Lost Communication DTCs diagnostic procedure. Refer to the **STORED LOST COMMUNICATION DTCS** .

U0154-00-LOST COMMUNICATION WITH OCCUPANT CLASSIFICATION MODULE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously when the ignition is on.

The battery voltage between 10.0 and 16.0 Volts.

Body Control Module (BCM) is configured correctly.

SET CONDITION

Bus messages not received from the Occupant Classification Module (OCM) for fifteen seconds.

POSSIBLE CAUSES

Possible Causes
CAN BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
OCCUPANT CLASSIFICATION MODULE POWER AND GROUND
BCM NOT CONFIGURED CORRECTLY
BODY CONTROL MODULE (BCM)
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

VERIFY THE DIAGNOSTIC TROUBLE CODE (DTC) IS ACTIVE

NOTE: Make sure the IOD fuse is installed and the battery is fully charged before proceeding.

1. Turn the ignition on.
2. With the scan tool, read active DTCs.

   Is this DTC active?

   Yes

   - Refer to **DIAGNOSTIC CODE INDEX** and perform the U0154-87-LOST COMMUNICATION WITH OCCUPANT CLASSIFICATION MODULE-MISSING MESSAGE diagnostic procedure.

   No

   - Perform the Stored Lost Communication DTCs diagnostic procedure. Refer to the **STORED LOST COMMUNICATION DTCS** .

U0155-00-LOST COMMUNICATION WITH CLUSTER/CCN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously when the ignition is on.

Battery voltage between 10 and 16 volts.

Body Control Module (BCM) is configured correctly.

SET CONDITION

Bus messages not received from the Instrument Cluster (IC) for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN BUS (+) CIRCUIT SHORTED TO VOLTAGE
CAN BUS (-) CIRCUIT SHORTED TO GROUND
INSTRUMENT CLUSTER (IC) POWER AND GROUND
BCM NOT CONFIGURED CORRECTLY
INSTRUMENT CLUSTER (IC)
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

VERIFY DTC IS ACTIVE

NOTE: Make sure the battery is fully charged before proceeding.

1. Turn the ignition on.
2. With the scan tool, read the active DTCs.

   Does the scan tool display: U0155-00-LOST COMMUNICATION WITH CLUSTER/CCN?

   Yes

   - Refer to **DIAGNOSTIC CODE INDEX** and perform the U0155-00-Lost Communication with Cluster/CCN diagnostic procedure.

   No

   - Perform the Stored Lost Communication DTCs diagnostic procedure. Refer to the **STORED LOST COMMUNICATION DTCS** .

U0170-00-LOST COMMUNICATION W/UP-FRONT LEFT SATELLITE SENSOR

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 17: Front Impact Sensor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Left Front Impact Sensor is mounted in the engine compartment behind the front lamp unit. Refer to **DESCRIPTION** . The Left Front Impact Sensor is directly hard wired to the Occupant Restraint Controller (ORC) Module. The impact sensors perform their own self test using power supplied by the Occupant Restraint Controller (ORC) then communicate this status back to the ORC with periodic updates. The repair of this fault condition involves verifying the integrity of the wiring between the ORC and the sensor.

WHEN MONITORED

With the ignition on, the Left Front Impact Sensor is equipped with on board diagnostics to monitor the sensor's internal circuits. If a problem is identified, the sensor sends the Left Front Impact Sensor Internal message to the Occupant Restraint Controller (ORC).

SET CONDITION

This code will set, if the ORC and the Left Front Impact Sensor do not establish and maintain valid data communications. The DTC will become Active after the fault has set for a minimum of 100 milliseconds (ms). The DTC will go to Stored after the ORC Left Front Impact Sensor communication fault has been removed or the suspect front impact sensor has been replaced. The clearing of this fault is immediate upon the suspect internal error being removed or the suspect sensor replaced. The Airbag Warning Lamp (AWL) will set in the instrument cluster.

POSSIBLE CAUSES

Possible Causes
(R79) LEFT FRONT IMPACT SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
(R79) LEFT FRONT IMPACT SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
(R79, R81) LEFT FRONT IMPACT SENSOR CIRCUITS SHORTED TOGETHER
(R81) LEFT FRONT IMPACT SENSOR GROUND CIRCUIT OPEN
(R79) LEFT FRONT IMPACT SENSOR SIGNAL CIRCUIT OPEN
OCCUPANT RESTRAINT CONTROLLER (ORC)
LEFT SIDE IMPACT SENSOR

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

   NOTE: Make sure the battery is fully charged.

   1. Turn the ignition on.
   2. With the scan tool, read ORC DTCs.

      Does the scan tool display active: U0170-00-LOST COMMUNICATION W/UP-FRONT LEFT SATELLITE SENSOR - DTC?

      Yes

      - Go To 2

      No

      - Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK THE (R79), (R81) LEFT FRONT IMPACT SENSOR SIGNAL AND GROUND**

CIRCUITS FOR A SHORT TO VOLTAGE

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the Left Front Impact Sensor harness connector.
2. Disconnect the ORC harness connector.

NOTE: Check the connectors - Clean and repair as necessary.

3. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)to the ORC C1 and C2 harness connectors.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

4. Measure the voltage of the (R79) Left Front Impact Sensor Signal circuit and (R81) Left Front Impact Sensor Ground circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)the C1A-17 and C1A-16 terminals and ground.

   Is there any voltage present on either circuit?

   Yes

   - Repair the (R79), (R81) Left Front Impact Sensor circuits for a short to voltage.
   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 3

3. **CHECK THE (R79) LEFT FRONT IMPACT SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Measure the resistance of the (R79) Left Front Impact Sensor Signal circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)the C1A-17 terminals and ground.

Is the resistance below 20 Ohms?

Yes

- Repair the (R79) Left Front Impact Sensor Signal circuit for a short to ground.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 4

4. **CHECK THE (R79), (R81) LEFT FRONT IMPACT SENSOR CIRCUITS FOR A SHORT TOGETHER**
   1. Measure the voltage of the (R79) Left Front Impact Sensor Signal circuit and (R81) Left Front Impact Sensor Ground circuits between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)the C1A-17 and C1A-16 terminals.

   Is the resistance below 20 Ohms?

   Yes

   - Repair the (R79), (R81) Left Front Impact Sensor circuits shorted together.
   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 5

5. **CHECK THE (R81) LEFT FRONT IMPACT SENSOR GROUND CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
   1. Measure the resistance of the (R81) Left Front Impact Sensor Ground circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)the C1A-16 terminals and Left Front Impact Sensor harness connector terminal 2.

   Is the resistance below 1 Ohm?

   Yes

   - Go To 6

   No

   - Repair the (R81) Left Front Impact Sensor Ground circuit for an open or high resistance.
   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

6. **CHECK THE (R79) LEFT FRONT IMPACT SENSOR SIGNAL CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
   1. Measure the resistance of the (R79) Left Front Impact Sensor Signal circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)the C1A-17 terminals and Left Front Impact Sensor harness connector terminal 1.

      Is the resistance below 1 Ohm?

      Yes

      - Go To 7

      No

      - Repair the (R79) Right Front Impact Sensor Signal circuit for an open or high resistance.
      - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
7. **CHECK OPERATION OF THE LEFT FRONT IMPACT SENSOR**
   1. Replace the Left Front Impact Sensor. Refer to **SENSOR, IMPACT, REMOVAL** .
   2. Reconnect the vehicle body harness to the impact sensor.
   3. Remove any special tools or jumper wires and reconnect all previously disconnected components - except the Battery.

      WARNING: **Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

   4. Connect the scan tool to the Data Link Connector - use the most current software available.
   5. Use the scan tool and erase the stored codes in all airbag system modules.
   6. Turn the Ignition Off, and wait five seconds before turning the Ignition On.
   7. Wait one minute, and read active codes and if there are none present read the stored codes.

      Did the active: U0170-00-LOST COMMUNICATION W/UP-FRONT LEFT SATELLITE SENSOR - DTC return?

      Yes

      - Go To 8

      No

      - Repair is complete.
      - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD**

PROCEDURE .

8. **REPLACE THE OCCUPANT RESTRAINT CONTROLLER**

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment. Failure to follow these instructions may result in possible serious or fatal injury.

Repair

- Replace the Occupant Restraint Controller in accordance with Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U0171-00-LOST COMMUNICATION W/UP-FRONT RIGHT SATELLITE SENSOR

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 18: Front Impact Sensor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Right Front Impact Sensor is mounted in the engine compartment behind the front lamp unit. Refer to **DESCRIPTION** . The Right Front Impact Sensor is directly hard wired to the Occupant Restraint Controller (ORC) Module. The impact sensors perform their own self test using power supplied by the Occupant Restraint Controller (ORC) then communicate this status back to the ORC with periodic updates. The repair of this fault condition involves verifying the integrity of the wiring between the ORC and the sensor.

WHEN MONITORED

With the ignition on, the Right Front Impact Sensor is equipped with on board diagnostics to monitor the

sensor's internal circuits. If a problem is identified, the sensor sends the Right Front Impact Sensor Internal message to the Occupant Restraint Controller (ORC).

SET CONDITION

This code will set, if the ORC and the Right Front Impact Sensor do not establish and maintain valid data communications. The DTC will become Active after the fault has set for a minimum of 100 milliseconds (ms). The DTC will go to Stored after the ORC Right Front Impact Sensor communication fault has been removed or the suspect front impact sensor has been replaced. The clearing of this fault is immediate upon the suspect internal error being removed or the suspect sensor replaced. The Airbag Warning Lamp (AWL) will set in the instrument cluster.

POSSIBLE CAUSES

Possible Causes
(R80) RIGHT FRONT IMPACT SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
(R80) RIGHT FRONT IMPACT SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
(R80, R82) RIGHT FRONT IMPACT SENSOR CIRCUITS SHORTED TOGETHER
(R82) RIGHT FRONT IMPACT SENSOR GROUND CIRCUIT OPEN
(R80) RIGHT FRONT IMPACT SENSOR SIGNAL CIRCUIT OPEN
RIGHT SIDE IMPACT SENSOR
OCCUPANT RESTRAINT CONTROLLER (ORC)

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

   NOTE: Make sure the battery is fully charged.

   1. Turn the ignition on.
   2. With the scan tool, read ORC DTCs.

      Does the scan tool display active: U0171-00-LOST-COMMUNICATION-W/UP-FRONT-RIGHT-SATELLITE-SENSOR- DTC?

      Yes

      - Go To 2

      No

      - Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK THE (R80), (R82) RIGHT FRONT IMPACT SENSOR SIGNAL AND GROUND CIRCUITS FOR A SHORT TO VOLTAGE**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the Right Front Impact Sensor harness connector.
2. Disconnect the ORC harness connector.

NOTE: Check the connectors - Clean and repair as necessary.

3. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)to the ORC C1 and C2 harness connectors.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

4. Measure the voltage of the (R80) Right Front Impact Sensor Signal circuit and (R82) Right Front Impact Sensor Ground circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)the C1A-13 and C1A-14 terminals and ground.

   Is there any voltage present on either circuit?

   Yes

   - Repair the (R80), (R82) Right Front Impact Sensor circuits for a short to voltage.
   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 3

3. **CHECK THE (R80) RIGHT FRONT IMPACT SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Measure the resistance of the (R80) Right Front Impact Sensor Signal circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)the C1A-13 terminals and ground.

   Is the resistance below 20 Ohms?

Yes

- Repair the (R80) Right Front Impact Sensor Signal circuit for a short to ground.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 4

4. **CHECK THE (R80), (R820) RIGHT FRONT IMPACT SENSOR CIRCUITS FOR A SHORT TOGETHER**
   1. Measure the voltage of the (R80) Right Front Impact Sensor Signal circuit and (R82) Right Front Impact Sensor Ground circuits between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)the C1A-13 and C1A-14 terminals.

      Is the resistance below 20 Ohms?

      Yes

      - Repair the (R80), (R82) Right Front Impact Sensor circuits shorted together.
      - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 5

5. **CHECK THE (R82) RIGHT FRONT IMPACT SENSOR GROUND CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
   1. Measure the resistance of the (R821) Right Front Impact Sensor Ground circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)the C1A-14 terminals and Right Front Impact Sensor harness connector terminal 2.

      Is the resistance below 1 Ohm?

      Yes

      - Go To 6

      No

      - Repair the (R82) Right Front Impact Sensor Ground circuit for an open or high resistance.
      - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

6. **CHECK THE (R80) RIGHT FRONT IMPACT SENSOR SIGNAL CIRCUIT FOR AN OPEN OR**

HIGH RESISTANCE

1. Measure the resistance of the (R80) Right Front Impact Sensor Signal circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)the C1A-13 terminals and Right Front Impact Sensor harness connector terminal 1.

   Is the resistance below 1 Ohm?

   Yes

   - Go To 7

   No

   - Repair the (R80) Right Front Impact Sensor Signal circuit for an open or high resistance.
   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

7. **CHECK OPERATION OF THE RIGHT FRONT IMPACT SENSOR**
   1. Replace the Right Front Impact Sensor. Refer to **SENSOR, IMPACT, REMOVAL** .
   2. Reconnect the vehicle body harness to the impact sensor.
   3. Remove any special tools or jumper wires and reconnect all previously disconnected components - except the Battery.

      WARNING: **Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

   4. Connect the scan tool to the Data Link Connector - use the most current software available.
   5. Use the scan tool and erase the stored codes in all airbag system modules.
   6. Turn the Ignition Off, and wait five seconds before turning the Ignition On.
   7. Wait one minute, and read active codes and if there are none present read the stored codes.

      Did the active: U0171-00-LOST-COMMUNICATION-W/UP-FRONT-RIGHT-SATELLITE-SENSOR - DTC return?

      Yes

      - Go To 8.

      No

      - Repair is complete.
      - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

8. **REPLACE THE OCCUPANT RESTRAINT CONTROLLER**

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment. Failure to follow these instructions may result in possible serious or fatal injury.

Repair

- Replace the Occupant Restraint Controller in accordance with Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U11EA-00-LOST COMMUNICATION WITH LEFT B-PILLAR IMPACT ACCELERATION SENSOR

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 19: Left Impact Sensor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Left Side Impact Sensor 1 is mounted to the passenger rear door opening. Refer to **DESCRIPTION** . The impact sensors perform their own self test using power supplied by the Occupant Restraint Controller (ORC) then communicate this status back to the ORC with periodic updates. The repair of this fault condition involves verifying the integrity of the wiring between the ORC and the sensor.

WHEN MONITORED

The Occupant Restraint Controller (ORC) continuously communicates with the Left Side Impact Sensor 1 over the sensor signal circuit. The sensor communication and on board diagnostics are powered by the ORC signal.

SET CONDITION

This code will set, if the ORC and the Left Side Impact Sensor 1 do not establish and maintain valid data communications. The DTC will become active after the fault has set for a minimum of 2.5 seconds. The DTC will go to Stored after the ORC to Left Side Impact Sensor 1 communication fault has been removed or the suspect sensor has been replaced for 2.5 seconds. The Airbag Warning Lamp (AWL) will set in the instrument cluster.

POSSIBLE CAUSES

Possible Causes
(R13) LEFT SIDE IMPACT SENSOR 1 SIGNAL CIRCUIT SHORTED TO VOLTAGE
(R13) LEFT SIDE IMPACT SENSOR 1 SIGNAL CIRCUIT SHORTED TO GROUND
(R13), (R15) LEFT SIDE IMPACT SENSOR 1 CIRCUITS SHORTED TOGETHER
(R15) LEFT SIDE IMPACT SENSOR 1 GROUND CIRCUIT OPEN
(R13) LEFT SIDE IMPACT SENSOR 1 SIGNAL CIRCUIT OPEN
LEFT SIDE IMPACT PRESSURE SENSOR 1
OCCUPANT RESTRAINT CONTROLLER (ORC)

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**
    1. Turn the ignition on.
    2. With the scan tool, read ORC DTCs.

    NOTE: Make sure the battery is fully charged.

    Does the scan tool display an active: U11EA-00-LOST COMMUNICATION WITH LEFT B-PILLAR IMPACT ACCELERATION SENSOR - DTC?

    Yes

    - Go To 2

    No

    - Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE (R13), (R15) LEFT SIDE IMPACT SENSOR 1 SIGNAL AND GROUND CIRCUITS FOR A SHORT TO VOLTAGE**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the Left Side Impact Sensor 1 harness connector.
2. Disconnect the ORC harness connector.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

3. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)to the ORC C1 and C2 harness connectors.
4. Measure the voltage of the (R13) Left Side Impact Sensor 1 Signal circuit and (R15) Left Side Impact Sensor 1 Ground circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)the C1B-25 and C1B-26 terminals and ground.

   Is there any voltage present?

   Yes

   - Repair the (R13) and (R15) Left Side Impact Sensor 1 circuits for a short to voltage.
   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 3

3. **CHECK THE (R13) LEFT SIDE IMPACT SENSOR 1 SIGNAL CIRCUIT FOR A SHORT TO GROUND**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Measure the resistance of the (R13) Left Side Impact Sensor 1 Signal circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)the C1B-25 terminals and ground.

   Is the resistance below 20 Ohms?

   Yes

   - Repair the (R13) Left Side Impact Sensor 1 Signal circuit for a short to ground.

- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 4

4. **CHECK THE (R13) AND (R15) LEFT SIDE IMPACT SENSOR 1 CIRCUITS FOR A SHORT TOGETHER**
   1. Measure the voltage of the (R13) Left Side Impact Sensor 1 Signal circuit and (R15) Left Side Impact Sensor 1 Ground circuits between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)the C1B-25 and C1B-26 terminals.

      Is the resistance below 20 Ohms?

      Yes

      - Repair the (R13) and(R15) Left Side Impact Sensor 1 circuits shorted together.
      - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 5

5. **CHECK THE (R15) LEFT SIDE IMPACT SENSOR 1 GROUND CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
   1. Measure the resistance of the (R15) Left Side Impact Sensor 1 Ground circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)the C1B-26 terminals and Left Side Impact Sensor 1 harness connector terminal 2.

      Is the resistance below 1 Ohm?

      Yes

      - Go To 6

      No

      - Repair the (R15) Left Side Impact Sensor 1 Ground circuit for an open or high resistance.
      - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

6. **CHECK THE (R13) LEFT SIDE IMPACT SENSOR 1 SIGNAL CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
   1. Measure the resistance of the (R13) Left Side Impact Sensor 1 Signal circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)the C1B-25 terminals and Left

Side Impact Sensor 1 harness connector terminal 1.

Is the resistance below 1 Ohm?

Yes

- Go To 7

No

- Repair the (R13) Left Side Impact Sensor 1 Signal circuit for an open or high resistance.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

7. **CHECK OPERATION OF THE LEFT SIDE IMPACT SENSOR 1**
   1. Replace the Left Side Impact Sensor 1. Refer to **SENSOR, IMPACT, REMOVAL** .
   2. Reconnect the vehicle body harness to the impact sensor.
   3. Remove any special tools or jumper wires and reconnect all previously disconnected components - except the Battery.

      WARNING: **Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

   4. Connect the scan tool to the Data Link Connector - use the most current software available.
   5. Use the scan tool and erase the stored codes in all airbag system modules.
   6. Turn the Ignition Off, and wait 15 seconds before turning the Ignition On.
   7. Wait one minute, and read active codes and if there are none present read the stored codes.

      Did the active U11EA-00-LOST COMMUNICATION WITH LEFT B-PILLAR IMPACT ACCELERATION SENSOR return?

      Yes

      - Go To 8

      No

      - Repair is complete.
      - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

8. **REPLACE THE OCCUPANT RESTRAINT CONTROLLER**

   WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two**

minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

WARNING: **If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment. Failure to follow these instructions may result in possible serious or fatal injury.**

Repair

- Replace the Occupant Restraint Controller in accordance with Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U11EB-00-LOST COMMUNICATION WITH LEFT C-PILLAR IMPACT ACCELERATION SENSOR

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 20: Left Impact Sensor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Left Side Impact Sensor 2 is mounted to the passenger rear door opening. Refer to **DESCRIPTION** . The impact sensors perform their own self test using power supplied by the Occupant Restraint Controller (ORC) then communicate this status back to the ORC with periodic updates. The repair of this fault condition involves verifying the integrity of the wiring between the ORC and the sensor.

WHEN MONITORED

The Occupant Restraint Controller (ORC) continuously communicates with the Left Side Impact Sensor 2 over the sensor signal circuit. The sensor communication and on board diagnostics are powered by the ORC signal.

SET CONDITION

This code will set, if the ORC and the Left Side Impact Sensor 2 do not establish and maintain valid data communications. The DTC will become active after the fault has set for a minimum of 2.5 seconds. The DTC will go to Stored after the ORC to Left Side Impact Sensor 2 communication fault has been removed or the suspect sensor has been replaced for 2.5 seconds. The Airbag Warning Lamp (AWL) will set in the instrument cluster.

POSSIBLE CAUSES

Possible Causes
(R17) LEFT SIDE IMPACT SENSOR 2 SIGNAL CIRCUIT SHORTED TO VOLTAGE
(R17) LEFT SIDE IMPACT SENSOR 2 SIGNAL CIRCUIT SHORTED TO GROUND
(R17), (R19) LEFT SIDE IMPACT SENSOR 2 CIRCUITS SHORTED TOGETHER
(R19) LEFT SIDE IMPACT SENSOR 2 GROUND CIRCUIT OPEN
(R17) LEFT SIDE IMPACT SENSOR 2 SIGNAL CIRCUIT OPEN
LEFT SIDE IMPACT PRESSURE SENSOR 2
OCCUPANT RESTRAINT CONTROLLER (ORC)

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED**
    1. Turn the ignition on.
    2. With the scan tool, read ORC DTCs.

    NOTE: Make sure the battery is fully charged.

    Does the scan tool display an active: U11EB-00-LOST COMMUNICATION WITH LEFT C-PILLAR IMPACT ACCELERATION SENSOR - DTC?

    Yes

    - Go To 2

    No

    - Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE (R17), (R19) LEFT SIDE IMPACT SENSOR 2 SIGNAL AND GROUND CIRCUITS FOR A SHORT TO VOLTAGE**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the Left Side Impact Sensor 2 harness connector.
2. Disconnect the ORC harness connector.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

3. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)to the ORC C1 and C2 harness connectors.
4. Measure the voltage of the (R17) Left Side Impact Sensor 2 Signal circuit and (R19) Left Side Impact Sensor 2 Ground circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)the C1B-53 and C1B-54 terminals and ground.

   Is there any voltage present?

   Yes

   - Repair the (R17), (R19) Left Side Impact Sensor 2 circuits for a short to voltage.
   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 3

3. **CHECK THE (R17) LEFT SIDE IMPACT SENSOR 2 SIGNAL CIRCUIT FOR A SHORT TO GROUND**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Measure the resistance of the (R17) Left Side Impact Sensor 2 Signal circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)the C1B-53 terminals and ground.

   Is the resistance below 20 Ohms?

   Yes

   - Repair the (R17) Left Side Impact Sensor 2 Signal circuit for a short to ground.

- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 4

4. **CHECK THE (R17) AND (R19) LEFT SIDE IMPACT SENSOR 2 CIRCUITS FOR A SHORT TOGETHER**
   1. Measure the voltage of the (R17) Left Side Impact Sensor 2 Signal circuit and (R19) Left Side Impact Sensor 2 Ground circuits between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)the C1B-53 and C1B-54 terminals.

      Is the resistance below 20 Ohms?

      Yes

      - Repair the (R17), (R19) Left Side Impact Sensor 2 circuits shorted together.
      - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 5

5. **CHECK THE (R19) LEFT SIDE IMPACT SENSOR 2 GROUND CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
   1. Measure the resistance of the (R19) Left Side Impact Sensor 2 Ground circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)the C1B-54 terminals and Left Side Impact Sensor 2 harness connector terminal 2.

      Is the resistance below 1 Ohm?

      Yes

      - Go To 6

      No

      - Repair the (R19) Left Side Impact Sensor 2 Ground circuit for an open or high resistance.
      - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

6. **CHECK THE (R17) LEFT SIDE IMPACT SENSOR 2 SIGNAL CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
   1. Measure the resistance of the (R17) Left Side Impact Sensor 2 Signal circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)the C1B-53 terminals and Left

Side Impact Sensor 2 harness connector terminal 1.

Is the resistance below 1 Ohm?

Yes

- Go To 7

No

- Repair the (R17) Left Side Impact Sensor 2 Signal circuit for an open or high resistance.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

7. **CHECK OPERATION OF THE LEFT SIDE IMPACT SENSOR 2**
   1. Replace the Left Side Impact Sensor 2. Refer to **SENSOR, IMPACT, REMOVAL** .
   2. Reconnect the vehicle body harness to the impact sensor.
   3. Remove any special tools or jumper wires and reconnect all previously disconnected components - except the Battery.

      WARNING: **Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

   4. Connect the scan tool to the Data Link Connector - use the most current software available.
   5. Use the scan tool and erase the stored codes in all airbag system modules.
   6. Turn the Ignition Off, and wait 15 seconds before turning the Ignition On.
   7. Wait one minute, and read active codes and if there are none present read the stored codes.

      Did the active U11EB-00-LOST COMMUNICATION WITH LEFT C-PILLAR IMPACT ACCELERATION SENSOR return?

      Yes

      - Go To 8

      No

      - Repair is complete.
      - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

8. **REPLACE THE OCCUPANT RESTRAINT CONTROLLER**

   WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two**

minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

WARNING: **If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment. Failure to follow these instructions may result in possible serious or fatal injury.**

Repair

- Replace the Occupant Restraint Controller in accordance with Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U11ED-00-LOST COMMUNICATION WITH RIGHT B-PILLAR IMPACT ACCELERATION SENSOR

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 21: Right Impact Sensor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Right Side Impact Sensor 1 is mounted to the passenger rear door opening. Refer to **DESCRIPTION** . The impact sensors perform their own self test using power supplied by the Occupant Restraint Controller (ORC) then communicate this status back to the ORC with periodic updates. The repair of this fault condition involves verifying the integrity of the wiring between the ORC and the sensor.

WHEN MONITORED

The Occupant Restraint Controller (ORC) continuously communicates with the Right Side Impact Sensor 1 over the sensor signal circuit. The sensor communication and on board diagnostics are powered by the ORC signal.

SET CONDITION

This code will set, if the ORC and the Right Side Impact Sensor 1 do not establish and maintain valid data communications. The DTC will become active after the fault has set for a minimum of 2.5 seconds. The DTC will go to Stored after the ORC to Right Side Impact Sensor 1 communication fault has been removed or the suspect sensor has been replaced for 2.5 seconds. The Airbag Warning Lamp (AWL) will set in the instrument cluster.

POSSIBLE CAUSES

Possible Causes
(R14) RIGHT SIDE IMPACT SENSOR 1 SIGNAL CIRCUIT SHORTED TO VOLTAGE
(R14) RIGHT SIDE IMPACT SENSOR 1 SIGNAL CIRCUIT SHORTED TO GROUND
(R14), (R16) RIGHT SIDE IMPACT SENSOR 1 CIRCUITS SHORTED TOGETHER
(R16) RIGHT SIDE IMPACT SENSOR 1 GROUND CIRCUIT OPEN
(R14) RIGHT SIDE IMPACT SENSOR 1 SIGNAL CIRCUIT OPEN
RIGHT SIDE IMPACT PRESSURE SENSOR 1
OCCUPANT RESTRAINT CONTROLLER (ORC)

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**
    1. Turn the ignition on.
    2. With the scan tool, read ORC DTCs.

    NOTE: Make sure the battery is fully charged.

    Does the scan tool display an active: U11ED-00-LOST COMMUNICATION WITH RIGHT B-PILLAR IMPACT ACCELERATION SENSOR - DTC?

    Yes

    - Go To 2

    No

    - Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE (R14), (R16) RIGHT SIDE IMPACT SENSOR 1 SIGNAL AND GROUND CIRCUITS FOR A SHORT TO VOLTAGE**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the Right Side Impact Sensor 1 harness connector.
2. Disconnect the ORC harness connector.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

3. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)to the ORC C1 and C2 harness connectors.
4. Measure the voltage of the (R14) Right Side Impact Sensor 1 Signal circuit and (R16) Right Side Impact Sensor 1 Ground circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)the C1B-29 and C1B-28 terminals and ground.

   Is there any voltage present?

   Yes

   - Repair the (R14) and (R16) Right Side Impact Sensor 1 circuits for a short to voltage.
   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 3

3. **CHECK THE (R14) RIGHT SIDE IMPACT SENSOR 1 SIGNAL CIRCUIT FOR A SHORT TO GROUND**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Measure the resistance of the (R14) Right Side Impact Sensor 1 Signal circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)the C1B-29 terminals and ground.

   Is the resistance below 20 Ohms?

   Yes

   - Repair the (R14) Right Side Impact Sensor 1 Signal circuit for a short to ground.

- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 4

4. **CHECK THE (R14) AND (R16) RIGHT SIDE IMPACT SENSOR 1 CIRCUITS FOR A SHORT TOGETHER**
   1. Measure the voltage of the (R14) Right Side Impact Sensor 1 Signal circuit and (R16) Right Side Impact Sensor 1 Ground circuits between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)the C1B-29 and C1B-28 terminals.

      Is the resistance below 20 Ohms?

      Yes

      - Repair the (R14) and(R165) Right Side Impact Sensor 1 circuits shorted together.
      - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 5

5. **CHECK THE (R16) RIGHT SIDE IMPACT SENSOR 1 GROUND CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
   1. Measure the resistance of the (R16) Right Side Impact Sensor 1 Ground circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)the C1B-28 terminals and Right Side Impact Sensor 1 harness connector terminal 2.

      Is the resistance below 1 Ohm?

      Yes

      - Go To 6

      No

      - Repair the (R16) Right Side Impact Sensor 1 Ground circuit for an open or high resistance.
      - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

6. **CHECK THE (R14) RIGHT SIDE IMPACT SENSOR 1 SIGNAL CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
   1. Measure the resistance of the (R14) Right Side Impact Sensor 1 Signal circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)the C1B-29 terminals and Right

Side Impact Sensor 1 harness connector terminal 1.

Is the resistance below 1 Ohm?

Yes

- Go To 7

No

- Repair the (R14) Right Side Impact Sensor 1 Signal circuit for an open or high resistance.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

7. **CHECK OPERATION OF THE RIGHT SIDE IMPACT SENSOR 1**
   1. Replace the Right Side Impact Sensor 1. Refer to **SENSOR, IMPACT, REMOVAL** .
   2. Reconnect the vehicle body harness to the impact sensor.
   3. Remove any special tools or jumper wires and reconnect all previously disconnected components - except the Battery.

      WARNING: **Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

   4. Connect the scan tool to the Data Link Connector - use the most current software available.
   5. Use the scan tool and erase the stored codes in all airbag system modules.
   6. Turn the Ignition Off, and wait 15 seconds before turning the Ignition On.
   7. Wait one minute, and read active codes and if there are none present read the stored codes.

      Did the active U11ED-00-LOST COMMUNICATION WITH RIGHT B-PILLAR IMPACT ACCELERATION SENSOR return?

      Yes

      - Go To 8

      No

      - Repair is complete.
      - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

8. **REPLACE THE OCCUPANT RESTRAINT CONTROLLER**

   WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two**

minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

WARNING: **If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment. Failure to follow these instructions may result in possible serious or fatal injury.**

Repair

- Replace the Occupant Restraint Controller in accordance with Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U11EE-00-LOST COMMUNICATION WITH RIGHT C-PILLAR IMPACT ACCELERATION SENSOR

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 22: Right Impact Sensor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Right Side Impact Sensor 2 is mounted to the passenger rear door opening. Refer to **DESCRIPTION** . The impact sensors perform their own self test using power supplied by the Occupant Restraint Controller (ORC) then communicate this status back to the ORC with periodic updates. The repair of this fault condition involves verifying the integrity of the wiring between the ORC and the sensor.

WHEN MONITORED

The Occupant Restraint Controller (ORC) continuously communicates with the Right Side Impact Sensor 2 over the sensor signal circuit. The sensor communication and on board diagnostics are powered by the ORC signal.

SET CONDITION

This code will set, if the ORC and the Right Side Impact Sensor 2 do not establish and maintain valid data communications. The DTC will become active after the fault has set for a minimum of 2.5 seconds. The DTC will go to Stored after the ORC to Right Side Impact Sensor 2 communication fault has been removed or the suspect sensor has been replaced for 2.5 seconds. The Airbag Warning Lamp (AWL) will set in the instrument cluster.

POSSIBLE CAUSES

Possible Causes
(R18) RIGHT SIDE IMPACT SENSOR 2 SIGNAL CIRCUIT SHORTED TO VOLTAGE
(R18) RIGHT SIDE IMPACT SENSOR 2 SIGNAL CIRCUIT SHORTED TO GROUND
(R18), (R160) RIGHT SIDE IMPACT SENSOR 2 CIRCUITS SHORTED TOGETHER
(R20) RIGHT SIDE IMPACT SENSOR 2 GROUND CIRCUIT OPEN
(R18) RIGHT SIDE IMPACT SENSOR 2 SIGNAL CIRCUIT OPEN
RIGHT SIDE IMPACT PRESSURE SENSOR 2
OCCUPANT RESTRAINT CONTROLLER (ORC)

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**
    1. Turn the ignition on.
    2. With the scan tool, read ORC DTCs.

    NOTE: Make sure the battery is fully charged.

    Does the scan tool display an active: U11EE-00-LOST-COMMUNICATION-WITH-RIGHT-C-PILLAR-IMPACT-ACCELERATION-SENSOR - DTC?

    Yes

    - Go To 2

    No

    - Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE (R18), (R20) RIGHT SIDE IMPACT SENSOR 2 SIGNAL AND GROUND CIRCUITS FOR A SHORT TO VOLTAGE**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the Right Side Impact Sensor 2 harness connector.
2. Disconnect the ORC harness connector.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

3. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)to the ORC C1 and C2 harness connectors.
4. Measure the voltage of the (R18) Right Side Impact Sensor 2 Signal circuit and (R20) Right Side Impact Sensor 2 Ground circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)the C1B-18 and C1B-17 terminals and ground.

   Is there any voltage present?

   Yes

   - Repair the (R18), (R20) Right Side Impact Sensor 2 circuits for a short to voltage.
   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 3

3. **CHECK THE (R18) RIGHT SIDE IMPACT SENSOR 2 SIGNAL CIRCUIT FOR A SHORT TO GROUND**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Measure the resistance of the (R18) Right Side Impact Sensor 2 Signal circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)the C1B-18 terminals and ground.

   Is the resistance below 20 Ohms?

   Yes

   - Repair the (R18) Right Side Impact Sensor 2 Signal circuit for a short to ground.

- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 4

4. **CHECK THE (R18), (R20) RIGHT SIDE IMPACT SENSOR 2 CIRCUITS FOR A SHORT TOGETHER**
   1. Measure the voltage of the (R18) Right Side Impact Sensor 2 Signal circuit and (R20) Right Side Impact Sensor 2 Ground circuits between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)the C1B-18 and C1B-17 terminals.

      Is the resistance below 20 Ohms?

      Yes

      - Repair the (R18), (R20) Right Side Impact Sensor 2 circuits shorted together.
      - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 5

5. **CHECK THE (R20) RIGHT SIDE IMPACT SENSOR 2 GROUND CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
   1. Measure the resistance of the (R20) Right Side Impact Sensor 2 Ground circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)the C1B-17 terminals and Right Side Impact Sensor 2 harness connector terminal 2.

      Is the resistance below 1 Ohm?

      Yes

      - Go To 6

      No

      - Repair the (R20) Right Side Impact Sensor 2 Ground circuit for an open or high resistance.
      - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

6. **CHECK THE (R18) RIGHT SIDE IMPACT SENSOR 2 SIGNAL CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
   1. Measure the resistance of the (R18) Right Side Impact Sensor 2 Signal circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)the C1B-18 terminals and Right

Side Impact Sensor 2 harness connector terminal 1.

Is the resistance below 1 Ohm?

Yes

- Go To 7

No

- Repair the (R18) Right Side Impact Sensor 2 Signal circuit for an open or high resistance.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

7. **CHECK OPERATION OF THE RIGHT SIDE IMPACT SENSOR 2**
   1. Replace the Right Side Impact Sensor 2. Refer to **SENSOR, IMPACT, REMOVAL** .
   2. Reconnect the vehicle body harness to the impact sensor.
   3. Remove any special tools or jumper wires and reconnect all previously disconnected components - except the Battery.

      WARNING: **Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

   4. Connect the scan tool to the Data Link Connector - use the most current software available.
   5. Use the scan tool and erase the stored codes in all airbag system modules.
   6. Turn the Ignition Off, and wait 15 seconds before turning the Ignition On.
   7. Wait one minute, and read active codes and if there are none present read the stored codes.

      Did the active U11EE-00-LOST-COMMUNICATION-WITH-RIGHT-C-PILLAR-IMPACT-ACCELERATION-SENSOR return?

      Yes

      - Go To 8

      No

      - Repair is complete.
      - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

8. **REPLACE THE OCCUPANT RESTRAINT CONTROLLER**

   WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two**

minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

WARNING: **If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment. Failure to follow these instructions may result in possible serious or fatal injury.**

Repair

- Replace the Occupant Restraint Controller in accordance with Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U11F0-00-LOST COMMUNICATION WITH LEFT IMPACT PRESSURE SENSOR

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 23: Left Impact Sensor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The driver door pressure sensor is mounted to the driver inner door panel behind the door trim panel. Refer to **DESCRIPTION** . The impact sensors perform their own self test using power supplied by the Occupant Restraint Controller (ORC) then communicate this status back to the ORC with periodic updates. The repair of this fault condition involves verifying the integrity of the wiring between the ORC and the sensor. A short to voltage fault on the door pressure sensor wiring can cause a loss of comm side impact code to set and the possible replacement of a good side impact sensor. The door pressure sensor is hardwired to the side impact

sensor which is hard wired to the ORC creating a daisy chain circuit. The short to battery fault in a loss of comm or internal circuit failure of the door pressure sensor can cause the side impact sensor on the same side to set a loss of comm code.

WHEN MONITORED

The Occupant Restraint Controller (ORC) continuously communicates with the Driver Door Pressure Sensor (Satellite) over the sensor signal circuit. The sensor communication and on board diagnostics are powered by the ORC signal.

SET CONDITION

This code will set, if the ORC and the Driver Door Pressure Sensor do not establish and maintain valid data communications. The DTC will become Active after the fault has set for a minimum of 2.5 seconds. The DTC will go to Stored after the ORC to Driver Door Pressure Sensor communication fault has been removed or the suspect pressure sensor has been replaced for 2.5 seconds. The Multifunction Indicator Lamp (MIL) will set in the instrument cluster.

POSSIBLE CAUSES

Possible Causes
(R130) LEFT SIDE IMPACT PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
(R150) LEFT SIDE IMPACT PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
(R130), (R150) LEFT SIDE IMPACT PRESSURE SENSOR CIRCUITS SHORTED TOGETHER
(R150) LEFT SIDE IMPACT PRESSURE SENSOR GROUND CIRCUIT OPEN
(R130) LEFT SIDE IMPACT PRESSURE SENSOR SIGNAL CIRCUIT OPEN
OCCUPANT RESTRAINT CONTROLLER (ORC)

DIAGNOSTIC TEST

1. **VERIFY THAT DTC - U11F0-00-LOST COMMUNICATION WITH LEFT IMPACT PRESSURE SENSOR IS ACTIVE**

   NOTE: Make sure the battery is fully charged.

   1. Turn the ignition on.
   2. With the scan tool, read ORC DTCs.

      Does the scan tool display active: U11F0-00-LOST COMMUNICATION WITH LEFT IMPACT PRESSURE SENSOR - DTC?

      Yes

      - Go To 2

No

- Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK THE (R130), (R150) LEFT SIDE IMPACT PRESSURE SENSOR SIGNAL AND GROUND CIRCUITS FOR A SHORT TO VOLTAGE**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the Left Side Impact Pressure Sensor harness connector.
2. Disconnect the ORC harness connector.

NOTE: Check the connectors - Clean and repair as necessary.

3. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)to the ORC C1 and C2 harness connectors.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

4. Measure the voltage of the (R130) Left Side Impact Pressure Sensor Signal circuit and (R150) Left Side Impact Pressure Sensor Ground circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)the C1B-31 and C1B-32 terminals and ground.

   Is there any voltage present on either circuit?

   Yes

   - Repair the (R130), (R150) Left Side Impact Pressure Sensor circuits for a short to voltage.
   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 3

3. **CHECK THE (R130) LEFT SIDE IMPACT PRESSURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Measure the resistance of the (R130) Left Side Impact Pressure Sensor Signal circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)the C1B-31 terminals and ground.

   Is the resistance below 20 Ohms?

   Yes

   - Repair the (R130) Left Side Impact Pressure Sensor Signal circuit for a short to ground.
   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 4

4. **CHECK THE (R130), (R150) LEFT SIDE IMPACT PRESSURE SENSOR CIRCUITS FOR A SHORT TOGETHER**
   1. Measure the voltage of the (R130) Left Side Impact Pressure Sensor Signal circuit and (R150) Left Side Impact Pressure Sensor Ground circuits between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)the C1B-31 and C1B-32 terminals.

      Is the resistance below 20 Ohms?

      Yes

      - Repair the (R130), (R150) Left Side Impact Pressure Sensor circuits shorted together.
      - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 5

5. **CHECK THE (R150) LEFT SIDE IMPACT PRESSURE SENSOR GROUND CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
   1. Measure the resistance of the (R150) Left Side Impact Pressure Sensor Ground circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)the C1B-32 terminals and Left Side Impact Pressure Sensor harness connector terminal 2.

      Is the resistance below 1 Ohm?

      Yes

      - Go To 6

      No

- Repair the (R150) Left Side Impact Pressure Sensor Ground circuit for an open or high resistance.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

6. **CHECK THE (R130) LEFT SIDE IMPACT PRESSURE SENSOR SIGNAL CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
   1. Measure the resistance of the (R130) Left Side Impact Pressure Sensor Signal circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)the C1B-31 terminals and Left Side Impact Pressure Sensor harness connector terminal 1.

      Is the resistance below 1 Ohm?

      Yes

      - Go To 7

      No

      - Repair the (R130) Left Side Impact Pressure Sensor Signal circuit for an open or high resistance.
      - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

7. **CHECK OPERATION OF THE LEFT SIDE IMPACT PRESSURE SENSOR**
   1. Replace the Left Side Impact Pressure Sensor. Refer to **SENSOR, IMPACT, REMOVAL** .
   2. Reconnect the vehicle body harness to the impact pressure sensor.
   3. Remove any special tools or jumper wires and reconnect all previously disconnected components - except the Battery.

      WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

   4. Connect the scan tool to the Data Link Connector - use the most current software available.
   5. Use the scan tool and erase the stored codes in all airbag system modules.
   6. Turn the Ignition Off, and wait five seconds before turning the Ignition On.
   7. Wait one minute, and read active codes and if there are none present read the stored codes.

      Did the active: U11F0-00-LOST COMMUNICATION WITH LEFT IMPACT PRESSURE SENSOR - DTC return?

      Yes

      - Go To 8

No

- Repair is complete.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

8. **REPLACE THE OCCUPANT RESTRAINT CONTROLLER**

WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

WARNING: **If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment. Failure to follow these instructions may result in possible serious or fatal injury.**

Repair

- Replace the Occupant Restraint Controller in accordance with Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U11F1-00-LOST COMMUNICATION WITH RIGHT IMPACT PRESSURE SENSOR

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 24: Right Impact Sensor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The passenger door pressure sensor is mounted to the passenger inner door panel behind the door trim panel. Refer to **DESCRIPTION** . The impact sensors perform their own self test using power supplied by the Occupant Restraint Controller (ORC) then communicate this status back to the ORC with periodic updates. The repair of this fault condition involves verifying the integrity of the wiring between the ORC and the sensor.

WHEN MONITORED

The Occupant Restraint Controller (ORC) continuously communicates with the Passenger Door Pressure Sensor (Satellite) over the sensor signal circuit. The sensor communication and on board diagnostics are powered by the ORC signal.

SET CONDITION

This code will set, if the ORC and the Passenger Door Pressure Sensor do not establish and maintain valid data communications. The DTC will become Active after the fault has set for a minimum of 2.5 seconds. The DTC will go to Stored after the ORC to Passenger Door Pressure Sensor communication fault has been removed or the suspect pressure sensor has been replaced for 2.5 seconds. The Airbag Warning Lamp (AWL) will set in the instrument cluster.

POSSIBLE CAUSES

Possible Causes
(R140) RIGHT SIDE IMPACT PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
(R140) RIGHT SIDE IMPACT PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
(R140), (R160) RIGHT SIDE IMPACT PRESSURE SENSOR CIRCUITS SHORTED TOGETHER
(R160) RIGHT SIDE IMPACT PRESSURE SENSOR GROUND CIRCUIT OPEN
(R140) RIGHT SIDE IMPACT PRESSURE SENSOR SIGNAL CIRCUIT OPEN
RIGHT SIDE IMPACT PRESSURE SENSOR
OCCUPANT RESTRAINT CONTROLLER (ORC)

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**
    1. Turn the ignition on.
    2. With the scan tool, read ORC DTCs.

    NOTE: Make sure the battery is fully charged.

    Does the scan tool display an active: U11F1-00-LOST COMMUNICATION WITH RIGHT IMPACT PRESSURE SENSOR - DTC?

    Yes

    - Go To 2

    No

    - Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE (R140), (R160) RIGHT SIDE IMPACT PRESSURE SENSOR SIGNAL AND GROUND CIRCUITS FOR A SHORT TO VOLTAGE**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the Right Side Impact Pressure Sensor harness connector.
2. Disconnect the ORC harness connector.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

3. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)to the ORC C1 and C2 harness connectors.
4. Measure the voltage of the (R140) Right Side Impact Pressure Sensor Signal circuit and (R160) Right Side Impact Pressure Sensor Ground circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)the C1B-34 and C1B-35 terminals and ground.

   Is there any voltage present?

   Yes

   - Repair the (R140), (R160) Right Side Impact Pressure Sensor circuits for a short to voltage.
   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 3

3. **CHECK THE (R140) RIGHT SIDE IMPACT PRESSURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Measure the resistance of the (R140) Right Side Impact Pressure Sensor Signal circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)the C1B-35 terminals and ground.

   Is the resistance below 20 Ohms?

   Yes

   - Repair the (R140) Right Side Impact Pressure Sensor Signal circuit for a short to ground.

- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 4

4. **CHECK THE (R140), (R160) RIGHT SIDE IMPACT PRESSURE SENSOR CIRCUITS FOR A SHORT TOGETHER**
   1. Measure the voltage of the (R140) Right Side Impact Pressure Sensor Signal circuit and (R160) Right Side Impact Pressure Sensor Ground circuits between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)the C1B-34 and C1B-35 terminals.

      Is the resistance below 20 Ohms?

      Yes

      - Repair the (R140), (R160) Right Side Impact Pressure Sensor circuits shorted together.
      - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 5

5. **CHECK THE (R160) RIGHT SIDE IMPACT PRESSURE SENSOR GROUND CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
   1. Measure the resistance of the (R160) Right Side Impact Pressure Sensor Ground circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)the C1B-34 terminals and Right Side Impact Pressure Sensor harness connector terminal 2.

      Is the resistance below 1 Ohm?

      Yes

      - Go To 6

      No

      - Repair the (R160) Right Side Impact Pressure Sensor Ground circuit for an open or high resistance.
      - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

6. **CHECK THE (R140) RIGHT SIDE IMPACT PRESSURE SENSOR SIGNAL CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
   1. Measure the resistance of the (R140) Right Side Impact Pressure Sensor Signal circuit between the

(special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)the C1B-35 terminals and Right Side Impact Pressure Sensor harness connector terminal 1.

Is the resistance below 1 Ohm?

Yes

- Go To 7

No

- Repair the (R140) Right Side Impact Pressure Sensor Signal circuit for an open or high resistance.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

7. **CHECK OPERATION OF THE RIGHT SIDE IMPACT PRESSURE SENSOR**
   1. Replace the Right Side Impact Pressure Sensor. Refer to **SENSOR, IMPACT, REMOVAL** .
   2. Reconnect the vehicle body harness to the impact sensor.
   3. Remove any special tools or jumper wires and reconnect all previously disconnected components - except the Battery.

      WARNING: **Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

   4. Connect the scan tool to the Data Link Connector - use the most current software available.
   5. Use the scan tool and erase the stored codes in all airbag system modules.
   6. Turn the Ignition Off, and wait 15 seconds before turning the Ignition On.
   7. Wait one minute, and read active codes and if there are none present read the stored codes.

      Did the active U11F1-00-LOST COMMUNICATION WITH RIGHT IMPACT PRESSURE SENSOR return?

      Yes

      - Go To 8

      No

      - Repair is complete.
      - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

8. **REPLACE THE OCCUPANT RESTRAINT CONTROLLER**

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment. Failure to follow these instructions may result in possible serious or fatal injury.

Repair

- Replace the Occupant Restraint Controller in accordance with Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U146D-00-IMPLAUSIBLE DATA RECEIVED FROM LEFT B-PILLAR IMPACT ACCELERATION SENSOR

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 25: Left Impact Sensor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Left Side Impact Sensor 1 is mounted to the passenger rear door opening. Refer to **DESCRIPTION** . The impact sensors perform their own self test using power supplied by the Occupant Restraint Controller (ORC) then communicate this status back to the ORC with periodic updates. The repair of this fault condition involves verifying the integrity of the wiring between the ORC and the sensor.

WHEN MONITORED

The Occupant Restraint Controller (ORC) continuously communicates with the Left Side Impact Sensor 1 over the sensor signal circuit. The sensor communication and on board diagnostics are powered by the ORC signal.

SET CONDITION

This code will set, if the ORC and the Left Side Impact Sensor 1 do not establish and maintain valid data communications. The DTC will become active after the fault has set for a minimum of 2.5 seconds. The DTC will go to Stored after the ORC to Left Side Impact Sensor 1 communication fault has been removed or the suspect sensor has been replaced for 2.5 seconds. The Airbag Warning Lamp (AWL) will set in the instrument cluster.

POSSIBLE CAUSES

Possible Causes
(R13) LEFT SIDE IMPACT SENSOR 1 SIGNAL CIRCUIT SHORTED TO VOLTAGE
(R13) LEFT SIDE IMPACT SENSOR 1 SIGNAL CIRCUIT SHORTED TO GROUND
(R13), (R15) LEFT SIDE IMPACT SENSOR 1 CIRCUITS SHORTED TOGETHER
(R15) LEFT SIDE IMPACT SENSOR 1 GROUND CIRCUIT OPEN
(R13) LEFT SIDE IMPACT SENSOR 1 SIGNAL CIRCUIT OPEN
LEFT SIDE IMPACT PRESSURE SENSOR 1
OCCUPANT RESTRAINT CONTROLLER (ORC)

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**
    1. Turn the ignition on.
    2. With the scan tool, read ORC DTCs.

    NOTE: Make sure the battery is fully charged.

    Does the scan tool display an active: U146D-00-IMPLAUSIBLE DATA RECEIVED FROM LEFT B-PILLAR IMPACT ACCELERATION SENSOR - DTC?

    Yes

    - Go To 2

    No

    - Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE (R13), (R15) LEFT SIDE IMPACT SENSOR 1 SIGNAL AND GROUND CIRCUITS FOR A SHORT TO VOLTAGE**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the Left Side Impact Sensor 1 harness connector.
2. Disconnect the ORC harness connector.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

3. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)to the ORC C1 and C2 harness connectors.
4. Measure the voltage of the (R13) Left Side Impact Sensor 1 Signal circuit and (R15) Left Side Impact Sensor 1 Ground circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)the C1B-25 and C1B-26 terminals and ground.

   Is there any voltage present?

   Yes

   - Repair the (R13) and (R15) Left Side Impact Sensor 1 circuits for a short to voltage.
   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 3

3. **CHECK THE (R13) LEFT SIDE IMPACT SENSOR 1 SIGNAL CIRCUIT FOR A SHORT TO GROUND**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Measure the resistance of the (R13) Left Side Impact Sensor 1 Signal circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)the C1B-25 terminals and ground.

   Is the resistance below 20 Ohms?

   Yes

   - Repair the (R13) Left Side Impact Sensor 1 Signal circuit for a short to ground.

- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 4

4. **CHECK THE (R13), (R15) LEFT SIDE IMPACT SENSOR 1 CIRCUITS FOR A SHORT TOGETHER**
   1. Measure the voltage of the (R13) Left Side Impact Sensor 1 Signal circuit and (R15) Left Side Impact Sensor 1 Ground circuits between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)the C1B-25 and C1B-26 terminals.

      Is the resistance below 20 Ohms?

      Yes

      - Repair the (R13) and(R15) Left Side Impact Sensor 1 circuits shorted together.
      - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 5

5. **CHECK THE (R15) LEFT SIDE IMPACT SENSOR 1 GROUND CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
   1. Measure the resistance of the (R15) Left Side Impact Sensor 1 Ground circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)the C1B-26 terminals and Left Side Impact Sensor 1 harness connector terminal 2.

      Is the resistance below 1 Ohm?

      Yes

      - Go To 6

      No

      - Repair the (R15) Left Side Impact Sensor 1 Ground circuit for an open or high resistance.
      - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

6. **CHECK THE (R13) LEFT SIDE IMPACT SENSOR 1 SIGNAL CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
   1. Measure the resistance of the (R13) Left Side Impact Sensor 1 Signal circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)the C1B-25 terminals and Left

Side Impact Sensor 1 harness connector terminal 1.

Is the resistance below 1 Ohm?

Yes

- Go To 7

No

- Repair the (R13) Left Side Impact Sensor 1 Signal circuit for an open or high resistance.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

7. **CHECK OPERATION OF THE LEFT SIDE IMPACT SENSOR 1**
   1. Replace the Left Side Impact Sensor 1. Refer to **SENSOR, IMPACT, REMOVAL** .
   2. Reconnect the vehicle body harness to the impact sensor.
   3. Remove any special tools or jumper wires and reconnect all previously disconnected components - except the Battery.

      WARNING: **Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

   4. Connect the scan tool to the Data Link Connector - use the most current software available.
   5. Use the scan tool and erase the stored codes in all airbag system modules.
   6. Turn the Ignition Off, and wait 15 seconds before turning the Ignition On.
   7. Wait one minute, and read active codes and if there are none present read the stored codes.

      Did the active U146D-00-IMPLAUSIBLE DATA RECEIVED FROM LEFT B-PILLAR IMPACT ACCELERATION SENSOR return?

      Yes

      - Go To 8

      No

      - Repair is complete.
      - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

8. **REPLACE THE OCCUPANT RESTRAINT CONTROLLER**

   WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two**

minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

WARNING: **If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment. Failure to follow these instructions may result in possible serious or fatal injury.**

Repair

- Replace the Occupant Restraint Controller in accordance with Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U146E-00-IMPLAUSIBLE DATA RECEIVED FROM LEFT C-PILLAR IMPACT ACCELERATION SENSOR

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 26: Left Impact Sensor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Left Side Impact Sensor 2 is mounted to the passenger rear door opening. Refer to **DESCRIPTION** . The impact sensors perform their own self test using power supplied by the Occupant Restraint Controller (ORC) then communicate this status back to the ORC with periodic updates. The repair of this fault condition involves verifying the integrity of the wiring between the ORC and the sensor.

WHEN MONITORED

The Occupant Restraint Controller (ORC) continuously communicates with the Left Side Impact Sensor 2 over the sensor signal circuit. The sensor communication and on board diagnostics are powered by the ORC signal.

SET CONDITION

This code will set, if the ORC and the Left Side Impact Sensor 2 do not establish and maintain valid data communications. The DTC will become active after the fault has set for a minimum of 2.5 seconds. The DTC will go to Stored after the ORC to Left Side Impact Sensor 2 communication fault has been removed or the suspect sensor has been replaced for 2.5 seconds. The Airbag Warning Lamp (AWL) will set in the instrument cluster.

POSSIBLE CAUSES

Possible Causes
(R17) LEFT SIDE IMPACT SENSOR 2 SIGNAL CIRCUIT SHORTED TO VOLTAGE
(R17) LEFT SIDE IMPACT SENSOR 2 SIGNAL CIRCUIT SHORTED TO GROUND
(R17), (R19) LEFT SIDE IMPACT SENSOR 2 CIRCUITS SHORTED TOGETHER
(R19) LEFT SIDE IMPACT SENSOR 2 GROUND CIRCUIT OPEN
(R17) LEFT SIDE IMPACT SENSOR 2 SIGNAL CIRCUIT OPEN
LEFT SIDE IMPACT PRESSURE SENSOR 2
OCCUPANT RESTRAINT CONTROLLER (ORC)

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**
    1. Turn the ignition on.
    2. With the scan tool, read ORC DTCs.

    NOTE: Make sure the battery is fully charged.

    Does the scan tool display an active: U146E-00-IMPLAUSIBLE DATA RECEIVED FROM LEFT C-PILLAR IMPACT ACCELERATION SENSOR - DTC?

    Yes

    - Go To 2

    No

    - Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE (R17), (R19) LEFT SIDE IMPACT SENSOR 2 SIGNAL AND GROUND CIRCUITS FOR A SHORT TO VOLTAGE**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the Left Side Impact Sensor 2 harness connector.
2. Disconnect the ORC harness connector.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

3. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)to the ORC C1 and C2 harness connectors.
4. Measure the voltage of the (R17) Left Side Impact Sensor 2 Signal circuit and (R19) Left Side Impact Sensor 2 Ground circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)the C1B-53 and C1B-54 terminals and ground.

   Is there any voltage present?

   Yes

   - Repair the (R17), (R19) Left Side Impact Sensor 2 circuits for a short to voltage.
   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 3

3. **CHECK THE (R17) LEFT SIDE IMPACT SENSOR 2 SIGNAL CIRCUIT FOR A SHORT TO GROUND**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Measure the resistance of the (R17) Left Side Impact Sensor 2 Signal circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)the C1B-53 terminals and ground.

   Is the resistance below 20 Ohms?

   Yes

   - Repair the (R17) Left Side Impact Sensor 2 Signal circuit for a short to ground.

- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 4

4. **CHECK THE (R17), (R19) LEFT SIDE IMPACT SENSOR 2 CIRCUITS FOR A SHORT TOGETHER**
   1. Measure the voltage of the (R17) Left Side Impact Sensor 2 Signal circuit and (R19) Left Side Impact Sensor 2 Ground circuits between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)the C1B-53 and C1B-54 terminals.

      Is the resistance below 20 Ohms?

      Yes

      - Repair the (R17), (R19) Left Side Impact Sensor 2 circuits shorted together.
      - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 5

5. **CHECK THE (R19) LEFT SIDE IMPACT SENSOR 2 GROUND CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
   1. Measure the resistance of the (R19) Left Side Impact Sensor 2 Ground circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)the C1B-54 terminals and Left Side Impact Sensor 2 harness connector terminal 2.

      Is the resistance below 1 Ohm?

      Yes

      - Go To 6

      No

      - Repair the (R19) Left Side Impact Sensor 2 Ground circuit for an open or high resistance.
      - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

6. **CHECK THE (R17) LEFT SIDE IMPACT SENSOR 2 SIGNAL CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
   1. Measure the resistance of the (R17) Left Side Impact Sensor 2 Signal circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)the C1B-53 terminals and Left

Side Impact Sensor 2 harness connector terminal 1.

Is the resistance below 1 Ohm?

Yes

- Go To 7

No

- Repair the (R17) Left Side Impact Sensor 2 Signal circuit for an open or high resistance.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

7. **CHECK OPERATION OF THE LEFT SIDE IMPACT SENSOR 2**
   1. Replace the Left Side Impact Sensor 2. Refer to **SENSOR, IMPACT, REMOVAL** .
   2. Reconnect the vehicle body harness to the impact sensor.
   3. Remove any special tools or jumper wires and reconnect all previously disconnected components - except the Battery.

      WARNING: **Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

   4. Connect the scan tool to the Data Link Connector - use the most current software available.
   5. Use the scan tool and erase the stored codes in all airbag system modules.
   6. Turn the Ignition Off, and wait 15 seconds before turning the Ignition On.
   7. Wait one minute, and read active codes and if there are none present read the stored codes.

      Did the active U11EB-00-LOST COMMUNICATION WITH LEFT C-PILLAR IMPACT ACCELERATION SENSOR return?

      Yes

      - Go To 8

      No

      - Repair is complete.
      - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

8. **REPLACE THE OCCUPANT RESTRAINT CONTROLLER**

   WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two**

minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

WARNING: **If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment. Failure to follow these instructions may result in possible serious or fatal injury.**

Repair

- Replace the Occupant Restraint Controller in accordance with Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U1470-00-IMPLAUSIBLE DATA RECEIVED FROM LEFT IMPACT PRESSURE SENSOR

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 27: Left Impact Sensor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The driver door pressure sensor is mounted to the driver inner door panel behind the door trim panel. Refer to **DESCRIPTION** . The impact sensors perform their own self test using power supplied by the Occupant Restraint Controller (ORC) then communicate this status back to the ORC with periodic updates. The repair of this fault condition involves verifying the integrity of the wiring between the ORC and the sensor. The door pressure sensor is hardwired to the Occupant Restraint Controller (ORC).

WHEN MONITORED

The Occupant Restraint Controller (ORC) continuously communicates with the Driver Door Pressure Sensor (Satellite) over the sensor signal circuit. The sensor communication and on board diagnostics are powered by the ORC signal.

SET CONDITION

This code will set, if the ORC and the Driver Door Pressure Sensor (Satellite) do not establish and maintain valid data communications. The DTC will become Active after the fault has set for a minimum of 100 milliseconds (ms). The DTC will go to Stored after the ORC to Driver Door Pressure Sensor (Satellite) communication fault has been removed or the suspect pressure sensor has been replaced. The clearing of this fault is immediate upon the suspect internal error being removed or the suspect sensor replaced. The Multifunction Indicator Lamp (MIL) will set in the instrument cluster.

POSSIBLE CAUSES

Possible Causes
(R130) LEFT SIDE IMPACT PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
(R150) LEFT SIDE IMPACT PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
(R130), (R150) LEFT SIDE IMPACT PRESSURE SENSOR CIRCUITS SHORTED TOGETHER
(R150) LEFT SIDE IMPACT PRESSURE SENSOR GROUND CIRCUIT OPEN
(R130) LEFT SIDE IMPACT PRESSURE SENSOR SIGNAL CIRCUIT OPEN
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **VERIFY THAT DTC U1470-00-IMPLAUSIBLE DATA RECEIVED FROM LEFT IMPACT PRESSURE SENSOR IS ACTIVE**

   NOTE: Make sure the battery is fully charged.

   1. Turn the ignition on.
   2. With the scan tool, read ORC DTCs.

      Does the scan tool display active: DTC U1470-00-IMPLAUSIBLE DATA RECEIVED FROM LEFT IMPACT PRESSURE SENSOR?

      Yes

      - Go To 2

No

- Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK THE (R130), (R150) LEFT SIDE IMPACT PRESSURE SENSOR SIGNAL AND GROUND CIRCUITS FOR A SHORT TO VOLTAGE**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the Left Side Impact Pressure Sensor harness connector.
2. Disconnect the ORC harness connectors.

NOTE: Check connectors - Clean and repair as necessary.

3. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)to the ORC C1 and C2 harness connectors.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

4. Measure the voltage of the (R130) Left Side Impact Pressure Sensor Signal circuit and (R150) Left Side Impact Pressure Sensor Ground circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)C1B-31 and ground and the C1B-32 and ground.

   Is there any voltage present?

   Yes

   - Repair the (R130), (R150) Left Side Impact Pressure Sensor circuits for a short to voltage.
   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 6

3. **CHECK THE (R130) LEFT SIDE IMPACT PRESSURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Measure the resistance of the (R130) Left Side Impact Pressure Sensor Signal circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)C1B-31 and ground.

   Is the resistance below 20 Ohms?

   Yes

   - Repair the (R130) Leftt Side Impact Pressure Sensor Signal circuit for a short to ground.
   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 4

4. **CHECK THE (R130), (R150) LEFT SIDE IMPACT PRESSURE SENSOR CIRCUITS FOR A SHORT TOGETHER**
   1. Measure the resistance between the (R130) Left Side Impact Pressure Sensor Signal circuit and the (R150) Left Side Impact Pressure Sensor Ground circuits between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)C1B-31 and C1B-32.

      Is the resistance below 20 Ohms?

      Yes

      - Repair the (R130), (R150) Left Side Impact Pressure Sensor circuits shorted together.
      - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 5

5. **CHECK THE (R150) LEFT SIDE IMPACT PRESSURE SENSOR GROUND CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
   1. Measure the resistance of the (R150) Left Side Impact Pressure Sensor Ground circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)C1B-32 and the Left Side Impact Pressure Sensor harness connector terminal 2.

      Is the resistance below 1 Ohm?

      Yes

      - Go To 6

      No

- Repair the (R150) Left Side Impact Pressure Sensor Ground circuit for an open or high resistance.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

6. **CHECK THE (R130) LEFT SIDE IMPACT PRESSURE SENSOR SIGNAL CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
   1. Measure the resistance of the (R130) Left Side Impact Pressure Sensor Signal circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)C1B-31 and the Left Side Impact Pressure Sensor harness connector terminal 1.

      Is the resistance below 1 Ohm?

      Yes

      - Go To 7

      No

      - Repair the (R130) Left Side Impact Pressure Sensor Signal circuit for an open or high resistance.
      - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

7. **CHECK OPERATION OF THE PASSENGER DOOR PRESSURE SENSOR (SATELLITE)**
   1. Replace the Left Door Pressure Sensor. Refer to **SENSOR, IMPACT, REMOVAL** .
   2. Reconnect the vehicle body harness to the impact pressure sensor.
   3. Remove any special tools or jumper wires and reconnect all previously disconnected components - except the Battery.

      WARNING: **Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

   4. Connect the scan tool to the Data Link Connector - use the most current software available.
   5. Use the scan tool and erase the stored codes in all airbag system modules.
   6. Turn the Ignition Off, and wait five seconds before turning the Ignition On.
   7. Wait one minute, and read active codes and if there are none present read the stored codes.

      Did the active: U1470-00-IMPLAUSIBLE DATA RECEIVED FROM LEFT IMPACT PRESSURE SENSOR return?

      Yes

      WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait**

two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

WARNING: **If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment. Failure to follow these instructions may result in possible serious or fatal injury.**

- Replace the Occupant Restrain Controller (ORC) in accordance with the Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Repair is complete.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U1471-00-IMPLAUSIBLE DATA RECEIVED FROM LEFT FRONTAL ACCELERATION SENSOR

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 28: Front Impact Sensor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Left Front Impact Sensor is mounted in the engine compartment behind the front lamp unit. Refer to **DESCRIPTION** . The Left Front Impact Sensor is directly hard wired to the Occupant Restraint Controller (ORC) Module. The impact sensors perform their own self test using power supplied by the Occupant Restraint Controller (ORC) then communicate this status back to the ORC with periodic updates. The repair of this fault condition involves verifying the integrity of the wiring between the ORC and the sensor.

WHEN MONITORED

With the ignition on, the Left Front Impact Sensor is equipped with on board diagnostics to monitor the sensor's

internal circuits. If a problem is identified, the sensor sends the Left Front Impact Sensor Internal message to the Occupant Restraint Controller (ORC).

SET CONDITION

This code will set, if the ORC and the Left Front Impact Sensor do not establish and maintain valid data communications. The DTC will become Active after the fault has set for a minimum of 100 milliseconds (ms). The DTC will go to Stored after the ORC Left Front Impact Sensor communication fault has been removed or the suspect front impact sensor has been replaced. The clearing of this fault is immediate upon the suspect internal error being removed or the suspect sensor replaced. The Airbag Warning Lamp (AWL) will set in the instrument cluster.

POSSIBLE CAUSES

Possible Causes
(R79) LEFT FRONT IMPACT SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
(R79) LEFT FRONT IMPACT SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
(R79, R81) LEFT FRONT IMPACT SENSOR CIRCUITS SHORTED TOGETHER
(R81) LEFT FRONT IMPACT SENSOR GROUND CIRCUIT OPEN
(R79) LEFT FRONT IMPACT SENSOR SIGNAL CIRCUIT OPEN
OCCUPANT RESTRAINT CONTROLLER (ORC)
LEFT SIDE IMPACT SENSOR

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

   NOTE: Make sure the battery is fully charged.

   1. Turn the ignition on.
   2. With the scan tool, read ORC DTCs.

      Does the scan tool display active: U1471-00-IMPLAUSIBLE-DATA-RECEIVED-FROM-LEFT-FRONTAL-ACCELERATION-SENSOR- DTC?

      Yes

      - Go To 2

      No

      - Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK THE (R79), (R81) LEFT FRONT IMPACT SENSOR SIGNAL AND GROUND CIRCUITS FOR A SHORT TO VOLTAGE**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the Left Front Impact Pressure Sensor harness connector.
2. Disconnect the ORC harness connector.

NOTE: Check the connectors - Clean and repair as necessary.

3. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)to the ORC C1 and C2 harness connectors.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

4. Measure the voltage of the (R79) Left Front Impact Sensor Signal circuit and (R81) Left Front Impact Sensor Ground circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)the C1A-17 and C1A-16 terminals and ground.

   Is there any voltage present on either circuit?

   Yes

   - Repair the (R79), (R81) Left Front Impact Sensor circuits for a short to voltage.
   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 3

3. **CHECK THE (R79) LEFT FRONT IMPACT SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Measure the resistance of the (R79) Left Front Impact Sensor Signal circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)the C1A-17 terminals and ground.

   Is the resistance below 20 Ohms?

Yes

- Repair the (R79) Left Front Impact Sensor Signal circuit for a short to ground.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 4

4. **CHECK THE (R79), (R810) LEFT FRONT IMPACT SENSOR CIRCUITS FOR A SHORT TOGETHER**
   1. Measure the voltage of the (R79) Left Front Impact Sensor Signal circuit and (R810) Left Front Impact Sensor Ground circuits between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)the C1A-17 and C1A-16 terminals.

      Is the resistance below 20 Ohms?

      Yes

      - Repair the (R79), (R81) Left Front Impact Sensor circuits shorted together.
      - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 5

5. **CHECK THE (R81) LEFT FRONT IMPACT SENSOR GROUND CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
   1. Measure the resistance of the (R81) Left Front Impact Sensor Ground circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)the C1A-16 terminals and Left Front Impact Sensor harness connector terminal 2.

      Is the resistance below 1 Ohm?

      Yes

      - Go To 6

      No

      - Repair the (R81) Left Front Impact Sensor Ground circuit for an open or high resistance.
      - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

6. **CHECK THE (R79) LEFT FRONT IMPACT SENSOR SIGNAL CIRCUIT FOR AN OPEN OR**

HIGH RESISTANCE

1. Measure the resistance of the (R79) Left Front Impact Sensor Signal circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)the C1A-17 terminals and Left Front Impact Sensor harness connector terminal 1.

   Is the resistance below 1 Ohm?

   Yes

   - Go To 7

   No

   - Repair the (R79) Right Front Impact Sensor Signal circuit for an open or high resistance.
   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

7. **CHECK OPERATION OF THE LEFT SIDE IMPACT PRESSURE SENSOR**
   1. Replace the Left Front Impact Sensor. Refer to **SENSOR, IMPACT, REMOVAL** .
   2. Reconnect the vehicle body harness to the impact sensor.
   3. Remove any special tools or jumper wires and reconnect all previously disconnected components - except the Battery.

      WARNING: **Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

   4. Connect the scan tool to the Data Link Connector - use the most current software available.
   5. Use the scan tool and erase the stored codes in all airbag system modules.
   6. Turn the Ignition Off, and wait five seconds before turning the Ignition On.
   7. Wait one minute, and read active codes and if there are none present read the stored codes.

      Did the active: U1471-00-IMPLAUSIBLE-DATA-RECEIVED-FROM-LEFT-FRONTAL-ACCELERATION-SENSOR- DTC return?

      Yes

      - Go To 8

      No

      - Repair is complete.
      - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

8. **REPLACE THE OCCUPANT RESTRAINT CONTROLLER**

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment. Failure to follow these instructions may result in possible serious or fatal injury.

Repair

- Replace the Occupant Restraint Controller in accordance with Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U1472-00-IMPLAUSIBLE DATA RECEIVED FROM RIGHT B-PILLAR IMPACT ACCELERATION SENSOR

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 29: Right Impact Sensor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Right Side Impact Sensor 1 is mounted to the passenger rear door opening. Refer to **DESCRIPTION** . The impact sensors perform their own self test using power supplied by the Occupant Restraint Controller (ORC) then communicate this status back to the ORC with periodic updates. The repair of this fault condition involves verifying the integrity of the wiring between the ORC and the sensor.

WHEN MONITORED

The Occupant Restraint Controller (ORC) continuously communicates with the Right Side Impact Sensor 1 over the sensor signal circuit. The sensor communication and on board diagnostics are powered by the ORC signal.

SET CONDITION

This code will set, if the ORC and the Right Side Impact Sensor 1 do not establish and maintain valid data communications. The DTC will become active after the fault has set for a minimum of 2.5 seconds. The DTC will go to Stored after the ORC to Right Side Impact Sensor 1 communication fault has been removed or the suspect sensor has been replaced for 2.5 seconds. The Airbag Warning Lamp (AWL) will set in the instrument cluster.

