   - Repair the short to voltage in the (L43) Left Low Beam Driver circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 3

3. **CHECK THE (L43) LEFT LOW BEAM DRIVER CIRCUIT FOR AN OPEN IN THE HARNESS**
   1. Turn the ignition off.
   2. Measure the resistance of the (L43) Left Low Beam Driver circuit between the Left Front Lamp Assembly C1 harness connector and the BCM C3 harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 4

      No

      - Repair the open in the (L43) Left Low Beam Driver circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK THE (Z915) GROUND CIRCUIT FOR AN OPEN IN THE HARNESS**
   1. Disconnect the Left Front Lamp Assembly C2 harness connector.
   2. Using a 12-volt test light connected to 12-volts, check the (Z915) Ground circuit at the Left Front Lamp Assembly C1 and C2 harness connectors.

      Does the test light illuminate brightly for both circuits?

      Yes

      - Go To 5

      No

      - Repair the open in the (Z915) Ground circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **CHECK THE BCM FOR CORRECT OPERATION**

1. Reconnect the Left Front Lamp Assembly C2 harness connector.
2. Reconnect the BCM C3 harness connector.
3. Connect a 12-volt test light between the (L43) Left Low Beam Driver circuit and the (Z915) Ground circuit in the Left Front Lamp Assembly C1 harness connector.
4. Turn the ignition on.
5. Turn the Headlamps on.

   Does the test light illuminate brightly?

   Yes

   - Replace the Left Low Beam Bulb in accordance with the Service Information. Refer to **UNIT, FRONT LAMP, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B162A-19-LEFT LOW BEAM CONTROL - OVER CURRENT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 9: Headlamp & Daytime Running Lamp Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Body Control Module (BCM) receives the input from the headlamp switch requesting low beam lamp illumination. The BCM provides a pulse width modulated (PWM) voltage output through the low beam driver circuit, which connects to the Low Beam Lamp. A common ground circuit is used for the Low and High Beam Lamps. For additional information on the Headlamp operation, refer to **OPERATION** .

WHEN MONITORED

With the low beam headlamps active.

SET CONDITION

When the Body Control Module (BCM) detects a low condition on the (L43) Left Low Beam Driver circuit.

POSSIBLE CAUSES

Possible Causes
(L43) LEFT LOW BEAM DRIVER CIRCUIT SHORTED TO GROUND LEFT LOW BEAM BULB BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. Turn the Headlamps on.
    3. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **ATTEMPT TO SET THE OPPOSITE DTC**
    1. Turn the ignition off.
    2. Disconnect the Left Front Lamp Assembly C1 harness connector.
    3. Turn the ignition on.
    4. Turn the Headlamps on.
    5. With the scan tool, read DTCs.

    Does the scan tool display DTC: B162A-18-LEFT LOW BEAM CONTROL - UNDER CURRENT?

    Yes

- Replace the Left Low Beam Bulb in accordance with the Service Information. Refer to **UNIT, FRONT LAMP, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 3

3. **CHECK THE (L43) LEFT LOW BEAM DRIVER CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Disconnect the BCM C3 harness connector.
   3. Measure the resistance between ground and the (L43) Left Low Beam Driver circuit.

   Is the resistance above 10K Ohms?

   Yes

   - Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Repair the short to ground in the (L43) Left Low Beam Driver circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B162A-19-LEFT LOW BEAM CONTROL-OVER CURRENT - EXPORT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Body Control Module (BCM) receives the input from the headlamp switch requesting low beam lamp illumination. The BCM provides a pulse width modulated (PWM) voltage output through the low beam driver circuit, which connects to the Low Beam Lamp. A common ground circuit is used for the Low and High Beam Lamps. For additional information on the Headlamp operation, refer to **OPERATION** .

WHEN MONITORED

With the low beam headlamps active.

SET CONDITION

When the Body Control Module (BCM) detects a low condition on the (L43) Left Low Beam Driver circuit.

POSSIBLE CAUSES

Possible Causes
(L43) LEFT LOW BEAM DRIVER CIRCUIT SHORTED TO GROUND
LEFT LOW BEAM BULB
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. Turn the Headlamps on.
    3. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **ATTEMPT TO SET THE OPPOSITE DTC**
    1. Turn the ignition off.
    2. Disconnect the Left Front Lamp Assembly C1 harness connector.
    3. Turn the ignition on.
    4. Turn the Headlamps on.
    5. With the scan tool, read DTCs.

    Does the scan tool display DTC: B162A-18-LEFT LOW BEAM CONTROL - UNDER CURRENT?

Yes

- Replace the Left Low Beam Bulb in accordance with the Service Information. Refer to **UNIT, FRONT LAMP, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 3

3. **CHECK THE (L43) LEFT LOW BEAM DRIVER CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Disconnect the BCM C3 harness connector.
   3. Measure the resistance between ground and the (L43) Left Low Beam Driver circuit.

   Is the resistance above 10K Ohms?

   Yes

   - Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Repair the short to ground in the (L43) Left Low Beam Driver circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B162E-18-RIGHT LOW BEAM CONTROL - UNDER CURRENT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 11: Headlamp & Daytime Running Lamp Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Body Control Module (BCM) receives the input from the headlamp switch requesting low beam lamp illumination. The BCM provides a pulse width modulated (PWM) voltage output through the low beam driver circuit, which connects to the Low Beam Lamp. A common ground circuit is used for the Low and High Beam Lamps. For additional information on the Headlamp operation, refer to **OPERATION** .

WHEN MONITORED

With the low beam headlamps active.

SET CONDITION

When the Body Control Module (BCM) detects a high condition on the (L44) Right Low Beam Driver circuit.

POSSIBLE CAUSES

Possible Causes
(L44) RIGHT LOW BEAM DRIVER CIRCUIT OPEN
(L44) RIGHT LOW BEAM DRIVER CIRCUIT SHORTED TO VOLTAGE
(Z906) GROUND CIRCUIT OPEN
RIGHT LOW BEAM BULB
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. Turn the Headlamps on.
    3. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE (L44) RIGHT LOW BEAM DRIVER CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS**
    1. Turn the Headlamps off.
    2. Turn the ignition off.
    3. Disconnect the Right Front Lamp Assembly C1 harness connector.
    4. Disconnect the BCM C3 harness connector.
    5. Turn the ignition on.
    6. Measure the voltage between ground and the (L44) Right Low Beam Driver circuit.

Is there any voltage present?

Yes

- Repair the short to voltage in the (L44) Right Low Beam Driver circuit.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 3

3. **CHECK THE (L44) RIGHT LOW BEAM DRIVER CIRCUIT FOR AN OPEN IN THE HARNESS**
   1. Turn the ignition off.
   2. Measure the resistance of the (L44) Right Low Beam Driver circuit between the Right Front Lamp Assembly C1 harness connector and the BCM C3 harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 4

   No

   - Repair the open in the (L44) Right Low Beam Driver circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK THE (Z906) GROUND CIRCUIT FOR AN OPEN IN THE HARNESS**
   1. Using a 12-volt test light connected to 12-volts, check the (Z906) Ground circuit at the Right Front Lamp Assembly C1 harness connector.

   Does the test light illuminate brightly?

   Yes

   - Go To 5

   No

   - Repair the open in the (Z906) Ground circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **CHECK THE BCM FOR CORRECT OPERATION**
   1. Reconnect the BCM C3 harness connector.
   2. Connect a 12-volt test light between the (L44) Right Low Beam Driver circuit and (Z906) Ground circuit in the Right Front Lamp Assembly C1 harness connector.

3. Turn the ignition on.
4. Turn the Headlamps on.

   Does the test light illuminate brightly?

   Yes

   - Replace the Right Low Beam Bulb in accordance with the Service Information. Refer to **UNIT, FRONT LAMP, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Repair the short to ground in the (L44) Right Low Beam Driver circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1632-18-LEFT HIGH BEAM CONTROL - UNDER CURRENT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 15: Headlamp & Daytime Running Lamp Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Body Control Module (BCM) receives a communication network message from the Steering Column Control Module (SCCM) requesting high beam lamp illumination. When this message is received, the BCM provides a Pulse Width Modulated (PWM) voltage output through the high beam driver circuit which connects to the Right and Left High Beam Lamps. A common ground circuit is used for the Low and High Beam Lamps. For additional information on the Headlamp operation, refer to **OPERATION** .

WHEN MONITORED

With the high beam headlamps active.

SET CONDITION

When the Body Control Module (BCM) detects a high condition on the (L33) Left High Beam Driver circuit.

POSSIBLE CAUSES

Possible Causes
(L33) LEFT HIGH BEAM DRIVER CIRCUIT OPEN
(L33) LEFT HIGH BEAM DRIVER CIRCUIT SHORTED TO VOLTAGE
(Z915) GROUND CIRCUIT OPEN
LEFT HIGH BEAM BULB
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. Turn the Headlamps on.
    3. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE (L33) LEFT HIGH BEAM DRIVER CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS**
    1. Turn the Headlamps off.
    2. Turn the ignition off.
    3. Disconnect the Left Front Lamp Assembly C1 harness connector.
    4. Disconnect the BCM C4 harness connector.
    5. Turn the ignition on.

6. Measure the voltage between ground and the (L33) Left High Beam Driver circuit.

   Is there any voltage present?

   Yes

   - Repair the short to voltage in the (L33) Left High Beam Driver circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 3

3. **CHECK THE (L33) LEFT HIGH BEAM DRIVER CIRCUIT FOR AN OPEN IN THE HARNESS**
   1. Turn the ignition off.
   2. Measure the resistance of the (L33) Left High Beam Driver circuit between the Left Front Lamp Assembly C1 harness connector and the BCM C4 harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 4

      No

      - Repair the open in the (L33) Left High Beam Driver circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK THE (Z915) GROUND CIRCUIT FOR AN OPEN IN THE HARNESS**
   1. Using a 12-volt test light connected to 12-volts, check the (Z915) Ground circuit at the Left Front Lamp Assembly C1 harness connector.

      Does the test light illuminate brightly?

      Yes

      - Go To 5

      No

      - Repair the open in the (Z915) Ground circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **CHECK THE BCM FOR CORRECT OPERATION**
   1. Reconnect the BCM C4 harness connector.

2. Connect a 12-volt test light between the (L33) Left High Beam Driver circuit and the (Z915) Ground circuit in the Left Front Lamp Assembly C1 harness connector.
3. Turn the ignition on.
4. Turn the Headlamps on.

   Does the test light illuminate brightly?

   Yes

   - Replace the Left High Beam Bulb in accordance with the Service Information. Refer to **UNIT, FRONT LAMP, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1632-18-LEFT HIGH BEAM CONTROL - UNDER CURRENT - EXPORT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Possible Causes
(L33) LEFT HIGH BEAM DRIVER CIRCUIT OPEN
(L33) LEFT HIGH BEAM DRIVER CIRCUIT SHORTED TO VOLTAGE
(Z915) GROUND CIRCUIT OPEN
LEFT HIGH BEAM BULB
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. Turn the Headlamps on.
    3. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE (L33) LEFT HIGH BEAM DRIVER CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS**
    1. Turn the Headlamps off.
    2. Turn the ignition off.
    3. Disconnect the Left Front Lamp Assembly C1 harness connector.
    4. Disconnect the BCM C4 harness connector.
    5. Turn the ignition on.

6. Measure the voltage between ground and the (L33) Left High Beam Driver circuit.

   Is there any voltage present?

   Yes

   - Repair the short to voltage in the (L33) Left High Beam Driver circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 3

3. **CHECK THE (L33) LEFT HIGH BEAM DRIVER CIRCUIT FOR AN OPEN IN THE HARNESS**
   1. Turn the ignition off.
   2. Measure the resistance of the (L33) Left High Beam Driver circuit between the Left Front Lamp Assembly C1 harness connector and the BCM C4 harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 4

      No

      - Repair the open in the (L33) Left High Beam Driver circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK THE (Z915) GROUND CIRCUIT FOR AN OPEN IN THE HARNESS**
   1. Disconnect the Left Front Lamp Assembly C2 harness connector.
   2. Using a 12-volt test light connected to 12-volts, check the (Z915) Ground circuit at the Left Front Lamp Assembly C1 and C2 harness connectors.

      Does the test light illuminate brightly?

      Yes

      - Go To 5

      No

      - Repair the open in the (Z915) Ground circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **CHECK THE BCM FOR CORRECT OPERATION**

1. Reconnect the Left Front Lamp Assembly C2 harness connector.
2. Reconnect the BCM C4 harness connector.
3. Connect a 12-volt test light between the (L33) Left High Beam Driver circuit and the (Z915) Ground circuit in the Left Front Lamp Assembly C1 harness connector.
4. Turn the ignition on.
5. Turn the Headlamps on.

   Does the test light illuminate brightly?

   Yes

   - Replace the Left High Beam Bulb in accordance with the Service Information. Refer to **UNIT, FRONT LAMP, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1632-19-LEFT HIGH BEAM CONTROL - OVER CURRENT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 17: Headlamp & Daytime Running Lamp Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Body Control Module (BCM) receives a communication network message from the Steering Column Control Module (SCCM) requesting high beam lamp illumination. When this message is received, the BCM provides a Pulse Width Modulated (PWM) voltage output through the high beam driver circuit which connects to the Right and Left High Beam Lamps. A common ground circuit is used for the Low and High Beam Lamps. For additional information on the Headlamp operation, refer to **OPERATION** .

WHEN MONITORED

With the high beam headlamps active.

SET CONDITION

When the Body Control Module (BCM) detects a low condition on the (L33) Left High Beam Driver circuit.

POSSIBLE CAUSES

Possible Causes
(L33) LEFT HIGH BEAM DRIVER CIRCUIT SHORTED TO GROUND
LEFT HIGH BEAM BULB
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. Turn the High Beam Headlamps on.
    3. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **ATTEMPT TO SET THE OPPOSITE DTC BY DISCONNECTING THE LEFT FRONT LAMP ASSEMBLY**
    1. Turn the ignition off.
    2. Disconnect the Left Front Lamp Assembly C1 harness connector.
    3. Turn the ignition on.
    4. Turn the High Beam Headlamps on.
    5. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

Yes

- Go To 3

No

- Replace the Left High Beam Bulb in accordance with the Service Information. Refer to **UNIT, FRONT LAMP, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (L33) LEFT HIGH BEAM DRIVER CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Disconnect the BCM C4 harness connector.
   3. Measure the resistance between ground and the (L33) Left High Beam Driver circuit.

   Is the resistance above 10K Ohms?

   Yes

   - Replace the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Repair the short to ground in the (L33) Left High Beam Driver circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1632-19-LEFT HIGH BEAM CONTROL - OVER CURRENT - EXPORT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

POSSIBLE CAUSES

Possible Causes
(L33) LEFT HIGH BEAM DRIVER CIRCUIT SHORTED TO GROUND
LEFT HIGH BEAM BULB
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. Turn the High Beam Headlamps on.
    3. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **ATTEMPT TO SET THE OPPOSITE DTC BY DISCONNECTING THE LEFT FRONT LAMP ASSEMBLY**
    1. Turn the ignition off.
    2. Disconnect the Left Front Lamp Assembly C1 harness connector.
    3. Turn the ignition on.
    4. Turn the High Beam Headlamps on.
    5. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

Yes

- Go To 3

No

- Replace the Left High Beam Bulb in accordance with the Service Information. Refer to **UNIT, FRONT LAMP, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (L33) LEFT HIGH BEAM DRIVER CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Disconnect the BCM C4 harness connector.
   3. Measure the resistance between ground and the (L33) Left High Beam Driver circuit.

   Is the resistance above 10K Ohms?

   Yes

   - Replace the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Repair the short to ground in the (L33) Left High Beam Driver circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1636-18-RIGHT HIGH BEAM CONTROL - UNDER CURRENT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 19: Headlamp & Daytime Running Lamp Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Body Control Module (BCM) receives a communication network message from the Steering Column Control Module (SCCM) requesting high beam lamp illumination. When this message is received, the BCM provides a Pulse Width Modulated (PWM) voltage output through the high beam driver circuit which connects to the Right and Left High Beam Lamps. A common ground circuit is used for the Low and High Beam Lamps. For additional information on the Headlamp operation, refer to **OPERATION** .

WHEN MONITORED

With the high beam headlamps active.

SET CONDITION

When the Body Control Module (BCM) detects a high condition on the (L34) Right High Beam Driver circuit.

POSSIBLE CAUSES

Possible Causes
(L34) RIGHT HIGH BEAM DRIVER CIRCUIT OPEN
(L34) RIGHT HIGH BEAM DRIVER CIRCUIT SHORTED TO VOLTAGE
(Z906) GROUND CIRCUIT OPEN
RIGHT HIGH BEAM BULB
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. Turn the Headlamps on.
    3. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE (L34) RIGHT HIGH BEAM DRIVER CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS**
    1. Turn the Headlamps off.
    2. Turn the ignition off.
    3. Disconnect the Right Front Lamp Assembly C1 harness connector.
    4. Disconnect the BCM C4 harness connector.
    5. Turn the ignition on.

6. Measure the voltage between ground and the (L34) Right High Beam Driver circuit.

   Is there any voltage present?

   Yes

   - Repair the short to voltage in the (L34) Right High Beam Driver circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 3

3. **CHECK THE (L34) RIGHT HIGH BEAM DRIVER CIRCUIT FOR AN OPEN IN THE HARNESS**
   1. Turn the ignition off.
   2. Measure the resistance of the (L34) Right High Beam Driver circuit between the Right Front Lamp Assembly C1 harness connector and the BCM C4 harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 4

      No

      - Repair the open in the (L34) Right High Beam Driver circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK THE (Z906) GROUND CIRCUIT FOR AN OPEN IN THE HARNESS**
   1. Using a 12-volt test light connected to 12-volts, check the (Z906) Ground circuit at the Left Front Lamp Assembly C1 harness connector.

      Does the test light illuminate brightly?

      Yes

      - Go To 5

      No

      - Repair the open in the (Z906) Ground circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **CHECK THE BCM FOR CORRECT OPERATION**

1. Reconnect the BCM C4 harness connector.
2. Connect a 12-volt test light between the (L34) Right High Beam Driver circuit and the (Z906) Ground circuit in the Right Front Lamp Assembly C1 harness connector.
3. Turn the ignition on.
4. Turn the Headlamps on.

   Does the test light illuminate brightly?

   Yes

   - Replace the Right High Beam Bulb in accordance with the Service Information. Refer to **UNIT, FRONT LAMP, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1636-18-RIGHT HIGH BEAM CONTROL - UNDER CURRENT - EXPORT

(L34) RIGHT HIGH BEAM DRIVER CIRCUIT SHORTED TO VOLTAGE
(Z906) GROUND CIRCUIT OPEN
RIGHT HIGH BEAM BULB
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. Turn the Headlamps on.
    3. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE (L34) RIGHT HIGH BEAM DRIVER CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS**
    1. Turn the Headlamps off.
    2. Turn the ignition off.
    3. Disconnect the Right Front Lamp Assembly C1 harness connector.
    4. Disconnect the BCM C4 harness connector.
    5. Turn the ignition on.

6. Measure the voltage between ground and the (L34) Right High Beam Driver circuit.

   Is there any voltage present?

   Yes

   - Repair the short to voltage in the (L34) Right High Beam Driver circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 3

3. **CHECK THE (L34) RIGHT HIGH BEAM DRIVER CIRCUIT FOR AN OPEN IN THE HARNESS**
   1. Turn the ignition off.
   2. Measure the resistance of the (L34) Right High Beam Driver circuit between the Right Front Lamp Assembly C1 harness connector and the BCM C4 harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 4

      No

      - Repair the open in the (L34) Right High Beam Driver circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK THE (Z906) GROUND CIRCUIT FOR AN OPEN IN THE HARNESS**
   1. Disconnect the Right Front Lamp Assembly C2 harness connector.
   2. Using a 12-volt test light connected to 12-volts, check the (Z906) Ground circuit at the Left Front Lamp Assembly C1 and C2 harness connectors.

      Does the test light illuminate brightly?

      Yes

      - Go To 5

      No

      - Repair the open in the (Z906) Ground circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **CHECK THE BCM FOR CORRECT OPERATION**
    1. Reconnect the Right Front Lamp Assembly C2 harness connector.
    2. Reconnect the BCM C4 harness connector.
    3. Connect a 12-volt test light between the (L34) Right High Beam Driver circuit and the (Z906) Ground circuit in the Right Front Lamp Assembly C1 harness connector.
    4. Turn the ignition on.
    5. Turn the Headlamps on.

    Does the test light illuminate brightly?

    Yes

    - Replace the Right High Beam Bulb in accordance with the Service Information. Refer to **UNIT, FRONT LAMP, REMOVAL** .
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

    No

    - Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   3. Measure the resistance between ground and the (L34) Right High Beam Driver circuit.

   Is the resistance above 10K Ohms?

   Yes

   - Replace the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Repair the short to ground in the (L34) Right High Beam Driver circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B163A-18-FRONT LEFT TURN LAMP CONTROL - UNDER CURRENT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 23: Headlamp & Daytime Running Lamp Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The BCM provides a pulsed voltage output through the front turn signal control circuit. The front turn signal control circuit connects to the Turn Signal Lamp. A ground path for the lamps is present through the harness to the sheet metal. For additional information on the Turn Signal Lamps operation, refer to **OPERATION** .

WHEN MONITORED

With the ignition on and the turn signal active.

SET CONDITION

When the Body Control Module (BCM) detects a high condition on the (L61) Left Front Turn Signal Control circuit.

POSSIBLE CAUSES

Possible Causes
(L61) LEFT FRONT TURN SIGNAL CONTROL CIRCUIT OPEN
(L61) LEFT FRONT TURN SIGNAL CONTROL CIRCUIT SHORTED TO VOLTAGE
(Z915) GROUND CIRCUIT OPEN
TURN SIGNAL BULB
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. Turn the Left Turn Signal on.
    3. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE (L61) LEFT FRONT TURN SIGNAL CONTROL CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS**
    1. Turn the Left Turn Signal off.
    2. Turn the ignition off.
    3. Disconnect the Left Front Lamp Assembly C1 harness connector.
    4. Disconnect the BCM C4 harness connector.
    5. Turn the ignition on.
    6. Measure the voltage between ground and the (L61) Left Front Turn Signal Control circuit.

Is there any voltage present?

Yes

- Repair the short to voltage in the (L61) Left Front Turn Signal Control circuit.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 3

3. **CHECK THE (L61) LEFT FRONT TURN SIGNAL CONTROL CIRCUIT FOR AN OPEN IN THE HARNESS**
   1. Turn the ignition off.
   2. Measure the resistance of the (L61) Left Front Turn Signal Control circuit between the Left Front Lamp Assembly C1 harness connector and the BCM C4 harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 4

   No

   - Repair the open in the (L61) Left Front Turn Signal Control circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
4. **CHECK THE (Z915) GROUND CIRCUIT FOR AN OPEN IN THE HARNESS**
   1. Disconnect the Left Front Lamp Assembly C2 and C3 harness connectors.
   2. Using a 12-volt test light connected to 12-volts, check the (Z915) Ground circuits.

   Does the test light illuminate brightly?

   Yes

   - Go To 5

   No

   - Repair the open in the (Z915) Ground circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
5. **CHECK THE BCM FOR CORRECT OPERATION**
   1. Turn the ignition off.
   2. Reconnect the Left Front Lamp Assembly C2 and C3 harness connectors.

3. Reconnect the BCM C4 harness connector.
4. Connect a 12-volt test light between the (L61) Left Front Turn Signal Control circuit and the (Z915) Ground circuit at the Left Front Lamp Assembly C1 harness connector.
5. Turn the ignition on.
6. Turn the Left Turn Signal on.

   Does the test light blink on and off?

   Yes

   - Replace the Park and Turn Signal Bulb in accordance with the Service Information. Refer to **UNIT, FRONT LAMP, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

(L61) LEFT FRONT TURN SIGNAL CONTROL CIRCUIT OPEN
(L61) LEFT FRONT TURN SIGNAL CONTROL CIRCUIT SHORTED TO VOLTAGE
(Z915) GROUND CIRCUIT OPEN
TURN SIGNAL BULB
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. Turn the Left Turn Signal on.
    3. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE (L61) LEFT FRONT TURN SIGNAL CONTROL CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS**
    1. Turn the Left Turn Signal off.
    2. Turn the ignition off.
    3. Disconnect the Left Front Lamp Assembly C1 harness connector.
    4. Disconnect the BCM C4 harness connector.
    5. Turn the ignition on.
    6. Measure the voltage between ground and the (L61) Left Front Turn Signal Control circuit.

Is there any voltage present?

Yes

- Repair the short to voltage in the (L61) Left Front Turn Signal Control circuit.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 3

3. **CHECK THE (L61) LEFT FRONT TURN SIGNAL CONTROL CIRCUIT FOR AN OPEN IN THE HARNESS**
   1. Turn the ignition off.
   2. Measure the resistance of the (L61) Left Front Turn Signal Control circuit between the Left Front Lamp Assembly C1 harness connector and the BCM C4 harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 4

   No

   - Repair the open in the (L61) Left Front Turn Signal Control circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
4. **CHECK THE (Z915) GROUND CIRCUIT FOR AN OPEN IN THE HARNESS**
   1. Disconnect the Left Front Lamp Assembly C2 harness connector.
   2. Using a 12-volt test light connected to 12-volts, check the (Z915) Ground circuits.

   Does the test light illuminate brightly?

   Yes

   - Go To 5

   No

   - Repair the open in the (Z915) Ground circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
5. **CHECK THE BCM FOR CORRECT OPERATION**
   1. Turn the ignition off.
   2. Reconnect the Left Front Lamp Assembly C2 harness connector.

3. Reconnect the BCM C4 harness connector.
4. Connect a 12-volt test light between the (L61) Left Front Turn Signal Control circuit and the (Z915) Ground circuit at the Left Front Lamp Assembly C1 harness connector.
5. Turn the ignition on.
6. Turn the Left Turn Signal on.

   Does the test light blink on and off?

   Yes

   - Replace the Turn Signal Bulb in accordance with the Service Information. Refer to **UNIT, FRONT LAMP, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B163A-19-FRONT LEFT TURN LAMP CONTROL - OVER CURRENT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 25: Headlamp & Daytime Running Lamp Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The BCM provides a pulsed voltage output through the front turn signal control circuit. The front turn signal control circuit connects to the Turn Signal Lamp. A ground path for the lamps is present through the harness to the sheet metal. For additional information on the Turn Signal Lamps operation, refer to **OPERATION** .

WHEN MONITORED

With the ignition on and the turn signal active.

SET CONDITION

When the Body Control Module (BCM) detects a low condition on the (L61) Left Front Turn Signal Control circuit.

POSSIBLE CAUSES

Possible Causes
(L61) LEFT FRONT TURN SIGNAL CONTROL CIRCUIT SHORTED TO GROUND TURN SIGNAL BULB BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. Turn the Left Turn Signal on.
    3. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **ATTEMPT TO SET THE OPPOSITE DTC**
    1. Turn the Left Turn Signal off.
    2. Turn the ignition off.
    3. Disconnect the Left Front Lamp Assembly C1 harness connector.
    4. Turn the ignition on.
    5. Turn the Left Turn Signal on.
    6. With the scan tool, read DTCs.

    Does the scan tool display DTC: B163A-18-FRONT LEFT TURN LAMP CONTROL - UNDER CURRENT?

Yes

- Replace the Left Turn Signal Bulb in accordance with the Service Information. Refer to **UNIT, FRONT LAMP, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 3

3. **CHECK THE (L61) LEFT FRONT TURN SIGNAL CONTROL CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Disconnect the BCM C4 harness connector.
   3. Measure the resistance between ground and the (L61) Left Front Turn Signal Control circuit.

   Is the resistance above 10K Ohms?

   Yes

   - Replace the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Repair the short to ground in the (L61) Left Front Turn Signal Control circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B163A-19-FRONT LEFT TURN LAMP CONTROL - OVER CURRENT - EXPORT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The BCM provides a pulsed voltage output through the front turn signal control circuit. The front turn signal control circuit connects to the Turn Signal Lamp. A ground path for the lamps is present through the harness to the sheet metal. For additional information on the Turn Signal Lamps operation, refer to **OPERATION** .

WHEN MONITORED

With the ignition on and the turn signal active.

SET CONDITION

When the Body Control Module (BCM) detects a low condition on the (L61) Left Front Turn Signal Control circuit.

POSSIBLE CAUSES

Possible Causes
(L61) LEFT FRONT TURN SIGNAL CONTROL CIRCUIT SHORTED TO GROUND TURN SIGNAL BULB BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. Turn the Left Turn Signal on.
    3. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **ATTEMPT TO SET THE OPPOSITE DTC**
    1. Turn the Left Turn Signal off.
    2. Turn the ignition off.
    3. Disconnect the Left Front Lamp Assembly C1 harness connector.
    4. Turn the ignition on.
    5. Turn the Left Turn Signal on.
    6. With the scan tool, read DTCs.

    Does the scan tool display DTC: B163A-18-FRONT LEFT TURN LAMP CONTROL - UNDER CURRENT?

Yes

- Replace the Left Turn Signal Bulb in accordance with the Service Information. Refer to **UNIT, FRONT LAMP, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 3

3. **CHECK THE (L61) LEFT FRONT TURN SIGNAL CONTROL CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Disconnect the BCM C4 harness connector.
   3. Measure the resistance between ground and the (L61) Left Front Turn Signal Control circuit.

   Is the resistance above 10K Ohms?

   Yes

   - Replace the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Repair the short to ground in the (L61) Left Front Turn Signal Control circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B163E-18-FRONT RIGHT TURN LAMP CONTROL - UNDER CURRENT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 27: Headlamp & Daytime Running Lamp Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The BCM provides a pulsed voltage output through the front turn signal control circuit. The front turn signal control circuit connects to the Turn Signal Lamp. A ground path for the lamps is present through the harness to the sheet metal. For additional information on the Turn Signal Lamps operation, refer to **OPERATION** .

WHEN MONITORED

With the ignition on and the turn signal active.

SET CONDITION

When the Body Control Module (BCM) detects a high condition on the (L60) Right Front Turn Signal Driver circuit.

POSSIBLE CAUSES

Possible Causes
(L60) RIGHT FRONT TURN SIGNAL DRIVER CIRCUIT OPEN
(L60) RIGHT FRONT TURN SIGNAL DRIVER CIRCUIT SHORTED TO VOLTAGE
(Z906) GROUND CIRCUIT OPEN
TURN SIGNAL BULB
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. Turn the Right Turn Signal on.
    3. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE (L60) RIGHT FRONT TURN SIGNAL DRIVER CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS**
    1. Turn the Right Turn Signal off.
    2. Turn the ignition off.
    3. Disconnect the Right Front Lamp Assembly C1 harness connector.
    4. Disconnect the BCM C4 harness connector.
    5. Turn the ignition on.
    6. Measure the voltage between ground and the (L60) Right Front Turn Signal Driver circuit.

Is there any voltage present?

Yes

- Repair the short to voltage in the (L60) Right Front Turn Signal Driver circuit.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 3

3. **CHECK THE (L60) RIGHT FRONT TURN SIGNAL DRIVER CIRCUIT FOR AN OPEN IN THE HARNESS**
   1. Turn the ignition off.
   2. Measure the resistance of the (L60) Right Front Turn Signal Driver circuit between the Right Front Lamp Assembly C1 harness connector and the BCM C4 harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 4

   No

   - Repair the open in the (L60) Right Front Turn Signal Driver circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
4. **CHECK THE (Z906) GROUND CIRCUIT FOR AN OPEN IN THE HARNESS**
   1. Disconnect the Right Front Lamp Assembly C2 and C3 harness connectors.
   2. Using a 12-volt test light connected to 12-volts, check the (Z906) Ground circuits.

   Does the test light illuminate brightly?

   Yes

   - Go To 5

   No

   - Repair the open in the (Z906) Ground circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
5. **CHECK THE BCM FOR CORRECT OPERATION**
   1. Turn the ignition off.
   2. Reconnect the Right Front Lamp Assembly C2 and C3 harness connectors.

3. Reconnect the BCM C4 harness connector.
4. Connect a 12-volt test light between the (L60) Right Front Turn Signal Driver circuit and the (Z906) Ground circuit at the Right Front Lamp Assembly C1 harness connector.
5. Turn the ignition on.
6. Turn the Right Turn Signal on.

   Does the test light blink on and off?

   Yes

   - Replace the Turn Signal Bulb in accordance with the Service Information. Refer to **UNIT, FRONT LAMP, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. Turn the Right Turn Signal on.
    3. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE (L60) RIGHT FRONT TURN SIGNAL DRIVER CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS**
    1. Turn the Right Turn Signal off.
    2. Turn the ignition off.
    3. Disconnect the Right Front Lamp Assembly C1 harness connector.
    4. Disconnect the BCM C4 harness connector.
    5. Turn the ignition on.
    6. Measure the voltage between ground and the (L60) Right Front Turn Signal Driver circuit.

Is there any voltage present?

Yes

- Repair the short to voltage in the (L60) Right Front Turn Signal Driver circuit.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 3

3. **CHECK THE (L60) RIGHT FRONT TURN SIGNAL DRIVER CIRCUIT FOR AN OPEN IN THE HARNESS**
   1. Turn the ignition off.
   2. Measure the resistance of the (L60) Right Front Turn Signal Driver circuit between the Right Front Lamp Assembly C1 harness connector and the BCM C4 harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 4

   No

   - Repair the open in the (L60) Right Front Turn Signal Driver circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
4. **CHECK THE (Z906) GROUND CIRCUIT FOR AN OPEN IN THE HARNESS**
   1. Disconnect the Right Front Lamp Assembly C2 harness connector.
   2. Using a 12-volt test light connected to 12-volts, check the (Z906) Ground circuits.

   Does the test light illuminate brightly?

   Yes

   - Go To 5

   No

   - Repair the open in the (Z906) Ground circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
5. **CHECK THE BCM FOR CORRECT OPERATION**
   1. Turn the ignition off.
   2. Reconnect the Right Front Lamp Assembly C2 harness connector.

3. Reconnect the BCM C4 harness connector.
4. Connect a 12-volt test light between the (L60) Right Front Turn Signal Driver circuit and the (Z906) Ground circuit at the Right Front Lamp Assembly C1 harness connector.
5. Turn the ignition on.
6. Turn the Right Turn Signal on.

   Does the test light blink on and off?

   Yes

   - Replace the Turn Signal Bulb in accordance with the Service Information. Refer to **UNIT, FRONT LAMP, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

THEORY OF OPERATION

The BCM provides a pulsed voltage output through the rear turn signal control circuit. The rear turn signal control circuit connects to the Turn Signal Lamp. A ground path for the lamps is present through the harness to the sheet metal. For additional information on the Turn Signal Lamps operation, refer to **OPERATION** .

WHEN MONITORED

With the ignition on and the turn signal active.

SET CONDITION

When the Body Control Module (BCM) detects a low condition on the (L62) Right Rear Turn Lamp Driver circuit.

POSSIBLE CAUSES

Possible Causes
(L62) RIGHT REAR TURN LAMP DRIVER CIRCUIT SHORTED TO GROUND
RIGHT REAR TURN SIGNAL BULB
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. Turn the Right Turn Signal on.
    3. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **ATTEMPT TO SET THE OPPOSITE DTC**
    1. Turn the Right Turn Signal off.
    2. Turn the ignition off.
    3. Disconnect the Right Tail Lamp Assembly harness connector.
    4. Turn the ignition on.
    5. Turn the Right Turn Signal on.
    6. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

- Replace the Right Rear Turn Signal Bulb in accordance with the Service Information. Refer to **LAMP, TAIL STOP TURN, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 3

3. **CHECK THE (L62) RIGHT REAR TURN LAMP DRIVER CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Disconnect the BCM C6 harness connector.
   3. Measure the resistance between ground and the (L62) Right Rear Turn Lamp Driver circuit.