POSSIBLE CAUSES

Possible Causes
(R14) RIGHT SIDE IMPACT SENSOR 1 SIGNAL CIRCUIT SHORTED TO VOLTAGE
(R14) RIGHT SIDE IMPACT SENSOR 1 SIGNAL CIRCUIT SHORTED TO GROUND
(R14), (R16) RIGHT SIDE IMPACT SENSOR 1 CIRCUITS SHORTED TOGETHER
(R16) RIGHT SIDE IMPACT SENSOR 1 GROUND CIRCUIT OPEN
(R14) RIGHT SIDE IMPACT SENSOR 1 SIGNAL CIRCUIT OPEN
RIGHT SIDE IMPACT PRESSURE SENSOR 1
OCCUPANT RESTRAINT CONTROLLER (ORC)

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**
    1. Turn the ignition on.
    2. With the scan tool, read ORC DTCs.

    NOTE: Make sure the battery is fully charged.

    Does the scan tool display an active: U1472-00-IMPLAUSIBLE DATA RECEIVED FROM RIGHT B-PILLAR IMPACT ACCELERATION SENSOR - DTC?

    Yes

    - Go To 2

    No

    - Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE (R14), (R16) RIGHT SIDE IMPACT SENSOR 1 SIGNAL AND GROUND CIRCUITS FOR A SHORT TO VOLTAGE**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the Right Side Impact Sensor 1 harness connector.
2. Disconnect the ORC harness connector.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

3. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)to the ORC C1 and C2 harness connectors.
4. Measure the voltage of the (R14) Right Side Impact Sensor 1 Signal circuit and (R16) Right Side Impact Sensor 1 Ground circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)the C1B-29 and C1B-28 terminals and ground.

   Is there any voltage present?

   Yes

   - Repair the (R14) and (R16) Right Side Impact Sensor 1 circuits for a short to voltage.
   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 3

3. **CHECK THE (R14) RIGHT SIDE IMPACT SENSOR 1 SIGNAL CIRCUIT FOR A SHORT TO GROUND**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Measure the resistance of the (R14) Right Side Impact Sensor 1 Signal circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)the C1B-29 terminals and ground.

   Is the resistance below 20 Ohms?

   Yes

   - Repair the (R14) Right Side Impact Sensor 1 Signal circuit for a short to ground.

- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 4

4. **CHECK THE (R14) AND (R16) RIGHT SIDE IMPACT SENSOR 1 CIRCUITS FOR A SHORT TOGETHER**
   1. Measure the voltage of the (R14) Right Side Impact Sensor 1 Signal circuit and (R16) Right Side Impact Sensor 1 Ground circuits between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)the C1B-29 and C1B-28 terminals.

      Is the resistance below 20 Ohms?

      Yes

      - Repair the (R14) and(R16) Right Side Impact Sensor 1 circuits shorted together.
      - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 5

5. **CHECK THE (R16) RIGHT SIDE IMPACT SENSOR 1 GROUND CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
   1. Measure the resistance of the (R16) Right Side Impact Sensor 1 Ground circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)the C1B-28 terminals and Right Side Impact Sensor 1 harness connector terminal 2.

      Is the resistance below 1 Ohm?

      Yes

      - Go To 6

      No

      - Repair the (R16) Right Side Impact Sensor 1 Ground circuit for an open or high resistance.
      - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

6. **CHECK THE (R14) RIGHT SIDE IMPACT SENSOR 1 SIGNAL CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
   1. Measure the resistance of the (R14) Right Side Impact Sensor 1 Signal circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)the C1B-29 terminals and Right

Side Impact Sensor 1 harness connector terminal 1.

Is the resistance below 1 Ohm?

Yes

- Go To 7

No

- Repair the (R14) Right Side Impact Sensor 1 Signal circuit for an open or high resistance.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

7. **CHECK OPERATION OF THE RIGHT SIDE IMPACT SENSOR 1**
   1. Replace the Right Side Impact Sensor 1. Refer to **SENSOR, IMPACT, REMOVAL** .
   2. Reconnect the vehicle body harness to the impact sensor.
   3. Remove any special tools or jumper wires and reconnect all previously disconnected components - except the Battery.

      WARNING: **Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

   4. Connect the scan tool to the Data Link Connector - use the most current software available.
   5. Use the scan tool and erase the stored codes in all airbag system modules.
   6. Turn the Ignition Off, and wait 15 seconds before turning the Ignition On.
   7. Wait one minute, and read active codes and if there are none present read the stored codes.

      Did the active U1472-00-IMPLAUSIBLE DATA RECEIVED FROM RIGHT B-PILLAR IMPACT ACCELERATION SENSOR return?

      Yes

      - Go To 8

      No

      - Repair is complete.
      - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

8. **REPLACE THE OCCUPANT RESTRAINT CONTROLLER**

   WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two**

minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

WARNING: **If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment. Failure to follow these instructions may result in possible serious or fatal injury.**

Repair

- Replace the Occupant Restraint Controller in accordance with Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U1473-00-IMPLAUSIBLE DATA RECEIVED FROM RIGHT C-PILLAR IMPACT ACCELERATION SENSOR

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 30: Right Impact Sensor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Right Side Impact Sensor 2 is mounted to the passenger rear door opening. Refer to **DESCRIPTION** . The impact sensors perform their own self test using power supplied by the Occupant Restraint Controller (ORC) then communicate this status back to the ORC with periodic updates. The repair of this fault condition involves verifying the integrity of the wiring between the ORC and the sensor.

WHEN MONITORED

The Occupant Restraint Controller (ORC) continuously communicates with the Right Side Impact Sensor 2 over the sensor signal circuit. The sensor communication and on board diagnostics are powered by the ORC signal.

SET CONDITION

This code will set, if the ORC and the Right Side Impact Sensor 2 do not establish and maintain valid data communications. The DTC will become active after the fault has set for a minimum of 2.5 seconds. The DTC will go to Stored after the ORC to Right Side Impact Sensor 2 communication fault has been removed or the suspect sensor has been replaced for 2.5 seconds. The Airbag Warning Lamp (AWL) will set in the instrument cluster.

POSSIBLE CAUSES

Possible Causes
(R18) RIGHT SIDE IMPACT SENSOR 2 SIGNAL CIRCUIT SHORTED TO VOLTAGE
(R18) RIGHT SIDE IMPACT SENSOR 2 SIGNAL CIRCUIT SHORTED TO GROUND
(R18), (R20) RIGHT SIDE IMPACT SENSOR 2 CIRCUITS SHORTED TOGETHER
(R20) RIGHT SIDE IMPACT SENSOR 2 GROUND CIRCUIT OPEN
(R18) RIGHT SIDE IMPACT SENSOR 2 SIGNAL CIRCUIT OPEN
RIGHT SIDE IMPACT PRESSURE SENSOR 2
OCCUPANT RESTRAINT CONTROLLER (ORC)

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**
    1. Turn the ignition on.
    2. With the scan tool, read ORC DTCs.

    NOTE: Make sure the battery is fully charged.

    Does the scan tool display an active: U1473-00-IMPLAUSIBLE-DATA-RECEIVED-FROM-RIGHT-C-PILLAR-IMPACT-ACCELERATION-SENSOR - DTC?

    Yes

    - Go To 2

    No

    - Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE (R18), (R20) RIGHT SIDE IMPACT SENSOR 2 SIGNAL AND GROUND CIRCUITS FOR A SHORT TO VOLTAGE**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the Right Side Impact Sensor 2 harness connector.
2. Disconnect the ORC harness connector.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

3. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)to the ORC C1 and C2 harness connectors.
4. Measure the voltage of the (R18) Right Side Impact Sensor 2 Signal circuit and (R20) Right Side Impact Sensor 2 Ground circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)the C1B-18 and C1B-17 terminals and ground.

   Is there any voltage present?

   Yes

   - Repair the (R18), (R20) Right Side Impact Sensor 2 circuits for a short to voltage.
   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 3

3. **CHECK THE (R18) RIGHT SIDE IMPACT SENSOR 2 SIGNAL CIRCUIT FOR A SHORT TO GROUND**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Measure the resistance of the (R18) Right Side Impact Sensor 2 Signal circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)the C1B-18 terminals and ground.

   Is the resistance below 20 Ohms?

   Yes

   - Repair the (R18) Right Side Impact Sensor 2 Signal circuit for a short to ground.

- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 4

4. **CHECK THE (R18), (R20) RIGHT SIDE IMPACT SENSOR 2 CIRCUITS FOR A SHORT TOGETHER**
   1. Measure the voltage of the (R18) Right Side Impact Sensor 2 Signal circuit and (R20) Right Side Impact Sensor 2 Ground circuits between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)the C1B-18 and C1B-17 terminals.

      Is the resistance below 20 Ohms?

      Yes

      - Repair the (R18), (R20) Right Side Impact Sensor 2 circuits shorted together.
      - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 5

5. **CHECK THE (R20) RIGHT SIDE IMPACT SENSOR 2 GROUND CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
   1. Measure the resistance of the (R20) Right Side Impact Sensor 2 Ground circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)the C1B-17 terminals and Right Side Impact Sensor 2 harness connector terminal 2.

      Is the resistance below 1 Ohm?

      Yes

      - Go To 3

      No

      - Repair the (R20) Right Side Impact Sensor 2 Ground circuit for an open or high resistance.
      - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

6. **CHECK THE (R18) RIGHT SIDE IMPACT SENSOR 2 SIGNAL CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
   1. Measure the resistance of the (R18) Right Side Impact Sensor 2 Signal circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)the C1B-18 terminals and Right

Side Impact Sensor 2 harness connector terminal 1.

Is the resistance below 1 Ohm?

Yes

- Go To 7

No

- Repair the (R18) Right Side Impact Sensor 2 Signal circuit for an open or high resistance.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

7. **CHECK OPERATION OF THE RIGHT SIDE IMPACT SENSOR 2**
   1. Replace the Right Side Impact Sensor 2. Refer to **SENSOR, IMPACT, REMOVAL** .
   2. Reconnect the vehicle body harness to the impact sensor.
   3. Remove any special tools or jumper wires and reconnect all previously disconnected components - except the Battery.

      WARNING: **Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

   4. Connect the scan tool to the Data Link Connector - use the most current software available.
   5. Use the scan tool and erase the stored codes in all airbag system modules.
   6. Turn the Ignition Off, and wait 15 seconds before turning the Ignition On.
   7. Wait one minute, and read active codes and if there are none present read the stored codes.

      Did the active U1473-00-IMPLAUSIBLE-DATA-RECEIVED-FROM-RIGHT-C-PILLAR-IMPACT-ACCELERATION-SENSOR return?

      Yes

      - Go To 8

      No

      - Repair is complete.
      - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

8. **REPLACE THE OCCUPANT RESTRAINT CONTROLLER**

   WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two**

minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

WARNING: **If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment. Failure to follow these instructions may result in possible serious or fatal injury.**

Repair

- Replace the Occupant Restraint Controller in accordance with Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U1475-00-IMPLAUSIBLE DATA RECEIVED FROM RIGHT IMPACT PRESSURE SENSOR IS ACTIVE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 31: Right Impact Sensor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The passenger door pressure sensor is mounted to the passenger inner door panel behind the door trim panel. Refer to **DESCRIPTION** . The impact sensors perform their own self test using power supplied by the Occupant Restraint Controller (ORC) then communicate this status back to the ORC with periodic updates. The repair of this fault condition involves verifying the integrity of the wiring between the ORC and the sensor. A short to voltage fault on the door pressure sensor wiring can cause a loss of comm side impact code to set and the possible replacement of a good side impact sensor. The door pressure sensor is hardwired to the side impact

sensor which is hard wired to the ORC creating a daisy chain circuit. The short to battery fault in a loss of comm or internal circuit failure of the door pressure sensor can cause the side impact sensor on the same side to set a loss of comm code.

WHEN MONITORED

The Occupant Restraint Controller (ORC) continuously communicates with the Passenger Door Pressure Sensor (Satellite) over the sensor signal circuit. The sensor communication and on board diagnostics are powered by the ORC signal.

SET CONDITION

This code will set, if the ORC and the Passenger Door Pressure Sensor (Satellite) do not establish and maintain valid data communications. The DTC will become Active after the fault has set for a minimum of 100 milliseconds (ms). The DTC will go to Stored after the ORC to Passenger Door (Pressure) Sensor communication fault has been removed or the suspect pressure sensor has been replaced. This fault will clear upon the next ignition cycle. The Multifunction Indicator Lamp (MIL) will set in the instrument cluster.

POSSIBLE CAUSES

Possible Causes
(R140) RIGHT SIDE IMPACT PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
(R140) RIGHT SIDE IMPACT PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
(R140), (R160) RIGHT SIDE IMPACT PRESSURE SENSOR CIRCUITS SHORTED TOGETHER
(R160) RIGHT SIDE IMPACT PRESSURE SENSOR GROUND CIRCUIT OPEN
(R140) RIGHT SIDE IMPACT PRESSURE SENSOR SIGNAL CIRCUIT OPEN
OCCUPANT RESTRAINT CONTROLLER (ORC)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **VERIFY THAT DTC U1475-00-IMPLAUSIBLE DATA RECEIVED FROM RIGHT IMPACT PRESSURE SENSOR IS ACTIVE**

   NOTE: Make sure the battery is fully charged.

   1. Turn the ignition on.
   2. With the scan tool, read ORC DTCs.

      Does the scan tool display active: DTC U1475-00-IMPLAUSIBLE DATA RECEIVED FROM RIGHT IMPACT PRESSURE SENSOR?

      Yes

- Go To 2

No

- Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK THE (R140), (R160) RIGHT SIDE IMPACT PRESSURE SENSOR SIGNAL AND GROUND CIRCUITS FOR A SHORT TO VOLTAGE**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the Right Side Impact Pressure Sensor harness connector.
2. Disconnect the ORC harness connectors.

NOTE: Check connectors - Clean and repair as necessary.

3. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)to the ORC C1 and C2 harness connectors.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

4. Measure the voltage of the (R140) Right Side Impact Pressure Sensor Signal circuit and (R160) Sensor Ground circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)C1B-34 and ground and the C1B-35 and ground.

Is there any voltage present?

Yes

- Repair the (R140), (R160) Right Side Impact Pressure Sensor circuits for a short to voltage.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 3

3. **CHECK THE (R140) RIGHT SIDE IMPACT PRESSURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two

minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Measure the resistance of the (R140) Right Side Impact Pressure Sensor Signal circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)C1B-34 and ground.

   Is the resistance below 20 Ohms?

   Yes

   - Repair the (R140) Right Side Impact Pressure Sensor Signal circuit for a short to ground.
   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 4

4. **CHECK THE (R140), (R160) RIGHT SIDE IMPACT PRESSURE SENSOR CIRCUITS FOR A SHORT TOGETHER**
   1. Measure the resistance between the (R140) Right Side Impact Pressure Sensor Signal circuit and the (R160) Sensor Ground circuits between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)C1B-34 and C1B-35.

      Is the resistance below 20 Ohms?

      Yes

      - Repair the (R140), (R160) Right Side Impact Pressure Sensor circuits shorted together.
      - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 5

5. **CHECK THE (R160) RIGHT SIDE IMPACT PRESSURE SENSOR GROUND CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
   1. Measure the resistance of the (R160) Right Side Impact Pressure Sensor Ground circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)C1B-34 and the Right Side Impact Pressure Sensor harness connector terminal 2.

      Is the resistance below 1 Ohm?

      Yes

      - Go To 6

No

- Repair the (R160) Right Side Impact Pressure Sensor Ground circuit for an open or high resistance.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

6. **CHECK THE (R140) RIGHT SIDE IMPACT PRESSURE SENSOR SIGNAL CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
   1. Measure the resistance of the (R140) Right Side Impact Pressure Sensor Signal circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)C1B-35 and the Right Side Impact Pressure Sensor harness connector terminal 1.

      Is the resistance below 1 Ohm?

      Yes

      - Go To 7

      No

      - Repair the (R140) Right Side Impact Pressure Sensor Signal circuit for an open or high resistance.
      - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

7. **CHECK OPERATION OF THE PASSENGER DOOR PRESSURE SENSOR (SATELLITE)**
   1. Replace the Right Door Pressure Sensor. Refer to **SENSOR, IMPACT, REMOVAL** .
   2. Reconnect the vehicle body harness to the impact pressure sensor.
   3. Remove any special tools or jumper wires and reconnect all previously disconnected components - except the Battery.

      WARNING: **Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

   4. Connect the scan tool to the Data Link Connector - use the most current software available.
   5. Use the scan tool and erase the stored codes in all airbag system modules.
   6. Turn the Ignition Off, and wait five seconds before turning the Ignition On.
   7. Wait one minute, and read active codes and if there are none present read the stored codes.

      Did the active: U1475-00-IMPLAUSIBLE DATA RECEIVED FROM RIGHT IMPACT PRESSURE SENSOR return?

      Yes

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment. Failure to follow these instructions may result in possible serious or fatal injury.

- Replace the Occupant Restrain Controller (ORC) in accordance with the Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Repair is complete.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U1476-00-IMPLAUSIBLE DATA RECEIVED FROM RIGHT FRONTAL ACCELERATION SENSOR

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 32: Front Impact Sensor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Right Front Impact Sensor is mounted in the engine compartment behind the front lamp unit. Refer to **DESCRIPTION** . The Right Front Impact Sensor is directly hard wired to the Occupant Restraint Controller (ORC) Module. The impact sensors perform their own self test using power supplied by the Occupant Restraint Controller (ORC) then communicate this status back to the ORC with periodic updates. The repair of this fault condition involves verifying the integrity of the wiring between the ORC and the sensor.

WHEN MONITORED

With the ignition on, the Right Front Impact Sensor is equipped with on board diagnostics to monitor the

sensor's internal circuits. If a problem is identified, the sensor sends the Right Front Impact Sensor Internal message to the Occupant Restraint Controller (ORC).

SET CONDITION

This code will set, if the ORC and the Right Front Impact Sensor do not establish and maintain valid data communications. The DTC will become Active after the fault has set for a minimum of 100 milliseconds (ms). The DTC will go to Stored after the ORC Right Front Impact Sensor communication fault has been removed or the suspect front impact sensor has been replaced. The clearing of this fault is immediate upon the suspect internal error being removed or the suspect sensor replaced. The Airbag Warning Lamp (AWL) will set in the instrument cluster.

POSSIBLE CAUSES

Possible Causes
(R80) RIGHT FRONT IMPACT SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
(R80) RIGHT FRONT IMPACT SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
(R80, R82) RIGHT FRONT IMPACT SENSOR CIRCUITS SHORTED TOGETHER
(R82) RIGHT FRONT IMPACT SENSOR GROUND CIRCUIT OPEN
(R80) RIGHT FRONT IMPACT SENSOR SIGNAL CIRCUIT OPEN
RIGHT SIDE IMPACT SENSOR
OCCUPANT RESTRAINT CONTROLLER (ORC)

DIAGNOSTIC TEST

1. **DETERMINE ACTIVE OR STORED DTC**

   NOTE: Make sure the battery is fully charged.

   1. Turn the ignition on.
   2. With the scan tool, read ORC DTCs.

      Does the scan tool display active: U1476-00-IMPLAUSIBLE-DATA-RECEIVED-FROM-RIGHT-FRONTAL-ACCELERATION-SENSOR- DTC?

      Yes

      - Go To 2

      No

      - Perform the RESTRAINTS SYSTEM INTERMITTENT TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK THE (R80), (R82) RIGHT FRONT IMPACT SENSOR SIGNAL AND GROUND CIRCUITS FOR A SHORT TO VOLTAGE**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the Right Front Impact Sensor harness connector.
2. Disconnect the ORC harness connector.

NOTE: Check the connectors - Clean and repair as necessary.

3. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)to the ORC C1 and C2 harness connectors.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

4. Measure the voltage of the (R80) Right Front Impact Sensor Signal circuit and (R82) Right Front Impact Sensor Ground circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)the C1A-13 and C1A-14 terminals and ground.

   Is there any voltage present on either circuit?

   Yes

   - Repair the (R80), (R82) Right Front Impact Sensor circuits for a short to voltage.
   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 3

3. **CHECK THE (R80) RIGHT FRONT IMPACT SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Measure the resistance of the (R80) Right Front Impact Sensor Signal circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)the C1A-13 terminals and ground.

   Is the resistance below 20 Ohms?

Yes

- Repair the (R80) Right Front Impact Sensor Signal circuit for a short to ground.
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 4

4. **CHECK THE (R80), (R820) RIGHT FRONT IMPACT SENSOR CIRCUITS FOR A SHORT TOGETHER**
   1. Measure the voltage of the (R80) Right Front Impact Sensor Signal circuit and (R82) Right Front Impact Sensor Ground circuits between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)the C1A-13 and C1A-14 terminals.

      Is the resistance below 20 Ohms?

      Yes

      - Repair the (R80), (R82) Right Front Impact Sensor circuits shorted together.
      - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 5

5. **CHECK THE (R82) RIGHT FRONT IMPACT SENSOR GROUND CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
   1. Measure the resistance of the (R821) Right Front Impact Sensor Ground circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)the C1A-14 terminals and Right Front Impact Sensor harness connector terminal 2.

      Is the resistance below 1 Ohm?

      Yes

      - Go To 6

      No

      - Repair the (R82) Right Front Impact Sensor Ground circuit for an open or high resistance.
      - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

6. **CHECK THE (R80) RIGHT FRONT IMPACT SENSOR SIGNAL CIRCUIT FOR AN OPEN OR**

HIGH RESISTANCE

1. Measure the resistance of the (R80) Right Front Impact Sensor Signal circuit between the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool)the C1A-13 terminals and Right Front Impact Sensor harness connector terminal 1.

   Is the resistance below 1 Ohm?

   Yes

   - Go To 7

   No

   - Repair the (R80) Right Front Impact Sensor Signal circuit for an open or high resistance.
   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

7. **CHECK OPERATION OF THE RIGHT FRONT IMPACT SENSOR**
   1. Replace the Right Front Impact Sensor. Refer to **SENSOR, IMPACT, REMOVAL** .
   2. Reconnect the vehicle body harness to the impact sensor.
   3. Remove any special tools or jumper wires and reconnect all previously disconnected components - except the Battery.

      WARNING: **Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

   4. Connect the scan tool to the Data Link Connector - use the most current software available.
   5. Use the scan tool and erase the stored codes in all airbag system modules.
   6. Turn the Ignition Off, and wait five seconds before turning the Ignition On.
   7. Wait one minute, and read active codes and if there are none present read the stored codes.

      Did the active: U1476-00-IMPLAUSIBLE-DATA-RECEIVED-FROM-RIGHT-FRONTAL-ACCELERATION-SENSOR- DTC return?

      Yes

      - Go To 8

      No

      - Repair is complete.
      - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

8. **REPLACE THE OCCUPANT RESTRAINT CONTROLLER**

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

WARNING: If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment. Failure to follow these instructions may result in possible serious or fatal injury.

Repair

- Replace the Occupant Restraint Controller in accordance with Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
- Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2014 RESTRAINTS

Occupant Restraint Controller (ORC) - Electrical Diagnostics - Cherokee

STANDARD PROCEDURE

RESTRAINTS SYSTEM INTERMITTENT TEST

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

DIAGNOSTIC INTERMITTENT TEST

1. **RECORD AND ERASE ALL RESTRAINT SYSTEM DTCS**
    1. With the scan tool, record and erase all DTCs from all restraints system modules. Monitor for any active codes as you work through the following steps.
        - Review the code monitored and set conditions for any DTCs that are stored and attempt to reproduce the conditions listed.

            WARNING: **Maintain a safe distance from all airbags while performing the following steps. Failure to follow these instructions may result in possible serious or fatal injury.**

        - Wiggle the wiring harness and connectors of the related airbag circuit, sensor, or component.

            WARNING: **Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

        - Disconnect components and inspect the harness and connectors for damage.
        - Reconnect components and ensure they are properly seated.

        If equipped with the keyless ignition, use this ignition on warning.

            WARNING: **Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

        If equipped with the standard key ignition, use this ignition on warning.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

- If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.
- Turn the ignition off.
- Perform any Technical Service Bulletins (TSBs) that may apply.

Was the source of the customer complaint found or did any DTCs appear and stay active?

Yes

- Make the appropriate repairs and either perform the RESTRAINTS SYSTEM VERIFICATION TEST, refer to **RESTRAINTS SYSTEM VERIFICATION TEST**, or for the appropriate diagnostic procedure refer to the **OCCUPANT RESTRAINT CONTROLLER (ORC) - DIAGNOSTIC CODE INDEX** .

No

- Go To 2

2. **ATTEMPT TO REPRODUCE THE CONDITION**
   1. In the event the customer complaint cannot be duplicated due to an intermittent condition in the restraints system, the following may aid in attempting to reproduce the condition.

WARNING: Turn the ignition off, disconnect the battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

- Using the wiring diagram/schematic as a guide, inspect the wiring and connectors related to the stored code or component in question.
- Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.
- Reconnect any disconnected components and harness connectors and ensure they are properly seated.

If equipped with the keyless ignition, use this ignition on warning.

WARNING: Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal

injury.

If equipped with the standard key ignition, use this ignition on warning.

WARNING: **Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

- If numerous trouble codes were set, use a schematic and inspect any common ground or supply circuits.

Was the source of the intermittent condition located?

Yes

- Make the appropriate repairs and perform the RESTRAINTS SYSTEM VERIFICATION PROCEDURE. Refer to **RESTRAINTS SYSTEM VERIFICATION TEST**.

No

- The problem cannot be found at this time.

RESTRAINTS SYSTEM PRE-DIAGNOSTIC PROCEDURE

DIAGNOSTIC PRE-TEST

1. Before attempting to repair any restraint system, technicians should be familiar with and fully understand the system operation. Refer to Restraints System **DESCRIPTION** and **OPERATION** for complete details. The following should be used as a checklist to be completed in its entirety prior to referencing specific Restraints Diagnostic Procedures.
2. **FOLLOW THE BASIC OUTLINE SET FORTH IN THE SIX-STEP TROUBLESHOOTING PROCEDURE**
    1. Verification of complaint.
    2. Verification of any related symptoms.
    3. Symptom analysis.
    4. Problem isolation.
    5. Repair of isolated problem.
    6. Verification of proper operation.
3. **TAKE INTO ACCOUNT CURRENT VEHICLE CONDITION, REPAIR HISTORY, AND TECHNICAL SERVICE BULLETINS (TSBs)**
    - Verify that there are no outward signs of vehicle damage or effects from a collision that could impact the proper operation of the Restraints system.

- Check for aftermarket vehicle accessories that may have been installed improperly or could interfere with the system.
- Check the vehicle repair history for repairs that may relate to the current condition.
- Check for current Technical Service Bulletins (TSBs) for the Restraints system related to the customer concern. If a TSB applies, follow the procedure outlined in the TSB.

4. **DIAGNOSE ONLY THOSE FAILURES THAT ARE ACTIVE AND CAN BE REPRODUCED**
   - Check the control module central to the subsystem that is exhibiting the condition for active DTCs.
   - For an intermittent failure that is not active at the time of vehicle inspection, perform the RESTRAINTS SYSTEM INTERMITTENT TEST diagnostic procedure and document the event on the repair order. Refer to **RESTRAINTS SYSTEM INTERMITTENT TEST**.
5. **ADDRESS ACTIVE DIAGNOSTIC TROUBLE CODES (DTCs) IN THE CORRECT ORDER**
   1. Low/High Voltage and Serial Data Loss of Communication Codes.
   2. Module Internal Failure and Configuration Mismatch Codes.
   3. Circuit specific DTC failures.
6. Should the malfunction still be present after conducting this Pre-diagnostic Procedure, technicians should continue to the appropriate DTC procedure. Refer to the **OCCUPANT RESTRAINT CONTROLLER (ORC) - DIAGNOSTIC CODE INDEX** .

   Was the Pre-Test reviewed and is the DTC still present?

   Yes

   - Perform the appropriate DTC procedure. Refer to the **OCCUPANT RESTRAINT CONTROLLER (ORC) - DIAGNOSTIC CODE INDEX** .

   No

   - Test Complete.

RESTRAINTS SYSTEM VERIFICATION TEST

DIAGNOSTIC VERIFICATION TEST

PERFORM RESTRAINTS SYSTEM VERIFICATION TEST

NOTE: **If the ORC has been replaced, the ORC Initialization Procedure must be performed to clear the ORC Unlocked DTC and bring the module to a full state of readiness."If the ORC is being replaced with a new unit or if the ORC software has been re-flashed, the Electronic Stability Control (ESC) system will require re-initialization using a diagnostic scan tool. Refer to the appropriate diagnostic procedures." Refer to the DTC list. Refer to the OCCUPANT RESTRAINT CONTROLLER (ORC) - DIAGNOSTIC CODE INDEX .**

1. Remove any special tools or jumper wires and reconnect all previously disconnected components - except

the Battery.

If equipped with the keyless ignition, use this ignition on warning.

WARNING: Disconnect the 12-volt battery wait two minutes before proceeding, remove the ORC fuses, connect the 12-volt battery, wait two minutes before proceeding. Cycle the ignition to the On position, then reconnect the ORC fuses. Wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

If equipped with the standard key ignition, use this ignition on warning.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

2. Connect the scan tool to the Data Link Connector - use the most current software available.
3. With the scan tool, erase stored DTCs in all airbag system modules.
4. Perform module reset.

NOTE: If equipped with an Airbag On - Off switch, read the DTCs in all switch positions.

5. Exercise the Restraints System to duplicate the appropriate monitor conditions for any DTCs that were set.
6. Wait one minute, and read active codes, if there are none present, read the stored codes.
7. If the scan tool shows any active or stored codes, return to the DTC index and follow the path specified for that trouble code. If no active or stored codes are present, the repair is complete.

Are any DTCs present or, is the original condition still present?

Yes

- Refer to the **OCCUPANT RESTRAINT CONTROLLER (ORC) - DIAGNOSTIC CODE INDEX** and perform the appropriate diagnostic procedure.

No

- If the battery was disconnected for any reason, you must perform the Battery Reconnection procedure of the Service Information.
- Repair is complete.

2014 RESTRAINTS

Service Information - Cherokee

WARNING

WARNING

WARNING: To avoid serious or fatal injury on vehicles equipped with the Supplemental Restraint System (SRS), never attempt to repair the electrically conductive circuits or wiring components related to the SRS for which there is no MOPAR wiring repair kit. It is important to use ONLY the recommended splicing kit and procedure. For applicable and available MOPAR wiring repair kits, please visit the MOPAR® Connector Web Site at the following address on the internet: (http://dto.vftis.com/mopar/disclaimer.asp). Inappropriate repairs can compromise the conductivity and current carrying capacity of those critical electrical circuits, which may cause SRS components not to deploy when required, or to deploy when not required. Only minor cuts or abrasions of wire and terminal insulation where the conductive material has not been damaged, or connector insulators where the integrity of the latching and locking mechanisms have not been compromised may be repaired using appropriate methods.

WARNING: To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog. Failure to follow these instructions may result in possible serious or fatal injury.

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to

disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

WARNING: To avoid potential physical injury or damage to sensitive electronic circuits and systems, always disconnect and isolate the battery negative (ground) cable and the positive cable, then ground the positive cable to discharge the Occupant Restraint Controller (ORC) capacitor before performing any welding operations on the vehicle. Failure to take the proper precautions could result in accidental airbag deployment, possible damage to the Supplemental Restraint System (SRS) circuits and components, and possible damage to other electronic circuits and components. Whenever a welding process is being performed within 12 inches (30 centimeters) of an electronic module or wiring harness, then that module or harness should be relocated out of the way, or disconnected. Always protect against component or vehicle damage from weld spatter by using weld blankets and screens.

WARNING: To avoid serious or fatal injury, do not attempt to dismantle an airbag unit or tamper with its inflator. Do not puncture, incinerate or bring into contact with electricity. Do not store at temperatures exceeding 93°C (200°F). An airbag inflator unit may contain sodium azide and potassium nitrate. These materials are poisonous and extremely flammable. Contact with acid, water, or heavy metals may produce harmful and irritating gases (sodium hydroxide is formed in the presence of moisture) or combustible compounds. An airbag inflator unit may also contain a gas canister pressurized to over 17.24 kPa (2500 psi). Failure to follow these instructions may result in possible serious or fatal injury.

WARNING: To avoid serious or fatal injury when handling a seat belt tensioner retractor or buckle, proper care should be exercised to keep fingers out from under the retractor or buckle cover and away from the seat belt webbing or cable where it exits from the retractor or buckle cover.

WARNING: To avoid serious or fatal injury, replace all Supplemental Restraint System (SRS) components only with parts specified in the Chrysler Mopar® Parts Catalog. Substitute parts may appear interchangeable, but internal differences may result in inferior occupant protection.

WARNING: To avoid serious or fatal injury, the fasteners, screws, and bolts originally used for the Supplemental Restraint System (SRS) components must never be replaced with any substitutes. These fasteners have special coatings and are specifically designed for the SRS. Anytime a new fastener is needed, replace it with the correct fasteners provided in the service package or specified in the Chrysler Mopar® Parts Catalog.

WARNING: To avoid serious or fatal injury when a steering column has an airbag unit attached, never place the column on the floor or any other surface with the steering wheel or airbag unit face down. Failure to follow these instructions may result in possible serious or fatal injury.

DESCRIPTION

SUPPLEMENTAL RESTRAINT SYSTEM

A Supplemental Restraint System (SRS) is standard factory-installed safety equipment on this vehicle. Available supplemental occupant restraints for this vehicle include both active and passive types. Active restraints are those which require the vehicle occupants to take some action to employ, such as fastening and adjusting a seat belt; while passive restraints require no action by the vehicle occupants to be employed. Additional details of each of these subsystems of the SRS can be found elsewhere within this service information.

ACTIVE RESTRAINTS

The active restraints for this vehicle include:

- **Child Restraint Anchors** - All vehicles are equipped with three, fixed-position child seat upper tether anchors for the rear seating. Two anchors are integral to the back of the left (60 percent) rear seat back panel, and one is integral to the right (40 percent) rear seat back panel. Two lower anchors are also provided for each outboard rear seating position. The lower anchors are integral to each rear seat stanchion assembly on the rear floor panel and are accessed from the front of the rear seat where the seat back meets the seat cushion.
- **Front Seat Belts** - Both front seating positions are equipped with three-point seat belt systems employing a lower B-pillar mounted inertia latch-type emergency locking retractor, a height-adjustable upper B-pillar mounted turning loop, a fixed lower seat belt anchor buckle secured to an anchor latch plate on the inner sill near the base of the B-pillar and a traveling end-release seat belt buckle secured to a bracket near the back of the upper inboard seat track. The driver and passenger side front seat belt buckles include an integral seat belt switch that detects whether the front seat belts have been fastened.
- **Rear Seat Belts** - All three rear seating positions are equipped with three-point seat belt systems. The outboard rear seating position belts employ a C-pillar mounted inertia latch-type emergency locking retractors, fixed position upper C-pillar mounted turning loops and fixed lower seat belt anchors secured to the lower C-pillars. The rear center seating position has an inertia latch-type emergency locking retractor that is secured within the left (60 percent) rear seat back. The rear center seating position belt lower anchor is secured to the traveling left rear seat cushion frame along with the left outboard and center end-release seat belt buckles. The right outboard seating position also has a end-release seat belt buckle secured to the traveling right rear seat cushion frame. In vehicles manufactured for certain export markets, each rear seat belt buckle includes an integral seat belt switch that detects whether the rear seat belts have been fastened.

PASSIVE RESTRAINTS

Fig. 1: SRS Logo
Courtesy of CHRYSLER GROUP, LLC

The passive restraints available for this vehicle include the following:

- **Active Head Restraints** - Inertia activated Active Head Restraints (AHR) are standard equipment for both front seating positions in this vehicle.
- **Dual Front Airbags** - A multistage Driver AirBag (DAB) and front Passenger AirBag (PAB) are used in this vehicle. This airbag system consists of passive, inflatable, Supplemental Restraint System (SRS) components and vehicles with this equipment can be readily identified by the **SRS - AIRBAG** logo molded into the DAB trim cover in the center of the steering wheel and also into the PAB area on the top of the instrument panel above the glove box. Vehicles with the airbag system can also be identified by the airbag indicator, which will illuminate in the Instrument Cluster (IC) (also known as the Instrument Panel Cluster/IPC) from four to six seconds as a bulb test each time the status of the ignition switch transitions to On. Pyrotechnic-type driver and passenger front seat belt retractors and anchor buckle tensioners also work in conjunction with the dual front and side curtain airbags.
- **Knee Airbags** - The front airbag system also includes driver and passenger front Knee AirBags (KAB) (also known as Inflatable Knee Blockers/IKB) that are located just below the lower instrument panel reinforcements. These airbags are also passive, inflatable, SRS components and vehicles with this equipment can be readily identified by the **SRS - AIRBAG** logo molded into the instrument panel trim just above each airbag location.
- **Front Seat Airbags** - Front seat integrated Seat AirBags (SAB) (also known as pelvic and thoracic airbags) are standard equipment in these vehicles. This airbag system consists of passive, inflatable SRS components and vehicles with this equipment can be readily identified by a sewn tag with the **SRS - AIRBAG** logo located on the outboard side of the front seat back trim cover.
- **Rear Seat Airbags** - Rear seat integrated Seat AirBags (SAB) (also known as pelvic and thoracic airbags) are optional equipment in these vehicles. This airbag system consists of passive, inflatable SRS components and vehicles with this equipment can be readily identified by a sewn tag with the **SRS - AIRBAG** logo located on the outboard sides of the rear seat cushion trim cover.
- **Side Curtain Airbags** - Side curtain airbags (also known as Side AirBag Inflatable Curtains/SABIC) are standard equipment in this vehicle. This airbag system consists of passive, inflatable SRS components and vehicles with this equipment can be readily identified by a molded identification **SRS - AIRBAG**

logo located near the top of each B-pillar trim panel.

The SRS includes the following major components, which are described in further detail elsewhere in this service information:

- **Active Head Restraints** - One Active Head Restraint (AHR) is located atop each front seat back unit.
- **Airbag Indicator** - The airbag indicator is integral to the Instrument Cluster (IC) (also known as the Instrument Panel Cluster/IPC), which is located on the instrument panel in front of the driver.
- **Clockspring** - The clockspring is located near the top of the steering column, directly beneath the steering wheel.
- **Driver Airbag** - The Driver AirBag (DAB) is located in the center of the steering wheel, beneath the DAB trim cover.
- **Front Impact Sensor** - Two front impact sensors are used on vehicles equipped with dual front airbags, one left side and one right side. One sensor is located on the back side of the Front End Module (FEM) carrier, just outboard of each side of the cooling module.
- **Knee Airbags** - This vehicle is equipped with Knee AirBags (KAB) (also known as Inflatable Knee Blockers/IKB). The KAB are mounted below the lower instrument panel reinforcements on each side of the vehicle.
- **Occupant Classification System** - Vehicles manufactured for domestic markets have a Occupant Classification System (OCS). The OCS includes a Seat Weight Sensor (SWS) bladder, a pressure hose and an Occupant Classification Module (OCM) integral to the calibrated passenger front seat cushion.
- **Occupant Detection Sensor** - Vehicles manufactured for export markets have a Occupant Detection Sensor (ODS) located on the top of the seat cushion foam of the passenger side front seat.
- **Occupant Restraint Controller** - The Occupant Restraint Controller (ORC) is located on the floor panel transmission tunnel, between the dash panel and the instrument panel center stack support.
- **Passenger Airbag** - The Passenger AirBag (PAB) is located in the instrument panel, beneath the instrument panel cover and above the glove box on the passenger side of the vehicle.
- **Front Seat Airbag** - A front Seat AirBag (SAB) (also known as pelvic and thoracic airbag) is secured to each outboard front seat back frame, where it is concealed beneath the seat back trim cover and foam.
- **Rear Seat Airbag** - The optional rear Seat AirBags (SAB) (also known as pelvic and thoracic airbags) are secured to each outboard end of the rear seat cushion pan, where they are concealed beneath the seat cushion trim cover and foam.
- **Seat Belt Tensioner** - A seat belt tensioner is integral to both front seat belt retractors and both front seat belt anchor buckle units. The seat belt retractor tensioner units are secured to each lower inner B-pillar and are concealed behind the lower B-pillar trim. The seat belt anchor buckle tensioner units are located on the inner sill near the base of the B-pillar and are concealed behind the inner sill trim.
- **Seat Track Position Sensor** - There are two Seat Track Position Sensors (STPS). One sensor is located on the inboard side of one of the seat adjuster tracks on both the driver and the passenger front seats.
- **Side Curtain Airbag** - A standard equipment side curtain airbag (also known as a Side AirBag Inflatable Curtain/SABIC) is secured to each inside roof side rail above the headliner, and extends from the A-pillar to just beyond the C-pillar.
- **Side Impact Sensor** - Six side impact sensors are used on vehicles equipped with side curtain airbags, three on each side of the vehicle. One acceleration-type sensor is located behind the B-pillar trim near the

base of each B-pillar, and one acceleration-type sensor is located behind the quarter panel trim near the base of each C-pillar. One pressure-type sensor is located on each front poor hardware carrier panel, concealed behind each front door inside trim panel.

The ORC, the IPC and the OCM each contain a microcontroller and programming that allow them to communicate with each other using the Controller Area Network (CAN) data bus. This method of communication is used by the ORC for control of the airbag indicator in the IPC. Refer to **COMMUNICATION, DESCRIPTION** .

Hard wired circuitry connects the SRS components to each other through the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system, and to the SRS components through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin out and location views for the various wire harness connectors, splices and grounds.

OPERATION

SUPPLEMENTAL RESTRAINT SYSTEM

The Supplemental Restraint System (SRS) is comprised of two primary subsystems: Active Restraints and Passive Restraints. Additional operational details on each of these subsystems of the SRS can be found elsewhere within this service information.

ACTIVE RESTRAINTS

The primary passenger restraints in this or any other vehicle are the standard equipment factory-installed seat belts and child restraint anchors. Seat belts and child restraint anchors are referred to as an active restraint because the vehicle occupants are required to physically fasten and properly adjust these restraints in order to benefit from them.

PASSIVE RESTRAINTS

The passive restraints are referred to as Supplemental Restraint System (SRS) components because they were designed and are intended to enhance the protection for the occupants of the vehicle **only** when used in conjunction with the seat belts. They are referred to as passive restraints because the vehicle occupants are not required to do anything to make them operate; however, the vehicle occupants must be wearing their seat belts in order to obtain the maximum safety benefit from the factory-installed SRS components. In addition, each front seat occupant must have their Active Head Restraint (AHR) unit properly adjusted in order to obtain its maximum safety benefit.

The SRS electrical circuits are continuously monitored and controlled by a microcontroller and software contained within the Occupant Restraint Controller (ORC). An airbag indicator in the Instrument Cluster (IC) (also known as the Instrument Panel Cluster/IPC) illuminates from four to six seconds as a bulb test each time the status of the ignition switch transitions to On or Start. Following the bulb test, the airbag indicator is turned

On or Off by the ORC to indicate the status of the SRS. If the airbag indicator comes On at any time other than during the bulb test, it indicates that there is a problem in the SRS electrical circuits. Such a problem may cause airbags not to deploy when required, or to deploy when not required.

Deployment of the SRS components depends upon the angle and severity of an impact. Deployment is not based upon vehicle speed; rather, deployment is based upon the rate of deceleration as measured by the forces of gravity (also known as G forces) upon the acceleration-type impact sensors, or by a pressure wave within a door as measured by the pressure-type impact sensor. When an impact is severe enough, the microcontroller within the ORC signals the inflator of the appropriate airbag units to deploy their airbag cushions. The Occupant Classification System (OCS) monitors the passenger side front seat to determine whether or not the passenger side front seat is occupied and, if the seat is occupied, classifies the size of the occupant. The Occupant Classification Module (OCM) then provides an additional logic input that is used by the ORC to determine the appropriate force with which the Passenger AirBag (PAB) and seat belt tensioner should be deployed.

The front seat belt retractor tensioners, front seat belt anchor buckle tensioners, the front seat belt adaptive load limiters and the Knee AirBags (KAB) (also known as the Inflatable Knee Blockers/IKB) are provided with a deployment signal by the ORC in conjunction with the front airbags. The side curtain airbags (also known as the Side AirBag Inflatable Curtains/SABIC) and the Seat AirBags (SAB) (also known as pelvic and thoracic airbags) are provided with a deployment signal individually by the ORC based upon a side impact sensor input for the same side of the vehicle. The ORC also contains a rollover sensor. Should the vehicle roll over and not cause any impact sensor to signal the need for a deployment, the rollover sensor in the ORC will deploy the SABIC units, the SAB units and under certain conditions, will also actuate the front seat belt retractor and anchor buckle tensioners.

During a frontal vehicle impact, the KAB units work in concert with properly fastened and adjusted seat belts to restrain both the driver and the front seat passenger in the proper position for an airbag deployment. The KAB units also absorb and distribute the crash energy from the driver and the front seat passenger to the structure of the instrument panel. The seat belt tensioners remove the slack from the front seat belts to provide further assurance that the driver and front seat passenger are properly positioned and restrained for a front airbag deployment. The adaptive load limiters for the front seat belts allow the ORC to control the belt pressure applied to the chests of the front seat occupants based upon the impact sensor inputs.

Typically, the vehicle occupants recall more about the events preceding and following a collision than they do of an airbag deployment itself. This is because the airbag deployment and deflation occur very rapidly. In a typical 48 kilometer-per-hour (30 mile-per-hour) barrier impact, from the moment of impact until the airbags are fully inflated takes about 40 milliseconds. Within one to two seconds from the moment of impact, the airbags are almost entirely deflated. The times cited for these events are approximations, which apply only to a barrier impact at the given speed. Actual times will vary somewhat, depending upon the vehicle speed, impact angle, severity of the impact and the type of collision.

When the ORC monitors a problem in any of the SRS circuits or components, including the seat belt tensioners and adaptive load limiter units, it stores a fault code or Diagnostic Trouble Code (DTC) in its memory circuit and sends an electronic message to the IC to turn On the airbag indicator. The hard wired circuits between components related to the SRS may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and

location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the SRS or the electronic controls and communication between other modules and devices that provide features of the SRS. The most reliable, efficient and accurate means to diagnose the SRS or the electronic controls and communication related to SRS operation, as well as the retrieval or erasure of a DTC requires the use of a diagnostic scan tool and may also require the use of the SRS Load Tool special tool along with the appropriate Load Tool Jumpers and Adapters. Refer to the appropriate diagnostic information.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - SUPPLEMENTAL RESTRAINT SYSTEM

The hard wired circuits between modules and components related to the Supplemental Restraint System (SRS) may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the SRS or the electronic controls and communication between other modules and devices that provide features of the SRS. The most reliable, efficient and accurate means to diagnose the SRS or the electronic controls and communication related to SRS operation, as well as the retrieval or erasure of a DTC requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

In addition to a diagnostic scan tool that contains the latest version of the proper diagnostic software, certain diagnostic procedures for the SRS may require the use of the SRS Load Tool special tool along with the appropriate Load Tool Jumpers and Adapters. Refer to the appropriate diagnostic information.

WARNING: **To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.**

STANDARD PROCEDURE

HANDLING NON-DEPLOYED SUPPLEMENTAL RESTRAINTS

At no time should any source of electricity be permitted near the inflator on the back of a non-deployed airbag or seat belt tensioner. When carrying a non-deployed airbag, the trim cover or airbag cushion side of the unit should be pointed away from the body to minimize injury in the event of an accidental deployment. If the airbag

unit is placed on a bench or any other surface, the trim cover or airbag cushion side of the unit should be face up to minimize movement in the event of an accidental deployment.

When handling a non-deployed seat belt tensioner, take proper care to keep fingers out from under the retractor or buckle cover and away from the seat belt webbing or cable where it exits from the retractor or buckle cover. In addition, the Supplemental Restraint System (SRS) should be disarmed whenever any steering wheel, steering column, seat belt tensioner, airbag, impact sensor or instrument panel components require diagnosis or service. Failure to observe this warning could result in accidental airbag deployment and possible personal injury.

All damaged, ineffective or non-deployed airbags and seat belt tensioners which are replaced on vehicles are to be handled and disposed of properly. If an airbag or seat belt tensioner unit is ineffective or damaged and non-deployed, refer to the Hazardous Substance Control System for information regarding the potentially hazardous properties of the subject component and the proper safe handling procedures. Then dispose of all non-deployed and deployed airbags and seat belt tensioners in a manner consistent with state, provincial, local and federal regulations.

SERVICE AFTER A SUPPLEMENTAL RESTRAINT SYSTEM DEPLOYMENT

Any vehicle which is to be returned to use following a Supplemental Restraint System (SRS) component deployment must have the deployed restraints replaced. In addition, the following guidelines MUST be observed.

- **Following ANY major vehicle impact damage in the vicinity of an impact sensor or the ORC** - It is critical that the mounting surfaces and mounting brackets for the Occupant Restraint Controller (ORC), front impact sensors and side impact sensors located within the proximity of the impact damage be closely inspected and restored to their original conditions. Because the ORC and each impact sensor are used by the SRS to monitor or confirm the direction and severity of a vehicle impact, improper orientation or insecure fastening of these components may cause airbags not to deploy when required, or to deploy when not required.
- **If an active head restraint is deployed** - An inertia-based Active Head Restraint (AHR) unit that is undamaged following a deployment may be reset. These units are designed with the intention of reuse.
- **If the driver airbag is deployed** - If the Driver AirBag (DAB) has been deployed, the clockspring and the steering column must also be replaced.
- **If the knee airbags are deployed** - If the Knee AirBags (KAB) (also known as Inflatable Knee Blockers/IKB) have been deployed, the instrument panel steering column opening cover (left side) and the glove box (right side) must also be replaced.
- **If the passenger airbag is deployed** - If the Passenger AirBag (PAB) has been deployed, the instrument panel upper trim cover must also be replaced.
- **If a front seat airbag is deployed** - If a front Seat AirBag (SAB) (also known as a pelvic and thoracic airbag) has been deployed, the front seat back frame, the front seat back foam and the front seat back trim cover on the same side of the vehicle as the deployed airbag must also be replaced.
- **If a rear seat airbag is deployed** - If a rear Seat AirBag (SAB) (also known as a pelvic and thoracic airbag) has been deployed, the rear seat cushion foam and the rear seat cushion trim cover must also be replaced.

- **If a seat belt tensioner is deployed** - The seat belt retractor and anchor buckle tensioners as well as the adaptive load limiters are deployed in conjunction with the front airbags, but can also be deployed with front Seat AirBag (SAB) (also known as a pelvic and thoracic airbag) or side curtain airbags (also known as Side AirBag Inflatable Curtains/SABIC). The seat belt tensioners must be replaced if either front airbag has been deployed, and must be inspected if either front SAB or SABIC has been deployed.
- **If a side curtain airbag is deployed** - If a side curtain airbag (also known as a Side AirBag Inflatable Curtain/SABIC) has been deployed, the headliner as well as the deploy brackets on the upper B-pillars and the upper C and D-pillars and the trim on the upper A, B, C and D-pillars on the same side of the vehicle as the deployed airbag must also be replaced. On vehicles with an optional sunroof, the sunroof drain tubes and hoses must be closely inspected following a SABIC deployment.

The components identified with the deployed SRS components in the preceding list are not intended for reuse and will be damaged or weakened as a result of an airbag deployment, which may or may not be obvious during a visual inspection. All other vehicle components should be closely inspected following any SRS component deployment, but are to be replaced only as required by the extent of the visible damage incurred.

SQUIB CIRCUIT DAMAGE

In addition to the preceding guidelines, be aware that the heat created by the initiator during an airbag or tensioner deployment will cause collateral damage to the connected wiring (squib circuits) and connector insulators. There are two methods by which an airbag or seat belt tensioner may be connected to the vehicle electrical system. The first method involves a short pigtail harness and connector insulator that are integral to the airbag or tensioner unit and are replaced as a unit with the service replacement airbag or seat belt tensioner. This connection method typically requires no additional wiring repair following a deployment.

However, the second connection method involves a wire harness takeout and connector insulator that are connected directly to the airbag or tensioner initiator or squib. These direct-connect type take outs and connector insulators **MUST** be repaired following an airbag or seat belt tensioner deployment using the approved Supplemental Restraint System Wiring Repairs procedure.

AIRBAG SQUIB STATUS

Multistage airbags with multiple initiators (squibs) must be checked to determine that all squibs were used during the deployment event. The Driver AirBag (DAB) and Passenger AirBag (PAB) in this vehicle are deployed by electrical signals generated by the Occupant Restraint Controller (ORC) through the driver or passenger squib 1 and squib 2 circuits to the two initiators in the airbag inflators. Typically, both initiators are used and all potentially hazardous chemicals are burned during an airbag deployment event. However, it is possible for only one initiator to be used; therefore, it is always necessary to confirm that both initiators have been used in order to avoid the improper handling or disposal of potentially live pyrotechnic or hazardous materials. The following procedure should be performed using a diagnostic scan tool to verify the status of both airbag squibs before either deployed airbag is removed from the vehicle for disposal.

CAUTION: Deployed front airbags having two initiators (squibs) in the airbag inflator may or may not have live pyrotechnic material within the inflator. Do not dispose of these airbags unless you are certain of complete deployment. Refer to the Hazardous Substance Control System for information

regarding the potentially hazardous properties of the subject component and the proper safe handling procedures. Then dispose of all non-deployed and deployed airbags and seat belt tensioners in a manner consistent with state, provincial, local and federal regulations.

1. Be certain that the diagnostic scan tool contains the latest version of the proper diagnostic software. Connect the scan tool to the 16-way Data Link Connector (DLC). The DLC is located on the driver side lower edge of the instrument panel, outboard of the steering column.
2. Transition the ignition switch to the On status.
3. Using the scan tool, read and record the active (current) Diagnostic Trouble Code (DTC) data.

Using the active DTC information, refer to the **AIRBAG SQUIB STATUS** table to determine the status of both DAB squibs and both PAB squibs.

AIRBAG SQUIB STATUS		
IF THE ACTIVE DTC IS:	**CONDITIONS**	**SQUIB STATUS**
Driver or Passenger Squib 1 open	**AND** the stored DTC minutes for both Driver or Passenger squibs are within 15 minutes of each other	Both Squib 1 and 2 were used.
Driver or Passenger Squib 2 open		
Driver or Passenger Squib 1 open	**AND** the stored DTC minutes for Driver or Passenger Squib 2 open is GREATER than the stored DTC minutes for Driver or Passenger Squib 1 by 15 minutes or more	Squib 1 was used; Squib 2 is live.
Driver or Passenger Squib 2 open		
Driver or Passenger Squib 1 open	**AND** the stored DTC minutes for Driver or Passenger Squib 1 open is GREATER than the stored DTC minutes for Driver or Passenger Squib 2 by 15 minutes or more	Squib 1 is live; Squib 2 was used.
Driver or Passenger Squib 2 open		
Driver or Passenger Squib 1 open	**AND** Driver or Passenger Squib 2 open is NOT an active code	Squib 1 was used; Squib 2 is live.
Driver or Passenger Squib 2 open	**AND** Driver or Passenger Squib 1 open is NOT an active code	Squib 1 is live; Squib 2 was used.

NOTE: **If none of the Driver or Passenger Squib 1 or 2 open are active codes, the status of the airbag squibs is unknown. In this case the airbag should be handled and disposed of as if the squibs were both live.**

CLEANUP PROCEDURE

Fig. 2: Clean Up Safety Equipment
Courtesy of CHRYSLER GROUP, LLC

Following a Supplemental Restraint System (SRS) component deployment, the vehicle interior will contain a powdery residue. This residue consists primarily of harmless particulate by-products of the small pyrotechnic charge that initiates the propellant used to deploy a SRS component. However, this residue may also contain traces of sodium hydroxide powder, a chemical by-product of the propellant material that is used to generate the inert gas that inflates the airbag. Since sodium hydroxide powder can irritate the skin, eyes, nose, or throat, be certain to wear safety glasses, rubber gloves, and a long-sleeved shirt during cleanup.

WARNING: **To avoid serious or fatal injury, if you experience skin irritation during cleanup, run cool water over the affected area. Also, if you experience irritation of the nose or throat, exit the vehicle for fresh air until the irritation ceases. If irritation continues, see a physician.**

Fig. 3: Vacuuming Residual Powder
Courtesy of CHRYSLER GROUP, LLC

1. Begin the cleanup by using a vacuum cleaner to remove any residual powder from the vehicle interior.

Clean from outside the vehicle and work your way inside, so that you avoid kneeling or sitting on a non-cleaned area.

2. Be certain to vacuum the heater and air conditioning outlets as well. Run the heater and air conditioner blower on the lowest speed setting and vacuum any powder expelled from the outlets.

CAUTION: Deployed front airbags having two initiators (squibs) in the airbag inflator may or may not have live pyrotechnic material within the inflator. Do not dispose of these airbags unless you are certain of complete deployment. Refer to the AIRBAG SQUIB STATUS heading within this information. All damaged, ineffective, or non-deployed Supplemental Restraint System (SRS) components which are replaced on vehicles are to be handled and disposed of properly. If an airbag or seat belt tensioner unit is ineffective or damaged and non-deployed, refer to the Hazardous Substance Control System for information regarding the potentially hazardous properties of the subject component and the proper safe handling procedures. Then dispose of all non-deployed and deployed airbags and seat belt tensioners in a manner consistent with state, provincial, local and federal regulations.

3. Next, remove the deployed SRS components from the vehicle. Refer to the appropriate service removal procedures.
4. You may need to vacuum the interior of the vehicle a second time to recover all of the powder.

SUPPLEMENTAL RESTRAINT STORAGE

Airbags and seat belt tensioners must be stored in their original, special container until they are used for service. Also, they must be stored in a clean, dry environment away from sources of extreme heat, sparks and high electrical energy. Always place or store any airbag on a surface with its trim cover or airbag cushion side facing up, to minimize movement in case of an accidental deployment.

SUPPLEMENTAL RESTRAINT SYSTEM VERIFICATION TEST

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

NOTE: The following procedure should be performed using a diagnostic scan tool to verify proper Supplemental Restraint System (SRS) operation following the

service or replacement of any SRS component. Refer to the appropriate diagnostic procedures.

1. During the following test, the negative cable of the battery remains disconnected and isolated, as it was during the Supplemental Restraint System (SRS) component removal and installation procedures.
2. Be certain that the diagnostic scan tool contains the latest version of the proper diagnostic software. Connect the scan tool to the 16-way Data Link Connector (DLC). The DLC is located on the driver side lower edge of the instrument panel, near the steering column opening cover and outboard of the steering column.
3. Transition the status of the ignition switch (also known as the Wireless Ignition Node/WIN, Keyless Ignition Node/KIN or IGnition Node Module/IGNM) to On and exit the vehicle with the scan tool.
4. Check to be certain that nobody is in the vehicle, then reconnect the negative cable to the battery.
5. Using the scan tool, read and record the active (current) Diagnostic Trouble Code (DTC) data.
6. Next, use the scan tool to read and record any stored (historical) DTC data.
7. If any DTC is found in Step 5 or Step 6, refer to the appropriate diagnostic information.
8. Use the scan tool to erase the stored DTC data. If any problems remain, the stored DTC data will not erase. Refer to the appropriate diagnostic information to diagnose any stored DTC that will not erase. If the stored DTC information is successfully erased, go to Step 9.
9. Transition the status of the ignition switch to Off for about 15 seconds, and then back to On. Observe the airbag indicator in the instrument cluster. It should light from four to six seconds, and then go out. This indicates that the SRS is functioning normally and that the repairs are complete. If the airbag indicator fails to light, or lights and stays On, there is still an active SRS fault or malfunction. Refer to the appropriate diagnostic information to diagnose the problem.

SUPPLEMENTAL RESTRAINT SYSTEM WIRING REPAIRS

It is important when repairing any Supplemental Restraint System (SRS) electrical circuits to use the recommended splicing kit and procedure. For applicable and available MOPAR wiring repair kits, please visit the MOPAR Connector Web Site at the following address on the internet: (http://dto.vftis.com/mopar/disclaimer.asp).

This recommended procedure involves crimping the wires together with a splice band, soldering the crimped connection and, finally, sealing and protecting the repair. The crimp and solder ensure a strong mechanical bond that will always pass a pull test while also maintaining the conductivity and current carrying capacity of the circuit. The adhesive sealant and heat shrink tubing ensures the splice repair will perform as well or better than the original wire and be safe from potential corrosion or short circuits.

There is no limit to the number of splice repairs that can be made in one harness using this procedure. However, as has been past practice, multiple adjacent splices should be offset from each other. This wiring splice repair procedure is approved for harness side repairs only. Repairs and splices to pigtail wires on SRS components such as airbag units, seat belt tensioner units or clocksprings are not approved or recommended.

REPAIR PROCEDURE

CAUTION: If additional wire is needed when making a splice repair to any wire, it is important that the same or next larger size wire gauge be used. Refer to the appropriate wiring diagram for the original wire gauge size.

1. Remove 13 millimeters (0.50 inch) of insulation from each wire that needs to be spliced.

Fig. 4: Splice Band
Courtesy of CHRYSLER GROUP, LLC

2. Place a piece of adhesive sealant-lined heat shrink tubing (Part Number 04778570 or equivalent) over the wire on one side of the splice. Be certain the length of tubing will be sufficient to cover and seal the entire repair area.
3. Place the strands of the wires being spliced so that they are overlapping each other within the splice band (1).

Fig. 5: Crimping Tool
Courtesy of CHRYSLER GROUP, LLC

4. Using a crimping tool (1) (MOPAR Part Number 05019912AA, Miller Special Tool Number (special tool #10042, Crimper, Wire/Terminal) or equivalent) crimp the splice band and wires together securely.

Fig. 6: Solder Splice
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Never use acid core solder for electrical wiring repairs.

5. Using rosin core type solder (1) only and a suitable soldering iron (3), solder the wire and splice band connection (2) together.

Fig. 7: Heat Shrink Tube
Courtesy of CHRYSLER GROUP, LLC

6. Center the heat shrink tubing (2) over the splice joint repair and heat using a suitable heat gun. Heat the joint until the tubing is tightly sealed and sealant (1) begins to ooze out of both ends of the tubing.

ADJUSTER, SEAT BELT TURNING LOOP

REMOVAL

REMOVAL

WARNING: To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog.

Fig. 8: B-Pillar, Height Adjuster, Screws, Nut, Seat Belt Turning Loop & Upper Trim
Courtesy of CHRYSLER GROUP, LLC

1. Remove the upper trim (6) from the inside of the B-pillar (1). Refer to **PANEL, B-PILLAR TRIM, REMOVAL** .
2. Remove the nut (4) that secures the seat belt turning loop (5) to the stud on the height adjuster (2).
3. Remove the seat belt turning loop from the height adjuster.
4. Remove the two screws (3) that secure the height adjuster to the upper inner B-pillar.
5. Remove the seat belt turning loop adjuster from the B-pillar.

INSTALLATION

INSTALLATION

WARNING: To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog.

Fig. 9: B-Pillar, Height Adjuster, Screws, Nut, Seat Belt Turning Loop & Upper Trim
Courtesy of CHRYSLER GROUP, LLC

1. Position the seat belt turning loop height adjuster (2) to the inside of the upper inner B-pillar (1).
2. Install and tighten the two screws (3) that secure the adjuster to the B-pillar. Tighten the screws to 45 N.m (33 ft. lbs.).
3. Position the seat belt turning loop (5) onto the stud of the height adjuster on the B-pillar. Be certain that the seat belt webbing between the retractor and the turning loop is not twisted.
4. Install and tighten the nut (4) that secures the turning loop to the height adjuster. Tighten the nut to 45 N.m (33 ft. lbs.).
5. Reinstall the upper trim (6) onto the inside of the B-pillar. Refer to **PANEL, B-PILLAR TRIM, INSTALLATION** .

AIR BAG, DRIVER

DESCRIPTION

DESCRIPTION

1012006765

Fig. 10: Steering Wheel & Driver AirBag (DAB)
Courtesy of CHRYSLER GROUP, LLC

The injection molded, thermoplastic Driver AirBag (DAB) protective trim cover (2) is the most visible part of the DAB. The DAB is located in the center of the steering wheel (1), where it is secured by a spring wire retainer integral to the fixing plate to two hooks of the steering wheel armature within the hub cavity of the steering wheel. An injection molded, bright emblem with the Chrysler logo is applied to the center of the trim cover.

1012006766

Fig. 11: Driver AirBag (DAB) Components
Courtesy of CHRYSLER GROUP, LLC

Concealed beneath the DAB trim cover (1) are the folded airbag cushion, the airbag housing (3), the airbag inflator (5) and the retainers that secure the inflator to the housing. The airbag cushion, housing and inflator are secured within an integral receptacle molded into the back of the trim cover. The vertical walls of this receptacle have numerous integral window features that are engaged by numerous hook features around the perimeter of the DAB housing. Once the trim cover is fully seated onto the housing, it can only be removed by cutting it off. The DAB housing also has four well nuts, to which four screws (6) are fastened to secure the spring wire retainer (4) and the floating horn switch/mounting plate unit (2) to the back of the housing.

The DAB used in this vehicle is a multistage-type that complies with revised federal airbag standards to deploy with less force than those used in some prior vehicles. A radial deploying fabric airbag cushion with internal tethers is used. The airbag inflator is a dual-initiator, non-azide, pyrotechnic-type unit and is secured to the airbag housing.

Keyed and color-coded connector receptacles on the two inflator initiators and a third, non-azide, pyrotechnic-type Micro Gas Generator (MGG) inflator for the DAB active vent are integral to the airbag housing. The three keyed and color-coded connector receptacles are connected to the vehicle electrical system through three jacketed, two-wire pigtail harnesses from the clockspring.

The DAB cannot be repaired, and must be replaced if deployed, ineffective or in any way damaged. The DAB trim cover and the floating horn switch are serviced only as a unit with the DAB.

OPERATION

OPERATION

The multistage Driver AirBag (DAB) and the active vent (domestic market vehicles only) are deployed by electrical signals generated by the Occupant Restraint Controller (ORC) through the DAB squib 1, 2 and 3 circuits to the two initiators in the airbag inflator and the active vent inflator. By using two initiators and an active vent, the airbag can be deployed at multiple levels of force. The force level is managed by the ORC to suit the monitored impact conditions by providing one of several delay intervals between the electrical signals provided to the two initiators and the active vent. The longer the delay between the initiator signals and the later the active vent is released, the less forcefully the DAB will deploy.

When the ORC sends the proper electrical signals to each inflator initiator, the electrical energy generates enough heat to initiate a small pyrotechnic charge which ignites chemical pellets within the inflator. Once ignited, these chemical pellets burn rapidly and produce a large quantity of inert gas. The inflator is sealed to the back of the DAB housing and a diffuser in the inflator directs all of the inert gas into the airbag cushion, causing the cushion to inflate. As the cushion inflates, the DAB trim cover will split at predetermined breakout lines, then fold back out of the way. Following a deployment, the airbag cushion quickly deflates by venting the inert gas towards the instrument panel through discrete vents within the fabric used to construct the back (steering wheel side) panel of the airbag cushion.

The active vent is like a small airbag cushion within the airbag cushion except the active vent cushion slows the deflation of the primary cushion by partially blocking the vents in the primary cushion. The ORC monitors a seat track position sensor on the driver front seat. The ORC signals the active vent Micro Gas Generator (MGG) to deploy in a manner that provides the optimal airbag deployment force to reduce the possibility of an airbag-induced injury.

Some of the chemicals used to create the inert gas may be considered hazardous while in their solid state before they are burned, but they are securely sealed within the airbag inflator. Typically, both initiators are used and all potentially hazardous chemicals are burned during an airbag deployment event. However, it is possible for only one initiator to be used during a deployment due to a Supplemental Restraint System (SRS) fault; therefore, it is necessary to always confirm that both initiators have been used in order to avoid the improper disposal of potentially live pyrotechnic or hazardous materials. Refer to **STANDARD PROCEDURE**.

The inert gas that is produced when the chemicals are burned during a deployment is harmless. However, a small amount of residue from the burned chemicals may cause some temporary discomfort if it contacts the skin, eyes or breathing passages. If skin or eye irritation is noted, rinse the affected area with plenty of cool, clean water. If breathing passages are irritated, move to another area where there is plenty of clean, fresh air to breath. If the irritation is not alleviated by these actions, contact a physician.

The ORC monitors the condition of the DAB through circuit resistance, and will illuminate the airbag indicator in the instrument cluster and store a Diagnostic Trouble Code (DTC) for any fault that is detected. Proper diagnosis of the DAB inflator and squib circuits requires the use of a diagnostic scan tool and may also require the use of the SRS Load Tool special tool along with the appropriate Load Tool Jumpers and Adapters. Refer to the appropriate diagnostic information.

REMOVAL

REMOVAL

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable

the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury when removing a deployed airbag, rubber gloves, eye protection, and a long-sleeved shirt should be worn. There may be deposits on the airbag cushion and other interior surfaces. In large doses, these deposits may cause irritation to the skin and eyes.

Fig. 12: Access Holes & Steering Wheel
Courtesy of CHRYSLER GROUP, LLC

NOTE: The following procedure is for replacement of an ineffective or damaged Driver AirBag (DAB). If the airbag is ineffective or damaged, but not deployed, review the recommended procedures for Handling Non-Deployed Supplemental Restraints. Refer to HANDLING NON-DEPLOYED SUPPLEMENTAL RESTRAINTS. If the DAB has been deployed, review the recommended procedures for Service After A Supplemental Restraint Deployment before removing the airbag from the vehicle. Refer to SERVICE AFTER A SUPPLEMENTAL RESTRAINT SYSTEM DEPLOYMENT.

1. Disconnect and isolate the negative cable from the battery. Wait two minutes for the system capacitor to discharge before further service.

2. Locate the access holes (2) in the lower surface of the steering wheel (1) hub rear trim cover near each of the two horizontal spokes.

Fig. 13: Driver AirBag (DAB) Mounting/Horn Switch Plate, Retainer Spring, Hooks & Steering Wheel Hub Cavity
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The graphic for this procedure shows the Driver AirBag (DAB) mounting/horn switch plate (3) and the retainer spring (4) engaged under the hooks (2) of the armature within the steering wheel hub cavity (1) without the DAB trim cover, cushion, housing and inflator present. This was done to provide graphical clarity of the components involved in DAB retention. The DAB trim cover, cushion, housing and inflator can only be removed as a unit with the mounting/horn switch plate and retainer spring as outlined in the following procedure.**

3. Insert an appropriately sized pin punch or Allen wrench through one of the steering wheel access holes. A guide and notch (5) integral to each side of the steering wheel hub rear trim cover (1) and the mounting/horn switch plate (3) will assist in directing the tool to the ends of the retainer spring (4).

Fig. 14: Special Tool, Groove, Retainer Spring & Hook
Courtesy of CHRYSLER GROUP, LLC

4. When the tool (3) makes contact with the retainer spring (2), push inward (toward the steering column) on the tool far enough to disengage the retainer spring from under the hook (1) of the steering wheel armature.

Fig. 15: Lower Rear Spoke Cover, Screws & Steering Wheel
Courtesy of CHRYSLER GROUP, LLC

NOTE: **It is not necessary, but may prove helpful to remove the two screws (2) that secure the lower rear spoke cover (1) to the back of the steering wheel (3) and remove the cover. It will then be possible to observe the Allen wrench or pin punch contacting and releasing the retainer spring.**

5. Pull the released side of the DAB away from the steering wheel far enough to insert a trim stick or another long and thin obstacle between the released side of the DAB trim cover and the steering wheel hub cavity. This will help to prevent the released end of the retainer spring from becoming accidentally engaged again, while the opposite end of the retainer spring is being released.
6. Repeat Steps 3 and 4 for the opposite end of the retainer spring.

1012006767

Fig. 16: View Of DAB Wiring Connections
Courtesy of CHRYSLER GROUP, LLC

7. Pull the DAB away from the steering wheel far enough to access the clockspring pigtail wire connections to the horn switch (1), the active vent (2 - domestic market vehicles only) and the DAB inflator initiators (3).
8. Disconnect the clockspring pigtail wire connector from the floating horn switch plate connector on the back of the switch plate.
9. On domestic market vehicles only, the clockspring DAB pigtail wire connector insulator is secured by an integral Connector Position Assurance (CPA) lock to the active vent connector receptacle, which is located on the back of the DAB housing. Pull the lock straight back from the connector insulator, then pull the insulator straight out from the connector receptacle to disengage and disconnect it.

Fig. 17: Clockspring DAB Pigtail Wire Connector Insulators, Latches & Connector Position Assurance (CPA) Lock
Courtesy of CHRYSLER GROUP, LLC

10. The clockspring DAB pigtail wire connector insulators (1) are secured by integral latches (3) and a CPA lock (2) to the airbag inflator connector receptacles, which are located on the back of the floating horn switch plate and the DAB housing. Pull the lock straight out from the connector insulator, then pull the insulators straight out from the connector receptacles to disengage and disconnect them.
11. Remove the DAB and floating horn switch plate from the steering wheel as a unit.
12. If the DAB has been deployed, the clockspring and the steering column must also be replaced. Refer to **CLOCKSPRING, REMOVAL**. Refer to **COLUMN, REMOVAL** .