   Is the resistance above 10K Ohms?

   Yes

   - Replace the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Repair the short to ground in the (L62) Right Rear Turn Lamp Driver circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B165B-18-PARK LAMP CONTROL - UNDER CURRENT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 35: Headlamp & Daytime Running Lamp Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Body Control Module (BCM) receives the input from the headlamp switch requesting park lamp illumination. The BCM provides a Pulse Width Modulated (PWM) voltage to the Side Marker Lamps. A ground path for the lamps is present through the harness to the body sheet metal. For additional information on the Side Marker Lamps operation, refer to **OPERATION** .

WHEN MONITORED

With the park lamps active.

SET CONDITION

When the Body Control Module (BCM) detects a short to battery or an open on the (L145) Side Marker Lamp Control circuit.

POSSIBLE CAUSES

Possible Causes
(L145) SIDE MARKER LAMP CONTROL CIRCUIT SHORTED TO BATTERY
(L145) SIDE MARKER LAMP CONTROL CIRCUIT OPEN
(Z915) GROUND CIRCUIT OPEN
(Z906) GROUND CIRCUIT OPEN
LEFT FRONT SIDE MARKER LAMP
RIGHT FRONT SIDE MARKER LAMP
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. Turn the park lamps on.
    3. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE (L145) SIDE MARKER LAMP CONTROL CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS**
    1. Turn the park lamps off.
    2. Turn the ignition off.
    3. Disconnect the Left and Right Daytime Running Lamp harness connectors.
    4. Disconnect the BCM C4 harness connector.

5. Turn the ignition on.
6. Measure the voltage between ground and the (L145) Side Marker Lamp Control circuit.

   Is there any voltage present?

   Yes

   - Repair the short to voltage in the (L145) Side Marker Lamp Control circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 3

3. **CHECK THE (L145) SIDE MARKER LAMP CONTROL CIRCUIT FOR AN OPEN IN THE HARNESS**
   1. Turn the ignition off.
   2. Measure the resistance of the (L145) Side Marker Lamp Control circuit between the Left and Right Daytime Running Lamp harness connectors and the BCM C4 harness connector.

      Is the resistance below 5.0 Ohms for both connections?

      Yes

      - Go To 4

      No

      - Repair the open in the (L145) Side Marker Lamp Control circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
4. **CHECK THE (Z915) GROUND CIRCUIT FOR AN OPEN IN THE HARNESS**
   1. Check the resistance of the (Z915) Ground circuit between the Left Daytime Running Lamp harness connector and ground.

      Is the resistance greater than 10K Ohms?

      Yes

      - Go To 5

      No

      - Repair the open in the (Z915) Ground circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **CHECK THE (Z906) GROUND CIRCUIT FOR AN OPEN IN THE HARNESS**
   1. Measure the resistance of the (Z906) Ground circuit between the Right Daytime Running Lamp harness connector and ground.

      Is the resistance greater than 10K Ohms?

      Yes

      - Go To 6

      No

      - Repair the open in the (Z906) Ground circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
6. **CHECK THE BCM FOR CORRECT OPERATION**
   1. Turn the ignition off.
   2. Reconnect the BCM C4 harness connector.
   3. Turn the ignition on.
   4. Turn the park lamps on.
   5. Measure the voltage between ground and the (L145) Side Marker Lamp Control circuit.

      Is the voltage above 4 volts at both connections?

      Yes

      - Replace the appropriate Backup Lamp in accordance with the Service Information. Refer to **LAMP, TAIL STOP TURN, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Replace the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B165B-19-PARK LAMP CONTROL-OVER CURRENT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 36: Headlamp & Daytime Running Lamp Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Body Control Module (BCM) receives the input from the headlamp switch requesting park lamp illumination. The BCM provides a Pulse Width Modulated (PWM) voltage to the Side Marker Lamps. A ground path for the lamps is present through the harness to the body sheet metal. For additional information on the Side Marker Lamps operation, refer to **OPERATION** .

WHEN MONITORED

With the park lamps active.

SET CONDITION

When the Body Control Module (BCM) detects a low condition on the (L145) Side Marker Lamp Control circuit.

POSSIBLE CAUSES

Possible Causes
(L145) SIDE MARKER LAMP CONTROL CIRCUIT SHORTED TO GROUND
LEFT FRONT SIDE MARKER LAMP BULB
RIGHT FRONT SIDE MARKER LAMP BULB
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE LEFT SIDE MARKER LAMP**
    1. Turn the Park Lamps off.
    2. Turn the ignition off.
    3. Disconnect the Left Daytime Running Lamp harness connector.
    4. Turn the ignition on.
    5. Turn the Park Lamps on.
    6. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

Yes

- Go To 3

No

- Replace the Left Side Marker Lamp in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE RIGHT SIDE MARKER LAMP**
   1. Turn the Park Lamps off.
   2. Turn the ignition off.
   3. Disconnect the Right Daytime Running Lamp harness connector.
   4. Turn the ignition on.
   5. Turn the Park Lamps on.
   6. With the scan tool, read DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Go To 4

   No

   - Replace the Right Side Marker Lamp in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK THE (L145) SIDE MARKER LAMP CONTROL CIRCUIT FOR A SHORT TO GROUND**
   1. Disconnect the BCM C4 harness connector.
   2. Measure the resistance between ground and the (L145) Side Marker Lamp Control circuit.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the short to ground in the (L145) Side Marker Lamp Control circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1666-18-LEFT REVERSE LAMP CONTROL - UNDER CURRENT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 37: Center Stop, Park, Backup & License Plate Lights Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The BCM provides a Pulse Width Modulated (PWM) voltage output through the backup lamp driver circuit. The driver circuit connects to the Backup Lamp. A ground path for the lamps is present through the harness to the body sheet metal. For additional information on the Backup Lamps operation, refer to **OPERATION** .

WHEN MONITORED

With the backup lamps active.

SET CONDITION

When the Body Control Module (BCM) detects a high condition on the (L1) Backup Lamp Driver circuit.

POSSIBLE CAUSES

Possible Causes
(L1) BACKUP LAMP DRIVER CIRCUIT OPEN
(L1) BACKUP LAMP DRIVER CIRCUIT SHORTED TO VOLTAGE
(Z923) GROUND CIRCUIT OPEN
BACKUP LAMP
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the brakes firmly applied, shift the gear selector into REVERSE.
    3. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE (L1) BACKUP LAMP DRIVER CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS**
    1. Shift the gear selector into PARK.
    2. Turn the ignition off.

3. Disconnect the Left and Right Liftgate Lamp harness connectors.
4. Disconnect the BCM C6 harness connector.
5. Turn the ignition on.
6. Measure the voltage between ground and the (L1) Backup Lamp Driver circuit.

   Is there any voltage present?

   Yes

   - Repair the short to voltage in the (L1) Backup Lamp Driver circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 3

3. **CHECK THE (L1) BACKUP LAMP DRIVER CIRCUIT FOR AN OPEN IN THE HARNESS**
   1. Turn the ignition off.
   2. Measure the resistance of the (L1) Backup Lamp Driver circuit between the Left and Right Liftgate Lamp harness connectors and the BCM C6 harness connector.

      Is the resistance below 5.0 Ohms for both connections?

      Yes

      - Go To 4

      No

      - Repair the open in the (L1) Backup Lamp Driver circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK THE (Z923) GROUND CIRCUIT FOR AN OPEN IN THE HARNESS**
   1. Using a 12-volt test light connected to 12-volts, check the (Z923) Ground circuit.

      Does the test light illuminate brightly?

      Yes

      - Go To 5

      No

      - Repair the open in the (Z923) Ground circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **CHECK THE BCM FOR CORRECT OPERATION**
    1. Turn the ignition off.
    2. Reconnect the BCM C6 harness connector.
    3. Connect a 12-volt test light between the (L1) Backup Lamp Driver circuit and the (Z923) Ground circuit at the Left and Right Liftgate Lamp harness connectors.
    4. Turn the ignition on.
    5. With the brakes firmly applied, shift the gear selector into REVERSE.

    Does the test light illuminate brightly at both connections?

    Yes

    - Replace the appropriate Backup Lamp in accordance with the Service Information. Refer to **LAMP, TAIL STOP TURN, REMOVAL** .
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

    No

    - Replace the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1666-19-LEFT REVERSE LAMP CONTROL - OVER CURRENT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 38: Center Stop, Park, Backup & License Plate Lights Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The BCM provides a Pulse Width Modulated (PWM) voltage output through the backup lamp driver circuit. The driver circuit connects to the Backup Lamp. A ground path for the lamps is present through the harness to the body sheet metal. For additional information on the Backup Lamps operation, refer to **OPERATION** .

WHEN MONITORED

With the backup lamps active.

SET CONDITION

When the Body Control Module (BCM) detects a low condition on the (L1) Backup Lamp Driver circuit.

POSSIBLE CAUSES

Possible Causes
(L1) BACKUP LAMP DRIVER CIRCUIT SHORTED TO GROUND
BACKUP LAMP
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the brakes firmly applied, shift the gear selector into REVERSE.
    3. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **ATTEMPT TO SET THE OPPOSITE DTC**
    1. Shift the gear selector into PARK.
    2. Turn the ignition off.
    3. Disconnect the Left and Right Liftgate Lamp harness connectors.
    4. Turn the ignition on.
    5. With the brakes firmly applied, shift the gear selector into REVERSE.
    6. With the scan tool, read DTCs.

    Does the scan tool display DTC: B1707-18-LEFT REVERSE LAMP CONTROL - UNDER

CURRENT?

Yes

- Replace the Backup Lamp in accordance with the Service Information. Refer to **LAMP, TAIL STOP TURN, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 3

3. **CHECK THE (L1) BACKUP LAMP DRIVER CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Disconnect the BCM C6 harness connector.
   3. Measure the resistance between ground and the (L1) Backup Lamp Driver circuit.

   Is the resistance above 10K Ohms?

   Yes

   - Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Repair the short to ground in the (L1) Backup Lamp Driver circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B166A-12-LEFT TRAILER TOW LAMP CONTROL - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 39: Trailer Tow Lamp Control Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

Four relays are used to provide voltage to the Trailer Tow connector. The trailer tow relays are used to switch fused battery voltage directly to the Trailer Tow connector when requested. The trailer tow relays are activated through a ground path provided by the Body Control Module (BCM).

WHEN MONITORED

With the ignition on, turn signal active.

SET CONDITION

The Body Control Module (BCM) detects a short to voltage on the Left Rear Trailer Turn Lamp Control circuit.

POSSIBLE CAUSES

Possible Causes
LEFT REAR TRAILER TURN LAMP CONTROL CIRCUIT SHORTED TO BATTERY
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
   1. Turn the ignition on.
   2. With the scan tool, read DTCs.

      Does the scan tool display this DTC as active?

      Yes

      - Go To 2

      No

      - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE (L655) LEFT REAR TRAILER TURN LAMP CONTROL CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS**
   1. Turn the ignition off.
   2. Disconnect the PDC C3 harness connector.
   3. Turn the ignition on.
   4. Measure the voltage between ground and the (L655) Left Rear Trailer Turn Lamp Control circuit at the PDC C3 harness connector.

      Is there any voltage present?

      Yes

      - Using the wiring diagrams as a guide, repair the short to voltage in the (L655) Left Rear Turn Signal Control circuit.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 3

3. **INSPECT RELATED WIRING AND CHECK FOR TSBs**
   1. Turn the ignition off.
   2. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the PDC and the BCM.
   3. Look for any chafed, pierced, pinched, or partially broken wires.
   4. Look for broken, bent, pushed out or corroded terminals.
   5. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B166A-14-LEFT TRAILER TOW LAMP CONTROL - CIRCUIT SHORT TO GROUND OR OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 40: Trailer Tow Lamp Control Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

Four relays are used to provide voltage to the Trailer Tow connector. The trailer tow relays are used to switch fused battery voltage directly to the Trailer Tow connector when requested. The trailer tow relays are activated through a ground path provided by the Body Control Module (BCM).

WHEN MONITORED

With the ignition on.

With the turn signal inactive.

SET CONDITION

If the Body Control Module (BCM) detects less than expected voltage on the (L655) Left Rear Turn Signal Control circuit.

POSSIBLE CAUSES

Possible Causes
(L655) LEFT REAR TURN SIGNAL CONTROL CIRCUIT OPEN
(L655) LEFT REAR TURN SIGNAL CONTROL CIRCUIT SHORTED TO GROUND
TRAILER TOW LEFT TURN RELAY
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, clear all DTCs.
    3. Wait 10 seconds.
    4. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE TRAILER TOW LEFT TURN RELAY**
    1. Turn the ignition off.
    2. Remove the Trailer Tow Left Turn Relay and substitute it with a known good relay.
    3. Turn the ignition on and wait 10 seconds.
    4. With the scan tool, read DTCs.

Is the status Active for this DTC?

Yes

- Go To 3

No

- Replace the Trailer Tow Left Turn Relay.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (L655) LEFT REAR TURN SIGNAL CONTROL CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Remove the Trailer Tow Left Turn Relay.
   3. Disconnect the BCM C8 harness connector.
   4. Measure the resistance between ground and the (L655) Left Rear Turn Signal Control circuit.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 4

   No

   - Repair the short to ground in the (L655) Left Rear Turn Signal Control circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
4. **CHECK THE (L655) LEFT REAR TURN SIGNAL CONTROL CIRCUIT FOR AN OPEN**
   1. Measure the resistance of the (L655) Left Rear Turn Signal Control circuit between the Trailer Tow Left Turn Relay harness connector and the BCM C8 harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 5

   No

   - Repair the open in the (L655) Left Rear Turn Signal Control circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
5. **INSPECT RELATED WIRING AND CHECK FOR TSBs**
   1. Turn the ignition off.

2. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Trailer Tow Left Turn Relay and the BCM.
3. Look for any chafed, pierced, pinched, or partially broken wires.
4. Look for broken, bent, pushed out or corroded terminals.
5. Perform any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B166E-12-RIGHT TRAILER TOW LAMP CONTROL - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 41: Trailer Tow Lamp Control Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

Four relays are used to provide voltage to the Trailer Tow connector. The trailer tow relays are used to switch fused battery voltage directly to the Trailer Tow connector when requested. The trailer tow relays are activated through a ground path provided by the Body Control Module (BCM).

WHEN MONITORED

With the ignition on, turn signal active.

SET CONDITION

The Body Control Module (BCM) detects a short to voltage on the Right Rear Trailer Turn Lamp Control circuit.

POSSIBLE CAUSES

Possible Causes
RIGHT REAR TRAILER TURN LAMP CONTROL CIRCUIT SHORTED TO BATTERY
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
   1. Turn the ignition on.
   2. With the scan tool, read DTCs.

      Does the scan tool display this DTC as active?

      Yes

      - Go To 2

      No

      - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE (L656) RIGHT REAR TRAILER TURN LAMP CONTROL CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS**
   1. Turn the ignition off.
   2. Disconnect the PDC C3 harness connector.
   3. Turn the ignition on.
   4. Measure the voltage between ground and the (L656) Right Rear Trailer Turn Lamp Control circuit at the PDC C3 harness connector.

      Is there any voltage present?

      Yes

      - Using the wiring diagrams as a guide, repair the short to voltage in the (L656) Right Rear

Turn Signal Control circuit.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 3

3. **INSPECT RELATED WIRING AND CHECK FOR TSBs**
   1. Turn the ignition off.
   2. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the PDC and the BCM.
   3. Look for any chafed, pierced, pinched, or partially broken wires.
   4. Look for broken, bent, pushed out or corroded terminals.
   5. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B166E-14-RIGHT TRAILER TOW LAMP CONTROL - CIRCUIT SHORT TO GROUND OR OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 42: Trailer Tow Lamp Control Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

Four relays are used to provide voltage to the Trailer Tow connector. The trailer tow relays are used to switch fused battery voltage directly to the Trailer Tow connector when requested. The trailer tow relays are activated through a ground path provided by the Body Control Module (BCM).

WHEN MONITORED

With the ignition on.

With the turn signal inactive.

SET CONDITION

If the Body Control Module (BCM) detects less than expected voltage on the (L656) Right Rear Turn Signal Control circuit.

POSSIBLE CAUSES

Possible Causes
(L656) RIGHT REAR TURN SIGNAL CONTROL CIRCUIT OPEN
(L656) RIGHT REAR TURN SIGNAL CONTROL CIRCUIT SHORTED TO GROUND
TRAILER TOW RIGHT TURN RELAY
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, clear all DTCs.
    3. Wait 10 seconds.
    4. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE TRAILER TOW RIGHT TURN RELAY**
    1. Turn the ignition off.
    2. Remove the Trailer Tow Right Turn Relay and substitute it with a known good relay.
    3. Turn the ignition on and wait 10 seconds.
    4. With the scan tool, read DTCs.

Is the status Active for this DTC?

Yes

- Go To 3

No

- Replace the Trailer Tow Right Turn Relay.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (L656) RIGHT REAR TURN SIGNAL CONTROL CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Remove the Trailer Tow Right Turn Relay.
   3. Disconnect the BCM C8 harness connector.
   4. Measure the resistance between ground and the (L656) Right Rear Turn Signal Control circuit.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 4

   No

   - Repair the short to ground in the (L656) Right Rear Turn Signal Control circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
4. **CHECK THE (L656) RIGHT REAR TURN SIGNAL CONTROL CIRCUIT FOR AN OPEN**
   1. Measure the resistance of the (L656) Right Rear Turn Signal Control circuit between the Trailer Tow Right Turn Relay harness connector and the BCM C8 harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 5

   No

   - Repair the open in the (L656) Right Rear Turn Signal Control circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
5. **INSPECT RELATED WIRING AND CHECK FOR TSBs**
   1. Turn the ignition off.

2. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Trailer Tow Right Turn Relay and the BCM.
3. Look for any chafed, pierced, pinched, or partially broken wires.
4. Look for broken, bent, pushed out or corroded terminals.
5. Perform any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B168E-2A-FRONT FOG LAMP SWITCH CIRCUIT-STUCK

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Body Control Module (BCM) receives an input voltage from the Headlamp switch. The BCM monitors the headlamp switch voltage and controls the exterior lighting functions based on the switch input. For additional information on Headlamp Switch operation, refer to **SWITCH, HEADLAMP, OPERATION** .

WHEN MONITORED

With the ignition on.

SET CONDITION

The BCM detects that the Fog Lamp switch is active for an extended amount of time.

POSSIBLE CAUSES

Possible Causes
HEADLAMP SWITCH

DIAGNOSTIC TEST

CHECK FOR AN ACTIVE DTC

1. Turn the ignition on.
2. Turn the Headlamps on.
3. Operate the Fog Lamp Switch several times.
4. With the scan tool, read DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Replace the Headlamp Switch in accordance with the Service Information. Refer to **SWITCH, HEADLAMP, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B16AF-09-LEFT STOP LAMP CONTROL - COMPONENT FAILURES

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Body Control Module (BCM) receives a hardwired brake signal from the Anti-lock Brake System (ABS) module indicating that the Brake Pedal is applied. When this signal is received, the BCM provides a voltage output through the rear park lamp control circuit. On the liftgate, the park lamp control circuit connects to the dual filament Park and Stop Lamp. The same ground circuit is used for both the Park and Stop Lamp filaments in a dual filament lamp. For additional information on the Brake Lamp operation, refer to **OPERATION** .

WHEN MONITORED

With the ignition on and the Brake Pedal applied.

SET CONDITION

When the Body Control Module (BCM) detects an outage in the Tail Lamp Assembly.

POSSIBLE CAUSES

Possible Causes
LEFT TAIL LAMP ASSEMBLY

DIAGNOSTIC TEST

CHECK FOR AN ACTIVE DTC

1. Turn the ignition on.
2. Apply the Brake Pedal.
3. With the scan tool, read DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Replace the Left Tail Lamp Assembly in accordance with the Service Information. Refer to **LAMP, TAIL STOP TURN, REMOVAL** .

   No

   - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B16B3-09-RIGHT STOP LAMP CONTROL - COMPONENT FAILURES

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Body Control Module (BCM) receives a hardwired brake signal from the Anti-lock Brake System (ABS) module indicating that the Brake Pedal is applied. When this signal is received, the BCM provides a voltage output through the rear park lamp control circuit. On the liftgate, the park lamp control circuit connects to the dual filament Park and Stop Lamp. The same ground circuit is used for both the Park and Stop Lamp filaments in a dual filament lamp. For additional information on the Brake Lamp operation, refer to **OPERATION** .

WHEN MONITORED

With the Brake Pedal applied.

SET CONDITION

When the Body Control Module (BCM) detects an outage on the Tail Lamp Assembly.

POSSIBLE CAUSES

Possible Causes
RIGHT TAIL LAMP ASSEMBLY

DIAGNOSTIC TEST

CHECK FOR AN ACTIVE DTC

1. Turn the ignition on.
2. Apply the Brake Pedal.
3. With the scan tool, read DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Replace the Right Tail Lamp Assembly in accordance with the Service Information. Refer to **LAMP, TAIL STOP TURN, REMOVAL** .

   No

   - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B16B7-18-CENTER STOP LAMP CONTROL - UNDER CURRENT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 43: Center Stop, Park, Backup & License Plate Lights Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Body Control Module (BCM) receives a hardwired brake signal from the Anti-lock Brake System (ABS) module indicating that the Brake Pedal is applied. When this signal is received, the BCM provides a voltage output through the Center High Mounted Stop Lamp (CHMSL) control circuit. For additional information on the Brake Lamp operation, refer to **OPERATION** .

WHEN MONITORED

With the ignition on and the Brake Pedal applied.

SET CONDITION

When the Body Control Module (BCM) detects a high condition on the (L56) CHMSL Driver circuit.

POSSIBLE CAUSES

Possible Causes
(L56) CHMSL DRIVER CIRCUIT OPEN
(L56) CHMSL DRIVER CIRCUIT SHORTED TO VOLTAGE
(Z923) GROUND CIRCUIT OPEN
CENTER HIGH MOUNTED STOP LAMP (CHMSL)
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. Apply the Brake Pedal.
    3. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE (L56) CHMSL DRIVER CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS**
    1. Turn the ignition off.
    2. Disconnect the Center High Mounted Stop Lamp harness connector.
    3. Disconnect the BCM C6 harness connector.
    4. Turn the ignition on.
    5. Measure the voltage between ground and the (L56) CHMSL Driver circuit.

Is there any voltage present?

Yes

- Repair the short to voltage in the (L56) CHMSL Driver circuit.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 3

3. **CHECK THE (L56) CHMSL DRIVER CIRCUIT FOR AN OPEN IN THE HARNESS**
   1. Turn the ignition off.
   2. Measure the resistance of the (L56) CHMSL Driver circuit between the Center High Mounted Stop Lamp harness connector and the BCM C6 harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 4

   No

   - Repair the open in the (L56) CHMSL Driver circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK THE (Z923) GROUND CIRCUIT FOR AN OPEN IN THE HARNESS**
   1. Using a 12-volt test light connected to 12-volts, check the (Z923) Ground circuit.

   Does the test light illuminate brightly?

   Yes

   - Go To 5

   No

   - Repair the open in the (Z923) Ground circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **CHECK THE BCM FOR CORRECT OPERATION**
   1. Turn the ignition off.
   2. Reconnect the BCM C6 harness connector.
   3. Connect a 12-volt test light between the (L56) CHMSL Driver circuit and the (Z923) Ground circuit at the Center High Mounted Stop Lamp harness connector.

4. Turn the ignition on.
5. Apply the Brake Pedal.

   Does the test light illuminate brightly?

   Yes

   - Replace the Center High Mounted Stop Lamp in accordance with the Service Information. Refer to **LAMP, CENTER HIGH MOUNTED STOP, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B16B7-19-CENTER STOP LAMP CONTROL - OVER CURRENT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 44: Center Stop, Park, Backup & License Plate Lights Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Body Control Module (BCM) receives a hardwired brake signal from the Anti-lock Brake System (ABS) module indicating that the Brake Pedal is applied. When this signal is received, the BCM provides a voltage output through the Center High Mounted Stop Lamp (CHMSL) control circuit. For additional information on the Brake Lamp operation, refer to **OPERATION** .

WHEN MONITORED

With the ignition on and the Brake Pedal applied.

SET CONDITION

When the Body Control Module (BCM) detects a low condition on the (L56) CHMSL Driver circuit.

POSSIBLE CAUSES

Possible Causes
(L56) CHMSL DRIVER CIRCUIT SHORTED TO GROUND
CENTER HIGH MOUNTED STOP LAMP (CHMSL)
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. Apply the Brake Pedal.
    3. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **ATTEMPT TO SET THE OPPOSITE DTC**
    1. Turn the ignition off.
    2. Disconnect the Center High Mounted Stop Lamp harness connector.
    3. Turn the ignition on.
    4. Apply the Brake Pedal.
    5. With the scan tool, read DTCs.

    Does the scan tool display DTC: B16B7-18-CENTER STOP LAMP CONTROL - UNDER CURRENT?

Yes

- Replace the Center High Mounted Stop Lamp in accordance with the Service Information. Refer to **LAMP, CENTER HIGH MOUNTED STOP, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 3

3. **CHECK THE (L56) CHMSL DRIVER CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Disconnect the BCM C6 harness connector.
   3. Measure the resistance between ground and the (L56) CHMSL Driver circuit.

   Is the resistance above 10K Ohms?

   Yes

   - Replace the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Repair the short to ground in the (L56) CHMSL Driver circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B16BB-12-TRAILER STOP LAMP CONTROL - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 45: Trailer Tow Module Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the ignition on, turn signal active.

SET CONDITION

The Body Control Module (BCM) detects a short to voltage on the Trailer Stop Lamp Control circuit.

POSSIBLE CAUSES

Possible Causes
TRAILER STOP LAMP CONTROL CIRCUIT SHORTED TO VOLTAGE
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
   1. Turn the ignition on.
   2. With the scan tool, read DTCs.

      Does the scan tool display this DTC as active?

      Yes

      - Go To 2

      No

      - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE (B122) TRAILER STOP LAMP CONTROL CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS**
   1. Turn the ignition off.
   2. Disconnect the BCM C6 harness connector.
   3. Turn the ignition on.
   4. Measure the voltage between ground and the (B122) Trailer Stop Lamp Control circuit at the BCM C6 harness connector.

      Is there any voltage present?

      Yes

      - Using the wiring diagrams as a guide, repair the short to voltage in the (B122) Trailer Stop Lamp Control circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 3

3. **INSPECT RELATED WIRING AND CHECK FOR TSBs**
   1. Turn the ignition off.
   2. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the PDC and the BCM.
   3. Look for any chafed, pierced, pinched, or partially broken wires.
   4. Look for broken, bent, pushed out or corroded terminals.
   5. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B16BB-14-TRAILER STOP LAMP CONTROL - CIRCUIT SHORT TO GROUND OR OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 46: Trailer Tow Module Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the ignition on.

With the stop lamps inactive.

SET CONDITION

If the Body Control Module (BCM) detects less than expected voltage on the (B122) Trailer Tow Stop Lamp Relay Control circuit.

POSSIBLE CAUSES

Possible Causes
(B122) TRAILER TOW STOP LAMP RELAY CONTROL CIRCUIT OPEN
(B122) TRAILER TOW STOP LAMP RELAY CONTROL CIRCUIT SHORTED TO GROUND
STOP LAMP TRAILER TOW RELAY
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, clear all DTCs.
    3. Wait 10 seconds.
    4. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE STOP LAMP TRAILER TOW RELAY**
    1. Turn the ignition off.
    2. Remove the Stop Lamp Trailer Tow Relay and substitute it with a known good relay.
    3. Turn the ignition on and wait 10 seconds.
    4. With the scan tool, read DTCs.

    Is the status Active for this DTC?

Yes

- Go To 3

No

- Replace the Stop Lamp Trailer Tow Relay.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (B122) TRAILER TOW STOP LAMP RELAY CONTROL CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Remove the Stop Lamp Trailer Tow Relay.
   3. Disconnect the BCM C6 harness connector.
   4. Measure the resistance between ground and the (B122) Trailer Tow Stop Lamp Relay Control circuit.

      Is the resistance above 10k Ohms?

      Yes

      - Go To 4

      No

      - Repair the short to ground in the (B122) Trailer Tow Stop Lamp Relay Control circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
4. **CHECK THE (B122) TRAILER TOW STOP LAMP RELAY CONTROL CIRCUIT FOR AN OPEN**
   1. Measure the resistance of the (B122) Trailer Tow Stop Lamp Relay Control circuit between the Stop Lamp Trailer Tow Relay harness connector and the BCM C6 harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 5

      No

      - Repair the open in the (B122) Trailer Tow Stop Lamp Relay Control circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
5. **INSPECT RELATED WIRING AND CHECK FOR TSBs**
   1. Turn the ignition off.

2. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Stop Lamp Trailer Tow Relay and the BCM.
3. Look for any chafed, pierced, pinched, or partially broken wires.
4. Look for broken, bent, pushed out or corroded terminals.
5. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B16CF-09-LEFT DRL LAMP CONTROL - COMPONENT FAILURES

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

When the Body Control Module (BCM) detects an outage in the Left Daytime Running Lamp (DRL).

POSSIBLE CAUSES

Possible Causes
LEFT DAYTIME RUNNING LAMP (DRL)

DIAGNOSTIC TEST

CHECK FOR AN ACTIVE DTC

1. Turn the ignition on.
2. With the scan tool, read DTCs.

   Does the scan tool display this DTC as active?

Yes

- Replace the Left Daytime Running Lamp in accordance with the Service Information.

No

- Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B16CF-19-LEFT DRL LAMP CONTROL - OVER CURRENT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 47: Headlamp & Daytime Running Lamp Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the DRL active.

SET CONDITION

When the Body Control Module (BCM) detects a low condition on the Left Daytime Running Lamp Driver circuit.

POSSIBLE CAUSES

Possible Causes
(L58) LEFT DAYTIME RUNNING LAMP DRIVER CIRCUIT SHORTED TO GROUND LEFT DAYTIME RUNNING LAMP BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE LEFT DAYTIME RUNNING LAMP**
    1. Turn the ignition off.
    2. Disconnect the Left Daytime Running Lamp C3 harness connector.
    3. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 3

    No

    - Replace the Left Daytime Running Lamp in accordance with the Service Information. Refer to **UNIT, FRONT LAMP, REMOVAL** .
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
3. **CHECK THE (L58) LEFT DAYTIME RUNNING LAMP DRIVER CIRCUIT FOR A SHORT TO GROUND**

1. Turn the ignition off.
2. Disconnect the BCM C4 harness connector.
3. Measure the resistance between ground and the (L58) Left Daytime Running Lamp Driver circuit.

   Is the resistance above 10K Ohms?

   Yes

   - Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Repair the short to ground in the (L58) Left Daytime Running Lamp Driver circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B16CF-19-LEFT DRL LAMP CONTROL - OVER CURRENT - EXPORT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 48: Daytime Running Lamp Circuit Diagram

WHEN MONITORED

With the DRL active.

SET CONDITION

When the Body Control Module (BCM) detects a low condition on the Left Daytime Running Lamp Driver

circuit.

POSSIBLE CAUSES

Possible Causes
(L58) LEFT DAYTIME RUNNING LAMP DRIVER CIRCUIT SHORTED TO GROUND LEFT DAYTIME RUNNING LAMP BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
   1. Turn the ignition on.
   2. With the scan tool, read DTCs.

      Does the scan tool display this DTC as active?

      Yes

      - Go To 2

      No

      - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE LEFT DAYTIME RUNNING LAMP**
   1. Turn the ignition off.
   2. Disconnect the Left Daytime Running Lamp C2 harness connector.
   3. With the scan tool, read DTCs.

      Does the scan tool display this DTC as active?

      Yes

      - Go To 3

      No

      - Replace the Left Daytime Running Lamp in accordance with the Service Information. Refer to **UNIT, FRONT LAMP, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
3. **CHECK THE (L58) LEFT DAYTIME RUNNING LAMP DRIVER CIRCUIT FOR A SHORT TO**

GROUND

1. Turn the ignition off.
2. Disconnect the BCM C4 harness connector.
3. Measure the resistance between ground and the (L58) Left Daytime Running Lamp Driver circuit.

   Is the resistance above 10K Ohms?

   Yes

   - Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Repair the short to ground in the (L58) Left Daytime Running Lamp Driver circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B16D3-09-RIGHT DRL LAMP CONTROL - COMPONENT FAILURES

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

When the Body Control Module (BCM) detects an outage in the Right Daytime Running Lamp (DRL).

POSSIBLE CAUSES

Possible Causes
RIGHT DAYTIME RUNNING LAMP (DRL)

DIAGNOSTIC TEST

CHECK FOR AN ACTIVE DTC

1. Turn the ignition on.
2. With the scan tool, read DTCs.

   Does the scan tool display this DTC as active?

   Yes

- Replace the Right Daytime Running Lamp in accordance with the Service Information.

No

- Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B16D3-19-RIGHT DRL LAMP CONTROL - OVER CURRENT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 49: Headlamp & Daytime Running Lamp Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the DRL active.

SET CONDITION

When the Body Control Module (BCM) detects a low condition on the Right Daytime Running Lamp Driver circuit.

POSSIBLE CAUSES

Possible Causes
(L59) RIGHT DAYTIME RUNNING LAMP DRIVER CIRCUIT SHORTED TO GROUND RIGHT DAYTIME RUNNING LAMP BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE RIGHT DAYTIME RUNNING LAMP**
    1. Turn the ignition off.
    2. Disconnect the Right Daytime Running Lamp C3 harness connector.
    3. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 3

    No

    - Replace the Right Daytime Running Lamp in accordance with the Service Information. Refer to **UNIT, FRONT LAMP, REMOVAL** .
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
3. **CHECK THE (L59) RIGHT DAYTIME RUNNING LAMP DRIVER CIRCUIT FOR A SHORT TO GROUND**

1. Turn the ignition off.
2. Disconnect the BCM C6 harness connector.
3. Measure the resistance between ground and the (L59) Right Daytime Running Lamp Driver circuit.

   Is the resistance above 10K Ohms?

   Yes

   - Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Repair the short to ground in the (L59) Right Daytime Running Lamp Driver circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B16D3-19-RIGHT DRL LAMP CONTROL - OVER CURRENT - EXPORT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 50: Daytime Running Lamp Circuit Diagram

WHEN MONITORED

With the DRL active.

SET CONDITION

When the Body Control Module (BCM) detects a low condition on the Right Daytime Running Lamp Driver

circuit.

POSSIBLE CAUSES

Possible Causes
(L59) RIGHT DAYTIME RUNNING LAMP DRIVER CIRCUIT SHORTED TO GROUND RIGHT DAYTIME RUNNING LAMP BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE RIGHT DAYTIME RUNNING LAMP**
    1. Turn the ignition off.
    2. Disconnect the Right Daytime Running Lamp C2 harness connector.
    3. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 3

    No

    - Replace the Right Daytime Running Lamp in accordance with the Service Information. Refer to **UNIT, FRONT LAMP, REMOVAL** .
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
3. **CHECK THE (L59) RIGHT DAYTIME RUNNING LAMP DRIVER CIRCUIT FOR A SHORT**

TO GROUND

1. Turn the ignition off.
2. Disconnect the BCM C6 harness connector.
3. Measure the resistance between ground and the (L59) Right Daytime Running Lamp Driver circuit.