INSTALLATION

INSTALLATION

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury, use extreme care to prevent any foreign material from entering the Driver AirBag (DAB), or becoming entrapped between the DAB cushion and the DAB trim cover. Failure to observe this warning could result in occupant injuries upon airbag deployment.

1012006767

Fig. 18: View Of DAB Wiring Connections
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The following procedure is for replacement of an ineffective or damaged Driver AirBag (DAB). If the airbag is ineffective or damaged, but not deployed, review the recommended procedures for Handling Non-Deployed Supplemental Restraints. Refer to HANDLING NON-DEPLOYED SUPPLEMENTAL RESTRAINTS. If the DAB has been deployed, review the recommended procedures for Service After A Supplemental Restraint Deployment before removing the airbag from the vehicle. Refer to SERVICE AFTER A SUPPLEMENTAL RESTRAINT SYSTEM DEPLOYMENT.**

1. Position the Driver AirBag (DAB) and floating horn switch unit close enough to the steering wheel to access the clockspring pigtail wire connections to the horn switch (1), the active vent (2 - domestic market vehicles only) and the DAB inflator initiators (3).
2. Reconnect the clockspring pigtail wire connectors to the airbag inflator initiator connector receptacles by pressing straight in on the connector insulator. Be certain to engage each keyed and color-coded connector to the matching connector receptacle. Be certain that each connector is fully engaged in its receptacle, then push the Connector Position Assurance (CPA) lock straight into the connector to lock it into place.
3. For domestic market vehicles only, reconnect the clockspring pigtail wire connector to the DAB active vent connector receptacle on the back of the mounting and horn switch plate. Be certain that the connector is fully engaged in its receptacle, then slide the CPA lock straight into the connector to lock it into place.
4. Reconnect the clockspring wire harness connector to the floating horn switch connector on the back of the mounting/horn switch plate.

5. Carefully position the DAB and floating horn switch unit into the steering wheel hub cavity while tugging lightly upward on the clockspring pigtail wires for the airbag and tucking the wires into the upper hub cavity of the steering wheel. Be certain that none of the steering wheel wiring is pinched between the airbag housing or the horn switch and the steering wheel armature.
6. Using both hands, push firmly and evenly on both sides of the DAB trim cover until both ends of the spring retainer have snapped into place under the hooks within the hub cavity of the steering wheel.
7. Do not reconnect the negative cable to the battery at this time. The Supplemental Restraint System (SRS) Verification Test procedure should be performed following service of any SRS component. Refer to **SUPPLEMENTAL RESTRAINT SYSTEM VERIFICATION TEST**.

AIR BAG, KNEE BLOCKER

DESCRIPTION

DESCRIPTION

Fig. 19: Airbag Housing, Studs, Inflator Initiator & Protective Cover
Courtesy of CHRYSLER GROUP, LLC

Knee AirBags (KAB) (also known as Inflatable Knee Blockers/IKB) are used on both the driver and passenger sides of this vehicle when it is manufactured for domestic markets. Vehicles manufactured for export markets have only a driver side KAB. These airbags are passive, inflatable Supplemental Restraint System (SRS) components. Vehicles with this equipment may be readily identified by the **SRS - AIRBAG** logo located on the instrument panel steering column opening cover for the driver side and on the glove box door for the passenger side. The KAB units are concealed below the lower edge of the instrument panel, just beneath the steering column opening cover on the driver side or just beneath the glove box door on the passenger side.

The stamped metal airbag housing (1) is secured by four studs (4) with nuts to the stamped metal lower instrument panel reinforcement of the instrument panel support structure. A molded plastic protective cover (5) is secured over the folded airbag cushion by several hook formations stamped into the airbag housing that are engaged through window openings in tabs integral to the outer perimeter of the cover.

The airbag housing contains the airbag inflator and a heat shield. The airbag inflator is a single-initiator, non-azide hybrid-type unit that is secured to the housing by two studs (2) with nuts and sealed within the airbag housing. The airbags are connected to the vehicle electrical system through dedicated take outs and connector insulators of the instrument panel wire harness that connect directly to the inflator initiator (3) of each airbag.

The driver and passenger side KAB units are not interchangeable. The inflator initiators are on the opposite, inboard ends of the module housing and the mounting stud locations are offset to prevent each airbag unit from being installed in the improper location.

The KAB units cannot be repaired, and must be replaced if deployed, ineffective or in any way damaged. If the KAB units are deployed, the steering column opening cover and the glove box must also be replaced.

OPERATION

OPERATION

The Knee AirBags (KAB) (also known as Inflatable Knee Blockers/IKB) are deployed by electrical signals generated by the Occupant Restraint Controller (ORC) to which it is connected through a driver or passenger KAB line 1 (or squib) circuit to the initiator in the airbag inflator. The hybrid-type inflator assembly for each airbag contains a small canister of highly compressed inert gas. When the ORC sends the proper electrical signal to the airbag inflator, the electrical energy creates enough heat to ignite chemical pellets within the inflator.

Once ignited, these chemical pellets burn rapidly and produce the pressure necessary to rupture a containment disk in the inert gas canister. The inflator is sealed to the airbag cushion and a diffuser in the inflator directs all of the inert gas into the airbag cushion, causing the cushion to inflate. As the cushion inflates, the KAB protective cover will split at predetermined tear seam lines concealed on the underside of the cover, then fold open and out of the way.

The cushion protects the lower extremities of the vehicle driver or front seat passenger and helps to keep the seat occupant properly positioned for the Driver AirBag (DAB) or Passenger AirBag (PAB) deployment during a frontal impact collision. Following an airbag deployment, the KAB cushion quickly deflates by venting the inert gas through the loose weave of the fabric used to construct the instrument panel side of the airbag cushion, and the deflated cushion hangs down loosely from the lower instrument panel.

The ORC monitors the condition of the KAB through circuit resistance, and will illuminate the airbag indicator in the instrument cluster and store a Diagnostic Trouble Code (DTC) for any fault that is detected. Proper diagnosis of the KAB initiators and squib circuits requires the use of a diagnostic scan tool and may also require the use of the SRS Load Tool special tool along with the appropriate Load Tool Jumpers and Adapters. Refer to the appropriate diagnostic information.

REMOVAL

DRIVER

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering

wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

WARNING: **To avoid serious or fatal injury when removing a deployed airbag, rubber gloves, eye protection, and a long-sleeved shirt should be worn. There may be deposits on the airbag cushion and other interior surfaces. In large doses, these deposits may cause irritation to the skin and eyes.**

Fig. 20: View Of Knee AirBag (KAB) Fasteners LH Side
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The following procedure is for replacement of an ineffective or damaged Knee AirBag (KAB) (also known as the Inflatable Knee Blocker/IKB). If the airbag is ineffective or damaged, but not deployed, review the recommended procedures for Handling Non-Deployed Supplemental Restraints. Refer to HANDLING NON-DEPLOYED SUPPLEMENTAL RESTRAINTS. If the KAB has been deployed, review the recommended procedures for Service After A Supplemental Restraint Deployment before removing the airbag from the vehicle. Refer to SERVICE AFTER A SUPPLEMENTAL RESTRAINT SYSTEM DEPLOYMENT.**

1. Disconnect and isolate the negative cable from the battery. Wait two minutes for the system capacitor to

discharge before further service.

2. Remove the steering column opening cover from the instrument panel. Refer to **COVER, STEERING COLUMN OPENING, REMOVAL** .
3. Remove the four nuts (1) that secure the Knee AirBag (KAB) (2) to the lower reinforcement (3) of the instrument panel structural support.
4. Rotate the outboard end of the KAB downward so that the KAB is vertical and the instrument panel wire harness connection to the KAB faces upward.

Fig. 21: Clockspring DAB Pigtail Wire Connector Insulators, Latches & Connector Position Assurance (CPA) Lock
Courtesy of CHRYSLER GROUP, LLC

5. The KAB connector insulator (1) is secured by integral latches (3) and a Connector Position Assurance (CPA) lock (2) to the airbag inflator connector receptacle. Pull the lock straight out from the connector insulator, then pull the insulator straight out from the connector receptacle to disengage and disconnect it.
6. Remove the KAB from the vehicle.

PASSENGER

WARNING: **To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.**

WARNING: **To avoid serious or fatal injury when removing a deployed airbag, rubber**

gloves, eye protection, and a long-sleeved shirt should be worn. There may be deposits on the airbag cushion and other interior surfaces. In large doses, these deposits may cause irritation to the skin and eyes.

Fig. 22: Knee AirBag (KAB) Fasteners RH Side
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The following procedure is for replacement of an ineffective or damaged Knee AirBag (KAB) (also known as the Inflatable Knee Blocker/IKB). If the airbag is ineffective or damaged, but not deployed, review the recommended procedures for Handling Non-Deployed Supplemental Restraints. Refer to HANDLING NON-DEPLOYED SUPPLEMENTAL RESTRAINTS. If the KAB has been deployed, review the recommended procedures for Service After A Supplemental Restraint Deployment before removing the airbag from the vehicle. Refer to SERVICE AFTER A SUPPLEMENTAL RESTRAINT SYSTEM DEPLOYMENT.**

1. Disconnect and isolate the negative cable from the battery. Wait two minutes for the system capacitor to discharge before further service.
2. Remove the glove box from the instrument panel. Refer to **GLOVE BOX, INSTRUMENT PANEL, REMOVAL** .
3. Remove the four nuts (3) that secure the Knee AirBag (KAB) (2) to the lower reinforcement (1) of the instrument panel structural support.
4. Rotate the outboard end of the KAB unit downward so that the KAB is vertical and the instrument panel wire harness connection to the KAB faces upward.

Fig. 23: Clockspring DAB Pigtail Wire Connector Insulators, Latches & Connector Position Assurance (CPA) Lock
Courtesy of CHRYSLER GROUP, LLC

5. The KAB connector insulator (1) is secured by integral latches (3) and a Connector Position Assurance (CPA) lock (2) to the airbag inflator connector receptacle. Pull the lock straight out from the connector insulator, then pull the insulator straight out from the connector receptacle to disengage and disconnect it.
6. Remove the KAB from the vehicle.

INSTALLATION

DRIVER

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury when removing a deployed airbag, rubber gloves, eye protection, and a long-sleeved shirt should be worn. There may be deposits on the airbag unit and other interior surfaces. In large doses, these deposits may cause irritation to the skin and eyes.

WARNING: To avoid serious or fatal injury, use extreme care to prevent any foreign material from entering the Inflatable Knee Blocker (IKB) airbag, or

becoming entrapped between the IKB airbag cushion and the IKB cover. Failure to observe this warning could result in occupant injuries upon airbag deployment.

Fig. 24: View Of Knee AirBag (KAB) Fasteners LH Side
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The following procedure is for replacement of an ineffective or damaged Knee AirBag (KAB) (also known as the Inflatable Knee Blocker/IKB). If the airbag is ineffective or damaged, but not deployed, review the recommended procedures for Handling Non-Deployed Supplemental Restraints. Refer to HANDLING NON-DEPLOYED SUPPLEMENTAL RESTRAINTS. If the KAB has been deployed, review the recommended procedures for Service After A Supplemental Restraint Deployment before removing the airbag from the vehicle. Refer to SERVICE AFTER A SUPPLEMENTAL RESTRAINT SYSTEM DEPLOYMENT.**

1. Position the Knee AirBag (KAB) (2) unit below the steering column opening of the instrument panel in a vertical orientation with the KAB inflator initiator connector receptacle facing upward.
2. Reconnect the connector insulator of the instrument panel wire harness take out for the KAB to the inflator initiator connector receptacle by pressing straight in on the connector. Be certain that the connector is fully engaged in its receptacle, then push the Connector Position Assurance (CPA) lock straight into the connector to lock it into place.
3. Carefully position the KAB unit to the lower reinforcement (3) of the instrument panel structural support. **Be certain the instrument panel wire harness take out for the KAB is routed behind the KAB and is not pinched between the KAB housing and the lower reinforcement of the instrument panel structural support.**

4. Install and tighten the four nuts (1) that secure the mounting studs of the KAB unit to the lower reinforcement of the instrument panel structural support. Tighten the nuts to 9 N.m (80 in. lbs.).
5. Reinstall the steering column opening cover onto the instrument panel. Refer to **COVER, STEERING COLUMN OPENING, INSTALLATION** .
6. Do not reconnect the negative cable to the battery at this time. The Supplemental Restraint System (SRS) Verification Test procedure should be performed following service of any SRS component. Refer to **SUPPLEMENTAL RESTRAINT SYSTEM VERIFICATION TEST**.

PASSENGER

WARNING: **To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.**

WARNING: **To avoid serious or fatal injury, use extreme care to prevent any foreign material from entering the Inflatable Knee Blocker (IKB) airbag, or becoming entrapped between the IKB airbag cushion and the IKB cover. Failure to observe this warning could result in occupant injuries upon airbag deployment.**

1011006177

Fig. 25: Knee AirBag (KAB) Fasteners RH Side
Courtesy of CHRYSLER GROUP, LLC

NOTE: The following procedure is for replacement of an ineffective or damaged Knee AirBag (KAB) (also known as the Inflatable Knee Blocker/IKB). If the airbag is ineffective or damaged, but not deployed, review the recommended procedures for Handling Non-Deployed Supplemental Restraints. Refer to HANDLING NON-DEPLOYED SUPPLEMENTAL RESTRAINTS. If the KAB has been deployed, review the recommended procedures for Service After A Supplemental Restraint Deployment before removing the airbag from the vehicle. Refer to SERVICE AFTER A SUPPLEMENTAL RESTRAINT SYSTEM DEPLOYMENT.

1. Position the Knee AirBag (KAB) (2) unit below the glove box opening of the instrument panel in a vertical orientation with the KAB inflator initiator connector receptacle facing upward.
2. Reconnect the connector insulator of the instrument panel wire harness take out for the KAB to the inflator initiator connector receptacle by pressing straight in on the connector. Be certain that the connector is fully engaged in its receptacle, then push the Connector Position Assurance (CPA) lock straight into the connector to lock it into place.
3. Carefully position the KAB unit to the lower reinforcement (1) of the instrument panel structural support. **Be certain the instrument panel wire harness take out for the KAB is routed behind the KAB and is not pinched between the KAB housing and the lower reinforcement of the instrument panel structural support.**
4. Install and tighten the four nuts (3) that secure the mounting studs of the KAB unit to the lower reinforcement of the instrument panel structural support. Tighten the nuts to 9 N.m (80 in. lbs.).
5. Reinstall the glove box into the instrument panel. Refer to **GLOVE BOX, INSTRUMENT PANEL, INSTALLATION** .
6. Do not reconnect the negative cable to the battery at this time. The Supplemental Restraint System (SRS) Verification Test procedure should be performed following service of any SRS component. Refer to **SUPPLEMENTAL RESTRAINT SYSTEM VERIFICATION TEST**.

AIR BAG, PASSENGER

DESCRIPTION

DESCRIPTION

Fig. 26: Air Bag, Passenger (PAB)
Courtesy of CHRYSLER GROUP, LLC

The horizontal surface of the instrument panel top pad (1) above the glove box (2) is the most visible part of the Passenger Airbag (PAB). The PAB door is integral to the top of the instrument panel top pad forward of and above the glove box on the instrument panel in front of the front seat passenger seating position.

Located below the PAB door area of the instrument panel top pad, the molded thermoplastic PAB retainer or chute is secured to the underside of the top pad. The retainer defines the PAB door breakout area of the top pad and serves as the receptacle for the PAB cushion and housing. Numerous small window openings on the forward and rearward flanges of the receptacle receive mating hook formations stamped into the airbag housing, which locate and secure the housing to the top pad.

Fig. 27: PAB Unit Components
Courtesy of CHRYSLER GROUP, LLC

The PAB unit is also secured by a mounting bracket (4) and two screws to the instrument panel structural support. The PAB unit used in this vehicle is a multistage type that complies with revised federal airbag standards to deploy with less force than those used in some prior vehicles. The PAB unit consists of a stamped metal housing (3), the airbag cushion (1), a Micro Gas Generator (MGG) for the active vent (6) (domestic market vehicles only) and the two-stage airbag inflator (2). The PAB inflator, the mounting bracket and the airbag cushion are secured to the housing by four studs and four nuts. The airbag housing contains the folded airbag cushion and the cushion retainer (7). An approximately 66 centimeter (26 inch) wide by 76 centimeter (30 inch) high rectangular fabric cushion is used.

The PAB inflator is a non-azide, pyrotechnic-type unit that is secured to and sealed within the airbag housing. Three dedicated take outs and yellow connectors of the PAB wire harness (5) with keyed, color-coded insulators connect the two inflator initiators and the active vent MGG to a yellow, 6 way connector secured to the mounting bracket. A dedicated take out and connector of the instrument panel wire harness connects the PAB to the vehicle electrical system.

The PAB cannot be repaired, and must be replaced if deployed, ineffective or in any way damaged. The PAB door and chute or retainer are serviced only as a unit with the instrument panel top pad. If the PAB is deployed, the top pad must also be replaced.

OPERATION

OPERATION

The multistage Passenger AirBag (PAB) is deployed by electrical signals generated by the Occupant Restraint

Controller (ORC) through PAB squib 1 and squib 2 circuits to the two initiators in the airbag inflator, and by a PAB squib 3 circuit to the initiator of the Micro Gas Generator (MGG) for the active vent (domestic market vehicles only). By using two initiators and an active vent, the PAB can be deployed at multiple levels of force. The force level is managed by the ORC to suit the monitored impact conditions by providing one of multiple delay intervals between the electrical signals provided to the two initiators and the tether release. The longer the delay between the initiator signals and the sooner the active vent is opened, the less forcefully the PAB will deploy.

When the ORC sends the proper electrical signals to each initiator, the electrical energy generates enough heat to initiate a small pyrotechnic charge which, in turn ignites chemical pellets within the inflator. Once ignited, these chemical pellets burn rapidly and produce a large quantity of inert gas. The inflator is sealed to the airbag cushion and a diffuser in the inflator directs all of the inert gas into the airbag cushion, causing the cushion to inflate. As the cushion inflates, the PAB door will split at predetermined tear seam lines concealed on the inside surface of the door, then the door will pivot up over the top of the instrument panel and out of the way. Following an airbag deployment, the airbag cushion quickly deflates by venting the inert gas through a discrete vent in each fabric side panel of the airbag cushion.

The MGG inflates a small cushion within the primary cushion to control the active vent. The ORC monitors a seat track position sensor on the passenger front seat. If the seat is in the full forward position when an airbag deployment occurs, the ORC keeps the active vent open. With the active vent open the airbag deployment is less forceful, which reduces the possibility of an airbag-induced injury when the passenger is seated close to the deploying airbag. If the passenger front seat is not in the full forward position, the active vent is closed during airbag deployment.

Typically, all initiators are used during a PAB deployment event. However, it is possible for only one initiator to be used during a deployment due to an airbag system fault; therefore, it is necessary to always confirm that all initiators have been used in order to avoid the improper disposal of potentially live pyrotechnic materials. Refer to **STANDARD PROCEDURE**.

The ORC monitors the condition of the PAB through circuit resistance, and will illuminate the airbag indicator in the instrument cluster and store a Diagnostic Trouble Code (DTC) for any fault that is detected. Proper diagnosis of the PAB inflator, the active vent MGG and the squib circuits requires the use of a diagnostic scan tool and may also require the use of the SRS Load Tool special tool along with the appropriate Load Tool Jumpers and Adapters. Refer to the appropriate diagnostic information.

REMOVAL

REMOVAL

WARNING: **To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in**

accidental airbag deployment.

WARNING: To avoid serious or fatal injury when removing a deployed airbag, rubber gloves, eye protection, and a long-sleeved shirt should be worn. There may be deposits on the airbag unit and other interior surfaces. In large doses, these deposits may cause irritation to the skin and eyes.

Fig. 28: Removing/Installing Passenger AirBag (PAB)
Courtesy of CHRYSLER GROUP, LLC

NOTE: The following procedure is for replacement of an ineffective or damaged Passenger AirBag (PAB). If the airbag is ineffective or damaged, but not deployed, review the recommended procedures for Handling Non-Deployed Supplemental Restraints. Refer to HANDLING NON-DEPLOYED SUPPLEMENTAL RESTRAINTS. If the PAB has been deployed, review the recommended procedures for Service After A Supplemental Restraint Deployment before removing the airbag from the vehicle. Refer to SERVICE AFTER A SUPPLEMENTAL RESTRAINT SYSTEM DEPLOYMENT.

1. Disconnect and isolate the negative cable from the battery. Wait two minutes for the system capacitor to discharge before further service.
2. Remove the glove box from the instrument panel. Refer to **GLOVE BOX, INSTRUMENT PANEL, REMOVAL** .
3. Reach through and above the glove box opening (4) of the instrument panel to access and remove the two screws (5) that secure the Passenger AirBag (PAB) (2) lower mounting bracket to the instrument panel structural support (3).

4. Still reaching through the glove box opening, disconnect the instrument panel wire harness connector from the PAB pigtail wire harness connector (1).

Fig. 29: Chute, Housing & Top Pad
Courtesy of CHRYSLER GROUP, LLC

5. Remove the top pad (3) and PAB from the instrument panel as a unit. Refer to **PAD, INSTRUMENT PANEL, REMOVAL** .
6. Place the top pad on a suitable work surface with the top facing down. If the top pad will be reused, be certain to take the proper precautions to prevent the top pad from receiving cosmetic damage during the following procedures.
7. Disengage each of the hooks on one side of the PAB housing (2) from the windows in the forward or rearward vertical walls of the PAB retainer or chute (1) on the underside of the top pad. To disengage the hooks, use hand pressure to pull the adjacent edge of the PAB housing firmly and evenly upward out of the retainer receptacle, while at the same time pulling the upper edge of the receptacle wall outward far enough to disengage the hooks.
8. With all of the hooks on one side of the PAB housing disengaged from the retainer, rotate that side of the housing upward far enough to disengage the hooks on the opposite side of the housing from the retainer.
9. With all of the hooks disengaged, lift the PAB housing, inflator, and cushion as a unit from the receptacle of the PAB retainer or chute on the underside of the instrument panel top pad.

INSTALLATION

INSTALLATION

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground)

cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury when removing a deployed airbag, rubber gloves, eye protection, and a long-sleeved shirt should be worn. There may be deposits on the airbag unit and other interior surfaces. In large doses, these deposits may cause irritation to the skin and eyes.

WARNING: To avoid serious or fatal injury, use extreme care to prevent any foreign material from entering the passenger airbag, or becoming entrapped between the passenger airbag cushion and the instrument panel top pad. Failure to observe this warning could result in occupant injuries upon airbag deployment.

Fig. 30: Chute, Housing & Top Pad
Courtesy of CHRYSLER GROUP, LLC

NOTE: The following procedure is for replacement of an ineffective or damaged Passenger AirBag (PAB). If the airbag is ineffective or damaged, but not deployed, review the recommended procedures for Handling Non-Deployed Supplemental Restraints. Refer to HANDLING NON-DEPLOYED SUPPLEMENTAL RESTRAINTS. If the PAB has been deployed, review the recommended procedures for Service After A Supplemental Restraint Deployment before removing the airbag from the vehicle. Refer to SERVICE AFTER A SUPPLEMENTAL RESTRAINT SYSTEM DEPLOYMENT.

1. Place the instrument panel top pad (3) on a suitable work surface with the Passenger AirBag (PAB) retainer or chute (1) receptacle facing up. Be certain to take the proper precautions to prevent the top pad

from receiving cosmetic damage during the following procedures.

2. Carefully position the PAB housing (2) to the PAB retainer or chute receptacle. The side of the PAB housing with 5 hooks faces rearward in the vehicle.
3. Engage all of the hooks on one side of the PAB housing through the windows on the same side of the PAB retainer or chute, then rotate the opposite side of the PAB housing downward into the receptacle.
4. Inspect around the perimeter of the PAB making certain each of the hooks on the PAB housing is fully engaged through the windows in the forward and rearward vertical walls of the PAB retainer or chute receptacle.
5. Reinstall the top pad onto the instrument panel. Refer to **PAD, INSTRUMENT PANEL, INSTALLATION** .

Fig. 31: Removing/Installing Passenger AirBag (PAB)
Courtesy of CHRYSLER GROUP, LLC

6. Reach through and above the glove box opening (4) of the instrument panel to reconnect the instrument panel wire harness connector to the PAB pigtail wire harness connector (1). Be certain that the connector is fully engaged and locked.
7. Still reaching through the glove box opening, install and tighten the two screws (5) that secure the PAB (2) lower mounting bracket to the instrument panel structural support (3). Tighten the screws to 9 N.m (80 in. lbs.).
8. Reinstall the glove box into the instrument panel. Refer to **GLOVE BOX, INSTRUMENT PANEL, INSTALLATION** .
9. Do not reconnect the negative cable to the battery at this time. The Supplemental Restraint System (SRS) Verification Test procedure should be performed following service of any SRS component. Refer to **SUPPLEMENTAL RESTRAINT SYSTEM VERIFICATION TEST**.

AIR BAG, SEAT

DESCRIPTION

FRONT

1011006269

Fig. 32: Front Seat Airbags (SAB)
Courtesy of CHRYSLER GROUP, LLC

The front Seat AirBags (SAB) (1) (also known as pelvic and thoracic airbags) are completely concealed beneath the seat back trim cover on the outboard sides of both front seat backs. Vehicles with this equipment can be readily identified by a sewn tag with the **SRS - AIRBAG** logo located on the outboard side of the front seat back trim cover. The folded SAB cushion is contained within a fabric wrap secured to the two airbag mounting studs. The airbag cushion is constructed of a coated nylon fabric. The airbags are inserted into a sewn pouch called an intensifier on the inside of the trim cover. The pouch is made of the same material as the airbag cushion.

The fabric wrap of the SAB also contains the airbag inflator and a heat shield. Two studs (3) are installed on the inflator within the fabric wrap and extend through the rearward side of the unit. The airbag is then secured to the seat back frame by nuts on those two studs. The SAB inflator is a single-initiator, pyrotechnic-type Micro Gas Generator (MGG) unit (2) that is secured to and sealed within the SAB. The SAB is connected to the vehicle electrical system through a dedicated jumper wire harness with a connector insulator that connects directly to the MGG initiator. The connector insulator is uniquely keyed and color-coded to ensure that it can only be connected to the initiator.

There are unique versions of the SAB for the various seat options available, and they are not interchangeable. Besides unique part numbers, the SAB for the standard seat is taller and narrower, while the SAB for the fold

flat (also known as the storage seat) is shorter and wider.

The front SAB cannot be repaired, and must be replaced if deployed, ineffective or in any way damaged. If the front SAB is deployed, the seat back frame, the seat back foam cushion, the seat back trim cover and the SAB jumper wire harness must also be replaced.

REAR

Fig. 33: Rear Seat Airbags (SAB)
Courtesy of CHRYSLER GROUP, LLC

The available rear Seat AirBags (SAB) (also known as pelvic and thoracic airbags) are completely concealed within the lower outboard ends of the rear seat cushion beneath the rear seat cushion trim cover and sandwiched between the outboard seat cushion frame (2) and the outboard seat cushion trim. Vehicles with this equipment can be readily identified by a sewn tag with the **SRS - AIRBAG** logo located on the outboard side of the rear seat cushion trim cover. The rear SAB cushion is constructed of a coated nylon fabric. The folded SAB cushion is contained within and protected by a soft fabric wrap (1) made of the same material as the airbag cushion. The airbags are inserted into a sewn pouch called an intensifier on the inside of the trim cover. The pouch is also made of the same material as the airbag cushion.

The open end of the SAB cushion is clamped over the outlet tube integral to the SAB inflator. Two studs (4) on the inflator are secured by nuts to a stamped metal bracket on the outboard side of the seat cushion frame, while a tether strap (3) on the loose end of the SAB cushion is secured by a screw to the rear corner of the seat cushion frame. The SAB inflator is a single-initiator, pyrotechnic-type unit. The SAB is connected to the vehicle electrical system through a dedicated take out and connector insulator of a rear seat cushion wire harness that connects directly to the inflator initiator (5). The connector insulators are uniquely keyed and color-coded to ensure they can only be connected to the initiator.

The rear SAB cannot be repaired, and must be replaced if deployed, ineffective or in any way damaged. If a rear SAB is deployed, the rear seat cushion foam, the seat cushion trim cover and the rear seat cushion wire harness must also be replaced.

OPERATION

FRONT

Each front Seat AirBag (SAB) (also known as a pelvic and thoracic airbag) is deployed individually by an electrical signal generated by the Occupant Restraint Controller (ORC) to which it is connected through left or right front SAB line 1 and line 2 (or squib) circuits. When the ORC sends the proper electrical signal to the pyrotechnic-type Micro Gas Generator (MGG) inflator, the electrical energy generates enough heat to initiate a small pyrotechnic charge which ignites chemical pellets within the inflator.

Once ignited, these chemical pellets burn rapidly and produce a large quantity of inert gas. The inflator is sealed to the SAB cushion and a diffuser in the inflator directs all of the inert gas into the folded SAB cushion, causing the cushion to inflate. As the cushion inflates it will split the fabric wrap, the pouch (intensifier) integral to the seat back trim cover and the outboard side of the seat back trim cover. The cushion then expands into the area between the outboard side of the front seat and the front door to form a cushion to protect the front seat occupant during a side impact collision or a vehicle rollover incident.

Following the SAB deployment, the cushion slowly deflates by venting the inert gas through the loose weave of the cushion fabric, and through a vent in the cushion. After venting is achieved, the deflated cushion hangs down loosely from the outboard side of the front seat back.

The ORC monitors the condition of the front SAB through circuit resistance, and will illuminate the airbag indicator in the Instrument Cluster (IC) (also known as the Instrument Panel Cluster/IPC) and store a Diagnostic Trouble Code (DTC) for any fault that is detected. Proper diagnosis of the front MGG SAB inflator and squib circuits requires the use of a diagnostic scan tool and may also require the use of the SRS Load Tool special tool along with the appropriate Load Tool Jumpers and Adapters. Refer to the appropriate diagnostic information.

REAR

Each rear Seat AirBag (SAB) (also known as a pelvic and thoracic airbag) is deployed individually by an electrical signal generated by the Occupant Restraint Controller (ORC) to which it is connected through left or right rear SAB line 1 and line 2 (or squib) circuits. Each SAB has a pyrotechnic-type Micro Gas Generator (MGG) inflator assembly.

When the ORC sends the proper electrical signal to the SAB inflator initiator, the electrical energy creates enough heat to initiate a small pyrotechnic charge which, in turn ignites chemical pellets within the inflator. Once ignited, these chemical pellets burn rapidly and produce a large quantity of inert gas.

The inflator is sealed to the airbag cushion and a diffuser in the inflator directs all of the inert gas into the airbag cushion, causing the cushion to inflate. As the cushion inflates it will split the fabric wrap, the pouch (intensifier) integral to the seat cushion trim cover and the outboard side of the seat cushion trim cover, then expand into the area between the outboard side of the rear seat and the rear door to form a cushion to protect the rear seat occupant during a side impact collision or a vehicle rollover incident.

Following the rear SAB deployment, the cushion slowly deflates by venting the inert gas through the loose weave of the cushion fabric and through a vent in the cushion. After venting is achieved, the deflated cushion hangs down loosely from the outboard side of the rear seat cushion.

The ORC monitors the condition of the rear SAB through circuit resistance, and will illuminate the airbag indicator in the Instrument Cluster (IC) (also known as the Instrument Panel Cluster/IPC) and store a Diagnostic Trouble Code (DTC) for any fault that is detected. Proper diagnosis of the rear SAB inflator and squib circuits requires the use of a diagnostic scan tool and may also require the use of the SRS Load Tool special tool along with the appropriate Load Tool Jumpers and Adapters. Refer to the appropriate diagnostic information.

REMOVAL

FRONT

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury when removing a deployed airbag, rubber gloves, eye protection, and a long-sleeved shirt should be worn. There may be deposits on the airbag unit and other interior surfaces. In large doses, these deposits may cause irritation to the skin and eyes.

Fig. 34: Inflator Connector Receptacle, Jumper Wire Harness & Seat Airbag

Courtesy of CHRYSLER GROUP, LLC

NOTE: The following procedure is for replacement of an ineffective or damaged Seat AirBag (SAB). If the airbag is ineffective or damaged, but not deployed, review the recommended procedures for Handling Non-Deployed Supplemental Restraints. Refer to HANDLING NON-DEPLOYED SUPPLEMENTAL RESTRAINTS. If the SAB has been deployed, review the recommended procedures for Service After A Supplemental Restraint Deployment before removing the airbag from the vehicle. Refer to SERVICE AFTER A SUPPLEMENTAL RESTRAINT SYSTEM DEPLOYMENT.

1. Position the front seat to its most forward position for easiest access to the front seat mounting hardware.
2. Disconnect and isolate the negative cable from the battery. Wait two minutes for the system capacitor to discharge before further service.
3. Remove the front seat from the vehicle. Refer to **SEAT, REMOVAL** .

CAUTION: During removal of the seat back trim cover, be certain not to tear or damage the integral nylon pouch that contains the seat airbag. If the nylon pouch or the trim cover are torn or damaged, the entire front seat back trim cover must be replaced with a new unit.

4. Remove the trim from the front and back of the front seat back frame, but do not remove from the outboard side of the seat back until after the Seat AirBag (SAB) (3) has been detached from the seat. Refer to **COVER, SEAT BACK, REMOVAL** .

CAUTION: Do not pull on the seat airbag jumper wire harness (4) take out or pry on the connector insulator to disengage the connector from the seat airbag (1) inflator connector receptacle. Improper removal of this take out and its connector insulator can result in damage to the airbag circuits or the connector insulator.

5. Disconnect the seat wire harness connector (2) from the top of the SAB inflator (1). Pull the lock straight out from the connector insulator, then pull the insulator straight out from the connector receptacle to disengage and disconnect it.

Fig. 35: Seat Back Frame, Nuts & Seat Airbag
Courtesy of CHRYSLER GROUP, LLC

6. Remove the two nuts (2) from the inside of the seat back frame (1) that secure the SAB (3) to the outside of the seat back frame.
7. Disengage the SAB mounting studs from the outboard side of the seat back frame, then remove the trim cover and the SAB from the seat back frame as a unit.
8. Carefully disengage the two SAB mounting studs from the nylon pouch (intensifier) and slide the SAB out of the pouch. Be careful not to tear or damage the pouch or the trim cover.

REAR

WARNING: **To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.**

WARNING: **To avoid serious or fatal injury when removing a deployed airbag, rubber gloves, eye protection, and a long-sleeved shirt should be worn. There may be deposits on the airbag unit and other interior surfaces. In large doses, these deposits may cause irritation to the skin and eyes.**

1021006273

Fig. 36: Rear Seat Airbag (SAB) & Tether Anchor Clip
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The following procedure is for replacement of an ineffective or damaged Seat AirBag (SAB). If the airbag is ineffective or damaged, but not deployed, review the recommended procedures for Handling Non-Deployed Supplemental Restraints. Refer to HANDLING NON-DEPLOYED SUPPLEMENTAL RESTRAINTS. If the SAB has been deployed, review the recommended procedures for Service After A Supplemental Restraint Deployment before removing the airbag from the vehicle. Refer to SERVICE AFTER A SUPPLEMENTAL RESTRAINT SYSTEM DEPLOYMENT.**

1. Disconnect and isolate the negative cable from the battery. Wait two minutes for the system capacitor to discharge before further service.
2. Remove the rear seat cushion from the vehicle. (Refer to **SEATS, REAR**).
3. Disengage the outboard end of the trim cover from the rear seat cushion.
4. Remove the screw (3) that secures the rear Seat AirBag (SAB) tether anchor clip (1) to the outboard rear corner of the seat cushion frame (2).

Fig. 37: Removing/Installing Seat AirBag (SAB)
Courtesy of CHRYSLER GROUP, LLC

5. Remove the screw (3) that secures the plastic SAB initiator cover to the bracket on the outboard front corner of the seat cushion frame (1).
6. Move the plastic SAB initiator cover far enough to access and disconnect the seat wire harness connector (5) from the rear SAB inflator initiator. Pull the Connector Position Assurance (CPA) lock straight out from the connector insulator, then pull the insulator straight out from the connector receptacle to disengage and disconnect it.
7. Remove the two nuts that secure the studs (2) of the SAB inflator to the bracket near the outboard front corner of the seat cushion frame.
8. Carefully disengage the SAB from the nylon pouch (intensifier) and slide the SAB out of the pouch. Be careful not to tear or damage the pouch or the trim cover.
9. Remove the SAB from the seat cushion frame.

INSTALLATION

FRONT

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to

disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

CAUTION: The seat airbag (1) must be installed into the nylon mesh pouch integral to the front seat back trim cover before the airbag or the trim cover are installed on the front seat back frame (2). Failure to do so will adversely affect the function of the seat airbag system.

Fig. 38: Seat Back Frame, Nuts & Seat Airbag
Courtesy of CHRYSLER GROUP, LLC

NOTE: The following procedure is for replacement of an ineffective or damaged Seat AirBag (SAB). If the airbag is ineffective or damaged, but not deployed, review the recommended procedures for Handling Non-Deployed Supplemental Restraints. Refer to HANDLING NON-DEPLOYED SUPPLEMENTAL RESTRAINTS. If the SAB has been deployed, review the recommended procedures for Service After A Supplemental Restraint Deployment before removing the airbag from the vehicle. Refer to SERVICE AFTER A SUPPLEMENTAL RESTRAINT SYSTEM DEPLOYMENT.

1. Carefully slide the Seat AirBag (SAB) (3) into the nylon pouch (intensifier) integral to the outboard side of the front seat back trim cover and engage the two SAB mounting studs through the holes provided in the pouch. Be careful not to tear or damage the pouch or the trim cover.
2. Position the SAB and trim cover as a unit to the outboard side of the seat back frame (1) and insert the studs through the mounting holes in the seat back frame.
3. Install and tighten the two nuts (2) that secure the SAB to the inside of the seat back frame. Tighten the nuts to 10 N.m (88 in. lbs.).

Fig. 39: Inflator Connector Receptacle, Jumper Wire Harness & Seat Airbag
Courtesy of CHRYSLER GROUP, LLC

4. Reconnect the seat wire harness connector (2) to the top of the SAB (3) inflator (1). You can be certain that the connector is fully engaged in its receptacle by listening carefully for a distinct, audible click as the connector snaps into place.
5. Push the Connector Position Assurance (CPA) lock firmly into the SAB connector insulator until it is flush with the upper surface of the insulator.

CAUTION: Be certain that all of the trim is properly reinstalled on the front seat back frame. Failure to do so will adversely affect the function of the seat airbag system.

6. Reinstall the trim onto the front and back of the front seat back frame. Refer to **COVER, SEAT BACK, INSTALLATION** .
7. Reinstall the front seat into the vehicle. Refer to **SEAT, INSTALLATION** .
8. Do not reconnect the negative cable to the battery at this time. The Supplemental Restraint System (SRS) Verification Test procedure should be performed following service of any SRS component. Refer to **SUPPLEMENTAL RESTRAINT SYSTEM VERIFICATION TEST**.

REAR

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to

disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

Fig. 40: Removing/Installing Seat AirBag (SAB)
Courtesy of CHRYSLER GROUP, LLC

NOTE: The following procedure is for replacement of an ineffective or damaged Seat AirBag (SAB). If the airbag is ineffective or damaged, but not deployed, review the recommended procedures for Handling Non-Deployed Supplemental Restraints. Refer to HANDLING NON-DEPLOYED SUPPLEMENTAL RESTRAINTS. If the SAB has been deployed, review the recommended procedures for Service After A Supplemental Restraint Deployment before removing the airbag from the vehicle. Refer to SERVICE AFTER A SUPPLEMENTAL RESTRAINT SYSTEM DEPLOYMENT.

1. Carefully slide the Seat AirBag (SAB) (3) into the nylon pouch (intensifier) integral to the outboard side of the rear seat cushion trim cover. Use care not to tear or damage the pouch or the trim cover.
2. Position the rear Seat AirBag (SAB) onto the bracket near the outboard front corner of the seat cushion frame (1).
3. Install and tighten the two nuts that secure the studs (2) of the SAB inflator to the bracket on the outboard front corner of the seat cushion frame. Tighten the nuts to 7 N.m (62 in. lbs.).
4. Reconnect the seat wire harness connector (5) to the SAB inflator. You can be certain that the connector is fully engaged in its receptacle by listening carefully for a distinct, audible click as the connector snaps into place.
5. Push the Connector Position Assurance (CPA) lock firmly into the SAB connector insulator until it is flush with the upper surface of the insulator.

6. Position the plastic SAB initiator cover to the bracket on the outboard front corner of the seat cushion frame.
7. Install and tighten the screw that secures the plastic SAB initiator cover to the bracket on the outboard front corner of the seat cushion frame. Tighten the screw to 3 N.m (27 in. lbs.).
8. Reinstall the outboard end of the trim cover (4) onto the rear seat cushion frame.
9. Position rear SAB tether anchor clip (1) to the outboard rear corner of the seat cushion frame (2).
10. Install and tighten the screw (3) that secures the rear SAB tether anchor clip to the seat cushion frame. Tighten the screw to 5 N.m (44 in. lbs.).
11. Reinstall the rear seat cushion into the vehicle. (Refer to **SEATS, REAR**).
12. Do not reconnect the negative cable to the battery at this time. The Supplemental Restraint System (SRS) Verification Test procedure should be performed following service of any SRS component. Refer to **SUPPLEMENTAL RESTRAINT SYSTEM VERIFICATION TEST**.

AIR BAG, SIDE CURTAIN

DESCRIPTION

DESCRIPTION

Fig. 41: Side Curtain Airbag
Courtesy of CHRYSLER GROUP, LLC

Side curtain airbags (also known as Side AirBag Inflatable Curtains/SABIC) are standard factory-installed equipment for this vehicle. These airbags are passive, inflatable, Supplemental Restraint System (SRS) components. The side curtain airbag system is designed to reduce injuries to the vehicle occupants in the event of a side impact collision or a vehicle rollover incident. Each side curtain airbag cushion provides full coverage of the side glass on the same side of the vehicle as the monitored impact.

Each vehicle is equipped with two individually controlled side curtain airbag units. These side curtain airbag units are concealed and mounted above the headliner where they are each secured to one of the roof side rails. Each folded airbag cushion is contained within a fabric wrap and suspended from plastic clamp hangers (3) that are spaced along the inner roof rail from the A-pillar at the front of the vehicle to near the D-pillar at the rear of the vehicle. A tether (2) extends down the A-pillar from the front of the side curtain airbag cushion, while a second tether (4) is secured above the D-pillar at the rear. A stamped retainer at the end of each tether is secured to a slot in the sheet metal. A nut secures the front tether retainer to a weld stud on the A-pillar, while a screw secures the rear tether to the inner roof rail.

The hybrid-type inflator (1) for each side curtain airbag is secured to the roof rail above the B-pillar and is connected to the airbag cushion by a long tubular manifold. The inflator bracket has an integral hook formation on one end. The inflator is initially hung from the roof rail by the hook formation, then plastic push-in fasteners secure the clamp hangers and the body of the airbag cushion to the roof rail and to stamped metal deploy brackets at the top of the B-pillar and above the C and D-pillars. Finally, the entire assembly is secured with screws to the inner roof rail.

The airbag inflator is connected to the vehicle electrical system through a dedicated take out and connector of the body wire harness near the top of the B-pillar. The body wire harness connects the side curtain airbag unit to the Occupant Restraint Controller (ORC).

The side curtain airbag units cannot be adjusted or repaired and must be replaced if deployed, ineffective or in any way damaged. Once a side curtain airbag has been deployed, the complete side curtain airbag unit, the deploy brackets, the headliner, the A-pillar trim as well as all other visibly damaged components must be replaced.

OPERATION

OPERATION

Each side curtain airbag (also known as Side AirBag Inflatable Curtain/SABIC) is deployed individually by an electrical signal generated by the Occupant Restraint Controller (ORC) to which it is connected through the left or right SABIC line 1 and line 2 (or squib) circuits. The hybrid-type inflator assembly for each airbag contains a small canister of highly compressed inert gas. When the ORC sends the proper electrical signal to the airbag inflator, the electrical energy creates enough heat to ignite chemical pellets within the inflator.

Once ignited, these chemicals burn rapidly and produce the pressure necessary to rupture a containment disk in the inert gas canister. The inflator and inert gas canister are sealed and connected to a tubular manifold so that all of the released gas is directed into the folded airbag cushion, causing the cushion to inflate. As the cushion inflates it will drop down from the roof rail between the edge of the headliner and the side glass/body pillars to form a curtain-like cushion to protect the vehicle occupants during a side impact collision or a vehicle rollover incident. The cushion features large chambers that inflate adjacent to the head of each front and rear seat occupant.

The front and rear tethers keep the side curtain airbag cushion taut to the side of the vehicle. In addition, the deploy brackets at the top of each B-pillar and above the C and D-pillars guide the cushion past the upper B, C and D-pillar trim into the proper deployment position. Following the deployment, the cushion slowly deflates by venting the inert gas through the loose weave of the cushion fabric and the deflated cushion hangs down

loosely from the roof rail.

The ORC monitors the condition of the side curtain airbags through circuit resistance, will illuminate the airbag indicator in the instrument cluster and will store a Diagnostic Trouble Code (DTC) for any fault that is detected. Proper diagnosis of the side curtain airbag inflator and squib circuits requires the use of a diagnostic scan tool and may also require the use of the SRS Load Tool special tool along with the appropriate Load Tool Jumpers and Adapters. Refer to the appropriate diagnostic information.

REMOVAL

AIRBAG

WARNING: **To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.**

WARNING: **To avoid serious or fatal injury when removing a deployed airbag, rubber gloves, eye protection, and a long-sleeved shirt should be worn. There may be deposits on the airbag unit and other interior surfaces. In large doses, these deposits may cause irritation to the skin and eyes.**

WARNING: **To avoid serious or fatal injury, use extreme care to prevent any foreign material from entering the side curtain airbag, or becoming entrapped between the side curtain airbag cushion and the headliner. Failure to observe this warning could result in occupant injuries upon airbag deployment.**

1009005966

Fig. 42: Removing/Installing C&D-Pillar Side AirBag Curtain
Courtesy of CHRYSLER GROUP, LLC

NOTE: The following procedure is for replacement of an ineffective or damaged side curtain airbag (also known as Side AirBag Inflatable Curtain/SABIC). If the airbag is ineffective or damaged, but not deployed, review the recommended procedures for Handling Non-Deployed Supplemental Restraints. Refer to HANDLING NON-DEPLOYED SUPPLEMENTAL RESTRAINTS. If the side curtain airbag has been deployed, review the recommended procedures for Service After A Supplemental Restraint Deployment before removing the airbag from the vehicle. Refer to SERVICE AFTER A SUPPLEMENTAL RESTRAINT SYSTEM DEPLOYMENT.

1. Disconnect and isolate the negative cable from the battery. Wait two minutes for the system capacitor to discharge before further service.
2. Remove the headliner from the vehicle. Refer to **HEADLINER, REMOVAL** .
3. Remove the screw that secures the Side AirBag Inflatable Curtain (SABIC) (1) rear tether to the inner roof rail (2).
4. Remove the two screws that secure the SABIC mounting tabs to the inner roof rail above the C (3) and D-pillars.
5. Disengage the plastic push-in retainers that secure the SABIC to the C and D-pillar deploy bracket (4) above the C and D-pillars.

NOTE: If the SABIC has been deployed, the C and D-pillar deploy bracket must also be replaced.

Fig. 43: Removing/Installing A-Pillar Side AirBag Curtain
Courtesy of CHRYSLER GROUP, LLC

6. Remove the nut (3) that secures the SABIC (1) front tether to the inner A-pillar (2) near the belt line.
7. Remove the two screws that secure the SABIC mounting tabs to the inner A-pillar and the inner roof rail above the A-pillar.
8. Disengage the plastic push-in retainers that secure the SABIC to the inner A-pillar and the inner roof rail above the A-pillar.

Fig. 44: Removing/Installing B-Pillar Side AirBag Curtain
Courtesy of CHRYSLER GROUP, LLC

9. Disconnect the body wire harness connector (3) from the connector receptacle at the rear of the SABIC inflator located on the inner roof rail (2) above the B-pillar (6). The SABIC connector insulator is secured by integral latches and a Connector Position Assurance (CPA) lock to the airbag inflator connector receptacle. Pull the lock straight out from the connector insulator, then pull the insulator straight out from the connector receptacle to disengage and disconnect it.
10. Remove the two screws (5) that secure the SABIC mounting tab to the inner roof rail above the rear door opening and the inflator bracket above the B-pillar.

NOTE: If the SABIC has been deployed, the B-pillar deploy bracket (1) must also be replaced.

11. Disengage the plastic push-in retainers that secure the SABIC to the inner roof rail.
12. Disengage the metal hooks that secure the inflator mounting bracket from the slots in the inner roof rail.
13. Remove the SABIC and inflator from the vehicle as a unit.

B-PILLAR

1009005962

Fig. 45: Removing/Installing B-Pillar Side Curtain Airbag
Courtesy of CHRYSLER GROUP, LLC

1. Remove the side curtain airbag (also known as Side AirBag Inflatable Curtain/SABIC) from the vehicle. Refer to **AIR BAG, SIDE CURTAIN, REMOVAL**.
2. Remove the three blind rivets (1) that secure the deploy bracket (3) near the top of the B-pillar (2).

3. Slide the bracket upward far enough to disengage the tabs at the top of the bracket from the locator holes in the inner B-pillar and roof rail.
4. Remove the deploy bracket from the vehicle and discard.

C AND D-PILLAR

1009005963

Fig. 46: Removing/Installing C&D-Pillar Side Curtain Airbag
Courtesy of CHRYSLER GROUP, LLC

1. Remove the side curtain airbag (also known as Side AirBag Inflatable Curtain/SABIC) from the vehicle. Refer to **AIR BAG, SIDE CURTAIN, REMOVAL**.
2. Remove the three blind rivets (1) that secure the deploy bracket (2) near the tops of the C-pillar (3) and D-pillar.
3. Disengage the tabs at the top of the bracket from the locator holes in the upper inner C-pillar.
4. Remove the deploy bracket from the vehicle and discard.

INSTALLATION

AIRBAG

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before

performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury when removing a deployed airbag, rubber gloves, eye protection, and a long-sleeved shirt should be worn. There may be deposits on the airbag unit and other interior surfaces. In large doses, these deposits may cause irritation to the skin and eyes.

WARNING: To avoid serious or fatal injury, use extreme care to prevent any foreign material from entering the side curtain airbag, or becoming entrapped between the side curtain airbag cushion and the headliner. Failure to observe this warning could result in occupant injuries upon airbag deployment.

Fig. 47: Removing/Installing B-Pillar Side AirBag Curtain
Courtesy of CHRYSLER GROUP, LLC

NOTE: The following procedure is for replacement of an ineffective or damaged side curtain airbag (also known as Side AirBag Inflatable Curtain/SABIC). If the airbag is ineffective or damaged, but not deployed, review the recommended procedures for Handling Non-Deployed Supplemental Restraints. Refer to HANDLING NON-DEPLOYED SUPPLEMENTAL RESTRAINTS. If the side curtain airbag has been deployed, review the recommended procedures for Service After A Supplemental Restraint Deployment before removing the airbag from the vehicle. Refer to SERVICE AFTER A SUPPLEMENTAL RESTRAINT SYSTEM DEPLOYMENT.

1. Position the Side AirBag Inflatable Curtain (SABIC) and inflator (4) into the vehicle as a unit.
2. Position the inflator mounting bracket to the inner roof rail above the deploy bracket (1) on the B-pillar (6) and engage the metal hooks on the inflator bracket into the slots in the inner roof rail (2).
3. Engage the plastic push-in retainers that temporarily secure the SABIC to the inner roof rail.
4. Install and tighten the two screws (5) that secure the inflator bracket above the B-pillar and the mounting tab to the inner roof rail above the rear door opening. Tighten the screw to 7 N.m (62 in. lbs.).
5. Reconnect the connector insulator (3) of the body wire harness take out for the SABIC to the inflator initiator connector receptacle at the rear of the inflator by pressing straight in on the connector. Be certain that the connector is fully engaged in its receptacle, then push the Connector Position Assurance (CPA) lock straight into the connector to lock it into place.

1009005965

Fig. 48: Removing/Installing A-Pillar Side AirBag Curtain
Courtesy of CHRYSLER GROUP, LLC

6. Engage the plastic push-in retainers that secure the SABIC (1) to the inner roof rail above the A-pillar and to the inner A-pillar (2).
7. Install and tighten the two screws (2) that secure SABIC mounting tabs to the inner roof rail above the A-pillar and to the inner A-pillar. Tighten the screws to 7 N.m (62 in. lbs.).
8. Install and tighten the nut (3) that secures the front tether to the inner A-pillar near the belt line. Tighten the nut to 7 N.m (62 in. lbs.).

1009005966

Fig. 49: Removing/Installing C&D-Pillar Side AirBag Curtain
Courtesy of CHRYSLER GROUP, LLC

9. Engage the plastic push-in retainers that secure the SABIC (1) to the C and D-pillar deploy bracket (4) above the C (3) and D-pillars.
10. Install and tighten the two screws that secure the SABIC mounting tabs to the inner roof rail (2). Tighten the screws to 7 N.m (62 in. lbs.).
11. Install and tighten the screw that secures the SABIC rear tether to the inner roof rail. Tighten the screw to 7 N.m (62 in. lbs.).
12. Reinstall the headliner into the vehicle. Refer to **HEADLINER, INSTALLATION** .
13. Do not reconnect the negative cable to the battery at this time. The Supplemental Restraint System (SRS) Verification Test procedure should be performed following service of any SRS component. Refer to **SUPPLEMENTAL RESTRAINT SYSTEM VERIFICATION TEST**.

B-PILLAR

1009005962

Fig. 50: Removing/Installing B-Pillar Side Curtain Airbag
Courtesy of CHRYSLER GROUP, LLC

1. Position the deploy bracket (3) near the top of the inner B-pillar (2).
2. Engage the tabs at the top of the bracket into the locator holes in the inner B-pillar.
3. Install three new blind rivets (1) to secure the bracket to the B-pillar.
4. Reinstall the side curtain airbag (also known as Side AirBag Inflatable Curtain/SABIC) into the vehicle. Refer to **AIR BAG, SIDE CURTAIN, INSTALLATION**.

C AND D-PILLAR

1009005963

Fig. 51: Removing/Installing C&D-Pillar Side Curtain Airbag
Courtesy of CHRYSLER GROUP, LLC

1. Position the deploy bracket (2) near the tops of the inner C-pillar (3) and D-pillar.
2. Engage the tabs at the top of the bracket into the locator holes in the upper inner C-pillar.
3. Install three new blind rivets (1) to secure the bracket near the tops of the C-pillar and D-pillar.
4. Reinstall the side curtain airbag (also known as Side AirBag Inflatable Curtain/SABIC) into the vehicle. Refer to **AIR BAG, SIDE CURTAIN, INSTALLATION**.

ANCHOR, CHILD SEAT

DESCRIPTION

DESCRIPTION

1009005960

Fig. 52: Child Seat Anchor/Tether
Courtesy of CHRYSLER GROUP, LLC

This vehicle is equipped with a Lower Anchors and Tether for CHildren (LATCH) child restraint anchorage system for domestic markets. The LATCH system provides for the installation of suitable child restraints in certain seating positions without using the standard equipment seat belt provided for that seating position. The rear seats in these vehicles are equipped with a fixed-position child restraint upper tether anchor for both the center and the two outboard seating positions, and child restraint lower anchors (also known as ISOFIX anchors) for child restraints in either the two outboard seating positions or for the right outboard and the center positions only. There should never be three child restraints installed in the rear seat at the same time. Vehicles manufactured for export markets are not equipped with the upper tether anchors, but do have the ISOFIX lower anchors.

The three upper tether anchors (3) are integral to the rear seat back panels. One anchor is integral to the back of the right rear panel (2), and two are integral to the left rear panel (1). These anchors are each constructed from short lengths of heavy-gauge steel wire that is securely welded to the seat back frames. A molded plastic trim bezel and cup provides a neat appearance to each of the anchor openings in the seat back panels.

These child restraint upper tether anchors cannot be adjusted or repaired and, if ineffective or damaged, they must be replaced as a unit with their respective rear seat back panels. The trim bezels are available for separate service replacement.

Fig. 53: ISOFIX Lower Anchors
Courtesy of CHRYSLER GROUP, LLC

The ISOFIX lower anchors are integral to the left or right rear seat stanchion assembly located beneath the rear edge of the rear seat cushion. These anchors are each constructed from a heavy-gauge steel wire loop that is securely welded to the rear seat stanchion frame. The rear seat ISOFIX lower anchors are each accessed from the front of their respective seat, at each side where the seat back meets the seat cushion. Round marker buttons with a molded child seat icon help identify the ISOFIX anchor locations as they may be otherwise difficult to see with the seat back in the upright position.

The child restraint ISOFIX lower tether anchors cannot be adjusted or repaired and, if ineffective or damaged, they must be replaced as a unit with the rear seat stanchion assembly.

WARNING: **To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog.**

OPERATION

OPERATION

All vehicles manufactured for sale in the United States and Canada are required to be equipped with a Lower Anchors and Tether for CHildren, or LATCH child restraint anchorage system. The second row seats in this vehicle have two pairs of anchor provisions for installing a LATCH-compatible child seat. A single seat may be mounted in the center seating position, one in each outboard seating position or one in the center and another in the right outboard position. There should never be three seats installed at the same time, or a seat in the center position in combination with a seat in the left outboard position.

With LATCH, child seats are secured by direct attachment to the vehicle seat structure, rather than by the seat belts. With LATCH-compatible child seats, lower (also known as ISOFIX) anchors attach to the seat structure through heavy-gauge wire loops located at the intersection between the seat cushion and the seat back surfaces.

Three upper tether anchors are integral to the second row seat back frames to secure the top tether strap of child seats equipped with this feature. These upper tether anchors work with both LATCH-compatible and other child seats equipped with a top tether strap. Vehicles manufactured for export markets are equipped with only the ISOFIX lower anchors, and have no upper tether anchor provisions.

The owner's information packet in the vehicle glove box contains details and suggestions on the proper use of all of the factory-installed child restraint anchors.

BUCKLE, SEAT BELT

STANDARD PROCEDURE

STANDARD PROCEDURE - SEAT BELT ANCHOR RELEASE

WARNING: To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog.

Fig. 54: Lower Anchor Buckle, Allen Key Wrench & Lower Anchor Latch Plate
Courtesy of CHRYSLER GROUP, LLC

Use two Allen key wrenches and the following steps in sequence to disconnect the front seat belt lower anchor latch plate (3) from the lower anchor buckle (1).

1. Insert an Allen key wrench (2) of the appropriate size into the outer hole at the bottom of the anchor buckle housing far enough to compress and hold compressed the internal lock feature of the buckle.
2. While pushing the anchor buckle lightly downward to relieve the tension of the buckle latch mechanism on the latch plate, insert a second Allen key wrench (4) of the appropriate size into the hole in the side of the buckle housing far enough to compress the internal latch plate release feature of the buckle.
3. Pull the seat belt anchor latch plate out of the anchor buckle.
4. Remove both Allen key wrenches from the holes in the anchor buckle housing.

REMOVAL

FRONT ANCHOR TENSIONER

WARNING: **To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in**

accidental airbag deployment.

WARNING: To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog.

Fig. 55: B-Pillar, Front Seat Belt Anchor Tensioner Buckle & Front Seat Belt Anchor Latch Plate
Courtesy of CHRYSLER GROUP, LLC

NOTE: The following procedure is for replacement of an ineffective or damaged seat belt anchor tensioner unit. If the front seat belt anchor tensioner is ineffective or damaged, but is not deployed, review the recommended procedures for Handling Non-Deployed Supplemental Restraints. Refer to HANDLING NON-DEPLOYED SUPPLEMENTAL RESTRAINTS. If the seat belt anchor tensioner has been deployed, review the recommended procedures for Service After A Supplemental Restraint Deployment before removing the unit from the vehicle. Refer to SERVICE AFTER A SUPPLEMENTAL RESTRAINT SYSTEM DEPLOYMENT.

1. Position the front seat for easiest access to the front seat belt anchor tensioner buckle (2).
2. Disconnect and isolate the negative cable from the battery. Wait two minutes for the system capacitor to

discharge before further service.

3. Release the front seat belt anchor latch plate (3) from the anchor buckle. Refer to **BUCKLE, SEAT BELT, STANDARD PROCEDURE**.

Fig. 56: Lower B-Pillar, Front Seat Belt Anchor Tensioner Unit, Screw & Harness Connector
Courtesy of CHRYSLER GROUP, LLC

4. Remove the trim from the lower B-pillar (1) and from over the front seat belt anchor tensioner unit (2) on the inner sill at the base of the B-pillar. Refer to **PANEL, B-PILLAR TRIM, REMOVAL** .
5. Disconnect the body wire harness connector (4) from the anchor tensioner initiator.
6. Remove the screw (3) that secures the anchor tensioner unit to the inner sill.
7. Remove the anchor tensioner unit from the vehicle.

FRONT SEAT

WARNING: **To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog.**

Fig. 57: Front Seat Belt Buckle, Seat Belt Buckle Switch Pigtail Wire Connector & Screw
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative cable from the battery.
2. Remove the front seat from the vehicle. Refer to **SEAT, REMOVAL** .
3. Remove the screw (3) that secures the front seat belt buckle (1) lower anchor to the bracket near the back of the upper inboard seat track.
4. Reach under the seat cushion to access and disconnect the seat wire harness connector from the seat belt buckle switch pigtail wire (2) connector.
5. Remove the seat belt buckle from the front seat.

REAR CENTER

WARNING: **To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog. Failure to follow these instructions may result in possible serious or fatal**

injury.

Fig. 58: Center Seat Belt Buckle And Anchor
Courtesy of CHRYSLER GROUP, LLC

1. Adjust the right (40 percent) rear seat to the full forward position, and the left (60 percent) rear seat to the full rearward position.
2. Working from behind the rear seats, unsnap and remove the trim cover from the inboard hinge bracket of the left (60 percent) rear seat.
3. Still working from behind the rear seats, remove the screw (1) that secures the lower anchor for the rear center seat belt buckle (2) to the inboard side of the left (60 percent) rear seat cushion frame (3).
4. Remove the center seat belt buckle and anchor from the left (60 percent) rear seat.

REAR LEFT

WARNING: **To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog. Failure to follow these instructions may result in possible serious or fatal injury.**

Fig. 59: Rear Left Seat Belt Buckle And Anchor Plate (60 Percent)
Courtesy of CHRYSLER GROUP, LLC

1. Remove the left (60 percent) rear seat from the vehicle. Refer to **SEAT, REAR, REMOVAL** .
2. Working beneath the rear of the left (60 percent) rear seat cushion, remove the screw (2) that secures the anchor plate of the rear left seat belt buckle (3) to the rear seat cushion frame (1).
3. Remove the rear left seat belt buckle and anchor plate from the left (60 percent) rear seat cushion as a unit.

REAR RIGHT

WARNING: **To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog. Failure to follow these instructions may result in possible serious or fatal injury.**

Fig. 60: Right Rear Seat Belt Buckle Ancchor
Courtesy of CHRYSLER GROUP, LLC

1. Adjust the left (60 percent) rear seat (4) to the full forward position, and the right (40 percent) rear seat (3) to the full rearward position.
2. Working from behind the rear seats, remove the screw (2) that secures the lower anchor for the right rear seat belt buckle (1) to the bracket at the back of the right rear seat upper inner adjuster track.
3. Remove the right rear seat belt buckle from between the rear seat cushions as a unit.

INSTALLATION

FRONT ANCHOR TENSIONER

WARNING: **To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.**

WARNING: **To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper**

installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog.

Fig. 61: Lower B-Pillar, Front Seat Belt Anchor Tensioner Unit, Screw & Harness Connector
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The following procedure is for replacement of an ineffective or damaged seat belt anchor buckle tensioner unit. The front seat belt anchor buckle is secured to a seat belt anchor buckle tensioner. If the front seat belt anchor buckle tensioner is ineffective or damaged, but the tensioner is not deployed, review the recommended procedures for Handling Non-Deployed Supplemental Restraints. Refer to HANDLING NON-DEPLOYED SUPPLEMENTAL RESTRAINTS. If the seat belt anchor buckle tensioner has been deployed, review the recommended procedures for Service After A Supplemental Restraint Deployment before removing the unit from the vehicle. Refer to SERVICE AFTER A SUPPLEMENTAL RESTRAINT SYSTEM DEPLOYMENT.**

1. Position the front seat belt anchor buckle tensioner unit (2) into the vehicle.
2. Install and tighten the screw (3) that secures the anchor tensioner unit to the inner sill. Tighten the screw to 45 N.m (33 ft. lbs.).
3. Reconnect the body wire harness connector (4) to the anchor tensioner initiator.
4. Reinstall the lower B-pillar trim panel over the front seat belt anchor tensioner unit on the inner sill at the base of the B-pillar. Refer to **PANEL, B-PILLAR TRIM, INSTALLATION** .

Fig. 62: B-Pillar, Front Seat Belt Anchor Tensioner Buckle & Front Seat Belt Anchor Latch Plate
Courtesy of CHRYSLER GROUP, LLC

5. Engage the front seat belt anchor latch plate (3) into the anchor buckle (2).
6. Do not reconnect the negative cable to the battery at this time. The Supplemental Restraint System (SRS) Verification Test procedure should be performed following service of any SRS component. Refer to **SUPPLEMENTAL RESTRAINT SYSTEM VERIFICATION TEST**.

FRONT SEAT

WARNING: **To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog.**

Fig. 63: Front Seat Belt Buckle, Seat Belt Buckle Switch Pigtail Wire Connector & Screw
Courtesy of CHRYSLER GROUP, LLC

1. Position the front seat belt buckle (1) lower anchor to the bracket near the back of the upper inboard seat track.
2. Reach under the seat cushion to access and reconnect the seat wire harness connector to the seat belt buckle switch pigtail wire (2) connector.
3. Install and tighten the screw (3) that secures the buckle lower anchor to the bracket. Tighten the screw to 45 N.m (33 ft. lbs.).
4. Reinstall the front seat into the vehicle. Refer to **SEAT, INSTALLATION** .
5. Reconnect the negative cable to the battery.

REAR CENTER

WARNING: **To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog.**

Failure to follow these instructions may result in possible serious or fatal injury.

Fig. 64: Center Seat Belt Buckle And Anchor
Courtesy of CHRYSLER GROUP, LLC

1. Position the rear center seat belt buckle (2) and anchor plate to the left (60 percent) rear seat.
2. Working from behind the rear seats, install and tighten the screw (1) that secures the lower anchor for the rear center seat belt buckle to the inboard side of the left (60 percent) rear seat cushion frame (3). Tighten the screw to 55 N.m (41 ft. lbs.).
3. Still working from behind the rear seats, reinstall the trim cover onto the inboard hinge bracket of the left (60 percent) rear seat.
4. Adjust the left (60 percent) rear seat and right (40 percent) rear seat to their original positions.

REAR LEFT

WARNING: **To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog. Failure to follow these instructions may result in possible serious or fatal**

injury.

Fig. 65: Rear Left Seat Belt Buckle And Anchor Plate
Courtesy of CHRYSLER GROUP, LLC

1. Working beneath the rear of the left (60 percent) rear seat cushion, position the rear left seat belt buckle (3) to the rear seat cushion frame (1).
2. Install and tighten the screw (2) that secures the anchor plate of the rear left seat belt buckle to the rear seat cushion frame. Tighten the screw to 55 N.m (41 ft. lbs.).
3. Reinstall the left (60 percent) rear seat into the vehicle. Refer to **SEAT, REAR, INSTALLATION** .

REAR RIGHT

WARNING: **To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog. Failure to follow these instructions may result in possible serious or fatal injury.**

Fig. 66: Right Rear Seat Belt Buckle Ancchor
Courtesy of CHRYSLER GROUP, LLC

1. Working from behind the rear seats, position the rear right seat belt buckle (1) between the rear seat cushions as a unit.
2. Position the lower anchor of the seat belt buckle to the bracket at the back of the right rear seat upper inner adjuster track.
3. Install and tighten the screw (2) that secures the buckle anchor to the bracket at the back of the right rear seat upper inner adjuster track. Tighten the screw to 55 N.m (41 ft. lbs.).
4. Adjust the left (60 percent) rear seat (4) and right (40 percent) rear seat (3) to their original positions.

CLOCKSPRING

DESCRIPTION

DESCRIPTION

Fig. 67: Steering Column Control Module (SCCM) & Clockspring
Courtesy of CHRYSLER GROUP, LLC

The clockspring (4) for this vehicle is secured to the Steering Column Control Module (SCCM) mounting housing (2) near the top of the steering column below the steering wheel. The clockspring is contained within a flat, molded plastic case that includes four integral mounting tabs that secure the unit with screws to mounts integral to the outer circumference of the SCCM mounting housing. The clockspring also includes an integral turn signal cancel cam that is serviced as a unit with the clockspring. The SCCM mounting housing also supports the left (1) and right (3) multifunction switches and the Steering Control Module (SCM), which is internal to the mounting housing. The multifunction switches and the SCM are serviced only as a unit with the SCCM mounting housing, while the clockspring can be separated from and is serviced separately from the SCCM mounting housing.

Within the plastic clockspring case is a spool-like molded clear plastic rotor with an exposed hub. The upper surface of the rotor hub has a large center hole, three short pigtail wires with connectors and a connector receptacle that face toward the steering wheel. The inner surface of the clockspring rotor hub has keyway features that are engaged by lug features on the outer circumference of the steering wheel hub. These interlocking features allow the steering wheel to drive the clockspring and also unlock the clockspring rotor when the steering wheel has been properly installed.

Wound around the rotor spool within the case are long ribbon-like tapes that consist of several thin copper wire leads sandwiched between two thin plastic membranes. The outer end of the tapes terminate at the terminal pins that are housed within a connector receptacle integral to the SCCM mounting housing and face the instrument panel, while the inner ends of the tapes terminate at the pigtail wires and connector receptacle on the hub of the clockspring rotor that face the steering wheel. The outer surface of the rotor spool hub within the clockspring case also has the integral lobes of the turn signal cancel cam.

The clockspring also has an interconnect with terminal pins that engage a mating interconnect receptacle integral to the SCCM mounting housing. This interconnect features several circuits which pass through the clockspring to connect the SCM to the vehicle electrical system.

The clear plastic clockspring rotor has an outer band that has a translucent or frosted appearance except for a small, clear inspection window area. The clockspring tape has several black squares that are only visible through the clear inspection window when the clockspring is properly centered. If these squares are not visible through the inspection window, clockspring centering has been compromised and the entire clockspring must be replaced with a new unit.

The service replacement clockspring is shipped with the clockspring pre-centered and with a yellow molded plastic locking tab installed. The locking tab secures the centered clockspring rotor to the clockspring case during shipment and handling, but must be removed after the clockspring is installed on the steering column and before the steering wheel can be installed. The clockspring cannot be repaired. If the clockspring is ineffective, damaged, if clockspring centering is compromised or if the Driver AirBag (DAB) has been deployed the entire clockspring unit must be replaced. Refer to **CLOCKSPRING, STANDARD PROCEDURE**.

OPERATION

OPERATION

The clockspring is a mechanical electrical circuit component that is used to provide continuous electrical continuity between the fixed instrument panel wire harness and certain electrical components mounted on or in the rotating steering wheel. On this vehicle the rotating electrical components include the Driver AirBag (DAB), the horn switch and, if the vehicle is so equipped, the odometer switch pod or the Electronic Vehicle Information Center (EVIC) switch pod, the Local Interface Network (LIN) module, the speed control switch pod and the remote radio switches. The clockspring is positioned and secured near the top of the steering column. The fixed connector receptacle on the back of the fixed Steering Column Control Module (SCCM) mounting housing connects the clockspring to the vehicle electrical system through a take out with connector from the instrument panel wire harness.

The turn signal cancel cam is integral to the rim of the clockspring rotor hub within the SCCM mounting housing so it also moves with the rotation of the steering wheel. Three short, sleeved pigtail wires on the upper surface of the clockspring rotor connect the clockspring to the DAB, while a steering wheel wire harness connected to the connector receptacle on the upper surface of the clockspring rotor completes circuits to the horn switch and, if the vehicle is so equipped, the odometer switch pod or the EVIC switch pod, the LIN module, the speed control switch pod and the remote radio switches.

Like the clockspring in a timepiece, the clockspring tape has travel limits and can be damaged by being wound too tightly during full stop-to-stop steering wheel rotation. To prevent this from occurring, the clockspring is centered when it is installed on the steering column. Centering the clockspring indexes the clockspring tape to the movable steering components so that the tape can operate within its designed travel limits.

However, if the steering shaft is disconnected from the steering gear the clockspring rotor spool can change position relative to other movable steering components. Clockspring centering must be confirmed by viewing the inspection window on the clockspring rotor. If the black squares of the clockspring tape are not visible in

the inspection window, clockspring centering has been compromised and the entire clockspring must be replaced with a new unit.

Service replacement clocksprings are shipped pre-centered and with a yellow plastic locking tab installed. This locking tab should not be removed until the clockspring has been properly installed on the steering column. If the locking tab is removed before the clockspring is installed on a steering column, clockspring centering must be confirmed by viewing the inspection window on the clockspring rotor. If the black squares of the clockspring tape are not visible in the inspection window, the clockspring must be replaced with a new unit.

The hard wired clockspring circuits may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the electronic controls and communication between stationary electronic modules and devices in the vehicle and the rotating electronic modules and devices on or in the steering wheel. The most reliable, efficient and accurate means to diagnose the electronic controls and communication related to clockspring operation requires the use of a diagnostic scan tool and may also require the use of the SRS Load Tool special tool along with the appropriate Load Tool Jumpers and Adapters. Refer to the appropriate diagnostic information.

STANDARD PROCEDURE

STANDARD PROCEDURE - CLOCKSPRING CENTERING

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

CAUTION: Always turn the steering wheel until the front wheels are in the straight-ahead position. Then, prior to disconnecting the steering column from the steering gear, lock the steering wheel to the steering column. If clockspring centering has been compromised for ANY reason, the entire Steering Column Control Module (SCCM) and clockspring unit MUST be replaced with a new unit.

Fig. 68: Clockspring Rotor, Inspection Window & Black Squares
Courtesy of CHRYSLER GROUP, LLC

Like the clockspring in a timepiece, the clockspring tape has travel limits and can be damaged by being wound too tightly during full stop-to-stop steering wheel rotation. To prevent this from occurring, the clockspring is centered when it is installed on the steering column. Centering the clockspring indexes the clockspring tape to the movable steering components so that the tape can operate within its designed travel limits. However, if the steering shaft is disconnected from the steering gear, the clockspring rotor spool can change position relative to the fixed steering components.

Clockspring centering must always be confirmed by viewing the inspection window (2) on the clockspring rotor (1). If the black squares (3) on the clockspring tape are not visible through the inspection window, clockspring centering has been compromised and the clockspring must be replaced with a new unit. Refer to **CLOCKSPRING, REMOVAL**.

The service replacement clockspring is shipped pre-centered and with a yellow plastic locking tab installed. This locking tab should not be removed until the clockspring has been properly installed on the steering column. If the locking tab is removed before the clockspring is installed on a steering column, clockspring centering must be confirmed by viewing the black squares on the clockspring tape through the inspection window on the clockspring rotor. If the black squares of the clockspring tape are not visible through the inspection window, clockspring centering has been compromised and the clockspring must be replaced with a new unit. Refer to **CLOCKSPRING, INSTALLATION**.

REMOVAL

REMOVAL

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

Fig. 69: Clockspring & Fasteners
Courtesy of CHRYSLER GROUP, LLC

NOTE: Before starting this procedure, be certain to turn the steering wheel until the front wheels are in the straight-ahead position and be certain that the entire steering system is locked or inhibited from rotation.

1. Place the front wheels in the straight ahead position.
2. Disconnect and isolate the negative cable from the battery.
3. Remove the Driver AirBag (DAB) from the steering wheel. Refer to **AIR BAG, DRIVER, REMOVAL**.
4. Disconnect the steering wheel wire harness connector from the upper clockspring connector receptacle.
5. Remove the steering wheel from the upper steering column shaft. Refer to **WHEEL, STEERING, REMOVAL** .
6. If the removed clockspring is to be reused, be certain that the clockspring rotor is secured to the clockspring case to maintain clockspring centering until the steering wheel is reinstalled on the steering

column. If clockspring centering is not maintained, the clockspring must be replaced with a new unit. Refer to **CLOCKSPRING, STANDARD PROCEDURE**.

7. Move the steering column to the fully lowered position and leave the tilt release lever in the released (down) position.
8. Remove the upper and lower shrouds from the steering column. Refer to **SHROUD, STEERING COLUMN, LOWER, REMOVAL** and **SHROUD, STEERING COLUMN, UPPER, REMOVAL** .
9. Disconnect the instrument panel wire harness connectors from the back of the Steering Column Control Module (SCCM) mounting housing (1).
10. Remove the four screws (2) that secure the clockspring to the outer circumference of the SCCM mounting housing.
11. Carefully pull the clockspring (3) away from the SCCM mounting housing far enough to disengage the interconnect terminal pins of the clockspring from the interconnect receptacle of the SCCM mounting housing.
12. Remove the clockspring from the steering column.

INSTALLATION

INSTALLATION

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

Fig. 70: Clockspring & Fasteners
Courtesy of CHRYSLER GROUP, LLC

NOTE: Before starting this procedure, be certain to turn the steering wheel until the front wheels are in the straight-ahead position and be certain that the entire steering system is locked or inhibited from rotation.

1. Carefully slide the clockspring (3) down over the steering column upper shaft far enough to align and engage the interconnect terminal pins of the clockspring with the interconnect receptacle of the Steering Column Control Module (SCCM) mounting housing (1).
2. Install and tighten the four screws (2) that secure the mounting tabs of the clockspring to the outer circumference of the SCCM mounting housing. Tighten the screws securely.
3. Reconnect the instrument panel wire harness connectors to the back of the SCCM mounting housing.
4. Reinstall the upper and lower shrouds onto the steering column. Refer to **SHROUD, STEERING COLUMN, LOWER, INSTALLATION** and **SHROUD, STEERING COLUMN, UPPER, INSTALLATION** .
5. Move the steering column back to the fully raised position and move the tilt release lever back to the locked (up) position.
6. If a new clockspring is being installed, remove (break off) the yellow locking tab that secures the clockspring rotor to the clockspring case.
7. Reinstall the steering wheel onto the upper steering column shaft. Be certain to align and insert the rotational lugs on the steering wheel hub into the slots in the hub of the clockspring. Also, the steering wheel fastener **MUST** be tightened to the proper torque specification to ensure proper clockspring operation. Refer to **WHEEL, STEERING, INSTALLATION** .
8. Reconnect the steering wheel wire harness connector to the upper clockspring connector receptacle.

9. Reinstall the Driver AirBag (DAB) onto the steering wheel. Refer to **AIR BAG, DRIVER, REMOVAL**.
10. Do not reconnect the negative cable to the battery at this time. The Supplemental Restraint System (SRS) Verification Test procedure should be performed following service of any SRS component. Refer to **SUPPLEMENTAL RESTRAINT SYSTEM VERIFICATION TEST**.

INDICATOR, SEAT BELT REMINDER (SBR)

DESCRIPTION

DESCRIPTION

Fig. 71: Seat Belt Reminder (SBR) Indicator
Courtesy of CHRYSLER GROUP, LLC

Vehicles manufactured for certain export markets are equipped with the Seat Belt Reminder (SBR) indicator (1), which is located within the overhead console. The SBR indicator consists of Light Emitting Diode (LED) units, a Local Interface Network (LIN) data bus communication microchip, an opaque overlay and a translucent outer lens.

The molded plastic indicator housing is secured to the inner surface of the overhead console housing by two spring clips (2) on each end of the housing. An integral connector receptacle on the back of the housing connects the SBR to the vehicle electrical system through a dedicated take out and connector of the overhead console wire harness.

The opaque overlay of the SBR includes five stencil-like cutouts of the International Control and Display Symbol icon for **Seat Belt** within the SBR indicator. Three of the icons in the center of the display are smaller and represent the three rear seating positions, while the two larger icons border the smaller ones and represent

the two front seating positions. An LED unit behind each icon causes that icon to appear in green or red through the translucent lens when it is illuminated from behind by the LED.

Some settings for the SBR feature may be programmable using a diagnostic scan tool and the appropriate commands through the Instrument Cluster (IC) (also known as the Instrument Panel Cluster/IPC) Electronic Control Unit (ECU). The SBR indicator cannot be adjusted or repaired and, if ineffective or damaged the SBR indicator unit must be replaced.

OPERATION

OPERATION

The Seat Belt Reminder (SBR) indicator gives an indication to the vehicle operator and occupants of the status of the seat belt for each seating position of the vehicle. When a seat belt is buckled, the icon for that seating position is illuminated in green and when a seat belt is unbuckled, the icon for that seating position is illuminated in red. In the case of the larger icons representing the front seating positions, the indicator is illuminated in red only if the seat is occupied (the driver seat is assumed to be occupied while the status of the ignition is On) and the seat belt is unbuckled, while the smaller icons representing the rear seating positions are illuminated in red with the seat belt unbuckled regardless of whether that seating position is occupied.

The Occupant Restraint Controller (ORC) monitors the status of each of the seat belt switches and the Occupant Detection Sensor (ODS) for the passenger side front seat. The ORC then sends the appropriate seat belt switch status messages over the Controller Area Network (CAN) data bus to the Instrument Cluster (IC) (also known as the Instrument Panel Cluster/IPC). The IC uses internal hardware and programming to interpret the messages from the ORC and manage both the audible and visual features of the seat belt reminder function. The IC controls audible outputs related to the seat belt reminder through an on board transducer soldered onto its Printed Circuit Board (PCB). The IC is also a Local Interface Network (LIN) master node and uses a number of electronic command messages to control the visual output of the SBR indicator, which is a LIN slave node.

Besides the seat belt switch messages from the ORC, the IC also monitors vehicle speed and the Reverse (**R**) gear status in order to implement the various visual and audible outputs it controls. Besides the solid red or green indications, the SBR red indication may be flashed on and off, as dictated by the LIN bus message from the IC. All seat belt reminder audible and visual indications have several pre-programmed counters that will cause the indications to change or cease upon expiration of certain timed intervals or due to a change of an input status. Some of the feature programming is mandated by state, provincial, local and federal regulations.

The SBR indicator is completely controlled by the IC. The indicator receives a battery current input on a fused ignition (run) circuit and is connected to a path to ground at all times. Therefore, the SBR indicator will always be Off when the status of the ignition switch (also known as the Keyless Ignition Node/KIN or IGnition Node Module/IGNM) is anything except On.

The IC and the ORC will store Diagnostic Trouble Codes (DTC) for any malfunctions they detect. The hard wired circuits between the SBR indicator and the IC may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the SBR indicator or the electronic controls and communication between other modules and devices that provide some features of the SBR. The most reliable, efficient and accurate means to diagnose the SBR indicator or the electronic controls and communication related to SBR indicator

operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

REMOVAL

Fig. 72: Overhead Console & Seat Belt Reminder (SBR) Indicator Location
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative cable from the battery.
2. Remove the overhead console (1) from the headliner. Refer to **CONSOLE, OVERHEAD, FRONT, REMOVAL** .
3. If the vehicle is so equipped, remove the Ultrasonic and Antitilt Module (UAM) (also known as the Ultrasonic Alarm Module/UAM or the Intrusion Transceiver Module/ITM) from the overhead console. Refer to **MODULE, ULTRASONIC AND ANTI-TILT, REMOVAL** .
4. Disconnect the overhead console wire harness connector (2) from the Seat Belt Reminder (SBR) indicator (3) connector receptacle.
5. Using a trim stick or another suitable wide flat-bladed tool, carefully and evenly pry each outboard end of the SBR away from the overhead console housing until all four spring clips are free.
6. Remove the SBR indicator from the overhead console.

INSTALLATION

INSTALLATION

Fig. 73: Overhead Console & Seat Belt Reminder (SBR) Indicator Location
Courtesy of CHRYSLER GROUP, LLC

1. Position the Seat Belt Reminder (SBR) indicator (3) to the overhead console (1) housing.
2. Align the SBR indicator to the opening in the overhead console housing.
3. Press the outboard ends of the SBR indicator firmly and evenly into the overhead console housing until the four spring clips are fully seated.
4. Reconnect the overhead console wire harness connector (2) to the SBR indicator connector receptacle.
5. If the vehicle is so equipped, reinstall the Ultrasonic and Antitilt Module (UAM) (also known as the Ultrasonic Alarm Module/UAM or the Intrusion Transceiver Module/ITM) onto the overhead console. Refer to **MODULE, ULTRASONIC AND ANTI-TILT, INSTALLATION** .
6. Reinstall the overhead console onto the headliner. Refer to **CONSOLE, OVERHEAD, FRONT, INSTALLATION** .
7. Reconnect the negative cable to the battery.

MODULE, OCCUPANT CLASSIFICATION

DESCRIPTION

DESCRIPTION

100868364

Fig. 74: Seat Cushion Foam, Insulator Pad, Occupant Classification Module, Pressure Hose & Bladder
Courtesy of CHRYSLER GROUP, LLC

In vehicles manufactured for domestic markets, the passenger side front seat incorporates the Occupant Classification System (OCS). The OCS consists of a single factory-calibrated unit, which includes the following components:

- **Electronic Pressure Sensor** - The electronic pressure sensor is integral and internal to the Occupant Classification Module (OCM). Only the hose nipple for the pressure hose is visible on the outside of the OCM housing. The remainder of the sensor and the sensor circuitry are concealed and protected within the molded black plastic OCM housing.
- **Occupant Classification Module** - The Occupant Classification Module (OCM) (3) is located beneath the front of the passenger front seat cushion. Concealed within a hollow in the center of the molded black plastic OCM housing is the electronic circuitry of the module. The module housing is sealed to enclose and protect the internal electronic circuitry. A connector receptacle integral to the front of the OCM housing contains terminal pins that connect the sensor to the vehicle electrical system through a dedicated take out and connector of the passenger front seat wire harness. A hose nipple formation is integral to the OCM housing.

  A slot integral to the top of the OCM housing snaps over a blade on a stamped metal bracket riveted to the inboard upper seat track on models with the base seat. On models with the optional storage seat, the OCM housing snaps over a blade on a molded plastic stanchion integral to the forward inboard underside of the seat cushion pan.

- **Pressure Hose** - Beneath the seat cushion a length of clear poly hose serves as the OCS pressure hose (4). The hose is securely clamped at one end to a hose nipple fitting that extends downward from the Seat Weight Sensor (SWS) (also known as the seat weight bladder), and at the opposite end to the hose nipple formation of the electronic pressure sensor integral to the outside of the OCM housing. The pressure sensor circuitry is internal and integral to the OCM. The pressure hose is filled with the same silicone fluid that fills the SWS.

- **Seat Cushion Foam** - The passenger front seat cushion foam (1) is an integral part of the factory-calibrated OCS. There are two unique foam configurations: one for the standard passenger front seat and another for the optional storage front seat. The storage front seat includes a small storage bin which is accessed by lifting the center insert of the seat cushion.
- **Seat Weight Sensor** - The Seat Weight Sensor (SWS) (also known as the seat weight bladder) is sandwiched between the seat cushion springs and the seat cushion foam. A heavy jute-like insulator pad (2) is installed between the lower surface of the bladder (5) and the seat cushion pan and springs. The bladder and pad are secured near the forward end to the seat cushion pan by two plastic push-in fasteners. There are two unique bladder configurations: one for the standard passenger front seat and another for the optional storage front seat. The storage front seat includes a small storage bin which is accessed by lifting the center insert of the seat cushion.

  The bladder consists of two sheets of an elastomeric material and a molded plastic hose nipple fitting. The two sheets of elastomeric material are sealed together around their perimeter and joined at numerous specific intervals within their field. The hose nipple fitting is sealed to a small round hole in the lower surface of the bladder and is pointed downward where it passes through a clearance hole in the insulator pad and extends to just below the seat cushion springs. The bladder is filled with a silicone fluid to become a pliable, quilted, resistive mat and is connected to a pressure hose that connects it to the electronic pressure sensor within the OCM unit.

All of the components that make up the OCS are a factory-calibrated and assembled unit. The OCS components cannot be adjusted or repaired and, if damaged or ineffective, they must be replaced as a calibrated unit. Any time the OCS is removed or replaced for any reason, the new OCS data must be configured within the Occupant Restraint Controller (ORC) using a diagnostic scan tool. Refer to the appropriate diagnostic information.

OPERATION

OPERATION

In vehicles manufactured for domestic markets, the Occupant Classification System (OCS) provides electronic message inputs to other electronic modules in the vehicle indicating whether the passenger front seat is occupied and the relative size classification of the seat occupant. The microcontroller within the Occupant Classification Module (OCM) contains the OCS logic and communication circuitry. The OCM uses On-Board Diagnostics (OBD) and can communicate with other electronic modules in the vehicle as well as with a diagnostic scan tool using the Controller Area Network (CAN) data bus. This method of communication is also used for OCS diagnosis and testing through the 16-way data link connector located on the driver side lower edge of the instrument panel.

The Seat Weight Sensor (SWS) (also known as the seat weight bladder) and the electronic pressure sensor integral and internal to the OCM allow the OCS logic circuits to sense the relative weight of a load applied to the passenger front seat cushion. When a load is applied to the seat cushion, silicone fluid within the bladder becomes pressurized. These changes in bladder fluid pressure are measured by the electronic pressure sensor circuitry through the OCS pressure hose. As the pressure within the bladder changes, the electronic pressure sensor input to the OCM microcontroller also changes. This electronic pressure sensor input allows the OCM to monitor the passenger front seat cushion by providing a weight-sensing reference to the relative load on the seat cushion.

Pre-programmed decision algorithms and OCS calibration allow the OCM microcontroller to determine the appropriate occupant classification based upon the seat cushion load as signaled by the pressure sensor. The OCM then sends the proper electronic **occupant classification status** messages over the CAN data bus to the Occupant Restraint Controller (ORC) and the ORC controls the deployment circuits for the passenger front supplemental restraints accordingly.

The OCM continuously monitors all of the OCS electrical circuits and components to determine the system readiness. If the OCM detects a monitored system fault, it sets an active and stored Diagnostic Trouble Code (DTC) and sends the appropriate electronic messages to the Occupant Restraint Controller (ORC) over the CAN data bus. Then the ORC sets a DTC and sends electronic messages to the Instrument Cluster (IC) (also known as the Instrument Panel Cluster/IPC) to control airbag indicator operation.

The OCM receives battery current on a fused ignition output (run-start) circuit through a fuse in the Power Distribution Center (PDC). The OCM circuitry has a path to ground at all times through a ground circuit and take out of the instrument panel wire harness, which it shares with the ORC. This take out is secured to the body sheet metal. These connections allow the OCM to be operational whenever the ignition switch status is ON or START.

The Body Control Module (BCM) stores and compares vehicle configuration data with the OCM as well as with other Electronic Control Units (ECU) in the vehicle. This process is referred to as PRogramming Of Configuration of Systems Integrated (PROCSI) (also known as PROXI). If a configuration mismatch is detected, the BCM sets a DTC. A configuration mismatch DTC will require the performance of a Restore BCM PROXI Configuration routine, or a PROXI Configuration Alignment routine using a diagnostic scan tool.

The hard wired inputs and outputs for the OCM may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the OCM or the electronic controls and communication between other modules and devices that provide some features of the OCS. The most reliable, efficient and accurate means to diagnose the OCM or the electronic controls and communication related to OCS operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

REMOVAL

WARNING: **To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.**

100868365

Fig. 75: Harness Connector, Blade, Stanchion & Occupant Classification Module
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The Occupant Classification System (OCS) is used only in the passenger side front seat of vehicles manufactured for domestic markets. Vehicles manufactured for export markets use the Occupant Detection Sensor (ODS) instead of the OCS on the passenger side front seat.**

NOTE: **All of the components of the Occupant Classification System (OCS) including the Occupant Classification Module (OCM), the Seat Weight Sensor (SWS) (also known as the seat weight bladder), the jute-like SWS pad, the passenger seat cushion foam, the electronic pressure sensor and the OCS pressure hose are serviced only as a factory-calibrated and assembled unit. Any time any one of these components requires replacement for any reason, the entire calibrated OCS must be replaced and re-zeroed in the Occupant Restraint Controller (ORC) using a diagnostic scan tool. Refer to the appropriate diagnostic information.**

1. Disconnect and isolate the negative cable from the battery. Wait two minutes for the system capacitor to discharge before further service.
2. Remove the passenger front seat from the vehicle. Refer to **SEAT, REMOVAL** .
3. Disconnect the seat wire harness connector (1) from the Occupant Classification Module (OCM) (4) beneath the inboard front corner of the seat cushion pan.
4. Using a small flat-bladed screwdriver or a small pick tool, carefully pry the latch tab integral to the OCM mount to release it from the blade (2) of the mounting bracket (base seat) or stanchion (3) (storage seat) beneath the inboard front corner of the seat cushion.
5. Remove the trim cover from the passenger front seat cushion. Refer to **COVER, SEAT CUSHION, REMOVAL** .

Fig. 76: Seat Cushion Foam, Seat Weight Sensor Pad & Seat Frame
Courtesy of CHRYSLER GROUP, LLC

6. Remove the foam (1) from the seat cushion.
7. Remove the two push-in plastic fasteners that secure the Seat Weight Sensor (SWS) (also known as the seat weight bladder) and the jute-like SWS pad (2) to the seat cushion pan (3).
8. Remove the SWS, the pad, the pressure hose and the OCM with integral electronic pressure sensor from above the front seat cushion as a unit.
9. If any of the OCS components requires replacement, discard the entire OCS unit. **Replace it with the entire contents of the factory-calibrated service replacement package, which includes an OCM with integral and internal electronic pressure sensor, a pressure hose, the SWS, the jute-like SWS pad and the seat cushion foam.**

INSTALLATION

INSTALLATION

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

Fig. 77: Seat Cushion Foam, Seat Weight Sensor Pad & Seat Frame
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The Occupant Classification System (OCS) is used only in the passenger side front seat of vehicles manufactured for domestic markets. Vehicles manufactured for export markets use the Occupant Detection Sensor (ODS) instead of the OCS on the passenger side front seat.**

NOTE: **All of the components of the Occupant Classification System (OCS) including the Occupant Classification Module (OCM), the Seat Weight Sensor (SWS) (also known as the seat weight bladder), the jute-like SWS pad, the passenger seat cushion foam, the electronic pressure sensor and the OCS pressure hose are serviced only as a factory-calibrated and assembled unit. Any time any one of these components requires replacement for any reason, discard all of the removed OCS components including the OCM with integral and internal electronic pressure sensor, the pressure hose, the SWS, the jute-like SWS pad and the seat cushion foam and replace them with the entire contents of the factory-calibrated OCS service replacement package.**

1. Position the Seat Weight Sensor (SWS) (also known as the seat weight bladder), the jute-like SWS pad (2), the Occupant Classification System (OCS) pressure hose and the Occupant Classification Module (OCM) with integral electronic pressure sensor to the top of the front seat cushion as a unit. Lift the back of the SWS and pad far enough to access and insert the OCM and pressure hose between the seat cushion springs to the underside of the seat cushion. Be certain the pressure hose is not pinched or kinked.
2. Install the two push-in plastic fasteners that secure the SWS and jute-like pad to the seat cushion pan (3).
3. Position the foam (1) onto the seat cushion.
4. Reinstall the trim cover onto the passenger front seat cushion. Refer to **COVER, SEAT CUSHION, INSTALLATION** .

100868365

Fig. 78: Harness Connector, Blade, Stanchion & Occupant Classification Module
Courtesy of CHRYSLER GROUP, LLC

5. From the underside of the seat cushion, snap the OCM (4) onto the blade (2) of the mounting bracket (base seat) or stanchion (3) (storage seat) beneath the inboard front corner of the seat cushion. Route the pressure hose away from sharp or moving objects and be certain the hose is not kinked.
6. Reconnect the seat wire harness connector (1) to the OCM beneath the inboard front corner of the seat cushion.
7. Reinstall the passenger front seat into the vehicle. Refer to **SEAT, INSTALLATION** .
8. If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.
9. Do not reconnect the negative cable to the battery at this time. The Supplemental Restraint System (SRS) Verification Test procedure should be performed following service of any SRS component. Refer to **SUPPLEMENTAL RESTRAINT SYSTEM VERIFICATION TEST**.
10. Following successful completion of the SRS Verification Test procedure, perform the OCM System Verification Test procedure found in the diagnostic scan tool under Miscellaneous Functions. Refer to the appropriate diagnostic procedures.

MODULE, OCCUPANT RESTRAINT CONTROLLER

DESCRIPTION

DESCRIPTION

Fig. 79: Occupant Restraint Controller, Printed Arrow, Connector Receptacles & Mounting Flanges
Courtesy of CHRYSLER GROUP, LLC

The Occupant Restraint Controller (ORC) (1) is secured by three nuts to three studs on the top of the floor panel transmission tunnel near the dash panel and beneath the instrument panel forward of the center stack in the passenger compartment of the vehicle. Concealed within a hollow in the center of the molded black plastic ORC housing is the electronic circuitry of the ORC which includes a microcontroller, an electronic impact sensor, an electronic safing sensor, a rollover sensor, a integral Electronic Stability Control (ESC) dynamics sensor (also known as the yaw sensor or sensor cluster) and an energy storage capacitor. A stamped metal cover plate is secured to the bottom of the ORC housing to enclose and protect the internal electronic circuitry and components.

An arrow (2) printed on the label on the top of the ORC housing provides a visual verification of the proper orientation of the unit, and should always be pointed toward the front of the vehicle. The ORC housing has integral mounting flanges (4) on the right and left front and the right rear corners. Two molded plastic electrical connector receptacles (3) exit the rearward facing side of the ORC housing. These receptacles connect the ORC to the vehicle electrical system through two dedicated take outs and connectors, one from the instrument panel wire harness and the second from the body wire harness.

The impact sensor and safing sensor internal to the ORC are calibrated for the specific vehicle, and are only serviced as a unit with the ORC. In addition, there are unique versions of the ORC for vehicles with or without certain optional Supplemental Restraint System (SRS) components. The ORC cannot be repaired or adjusted and, if damaged or ineffective, it must be replaced.

OPERATION

OPERATION

The microcontroller within the Occupant Restraint Controller (ORC) contains the Supplemental Restraint System (SRS) logic circuits and controls all of the SRS components. The ORC uses On-Board Diagnostics (OBD) and can communicate with other electronic modules in the vehicle as well as with the diagnostic scan tool using the Controller Area Network (CAN) data bus. This method of communication is used for control of the airbag and seat belt indicators in the Instrument Cluster (IC) (also known as the Instrument Panel Cluster/IPC) and for SRS diagnosis and testing through the 16-way data link connector located on the driver side lower edge of the instrument panel.

The ORC microcontroller continuously monitors all of the SRS electrical circuits to determine the system readiness. If the ORC detects a monitored system fault, it sets an active and stored Diagnostic Trouble Code (DTC) and sends electronic messages to the IC over the CAN data bus to turn On the airbag indicator. An active fault only remains for the duration of the fault, or in some cases for the duration of the current ignition cycle, while a stored fault causes a DTC to be stored in memory by the ORC. In the case of some faults which have not recurred for a number of ignition cycles, the ORC will automatically erase the stored DTC. For other internal faults, the stored DTC is latched forever.

The ORC receives battery current through two circuits; a fused ignition output (run) circuit through a fuse in the Power Distribution Center (PDC) and a fused ignition output (run-start) circuit through a second fuse in the PDC. The ORC receives ground through a ground circuit and take out of the instrument panel wire harness that is secured by a ground screw to the body sheet metal. These connections allow the ORC to be operational whenever the status of the ignition switch (also known as the Keyless Ignition Node/KIN or the IGnition Node Module/IGNM) is Start or On.

The ORC also contains an energy-storage capacitor. When the ignition switch status is Start or On, this capacitor is continually being charged with enough electrical energy to deploy the SRS components for up to one second following a battery disconnect or failure. The purpose of the capacitor is to provide backup SRS protection in case there is a loss of battery current supply to the ORC during an impact event.

Various sensors within the ORC are continuously monitored by the ORC logic. These internal sensors, along with several external impact sensor inputs allow the ORC to determine both the severity of an impact and to verify the necessity for deployment of any SRS components. Two remote front impact sensors are located on the back of the right and left sides of the Front End Module (FEM) carrier inboard of the headlamps near the front of the vehicle. The electronic impact sensors are accelerometers that sense the rate of vehicle deceleration, which provides verification of the direction and severity of an impact.

The ORC also monitors inputs from an internal rollover sensor, the seat track position sensors, the front seat belt switches, the rear seat belt switches (export markets only) and six additional remote side impact sensors located on the left and right front door hardware module carriers, on the right and left lower B-pillars and on the right and left lower C-pillars to control deployment of the side curtain airbag units, the front seat airbags (also known as pelvic and thoracic airbags) and, if equipped, the rear seat airbags. The ORC also uses electronic message inputs from the Occupant Classification Module (OCM) beneath the passenger front seat cushion pan and will send electronic messages to the IC to illuminate the seat belt indicator when appropriate.

The impact sensors within the ORC are electronic accelerometer sensors that provide an additional logic input to the ORC microcontroller. These sensors are used to verify the need for a SRS component deployment by detecting impact energy of a lesser magnitude than that of the primary electronic impact sensors, and must exceed a safing threshold in order for the SRS components to deploy. A separate impact sensor within the ORC

provides confirmation to the ORC microcontroller of side impact forces. The ORC uses this input to verify the need for side curtain airbags or seat airbag deployment. This separate sensor is a bi-directional unit that detects impact forces from either side of the vehicle.

In most domestic markets this vehicle is also equipped with the Occupant Classification System (OCS). The ORC communicates with the Occupant Classification Module (OCM) over the CAN data bus. The ORC uses inputs from the OCM as an additional logic input for determining the appropriate level of airbag deployment force required for the front passenger seating position. The OCM notifies the ORC when it has detected a monitored system fault and stored a DTC in its memory for any ineffective OCS component or circuit, then the ORC sets a DTC and will send electronic messages to the IC to illuminate the airbag indicator as appropriate.

Pre-programmed decision algorithms in the ORC microcontroller determine when the deceleration rate as signaled by the impact sensors indicate an impact that is severe enough to require SRS protection. Based upon the severity of the monitored impact as well as the seat track position sensor and the passenger front seat OCS inputs, the ORC logic determines the level of front airbag deployment force required for each front seating position. When the programmed conditions are met, the ORC sends the proper electrical signals to deploy the dual multistage front airbags at the programmed force levels, the knee airbags, the front seat belt tensioners, either side curtain airbag and either right or left, front and rear seat airbag units.

The ORC also contains a integral Electronic Stability Control (ESC) dynamics sensor (also known as the yaw sensor or the sensor cluster). The ORC microcontroller energizes the ESC dynamics sensor, then relays the sensor outputs to the Antilock Brake Module (ABM) over the CAN data bus. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, OPERATION** .

The Body Control Module (BCM) stores and compares vehicle configuration data with the ORC as well as with other Electronic Control Units (ECU) in the vehicle. This process is referred to as PRogramming Of Configuration of Systems Integrated (PROCSI) (also known as PROXI). If a configuration mismatch is detected, the BCM sets a DTC. A configuration mismatch DTC will require the performance of a Restore BCM PROXI Configuration routine, or a PROXI Configuration Alignment routine using a diagnostic scan tool.

The hard wired inputs and outputs for the ORC may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the ORC or the electronic controls and communication between other modules and devices that provide some features of the SRS. The most reliable, efficient and accurate means to diagnose the ORC or the electronic controls and communication related to SRS operation requires the use of a diagnostic scan tool and may also require the use of the SRS Load Tool special tool along with the appropriate Load Tool Jumpers and Adapters. Refer to the appropriate diagnostic information.

REMOVAL

REMOVAL

WARNING: To avoid serious or fatal injury on vehicles equipped with side curtain airbags, disable the Supplemental Restraint System (SRS) before attempting any Occupant Restraint Controller (ORC) diagnosis or service. The ORC may contain a rollover sensor, which enables the system to deploy the side SRS components in the event of a vehicle rollover event.

If an ORC containing a rollover sensor is accidentally rolled during service while still connected to battery power, the side SRS components will deploy. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: **To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.**

WARNING: **To avoid serious or fatal injury, never strike or drop the Occupant Restraint Controller (ORC), as it can damage the impact sensor or affect its calibration. The ORC contains the impact sensor, which enables the system to deploy the Supplemental Restraint System (SRS) components. If an ORC is accidentally dropped during service, the module must be scrapped and replaced with a new unit. Failure to observe this warning could result in accidental, incomplete, or improper SRS component deployment.**

100868612

Fig. 80: Nuts, Occupant Restraint Controller, Harness Connectors & Transmission Tunnel
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative cable from the battery. Wait two minutes for the system capacitor to discharge before further service.
2. Remove the front side panels from the center floor console on both the right and left sides of the floor panel transmission tunnel. Refer to **CONSOLE, FLOOR, REMOVAL** .
3. Working from the left side front floor panel, reach around the forward edge of the instrument panel center stack support on the floor panel transmission tunnel (5) to access, unlatch and disconnect the body wire harness connector (4) from the Occupant Restraint Controller (ORC) (2) connector receptacle located on the rearward facing side of the module. To disconnect the wire harness connector from the ORC, depress the release tab and lift the lever arm on the connector.
4. Still working from the left side front floor panel, remove the nut (1) that secures the left front mount of the ORC to the stud on the top of the floor panel transmission tunnel.
5. Working from the right side front floor panel, remove the bracket that secures the lower instrument panel center stack structural support to the floor panel transmission tunnel. Refer to **PANEL, INSTRUMENT, REMOVAL** .
6. Still working from the right side front floor panel, reach around the forward edge of the instrument panel center stack support to access, unlatch and disconnect the instrument panel wire harness connector (3) from the ORC connector receptacle located on the rearward facing side of the module. To disconnect the wire harness connector from the ORC, depress the release tab and lift the lever arm on the connector.
7. Still on the right side, remove the two nuts (1) that secure the right front and rear mounts of the ORC to the studs on the top of the floor panel transmission tunnel.
8. Remove the ORC from the vehicle.

INSTALLATION

INSTALLATION

WARNING: To avoid serious or fatal injury on vehicles equipped with side curtain airbags, disable the Supplemental Restraint System (SRS) before attempting any Occupant Restraint Controller (ORC) diagnosis or service. The ORC may contain a rollover sensor, which enables the system to deploy the side SRS components in the event of a vehicle rollover event. If an ORC containing a rollover sensor is accidentally rolled during service while still connected to battery power, the side SRS components will deploy. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury, never strike or drop the Occupant Restraint Controller (ORC), as it can damage the impact sensor or affect its calibration. The ORC contains the impact sensor, which enables the system to deploy the Supplemental Restraint System (SRS) components. If an ORC is accidentally dropped during service, the module must be scrapped and replaced with a new unit. Failure to observe this warning could result in accidental, incomplete, or improper SRS component deployment.

100868612

Fig. 81: Nuts, Occupant Restraint Controller, Harness Connectors & Transmission Tunnel
Courtesy of CHRYSLER GROUP, LLC

1. Working from the right side front floor panel, carefully position the Occupant Restraint Controller (ORC) (2) onto the front of the floor panel transmission tunnel (5), aligning the mounts of the ORC to the studs on the floor panel. When the ORC is correctly positioned, the bottom of the housing will fit flush with the floor and the orientation arrow on the label on top of the housing will be pointed forward in the vehicle.
2. Still working from the right side front floor panel, reach around the forward edge of the instrument panel center stack support on the floor panel transmission tunnel to install and tighten the two nuts (1) that secure the ORC to the studs on the floor panel transmission tunnel. Tighten the nuts to 8 N.m (71 in. lbs.).
3. Still on the right side, reconnect and latch the instrument panel wire harness connector (3) to the ORC connector receptacle located on the rearward facing side of the module. Be certain that the latch on the connector is fully engaged.
4. Still on the right side, reinstall the bracket that secures the lower instrument panel center stack structural support to the floor panel transmission tunnel. Refer to **PANEL, INSTRUMENT, INSTALLATION** .
5. Working from the left side front floor panel, reach around the forward edge of the instrument panel center stack support on the floor panel transmission tunnel to install and tighten the nut (1) that secures the ORC to the stud on the floor panel transmission tunnel. Tighten the nut to 8 N.m (71 in. lbs.).
6. Still working from the left side front floor panel, reconnect and latch the body wire harness connector (4) to the ORC connector receptacle located on the rearward facing side of the module. Be certain that the latch on the connector is fully engaged.
7. Reinstall the front side panels onto the center floor console on both the right and left sides of the floor panel transmission tunnel. Refer to **CONSOLE, FLOOR, INSTALLATION** .
8. If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM)

Miscellaneous Functions menu.

9. If this Electronic Control Unit (ECU) is being replaced with a new unit, the Initialize ORC Miscellaneous Function must be run using a diagnostic scan tool. Refer to **STANDARD PROCEDURE** .
10. Do not reconnect the negative cable to the battery at this time. The Supplemental Restraint System (SRS) Verification Test procedure should be performed following service of any SRS component. Refer to **SUPPLEMENTAL RESTRAINT SYSTEM VERIFICATION TEST**.

RESTRAINT, ACTIVE HEAD

DESCRIPTION

DESCRIPTION

Fig. 82: Active Head Restraint (AHR) Units & Mechanical Components
Courtesy of CHRYSLER GROUP, LLC

Active Head Restraint (AHR) units (1) are standard equipment for both front seating positions in this vehicle. One inertia-activated AHR unit is located atop each front seat back. Outwardly, an inertia-activated AHR appears the same as a non-active head restraint. The mechanical components (2) that articulate the inertia-activated AHR headrest pad are all concealed within the front seat back frame assembly.

At the top of the seat back frame are two stamped steel headrest guide tubes. The guide tubes are each inserted through a molded plastic fulcrum bushing installed in the upper seat back frame member and are permanently fixed to a movable stamped steel armature bracket located just below the upper frame member near the top of the seat back. The armature bracket is secured to a stamped steel pivot link at each side that pivots on a screw threaded into a mounting bracket welded to each side member of the seat back frame.

The pivot links are each have a spring attached to a lever opposite the armature bracket attachment that is

anchored to the seat back frame side member below, which provides the spring-loaded return action of the inertia mechanism. The upper end of the static lumbar assembly is secured at each side to the base of the armature bracket. Each side of the lower end of the lumbar assembly is engaged in a ramp bracket riveted to the lower seat back frame member.

The inertia-activated AHR linkage cannot be repaired. If damaged or ineffective, it must be replaced as a unit with a new seat back frame assembly.

OPERATION

OPERATION

The inertia-activated Active Head Restraint (AHR) units are deployed automatically by the mechanism contained within each front seat back assembly. During a rear impact, inertia drives the seat occupant rearward into the seat back, loading the seat lumbar assembly. The ramp brackets at the base of the lumbar assembly translate this rearward travel into a vertical motion. The vertical motion of the lumbar assembly is then transmitted to the armature bracket.

Through the rotation of the pivot links at each side of the armature bracket, the vertical motion of the lumbar assembly is converted to a slightly forward and upward arc of the armature bracket, headrest guide tubes and headrest that is designed to reduce the space between the back of the head of the seat occupant and the head restraint pad. Closing this space catches the head of the seat occupant during a low speed rear impact collision event and is important in reducing or eliminating potentially debilitating cervical (also known as whiplash) injuries.

Unless damaged following the rear impact, the inertia-activated AHR can be reset by simply pushing the front seat headrests rearward to their normal positions.

STANDARD PROCEDURE

STANDARD PROCEDURE - ACTIVE HEAD RESTRAINT RESET

If the Active Head Restraint (AHR) units have been deployed, both the driver and passenger side units must be reset. You can recognize that an AHR has been deployed by the forward position of the head restraint cushion. If deployed, the AHR units can be manually reset by pressing the head restraint rearward.

RETRACTOR, SEAT BELT

DESCRIPTION

DESCRIPTION

The seat belt retractors used in all seating positions include an inertia-type, Emergency Locking Retractor (ELR) mechanism as standard equipment. However, the ELR for all seating positions except the driver side front are mechanically switchable from an ELR to an Automatic Locking Retractor (ALR). Both front seat belt retractors also include a seat belt tensioner feature and an adaptive load limiting feature. Refer to **TENSIONER, SEAT BELT, DESCRIPTION**.

The ELR mechanism, the ALR mechanism, the tensioner mechanism and the adaptive load limiting feature are all integral to the seat belt and retractor unit and are concealed beneath molded plastic covers located on the sides of the retractor spool. These features cannot be adjusted or repaired and if ineffective, damaged or deployed, the entire seat belt and retractor unit must be replaced.

OPERATION

OPERATION

The standard inertia-type Emergency Locking Retractor (ELR) will allow the seat belt webbing to unwind from and wind onto the retractor spool freely unless and until a predetermined inertia load is sensed. The retractor has an internal inertia latch mechanism that will lock the retractor spool once the predetermined inertia load is sensed. Locking the retractor spool prevents the seat belt webbing from being extracted from the retractor and firmly restrains the occupant wearing the seat belt. The retractor spool is automatically unlatched once the loading of the retractor inertia mechanism and the seat belt are relieved.

The primary function of the switchable ELR to Automatic Locking Retractor (ALR) feature is to securely accommodate an infant or child booster seat in any seating position of the vehicle except the driver side front seat without the need for a self-cinching seat belt tip half latch plate unit or another supplemental device that would be required to prevent the seat belt webbing from unwinding freely from the retractor spool of an inertia-type ELR in situations where the minimum inertia locking threshold has not been achieved.

The locked mode of the ALR is engaged and the retractor is switched from operating as a standard inertia-type ELR by first buckling the combination lap and shoulder belt buckle. Then all of the shoulder belt webbing is pulled out from the retractor. Once all of the belt webbing is extracted from the retractor spool, the retractor will automatically become engaged in the pre-locked ALR mode and will make a light, audible clicking or ratchet-like sound as the shoulder belt is allowed to retract onto the spool to provide an audible confirmation that the ALR mode is engaged. Once the ALR mode is engaged, the retractor will remain locked and the belt will remain tight around whatever it is restraining.

The retractor is returned to standard ELR (inertia) mode by unbuckling the combination lap and shoulder belt buckle and allowing the belt webbing to be almost fully retracted back onto the retractor spool. The ELR mode is confirmed by the absence of the light, audible clicking or ratchet-like sound as the belt webbing retracts. This mode will allow the belt to unwind from and wind onto the retractor spool freely unless and until a predetermined inertia load threshold is sensed, or until the retractor is again switched to the ALR mode.

REMOVAL

FRONT

WARNING: **To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to**

disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog.

Fig. 83: B-Pillar, Front Seat Belt Anchor Tensioner Buckle & Front Seat Belt Anchor Latch Plate
Courtesy of CHRYSLER GROUP, LLC

NOTE: The following procedure is for replacement of an ineffective or damaged seat belt and retractor unit. The front retractor also includes a seat belt tensioner. If the front seat belt or retractor is ineffective or damaged, but the seat belt tensioner is not deployed, review the recommended procedures for Handling Non-Deployed Supplemental Restraints. Refer to HANDLING NON-DEPLOYED SUPPLEMENTAL RESTRAINTS. If the seat belt tensioner has been deployed, review the recommended procedures for Service After A Supplemental Restraint Deployment before removing the unit from the vehicle. Refer to SERVICE AFTER A SUPPLEMENTAL RESTRAINT SYSTEM DEPLOYMENT.

1. Position the front seat for easiest access to the front seat belt anchor buckle (2).

2. Disconnect and isolate the negative cable from the battery. Wait two minutes for the system capacitor to discharge before further service.
3. Release the front seat belt anchor latch plate (3) from the anchor buckle. Refer to **BUCKLE, SEAT BELT, STANDARD PROCEDURE**.

Fig. 84: B-Pillar, Height Adjuster, Nut, Upper Trim, Seat Belt & Web Guide
Courtesy of CHRYSLER GROUP, LLC

4. Remove the upper trim (4) from the inside of the B-pillar (1). Refer to **PANEL, B-PILLAR TRIM, REMOVAL** .
5. Remove the nut (3) that secures the seat belt (5) turning loop to the stud on the height adjuster (2).
6. Remove the seat belt turning loop from the height adjuster.
7. Unsnap the seat belt web guide (6) from the inside of the B-pillar.

1012006768

Fig. 85: Remove/Install B-Pillar Seat Belt Retractor
Courtesy of CHRYSLER GROUP, LLC

8. Remove the lower trim from the inside of the B-pillar (2) and from over the front seat belt retractor tensioner unit (6) near the base of the B-pillar. Refer to **PANEL, B-PILLAR TRIM, REMOVAL** .
9. Remove the screw (4) that secures the retractor lower bracket to the base of the inner B-pillar.
10. Pull the retractor out from the B-pillar far enough to access the yellow body wire harness (5) connectors on the retractor.
11. Disconnect the yellow body wire harness connector (3) from the retractor tensioner initiator. The connector insulator is secured by integral latches and a Connector Position Assurance (CPA) lock to the initiator connector receptacle. Pull the lock straight out from the connector insulator, then pull the insulator straight out from the connector receptacle to disengage and disconnect it.
12. Disconnect the yellow body wire harness connector (1) from the retractor adaptive tension limiter initiator. The connector insulator is secured by integral latches and a CPA lock to the initiator connector receptacle. Pull the lock straight out from the connector insulator, then pull the insulator straight out from the connector receptacle to disengage and disconnect it.
13. Remove the front seat belt and retractor from the vehicle as a unit.

REAR CENTER

WARNING: **To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor.**

Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog. Failure to follow these instructions may result in possible serious or fatal injury.

Fig. 86: Seat Belt Lower Anchor Plate
Courtesy of CHRYSLER GROUP, LLC

NOTE: **All seat belt retractors except the driver side front and the rear center include a switchable automatic locking mechanism. Refer to RETRACTOR, SEAT BELT, DESCRIPTION.**

1. Remove the left (60 percent) rear seat from the vehicle as a unit and place it on a suitable work surface. Be certain to take the proper precautions to prevent the trim cover from receiving cosmetic damage during the following procedures. Refer to **SEAT, REAR, REMOVAL** .
2. Working from behind the seat, remove the screw (2) that secures the seat belt lower anchor plate (1) to the bracket on the back of the seat cushion frame.

Fig. 87: Seat Belt Web Bezel & Fasteners
Courtesy of CHRYSLER GROUP, LLC

3. Remove the two screws that secure the seat belt web bezel (1) to the top of the seat back and disengage the webbing through the slot in the bezel.
4. Remove the trim cover (2) and foam from the left (60 percent) seat back frame. Refer to **SEAT BACK, FRONT, DISASSEMBLY** .

Fig. 88: Seat Back Frame & Seat Belt Web Guide
Courtesy of CHRYSLER GROUP, LLC

5. Remove the two screws that secure the seat belt web guide (1) to the top of the seat back frame and disengage the webbing through the slot in the guide.

6. Disengage the push-in plastic fastener that secures the plastic scabbard (2) of the retractor (3) to the seat back frame.

Fig. 89: Rear Center Seat Belt Retractor Fastener
Courtesy of CHRYSLER GROUP, LLC

7. Remove the screw (3) that secures the rear center seat belt retractor to the rear left (60 percent) seat back panel.
8. Disengage the T-tab (2) of the retractor bracket from the T-slot of the seat back panel.
9. Remove the rear center seat belt and retractor unit from the seat back panel.

REAR OUTBOARD

WARNING: **To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog. Failure to follow these instructions may result in possible serious or fatal injury.**

1012006769

Fig. 90: C-Pillar Seat Belt Webbing Lower Anchor Attachment
Courtesy of CHRYSLER GROUP, LLC

1. Adjust the left or right rear seat to its most forward position for easiest access to the base of the C-pillar (4).
2. Disengage and slide the lower anchor cover (5) up the seat belt webbing (1) far enough to access the lower anchor attachment.
3. Unscrew the captive nut (3) on the lower anchor from the stud (2) at the base of the C-pillar.

Fig. 91: Remove/Install Rear Outboard Seat Belt And Retractor
Courtesy of CHRYSLER GROUP, LLC

4. Disengage the upper quarter trim panel (3) from the upper C-pillar (1). Refer to **PANEL, QUARTER TRIM, REMOVAL** .
5. Unsnap the C-pillar belt opening bezel (4) from the upper quarter trim panel.
6. Feed the bezel, the belt webbing (6), the latch plate and the lower anchor through the upper quarter trim panel belt opening.
7. Remove the screw (2) that secures the seat belt turning loop to the inside of the upper C-pillar.
8. Remove the seat belt turning loop from the upper inner C-pillar.
9. Remove the screw (5) that secures the retractor (7) bracket to the inner C-pillar.
10. Lift the retractor upward far enough to disengage the retractor bracket tab from the keyed slot in the inner C-pillar.
11. Remove the rear outboard seat belt and retractor from the vehicle as a unit.

INSTALLATION

FRONT

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before

performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog.

1012006768

Fig. 92: Remove/Install B-Pillar Seat Belt Retractor
Courtesy of CHRYSLER GROUP, LLC

NOTE: The following procedure is for replacement of an ineffective or damaged seat belt and retractor unit. The front retractor also includes a seat belt tensioner. If the front seat belt or retractor is ineffective or damaged, but the seat belt tensioner is not deployed, review the recommended procedures for Handling Non-Deployed Supplemental Restraints. Refer to HANDLING NON-DEPLOYED SUPPLEMENTAL RESTRAINTS. If the seat belt tensioner has been deployed,

review the recommended procedures for Service After A Supplemental Restraint Deployment before removing the unit from the vehicle. Refer to SERVICE AFTER A SUPPLEMENTAL RESTRAINT SYSTEM DEPLOYMENT.

1. Position the seat belt and retractor (5) into the vehicle as a unit.
2. Reconnect the yellow body wire harness connector (3) to the retractor seat belt tensioner initiator by pressing straight in on the connector. Be certain that the connector is fully engaged in its receptacle, then push the Connector Position Assurance (CPA) lock straight into the connector to lock it into place.
3. Reconnect the yellow body wire harness connector (2) to the retractor adaptive tension limiter initiator by pressing straight in on the connector. Be certain that the connector is fully engaged in its receptacle, then push the CPA lock straight into the connector to lock it into place.
4. Position the retractor lower bracket to the inner B-pillar (1).
5. Install and tighten the screw (4) that secures the retractor to the inner B-pillar. Tighten the screw to 58 N.m (43 ft. lbs.).
6. Reinstall the lower trim onto the inside of the B-pillar. Refer to **PANEL, B-PILLAR TRIM, INSTALLATION** .

Fig. 93: B-Pillar, Height Adjuster, Nut, Upper Trim, Seat Belt & Web Guide
Courtesy of CHRYSLER GROUP, LLC

7. Snap the seat belt web guide (6) onto the inner B-pillar (1). Be certain that the seat belt webbing (5) between the retractor and the web guide is not twisted.
8. Position the seat belt turning loop onto the stud on the height adjuster (2). Be certain that the seat belt webbing between the web guide and the turning loop is not twisted.
9. Install and tighten the nut (3) that secures the turning loop to the bracket. Tighten the nut to 45 N.m (33 ft. lbs.).
10. Reinstall the upper trim onto the inside of the B-pillar. Refer to **PANEL, B-PILLAR TRIM, INSTALLATION** .

Fig. 94: B-Pillar, Front Seat Belt Anchor Tensioner Buckle & Front Seat Belt Anchor Latch Plate
Courtesy of CHRYSLER GROUP, LLC

11. Be certain the seat belt webbing between the turning loop and the lower anchor buckle (2) is not twisted.
12. Insert the lower anchor latch plate into the anchor buckle until it latches into position.
13. Do not reconnect the negative cable to the battery at this time. The Supplemental Restraint System (SRS) Verification Test procedure should be performed following service of any SRS component. Refer to **SUPPLEMENTAL RESTRAINT SYSTEM VERIFICATION TEST**.

REAR CENTER

WARNING: **To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog. Failure to follow these instructions may result in possible serious or fatal injury.**

Fig. 95: Rear Center Seat Belt Retractor Fastener
Courtesy of CHRYSLER GROUP, LLC

NOTE: **All seat belt retractors except the driver side front and the rear center include a switchable automatic locking mechanism. Refer to RETRACTOR, SEAT BELT, DESCRIPTION.**

1. Position the rear center seat belt and retractor unit onto the left (60 percent) seat back panel (1). Be certain to engage the T-tab (2) on the retractor frame into the T-slot in the back panel.
2. Install and tighten the screw (3) that secures the retractor to the seat back panel. Tighten the screw to 55 N.m (41 ft. lbs.).

Fig. 96: Seat Back Frame & Seat Belt Web Guide

Courtesy of CHRYSLER GROUP, LLC

3. Engage the push-in plastic fastener that secures the plastic scabbard (2) of the retractor (3) to the seat back frame.
4. Engage the seat belt webbing through the slot in the seat belt web guide (1) and position the guide to the top of the seat back frame. Be certain the seat belt webbing between the retractor and the guide is not twisted.
5. Install and tighten the two screws that secure the seat belt web guide to the top of the seat back frame. Tighten the screws securely.

Fig. 97: Seat Belt Web Bezel & Fasteners
Courtesy of CHRYSLER GROUP, LLC

6. Reinstall the foam and the trim cover (2) onto the seat back frame. Refer to **SEAT BACK, FRONT, ASSEMBLY** .
7. Engage the seat belt webbing through the slot in the seat belt web bezel (1) and position the bezel to the top of the seat back.
8. Install and tighten the two screw that secure the seat belt web bezel to the top of the seat back frame. Tighten the screws securely.

Fig. 98: Seat Belt Lower Anchor Plate
Courtesy of CHRYSLER GROUP, LLC

9. Working from behind the rear seat, position the rear center seat belt lower anchor plate (1) to the bracket at the back of the seat cushion frame. Be certain the seat belt webbing between the bezel at the top of the seat back and the lower anchor plate is not twisted.
10. Install and tighten the screw (2) that secures the rear center seat belt lower anchor plate to the bracket at the back of the seat cushion frame. Tighten the screw to 55 N.m (41 ft. lbs.).
11. Reinstall the left (60 percent) rear seat into the vehicle. Refer to **SEAT, INSTALLATION** **SEAT, REAR, INSTALLATION** .

REAR OUTBOARD

WARNING: **To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog.**

Fig. 99: Remove/Install Rear Outboard Seat Belt And Retractor
Courtesy of CHRYSLER GROUP, LLC

1. Position the rear outboard seat belt and retractor unit (7) onto the inner C-pillar (1). Be certain to engage the retractor bracket tab into the keyed slot in the inner C-pillar.
2. Install and tighten the screw (5) that secures the retractor bracket to the inner C-pillar. Tighten the screw to 45 N.m (33 ft. lbs.).
3. Position the seat belt turning loop onto the upper inner C-pillar. Be certain the seat belt webbing (6) is not twisted between the retractor and the turning loop.
4. Install and tighten the screw (2) that secures the seat belt turning loop to the inside of the upper C-pillar. Tighten the screw to 45 N.m (33 ft. lbs.).
5. Feed the seat belt lower anchor, the latch plate, the seat belt opening bezel (4) and the belt webbing (6) through the upper quarter trim panel (3) belt opening. Be certain the seat belt webbing is not twisted between the turning loop and the upper quarter trim panel belt opening.
6. Snap the C-pillar belt opening bezel into the upper quarter trim panel.
7. Reinstall the upper quarter trim panel onto the upper C-pillar. Refer to **PANEL, QUARTER TRIM, INSTALLATION** .

Fig. 100: C-Pillar Seat Belt Webbing Lower Anchor Attachment
Courtesy of CHRYSLER GROUP, LLC

8. Position the rear outboard seat belt lower anchor to the stud (2) at the base of the C-pillar (4). Be certain the seat belt webbing (1) is not twisted between the upper C-pillar belt opening bezel and the lower anchor.
9. Install and tighten the captive nut (3) that secures the rear outboard seat belt lower anchor to the stud at the base of the C-pillar. Tighten the nut to 45 N.m (33 ft. lbs.).
10. Slide the lower anchor cover (5) down the seat belt webbing and engage it over the lower anchor attachment.
11. Restore the left or right rear seat to its rearward position.

SENSOR, IMPACT

DESCRIPTION

IMPACT SENSORS

Remote or satellite impact sensors are mounted in various strategic locations of the vehicle. These sensors are mounted remotely from the impact sensor that is internal to the Occupant Restraint Controller (ORC). Sensors at the front of the vehicle provide an additional logic input for use by the Occupant Restraint Controller (ORC) to control the front airbags and the seat belt pretensioners. Sensors on each side of the vehicle provide an additional logic input for use by the ORC to control the side curtain airbags, seat airbags and the seat belt pretensioners. Two types of sensors are used in this vehicle. They are the acceleration-type and the pressure-type, which are described in further detail elsewhere within this service information.

ACCELERATION TYPE

Fig. 101: Acceleration-Type Impact Sensor, Metal Sleeve, Connector Receptacle & Latch
Courtesy of CHRYSLER GROUP, LLC

Remote or satellite acceleration-type impact sensors (1) are mounted in various locations in the vehicle. These sensors are mounted remotely from the impact sensor that is internal to the Occupant Restraint Controller (ORC). Sensors at the front of the vehicle provide an additional logic input for use by the ORC to control the front airbags and the seat belt pretensioners. Sensors on each side of the vehicle provide an additional logic input for use by the ORC to control the side curtain airbags, the seat belt pretensioners and the seat (also known as pelvic and thorax) airbags.

Although the front and side acceleration-type impact sensors are similar in appearance and construction, they may not be interchangeable. The front impact sensors may monitor acceleration forces on a different axis than those monitored by the side impact sensors. Each sensor is secured to its mounting location by a single screw or by a nut and a weld stud. The front sensors are located on each vertical support member of the Front End Module (FEM) carrier between the cooling module and the front lamp unit. A side sensor is located on each inner B-pillar and each inner C-pillar and concealed behind the interior trim.

Each sensor housing has an integral connector receptacle (3), an integral locator pin with a latch feature (4) and an integral mounting hole with a metal sleeve (2) to provide crush protection. A cavity in the center of the molded plastic impact sensor housing contains the electronic circuitry of the sensor which includes an electronic communication chip and an electronic acceleration sensor. Potting material fills the housing, which is laser welded to seal and protect the internal electronic circuitry and components.

The front impact sensors are each connected to the vehicle electrical system through dedicated take outs and connectors of the Front End Module (FEM) wire harness, while the side impact sensors are connected through dedicated take outs and connectors of the body wire harness.

The acceleration-type impact sensors cannot be repaired or adjusted and, if damaged or ineffective, they must be replaced.

PRESSURE TYPE

Fig. 102: Pressure-Type Front Door Side Impact Sensors
Courtesy of CHRYSLER GROUP, LLC

Two pressure-type front door side impact sensors (2) are used on this vehicle, one each for the left and right sides of the vehicle. These sensors are mounted remotely from the impact sensor that is internal to the Occupant Restraint Controller (ORC). Each side sensor is secured with two screws and is sealed by a resilient gasket (1) to the front door hardware module carrier on the front door inner panel. The sensors are concealed behind the front door trim panel within the passenger compartment.

The right and left front door side impact sensors are identical in construction and calibration. The impact sensor housing has an integral connector receptacle (3), two integral mounting tabs, and an integral hood-like water shield (4). The water shield extends through a hole in the front door module carrier into the interior of the door cavity and protects the sensor orifice from contamination.

A cavity in the center of the molded plastic impact sensor housing contains the electronic circuitry of the sensor, which includes an electronic communication chip and the pressure sensor. The housing cavity is filled with a potting material to seal and protect the internal electronic circuitry and components. The pressure-type side impact sensors are each connected to the vehicle electrical system through a dedicated take out and connector of the front door wire harness.

The pressure-type side impact sensors cannot be repaired or adjusted and, if damaged or ineffective, they must be replaced.

OPERATION

IMPACT SENSORS

Two types of impact sensors are used in this vehicle. They are the acceleration-type and the pressure-type. Additional operational details of each of these sensor types is described in further detail elsewhere within this service information.

ACCELERATION TYPE

The acceleration-type impact sensors are electronic accelerometers that sense the rate of vehicle deceleration, which provides verification of the direction and severity of an impact. Each sensor also contains an electronic communication chip that allows the unit to communicate the sensor status as well as sensor fault information to the microcontroller within the Occupant Restraint Controller (ORC).

The ORC microcontroller continuously monitors all of the Supplemental Restraint System (SRS) electrical circuits to determine the system readiness. If the ORC detects a monitored system fault, it sets a Diagnostic Trouble Code (DTC) and controls the airbag indicator operation accordingly. The impact sensors each receive battery current and ground through dedicated left and right sensor plus and minus circuits from the ORC. The impact sensors and the ORC communicate by modulating the voltage in the sensor plus circuit.

The hard wired circuits between the impact sensors and the ORC may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the impact sensors or the electronic controls and communication between other modules and devices that provide some features of the SRS. The most reliable, efficient and accurate means to diagnose the acceleration-type impact sensors or the electronic controls and communication related to impact sensor operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

PRESSURE TYPE

The pressure-type front door side impact sensors recognize a side impact in the front door area by monitoring changes in pressure within the front door cavity. A sudden pressure wave is created as the door collapses during an impact event. Each sensor also contains an electronic communication chip that allows the unit to communicate the sensor status as well as sensor fault information to the microcontroller within the Occupant Restraint Controller (ORC).

The ORC microcontroller continuously monitors all of the Supplemental Restraint System (SRS) electrical circuits to determine the system readiness. If the ORC detects a monitored system fault, it sets a Diagnostic Trouble Code (DTC) and controls the airbag indicator operation accordingly. The impact sensors each receive battery current and ground through dedicated left and right sensor plus and minus circuits from the ORC. The impact sensors and the ORC communicate by modulating the current in the sensor plus circuit.

The hard wired circuits between the pressure-type front door side impact sensors and the ORC may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the impact sensors or the electronic controls and communication between other modules and devices that provide features of the SRS. The most reliable, efficient and accurate means to diagnose the pressure-type impact sensors or the electronic controls and communication related to impact sensor operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

FRONT

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury, never strike or drop the front impact sensor, as it can damage the impact sensor or affect its calibration. The front impact sensor enables the system to deploy the front supplemental restraints. If an impact sensor is accidentally dropped during service, the sensor must be scrapped and replaced with a new unit. Failure to observe this warning could result in accidental, incomplete, or improper front supplemental restraint deployment.

Fig. 103: Front Impact Sensor
Courtesy of CHRYSLER GROUP, LLC

NOTE: The front and the side impact sensors are NOT interchangeable.

1. Disconnect and isolate the negative cable from the battery. Wait two minutes for the system capacitor to discharge before further service.
2. For the left impact sensor only, remove the battery tray from the left side of the engine compartment.

   Refer to **TRAY, BATTERY, REMOVAL** .

3. For the right impact sensor only, remove the engine air cleaner housing from the right side of the engine compartment. Refer to **BODY, AIR CLEANER, REMOVAL** -2.0L, **BODY, AIR CLEANER, REMOVAL** -2.4L, or **BODY, AIR CLEANER, REMOVAL** -3.2L.
4. Locate the front impact sensor (2) located on the engine compartment side of the Front End Module (FEM) carrier (3), below the upper radiator cross member and just outboard of the cooling module.
5. Disconnect the FEM wire harness connector (4) from the right or left front impact sensor connector receptacle.
6. Remove the screw (1) that secures the sensor to the back of the FEM carrier.
7. Gently pry the sensor away from the FEM carrier far enough to disengage the latch feature of the locator pin on the back of the sensor from the locator hole in the FEM carrier.
8. Remove the right or left front impact sensor from the vehicle.

SIDE - B-PILLAR

WARNING: **To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.**

WARNING: **To avoid serious or fatal injury, never strike or drop the side impact sensor, as it can damage the impact sensor or affect its calibration. The side impact sensor enables the system to deploy the side Supplemental Restraint System (SRS) components. If an impact sensor is accidentally dropped during service, the sensor must be scrapped and replaced with a new unit. Failure to observe this warning could result in accidental, incomplete, or improper side SRS component deployment.**

Fig. 104: B-Pillar Side Impact Sensor
Courtesy of CHRYSLER GROUP, LLC

NOTE: The front and the side impact sensors are NOT interchangeable.

1. Adjust the driver or passenger side front seat to its most forward position for easiest access to the B-pillar trim.
2. Disconnect and isolate the negative cable from the battery. Wait two minutes for the system capacitor to discharge before further service.
3. Remove the trim from the inside of the B-pillar (1). Refer to **PANEL, B-PILLAR TRIM, REMOVAL** .
4. Disconnect the body wire harness connector (2) from the side impact sensor (3) connector receptacle.
5. Remove the nut (4) that secures the sensor to the weld stud on the lower B-pillar.
6. Gently pry the sensor away from the inner B-pillar far enough to disengage the latch feature of the locator pin from the locator hole.
7. Remove the sensor from the inner B-pillar.

SIDE - C-PILLAR

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to

disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury, never strike or drop the side impact sensor, as it can damage the impact sensor or affect its calibration. The side impact sensor enables the system to deploy the side Supplemental Restraint System (SRS) components. If an impact sensor is accidentally dropped during service, the sensor must be scrapped and replaced with a new unit. Failure to observe this warning could result in accidental, incomplete, or improper side SRS component deployment.

Fig. 105: C-Pillar Side Impact Sensor
Courtesy of CHRYSLER GROUP, LLC

NOTE: The front and the side impact sensors are NOT interchangeable.

1. Disconnect and isolate the negative cable from the battery. Wait two minutes for the system capacitor to discharge before further service.
2. Remove the trim from the inside of the lower C-pillar (1). Refer to **PANEL, QUARTER TRIM, REMOVAL** .
3. Disconnect the body wire harness connector (4) from the side impact sensor (3) connector receptacle.
4. Remove the nut (2) that secures the sensor to the weld stud on the inner C-pillar.
5. Gently pry the sensor away from the inner C-pillar far enough to disengage the latch feature of the locator pin from the locator hole.
6. Remove the sensor from the inner C-pillar.

SIDE - FRONT DOOR

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury, never strike or drop the side impact sensor, as it can damage the impact sensor or affect its calibration. The side impact sensor enables the system to deploy the side Supplemental Restraint System (SRS) components. If an impact sensor is accidentally dropped during service, the sensor must be scrapped and replaced with a new unit. Failure to observe this warning could result in accidental, incomplete, or improper side SRS component deployment.

Fig. 106: Front Door Side Impact Sensor
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative cable from the battery. Wait two minutes for the system capacitor to discharge before further service.
2. Remove the trim panel from the inside of the right or left front door. Refer to **PANEL, DOOR TRIM,**

REMOVAL .

3. Disconnect the front door wire harness connector (3) from the side impact sensor (2) connector receptacle.
4. Remove the two screws (1) that secure the side impact sensor to the front door hardware module carrier panel (4).
5. Remove the side impact sensor from the vehicle.

INSTALLATION

FRONT

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury, never strike or drop the front impact sensor, as it can damage the impact sensor or affect its calibration. The front impact sensor enables the system to deploy the front Supplemental Restraint System (SRS) components. If an impact sensor is accidentally dropped during service, the sensor must be scrapped and replaced with a new unit. Failure to observe this warning could result in accidental, incomplete, or improper front SRS component deployment.

1014006016

Fig. 107: Front Impact Sensor
Courtesy of CHRYSLER GROUP, LLC

NOTE: The front and the side impact sensors are NOT interchangeable.

1. Position the right or left front impact sensor (2) to the back of the Front End Module (FEM) carrier (3) just outboard of the cooling module.
2. Be certain to engage the locating pin integral to the back of the sensor into the locating hole in the FEM carrier.
3. Install and tighten the screw (1) that secures the sensor to the back of the FEM carrier. Tighten the screw to 11 N.m (97 in. lbs.).
4. Reconnect the FEM wire harness connector (4) to the sensor connector receptacle.
5. For the left impact sensor only, reinstall the battery tray into the left side of the engine compartment. Refer to **TRAY, BATTERY, INSTALLATION** .
6. For the right impact sensor only, reinstall the engine air cleaner housing into the right side of the engine compartment. Refer to **BODY, AIR CLEANER, INSTALLATION** -2.0L, **BODY, AIR CLEANER, INSTALLATION** -2.4L, or **BODY, AIR CLEANER, INSTALLATION** -3.2L.
7. Do not reconnect the negative cable to the battery at this time. The Supplemental Restraint System (SRS) Verification Test procedure should be performed following service of any SRS component. Refer to **SUPPLEMENTAL RESTRAINT SYSTEM VERIFICATION TEST**.

SIDE - B-PILLAR

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering

wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

WARNING: **To avoid serious or fatal injury, never strike or drop the side impact sensor, as it can damage the impact sensor or affect its calibration. The side impact sensor enables the system to deploy the side Supplemental Restraint System (SRS) components. If an impact sensor is accidentally dropped during service, the sensor must be scrapped and replaced with a new unit. Failure to observe this warning could result in accidental, incomplete, or improper side SRS component deployment.**

Fig. 108: B-Pillar Side Impact Sensor
Courtesy of CHRYSLER GROUP, LLC

NOTE: The front and the side impact sensors are NOT interchangeable.

1. Position the side impact sensor (3) onto the weld stud on the inner B-pillar (1). Be certain that the locator pin on the sensor is fully engaged in the locator hole of the inner B-pillar.
2. Install and tighten the nut (4) that secures the sensor to the inner B-pillar. Tighten the nut to 11 N.m (97 in. lbs.).
3. Reconnect the body wire harness connector (2) to the sensor connector receptacle.

4. Reinstall the trim onto the inside of the B-pillar. Refer to **PANEL, B-PILLAR TRIM, INSTALLATION** .
5. Do not reconnect the negative cable to the battery at this time. The Supplemental Restraint System (SRS) Verification Test procedure should be performed following service of any SRS component. Refer to **SUPPLEMENTAL RESTRAINT SYSTEM VERIFICATION TEST**.

SIDE - C-PILLAR

WARNING: **To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.**

WARNING: **To avoid serious or fatal injury, never strike or drop the side impact sensor, as it can damage the impact sensor or affect its calibration. The side impact sensor enables the system to deploy the side Supplemental Restraint System (SRS) components. If an impact sensor is accidentally dropped during service, the sensor must be scrapped and replaced with a new unit. Failure to observe this warning could result in accidental, incomplete, or improper side SRS component deployment.**

1014006014

Fig. 109: C-Pillar Side Impact Sensor
Courtesy of CHRYSLER GROUP, LLC

NOTE: The front and the side impact sensors are NOT interchangeable.

1. Position the side impact sensor (3) onto the weld stud on the inner C-pillar (1). Be certain that the locator pin on the sensor is fully engaged in the locator hole of the inner C-pillar.
2. Install and tighten the nut (2) that secures the sensor to the inner C-pillar. Tighten the nut to 11 N.m (97 in. lbs.).
3. Reconnect the body wire harness connector (4) to the sensor connector receptacle.
4. Reinstall the trim onto the inside of the C-pillar. Refer to **PANEL, QUARTER TRIM, INSTALLATION** .
5. Do not reconnect the negative cable to the battery at this time. The Supplemental Restraint System (SRS) Verification Test procedure should be performed following service of any SRS component. Refer to **SUPPLEMENTAL RESTRAINT SYSTEM VERIFICATION TEST**.

SIDE - FRONT DOOR

WARNING: **To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.**

WARNING: **To avoid serious or fatal injury, never strike or drop the side impact sensor, as it can damage the impact sensor or affect its calibration. The side impact sensor enables the system to deploy the side Supplemental Restraint System (SRS) components. If an impact sensor is accidentally dropped during service, the sensor must be scrapped and replaced with a new unit. Failure to observe this warning could result in accidental, incomplete, or improper side SRS component deployment.**

Fig. 110: Front Door Side Impact Sensor
Courtesy of CHRYSLER GROUP, LLC

NOTE: Be certain that the gasket between the pressure-type side impact sensor and the front door hardware module carrier panel is in good condition and positioned on the back of the sensor. There MUST be a good seal between the sensor and the hardware module carrier panel for the sensor to operate properly. If the gasket is in poor condition, replace the sensor.

1. Position the side impact sensor (2) to the right or left front door hardware module carrier panel (4). When the sensor is correctly positioned, the sensor connector receptacle will be pointed toward the bottom of the door.
2. Install and tighten the two screws (1) that secure the side impact sensor to the door hardware module carrier panel. Tighten the screws to 2.4 N.m (21 in. lbs.).
3. Reconnect the front door wire harness connector (3) to the sensor connector receptacle.
4. Reinstall the trim panel onto the inside of the right or left front door. Refer to **PANEL, DOOR TRIM, INSTALLATION** .
5. Do not reconnect the negative cable to the battery at this time. The Supplemental Restraint System (SRS) Verification Test procedure should be performed following service of any SRS component. Refer to **SUPPLEMENTAL RESTRAINT SYSTEM VERIFICATION TEST**.

SENSOR, OCCUPANT DETECTION

DESCRIPTION

DESCRIPTION

Fig. 111: Occupant Detection Sensor (ODS)
Courtesy of CHRYSLER GROUP, LLC

Vehicles manufactured for export markets have an Occupant Detection Sensor (ODS) as standard equipment. The ODS is located directly below the passenger side front seat cushion trim cover. This sensor provides information to the Occupant Restraint Controller (ORC) used for control of the passenger belt alert feature.

The ODS consists of a flexible clear plastic sensor mat (2) containing several resistive membrane, force sensing resistor cells that is secured by an adhesive strip (1) to the top surface of the seat cushion foam. The adhesive patch on the ODS is a one time only material and cannot be reactivated or reused if removed.

A short, two-conductor pigtail wire and connector (4) connect the sensor to the vehicle electrical system through a dedicated take out and connector of the seat wire harness. A hot melt adhesive block (3) encapsulates and protects the connections between the electrical conductors in the tail of the sensor mat and the pigtail wires as well as a diagnostic resistor.

The ODS cannot be adjusted or repaired, and must be replaced if damaged or ineffective.