   Is the resistance above 10K Ohms?

   Yes

   - Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Repair the short to ground in the (L59) Right Daytime Running Lamp Driver circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B16E7-18-LICENSE PLATE LAMP CONTROL - UNDER CURRENT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Body Control Module (BCM) receives the input from the headlamp switch requesting lamp illumination. The BCM provides a Pulse Width Modulated (PWM) voltage output through the license plate lamp control circuit. The control circuit connects to the License Plate Lamps, which are part of the Park Lamp lighting system. A ground path for the lamps is present through the harness to the body sheet metal. For additional information on the Park Lamps operation, refer to **OPERATION** .

WHEN MONITORED

With the ignition on and the park lamps active.

SET CONDITION

When the Body Control Module (BCM) detects a high condition on the (L3) License Plate Lamp Driver circuit.

POSSIBLE CAUSES

Possible Causes
(L3) LICENSE PLATE LAMP DRIVER CIRCUIT OPEN
(L3) LICENSE PLATE LAMP DRIVER CIRCUIT SHORTED TO VOLTAGE
(Z924) GROUND CIRCUIT OPEN
LICENSE PLATE LAMP

BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
   1. Turn the ignition on.
   2. Turn the Park Lamps on.
   3. With the scan tool, read DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Go To 2

   No

   - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE (L3) LICENSE PLATE LAMP DRIVER CIRCUIT FOR A SHORT TO VOLTAGE**
   1. Turn the Park Lamps off.
   2. Turn the ignition off.
   3. Disconnect the License Plate Lamp harness connector.
   4. Disconnect the BCM C6 harness connector.
   5. Turn the ignition on.
   6. Measure the voltage between ground and the (L3) License Plate Lamp Driver circuit.

   Is there any voltage present?

   Yes

   - Repair the short to voltage in the (L3) License Plate Lamp Driver circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 3
3. **CHECK THE (L3) LICENSE PLATE LAMP DRIVER CIRCUIT FOR AN OPEN**
   1. Turn the ignition off.
   2. Measure the resistance of the (L3) License Plate Lamp Driver circuit between the License Plate

Lamp harness connector and the BCM C6 harness connector.

Is the resistance below 5.0 Ohms?

Yes

- Go To 4

No

- Repair the open in the (L3) License Plate Lamp Driver circuit.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK THE (Z924) GROUND CIRCUIT FOR AN OPEN**
   1. Using a 12-volt test light connected to 12-volts, check the (Z924) Ground circuit.

   Does the test light illuminate brightly?

   Yes

   - Go To 5

   No

   - Repair the open in the (Z924) Ground circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **CHECK THE BCM FOR CORRECT OPERATION**
   1. Turn the ignition off.
   2. Reconnect the BCM C6 harness connector.
   3. Connect a 12-volt test light between the (L3) License Plate Lamp Driver circuit and the (Z924) Ground circuit at the License Plate Lamp harness connector.
   4. Turn the ignition on.
   5. Turn the Park Lamps on.

   Does the test light illuminate brightly?

   Yes

   - Replace the License Plate Lamp in accordance with the Service Information. Refer to **LAMP, LICENSE PLATE, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

- Replace the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B16E7-19-LICENSE PLATE LAMP CONTROL - OVER CURRENT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Body Control Module (BCM) receives the input from the headlamp switch requesting lamp illumination. The BCM provides a Pulse Width Modulated (PWM) voltage output through the license plate lamp control circuit. The control circuit connects to the License Plate Lamps, which are part of the Park Lamp lighting system. A ground path for the lamps is present through the harness to the body sheet metal. For additional information on the Park Lamps operation, refer to **OPERATION** .

WHEN MONITORED

With the ignition on and the park lamps active.

SET CONDITION

When the Body Control Module (BCM) detects a low condition on the (L3) License Plate Lamp Driver circuit.

POSSIBLE CAUSES

Possible Causes
(L3) LICENSE PLATE LAMP DRIVER CIRCUIT SHORTED TO GROUND
LICENSE PLATE LAMP
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. Turn the Park Lamps on.
    3. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

- Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **ATTEMPT TO SET THE OPPOSITE DTC**
   1. Turn the Park Lamps off.
   2. Turn the ignition off.
   3. Disconnect the License Plate Lamp harness connector.
   4. Turn the ignition on.
   5. Turn the Park Lamps on.
   6. With the scan tool, read DTCs.

   Does the scan tool display DTC: B16E7-18-LICENSE PLATE LAMP CONTROL- UNDER CURRENT?

   Yes

   - Replace the License Plate Lamp in accordance with the Service Information. Refer to **LAMP, LICENSE PLATE, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 3

3. **CHECK THE (L3) LICENSE PLATE LAMP DRIVER CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Disconnect the BCM C6 harness connector.
   3. Measure the resistance between ground and the (L3) License Plate Lamp Driver circuit.

   Is the resistance above 10K Ohms?

   Yes

   - Replace the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Repair the short to ground in the (L3) License Plate Lamp Driver circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1751-12-COURTESY LAMP CONTROL - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 51: Dome Lamp Control Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the ignition on and the Courtesy Lamps on.

SET CONDITION

This DTC will set when the Body Control Module (BCM) detects a short to voltage on the Ambient Lighting Control circuit.

POSSIBLE CAUSES

Possible Causes
AMBIENT LIGHTING CONTROL CIRCUIT SHORTED TO VOLTAGE BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE (M108) AMBIENT LIGHTING CONTROL FOR A SHORT TO VOLTAGE**
    1. Turn the ignition off.
    2. Disconnect the BCM C6 harness connector.
    3. Disconnect the Left and Right Front Footwell Lamp harness connectors.
    4. Measure the voltage of the (M108) Ambient Lighting Control circuit.

    Is the voltage above 5.0 volts?

    Yes

    - Repair the (M108) Ambient Lighting Control circuit for a short to voltage.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace the Body Control Module in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1783-18-STOP LAMP CONTROL - UNDER CURRENT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 52: Center Stop, Park, Backup & License Plate Lights Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Body Control Module (BCM) receives the input from the headlamp switch requesting park lamp illumination. The BCM provides a Pulse Width Modulated (PWM) voltage to the Park Lamps. A ground path for the lamps is present through the harness to the body sheet metal. For additional information on the Park Lamps operation, refer to **OPERATION** .

WHEN MONITORED

With the park lamps active.

SET CONDITION

When the Body Control Module (BCM) detects a short to battery or an open on the (L17) Park Lamp Driver circuit.

POSSIBLE CAUSES

Possible Causes
(L17) PARK LAMP DRIVER CIRCUIT SHORTED TO BATTERY
(L17) PARK LAMP DRIVER CIRCUIT OPEN
(Z923) GROUND CIRCUIT OPEN
LEFT LIFTGATE PARK LAMP
RIGHT LIFTGATE PARK LAMP
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. Turn the park lamps on.
    3. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE (L17) PARK LAMP DRIVER CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS**
    1. Turn the ignition off.
    2. Disconnect the Left and Right Liftgate Lamp harness connectors.
    3. Disconnect the BCM C6 harness connector.
    4. Turn the ignition on.

5. Measure the voltage between ground and the (L17) Park Lamp Driver circuit.

   Is there any voltage present?

   Yes

   - Repair the short to voltage in the (L17) Park Lamp Driver circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 3

3. **CHECK THE (L17) PARK LAMP DRIVER CIRCUIT FOR AN OPEN IN THE HARNESS**
   1. Turn the ignition off.
   2. Measure the resistance of the (L17) Park Lamp Driver circuit between the Left and Right Liftgate Lamp harness connectors and the BCM C6 harness connector.

      Is the resistance below 5.0 Ohms for both connections?

      Yes

      - Go To 4

      No

      - Repair the open in the (L17) Park Lamp Driver circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK THE (Z923) GROUND CIRCUIT FOR AN OPEN IN THE HARNESS**
   1. Using a 12-volt test light connected to 12-volts, check the (Z923) Ground circuit at the Left and Right Liftgate Lamp harness connectors.

      Does the test light illuminate brightly for both connections?

      Yes

      - Go To 5

      No

      - Repair the open in the (Z923) Ground circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **CHECK THE BCM FOR CORRECT OPERATION**
   1. Turn the ignition off.

2. Reconnect the BCM C6 harness connector.
3. Turn the ignition on.
4. Turn the park lamps on.
5. Connect a 12-volt test light between ground and the (L17) Park Lamp Driver circuit at the Left and Right Liftgate Lamp harness connectors.

   Does the test light illuminate brightly at both connections?

   Yes

   - Replace the appropriate Liftgate Park Lamp in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1783-19-STOP LAMP CONTROL - OVER CURRENT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 53: Center Stop, Park, Backup & License Plate Lights Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Body Control Module (BCM) receives the input from the headlamp switch requesting park lamp illumination. The BCM provides a Pulse Width Modulated (PWM) voltage to the Park Lamps. A ground path for the lamps is present through the harness to the body sheet metal. For additional information on the Park Lamps operation, refer to **OPERATION** .

WHEN MONITORED

With the park lamps active.

SET CONDITION

When the Body Control Module (BCM) detects a low condition on the (L17) Park Lamp Driver circuit.

POSSIBLE CAUSES

Possible Causes
(L17) PARK LAMP DRIVER CIRCUIT SHORTED TO GROUND
LEFT LIFTGATE PARK LAMP
RIGHT LIFTGATE PARK LAMP
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE LEFT LIFTGATE STOP LAMP**
    1. Turn the ignition off.
    2. Disconnect the Left Liftgate Lamp harness connector.
    3. Turn the ignition on.
    4. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

- Go To 3

No

- Replace the Left Liftgate Lamp in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE RIGHT LIFTGATE STOP LAMP**
   1. Turn the ignition off.
   2. Disconnect the Right Liftgate Lamp harness connector.
   3. Turn the ignition on.
   4. With the scan tool, read DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Go To 4

   No

   - Replace the Right Liftgate Lamp in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
4. **CHECK THE (L17) PARK LAMP DRIVER CIRCUIT FOR A SHORT TO GROUND**
   1. Disconnect the BCM C6 harness connector.
   2. Measure the resistance between ground and the (L17) Park Lamp Driver circuit.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the short to ground in the (L17) Park Lamp Driver circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B178E-11-HEADLAMP SWITCH INPUT CIRCUIT - SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 54: Headlamp Switch Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Body Control Module (BCM) receives an input voltage from the headlamp switch. The BCM monitors the headlamp switch voltage and controls the exterior lighting functions based on the switch input. For additional information on Headlamp Switch operation, refer to **SWITCH, HEADLAMP, OPERATION** .

WHEN MONITORED

With the ignition on.

SET CONDITION

The BCM detects a low condition on the (L307) Headlamp Switch MUX circuit.

POSSIBLE CAUSES

Possible Causes
(L307) HEADLAMP SWITCH MUX CIRCUIT SHORTED TO GROUND
(L307) HEADLAMP SWITCH MUX CIRCUIT SHORTED TO THE (L900) HEADLAMP SWITCH MUX RETURN CIRCUIT
HEADLAMP SWITCH
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read the DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE HEADLAMP SWITCH FOR AN INTERNAL SHORT TO GROUND**
    1. Turn the ignition off.
    2. Disconnect the Headlamp Switch harness connector.
    3. Turn the ignition on.
    4. With the scan tool, read the DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 3

    No

    - Replace the Headlamp Switch in accordance with the Service Information. Refer to

SWITCH, HEADLAMP, REMOVAL .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (L307) HEADLAMP SWITCH MUX CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Disconnect the BCM C8 harness connector.
   3. Measure the resistance between ground and the (L307) Headlamp Switch MUX circuit.

      Is the resistance above 10K Ohms?

      Yes

      - Go To 4

      No

      - Repair the short to ground on the (L307) Headlamp Switch MUX circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
4. **CHECK THE (L307) HEADLAMP SWITCH MUX CIRCUIT FOR A SHORT TO THE (L900) HEADLAMP SWITCH MUX RETURN CIRCUIT**
   1. Measure the resistance between the (L307) Headlamp Switch MUX circuit and the (L900) Headlamp Switch MUX Return circuit.

      Is the resistance above 10K Ohms?

      Yes

      - Replace the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Repair the short between the (L307) Headlamp Switch MUX circuit and the (L900) Headlamp Switch MUX Return circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B178E-15-HEADLAMP SWITCH INPUT - CIRCUIT SHORT TO BATTERY OR OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 55: Headlamp Switch Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Body Control Module (BCM) receives an input voltage from the headlamp switch. The BCM monitors the headlamp switch voltage and controls the exterior lighting functions based on the switch input. For additional information on Headlamp Switch operation, refer to **SWITCH, HEADLAMP, OPERATION** .

WHEN MONITORED

With the ignition on.

SET CONDITION

The BCM detects a short to voltage or an open on the (L307) Headlamp Switch MUX circuit.

POSSIBLE CAUSES

Possible Causes
(L307) HEADLAMP SWITCH MUX CIRCUIT SHORTED TO VOLTAGE
(L307) HEADLAMP SWITCH MUX CIRCUIT OPEN
(L900) HEADLAMP SWITCH MUX RETURN CIRCUIT OPEN
HEADLAMP SWITCH
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
    1. Turn the ignition on.
    2. Turn the Headlamps on.
    3. With the scan tool, read the DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK (L307) HEADLAMP SWITCH MUX CIRCUIT FOR A SHORT TO VOLTAGE**
    1. Turn the ignition off.
    2. Disconnect the Headlamp Switch harness connector.
    3. Turn the ignition on.
    4. Measure the voltage of the (L307) Headlamp Switch MUX circuit.

    Is the voltage above 5.0 volts?

    Yes

    - Repair the (L307) Headlamp Switch MUX circuit for a short to voltage.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 3

3. **CHECK THE HEADLAMP SWITCH**
   1. Turn the ignition off.
   2. Connect a jumper wire between ground and the (L307) Headlamp Switch MUX circuit at the Headlamp Switch harness connector.
   3. Turn the ignition on.
   4. With the scan tool, read the DTCs.

   Does the scan tool display DTC: B178E-11-HEADLAMP SWITCH INPUT - CIRCUIT SHORT TO GROUND?

   Yes

   - Replace the Headlamp Switch in accordance with the Service Information. Refer to **SWITCH, HEADLAMP, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 4

4. **CHECK (L307) HEADLAMP SWITCH MUX CIRCUIT FOR AN OPEN**
   1. Turn the ignition off.
   2. Disconnect the BCM C8 harness connector.
   3. Measure the resistance of the (L307) Headlamp Switch MUX circuit.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 5

   No

   - Repair the (L307) Headlamp Switch MUX circuit for an open.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **CHECK (L900) HEADLAMP SWITCH MUX RETURN CIRCUIT FOR AN OPEN**
   1. Measure the resistance of the (L900) Headlamp Switch MUX Return circuit.

   Is the resistance below 5.0 Ohms?

   Yes

- Replace the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Repair the (L307) Headlamp Switch MUX Return circuit for an open.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B178E-64-HEADLAMP SWITCH INPUT SIGNAL - PLAUSIBILITY FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

This DTC will set if the incorrect Headlamp Switch is installed on the vehicle.

POSSIBLE CAUSES

Possible Causes
INCORRECT HEADLAMP SWITCH INSTALLED

DIAGNOSTIC TEST

CHECK FOR ACTIVE DTC

1. Turn the ignition on.
2. With the scan tool, read the DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Replace the Headlamp Switch in accordance with the Service Information. Refer to **SWITCH, HEADLAMP, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water

intrusion, corrosion, pushed out or bent terminals and correct pin tension.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B179F-2A-REAR FOG LAMP SWITCH - STUCK

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Body Control Module (BCM) receives the input from the headlamp switch requesting fog lamp illumination. The BCM provides a pulse width modulated (PWM) voltage output through the fog lamp driver circuit, which connects to the Fog Lamp. A ground path for the lamps is present through the harness.

WHEN MONITORED

With the fog lamps active.

SET CONDITION

The BCM detects that the Rear Fog Lamp switch is active for an extended amount of time.

POSSIBLE CAUSES

Possible Causes
HEADLAMP SWITCH

DIAGNOSTIC TEST

CHECK FOR AN ACTIVE DTC

1. Turn the ignition on.
2. Turn the Rear Fog Lamps on.
3. With the scan tool, read DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Replace the Headlamp Switch in accordance with the Service Information. Refer to **SWITCH, HEADLAMP, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Test complete. The condition or conditions that originally set this DTC are not present at this time.

Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B17C5-12-TRAILER TOW REVERSE LAMP CONTROL - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 56: Trailer Tow Lamp Control Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

Four relays are used to provide voltage to the Trailer Tow connector. The trailer tow relays are used to switch fused battery voltage directly to the Trailer Tow connector when requested. The trailer tow relays are activated through a ground path provided by the Body Control Module (BCM).

WHEN MONITORED

With the ignition on, turn signal active.

SET CONDITION

The Body Control Module (BCM) detects a short to voltage on the Trailer Reverse Lamp Control circuit.

POSSIBLE CAUSES

Possible Causes
TRAILER REVERSE LAMP CONTROL CIRCUIT SHORTED TO VOLTAGE
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE (L658) TRAILER REVERSE LAMP CONTROL CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS**
    1. Turn the ignition off.
    2. Disconnect the PDC C2 harness connector.
    3. Turn the ignition on.
    4. Measure the voltage between ground and the (L658) Trailer Reverse Lamp Control circuit at the

PDC C2 harness connector.

Is there any voltage present?

Yes

- Using the wiring diagrams as a guide, repair the short to voltage in the (L658) Trailer Reverse Lamp Control circuit.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 3

3. **INSPECT RELATED WIRING AND CHECK FOR TSBs**
   1. Turn the ignition off.
   2. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the PDC and the BCM.
   3. Look for any chafed, pierced, pinched, or partially broken wires.
   4. Look for broken, bent, pushed out or corroded terminals.
   5. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B17C5-14-TRAILER TOW REVERSE LAMP CONTROL - CIRCUIT SHORT TO GROUND OR OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 57: Trailer Tow Lamp Control Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

Four relays are used to provide voltage to the Trailer Tow connector. The trailer tow relays are used to switch fused battery voltage directly to the Trailer Tow connector when requested. The trailer tow relays are activated through a ground path provided by the Body Control Module (BCM).

WHEN MONITORED

With the ignition on.

With the reverse lamps inactive.

SET CONDITION

If the Body Control Module (BCM) detects less than expected voltage on the (L658) Trailer Tow Reverse Lamp Relay Control circuit.

POSSIBLE CAUSES

Possible Causes
(L658) TRAILER TOW REVERSE LAMP RELAY CONTROL CIRCUIT OPEN
(L658) TRAILER TOW REVERSE LAMPS RELAY CONTROL CIRCUIT SHORTED TO GROUND
TRAILER TOW BACKUP RELAY
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, clear all DTCs.
    3. Wait 10 seconds.
    4. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE TRAILER TOW BACKUP RELAY**
    1. Turn the ignition off.
    2. Remove the Trailer Tow Backup Relay and substitute it with a known good relay.
    3. Turn the ignition on and wait 10 seconds.
    4. With the scan tool, read DTCs.

Is the status Active for this DTC?

Yes

- Go To 3

No

- Replace the Trailer Tow Backup Relay.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (L658) TRAILER TOW REVERSE LAMP RELAY CONTROL CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Remove the Trailer Tow Backup Relay.
   3. Disconnect the BCM C8 harness connector.
   4. Measure the resistance between ground and the (L658) Trailer Tow Reverse Lamp Relay Control circuit.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 4

   No

   - Repair the short to ground in the (L658) Trailer Tow Reverse Lamp Relay Control circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK THE (L658) TRAILER TOW REVERSE LAMP RELAY CONTROL CIRCUIT FOR AN OPEN**
   1. Measure the resistance of the (L658) Trailer Tow Reverse Lamp Relay Control circuit between the Trailer Tow Backup Relay harness connector and the BCM C8 harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 5

   No

   - Repair the open in the (L658) Trailer Tow Reverse Lamp Relay Control circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **INSPECT RELATED WIRING AND CHECK FOR TSBs**

1. Turn the ignition off.
2. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Trailer Tow Backup Relay and the BCM.
3. Look for any chafed, pierced, pinched, or partially broken wires.
4. Look for broken, bent, pushed out or corroded terminals.
5. Perform any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B17F3-8F-AUTO HIGH BEAM SYSTEM AIM - ERRATIC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

The DTC will be set if the target light source is not within the correctable limits of the mirror.

POSSIBLE CAUSES

Possible Causes
SMART BEAM CALIBRATION

DIAGNOSTIC TEST

CHECK FOR AN ACTIVE DTC

1. Turn the ignition on.
2. Using the scan tool, read DTCs.

Does the scan tool display this DTC as active?

Yes

- Perform the Smart Beam Calibration in accordance with the Service Information.

No

- Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B17F6-12-TRAILER TAILLAMP CONTROL - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 58: Trailer Tow Lamp Control Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

Four relays are used to provide voltage to the Trailer Tow connector. The trailer tow relays are used to switch fused battery voltage directly to the Trailer Tow connector when requested. The trailer tow relays are activated through a ground path provided by the Body Control Module (BCM).

WHEN MONITORED

With the ignition on, park lamps active.

SET CONDITION

The Body Control Module (BCM) detects a short to voltage on the Trailer Tow Park Lamps Relay Control circuit.

POSSIBLE CAUSES

Possible Causes
(L657) TRAILER TOW PARK LAMPS RELAY CONTROL CIRCUIT SHORTED TO VOLTAGE
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
   1. Turn the ignition on.
   2. With the scan tool, read DTCs.

      Does the scan tool display this DTC as active?

      Yes

      - Go To 2

      No

      - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE (L657) TRAILER PARK LAMP CONTROL CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS**
   1. Turn the ignition off.
   2. Disconnect the PDC C2 harness connector.
   3. Turn the ignition on.
   4. Measure the voltage between ground and the (L657) Trailer Park Lamp Control circuit at the PDC C2 harness connector.

      Is there any voltage present?

      Yes

      - Using the wiring diagrams as a guide, repair the short to voltage in the (L657) Trailer Park

Lamp Control circuit.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 3

3. **INSPECT RELATED WIRING AND CHECK FOR TSBs**
   1. Turn the ignition off.
   2. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the PDC and the BCM.
   3. Look for any chafed, pierced, pinched, or partially broken wires.
   4. Look for broken, bent, pushed out or corroded terminals.
   5. Perform any Technical Service Bulletins that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B17F6-14-TRAILER TAILLAMP CONTROL - CIRCUIT SHORT TO GROUND OR OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 59: Trailer Tow Lamp Control Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

Four relays are used to provide voltage to the Trailer Tow connector. The trailer tow relays are used to switch fused battery voltage directly to the Trailer Tow connector when requested. The trailer tow relays are activated through a ground path provided by the Body Control Module (BCM).

WHEN MONITORED

With the ignition on.

With the park lamps inactive.

SET CONDITION

If the Body Control Module (BCM) detects less than expected voltage on the (L657) Trailer Tow Park Lamps Relay Control circuit.

POSSIBLE CAUSES

Possible Causes
(L657) TRAILER TOW PARK LAMPS RELAY CONTROL CIRCUIT OPEN
(L657) TRAILER TOW PARK LAMPS RELAY CONTROL CIRCUIT SHORTED TO GROUND
TRAILER TOW PARK RELAY
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, clear all DTCs.
    3. Wait 10 seconds.
    4. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE TRAILER TOW PARK RELAY**
    1. Turn the ignition off.
    2. Remove the Trailer Tow Park Relay and substitute it with a known good relay.
    3. Turn the ignition on and wait 10 seconds.
    4. With the scan tool, read DTCs.

Is the status Active for this DTC?

Yes

- Go To 3

No

- Replace the Trailer Tow Park Relay.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (L657) TRAILER TOW PARK LAMPS RELAY CONTROL CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Remove the Trailer Tow Park Relay.
   3. Disconnect the BCM C4 harness connector.
   4. Measure the resistance between ground and the (L657) Trailer Tow Park Lamps Relay Control circuit.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 4

   No

   - Repair the short to ground in the (L657) Trailer Tow Park Lamps Relay Control circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
4. **CHECK THE (L657) TRAILER TOW PARK LAMPS RELAY CONTROL CIRCUIT FOR AN OPEN**
   1. Measure the resistance of the (L657) Trailer Tow Park Lamps Relay Control circuit between the Trailer Tow Park Relay harness connector and the BCM C4 harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 5

   No

   - Repair the open in the (L657) Trailer Tow Park Lamps Relay Control circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
5. **INSPECT RELATED WIRING AND CHECK FOR TSBs**

1. Turn the ignition off.
2. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Trailer Tow Park Relay and the BCM.
3. Look for any chafed, pierced, pinched, or partially broken wires.
4. Look for broken, bent, pushed out or corroded terminals.
5. Perform any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B17FB-8F-AUTO HIGH BEAM CAMERA VIEW BLOCK - ERRATIC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

The DTC will be set if the target light source is not within the correctable limits of the mirror.

POSSIBLE CAUSES

Possible Causes
SMART BEAM CALIBRATION

DIAGNOSTIC TEST

CHECK FOR AN ACTIVE DTC

1. Turn the ignition on.
2. With the scan tool, read DTCs.

Does the scan tool display this DTC as active?

Yes

- Perform the Smart Beam Calibration in accordance with the Service Information.

No

- Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B17FF-11-AMBIENT CABIN LIGHT DIMMER SWITCH - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 60: Dimmer Switch Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the ignition on.

SET CONDITION

The Body Control Module (BCM) detects a short to ground on the (E3) Ambient Lamps Dimmer Signal circuit.

POSSIBLE CAUSES

Possible Causes
(E3) AMBIENT LAMPS DIMMER SIGNAL CIRCUIT SHORTED TO GROUND
DIMMER SWITCH
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
   1. Turn the ignition on.
   2. With the scan tool, read DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Go To 2

   No

   - Test complete. The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded or contaminated terminals.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE OPERATION OF DIMMER SWITCH**
   1. Turn the ignition off.
   2. Disconnect the Dimmer Switch harness connector.
   3. Turn the ignition on.
   4. With the scan tool, read DTCs.

   Does the scan tool display DTC: B17FF-15-AMBIENT CABIN LIGHT DIMMER SWITCH - CIRCUIT SHORT TO BATTERY OR OPEN as active?

   Yes

   - Replace the Dimmer Switch in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 3
3. **CHECK THE (E3) AMBIENT LAMPS DIMMER SIGNAL CIRCUIT FOR A SHORT TO GROUND**

1. Turn the ignition off.
2. Disconnect the BCM C8 harness connector.
3. Measure the resistance between ground and the (E3) Ambient Lamps Dimmer Signal circuit.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the short to ground in the (E3) Ambient Lamps Dimmer Signal circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B17FF-15-AMBIENT CABIN LIGHT DIMMER SWITCH - CIRCUIT SHORT TO BATTERY OR OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 61: Dimmer Switch Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the ignition on.

SET CONDITION

The Body Control Module (BCM) detects a short to voltage or an open on the (E3) Ambient Lamps Dimmer Signal is greater than expected for more than one second.

POSSIBLE CAUSES

Possible Causes
(E3) AMBIENT LAMPS DIMMER SIGNAL CIRCUIT SHORTED TO VOLTAGE
(E3) AMBIENT LAMPS DIMMER SIGNAL CIRCUIT OPEN
DIMMER SWITCH
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
   1. Turn the ignition on.
   2. With the scan tool, read DTCs.

      Does the scan tool display this DTC as active?

      Yes

      - Go To 2

      No

      - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE (E3) AMBIENT LAMPS DIMMER SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**
   1. Turn the ignition off.
   2. Disconnect the Dimmer Switch harness connector.
   3. Disconnect the BCM C8 harness connector.
   4. Turn the ignition on.
   5. Measure the voltage on the (E3) Ambient Lamps Dimmer Signal circuit.

      Is there any voltage present?

      Yes

      - Repair the short to voltage in (E3) Ambient Lamps Dimmer Signal circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

- Go To 3

3. **CHECK THE (E3) AMBIENT LAMPS DIMMER SIGNAL CIRCUIT FOR AN OPEN**
   1. Turn the ignition off.
   2. Measure the resistance of the (E3) Ambient Lamps Dimmer Signal circuit between the Dimmer Switch harness connector and the BCM C8 harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 4

      No

      - Repair the open in the (E3) Ambient Lamps Dimmer Signal circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
4. **CHECK THE OPERATION OF THE PANEL LAMPS DIMMER SWITCH**
   1. Reconnect the BCM C8 harness connector.
   2. Connect a jumper wire at the Dimmer Switch harness connector between the (E3) Ambient Lamps Dimmer Signal circuit and ground.
   3. Turn the ignition on.
   4. With the scan tool, read DTCs.

      Does the scan tool display DTC: B17FF-11-AMBIENT CABIN LIGHT DIMMER SWITCH - CIRCUIT SHORT TO GROUND as active?

      Yes

      - Replace the Dimmer Switch in accordance with the Service Information.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Replace the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1800-2A-DRIVER DOOR LOCK/UNLOCK SWITCH-STUCK

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

This DTC will set if the BCM detects the Driver Door Lock/Unlock Switch stuck in the LOCK or UNLOCK position.

POSSIBLE CAUSES

Possible Causes
DRIVER WINDOW/DOOR LOCK SWITCH

DIAGNOSTIC TEST

CHECK FOR AN ACTIVE DTC

1. Turn the ignition on.
2. With the scan tool, read DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Replace the Driver Window/Door Lock Switch in accordance with the Service Information. Refer to **SWITCH, POWER WINDOW, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1805-2A-PASSENGER DOOR LOCK/UNLOCK SWITCH-STUCK

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

This DTC will set if the BCM detects the Passenger Door Lock/Unlock Switch stuck in the LOCK or UNLOCK position.

POSSIBLE CAUSES

Possible Causes
PASSENGER WINDOW/DOOR LOCK SWITCH

DIAGNOSTIC TEST

CHECK FOR AN ACTIVE DTC

1. Turn the ignition on.
2. With the scan tool, read DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Replace the Passenger Window/Door Lock Switch in accordance with the Service Information. Refer to **SWITCH, POWER WINDOW, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B181C-23-TRUNK/LIFTGATE INPUT - SIGNAL STUCK LOW

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 62: Trunk/Liftgate Latch Switch Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the ignition on.

SET CONDITION

This DTC will set when the Body Control Module (BCM) detects the Liftgate Release Switch is stuck in the ON position.

POSSIBLE CAUSES

Possible Causes

(P223) LIFTGATE RELEASE SWITCH SENSE CIRCUIT SHORTED TO GROUND
LIFTGATE RELEASE SWITCH
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
   1. Turn the ignition on.
   2. Press the Liftgate Release Switch several times.
   3. With the scan tool, read DTCs.

      Does the scan tool display this DTC as active?

      Yes

      - Go To 2

      No

      - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK FOR A STUCK LIFTGATE RELEASE SWITCH**
   1. Turn the ignition off.
   2. Disconnect the Liftgate Release Switch harness connector.
   3. Turn the ignition on.
   4. With the scan tool, read DTCs.

      Does the scan tool display this DTC as active?

      Yes

      - Go To 3

      No

      - Replace the Liftgate Release Switch in accordance with the Service Information.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
3. **CHECK THE (P223) LIFTGATE RELEASE SWITCH SENSE CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Disconnect the BCM C8 harness connector.

3. Measure the resistance between ground and the (P223) Liftgate Release Switch Sense circuit at the Liftgate Release Switch harness connector.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the (P223) Liftgate Release Switch Sense circuit for a short to ground.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the Body Control Module in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B181E-11-HOOD AJAR INPUT - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 63: Hood Ajar Switch Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Body Control Module (BCM) provides a reference voltage on the hood ajar switch sense circuit through a pull-up resistor that is connected to battery voltage. The Hood Ajar Switch switches the hood ajar switch sense circuit to ground when the hood is open. A diagnostic resistor internal to the switch is placed in parallel with the switch.

WHEN MONITORED

With the ignition on.

SET CONDITION

This DTC will set when the Body Control Module (BCM) detects a short to ground in the Hood Ajar Switch Sense circuit.

POSSIBLE CAUSES

Possible Causes
(G70) HOOD AJAR SWITCH SENSE CIRCUIT SHORTED TO GROUND
HOOD AJAR SWITCH
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. Press down on the Hood Ajar Switch several times.
    3. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK FOR A STUCK HOOD AJAR SWITCH**
    1. Turn the ignition off.
    2. Disconnect the Hood Ajar Switch harness connector.
    3. Turn the ignition on.
    4. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 3

    No

- Replace the Hood Ajar Switch in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (G70) HOOD AJAR SWITCH SENSE CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Disconnect the BCM C4 harness connector.
   3. Measure the resistance between ground and the (G70) Hood Ajar Switch Sense circuit at the Liftgate Release Switch harness connector.

      Is the resistance below 10K Ohms?

      Yes

      - Repair the (G70) Hood Ajar Switch Sense circuit for a short to ground.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Replace the Body Control Module in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B181E-15-HOOD AJAR INPUT - CIRCUIT SHORT TO BATTERY OR OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 64: Hood Ajar Switch Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Body Control Module (BCM) provides a reference voltage on the hood ajar switch sense circuit through a pull-up resistor that is connected to battery voltage. The Hood Ajar Switch switches the hood ajar switch sense circuit to ground when the hood is open. A diagnostic resistor internal to the switch is placed in parallel with the switch.

WHEN MONITORED

Continuously

SET CONDITION

When the BCM detects that the parallel resistor is not detected in the circuit and the switch is not closed.

POSSIBLE CAUSES

Possible Causes
(G70) HOOD AJAR SWITCH SENSE CIRCUIT SHORT TO VOLTAGE
(G70) HOOD AJAR SWITCH SENSE CIRCUIT OPEN
(G931) GROUND CIRCUIT OPEN
HOOD AJAR SWITCH
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE HOOD AJAR SWITCH FOR AN OPEN**
    1. Turn the ignition off.
    2. Disconnect the Hood Ajar Switch harness connector.
    3. Depress the plunger of the hood ajar switch and measure the resistance between the two terminals of the switch.

    Is the resistance approximately 1K Ohms?

    Yes

    - Go To 3

    No

- Replace the Hood Ajar Switch in accordance with the Service Information. Refer to **SWITCH, HOOD AJAR, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (G70) HOOD AJAR SWITCH SENSE CIRCUIT FOR A SHORT TO BATTERY**
   1. Disconnect the BCM C4 harness connector.
   2. Turn the ignition on.
   3. Measure the voltage of the (G70) Hood Ajar Switch Sense circuit.

      Is the voltage present?

      Yes

      - Repair the short to voltage on the (G70) Hood Ajar Switch Sense circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 4
4. **CHECK THE (G70) HOOD AJAR SWITCH SENSE CIRCUIT FOR AN OPEN**
   1. Turn the ignition off.
   2. Measure the resistance of the (G70) Hood Ajar Switch Sense circuit between the BCM C4 and Hood Ajar Switch harness connectors.

      Is the resistance above 5.0 Ohms?

      Yes

      - Repair the open in the (G70) Hood Ajar Switch Sense circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 5
5. **CHECK THE (G931) GROUND CIRCUIT FOR AN OPEN**
   1. Measure the resistance of the (G931) Ground circuit between the BCM C4 and Hood Ajar Switch harness connectors.

      Is the resistance above 5.0 Ohms?