OPERATION

OPERATION

In vehicles manufactured for export markets, the Occupant Detection Sensor (ODS) acts as a simple switch to detect loads placed upon the passenger side front seat cushion. The sensor circuits are connected to and monitored by the Occupant Restraint Controller (ORC) whenever the status of the ignition switch (also known as the Keyless Ignition Node/KIN or the IGnition Node Module/IGNM) is On. The ORC uses an algorithm logic in monitoring the changing states of the sensor input to determine whether the seat cushion load is static or

dynamic.

The ORC microcontroller continuously monitors all of the Supplemental Restraint System (SRS) electrical circuits to determine the system status and readiness. If the ORC detects a monitored system fault, it sets a Diagnostic Trouble Code (DTC). However, because the ODS input is only used for control of the passenger belt alert feature, which has no effect on SRS component features or functions, the airbag indicator is **NOT** illuminated in response to a detected ODS circuit fault.

The ODS receives source current and a clean ground through dedicated sensor plus and minus circuits from the ORC. The ORC then sends the appropriate sensor status information over the Controller Area Network (CAN) data bus to the Instrument Cluster (IC) (also known as the Instrument Panel Cluster/IPC), which uses this information as an additional logic input used for control of the seat belt indicator and the passenger belt alert feature.

The hard wired circuits between the ODS and the ORC may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the ODS or the electronic controls and communication between other modules and devices that provide some features of the passenger belt alert feature. The most reliable, efficient and accurate means to diagnose the ODS or the electronic controls and communication related to the passenger belt alert feature operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

REMOVAL

WARNING: **To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.**

Fig. 113: Storage Seat
Courtesy of CHRYSLER GROUP, LLC

NOTE: The Occupant Detection Sensor (ODS) is used only in the passenger side front

seat of vehicles manufactured for export markets. Vehicles manufactured for domestic markets use the Occupant Classification System (OCS) instead of the ODS on the passenger side front seat.

1. Position the passenger side front seat to its most forward position for easiest access to the front seat mounting hardware.
2. Disconnect and isolate the negative cable from the battery. Wait two minutes for the system capacitor to discharge before further service.
3. Remove the passenger side front seat from the vehicle. Refer to **SEAT, REMOVAL** .
4. Remove the trim from the front seat cushion foam (1) and frame. Refer to **COVER, SEAT CUSHION, REMOVAL** .
5. If equipped, remove the heater and/or ventilation elements from the seat cushion foam. Refer to **PAD, HEATER, REMOVAL** .
6. Reach under the seat cushion pan to access and disconnect the Occupant Detection Sensor (ODS) pigtail wire harness connector from the seat wire harness.
7. Carefully disengage the adhesive patch (2) of the ODS mat (3) from the top surface of the seat cushion foam.

NOTE: **Care must be taken not to pull off any of the seat cushion foam along with the ODS mat. If part of the seat cushion foam is removed with the mat, the entire seat cushion foam should be replaced.**

8. Extract the tail of the ODS and the sensor pigtail wire harness from the clearance hole in the seat cushion foam.

INSTALLATION

INSTALLATION

WARNING: **To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.**

CAUTION: **When handling a new Occupant Detection Sensor (ODS), it should never be bent, creased, torn, cut or abraded. The ODS should not be handled with or come into contact with hard or sharp-edged tools or objects. Do not allow the ODS to drop more than 2 meters (6.5 feet). Prior to installation, do not sit on, stand on or place boxes, tools or any other foreign object on the ODS. If the ODS adhesive patches become**

inadvertently adhered to any seat materials or foreign objects prior to proper positioning on the seat cushion, the ODS must be scrapped and replaced with a new unit. Do not modify the seat foam or trim materials of a seat that contains an ODS. Failure to observe these cautions may result in an inoperative ODS, or an ODS that provides inaccurate inputs to the Occupant Restraint Controller (ORC).

CAUTION: The adhesive used to secure the ODS to the seat is heat activated and requires that both the adhesive and the material it is applied to be ideally between 21° and 38° C (between 70° and 100° F). Application of the ODS to surfaces below 10° C (50° F) is not recommended as the adhesive becomes too firm to readily adhere. Do not touch or allow the adhesive patches to contact any foreign materials with the release paper removed. Do not attempt to add adhesive materials to the ODS.

Fig. 114: Base (Non-Storage) Seat
Courtesy of CHRYSLER GROUP, LLC

1017009896

Fig. 115: Storage Seat
Courtesy of CHRYSLER GROUP, LLC

NOTE: The Occupant Detection Sensor (ODS) is used only in the passenger side front seat of vehicles manufactured for export markets. Vehicles manufactured for domestic markets use the Occupant Classification System (OCS) instead of the ODS on the passenger side front seat.

1. Carefully inspect the Occupant Detection Sensor (ODS) (3) to be certain that it is in good condition.
2. Insert the ODS pigtail wire harness and the tail of the ODS through the clearance hole near the back (with base, non-storage seat) or near the center (with storage seat) of the seat cushion foam.
3. Carefully position and center the ODS mat onto the seat cushion foam (1). On a base (non-storage) seat, the distance (A) from the rear edge of the trench in the foam to the rear edge of the sensor mat should be 145 millimeters (inches). On a storage seat, the distance (A) from the rear edge of the trench to the front edge of the sensor mat should be 70 millimeters (inches).
4. Remove the release paper from the adhesive patch of the ODS mat.

NOTE: The release paper should not be removed from the adhesive patch of a new ODS mat until just prior to application to the seat cushion foam.

5. Apply hand pressure (0.8 bar or 12 psi) over the adhesive patch of the ODS for at least four seconds to activate and adhere the adhesive to the seat cushion foam.
6. Reach under the seat cushion pan to access and reconnect the ODS pigtail wire connector to the seat wire harness.
7. If equipped, reinstall the heater and/or ventilation elements onto the seat cushion foam.

Refer to **PAD, HEATER, INSTALLATION** .

8. Reinstall the trim onto the front seat cushion foam and pan. Refer to **COVER, SEAT CUSHION, INSTALLATION** .
9. Reinstall the passenger side front seat into the vehicle. Refer to **SEAT, INSTALLATION** .
10. Reconnect the negative cable to the battery.

SENSOR, SEAT TRACK POSITION

DESCRIPTION

DESCRIPTION

Fig. 116: Identifying Seat Track Position Sensor
Courtesy of CHRYSLER GROUP, LLC

The Seat Track Position Sensor (STPS) (2) is a Hall Effect-type sensor used on some vehicles. This sensor consists of a Hall Effect Integrated Circuit (IC) chip encased in potting material within a cavity of the molded plastic sensor housing.

The STPS housing has a mounting slot containing an integral latch feature (1) and slides and latches onto a stamped metal blade-type bracket located on the inboard side of the upper inboard seat adjuster track near the rear of both the passenger and driver front seats. A molded connector receptacle (3) integral to the STPS housing is connected to the vehicle electrical system through a connector and take out of the seat wire harness beneath the front seat cushion frame.

The STPS cannot be adjusted or repaired and, if ineffective or damaged, the entire STPS unit must be replaced.

OPERATION

OPERATION

The Seat Track Position Sensor (STPS) is designed to provide a seat position data input to the Occupant Restraint Controller (ORC) indicating whether the driver or passenger front seat is in a full forward or a not full forward position. The ORC uses this data as an additional logic input for use in determining the appropriate force to be used when deploying the multistage Driver AirBag (DAB) or Passenger AirBag (PAB).

The STPS receives a nominal five volt supply from the ORC. The STPS communicates the seat position by modulating the voltage returned to the ORC on a sensor data circuit. The ORC also monitors the condition of the STPS circuits and will store a Diagnostic Trouble Code (DTC) for any fault that is detected. The ORC sends messages over the CAN data bus to control the illumination of the airbag indicator in the Instrument Cluster (IC) (also known as the Instrument Panel Cluster/IPC).

The hard wired circuits between the STPS and the ORC may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the STPS or the electronic controls and communication between other modules and devices that provide features of the Supplemental Restraint System (SRS). The most reliable, efficient and accurate means to diagnose the STPS or the electronic controls and communication related to STPS operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

REMOVAL

WARNING: **To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.**

Fig. 117: Seat Track Position Sensor, Bracket, Upper Inboard Seat Track & Harness Connector
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative cable from the battery. Wait two minutes for the system capacitor to discharge before further service.
2. Reach under the rear edge of the front seat cushion to access the Seat Track Position Sensor (STPS) (2) on a bracket (1) located on the inboard side near the rear of one of the upper seat tracks (4).
3. Using a small screwdriver, hold the latch feature (3) depressed while sliding the connector end of the STPS off of the bracket.
4. Disconnect the seat wire harness connector (5) from the STPS connector receptacle.
5. Remove the STPS from under the front seat.

INSTALLATION

INSTALLATION

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

Fig. 118: Seat Track Position Sensor, Bracket, Upper Inboard Seat Track & Harness Connector
Courtesy of CHRYSLER GROUP, LLC

1. Reach under the rear edge of the front seat cushion to reconnect the seat wire harness connector (5) to the Seat Track Position Sensor (STPS) (2) connector receptacle. Be certain that the latch on the connector is fully engaged.
2. Align the open end of the STPS mounting slot to the blade of the STPS bracket (1) located on the inboard side near the rear of one of the upper seat tracks (4).
3. Push the STPS firmly onto the bracket until the latch feature (3) snaps into place with an audible click.
4. Do not reconnect the negative cable to the battery at this time. The Supplemental Restraint System (SRS) Verification Test procedure should be performed following service of any SRS component. Refer to **SUPPLEMENTAL RESTRAINT SYSTEM VERIFICATION TEST**.

SWITCH, SEAT BELT

DESCRIPTION

DESCRIPTION

Fig. 119: Seat Belt Buckle, Pigtail Wire & Connector
Courtesy of CHRYSLER GROUP, LLC

Both the driver and passenger front seat belt switches for this vehicle are actually Hall Effect-type sensors. These sensors consist of a fixed-position, Hall Effect Integrated Circuit (IC) chip and a small permanent magnet that are integral to the front seat belt buckles (1). The front seat belt buckles are located on a molded plastic scabbard and secured by a screw to a bracket near the back of the upper, inboard seat adjuster track. The front seat belt switches are connected to the vehicle electrical system through a two-lead pigtail wire and connector (2) on the front seat belt buckle-half, which is connected to a wire harness connector and take out of the seat wire harness. A one kilohm diagnostic resistor is connected in parallel with the IC where the two pigtail wire leads connect to the IC pins.

Vehicles manufactured for certain export markets also have seat belt switches for each of the rear seating positions. The rear seat belt switches are small, normally open, single pole, single throw, mechanical leaf contact, momentary switches. These switches are integral to the buckle of each rear seat belt buckle-half. The rear seat belt switches are connected to the vehicle electrical system through a two-wire pigtail wire and connector on the seat belt buckle-half, which is connected to a wire harness connector and take out of the seat wire harness routed beneath the rear seat cushions in the passenger compartment.

The front and rear seat belt switches cannot be adjusted or repaired and, if ineffective or damaged, the entire front or rear seat belt buckle-half unit must be replaced.

OPERATION

OPERATION

The driver front seat belt switch is designed to control a hard wired sense input to the Occupant Restraint Controller (ORC), while the passenger front seat belt switch controls a similar input to the Occupant Classification Module (OCM). A spring-loaded slide with a small window-like opening is integral to each buckle latch mechanism. When a seat belt tip-half is inserted and latched into the seat belt buckle, the slide is pushed downward and the window of the slide exposes the Hall-effect Integrated Circuit (IC) chip within the buckle. The field of the permanent magnet induces a current within the chip. The chip provides this induced

current as an output to the ORC or the OCM. When the seat belt is unbuckled, the spring-loaded slide moves upward and shields the IC from the field of the permanent magnet, causing the output current from the seat belt switch to be reduced. The front seat belt switches receive a supply of current from the ORC or the OCM, and the ORC or OCM senses the status of the front seat belt switch through its connection to the seat wire harnesses.

In vehicles built for certain export markets equipped with rear seat belt switches, the seat belt switches are designed to control a path to ground for the seat belt switch sense inputs of the ORC. When the rear seat belt tip-half is inserted into the seat belt buckle, the switch closes the path to ground; and, when the rear seat belt tip-half is removed from the seat belt buckle, the switch opens the ground path. The switch is actuated by the latch mechanism within the seat belt buckle. The seat belt switch is connected in series between ground and the seat belt switch sense input of the ORC. The seat belt switch receives ground at all times through its pigtail wire connection to the seat wire harness from a take out of the body wire harness. An eyelet terminal connector on the body wire harness ground take out is secured to the body sheet metal.

The ORC or the OCM provides electronic **seat belt switch status** messages to the Instrument Cluster (IC) (also known as the Instrument Panel Cluster/IPC) over the Controller Area Network (CAN) data bus. The IC uses these messages as an additional logic input for control of the seat belt indicator. In vehicles built for certain export markets equipped with rear seat belt switches, the IC reads the messages received from the ORC then controls the Seat Belt Reminder (SBR) indications in the overhead console using Local Interface Network (LIN) data bus communication. The ORC and OCM monitor the condition of the seat belt switch circuits and will store a Diagnostic Trouble Code (DTC) for any fault that is detected.

The hard wired circuits between the seat belt switches and the ORC or OCM may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the switches or the electronic controls and communication between other modules and devices that provide some features of the seat belt reminder system. The most reliable, efficient and accurate means to diagnose the seat belt switches or the electronic controls and communication related to seat belt switch operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

TENSIONER, SEAT BELT

DESCRIPTION

SEAT BELT TENSIONERS

The seat belts for both front seats in this vehicle incorporate dual tensioners. One tensioner is integral to the seat belt retractor, and one tensioner is integral to the seat belt lower anchor. Each of these tensioner types is described in further detail elsewhere within this service information.

ANCHOR TENSIONER

Fig. 120: Anchor Latch Plate, Gas Generator, Metal Cylinder Tube & Bracket
Courtesy of CHRYSLER GROUP, LLC

A seat belt anchor tensioner supplements the dual front airbag system for all versions of this vehicle. These tensioners are integral to the front seat belt anchor units, which are secured to the inside of the sill at the base of the B-pillar outboard of each front seat. The anchor tensioner consists of the anchor latch plate (1), a cable and piston, a cable guide and bracket (4), a metal cylinder tube (3) and a small pyrotechnically activated Micro Gas Generator (MGG) (2). The anchor tensioners are controlled by the Occupant Restraint Controller (ORC) and are connected to the vehicle electrical system through dedicated take outs of the body wire harness by keyed and latching yellow molded plastic connector insulators to ensure a secure connection.

A special procedure requiring two small Allen key wrenches is used to disconnect the seat belt anchor latch plate from the anchor buckle. Refer to **BUCKLE, SEAT BELT, STANDARD PROCEDURE**.

The anchor tensioners cannot be repaired and, if ineffective or damaged, the entire anchor tensioner unit must be replaced. If the front airbags have been deployed, the anchor tensioners have also been deployed. The anchor tensioners are not intended for reuse and must be replaced following any front airbag deployment. Refer to **BUCKLE, SEAT BELT, REMOVAL**.

RETRACTOR TENSIONER

Fig. 121: Seat Belt Retractor Unit & Connector Insulator
Courtesy of CHRYSLER GROUP, LLC

Seat belt retractor tensioners supplement the dual front airbag system for all versions of this vehicle. These tensioners are integral to the front seat belt retractor units (1), which are secured near the base of the inner B-pillar on the right and left sides of the vehicle. The retractor is concealed beneath the molded plastic inner B-pillar trim. The retractor tensioners are controlled by the Occupant Restraint Controller (ORC). Each retractor tensioner has an initiator connected to the vehicle electrical system through a dedicated take out of the body wire harness by a keyed and latching yellow molded plastic connector insulator (2) to ensure a secure connection.

An adaptive load-limiting device is also integral to the front seat belt retractor to supplement the anchor and retractor tensioners. The adaptive load limiter is also controlled by the ORC. Each adaptive load limiter initiator is connected to the vehicle electrical system through a dedicated take out of the body wire harness by a keyed and latching yellow molded plastic connector insulator (3) to ensure a secure connection.

The retractor tensioners and adaptive load limiters cannot be repaired and, if ineffective or damaged, the entire front seat belt and retractor unit must be replaced. If the front airbags have been deployed, the retractor tensioners and adaptive load limiters have also been deployed. The retractor tensioners and adaptive load limiters are not intended for reuse and must be replaced following any front airbag deployment. A growling or grinding sound while attempting to operate the seat belt retractor is a sure indication that the retractor tensioner and adaptive load limiter have been deployed and require replacement. Refer to **RETRACTOR, SEAT BELT, REMOVAL**.

OPERATION

OPERATION

The seat belt tensioners and adaptive load limiter are deployed in conjunction with the dual front airbags by

signals generated by the Occupant Restraint Controller (ORC) through the individual driver or passenger retractor (or sill end), pretensioner (or anchor) or adaptive load limiter line 1 and line 2 (or squib) circuits. When the ORC sends the proper electrical signal to the tensioner and adaptive load limiter initiators, the electrical energy generates enough heat to initiate a small pyrotechnic Micro Gas Generator (MGG).

In sequence, the ORC activates the retractor tensioner, followed by the anchor tensioner. The adaptive load limiter on the retractor is activated only after both the retractor and anchor buckle tensioners. The retractor tensioner gas generator drives the seat belt retractor spool causing slack to be removed from the front seat belt. The anchor tensioner gas generator pulls the buckle downward, causing the slack to be removed from the front seat belt. The ORC uses the adaptive load limiter to adjust the belt resistance based upon impact data, to reduce the force of the tightened seat belt on the chest of the front seat occupant, reducing the potential for injuries.

Removing excess slack from the front seat belts not only keeps the occupants properly positioned for an airbag deployment following a frontal impact of the vehicle, but also helps to reduce injuries that the occupants of the front seats might experience in these situations as a result of harmful contact with the steering wheel, steering column, instrument panel or windshield.

The ORC monitors the condition of the seat belt tensioners and adaptive load limiter through circuit resistance, and will illuminate the airbag indicator in the Instrument Cluster (IC) (also known as the (Instrument Panel Cluster/IPC) and store a Diagnostic Trouble Code (DTC) for any fault that is detected. Proper diagnosis of the seat belt tensioner and adaptive load limiter initiators and squib circuits requires the use of a diagnostic scan tool and may also require the use of the SRS Load Tool special tool along with the appropriate Load Tool Jumpers and Adapters. Refer to the appropriate diagnostic information.

DIAGNOSIS AND TESTING

C0051-04 STEERING WHEEL POSITION SENSOR - SYSTEM INTERNAL FAILURES

For a complete wiring diagram, refer to appropriate SYSTEM WIRING DIAGRAMS article.

WHEN MONITORED

Continuously.

SET CONDITION

If the Electronic Power Steering (EPS) Module detects an internal fault from the Steering Angle Sensor (SAS), this DTC will set. Most of internal faults that can set this DTC will result in the EPS assist not operating for the remainder of the current key cycle.

POSSIBLE CAUSES

Possible Causes
STEERING ANGLE SENSOR (SAS) ELECTRONIC POWER STEERING (EPS) MODULE

DIAGNOSTIC TEST

VERIFY THE DTC IS ACTIVE

NOTE: This DTC must be active for the results of this test to be valid.

1. Ignition on, engine not running.
2. With the scan tool, read DTCs and record on vehicle work order.
3. With the scan tool, erase DTCs.
4. Start the engine and run for two minutes.
5. Turn the steering wheel from lock to lock.
6. With the scan tool, read DTCs.

   Is the DTC active at this time?

   Yes

   - Replace the Electronic Power Steering (EPS) Module in accordance with service information. Refer to **GEAR, REMOVAL** .
   - Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring harness and electrical connectors.
- Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C0051-2F-STEERING WHEEL POSITION SENSOR - SIGNAL ERRATIC

For a complete wiring diagram, refer to appropriate SYSTEM WIRING DIAGRAMS article.

WHEN MONITORED

Continuously.

SET CONDITION

When the Electronic Power Steering (EPS) Module detects an erratic signal from the Steering Angle Sensor (SAS).

POSSIBLE CAUSES

Possible Causes
STEERING ANGLE SENSOR (SAS) NOT CALIBRATED
STEERING ANGLE SENSOR (SAS)
ELECTRONIC POWER STEERING (EPS) MODULE

DIAGNOSTIC TEST

VERIFY THE DTC IS ACTIVE

1. Perform any Technical Service Bulletins (TSBs) that may apply.
2. Ignition on, engine running.
3. With the scan tool, read DTCs and record on vehicle work order.
4. With the scan tool, erase DTCs.
5. With the scan tool, graph the steering angle while slowly rotating steering wheel from lock to lock.
6. With the scan tool, under "Miscellaneous Functions" run the EPS Learn routine.
7. With the scan tool, read the DTCs.

   Is the graph displaying an erratic behavior or is the DTC active at this time?

   Yes

   - Replace the Electronic Power Steering (EPS) Module in accordance with service information. Refer to **GEAR, REMOVAL** .

- Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring harness and electrical connectors.
- Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C0051-31-STEERING WHEEL POSITION SENSOR - NO SIGNAL

For a complete wiring diagram, refer to appropriate SYSTEM WIRING DIAGRAMS article.

WHEN MONITORED

Continuously with the ignition on.

SET CONDITION

When the Electronic Power Steering (EPS) Module detects an internal voltage out of range from the Steering Angle Sensor (SAS).

POSSIBLE CAUSES

Possible Causes
STEERING ANGLE SENSOR (SAS) ELECTRONIC POWER STEERING (EPS) MODULE

DIAGNOSTIC TEST

VERIFY THE DTC IS ACTIVE

1. Perform any Technical Service Bulletins (TSBs) that may apply.
2. Ignition on, engine not running.
3. With the scan tool, read DTCs and record on vehicle work order.
4. With the scan tool, erase DTCs.
5. Cycle the ignition from off to on and start the engine.
6. Slowly rotate the steering wheel from lock to lock.
7. With the scan tool, read the DTCs.

   Is the DTC active at this time?

   Yes

   - Replace the Electronic Power Steering (EPS) Module in accordance with service information.

Refer to **GEAR, REMOVAL** .

- Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring harness and electrical connectors.
- Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C0051-54-STEERING WHEEL POSITION SENSOR - MISSING CALIBRATION

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Ignition on.

SET CONDITION

When the Electronic Power Steering (EPS) Module detects that the supply voltage is out of range or the Steering Angle Sensor has not been calibrated.

POSSIBLE CAUSES

Possible Causes
STEERING ANGLE SENSOR (SAS) NOT INITIALIZED
ELECTRONIC POWER STEERING (EPS) MODULE SUPPLY VOLTAGE
ELECTRONIC POWER STEERING (EPS) MODULE

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Perform any Technical Service Bulletins (TSBs) that may apply.
    2. Ignition on, engine running.
    3. With the scan tool, read DTCs and record on vehicle work order.
    4. With the scan tool, erase DTCs.
    5. Start the engine.
    6. Turn the steering wheel slowly from lock to lock and back to center.
    7. With the scan tool, read the DTCs.

    Is the DTC active at this time?

    Yes

- Go To 2

No

- The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring harness and electrical connectors.
- Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

2. **INITIALIZE EPS MODULE**
   1. With the scan tool, under "Miscellaneous Functions" run the EPS Learn routine.
   2. Cycle the ignition off to on.
   3. With the scan tool, erase the DTCs.
   4. Cycle the ignition off to on.
   5. Wait ten seconds.
   6. With the scan tool, read the DTCs.

   Does the DTC remain active?

   Yes

   - Replace the Electric Power Steering (EPS) Module in accordance with service information. Refer to **GEAR, REMOVAL** .
   - Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

C006A-49-MULTI-AXIS ACCELERATION SENSOR - INTERNAL ELECTRONIC FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Ignition on.

SET CONDITION

The Dynamics Sensor has indicated that it has detected an internal failure.

NOTE: The Dynamics Sensor is internal to the Occupant Restraint Controller (ORC).

POSSIBLE CAUSES

Possible Causes
OCCUPANT RESTRAINT CONTROLLER (ORC) ELECTRIC POWER STEERING (EPS) MODULE

NOTE: **If DTC U0002-88 is present, perform the diagnostics for this DTC before continuing with this test. Refer to DTC INDEX .**

DIAGNOSTIC TEST

1. **ANTI-LOCK BRAKE SYSTEM (ABS) MODULE DTCS PRESENT**
   1. Turn the ignition on, engine not running.
   2. With the scan tool, read DTCs in the ABS Module.

      Are there any ABS Module DTCs present?

      Yes

      - Perform the appropriate diagnostic procedures before continuing with this test. Refer to **DIAGNOSIS AND TESTING** .

      No

      - Go To 2
2. **VERIFY THE IS ACTIVE**
   1. Perform any Technical Service Bulletins (TSBs) that may apply.
   2. Ignition on, engine not running.
   3. With the scan tool, read and record Environmental Data (EV Data).
   4. With the scan tool, read the DTCs and record on vehicle work order.
   5. With the scan tool, erase the DTCs.
   6. Test drive the vehicle at a velocity between 15 and 35 km/h (9 and 22 mph).
   7. With the scan tool, read the DTCs.

      Is the DTC active at this time?

      Yes

      - Go To 3

      No

      - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

3. **ELECTRIC POWER STEERING (EPS) MODULE**
    1. Turn the ignition off to the lock position.
    2. Replace the Occupant Restraint Controller (ORC) in accordance with the Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
    3. Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
    4. Test drive the vehicle on mainly straight road conditions at a velocity between 15 and 35 km/h (9 and 22 mph).
    5. With the scan tool, read the DTCs.

       Does the DTC remain active?

       Yes

       - Replace the Electric Power Steering (EPS) Module in accordance with the Service Information. Refer to **GEAR, REMOVAL** .
       - Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

       No

       - Test complete.

C1592-01-ELECTRONIC POWER STEERING MOTOR CIRCUIT - GENERAL ELECTRICAL FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 1: Electric Power Steering (EPS) Module - Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

Continuously with the ignition on.

SET CONDITION

The Electric Power Steering (EPS) Module as detected a short to ground in the motor circuit.

POSSIBLE CAUSES

Possible Causes
(A951) FUSED B(+) SHORT TO GROUND ELECTRIC POWER STEERING (EPS) MODULE

NOTE: If DTC C0051-54 is present, perform the diagnostics for this DTC before continuing with this diagnostic procedure. Refer to C0051-54-STEERING WHEEL POSITION SENSOR - MISSING CALIBRATION.

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**

   NOTE: This DTC must be active for the results of this test to be valid.

   1. Ignition on, engine not running.
   2. With the scan tool, read and record DTCs on vehicle work order.
   3. With the scan tool, erase DTCs.
   4. Start the engine and run for two minutes.
   5. Turn the steering wheel from lock to lock.
   6. With the scan tool, read DTCs.

   Is the DTC active at this time?

   Yes

   - Go To 2

   No

   - The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring harness and electrical connectors.
   - Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

2. **(A951) FUSED B(+) CIRCUIT SHORTED TO GROUND**
   1. Turn the ignition off.
   2. Remove the F1 70A fuse.
   3. Disconnect the EPS Module C1 harness connector.
   4. Measure the resistance between ground and the (A951) Fused B(+) circuit in the EPS Module harness connector.

   Is the resistance above 100 Ohms?

Yes

- Replace the Electronic Power Steering (EPS) Module in accordance with service information. Refer to **GEAR, REMOVAL** .
- Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Repair the (A951) Fused B(+) circuit for a short to ground.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

C1592-16-ELECTRONIC POWER STEERING MOTOR CIRCUIT - CIRCUIT VOLTAGE BELOW THRESHOLD

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 2: Electric Power Steering (EPS) Module - Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

Continuously with the ignition on.

SET CONDITION

If the voltage to the Electric Power Steering (EPS) Module is below 10 volts for more than 15 seconds.

POSSIBLE CAUSES

Possible Causes
POWERTRAIN CONTROL MODULE (PCM) CHARGING SYSTEM DTCS PRESENT (A951) FUSED B(+) CIRCUIT OPEN OR HIGH RESISTANCE ELECTRIC POWER STEERING (EPS) MODULE

DIAGNOSTIC TEST

1. **CHARGING SYSTEM DTCS PRESENT**

   NOTE: Disconnect battery charger before continuing.

   1. Start the engine.
   2. With the scan tool, read DTCs in the PCM.

      Are there any Charging System or related voltage DTCs present?

      Yes

      - Perform the appropriate Charging System DTC diagnostic procedures before continuing with this test. Refer to **DTC INDEX** .

      No

      - Go To 2

2. **VERIFY THE DTC IS ACTIVE**

   NOTE: If any other DTCs are present, repair them first before continuing with this diagnostic procedure.

   1. Ignition on, engine not running.
   2. With the scan tool, read DTCs and record on vehicle work order.
   3. With the scan tool, erase DTCs.
   4. Start the engine and run for two minutes.
   5. Turn the steering wheel from lock to lock.
   6. With the scan tool, read DTCs.

      Is the DTC active at this time?

      Yes

      - Go To 3

No

- The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring harness and electrical connectors.
- Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

3. **(A951) FUSED B(+) CIRCUIT OPEN OR HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Disconnect the EPS Module C1 harness connector.
   3. Turn the ignition on.
   4. With a 12-volt test light connected to ground, check the (A951) Fused B+ circuit at the EPS Module C1 harness connector.

      Does the test light illuminate brightly?

      Yes

      - Replace the Electronic Power Steering (EPS) Module in accordance with service information. Refer to **GEAR, REMOVAL** .
      - Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Repair the (A951) Fused B(+) circuit for an open or high resistance.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

C1592-29-ELECTRIC POWER STEERING MOTOR CIRCUIT - SIGNAL INVALID

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously with the ignition on.

SET CONDITION

The Electronic Power Steering (EPS) Module is not detecting a signal the internal power steering gear motor.

POSSIBLE CAUSES

Possible Causes
ELECTRONIC POWER STEERING (EPS) MODULE

DIAGNOSTIC TEST

VERIFY THE DTC IS ACTIVE

NOTE: This DTC must be active for the results of this test to be valid.

1. Ignition on, engine not running.
2. With the scan tool, read DTCs and record on vehicle work order.
3. With the scan tool, erase DTCs.
4. Start the engine.
5. Turn the steering wheel from lock to lock and back to center.
6. With the scan tool, read DTCs.

Is the DTC active at this time?

Yes

- Replace the Electronic Power Steering (EPS) Module in accordance with service information. Refer to **GEAR, REMOVAL** .
- Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring harness and electrical connectors.
- Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C1592-4B-ELECTRONIC POWER STEERING MOTOR CIRCUIT - OVER TEMPERATURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously with the ignition on.

SET CONDITION

The Electronic Power Steering (EPS) Module is sensing steering system temperature is above 120°C (248°F).

POSSIBLE CAUSES

Possible Causes
STEERING GEAR MECHANICAL FAILURE
ELECTRONIC POWER STEERING (EPS) MODULE

DIAGNOSTIC TEST

1. **INSPECT THE STEERING GEAR FOR INCORRECT INSTALLATION, DAMAGE OR MECHANICAL FAILURE**
   1. Turn the ignition off.
   2. Visually inspect the Steering Gear for Improper installation, damage or mechanical failure. Refer to **GEAR, INSTALLATION** .

      Were any problems found?

      Yes

      - Repair as necessary.
      - Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Go To 2
2. **VERIFY THE DTC IS ACTIVE**

   NOTE: This DTC must be active for the results of this test to be valid.

   NOTE: Let the vehicle sit for 30 minutes before continuing with this test.

   1. Ignition on, engine not running.
   2. With the scan tool, read DTCs and record on vehicle work order.
   3. With the scan tool, erase DTCs.
   4. Start the engine.
   5. Turn the steering wheel from lock to lock several times.
   6. With the scan tool, read DTCs.

      Is the DTC active at this time?

      Yes

      - Replace the Electronic Power Steering (EPS) Module in accordance with service information. Refer to **GEAR, REMOVAL** .
      - Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring harness and electrical connectors.
      - Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C1592-74-ELECTRONIC POWER STEERING MOTOR CIRCUIT - ACTUATOR SLIPPING

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously with the ignition on.

SET CONDITION

The Electronic Power Steering (EPS) Module receives a calculated torque on a slipping power steering clutch exceeding 6, 5Nm (4.8ft. lbs) for more than three times consecutively.

POSSIBLE CAUSES

Possible Causes
STEERING WHEEL ALIGNMENT
STEERING GEAR MECHANICAL FAILURE
ELECTRONIC POWER STEERING (EPS) MODULE

NOTE: **If DTC C0051-54 is present, perform the diagnostics for this DTC before continuing with this diagnostic procedure. Refer to C0051-54-STEERING WHEEL POSITION SENSOR - MISSING CALIBRATION.**

DIAGNOSTIC TEST

1. **CHECK FOR STEERING ALIGNMENT**
   1. Check the Steering Alignment.

      Is the Steering Alignment with in specifications?

      Yes

      - Go To 2

      No

      - Repair as necessary.
      - Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
2. **INSPECT THE STEERING GEAR FOR INCORRECT INSTALLATION, DAMAGE OR MECHANICAL FAILURE**
   1. Turn the ignition off.
   2. Visually inspect the Steering Gear for Improper installation, damage or mechanical failure. Refer to **GEAR, INSTALLATION** .

Were any problems found?

Yes

- Repair as necessary.
- Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 3

3. **VERIFY THE DTC IS ACTIVE**

NOTE: This DTC must be active for the results of this test to be valid.

1. Ignition on, engine not running.
2. With the scan tool, read DTCs and record on vehicle work order.
3. With the scan tool, erase DTCs.
4. Start the engine.
5. Turn the steering wheel from lock to lock and back to center.
6. With the scan tool, read DTCs.

Is the DTC active at this time?

Yes

- Replace the Electronic Power Steering (EPS) Module in accordance with service information. Refer to **GEAR, REMOVAL** .
- Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring harness and electrical connectors.
- Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C1592-98-ELECTRONIC POWER STEERING MOTOR CIRCUIT - COMPONENT OR SYSTEM OVER TEMPERATURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously with the ignition on.

SET CONDITION

The Electronic Power Steering (EPS) Module is sensing steering system temperature is above 120°C (248°F).

POSSIBLE CAUSES

Possible Causes
STEERING GEAR INCORRECT INSTALLATION, DAMAGE OR MECHANICAL FAILURE ELECTRONIC POWER STEERING (EPS) MODULE

DIAGNOSTIC TEST

1. **INSPECT THE STEERING GEAR FOR INCORRECT INSTALLATION, DAMAGE OR MECHANICAL FAILURE**
   1. Turn the ignition off.
   2. Visually inspect the Steering Gear for Improper installation, damage or mechanical failure. Refer to **GEAR, INSTALLATION** .

      Were any problems found?

      Yes

      - Repair as necessary.
      - Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Go To 2
2. **VERIFY THE DTC IS ACTIVE**

   NOTE: This DTC must be active for the results of this test to be valid.

   NOTE: Let the vehicle sit for 30 minutes before continuing with this test.

   1. Ignition on, engine not running.
   2. With the scan tool, read DTCs and record on vehicle work order.
   3. With the scan tool, erase DTCs.
   4. Start the engine.
   5. Turn the steering wheel from lock to lock and back to center.
   6. With the scan tool, read DTCs.

      Is the DTC active at this time?

Yes

- Replace the Electronic Power Steering (EPS) Module in accordance with service information. Refer to **GEAR, REMOVAL** .
- Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring harness and electrical connectors.
- Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C15C1-00-EPS MECHANICAL PERFORMANCE

WHEN MONITORED

Continuously above 30 km/h (19 mph).

SET CONDITION

The Electric Power Steering (EPS) Module detects high friction in the steering system when requesting a motor torque change and the rotor positioning is not responding within two seconds.

POSSIBLE CAUSES

Possible Causes
SUSPENSION DAMAGE OR MECHANICAL FAILURE STEERING GEAR IMPROPERLY INSTALLED, DAMAGED OR MECHANICAL FAILURE ELECTRIC POWER STEERING (EPS) MODULE

DIAGNOSTIC TEST

1. **INSPECT THE FRONT SUSPENSION FOR DAMAGE OR MECHANICAL FAILURE**
    1. Turn the ignition off.
    2. Visually inspect the Front Suspension for binding, damage or mechanical failure. Refer to **WHEEL ALIGNMENT, STANDARD PROCEDURE** .

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

- Go To 2

2. **INSPECT THE STEERING GEAR FOR INCORRECT INSTALLATION, DAMAGE OR MECHANICAL FAILURE**

NOTE: Pay particular attention to the inner tie rod boots for damage.

Visually inspect the Steering Gear for Improper installation, damage or mechanical failure. Refer to **GEAR, INSTALLATION** .

Were any problems found?

Yes

- Repair as necessary.
- Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 3

3. **VERIFY THE DTC IS ACTIVE**

NOTE: This DTC must be active for the results of this test to be valid.

1. Ignition on, engine not running.
2. With the scan tool, read DTCs and record on vehicle work order.
3. With the scan tool, erase DTCs.
4. Test drive the vehicle at speeds above 30 k/mh (19 mph) and evaluate return effort of power steering.
5. Park the vehicle.
6. With the scan tool, read DTCs.

Is there excessive return effort in the power steering or is the DTC active at this time?

Yes

- Replace the Electric Power Steering (EPS) Module in accordance with service information. Refer to **GEAR, REMOVAL** .
- Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring harness and electrical connectors.

- Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C15CA-00-BRAKE SYSTEM MODULE - EVENT INFORMATION

WHEN MONITORED

Continuously.

SET CONDITION

The Electronic Power Steering (EPS) Module receiving invalid CAN bus messages from the Anti-lock Brake System (ABS) Module.

POSSIBLE CAUSES

Possible Causes
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE DTCS ELECTRONIC POWER STEERING (EPS) MODULE

DIAGNOSTIC TEST

1. **CHECK IF ABS DTCS ARE PRESENT**
   1. With the scan tool, read the DTCs in the ABS Module.

      Are there any ABS DTCs present?

      Yes

      - Perform the appropriate diagnostic procedure. Refer to **DIAGNOSIS AND TESTING** .

      No

      - Go To 2
2. **VERIFY THE DTC IS ACTIVE**

   NOTE: This DTC must be active for the results of this test to be valid.

   1. Ignition on, engine not running.
   2. With the scan tool, read DTCs and record on vehicle work order.
   3. With the scan tool, erase DTCs.
   4. Start the engine and run for two minutes.
   5. Turn the steering wheel from lock to lock and back to center.
   6. With the scan tool, read DTCs.

Is the DTC active at this time?

Yes

- Replace the Electronic Power Steering (EPS) Module in accordance with service information. Refer to **GEAR, REMOVAL** .
- Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring harness and electrical connectors.
- Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C2100-16-BATTERY VOLTAGE LOW - CIRCUIT VOLTAGE BELOW THRESHOLD

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 3: Electric Power Steering (EPS) Module - Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

Ignition on.

SET CONDITION

If the sensed battery voltage is below 10.7 volts and engine speeds are above 750 RPM for three seconds, undervoltage detection is activated.

POSSIBLE CAUSES

Possible Causes
CHARGING SYSTEM (A951) FUSED B(+) CIRCUIT OPEN OR HIGH RESISTANCE (F942) FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT OPEN OR HIGH RESISTANCE (Z907) GROUND CIRCUIT OPEN OR HIGH RESISTANCE ELECTRONIC POWER STEERING (ESP) MODULE

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**

   NOTE: Diagnose and repair any Powertrain Charging system DTCs before continuing with this procedure.

   NOTE: Make sure the battery is fully charged.

   1. Ignition on, engine not running.
   2. With the scan tool, record and erase DTCs.
   3. Turn the ignition off and wait ten seconds.
   4. Ignition on, engine not running.
   5. With the scan tool, read DTCs.

   Is the DTC active at this time?

   Yes

   - Go To 2

   No

   - The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring harness and electrical connectors.
   - Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

2. **CHARGING SYSTEM DTCS PRESENT**
   1. Start the engine.
   2. With the scan tool, read DTCs in the PCM.

   Are there any Charging System or related voltage DTCs present?

   Yes

- Perform the appropriate Charging System DTC diagnostic procedures before continuing with this test. Refer to **DTC INDEX** .

No

- Go To 3

3. **(A951) FUSED B(+) CIRCUIT OPEN OR HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Disconnect the EPS Module C1 harness connector.
   3. Turn the ignition on.
   4. With a 12-volt test light connected to ground, check the (A951) Fused B+ circuit at the EPS Module C1 harness connector.

      Does the test light illuminate brightly?

      Yes

      - Go To 4

      No

      - Repair the (A951) Fused B(+) circuit for an open or high resistance.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
4. **(F942) FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT OPEN OR HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Disconnect the EPS Module C2 harness connector.
   3. Turn the ignition on.
   4. With a 12-volt test light connected to ground, check the (F942) Fused Ignition Switch Output circuit at the EPS Module C2 harness connector.

      Does the test light illuminate brightly?

      Yes

      - Go To 5

      No

      - Repair the (F942) Fused Ignition Switch Output circuit for an open or high resistance.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
5. **(Z907) GROUND CIRCUIT OPEN OR HIGH RESISTANCE**
   1. Turn the ignition off.

2. With a test light connected to B+ check the (Z907) Ground circuit at the EPS Module C1 harness connector.

   Does the test light illuminate brightly?

   Yes

   - Replace the Electronic Power Steering (EPS) Module in accordance with service information. Refer to **GEAR, REMOVAL** .
   - Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Repair the (Z907) Ground circuit for an open or high resistance.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

C2101-17-BATTERY VOLTAGE HIGH - CIRCUIT VOLTAGE ABOVE THRESHOLD

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Ignition on.

SET CONDITION

If the sensed ignition voltage is greater than 17 volts for three seconds.

POSSIBLE CAUSES

Possible Causes
POWERTRAIN CONTROL MODULE (PCM) CHARGING SYSTEM DTCS PRESENT ELECTRONIC POWER STEERING (EPS) MODULE

DIAGNOSTIC TEST

1. **CHARGING SYSTEM DTCS PRESENT**

   NOTE: Disconnect battery charger before continuing.

   1. Start the engine.
   2. With the scan tool, read DTCs in the PCM.

      Are there any Charging System or related voltage DTCs present?

Yes

- Perform the appropriate Charging System DTC diagnostic procedures before continuing with this test. Refer to **DTC INDEX** .

No

- Go To 2

2. **VERIFY THE DTC IS ACTIVE**
   1. Ignition on, engine not running.
   2. With the scan tool, read DTCs and record on vehicle work order.
   3. With the scan tool, erase DTCs.
   4. Turn ignition off to the lock position.
   5. Start the engine.
   6. With the scan tool, read DTCs.

   Is the DTC active at this time?

   Yes

   - Replace the Electronic Power Steering (EPS) Module in accordance with service information. Refer to **GEAR, REMOVAL** .
   - Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring harness and electrical connectors.
   - Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C2129-13-BATTERY VOLTAGE - CIRCUIT OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 4: Electric Power Steering (EPS) Module - Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

Continuously with the ignition on.

SET CONDITION

If the voltage to the Electric Power Steering (EPS) Module is below 10 volts for more than 15 seconds.

POSSIBLE CAUSES

Possible Causes
(A951) FUSED B(+) CIRCUIT OPEN OR HIGH RESISTANCE DTCS PRESENT (Z907) GROUND CIRCUIT OPEN OR HIGH RESISTANCE ELECTRIC POWER STEERING (EPS) MODULE

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**

   NOTE: This DTC must be active for the results of this test to be valid.

   1. Ignition on, engine not running.
   2. With the scan tool, read DTCs and record on vehicle work order.
   3. With the scan tool, erase DTCs.
   4. Start the engine and run for two minutes.
   5. Turn the steering wheel from lock to lock.
   6. With the scan tool, read DTCs.

   Is the DTC active at this time?

   Yes

   - Go To 2

   No

   - The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring harness and electrical connectors.
   - Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

2. **(A951) FUSED B(+) CIRCUIT OPEN OR HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Disconnect the EPS Module C1 harness connector.
   3. Turn the ignition on.
   4. With a 12-volt test light connected to ground, check the (A951) Fused B+ circuit at the EPS Module C1 harness connector.

   Does the test light illuminate brightly?

   Yes

   - Go To 3

No

- Repair the (A951) Fused B(+) circuit for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **(Z907) GROUND CIRCUIT OPEN OR HIGH RESISTANCE**
   1. Turn the ignition off.
   2. With a test light connected to B+ check the (Z907) Ground circuit at the EPS Module C1 harness connector.

      Does the test light illuminate brightly?

      Yes

      - Replace the Electronic Power Steering (EPS) Module in accordance with service information. Refer to **GEAR, REMOVAL** .
      - Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Repair the (Z907) Ground circuit for an open or high resistance.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

C2202-00-ORIGINAL VIN MISMATCH/MISSING

WHEN MONITORED

Ignition on.

SET CONDITION

This DTC will set if the current VIN does not match the broadcast VIN.

POSSIBLE CAUSES

Possible Causes
ELECTRONIC POWER STEERING (EPS) MODULE NOT INITIALIZED
POWERTRAIN CONTROL MODULE (PCM) VIN NOT PROGRAMMED
ELECTRONIC POWER STEERING (EPS) MODULE
POWERTRAIN CONTROL MODULE (PCM)

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**

NOTE: This DTC must be active for the results of this test to be valid.

1. Ignition on, engine not running.
2. With the scan tool, read DTCs and record on vehicle work order.
3. With the scan tool, erase DTCs.
4. Turn ignition off to the lock position.
5. Ignition on, engine not running.
6. Wait ten seconds.
7. With the scan tool, read DTCs.

   Is the DTC active at this time?

   Yes

   - Go To 2

   No

   - The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring harness and electrical connectors.
   - Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

2. **WRONG VIN PROGRAMMED IN PCM**
   1. Ignition on, engine not running.
   2. With the scan tool, read the VIN in the PCM.
   3. Compare VIN in the PCM to the vehicle VIN.

      Is the correct VIN programmed in the PCM?

      Yes

      - Go To 3

      No

      - Program the correct VIN into the PCM. Follow the VIN programing procedure in the PCM/ECM reprogramming procedure. Refer to the appropriate Testing & Diagnostics article in Engine Performance .
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **INITIALIZE THE EPS MODULE**
   1. Perform any Technical Service Bulletins that may apply.
   2. With the scan tool, under "Miscellaneous Functions" run the EPS Learn routine.
   3. Turn ignition off to the lock position.

4. Cycle the ignition from off to on.
5. Wait ten seconds.
6. With the scan tool, read DTCs.

   Does the DTC remain active?

   Yes

   - Replace the Electronic Power Steering (EPS) Module in accordance with service information. Refer to **GEAR, REMOVAL** .
   - Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C2217-00-ELECTRIC POWER STEERING MODULE INTERNAL

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously.

SET CONDITION

If the Electric Power Steering (EPS) Module detects an internal fault, this DTC will set. Most of internal faults that can set this DTC will result in the EPS assist not operating for the remainder of the current key cycle.

POSSIBLE CAUSES

Possible Causes
ELECTRIC POWER STEERING (EPS) MODULE

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
   1. Ignition on, engine not running.
   2. With the scan tool, read and record the Environmental Data to help identify the conditions in which the DTC was set.
   3. With the scan tool, read DTCs and record on vehicle work order.

   NOTE: Do not erase the DTCs at this time.

Is the DTC active at this time?

Yes

- Replace the Electric Power Steering (EPS) Module in accordance with service information. Refer to **GEAR, REMOVAL** .
- Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 2

2. **VERIFY CUSTOMER COMPLAINT**
   1. Check with customer to verify loss or degradation of power steering assist.

   Was the customer complaint related to a loss or degradation of power steering assist?

   Yes

   - Replace the Electric Power Steering (EPS) Module in accordance with service information. Refer to **GEAR, REMOVAL** .
   - Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 3

3. **VERIFY THE DTC IS STILL ACTIVE**

NOTE: This DTC must be active for the results of this test to be valid.

1. Ignition on, engine not running.
2. With the scan tool, read DTCs and record on vehicle work order.
3. With the scan tool, erase DTCs.
4. Test drive the vehicle at speeds above 30 k/mh (19 mph).
5. Park the vehicle.
6. With the scan tool, read DTCs.

Is the DTC active at this time?

Yes

- Replace the Electric Power Steering (EPS) Module in accordance with service information. Refer to **GEAR, REMOVAL** .
- Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring harness and electrical connectors.
- Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C221C-00-ECU FLASH REQUIRED

WHEN MONITORED

Continuously with ignition on and battery voltage above 10 volts.

SET CONDITION

The Electronic Power Steering (EPS) Module has incorrect software installed.

POSSIBLE CAUSES

Possible Causes
ELECTRONIC POWER STEERING (EPS) MODULE NOT FLASHED
ELECTRONIC POWER STEERING (EPS) MODULE

DIAGNOSTIC TEST

CONTROL MODULE PROGRAMMING ERROR

NOTE: Controller is programmed with outdated or generic software.

1. With the scan tool read and record the vehicles controller part number.
2. Select Use Controller Part Number under the Flash Tab.
3. Flash the controller with the correct software.

   Verify the controller flashed successfully.

   Test Complete

   - Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C221F-00-ECU NOT INITIALIZED

WHEN MONITORED

Continuously.

SET CONDITION

The Steering Angle Sensor is not Calibrated and or the Electronic Power Steering (EPS) Module is not initialized, this DTC will set. Most of internal faults that can set this DTC will result in the EPS assist not operating for the remainder of the current key cycle.

POSSIBLE CAUSES

Possible Causes
STEERING ANGLE SENSOR NOT CALIBRATED
ELECTRONIC POWER STEERING (EPS) MODULE NOT INITIALIZED
ELECTRONIC POWER STEERING (EPS) MODULE

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**

   NOTE: This DTC must be active for the results of this test to be valid.

   1. Perform any Technical Service Bulletins that may apply.
   2. Ignition on, engine not running.
   3. With the scan tool, read DTCs and record on vehicle work order.
   4. With the scan tool, erase DTCs.
   5. Start the engine.
   6. Turn the steering wheel from lock to lock and back to center.
   7. With the scan tool, read DTCs.

   Is the DTC active at this time?

   Yes

   - Go To 2

   No

   - The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring harness and electrical connectors.
   - Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

2. **INITIALIZE EPS MODULE**
   1. With the scan tool, under "Miscellaneous Functions" run the EPS Learn routine.
   2. Turn ignition off to the lock position.
   3. Cycle the ignition from off to on.
   4. Wait ten seconds.
   5. With the scan tool, read DTCs.

Does the DTC remain active?

Yes

- Replace the Electronic Power Steering (EPS) Module in accordance with service information. Refer to **GEAR, REMOVAL** .
- Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time.

U0001-87-CAN-C BUS MISSING MESSAGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously when the ignition is on.

The battery voltage between 10 and 16 Volts.

Body Control Module (BCM) is configured correctly.

SET CONDITION

The controller detects an open, short to ground or a short to voltage on the High Speed CAN Bus circuits.

POSSIBLE CAUSES

Possible Causes
HIGH SPEED CAN BUS CIRCUITS OPEN OR SHORTED DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES ANY HIGH SPEED CAN BUS MODULE

DIAGNOSTIC TEST

VERIFY THE DTC IS ACTIVE

1. Turn the ignition on.
2. With the scan tool, read the DTCs.

   Is this DTC active at this time?

   Yes

- **Refer to DTC INDEX** and perform the U0001-87-CAN C BUS - NO SIGNAL diagnostic procedure.

No

- **Refer to DIAGNOSIS AND TESTING** and perform the Stored Lost Communication DTCs diagnostic procedure.

U0002-00 CAN C BUS OFF PERFORMANCE

WHEN MONITORED

Ignition run time is greater than one second. Battery voltage between 9 and 16 volts. Engine run time greater than three seconds.

SET CONDITION

Bus messages not received from the Body Control Module (BCM) for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN C BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
BODY CONTROL MODULE (BCM) POWER AND GROUND
BCM NOT CONFIGURED CORRECTLY
BODY CONTROL MODULE (BCM)
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

VERIFY THE DTC IS ACTIVE

1. Ignition on, engine not running.
2. With the scan tool, read DTCs and record on vehicle work order.

   Is the DTC Active at this time?

   Yes

   NOTE: Diagnose the U0002-88 CAN C BUS OFF PERFORMANCE-BUSS OFF as the U0010-00 CAN C BUS CIRCUIT test.

   - Perform the U0010-00-Can C Bus diagnostic procedure. **Refer to DTC INDEX** .

No

- Perform the Stored Lost Communication DTCs diagnostic procedure. **Refer to DIAGNOSIS AND TESTING** .

U0100-00-LOST COMMUNICATION WITH ECM/PCM

Perform the COMMUNICATION PRE-DIAGNOSTIC PROCEDURE. Refer to **STANDARD PROCEDURE** .

U0102-00-LOST COMMUNICATION WITH TRANSFER CASE CONTROL MODULE / AWD

Perform the COMMUNICATION PRE-DIAGNOSTIC PROCEDURE. Refer to **STANDARD PROCEDURE** .

U0103-00-LOST COMMUNICATION WITH ELECTRIC GEAR SHIFT MODULE

Perform the COMMUNICATION PRE-DIAGNOSTIC PROCEDURE. Refer to **STANDARD PROCEDURE** .

U0121-00-LOST COMMUNICATION WITH ANTI-LOCK BRAKE SYSTEM (ABS) CONTROL MODULE

Perform the COMMUNICATION PRE-DIAGNOSTIC PROCEDURE. Refer to **STANDARD PROCEDURE** .

U0140-00-LOST COMMUNICATION WITH BODY CONTROL MODULE

Perform the COMMUNICATION PRE-DIAGNOSTIC PROCEDURE. Refer to **STANDARD PROCEDURE** .

U0151-00-LOST COMMUNICATION WITH OCCUPANT RESTRAINT CONTROLLER (ORC)

Perform the COMMUNICATION PRE-DIAGNOSTIC PROCEDURE. Refer to **STANDARD PROCEDURE** .

U0159-00-LOST COMMUNICATION WITH PARK ASSIST CONTROL MODULE (PTS)

Perform the COMMUNICATION PRE-DIAGNOSTIC PROCEDURE. Refer to **STANDARD PROCEDURE** .

U0401-86-IMPLAUSIBLE DATA RECEIVED FROM ECM/PCM - SIGNAL INVALID

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously with the ignition on, one valid CAN message received at least once, and no U0002-00-CAN C Bus Off Performance DTC present.

SET CONDITION

When the Electric Power Steering (EPS) Module detects an incorrect CAN message from the Powertrain Control Module (PCM).

POSSIBLE CAUSES

Possible Causes
ELECTRIC POWER STEERING (EPS) MODULE CAN BUS DTCS
POWERTRAIN CONTROL MODULE (PCM) DTCS
ELECTRIC POWER STEERING (EPS) MODULE

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**

   NOTE: This DTC must be active for the results of this test to be valid.

   1. Turn the ignition on.
   2. With the scan tool, record and erase DTCs.
   3. Cycle the ignition switch from off to on.
   4. With the scan tool, read DTCs.

   Is the DTC active at this time?

   Yes

   - Go To 2

   No

   - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
2. **CHECK IF BCM CAN BUS DTCS ARE PRESENT**
   1. With the scan tool, read BCM DTCs.

   Are there any BCM CAN BUS DTCs present?

   Yes

- Perform the appropriate diagnostic procedure. Refer to **DIAGNOSTIC CODE INDEX** .

No

- Go To 3

3. **CHECK IF ENGINE DTCS ARE PRESENT**
   1. With the scan tool, read PCM DTCs.

      Are there any PCM DTCs present?

      Yes

      - Perform the appropriate diagnostic procedure. Refer to **DTC INDEX** .

      No

      - Using the schematics as a guide, check the Electric Power Steering (EPS) Module pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Electric Power Steering (EPS) Module in accordance with the Service Information. Refer to **GEAR, REMOVAL** .
      - Perform the EPS Module Verification Test. Refer to **STANDARD PROCEDURE**.

U0403-00-IMPLAUSIBLE DATA RECEIVED FROM T-CASE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously with the ignition on, one valid CAN message received at least once, and no CAN C Bus Off Performance DTC present.

SET CONDITION

When the Electric Power Steering (EPS) Module detects an incorrect CAN message from the Drive Train Control Module (DTCM).

POSSIBLE CAUSES

Possible Causes
ELECTRIC POWER STEERING (EPS) MODULE CAN BUS DTCS
BODY CONTROL MODULE (BCM) DTCS
DRIVE TRAIN CONTROL MODULE (DTCM) DTCS
ELECTRIC POWER STEERING (EPS) MODULE

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, record and erase DTCs.
    3. Cycle the ignition from off to on.
    4. With the scan tool, read DTCs.

    Is the DTC active at this time?

    Yes

    - Go To 2

    No

    - Go To 5
2. **CHECK FOR BODY CONTROL MODULE (BCM) DTCS**
    1. With the scan tool, read BCM DTCs.

    Are there any BCM CAN Bus DTCs present?

    Yes

    - Perform the appropriate diagnostic procedure. Refer to **DIAGNOSIS AND TESTING** .

    No

    - Go To 3
3. **CHECK FOR DRIVE TRAIN CONTROL MODULE (DTCM) DTCS**
    1. With the scan tool, read DTCM DTCs.

    Are there any DTCM DTCs present?

    Yes

    - Perform the appropriate diagnostic procedure. Refer to **DIAGNOSIS AND TESTING** .

    No

    - Go To 4
4. **CHECK OTHER MODULES FOR DTCS**
    1. With the scan tool, read DTCs.

Are there any other modules reporting implausible communication DTCs against the DTCM?

Yes

- Replace the Drive Train Control Module (DTCM) in accordance with the Service Information. Refer to **MODULE, DRIVETRAIN CONTROL, REMOVAL** .
- Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Using the schematics as a guide, check the EPS pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Electric Power Steering (EPS) Module in accordance with the Service Information. Refer to **GEAR, REMOVAL** .
- Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

5. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this module. Wiggle the wiring and connectors while checking for shorted and open circuits.
   3. Check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Check Service Bulletins for any possible causes that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

U0404-00-IMPLAUSIBLE DATA RECEIVED FROM ESM

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously with the ignition on, one valid CAN message received at least once, and no CAN C Bus Off Performance DTC present.

SET CONDITION

When the Electric Power Steering (EPS) Module detects an incorrect CAN message from the Electronic Shift Module (ESM).

POSSIBLE CAUSES

Possible Causes
ELECTRIC POWER STEERING (EPS) MODULE CAN BUS DTCS
BODY CONTROL MODULE (BCM) DTCS
ELECTRONIC SHIFT MODULE (ESM) DTCS
ELECTRIC POWER STEERING (EPS) MODULE

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, record and erase DTCs.
    3. Cycle the ignition from off to on.
    4. With the scan tool, read DTCs.

    Is the DTC active at this time?

    Yes

    - Go To 2

    No

    - Go To 5
2. **CHECK FOR BODY CONTROL MODULE (BCM) DTCS**
    1. With the scan tool, read BCM DTCs.

    Are there any BCM CAN Bus DTCs present?

    Yes

    - Perform the appropriate diagnostic procedure. Refer to **DIAGNOSIS AND TESTING** .

    No

    - Go To 3
3. **CHECK FOR ELECTRONIC SHIFT MODULE (ESM) DTCS**
    1. With the scan tool, read ESM DTCs.

    Are there any ESM DTCs present?

Yes

- Perform the appropriate diagnostic procedure. Refer to **DIAGNOSIS AND TESTING** .

No

- Go To 4

4. **CHECK OTHER MODULES FOR DTCS**
   1. With the scan tool, read DTCs.

      Are there any other modules reporting implausible communication DTCs against the ESM?

      Yes

      - Replace the Electronic Shift Module (ESM) in accordance with the Service Information. Refer to **SHIFTER, FLOOR CONSOLE, REMOVAL** .
      - Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Using the schematics as a guide, check the EPS pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Electric Power Steering (EPS) Module in accordance with the Service Information. Refer to **GEAR, REMOVAL** .
      - Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

5. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this module. Wiggle the wiring and connectors while checking for shorted and open circuits.
   3. Check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Check Service Bulletins for any possible causes that may apply.

      Were there any problems found?

      Yes

      - Repair as necessary.
      - Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Test complete.

U0415-00-IMPAUSIBLE DATA RECEIVED FROM ABS

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously while the system is active.

SET CONDITION

An error message has been received over the bus from the Anti-lock Brake System (ABS) Module.

POSSIBLE CAUSES

Possible Causes
CAN BUS OPEN OR SHORTED CONDITION ANTI-LOCK BRAKE SYSTEM (ABS) MODULE DTCS ELECTRIC POWER STEERING (EPS) MODULE

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs and record on vehicle work order.
    3. With the scan tool, erase DTCs.
    4. Cycle the ignition from off to on.
    5. With the scan tool, read the DTCs.

    Is the DTC active at this time?

    Yes

    - Go To 2

    No

    - Go To 3
2. **CHECK FOR DTCS IN THE ABS MODULE**
    1. With the scan tool, read DTCs in the ABS Module.

    Is the ABS Module reporting any DTCs?

    Yes

- Perform the appropriate diagnostic procedure. Refer to **DIAGNOSIS AND TESTING** .

No

- Replace the Electric Power Steering (EPS) Module in accordance with the Service Information. Refer to **GEAR, REMOVAL** .
- Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

3. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. With the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
   3. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Wiggle the wiring and connectors while checking for shorted and open circuits.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

U0415-27-IMPAUSIBLE DATA RECEIVED FROM ABS - SIGNAL RATE OF CHANGE ABOVE THRESHOLD

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously with the ignition on, one valid CAN message received at least once, and no U0002-00-CAN C Bus Off Performance DTC present.

SET CONDITION

When the Electric Power Steering (EPS) Module detects an incorrect CAN message from the Anti-lock Brake System (ABS) Module.

POSSIBLE CAUSES

Possible Causes

ELECTRIC POWER STEERING (EPS) MODULE CAN BUS DTCS
BODY CONTROL MODULE (BCM) DTCS
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE DTCS
ELECTRIC POWER STEERING (EPS) MODULE

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, record and erase DTCs.
    3. Cycle the ignition from off to on.
    4. With the scan tool, read DTCs.

    Is the DTC active at this time?

    Yes

    - Go To 2

    No

    - Go To 5
2. **CHECK FOR BODY CONTROL MODULE (BCM) DTCS**
    1. With the scan tool, read BCM DTCs.

    Are there any BCM CAN Bus DTCs present?

    Yes

    - Perform the appropriate diagnostic procedure. Refer to **DIAGNOSIS AND TESTING** .

    No

    - Go To 3
3. **CHECK FOR ANTI-LOCK BRAKE SYSTEM (ABS) MODULE DTCS**
    1. With the scan tool, read ABS Module DTCs.

    Are there any ABS Module DTCs present?

    Yes

    - Perform the appropriate diagnostic procedure. Refer to **DIAGNOSIS AND TESTING** .

    No

- Go To 4

4. **CHECK OTHER MODULES FOR DTCS**
   1. With the scan tool, read DTCs.

      Are there any other modules reporting implausible communication DTCs against the ABS Module?

      Yes

      - Replace the Anti-lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
      - Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Using the schematics as a guide, check the EPS Module pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Electric Power Steering (EPS) Module in accordance with the Service Information. Refer to **GEAR, REMOVAL** .
      - Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
5. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this module. Wiggle the wiring and connectors while checking for shorted and open circuits.
   3. Check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Check Service Bulletins for any possible causes that may apply.

      Were there any problems found?

      Yes

      - Repair as necessary.
      - Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Test complete.

U0415-35-IMPAUSIBLE DATA RECEIVED FROM ABS - SIGNAL HIGH TIME > MAXIMUM

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously with the ignition on, one valid CAN message received at least once, and no U0002-00-CAN C Bus Off Performance DTC present.

SET CONDITION

When the Electric Power Steering (EPS) Module detects an incorrect CAN message from the Anti-lock Brake System (ABS) Module.

POSSIBLE CAUSES

Possible Causes
ELECTRIC POWER STEERING (EPS) MODULE CAN BUS DTCS
BODY CONTROL MODULE (BCM) DTCS
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE DTCS
ELECTRIC POWER STEERING (EPS) MODULE

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, record and erase DTCs.
    3. Cycle the ignition from off to on.
    4. With the scan tool, read DTCs.

    Is the DTC active at this time?

    Yes

    - Go To 2

    No

    - Go To 5
2. **CHECK FOR BODY CONTROL MODULE (BCM) DTCS**
    1. With the scan tool, read BCM DTCs.

    Are there any BCM CAN Bus DTCs present?

    Yes

    - Perform the appropriate diagnostic procedure. Refer to **DIAGNOSIS AND TESTING** .

    No

- Go To 3

3. **CHECK FOR ANTI-LOCK BRAKE SYSTEM (ABS) MODULE DTCS**
   1. With the scan tool, read ABS Module DTCs.

      Are there any ABS Module DTCs present?

      Yes

      - Perform the appropriate diagnostic procedure. Refer to **DIAGNOSIS AND TESTING** .

      No

      - Go To 4

4. **CHECK OTHER MODULES FOR DTCS**
   1. With the scan tool, read DTCs.

      Are there any other modules reporting implausible communication DTCs against the ABS Module?

      Yes

      - Replace the Anti-lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
      - Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Using the schematics as a guide, check the EPS Module pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Electric Power Steering (EPS) Module in accordance with the Service Information. Refer to **GEAR, REMOVAL** .
      - Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

5. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this module. Wiggle the wiring and connectors while checking for shorted and open circuits.
   3. Check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Check Service Bulletins for any possible causes that may apply.

      Were there any problems found?

      Yes

- Repair as necessary.
- Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete.

U0415-85-IMPAUSIBLE DATA RECEIVED FROM ABS - SIGNAL ABOVE ALLOWABLE RANGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously with the ignition on, one valid CAN message received at least once, and no U0002-00-CAN C Bus Off Performance DTC present.

SET CONDITION

When the Electric Power Steering (EPS) Module detects an incorrect CAN message from the Anti-lock Brake System (ABS) Module.

POSSIBLE CAUSES

Possible Causes
ELECTRIC POWER STEERING (EPS) MODULE CAN BUS DTCS
BODY CONTROL MODULE (BCM) DTCS
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE DTCS
ELECTRIC POWER STEERING (EPS) MODULE

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, record and erase DTCs.
    3. Cycle the ignition from off to on.
    4. With the scan tool, read DTCs.

    Is the DTC active at this time?

    Yes

    - Go To 2

    No

- Go To 5

2. **CHECK FOR BODY CONTROL MODULE (BCM) DTCS**
   1. With the scan tool, read BCM DTCs.

      Are there any BCM CAN Bus DTCs present?

      Yes

      - Perform the appropriate diagnostic procedure. Refer to **DIAGNOSIS AND TESTING** .

      No

      - Go To 3

3. **CHECK FOR ANTI-LOCK BRAKE SYSTEM (ABS) MODULE DTCS**
   1. With the scan tool, read ABS Module DTCs.

      Are there any ABS Module DTCs present?

      Yes

      - Perform the appropriate diagnostic procedure. Refer to **DIAGNOSIS AND TESTING** .

      No

      - Go To 4

4. **CHECK OTHER MODULES FOR DTCS**
   1. With the scan tool, read DTCs.

      Are there any other modules reporting implausible communication DTCs against the ABS Module?

      Yes

      - Replace the Anti-lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
      - Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Using the schematics as a guide, check the EPS Module pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Electric Power Steering (EPS) Module in accordance with the Service Information. Refer to **GEAR, REMOVAL** .
      - Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

5. **CHECK THE WIRING AND CONNECTORS**

1. The conditions necessary to set the DTC are not present at this time.
2. Using the schematics as a guide, inspect the wiring and connectors specific to this module. Wiggle the wiring and connectors while checking for shorted and open circuits.
3. Check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
4. Check Service Bulletins for any possible causes that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

U0415-86-IMPAUSIBLE DATA RECEIVED FROM ABS - SIGNAL INVALID

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously with the ignition on, one valid CAN message received at least once, and no U0002-00-CAN C Bus Off Performance DTC present.

SET CONDITION

When the Electric Power Steering (EPS) Module detects an incorrect CAN message from the Anti-lock Brake System (ABS) Module.

POSSIBLE CAUSES

Possible Causes
ELECTRIC POWER STEERING (EPS) MODULE CAN BUS DTCS
BODY CONTROL MODULE (BCM) DTCS
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE DTCS
ELECTRIC POWER STEERING (EPS) MODULE

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**

NOTE: This DTC must be active for the results of this test to be valid.

1. Turn the ignition on.
2. With the scan tool, read DTCs and record on vehicle work order.
3. With the scan tool, erase DTCs.
4. Cycle the ignition switch from off to on.
5. With the scan tool, read DTCs.

   Is the DTC active at this time?

   Yes

   - Go To 2

   No

   - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

2. **CHECK IF BCM CAN BUS DTCS ARE PRESENT**
   1. With the scan tool, read the DTCs in the BCM.

      Are there any BCM CAN BUS DTCs present?

      Yes

      - Perform the appropriate diagnostic procedure. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 3

3. **CHECK IF ABS DTCS ARE PRESENT**
   1. With the scan tool, read the DTCs in the ABS Module.

      Are there any ABS DTCs present?

      Yes

      - Perform the appropriate diagnostic procedure. Refer to **DIAGNOSIS AND TESTING** .

      No

      - Using the schematics as a guide, check the Electric Power Steering (EPS) Module pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular

attention to all power and ground circuits. If no problems are found, replace the Electric Power Steering (EPS) Module in accordance with the Service Information. Refer to **GEAR, REMOVAL** .

- Perform the EPS Module Verification Test. Refer to **STANDARD PROCEDURE**.

U0415-90-IMPAUSIBLE DATA RECEIVED FROM ABS - STUCK ON

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously with the ignition on, one valid CAN message received at least once, and no U0002-00-CAN C Bus Off Performance DTC present.

SET CONDITION

When the Electric Power Steering (EPS) Module detects an incorrect CAN message from the Anti-lock Brake System (ABS) Module.

POSSIBLE CAUSES

Possible Causes
ELECTRIC POWER STEERING (EPS) MODULE CAN BUS DTCS
BODY CONTROL MODULE (BCM) DTCS
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE DTCS
ELECTRIC POWER STEERING (EPS) MODULE

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, record and erase DTCs.
    3. Cycle the ignition from off to on.
    4. With the scan tool, read DTCs.

    Is the DTC active at this time?

    Yes

    - Go To 2

    No

    - Go To 5
2. **CHECK FOR BODY CONTROL MODULE (BCM) DTCS**

1. With the scan tool, read BCM DTCs.

   Are there any BCM CAN Bus DTCs present?

   Yes

   - Perform the appropriate diagnostic procedure. Refer to **DIAGNOSIS AND TESTING** .

   No

   - Go To 3

3. **CHECK FOR ANTI-LOCK BRAKE SYSTEM (ABS) MODULE DTCS**
   1. With the scan tool, read ABS Module DTCs.

      Are there any ABS Module DTCs present?

      Yes

      - Perform the appropriate diagnostic procedure. Refer to **DIAGNOSIS AND TESTING** .

      No

      - Go To 4

4. **CHECK OTHER MODULES FOR DTCS**
   1. With the scan tool, read DTCs.

      Are there any other modules reporting implausible communication DTCs against the ABS Module?

      Yes

      - Replace the Anti-lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
      - Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Using the schematics as a guide, check the EPS Module pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Electric Power Steering (EPS) Module in accordance with the Service Information. Refer to **GEAR, REMOVAL** .
      - Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

5. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this module. Wiggle

the wiring and connectors while checking for shorted and open circuits.

3. Check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
4. Check Service Bulletins for any possible causes that may apply.

Were there any problems found?

Yes

- Repair as necessary.
- Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete.

U0422-00-IMPAUSIBLE DATA RECEIVED FROM BODY CONTROL MODULE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously with the ignition on, one valid CAN message received at least once, and no U0002-00-CAN C Bus Off Performance DTC present.

SET CONDITION

When the Electric Power Steering (EPS) Module detects an incorrect CAN message from the Body Control Module (BCM).

POSSIBLE CAUSES

Possible Causes
ELECTRIC POWER STEERING (EPS) MODULE CAN BUS DTCS
BODY CONTROL MODULE (BCM) DTCS
POWERTRAIN CONTROL MODULE (PCM) DTCS
ELECTRIC POWER STEERING (EPS) MODULE

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**

NOTE: This DTC must be active for the results of this test to be valid.

1. Perform any Technical Service Bulletins (TSBs) that may apply.

2. Turn the ignition on.
3. With the scan tool, record and erase DTCs.
4. Cycle the ignition switch from off to on.
5. With the scan tool, read the DTCs.

Is the DTC active at this time?

Yes

- Go To 2

No

- Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

2. **CHECK POWERTRAIN CONTROL MODULE (PCM) CAN BUS DTCS ARE PRESENT**
   1. With the scan tool, read the PCM DTCs.

   Are there any PCM CAN BUS DTCs present?

   Yes

   - Perform the appropriate diagnostic procedures. Refer to **DTC INDEX** .
   - Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 3

3. **CHECK BODY CONTROL MODULE (BCM) CAN BUS DTCS ARE PRESENT**
   1. With the scan tool, read the BCM DTCs.

   Are there any BCM CAN BUS DTCs present?

   Yes

   - Perform the appropriate diagnostic procedures. Refer to **DIAGNOSIS AND TESTING** .
   - Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Using the schematics as a guide, check the Electric Power Steering (EPS) Module pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Electric Power Steering (EPS) Module accordance with Service Information. Refer to **GEAR, REMOVAL** .

- Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

U0452-00-IMPLAUSIBLE DATA RECEIVED FROM RESTRAINTS CONTROL MODULE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously with the ignition on, one valid CAN message received at least once, and no CAN C Bus Off Performance DTC present.

SET CONDITION

When the Electric Power Steering (EPS) Module detects an incorrect CAN message from the Occupant Restraint Controller (ORC).

POSSIBLE CAUSES

Possible Causes
ELECTRIC POWER STEERING (EPS) MODULE CAN BUS DTCS
BODY CONTROL MODULE (BCM) DTCS
OCCUPANT RESTRAINT CONTROLLER (ORC) DTCS
ELECTRIC POWER STEERING (EPS) MODULE

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, record and erase DTCs.
    3. Cycle the ignition from off to on.
    4. With the scan tool, read DTCs.

    Is the DTC active at this time?

    Yes

    - Go To 2

    No

    - Go To 5
2. **CHECK FOR BODY CONTROL MODULE (BCM) DTCS**
    1. With the scan tool, read BCM DTCs.

Are there any BCM CAN Bus DTCs present?

Yes

- Perform the appropriate diagnostic procedure. Refer to **DIAGNOSIS AND TESTING** .

No

- Go To 3

3. **CHECK FOR OCCUPANT RESTRAINT CONTROLLER (ORC) DTCS**
   1. With the scan tool, read ORC DTCs.

   Are there any ORC DTCs present?

   Yes

   - Perform the appropriate diagnostic procedure. Refer to **DIAGNOSIS AND TESTING** .

   No

   - Go To 4

4. **CHECK OTHER MODULES FOR DTCS**
   1. With the scan tool, read DTCs.

   Are there any other modules reporting implausible communication DTCs against the ORC?

   Yes

   - Replace the Occupant Restraint Controller (ORC) in accordance with the Service Information. Refer to **REMOVAL** .
   - Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Using the schematics as a guide, check the EPS pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Electric Power Steering (EPS) Module in accordance with the Service Information. Refer to **GEAR, REMOVAL** .
   - Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

5. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this module. Wiggle the wiring and connectors while checking for shorted and open circuits.
   3. Check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent

terminals, and correct pin tension.

4. Check Service Bulletins for any possible causes that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

U0452-86-IMPLAUSIBLE DATA RECEIVED FROM RESTRAINTS CONTROL MODULE - SIGNAL INVALID

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously with the ignition on, one valid CAN message received at least once, and no CAN C Bus Off Performance DTC present.

SET CONDITION

When the Electric Power Steering (EPS) Module detects an incorrect CAN message from the Occupant Restraint Controller (ORC).

POSSIBLE CAUSES

Possible Causes
ELECTRIC POWER STEERING (EPS) MODULE CAN BUS DTCS
BODY CONTROL MODULE (BCM) DTCS
OCCUPANT RESTRAINT CONTROLLER (ORC) DTCS
ELECTRIC POWER STEERING (EPS) MODULE

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
   1. Turn the ignition on.
   2. With the scan tool, record and erase DTCs.
   3. Cycle the ignition from off to on.
   4. With the scan tool, read DTCs.

Is the DTC active at this time?

Yes

- Go To 2

No

- Go To 5

2. **CHECK FOR BODY CONTROL MODULE (BCM) DTCS**
   1. With the scan tool, read BCM DTCs.

      Are there any BCM CAN Bus DTCs present?

      Yes

      - Perform the appropriate diagnostic procedure. Refer to **DIAGNOSIS AND TESTING** .

      No

      - Go To 3

3. **CHECK FOR OCCUPANT RESTRAINT CONTROLLER (ORC) DTCS**
   1. With the scan tool, read ORC DTCs.

      Are there any ORC DTCs present?

      Yes

      - Perform the appropriate diagnostic procedure. Refer to **DIAGNOSIS AND TESTING** .

      No

      - Go To 4

4. **CHECK OTHER MODULES FOR DTCS**
   1. With the scan tool, read DTCs.

      Are there any other modules reporting implausible communication DTCs against the ORC?

      Yes

      - Replace the Occupant Restraint Controller (ORC) in accordance with the Service Information. Refer to **REMOVAL** .
      - Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Using the schematics as a guide, check the EPS pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Electric Power Steering (EPS) Module in accordance with the Service Information. Refer to **GEAR, REMOVAL** .
- Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

5. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this module. Wiggle the wiring and connectors while checking for shorted and open circuits.
   3. Check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Check Service Bulletins for any possible causes that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

U045A-00-IMPLAUSIBLE DATA RECEIVED FROM PARKING ASSIST MODULE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously with the ignition on, one valid CAN message received at least once, and no CAN C Bus Off Performance DTC present.

SET CONDITION

When the Electric Power Steering (EPS) Module detects an incorrect CAN message from the Park Assist Module (PAM).

POSSIBLE CAUSES

Possible Causes
ELECTRIC POWER STEERING (EPS) MODULE CAN BUS DTCS

BODY CONTROL MODULE (BCM) DTCS
PARK ASSIST MODULE (PAM) DTCS
ELECTRIC POWER STEERING (EPS) MODULE

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, record and erase DTCs.
    3. Cycle the ignition from off to on.
    4. With the scan tool, read DTCs.

    Is the DTC active at this time?

    Yes

    - Go To 2

    No

    - Go To 5
2. **CHECK FOR BODY CONTROL MODULE (BCM) DTCS**
    1. With the scan tool, read BCM DTCs.

    Are there any BCM CAN Bus DTCs present?

    Yes

    - Perform the appropriate diagnostic procedure. Refer to **DIAGNOSIS AND TESTING** .

    No

    - Go To 3
3. **CHECK FOR PARK ASSIST MODULE (PAM) DTCS**
    1. With the scan tool, read PAM DTCs.

    Are there any PAM DTCs present?

    Yes

    - Perform the appropriate diagnostic procedure. Refer to **DIAGNOSIS AND TESTING** .

    No

- Go To 4

4. **CHECK OTHER MODULES FOR DTCS**
   1. With the scan tool, read DTCs.

      Are there any other modules reporting implausible communication DTCs against the PAM?

      Yes

      - Replace the Park Assist Module (PAM) in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
      - Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Using the schematics as a guide, check the EPS pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Electric Power Steering (EPS) Module in accordance with the Service Information. Refer to **GEAR, REMOVAL** .
      - Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
5. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this module. Wiggle the wiring and connectors while checking for shorted and open circuits.
   3. Check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Check Service Bulletins for any possible causes that may apply.

      Were there any problems found?

      Yes

      - Repair as necessary.
      - Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Test complete.

U1206-00-LOST COMMUNICATION WITH ELECTRONIC PARK BRAKE MODULE

Perform the COMMUNICATION PRE-DIAGNOSTIC PROCEDURE. Refer to **STANDARD PROCEDURE** .

U1215-00-LOST COMMUNICATION WITH FORWARD FACING CAMERA

Perform the COMMUNICATION PRE-DIAGNOSTIC PROCEDURE. Refer to **STANDARD PROCEDURE** .

U148D-00-IMPLAUSIBLE DATA RECEIVED FROM FORWARD FACING CAMERA

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously with the ignition on, one valid CAN message received at least once, and no CAN C Bus Off Performance DTC present.

SET CONDITION

When the Electric Power Steering (EPS) Module detects an incorrect CAN message from the Forward Facing Camera Module (FFCM).

POSSIBLE CAUSES

Possible Causes
ELECTRIC POWER STEERING (EPS) MODULE CAN BUS DTCS
BODY CONTROL MODULE (BCM) DTCS
FORWARD FACING CAMERA MODULE (FFCM) DTCS
ELECTRIC POWER STEERING (EPS) MODULE

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, record and erase DTCs.
    3. Cycle the ignition from off to on.
    4. With the scan tool, read DTCs.

    Is the DTC active at this time?

    Yes

    - Go To 2

    No

    - Go To 5
2. **CHECK FOR BODY CONTROL MODULE (BCM) DTCS**
    1. With the scan tool, read BCM DTCs.

Are there any BCM CAN Bus DTCs present?

Yes

- Perform the appropriate diagnostic procedure. Refer to **DIAGNOSIS AND TESTING** .

No

- Go To 3

3. **CHECK FOR FORWARD FACING CAMERA MODULE (FFCM) DTCS**
   1. With the scan tool, read FFCM DTCs.

   Are there any FFCM DTCs present?

   Yes

   - Perform the appropriate diagnostic procedure. Refer to **DIAGNOSIS AND TESTING** .

   No

   - Go To 4

4. **CHECK OTHER MODULES FOR DTCS**
   1. With the scan tool, read DTCs.

   Are there any other modules reporting implausible communication DTCs against the FFCM?

   Yes

   - Replace the Forward Facing Camera Module (FFCM) in accordance with the Service Information. Refer to **MODULE, FORWARD FACING CAMERA, REMOVAL** .
   - Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Using the schematics as a guide, check the EPS pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Electric Power Steering (EPS) Module in accordance with the Service Information. Refer to **GEAR, REMOVAL** .
   - Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

5. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this module. Wiggle the wiring and connectors while checking for shorted and open circuits.
   3. Check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent

terminals, and correct pin tension.

4. Check Service Bulletins for any possible causes that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

U148D-27-IMPLAUSIBLE DATA RECEIVED FROM FORWARD FACING CAMERA - SIGNAL RATE OF CHANGE ABOVE THRESHOLD

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously with the ignition on, one valid CAN message received at least once, and no CAN C Bus Off Performance DTC present.

SET CONDITION

When the Electric Power Steering (EPS) Module detects an incorrect CAN message from the Forward Facing Camera Module (FFCM).

POSSIBLE CAUSES

Possible Causes
ELECTRIC POWER STEERING (EPS) MODULE CAN BUS DTCS
BODY CONTROL MODULE (BCM) DTCS
FORWARD FACING CAMERA MODULE (FFCM) DTCS
ELECTRIC POWER STEERING (EPS) MODULE

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
   1. Turn the ignition on.
   2. With the scan tool, record and erase DTCs.
   3. Cycle the ignition from off to on.
   4. With the scan tool, read DTCs.

Is the DTC active at this time?

Yes

- Go To 2

No

- Go To 5

2. **CHECK FOR BODY CONTROL MODULE (BCM) DTCS**
   1. With the scan tool, read BCM DTCs.

      Are there any BCM CAN Bus DTCs present?

      Yes

      - Perform the appropriate diagnostic procedure. Refer to **DIAGNOSIS AND TESTING** .

      No

      - Go To 3

3. **CHECK FOR FORWARD FACING CAMERA MODULE (FFCM) DTCS**
   1. With the scan tool, read FFCM DTCs.

      Are there any FFCM DTCs present?

      Yes

      - Perform the appropriate diagnostic procedure. Refer to **DIAGNOSIS AND TESTING** .

      No

      - Go To 4

4. **CHECK OTHER MODULES FOR DTCS**
   1. With the scan tool, read DTCs.

      Are there any other modules reporting implausible communication DTCs against the FFCM?

      Yes

      - Replace the Forward Facing Camera Module (FFCM) in accordance with the Service Information. Refer to **MODULE, FORWARD FACING CAMERA, REMOVAL** .
      - Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Using the schematics as a guide, check the EPS pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Electric Power Steering (EPS) Module in accordance with the Service Information. Refer to **GEAR, REMOVAL** .
- Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

5. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this module. Wiggle the wiring and connectors while checking for shorted and open circuits.
   3. Check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Check Service Bulletins for any possible causes that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

U148D-2A-IMPLAUSIBLE DATA RECEIVED FROM FORWARD FACING CAMERA - STUCK

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously with the ignition on, one valid CAN message received at least once, and no CAN C Bus Off Performance DTC present.

SET CONDITION

When the Electric Power Steering (EPS) Module detects an incorrect CAN message from the Forward Facing Camera Module (FFCM).

POSSIBLE CAUSES

Possible Causes
ELECTRIC POWER STEERING (EPS) MODULE CAN BUS DTCS

BODY CONTROL MODULE (BCM) DTCS
FORWARD FACING CAMERA MODULE (FFCM) DTCS
ELECTRIC POWER STEERING (EPS) MODULE

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, record and erase DTCs.
    3. Cycle the ignition from off to on.
    4. With the scan tool, read DTCs.

    Is the DTC active at this time?

    Yes

    - Go To 2

    No

    - Go To 5
2. **CHECK FOR BODY CONTROL MODULE (BCM) DTCS**
    1. With the scan tool, read BCM DTCs.

    Are there any BCM CAN Bus DTCs present?

    Yes

    - Perform the appropriate diagnostic procedure. Refer to **DIAGNOSIS AND TESTING** .

    No

    - Go To 3
3. **CHECK FOR FORWARD FACING CAMERA MODULE (FFCM) DTCS**
    1. With the scan tool, read FFCM DTCs.

    Are there any FFCM DTCs present?

    Yes

    - Perform the appropriate diagnostic procedure. Refer to **DIAGNOSIS AND TESTING** .

    No

- Go To 4

4. **CHECK OTHER MODULES FOR DTCS**
   1. With the scan tool, read DTCs.

      Are there any other modules reporting implausible communication DTCs against the FFCM?

      Yes

      - Replace the Forward Facing Camera Module (FFCM) in accordance with the Service Information. Refer to **MODULE, FORWARD FACING CAMERA, REMOVAL** .
      - Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Using the schematics as a guide, check the EPS pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Electric Power Steering (EPS) Module in accordance with the Service Information. Refer to **GEAR, REMOVAL** .
      - Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
5. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this module. Wiggle the wiring and connectors while checking for shorted and open circuits.
   3. Check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Check Service Bulletins for any possible causes that may apply.

      Were there any problems found?

      Yes

      - Repair as necessary.
      - Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Test complete.

U148D-85-IMPLAUSIBLE DATA RECEIVED FROM FORWARD FACING CAMERA - SIGNAL ABOVE ALLOWABLE RANGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously with the ignition on, one valid CAN message received at least once, and no CAN C Bus Off Performance DTC present.

SET CONDITION

When the Electric Power Steering (EPS) Module detects an incorrect CAN message from the Forward Facing Camera Module (FFCM).

POSSIBLE CAUSES

Possible Causes
ELECTRIC POWER STEERING (EPS) MODULE CAN BUS DTCS
BODY CONTROL MODULE (BCM) DTCS
FORWARD FACING CAMERA MODULE (FFCM) DTCS
ELECTRIC POWER STEERING (EPS) MODULE

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, record and erase DTCs.
    3. Cycle the ignition from off to on.
    4. With the scan tool, read DTCs.

    Is the DTC active at this time?

    Yes

    - Go To 2

    No

    - Go To 5
2. **CHECK FOR BODY CONTROL MODULE (BCM) DTCS**
    1. With the scan tool, read BCM DTCs.

    Are there any BCM CAN Bus DTCs present?

    Yes

    - Perform the appropriate diagnostic procedure. Refer to **DIAGNOSIS AND TESTING** .

    No

- Go To 3

3. **CHECK FOR FORWARD FACING CAMERA MODULE (FFCM) DTCS**
   1. With the scan tool, read FFCM DTCs.

      Are there any FFCM DTCs present?

      Yes

      - Perform the appropriate diagnostic procedure. Refer to **DIAGNOSIS AND TESTING** .

      No

      - Go To 4

4. **CHECK OTHER MODULES FOR DTCS**
   1. With the scan tool, read DTCs.

      Are there any other modules reporting implausible communication DTCs against the FFCM?

      Yes

      - Replace the Forward Facing Camera Module (FFCM) in accordance with the Service Information. Refer to **MODULE, FORWARD FACING CAMERA, REMOVAL** .
      - Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Using the schematics as a guide, check the EPS pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Electric Power Steering (EPS) Module in accordance with the Service Information. Refer to **GEAR, REMOVAL** .
      - Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

5. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this module. Wiggle the wiring and connectors while checking for shorted and open circuits.
   3. Check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Check Service Bulletins for any possible causes that may apply.

      Were there any problems found?

      Yes

- Repair as necessary.
- Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete.

STANDARD PROCEDURE

EPS VERIFICATION TEST

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

EPS VERIFICATION TEST

1. Turn the ignition off to the lock position.
2. Remove all test equipment.
3. Connect all previously disconnected components and connectors.
4. Verify all accessories are turned off, the battery is fully charged and the charging system has a status of "recharging".
5. Verify that the ignition is on. With the scan tool, record and erase all DTCs from all modules. Start the engine and allow it to run for two minutes and fully operate the system that was indicating the failure.

   NOTE: Turn the steering wheel from lock to lock, holding at each lock position for One second.

6. Turn the ignition off and wait five seconds. Turn the ignition on and using the scan tool, read Diagnostic Trouble Codes (DTCs) from all modules.
7. If there are no DTCs present after turning ignition on, road test the vehicle for at least five minutes.
8. Again, with the scan tool read DTCs. If any DTCs are present, refer to **DTC INDEX** for the Diagnostic procedure and troubleshoot the new or recurring symptom.
9. If there are no DTCs present and the customer's concern can no longer be duplicated, the repair is complete.

   Are any DTCs present or is the original concern still present?

   Yes

   - Perform the appropriate diagnostic procedure. Refer to **DIAGNOSIS AND TESTING**.

   No

   - Repair is complete.

EPS LEARN PROCEDURE

PERFORMING EPS LEARN PROCEDURE

1. Using the scan tool, under "Miscellaneous Functions" perform the EPS Learn procedure.
2. With the scan tool, select View DTCs in the EPS.

   Are there any DTCs present?

   Yes

   - Refer to **DIAGNOSTIC CODE INDEX** and perform the appropriate diagnostic procedure(s).

   No

   - Test Complete
   - Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

2014 STEERING

Steering Control Module (SCM) - Electrical Diagnostics - Cherokee

DIAGNOSTIC CODE INDEX

DIAGNOSTIC CODE INDEX

DTC	Description
B178F-92	TURN SIGNAL SWITCH - PERFORMANCE OR INCORRECT OPERATION
B2225-00	SCM STEERING COLUMN MODULE INTERNAL
B2309-29	REAR WIPER SWITCH - SIGNAL INVALID
B232E-00	REAR WASHER SWITCH STUCK
B232F-00	MIST SWITCH STUCK
B23A1-2A	FLASH TO PASS/OPTICAL HORN SWITCH - STUCK
C2129-16	BATTERY VOLTAGE - CIRCUIT VOLTAGE BELOW THRESHOLD
C2129-17	BATTERY VOLTAGE - CIRCUIT VOLTAGE ABOVE THRESHOLD
U0001-00	CAN C BUS
U0002-00	CAN C BUS OFF PERFORMANCE
U0100-00	LOST COMMUNICATION WITH ECM/PCM
U0140-00	LOST COMMUNICATION WITH BODY CONTROL MODULE
U0401-00	IMPLAUSIBLE DATA RECEIVED FROM ECM/PCM
U0422-00	IMPLAUSIBLE DATA RECEIVED FROM THE BODY CONTROL MODULE
U1008-00	LIN 1 BUS
U121E-00	LOST COMMUNICATION WITH STEERING WHEEL CRUISE CONTROL SWITCH

DIAGNOSIS AND TESTING

B178F-92-TURN SIGNAL SWITCH - PERFORMANCE OR INCORRECT OPERATION

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

The BCM detects the Turn Signal function inoperative.

POSSIBLE CAUSES

Possible Causes
LEFT MULTIFUNCTION SWITCH

DIAGNOSTIC TEST

CHECK FOR AN ACTIVE DTC

NOTE: Before proceeding with this diagnostic procedure, verify the Left and Right Multifunction Switch and Clockspring harness connectors are properly seated and verify proper pin terminal tension. A loose connection at any of these connectors may cause this DTC to set.

1. Turn the ignition on.
2. Actuate the left and right turn signals with the Left Multifunction Switch.
3. With the scan tool, read DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Replace the Left Multifunction Switch in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.

B2225-00-SCM STEERING COLUMN MODULE INTERNAL

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The SCCM is located near the top of the steering column below the steering wheel. The SCCM includes the Clockspring, the Multi-function Switch and a LIN/CAN C Gateway. LIN Bus messages received by the LIN/CAN C Gateway are broadcast over the CAN C Bus to the appropriate modules.

WHEN MONITORED

With the ignition on.

SET CONDITION

The Steering Column Control Module (SCCM) has set an internal electronic failure status.

POSSIBLE CAUSES

Possible Causes
(A929) FUSED B(+) CIRCUIT OPEN, SHORTED TO GROUND OR HIGH RESISTANCE
LOW BATTERY VOLTAGE
STEERING COLUMN CONTROL MODULE (SCCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
   1. Turn the ignition on.
   2. With the scan tool, read DTCs.

      Does the scan tool display this DTC as active?

      Yes

      - Go To 2

      No

      - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **LOW BATTERY VOLTAGE**
   1. Turn the ignition off.
   2. Disconnect the Steering Control Module C2 harness connector.
   3. Turn the ignition on.
   4. Measure the voltage of the (A929) Fused B(+) circuit.

      Is battery voltage present?

      Yes

      - Replace the Steering Column Control Module (SCCM) in accordance with the Service Information. Refer to **MODULE, STEERING COLUMN, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

- Repair the (A929) Fused B(+) circuit for an open, short to ground or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B2309-29-REAR WIPER SWITCH - SIGNAL INVALID

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Rear Wiper/Washer Switch is part of the Multi-function Switch and is integral to the Steering Column Control Module (SCCM). The SCCM is located near the top of the steering column below the steering wheel. The SCCM includes the Clockspring, the Multi-function Switch and a LIN/CAN C Gateway. LIN Bus messages received by the LIN/CAN C Gateway are broadcast over the CAN C Bus to the appropriate modules.

WHEN MONITORED

With the ignition on.

SET CONDITION

The BCM detects the Rear Wiper Switch function is inoperative.

POSSIBLE CAUSES

Possible Causes
REAR WIPER SWITCH

DIAGNOSTIC TEST

CHECK FOR AN ACTIVE DTC

NOTE: Before proceeding with this diagnostic procedure, verify the Left and Right Multifunction Switch and Clockspring harness connectors are properly seated and verify proper pin terminal tension. A loose connection at any of these connectors may cause this DTC to set.

1. Turn the ignition on.
2. Activate the Rear Wiper Switch.
3. With the scan tool, read DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Replace the Rear Wiper Switch in accordance with the Service Information.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.

B232E-00-REAR WASHER SWITCH STUCK

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Rear Wiper/Washer Switch is part of the Multi-function Switch and is integral to the Steering Column Control Module (SCCM). The SCCM is located near the top of the steering column below the steering wheel. The SCCM includes the Clockspring, the Multi-function Switch and a LIN/CAN C Gateway. LIN Bus messages received by the LIN/CAN C Gateway are broadcast over the CAN C Bus to the appropriate modules.

WHEN MONITORED

With the ignition on.

SET CONDITION

The SCCM detects the Rear Washer Switch is active for greater than 20 seconds.

POSSIBLE CAUSES

Possible Causes
STEERING COLUMN CONTROL MODULE (SCCM)
REAR WASHER SWITCH STUCK

DIAGNOSTIC TEST

CHECK FOR AN ACTIVE DTC

1. Turn the ignition on.
2. Press the Rear Washer Switch twice.
3. With the scan tool, read DTCs.

   Does the scan tool display this DTC as active?

   Yes

- Replace the Steering Column Control Module (SCCM) in accordance with the Service Information. Refer to **MODULE, STEERING COLUMN, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B232F-00-MIST SWITCH STUCK

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

The SCCM detects the Mist Switch is active for greater than 20 seconds.

POSSIBLE CAUSES

Possible Causes
STEERING COLUMN CONTROL MODULE (SCCM)
MIST SWITCH STUCK

DIAGNOSTIC TEST

CHECK FOR AN ACTIVE DTC

1. Turn the ignition on.
2. Activate the Mist Switch twice.
3. With the scan tool, read DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Replace the Steering Column Control Module (SCCM) in accordance with the Service Information. Refer to **MODULE, STEERING COLUMN, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B23A1-2A-FLASH TO PASS/OPTICAL HORN SWITCH - STUCK

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Flash to Pass/Optical Horn Switch is part of the Multi-function Switch and is integral to the Steering Column Control Module (SCCM). The SCCM is located near the top of the steering column below the steering wheel. The SCCM includes the Clockspring, the Multi-function Switch and a LIN/CAN C Gateway. LIN Bus messages received by the LIN/CAN C Gateway are broadcast over the CAN C Bus to the appropriate modules.

WHEN MONITORED

With the ignition on.

SET CONDITION

The SCCM detects the Flash to Pass/Optical Horn Switch is active for greater than 20 seconds.

POSSIBLE CAUSES

Possible Causes
STEERING COLUMN CONTROL MODULE (SCCM)
FLASH TO PASS/OPTICAL HORN SWITCH STUCK

DIAGNOSTIC TEST

CHECK FOR AN ACTIVE DTC

1. Turn the ignition on.
2. Actuate the Flash To Pass/Optical Horn Switch twice.
3. With the scan tool, read DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Replace the Steering Column Control Module (SCCM) in accordance with the Service Information. Refer to **MODULE, STEERING COLUMN, REMOVAL** .

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

C2129-16-BATTERY VOLTAGE - CIRCUIT VOLTAGE BELOW THRESHOLD

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 1: Steering Control Module - Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

Continuously with the ignition on.

SET CONDITION

If the voltage to the Steering Column Control Module (SCCM) is below 10 volts for more than 15 seconds.

POSSIBLE CAUSES

Possible Causes
RELATED DTCS PRESENT IN PCM
LOW BATTERY VOLTAGE
(A929) FUSED B(+) CIRCUIT HIGH RESISTANCE
(Z917) GROUND CIRCUIT HIGH RESISTANCE
STEERING COLUMN CONTROL MODULE (SCCM)

DIAGNOSTIC TEST

1. **RELATED DTC(S) PRESENT IN PCM**
    1. Turn the ignition on.
    2. With the scan tool, select View DTCs in the Powertrain Control Module (PCM).

    Are there any charging system or related battery voltage DTCs present in the PCM?

    Yes

    - Perform the appropriate diagnostic procedure. Refer to **DTC INDEX** .

    No

    - Go To 2
2. **CHECK FOR AN ACTIVE DTC**
    1. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 3

    No

    - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
3. **(A929) FUSED B(+) CIRCUIT OPEN OR SHORTED TO GROUND**
    1. Turn the ignition off.
    2. Disconnect the Steering Control Module C2 harness connector.
    3. Turn the ignition on.

4. Measure the voltage of the (A929) Fused B(+) circuit.

   Is battery voltage present?

   Yes

   - Go To 4

   No

   - Repair the (A929) Fused B(+) circuit for an open, short to ground or high resistance.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **(Z917) GROUND CIRCUIT OPEN OR HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Measure the resistance between ground and the (Z917) Ground circuit.

      Is the resistance below 5.0 Ohms?

      Yes

      - Replace the Steering Column Control Module (SCCM) in accordance with the Service Information. Refer to **MODULE, STEERING COLUMN, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Repair the (Z917) Ground circuit for an open or high resistance.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

C2129-17-BATTERY VOLTAGE - CIRCUIT VOLTAGE ABOVE THRESHOLD

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously.

SET CONDITION

If the voltage to the Steering Column Control Module (SCCM) is above 16 volts for more than 15 seconds.

POSSIBLE CAUSES

Possible Causes

RELATED DTC(S) PRESENT IN THE PCM
HIGH BATTERY VOLTAGE
STEERING COLUMN CONTROL MODULE (SCCM)

DIAGNOSTIC TEST

1. **RELATED DTC(S) PRESENT IN THE PCM**
   1. Ignition on, engine not running.
   2. With the scan tool, select View DTCs in the Powertrain Control Module (PCM).

      Are there any charging system or related battery voltage DTCs present in the PCM?

      Yes

      - Perform the appropriate diagnostic procedure. Refer to **DTC INDEX** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 2
2. **CHECK FOR AN ACTIVE DTC**
   1. Ignition on, engine not running.
   2. With the scan tool, read DTCs.

      Does the scan tool display this DTC as active?

      Yes

      - Replace the Steering Column Control Module (SCCM) in accordance with the Service information. Refer to **MODULE, STEERING COLUMN, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U0001-00-CAN C BUS

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously when the ignition is on.

Battery voltage between 10 and 16 volts.

SET CONDITION

The controller detects an open, short to ground or a short to voltage on the CAN C Bus circuit.

POSSIBLE CAUSES

Possible Causes
CAN C BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
BODY CONTROL MODULE (BCM) POWER AND GROUND
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

VERIFY DIAGNOSTIC TROUBLE CODE (DTC) IS ACTIVE

NOTE: Make sure the battery voltage is between 10 and 16 volts before proceeding.

1. Turn the ignition on.
2. With the scan tool, read the active DTCs.

   Does the scan tool display: U0001-00-CAN C BUS?

   Yes

   - **Refer to DTC INDEX** and perform the CAN C Signal Missing - Bus Off Performance diagnostic procedure.

   No

   - **Refer to DIAGNOSIS AND TESTING** and perform the Stored Lost Communication DTCs diagnostic procedure.

U0002-00-CAN C BUS OFF PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Ignition run time is greater than one second.

Battery voltage between 9 and 16 volts.

Engine run time greater than three seconds.

SET CONDITION

The Steering Column Control Module (SCCM) detects a short condition on one of the CAN C Bus circuits.

POSSIBLE CAUSES

Possible Causes
CAN C BUS (+) CIRCUIT SHORTED TO GROUND
CAN C BUS (-) CIRCUIT SHORTED TO VOLTAGE
CAN C BUS (+) CIRCUIT SHORTED TO THE CAN C BUS (-) CIRCUIT
STAR CONNECTOR
ANY MODULE CONNECTED TO THE CAN C BUS

DIAGNOSTIC TEST

CHECK FOR AN ACTIVE DTC

1. Ignition on, engine not running.
2. With the scan tool, select view DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - **Refer to DTC INDEX** and perform the U0002-00-CAN C BUS OFF PERFORMANCE diagnostic procedure.

   No

   - **Refer to DIAGNOSIS AND TESTING** and perform the Stored Lost Communication DTCs diagnostic procedure.

U0100-00-LOST COMMUNICATION WITH ECM/PCM

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously when the ignition is on.

The battery voltage between 10 and 16 Volts.

Body Control Module (BCM) is configured correctly.

SET CONDITION

Bus messages not received from the Powertrain Control Module (PCM) for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN C BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
POWERTRAIN CONTROL MODULES POWER AND GROUND
BCM NOT CONFIGURED CORRECTLY
POWERTRAIN CONTROL MODULE (PCM)
ANY MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

VERIFY THE DTC IS ACTIVE

1. Turn the ignition on.
2. With the scan tool, read the active DTCs.

   Is the DTC active at this time?

   Yes

   - Perform the U0100-87-Lost Communication with ECM/PCM diagnostic procedure. **Refer to DIAGNOSIS AND TESTING** .

   No

   - Perform the Stored Lost Communication DTCs diagnostic procedure. **Refer to DIAGNOSIS AND TESTING** .

U0140-00-LOST COMMUNICATION WITH BODY CONTROL MODULE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously when the ignition is on.

The battery voltage between 10.0 and 16.0 Volts.

Body Control Module (BCM) is configured correctly.

SET CONDITION

Bus messages not received from the Body Control Module (BCM) for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
BODY CONTROL MODULE POWER AND GROUND
BCM NOT CONFIGURED CORRECTLY
BODY CONTROL MODULE (BCM)
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

VERIFY DTC IS ACTIVE

1. Turn the ignition on.
2. With the scan tool, read the active DTCs.

   Does the scan tool display; U0140-00-LOST COMMUNICATION WITH BODY CONTROL MODULE as active?

   Yes

   - **Refer to DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM BCM (BODY CONTROL MODULE) diagnostic procedure.

   No

   - **Refer to DIAGNOSIS AND TESTING** and perform the Stored Lost Communication DTCs diagnostic procedure.

U0401-00-IMPLAUSIBLE DATA RECEIVED FROM ECM/PCM

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

Implausible data from the PCM.

POSSIBLE CAUSES

Possible Causes
POWERTRAIN CONTROL MODULE (PCM) DTCS PRESENT STEERING COLUMN CONTROL MODULE (SCCM)

DIAGNOSTIC TEST

CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)

1. Turn the ignition on.
2. With the scan tool, read active DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Refer to **DTC INDEX** and perform the appropriate diagnostic procedure.

   No

   - Replace Steering Column Control Module (SCCM) in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U0422-00-IMPLAUSIBLE DATA RECEIVED FROM THE BODY CONTROL MODULE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

Incorrect data received from the Body Control Module (BCM).

POSSIBLE CAUSES

Possible Causes
NO COMMUNICATION WITH THE BODY CONTROL MODULE (BCM)
DTCS STORED OR ACTIVE IN THE BCM
STEERING COLUMN CONTROL MODULE (SCCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**

   NOTE: Diagnose and repair any Body Control Module DTCs before proceeding with this diagnostic procedure.

   1. Turn the ignition on.
   2. With the scan tool, read active DTCs.

      Does the scan tool display this DTC as active?

      Yes

      - Go To 2

      No

      - Test Complete. The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **VERIFY THE BCM IS ACTIVE ON THE CAN BUS**
   1. With the scan tool, verify that the BCM is active on the bus.

      Is the BCM active on the bus?

      Yes

      - Replace Steering Column Control Module (SCCM) in accordance with the Service Information.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Refer to **DIAGNOSIS AND TESTING** and perform the No Response from BCM diagnostic procedure.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U1008-00-LIN 1 BUS

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 2: Steering Control Module - Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Right Steering Wheel Switch communicates with the Steering Column Control Module (SCCM) via the LIN Bus.

The SCCM is located near the top of the steering column below the steering wheel. The SCCM includes the Clockspring, the Multi-function Switch and a LIN/CAN C Gateway. LIN Bus messages received by the

LIN/CAN C Gateway are broadcast over the CAN C Bus to the appropriate modules.

WHEN MONITORED

Continuously with the ignition on.

SET CONDITION

Fault signifies when the LIN Bus is shorted to ground, shorted to battery, or a defective Right Steering Wheel Switch (Speed Control Switch).

POSSIBLE CAUSES

Possible Causes
RIGHT STEERING WHEEL SWITCH (SPEED CONTROL SWITCH)
STEERING WHEEL WIRING HARNESS / CONNECTORS

DIAGNOSTIC TEST

CHECK FOR AN ACTIVE DTC

1. Turn the ignition on.
2. With the scan tool, read DTCs

   Does the scan tool display this DTC as active?

   Yes

   WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

   WARNING: Do not place an intact non-deployed airbag face down on a hard surface, the airbag propels into the air if accidentally deployed. Failure to follow these instructions may result in possible serious or fatal injury.

   NOTE: Visually and physically inspect the wiring harness between the Right Steering Wheel Switch (Speed Control Switch) harness connector and the SCCM harness connector. Repair any damaged wires, connectors, and open/spread terminals. If harness is OK, view repair.

   - Replace the Right Steering Wheel Switch (Speed Control Switch) in accordance with the Service Information. Refer to **SWITCH, SPEED CONTROL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U121E-00-LOST COMMUNICATION WITH STEERING WHEEL CRUISE CONTROL SWITCH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Ignition on. No active LIN Bus DTCs present.

SET CONDITION

The Steering Column Control Module (SCCM) detects no communication with the Cruise Control Switch over the LIN Bus.

POSSIBLE CAUSES

Possible Causes
RIGHT STEERING WHEEL SWITCH (SPEED CONTROL SWITCH) UNPLUGGED, POOR CONNECTION OR WIRING HARNESS
RIGHT STEERING WHEEL SWITCH (SPEED CONTROL SWITCH)
STEERING COLUMN CONTROL MODULE (SCCM)

DIAGNOSTIC TEST

1. **CHECK IF THE DTC IS ACTIVE**
   1. Turn the ignition on.
   2. With the scan tool, read DTCs.

      Does the scan tool display this DTC as active?

      Yes

      - Go To 2

      No

      - The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK THE RIGHT STEERING WHEEL SWITCH AND WIRING HARNESS**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

WARNING: Do not place an intact non-deployed airbag face down on a hard surface, the airbag propels into the air if accidentally deployed. Failure to follow these instructions may result in possible serious or fatal injury.

1. Visually and physically inspect the wiring harness between the Right Steering Wheel Switch (Speed Control Switch) harness connector and the SCCM harness connector for damaged wires, connectors, and open/spread terminals.

   Were there any problems found?

   Yes

   - Repair or replace the wiring harness as necessary.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 3

3. **CHECK THE STEERING COLUMN CONTROL MODULE**
   1. Replace the Right Steering Wheel Switch (Speed Control Switch) in accordance with the Service Information. Refer to **SWITCH, SPEED CONTROL, REMOVAL** .
   2. Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   Does this DTC reset?

   Yes

   - Replace the Steering Column Control Module (SCCM) in accordance with the Service Information. Refer to **MODULE, STEERING COLUMN, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Test Complete.

2014 STEERING

Steering System - Cherokee

DESCRIPTION

DESCRIPTION

This vehicle comes with Electric Power Steering (EPS) as standard equipment and it is the only steering system available. The power steering system consists of these major components:

- Rack and Pinion Steering Gear with EPS assist
- Steering Column
- Inner and Outer Tie Rod Ends

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - STEERING DIAGNOSIS CHARTS

NOTE: There are two diagnosis charts following that cover PERFORMANCE ISSUES and NOISE, VIBRATION AND HARSHNESS (NVH) ISSUES.

NOTE: For any performance issues, check for DTCs related to the steering system. Verify the correct software and calibration files are loaded in the Electric Power Steering (EPS) system.

PERFORMANCE ISSUES

CONDITION	POSSIBLE CAUSES	EVALUATION/CORRECTION
STEERING WHEEL IS OFF CENTER	1. Front toe is out of adjustment.	1. Perform wheel alignment. Refer to **WHEEL ALIGNMENT, STANDARD PROCEDURE** .
VEHICLE PULLS LEFT OR RIGHT	1. The center position of the column does not match the center position of the vehicle alignment.	1. Perform wheel alignment. Refer to **WHEEL ALIGNMENT, STANDARD PROCEDURE** .
	2. Suspension components are bent and/or damaged.	2. Inspect suspension components for damage.
STEERING WHEEL OR COLUMN HAS FREE-PLAY/LASH/LOOSENESS	1. Loose coupling pinch bolt at gear input shaft.	1. Check pinch bolt torque. Replace pinch bolt with thread locker patch and tighten to specifications.

(CLUNKING OR RATTLING)		
	2. Steering gear loose on cradle/crossmember.	2. Inspect gear mounting bolts. Replace if necessary and tighten to specifications.
	3. Excessive free-play or noise from steering column bearings.	3. Replace steering column. Refer to **COLUMN, REMOVAL**.
	4. Excessive intermediate (steering) shaft coupling U-joint free-play.	4. Rotate steering wheel back-and-forth while watching coupling. Observe for free-play. Replace the column as necessary. Refer to **COLUMN, REMOVAL**.
	5. Loose or worn inner tie rod or outer tie rod.	5. For evaluation and correction, refer to **TIE ROD, STEERING, DIAGNOSIS AND TESTING**.
	6. Lack of lubrication in lower ball joint or ball joint is damaged.	6. Lubricate ball joint if equipped with a zerk fitting and check for function. If not equipped with a zerk fitting, test and replace ball joint/lower control arm as necessary.
	7. Excessive lash inside steering gear.	7. Disconnect intermediate shaft and turn steering gear input shaft. Observe for any movement without a corresponding tire movement. Replace steering gear as necessary.
STEERING WHEEL HAS FORE AND AFT LOOSENESS	1. Steering wheel retaining bolt loose.	1. Check steering wheel retaining bolt torque and tighten to specifications as necessary.
	2. Loose steering column to instrument panel fasteners.	2. Check steering column to instrument panel fastener torque and tighten to specifications as necessary.
STEERING WHEEL, DASH OR VEHICLE VIBRATES DURING STEERING MANEUVERS (ESPECIALLY AT LOW SPEED OR STANDSTILL)	1. Tire(s) not properly inflated.	1. Check and inflate tires to the specified pressure.
	2. Excessive engine vibration.	2. Ensure that the engine is tuned properly.
	3. Loose tie rod end jam nut.	3. Check torque and tighten the inner to outer tie rod jam nut to specifications.
	4. Grounded, damaged or loose engine mount.	4. Visually inspect for damaged or misaligned mounts. Check fastener torque. Replace or realign as necessary.
	5. Loose or worn outer tie rod.	5. For evaluation and correction, refer to **TIE ROD, STEERING, DIAGNOSIS AND TESTING**.
	6. Steering gear noisy.	6. During a parking event at 0 mph, verify there is vibration only with steering. Steer in both directions

		and verify that the noise follows the steering input. Check TSBs for any known issues. Replace steering gear as necessary.
	7. Steering gear has instability, shudder, etc.	7. Perform EPS calibration procedures. If this does not fix the issue, replace the steering gear.
INCREASED STEERING EFFORT/STEERING WHEEL DOES NOT RETURN TO CENTER POSITION	1. Tire(s) not properly inflated.	1. Check and inflate tires to the specified pressure.
	2. Lack of lubrication in lower ball joint or ball joint is damaged.	2. Lubricate ball joint if equipped with a zerk fitting and check for function. If not equipped with a zerk fitting, test and replace ball joint as necessary.
	3. Steering knuckle binding.	3. Disconnect the outer tie rod end from knuckle and then rotate knuckle. Refer to **TIE ROD, STEERING, REMOVAL**. If the knuckle does not rotate freely separate the strut from the knuckle to determine if the ball joint or strut mount bearing is the cause of the binding and replace components as necessary or refer to **STRUT, SUSPENSION, ASSEMBLY, REMOVAL** .
	4. EPS steering not functioning.	4. Perform EPS calibration procedures. If this does not fix the issue, replace the steering gear.
	5. Steering column internal issue.	**Do not turn past two revolutions. Damage to the clockspring may occur. Always rotate steering column back to initial position. Steering column is equipped with an absolute position sensor that has a unique zero position.** 5. Disconnect the intermediate shaft and rotate steering column. If condition is still present, replace steering column. Refer to **COLUMN, INSTALLATION**.
	6. Binding outer tie rod.	6. For evaluation and correction, refer to **TIE ROD, STEERING, DIAGNOSIS AND TESTING**.
	7. Improper front wheel alignment.	7. Check and adjust wheel alignment as necessary.
EXCESSIVE STEERING WHEEL KICKBACK FROM ROAD INPUTS	1. Steering gear loose on cradle/crossmember.	1. Inspect gear mounting bolts. Replace if necessary and tighten to specifications.
	2. Steering column, coupling or intermediate shaft worn or loose.	2. Rotate steering wheel back-and-forth while inspecting intermediate shaft going into steering gear. Look for excessive free-play. Retighten if loose bolt is found. Replace steering column if necessary. Refer to **COLUMN, REMOVAL**.

NOISE, VIBRATION AND HARSHNESS (NVH) ISSUES

CONDITION	POSSIBLE CAUSES	EVALUATION/CORRECTION
RATTLE OR EXCESSIVE CLUNK*	1. Steering gear loose on engine cradle/crossmember.	1. Check fastener torque and tighten to specifications. Replace as necessary. Check steering wheel center following repair.
	2. Loose strut assembly mounting fasteners at tower or knuckle.	2. Check fastener torque and tighten to specifications.
	3. Excessive play in inner or outer tie rod.	3. For evaluation and correction, refer to **TIE ROD, STEERING, DIAGNOSIS AND TESTING**.
	4. Engine cradle/crossmember mounting fasteners loose at frame or bushings worn.	4. Check fastener torque and tighten to specifications. Inspect bushings and repair as necessary.
	5. Wheel mounting (lug) bolts loose.	5. Inspect wheel mounting (Lug) bolts and repair as necessary. Tighten bolts to specifications.
	6. Stabilizer bar link joints worn (occurs with steering input only when moving, not stationary).	6. At park, jounce only one side of vehicle front to exercise stabilizer bar. Replace stabilizer bar link.
	7. Loose lower control arm mounting bolts at engine cradle, frame or crossmember (occurs with steering input only when moving, not stationary).	7. Check control arm mounting bolts and tighten to specified torque.
	8. Loose intermediate shaft or column.	8. Rotate intermediate (steering) shaft in relationship to gear, checking for free-play. Check column fasteners and tighten to specifications as necessary.
	9. Lower control arm pivot bushing worn (occurs with steering input only when moving, not stationary).	9. Inspect bushings for wear and replace lower control arm as necessary.
	10. Internal steering gear noise.	10. Drive vehicle on rough road listening for noises. Also, steer rapidly back and forth when stopped listening for noises. Replace steering gear as necessary.
	11. Loose inner or outer tie rod.	11. For evaluation and correction, refer to **TIE ROD, STEERING, DIAGNOSIS AND TESTING**.
	12. Damaged engine cradle/crossmember.	12. Inspect the cradle/crossmember for cracks or other damage. Replace as necessary.
POPPING NOISE	1. Loose steering gear mounting fasteners.	1. Check fasteners for proper torque and retighten as necessary.
	2. Loose outer tie rod mounting nut or jam nut.	2. Check fastener torque. Replace nuts as necessary and tighten to specifications.
	3. Loose intermediate (steering)	3. Make sure coupling is fully seated on gear

	shaft coupling at gear input shaft.	input shaft. Retighten or re-seat as necessary.
	4. Worn tie rod (outer or inner).	4. For evaluation and correction, refer to **TIE ROD, STEERING, DIAGNOSIS AND TESTING**.
	5. Worn axle half-shaft.	5. For evaluation and correction, refer to **DIAGNOSIS AND TESTING** .
SQUEAKING OR RUBBING SOUND	1. Steering column shroud or shaft rubbing.	1. While turning the steering wheel, listen down column to locate. Check interference between moving components. Move or realign shrouds or shaft as necessary. Replace components if this does not correct problem.
	2. Clockspring inside steering column noisy.	2. Remove clockspring and reinstall steering wheel for testing. If noise is gone, replace clockspring.
	3. Boot/dash seal lubrication inadequate.	3. Remove boot seal and recheck for noise. Lubricate seal as necessary.
	4. Steering gear inner or outer tie rod noisy.	4. While a helper turns the steering wheel, use an electronic listening tool to determine if noise is coming from either outer tie rod. Replace outer tie rods as necessary. Refer to **DIAGNOSIS AND TESTING**.
	5. Steering gear internally noisy.	5. Remove dash seal boot, then exercise the steering wheel. If noise is still present at gear, replace steering gear.
SCRUBBING OR KNOCKING SOUND	1. Incorrect tire or wheel size.	1. Replace incorrect size tire or wheel with original equipment size.
	2. Worn motor or transmission mount.	2. Drive vehicle, moving accelerator pedal rapidly up and down attempting to locate noise. Try in both forward and reverse. Replace mounts as necessary.
	3. Tires contacting wheel well.	3. Make sure wheel house is properly positioned. If not, reposition as necessary. If steering wheel is properly centered, check steering gear travel left to right by rotating the steering wheel to each stop. Steering wheel should rotate the same amount in both directions from center. If not, replace steering gear.
	4. Interference between moving steering components and other components.	4. Check for bent or misaligned components. Correct or replace as necessary.

NOTE: *** A light clunk may be felt or heard during steering wheel reversal while vehicle is stationary. This results from internal steering gear rack movement at the bushings and in no way affects the performance of the steering system. This**

movement may be felt in the steering components during steering wheel reversal.

COLUMN

WARNING

WARNING

WARNING: Safety goggles should be worn at all times when working on steering columns.

WARNING: Before beginning any service procedure that involves removing the air bag: Remove and isolate the negative (-) battery cable (ground) from the vehicle battery. This is the only sure way to disable the air bag system. Failure to do this could result in accidental air bag deployment and possible personal injury.

WARNING: The air bag system is a sensitive, complex electro-mechanical unit. Before attempting to diagnose, remove or install the air bag system components you must first disconnect and isolate the battery negative (ground) cable. Failure to do so could result in accidental deployment of the air bag and possible personal injury. The fasteners, screws, and bolts, originally used for the air bag components, have special coatings and are specifically designed for the air bag system. They must never be replaced with any substitutes. Anytime a new fastener is needed, replace with the correct fasteners provided in the service package or fasteners listed in the parts books. Before servicing a steering column equipped with an air bag,

WARNING: When handling an undeployed air bag during servicing of the steering column, the following precautions should be observed:

- **At no time should any source of electricity be permitted near the inflator on the back of the air bag.**
- **When carrying a live air bag, the trim cover should be pointed away from the body to minimize injury if the air bag should accidently deploy.**
- **If the air bag is placed on a bench or other surface, the plastic cover should be face-up to minimize movement, in case of accidental deployment.**

CAUTION: Disconnect negative (ground) cable from the battery before servicing any column component.

DESCRIPTION

DESCRIPTION

Fig. 1: Identifying Steering Column
Courtesy of CHRYSLER GROUP, LLC

This vehicle is equipped with a tilt/telescoping type steering column (1). When the lever is in the released position, the column can be tilted or telescoped manually.

The steering column is designed to be serviced only as a complete assembly if an internal component is found to be defective. The shaft, bearings and intermediate shaft are all serviced with the column.

The major components on the steering column assembly are:

- Clockspring (Integral part of Steering Column Control Module (SCCM))
- Driver Airbag
- Multi-Function Switches
- Tilt Lever
- Shrouds
- Steering Wheel

These components can be serviced without removal of the steering column from the vehicle. Refer to the appropriate Service Information for servicing these components separately.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - STEERING COLUMN

NOTE: Refer to DIAGNOSIS AND TESTING .

If the vehicle is involved in a front end collision or the air bag has deployed or both, the steering column must be replaced.

REMOVAL

REMOVAL

WARNING: When an undeployed airbag module is to be removed from the vehicle, first disconnect the battery ground cable and isolate it. Allow the system capacitor to discharge for a minimum of two minutes before starting any removal.

NOTE: Before proceeding, refer to COLUMN, WARNING.

1. Disconnect the negative cable from the battery and isolate the cable.
2. Position the column tilt at the full-downward position.

Fig. 2: Identifying Lower Shroud & Fasteners
Courtesy of CHRYSLER GROUP, LLC

3. Remove upper and lower (2) shrouds from the steering column. Refer to **SHROUD, STEERING**

COLUMN, LOWER, REMOVAL and **SHROUD, STEERING COLUMN, UPPER, REMOVAL**.

4. Remove the steering column opening cover. Refer to **COVER, STEERING COLUMN OPENING, REMOVAL** .
5. Remove the screws to the steering column trim ring.
6. Remove knee blocker air bag, if equipped. Refer to **AIR BAG, KNEE BLOCKER, REMOVAL** .
7. Remove the driver air bag. Refer to **AIR BAG, DRIVER, REMOVAL** .
8. Disconnect the wiring harness connectors at the Steering Column Control Module (SCCM).
9. Disconnect all other wiring harness connectors at column components.

Fig. 3: Identifying Intermediate Shaft, Pinch Bolt And Steering Gear Pinion Shaft
Courtesy of CHRYSLER GROUP, LLC

10. Remove intermediate shaft pinch bolt (3) and separate the intermediate shaft (1) at the base of the column from the steering gear pinion shaft (2). Discard the pinch bolt (3); it is not to be reused.

190968837

Fig. 4: Steering Column Mounting Bolts & Nuts
Courtesy of CHRYSLER GROUP, LLC

11. Remove the two mounting bolts (1) and nuts (2) attaching the steering column to the instrument panel.
12. Remove the steering column from the vehicle.

190968836

Fig. 5: Plastic Bracket & Screws

Courtesy of CHRYSLER GROUP, LLC

13. If replacing the column, remove the mounting screws (2) and transfer the plastic bracket (1) to the new column.

INSTALLATION

INSTALLATION

Fig. 6: Plastic Bracket & Screws
Courtesy of CHRYSLER GROUP, LLC

1. If the column was replaced, position the plastic bracket (1) and install and securely tighten the screws (2).

Fig. 7: Steering Column Mounting Bolts & Nuts
Courtesy of CHRYSLER GROUP, LLC

2. Install the steering column with the steering column trim ring, through the steering column opening.
3. Raise the column onto the mounting studs and install the two mounting nuts (2) on the studs and install the mounting bolts (1).

NOTE: Verify that the tilt lever is in the unlocked position prior to tightening the steering column fasteners.

4. Install two column mounting bolts (1). Tighten all 4 column fasteners to 24 N.m (18 ft. lbs.).

Fig. 8: Identifying Intermediate Shaft, Pinch Bolt And Steering Gear Pinion Shaft
Courtesy of CHRYSLER GROUP, LLC

NOTE: A new pinch bolt (3) must be installed every time the pinch bolt is removed.

5. Verify the front wheels of vehicle are in the STRAIGHT-AHEAD position.
6. Slide the intermediate shaft (1) onto the steering gear pinion shaft (2).
7. Install a **NEW** pinch bolt (3) and tighten the bolt to 30 N.m (22 ft. lbs.).
8. Confirm that:
   a. The front wheels are in the STRAIGHT-AHEAD position.
   b. The turn signal stalk is in the NEUTRAL position.
9. Connect wiring harness connectors at the Steering Column Control Module (SCCM).
10. Connect any other wiring harness connectors at the steering column components.
11. Install knee blocker air bag, if equipped. Refer to **AIR BAG, KNEE BLOCKER, INSTALLATION** .
12. Install the driver air bag. Refer to **AIR BAG, DRIVER, INSTALLATION** .
13. Install the screws to the steering column trim ring.
14. Install the steering column opening cover. Refer to **COVER, STEERING COLUMN OPENING, INSTALLATION** .

Fig. 9: Identifying Lower Shroud & Fasteners
Courtesy of CHRYSLER GROUP, LLC

15. Install the upper and lower (2) shrouds on the steering column. Refer to **SHROUD, STEERING COLUMN, LOWER, INSTALLATION** and **SHROUD, STEERING COLUMN, UPPER, INSTALLATION**.

WARNING: **Do not connect the battery ground cable without following the proper procedure as indicated in the following step. Personal injury or death may result if the Airbag System Test is not performed first.**

16. Reconnect the battery ground terminal following the air bag system test found in restraints. Refer to **DIAGNOSIS AND TESTING** .
17. Perform Vehicle Trim Procedure. Refer to **STANDARD PROCEDURE** .
18. Test the operation of all column mounted components.
19. Road test the vehicle to ensure proper operation of the steering system.

SHROUD, STEERING COLUMN, LOWER

REMOVAL

REMOVAL

Fig. 10: Identifying Lower Shroud & Fasteners
Courtesy of CHRYSLER GROUP, LLC

1. Push the column tilt lever downward.
2. Remove the screws (3, 1) attaching the lower shroud (2) to the column.
3. Separate the lower shroud (2) from the upper shroud by pressing on the edges of the shrouds.
4. Remove the lower shroud from the column.

INSTALLATION

INSTALLATION

Fig. 11: Identifying Lower Shroud & Fasteners

Courtesy of CHRYSLER GROUP, LLC

1. Push the column tilt lever downward.
2. Install the lower shroud (2) into the upper shroud, snapping the shrouds together.
3. Install the screws (3, 1) attaching the lower shroud (2) to the column.

SHROUD, STEERING COLUMN, UPPER

REMOVAL

REMOVAL

Fig. 12: Identifying Lower Shroud & Fasteners
Courtesy of CHRYSLER GROUP, LLC

1. Push the column tilt lever downward.
2. Remove the screws (3, 1) attaching the lower shroud (2) to the column.
3. Separate the lower shroud (2) from the upper shroud by pressing on the edges of the shrouds.

Fig. 13: Identifying Upper Shroud
Courtesy of CHRYSLER GROUP, LLC

4. Remove the upper shroud (1) from the lower shroud.

INSTALLATION

INSTALLATION

Fig. 14: Identifying Upper Shroud, Positioning Keys & Fasteners
Courtesy of CHRYSLER GROUP, LLC

1. Install the upper shroud onto the column and position the keys (1) into the steering column trim ring.

Fig. 15: Identifying Lower Shroud & Fasteners
Courtesy of CHRYSLER GROUP, LLC

2. Push the column tilt lever downward.
3. Install the lower shroud (2) into the upper shroud, snapping the shrouds together.
4. Install the screws (3, 1) attaching the lower shroud (2) to the column.

WHEEL, STEERING

REMOVAL

REMOVAL

WARNING:

- **Do not place a non-deployed airbag face down on a hard surface. The airbag will propel into the air if accidentally deployed. Failure to follow this instruction may result in possible serious or fatal injury.**
- **Disconnect and isolate the battery negative (ground) cable before beginning steering wheel removal or installation. This will disable the airbag system. Failure to follow this instruction may result in accidental airbag deployment and possible serious or fatal injury.**
- **Allow the airbag system capacitor to discharge for two minutes before removing the steering wheel or any airbag system component. Failure to follow this instruction may result in accidental airbag deployment and possible serious or fatal injury.**

Fig. 16: Identifying Steering Wheel & Nut
Courtesy of CHRYSLER GROUP, LLC

1. Adjust the steering wheel so that the tires are in the STRAIGHT-AHEAD position.
2. Disconnect and isolate the negative battery cable.
3. Remove the driver airbag. Refer to **AIR BAG, DRIVER, REMOVAL** .
4. Disconnect the wiring connector at the clockspring.

CAUTION: Do not bump or hammer on the steering wheel or steering column shaft when removing the steering wheel.

CAUTION: Do not attempt to rotate the clockspring rotor once the steering wheel is removed. The clockspring must remain centered in its travel to avoid overextending the clockspring inner parts, causing the clockspring to become inoperative. If removed and handled properly using the correct procedures, it should remain in the "centered" position. If there is any question as to whether the clockspring is in the "centered" position of travel, perform the clockspring centering procedure before installing the steering wheel.

5. While holding the steering wheel (1) firmly in place, remove the nut (2) that secures the steering wheel to the steering column shaft.
6. While holding the steering wheel firmly in the STRAIGHT-AHEAD position, remove the steering wheel from the steering column shaft splines.

INSTALLATION

INSTALLATION

CAUTION: When installing the steering wheel, the clockspring must be centered in its travel to avoid overextending the clockspring inner parts, causing the clockspring to become inoperative. If removed and handled properly using the correct procedures, it should be in the "centered" position. If there is any question as to whether the clockspring is in the "centered" position of travel, perform the clockspring centering procedure before proceeding.

Fig. 17: Identifying Steering Wheel & Nut
Courtesy of CHRYSLER GROUP, LLC

1. Confirm that:
   a. The front wheels are in the STRAIGHT-AHEAD position.
   b. The turn signal stalk is in the NEUTRAL position.
2. Install the steering wheel retaining nut (2). Tighten the steering wheel retaining nut to 50 N.m (37 ft. lbs.).
3. Connect the wiring connector at the clockspring.
4. Install the driver airbag. Refer to **AIR BAG, DRIVER, INSTALLATION** .

WARNING: Do not reconnect the battery without first performing the Airbag System Test procedure. Failure to perform the Airbag System Test may result in accidental airbag deployment and serious or fatal injury.

5. Reconnect the battery using the Airbag System Test procedure. Refer to **DIAGNOSIS AND TESTING** .
6. Verify vehicle and system operation.

GEAR

DESCRIPTION

DESCRIPTION

Fig. 18: Steering Gear
Courtesy of CHRYSLER GROUP, LLC

The steering gear is the rack-and-pinion type with Electric Power Assist (EPS). It is mounted on the front suspension crossmember, and the front crossmember must be removed from the vehicle to service the steering gear. The only serviceable parts of the steering gear are the inner tie rods, outer tie rods, and the inner tie rod bellows.

The EPS system is only serviced as an assembly, including the Steering Angle Sensor (SAS). If the SAS requires replacement, the entire steering gear must be replaced.

NOTE: If a NEW steering gear is installed, programming is required. Refer to STANDARD PROCEDURE .

OPERATION

OPERATION

Turning of the steering wheel is converted into linear (side-to-side) travel through the meshing of the helical pinion teeth with the rack teeth within the steering gear. The lateral travel pushes and pulls the tie rods to change the direction of the vehicle's front wheels.

Power assist steering is provided by an electric motor and control unit connected to the steering gear. The Electric Power Steering (EPS) system provides variable assist for steering maneuvers based on several inputs:

- Steering wheel position and rate of movement from Steering Angle Sensor (SAS)
- Steering wheel torque from torque sensors in the EPS Gear
- Vehicle speed

No components of the EPS system can be serviced separately. If any component of the EPS requires service, the entire steering gear must be replaced. The only serviceable parts are inner and outer tie rods, and tie rod bellows.

The EPS system communicates over the CAN network, including broadcasting the Steering Angle Sensor (SAS) position.

Manual steering control of the vehicle can be maintained if power steering assist is lost. However, under this condition, steering effort is significantly increased.

REMOVAL

REMOVAL

NOTE: Before proceeding, refer to FRONT, WARNING .

NOTE: If equipped, removal of the power transfer unit may be necessary in order to remove the steering gear . Refer to REMOVAL .

Fig. 19: Identifying Intermediate Shaft, Pinch Bolt And Steering Gear Pinion Shaft
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect battery negative cable.
2. Using a steering wheel holder, lock the steering wheel in place to keep it from rotating. This keeps the

clockspring in the proper orientation.

3. Remove pinch bolt (3) and separate intermediate shaft (1) from steering gear shaft (2).

1715005812

Fig. 20: Identifying Steering Link, Outer Tie Rod End & Nuts
Courtesy of CHRYSLER GROUP, LLC

4. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
5. Remove the wheel mounting bolts, then the tire and wheel assembly.
6. Remove the engine belly pan. Refer to **BELLY PAN, REMOVAL** .

NOTE: Repeat STEP 7 to STEP 14 on opposite side of vehicle.

7. While holding the stabilizer bar link stud stationary, remove the nut securing the link (1) to the stabilizer bar.

Fig. 21: Removing/Installing The Lower Ball Joint Nut To Control Arm
Courtesy of CHRYSLER GROUP, LLC

8. Remove the outer tie rod end (8) from the knuckle. Refer to **TIE ROD, STEERING, REMOVAL**.
9. Remove the ball joint to control arm retaining nut (4). **Discard the nut; it is not to be reused.**
10. Using (special tool #C-3894-A, Puller, Tie Rod) separate the ball joint stud from the control arm.

Fig. 22: Identifying Pry Bar & Control Arm
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Use care when separating the ball joint stud from the knuckle so the ball joint boot does not get cut**

NOTE: After separating the control arm from the knuckle, do not let it swing rapidly back up, this can tear the ball joint dust boot.

11. Insert a pry bar (1) in the opening between the control arm front mounting bolt and the front fascia support beam.
12. Pry down on the control arm (2) until the ball joint stud is clear of the control arm, then push the knuckle assembly to the side when it is clear of the ball joint stud and slowly release the control arm.

020568625

Fig. 23: Crossmember To Fascia Support Beams Bracket Retaining Bolts
Courtesy of CHRYSLER GROUP, LLC

13. Remove the four bracket retaining bolts (1) from the cross member to fascia support beams bracket, then remove the bracket.

Fig. 24: Lower Bumper Reinforcements & Fasteners
Courtesy of CHRYSLER GROUP, LLC

14. Remove the fasteners (2) securing the lower bumper reinforcement (1) and front fascia support beams to the frame/front end module.

Fig. 25: Front Fascia Support Beams
Courtesy of CHRYSLER GROUP, LLC

15. Remove the front fascia support beams.

191069435

Fig. 26: Steering Gear Control Module & Harness Connectors
Courtesy of CHRYSLER GROUP, LLC

16. Disconnect the downstream oxygen sensor harness connector.
17. Remove the exhaust extension pipe.
18. Disconnect the harness connectors (2) at the steering gear control module (1).

191069436

Fig. 27: Steering Gear Connector & Tie Strap
Courtesy of CHRYSLER GROUP, LLC

19. Disconnect the steering gear connector (1) from the body harness connector at the bottom of the dash panel.
20. Separate the steering gear harness from the crossmember by removing the tie strap (2) from the crossmember.
21. Remove the rear engine mount.

NOTE: **Before lowering the front suspension crossmember, the location of the crossmember must be marked on the body of the vehicle. Do this so the crossmember can be relocated, upon reinstallation, against the body of vehicle in the same location as before removal. If the front suspension crossmember is not reinstalled in exactly the same location as before removal, the preset front wheel alignment settings (caster and camber) may be lost.**

22. Mark the position of the cross member with a grease pencil or equivalent.

Fig. 28: Upper Crossmember Mounting Bolt
Courtesy of CHRYSLER GROUP, LLC

23. Support the crossmember with a transmission jack, or equivalent.
24. Remove the upper mounting bolt (1) from each side of the crossmember.

Fig. 29: Crossmember Rear Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

25. Remove the four rear mounting bolts (1, 3) that secure the crossmember (2) to the vehicle
26. Slowly lower the crossmember with the jack and remove from the vehicle.

Fig. 30: Steering Gear

Courtesy of CHRYSLER GROUP, LLC

27. Remove the steering rack mounting fasteners (1) and remove the steering rack from the crossmember.

INSTALLATION

INSTALLATION

NOTE: Transfer the tie rod ends if they are being reused.

NOTE: If removed, install the power transfer unit Refer to INSTALLATION .

Fig. 31: Steering Gear
Courtesy of CHRYSLER GROUP, LLC

1. Install the steering gear to the crossmember.
2. Install the steering gear mounting bolts (1) and tighten to 115 N.m (85 ft. lbs.).

Fig. 32: Crossmember Rear Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

3. Slowly raise the crossmember (2) into mounted position using the transmission jack matching the crossmember to the marked locations on the body made during removal.
4. Install four mounting bolts (1, 3) and tighten to 126 N.m (93 ft. lbs.).

Fig. 33: Upper Crossmember Mounting Bolt
Courtesy of CHRYSLER GROUP, LLC

5. Install the upper mounting bolt (1) on each side of the crossmember and tighten to 120 N.m (86 ft. lbs.).

Fig. 34: Steering Gear Connector & Tie Strap
Courtesy of CHRYSLER GROUP, LLC

6. Connect the steering harness connector (1) to the body harness connector at the bottom of the dash panel.
7. Install the tie strap (2) to the crossmember.

191069435

Fig. 35: Steering Gear Control Module & Harness Connectors
Courtesy of CHRYSLER GROUP, LLC

8. Connect the harness connectors (2) at the steering gear module (1).
9. Install the rear engine mount. Refer to **INSULATOR, ENGINE MOUNT, RIGHT, INSTALLATION** for 2.0L Diesel, **INSULATOR, ENGINE MOUNT, LEFT, INSTALLATION** for 2.0L Diesel, **INSULATOR, ENGINE MOUNT, REAR, INSTALLATION** for 2.0L Diesel, **INSULATOR, ENGINE MOUNT, LEFT, INSTALLATION** for 2.4L, **INSULATOR, ENGINE MOUNT, REAR, INSTALLATION** for 2.4L, **INSULATOR, ENGINE MOUNT, RIGHT, INSTALLATION** for 2.4L, **INSULATOR, ENGINE MOUNT, LEFT, INSTALLATION** for 3.2L, **INSULATOR, ENGINE MOUNT, RIGHT, INSTALLATION** for 3.2L, **INSULATOR, ENGINE MOUNT, REAR, INSTALLATION** for 3.2L.
10. Install the exhaust extension pipe.
11. Connect the downstream oxygen sensor harness connector.

NOTE: Repeat STEP 12 through STEP 19 on each side of vehicle.

Fig. 36: Front Fascia Support Beams
Courtesy of CHRYSLER GROUP, LLC

12. Install the front fascia beams (1).

Fig. 37: Lower Bumper Reinforcements & Fasteners
Courtesy of CHRYSLER GROUP, LLC

13. Install the fasteners (2) securing the lower bumper reinforcement (1) to the frame/front end module. Tighten the fasteners to 45 N.m (33 ft. lbs.).

Fig. 38: Crossmember To Fascia Support Beams Bracket Retaining Bolts
Courtesy of CHRYSLER GROUP, LLC

14. Install the crossmember to fascia support beam bracket and install the four retaining bolts (1) and tighten to 95 N.m (70 ft. lbs.).

Fig. 39: Identifying Pry Bar & Control Arm
Courtesy of CHRYSLER GROUP, LLC

15. Insert a pry bar (1) in the opening between the control arm front mounting bolt and the front fascia

support beam.

16. Pry down on the control arm (2) until the ball joint stud is clear of the control arm, align the stud with hole in control arm then slowly release the control arm.

Fig. 40: Removing/Installing The Lower Ball Joint Nut To Control Arm
Courtesy of CHRYSLER GROUP, LLC

17. Install a **NEW** ball joint to control arm retaining nut (4) and tighten to 25 N.m plus 175° (18 ft. lbs. plus 175°).
18. Install the outer tie rod end (8) into the knuckle. Refer to **TIE ROD, STEERING, INSTALLATION**.

1715005812

Fig. 41: Identifying Steering Link, Outer Tie Rod End & Nuts
Courtesy of CHRYSLER GROUP, LLC

19. Install the stabilizer link stud into the stabilizer bar. Refer to **LINK, STABILIZER BAR, INSTALLATION** .
20. Install the engine belly pan. Refer to **BELLY PAN, INSTALLATION** .
21. Install the tire and wheel assembly. Refer to **INSTALLATION** .
22. Lower the vehicle.

Fig. 42: Identifying Intermediate Shaft, Pinch Bolt And Steering Gear Pinion Shaft

Courtesy of CHRYSLER GROUP, LLC

NOTE: The intermediate shaft has a block teeth design and can only be installed in the correct direction. Do not force the shaft onto the pinion shaft.

23. Install the intermediate shaft (1) to the steering gear pinion shaft (2).
24. Install a **NEW** pinch bolt (3) and tighten to 30 N-m (22 ft. lbs.).
25. Remove the steering wheel holder.
26. Connect the battery negative cable.
27. If a **NEW** steering gear is installed, programming is required. Refer to **STANDARD PROCEDURE** .

TIE ROD, STEERING

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - TIE ROD

Tie rod free-play can be measured using the following hand methods:

OUTER TIE ROD

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove the front wheels. Refer to **REMOVAL** .
3. Install two standard wheel mounting nuts, flat side to rotor, diagonally opposite to each on the rotor.

Fig. 43: Magnetic Dial Indicator (2)
Courtesy of CHRYSLER GROUP, LLC

4. Attach a magnetic dial indicator (2) to the inside or outside of the brake rotor, then align the dial indicator's contact pointer (1) with the direction of the stud axis and touch the outer tie rod.

5. Zero the dial indicator. (3)

Fig. 44: Checking Outer Tie Rod Free-Play
Courtesy of CHRYSLER GROUP, LLC

NOTE: When checking free-play, DO NOT rotate the tie rod. Just because a tie rod rotates easily does not mean that it is necessarily faulty. Using more than light hand pressure will result in a false reading.

6. Grasp the outer tie rod near the ball stud and attempt to move the tie rod straight up and down using light hand pressure. (Less than 10 lbs. of force.)
7. Measure and record any tie rod free-play movement.
8. Remove the magnetic dial indicator.
9. Remove the standard wheel mounting nuts from the two studs.

If the free-play in the tie rod exceeds 0.05 mm (.002 in.), replace the outer tie rod. Refer to **TIE ROD, STEERING, REMOVAL**. If the free-play is less than 0.05 mm (.002 in.) at the outer tie rod check the inner tie rod for free-play. Refer to the following procedure.

INNER TIE ROD

NOTE: Always check and repair (if necessary) outer tie rod free-play before checking inner tie rod free-play. False results can otherwise be obtained.

Fig. 45: Checking Inner Tie Rod Free-Play
Courtesy of CHRYSLER GROUP, LLC

1. Grasp the inner tie rod near the steering gear bellows and attempt to move the tie rod straight up and down. If any free-play is felt, replace the inner tie rod. Refer to **TIE ROD, STEERING, REMOVAL**.
2. If no free-play is felt, install the front wheels. Refer to **INSTALLATION** .
3. Remove support and lower the vehicle.

REMOVAL

OUTER TIE ROD END

Fig. 46: Identifying Tie Rod End, Jam Nut, Knuckle & Nut
Courtesy of CHRYSLER GROUP, LLC

NOTE: **When unscrewing the outer tie rod from inner, count the number of revolutions to take it off. This action will aid in installation, getting the toe close to where it needs to be when setting the wheel alignment.**

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove the front wheel mounting bolts and remove the front wheel.
3. Loosen the jam nut (4) from the tie rod end (1).
4. Remove the retaining nut (2) from the outer tie rod end (1).

   Discard the nut; it is not to be reused.

5. Separate the outer tie rod end (1) from the knuckle (3) using (special tool #C-3894-A, Puller, Tie Rod) and remove from the inner tie rod.

INNER TIE ROD

Fig. 47: Bellows Clamps
Courtesy of CHRYSLER GROUP, LLC

1. Remove the outer tie rod. Refer to **TIE ROD, STEERING, REMOVAL**.
2. Remove the tie rod jam nut from the inner tie rod.
3. Remove the clamp (2) securing the bellows (1) to the steering gear body.
4. Remove the clamp (3) from the small end of the bellows and remove the bellows (1) from the gear.

Fig. 48: Travel Restrictor, O Ring & Steering Gear
Courtesy of CHRYSLER GROUP, LLC

CAUTION: If the inner tie rod cannot be removed using the specified tools, do not use a hammer or heat to loosen. Damage to the steering gear will occur. Replace the entire steering gear.