      Yes

      - Repair the open in the (G931) Ground circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B182C-64-ALL DOOR LOCK CONTROL SIGNAL - PLAUSIBILITY FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 65: Passenger Door Lock Control Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the ignition on.

SET CONDITION

The Body Control Module will set this DTC if voltage is detected on the Door Lock Relay Output circuit with the Door Lock Relay inactive.

POSSIBLE CAUSES

Possible Causes
DOOR LOCK RELAY OUTPUT CIRCUIT SHORTED TO VOLTAGE BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE (P778) DOOR LOCK RELAY OUTPUT CIRCUIT FOR A SHORT TO VOLTAGE**
    1. Turn the ignition off.
    2. Disconnect the BCM C5 harness connector.
    3. Turn the ignition on.
    4. Measure the voltage of the (P778) Door Lock Relay Output circuit.

    Is voltage present?

    Yes

    - Repair the short to voltage on the (P778) Door Lock Relay Output circuit.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

    No

    - Replace the Body Control Module in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2014 ACCESSORIES AND EQUIPMENT

Body Control Module (BCM) - Electrical Diagnostics - Cherokee

DIAGNOSIS AND TESTING

B186E-64-ALL DOOR SECONDARY LOCK CONTROL - SIGNAL PLAUSIBILITY FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 1: Secondary Lock Control Circuit Diagram

WHEN MONITORED

With the ignition on.

SET CONDITION

The Body Control Module will set this DTC if voltage is detected on the (P235) Dead Bolt Lock Relay Output circuit.

POSSIBLE CAUSES

Possible Causes
(P235) DEAD BOLT LOCK RELAY OUTPUT CIRCUIT SHORTED TO VOLTAGE BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
   1. Turn the ignition on.
   2. With the scan tool, read DTCs.

      Does the scan tool display this DTC as active?

      Yes

      - Go To 2

      No

      - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE (P235) DEAD BOLT LOCK RELAY OUTPUT CIRCUIT FOR A SHORT TO VOLTAGE**
   1. Turn the ignition off.
   2. Disconnect the BCM C5 harness connector.
   3. Turn the ignition on.
   4. Measure the voltage of the (P235) Dead Bolt Lock Relay Output circuit.

      Is voltage present?

      Yes

      - Repair the short to voltage on the (P235) Dead Bolt Lock Relay Output circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Replace the Body Control Module in accordance with the Service Information. Refer to

MODULE, BODY CONTROL, REMOVAL .

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1989-64-ALL DOOR SECONDARY UNLOCK CONTROL - SIGNAL PLAUSIBILITY FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 2: Secondary Lock Control Circuit Diagram

WHEN MONITORED

With the ignition on.

SET CONDITION

The Body Control Module will set this DTC if voltage is detected on the (P237) Dead Bolt Unlock Relay Output circuit.

POSSIBLE CAUSES

Possible Causes
(P237) DEAD BOLT UNLOCK RELAY OUTPUT CIRCUIT SHORTED TO VOLTAGE BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE (P237) DEAD BOLT UNLOCK RELAY OUTPUT CIRCUIT FOR A SHORT TO VOLTAGE**
    1. Turn the ignition off.
    2. Disconnect the BCM C5 harness connector.
    3. Turn the ignition on.
    4. Measure the voltage of the (P237) Dead Bolt Unlock Relay Output circuit.

    Is voltage present?

Yes

- Repair the short to voltage on the (P237) Dead Bolt Unlock Relay Output circuit.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace the Body Control Module in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1A90-51-SECRET KEY NOT STORED IN BCM - NOT PROGRAMMED

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

Error is detected if the BCM still has the default Secret Key (BCM has not received a new Secret Key from the RFHM).

POSSIBLE CAUSES

Possible Causes
BODY CONTROL MODULE NOT PROGRAMMED

DIAGNOSTIC TEST

CHECK FOR AN ACTIVE DTC

1. Turn the ignition on.
2. With the scan tool, read DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Refer to **STANDARD PROCEDURE** and perform the PROGRAM THE BCM (Body Control Module) procedure.

   No

- Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B2100-12-IGNITION RUN/START INPUT-CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 3: Ignition Run/Start Input Circuit Diagram

Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Body Control Module (BCM) receives an ignition feed from the Radio Frequency (RF) Hub indicating run/start operation is requested. The BCM provides a voltage output through the run/start relay control circuit, which connects to the coil side of the Run/Start Relay. The Body Control Module (BCM) monitors the ignition switch status message received over the Controller Area Network (CAN) bus.

WHEN MONITORED

With the Ignition Run/Start Relay off.

SET CONDITION

When the Body Control Module (BCM) detects voltage on the (F20) Ignition Run/Start Control Output circuit when the RF Hub indicates the ignition is off.

POSSIBLE CAUSES

Possible Causes
(F20) IGNITION RUN/START CONTROL OUTPUT CIRCUIT SHORTED TO VOLTAGE RADIO FREQUENCY (RF) HUB BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE BCM FOR CORRECT OPERATION**
    1. Turn the ignition off.

2. Disconnect the BCM C8 harness connector.
3. Measure the voltage of the (F20) Ignition Run/Start Control Output circuit at the BCM C8 harness connector.

   Is voltage present?

   Yes

   - Go To 3

   No

   - Replace the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (F20) IGNITION RUN/START CONTROL OUTPUT CIRCUIT FOR A SHORT TO VOLTAGE**
   1. Disconnect the RF Hub C1 harness connector.
   2. Measure the voltage of the (F20) Ignition Run/Start Control Output circuit at the RF Hub C1 harness connector.

      Is voltage present?

      Yes

      - Repair the short to voltage in the (F20) Ignition Run/Start Control Output circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Replace the RF Hub in accordance with the Service Information. Refer to **MODULE, RADIO FREQUENCY (RF HUB), REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B2100-14-IGNITION RUN/START INPUT - CIRCUIT SHORT TO GROUND OR OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 4: Ignition Run/Start Input Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Body Control Module (BCM) receives an ignition feed from the Radio Frequency (RF) Hub indicating run/start operation is requested. The BCM provides a voltage output through the run/start relay control circuit, which connects to the coil side of the Run/Start Relay. The Body Control Module (BCM) monitors the ignition switch status message received over the Controller Area Network (CAN) bus.

WHEN MONITORED

With the Ignition Run/Start Relay off.

SET CONDITION

When the Body Control Module (BCM) detects no voltage on the (F20) Ignition Run/Start Control Output circuit when the RF Hub indicates the ignition is on.

POSSIBLE CAUSES

Possible Causes
(F20) IGNITION RUN/START CONTROL OUTPUT CIRCUIT SHORTED TO GROUND OR OPEN RADIO FREQUENCY (RF) HUB BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE BCM FOR CORRECT OPERATION**
    1. Turn the ignition off.
    2. Disconnect the BCM C8 harness connector.
    3. Turn the ignition on.
    4. Measure the voltage of the (F20) Ignition Run/Start Control Output circuit at the BCM C8 harness connector.

    Is the voltage greater than 10 volts?

    Yes

    - Replace the BCM in accordance with the Service Information. Refer to **MODULE, BODY**

CONTROL, REMOVAL .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 3

3. **CHECK THE (F20) IGNITION RUN/START CONTROL OUTPUT CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Disconnect the RF Hub C1 harness connector.
   3. Measure the resistance between ground and the (F20) Ignition Run/Start Control Output circuit at the RF Hub C1 harness connector.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the short to ground on the (F20) Ignition Run/Start Control Output circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 4

4. **CHECK THE (F20) IGNITION RUN/START CONTROL OUTPUT CIRCUIT FOR AN OPEN**
   1. Measure the resistance of the (F20) Ignition Run/Start Control Output circuit between the RF Hub C1 and BCM C8 harness connectors.

   Is the resistance above 5.0 Ohms?

   Yes

   - Repair the open in the (F20) Ignition Run/Start Control Output circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the RF Hub in accordance with the Service Information. Refer to **MODULE, RADIO FREQUENCY (RF HUB), REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B2103-18-IGNITION RUN/START 1 CONTROL-UNDER CURRENT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 5: Ignition Run/Start Input Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the ignition on.

SET CONDITION

This DTC will set if the Body Control Module (BCM) detects an open or short to voltage on the Run/Start Relay Control circuit.

POSSIBLE CAUSES

Possible Causes
GROUND CIRCUIT OPEN
RUN/START RELAY CONTROL CIRCUIT OPEN OR SHORT TO VOLTAGE
RUN/START RELAY
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE RUN/START RELAY FOR CORRECT OPERATION**
    1. Turn the ignition off.
    2. Replace the Run/Start Relay with a known good relay.
    3. Turn the ignition on.
    4. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 3

    No

    - Replace the Run/Start Relay.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
3. **CHECK THE (Z909) GROUND CIRCUIT FOR AN OPEN**

1. Turn the ignition off.
2. Remove the Run/Start Relay from the PDC.
3. Measure the resistance between ground and the (Z909) Ground circuit at the Run/Start Relay cavity in the PDC.

   Is the resistance above 5.0 Ohms?

   Yes

   - Repair the (Z909) Ground circuit for an open circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 4

4. **CHECK THE (K617) RUN/START RELAY CONTROL CIRCUIT FOR A SHORT TO VOLTAGE**
   1. Turn the ignition off.
   2. Disconnect the BCM C4 harness connector.
   3. Turn the ignition on.
   4. Measure the voltage of the (K617) Run/Start Relay circuit at the Run/Start Relay cavity in the PDC.

      Is voltage present?

      Yes

      - Repair the (K617) Run/Start Relay circuit for a short to voltage.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 5

5. **CHECK THE (K617) RUN/START RELAY CONTROL CIRCUIT FOR AN OPEN**
   1. Turn the ignition off.
   2. Measure the resistance of the (K617) Run/Start Relay circuit between the BCM C4 harness connector and the Run/Start Relay cavity in the PDC.

      Is the resistance above 5.0 Ohms?

      Yes

      - Repair the (K617) Run/Start Relay circuit for an open circuit.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace the Body Control Module in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B2103-19-IGNITION RUN/START 1 CONTROL - OVER CURRENT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 6: Ignition Run/Start Input Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the ignition on.

SET CONDITION

This DTC will set if the Body Control Module (BCM) detects a short to ground on the Run/Start Relay Control circuit.

POSSIBLE CAUSES

Possible Causes
RUN/START RELAY CONTROL CIRCUIT SHORT TO GROUND
RUN/START RELAY
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE RUN/START RELAY FOR CORRECT OPERATION**
    1. Turn the ignition off.
    2. Replace the Run/Start Relay with a known good relay.
    3. Turn the ignition on.
    4. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 3

    No

    - Replace the Run/Start Relay.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
3. **CHECK THE (K617) RUN/START RELAY CONTROL CIRCUIT FOR A SHORT TO GROUND**
    1. Turn the ignition off.

2. Remove the Run/Start Relay from the PDC.
3. Disconnect the BCM C4 harness connector.
4. Measure the resistance between ground and the (K617) Run/Start Relay circuit at the Run/Start Relay cavity in the PDC.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the (K617) Run/Start Relay circuit for a short to ground.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the Body Control Module in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B2121-12-IGNITION RUN CONTROL 1 - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 7: Ignition Run Control Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Body Control Module (BCM) receives the network communication message from the Radio Frequency (RF) Hub indicating run operation is requested. The BCM provides a ground to the ignition run relay control circuit, which connects to the coil side of the Ignition Run Relay.

WHEN MONITORED

With the Ignition Run Relay off.

SET CONDITION

When the Body Control Module (BCM) detects a high condition on the Ignition Run Control Output circuit.

POSSIBLE CAUSES

Possible Causes
IGNITION RUN CONTROL OUTPUT CIRCUIT SHORTED TO VOLTAGE RUN RELAY BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE IGNITION RUN RELAY FOR CORRECT OPERATION**
    1. Turn the ignition off.
    2. Remove the Run Relay and substitute it with a known good relay.
    3. Turn the ignition on.
    4. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 3

    No

    - Replace the Run Relay.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (K619) IGNITION RUN CONTROL OUTPUT CIRCUIT FOR A SHORT TO VOLTAGE**
   1. Turn the ignition off.
   2. Remove the Ignition Run Relay.
   3. Turn the ignition on.
   4. Using a 12-volt test light connected to ground, check the (K619) Ignition Run Control Output circuit.

      Does the test light illuminate brightly?

      Yes

      - Repair the short to voltage in the (K619) Ignition Run Control Output circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B2121-14-IGNITION RUN CONTROL 1 - CIRCUIT SHORT TO GROUND OR OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 8: Ignition Run Control Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Body Control Module (BCM) receives the network communication message from the Radio Frequency (RF) Hub indicating run operation is requested. The BCM provides a ground to the ignition run relay control circuit, which connects to the coil side of the Ignition Run Relay.

WHEN MONITORED

With the Ignition Run Relay active.

SET CONDITION

When the Body Control Module (BCM) detects a low condition on the Ignition Run Relay Control circuit.

POSSIBLE CAUSES

Possible Causes
IGNITION RUN RELAY CONTROL CIRCUIT SHORTED TO GROUND OR OPEN RUN RELAY BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE RUN RELAY FOR CORRECT OPERATION**
    1. Turn the ignition off.
    2. Remove the Run Relay and substitute it with a known good relay.
    3. Turn the ignition on.
    4. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 3

    No

    - Replace the Run Relay.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (K619) IGNITION RUN RELAY CONTROL CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Remove the Run Relay.
   3. Disconnect the BCM C4 harness connector.
   4. Measure the resistance between ground and the (K619) Ignition Run Relay Control circuit.

      Is the resistance below 10K Ohms?

      Yes

      - Repair the short to ground in the (K619) Ignition Run Relay Control circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 4
4. **CHECK THE (K619) IGNITION RUN RELAY CONTROL CIRCUIT FOR AN OPEN**
   1. Measure the resistance of the (K619) Ignition Run Relay Control circuit between the BCM C4 harness connector and the Ignition Run Relay.

      Is the resistance above 5.0 Ohms?

      Yes

      - Repair the open in the (K619) Ignition Run Relay Control circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B212E-12-IGNITION RUN/ACC CONTROL - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Body Control Module (BCM) receives the network communication message from the Radio Frequency (RF) Hub indicating run or accessory operation is requested. The BCM provides a ground through the accessory delay relay control circuit, which connects to the coil side of the Ignition Run/Acc Relay.

WHEN MONITORED

With the Run/Acc Relay off.

SET CONDITION

When the Body Control Module (BCM) detects a high condition on the Accessory Delay Relay Control circuit.

POSSIBLE CAUSES

Possible Causes
ACCESSORY DELAY RELAY CONTROL CIRCUIT SHORTED TO VOLTAGE RUN/ACC RELAY BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE RUN/ACC RELAY FOR CORRECT OPERATION**
    1. Turn the ignition off.
    2. Remove the Run/Acc Relay and substitute it with a known good relay.
    3. Turn the ignition on.
    4. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 3

No

- Replace the Run/Acc Relay.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (P305) ACCESSORY DELAY RELAY CONTROL CIRCUIT FOR A SHORT TO VOLTAGE**
   1. Turn the ignition off.
   2. Disconnect the BCM C4 harness connector.
   3. Turn the ignition on.
   4. Using a 12-volt test light connected to ground, check the (P305) Accessory Delay Relay Control circuit.

   Does the test light illuminate brightly?

   Yes

   - Repair the short to voltage in the (P305) Accessory Delay Relay Control circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B212E-14-IGNITION RUN/ACC CONTROL - CIRCUIT SHORT TO GROUND OR OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Body Control Module (BCM) receives the network communication message from the Radio Frequency (RF) Hub indicating run or accessory operation is requested. The BCM provides a ground through the accessory delay relay control circuit, which connects to the coil side of the Ignition Run/Acc Relay.

WHEN MONITORED

With the Run/Acc Relay active.

SET CONDITION

When the Body Control Module (BCM) detects a low condition on the Accessory Delay Relay Control circuit.

POSSIBLE CAUSES

Possible Causes
ACCESSORY DELAY RELAY CONTROL CIRCUIT SHORTED TO GROUND OR OPEN RUN/ACC RELAY BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE RUN/ACC RELAY FOR CORRECT OPERATION**
    1. Turn the ignition off.
    2. Remove the Run/Acc Relay and substitute it with a known good relay.
    3. Turn the ignition on.
    4. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 3

    No

    - Replace the Run/Acc Relay.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
3. **CHECK THE (P305) ACCESSORY DELAY RELAY CONTROL CIRCUIT FOR A SHORT TO GROUND**
    1. Turn the ignition off.
    2. Disconnect the BCM C4 harness connector.

3. Turn the ignition on.
4. Measure the resistance between ground and the (P305) Accessory Delay Relay Control circuit.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the short to ground in the (P305) Accessory Delay Relay Control circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 4

4. **CHECK THE (P305) ACCESSORY DELAY RELAY CONTROL CIRCUIT FOR AN OPEN**
   1. Measure the resistance of the (P305) Accessory Delay Relay Control circuit between the BCM C4 harness connector and the Run/Acc Relay.

      Is the resistance above 5.0 Ohms?

      Yes

      - Repair the open in the (P305) Accessory Delay Relay Control circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B2143-12-UGDO ENABLE CONTROL - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 9: UGDO Enable Control Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Body Control Module (BCM) provides voltage to the Universal Garage Door Opener (UGDO) located in the Vanity Mirror. When the anti-theft alarm is active, the BCM disables the power feed to the UGDO.

WHEN MONITORED

UGDO enable is active.

SET CONDITION

The Body Control Module detects a short to battery condition on the UGDO Enable Control circuit.

POSSIBLE CAUSES

Possible Causes
UGDO ENABLE CONTROL CIRCUIT SHORTED TO VOLTAGE
VANITY MIRROR
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE VANITY MIRROR FOR AN INTERNAL SHORT**
    1. Turn the ignition off.
    2. Disconnect the Vanity Mirror harness connector.
    3. Turn the ignition on.
    4. With the scan tool, read DTCs.

    Does the scan tool display DTC: B2143-12-UGDO ENABLE CONTROL - CIRCUIT SHORT TO BATTERY?

    Yes

- Go To 3

No

- Replace the Vanity Mirror in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (G38) UGDO ENABLE CONTROL CIRCUIT FOR A SHORT TO BATTERY**
   1. Turn the ignition off.
   2. Disconnect the BCM C6 harness connector.
   3. Turn the ignition on.
   4. Measure the voltage of the (G38) UGDO Enable Control circuit.

   Is voltage present?

   Yes

   - Repair the short to voltage on the (G38) UGDO Enable Control circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B2143-14-UGDO ENABLE CONTROL - CIRCUIT SHORT TO GROUND OR OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 10: UGDO Enable Control Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Body Control Module (BCM) provides voltage to the Universal Garage Door Opener (UGDO) located in the Vanity Mirror. When the anti-theft alarm is active, the BCM disables the power feed to the UGDO.

WHEN MONITORED

UGDO enable is active.

SET CONDITION

The Body Control Module detects a low condition or an open on the UGDO Enable Control circuit.

POSSIBLE CAUSES

Possible Causes
UGDO ENABLE CONTROL CIRCUIT SHORTED TO GROUND
UGDO ENABLE CONTROL CIRCUIT OPEN
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE (G38) UGDO ENABLE CONTROL CIRCUIT FOR A SHORT TO GROUND**
    1. Turn the ignition off.
    2. Disconnect the BCM C6 harness connector.
    3. Disconnect the Vanity Mirror harness connector.
    4. Measure the resistance between ground and the (G38) UGDO Enable Control circuit.

    Is the resistance below 10K Ohms?

    Yes

    - Repair the short to ground in the (G38) UGDO Enable Control circuit.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 3

3. **CHECK THE (G38) UGDO ENABLE CONTROL CIRCUIT FOR AN OPEN**
   1. Measure the resistance of the (G38) UGDO Enable Control circuit between the BCM C6 and Vanity Mirror harness connectors.

      Is the resistance above 5.0 Ohms?

      Yes

      - Repair the open in the (G38) UGDO Enable Control circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B215B-18-IGNITION RUN START 2 - CONTROL UNDER CURRENT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 11: Ignition Run/Start Input Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the ignition on.

SET CONDITION

This DTC will set if the Body Control Module (BCM) detects an open or short to voltage on the Run/Start Relay Control circuit.

POSSIBLE CAUSES

Possible Causes
GROUND CIRCUIT OPEN
RUN/START RELAY CONTROL CIRCUIT OPEN OR SHORT TO VOLTAGE
RUN/START RELAY
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE RUN/START RELAY FOR CORRECT OPERATION**
    1. Turn the ignition off.
    2. Replace the Run/Start Relay with a known good relay.
    3. Turn the ignition on.
    4. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 3

    No

    - Replace the Run/Start Relay.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
3. **CHECK THE (Z909) GROUND CIRCUIT FOR AN OPEN**

1. Turn the ignition off.
2. Remove the Run/Start Relay from the PDC.
3. Measure the resistance between ground and the (Z909) Ground circuit at the Run/Start Relay cavity in the PDC.

   Is the resistance above 5.0 Ohms?

   Yes

   - Repair the (Z909) Ground circuit for an open circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 4

4. **CHECK THE (K617) RUN/START RELAY CONTROL CIRCUIT FOR A SHORT TO VOLTAGE**
   1. Turn the ignition off.
   2. Disconnect the BCM C4 harness connector.
   3. Turn the ignition on.
   4. Measure the voltage of the (K617) Run/Start Relay circuit at the Run/Start Relay cavity in the PDC.

      Is voltage present?

      Yes

      - Repair the (K617) Run/Start Relay circuit for a short to voltage.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 5

5. **CHECK THE (K617) RUN/START RELAY CONTROL CIRCUIT FOR AN OPEN**
   1. Turn the ignition off.
   2. Measure the resistance of the (K617) Run/Start Relay circuit between the BCM C4 harness connector and the Run/Start Relay cavity in the PDC.

      Is the resistance above 5.0 Ohms?

      Yes

      - Repair the (K617) Run/Start Relay circuit for an open circuit.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace the Body Control Module in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B215B-19-IGNITION RUN START 2 CONTROL OVER CURRENT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 12: Ignition Run/Start Input Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the ignition on.

SET CONDITION

This DTC will set if the Body Control Module (BCM) detects a short to ground on the Run/Start Relay Control circuit.

POSSIBLE CAUSES

Possible Causes
RUN/START RELAY CONTROL CIRCUIT SHORT TO GROUND
RUN/START RELAY
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE RUN/START RELAY FOR CORRECT OPERATION**
    1. Turn the ignition off.
    2. Replace the Run/Start Relay with a known good relay.
    3. Turn the ignition on.
    4. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 3

    No

    - Replace the Run/Start Relay.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
3. **CHECK THE (K617) RUN/START RELAY CONTROL CIRCUIT FOR A SHORT TO GROUND**
    1. Turn the ignition off.

2. Remove the Run/Start Relay from the PDC.
3. Disconnect the BCM C4 harness connector.
4. Measure the resistance between ground and the (K617) Run/Start Relay circuit at the Run/Start Relay cavity in the PDC.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the (K617) Run/Start Relay circuit for a short to ground.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the Body Control Module in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B2199-16-BATTERY VOLTAGE - CIRCUIT VOLTAGE BELOW THRESHOLD

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 13: Battery Voltage Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

Continuously.

SET CONDITION

When the Body Control Module (BCM) detects a low voltage condition on both Fused B(+) circuits, where the voltage input is below 9.0 volts for more than one second.

POSSIBLE CAUSES

POSSIBLE CAUSES
LOW BATTERY VOLTAGE
CHARGING SYSTEM CONCERN
FUSED B(+) CIRCUITS HIGH RESISTANCE
GROUND CIRCUITS HIGH RESISTANCE
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR ANY POWERTRAIN DTCS**

   NOTE: Make sure the Battery is in good condition and perform the Battery System diagnostic procedure. Refer to DIAGNOSIS AND TESTING .

   NOTE: Inspect the vehicle for after market accessories that may exceed the Generator System output.

   NOTE: Make sure the generator drive belt is in good operating condition.

   NOTE: Inspect the fuses in the Power Distribution Center (PDC). If an open fuse is found, use the wire diagram/schematic as a guide, inspect the wiring and connectors for damage.

   1. With the scan tool, read PCM DTCs.

      Are there any Battery or Charging System DTCs?

      Yes

      - Refer to **DTC INDEX** and perform the appropriate diagnostic procedure for the charging system DTCs.

      No

      - Go To 2

2. **TEST FOR INTERMITTENT CONDITION**
   1. Start the engine and run for two minutes.
   2. With the scan tool, read the Active DTCs.

      Does the scan tool display this DTC as active?

      Yes

- Go To 3

No

- Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (A903), (A904) AND (905) FUSED B(+) CIRCUITS FOR HIGH RESISTANCE**
   1. Disconnect the BCM C1, C2 and C3 harness connectors.
   2. Using a 12-volt test light connected to ground, check the (A903) Fused B(+) circuit in the BCM C1 harness connector.
   3. Using a 12-volt test light connected to ground, check the (A904) Fused B(+) circuit in the BCM C2 harness connector.
   4. Using a 12-volt test light connected to ground, check the (A905) Fused B(+) circuit in the BCM C3 harness connector.

   NOTE: Compare the brightness to that of a direct connection to the battery.

   Does the test light illuminate brightly for both circuits?

   Yes

   - Go To 4

   No

   - Repair the (A903), (A904) or (A905) Fused B(+) circuits for high resistance.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK THE (Z914) GROUND CIRCUITS FOR HIGH RESISTANCE**
   1. Using a 12-volt test light connected to 12-volts, check the (Z914) Ground circuits in the BCM C7 harness connector.

   NOTE: Compare the brightness to that of a direct connection to the battery.

   Does the test light illuminate brightly?

   Yes

   - Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Repair the (Z914) Ground circuits for high resistance.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B2199-17-BATTERY VOLTAGE - CIRCUIT VOLTAGE ABOVE THRESHOLD

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 14: Battery Voltage Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

Continuously.

SET CONDITION

When the Body Control Module (BCM) detects a high voltage condition on either the Fused B(+) circuits, where the voltage input is above 16.0 volts for more than one second.

POSSIBLE CAUSES

POSSIBLE CAUSES
GENERATOR OPERATION POWERTRAIN CONTROL MODULE (PCM)

DIAGNOSTIC TEST

CHECK FOR ANY POWERTRAIN CONTROL MODULES DTCS

NOTE: Make sure the Battery is in good condition and perform the Battery System diagnostic procedure. Refer to DIAGNOSIS AND TESTING .

1. Turn the ignition on.
2. With the scan tool, read active PCM DTCs.

   Does the scan tool display any active PCM DTCs?

   Yes

   - Refer to **DTC INDEX** and perform the appropriate diagnostic test procedure.

   No

   - Check the above conditions that can cause a high voltage condition. Repair as necessary.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B2204-55-ECU CONFIGURATION MISMATCH - NOT CONFIGURED

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

When replacing a module, a PROXI procedure may need to be completed for that module. The PROXI Alignment Procedure is needed to learn the PROXI Configuration from the BCM. This PROXI information configures the modules based on the content of the vehicle. Refer to the information below for each module

requirement.

WHEN MONITORED

One time whenever the ignition is turned on.

SET CONDITION

The Body Control Module (BCM) PROXI configuration has not been completed.

The PROXI configuration alignment has not been completed on one or more PROXI user module(s).

POSSIBLE CAUSES

Possible Causes
BCM REPLACED AND RESTORE PROXI CONFIGURATION ROUTINE HAS NOT BEEN COMPLETED PROXI USER MODULE MISMATCH OR PROXI CONFIGURATION ALIGNMENT ROUTINE HAS NOT BEEN COMPLETED

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK FOR BCM REPLACEMENT**

    Has the BCM been replaced?

    Yes

    - With the scan tool, perform the Restore BCM PROXI Configuration Routine in the BCM,

Miscellaneous Functions. Follow the on-screen instructions.
- Once routine is complete, cycle the ignition.
- With the scan tool, read DTCs.
- If the DTC is still active, Go To 3.
- If DTC is not active, test complete.

No

- Go To 3

3. **PERFORM THE PROXI CONFIGURATION ALIGNMENT ROUTINE IN THE BCM**
   1. With the scan tool, perform the PROXI Configuration Alignment Routine in the BCM, Miscellaneous Functions.
   2. Follow the on-screen instructions.
   3. Cycle the ignition.
   4. With the scan tool, read DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension. If all connections are OK, replace the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B221D-29-(RSM) RAIN SENSOR MODULE INTERNAL - SIGNAL INVALID

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

The Light/Rain Sensing Module (LRSM) detects an internal failure.

POSSIBLE CAUSES

Possible Causes
LIGHT/RAIN SENSING MODULE (LRSM)

DIAGNOSTIC TEST

CHECK FOR AN ACTIVE DTC

1. Turn the ignition on.
2. With the scan tool, read DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Replace the LRSM in accordance with the Service Information. Refer to **MODULE, LIGHT RAIN SENSOR, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B223A-8F-AUTO HIGH BEAM ECU INTERNAL - ERRATIC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

The Automatic High Beam Module (AHBM) reports an internal failure to the Body Control Module (BCM).

POSSIBLE CAUSES

Possible Causes
AUTOMATIC HIGH BEAM MODULE (AHBM)

DIAGNOSTIC TEST

CHECK FOR AN ACTIVE DTC

1. Turn the ignition on.
2. With the scan tool, read DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Replace the Automatic High Beam Module (AHBM) in accordance with the Service Information. Refer to **MIRROR, REARVIEW, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B225C-29-COMPASS MODULE INTERNAL - SIGNAL INVALID

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

The Compass Module detects an internal failure.

POSSIBLE CAUSES

Possible Causes
COMPASS MODULE

DIAGNOSTIC TEST

CHECK FOR AN ACTIVE DTC

1. Turn the ignition on.
2. With the scan tool, read DTCs.

   Does the scan tool display: B225C-29-COMPASS MODULE INTERNAL - SIGNAL INVALID?

Yes

- Replace the Compass Module in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B2267-8F-ELECTRO CHROMATIC MIRROR MODULE INTERNAL - ERRATIC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

This DTC will set when the Rearview Mirror detects an internal failure.

POSSIBLE CAUSES

Possible Causes
REARVIEW MIRROR

DIAGNOSTIC TEST

CHECK FOR AN ACTIVE DTC

1. Turn the ignition on.
2. With the scan tool, read DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Replace the Rearview Mirror in accordance with the Service Information. Refer to **MIRROR, REARVIEW, REMOVAL** .

   No

- Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B22A9-44-ECU INTERNAL PERFORMANCE - DATA MEMORY FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously.

SET CONDITION

The Body Control Module (BCM) detects an internal Random Access Memory (RAM) failure.

POSSIBLE CAUSES

Possible Causes
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)

1. Turn the ignition on.
2. With the scan tool, read DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Replace the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.

B22A9-45-ECU INTERNAL PERFORMANCE - PROGRAM MEMORY FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously.

SET CONDITION

The Body Control Module (BCM) detects internal FLASH/Read Only Memory (ROM) failure.

POSSIBLE CAUSES

Possible Causes
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)

1. Turn the ignition on.
2. With the scan tool, read DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Replace the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.

B22A9-46-ECU INTERNAL PERFORMANCE - CALIBRATION/PARAMETER MEMORY FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously.

SET CONDITION

The Body Control Module (BCM) detects internal EEPROM failure.

POSSIBLE CAUSES

Possible Causes
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)

1. Turn the ignition on.
2. With the scan tool, read DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Replace the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.

B22A9-47-ECU INTERNAL PERFORMANCE - WATCHDOG/SAFETY FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously.

SET CONDITION

The Body Control Module (BCM) detects an internal failure.

POSSIBLE CAUSES

Possible Causes
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)

1. Turn the ignition on.
2. With the scan tool, read DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Replace the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.

B2303-64-WIPER PARK SWITCH INPUT - SIGNAL PLAUSIBILITY FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Body Control Module (BCM) provides a reference voltage on the wiper park switch sense circuit through a pull-up resistor that is connected to battery voltage. The Wiper Park Switch switches the signal circuit to ground when the wiper motor is in the park position.

WHEN MONITORED

With the ignition on.

Front Wiper is off or Front Wiper is on following a timeout period.

SET CONDITION

The Body Control Module (BCM) detects an internal failure with the Park Switch in the Front Wiper Motor.

POSSIBLE CAUSES

Possible Causes
FRONT WIPER MOTOR

DIAGNOSTIC TEST

CHECK FOR AN ACTIVE DTC

1. Turn the ignition on.
2. Cycle the Wiper Switch on and off three times.
3. With the scan tool, read DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Replace the Front Wiper Motor in accordance with the Service Information. Refer to **MOTOR, WIPER, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B2303-71-WIPER PARK SWITCH INPUT - ACTUATOR STUCK

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Body Control Module (BCM) provides a reference voltage on the wiper park switch sense circuit through a pull-up resistor that is connected to battery voltage. The Wiper Park Switch switches the signal circuit to ground when the wiper motor is in the park position.

WHEN MONITORED

With the ignition on.

Front Wiper is active.

SET CONDITION

The Body Control Module (BCM) detects an internal failure in the Front Wiper Motor.

POSSIBLE CAUSES

Possible Causes

FRONT WIPER MOTOR

DIAGNOSTIC TEST

CHECK FOR AN ACTIVE DTC

1. Turn the ignition on.
2. Cycle the Wiper Switch on and off three times.
3. With the scan tool, read DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Replace the Front Wiper Motor in accordance with the Service Information. Refer to **MOTOR, WIPER, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B2309-2A-REAR WIPER SWITCH - STUCK

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Body Control Module (BCM) provides a reference voltage on the rear wiper park switch sense circuit through a pull-up resistor that is connected to battery voltage. The Rear Wiper Park Switch switches the signal circuit to ground when the wiper motor is in the park position.

WHEN MONITORED

With the ignition on.

Rear Wiper is active.

SET CONDITION

The Body Control Module (BCM) detects an internal failure in the Rear Wiper Motor.

POSSIBLE CAUSES

Possible Causes
REAR WIPER MOTOR

DIAGNOSTIC TEST

CHECK FOR AN ACTIVE DTC

1. Turn the ignition on.
2. Cycle the Rear Wiper Switch on and off three times.
3. With the scan tool, read DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Replace the Rear Wiper Motor in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B2322-12-HEADLAMP WASHER MOTOR CONTROL - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 15: Headlamp Washer Motor Control Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

Headlamp Washers are active.

SET CONDITION

The Body Control Module detects a short to battery condition on the Headlamp Washer Relay Control circuit.

POSSIBLE CAUSES

Possible Causes
HEADLAMP WASHER RELAY CONTROL CIRCUIT SHORTED TO VOLTAGE
HEADLAMP WASHER RELAY
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE HEADLAMP WASHER RELAY FOR CORRECT OPERATION**
    1. Turn the ignition off.
    2. Replace the Headlamp Washer Relay with a known good relay.
    3. Turn the ignition on.
    4. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 3

    No

    - Replace the Headlamp Washer Relay.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
3. **CHECK THE (W244) HEADLAMP WASHER RELAY CONTROL CIRCUIT FOR A SHORT TO VOLTAGE**

1. Turn the ignition off.
2. Disconnect the BCM C4 harness connector.
3. Turn the ignition on.
4. Measure the voltage of the (W244) Headlamp Washer Relay circuit at the Headlamp Washer Relay cavity in the PDC.

   Is voltage present?

   Yes

   - Repair the (W244) Headlamp Washer Relay circuit for a short to voltage.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the Body Control Module in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B2322-14-HEADLAMP WASHER MOTOR CONTROL - CIRCUIT SHORT TO GROUND OR OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 16: Headlamp Washer Motor Control Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the ignition on.

SET CONDITION

This DTC will set if the Body Control Module (BCM) detects a short to ground on the Headlamp Washer Relay

Control circuit.

POSSIBLE CAUSES

Possible Causes
HEADLAMP WASHER RELAY CONTROL CIRCUIT OPEN OR SHORT TO GROUND HEADLAMP WASHER RELAY BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE HEADLAMP WASHER RELAY FOR CORRECT OPERATION**
    1. Turn the ignition off.
    2. Replace the Headlamp Washer Relay with a known good relay.
    3. Turn the ignition on.
    4. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 3

    No

    - Replace the Headlamp Washer Relay.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (W244) HEADLAMP WASHER RELAY CONTROL CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Remove the Headlamp Washer Relay from the PDC.
   3. Disconnect the BCM C4 harness connector.
   4. Measure the resistance between ground and the (W244) Headlamp Washer Relay circuit at the Headlamp Washer Relay cavity in the PDC.

      Is the resistance below 10K Ohms?

      Yes

      - Repair the (W244) Headlamp Washer Relay circuit for a short to ground.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 4
4. **CHECK THE (W244) HEADLAMP WASHER RELAY CONTROL CIRCUIT FOR AN OPEN**
   1. Turn the ignition off.
   2. Measure the resistance of the (W244) Headlamp Washer Relay circuit between the BCM C4 harness connector and the Headlamp Washer Relay cavity in the PDC.

      Is the resistance above 5.0 Ohms?

      Yes

      - Repair the (W244) Headlamp Washer Relay circuit for an open circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Replace the Body Control Module in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B2345-18-WIPER MOTOR LOW SPEED CONTROL - UNDER CURRENT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 17: Wiper Motor Speed Control Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the ignition on.

SET CONDITION

The Body Control Module (BCM) detects a short to voltage or open in the Wiper Low Speed Control Output circuit.

POSSIBLE CAUSES

Possible Causes
WIPER LOW SPEED CONTROL OUTPUT CIRCUIT OPEN
WIPER LOW SPEED CONTROL OUTPUT CIRCUIT SHORTED TO VOLTAGE
FRONT WIPER MOTOR
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE (W3) WIPER LOW SPEED CONTROL OUTPUT CIRCUIT FOR A SHORT TO VOLTAGE**
    1. Turn the ignition off.
    2. Disconnect the Front Wiper Motor harness connector.
    3. Turn the ignition on.
    4. Measure the voltage of the (W3) Wiper Low Speed Control Output circuit.

    Is voltage present?

    Yes

    - Repair the short to voltage in the (W3) Wiper Low Speed Control Output circuit.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 3

3. **CHECK FOR VOLTAGE ON THE (W3) WIPER LOW SPEED CONTROL OUTPUT CIRCUIT WITH LOW SPEED WIPERS TURNED ON**
   1. Turn the Low Speed Wipers on.
   2. Measure the voltage of the (W3) Wiper Low Speed Control Output circuit.

   Is the voltage greater than 10.0 volts?

   Yes

   - Replace the Front Wiper Motor in accordance with the Service Information. Refer to **MOTOR, WIPER, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 4

4. **CHECK THE (W3) WIPER LOW SPEED CONTROL OUTPUT CIRCUIT FOR AN OPEN**
   1. Turn the ignition off.
   2. Disconnect the BCM C3 harness connector.
   3. Measure the resistance of the (W3) Wiper Low Speed Control Output circuit between the BCM C3 and Front Wiper Motor harness connectors.

   Is the resistance above 5.0 Ohms?

   Yes

   - Repair the open in the (W3) Wiper Low Speed Control Output circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the Body Control Module in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B2345-19-WIPER MOTOR LOW SPEED CONTROL - OVERCURRENT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 18: Wiper Motor Speed Control Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the low speed windshield wipers on.

SET CONDITION

The Body Control Module (BCM) detects the Wiper Low Speed Control Output circuit is shorted to ground.

POSSIBLE CAUSES

Possible Causes
WIPER LOW SPEED CONTROL OUTPUT CIRCUIT SHORTED TO GROUND
FRONT WIPER MOTOR
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. Turn the low wipers on.
    3. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE FRONT WIPER MOTOR FOR AN INTERNAL SHORT TO GROUND**
    1. Turn the ignition off.
    2. Disconnect the Front Wiper Motor harness connector.
    3. Turn the ignition on.
    4. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 3

    No

    - Replace the Front Wiper Motor in accordance with the Service Information. Refer to **MOTOR, WIPER, REMOVAL** .

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (W3) WIPER LOW SPEED CONTROL OUTPUT CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Disconnect the BCM C3 harness connector.
   3. Measure the resistance between ground and the (W3) Wiper Low Speed Control Output circuit.

      Is the resistance above 10K Ohms?

      Yes

      - Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Repair the short to ground on the (W3) Wiper Low Speed Control Output circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B2349-18-WIPER MOTOR HI SPEED CONTROL - UNDER CURRENT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 19: Wiper Motor Speed Control Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the ignition on.

SET CONDITION

The Body Control Module (BCM) detects a short to voltage or open in the Wiper High Speed Control Output circuit.

POSSIBLE CAUSES

Possible Causes
WIPER HIGH SPEED CONTROL OUTPUT CIRCUIT OPEN
WIPER HIGH SPEED CONTROL OUTPUT CIRCUIT SHORTED TO VOLTAGE
FRONT WIPER MOTOR
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
   1. Turn the ignition on.
   2. With the scan tool, read DTCs.

      Does the scan tool display this DTC as active?

      Yes

      - Go To 2

      No

      - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE (W4) WIPER HIGH SPEED CONTROL OUTPUT CIRCUIT FOR A SHORT TO VOLTAGE**
   1. Turn the ignition off.
   2. Disconnect the Front Wiper Motor harness connector.
   3. Turn the ignition on.
   4. Measure the voltage of the (W4) Wiper High Speed Control Output circuit.

      Is voltage present?

      Yes

      - Repair the short to voltage in the (W4) Wiper High Speed Control Output circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 3

3. **CHECK FOR VOLTAGE ON THE (W4) WIPER HIGH SPEED CONTROL OUTPUT CIRCUIT WITH HIGH SPEED WIPERS TURNED ON**
   1. Turn the High Speed Wipers on.
   2. Measure the voltage of the (W4) Wiper High Speed Control Output circuit.

   Is the voltage greater than 10.0 volts?

   Yes

   - Replace the Front Wiper Motor in accordance with the Service Information. Refer to **MOTOR, WIPER, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 4

4. **CHECK THE (W4) WIPER HIGH SPEED CONTROL OUTPUT CIRCUIT FOR AN OPEN**
   1. Turn the ignition off.
   2. Disconnect the BCM C3 harness connector.
   3. Measure the resistance of the (W4) Wiper High Speed Control Output circuit between the BCM C3 and Front Wiper Motor harness connectors.

   Is the resistance above 5.0 Ohms?

   Yes

   - Repair the open in the (W4) Wiper High Speed Control Output circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the Body Control Module in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B2349-19-WIPER MOTOR HI SPEED CONTROL - OVERCURRENT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 20: Wiper Motor Speed Control Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the high speed windshield wipers on.

SET CONDITION

The Body Control Module (BCM) detects the Wiper High Speed Control Output circuit is shorted to ground.

POSSIBLE CAUSES

Possible Causes
WIPER HIGH SPEED CONTROL OUTPUT CIRCUIT SHORTED TO GROUND
FRONT WIPER MOTOR
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. Turn the low wipers on.
    3. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE FRONT WIPER MOTOR FOR AN INTERNAL SHORT TO GROUND**
    1. Turn the ignition off.
    2. Disconnect the Front Wiper Motor harness connector.
    3. Turn the ignition on.
    4. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 3

    No

    - Replace the Front Wiper Motor in accordance with the Service Information. Refer to **MOTOR, WIPER, REMOVAL** .

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (W4) WIPER HIGH SPEED CONTROL OUTPUT CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Disconnect the BCM C3 harness connector.
   3. Measure the resistance between ground and the (W4) Wiper High Speed Control Output circuit.

      Is the resistance above 10K Ohms?

      Yes

      - Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Repair the short to ground on the (W4) Wiper High Speed Control Output circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B23B9-18-REAR WIPER CONTROL - UNDER CURRENT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 21: Wiper Motor Speed Control Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the ignition on.

SET CONDITION

The Body Control Module (BCM) detects a short to voltage or open in the Rear Wiper Motor Control circuit.

POSSIBLE CAUSES

Possible Causes
REAR WIPER MOTOR CONTROL OUTPUT CIRCUIT OPEN
REAR WIPER MOTOR CONTROL OUTPUT CIRCUIT SHORTED TO VOLTAGE
REAR WIPER MOTOR
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
   1. Turn the ignition on.
   2. With the scan tool, read DTCs.

      Does the scan tool display this DTC as active?

      Yes

      - Go To 2

      No

      - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE (W13) REAR WIPER MOTOR CONTROL CIRCUIT FOR A SHORT TO VOLTAGE**
   1. Turn the ignition off.
   2. Disconnect the Rear Wiper Motor harness connector.
   3. Turn the ignition on.
   4. Measure the voltage of the (W13) Rear Wiper Motor Control circuit.

      Is voltage present?

      Yes

      - Repair the short to voltage in the (W13) Rear Wiper Motor Control circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

- Go To 3

3. **CHECK FOR VOLTAGE ON THE (W13) REAR WIPER MOTOR CONTROL CIRCUIT WITH WIPER TURNED ON**
   1. Turn the Rear Wiper on.
   2. Measure the voltage of the (W13) Rear Wiper Motor Control circuit.

      Is the voltage greater than 10.0 volts?

      Yes

      - Replace the Rear Wiper Motor in accordance with the Service Information.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 4

4. **CHECK THE (W13) REAR WIPER MOTOR CONTROL CIRCUIT FOR AN OPEN**
   1. Turn the ignition off.
   2. Disconnect the BCM C5 harness connector.
   3. Measure the resistance of the (W13) Rear Wiper Motor Control circuit between the BCM C5 and Rear Wiper Motor harness connectors.

      Is the resistance above 5.0 Ohms?

      Yes

      - Repair the open in the (W13) Rear Wiper Motor Control circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Replace the Body Control Module in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B23B9-19-REAR WIPER CONTROL - OVERCURRENT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 22: Wiper Motor Speed Control Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the Rear Wiper on.

SET CONDITION

The Body Control Module (BCM) detects the Rear Wiper Motor Control circuit is shorted to ground.

POSSIBLE CAUSES

Possible Causes
REAR WIPER MOTOR CONTROL CIRCUIT SHORTED TO GROUND
REAR WIPER MOTOR
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. Turn the rear wiper on.
    3. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE REAR WIPER MOTOR FOR AN INTERNAL SHORT TO GROUND**
    1. Turn the ignition off.
    2. Disconnect the Rear Wiper Motor harness connector.
    3. Turn the ignition on.
    4. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 3

    No

    - Replace the Rear Wiper Motor in accordance with the Service Information.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (W13) REAR WIPER MOTOR CONTROL CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Disconnect the BCM C5 harness connector.
   3. Measure the resistance between ground and the (W13) Rear Wiper Motor Control circuit.

      Is the resistance above 10K Ohms?

      Yes

      - Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Repair the short to ground on the (W13) Rear Wiper Motor Control circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B25B3-64-PASSENGER DOOR LOCK/UNLOCK RELAY SIGNAL - PLAUSIBILITY FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 23: Passenger Door Lock Control Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the ignition on.

SET CONDITION

The Body Control Module will set this DTC if voltage is detected on the (P303) Passenger Door Unlock Driver circuit with the Passenger Unlock Door Relay inactive.

POSSIBLE CAUSES

Possible Causes
(P303) PASSENGER DOOR UNLOCK DRIVER CIRCUIT SHORTED TO VOLTAGE BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE (P303) PASSENGER DOOR UNLOCK DRIVER CIRCUIT FOR A SHORT TO VOLTAGE**
    1. Turn the ignition off.
    2. Disconnect the BCM C5 harness connector.
    3. Turn the ignition on.
    4. Measure the voltage of the (P303) Passenger Door Unlock Driver circuit.

    Is voltage present?

    Yes

    - Repair the short to voltage on the (P303) Passenger Door Unlock Driver circuit.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

    No

    - Replace the Body Control Module in accordance with the Service Information. Refer to

MODULE, BODY CONTROL, REMOVAL .

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B2880-11-FOG LAMP CONTROL - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 24: Headlamp Switch Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Body Control Module (BCM) receives an input voltage from the Headlamp switch. The BCM monitors the headlamp switch voltage and controls the exterior lighting functions based on the switch input. For additional information on Headlamp Switch operation, refer to **SWITCH, HEADLAMP, OPERATION** .

WHEN MONITORED

With the ignition on.

SET CONDITION

When the Body Control Module (BCM) detects a low condition on the (L116) Front Fog Lamp Switch Signal circuit.

POSSIBLE CAUSES

Possible Causes
(L116) FRONT FOG LAMP SWITCH SIGNAL CIRCUIT SHORTED TO GROUND HEADLAMP SWITCH BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE HEADLAMP SWITCH FOR AN INTERNAL SHORT TO GROUND**
    1. Turn the ignition off.
    2. Disconnect the Headlamp Switch harness connector.
    3. Turn the ignition on.
    4. With the scan tool, read the DTCs.

    Does the scan tool display this DTC as active?

    Yes

- Go To 3

No

- Replace the Headlamp Switch in accordance with the Service Information. Refer to **SWITCH, HEADLAMP, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (L116) FOG LAMP SWITCH SIGNAL CIRCUIT FOR A SHORT TO GROUND**
   1. Disconnect the BCM C8 harness connector.
   2. Measure the resistance between ground and the (L116) Fog Lamp Switch Signal circuit.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the short to ground in the (L116) Fog Lamp Switch Signal circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B2880-15-FOG LAMP CONTROL - CIRCUIT SHORT TO BATTERY OR OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 25: Headlamp Switch Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Body Control Module (BCM) receives an input voltage from the Headlamp switch. The BCM monitors the headlamp switch voltage and controls the exterior lighting functions based on the switch input. For additional information on Headlamp Switch operation, refer to **SWITCH, HEADLAMP, OPERATION** .

WHEN MONITORED

With the fog lamps on.

SET CONDITION

The BCM detects a short to voltage or an open on the (L116) Fog Lamp Switch Signal circuit.

POSSIBLE CAUSES

Possible Causes
(L116) FOG LAMP SWITCH SIGNAL CIRCUIT SHORTED TO VOLTAGE
(L116) FOG LAMP SWITCH SIGNAL CIRCUIT OPEN
HEADLAMP SWITCH
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
    1. Turn the ignition on.
    2. Turn the Headlamps on.
    3. With the scan tool, read the DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK (L116) FOG LAMP SWITCH SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**
    1. Turn the ignition off.
    2. Disconnect the Headlamp Switch harness connector.
    3. Disconnect the BCM C8 harness connector.
    4. Turn the ignition on.
    5. Measure the voltage of the (L116) Fog Lamp Switch Signal circuit.

    Is there any voltage present?

    Yes

    - Repair the (L116) Fog Lamp Switch Signal circuit for a short to voltage.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 3

3. **CHECK THE (L116) FOG LAMP SWITCH SIGNAL CIRCUIT FOR AN OPEN IN THE HARNESS**
   1. Turn the ignition off.
   2. Measure the resistance of the (L116) Fog Lamp Switch Signal circuit between the Headlamp harness connector and the BCM C8 harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 4

      No

      - Repair the open in the (L116) Fog Lamp Switch Signal circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
4. **CHECK THE HEADLAMP SWITCH**
   1. Connect the BCM C8 harness connector.
   2. Connect a jumper wire between ground and the (L116) Fog Lamp Switch Signal circuit at the Headlamp Switch harness connector.
   3. Turn the ignition on.
   4. With the scan tool, read the DTCs.

      Does the scan tool display DTC: B2880-11-FOG LAMP CONTROL-CIRCUIT SHORT TO GROUND?

      Yes

      - Replace the Headlamp Switch in accordance with the Service Information. Refer to **SWITCH, HEADLAMP, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Replace the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B2881-19-LEFT REAR PARK LAMP CONTROL - OVERCURRENT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 26: Tail Lamp/Backup Lamp Assembly Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Body Control Module (BCM) receives the input from the headlamp switch requesting park lamp illumination. The BCM provides a Pulse Width Modulated (PWM) voltage to the Park Lamps. A ground path for the lamps is present through the harness to the body sheet metal. For additional information on the Park Lamps operation, refer to **OPERATION** .

WHEN MONITORED

With the park lamps active.

SET CONDITION

When the Body Control Module (BCM) detects a low condition on the Left Park Lamp Driver circuit.

POSSIBLE CAUSES

Possible Causes
LEFT PARK LAMP DRIVER CIRCUIT SHORTED TO GROUND
LEFT PARK LAMP BULB
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE PARK LAMP BULB**
    1. Turn the Park Lamps off.
    2. Turn the ignition off.
    3. Disconnect the Left Tail Lamp Assembly harness connector.
    4. Turn the ignition on.
    5. Turn the Park Lamps on.
    6. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 3

No

- Replace the Left Park Lamp in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (L7) LEFT PARK LAMP DRIVER CIRCUIT FOR A SHORT TO GROUND**
   1. Disconnect the BCM C6 harness connector.
   2. Measure the resistance between ground and the (L7) Left Park Lamp Driver circuit.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the short to ground in the (L7) Left Park Lamp Driver circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B2881-19-LEFT REAR PARK LAMP CONTROL - OVERCURRENT - EXPORT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 27: Tail Lamp Assembly Circuit Diagram

THEORY OF OPERATION

The Body Control Module (BCM) receives the input from the headlamp switch requesting park lamp illumination. The BCM provides a Pulse Width Modulated (PWM) voltage to the Park Lamps. A ground path for the lamps is present through the harness to the body sheet metal. For additional information on the Park Lamps operation, refer to **OPERATION** .

WHEN MONITORED

With the park lamps active.

SET CONDITION

When the Body Control Module (BCM) detects a low condition on the Left Park Lamp Driver circuit.

POSSIBLE CAUSES

Possible Causes
LEFT PARK LAMP DRIVER CIRCUIT SHORTED TO GROUND
LEFT PARK LAMP BULB
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE PARK LAMP BULB**
    1. Turn the Park Lamps off.
    2. Turn the ignition off.
    3. Disconnect the Left Tail Lamp Assembly harness connector.
    4. Turn the ignition on.
    5. Turn the Park Lamps on.
    6. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

- Go To 3

No

- Replace the Left Park Lamp in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (L7) LEFT PARK LAMP DRIVER CIRCUIT FOR A SHORT TO GROUND**
   1. Disconnect the BCM C6 harness connector.
   2. Measure the resistance between ground and the (L7) Left Park Lamp Driver circuit.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the short to ground in the (L7) Left Park Lamp Driver circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B2882-19-RIGHT REAR PARK LAMP CONTROL - OVERCURRENT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 28: Tail Lamp/Backup Lamp Assembly Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Body Control Module (BCM) receives the input from the headlamp switch requesting park lamp illumination. The BCM provides a Pulse Width Modulated (PWM) voltage to the Park Lamps. A ground path for the lamps is present through the harness to the body sheet metal. For additional information on the Park Lamps operation, refer to **OPERATION** .

WHEN MONITORED

With the park lamps active.

SET CONDITION

When the Body Control Module (BCM) detects a low condition on the Right Park Lamp Driver circuit.

POSSIBLE CAUSES

Possible Causes
RIGHT PARK LAMP DRIVER CIRCUIT SHORTED TO GROUND
RIGHT PARK LAMP BULB
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
   1. Turn the ignition on.
   2. With the scan tool, read DTCs.

      Does the scan tool display this DTC as active?

      Yes

      - Go To 2

      No

      - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE PARK LAMP BULB**
   1. Turn the Park Lamps off.
   2. Turn the ignition off.
   3. Disconnect the Right Tail Lamp Assembly harness connector.
   4. Turn the ignition on.
   5. Turn the Park Lamps on.
   6. With the scan tool, read DTCs.

      Does the scan tool display this DTC as active?

      Yes

      - Go To 3

No

- Replace the Right Park Lamp in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (L70) RIGHT PARK LAMP DRIVER CIRCUIT FOR A SHORT TO GROUND**
   1. Disconnect the BCM C6 harness connector.
   2. Measure the resistance between ground and the (L70) Right Park Lamp Driver circuit.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the short to ground in the (L70) Right Park Lamp Driver circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B2882-19-RIGHT REAR PARK LAMP CONTROL - OVERCURRENT - EXPORT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 29: Tail Lamp Assembly Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Body Control Module (BCM) receives the input from the headlamp switch requesting park lamp illumination. The BCM provides a Pulse Width Modulated (PWM) voltage to the Park Lamps. A ground path for the lamps is present through the harness to the body sheet metal. For additional information on the Park Lamps operation, refer to **OPERATION** .

WHEN MONITORED

With the park lamps active.

SET CONDITION

When the Body Control Module (BCM) detects a low condition on the Right Park Lamp Driver circuit.

POSSIBLE CAUSES

Possible Causes
RIGHT PARK LAMP DRIVER CIRCUIT SHORTED TO GROUND
RIGHT PARK LAMP BULB
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE PARK LAMP BULB**
    1. Turn the Park Lamps off.
    2. Turn the ignition off.
    3. Disconnect the Right Tail Lamp Assembly harness connector.
    4. Turn the ignition on.
    5. Turn the Park Lamps on.
    6. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

- Go To 3

No

- Replace the Right Park Lamp in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (L70) RIGHT PARK LAMP DRIVER CIRCUIT FOR A SHORT TO GROUND**
   1. Disconnect the BCM C6 harness connector.
   2. Measure the resistance between ground and the (L70) Right Park Lamp Driver circuit.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the short to ground in the (L70) Right Park Lamp Driver circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B2883-18-LEFT REVERSE/BUX TURN SIGNAL CONTROL - UNDER CURRENT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 30: Tail Lamp/Backup Lamp Assembly Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The BCM provides a Pulse Width Modulated (PWM) voltage output through the backup lamp driver circuit. The driver circuit connects to the Backup Lamp. A ground path for the lamps is present through the harness to the body sheet metal. For additional information on the Backup Lamps operation, refer to **OPERATION** .

WHEN MONITORED

With the backup lamps active.

SET CONDITION

When the Body Control Module (BCM) detects a high condition on the (L15) Left Backup Lamp Driver circuit.

POSSIBLE CAUSES

Possible Causes
(L15) LEFT BACKUP LAMP DRIVER CIRCUIT OPEN
(L15) LEFT BACKUP LAMP DRIVER CIRCUIT SHORTED TO VOLTAGE
(Z923) GROUND CIRCUIT OPEN
LEFT BACKUP LAMP
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
   1. Turn the ignition on.
   2. With the brakes firmly applied, shift the gear selector into REVERSE.
   3. With the scan tool, read DTCs.

      Does the scan tool display this DTC as active?

      Yes

      - Go To 2

      No

      - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE (L15) LEFT BACKUP LAMP DRIVER CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS**
   1. Shift the gear selector into PARK.
   2. Turn the ignition off.
   3. Disconnect the Left Tail Lamp harness connector.
   4. Disconnect the BCM C6 harness connector.
   5. Turn the ignition on.
   6. Measure the voltage between ground and the (L15) Left Backup Lamp Driver circuit.

      Is there any voltage present?

      Yes

- Repair the short to voltage in the (L15) Left Backup Lamp Driver circuit.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 3

3. **CHECK THE (L15) LEFT BACKUP LAMP DRIVER CIRCUIT FOR AN OPEN IN THE HARNESS**
   1. Turn the ignition off.
   2. Measure the resistance of the (L15) Left Backup Lamp Driver circuit between the Left Tail Lamp harness connectors and the BCM C6 harness connector.

      Is the resistance below 5.0 Ohms for both connections?

      Yes

      - Go To 4

      No

      - Repair the open in the (L15) Left Backup Lamp Driver circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
4. **CHECK THE (Z923) GROUND CIRCUIT FOR AN OPEN IN THE HARNESS**
   1. Using a 12-volt test light connected to 12-volts, check the (Z923) Ground circuit.

      Does the test light illuminate brightly?

      Yes

      - Go To 5

      No

      - Repair the open in the (Z923) Ground circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
5. **CHECK THE BCM FOR CORRECT OPERATION**
   1. Turn the ignition off.
   2. Reconnect the BCM C6 harness connector.
   3. Connect a 12-volt test light between the (L15) Left Backup Lamp Driver circuit and the (Z923) Ground circuit at the Left Tail Lamp harness connectors.
   4. Turn the ignition on.
   5. With the brakes firmly applied, shift the gear selector into REVERSE.

Does the test light illuminate brightly at both connections?

Yes

- Replace the Left Backup Lamp in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B2883-19-LEFT REVERSE/BUX TURN SIGNAL CONTROL - OVERCURRENT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 31: Tail Lamp/Backup Lamp Assembly Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The BCM provides a Pulse Width Modulated (PWM) voltage output through the backup lamp driver circuit. The driver circuit connects to the Backup Lamp. A ground path for the lamps is present through the harness to the body sheet metal. For additional information on the Backup Lamps operation, refer to **OPERATION** .

WHEN MONITORED

With the backup lamps active.

SET CONDITION

When the Body Control Module (BCM) detects a low condition on the (L15) Left Backup Lamp Driver circuit.

POSSIBLE CAUSES

Possible Causes
(L15) LEFT BACKUP LAMP DRIVER CIRCUIT SHORTED TO GROUND
LEFT BACKUP LAMP
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the brakes firmly applied, shift the gear selector into REVERSE.
    3. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **ATTEMPT TO SET THE OPPOSITE DTC**
    1. Shift the gear selector into PARK.
    2. Turn the ignition off.
    3. Disconnect the Left Tail Lamp harness connector.
    4. Turn the ignition on.
    5. With the brakes firmly applied, shift the gear selector into REVERSE.
    6. With the scan tool, read DTCs.

    Does the scan tool display DTC: B1707-18-LEFT REVERSE LAMP CONTROL - UNDER CURRENT?

    Yes

    - Replace the Left Backup Lamp in accordance with the Service Information. Refer to **LAMP, TAIL STOP TURN, REMOVAL** .

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 3

3. **CHECK THE (L15) LEFT BACKUP LAMP DRIVER CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Disconnect the BCM C6 harness connector.
   3. Measure the resistance between ground and the (L15) Left Backup Lamp Driver circuit.

   Is the resistance above 10K Ohms?

   Yes

   - Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Repair the short to ground in the (L15) Left Backup Lamp Driver circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B2884-18-RIGHT REVERSE/BUX TURN SIGNAL CONTROL-UNDER CURRENT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 32: Tail Lamp/Backup Lamp Assembly Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The BCM provides a Pulse Width Modulated (PWM) voltage output through the backup lamp driver circuit. The driver circuit connects to the Backup Lamp. A ground path for the lamps is present through the harness to the body sheet metal. For additional information on the Backup Lamps operation, refer to **OPERATION** .

WHEN MONITORED

With the backup lamps active.

SET CONDITION

When the Body Control Module (BCM) detects a high condition on the (L16) Right Backup Lamp Driver circuit.

POSSIBLE CAUSES

Possible Causes
(L16) RIGHT BACKUP LAMP DRIVER CIRCUIT OPEN
(L16) RIGHT BACKUP LAMP DRIVER CIRCUIT SHORTED TO VOLTAGE
(Z923) GROUND CIRCUIT OPEN
RIGHT BACKUP LAMP
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the brakes firmly applied, shift the gear selector into REVERSE.
    3. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE (L16) RIGHT BACKUP LAMP DRIVER CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS**
    1. Shift the gear selector into PARK.
    2. Turn the ignition off.
    3. Disconnect the Right Tail Lamp harness connector.
    4. Disconnect the BCM C6 harness connector.
    5. Turn the ignition on.
    6. Measure the voltage between ground and the (L16) Right Backup Lamp Driver circuit.

    Is there any voltage present?

    Yes

- Repair the short to voltage in the (L16) Right Backup Lamp Driver circuit.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 3

3. **CHECK THE (L16) RIGHT BACKUP LAMP DRIVER CIRCUIT FOR AN OPEN IN THE HARNESS**
   1. Turn the ignition off.
   2. Measure the resistance of the (L16) Right Backup Lamp Driver circuit between the Right Tail Lamp harness connectors and the BCM C6 harness connector.

      Is the resistance below 5.0 Ohms for both connections?

      Yes

      - Go To 4

      No

      - Repair the open in the (L16) Right Backup Lamp Driver circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
4. **CHECK THE (Z923) GROUND CIRCUIT FOR AN OPEN IN THE HARNESS**
   1. Using a 12-volt test light connected to 12-volts, check the (Z923) Ground circuit.

      Does the test light illuminate brightly?

      Yes

      - Go To 5

      No

      - Repair the open in the (Z923) Ground circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
5. **CHECK THE BCM FOR CORRECT OPERATION**
   1. Turn the ignition off.
   2. Reconnect the BCM C6 harness connector.
   3. Connect a 12-volt test light between the (L16) Right Backup Lamp Driver circuit and the (Z923) Ground circuit at the Right Tail Lamp harness connectors.
   4. Turn the ignition on.
   5. With the brakes firmly applied, shift the gear selector into REVERSE.

Does the test light illuminate brightly at both connections?

Yes

- Replace the Right Backup Lamp in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B2884-19-RIGHT REVERSE/BUX TURN SIGNAL CONTROL - OVERCURRENT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 33: Tail Lamp/Backup Lamp Assembly Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The BCM provides a Pulse Width Modulated (PWM) voltage output through the backup lamp driver circuit. The driver circuit connects to the Backup Lamp. A ground path for the lamps is present through the harness to the body sheet metal. For additional information on the Backup Lamps operation, refer to **OPERATION** .

WHEN MONITORED

With the backup lamps active.

SET CONDITION

When the Body Control Module (BCM) detects a low condition on the (L16) Right Backup Lamp Driver circuit.

POSSIBLE CAUSES

Possible Causes
(L16) RIGHT BACKUP LAMP DRIVER CIRCUIT SHORTED TO GROUND
RIGHT BACKUP LAMP
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the brakes firmly applied, shift the gear selector into REVERSE.
    3. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **ATTEMPT TO SET THE OPPOSITE DTC**
    1. Shift the gear selector into PARK.
    2. Turn the ignition off.
    3. Disconnect the Right Tail Lamp harness connector.
    4. Turn the ignition on.
    5. With the brakes firmly applied, shift the gear selector into REVERSE.
    6. With the scan tool, read DTCs.

    Does the scan tool display DTC: B1707-18-LEFT REVERSE LAMP CONTROL - UNDER CURRENT?

    Yes

    - Replace the Right Backup Lamp in accordance with the Service Information. Refer to

LAMP, TAIL STOP TURN, REMOVAL .

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 3

3. **CHECK THE (L16) RIGHT BACKUP LAMP DRIVER CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Disconnect the BCM C6 harness connector.
   3. Measure the resistance between ground and the (L16) Right Backup Lamp Driver circuit.

   Is the resistance above 10K Ohms?

   Yes

   - Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Repair the short to ground in the (L16) Right Backup Lamp Driver circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

C1006-15-BRAKE FLUID LEVEL INPUT - CIRCUIT SHORT TO BATTERY OR OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 34: Brake Fluid Level Sensor & Stop Lamp Switch Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Body Control Module (BCM) provides a reference voltage on the brake fluid level signal circuit through a pull-up resistor that is connected to battery voltage. The Brake Fluid Level Switch switches the brake fluid level signal circuit to ground when the fluid level is low. A diagnostic resistor internal to the switch is placed in parallel with the switch.

WHEN MONITORED

With the ignition on.

SET CONDITION

When the BCM detects a short to voltage or an open in the Brake Fluid Level Signal circuit.

POSSIBLE CAUSES

Possible Causes
(B20) BRAKE FLUID LEVEL SIGNAL CIRCUIT SHORT TO VOLTAGE
(B20) BRAKE FLUID LEVEL SIGNAL CIRCUIT OPEN
(Z905) GROUND CIRCUIT OPEN
BRAKE FLUID LEVEL SWITCH
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE (B20) BRAKE FLUID LEVEL SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**
    1. Turn the ignition off.
    2. Disconnect the Brake Fluid Level Switch harness connector.
    3. Disconnect the BCM C4 harness connector.
    4. Turn the ignition on.
    5. Measure the voltage between ground and the (B20) Brake Fluid Level Signal circuit.

    Is the voltage present?

    Yes

    - Repair the short to voltage on the (B20) Brake Fluid Level Signal circuit.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 3

3. **CHECK THE (B20) BRAKE FLUID LEVEL SIGNAL CIRCUIT FOR AN OPEN**
   1. Turn the ignition off.
   2. Measure the resistance of the (B20) Brake Fluid Level Signal circuit between the BCM C4 and Brake Fluid Level Switch harness connectors.

      Is the resistance above 5.0 Ohms?

      Yes

      - Repair the open in the (B20) Brake Fluid Level Signal circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 4

4. **CHECK THE (Z905) GROUND CIRCUIT FOR AN OPEN**
   1. Using a 12-volt test light connected to 12-volts, check the (Z905) Ground circuit at the Brake Fluid Level Switch harness connector.

      Does the test light illuminate brightly?

      Yes

      - Go To 5

      No

      - Repair the open in the (Z905) Ground circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **CHECK THE BCM FOR CORRECT OPERATION**
   1. Turn the ignition off.
   2. Connect a jumper wire between the (B20) Brake Fluid Level Signal circuit and the (Z905) Ground circuit at the Brake Fluid Level Switch harness connector.
   3. Turn the ignition on.
   4. With the scan tool, read the Brake Fluid Level.

      Does the Brake Fluid Level display Low?

      Yes

- Replace the Brake Fluid Level Switch in accordance with the Service Information. Refer to **SWITCH, BRAKE FLUID LEVEL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

C107D-67-BRAKE PEDAL SWITCH 1/2 CORRELATION - SIGNAL INCORRECT AFTER EVENT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 35: Brake Fluid Level Sensor & Stop Lamp Switch Circuit Diagram

Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the ignition on.

SET CONDITION

This DTC will set if the Body Control Module (BCM) detects incorrect voltage inputs from the two Brake Switch Signals.

POSSIBLE CAUSES

Possible Causes
BRAKE SIGNAL 1 CIRCUIT OPEN OR SHORTED TO GROUND
BRAKE SIGNAL 2 CIRCUIT OPEN OR SHORTED TO GROUND
BRAKE SWITCH
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**

   NOTE: Verify that the Brake Switch is installed correctly on the vehicle before proceeding.

   1. Turn the ignition on.
   2. With the scan tool, read DTCs.

      Does the scan tool display this DTC as active?

      Yes

      - Go To 2

      No

      - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK THE (B135) BRAKE SIGNAL 1 CIRCUIT FOR A SHORT TO GROUND OR OPEN**

   NOTE: The (B135) Brake Signal 1 circuit is normally OPEN when the brake pedal

is NOT PRESSED.

1. Turn the ignition off.
2. Disconnect the BCM C4 harness connector.
3. With the Brake Pedal PRESSED, measure the voltage of the (B135) Brake Signal 1 circuit at the BCM C4 harness connector.

   Is the voltage above 10 volts?

   Yes

   - Go To 3

   No

   - Using the wiring diagrams as a guide, repair the (B135) Brake Signal 1 circuit for an open or short to ground.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (B134) BRAKE SIGNAL 2 CIRCUIT FOR A SHORT TO GROUND OR OPEN**

NOTE: The (B134) Brake Signal 2 circuit is normally CLOSED when the brake pedal is NOT PRESSED.