5. Install an appropriate inner tie rod removal tool on the flats of the inner tie rod.
6. Unthread and remove the inner tie rod from the steering gear (1).
7. Inspect the inner portion of the gear for corrosion, contamination, and damage. If any is found, replace the steering gear.

INSTALLATION

OUTER TIE ROD END

Fig. 49: Identifying Tie Rod End, Jam Nut, Knuckle & Nut
Courtesy of CHRYSLER GROUP, LLC

1. If it is not already installed, install the jam nut (4) on the inner tie rod threads.
2. Thread the outer tie rod (1) onto the inner tie rod approximately the same amount of revolutions as the original was installed.
3. Thread the jam nut (4) down the inner tie rod far enough to hold the outer tie rod. Do not tighten the jam nut at this time.
4. Install the outer tie rod end (1) stud into the hole in the knuckle arm (3). Start a **NEW** tie rod retaining nut (2) on the stud. While holding the tie rod end stud with a wrench, tighten the nut (2) to 30 N.m Plus 90° (22 ft. lbs. Plus 90°).
5. Install the tire and wheel assembly. Refer to **INSTALLATION** .
6. Adjust the front wheel toe setting. Refer to **WHEEL ALIGNMENT, STANDARD PROCEDURE** .
7. Tighten the tie rod jam nut (4) to 70 N.m (52 ft. lbs.) once wheel toe is set.
8. Lower the vehicle.

INNER TIE ROD

Fig. 50: Travel Restrictor, O Ring & Steering Gear
Courtesy of CHRYSLER GROUP, LLC

1. Apply Mopar® Lock AND Seal Adhesive or equivalent medium thread locker adhesive to the inboard end threads of the inner tie rod.
2. Install the inner tie rod onto the gear (1) using an appropriate inner tie rod installation tool on the flats. Tighten the inner tie rod to 110 N.m. (81 ft. lbs.).

Fig. 51: Crimping Pliers On Bellows Clamp
Courtesy of CHRYSLER GROUP, LLC

3. Loosely place a NEW clamp over the large end of the NEW bellows.
4. Using crimping pliers (1), crimp the large clamp (2) securing the bellows to the gear body.

Fig. 52: Bellows Clamps
Courtesy of CHRYSLER GROUP, LLC

5. Install small end of bellows into groove and secure with clip (3).
6. Thread the tie rod jam nut onto the inner tie rod far enough to install the outer tie rod.
7. Install the outer tie rod. Refer to **TIE ROD, STEERING, INSTALLATION**.

2014 SUSPENSION

Front Suspension & Wheel Alignment - Cherokee

STANDARD PROCEDURE

STANDARD PROCEDURE - LUBRICATION

There are no serviceable lubrication points on the front or rear suspension. The ball joints and tie rod ends are sealed for life and require no maintenance.

SPECIAL TOOLS

SPECIAL TOOLS

	9360 - Remover, Ball Joint (Originally Shipped In Kit Number(s) 9329, 9515, 9516, 9516-CAN, 9517, 9517-CAN, 9518, 9519, 9540, 9541.)
	9362 - Wrench, Strut Nut (Originally Shipped In Kit Number(s) 9329, 9515, 9516, 9516-CAN, 9517,

	9517-CAN, 9518, 9519, 9540, 9541.)
	C-3339A - Set, Dial Indicator (Originally Shipped In Kit Number(s) 9202.)
	C-3894-A - Puller, Tie Rod (Originally Shipped In Kit Number(s)

FRONT

WARNING

WARNING

WARNING: Chrysler does not manufacture any vehicles or replacement parts that contain asbestos. Aftermarket products may or may not contain asbestos. Refer to aftermarket product packaging for product information.

Whether the product contains asbestos or not, dust and dirt can accumulate on brake parts during normal use. Follow practices prescribed by appropriate regulations for the handling, processing and disposing of dust and debris.

WARNING: Do not remove the strut rod nut while strut assembly is installed in vehicle, or before the coil spring is compressed with a compression tool. The spring is held under high pressure.

CAUTION: At no time when servicing a vehicle can a sheet metal screw, bolt, or other metal fastener be installed in the shock tower to take the place of an original plastic clip. It may come into contact with the strut or coil spring.

CAUTION: Wheel bearing damage will result if after loosening the axle hub nut, the vehicle is rolled on the ground or the weight of the vehicle is allowed to be supported by the tires for any length of time.

ARM, LOWER CONTROL

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - LOWER CONTROL ARM

Inspect the lower control arm for signs of damage from contact with the ground or road debris. If the lower control arm shows any sign of damage, look for distortion. Do not attempt to repair or straighten a broken or bent lower control arm. If damaged, the lower control arm is serviced only as a complete component.

Inspect both lower control arm isolator bushings for severe deterioration and replace the lower control arm as required.

REMOVAL

REMOVAL

NOTE: Before proceeding, refer to FRONT, WARNING.

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove the wheel mounting bolts and the tire and wheel assembly.

Fig. 1: Identifying Lower Ball Joint Nut
Courtesy of CHRYSLER GROUP, LLC

3. Remove and discard the lower ball joint nut (1).
4. Using (special tool #C-3894-A, Puller, Tie Rod), separate the lower ball joint stud from the control arm.

Fig. 2: Identifying Pry Bar & Control Arm
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Make sure the ball joint boot does not get cut when separating the ball joint stud from the control arm.**

NOTE: **After separating the control arm from the knuckle, do not let it swing rapidly back up. This can tear the ball joint dust boot.**

5. Insert a pry bar (1) in the opening between the control arm front mounting bolt and the front fascia support beam.
6. Pry down on the control arm (2) until the ball joint stud is clear of the control arm, then push the knuckle assembly to the side when it is clear of the ball joint stud and slowly release the control arm.
7. Remove the Lower Load Beam. Refer to **REMOVAL** .

Fig. 3: Identifying Front Lower Control Arm Nut
Courtesy of CHRYSLER GROUP, LLC

8. Remove and discard the front lower control arm nut (1). Then remove the bolt attaching the lower control arm to the front suspension crossmember.

Fig. 4: Identifying Rear Lower Control Arm Nut
Courtesy of CHRYSLER GROUP, LLC

9. Remove and discard the rear lower control arm nut (1). Then remove the lower control arm bolt.
10. Remove the lower control arm from the crossmember.

INSTALLATION

INSTALLATION

1. Position the lower control arm in the front suspension crossmember.

Fig. 5: Identifying Rear Lower Control Arm Nut

Courtesy of CHRYSLER GROUP, LLC

2. Install a **NEW** rear lower control arm bolt and a **NEW** rear lower control arm nut (1). Do not tighten to specification at this time.

Fig. 6: Identifying Front Lower Control Arm Nut
Courtesy of CHRYSLER GROUP, LLC

3. Install a **NEW** front lower control arm bolt and a **NEW** front lower control arm nut (1). Do not tighten to specification at this time.

Fig. 7: Identifying Pry Bar & Control Arm
Courtesy of CHRYSLER GROUP, LLC

4. Insert a pry bar (1) in the opening between the control arm front mounting bolt and the front fascia support beam.
5. Pry down on the control arm (2) until the ball joint stud is clear of the control arm, align the stud with hole in control arm then slowly release the control arm.
6. Lower the vehicle and install a floor jack under the control arm. Raise the jack until the lower control arm is at ride height. Tighten the bolts:
   - Front lower control arm bolt: 100 N.m Plus 135° (74 ft. lbs. Plus 135°).
   - Rear lower control arm bolt: 75 N.m Plus 90° (55 ft. lbs Plus 90°.).
7. Raise the vehicle back up to the original position.
8. Install the Lower Load Beam. Refer to **LOAD BEAM, LOWER, INSTALLATION** .

Fig. 8: Identifying Lower Ball Joint Nut
Courtesy of CHRYSLER GROUP, LLC

9. Install a **NEW** ball joint nut (1) and tighten to 25 N.m plus 175° (18 ft. lbs. plus 175°).
10. Install the wheel and tire assembly. Refer to **INSTALLATION** .
11. Lower the vehicle.

BALL JOINT, SUSPENSION, LOWER

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - LOWER BALL JOINT

1. Raise the vehicle allowing the front suspension to hang.
2. Remove the tire and wheel assembly.
3. Using Dial Indicator (special tool #C-3339A, Set, Dial Indicator), or equivalent, attach the dial indicator

mount to the knuckle and align the dial indicator's plunger with the direction of the stud axis, touching the end of the ball joint stud in the lower control arm.

4. Push up on the lower control arm and zero the dial indicator.

NOTE: Use care when applying load to the knuckle as to avoid damaging the ball joint seal boot.

5. From the front of the vehicle, insert a pry bar between the knuckle and lower control arm, resting it on the lower control arm. Use lever principle to push the knuckle up from the lower control arm. Apply the load until the needle of the dial indicator no longer moves.
6. Record the ball joint movement. The end play is acceptable if no more than 1.0 mm (0.039 in.) of end play is achieved back-to-back.
7. Perform this procedure on each side of the vehicle as necessary.

HUB AND BEARING

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - HUB AND BEARING - NOISE

NOTE: The wheel bearing is designed to last for the life of the vehicle and requires no type of periodic maintenance.

Bearings will produce noise if worn or damaged. The noise will generally change when the bearings are loaded. A road test of the vehicle is normally required to determine if there is a bearing noise, or if it may be some other component, and to assist in finding the location. The following procedure, together with the **DIAGNOSTIC CHART** , should help determine the proper cause. Note that if a particular vehicle road test maneuver, steering to the right for instance, results in noise only part of the time, it is not likely a faulty bearing. Bearing noises are not typically intermittent.

NOTE: Damaged bearing seals and the resulting excessive grease loss may also require bearing replacement. Moderate grease seepage from the bearing is considered normal and should not require replacement of the wheel bearing. Wheel bearings are designed to last the life of the vehicle and require no type of periodic maintenance. To diagnose the hub, measure hub runout. Refer to ROTOR, BRAKE, DIAGNOSIS AND TESTING .

DIAGNOSTIC PROCEDURE:

1. Perform drive evaluation. Find a smooth level road surface void of traffic or obstructions. Turn off any accessories which may cause background noise. Evaluate for noise at 50 km/h (30 mph) and 100 km/h (60 mph) and with vehicle in neutral to eliminate potential drivetrain noises. With vehicle at a constant speed, steer back and forth to left and right (approximately 45 degree steering input each way). This will load and unload the bearings and may change the noise level. When bearing damage is slight, the noise is sometimes noticeable at lower speeds and at other times is more noticeable at higher speeds.

2. Drive evaluation results: Noise increase when turning right may indicate a problem with the left bearing. Noise increase when turning left may indicate a problem with the right bearing.
3. Put vehicle up on hoist. Grab the tire by pushing in on the top center and pulling out on the bottom center to check for excessive movement in the bearing.
4. Check for potential rubbing on rotating components, such as rotor splash shields, heat shields touching propshaft or halfshaft, wheel well liners contacting tire, wheel cover on wheel, etc. Any cyclic noise (once per wheel revolution for example) is not likely a wheel bearing fault.
5. Remove the wheel and tire assembly, disc brake caliper and brake rotor. Refer to **ROTOR, BRAKE, DIAGNOSIS AND TESTING** .
6. Rotate the wheel hub, checking for resistance or roughness.
7. Any roughness or resistance to rotation may indicate dirt intrusion or a failed hub bearing. If the bearing exhibits any of these conditions, the hub & bearing will require replacement. Do not attempt to disassemble the bearing for repair.
8. Rotate the wheel hub, utilize Chassis Ears (or equivalent) to check for noise.
9. If none of the above checks indicate a bearing failure, refer to the **DIAGNOSTIC CHART** for other possible causes.

DIAGNOSTIC CHART - HUB & BEARING

CONDITION	POSSIBLE CAUSES	POTENTIAL CORRECTIONS
FRONT END WHINE ON TURNS	1. Low Power Steering Fluid Level (if applicable)	1. Fill power steering fluid reservoir to proper level, check for leaks (make sure all air is bled from system fluid)
	2. Worn Tires and/or Incorrect Wheel Alignment	2. Replace Tires, Check And Reset Wheel Alignment
	3. Defective Wheel Bearing	3. Replace Wheel Bearing
	4. Wrong Power Steering Fluid (if applicable)	4. Replace With Correct Power Steering Fluid
FRONT END GROWL OR GRINDING ON TURNS	1. Loose Wheel Lug Nuts	1. Verify Wheel Lug Nut Torque
	2. Engine Mount Grounding Against Frame Or Body Of Vehicle	2. Check For Engine Mount Hitting Frame Rail And Reposition Engine As Required
	3. Worn Tires and/or Incorrect Wheel Alignment	3. Replace Tires, Check and Reset Wheel Alignment
	4. Defective Wheel Bearing	4. Replace Wheel Bearing
	5. Worn or Broken C/V Joint	5. Replace C/V Joint
	6. Engine Not Centered, Causing Axle Half Shaft to Bottom Out	6. Center the Engine

POPPING/CLICKING/SNAPPING DURING ACCELERATION AFTER DRIVE-TO-REVERSE SHIFT, REVERSE-TO-DRIVE SHIFT OR WHILE TURNING	1. Insufficient Hub Nut Torque 2. Insufficient Grease on Mating Surface of Axle Half Shaft Outer C/V Joint to Wheel Hub/Bearing, or Worn/Damaged Gasket	1. Torque Hub Nut to Spec 2. Separate Half Shaft From Hub and Bearing and Wipe Mating Surfaces Clean. Apply Light Coating of Wheel Bearing Grease to C/V Joint Surface and Reassemble, or Replace Gasket. Torque Hub Nut to Spec
WHINE/HUM/ROAR WITH VEHICLE GOING STRAIGHT AT A CONSTANT SPEED	1. Worn Tires and/or Incorrect Wheel Alignment 2. Defective Wheel Bearing	1. Replace Tires and Reset Wheel Alignment 2. Replace Wheel Bearing
GROWL OR GRINDING WITH VEHICLE GOING STRAIGHT AT A CONSTANT SPEED	1. Engine Mount Grinding Against Frame or Body 2. Defective Wheel Bearing 3. Worn or Broken C/V Joint	1. Check and Reposition Engine as Required 2. Replace Wheel Bearing 3. Replace C/V Joint

REMOVAL

REMOVAL

NOTE: Before proceeding, review all Warnings and Cautions. Refer to FRONT, WARNING.

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove the wheel mounting bolts and the tire and wheel assembly.

Fig. 9: Identifying Staked Areas, Hub Nut & Rotor Bolt
Courtesy of CHRYSLER GROUP, LLC

3. Using a suitable punch, lift the two staked areas (1) in the hub nut. Use care not to damage the half-shaft.
4. While a helper applies the brakes to keep the hub from rotating, remove the hub nut (2) and discard it. Remove the rotor bolt (3).**Do not reuse hub nut.**
5. Remove the front brake rotor. Refer to **ROTOR, BRAKE, REMOVAL** .
6. Remove the four hub and bearing bolts.

NOTE: The bolts are one time use. Discard the bolts.

Fig. 10: Identifying Hub & Bearing
Courtesy of CHRYSLER GROUP, LLC

7. Slide the hub and bearing (1) off the half shaft and out of the knuckle.

INSTALLATION

INSTALLATION

Fig. 11: Identifying Hub & Bearing
Courtesy of CHRYSLER GROUP, LLC

1. Position the halfshaft into the hub and bearing. Install the hub and bearing (1) in to the knuckle.
2. Install four **NEW** hub and bearing bolts and tighten to. Refer to **FRONT, SPECIFICATIONS**.
3. Install the front brake rotor and caliper assembly. Refer to **ROTOR, BRAKE, INSTALLATION** .
4. Install a **NEW** hub nut and while a helper applies the brakes, tighten to specification. Refer to **SPECIFICATIONS** .

NOTE: Do not use air tools on staking tool while staking hub nut.

Fig. 12: Correct Hub Nut Staking
Courtesy of CHRYSLER GROUP, LLC

Correct Hub Nut Staking

5. Using (special tool #10287, Tool, Front Hub Staking) align the leading cutting edge of tool with the top left side channel on axle. Tighten fastener on staking tool with hand tools until the threads bottom out completely.

NOTE: The hub nut must be staked (1) as shown in Correct Hub Nut Staking. Both edges must be split and bent into the shape shown (3). The staking must be in the opposite direction from the forward rotation of the wheel.

NOTE: Do not stake the hub nut as shown (2).

6. Install the wheel and tire assembly. Refer to **INSTALLATION** .

KNUCKLE, STEERING

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - KNUCKLE

The front suspension knuckle is not a repairable component of the front suspension. It must be replaced if found to be damaged in any way. If it is determined that the knuckle is bent when servicing the vehicle, no attempt is to be made to straighten the knuckle.

REMOVAL

REMOVAL

NOTE: Before proceeding, review all Warnings and Cautions. Refer to FRONT, WARNING.

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove the wheel mounting bolts and the tire and wheel assembly.

Fig. 13: Identifying Staked Areas, Hub Nut & Rotor Bolt
Courtesy of CHRYSLER GROUP, LLC

3. Using a suitable punch, lift the two staked areas (1) on the hub nut. Use care not to damage the half-shaft.
4. While a helper applies the brakes to keep the hub from rotating, remove the hub nut (2) and discard it. Remove the rotor bolt (3). **Do not reuse the hub nut.**
5. Remove the front brake rotor. Refer to **ROTOR, BRAKE, REMOVAL** .

Fig. 14: Identifying Hub & Bearing
Courtesy of CHRYSLER GROUP, LLC

6. Remove the four hub and bearing to knuckle bolts and slide the hub and bearing (1) off the half shaft and out of the knuckle.

7. Remove the front brake rotor splash shield.

Fig. 15: Identifying Wheel Speed Sensor
Courtesy of CHRYSLER GROUP, LLC

8. Remove the wheel speed sensor (1) and position it aside.

Fig. 16: Identifying Outer Tie Rod End
Courtesy of CHRYSLER GROUP, LLC

9. Remove the outer tie rod end (1) from the knuckle. Refer to **TIE ROD, STEERING, REMOVAL** .

Fig. 17: Identifying Lower Ball Joint Nut
Courtesy of CHRYSLER GROUP, LLC

10. Remove and discard the lower ball joint nut (1).
11. Using (special tool #C-3894-A, Puller, Tie Rod) separate the ball joint stud from the control arm.

Fig. 18: Identifying Pry Bar & Control Arm
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Make sure the ball joint boot does not get cut when separating the control arm from the knuckle.**

NOTE: After separating the control arm from the knuckle, do not let it swing rapidly back up. This can tear the ball joint dust boot.

12. Insert a pry bar (1) in the opening between the control arm front mounting bolt and the front fascia support beam.
13. Pry down on the control arm (2) until the ball joint stud is clear of the control arm. Position the knuckle assembly to the side until it is clear of the ball joint stud. Slowly release the control arm.

Fig. 19: Identifying Knuckle To Strut Pinch Bolt & Nut
Courtesy of CHRYSLER GROUP, LLC

14. Remove the knuckle to strut pinch bolt and nut (1).

Discard the nut and bolt.

NOTE: Do not allow the half shaft to hang by the inner C/V joint. Support the half shaft to keep the joint from separating.

15. Remove the knuckle.

INSTALLATION

INSTALLATION

1. Position the half shaft into the knuckle and slide the strut into the knuckle.

Fig. 20: Identifying Knuckle To Strut Pinch Bolt & Nut
Courtesy of CHRYSLER GROUP, LLC

2. Install a **NEW** strut pinch bolt and nut (1). Tighten the pinch bolt to specification.

Fig. 21: Identifying Pry Bar & Control Arm
Courtesy of CHRYSLER GROUP, LLC

3. Insert a pry bar (1) in the opening between the control arm front mounting bolt and the front fascia support beam.
4. Pry down on the control arm (2) until the ball joint stud is clear of the control arm, align the stud with hole in control arm then slowly release the control arm.

Fig. 22: Identifying Lower Ball Joint Nut
Courtesy of CHRYSLER GROUP, LLC

5. Install a **NEW** lower ball joint nut (1). Tighten the lower ball joint nut to specification.

Fig. 23: Identifying Outer Tie Rod End
Courtesy of CHRYSLER GROUP, LLC

6. Install the outer tie rod to the knuckle. Refer to **TIE ROD, STEERING, INSTALLATION** .

Fig. 24: Identifying Wheel Speed Sensor
Courtesy of CHRYSLER GROUP, LLC

7. Install the wheel speed sensor. Tighten the wheel speed sensor bolt to specification.
8. Install the front brake rotor splash shield.

Fig. 25: Identifying Hub & Bearing
Courtesy of CHRYSLER GROUP, LLC

9. Position the half shaft into the hub and bearing. Install the hub and bearing (1) to the knuckle. Install four **new** hub an bearing bolts. Tighten the hub bolts to specification.
10. Install the front brake rotor and brake caliper. Refer to **CALIPER, DISC BRAKE, FRONT, INSTALLATION** and **ROTOR, BRAKE, INSTALLATION** .

NOTE: **Always install a new hub nut. The original hub nut is one-time use only and must be discarded when removed.**

11.
12. Install a **NEW** hub nut and while a helper applies the brakes, tighten the nut to 200 N.m (148 ft. lbs.)

NOTE: **Do not use air tools on staking tool while staking hub nut.**

Fig. 26: Correct Hub Nut Staking
Courtesy of CHRYSLER GROUP, LLC

Correct Hub Nut Staking

13. Using (special tool #10287, Tool, Front Hub Staking) align the leading cutting edge of tool with the top left side channel on axle. Tighten fastener on staking tool with hand tools until the threads bottom out completely.

NOTE: **The hub nut must be staked (1) as shown in Correct Hub Nut Staking. Both edges must be split and bent into the shape shown (3). The staking must be in the opposite direction from the forward rotation of the wheel.**

NOTE: **Do not stake the hub nut as shown (2).**

14. Install the wheel and tire assembly. Refer to **INSTALLATION** .

LINK, STABILIZER BAR

REMOVAL

REMOVAL

NOTE: Before proceeding, refer to FRONT, WARNING.

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove the wheel mounting bolts and the tire and wheel assembly.

Fig. 27: Identifying Upper & Lower Nut
Courtesy of CHRYSLER GROUP, LLC

3. Hold the stabilizer bar link studs stationary and remove the upper nut (1) and the lower nut (2).
4. Remove the stabilizer bar link.

INSTALLATION

INSTALLATION

Fig. 28: Identifying Upper & Lower Nut
Courtesy of CHRYSLER GROUP, LLC

1. Position the stabilizer bar link to the strut and install the stabilizer bar link nut (1).
2. Position the stabilizer bar link to the stabilizer bar and install the stabilizer bar link nut (2).
3. Hold the stabilizer bar link studs stationary and tighten the Stabilizer Bar Link Nuts to Specification.
4. Install the tire and wheel assembly and the lug bolts. Refer to **INSTALLATION** .
5. Lower the vehicle.

STABILIZER BAR, FRONT

REMOVAL

REMOVAL

NOTE: Before proceeding, refer to FRONT, WARNING.

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove the crossmember. Refer to **CROSSMEMBER, FRONT SUSPENSION, REMOVAL** .

Fig. 29: Stabilizer Bar Retaining Bolts
Courtesy of CHRYSLER GROUP, LLC

3. Remove the four stabilizer bolts (1, 3) and separate the stabilizer bar (2) from the crossmember.

INSTALLATION

INSTALLATION

NOTE: Inspect the brackets, insulators and links for wear or damage. Install new components as necessary.

1. Install the stabilizer bar (2) to the crossmember.

Fig. 30: Stabilizer Bar Retaining Bolts
Courtesy of CHRYSLER GROUP, LLC

2. Install the four stabilizer bar mounting bolts (1, 3). Tighten the to Stabilizer Bar Mounting Bolts to Specification.
3. Install the crossmember. Refer to **CROSSMEMBER, FRONT SUSPENSION, INSTALLATION** .

STRUT, SUSPENSION, ASSEMBLY

DESCRIPTION

DESCRIPTION

Fig. 31: Front Strut Components
Courtesy of CHRYSLER GROUP, LLC

A Macpherson type design strut assembly is used in place of the traditional front suspension upper control arm and upper ball joint. The bottom of the strut mounts directly to the steering knuckle using a "shark fin" and pinch bolt going through the knuckle. The top of the strut mounts directly to the strut tower of the vehicle using a retaining clip on the strut assembly upper mount.

The strut assembly includes the following components:

- Strut (damper) (1)
- Dust shield (2)
- Strut rod nut (3)
- Bearing and upper spring seat (4)
- Upper spring isolator (5)
- Coil spring (6)
- Lower spring isolator (7)

Each component is serviced by removing the strut assembly from the vehicle and disassembling it.

Coil springs are rated separately for each corner or side of the vehicle depending on optional equipment and type of vehicle service. If a coil spring requires replacement, be sure that it is replaced with a spring meeting the correct load rating for the vehicle and its specific options.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - STRUT ASSEMBLY

Inspect the strut assembly for the following conditions:

- Inspect for a damaged or broken coil spring.
- Inspect for a torn or damaged dust shield.
- Lift the dust shield and inspect the strut assembly for evidence of fluid running from the upper end of the strut fluid reservoir. (Actual leakage will be a stream of fluid running down the side and dripping off lower end of unit). A slight amount of seepage between the strut shaft and strut shaft seal is not unusual and does not affect performance of the strut assembly.
- Inspect the jounce bumper for signs of damage or deterioration.
- Inspect the clearance between the shock tower and the coil spring. Make sure no fasteners are protruding through the shock tower possibly contacting the coil spring and strut. Because of the minimum clearance in this area, installation of metal fasteners could damage the coil spring coating and lead to a corrosion failure of the spring.

REMOVAL

REMOVAL

NOTE: Before proceeding, refer to FRONT, WARNING.

NOTE: Removal of the strut assembly is the same for both sides.

NOTE: If both strut assemblies are removed, label the strut assemblies right or left. Keep the other strut parts separated with right or left as well. Not all parts of the strut assembly are interchangeable side-to-side.

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove the wheel mounting bolts and the tire and wheel assembly.

Fig. 32: Identifying Staked Areas, Hub Nut & Rotor Bolt
Courtesy of CHRYSLER GROUP, LLC

3. Using a suitable punch, lift the two staked areas (1) on the hub nut. Use care not to damage the halfshaft.
4. While a helper applies the brakes to keep the hub from rotating, remove the hub nut (2) and discard it. Remove the rotor bolt (3). **Do not reuse the hub nut.**
5. Remove the font brake rotor. Refer to **ROTOR, BRAKE, REMOVAL** .

Fig. 33: Identifying Wheel Speed Sensor
Courtesy of CHRYSLER GROUP, LLC

6. Remove the wheel speed sensor (1) and remove the wire harness from the strut. Position the wire harness aside.

7. Remove the stabilizer bar link. Refer to **LINK, STABILIZER BAR, REMOVAL**.

Fig. 34: Identifying Outer Tie Rod End
Courtesy of CHRYSLER GROUP, LLC

8. Remove the outer tie rod end from the knuckle (1). Refer to **TIE ROD, STEERING, REMOVAL** .

Fig. 35: Identifying Lower Ball Joint Nut
Courtesy of CHRYSLER GROUP, LLC

9. Remove and discard the lower ball joint nut (1).
10. Using (special tool #C-3894-A, Puller, Tie Rod) separate the ball joint stud from the control arm.

Fig. 36: Identifying Pry Bar & Control Arm
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Make sure the ball joint boot does not get cut when separating the control arm from the knuckle.**

NOTE: **After separating the control arm from the knuckle, do not let it swing rapidly back up. This can tear the ball joint dust boot.**

11. Insert a pry bar (1) in the opening between the control arm front mounting bolt and the front fascia support beam.
12. Pry down on the control arm (2) until the ball joint stud is clear of the control arm, then push the knuckle assembly to the side when it is clear of the ball joint stud and slowly release the control arm.
13. Separate the axle from the knuckle and support the axle.

Fig. 37: Identifying Strut & Clips
Courtesy of CHRYSLER GROUP, LLC

14. Insert the ball joint back into the control arm to support the strut during upper strut clip removal.
15. Lower the hoist until a floor jack can be used to raise the strut (1) to relieve tension on the upper strut clip.
16. Using two screwdrivers, pry the two ends (2) of the strut clip in opposite directions to separate and break the clip. **Discard the clips after removal.**

Fig. 38: Identifying Knuckle To Strut Pinch Bolt & Nut
Courtesy of CHRYSLER GROUP, LLC

17. Remove the knuckle to strut pinch bolt and nut (1). **Discard the nut and bolt.**

18. Remove the strut from the vehicle.
19. To disassemble the strut, refer to **STRUT, SUSPENSION, ASSEMBLY, DISASSEMBLY**.

DISASSEMBLY

DISASSEMBLY

Fig. 39: Identifying Pliers On Chrome Machined Surface Of Shock/Strut Rod
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not use any type of pliers on the chrome machined surface of shock/strut rod to assist in the disassembly/assembly of shocks or struts. Use only tools designed to hold the shock/strut rod stationary when servicing shock or strut components.

NOTE: The strut assembly must be removed from the vehicle for it to be disassembled and assembled. Refer to STRUT, SUSPENSION, ASSEMBLY, REMOVAL.

For the disassembly and assembly of the strut assembly, use strut spring compressor, teamPSE tool 223-7400, or the equivalent, to compress the coil spring. Follow the manufacturer's instructions closely.

WARNING: Do not remove the strut rod nut before the coil spring is properly compressed. The coil spring is held under pressure. The coil spring must be compressed, removing spring tension from the upper mount and bearing, before the strut rod nut is removed.

050870143

Fig. 40: Spring Compressor & Strut Assembly
Courtesy of CHRYSLER GROUP, LLC

1. If both struts are being serviced at the same time, mark both the coil spring and strut assembly according to which side of the vehicle the strut is being removed from.
2. Position the strut assembly (2) in the strut coil spring compressor (1) following the manufacturer's instructions and set the lower and upper hooks of the compressor on the coil spring. Position the strut clevis bracket straight outward, away from the compressor.
3. Compress the coil spring until all coil spring tension is removed from the upper mount and bearing.

Fig. 41: Hex Head Wrench & Special Tool #9362
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Never use impact or high speed tools to remove the strut rod nut. Damage to the strut internal bearings can occur.

4. Once the spring is sufficiently compressed, install (special tool #9362, Wrench, Strut Nut) (2), on the strut rod nut. Next, install a hex head wrench (1) into the strut rod internal hex. While holding the strut rod from turning, remove the nut using the strut nut wrench.
5. Remove the clamp (if installed) from the bottom of the coil spring and remove the strut (damper) out through the bottom of the coil spring.
6. Remove the lower spring isolator from the strut seat.
7. Remove the dust shield.
8. Remove the upper strut mount from the top of the bearing and upper spring seat.
9. Remove the upper spring seat and isolator from the top of the coil spring.
10. Release the tension from the coil spring by backing off the compressor drive completely. Push back the compressor hooks and remove the coil spring.
11. Inspect the strut assembly components for the following and replace as necessary:

- Inspect the strut (damper) for shaft binding over the full stroke of the shaft.
- Inspect the jounce bumper for cracks and signs of deterioration.
- Inspect the dust shield for cracks and tears.
- Check the upper mount for cracks and distortion and its retaining studs for any sign of damage.
- Check the bearing and upper spring seat for any binding.

- Inspect the upper and lower spring isolators for material deterioration and distortion.
- Inspect the coil spring for any sign of damage to the coating.

NOTE: For reassembly, refer to STRUT, SUSPENSION, ASSEMBLY, ASSEMBLY.

ASSEMBLY

ASSEMBLY

Fig. 42: Identifying Pliers On Chrome Machined Surface Of Shock/Strut Rod
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not use any type of pliers on the chrome machined surface of shock/strut rod to assist in the disassembly/assembly of shocks or struts. Use only tools designed to hold the shock/strut rod stationary when servicing shock or strut components.

1. Place the coil spring in the spring compressor following the manufacturer's instructions. Before compressing the spring, rotate the spring so the end of the bottom coil is at approximately the 9 o'clock position as viewed above (or to where the spring was when removed from the compressor). This action will allow the strut (damper) clevis bracket to be positioned outward, away from the compressor once installed.
2. Slowly compress the coil spring until enough room is available for strut assembly reassembly.
3. Install the bearing and upper spring seat, and isolator on top of the coil spring.
4. Install the upper mount on top of the bearing and upper spring seat.
5. Install the lower spring isolator on the spring seat on the strut (damper).
6. Slide the jounce bumper and dust shield onto the strut rod.

7. Install the strut up through the bottom of the coil spring and upper spring seat, mount, and bearing until the lower spring seat contacts the lower end of the coil spring. Rotate the strut as necessary until the end of the bottom coil comes in contact with the stop built into the lower spring isolator.
8. While holding the strut in position, install the (special tool #10140-2, Receiver) nut on the end of the strut rod.

Fig. 43: Hex Head Wrench & Special Tool #9362
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Never use impact or high speed tools to remove the strut rod nut. Damage to the strut internal bearings can occur.

9. Install (special tool #9362, Wrench, Strut Nut) (2) on the strut rod nut. Next, install an hex head wrench (1) on the end of the strut rod. While holding the strut rod from turning, tighten the strut rod nut to 68 N.m (50 ft. lbs.) using a torque wrench on the end of Special Tool (special tool #9362, Wrench, Strut Nut).

050870143

Fig. 44: Spring Compressor & Strut Assembly
Courtesy of CHRYSLER GROUP, LLC

10. Slowly release the tension from the coil spring by backing off the compressor drive completely. As the tension is relieved, make sure the upper mount and bearing align properly. Verify the upper mount does not bind when rotated.
11. Remove the strut assembly (2) from the spring compressor (1).
12. Install the strut assembly on the vehicle. Refer to **STRUT, SUSPENSION, ASSEMBLY, INSTALLATION**.

INSTALLATION

INSTALLATION

NOTE: Installation of the strut assembly is the same for both sides.

Fig. 45: Identifying Strut Mount Slot & Forward Hole
Courtesy of CHRYSLER GROUP, LLC

1. Install the strut into the vehicle. **When installing the strut, align the slot in the strut mount (2) with the forward hole (1) in the body of the strut tower.**

NOTE: The strut retaining clip must be fully closed and the serrations fully engaged after installation.

Fig. 46: Identifying Strut & Clips
Courtesy of CHRYSLER GROUP, LLC

2. Install the cover (1) and each half of the upper strut clip (2).

3. Press each side of the strut clip (2) toward each other to assemble the clip. Make sure that the clip is fully closed and the serrations fully engaged.
4. Install the strut into the top of the knuckle.

Fig. 47: Identifying Knuckle To Strut Pinch Bolt & Nut
Courtesy of CHRYSLER GROUP, LLC

5. Install the **NEW** knuckle to strut pinch bolt and nut (1). Tighten the Knuckle to Strut Nut to Specification.
6. Install the axle into the knuckle.

Fig. 48: Identifying Pry Bar & Control Arm

Courtesy of CHRYSLER GROUP, LLC

7. Insert a pry bar (1) in the opening between the control arm front mounting bolt and the front fascia support beam.
8. Pry down on the control arm (2) until the ball joint stud is clear of the control arm, align the stud with hole in control arm then slowly release the control arm.

Fig. 49: Identifying Lower Ball Joint Nut
Courtesy of CHRYSLER GROUP, LLC

9. Install a **NEW** lower ball joint nut (1). Tighten the Lower Ball Joint Nut to Specification.

Fig. 50: Identifying Outer Tie Rod End

Courtesy of CHRYSLER GROUP, LLC

10. Install the outer tie rod end into the knuckle (1). Tighten the Outer Tie Rod End Nut to Specification. Refer to **TIE ROD, STEERING, INSTALLATION** .
11. Install the stabilizer bar link. Refer to **LINK, STABILIZER BAR, INSTALLATION**.

Fig. 51: Identifying Wheel Speed Sensor
Courtesy of CHRYSLER GROUP, LLC

12. Install the wheel speed sensor (1) and connect the harness to the strut. Tighten the Wheel Speed Sensor Bolt to Specification.
13. Install the front brake rotor and caliper assembly. Refer to **ROTOR, BRAKE, INSTALLATION** .
14. Install the **NEW** hub nut and while a helper applies the brakes, tighten the Hub Nut to Specification.

NOTE: Do not use air tools on staking tool while staking hub nut.

Fig. 52: Correct Hub Nut Staking
Courtesy of CHRYSLER GROUP, LLC

Correct Hub Nut Staking

15. Using (special tool #10287, Tool, Front Hub Staking)align the leading cutting edge of tool with the top left side channel on the axle. Tighten fastener on staking tool with hand tools until the threads bottom out completely.

NOTE: **The hub nut must be staked as shown (1) in Correct Hub Nut Staking. Both edges must be split and bent into the shape shown (3). The staking must be in the opposite direction from the forward rotation of the wheel.**

NOTE: **Do not stake the hub nut as shown in Correct Hub Nut Staking (2).**

16. Install wheel and tire assembly. Refer to **INSTALLATION** .
17. Perform alignment procedure. Refer to **WHEEL ALIGNMENT, STANDARD PROCEDURE**.

WHEEL ALIGNMENT

STANDARD PROCEDURE

CURB HEIGHT MEASUREMENT

The wheel alignment is to be checked and all alignment adjustments made with the vehicle at its required curb height specification.

Vehicle height is to be checked with the vehicle on a flat, level surface, preferably a vehicle alignment rack. The tires are to be inflated to the recommended pressure. All tires are to be the same size as standard equipment. **Vehicle height is checked with the fuel tank full of fuel, and no passenger or luggage compartment load.**

Vehicle height is not adjustable. If the measurement is not within specifications, inspect the vehicle for bent or weak suspension components. Compare the parts tag on the suspect coil spring(s) to the parts book and the vehicle sales code, checking for a match. Once removed from the vehicle, compare the coil spring height to a correct new or known good coil spring. The heights should vary if the suspect spring is weak.

NOTE: Do not apply the electric park brake (EPB) during ride height and alignment measurements.

NOTE: Prior to reading the curb height measurement, the front and rear of the vehicle must be jounced to settle the suspension. Induce jounce by pushing down on the center of the bumper (fascia), using care not to damage the vehicle, moving the vehicle up and down, gradually increasing the suspension travel with each stroke. Release the bumper at the bottom of each stroke, repeating this action several times. Perform this to both front and rear suspensions an equal amount of times.

Measure curb height as follows:

1. Jounce the vehicle. Refer to above note.

0207014766

Fig. 53: Identifying Distance Measurements
Courtesy of CHRYSLER GROUP, LLC

NOTE: On some vehicles it may be necessary to remove an engine belly pan in order to gain access to the cradle bolt.

2. FRONT - On each side of the vehicle, measure the distance (1) from the center of the front cradle bolt head to the floor or alignment rack/lift runway surface. It may be necessary to measure to the bottom of a straight edge placed from lift runway to runway to get an accurate measurement.
3. FRONT - Measure and record the distance (3) from the center of the spindle to the same surface or straight edge used to measure from the vertical pivot bolt.
4. Subtract the cradle bolt height (1) from the spindle height (3) to obtain the curb height value (2). Compare the curb height value (2) to specifications listed in the following CURB HEIGHT SPECIFICATIONS chart. **Maximum left-to-right differential is not to exceed 10 mm (0.39 in.).**

Fig. 54: Mounting Bolt Height, Spindle Height & Curb Height Value
Courtesy of CHRYSLER GROUP, LLC

5. REAR - On each side of the vehicle, measure and record the distance (1) from the bottom of the cradle toe link mount to the floor or alignment rack/lift runway surface. It may be necessary to measure to the bottom of a straight edge placed from lift runway to runway, to get an accurate measurement.
6. REAR - On each side of the vehicle, measure and record the distance (3) from the center of the rear spindle to the same surface that was used to measure the cradle toe link mount.
7. REAR - Subtract the cradle toe link mount height (1) from the spindle height (3) to obtain the curb height value (2). Compare the curb height value (2) to specifications listed in the following CURB HEIGHT SPECIFICATIONS chart. **Maximum left-to-right differential is not to exceed 10 mm (0.39 in.).**
8. If curb height is found to be out of specification and there is no sign of excessive body damage, curb height can be changed by replacing the applicable spring with a spring offering a different check load. Refer to **STRUT, SUSPENSION, ASSEMBLY, REMOVAL**.

CURB HEIGHT SPECIFICATIONS

		FWD	AWD	Lifted
Center of Spindle to Front Cradle Attachment Bolt	**Front**	130 mm (5.12 in.)	117 mm (4.61)	88 mm (3.46 in.)

Center of Spindle to Rear Cradle	**Rear**	106 mm (4.17 in.)	105 mm (4.13 in.)	92 mm (3.62 in.)
All curb height tolerances +/- 10 mm (0.39 in.) with full tank of fuel.				

WHEEL ALIGNMENT

PRE-WHEEL ALIGNMENT INSPECTION

Before any attempt is made to change or correct the wheel alignment, the following inspection and necessary corrections must be made to the vehicle to ensure proper alignment.

1. This vehicle is equipped with an Electronic Power Steering (EPS) system. Make sure there are no faults or problems with the EPS system before diagnosing an alignment issue.
2. Verify the fuel tank is full of fuel. If the fuel tank is not full, the reduction in weight will affect the curb height of the vehicle and the alignment specifications.
3. The passenger and luggage compartments of the vehicle should be free of any load that is not factory equipment.
4. Check the tires on the vehicle. The tires are to be inflated to the recommended air pressure. All tires must be the same size and in good condition with approximately the same tread wear.
5. Check the front tire and wheel assemblies for excessive radial runout.
6. Inspect all suspension component fasteners for looseness and proper torque.
7. Inspect the lower front ball joints and all steering linkage for looseness and any sign of wear or damage.
8. Inspect the rubber bushings on all the suspension components for signs of wear or deterioration. If any bushings show signs of wear or deterioration, they should be replaced prior to aligning the vehicle.
9. Check vehicle curb height to verify it is within specifications. Refer to **WHEEL ALIGNMENT, STANDARD PROCEDURE**.

WHEEL ALIGNMENT SETUP

1. Position the vehicle on an alignment rack.
2. Install all required alignment equipment on the vehicle, per the alignment equipment manufacturer's instructions. On this vehicle, a four-wheel alignment is recommended.

NOTE: **Prior to reading the vehicle's alignment readouts, the front and rear of vehicle should be jounced. Induce jounce (rear first, then front) by grasping the center of the bumper and jouncing each end of vehicle an equal number of times. The bumper should always be released when vehicle is at the bottom of the jounce cycle.**

3. Read the vehicle's current front and rear alignment settings. Compare the vehicle's current alignment settings to the vehicle specifications for camber, caster and toe-in. Refer to **WHEEL ALIGNMENT, SPECIFICATIONS**.

REAR CAMBER

CAUTION: Do not attempt to adjust the vehicle's wheel alignment by heating or bending any of the suspension components.

The rear toe link mounting location to the cradle is slotted with a cam bolt to adjust the camber.

FRONT CAMBER AND CASTER

Front camber and caster settings on this vehicle are determined at the time the vehicle is designed, by the location of the vehicle's suspension components. This is referred to as Net Build. The result is no required adjustment of camber and caster after the vehicle is built or when servicing the suspension components. Thus, when performing a wheel alignment, caster and camber are not normally considered adjustable angles but some adjustment can be made. Camber and caster should be checked to ensure they meet vehicle specifications. Refer to **WHEEL ALIGNMENT, SPECIFICATIONS**.

If individual front camber or caster is found not to meet alignment specifications, the only adjustment available is shifting the front crossmember.

CAUTION: Do not attempt to adjust the vehicle's wheel alignment by heating or bending any of the suspension components.

ADJUSTMENT BY SHIFTING CROSSMEMBER

CAUTION: Always use care when shifting crossmember to avoid damaging other components on the vehicle.

1. Loosen the bolts fastening the front crossmember to the frame just enough to allow movement of the crossmember. Refer to **CROSSMEMBER, FRONT SUSPENSION, REMOVAL** .

CAUTION: When shifting the front crossmember, keep in mind that the front and rear engine mounts are attached to the front crossmember and fore/aft crossmember and should be inspected following the crossmember shift to make sure they are properly aligned.

2. Shift front crossmember as necessary (See following charts) to bring camber or caster into specifications. When shifting crossmember, use care not to move other angles (camber or caster) that are within specifications, out of specifications.

FRONT CAMBER ADJUSTMENT BY SHIFTING CROSSMEMBER*	
Left Camber Below Specification	Move crossmember to the right
Left Camber Above Specification	Move crossmember to the left
Right Camber Below Specification	Move crossmember to the left
Right Camber Above Specification	Move crossmember to the right
Cross Camber Below Specification	Move crossmember to the right

Cross Camber Above Specification	Move crossmember to the left
* For every move to adjust one side of the vehicle, a countermove on the opposite side will occur.	

FRONT CASTER ADJUSTMENT BY SHIFTING CROSSMEMBER	
Left Caster Below Specification	Move left side of crossmember forward
Left Caster Above Specification	Move left side of crossmember rearward
Right Caster Below Specification	Move right side of crossmember forward
Right Caster Above Specification	Move right side of crossmember rearward
Cross Caster Below Specification	Move left side of crossmember forward and right side rearward
Cross Caster Above Specification	Move left side of crossmember rearward and right side forward

3. Tighten all previously loosened fasteners (bolts) securing the crossmember to the vehicle to specifications. Refer to **CROSSMEMBER, FRONT SUSPENSION, INSTALLATION** .
4. Jounce the rear, then front of the vehicle an equal amount of times.
5. Measure camber and caster. If camber and caster are within specifications, proceed to TOE. If camber and/or caster cannot be brought into specifications, check for bent or damaged components.

TOE

NOTE: When setting toe, make sure to set rear toe to the preferred specifications before setting front toe to the preferred specifications

1. Center the steering wheel and lock it in place using a steering wheel clamp.

REAR TOE

NOTE: Perform the following at each rear wheel as necessary.

1. While holding the cam bolt head stationary, loosen the spring link mounting cam bolt nut.
2. Rotate the cam bolt head left or right until the rear wheel toe for that rear wheel is set to the preferred specification. Refer to **WHEEL ALIGNMENT, SPECIFICATIONS**.
3. While holding the cam bolt head stationary, tighten the spring link mounting cam bolt nut to specifications. Refer to **SPECIFICATIONS** .

FRONT TOE

NOTE: Perform the following at each front wheel as necessary.

CAUTION: Do not twist the inner tie rod-to-steering gear boot (bellows) while turning the inner tie rod during front toe adjustment. It may be necessary to remove the clamp where the boot meets the inner tie rod.

1. Loosen the tie rod adjusting jam nut. Grasp the inner tie rod and rotate it one way or the other until the front wheel toe is set to the preferred specification. Refer to **WHEEL ALIGNMENT, SPECIFICATIONS**.
2. Tighten the tie rod adjusting jam nut to specifications. Refer to **FRONT, SPECIFICATIONS**.
3. Make sure the inner tie rod-to-steering gear boot is not twisted. If removed, reinstall the clamp where the boot meets the inner tie rod.
4. Remove the steering wheel clamp.
5. Remove the alignment equipment.
6. Perform the Clear Steering Pull Compensation Procedure. Refer to **STANDARD PROCEDURE** .
7. Road test the vehicle to verify the steering wheel is straight and the vehicle does not pull or wander.

SPECIFICATIONS

SPECIFICATIONS

NOTE: All specifications are given in degrees.

NOTE: All wheel alignments are to be set with the vehicle at curb height. Refer to WHEEL ALIGNMENT, STANDARD PROCEDURE.

2014 SUSPENSION

Rear Suspension - Cherokee

WARNING

WARNING

WARNING: Chrysler LLC does not manufacture any vehicles or replacement parts that contain asbestos. Aftermarket products may or may not contain asbestos. Refer to aftermarket product packaging for product information.

Whether the product contains asbestos or not, dust and dirt can accumulate on brake parts during normal use. Follow practices prescribed by appropriate regulations for the handling, processing and disposing of dust and debris.

CAUTION: Only frame contact or wheel lift hoisting equipment can be used on this vehicle. It cannot be hoisted using equipment designed to lift a vehicle by the rear axle. If this type of hoisting equipment is used, damage to rear suspension components will occur.

NOTE: If a rear suspension component becomes bent, damaged or fails, no attempt should be made to straighten or repair it. Always replace it with a new component.

KNUCKLE, REAR

REMOVAL

REMOVAL

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove the wheel mounting bolts, then the tire and wheel assembly.

1715005817

Fig. 1: Removing/Installing Rear Wheel Speed Sensor
Courtesy of CHRYSLER GROUP, LLC

3. Remove wheel speed sensor retaining bolt (6) and wheel speed sensor (5) from knuckle.

Fig. 2: Hub Nut & Halfshaft
Courtesy of CHRYSLER GROUP, LLC

4. If equipped with halfshaft, using a suitable punch, lift the two staked areas in the hub nut to avoid damaging the halfshaft.
5. While a helper applies the brakes to keep the hub from rotating, remove the hub nut (1) from the halfshaft (2) and discard it.

   The used hub nut is not reusable.

1715005823

Fig. 3: Identifying Spring Link, Camber Link, Nuts & Bolts
Courtesy of CHRYSLER GROUP, LLC

6. Remove the brake rotor. Refer to **ROTOR, BRAKE, REMOVAL** .
7. Support the outer end of the spring link (6).
8. Remove spring assembly. Refer to **SPRING(S), REMOVAL**.
9. Remove the camber link (2) from the knuckle. Refer to **LINK, CAMBER, REMOVAL**, **LINK, TOE, REMOVAL** and **LINK, SPRING, REMOVAL**.

1710009331

Fig. 4: Identifying Toe Link, Trailing Link, Knuckle, Nuts & Bolts

Courtesy of CHRYSLER GROUP, LLC

10. Remove the trailing link (3) from the knuckle. Refer to **LINK, TRAILING, REAR, REMOVAL**.

Fig. 5: Identifying Toe Link, Nuts & Bolts
Courtesy of CHRYSLER GROUP, LLC

11. Remove the toe link (1) from the knuckle. Refer to **LINK, CAMBER, REMOVAL**, **LINK, TOE, REMOVAL** and **LINK, SPRING, REMOVAL**.

0508006463

Fig. 6: Identifying Lower Shock, Nuts & Bolts
Courtesy of CHRYSLER GROUP, LLC

12. Disconnect the lower shock (1) from knuckle. Refer to **SHOCK ABSORBER, SUSPENSION, REMOVAL**.
13. Remove the rear knuckle from vehicle.
14. If necessary, remove the hub from the knuckle. Refer to **HUB AND BEARING, REMOVAL**.

INSTALLATION

INSTALLATION

1. If necessary, install the hub/bearing in the knuckle. Refer to **HUB AND BEARING, INSTALLATION**.

1710009331

Fig. 7: Identifying Toe Link, Trailing Link, Knuckle, Nuts & Bolts
Courtesy of CHRYSLER GROUP, LLC

2. Position the knuckle to the trailing arm link (3) and install fasteners (4). Refer to **KNUCKLE, REAR, INSTALLATION**.

1710009334

Fig. 8: Identifying Toe Link, Nuts & Bolts
Courtesy of CHRYSLER GROUP, LLC

3. Install the toe link (1) to the knuckle. Refer to **LINK, CAMBER, INSTALLATION**, **LINK, TOE, INSTALLATION** and **LINK, SPRING, INSTALLATION**.

1715005823

Fig. 9: Identifying Spring Link, Camber Link, Nuts & Bolts
Courtesy of CHRYSLER GROUP, LLC

4. Install the camber link (2) to the knuckle. Refer to **LINK, CAMBER, INSTALLATION**, **LINK, TOE, INSTALLATION** and **LINK, SPRING, INSTALLATION**.
5. Install the spring. Refer to **SPRING(S), INSTALLATION**.
6. Remove the support from the spring link.
7. Install the brake rotor and brake caliper assembly. Refer to **ROTOR, BRAKE, INSTALLATION** .

NOTE: **Always install a new hub nut. The original hub nut is one-time use only and must be discarded when removed.**

8. If equipped with halfshaft, install a **NEW** hub nut and while a helper applies the brakes, tighten the nut to specifications. Refer to **SPECIFICATIONS**.

Fig. 10: Correct Hub Nut Staking
Courtesy of CHRYSLER GROUP, LLC

NOTE: Do not use air tools on staking tool while staking hub nut.

9. Using (special tool #10287, Tool, Front Hub Staking) align the leading cutting edge of tool with the top left side channel on axle as shown (1). Tighten fastener on staking tool with hand tools until the threads bottom out completely.

NOTE: The hub nut must be staked so that it looks similar to. Both edges must be split and bent into the shape shown (3). The staking must be in the opposite direction from the forward rotation of the wheel.

0508006463

Fig. 11: Identifying Lower Shock, Nuts & Bolts
Courtesy of CHRYSLER GROUP, LLC

10. Connect the lower shock (1) from knuckle. Refer to **SHOCK ABSORBER, SUSPENSION, INSTALLATION**.

1715005817

Fig. 12: Removing/Installing Rear Wheel Speed Sensor
Courtesy of CHRYSLER GROUP, LLC

11. Install wheel speed sensor (5) into knuckle.
12. Install the retaining bolt (6) and tighten to specifications. Refer to **SPECIFICATIONS** .
13. Install the wheel and tire assembly. Refer to **INSTALLATION** .
14. Remove the supports and lower the vehicle.

HUB AND BEARING

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - HUB AND BEARING - NOISE

NOTE: The wheel bearing is designed to last for the life of the vehicle and requires no type of periodic maintenance.

Bearings will produce noise if worn or damaged. The noise will generally change when the bearings are loaded. A road test of the vehicle is normally required to determine if there is a bearing noise, or if it may be some other component, and to assist in finding the location. The following procedure, together with the **DIAGNOSTIC CHART** , should help determine the proper cause. Note that if a particular vehicle road test maneuver, steering to the right for instance, results in noise only part of the time, it is not likely a faulty bearing. Bearing noises are not typically intermittent.

NOTE: Damaged bearing seals and the resulting excessive grease loss may also require bearing replacement. Moderate grease seepage from the bearing is considered normal and should not require replacement of the wheel bearing. Wheel bearings are designed to last the life of the vehicle and require no type of periodic maintenance. To diagnose the hub, measure hub runout. Refer to ROTOR, BRAKE, DIAGNOSIS AND TESTING .

DIAGNOSTIC PROCEDURE:

1. Perform drive evaluation. Find a smooth level road surface void of traffic or obstructions. Turn off any accessories which may cause background noise. Evaluate for noise at 50 km/h (30 mph) and 100 km/h (60 mph) and with vehicle in neutral to eliminate potential drivetrain noises. With vehicle at a constant speed, steer back and forth to left and right (approximately 45 degree steering input each way). This will load and unload the bearings and may change the noise level. When bearing damage is slight, the noise is sometimes noticeable at lower speeds and at other times is more noticeable at higher speeds.
2. Drive evaluation results: Noise increase when turning right may indicate a problem with the left bearing. Noise increase when turning left may indicate a problem with the right bearing.
3. Put vehicle up on hoist. Grab the tire by pushing in on the top center and pulling out on the bottom center to check for excessive movement in the bearing.
4. Check for potential rubbing on rotating components, such as rotor splash shields, heat shields touching propshaft or halfshaft, wheel well liners contacting tire, wheel cover on wheel, etc. Any cyclic noise (once per wheel revolution for example) is not likely a wheel bearing fault.
5. Remove the wheel and tire assembly, disc brake caliper and brake rotor. Refer to **ROTOR, BRAKE,**

DIAGNOSIS AND TESTING .

6. Rotate the wheel hub, checking for resistance or roughness.
7. Any roughness or resistance to rotation may indicate dirt intrusion or a failed hub bearing. If the bearing exhibits any of these conditions, the hub & bearing will require replacement. Do not attempt to disassemble the bearing for repair.
8. Rotate the wheel hub, utilize Chassis Ears (or equivalent) to check for noise.
9. If none of the above checks indicate a bearing failure, refer to the **DIAGNOSTIC CHART** for other possible causes.

DIAGNOSTIC CHART - HUB & BEARING

CONDITION	POSSIBLE CAUSES	POTENTIAL CORRECTIONS
FRONT END WHINE ON TURNS	1. Low Power Steering Fluid Level (if applicable)	1. Fill power steering fluid reservoir to proper level, check for leaks (make sure all air is bled from system fluid)
	2. Worn Tires and/or Incorrect Wheel Alignment	2. Replace Tires, Check And Reset Wheel Alignment
	3. Defective Wheel Bearing	3. Replace Wheel Bearing
	4. Wrong Power Steering Fluid (if applicable)	4. Replace With Correct Power Steering Fluid
FRONT END GROWL OR GRINDING ON TURNS	1. Loose Wheel Lug Nuts	1. Verify Wheel Lug Nut Torque
	2. Engine Mount Grounding Against Frame Or Body Of Vehicle	2. Check For Engine Mount Hitting Frame Rail And Reposition Engine As Required
	3. Worn Tires and/or Incorrect Wheel Alignment	3. Replace Tires, Check and Reset Wheel Alignment
	4. Defective Wheel Bearing	4. Replace Wheel Bearing
	5. Worn or Broken C/V Joint	5. Replace C/V Joint
	6. Engine Not Centered, Causing Axle Half Shaft to Bottom Out	6. Center the Engine
POPPING/CLICKING/SNAPPING DURING ACCELERATION AFTER DRIVE-TO-REVERSE SHIFT, REVERSE-TO-DRIVE SHIFT OR WHILE TURNING	1. Insufficient Hub Nut Torque	1. Torque Hub Nut to Spec
	2. Insufficient Grease on Mating Surface of Axle Half Shaft Outer C/V Joint to Wheel Hub/Bearing, or Worn/Damaged Gasket	2. Separate Half Shaft From Hub and Bearing and Wipe Mating Surfaces Clean. Apply Light Coating of Wheel Bearing Grease to C/V Joint Surface and Reassemble, or Replace Gasket. Torque Hub

		Nut to Spec
WHINE/HUM/ROAR WITH VEHICLE GOING STRAIGHT AT A CONSTANT SPEED	1. Worn Tires and/or Incorrect Wheel Alignment 2. Defective Wheel Bearing	1. Replace Tires and Reset Wheel Alignment 2. Replace Wheel Bearing
GROWL OR GRINDING WITH VEHICLE GOING STRAIGHT AT A CONSTANT SPEED	1. Engine Mount Grinding Against Frame or Body 2. Defective Wheel Bearing 3. Worn or Broken C/V Joint	1. Check and Reposition Engine as Required 2. Replace Wheel Bearing 3. Replace C/V Joint

REMOVAL

REMOVAL

NOTE: Before proceeding, refer to WARNING.

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove the wheel mounting bolts, then the tire and wheel assembly.

Fig. 13: Hub Nut & Halfshaft
Courtesy of CHRYSLER GROUP, LLC

3. Using a suitable punch, lift the two staked areas in the hub nut to avoid damaging the halfshaft (if equipped).
4. While a helper applies the brakes to keep the hub from rotating, remove the hub nut (1) from the halfshaft

(if equipped) (2) and discard it.

The used hub nut is not reusable.

5. Access and remove the rear brake rotor. Refer to **ROTOR, BRAKE, REMOVAL** .

1715005817

Fig. 14: Removing/Installing Rear Wheel Speed Sensor
Courtesy of CHRYSLER GROUP, LLC

6. Remove the rear wheel speed sensor retaining bolt (6) and remove the sensor (5) from the knuckle.

1715005821

Fig. 15: Removing Caliper Bracket Mounting Bolts And Mounting Bracket
Courtesy of CHRYSLER GROUP, LLC

7. Remove the four bolts (1) fastening the hub and bearing to the knuckle.

NOTE: The bolts are one time use and need to be discarded.

8. Slide the hub and bearing off the halfshaft (if equipped) and out of the knuckle.

INSTALLATION

INSTALLATION

1715005821

Fig. 16: Removing Caliper Bracket Mounting Bolts And Mounting Bracket
Courtesy of CHRYSLER GROUP, LLC

1. Slide the hub and bearing onto the half shaft (if equipped) and install into the knuckle.
2. Install four **NEW** mounting bolts (1). Refer to **SPECIFICATIONS** and tighten to specifications.

1715005817

Fig. 17: Removing/Installing Rear Wheel Speed Sensor
Courtesy of CHRYSLER GROUP, LLC

3. Install the rear wheel speed sensor (5) in the knuckle.
4. Install the retaining bolt (6) and tighten to specifications. Refer to **SPECIFICATIONS** .

NOTE: Always install a new hub nut. The original hub nut is one-time use only and must be discarded when removed.

5. Install the rear brake rotor. Refer to **ROTOR, BRAKE, INSTALLATION** .
6. Install a **NEW** hub nut and while a helper applies the brakes, tighten the nut to specifications. Refer to **SPECIFICATIONS**.

Fig. 18: Correct Hub Nut Staking
Courtesy of CHRYSLER GROUP, LLC

NOTE: Do not use air tools on staking tool while staking hub nut.

7. Using (special tool #10287, Tool, Front Hub Staking) align the leading cutting edge of tool with the top left side channel on axle as shown (1). Tighten fastener on staking tool with hand tools until the threads bottom out completely.

NOTE: The hub nut must be staked so that it looks similar to Fig. 2. Both edges must be split and bent into the shape shown (3). The staking must be in the opposite direction from the forward rotation of the wheel.

8. Install the wheel and tire assembly. Refer to **INSTALLATION** .
9. Lower the vehicle.
10. Pump the brake pedal several times to ensure the vehicle has a firm brake pedal before moving the vehicle.

LINK, STABILIZER BAR

REMOVAL

REMOVAL

Fig. 19: Identifying Spring Link, Camber Link, Nuts & Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Hold the stabilizer bar link stud stationary and remove the lower nut (5) securing the link.

1715005806

Fig. 20: Identifying Stabilizer Bar Link & Upper Nut
Courtesy of CHRYSLER GROUP, LLC

3. Hold the stabilizer bar link stud stationary and remove the upper nut (1) securing the link (2).
4. Remove the stabilizer bar link (2).

INSTALLATION

INSTALLATION

1715005806

Fig. 21: Identifying Stabilizer Bar Link & Upper Nut
Courtesy of CHRYSLER GROUP, LLC

1. Install the stabilizer link (2) upper stud in the end of the stabilizer bar from the outboard side. Install the nut (1) on the upper stud and while holding the stabilizer link stud stationary, tighten the nut to specifications. Refer to **SPECIFICATIONS**.

1715005823

Fig. 22: Identifying Spring Link, Camber Link, Nuts & Bolts

Courtesy of CHRYSLER GROUP, LLC

2. Attach the stabilizer bar link to the spring link (6). Install the nut (5) and while holding the stabilizer bar link lower stud stationary, tighten the nut (5) to specification. Refer to **SPECIFICATIONS**.
3. Lower the vehicle.

SHOCK ABSORBER, SUSPENSION

REMOVAL

REMOVAL

NOTE: Before proceeding, refer to WARNING.

0508006463

Fig. 23: Identifying Lower Shock, Nuts & Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove the wheel mounting bolts, then the rear tire and wheel assembly.
3. Remove the wheel house splash shield. Refer to **SHIELD, SPLASH, REAR WHEELHOUSE, REMOVAL** .
4. Support the rear suspension with a jack stand or equivalent.
5. Remove the bolt (4) securing the lower end of the shock assembly (1) to the lower knuckle assembly.

Fig. 24: Upper Shock Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

6. Remove the upper shock mounting bolts (1) and remove the shock from the vehicle.

DISASSEMBLY

DISASSEMBLY

Fig. 25: Identifying Pliers On Chrome Machined Surface Of Shock/Strut Rod

Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not use any type of pliers on the chrome machined surface of shock/strut rod to assist in the disassembly/assembly of shocks or struts. Use only tools designed to hold the shock/strut rod stationary when servicing shock or strut components.

NOTE: View is typical

NOTE: The shock assembly must be removed from the vehicle for it to be disassembled and assembled. Refer to SHOCK ABSORBER, SUSPENSION, REMOVAL.

171069591

Fig. 26: Retaining Nut, Upper Shock Mount, Dust Shield & Shock Body
Courtesy of CHRYSLER GROUP, LLC

1. Remove the retaining nut (1) using the appropriate shock absorber tool kit.
2. Remove the upper shock mount (2).
3. Remove the dust shield (3) from the shock body (4).
4. Perform the inspection procedure below:
   - Inspect the shock absorber (damper) (4) for shaft binding over the full stroke of the shaft.
   - Inspect the dust shield (3) for cracks and tears.
   - Check the upper mounting bracket (2) for cracks and distortion
5. For reassembly, refer to **SHOCK ABSORBER, SUSPENSION, ASSEMBLY**.

ASSEMBLY

ASSEMBLY

Fig. 27: Identifying Pliers On Chrome Machined Surface Of Shock/Strut Rod
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not use any type of pliers on the chrome machined surface of shock/strut rod to assist in the disassembly/assembly of shocks or struts. Use only tools designed to hold the shock/strut rod stationary when servicing shock or strut components.

NOTE: View is typical

171069591

Fig. 28: Retaining Nut, Upper Shock Mount, Dust Shield & Shock Body
Courtesy of CHRYSLER GROUP, LLC

1. Place the dust shield (3) over the shock body (4).
2. Install the upper shock mount (2) and install the retaining nut (1). Using the appropriate shock absorber tool kit, tighten the nut to 30 N.m (22 ft. lbs.).
3. Install the shock in the vehicle. Refer to **SHOCK ABSORBER, SUSPENSION, INSTALLATION**.

INSTALLATION

INSTALLATION

Fig. 29: Upper Shock Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Use a jack stand or equivalent to raise the suspension into position.
2. Install the shock upper mount to the body and install the upper mounting bolts (1) and tighten to specifications. Refer to **SPECIFICATIONS**.

Fig. 30: Identifying Lower Shock, Nuts & Bolts
Courtesy of CHRYSLER GROUP, LLC

3. Position the lower end of the shock (1) to the knuckle assembly.
4. Install the lower retaining bolt (4) and tighten to specifications. Refer to **SPECIFICATIONS**.
5. Install the wheel house splash shield. Refer to **SHIELD, SPLASH, REAR WHEELHOUSE, INSTALLATION** .
6. Install the tire and wheel assembly. Refer to **INSTALLATION** .
7. Lower the vehicle.

SPRING(S)

REMOVAL

REMOVAL

1715005806

Fig. 31: Identifying Stabilizer Bar Link & Upper Nut
Courtesy of CHRYSLER GROUP, LLC

NOTE: Before proceeding, refer to WARNING.

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove the wheel mounting bolts, then the rear tire and wheel assembly.
3. Hold the upper stud stationary and remove the stabilizer link nut (1).
4. Separate the stabilizer link (2) from the stabilizer bar.

1715005823

Fig. 32: Identifying Spring Link, Camber Link, Nuts & Bolts
Courtesy of CHRYSLER GROUP, LLC

5. Support the suspension with a jack stand or equivalent.
6. Remove the spring link bolt (4) and separate the spring link (6) from the knuckle.

1715005820

Fig. 33: Identifying Coil Spring

Courtesy of CHRYSLER GROUP, LLC

7. Slowly lower the jack stand and remove the coil spring (1).
8. If replacing the spring, remove the spring isolators from the top and bottom of the spring.

INSTALLATION

INSTALLATION

Fig. 34: Identifying Lower End Of Spring & Spring Isolator
Courtesy of CHRYSLER GROUP, LLC

NOTE: When installing the spring, the lower end of the spring (1) and the spring isolator orientation feature (2) must be aligned as shown. The lower end of the spring is always outboard.

NOTE: The label on the spring is always closest to the top isolator.

1. If spring isolators were removed or a new spring is being installed, place spring isolator on each end of spring.

1715005820

Fig. 35: Identifying Coil Spring
Courtesy of CHRYSLER GROUP, LLC

2. Place the coil spring (1) on top of the spring link perches.

1715005823

Fig. 36: Identifying Spring Link, Camber Link, Nuts & Bolts
Courtesy of CHRYSLER GROUP, LLC

3. Use a jack stand or equivalent to raise the suspension into place.
4. Position the spring link (6) in the installed position and install the bolt (4). Do not tighten to specification at this time.

1715005806

Fig. 37: Identifying Stabilizer Bar Link & Upper Nut
Courtesy of CHRYSLER GROUP, LLC

5. Install the stabilizer link (2) stud to the stabilizer bar and install the retaining nut (1).
6. While holding the stabilizer link stud stationary, tighten the nut to specifications. Refer to **SPECIFICATIONS**.
7. Install the tire and wheel assembly. Refer to **INSTALLATION** .
8. Lower the vehicle to normal ride height and tighten the spring link to the lower knuckle assembly bolt to specifications. Refer to **SPECIFICATIONS**.
9. Check for proper vehicle curb height. Refer to **WHEEL ALIGNMENT, STANDARD PROCEDURE** .

STABILIZER BAR, REAR SUSPENSION

REMOVAL

REMOVAL

1715005806

Fig. 38: Identifying Stabilizer Bar Link & Upper Nut
Courtesy of CHRYSLER GROUP, LLC

NOTE: Before proceeding, refer to WARNING.

NOTE: The stabilizer cushions are not serviced separately. If they require replacement, the entire stabilizer bar must be replaced.

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. On each side of the vehicle, while holding the stabilizer bar link studs stationary, remove the nuts (1) securing the link (2) to the stabilizer bar.

0508006461

Fig. 39: Identifying Stabilizer Bar, Crossmember, Brackets & Fasteners
Courtesy of CHRYSLER GROUP, LLC

3. On each side of the vehicle, remove the screws (1) securing the brackets (3) to the crossmember and remove brackets.
4. On each side of the vehicle, remove the upper and lower screws (5) securing the stabilizer bar (2) to the crossmember.
5. Remove the stabilizer bar (2) from the vehicle.

INSTALLATION

INSTALLATION

0508006461

Fig. 40: Identifying Stabilizer Bar, Crossmember, Brackets & Fasteners
Courtesy of CHRYSLER GROUP, LLC

1. Position the stabilizer bar (2) on the rear crossmember.
2. Install the upper and lower retaining screws (5) in the mounting holes. Do not tighten the screws at this time.

1715005806

Fig. 41: Identifying Stabilizer Bar Link & Upper Nut
Courtesy of CHRYSLER GROUP, LLC

3. On each side of the vehicle, install the stabilizer link (2) studs, one in the in the end of the stabilizer bar and one in the lower mounting location. Install the nut (1) on each end and while holding the stabilizer link stud stationary, tighten each nut to specifications. Refer to **SPECIFICATIONS**.
4. On each side of the vehicle, tighten the stabilizer bar to crossmember retainer screws (1). Refer to **SPECIFICATIONS**.

0508006461

Fig. 42: Identifying Stabilizer Bar, Crossmember, Brackets & Fasteners
Courtesy of CHRYSLER GROUP, LLC

5. On each side of the vehicle, install the brackets (3) and the screws (1) securing the brackets to the crossmember.
6. Lower the vehicle.

LINK, CAMBER

DESCRIPTION

DESCRIPTION

Fig. 43: Identifying Toe Link, Nuts & Bolts
Courtesy of CHRYSLER GROUP, LLC

The camber link (1) is connected between the cradle and the front of the knuckle with a bonded bushing on each end. The bushings are serviced with a new link only. On the knuckle side of the link, the bushing is not between two parts of a bracket. Because of this the bolt (2) has a captive washer that will hold the bushing/link in place if the bonding were to separate from the link. Make sure that the proper bolts and nuts are used when servicing.

REMOVAL

REMOVAL

Fig. 44: Identifying Toe Link, Nuts & Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove the camber link to cradle bolt/nut (2), the camber link to knuckle bolt/nut (2) and remove the camber link (1) from the vehicle.

INSTALLATION

INSTALLATION

Fig. 45: Identifying Toe Link, Nuts & Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Position the camber link (1) and install the camber link to knuckle bolt/nut (2) and camber link to cradle cam bolt/nut (2). Do not tighten.
2. Using a suitable holding fixture, support the outboard end of the spring link and lift it to normal ride height.
3. Tighten the camber link to knuckle bolt/nut to specifications. Refer to **SPECIFICATIONS**.
4. Tighten the camber link to cradle bolt/nut to specifications. Refer to **SPECIFICATIONS**.
5. Remove the spring link holding fixture.
6. Lower the vehicle.

LINK, TOE

DESCRIPTION

DESCRIPTION

1715005823

Fig. 46: Identifying Spring Link, Camber Link, Nuts & Bolts
Courtesy of CHRYSLER GROUP, LLC

The toe link (2) is connected between the cradle and the middle of the knuckle with a bonded bushing on the cradle side end. The bushing is serviced with a new link only. On the cradle side of the link a cam bolt (1) is used for alignment purposes. On the knuckle side of the link, the bushing is on the knuckle and is between the two parts of the toe link. Make sure that the proper bolts and nuts are used when servicing.

REMOVAL

REMOVAL

1715005823

Fig. 47: Identifying Spring Link, Camber Link, Nuts & Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove the wheel.

NOTE: Mark the position of the cam nut/bolt on the cradle side for installation.

3. Remove and discard the toe link to cradle bolt/nut (1) and the toe link to knuckle bolt/nut (3) and remove the toe link (2) from the vehicle.

INSTALLATION

INSTALLATION

Fig. 48: Identifying Spring Link, Camber Link, Nuts & Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Position the toe link (2) and install a **New** link to knuckle bolt/nut (3). Do not tighten.

NOTE: Always use new fasteners

2. Install a **New** toe link to cradle cam bolt/nut (1). Do not tighten.
3. Using a suitable holding fixture, support the outboard end of the spring link and lift it to normal ride height.
4. Tighten the toe link to knuckle bolt/nut (3) to specifications. Refer to **SPECIFICATIONS**.

NOTE: Position the cam as close to removal marking as possible to aid in alignment.

5. Tighten the toe link to cradle cam bolt/nut (1) to specifications. Refer to **SPECIFICATIONS**.
6. Remove the spring link holding fixture.
7. Install the wheel. Refer to **INSTALLATION** .
8. Remove the supports and lower the vehicle.
9. Perform an alignment. Refer to **WHEEL ALIGNMENT, STANDARD PROCEDURE** .

LINK, SPRING

REMOVAL

REMOVAL

YouTube	A multimedia supplement to the instructions contained in this article is available. To view the multimedia example of the condition described go to; **http://www.youtube.com/user/Mitchell1Tips** **then type "A00641397.vid1" into the "Search Channel" box.**

1715005823

Fig. 49: Identifying Spring Link, Camber Link, Nuts & Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: On four wheel drive models, the spring link to cradle bolt (7) will contact the rear differential unit when attempting to remove it. To remove it, partially remove the bolt, cut it in half, then remove the remaining portion of the bolt. Install the new bolt and cam nut in the opposite direction from which it was removed.

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove the wheel mounting bolts then the tire and wheel assembly.
3. Support the spring link with a jack stand or equivalent.
4. While holding the lower stud stationary, remove the lower stabilizer link nut (5) and separate the link from the spring link.

NOTE: Mark the location of the outer mounting bolt (4) with a grease pencil or equivalent to mark the position to help during installation and rear wheel alignment.

5. Remove and discard the bolt/nut (4) from the spring link (6).

1715005820

Fig. 50: Identifying Coil Spring
Courtesy of CHRYSLER GROUP, LLC

6. Slowly lower the jack stand or equivalent and remove the rear spring (1) from the vehicle while separating the spring link from the knuckle.

1715005823

Fig. 51: Identifying Spring Link, Camber Link, Nuts & Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Mark the location of the inner mounting bolts (7) with a paint marker or equivalent. The marked location will be used during installation to make sure the rear alignment is not changed.**

7. Remove and discard the spring link bolt/nut (7) from the spring link.

INSTALLATION

INSTALLATION

Fig. 52: Identifying Lower End Of Spring & Spring Isolator
Courtesy of CHRYSLER GROUP, LLC

NOTE: **When installing the spring, the lower end of the spring (1) and the spring isolator orientation feature (2) must be aligned as shown. The lower end of the spring is always outboard.**

NOTE: **The label on the spring is always closest to the top isolator.**

1715005823

Fig. 53: Identifying Spring Link, Camber Link, Nuts & Bolts

Courtesy of CHRYSLER GROUP, LLC

1. Position the spring link (6) to the mount.

NOTE: On four wheel drive models, install the spring link to cradle bolt in the opposite direction from which it was removed.

2. Install a **NEW** bolt/nut (7), but do not tighten to specification at this time. Support the spring link with a jack stand or equivalent.

1715005820

Fig. 54: Identifying Coil Spring
Courtesy of CHRYSLER GROUP, LLC

3. Install the rear spring (1) into the vehicle.

1715005823

Fig. 55: Identifying Spring Link, Camber Link, Nuts & Bolts
Courtesy of CHRYSLER GROUP, LLC

4. While raising the jack stand or equivalent, attach the spring link (6) to the knuckle.
5. Install a **NEW** bolt/nut (4) but do not tighten to specification at this time.

1715005823

Fig. 56: Identifying Spring Link, Camber Link, Nuts & Bolts

Courtesy of CHRYSLER GROUP, LLC

6. Install the stabilizer link to the spring link.
7. Hold the stabilizer stud stationary and tighten the retaining nut to specifications. Refer to **SPECIFICATIONS**.
8. Install the tire and wheel assembly. Refer to **INSTALLATION** .
9. Lower vehicle to normal ride height. Tighten the spring link to knuckle and the spring link to cradle fasteners to specifications. Refer to **SPECIFICATIONS**.
10. Perform wheel alignment as necessary. Refer to **WHEEL ALIGNMENT, STANDARD PROCEDURE** .

LINK, TRAILING, REAR

REMOVAL

REMOVAL

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove the wheel mounting bolts, then the tire and wheel assembly.

Fig. 57: Identifying Toe Link, Trailing Link, Knuckle, Nuts & Bolts
Courtesy of CHRYSLER GROUP, LLC

3. Remove the routing clips attached to the trailing link (3).
4. Remove the three bolts (4) securing the knuckle to the trailing link (3).

Fig. 58: Identifying Trailing Link & Bolts
Courtesy of CHRYSLER GROUP, LLC

5. Remove the two bolts (1) fastening the leading end of the trailing link (2) to the body.
6. Remove the trailing link.

INSTALLATION

INSTALLATION

Fig. 59: Identifying Toe Link, Trailing Link, Knuckle, Nuts & Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Position the trailing link (3) and install the three bolts (4) securing the trailing link to the knuckle. Tighten the mounting bolts to specifications. Refer to **SPECIFICATIONS**.

Fig. 60: Identifying Trailing Link & Bolts
Courtesy of CHRYSLER GROUP, LLC

2. Position the forward end of the trailing link (2) on the body and install the two mounting bolts (1). Do not tighten the bolts at this time.
3. Using a suitable holding fixture, support the outboard end of the spring link and lift it to normal ride height.
4. Tighten the two mounting bolts (1) fastening the leading end of the trailing link (2) to the body to specifications. Refer to **SPECIFICATIONS**.
5. Remove the lower control arm holding fixture.
6. Install the routing clips attached to the trailing link.
7. Install tire and wheel assembly. Refer to **INSTALLATION** .
8. Lower the vehicle.

2014 SUSPENSION

Tires & Wheels - Service Information - Cherokee

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - TIRE AND WHEEL VIBRATION

Tire and wheel imbalance, runout and tire road force variation can cause vehicles to exhibit steering wheel vibration and/or seat vibration.

VISUAL INSPECTION

Visual inspection of the vehicle is recommended prior to road testing or performing any other procedure. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .

Inspect for the following:

- Verify correct (OEM) wheel and tire, as well as presence of wheel weights.
- Inspect tires and wheels for damage, mud packing and unusual wear; correct as necessary.
- Check and adjust tire air pressure to the pressure listed on the label attached to the driver's door opening.

ROAD TEST

NOTE: If a Noise & Vibration Analyzer is available, use it to diagnosis the issue during the road test.

NOTE: If the vehicle has been sitting for an extended period of time it is recommended to drive to warm the tires. This process could eliminate flat spots that can cause vibration.

Road test vehicle on a smooth road **at and near the designated speed** where legal speed limits allow. Lightly place hands on steering wheel at the 10:00 and 2:00 positions and observe for:

- Steering wheel oscillation: clockwise/counterclockwise
- Steering wheel high frequency movement: rapid vibration up and down
- Seat high frequency movement: rapid vibration up and down

To rule out vibrations due to brakes or powertrain:

- Lightly apply brakes at the designated speed; if vibration occurs or is enhanced, vibration is likely due to a brake concern.
- Shift transmission into neutral while vibration is occurring; if vibration is eliminated, vibration is likely due to a powertrain concern. Refer to **DIAGNOSIS AND TESTING** for additional information.

TIRE/WHEEL BALANCE AND ROAD FORCE VARIATION

NOTE: If wheel balance equipment is capable of testing tire road force variation and the tire/wheel assemblies are within specification, place the tires with the greater road force variation on the rear of the vehicle.

Balance the tire and wheel assemblies as necessary, and if wheel balance equipment is capable, also test for tire and wheel runout and road force variation following the wheel balancer manufacturer's instructions and using the information listed in Tire And Wheel Balance. Refer to **STANDARD PROCEDURE**. Repeat the road test above to verify the vibration is repaired.

STANDARD PROCEDURE

TIRE AND WHEEL BALANCE

NOTE: Always verify the wheel and tire balance before removing any wheel weights. If assembly is within specification and weights are not corroded or loose, do not remove weights. The process of removing and adding weight could damage wheel protective coating.

NOTE: Balance and road force variation equipment must be calibrated and maintained per equipment manufacturer's specifications.

NOTE: If a tire sealant & inflator kit was used to temporarily repair small punctures then the tire must be removed from wheel and all the sealant must be removed with a water damped cloth before repairing & balancing the assembly.

NOTE: Some wheels may not have an outer flange. Apply adhesive weights on midplane surface to balance.

24801P3

Fig. 1: Balancing Wheels Using Cone/Collet
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Use of the proper collet will prevent potential damage to the Chrome Clad wheels.**

NOTE: **Balance equipment could read an incorrect balance result when measuring Chrome Clad wheels. This is caused by the equipments mounting cone/collet contacting the cladding or the cone/collet is not balanced. A dual-taper collet (1) type wheel centering tool is recommended as opposed to a high-taper cone (2) type wheel centering tool. Always use the manufacturer's recommended balance equipment.**

- **Dual-taper collet type (1)**
- **High-taper cone type (2)**
- **Possible obstruction (3)**
- **May not seat properly (4)**
- **No obstruction (5)**
- **Properly seated (6)**

NOTE: **If wheel balance equipment is capable of testing tire road force variation and the tire/wheel assemblies are within specification, place the tires with the greater road force variation on the rear of the vehicle.**

Fig. 2: Dynamic Balancing
Courtesy of CHRYSLER GROUP, LLC

For dynamic balancing (**recommended**), the balance equipment is designed to indicate the location and amount of weight to be applied to both the inner and outer rim flanges (2).

Fig. 3: Static Balancing
Courtesy of CHRYSLER GROUP, LLC

For static balancing (**not recommended**), find the location of the heavy spot causing the imbalance (1). Counter balance the wheel directly opposite the heavy spot. Determine weight required to counterbalance the area of imbalance. Place half of this weight on the **inner** rim flange and the other half on the **outer** rim flange (3) at the predetermined spots.

Aluminum wheels use a different type wheel weight than steel wheels. Be sure to use the correct wheel weight for the wheel type.

Always verify the balance. When using off-vehicle equipment, remount the tire and wheel assembly 180 degrees on the balancer spindle and recheck balance. Balance variation from one spot to the other should not be more than 0.125 (?) ounce. If variation is more than 0.125 ounce, balancing equipment could be malfunctioning, or the wrong collet/cone may have been used.

If difficult to balance, break down the tire and wheel assembly and check for loose debris inside the tire. Prior to disassembly, mark (index) the tire at the valve stem. Use this mark in order to remount the tire in its original orientation with respect to the wheel.

TIRE AND WHEEL ROTATION

NOTE: Refer to the Owner's Manual for rotation schedules.

NON-DIRECTIONAL TREAD PATTERN TIRES

Fig. 4: Forward-Cross Tire Rotation Method
Courtesy of CHRYSLER GROUP, LLC

Tires on the front and rear operate at different loads and perform different steering, driving, and braking functions. For these reasons they wear at unequal rates and tend to develop irregular wear patterns. These effects can be reduced by rotating the tires at regular intervals. The benefits of tire rotation are:

- Increase tread life
- Maintain traction levels
- A smooth, quiet ride

The suggested method of tire rotation is shown in this graphic. Other rotation methods can be used, but they will not provide all the tire longevity benefits.

CAUTION: Only the four-tire rotation may be used on vehicles equipped with tire pressure monitoring (TPM) due to sensors being present in the four road wheels and not in the spare.

NOTE: Only the four-tire rotation method may be used if the vehicle is equipped with a compact or temporary spare tire.

DIRECTIONAL TREAD PATTERN TIRES

Some vehicles may be fitted with special high-performance tires having a directional tread pattern. These tires are designed to improve traction on wet pavement. To obtain the full benefits of this design, the tires must be installed so that they rotate in the correct direction. This is indicated by arrows on the tire sidewalls.

When being installed, extra care is needed to ensure that this direction of rotation is maintained.

REMOVAL

REMOVAL

1. Raise and support the vehicle so that tire and wheel assembly clears ground level. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove the five wheel mounting (lug) bolts.
3. Remove the tire and wheel assembly from the hub.

INSTALLATION

INSTALLATION

WARNING: **Installing wheels without good metal-to-metal contact with the mounting surface could cause loosening of the wheel mounting (lug) bolts. This could adversely affect the safety and handling of the vehicle.**

1. Never use oil or grease on studs or wheel mounting (lug) bolts.

   Clean the wheel mounting surfaces, removing any build-up of corrosion. It is important to have good metal-to-metal contact between the wheel and vehicle.

2. Install and lightly snug all five wheel mounting (lug) bolts. **Do not tighten at this time** .
3. Remove the support and lower the vehicle.
4. Progressively tighten all the wheel mounting (lug) bolts in a star pattern to the proper specification. Refer to **SPECIFICATIONS** .

TIRE PRESSURE MONITORING

DESCRIPTION

DESCRIPTION

The Tire Pressure Monitoring (TPM) system monitors air pressure in the four road tires (excludes spare). Pressure in the spare tire is monitored incase of a matching spare with sensor. Sensor transmissions occur if there is significant change in pressure. RFHM has to be awake when sensor transmits to monitor spare pressure.

The TPM system consists of tire pressure monitoring sensors attached to each road wheel through the valve stem mounting hole, an electronic display, and an indicator lamp. The system communicates through the RF Hub Module.

The receiver circuit for the TPM system is integrated into the RF Hub. The RF Hub decodes the RF signals transmitted by each of the vehicle's tire pressure sensors. The decoded information is used to determine if "warning" or "fault" conditions exist within the TPM system.

Upon detection of a warning or fault condition, the RF Hub will send a request to the module that controls the indicator lamp and the text display via the vehicle bus system to illuminate or flash the indicator lamp. Also, upon detection of a warning or fault condition, the electronic display will send a request to sound the "chime".

The RF Hub will store all warning and fault conditions, placard pressure values and low-pressure threshold values (lamp ON and OFF) in memory that can be accessed through diagnostic communication. If new sensors are introduced to the vehicle, the data stored for the sensor being replaced will be deleted.

The RF Hub will store all wheel sensor IDs and locations and faults in memory that can be accessed through diagnostic communication. All other data values transmitted from each active wheel sensor shall be stored in the RF Hub memory.

The RF Hub automatically learns and stores the sensor IDs while driving "within 20 minutes continuously above 20 mph (32 km/h)" after a sensor has been replaced. The learning sequence will initiate when the vehicle has been stopped for more than 20 minutes.

NOTE: A new sensor ID can also be programmed directly into the RF Hub by using a RKE-TPM Analyzer in conjunction with a Scan Tool. Once the new sensor ID has been programmed, the RKE-TPM Analyzer can be used to update the TPMS by activating the sensor.

OPERATION

OPERATION

TIRE PRESSURE MONITORING

The tire pressure monitoring system (TPMS) is designed to operate without loss of function for all OEM tire construction for this vehicle. Sensors, mounted to each road wheel as part of the valve stem, transmit an RF signal indicating their individual pressure to a receiver located in the Radio Frequency (RF) Hub. Refer to **SENSOR, TIRE PRESSURE MONITORING (TPM), OPERATION**.

If the TPM system detects that the tire pressure in any road tire is low, beyond the Low Pressure (lamp) ON threshold (see placard table below), the TPM system will continuously illuminate an indicator lamp. If a system fault is detected, the indicator lamp will flash on/off for 75 seconds, then remain on solid.

If the RF Hub detects a warning or fault condition at ignition key "on", the display module will request a chime once per ignition cycle for the first "warning" or "fault" condition detected. A "warning" or "fault" condition will remain enabled until the problem causing the condition is corrected and removed/reset.

The RF Hub shall continuously monitor for the receipt of tire pressure RF message transmissions from the wheel sensors during both the ignition key "on" and key "off" cycles. The wheel sensor ID's and the location of each sensor (e.g. Tire 1, Tire 2 etc.) are stored in the RF Hub non-volatile memory during the initial

Manufacturing Plant Process, or during a service procedure, as required.

The TPM System will continue to warn the driver of low tire pressure as long as the condition exists, and will not turn off the indicator lamp until the tire pressure is at or above the placard. The system will automatically update and the TPM indicator lamp will extinguish once the updated tire pressures have been received.

Tire pressure will vary with temperature by about 1 psi (6.9 kPa) for every 12°F (6.5°C). This means that when the outside temperature decreases, the tire pressure will decrease. Tire pressure should always be set based on cold inflation tire pressure (placard pressure). This is defined as the tire pressure after a vehicle has not been driven for more than 3 hours (and in outside ambient temperature). The tire pressure will also increase as the vehicle is driven; this is normal and there should be no adjustment for this increased pressure. For a system fault, the system will return to normal once the RF Hub receives a valid transmission from that sensor location.

TPM THRESHOLD PRESSURES

The recommended "Placard Pressure" for the tires installed on the vehicle, are stored in the RF Hub non-volatile memory during the initial Manufacturing Plant Process, or during a service procedure, as required. To determine the pressure thresholds for a vehicle, refer to the Tire Inflation Pressure (Placard) Label, and then apply the placard pressure to the following table.

For further information, refer to the Owners Manual or the Appropriate Diagnostic Information.

TPM THRESHOLD PRESSURES

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - TIRE PRESSURE MONITORING

When diagnosing a tire pressure issue, first check the Tire Pressure Monitoring (TPM) indicator lamp in the instrument cluster during ignition key ON. From the OFF position, turn the key to ON and check the TPM indicator lamp to observe one of the following:

- If after 10 seconds the indicator lamp is illuminating continuously (not flashing), proceed to **LOW PRESSURE** .
- If after 10 seconds the indicator lamp flashes on/off for 75 seconds, then remains on solid, there is a system fault detected. Proceed to **SYSTEM FAULT** .

LOW PRESSURE

NOTE: Tire pressure may increase from 2 to 6 psi (14 to 41 kPa) during normal driving conditions. Do NOT reduce this normal pressure build up.

NOTE: Tire pressure will vary with temperature by about 1 psi (6.9 kPa) for every 12°F (6.5°C). This means that when the outside temperature decreases, the tire pressure will also decrease. Tire pressure should always be set based on cold inflation tire pressure. For details, refer to TIRES, STANDARD PROCEDURE.

Check air pressure as necessary in all tires using a known accurate air gauge and adjust to the specification listed on the Tire Inflation Pressure Label (Placard) provided with the vehicle (usually applied to the driver side B-pillar). After adjusting air pressure in a tire on the vehicle, allow approximately two minutes for the message or indicator lamp to go out.

If air pressure in any tire is low, inspect **all** the tires for leaks. A water "dunk tank" or other water test may be used to check for a leak around the sensor as long as any water at the valve core is removed once the procedure is completed. The water can be easily expelled from the core area by pushing in on the core for several seconds, allowing escaping air to drive out any moisture. Reinflate the tire as necessary. Always make sure the original (special) valve stem cap is securely installed to keep moisture out of the sensor.

If the indicator lamp is still ON continuously, refer to the appropriate diagnostic information.

SYSTEM FAULT

If a system fault is detected, a chime will sound, and the TPM indicator lamp will flash for 75 seconds, then remain on solid. For vehicles with TPM Systems, a "SERVICE TIRE PRESSURE MONITORING SYSTEM" (Highline IPC) or "SERVICE TIRE PRESSURE SYSTEM" (Midline IPC) message will appear in the Electronic Vehicle Information Center (EVIC), followed by a graphic display. A system fault can occur by many scenarios, including the following:

- Signal interference due to electronic devices or driving next to facilities emitting the same Radio Frequencies as the TPM sensors.
- Installing some form of aftermarket window tinting that affects radio wave signals.
- Accumulation of snow or ice around the wheels or wheel housings.
- Using tire chains on the vehicle.
- Using wheels not equipped with TPM sensors.

Refer to the appropriate diagnostic information.

SENSOR, TIRE PRESSURE MONITORING (TPM)

CAUTION

CAUTION

CAUTION: The Tire Pressure Monitoring (TPM) system has been optimized for the original equipment tires and wheels. TPM system pressures have been established for the tire size equipped on the vehicle. Undesirable system operation or sensor damage may result when using replacement equipment that is not of the same size, type, or style. Aftermarket wheels can cause sensor damage. Do not use aftermarket tire sealants or balance beads if your vehicle is equipped with TPM, as damage to the sensors may result.

CAUTION: Do not attempt to install a tire pressure sensor in an aftermarket wheel. Use tire pressure sensors in original style factory wheels only. If aftermarket wheels are installed, and therefore do not contain tire pressure sensors, the system will not function properly and the driver will be continuously notified of a system malfunction.

CAUTION: After inspecting or adjusting the tire pressure always reinstall the valve stem cap. This will prevent moisture and dirt from entering the valve stem, which could damage the Tire Pressure Sensor.

CAUTION: Tire pressure sensor valve stem caps and cores are specially designed for

the sensors. Due to risk of corrosion, do not use a standard valve stem cap or core in a tire pressure sensor in place of the original equipment style sensor cap and core.

CAUTION: Any time a sensor is to be installed in a wheel, it is necessary to install a new sensor-to-wheel seal, metal washer and valve stem nut, to ensure air tight sealing.

CAUTION: When installing the valve core, be sure to tighten the core to specifications. Overtightening by a little as three or four inch pounds can damage the sensor.

DESCRIPTION

DESCRIPTION

Fig. 5: Tire Pressure Sensor & Components
Courtesy of CHRYSLER GROUP, LLC

NOTE: Replace the valve stem assembly and tire pressure sensor mounting screw with each tire change.

One tire pressure sensor (1) is mounted to a valve stem (3) specifically designed for mounting the pressure sensor (1) in each wheel in place of the traditional tire valve stem. Each sensor has an internal battery that lasts up to 10 years. The battery is not serviceable. At the time of battery failure, the sensor (1) must be replaced. The TPM system operates on a 433 MHz radio frequency. The tire pressure sensor valve stem (3) looks similar to a standard valve stem with the tire mounted on the wheel.

NOTE: This vehicle uses the 433 MHz TPM sensor. Although 315 MHz and 433 MHz sensors are identical in size and shape, they are not interchangeable. Always make sure the correct sensor is being used. A RKE-TPM Analyzer can be used to determine the sensor's frequency without having to dismount the tire.

The TPM sensors are designed for original style factory wheels. It is not recommended to install a tire pressure sensor in an aftermarket wheel. (This could cause sealing and system performance issues.)

The serviceable components of the tire pressure sensor are:

- Tire pressure sensor (1), including all components below:
- Valve stem (3), including screw (2).
- Valve stem core (not shown).
- Valve stem cap (4)

The valve stem caps and cores used are specifically designed for the tire pressure monitoring sensors. Although similar to standard valve stem caps and cores, they are different. The valve stem cap has a special seal inside to keep moisture and corrosion out. The valve stem core has a special nickel coating to protect from corrosion.

OPERATION

OPERATION

CAUTION: The TPMS has been optimized for the original equipment tires and wheels. TPMS pressures have been established for the tire size equipped on your vehicle. Undesirable system operation or sensor damage may result when using replacement equipment that is not of the same size, type, and/or style. After-market wheels can cause sensor damage. Do not use aftermarket tire sealants or balance beads if your vehicle is equipped with a TPMS, as damage to the sensors may result.

CAUTION: After inspecting or adjusting the tire pressure always reinstall the valve stem cap. This will prevent moisture and dirt from entering the valve stem, which could damage the Tire Pressure Monitoring Sensor.

CAUTION: Tire pressure sensor valve stem caps and cores are specially designed for the sensors. Due to risk of corrosion, do not use a standard valve stem cap or core in a tire pressure sensor in place of the original equipment style sensor cap and core.

CAUTION: Any time a sensor is to be reinstalled in a wheel, a new valve stem assembly must be installed to ensure air tight sealing.

NOTE: TPM thresholds have been established for the original tire size equipped on the

vehicle. Use original size tires only to maintain system accuracy.

The battery operated tire pressure sensor is both a transmitter and a receiver. The TPM sensor can be forced to transmit if using a special tool such as a TPM-RKE Analyzer. The TPM-RKE Analyzer has the ability to change the sensor mode and to diagnose a faulty TPM sensor. Using a TPM-RKE Analyzer can take up to a minute to force a transmission from a sensor.

Each sensor's (transmitter) broadcast is uniquely coded so that the module can monitor the state of each of the sensors on the four rotating road wheels. The module can automatically learn and store the sensor's ID while driving "within 20 minutes continuously above 20 m.p.h. (32 Km/h)" after a sensor has been replaced. The vehicle must be stationary for more then 20 minutes in order to initiate the learning sequence.

The sensor IDs can also be programmed using the TPM-RKE Analyzer Tool. Scan each TPM sensor at each road wheel, and store each Sensor ID in the correct location. (LEFT FRONT, LEFT REAR, RIGHT FRONT, and RIGHT REAR) Connect the TPM-RKE Analyzer Tool to the Scan Tool. Then follow the programming steps outlined in the diagnostic Scan Tool for "Program Tire Pressure Sensor ID w/ TPM Tool".

REMOVAL

REMOVAL

1. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove tire and wheel assembly.

CAUTION: The cap used on this valve stem contains an O-ring seal to prevent contamination and moisture from entering the valve stem. Do not substitute a regular valve stem cap in its place.

Fig. 6: Start Mount/Dismount Tool Within 10 Degrees Of Valve Stem
Courtesy of CHRYSLER GROUP, LLC

3. Dismount tire from wheel following tire changer manufacturers instructions while paying special attention to the following to avoid damaging the pressure sensor:
   a. When breaking the tire bead loose from the wheel rim, avoid using the Bead Breaker in the area of the sensor (1). That includes both outer and inner beads of the tire.
   b. When preparing to dismount the tire from the wheel, carefully insert the mounting/dismounting tool 280° from the valve stem ± 10°, then proceed to dismount the tire from the wheel. Use this process on both outer and inner tire beads.

Fig. 7: Tire Pressure Sensor & Components
Courtesy of CHRYSLER GROUP, LLC

4. Remove the sensor to valve stem retainer screw (2) and remove the sensor (1) from the valve stem (3).
5. Remove the valve stem (3) from the wheel.

INSTALLATION

INSTALLATION

NOTE: **If replacing tire pressure sensor, a new valve stem will be pre-mounted to the sensor as an assembly. Verify that the sensor is positioned properly before seating the valve stem. If replacing a valve stem only (using the existing tire pressure sensor), the new valve stem will include a new tire pressure sensor mounting screw. Always use a new mounting screw when attaching a sensor to a valve stem.**

Fig. 8: Tire Pressure Sensor & Components
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Any time a sensor is to be reinstalled in a wheel, a new valve stem assembly must be installed to ensure air tight sealing.

1. Wipe area clean around sensor/valve stem mounting hole in wheel. Make sure surface of wheel is not damaged.

NOTE: When installing a new valve stem, tire bead lubricant should be used for proper installation.

NOTE: If replacing tire pressure sensor, a new valve stem will be pre-mounted to the sensor as an assembly. Verify that the sensor is positioned properly before seating the valve stem.

2. Insert valve stem (3) through wheel and pull through to seat with standard valve stem installation tool.
3. If replacing the valve stem (3) only (using the existing tire pressure sensor), verify that the flat sides of the brass extension on the bottom of the valve stem (5) are at a 90 degree angle with the wheel. Position the pressure sensor (1) over the brass extension (5), install the retainer screw (2) and tighten to 1.4 N.m (12 in. lbs.).
4. Mount tire on wheel following tire changer manufacturers instructions, paying special attention to the following to avoid damaging tire pressure sensor:

Fig. 9: Mounting Tire Using Rotating Wheel Machine
Courtesy of CHRYSLER GROUP, LLC

a. Rotating Wheel Tire Changers - Once the wheel is mounted to the changer, position the sensor valve stem (2) approximately 280° from the head of the changer (located at 1) in a clockwise direction before rotating the wheel (also in a clockwise direction) to mount the tire. Use this procedure on both the outer and inner tire beads.

Fig. 10: Mounting Tire Using Rotating Tool Machine
Courtesy of CHRYSLER GROUP, LLC

b. Rotating Tool Tire Changers - Position the wheel on the changer so that the sensor valve stem (1) is

located approximately 210° clockwise from the installation end of the mounting/dismounting tool (2) once the tool is mounted for tire installation. Make sure the sensor is clear of the lower bead breaker area (3) to avoid damaging the sensor when the breaker rises. Rotate the tool (2) in a counterclockwise direction to mount the tire. Use this procedure on both the outer and inner tire beads.

c. Adjust air pressure to that listed on Tire Inflation Pressure Label (Placard) provided with vehicle (usually applied to driver's side B-pillar). Make sure **original style** valve stem cap is securely installed to keep moisture out of sensor.
d. Install tire and wheel assembly on the vehicle.
e. Remove the support and lower the vehicle.
f. Perform one of the following to make the system learn the new sensor ID.
g. Use the TPM-RKE Analyzer, 9936, with the Scan Tool to program the RF Hub module with the tire pressure sensor ID. This is part of the TPM Diagnostic Verification Test. Refer to **STANDARD PROCEDURE** .
h. Once the vehicle has remained stationary for more than 20 minutes, drive vehicle for a minimum of 20 minutes while maintaining a continuous speed above 20 mph (32 km/h). During this time, the system will learn the new sensor ID. This is part of the TPM Diagnostic Verification Test. Refer to **STANDARD PROCEDURE** .

NOTE: If a sensor cannot be trained, refer to appropriate diagnostic information.

TIRES

DESCRIPTION

TIRE

Tires are designed and engineered for each specific vehicle. They provide the best overall performance for normal operation. The ride and handling characteristics match the vehicle's requirements. With proper care they will give excellent reliability, traction, skid resistance, and tread life.

Driving habits have more effect on tire life than any other factor. Careful drivers will obtain, in most cases, much greater mileage than severe use or careless drivers. A few of the driving habits which will shorten the life of any tire are:

- Rapid acceleration
- Severe application of brakes
- High-speed driving
- Taking turns at excessive speeds
- Striking curbs and other obstacles
- Operating vehicle with over or under inflated tire pressures

Radial ply tires are more prone to irregular tread wear. It is important to follow the tire rotation interval shown in **TIRE AND WHEEL ROTATION** . This will help to achieve a greater tread-life potential.

TIRE IDENTIFICATION

Tire type, size, load index and speed rating are encoded in the letters and numbers imprinted on the side wall of the tire. Refer to the Tire Identification chart to decipher the code. An All Season type tire will also have either M + S, M AND S or M - S (indicating mud and snow traction) imprinted on the side wall. An Extra or Light Load marking "XL" or "LL" may also be listed on the sidewall.

Fig. 11: Tire Aspect Ratio
Courtesy of CHRYSLER GROUP, LLC

For example purposes, tire size P225/60 R 16 97 T is used in the Tire Identification chart. P stands for Passenger tire. Sectional width (1) is 225mm. Sectional height (2) is 60 percent of sectional width. R represents Radial construction. 16 is the wheel diameter in inches. 97 T is the tire manufacturers load and speed ratings.

TIRE IDENTIFICATION

Reading Tire Codes		
P	TIRE TYPE (Not present on all tires)	P - Passenger
		T - Temporary
		C - Commercial
		LT - Light Truck
225	SECTIONAL WIDTH	SHOWN IN MILLIMETERS
60	ASPECT RATIO	SHOWN IN PERCENTAGE
R	CONSTRUCTION TYPE	R - RADIAL
		B - BIAS BELTED
		D - DIAGONAL (BIAS)
16	WHEEL DIAMETER	SHOWN IN INCHES
97	LOAD INDEX	*
T	SPEED RATING	*
* Consult the tire manufacturer regarding any questions on tire specifications or capabilities.		

TIRE CHAINS

Refer to the owners manual supplied with the vehicle to determine whether the use of tire chains is permitted on this vehicle.

REPLACEMENT TIRES

WARNING: Failure to equip the vehicle with tires having adequate speed capability can result in sudden tire failure.

WARNING: In order to maintain the speed capability of the vehicle, replacement tires must have speed ratings equal to or higher than those fitted to the vehicle as original equipment. If tires with lower speed ratings are fitted, the vehicle's handling may be affected and the speed capability of the vehicle may be lowered to the maximum speed capability of the replacement tires. To avoid an accident resulting in severe or fatal injury, consult the tire manufacturer in regards to maximum speed ratings.

It is recommended that tires equivalent to the original equipment tires be used when replacement is needed.

Failure to use equivalent replacement tires may adversely affect the safety and handling of the vehicle.

The original equipment tires provide a proper combination of many characteristics such as:

- Ride
- Noise
- Handling
- Durability
- Tread life
- Traction
- Rolling resistance
- Speed capability

The use of tires smaller than the minimum tire size approved for the vehicle can result in tire overloading and failure.

Use tires that have the approved load rating for the vehicle and never overload them. Failure to equip the vehicle with tires having adequate speed capability can result in sudden tire failure and loss of vehicle control.

The use of oversize tires may cause interference with vehicle components. Under extremes of suspension and steering travel, interference with vehicle components may cause tire damage.

SPARE TIRE

A compact (temporary) spare tire and wheel assembly is standard equipment on this vehicle.

Some vehicles are equipped with a Tire Inflator/Sealant tire repair kit as standard equipment in place of a spare tire. It is to be used to repair small punctures in the tire as necessary. For additional information, refer to the Owners Manual.

The compact spare tire is designed for emergency use only. The original tire should be repaired or replaced at the first opportunity, then reinstalled. Do not exceed speeds of 80 km/h (50 mph) when using the compact spare tire. Refer to the Owner's Manual for complete details.

DIAGNOSIS AND TESTING

TIRE NOISE

Unusual tire noise can be associated with tire and wheel vibration or irregular tire wear. For vibration issues, refer to **DIAGNOSIS AND TESTING**. For irregular tire wear issues, refer to **TIRES, DIAGNOSIS AND TESTING**.

TIRE WEAR PATTERNS

Fig. 12: Identifying Tire Wear Patterns
Courtesy of CHRYSLER GROUP, LLC

Under inflation will cause wear on the shoulders of tire. Over inflation will cause wear at the center of tire.

Excessive camber causes the tire to run at an angle to the road. One side of tread is then worn more than the other.

Excessive toe-in or toe-out causes wear on the tread edges and a feathered effect across the tread.

TREAD WEAR INDICATORS

Fig. 13: Identifying Tread Wear Indicators
Courtesy of CHRYSLER GROUP, LLC

Tread wear indicators are molded into the bottom of the tread grooves. When tread depth is 1.6 mm (1/16 in.), the tread wear indicators will appear as a 13 mm (1/2 in.) band (3).

Tire replacement is necessary when indicators appear in two or more grooves or if localized balding occurs.

STANDARD PROCEDURE

TIRE INFLATION PRESSURES

The specified tire pressures have been chosen to provide safe operation, vehicle stability, and a smooth ride. The proper tire pressure specification can be found on the Tire And Loading Information Label provided with the vehicle (usually on the driver's door opening (B-pillar) or rear shutface of driver's door).

A quality air pressure gauge is recommended to check tire air pressure. Tire pressure should be checked cold once per month. Check tire pressure more frequently when the weather temperature varies widely. Tire pressure will decrease when the outdoor temperature drops. After checking the air pressure, replace valve cap finger tight.

Inflation pressures specified on the Tire Inflation Pressure Label are always the cold inflation pressure of the tire. Cold inflation pressure is obtained after the vehicle has not been operated for at least 3 hours, or the vehicle is driven less than one mile after being inoperative for 3 hours. Tire inflation pressures may increase from 2 to 6 pounds per square inch (psi) during operation. Do not reduce this normal pressure buildup.

Improper inflation can cause:

- Uneven wear patterns
- Reduced tread life
- Reduced fuel economy
- Unsatisfactory ride

- The vehicle to drift.

WARNING: Over or Under inflated tires can affect vehicle handling. The tire can fail suddenly, resulting in loss of vehicle control.

Fig. 14: Under Inflation
Courtesy of CHRYSLER GROUP, LLC

Under inflation causes rapid shoulder wear, tire flexing, and can result in tire failure (1).

Fig. 15: Identifying Over Inflated Tire
Courtesy of CHRYSLER GROUP, LLC

Over inflation causes rapid center wear and loss of the tire's ability to cushion shocks (1).

TIRE PRESSURE FOR HIGH SPEED OPERATION

Refer to the vehicle's Owners Manual Package.

TIRE LEAK REPAIRING

Fig. 16: Identifying Tire Repair Area
Courtesy of CHRYSLER GROUP, LLC

For proper repairing, a radial tire must be removed from the wheel. Repairs should only be made if the defect, or puncture, is in the tread area (1). The tire should be replaced if the puncture is located in the sidewall.

Deflate tire completely before attempting to dismount the tire from the wheel. **Use a lubricant such as a mild soap solution when dismounting or mounting tire.** Use tools free of burrs or sharp edges which could damage the tire or wheel rim.

Before mounting tire on wheel, make sure all rust is removed from the rim bead and repaint if necessary.

Install wheel on vehicle. Refer to **INSTALLATION**.

CLEANING

CLEANING

Before delivery of a vehicle, remove the protective coating on the tires with white sidewalls or raised white letters. To remove the protective coating, apply warm water and let it soak for a few minutes. Afterwards, scrub the coating away with a soft bristle brush. Steam cleaning may also be used to remove the coating.

CAUTION: DO NOT use gasoline, mineral oil, oil-based solvent or a wire brush for cleaning.

REMOVAL

REMOVAL

	A multimedia supplement to the instructions contained in this article is

YouTube	available. To view the multimedia example of the condition described go to; **http://www.youtube.com/user/Mitchell1Tips** **then type "A00641393.vid1" into the "Search Channel" box.**

YouTube	A multimedia supplement to the instructions contained in this article is available. To view the multimedia example of the condition described go to; **http://www.youtube.com/user/Mitchell1Tips** **then type "A00641393.vid2" into the "Search Channel" box.**

IF REMOVING THE TIRE FROM THE WHEEL, PERFORM THE PROCEDURE BELOW:

CAUTION: The cap used on this valve stem contains an O-ring seal to prevent contamination and moisture from entering the valve stem. Do not substitute a regular valve stem cap in its place.

Fig. 17: Start Mount/Dismount Tool Within 10 Degrees Of Valve Stem
Courtesy of CHRYSLER GROUP, LLC

1.
2. Dismount tire from wheel following tire changer manufacturers instructions while paying special attention to the following to avoid damaging the pressure sensor:
   a. When breaking the tire bead loose from the wheel rim, avoid using the Bead Breaker in the area of the sensor (1). That includes both outer and inner beads of the tire.
   b. When preparing to dismount the tire from the wheel, carefully insert the mounting/dismounting tool 280° from the valve stem ± 10°, then proceed to dismount the tire from the wheel. Use this process on both outer and inner tire beads.

Fig. 18: Sensor Mounting To Wheel
Courtesy of CHRYSLER GROUP, LLC

3. Remove the sensor to valve stem retainer screw (3) and remove the sensor (1) from the valve stem (2).
4. Remove the valve stem (2) from the wheel (4).

INSTALLATION

INSTALLATION

NOTE: **If replacing tire pressure sensor, a new valve stem will be pre-mounted to the sensor as an assembly. Verify that the sensor is positioned properly before seating the valve stem. If replacing a valve stem only (using the existing tire pressure sensor), the new valve stem will include a new tire pressure sensor mounting screw. Always use a new mounting screw when attaching a sensor to a valve stem.**

Fig. 19: Sensor Mounting To Wheel
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Any time a sensor is to be reinstalled in a wheel, a new valve stem assembly must be installed to ensure air tight sealing.

IF THE TIRE WAS REMOVED FROM THE WHEEL, PERFORM THE PROCEDURE BELOW:

1. Wipe area clean around sensor/valve stem mounting hole in wheel (4). Make sure surface of wheel is not damaged.

NOTE: A new valve stem is pre-lubricated for proper installation with a standard tool.

NOTE: If replacing tire pressure sensor, a new valve stem will be pre-mounted to the sensor as an assembly. Verify that the sensor is positioned properly before seating the valve stem.

Fig. 20: Tire Pressure Sensor & Components
Courtesy of CHRYSLER GROUP, LLC

2. Insert valve stem (3) through wheel and pull through to seat with standard valve stem installation tool.
3. If replacing the valve stem (3) only (using the existing tire pressure sensor), verify that the flat sides of the brass extension on the bottom of the valve stem (3) are at a 90 degree angle with the wheel. Position the pressure sensor (1) over the brass extension (5), install the retainer screw (2) and tighten to 1.4 N.m (12 in. lbs.).
4. Mount tire on wheel following tire changer manufacturers instructions, paying special attention to the following to avoid damaging tire pressure sensor:

Fig. 21: Mounting Tire Using Rotating Wheel Machine
Courtesy of CHRYSLER GROUP, LLC

a. Rotating Wheel Tire Changers - Once the wheel is mounted to the changer, position the sensor valve stem (2) approximately 280° from the head of the changer (located at 1) in a clockwise direction before rotating the wheel (also in a clockwise direction) to mount the tire. Use this procedure on both the outer and inner tire beads.

Fig. 22: Mounting Tire Using Rotating Tool Machine
Courtesy of CHRYSLER GROUP, LLC

b. Rotating Tool Tire Changers - Position the wheel on the changer so that the sensor valve stem (1) is located approximately 210° clockwise from the installation end of the mounting/dismounting tool (2) once the tool is mounted for tire installation. Make sure the sensor is clear of the lower bead breaker area (3) to avoid damaging the sensor when the breaker rises. Rotate the tool (2) in a counterclockwise direction to mount the tire. Use this procedure on both the outer and inner tire beads.

c. Adjust air pressure to that listed on Tire Inflation Pressure Label (Placard) provided with vehicle (usually applied to driver's side B-pillar). Make sure **original style** valve stem cap is securely installed to keep moisture out of sensor.

d. Install tire and wheel assembly on the vehicle.

e. Remove the support and lower the vehicle.

f. Perform one of the following to make the system learn the new sensor ID.

g. Use the TPM-RKE Analyzer, 9936, with the Scan Tool to program the RF Hub module with the tire pressure sensor ID. This is part of the TPM Diagnostic Verification Test. Refer to **STANDARD PROCEDURE** .

h. Once the vehicle has remained stationary for more than 20 minutes, drive vehicle for a minimum of 10 minutes while maintaining a continuous speed above 15 mph (24 km/h). During this time, the

system will learn the new sensor ID. This is part of the TPM Diagnostic Verification Test. Refer to **STANDARD PROCEDURE** .

NOTE: If a sensor cannot be trained, refer to appropriate diagnostic information.

WHEELS

DESCRIPTION

DESCRIPTION

Fig. 23: Identifying Wheel/Rim Design
Courtesy of CHRYSLER GROUP, LLC

All vehicles use either steel or cast aluminum drop center wheels. The original equipment wheels are designed for proper operation at all loads up to the specified maximum vehicle capacity.

Every wheel has raised sections between the rim flanges (1) and drop well (3) called safety humps (2). In case of air loss, these raised sections help hold the tire in position on the wheel until the vehicle can be brought to a safe stop. When being installed on the wheel, initial inflation of the tire forces the tire bead over these raised sections into place.

The wheel studs and nuts are designed for specific wheel applications and must be replaced with equivalent parts. Do not use replacement parts of lesser quality or of a substitute design. All aluminum and steel wheels have wheel stud nuts with an enlarged nose. This enlarged nose is necessary to ensure proper retention of the wheels.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - WHEEL INSPECTION

Inspect wheels for:

- Excessive runout
- Dents, cracks or irregular bends
- Damaged wheel stud (lug) holes
- Air Leaks

NOTE: Do not attempt to repair a wheel by hammering, heating or welding.

If a wheel is damaged, an original equipment replacement wheel should be used. When obtaining replacement wheels, they should be equivalent in load carrying capacity. The diameter, width, offset, pilot hole and bolt circle of the wheel should be the same as the original wheel.

WARNING: **Failure to use equivalent replacement wheels may adversely affect the safety and handling of the vehicle.**

WARNING: **Replacement with used wheels is not recommended. The service history of the wheel may have included severe treatment or very high mileage. The rim could fail without warning.**

WARNING: **Chrysler LLC does not recommend that customers use "reconditioned" wheels (wheels that have been damaged and repaired) because they can result in a sudden catastrophic wheel failure which could cause loss of control and result in injury or death. For clarification:**

- **Cosmetic refinishing for the purpose of repairing a superficial flaw is an acceptable procedure providing it is limited to paint or clear coat only, the wheel is not modified in any way, and there is no exposure to paint curing heat over 200 degrees Fahrenheit (93 degrees Celsius).**
- **Damaged wheels are those which have been bent, broken, cracked or sustained some other physical damage which may have compromised the wheel structure.**
- **Repaired indicates that the wheel has been modified through bending, welding, heating, straightening, or material removal to rectify damage.**
- **Re-plating of chrome plated wheels is not an acceptable procedure nor is chrome plating of original equipment painted or polished wheels, as this may alter mechanical properties and affect fatigue life.**

CLEANING

CLEANING

All wheels and wheel trim, especially aluminum and chrome plated, should be cleaned regularly using mild soap and water to maintain their luster and to prevent corrosion. Wash them with the same soap solution recommended for the body of the vehicle.

When cleaning extremely dirty wheels, care must be taken in the selection of tire and wheel cleaning chemicals and equipment to prevent damage to the wheels. Mopar® Wheel Treatment or Mopar® Chrome Cleaner is recommended. Any of the "DO NOT USE" items listed below can damage wheels and wheel trim.

DO NOT USE:

- Any abrasive cleaner
- Any abrasive cleaning pad (such as steel wool) or abrasive brush
- Any cleaner that contains an acid which can react with and discolor the chrome surface. **Many wheel cleaners contain acids that can harm the wheel surface.**
- Oven cleaner
- A car wash that uses carbide-tipped wheel cleaning brushes or acidic solutions.

2014 TRANSFER CASE

Power Transfer Unit - Service Information - Cherokee

DESCRIPTION

DESCRIPTION

ONE SPEED PTU

The one Speed Power Transfer Unit (PTU) is a **service as an assembly component** when mechanical faults are evident. The shift actuator is a serviceable component, and if leaking, the input shaft seal(s), drive pinion seal, and case gasket can be serviced. Special tools have been developed to service the seals in the one speed PTU.

NOTE: There are two one speed PTU's in use, one for the automatic transmission and one for the manual transmission, they have unique mounting provisions, and are not interchangeable. The manual transmission version also has two opposed seals on the input shaft, the automatic transmission version has a single seal on the input shaft.

TWO SPEED PTU

The two Speed Power Transfer Unit (PTU) is a **service as assembly component** when mechanical faults and some oil leaks are evident. The shift actuator, rear output seal, right halfshaft outer seal, and the plug are serviceable. Special tools have been developed to service the seals in the two speed PTU. If hypoid fluid is leaking from the weep-hole between the transaxle and the PTU, the two speed PTU must be replaced.

STANDARD PROCEDURE

STANDARD PROCEDURE - PTU FLUID FILL

1. Raise vehicle on hoist. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Position a drain pan under the fill plug.
3. Remove the Power Transfer Unit (PTU) fill plug. The fill plug is located on the right side of the case.
4. Fill the PTU to the bottom of the fill plug hole using the specified fluid.

   Refer to **CAPACITIES AND RECOMMENDED FLUIDS, SPECIFICATIONS** .

   NOTE: It may take several minutes for the fluid to equalize in the PTU before a final fluid level check can be determined.

5. Install fill plug and tighten to the proper specification. Refer to **SPECIFICATIONS**.
6. Lower vehicle.

SPECIFICATIONS

ONE SPEED PTU SPECIFICATIONS

ONE SPEED PTU SPECIFICATIONS

PTU SPECIFIC	SPECIFICATIONS
Fluid Type	75-W 90 Gear Lube
Fluid Capacity	0.7 L (0.74 qt.)
Weight	23 kg (50 lb.)
Gear Ratio	2.734:1
Hypoid Gear Ratio	2.231 (13:29)*
Helical Gear Ratio	1.226 (31:38)*
Ring Gear Diameter	131 mm (5.2 in)
* = Gear to Gear Count Ratio

REMOVAL

REMOVAL

1. Position the vehicle on a suitable hoist with the transaxle in neutral. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Disconnect the battery negative cable clamp from the battery.
3. Remove the right front wheel. Refer to **REMOVAL** .
4. Remove the right front halfshaft. Refer to **REMOVAL** .
5. If equipped with a 2.4L, remove the intake manifold. Refer to **MANIFOLD, INTAKE, REMOVAL** .
6. Remove the rear propeller shaft. Refer to **REMOVAL** .
7. Remove the bolts holding the rear maniverter to the cylinder head. Refer to **MANIFOLD, EXHAUST, REMOVAL** .
8. Separate the rear catalytic converter from the cylinder head and wire it up and out of the way.
9. Remove the crossunder exhaust pipe. Refer to **PIPE, EXHAUST CROSSUNDER, REMOVAL** .

Fig. 1: Heat Shield & Bolts
Courtesy of CHRYSLER GROUP, LLC

10. Remove the bolts (2) holding the heat shield (1) to the PTU.
11. Separate the heat shield (1) from the PTU.

Fig. 2: PTU Support Bracket & Bolts At PTU
Courtesy of CHRYSLER GROUP, LLC

12. Remove the bolts (2) holding the PTU support bracket (1) to the PTU.

Fig. 3: PTU Support Bracket & Bolts At Block & Oil Pan
Courtesy of CHRYSLER GROUP, LLC

13. Remove the bolts (4) holding the PTU support bracket (2) to the engine block and the oil pan (3).
14. Separate the PTU support bracket (2) from the PTU (5).

Fig. 4: PTU & Bolts At Transaxle
Courtesy of CHRYSLER GROUP, LLC

15. Remove the bolts (1) holding the PTU (2) to the transaxle.

Fig. 5: Shifting PTU To Right Away From Transaxle
Courtesy of CHRYSLER GROUP, LLC

16. Shift the PTU (1) to the right away from the transaxle (2) and separate the spline shaft from the transaxle output shaft.

Fig. 6: Removing/Installing PTU
Courtesy of CHRYSLER GROUP, LLC

17. Push the PTU (1) to the right side of the vehicle and tip the left side downward and out of the vehicle.

DISASSEMBLY

ONE SPEED PTU DISASSEMBLY

NOTE: The PTU is a service by replacement component. If the PTU is leaking fluid, the lip seals can be replaced.

1. Remove the Power Transfer Unit (PTU) from the vehicle.
2. Place the PTU on a suitable, clean and stable work surface.
3. Drain the fluid from the PTU into a suitable drain pan.

Fig. 7: PTU Shift Actuator & Screws
Courtesy of CHRYSLER GROUP, LLC

4. Remove the screws holding the shift actuator to the PTU and discard screws.
5. Remove the PTU shift actuator.

Fig. 8: Locating PTU Housing Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: **It is not necessary to remove the intermediate shaft from the PTU to service the seals.**

6. Remove the bolts (1) holding the PTU housing halves together.

Fig. 9: Prying PTU Housing Halves Apart
Courtesy of CHRYSLER GROUP, LLC

7. Using a suitable pry bar, pry (1) the PTU housing halves apart.

Fig. 10: Separating/Installing Right Housing At PTU Housing
Courtesy of CHRYSLER GROUP, LLC

NOTE: When separating the housing, bearings and preload shims may dislodge. Make note of bearing cup and shim location for proper reassembly.

8. Carefully separate the right housing (1) from the PTU housing (2).

Fig. 11: PTU Housing & Gasket
Courtesy of CHRYSLER GROUP, LLC

9. Remove the gasket (1) from the groove in the PTU housing (2).

Fig. 12: Removing/Installing Input Gear & Output Ring Gear At PTU Housing
Courtesy of CHRYSLER GROUP, LLC

10. In unison, pull the input gear (1) and output ring gear (2) from the PTU housing.

Fig. 13: Locating Dog Clutch Sleeve
Courtesy of CHRYSLER GROUP, LLC

11. Remove the dog clutch sleeve (1) from the input shaft.

NOTE: **Note the orientation of the tapered splines in the dog clutch sleeve for reassembly.**

Fig. 14: Removing/Installing Input Shaft & Bearing At PTU Housing
Courtesy of CHRYSLER GROUP, LLC

12. Remove the input shaft (1) and bearing from the PTU housing.

Fig. 15: Removing Seal(s) From PTU Housing
Courtesy of CHRYSLER GROUP, LLC

13. Using a suitable screw driver, remove both the inner and outer input shaft seals if a manual transmission vehicle, or the single seal if an automatic transmission equipped vehicle from the PTU housing (1).

NOTE: The inner lip seal keeps PTU fluid from entering the transmission, the outer lip seal keeps transmission fluid from entering the PTU when

equipped with a manual transmission. There is a weep hole in the cavity between the two seals.

Fig. 16: Removing Seal(s) From Input Shaft
Courtesy of CHRYSLER GROUP, LLC

14. Using a suitable screw driver, remove the inner and outer seals if a manual transmission vehicle, or the single seal if an automatic transmission equipped vehicle from the inside of the input shaft (1).

NOTE: **The inner lip seal keeps PTU fluid from entering the transmission, the outer lip seal keeps transmission fluid from entering the PTU when equipped with a manual transmission. There is a weep hole in the cavity between the two seals.**

ASSEMBLY

ONE SPEED PTU ASSEMBLY

Clean the Power Transfer Unit (PTU) components using a suitable solvent. Blow the components dry using regulated 344 kPa (50 psi) shop air. Inspect all sealing surfaces for excessive wear or scratches the may cause damage to new seals. If damage is evident replace the PTU assembly.

Fig. 17: Installing Outer Seal In Input Gear
Courtesy of CHRYSLER GROUP, LLC

1. If a manual transmission equipped vehicle, using tool (special tool #10517, Installer, Seal) (1), with the long side (4) toward the seal (2), install the outer seal (2) in the input gear (3) with the tension spring facing outward. The shoulder on the tool will stop against the input shaft (3) roller bearing.
2. For both automatic and manual transmission equipped vehicle, using tool (special tool #10517, Installer, Seal) (1), with the short side (4) toward the seal (2), install the inner seal (2) in the input gear (3) with the tension spring facing the tool. The shoulder on the tool will stop against the input shaft (3) roller bearing.

Fig. 18: Installing Outer Seal Into Housing
Courtesy of CHRYSLER GROUP, LLC

3. If a manual transmission equipped vehicle, using tool (special tool #10515, Installer, Seal) and (special tool #C-4171, Driver Handle, Universal), with the long side (2) toward the seal (1), install the outer seal (1) in the housing (4) with the tension spring facing outward. The shoulder on the tool will stop against the top of the bore in the housing (4).
4. For both automatic and manual transmission equipped vehicle, using tool (special tool #10515, Installer, Seal) and (special tool #C-4171, Driver Handle, Universal), with the short side (2) toward the seal (1), install the inner seal (1) in the housing (4) with the tension spring facing the tool. The shoulder on the tool will stop against the top of the bore in the housing (4).

Fig. 19: Removing/Installing Input Shaft & Bearing At PTU Housing
Courtesy of CHRYSLER GROUP, LLC

5. Install the input shaft (1) and bearing into the PTU housing.

Fig. 20: Locating Dog Clutch Sleeve
Courtesy of CHRYSLER GROUP, LLC

6. Install the dog clutch sleeve (1) onto the input shaft

Fig. 21: Ensuring Proper Orientation Of Tapered Splines On Dog Clutch Sleeve
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Ensure that the dog clutch sleeve is oriented so that the tapered splines (1) are facing the input gear (towards the interior of the case).**

Fig. 22: Removing/Installing Input Gear & Output Ring Gear At PTU Housing
Courtesy of CHRYSLER GROUP, LLC

7. In unison, install the input gear (1) and output ring gear (2) into the PTU housing.

Fig. 23: PTU Housing & Gasket
Courtesy of CHRYSLER GROUP, LLC

8. Install the gasket (1) into the groove in the PTU housing (2).

Fig. 24: Separating/Installing Right Housing At PTU Housing
Courtesy of CHRYSLER GROUP, LLC

9. If necessary, install the bearing cups and shims into their proper bores of the right PTU housing. Use a light grease to retain the cups in their bores.
10. Place the right housing (1) onto the PTU housing (2).

Fig. 25: Locating PTU Housing Bolts
Courtesy of CHRYSLER GROUP, LLC

11. Install the bolts (1) to hold the PTU housing halves together. Refer to **SPECIFICATIONS**.
12. Lubricate the intermediate shaft splines.

13. Install the PTU in the vehicle.
14. Fill the PTU to the proper lever with Mopar® 75W-90 fluid.
15. Road test the vehicle to verify the repair.

INSTALLATION

INSTALLATION

1. If manual transmission equipped, install a new O-ring in the groove around the outside of the Power Transfer Unit (PTU) input shaft housing.

Fig. 26: Removing/Installing PTU
Courtesy of CHRYSLER GROUP, LLC

2. Tip the right side upward and into the gap over the suspension cradle and align the PTU (1) with the transaxle output shaft.

Fig. 27: Shifting PTU To Right Away From Transaxle
Courtesy of CHRYSLER GROUP, LLC

3. Shift the PTU (1) to the left onto transaxle (2) and engage the spline shaft into the transaxle output shaft adapter.

Fig. 28: PTU & Bolts At Transaxle
Courtesy of CHRYSLER GROUP, LLC

4. Install the bolts (1) to hold the PTU (2) to the transaxle. Refer to **SPECIFICATIONS**.

Fig. 29: PTU Support Bracket & Bolts At Block & Oil Pan
Courtesy of CHRYSLER GROUP, LLC

NOTE: The PTU to block bracket has a sleeve that slides in the bracket, if the sleeve is seized in the bracket, the bracket must be replaced.

5. Place the PTU support bracket (2) in position on the PTU (5).
6. Install the bolts (4) to hold the PTU support bracket (2) to the engine block (3). Refer to **SPECIFICATIONS**.

Fig. 30: PTU Support Bracket & Bolts At PTU
Courtesy of CHRYSLER GROUP, LLC

7. Install the bolts (2) to hold the PTU support bracket (1) to the PTU. Refer to **SPECIFICATIONS**.

Fig. 31: Heat Shield & Bolts
Courtesy of CHRYSLER GROUP, LLC

8. Place the heat shield (1) in position on the PTU.
9. Install the bolts (2) to hold the heat shield (1) to the PTU. Refer to **SPECIFICATIONS**.
10. Install the crossunder exhaust pipe. Refer to **PIPE, EXHAUST CROSSUNDER, INSTALLATION** .
11. If equipped with a 3.2L, place the rear catalytic converter in position the cylinder head.
12. Install the bolts holding the rear maniverter to the cylinder head. Install the rear propeller shaft. Refer to **INSTALLATION** .
13. If equipped with a 2.4L, install the intake manifold. Refer to **MANIFOLD, INTAKE, INSTALLATION** .

NOTE: **The right halfshaft passes through multiple seals in manual transmission equipped vehicles, use care when installing the halfshaft.**

14. Install the right front halfshaft. Refer to **INSTALLATION** .
15. Install the right front wheel. Refer to **INSTALLATION** .
16. Verify that the PTU and transaxle are filled to the specified fluid level. Refer to **CAPACITIES AND RECOMMENDED FLUIDS, SPECIFICATIONS** .
17. Lower the vehicle.
18. Connect the battery negative cable clamp to the battery.
19. Road test the vehicle to verify the repair.

ACTUATOR, SHIFT

REMOVAL

ONE SPEED PTU

1. Remove the Power Transfer Unit (PTU) from the vehicle.
2. Place the PTU on a suitable, clean and stable work surface.
3. Drain the fluid from the PTU into a suitable drain pan.

Fig. 32: PTU Shift Actuator & Screws
Courtesy of CHRYSLER GROUP, LLC

4. Remove the screws (2) holding the shift actuator (1) to the PTU. Discard the screws.
5. Separate the shift actuator from the PTU.

Fig. 33: Shift Actuator, Shift Fork & Gasket
Courtesy of CHRYSLER GROUP, LLC

6. Remove the gasket (2) from the groove in the shift actuator (1).

TWO SPEED PTU

NOTE: **If the PTU actuator is functional and is being removed to correct a fluid leak, the PTU should be placed in the 2WD mode before removing the PTU from the vehicle. If the actuator is not functional the actuator can be removed when the PTU is not in the 2WD mode, but it will be difficult to install the shift forks on the shift sleeves.**

1. Remove the PTU from the vehicle.
2. Place the PTU on a suitable work surface

Fig. 34: Shift Actuator & Screws
Courtesy of CHRYSLER GROUP, LLC

3. Remove the screws (2) holding the shift actuator (1) to the PTU housing. Discard the screws.

Fig. 35: Removing/Installing Shift Actuator At PTU
Courtesy of CHRYSLER GROUP, LLC

4. Separate the shift actuator (2) from the PTU (1).

Fig. 36: Locating Gasket At Shift Actuator Sealing Surface Groove
Courtesy of CHRYSLER GROUP, LLC

5. Remove the gasket (2) from the groove in the shift actuator sealing surface (1).

INSTALLATION

ONE SPEED PTU

NOTE: **If installing a new actuator, there are two locating dowels that may have stayed in the case, remove them from the case as the dowels will come installed in the new actuator.**

Fig. 37: Shift Actuator, Shift Fork & Gasket
Courtesy of CHRYSLER GROUP, LLC

1. Using a clean lint free cloth, wipe the sealing surfaces clean.

   NOTE: **Do not use solvent to clean the PTU components.**

2. Install a NEW gasket (2) in the groove on the shift actuator.
3. Place the shift actuator in position on the PTU.
4. Engage the shift fork in the groove on the shift sleeve in the PTU and align the locating dowels.

Fig. 38: PTU Shift Actuator & Screws
Courtesy of CHRYSLER GROUP, LLC

NOTE: Do not reuse the actuator mounting screws.

5. Install **NEW** screws (2) to hold the shaft actuator to the PTU. Refer to **SPECIFICATIONS**.
6. Install the PTU in the vehicle.
7. Verify that the PTU is properly filled with Mopar® 75W-90 fluid.
8. Road test the vehicle to verify the repair.

TWO SPEED PTU

NOTE: If the actuator was inoperative and was not in the 2WD mode before it was removed, the shift forks can be aligned by placing a large plastic loom tie between the shift fork and the actuator housing to position the fork closer to the center of the actuator. Do not attempt to join the ends of the loop tie around the shift mechanism. The loom tie will serve as a shim and can be pulled out after the actuator is in position on the PTU.

NOTE: If installing a new actuator, there are two locating dowels that may have stayed in the case, remove them from the case as the dowels will come installed in the new actuator.

1. Using a clean lint free cloth, wipe the sealing surfaces clean.

NOTE: Do not use solvent to clean the PTU components.

Fig. 39: Locating Gasket At Shift Actuator Sealing Surface Groove
Courtesy of CHRYSLER GROUP, LLC

2. Install a NEW gasket (2) in the groove in the sealing surface of the shaft actuator (1).

Fig. 40: Actuator, Shift Forks, Shifts Sleeves & PTU
Courtesy of CHRYSLER GROUP, LLC

3. While carefully guiding the shift forks (3 and 4) into the PTU housing, align the grooves in the shift forks (3 and 4) to the rails on the shift sleeves (5 and 6).

Fig. 41: Removing/Installing Shift Actuator At PTU
Courtesy of CHRYSLER GROUP, LLC

4. Push the actuator (2) downward until the sealing surfaces mate and the locating dowels line up with the PTU (1).
5. If a loom tie was used as a shim, pull the loom tie out from under the actuator.

Fig. 42: Shift Actuator & Screws
Courtesy of CHRYSLER GROUP, LLC

NOTE: Do not reuse the actuator mounting screws.

6. Install **new** screws (2) to hold the shift actuator to the PTU housing. Refer to **SPECIFICATIONS**.

NOTE: **Prior to fully installing the PTU in vehicle, use the scan tool to actuate the actuator to all positions to verify the shift forks properly engaged the hubs in the PTU. It may be necessary to manually manipulate the output shafts to allow the actuator to engage in all positions.**

7. Install the PTU in the vehicle. Refer to **INSTALLATION**.
8. Fill the PTU to the proper level with the specified fluid.
9. Road test the vehicle to verify the repair.

PLUG, RING GEAR SHAFT

REMOVAL

REMOVAL

1. Remove the PTU from the vehicle.
2. Place the PTU on a suitable work surface.

Fig. 43: Piercing Hole In Center Of Plug Using Chisel
Courtesy of CHRYSLER GROUP, LLC

3. Using a suitable sharp chisel (1), pierce a hole in the center of the plug (2).

Fig. 44: Driving Chisel Side Ways To Lever Plug Out Of PTU
Courtesy of CHRYSLER GROUP, LLC

4. Drive the chisel (1) side ways to lever the plug (2) out of the PTU.

Fig. 45: Separating Plug From PTU
Courtesy of CHRYSLER GROUP, LLC

5. Separate the plug (1) from the PTU.

INSTALLATION

INSTALLATION

Fig. 46: Placing New Plug Into Hole In PTU
Courtesy of CHRYSLER GROUP, LLC

1. Using the clean lint free cloth, wipe the circumference of the plug hole free of debris and oil.
2. Place a NEW plug into the hole in the PTU.

Fig. 47: Driving New Plug Into Hole In PTU
Courtesy of CHRYSLER GROUP, LLC

3. Using tool (special tool #6342, Installer, Seal), drive the new plug into the hole in the PTU until the lip of the plug is flush against the outer surface of the PTU.
4. Install the PTU in the vehicle.

5. Verify that the PTU fluid is at the specified level.
6. Road test the vehicle to verify the repair.

SEAL, AXLE DRIVE SHAFT, OUTER

REMOVAL

REMOVAL

1. Position the vehicle on a suitable hoist with the transaxle in neutral.
2. Place a suitable drain pan under the PTU to catch fluid that may spill when the seal is removed.
3. Remove right halfshaft. Refer to **REMOVAL** .

Fig. 48: Removing Output Shaft Seal From PTU Housing
Courtesy of CHRYSLER GROUP, LLC

4. Using a suitable screw driver (1), remove the output shaft seal (3) from the PTU housing (2).

INSTALLATION

INSTALLATION

1. Using a clean lint free cloth, wipe the seal cavity clean of oil and debris.
2. Inspect the seal bore for scratches or cracks. If damage is evident replace the PTU.

Fig. 49: Placing New Lip Seal Into Position On PTU Housing
Courtesy of CHRYSLER GROUP, LLC

3. Place the new lip seal (1) in position on the PTU housing (2).

Fig. 50: Installing New Lip Seal Into PTU Housing
Courtesy of CHRYSLER GROUP, LLC

4. Using tool (special tool #9684, Installer, Seal) (2) and (special tool #C-4171, Driver Handle, Universal) (3), install the new seal in the PTU housing (1).
5. Install the right side halfshaft. Refer to **INSTALLATION** .
6. Remove the drain pan from under the vehicle.

7. Fill the PTU with the proper fluid.
8. Lower the vehicle.
9. Road test the vehicle to verify the repair.

SEAL, REAR OUTPUT SHAFT

REMOVAL

ONE SPEED PTU

1. Position the vehicle on a suitable hoist with the transaxle in neutral.
2. Raise the vehicle to gain access to the rear drive shaft. Refer to **HOISTING, STANDARD PROCEDURE** .
3. Remove the rear drive shaft from the vehicle. Refer to **REMOVAL** .

Fig. 51: Removing/Installing Circlip At Rear Output Shaft
Courtesy of CHRYSLER GROUP, LLC

4. Remove the c-clip (2) from the groove in the rear output shaft (1).

Fig. 52: Removing/Installing O-Ring At Rear Output Shaft
Courtesy of CHRYSLER GROUP, LLC

5. Remove the O-ring seal (1) from the groove in the rear output shaft (2).

Fig. 53: Dust Deflector & Rear Output Shaft
Courtesy of CHRYSLER GROUP, LLC

6. Using suitable prying tools, pry the dust deflector from the rear output shaft.

NOTE: **It may be necessary to punch a hole in the metal deflector to enable removal.**

7. Place a suitable drain pan under the PTU output shaft to catch fluid that may spill from PTU when the seal is removed.

Fig. 54: Removing Seal From PTU Housing
Courtesy of CHRYSLER GROUP, LLC

8. Using tool (special tool #9082A, Remover, Bearing), remove the seal from the PTU housing.

NOTE: **It may be necessary to squeeze the spring fingers on tool (special tool #9082A, Remover, Bearing) with suitable pliers to lock the jaws into the shoulder on the lip seal.**

9. Clean and inspect the sealing surface and the seal bore, if any damage is present, it will be necessary to replace the PTU.

TWO SPEED PTU

1. Position the vehicle on a suitable hoist with the transaxle in neutral.
2. Raise the vehicle to gain access to the rear drive shaft. Refer to **HOISTING, STANDARD PROCEDURE** .
3. Remove the rear drive shaft from the vehicle. Refer to **REMOVAL** .

Fig. 55: Removing/Installing Circlip At Rear Output Shaft
Courtesy of CHRYSLER GROUP, LLC

4. Remove the circlip (2) from the groove in the rear output shaft (1).

Fig. 56: Removing/Installing O-Ring At Rear Output Shaft
Courtesy of CHRYSLER GROUP, LLC

5. Remove the O-ring seal (1) from the groove in the rear output shaft (2).

Fig. 57: Dust Deflector & PTU Housing
Courtesy of CHRYSLER GROUP, LLC

6. Using suitable prying tools, pry the dust deflector (2) from the rear output shaft.

NOTE: **It may be necessary to punch a hole in the dust deflector to enable removal.**

7. Place a suitable drain pan under the PTU output shaft to catch fluid that may spill from PTU when the seal is removed.

Fig. 58: Removing Seal From PTU Lower Housing
Courtesy of CHRYSLER GROUP, LLC

8. Using tool (special tool #9082A, Remover, Bearing) (2), remove the seal (1) from the PTU lower housing (3).

NOTE: It may be necessary to squeeze the spring fingers on tool (special tool #9082A, Remover, Bearing) with suitable pliers to lock the jaws into the shoulder on the lip seal.

9. Clean and inspect the sealing surfaces and the seal bore, if any damage is present it will be necessary to replace the PTU.

INSTALLATION

ONE SPEED PTU

Fig. 59: Placing New Seal In Position On PTU Output Shaft
Courtesy of CHRYSLER GROUP, LLC

1. Apply assembly lube on the lip of the seal to aid installation onto the output shaft.
2. Place the NEW seal (1) in position on the PTU output shaft.

Fig. 60: Installing New Seal Into PTU Housing
Courtesy of CHRYSLER GROUP, LLC

3. Using tool (2) (special tool #10117, Installer, Seal), install the NEW seal (1) into the PTU housing
4. Remove the drain pan from under the PTU output shaft.

Fig. 61: Dust Deflector & Rear Output Shaft
Courtesy of CHRYSLER GROUP, LLC

5. Place the dust deflector (1) in position on the rear output shaft (2).

Fig. 62: Installing Dust Deflector
Courtesy of CHRYSLER GROUP, LLC

6. Using tool (special tool #10518, Installer, Oil Slinger) (1), install the dust deflector (2).

Fig. 63: Removing/Installing O-Ring At Rear Output Shaft
Courtesy of CHRYSLER GROUP, LLC

7. Install the O-ring seal (1) in the groove in the rear output shaft (2).

Fig. 64: Removing/Installing Circlip At Rear Output Shaft
Courtesy of CHRYSLER GROUP, LLC

8. Install the circlip (2) in the groove in the rear output shaft (1).
9. Install the rear drive shaft in the vehicle. Refer to **INSTALLATION** .
10. Fill the PTU to the proper level with the Mopar® 75W90 fluid.
11. Lower the vehicle.
12. Road test the vehicle to verify the repair.

TWO SPEED PTU

Fig. 65: Placing New Seal In Position On PTU Rear Output Shaft

Courtesy of CHRYSLER GROUP, LLC

1. Apply assembly lube on the lip of the seal to aid installation onto the output shaft.
2. Place the NEW seal (1) in position on the PTU (2) rear output shaft.

Fig. 66: Installing New Seal Into PTU Lower Housing
Courtesy of CHRYSLER GROUP, LLC

3. Using tool (3) (special tool #10117, Installer, Seal), install the NEW seal (2) into the PTU lower housing (1).
4. Remove the drain pan from under the PTU output shaft.

Fig. 67: Dust Deflector & PTU Housing

Courtesy of CHRYSLER GROUP, LLC

5. Place the dust deflector (2) in position on the rear output shaft (1).

Fig. 68: Installing Dust Deflector
Courtesy of CHRYSLER GROUP, LLC

6. Using tool (special tool #10518, Installer, Oil Slinger) (1), Install the dust deflector (2).

Fig. 69: Removing/Installing O-Ring At Rear Output Shaft
Courtesy of CHRYSLER GROUP, LLC

7. Install the O-ring seal (1) in the groove in the rear output shaft (2).

Fig. 70: Removing/Installing Circlip At Rear Output Shaft
Courtesy of CHRYSLER GROUP, LLC

8. Install the Circlip (2) in the groove in the rear output shaft (1).
9. Install the rear drive shaft in the vehicle. Refer to **INSTALLATION** .
10. Fill the PTU to the proper level with the Mopar® 75W90 fluid.
11. Lower the vehicle.
12. Road test the vehicle to verify the repair.