1. Turn the ignition on.
2. With the Brake Pedal NOT PRESSED, measure the voltage of the (B135) Brake Signal 1 circuit at the BCM C4 harness connector.

   Is the voltage above 10 volts?

   Yes

   - Replace the Body Control Module (BCM) in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Using the wiring diagrams as a guide, repair the (B134) Brake Signal 2 circuit for an open or short to ground.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

P0070-11-AMBIENT AIR TEMPERATURE SENSOR CIRCUIT - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 36: Ambient Air Temperature Sensor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the ignition on.

Battery voltage greater than 10.4 volts.

SET CONDITION

The Body Control Module (BCM) detects the Ambient Air Temperature Sensor input voltage is below the minimum acceptable value.

POSSIBLE CAUSES

Possible Causes
(G31) AAT SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
(G31) AAT SENSOR SIGNAL CIRCUIT SHORTED TO THE (G931) SENSOR RETURN CIRCUIT
AMBIENT AIR TEMPERATURE (AAT) SENSOR
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
   1. Turn the ignition on.
   2. With the scan tool, read DTCs.

      Does the scan tool display this DTC as active?

      Yes

      - Go To 2

      No

      - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE AMBIENT AIR TEMPERATURE SENSOR**
   1. Turn the ignition off.
   2. Disconnect the Ambient Air Temperature Sensor harness connector.
   3. Turn the ignition on.
   4. With the scan tool, read the DTCs.

      Does the scan tool display DTC: P0070-15-AMBIENT AIR TEMPERATURE SENSOR CIRCUIT - CIRCUIT SHORT TO BATTERY OR OPEN?

      Yes

      - Verify there is good pin to terminal contact in the AAT Sensor and BCM harness connectors. Replace the Ambient Temperature Sensor if no problems were found with the connectors in accordance with the Service Information. Refer to **SENSOR, AMBIENT TEMPERATURE, REMOVAL** .

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 3

3. **CHECK THE (G31) AAT SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Disconnect the BCM C6 harness connector.
   3. Measure the resistance between ground and the (G31) AAT Sensor Signal circuit in the Ambient Air Temperature Sensor harness connector.

      Is the resistance above 10K Ohms?

      Yes

      - Go To 4

      No

      - Repair the short to ground in the (G31) AAT Sensor Signal circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
4. **CHECK THE (G31) AAT SENSOR SIGNAL CIRCUIT FOR A SHORT TO THE (G931) SENSOR RETURN CIRCUIT**
   1. Measure the resistance between the (G31) AAT Sensor Signal circuit and the (G931) Sensor Return circuit in the Ambient Air Temperature Sensor harness connector.

      Is the resistance above 10K Ohms?

      Yes

      - Go To 5

      No

      - Repair the short between the (G31) AAT Sensor Signal circuit and the (G931) Sensor Return circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
5. **BODY CONTROL MODULE (BCM)**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Ambient Air Temperature Sensor and the BCM.
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals.
   4. Verify that there is good pin to terminal contact in the AAT Sensor and BCM connectors.

5. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
6. Look for the data to change or for the DTC to reset during the wiggle test.
7. Perform any Technical Service Bulletins (TSB)s that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

P0070-15-AMBIENT AIR TEMPERATURE SENSOR CIRCUIT - CIRCUIT SHORT TO BATTERY OR OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 37: Ambient Air Temperature Sensor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the ignition on.

Battery voltage greater than 10.4 volts.

SET CONDITION

The Body Control Module (BCM) detects the Ambient Air Temperature Sensor input voltage is above the maximum acceptable value.

POSSIBLE CAUSES

Possible Causes
(G31) AAT SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
(G31) AAT SENSOR SIGNAL CIRCUIT OPEN
(G931) SENSOR RETURN CIRCUIT OPEN
AMBIENT AIR TEMPERATURE (AAT) SENSOR
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE (G31) AAT SENSOR SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**
    1. Turn the ignition off.
    2. Disconnect the Ambient Air Temperature Sensor harness connector.
    3. Disconnect the BCM C6 harness connector.
    4. Turn the ignition on.
    5. Measure the voltage of the (G31) AAT Sensor Signal circuit in the Ambient Air Temperature Sensor harness connector.

    Is there any voltage present?

    Yes

    - Repair the short to voltage in the (G31) AAT Sensor Signal circuit.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 3

3. **CHECK THE AMBIENT AIR TEMPERATURE SENSOR**
   1. Turn the ignition off.
   2. Reconnect the BCM C6 harness connector.
   3. Connect a jumper wire between the (G31) AAT Sensor Signal circuit and the (G931) Sensor Return in the Ambient Air Temperature Sensor harness connector.
   4. Turn the ignition on.
   5. With the scan tool, read the DTCs.

   Does the scan tool display DTC: P0070-11-AMBIENT AIR TEMPERATURE SENSOR CIRCUIT - CIRCUIT SHORT TO GROUND?

   Yes

   - Verify there is good pin to terminal contact in the AAT Sensor and BCM harness connectors. Replace the Ambient Temperature Sensor if no problems were found with the connectors in accordance with the Service Information. Refer to **SENSOR, AMBIENT TEMPERATURE, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 4

4. **CHECK THE (G31) AAT SENSOR SIGNAL CIRCUIT FOR AN OPEN**
   1. Turn the ignition off.
   2. Disconnect the BCM C6 harness connector.
   3. Measure the resistance of the (G31) AAT Sensor Signal circuit between the Ambient Air Temperature Sensor harness connector and the BCM C6 harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 5

   No

   - Repair the open in the (G31) AAT Sensor Signal circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **CHECK THE (G931) SENSOR RETURN CIRCUIT FOR AN OPEN**
    1. Measure the resistance of the (G931) Sensor Return circuit between the Ambient Air Temperature Sensor harness connector and the BCM C6 harness connector.

       Is the resistance below 5.0 Ohms?

       Yes

       - Go To 6

       No

       - Repair the open in the (G931) Sensor Return circuit.
       - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
6. **BODY CONTROL MODULE (BCM)**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Ambient Air Temperature Sensor and the Body Control Module (BCM).
    2. Look for any chafed, pierced, pinched, or partially broken wires.
    3. Look for broken, bent, pushed out or corroded terminals.
    4. Verify that there is good pin to terminal contact in the AAT Sensor and BCM connectors.
    5. Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.
    6. Look for the data to change or for the DTC to reset during the wiggle test.
    7. Perform any Technical Service Bulletins (TSB)s that may apply.

       Were any problems found?

       Yes

       - Repair as necessary.
       - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

       No

       - Replace the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
       - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

P0460-11-FUEL LEVEL SENSOR 1 - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 38: Fuel Level Sensor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Body Control Module (BCM) provides a switched reference voltage on the fuel level signal circuit through a pull-up resistor that is connected to battery voltage. The BCM monitors the voltage on the fuel level signal circuit. The fuel level signal is adjusted for changes in battery voltage. The voltage value is then transmitted as a network message on the communication network.

WHEN MONITORED

With the ignition on.

Battery voltage greater than 10.4 volts.

SET CONDITION

The Body Control Module (BCM) detects that the Fuel Level Sensor input voltage is below the minimum acceptable value.

POSSIBLE CAUSES

Possible Causes
(N4) FUEL LEVEL SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
(N4) FUEL LEVEL SENSOR SIGNAL CIRCUIT SHORTED TO THE (G109) FUEL LEVEL SENSE RETURN CIRCUIT
FUEL LEVEL SENSOR
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **ATTEMPT TO SET THE OPPOSITE DTC**
    1. Turn the ignition off.
    2. Disconnect the Fuel Pump Module C1 harness connector.
    3. Turn the ignition on.
    4. With the scan tool, read DTCs.

    Does the scan tool display DTC: P0460-15-FUEL LEVEL SENSOR 1 - CIRCUIT SHORT TO BATTERY OR OPEN?

Yes

- Replace the Fuel Level Sending Unit in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 3

3. **CHECK THE (N4) FUEL LEVEL SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Disconnect the BCM C6 harness connector.
   3. Measure the resistance between ground and the (N4) Fuel Level Sensor Signal circuit at the Fuel Pump Module harness connector.

      Is the resistance above 10K Ohms?

      Yes

      - Go To 4

      No

      - Repair the short to ground in the (N4) Fuel Level Sensor Signal circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
4. **CHECK THE (N4) FUEL LEVEL SENSOR SIGNAL CIRCUIT FOR A SHORT TO THE (G109) FUEL LEVEL SENSE RETURN CIRCUIT**
   1. Measure the resistance between the (G109) Fuel Level Sense Return circuit and the (N4) Fuel Level Sensor Signal circuit at the Fuel Pump Module harness connector.

      Is the resistance above 10K Ohms?

      Yes

      - Go To 5

      No

      - Repair the short between the (G109) Fuel Level Sense Return circuit and the (N4) Fuel Level Sensor Signal circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
5. **BODY CONTROL MODULE (BCM)**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Fuel Pump Module and the BCM.

2. Look for any chafed, pierced, pinched, or partially broken wires.
3. Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the Fuel Pump Module and the BCM harness connectors.
4. Perform any Technical Service Bulletins (TSB)s that may apply.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

P0460-15-FUEL LEVEL SENSOR 1 - CIRCUIT SHORT TO BATTERY OR OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 39: Fuel Level Sensor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Body Control Module (BCM) provides a switched reference voltage on the fuel level signal circuit through a pull-up resistor that is connected to battery voltage. The BCM monitors the voltage on the fuel level signal circuit. The fuel level signal is adjusted for changes in battery voltage. The voltage value is then transmitted as a network message on the communication network.

WHEN MONITORED

With the ignition on.

Battery voltage greater than 10.4 volts.

SET CONDITION

The Body Control Module (BCM) detects that the Fuel Level Sensor input voltage is above the maximum acceptable value.

POSSIBLE CAUSES

Possible Causes
(N4) FUEL LEVEL SENSOR SIGNAL CIRCUIT OPEN
(N4) FUEL LEVEL SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
(G109) FUEL LEVEL SENSE RETURN CIRCUIT OPEN
FUEL LEVEL SENSOR
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE (N4) FUEL LEVEL SENSOR SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**
    1. Turn the ignition off.
    2. Disconnect the Fuel Pump Module C1 harness connector.
    3. Disconnect the BCM C6 harness connector.
    4. Turn the ignition on.
    5. Measure the voltage between ground and the (N4) Fuel Level Sensor Signal circuit at the Fuel Pump Module harness connector.

Is there any voltage present?

Yes

- Repair the short to voltage in the (N4) Fuel Level Sensor Signal circuit.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 3

3. **CHECK THE FUEL LEVEL SENSOR FOR CORRECT OPERATION**
   1. Turn the ignition off.
   2. Reconnect the BCM C6 harness connector.
   3. Connect a jumper wire between the (N4) Fuel Level Sensor Signal circuit and the (G109) Fuel Level Sense Return circuit at the Fuel Pump Module harness connector.
   4. Turn the ignition on.
   5. With the scan tool, read DTCs.

   Does the scan tool display DTC: P0460-11-FUEL LEVEL SENSOR 1 - CIRCUIT SHORT TO GROUND?

   Yes

   - Replace the Fuel Level Sending Unit in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 4

4. **CHECK THE (N4) FUEL LEVEL SENSOR SIGNAL CIRCUIT FOR AN OPEN**
   1. Turn the ignition off.
   2. Disconnect the BCM C6 harness connector.
   3. Measure the resistance of the (N4) Fuel Level Sensor Signal circuit between the Fuel Pump Module harness connector and the BCM C6 harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 5

   No

- Repair the open in the (N4) Fuel Level Sensor Signal circuit.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **CHECK THE (G109) FUEL LEVEL SENSE RETURN CIRCUIT FOR AN OPEN**
   1. Measure the resistance of the (G109) Fuel Level Sense Return circuit between the Fuel Pump Module harness connector and the BCM C6 harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 6

      No

      - Repair the open in the (G109) Fuel Level Sense Return circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
6. **BODY CONTROL MODULE (BCM)**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Fuel Pump Module and the BCM.
   2. Look for any chafed, pierced, pinched, or partially broken wires.
   3. Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the Fuel Pump Module and the BCM harness connectors.
   4. Perform any Technical Service Bulletins (TSB)s that may apply.

      Were any problems found?

      Yes

      - Repair as necessary.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Replace the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

P0615-12-STARTER CONTROL CIRCUIT-CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 40: Ignition Run/Start Input Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the ignition on.

Battery voltage greater than 10.4 volts.

SET CONDITION

This DTC will set if the Body Control Module (BCM) detects a short to voltage on the Starter Relay Control

circuit.

POSSIBLE CAUSES

Possible Causes
STARTER RELAY CONTROL CIRCUIT SHORTED TO VOLTAGE
STARTER SOLENOID RELAY
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
   1. Turn the ignition on.
   2. With the scan tool, read DTCs.

      Does the scan tool display this DTC as active?

      Yes

      - Go To 2

      No

      - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE STARTER SOLENOID RELAY FOR CORRECT OPERATION**
   1. Turn the ignition off.
   2. Replace the Starter Solenoid Relay with a known good relay.
   3. Turn the ignition on. Start the vehicle.
   4. Turn the ignition off and back on again.
   5. With the scan tool, read DTCs.

      Does the scan tool display this DTC as active?

      Yes

      - Go To 3

      No

      - Replace the Starter Solenoid Relay.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (K90) STARTER RELAY CONTROL CIRCUIT FOR A SHORT TO VOLTAGE**
   1. Turn the ignition off.
   2. Remove the Starter Solenoid Relay from the PDC.
   3. Disconnect the BCM C4 harness connector.
   4. Turn the ignition on.
   5. Measure the voltage of the (K90) Starter Relay Control circuit.

   Is voltage Present?

   Yes

   - Repair the (K90) Starter Relay Control circuit for a short to voltage.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

P2065-11-FUEL LEVEL SENSOR 2 - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 41: Fuel Level Sensor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Body Control Module (BCM) provides a switched reference voltage on the fuel level signal circuit through a pull-up resistor that is connected to battery voltage. The BCM monitors the voltage on the fuel level signal 2 circuit. The fuel level signal is adjusted for changes in battery voltage. The voltage value is then transmitted as a network message on the communication network.

WHEN MONITORED

With the ignition on.

Battery voltage greater than 10.4 volts.

SET CONDITION

The Body Control Module (BCM) detects that the Fuel Level Signal 2 input voltage is below the minimum acceptable value.

POSSIBLE CAUSES

Possible Causes
FUEL LEVEL SIGNAL 2 CIRCUIT SHORTED TO GROUND
FUEL LEVEL SIGNAL 2 CIRCUIT SHORTED TO THE FUEL LEVEL SENSE RETURN CIRCUIT
FUEL LEVEL SENSOR
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN INTERMITTENT CONDITION**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE FUEL LEVEL SENDING UNIT**
    1. Turn the ignition off.
    2. Disconnect the Fuel Tank Assembly in-line harness connector.
    3. Turn the ignition on.
    4. With the scan tool, read DTCs.

    Does the scan tool display DTC: P2065-15-FUEL LEVEL SENSOR 2 - CIRCUIT SHORT TO BATTERY OR OPEN with the connector unplugged?

Yes

- Check the Fuel Tank Assembly harness for any signs of damage which could cause an open or shorted circuit. If the harness checks good, replace the Fuel Tank Pressure Sensor in accordance with the service information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 3

3. **CHECK THE (N5) FUEL LEVEL SIGNAL 2 CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Disconnect the BCM C8 harness connector.
   3. Measure the resistance between ground and the (N5) Fuel Level Signal 2 circuit at the Fuel Tank Assembly in-line harness connector.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 4

   No

   - Repair the short to ground in the (N5) Fuel Level Signal 2 circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK THE (N5) FUEL LEVEL SIGNAL 2 CIRCUIT FOR A SHORT TO THE (G109) FUEL LEVEL SENSE RETURN CIRCUIT**
   1. Measure the resistance between the (G109) Fuel Level Sense Return circuit and the (N5) Fuel Level Signal 2 circuit at the Fuel Tank Assembly in-line harness connector.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 5

   No

   - Repair the short between the (G109) Fuel Level Sense Return circuit and the (N5) Fuel Level Signal 2 circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **BODY CONTROL MODULE (BCM)**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors at the Fuel Tank

Assembly in-line, Fuel Pump Module and the BCM.

2. Look for any chafed, pierced, pinched, or partially broken wires.
3. Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the Fuel Pump Module and the BCM harness connectors.
4. Perform any Technical Service Bulletins (TSB)s that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

P2065-15-FUEL LEVEL SENSOR 2 - CIRCUIT SHORT TO BATTERY OR OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 42: Fuel Level Sensor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Body Control Module (BCM) provides a switched reference voltage on the fuel level signal circuit through a pull-up resistor that is connected to battery voltage. The BCM monitors the voltage on the fuel level signal 2 circuit. The fuel level signal is adjusted for changes in battery voltage. The voltage value is then transmitted as a network message on the communication network.

WHEN MONITORED

With the ignition on.

Battery voltage greater than 10.4 volts.

SET CONDITION

The Body Control Module (BCM) detects that the Fuel Level Signal 2 input voltage is above the maximum acceptable value.

POSSIBLE CAUSES

Possible Causes
FUEL LEVEL SIGNAL 2 CIRCUIT OPEN
FUEL LEVEL SIGNAL 2 CIRCUIT SHORTED TO VOLTAGE
FUEL LEVEL SENSOR
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE (N5) FUEL LEVEL SIGNAL 2 CIRCUIT FOR A SHORT TO VOLTAGE**
    1. Turn the ignition off.
    2. Disconnect the Fuel Tank Assembly in-line harness connector.
    3. Turn the ignition on.
    4. Measure the voltage between ground and the (N5) Fuel Level Signal 2 circuit at the Fuel Tank Assembly in-line harness connector.

    Is the voltage above 5.2 volts?

Yes

- Repair the short to voltage in the (N5) Fuel Level Signal 2 circuit.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 3

3. **CHECK THE FUEL LEVEL SENSOR FOR CORRECT OPERATION**
   1. Connect a jumper between ground and the (N5) Fuel Level Signal 2 circuit at the Fuel Tank Assembly in-line harness connector.
   2. Turn the ignition on.
   3. With the scan tool, read DTCs.

   Does the scan tool display DTC: P2065-11-FUEL LEVEL SENSOR 2 - CIRCUIT SHORT TO GROUND with the jumper in place?

   Yes

   - Check the Fuel Tank Assembly harness for any signs of damage which could cause an open or shorted circuit. If the harness checks good, replace the Fuel Tank Pressure Sensor in accordance with the service information.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 4

4. **CHECK THE (N5) FUEL LEVEL SIGNAL 2 CIRCUIT FOR AN OPEN**
   1. Turn the ignition off.
   2. Disconnect the BCM C8 harness connector.
   3. Measure the resistance of the (N5) Fuel Level Signal 2 circuit between the Fuel Tank Assembly in-line harness connector and the BCM C8 harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 5

   No

   - Repair the open in the (N5) Fuel Level Signal 2 circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **BODY CONTROL MODULE (BCM)**
    1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors at the Fuel Tank Assembly in-line, Fuel Pump Module and the BCM.
    2. Look for any chafed, pierced, pinched, or partially broken wires.
    3. Look for broken, bent, pushed out or corroded terminals. Verify that there is good pin to terminal contact in the Fuel Tank Assembly in-line and the BCM harness connectors.
    4. Perform any Technical Service Bulletins (TSB)s that may apply.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

    No

    - Replace the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

P2687-12-FUEL SUPPLY HEATER CONTROL - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 43: Fuel Pump Module & Fuel Heater Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the ignition on and the fuel heater active.

SET CONDITION

The Body Control Module (BCM) detects a short to voltage on the (K37) Fuel Heater Relay Control circuit.

POSSIBLE CAUSES

Possible Causes
(K37) FUEL HEATER RELAY CONTROL CIRCUIT SHORTED TO VOLTAGE
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
   1. Turn the ignition on.
   2. With the scan tool, read DTCs.

      Does the scan tool display this DTC as active?

      Yes

      - Go To 2

      No

      - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE (K37) FUEL HEATER RELAY CONTROL CIRCUIT FOR A SHORT TO VOLTAGE IN THE HARNESS**
   1. Turn the ignition off.
   2. Remove the Fuel Heater Relay.
   3. Turn the ignition on.
   4. Measure the voltage between ground and the (K37) Fuel Heater Relay Control circuit.

      Is there any voltage present?

      Yes

      - Using the wiring diagrams as a guide, repair the short to voltage in the (K37) Fuel Heater Relay Control circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 3

3. **INSPECT RELATED WIRING AND CHECK FOR TSBS**
    1. Turn the ignition off.
    2. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Fuel Heater Relay and the BCM.
    3. Look for any chafed, pierced, pinched, or partially broken wires.
    4. Look for broken, bent, pushed out or corroded terminals.
    5. Perform any Technical Service Bulletins that may apply.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

    No

    - Replace the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

P2687-14-FUEL SUPPLY HEATER CONTROL - CIRCUIT SHORT TO GROUND OR OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 44: Fuel Pump Module & Fuel Heater Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the ignition on.

With the fuel heater inactive.

SET CONDITION

If the Body Control Module (BCM) detects less than expected voltage on the (K37) Fuel Heater Relay Control circuit.

POSSIBLE CAUSES

Possible Causes
(K37) FUEL HEATER RELAY CONTROL CIRCUIT OPEN
(K37) FUEL HEATER RELAY CONTROL CIRCUIT SHORTED TO GROUND
FUEL HEATER RELAY
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, clear all DTCs.
    3. Wait 10 seconds.
    4. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE FUEL HEATER RELAY**
    1. Turn the ignition off.
    2. Remove the Fuel Heater Relay and substitute it with a known good relay.
    3. Turn the ignition on and wait 10 seconds.
    4. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

Yes

- Go To 3

No

- Replace the Fuel Heater Relay.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (K37) FUEL HEATER RELAY CONTROL CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Remove the Fuel Heater Relay.
   3. Disconnect the BCM C8 harness connector.
   4. Measure the resistance between ground and the (K37) Fuel Heater Relay Control circuit.

      Is the resistance above 10k Ohms?

      Yes

      - Go To 4

      No

      - Repair the short to ground in the (K37) Fuel Heater Relay Control circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
4. **CHECK THE (K37) FUEL HEATER RELAY CONTROL CIRCUIT FOR AN OPEN**
   1. Measure the resistance of the (K37) Fuel Heater Relay Control circuit between the Fuel Heater Relay and the BCM C8 harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 5

      No

      - Repair the open in the (K37) Fuel Heater Relay Control circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
5. **INSPECT RELATED WIRING AND CHECK FOR TSBS**
   1. Turn the ignition off.
   2. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Fuel Heater Relay and the BCM.

3. Look for any chafed, pierced, pinched, or partially broken wires.
4. Look for broken, bent, pushed out or corroded terminals.
5. Perform any Technical Service Bulletins that may apply.

Were any problems found?

Yes

- Repair as necessary.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U0010-87-CAN INTERIOR BUS - MISSING MESSAGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The primary communication network between electronic control modules is the Controller Area Network (CAN) data bus system. The Controller Area Network (CAN) data bus allows all electronic modules connected to the bus to share information with each other. Regardless of whether a message originates from a module on the higher speed CAN C (500K) Bus or on the lower speed bus, CAN Interior High Speed (IHS) (125K) Bus, the message structure and layout is similar, which allows the Body Control Module (BCM) to process and transfer messages between the CAN buses. The BCM stores Diagnostic Trouble Codes (DTCs) for certain bus network faults on the CAN C (500K) Bus and CAN IHS (125K) Bus.

All modules transmit and receive messages over one of these buses. Data exchange between the modules is achieved by serial transmission of encoded data messages (a form of transmission in which data bits are sent sequentially, one at a time, over a single line). Each module can both send and receive serial data simultaneously. Each data bit of a CAN Bus message is carried over the bus as a voltage differential between the two bus circuits which, when strung together, form a message. Each module uses arbitration to sort the message priority if two competing messages are attempting to be broadcast at the same time. Corruption of a single bit within a message will corrupt the entire message. Each message contains a Cyclic Redundancy Check (CRC) which specifies the message size exactly. If the message detected conflicts with the CRC the ECU receiving it will determine the message to be an error and consider that communication has not been possible. Diagnosis of this condition using a lab scope may reveal activity that appears to be Bus data messages even if no actual communication is possible. Communication problems that affect the whole bus, as a result of opens and terminal push outs are more likely to occur on data busses that operate at a high speed than a data bus that operates at a lower speed.

When an open circuit or terminal push out occurs one or more modules can become isolated from the remainder

of the bus. The isolated module will attempt to communicate, but will not be able to receive messages or determine arbitration from other modules. Each time the isolated module attempts to communicate it alters the bus voltage on the intact bus circuit. Without functioning arbitration the isolated module alters the bus voltage while other bus messages are being sent thereby corrupting the messages on the remainder of the bus.

The CAN bus modules are connected in parallel to the two-wire bus using a twisted pair, where the wires are wrapped around each other to provide shielding from unwanted electromagnetic induction, thus preventing interference with the relatively low voltage signals being carried through them. While the CAN bus is operating (active), one of the bus wires will carry a higher voltage and is referred to as the CAN High or CAN bus (+) wire, while the other bus wire will carry a lower voltage and is referred to as the CAN Low or CAN bus (-) wire.

For additional information on the communication network and star connector locations, refer to **COMMUNICATION, DESCRIPTION** .

WHEN MONITORED

With the ignition on.

SET CONDITION

The Body Control Module (BCM) detects that the CAN IHS Bus has been off for more than five seconds when activity was expected.

POSSIBLE CAUSES

Possible Causes
CAN IHS BUS (125K) (+) CIRCUIT SHORTED TO GROUND
CAN IHS BUS (125K) (-) CIRCUIT SHORTED TO VOLTAGE
CAN IHS BUS (125K) (+) CIRCUIT SHORTED TO THE CAN IHS BUS (125K) (-) CIRCUIT
ANY CAN IHS BUS MODULE
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Turn the ignition on.
    2. With the scan tool, record and erase DTCs.
    3. Cycle the ignition from on to off three times.
    4. Turn the ignition on and wait 10 seconds.
    5. With the scan tool, read active DTCs.

    Does the scan tool display this DTC as active?

    Yes

- Go To 2

No

- Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK THE CAN IHS BUS CIRCUITS FOR THE CAN IHS BUS (125K) MODULES**

NOTE: When performing this step, turn the ignition off (wait one minute) before disconnecting any module. When the module is disconnected turn the ignition on.

NOTE: This step is to determine if the fault is a module or the circuits between the module and the Star Connector.

1. While monitoring the scan tool, disconnect each CAN IHS Bus (125K) module at the Front CAN IHS Star Connector (except for the BCM and DLC), one at a time.
2. Check for this DTC to become stored after disconnecting each CAN IHS Bus (125K) module the vehicle is equipped with.

NOTE: If the DTC becomes stored when a particular module is disconnected, that module or related circuits are causing the DTC to set.

With all the CAN IHS Bus modules disconnected at the Star Connector (except for BCM and DLC), does the scan tool display this DTC as active?

Yes

- Go To 3

No

- Diagnose the wiring and connectors between the Front CAN IHS Star Connector and the module that when disconnected caused this DTC to become stored for damage or shorted circuits. If OK, replace the module that when disconnected caused this DTC to become stored in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (D158) CAN IHS BUS (125K) (-) CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 45: Checking CAN IHS BUS (125K) (-) Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the scan tool.
3. Disconnect the Front CAN IHS Star Connector for the DLC.
4. Turn the ignition on.
5. Measure the voltage between ground and the (D158) CAN IHS Bus (125K) (-) circuit.

   Is there any voltage present?

   Yes

   - Repair the short to voltage in the (D158) CAN IHS Bus (-) circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

- Go To 4

4. **CHECK THE (D157) CAN IHS BUS (125K) (+) CIRCUIT FOR A SHORT TO GROUND**

Fig. 46: Checking CAN IHS BUS (125K) (+) Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between ground and the (D157) CAN IHS Bus (125K) (+) circuit.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 5

   No

   - Repair the short to ground in the (D157) CAN IHS Bus (125K) (+) circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **CHECK FOR A SHORT BETWEEN THE (D157) CAN IHS BUS (125K) (+) CIRCUIT AND (D158) CAN IHS BUS (125K) (-) CIRCUIT**

Fig. 47: Checking For A Short Between The CAN IHS BUS (125K) (+) Circuit And CAN IHS BUS (125K) (-) Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (D158) CAN IHS Bus (125K) (-) and the (D157) CAN IHS Bus (125K) (+) circuits.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 6

   No

   - Repair the short between the (D157) CAN IHS Bus (125K) (+) circuit and the (D158) CAN

IHS Bus (125K) (-) circuit.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

6. **CHECK THE CAN IHS BUS CIRCUITS FOR BCM**
   1. Disconnect the Front CAN IHS Star Connector for the BCM.
   2. Reconnect all other connectors.
   3. Cycle the ignition from on to off three times.
   4. Turn the ignition on and wait 10 seconds.
   5. With the scan tool, read all DTCs.

   Do any modules on the CAN IHS BUS (125K) display this DTC as active?

   Yes

   - Reconnect all the connectors and retest. If the concern is still present, replace the Star Connector.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Diagnose the wiring and connectors between the Front CAN IHS Star Connector and the BCM. If OK, replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U0010-88-CAN INTERIOR BUS - BUS OFF

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The primary communication network between electronic control modules is the Controller Area Network (CAN) data bus system. The Controller Area Network (CAN) data bus allows all electronic modules connected to the bus to share information with each other. Regardless of whether a message originates from a module on the higher speed CAN C (500K) Bus or on the lower speed bus, CAN Interior High Speed (IHS) (125K) Bus, the message structure and layout is similar, which allows the Body Control Module (BCM) to process and transfer messages between the CAN buses. The BCM stores Diagnostic Trouble Codes (DTCs) for certain bus network faults on the CAN C (500K) Bus and CAN IHS (125K) Bus.

All modules transmit and receive messages over one of these buses. Data exchange between the modules is achieved by serial transmission of encoded data messages (a form of transmission in which data bits are sent sequentially, one at a time, over a single line). Each module can both send and receive serial data simultaneously. Each data bit of a CAN Bus message is carried over the bus as a voltage differential between the two bus circuits which, when strung together, form a message. Each module uses arbitration to sort the message priority if two competing messages are attempting to be broadcast at the same time. Corruption of a single bit within a message will corrupt the entire message. Each message contains a Cyclic Redundancy Check

(CRC) which specifies the message size exactly. If the message detected conflicts with the CRC the ECU receiving it will determine the message to be an error and consider that communication has not been possible. Diagnosis of this condition using a lab scope may reveal activity that appears to be Bus data messages even if no actual communication is possible. Communication problems that affect the whole bus, as a result of opens and terminal push outs are more likely to occur on data busses that operate at a high speed than a data bus that operates at a lower speed.

When an open circuit or terminal push out occurs one or more modules can become isolated from the remainder of the bus. The isolated module will attempt to communicate, but will not be able to receive messages or determine arbitration from other modules. Each time the isolated module attempts to communicate it alters the bus voltage on the intact bus circuit. Without functioning arbitration the isolated module alters the bus voltage while other bus messages are being sent thereby corrupting the messages on the remainder of the bus.

The CAN bus modules are connected in parallel to the two-wire bus using a twisted pair, where the wires are wrapped around each other to provide shielding from unwanted electromagnetic induction, thus preventing interference with the relatively low voltage signals being carried through them. While the CAN bus is operating (active), one of the bus wires will carry a higher voltage and is referred to as the CAN High or CAN bus (+) wire, while the other bus wire will carry a lower voltage and is referred to as the CAN Low or CAN bus (-) wire.

For additional information on the communication network and star connector locations, refer to **COMMUNICATION, DESCRIPTION** .

WHEN MONITORED

With the ignition on.

SET CONDITION

The Body Control Module (BCM) detects a short condition in one of the CAN IHS Bus (125K) circuits for less than one second.

POSSIBLE CAUSES

Possible Causes
CAN IHS BUS (125K) (+) CIRCUIT SHORTED TO GROUND
CAN IHS BUS (125K) (-) CIRCUIT SHORTED TO VOLTAGE
CAN IHS BUS (125K) (+) CIRCUIT SHORTED TO THE CAN IHS BUS (125K) (-) CIRCUIT
ANY CAN IHS BUS MODULE
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Turn the ignition on.
    2. With the scan tool, record and erase DTCs.

3. Cycle the ignition from on to off three times.
4. Turn the ignition on and wait 10 seconds.
5. With the scan tool, read active DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Go To 2

   No

   - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK THE CAN IHS BUS CIRCUITS FOR THE CAN IHS BUS (125K) MODULES**

NOTE: **When performing this step, turn the ignition off (wait one minute) before disconnecting any module. When the module is disconnected turn the ignition on.**

NOTE: **This step is to determine if the fault is a module or the circuits between the module and the Star Connector.**

1. While monitoring the scan tool, disconnect each CAN IHS Bus (125K) module at the Front CAN IHS Star Connector (except for the BCM and DLC), one at a time.
2. Check for this DTC to become stored after disconnecting each CAN IHS Bus (125K) module the vehicle is equipped with.

   NOTE: **If the DTC becomes stored when a particular module is disconnected, that module or related circuits are causing the DTC to set.**

   With all the CAN IHS Bus modules disconnected at the Star Connector (except for BCM and DLC), does the scan tool display this DTC as active?

   Yes

   - Go To 3

   No

   - Diagnose the wiring and connectors between the Front CAN IHS Star Connector and the module that when disconnected caused this DTC to become stored for damage or shorted

circuits. If OK, replace the module that when disconnected caused this DTC to become stored in accordance with the Service Information.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (D158) CAN IHS BUS (125K) (-) CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 48: Checking CAN IHS BUS (125K) (-) Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the scan tool.
3. Disconnect the Front CAN IHS Star Connector for the DLC.
4. Turn the ignition on.
5. Measure the voltage between ground and the (D158) CAN IHS Bus (125K) (-) circuit.

   Is there any voltage present?

   Yes

- Repair the short to voltage in the (D158) CAN IHS Bus (-) circuit.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 4

4. **CHECK THE (D157) CAN IHS BUS (125K) (+) CIRCUIT FOR A SHORT TO GROUND**

Fig. 49: Checking CAN IHS BUS (125K) (+) Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between ground and the (D157) CAN IHS Bus (125K) (+) circuit.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 5

No

- Repair the short to ground in the (D157) CAN IHS Bus (125K) (+) circuit.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **CHECK FOR A SHORT BETWEEN THE (D157) CAN IHS BUS (125K) (+) CIRCUIT AND (D158) CAN IHS BUS (125K) (-) CIRCUIT**

Fig. 50: Checking For A Short Between The CAN IHS BUS (125K) (+) Circuit And CAN IHS BUS (125K) (-) Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (D158) CAN IHS Bus (125K) (-) and the (D157) CAN IHS Bus (125K) (+) circuits.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 6

No

- Repair the short between the (D157) CAN IHS Bus (125K) (+) circuit and the (D158) CAN IHS Bus (125K) (-) circuit.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

6. **CHECK THE CAN IHS BUS CIRCUITS FOR A BCM CONCERN**
   1. Disconnect the Front CAN IHS Star Connector for the BCM.
   2. Reconnect all other connectors.
   3. Cycle the ignition from on to off three times.
   4. Turn the ignition on and wait 10 seconds.
   5. With the scan tool, read all DTCs.

   Do any modules on the CAN IHS BUS (125K) display this DTC or U0010-00-CAN INTERIOR BUS as active?

   Yes

   - Reconnect all the connectors and retest. If the concern is still present, replace the Star Connector.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Diagnose the wiring and connectors between the Front CAN IHS Star Connector and the BCM. If OK, replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U0100-87-LOST COMMUNICATION WITH ECM/PCM - MISSING MESSAGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The primary communication network between electronic control modules is the Controller Area Network (CAN) data bus system. The Controller Area Network (CAN) data bus allows all electronic modules connected to the bus to share information with each other. Regardless of whether a message originates from a module on the higher speed CAN C (500K) Bus or on the lower speed bus, CAN Interior High Speed (IHS) (125K) Bus, the message structure and layout is similar, which allows the Body Control Module (BCM) to process and transfer messages between the CAN buses. The BCM stores Diagnostic Trouble Codes (DTCs) for certain bus network faults on the CAN C (500K) Bus and CAN IHS (125K) Bus.

All modules transmit and receive messages over one of these buses. Data exchange between the modules is achieved by serial transmission of encoded data messages (a form of transmission in which data bits are sent

sequentially, one at a time, over a single line). Each module can both send and receive serial data simultaneously. Each data bit of a CAN Bus message is carried over the bus as a voltage differential between the two bus circuits which, when strung together, form a message. Each module uses arbitration to sort the message priority if two competing messages are attempting to be broadcast at the same time. Corruption of a single bit within a message will corrupt the entire message. Each message contains a Cyclic Redundancy Check (CRC) which specifies the message size exactly. If the message detected conflicts with the CRC the ECU receiving it will determine the message to be an error and consider that communication has not been possible. Diagnosis of this condition using a lab scope may reveal activity that appears to be Bus data messages even if no actual communication is possible. Communication problems that affect the whole bus, as a result of opens and terminal push outs are more likely to occur on data busses that operate at a high speed than a data bus that operates at a lower speed.

When an open circuit or terminal push out occurs one or more modules can become isolated from the remainder of the bus. The isolated module will attempt to communicate, but will not be able to receive messages or determine arbitration from other modules. Each time the isolated module attempts to communicate it alters the bus voltage on the intact bus circuit. Without functioning arbitration the isolated module alters the bus voltage while other bus messages are being sent thereby corrupting the messages on the remainder of the bus.

The CAN bus modules are connected in parallel to the two-wire bus using a twisted pair, where the wires are wrapped around each other to provide shielding from unwanted electromagnetic induction, thus preventing interference with the relatively low voltage signals being carried through them. While the CAN bus is operating (active), one of the bus wires will carry a higher voltage and is referred to as the CAN High or CAN bus (+) wire, while the other bus wire will carry a lower voltage and is referred to as the CAN Low or CAN bus (-) wire.

For additional information on the communication network and star connector locations, refer to **COMMUNICATION, DESCRIPTION** .

WHEN MONITORED

With the ignition on for at least five seconds.

Battery voltage between 10 and 16 volts.

Body Control Module (BCM) is configured correctly.

SET CONDITION

Bus messages not received from the Powertrain Control Module (PCM) for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN C BUS (+) CIRCUIT SHORTED TO VOLTAGE
CAN C BUS (-) CIRCUIT SHORTED TO GROUND
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES

BCM NOT CONFIGURED CORRECTLY
PCM POWER AND GROUND
POWERTRAIN CONTROL MODULE (PCM)
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**

   NOTE: Make sure the battery voltage is between 10 and 16 volts before proceeding.

   1. With the scan tool, read active DTCs.

      Is this DTC active?

      Yes

      - Go To 2

      No

      - Refer to **DIAGNOSIS AND TESTING** and perform the STORED LOST COMMUNICATION DTCS diagnostic procedure.
2. **CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS**
   1. With the scan tool, read all active DTCs from all modules.

      NOTE: Check for BCM configuration, CAN C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

      Does the scan tool display any active DTCs to the conditions listed above?

      Yes

      - Go to the **DTC INDEX** and perform the appropriate diagnostic procedure.

      No

      - Go To 3
3. **VERIFY THE PCM IS ACTIVE ON THE BUS**
   1. Turn the ignition on.
   2. With the scan tool, verify the PCM is active on the bus.

      Is the PCM active on the bus?

Yes

- Go To 4

No

- Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM PCM (POWERTRAIN CONTROL MODULE) diagnostic procedure.

4. **CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS**
   1. With the scan tool, read all the DTCs.

   Is there more than one module with active DTCs "Logged Against" the PCM?

   Yes

   - Replace/update the PCM in accordance with the Service Information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to the appropriate diagnosis and testing article in engine performance .

   No

   - Go To 5

5. **CLEAR DTC IN MODULE SETTING FAULT**
   1. With the scan tool, select the module setting the DTC against the PCM.
   2. Clear active DTCs.

   Is this DTC still active?

   Yes

   - Replace/update the module that set this DTC in accordance with the Service Information.
   - Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 6

6. **CYCLE IGNITION**
   1. Cycle the ignition from RUN to OFF three times ending with the key in the RUN position.

   Does this DTC become active?

Yes

- Go To 7

No

- The condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched and partially broken wires and the wiring harness connectors for broken, bent, pushed out and corroded terminals.
- Perform the appropriate verification test for the module. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

7. **CHECK FOR ADDITIONAL LOST COMMUNICATION FAULTS**
   1. With the scan tool, view the modules.

      Does the BCM and other CAN C BUS modules show Lost Communication with the remaining CAN C BUS modules?

      Yes

      - Go To 8

      No

      - Replace/update the module that set this DTC in accordance with the Service Information.
      - Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

8. **CHECK THE CAN C BUS (+) CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 51: Checking CAN C BUS (+) Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Measure the voltage between the (D57) CAN C Bus (+) circuit and ground.

   Is the voltage above 5.0 volts?

   Yes

   - Repair the short to voltage in the CAN C Bus (+) circuit. The short to voltage is present in one of the CAN C Bus circuits. Use the Star Connectors to isolate portions of the CAN C Bus in order to locate the concern.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 9

9. **CHECK THE CAN C BUS (-) CIRCUIT FOR A SHORT TO GROUND**

Fig. 52: Checking CAN C BUS (-) Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between ground and the (D58) CAN C Bus (-) circuit.

   Is the resistance below 10k Ohms?

   Yes

   - Repair the short to ground in the CAN C Bus (-) circuit. The short to ground is present in one of the CAN C Bus circuits. Use the Star Connectors to isolate portions of the CAN C Bus in order to locate the concern.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

- Replace/update the module that set this DTC in accordance with the Service Information.
- Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U0101-87-LOST COMMUNICATION WITH TCM - MISSING MESSAGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The primary communication network between electronic control modules is the Controller Area Network (CAN) data bus system. The Controller Area Network (CAN) data bus allows all electronic modules connected to the bus to share information with each other. Regardless of whether a message originates from a module on the higher speed CAN C (500K) Bus or on the lower speed bus, CAN Interior High Speed (IHS) (125K) Bus, the message structure and layout is similar, which allows the Body Control Module (BCM) to process and transfer messages between the CAN buses. The BCM stores Diagnostic Trouble Codes (DTCs) for certain bus network faults on the CAN C (500K) Bus and CAN IHS (125K) Bus.

All modules transmit and receive messages over one of these buses. Data exchange between the modules is achieved by serial transmission of encoded data messages (a form of transmission in which data bits are sent sequentially, one at a time, over a single line). Each module can both send and receive serial data simultaneously. Each data bit of a CAN Bus message is carried over the bus as a voltage differential between the two bus circuits which, when strung together, form a message. Each module uses arbitration to sort the message priority if two competing messages are attempting to be broadcast at the same time. Corruption of a single bit within a message will corrupt the entire message. Each message contains a Cyclic Redundancy Check (CRC) which specifies the message size exactly. If the message detected conflicts with the CRC the ECU receiving it will determine the message to be an error and consider that communication has not been possible. Diagnosis of this condition using a lab scope may reveal activity that appears to be Bus data messages even if no actual communication is possible. Communication problems that affect the whole bus, as a result of opens and terminal push outs are more likely to occur on data busses that operate at a high speed than a data bus that operates at a lower speed.

When an open circuit or terminal push out occurs one or more modules can become isolated from the remainder of the bus. The isolated module will attempt to communicate, but will not be able to receive messages or determine arbitration from other modules. Each time the isolated module attempts to communicate it alters the bus voltage on the intact bus circuit. Without functioning arbitration the isolated module alters the bus voltage while other bus messages are being sent thereby corrupting the messages on the remainder of the bus.

The CAN bus modules are connected in parallel to the two-wire bus using a twisted pair, where the wires are wrapped around each other to provide shielding from unwanted electromagnetic induction, thus preventing interference with the relatively low voltage signals being carried through them. While the CAN bus is operating (active), one of the bus wires will carry a higher voltage and is referred to as the CAN High or CAN bus (+) wire, while the other bus wire will carry a lower voltage and is referred to as the CAN Low or CAN bus (-) wire.

For additional information on the communication network and star connector locations, refer to

COMMUNICATION, DESCRIPTION .

WHEN MONITORED

With the ignition on for at least five seconds.

Battery voltage between 10 and 16 volts.

Body Control Module (BCM) is configured correctly.

SET CONDITION

Bus messages not received from the Transmission Control Module (TCM) for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN C BUS (+) CIRCUIT SHORTED TO VOLTAGE
CAN C BUS (-) CIRCUIT SHORTED TO GROUND
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
BCM NOT CONFIGURED CORRECTLY
TCM POWER AND GROUND
TRANSMISSION CONTROL MODULE (TCM)
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**

NOTE: Make sure the battery voltage is between 10 and 16 volts before proceeding.

1. With the scan tool, read active DTCs.

   Is this DTC active?

   Yes

   - Go To 2

   No

   - Refer to **DIAGNOSIS AND TESTING** and perform the STORED LOST COMMUNICATION DTCS diagnostic procedure.

2. **CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS**
   1. With the scan tool, read all active DTCs from all modules.

      NOTE: Check for BCM configuration, CAN C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

      Does the scan tool display any active DTCs to the conditions listed above?

      Yes

      - Go to the **DTC INDEX** and perform the appropriate diagnostic procedure.

      No

      - Go To 3
3. **VERIFY THE TCM IS ACTIVE ON THE BUS**
   1. Turn the ignition on.
   2. With the scan tool, verify the TCM is active on the bus.

      Is the TCM active on the bus?

      Yes

      - Go To 4

      No

      - Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM TCM diagnostic procedure.
4. **CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS**
   1. With the scan tool, read all the DTCs.

      Is there more than one module with active DTCs "Logged Against" the TCM?

      Yes

      - Replace/update the TCM in accordance with the Service Information.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **TRANSMISSION VERIFICATION TEST-948TE** .

      No

      - Go To 5
5. **CLEAR DTC IN MODULE SETTING FAULT**

1. With the scan tool, select the module setting the DTC against the TCM.
2. Clear active DTCs.

   Is this DTC still active?

   Yes

   - Replace/update the module that set this DTC in accordance with the Service Information.
   - Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 6

6. **CYCLE IGNITION**
   1. Cycle the ignition from RUN to OFF three times ending with the key in the RUN position.

      Does this DTC become active?

      Yes

      - Go To 7

      No

      - The condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.
      - Perform the appropriate verification test for the module. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

7. **CHECK FOR ADDITIONAL LOST COMMUNICATION FAULTS**
   1. With the scan tool, view the modules.

      Does the BCM and other CAN C BUS modules show Lost Communication with the remaining CAN C BUS modules?

      Yes

      - Go To 8

      No

- Replace/update the module that set this DTC in accordance with the Service Information.
- Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

8. **CHECK THE CAN C BUS (+) CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 53: Checking CAN C BUS (+) Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Measure the voltage between the (D57) CAN C Bus (+) circuit and ground.

   Is the voltage above 5.0 volts?

   Yes

   - Repair the short to voltage in the CAN C Bus (+) circuit. The short to voltage is present in one of the CAN C Bus circuits. Use the Star Connectors to isolate portions of the CAN C Bus in order to locate the concern.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 9

9. **CHECK THE CAN C BUS (-) CIRCUIT FOR A SHORT TO GROUND**

Fig. 54: Checking CAN C BUS (-) Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between ground and the (D58) CAN C Bus (-) circuit.

   Is the resistance below 10k Ohms?

   Yes

   - Repair the short to ground in the CAN C Bus (-) circuit. The short to ground is present in one of the CAN C Bus circuits. Use the Star Connectors to isolate portions of the CAN C Bus in order to locate the concern.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace/update the module that set this DTC in accordance with the Service Information.
- Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U0102-87-LOST COMMUNICATION WITH TRANSFER CASE CONTROL MODULE/AWD - MISSING MESSAGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The primary communication network between electronic control modules is the Controller Area Network (CAN) data bus system. The Controller Area Network (CAN) data bus allows all electronic modules connected to the bus to share information with each other. Regardless of whether a message originates from a module on the higher speed CAN C (500K) Bus or on the lower speed bus, CAN Interior High Speed (IHS) (125K) Bus, the message structure and layout is similar, which allows the Body Control Module (BCM) to process and transfer messages between the CAN buses. The BCM stores Diagnostic Trouble Codes (DTCs) for certain bus network faults on the CAN C (500K) Bus and CAN IHS (125K) Bus.

All modules transmit and receive messages over one of these buses. Data exchange between the modules is achieved by serial transmission of encoded data messages (a form of transmission in which data bits are sent sequentially, one at a time, over a single line). Each module can both send and receive serial data simultaneously. Each data bit of a CAN Bus message is carried over the bus as a voltage differential between the two bus circuits which, when strung together, form a message. Each module uses arbitration to sort the message priority if two competing messages are attempting to be broadcast at the same time. Corruption of a single bit within a message will corrupt the entire message. Each message contains a Cyclic Redundancy Check (CRC) which specifies the message size exactly. If the message detected conflicts with the CRC the ECU receiving it will determine the message to be an error and consider that communication has not been possible. Diagnosis of this condition using a lab scope may reveal activity that appears to be Bus data messages even if no actual communication is possible. Communication problems that affect the whole bus, as a result of opens and terminal push outs are more likely to occur on data busses that operate at a high speed than a data bus that operates at a lower speed.

When an open circuit or terminal push out occurs one or more modules can become isolated from the remainder of the bus. The isolated module will attempt to communicate, but will not be able to receive messages or determine arbitration from other modules. Each time the isolated module attempts to communicate it alters the bus voltage on the intact bus circuit. Without functioning arbitration the isolated module alters the bus voltage while other bus messages are being sent thereby corrupting the messages on the remainder of the bus.

The CAN bus modules are connected in parallel to the two-wire bus using a twisted pair, where the wires are wrapped around each other to provide shielding from unwanted electromagnetic induction, thus preventing interference with the relatively low voltage signals being carried through them. While the CAN bus is operating (active), one of the bus wires will carry a higher voltage and is referred to as the CAN High or CAN bus (+) wire, while the other bus wire will carry a lower voltage and is referred to as the CAN Low or CAN bus (-)

wire.

For additional information on the communication network and star connector locations, refer to **COMMUNICATION, DESCRIPTION** .

WHEN MONITORED

With the ignition on for at least five seconds.

Battery voltage between 10 and 16 volts.

Body Control Module (BCM) is configured correctly.

SET CONDITION

Bus messages not received from the Drive Train Control Module (DTCM) for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN C BUS (+) CIRCUIT SHORTED TO VOLTAGE
CAN C BUS (-) CIRCUIT SHORTED TO GROUND
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
BCM NOT CONFIGURED CORRECTLY
DRIVE TRAIN CONTROL MODULE (DTCM) POWER AND GROUND
DRIVE TRAIN CONTROL MODULE (DTCM)
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**

   NOTE: Make sure the battery voltage is between 10 and 16 volts before proceeding.

   1. With the scan tool, read active DTCs.

      Is this DTC active?

      Yes

      - Go To 2

      No

- Refer to **DIAGNOSIS AND TESTING** and perform the STORED LOST COMMUNICATION DTCS diagnostic procedure.

2. **CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS**
   1. With the scan tool, read all active DTCs from all modules.

      NOTE: Check for BCM configuration, CAN C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

      Does the scan tool display any active DTCs to the conditions listed above?

      Yes

      - Go to the **DTC INDEX** and perform the appropriate diagnostic procedure.

      No

      - Go To 3

3. **VERIFY THE DRIVE TRAIN CONTROL MODULE (DTCM) IS ACTIVE ON THE BUS**
   1. Turn the ignition on.
   2. With the scan tool, verify the Drive Train Control Module (DTCM) is active on the bus.

      Is the Transfer Case Control Module active on the bus?

      Yes

      - Go To 4

      No

      - Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM DTCM diagnostic procedure.

4. **CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS**
   1. With the scan tool, read all the DTCs.

      Is there more than one module with active DTCs "Logged Against" the DTCM?

      Yes

      - Replace/update the DTCM in accordance with the Service Information.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 5

5. **CLEAR DTC IN MODULE SETTING FAULT**
   1. With the scan tool, select the module setting the DTC against the DTCM.
   2. Clear active DTCs.

      Is this DTC still active?

      Yes

      - Replace/update the module that set this DTC in accordance with the Service Information.
      - Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 6
6. **CYCLE IGNITION**
   1. Cycle the ignition from RUN to OFF three times ending with the key in the RUN position.

      Does this DTC become active?

      Yes

      - Go To 7

      No

      - The condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.
      - Perform the appropriate verification test for the module. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
7. **CHECK FOR ADDITIONAL LOST COMMUNICATION FAULTS**
   1. With the scan tool, view the modules.

      Does the BCM and other CAN C BUS modules show Lost Communication with the remaining CAN C BUS modules?

      Yes

      - Go To 8

      No

- Replace/update the module that set this DTC in accordance with the Service Information.
- Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

8. **CHECK THE CAN C BUS (+) CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 55: Checking CAN C BUS (+) Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Measure the voltage between the (D57) CAN C Bus (+) circuit and ground.

   Is the voltage above 5.0 volts?

   Yes

   - Repair the short to voltage in the CAN C Bus (+) circuit. The short to voltage is present in one of the CAN C Bus circuits. Use the Star Connectors to isolate portions of the CAN C Bus in order to locate the concern.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 9

9. **CHECK THE CAN C BUS (-) CIRCUIT FOR A SHORT TO GROUND**

Fig. 56: Checking CAN C BUS (-) Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between ground and the (D58) CAN C Bus (-) circuit.

   Is the resistance below 10k Ohms?

   Yes

   - Repair the short to ground in the CAN C Bus (-) circuit. The short to ground is present in one of the CAN C Bus circuits. Use the Star Connectors to isolate portions of the CAN C Bus in order to locate the concern.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace/update the module that set this DTC in accordance with the Service Information.
- Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U0103-87-LOST COMMUNICATION WITH ELECTRIC GEAR SHIFT MODULE - MISSING MESSAGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The primary communication network between electronic control modules is the Controller Area Network (CAN) data bus system. The Controller Area Network (CAN) data bus allows all electronic modules connected to the bus to share information with each other. Regardless of whether a message originates from a module on the higher speed CAN C (500K) Bus or on the lower speed bus, CAN Interior High Speed (IHS) (125K) Bus, the message structure and layout is similar, which allows the Body Control Module (BCM) to process and transfer messages between the CAN buses. The BCM stores Diagnostic Trouble Codes (DTCs) for certain bus network faults on the CAN C (500K) Bus and CAN IHS (125K) Bus.

All modules transmit and receive messages over one of these buses. Data exchange between the modules is achieved by serial transmission of encoded data messages (a form of transmission in which data bits are sent sequentially, one at a time, over a single line). Each module can both send and receive serial data simultaneously. Each data bit of a CAN Bus message is carried over the bus as a voltage differential between the two bus circuits which, when strung together, form a message. Each module uses arbitration to sort the message priority if two competing messages are attempting to be broadcast at the same time. Corruption of a single bit within a message will corrupt the entire message. Each message contains a Cyclic Redundancy Check (CRC) which specifies the message size exactly. If the message detected conflicts with the CRC the ECU receiving it will determine the message to be an error and consider that communication has not been possible. Diagnosis of this condition using a lab scope may reveal activity that appears to be Bus data messages even if no actual communication is possible. Communication problems that affect the whole bus, as a result of opens and terminal push outs are more likely to occur on data busses that operate at a high speed than a data bus that operates at a lower speed.

When an open circuit or terminal push out occurs one or more modules can become isolated from the remainder of the bus. The isolated module will attempt to communicate, but will not be able to receive messages or determine arbitration from other modules. Each time the isolated module attempts to communicate it alters the bus voltage on the intact bus circuit. Without functioning arbitration the isolated module alters the bus voltage while other bus messages are being sent thereby corrupting the messages on the remainder of the bus.

The CAN bus modules are connected in parallel to the two-wire bus using a twisted pair, where the wires are wrapped around each other to provide shielding from unwanted electromagnetic induction, thus preventing interference with the relatively low voltage signals being carried through them. While the CAN bus is operating (active), one of the bus wires will carry a higher voltage and is referred to as the CAN High or CAN bus (+) wire, while the other bus wire will carry a lower voltage and is referred to as the CAN Low or CAN bus (-)

wire.

For additional information on the communication network and star connector locations, refer to **COMMUNICATION, DESCRIPTION** .

WHEN MONITORED

With the ignition on for at least five seconds.

Battery voltage between 10 and 16 volts.

Body Control Module (BCM) is configured correctly.

SET CONDITION

Bus messages not received from the Electronic Shift Module (ESM) for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN C BUS (+) CIRCUIT SHORTED TO VOLTAGE
CAN C BUS (-) CIRCUIT SHORTED TO GROUND
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
BCM NOT CONFIGURED CORRECTLY
ESM POWER AND GROUND
ELECTRONIC SHIFT MODULE (ESM)
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**

   NOTE: Make sure the battery voltage is between 10 and 16 volts before proceeding.

   1. With the scan tool, read active DTCs.

      Is this DTC active?

      Yes

      - Go To 2

      No

- Refer to **DIAGNOSIS AND TESTING** and perform the STORED LOST COMMUNICATION DTCS diagnostic procedure.

2. **CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS**
   1. With the scan tool, read all active DTCs from all modules.

      NOTE: Check for BCM configuration, CAN C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

      Does the scan tool display any active DTCs to the conditions listed above?

      Yes

      - Go to the **DTC INDEX** and perform the appropriate diagnostic procedure.

      No

      - Go To 3

3. **VERIFY THE ESM IS ACTIVE ON THE BUS**
   1. Turn the ignition on.
   2. With the scan tool, verify the ESM is active on the bus.

      Is the ESM active on the bus?

      Yes

      - Go To 4

      No

      - Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM ESM (POWERTRAIN CONTROL MODULE) diagnostic procedure.

4. **CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS**
   1. With the scan tool, read all the DTCs.

      Is there more than one module with active DTCs "Logged Against" the ESM?

      Yes

      - Replace/update the ESM in accordance with the Service Information.
      - Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

- Go To 5

5. **CLEAR DTC IN MODULE SETTING FAULT**
   1. With the scan tool, select the module setting the DTC against the ESM.
   2. Clear active DTCs.

      Is this DTC still active?

      Yes

      - Replace/update the module that set this DTC in accordance with the Service Information.
      - Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 6
6. **CYCLE IGNITION**
   1. Cycle the ignition from RUN to OFF three times ending with the key in the RUN position.

      Does this DTC become active?

      Yes

      - Go To 7

      No

      - The condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched and partially broken wires and the wiring harness connectors for broken, bent, pushed out and corroded terminals.
      - Perform the appropriate verification test for the module. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
7. **CHECK FOR ADDITIONAL LOST COMMUNICATION FAULTS**
   1. With the scan tool, view the modules.

      Does the BCM and other CAN C BUS modules show Lost Communication with the remaining CAN C BUS modules?

      Yes

      - Go To 8

No

- Replace/update the module that set this DTC in accordance with the Service Information.
- Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

8. **CHECK THE CAN C BUS (+) CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 57: Checking CAN C BUS (+) Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Measure the voltage between the (D57) CAN C Bus (+) circuit and ground.

   Is the voltage above 5.0 volts?

   Yes

   - Repair the short to voltage in the CAN C Bus (+) circuit. The short to voltage is present in one of the CAN C Bus circuits. Use the Star Connectors to isolate portions of the CAN C Bus in order to locate the concern.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

- Go To 9

9. **CHECK THE CAN C BUS (-) CIRCUIT FOR A SHORT TO GROUND**

Fig. 58: Checking CAN C BUS (-) Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between ground and the (D58) CAN C Bus (-) circuit.

   Is the resistance below 10k Ohms?

   Yes

   - Repair the short to ground in the CAN C Bus (-) circuit. The short to ground is present in one of the CAN C Bus circuits. Use the Star Connectors to isolate portions of the CAN C Bus in order to locate the concern.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace/update the module that set this DTC in accordance with the Service Information.
- Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U0121-87-LOST COMMUNICATION WITH ANTI-LOCK BRAKE SYSTEM (ABS) CONTROL MODULE - MISSING MESSAGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The primary communication network between electronic control modules is the Controller Area Network (CAN) data bus system. The Controller Area Network (CAN) data bus allows all electronic modules connected to the bus to share information with each other. Regardless of whether a message originates from a module on the higher speed CAN C (500K) Bus or on the lower speed bus, CAN Interior High Speed (IHS) (125K) Bus, the message structure and layout is similar, which allows the Body Control Module (BCM) to process and transfer messages between the CAN buses. The BCM stores Diagnostic Trouble Codes (DTCs) for certain bus network faults on the CAN C (500K) Bus and CAN IHS (125K) Bus.

All modules transmit and receive messages over one of these buses. Data exchange between the modules is achieved by serial transmission of encoded data messages (a form of transmission in which data bits are sent sequentially, one at a time, over a single line). Each module can both send and receive serial data simultaneously. Each data bit of a CAN Bus message is carried over the bus as a voltage differential between the two bus circuits which, when strung together, form a message. Each module uses arbitration to sort the message priority if two competing messages are attempting to be broadcast at the same time. Corruption of a single bit within a message will corrupt the entire message. Each message contains a Cyclic Redundancy Check (CRC) which specifies the message size exactly. If the message detected conflicts with the CRC the ECU receiving it will determine the message to be an error and consider that communication has not been possible. Diagnosis of this condition using a lab scope may reveal activity that appears to be Bus data messages even if no actual communication is possible. Communication problems that affect the whole bus, as a result of opens and terminal push outs are more likely to occur on data busses that operate at a high speed than a data bus that operates at a lower speed.

When an open circuit or terminal push out occurs one or more modules can become isolated from the remainder of the bus. The isolated module will attempt to communicate, but will not be able to receive messages or determine arbitration from other modules. Each time the isolated module attempts to communicate it alters the bus voltage on the intact bus circuit. Without functioning arbitration the isolated module alters the bus voltage while other bus messages are being sent thereby corrupting the messages on the remainder of the bus.

The CAN bus modules are connected in parallel to the two-wire bus using a twisted pair, where the wires are wrapped around each other to provide shielding from unwanted electromagnetic induction, thus preventing interference with the relatively low voltage signals being carried through them. While the CAN bus is operating

(active), one of the bus wires will carry a higher voltage and is referred to as the CAN High or CAN bus (+) wire, while the other bus wire will carry a lower voltage and is referred to as the CAN Low or CAN bus (-) wire.

For additional information on the communication network and star connector locations, refer to **COMMUNICATION, DESCRIPTION** .

WHEN MONITORED

With the ignition on for at least five seconds.

Battery voltage between 10 and 16 volts.

Body Control Module (BCM) is configured correctly.

SET CONDITION

Bus messages not received from the Anti-Lock Brake Module (ABS) for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN C BUS (+) CIRCUIT SHORTED TO VOLTAGE
CAN C BUS (-) CIRCUIT SHORTED TO GROUND
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
BCM NOT CONFIGURED CORRECTLY
ABS POWER AND GROUND
ANTI-LOCK BRAKE MODULE (ABS)
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**

   NOTE: Make sure the battery voltage is between 10 and 16 volts before proceeding.

   1. With the scan tool, read active DTCs.

      Is this DTC active?

      Yes

      - Go To 2

No

- Refer to **DIAGNOSIS AND TESTING** and perform the STORED LOST COMMUNICATION DTCS diagnostic procedure.

2. **CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS**
   1. With the scan tool, read all active DTCs from all modules.

      NOTE: Check for BCM configuration, CAN C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

      Does the scan tool display any active DTCs to the conditions listed above?

      Yes

      - Go to the **DTC INDEX** and perform the appropriate diagnostic procedure.

      No

      - Go To 3

3. **VERIFY THE ABS IS ACTIVE ON THE BUS**
   1. Turn the ignition on.
   2. With the scan tool, verify the ABS is active on the bus.

      Is the ABS active on the bus?

      Yes

      - Go To 4

      No

      - Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM ABS diagnostic procedure.

4. **CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS**
   1. With the scan tool, read all the DTCs.

      Is there more than one module with active DTCs "Logged Against" the ABS?

      Yes

      - Replace/update the ABS module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 5

5. **CLEAR DTC IN MODULE SETTING FAULT**
   1. With the scan tool, select the module setting the DTC against the ABS.
   2. Clear active DTCs.

   Is this DTC still active?

   Yes

   - Replace/update the module that set this DTC in accordance with the Service Information.
   - Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 6

6. **CYCLE IGNITION**
   1. Cycle the ignition from RUN to OFF three times ending with the key in the RUN position.

   Does this DTC become active?

   Yes

   - Go To 7

   No

   - The condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.
   - Perform the appropriate verification test for the module. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

7. **CHECK FOR ADDITIONAL LOST COMMUNICATION FAULTS**
   1. With the scan tool, view the modules.

   Does the BCM and other CAN C BUS modules show Lost Communication with the remaining CAN C BUS modules?

   Yes

- Go To 8

No

- Replace/update the module that set this DTC in accordance with the Service Information.
- Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

8. **CHECK THE CAN C BUS (+) CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 59: Checking CAN C BUS (+) Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Measure the voltage between the (D57) CAN C Bus (+) circuit and ground.

   Is the voltage above 5.0 volts?

   Yes

   - Repair the short to voltage in the CAN C Bus (+) circuit. The short to voltage is present in one of the CAN C Bus circuits. Use the Star Connectors to isolate portions of the CAN C Bus in order to locate the concern.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 9

9. **CHECK THE CAN C BUS (-) CIRCUIT FOR A SHORT TO GROUND**

Fig. 60: Checking CAN C BUS (-) Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between ground and the (D58) CAN C Bus (-) circuit.

   Is the resistance below 10k Ohms?

   Yes

   - Repair the short to ground in the CAN C Bus (-) circuit. The short to ground is present in one

of the CAN C Bus circuits. Use the Star Connectors to isolate portions of the CAN C Bus in order to locate the concern.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace/update the module that set this DTC in accordance with the Service Information.
- Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U0128-87-LOST COMMUNICATION WITH PARK BRAKE CONTROL MODULE - MISSING MESSAGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The primary communication network between electronic control modules is the Controller Area Network (CAN) data bus system. The Controller Area Network (CAN) data bus allows all electronic modules connected to the bus to share information with each other. Regardless of whether a message originates from a module on the higher speed CAN C (500K) Bus or on the lower speed bus, CAN Interior High Speed (IHS) (125K) Bus, the message structure and layout is similar, which allows the Body Control Module (BCM) to process and transfer messages between the CAN buses. The BCM stores Diagnostic Trouble Codes (DTCs) for certain bus network faults on the CAN C (500K) Bus and CAN IHS (125K) Bus.

All modules transmit and receive messages over one of these buses. Data exchange between the modules is achieved by serial transmission of encoded data messages (a form of transmission in which data bits are sent sequentially, one at a time, over a single line). Each module can both send and receive serial data simultaneously. Each data bit of a CAN Bus message is carried over the bus as a voltage differential between the two bus circuits which, when strung together, form a message. Each module uses arbitration to sort the message priority if two competing messages are attempting to be broadcast at the same time. Corruption of a single bit within a message will corrupt the entire message. Each message contains a Cyclic Redundancy Check (CRC) which specifies the message size exactly. If the message detected conflicts with the CRC the ECU receiving it will determine the message to be an error and consider that communication has not been possible. Diagnosis of this condition using a lab scope may reveal activity that appears to be Bus data messages even if no actual communication is possible. Communication problems that affect the whole bus, as a result of opens and terminal push outs are more likely to occur on data busses that operate at a high speed than a data bus that operates at a lower speed.

When an open circuit or terminal push out occurs one or more modules can become isolated from the remainder of the bus. The isolated module will attempt to communicate, but will not be able to receive messages or determine arbitration from other modules. Each time the isolated module attempts to communicate it alters the bus voltage on the intact bus circuit. Without functioning arbitration the isolated module alters the bus voltage while other bus messages are being sent thereby corrupting the messages on the remainder of the bus.

The CAN bus modules are connected in parallel to the two-wire bus using a twisted pair, where the wires are

wrapped around each other to provide shielding from unwanted electromagnetic induction, thus preventing interference with the relatively low voltage signals being carried through them. While the CAN bus is operating (active), one of the bus wires will carry a higher voltage and is referred to as the CAN High or CAN bus (+) wire, while the other bus wire will carry a lower voltage and is referred to as the CAN Low or CAN bus (-) wire.

For additional information on the communication network and star connector locations, refer to **COMMUNICATION, DESCRIPTION** .

WHEN MONITORED

With the ignition on for at least five seconds.

Battery voltage between 10 and 16 volts.

Body Control Module (BCM) is configured correctly.

SET CONDITION

Bus messages not received from the Park Brake Module for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN C BUS (+) CIRCUIT SHORTED TO VOLTAGE
CAN C BUS (-) CIRCUIT SHORTED TO GROUND
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
BCM NOT CONFIGURED CORRECTLY
PARK BRAKE CONTROL MODULE POWER AND GROUND
PARK BRAKE CONTROL MODULE
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**

NOTE: Make sure the battery voltage is between 10 and 16 volts before proceeding.

1. With the scan tool, read active DTCs.

   Is this DTC active?

   Yes

- Go To 2

No

- Refer to **DIAGNOSIS AND TESTING** and perform the STORED LOST COMMUNICATION DTCS diagnostic procedure.

2. **CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS**
   1. With the scan tool, read all active DTCs from all modules.

      NOTE: Check for BCM configuration, CAN C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

      Does the scan tool display any active DTCs to the conditions listed above?

      Yes

      - Go to the **DTC INDEX** and perform the appropriate diagnostic procedure.

      No

      - Go To 3

3. **VERIFY THE PARK BRAKE CONTROL MODULE IS ACTIVE ON THE BUS**
   1. Turn the ignition on.
   2. With the scan tool, verify the Park Brake Control Module is active on the bus.

      Is the Park Brake Control Module active on the bus?

      Yes

      - Go To 4

      No

      - Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM PARK ASSIST MODULE diagnostic procedure.

4. **CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS**
   1. With the scan tool, read all the DTCs.

      Is there more than one module with active DTCs "Logged Against" the Park Brake Control Module?

      Yes

      - Replace/update the Park Brake Control Module in accordance with the Service Information.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 5

5. **CLEAR DTC IN MODULE SETTING FAULT**
   1. With the scan tool, select the module setting the DTC against the Park Brake Control Module.
   2. Clear active DTCs.

      Is this DTC still active?

      Yes

      - Replace/update the module that set this DTC in accordance with the Service Information.
      - Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 6

6. **CYCLE IGNITION**
   1. Cycle the ignition from RUN to OFF three times ending with the key in the RUN position.

      Does this DTC become active?

      Yes

      - Go To 7

      No

      - The condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.
      - Perform the appropriate verification test for the module. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

7. **CHECK FOR ADDITIONAL LOST COMMUNICATION FAULTS**
   1. With the scan tool, view the modules.

      Does the BCM and other CAN C BUS modules show Lost Communication with the remaining CAN C BUS modules?

Yes

- Go To 8

No

- Replace/update the module that set this DTC in accordance with the Service Information.
- Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

8. **CHECK THE CAN C BUS (+) CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 61: Checking CAN C BUS (+) Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Measure the voltage between the (D57) CAN C Bus (+) circuit and ground.

   Is the voltage above 5.0 volts?

   Yes

   - Repair the short to voltage in the CAN C Bus (+) circuit. The short to voltage is present in one of the CAN C Bus circuits. Use the Star Connectors to isolate portions of the CAN C

Bus in order to locate the concern.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 9

9. **CHECK THE CAN C BUS (-) CIRCUIT FOR A SHORT TO GROUND**

Fig. 62: Checking CAN C BUS (-) Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between ground and the (D58) CAN C Bus (-) circuit.

   Is the resistance below 10k Ohms?

Yes

- Repair the short to ground in the CAN C Bus (-) circuit. The short to ground is present in one of the CAN C Bus circuits. Use the Star Connectors to isolate portions of the CAN C Bus in order to locate the concern.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace/update the module that set this DTC in accordance with the Service Information.
- Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U0131-87-LOST COMMUNICATION WITH ELECTRIC POWER STEERING CONTROL MODULE - MISSING MESSAGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The primary communication network between electronic control modules is the Controller Area Network (CAN) data bus system. The Controller Area Network (CAN) data bus allows all electronic modules connected to the bus to share information with each other. Regardless of whether a message originates from a module on the higher speed CAN C (500K) Bus or on the lower speed bus, CAN Interior High Speed (IHS) (125K) Bus, the message structure and layout is similar, which allows the Body Control Module (BCM) to process and transfer messages between the CAN buses. The BCM stores Diagnostic Trouble Codes (DTCs) for certain bus network faults on the CAN C (500K) Bus and CAN IHS (125K) Bus.

All modules transmit and receive messages over one of these buses. Data exchange between the modules is achieved by serial transmission of encoded data messages (a form of transmission in which data bits are sent sequentially, one at a time, over a single line). Each module can both send and receive serial data simultaneously. Each data bit of a CAN Bus message is carried over the bus as a voltage differential between the two bus circuits which, when strung together, form a message. Each module uses arbitration to sort the message priority if two competing messages are attempting to be broadcast at the same time. Corruption of a single bit within a message will corrupt the entire message. Each message contains a Cyclic Redundancy Check (CRC) which specifies the message size exactly. If the message detected conflicts with the CRC the ECU receiving it will determine the message to be an error and consider that communication has not been possible. Diagnosis of this condition using a lab scope may reveal activity that appears to be Bus data messages even if no actual communication is possible. Communication problems that affect the whole bus, as a result of opens and terminal push outs are more likely to occur on data busses that operate at a high speed than a data bus that operates at a lower speed.

When an open circuit or terminal push out occurs one or more modules can become isolated from the remainder of the bus. The isolated module will attempt to communicate, but will not be able to receive messages or determine arbitration from other modules. Each time the isolated module attempts to communicate it alters the bus voltage on the intact bus circuit. Without functioning arbitration the isolated module alters the bus voltage

while other bus messages are being sent thereby corrupting the messages on the remainder of the bus.

The CAN bus modules are connected in parallel to the two-wire bus using a twisted pair, where the wires are wrapped around each other to provide shielding from unwanted electromagnetic induction, thus preventing interference with the relatively low voltage signals being carried through them. For additional information on the communication network and star connector locations, refer to **COMMUNICATION, DESCRIPTION** .

WHEN MONITORED

With the ignition on for at least five seconds.

Battery voltage between 10 and 16 volts.

Body Control Module (BCM) is configured correctly.

SET CONDITION

Bus messages not received from the Electric Power Steering Module (EPS) for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN C BUS (+) CIRCUIT SHORTED TO VOLTAGE
CAN C BUS (-) CIRCUIT SHORTED TO GROUND
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
BCM NOT CONFIGURED CORRECTLY
EPS POWER AND GROUND
ELECTRIC POWER STEERING MODULE (EPS)
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**

NOTE: Make sure the battery voltage is between 10 and 16 volts before proceeding.

1. With the scan tool, read active DTCs.

Is this DTC active?

Yes

- Go To 2

No

- Refer to **DIAGNOSIS AND TESTING** and perform the STORED LOST COMMUNICATION DTCS diagnostic procedure.

2. **CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS**
   1. With the scan tool, read all active DTCs from all modules.

      NOTE: Check for BCM configuration, CAN C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

      Does the scan tool display any active DTCs to the conditions listed above?

      Yes

      - Refer to **DTC INDEX** and perform the appropriate diagnostic procedure.

      No

      - Go To 3

3. **VERIFY THE EPS IS ACTIVE ON THE BUS**
   1. Turn the ignition on.
   2. With the scan tool, verify the EPS is active on the bus.

      Is the EPS active on the bus?

      Yes

      - Go To 4

      No

      - Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM EPS (ELECTRIC POWER STEERING MODULE) diagnostic procedure.

4. **CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS**
   1. With the scan tool, read all the DTCs.

      Is there more than one module with active DTCs "Logged Against" the EPS?

Yes

- Replace/update the EPS in accordance with the Service Information.
- Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 5

5. **CLEAR DTC IN MODULE SETTING FAULT**
   1. With the scan tool, select the module setting the DTC against the EPS.
   2. Clear active DTCs.

   Is this DTC still active?

   Yes

   - Replace/update the module that set this DTC in accordance with the Service Information.
   - Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 6

6. **CYCLE IGNITION**
   1. Cycle the ignition from RUN to OFF three times ending with the key in the RUN position.

   Does this DTC become active?

   Yes

   - Go To 7

   No

   - The condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched and partially broken wires and the wiring harness connectors for broken, bent, pushed out and corroded terminals.
   - Perform the appropriate verification test for the module. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

7. **CHECK FOR ADDITIONAL LOST COMMUNICATION FAULTS**

1. With the scan tool, view the modules.

   Does the BCM and other CAN C BUS modules show Lost Communication with the remaining CAN C BUS modules?

   Yes

   - Go To 8

   No

   - Replace/update the module that set this DTC in accordance with the Service Information.
   - Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

8. **CHECK THE CAN C BUS (+) CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 63: Checking CAN C BUS (+) Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Measure the voltage between the (D57) CAN C Bus (+) circuit and ground.

   Is the voltage above 5.0 volts?

Yes

- Repair the short to voltage in the CAN C Bus (+) circuit. The short to voltage is present in one of the CAN C Bus circuits. Use the Star Connectors to isolate portions of the CAN C Bus in order to locate the concern.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 9

9. **CHECK THE CAN C BUS (-) CIRCUIT FOR A SHORT TO GROUND**

Fig. 64: Checking CAN C BUS (-) Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.

2. Measure the resistance between ground and the (D58) CAN C Bus (-) circuit.

   Is the resistance below 10k Ohms?

   Yes

   - Repair the short to ground in the CAN C Bus (-) circuit. The short to ground is present in one of the CAN C Bus circuits. Use the Star Connectors to isolate portions of the CAN C Bus in order to locate the concern.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace/update the module that set this DTC in accordance with the Service Information.
   - Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U0151-87-LOST COMMUNICATION WITH OCCUPANT RESTRAINT CONTROLLER (ORC) - MISSING MESSAGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The primary communication network between electronic control modules is the Controller Area Network (CAN) data bus system. The Controller Area Network (CAN) data bus allows all electronic modules connected to the bus to share information with each other. Regardless of whether a message originates from a module on the higher speed CAN C (500K) Bus or on the lower speed bus, CAN Interior High Speed (IHS) (125K) Bus, the message structure and layout is similar, which allows the Body Control Module (BCM) to process and transfer messages between the CAN buses. The BCM stores Diagnostic Trouble Codes (DTCs) for certain bus network faults on the CAN C (500K) Bus and CAN IHS (125K) Bus.

All modules transmit and receive messages over one of these buses. Data exchange between the modules is achieved by serial transmission of encoded data messages (a form of transmission in which data bits are sent sequentially, one at a time, over a single line). Each module can both send and receive serial data simultaneously. Each data bit of a CAN Bus message is carried over the bus as a voltage differential between the two bus circuits which, when strung together, form a message. Each module uses arbitration to sort the message priority if two competing messages are attempting to be broadcast at the same time. Corruption of a single bit within a message will corrupt the entire message. Each message contains a Cyclic Redundancy Check (CRC) which specifies the message size exactly. If the message detected conflicts with the CRC the ECU receiving it will determine the message to be an error and consider that communication has not been possible. Diagnosis of this condition using a lab scope may reveal activity that appears to be Bus data messages even if no actual communication is possible. Communication problems that affect the whole bus, as a result of opens and terminal push outs are more likely to occur on data busses that operate at a high speed than a data bus that operates at a lower speed.

When an open circuit or terminal push out occurs one or more modules can become isolated from the remainder of the bus. The isolated module will attempt to communicate, but will not be able to receive messages or determine arbitration from other modules. Each time the isolated module attempts to communicate it alters the bus voltage on the intact bus circuit. Without functioning arbitration the isolated module alters the bus voltage while other bus messages are being sent thereby corrupting the messages on the remainder of the bus.

The CAN bus modules are connected in parallel to the two-wire bus using a twisted pair, where the wires are wrapped around each other to provide shielding from unwanted electromagnetic induction, thus preventing interference with the relatively low voltage signals being carried through them. While the CAN bus is operating (active), one of the bus wires will carry a higher voltage and is referred to as the CAN High or CAN bus (+) wire, while the other bus wire will carry a lower voltage and is referred to as the CAN Low or CAN bus (-) wire.

For additional information on the communication network and star connector locations, refer to **COMMUNICATION, DESCRIPTION** .

WHEN MONITORED

With the ignition on for at least five seconds.

Battery voltage between 10 and 16 volts.

Body Control Module (BCM) is configured correctly.

SET CONDITION

Bus messages not received from the Occupant Restraint Controller (ORC) for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN C BUS (+) CIRCUIT SHORTED TO VOLTAGE
CAN C BUS (-) CIRCUIT SHORTED TO GROUND
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
BCM NOT CONFIGURED CORRECTLY
ORC POWER AND GROUND
OCCUPANT RESTRAINT CONTROLLER (ORC)
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**

NOTE: Make sure the battery voltage is between 10 and 16 volts before

proceeding.

1. With the scan tool, read active DTCs.

   Is this DTC active?

   Yes

   - Go To 2

   No

   - Refer to **DIAGNOSIS AND TESTING** and perform the STORED LOST COMMUNICATION DTCS diagnostic procedure.

2. **CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS**
   1. With the scan tool, read all active DTCs from all modules.

      NOTE: Check for BCM configuration, CAN C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

      Does the scan tool display any active DTCs to the conditions listed above?

      Yes

      - Go to the **DTC INDEX** and perform the appropriate diagnostic procedure.

      No

      - Go To 3

3. **VERIFY THE ORC IS ACTIVE ON THE BUS**
   1. Turn the ignition on.
   2. With the scan tool, verify the ORC is active on the bus.

      Is the ORC active on the bus?

      Yes

      - Go To 4

      No

      - Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM ORC diagnostic procedure.

4. **CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS**

1. With the scan tool, read all the DTCs.

   Is there more than one module with active DTCs "Logged Against" the ORC?

   Yes

   - Replace/update the ORC in accordance with the Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 5

5. **CLEAR DTC IN MODULE SETTING FAULT**
   1. With the scan tool, select the module setting the DTC against the ORC.
   2. Clear active DTCs.

      Is this DTC still active?

      Yes

      - Replace/update the module that set this DTC in accordance with the Service Information.
      - Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 6

6. **CYCLE IGNITION**
   1. Cycle the ignition from RUN to OFF three times ending with the key in the RUN position.

      Does this DTC become active?

      Yes

      - Go To 7

      No

      - The condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

- Perform the appropriate verification test for the module. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

7. **CHECK FOR ADDITIONAL LOST COMMUNICATION FAULTS**
   1. With the scan tool, view the modules.

      Does the BCM and other CAN C BUS modules show Lost Communication with the remaining CAN C BUS modules?

      Yes

      - Go To 8

      No

      - Replace/update the module that set this DTC in accordance with the Service Information.
      - Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
8. **CHECK THE CAN C BUS (+) CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 65: Checking CAN C BUS (+) Circuit For A Short To Voltage

Courtesy of CHRYSLER GROUP, LLC

1. Measure the voltage between the (D57) CAN C Bus (+) circuit and ground.

   Is the voltage above 5.0 volts?

   Yes

   - Repair the short to voltage in the CAN C Bus (+) circuit. The short to voltage is present in one of the CAN C Bus circuits. Use the Star Connectors to isolate portions of the CAN C Bus in order to locate the concern.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 9

9. **CHECK THE CAN C BUS (-) CIRCUIT FOR A SHORT TO GROUND**

Fig. 66: Checking CAN C BUS (-) Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between ground and the (D58) CAN C Bus (-) circuit.

   Is the resistance below 10k Ohms?

   Yes

   - Repair the short to ground in the CAN C Bus (-) circuit. The short to ground is present in one of the CAN C Bus circuits. Use the Star Connectors to isolate portions of the CAN C Bus in order to locate the concern.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

- Replace/update the module that set this DTC in accordance with the Service Information.
- Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U0154-87-LOST COMMUNICATION WITH OCCUPANT CLASSIFICATION MODULE - MISSING MESSAGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The primary communication network between electronic control modules is the Controller Area Network (CAN) data bus system. The Controller Area Network (CAN) data bus allows all electronic modules connected to the bus to share information with each other. Regardless of whether a message originates from a module on the higher speed CAN C (500K) Bus or on the lower speed bus, CAN Interior High Speed (IHS) (125K) Bus, the message structure and layout is similar, which allows the Body Control Module (BCM) to process and transfer messages between the CAN buses. The BCM stores Diagnostic Trouble Codes (DTCs) for certain bus network faults on the CAN C (500K) Bus and CAN IHS (125K) Bus.

All modules transmit and receive messages over one of these buses. Data exchange between the modules is achieved by serial transmission of encoded data messages (a form of transmission in which data bits are sent sequentially, one at a time, over a single line). Each module can both send and receive serial data simultaneously. Each data bit of a CAN Bus message is carried over the bus as a voltage differential between the two bus circuits which, when strung together, form a message. Each module uses arbitration to sort the message priority if two competing messages are attempting to be broadcast at the same time. Corruption of a single bit within a message will corrupt the entire message. Each message contains a Cyclic Redundancy Check (CRC) which specifies the message size exactly. If the message detected conflicts with the CRC the ECU receiving it will determine the message to be an error and consider that communication has not been possible. Diagnosis of this condition using a lab scope may reveal activity that appears to be Bus data messages even if no actual communication is possible. Communication problems that affect the whole bus, as a result of opens and terminal push outs are more likely to occur on data busses that operate at a high speed than a data bus that operates at a lower speed.

When an open circuit or terminal push out occurs one or more modules can become isolated from the remainder of the bus. The isolated module will attempt to communicate, but will not be able to receive messages or determine arbitration from other modules. Each time the isolated module attempts to communicate it alters the bus voltage on the intact bus circuit. Without functioning arbitration the isolated module alters the bus voltage while other bus messages are being sent thereby corrupting the messages on the remainder of the bus.

The CAN bus modules are connected in parallel to the two-wire bus using a twisted pair, where the wires are wrapped around each other to provide shielding from unwanted electromagnetic induction, thus preventing interference with the relatively low voltage signals being carried through them. While the CAN bus is operating (active), one of the bus wires will carry a higher voltage and is referred to as the CAN High or CAN bus (+) wire, while the other bus wire will carry a lower voltage and is referred to as the CAN Low or CAN bus (-) wire.

For additional information on the communication network and star connector locations, refer to **COMMUNICATION, DESCRIPTION** .

WHEN MONITORED

With the ignition on for at least five seconds.

Battery voltage between 10 and 16 volts.

Body Control Module (BCM) is configured correctly.

SET CONDITION

Bus messages not received from the Occupant Classification Module (OCM) for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN C BUS (+) CIRCUIT SHORTED TO VOLTAGE
CAN C BUS (-) CIRCUIT SHORTED TO GROUND
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
BCM NOT CONFIGURED CORRECTLY
OCM POWER AND GROUND
OCCUPANT CLASSIFICATION MODULE (OCM)
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**

   NOTE: Make sure the battery voltage is between 10 and 16 volts before proceeding.

   1. With the scan tool, read active DTCs.

      Is this DTC active?

      Yes

      - Go To 2

      No

      - Refer to **DIAGNOSIS AND TESTING** and perform the STORED LOST

COMMUNICATION DTCS diagnostic procedure.

2. **CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS**
   1. With the scan tool, read all active DTCs from all modules.

      NOTE: Check for BCM configuration, CAN C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

      Does the scan tool display any active DTCs to the conditions listed above?

      Yes

      - Go to the **DTC INDEX** and perform the appropriate diagnostic procedure.

      No

      - Go To 3
3. **VERIFY THE OCM IS ACTIVE ON THE BUS**
   1. Turn the ignition on.
   2. With the scan tool, verify the OCM is active on the bus.

      Is the OCM active on the bus?

      Yes

      - Go To 4

      No

      - Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM OCM (OCCUPANT CLASSIFICATION MODULE) diagnostic procedure.
4. **CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS**
   1. With the scan tool, read all the DTCs.

      Is there more than one module with active DTCs "Logged Against" the OCM?

      Yes

      - Replace/update the OCM in accordance with the Service Information. Refer to **MODULE, OCCUPANT CLASSIFICATION, REMOVAL** .
      - Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

- Go To 5

5. **CLEAR DTC IN MODULE SETTING FAULT**
   1. With the scan tool, select the module setting the DTC against the OCM.
   2. Clear active DTCs.

      Is this DTC still active?

      Yes

      - Replace/update the module that set this DTC in accordance with the Service Information.
      - Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 6
6. **CYCLE IGNITION**
   1. Cycle the ignition from RUN to OFF three times ending with the key in the RUN position.

      Does this DTC become active?

      Yes

      - Go To 7

      No

      - The condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched and partially broken wires and the wiring harness connectors for broken, bent, pushed out and corroded terminals.
      - Perform the appropriate verification test for the module. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
7. **CHECK FOR ADDITIONAL LOST COMMUNICATION FAULTS**
   1. With the scan tool, view the modules.

      Does the BCM and other CAN C BUS modules show Lost Communication with the remaining CAN C BUS modules?

      Yes

      - Go To 8

No

- Replace/update the module that set this DTC in accordance with the Service Information.
- Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

8. **CHECK THE CAN C BUS (+) CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 67: Checking CAN C BUS (+) Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Measure the voltage between the (D57) CAN C Bus (+) circuit and ground.

   Is the voltage above 5.0 volts?

   Yes

   - Repair the short to voltage in the CAN C Bus (+) circuit. The short to voltage is present in one of the CAN C Bus circuits. Use the Star Connectors to isolate portions of the CAN C Bus in order to locate the concern.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

- Go To 9

9. **CHECK THE CAN C BUS (-) CIRCUIT FOR A SHORT TO GROUND**

Fig. 68: Checking CAN C BUS (-) Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between ground and the (D58) CAN C Bus (-) circuit.

   Is the resistance below 10k Ohms?

   Yes

   - Repair the short to ground in the CAN C Bus (-) circuit. The short to ground is present in one of the CAN C Bus circuits. Use the Star Connectors to isolate portions of the CAN C Bus in order to locate the concern.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace/update the module that set this DTC in accordance with the Service Information.
- Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U0155-87-LOST COMMUNICATION WITH CLUSTER/CCN - MISSING MESSAGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The primary communication network between electronic control modules is the Controller Area Network (CAN) data bus system. The Controller Area Network (CAN) data bus allows all electronic modules connected to the bus to share information with each other. Regardless of whether a message originates from a module on the higher speed CAN C (500K) Bus or on the lower speed bus, CAN Interior High Speed (IHS) (125K) Bus, the message structure and layout is similar, which allows the Body Control Module (BCM) to process and transfer messages between the CAN buses. The BCM stores Diagnostic Trouble Codes (DTCs) for certain bus network faults on the CAN C (500K) Bus and CAN IHS (125K) Bus.

All modules transmit and receive messages over one of these buses. Data exchange between the modules is achieved by serial transmission of encoded data messages (a form of transmission in which data bits are sent sequentially, one at a time, over a single line). Each module can both send and receive serial data simultaneously. Each data bit of a CAN Bus message is carried over the bus as a voltage differential between the two bus circuits which, when strung together, form a message. Each module uses arbitration to sort the message priority if two competing messages are attempting to be broadcast at the same time. Corruption of a single bit within a message will corrupt the entire message. Each message contains a Cyclic Redundancy Check (CRC) which specifies the message size exactly. If the message detected conflicts with the CRC the ECU receiving it will determine the message to be an error and consider that communication has not been possible. Diagnosis of this condition using a lab scope may reveal activity that appears to be Bus data messages even if no actual communication is possible. Communication problems that affect the whole bus, as a result of opens and terminal push outs are more likely to occur on data busses that operate at a high speed than a data bus that operates at a lower speed.

When an open circuit or terminal push out occurs one or more modules can become isolated from the remainder of the bus. The isolated module will attempt to communicate, but will not be able to receive messages or determine arbitration from other modules. Each time the isolated module attempts to communicate it alters the bus voltage on the intact bus circuit. Without functioning arbitration the isolated module alters the bus voltage while other bus messages are being sent thereby corrupting the messages on the remainder of the bus.

The CAN bus modules are connected in parallel to the two-wire bus using a twisted pair, where the wires are wrapped around each other to provide shielding from unwanted electromagnetic induction, thus preventing interference with the relatively low voltage signals being carried through them. While the CAN bus is operating (active), one of the bus wires will carry a higher voltage and is referred to as the CAN High or CAN bus (+)

wire, while the other bus wire will carry a lower voltage and is referred to as the CAN Low or CAN bus (-) wire.

For additional information on the communication network and star connector locations, refer to **COMMUNICATION, DESCRIPTION** .

WHEN MONITORED

With the ignition on for at least five seconds.

Battery voltage between 10 and 16 volts.

Body Control Module (BCM) is configured correctly.

SET CONDITION

Bus messages not received from the Instrument Panel Cluster (IPC)/Instrument Cluster (IC) for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN C BUS (+) CIRCUIT SHORTED TO VOLTAGE
CAN C BUS (-) CIRCUIT SHORTED TO GROUND
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
BCM NOT CONFIGURED CORRECTLY
IC POWER AND GROUND
INSTRUMENT CLUSTER (IC)
MODULE THAT SET THE DTC

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**

   NOTE: Make sure the battery voltage is between 10 and 16 volts before proceeding.

   1. With the scan tool, read active DTCs.

      Is this DTC active?

      Yes

      - Go To 2

No

- Refer to **DIAGNOSIS AND TESTING** and perform the STORED LOST COMMUNICATION DTCS diagnostic procedure.

2. **CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS**
   1. With the scan tool, read all active DTCs from all modules.

      NOTE: Check for BCM configuration, CAN C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

      Does the scan tool display any active DTCs to the conditions listed above?

      Yes

      - Go to the **DTC INDEX** and perform the appropriate diagnostic procedure.

      No

      - Go To 3

3. **VERIFY THE IPC IS ACTIVE ON THE BUS**
   1. Turn the ignition on.
   2. With the scan tool, verify the IPC is active on the bus.

      Is the IPC active on the bus?

      Yes

      - Go To 4

      No

      - Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM IC (INSTRUMENT CLUSTER) diagnostic procedure.

4. **CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS**
   1. With the scan tool, read all the DTCs.

      Is there more than one module with active DTCs "Logged Against" the IPC?

      Yes

      - Replace/update the Instrument Cluster (IC) in accordance with the Service Information. Refer to **REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 5

5. **CLEAR DTC IN MODULE SETTING FAULT**
   1. With the scan tool, select the module setting the DTC against the IPC.
   2. Clear active DTCs.

   Is this DTC still active?

   Yes

   - Replace/update the module that set this DTC in accordance with the Service Information.
   - Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 6

6. **CYCLE IGNITION**
   1. Cycle the ignition from RUN to OFF three times ending with the key in the RUN position.

   Does this DTC become active?

   Yes

   - Go To 7

   No

   - The condition is not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   - Perform the appropriate verification test for the module. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

7. **CHECK FOR ADDITIONAL LOST COMMUNICATION FAULTS**
   1. With the scan tool, view the modules.

   Does the BCM and other CAN C BUS modules show Lost Communication with the remaining CAN C BUS modules?

   Yes

- Go To 8

No

- Replace/update the module that set this DTC in accordance with the Service Information.
- Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

8. **CHECK THE CAN C BUS (+) CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 69: Checking CAN C BUS (+) Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Measure the voltage between the (D57) CAN C Bus (+) circuit and ground.

   Is the voltage above 5.0 volts?

   Yes

   - Repair the short to voltage in the CAN C Bus (+) circuit. The short to voltage is present in one of the CAN C Bus circuits. Use the Star Connectors to isolate portions of the CAN C Bus in order to locate the concern.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 9

9. **CHECK THE CAN C BUS (-) CIRCUIT FOR A SHORT TO GROUND**

Fig. 70: Checking CAN C BUS (-) Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between ground and the (D58) CAN C Bus (-) circuit.

   Is the resistance below 10k Ohms?

   Yes

   - Repair the short to ground in the CAN C Bus (-) circuit. The short to ground is present in one

of the CAN C Bus circuits. Use the Star Connectors to isolate portions of the CAN C Bus in order to locate the concern.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace/update the module that set this DTC in accordance with the Service Information.
- Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U0159-LOST COMMUNICATION WITH PARKING ASSIST CONTROL MODULE-MISSING MESSAGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The primary communication network between electronic control modules is the Controller Area Network (CAN) data bus system. The Controller Area Network (CAN) data bus allows all electronic modules connected to the bus to share information with each other. Regardless of whether a message originates from a module on the higher speed CAN C (500K) Bus or on the lower speed bus, CAN Interior High Speed (IHS) (125K) Bus, the message structure and layout is similar, which allows the Body Control Module (BCM) to process and transfer messages between the CAN buses. The BCM stores Diagnostic Trouble Codes (DTCs) for certain bus network faults on the CAN C (500K) Bus and CAN IHS (125K) Bus.

All modules transmit and receive messages over one of these buses. Data exchange between the modules is achieved by serial transmission of encoded data messages (a form of transmission in which data bits are sent sequentially, one at a time, over a single line). Each module can both send and receive serial data simultaneously. Each data bit of a CAN Bus message is carried over the bus as a voltage differential between the two bus circuits which, when strung together, form a message. Each module uses arbitration to sort the message priority if two competing messages are attempting to be broadcast at the same time. Corruption of a single bit within a message will corrupt the entire message. Each message contains a Cyclic Redundancy Check (CRC) which specifies the message size exactly. If the message detected conflicts with the CRC the ECU receiving it will determine the message to be an error and consider that communication has not been possible. Diagnosis of this condition using a lab scope may reveal activity that appears to be Bus data messages even if no actual communication is possible. Communication problems that affect the whole bus, as a result of opens and terminal push outs are more likely to occur on data busses that operate at a high speed than a data bus that operates at a lower speed.

When an open circuit or terminal push out occurs one or more modules can become isolated from the remainder of the bus. The isolated module will attempt to communicate, but will not be able to receive messages or determine arbitration from other modules. Each time the isolated module attempts to communicate it alters the bus voltage on the intact bus circuit. Without functioning arbitration the isolated module alters the bus voltage while other bus messages are being sent thereby corrupting the messages on the remainder of the bus.

The CAN bus modules are connected in parallel to the two-wire bus using a twisted pair, where the wires are

wrapped around each other to provide shielding from unwanted electromagnetic induction, thus preventing interference with the relatively low voltage signals being carried through them. While the CAN bus is operating (active), one of the bus wires will carry a higher voltage and is referred to as the CAN High or CAN bus (+) wire, while the other bus wire will carry a lower voltage and is referred to as the CAN Low or CAN bus (-) wire.

For additional information on the communication network and star connector locations, refer to **COMMUNICATION, DESCRIPTION** .

WHEN MONITORED

With the ignition on for at least five seconds.

Battery voltage between 10 and 16 volts.

Body Control Module (BCM) is configured correctly.

SET CONDITION

Bus messages not received from the Park Assist Module (PAM) for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN C BUS (+) CIRCUIT SHORTED TO VOLTAGE
CAN C BUS (-) CIRCUIT SHORTED TO GROUND
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
BCM NOT CONFIGURED CORRECTLY
PAM POWER AND GROUND
PARK ASSIST MODULE (PAM)
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**

NOTE: Make sure the battery voltage is between 10 and 16 volts before proceeding.

1. With the scan tool, read active DTCs.

   Is this DTC active?

   Yes

- Go To 2

No

- Refer to **DIAGNOSIS AND TESTING** and perform the STORED LOST COMMUNICATION DTCS diagnostic procedure.

2. **CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS**
   1. With the scan tool, read all active DTCs from all modules.

      NOTE: Check for BCM configuration, CAN C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

      Does the scan tool display any active DTCs to the conditions listed above?

      Yes

      - Go to the **DTC INDEX** and perform the appropriate diagnostic procedure.

      No

      - Go To 3

3. **VERIFY THE PAM IS ACTIVE ON THE BUS**
   1. Turn the ignition on.
   2. With the scan tool, verify the PAM is active on the bus.

      Is the PAM active on the bus?

      Yes

      - Go To 4

      No

      - Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM PAM (PARK ASSIST MODULE) diagnostic procedure.

4. **CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS**
   1. With the scan tool, read all the DTCs.

      Is there more than one module with active DTCs "Logged Against" the PAM?

      Yes

      - Replace/update the PAM in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .

- Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 5

5. **CLEAR DTC IN MODULE SETTING FAULT**
   1. With the scan tool, select the module setting the DTC against the PAM.
   2. Clear active DTCs.

   Is this DTC still active?

   Yes

   - Replace/update the module that set this DTC in accordance with the Service Information.
   - Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 6

6. **CYCLE IGNITION**
   1. Cycle the ignition from RUN to OFF three times ending with the key in the RUN position.

   Does this DTC become active?

   Yes

   - Go To 7

   No

   - The condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched and partially broken wires and the wiring harness connectors for broken, bent, pushed out and corroded terminals.
   - Perform the appropriate verification test for the module. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

7. **CHECK FOR ADDITIONAL LOST COMMUNICATION FAULTS**
   1. With the scan tool, view the modules.

   Does the BCM and other CAN C BUS modules show Lost Communication with the remaining

CAN C BUS modules?

Yes

- Go To 8

No

- Replace/update the module that set this DTC in accordance with the Service Information.
- Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

8. **CHECK THE CAN C BUS (+) CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 71: Checking CAN C BUS (+) Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Measure the voltage between the (D57) CAN C Bus (+) circuit and ground.

   Is the voltage above 5.0 volts?

   Yes

- Repair the short to voltage in the CAN C Bus (+) circuit. The short to voltage is present in one of the CAN C Bus circuits. Use the Star Connectors to isolate portions of the CAN C Bus in order to locate the concern.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 9

9. **CHECK THE CAN C BUS (-) CIRCUIT FOR A SHORT TO GROUND**

Fig. 72: Checking CAN C BUS (-) Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between ground and the (D58) CAN C Bus (-) circuit.

Is the resistance below 10k Ohms?

Yes

- Repair the short to ground in the CAN C Bus (-) circuit. The short to ground is present in one of the CAN C Bus circuits. Use the Star Connectors to isolate portions of the CAN C Bus in order to locate the concern.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace/update the module that set this DTC in accordance with the Service Information.
- Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U0164-87-LOST COMMUNICATION WITH HVAC CONTROL MODULE - MISSING MESSAGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The primary communication network between electronic control modules is the Controller Area Network (CAN) data bus system. The Controller Area Network (CAN) data bus allows all electronic modules connected to the bus to share information with each other. Regardless of whether a message originates from a module on the higher speed CAN C (500K) Bus or on the lower speed bus, CAN Interior High Speed (IHS) (125K) Bus, the message structure and layout is similar, which allows the Body Control Module (BCM) to process and transfer messages between the CAN buses. The BCM stores Diagnostic Trouble Codes (DTCs) for certain bus network faults on the CAN C (500K) Bus and CAN IHS (125K) Bus.

All modules transmit and receive messages over one of these buses. Data exchange between the modules is achieved by serial transmission of encoded data messages (a form of transmission in which data bits are sent sequentially, one at a time, over a single line). Each module can both send and receive serial data simultaneously. Each data bit of a CAN Bus message is carried over the bus as a voltage differential between the two bus circuits which, when strung together, form a message. Each module uses arbitration to sort the message priority if two competing messages are attempting to be broadcast at the same time. Corruption of a single bit within a message will corrupt the entire message. Each message contains a Cyclic Redundancy Check (CRC) which specifies the message size exactly. If the message detected conflicts with the CRC the ECU receiving it will determine the message to be an error and consider that communication has not been possible. Diagnosis of this condition using a lab scope may reveal activity that appears to be Bus data messages even if no actual communication is possible. Communication problems that affect the whole bus, as a result of opens and terminal push outs are more likely to occur on data busses that operate at a high speed than a data bus that operates at a lower speed.

When an open circuit or terminal push out occurs one or more modules can become isolated from the remainder of the bus. The isolated module will attempt to communicate, but will not be able to receive messages or determine arbitration from other modules. Each time the isolated module attempts to communicate it alters the

bus voltage on the intact bus circuit. Without functioning arbitration the isolated module alters the bus voltage while other bus messages are being sent thereby corrupting the messages on the remainder of the bus.

The CAN bus modules are connected in parallel to the two-wire bus using a twisted pair, where the wires are wrapped around each other to provide shielding from unwanted electromagnetic induction, thus preventing interference with the relatively low voltage signals being carried through them. While the CAN bus is operating (active), one of the bus wires will carry a higher voltage and is referred to as the CAN High or CAN bus (+) wire, while the other bus wire will carry a lower voltage and is referred to as the CAN Low or CAN bus (-) wire.

For additional information on the communication network and star connector locations, refer to **COMMUNICATION, DESCRIPTION** .

WHEN MONITORED

With the ignition on for at least five seconds.

Battery voltage between 10 and 16 volts.

Body Control Module (BCM) is configured correctly.

SET CONDITION

Bus messages not received from the HVAC Control Module for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN IHS BUS (125K) (+) CIRCUIT SHORTED TO VOLTAGE
CAN IHS BUS (125K) (-) CIRCUIT SHORTED TO GROUND
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
BCM NOT CONFIGURED CORRECTLY
HVAC POWER AND GROUND
HVAC CONTROL MODULE
MODULE THAT SET THE DTC

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**

NOTE: Make sure the battery voltage is between 10 and 16 volts before proceeding.

1. With the scan tool, read active DTCs.

Is this DTC active?

Yes

- Go To 2

No

- Refer to **DIAGNOSIS AND TESTING** and perform the STORED LOST COMMUNICATION DTC diagnostic procedure.

2. **CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS**
   1. With the scan tool, read active DTCs from all modules.

      NOTE: Check for BCM configuration, CAN Interior Bus hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

      Does the scan tool display any active DTCs to the conditions listed above?

      Yes

      - Go to the **DTC INDEX** and perform the appropriate diagnostic procedure.

      No

      - Go To 3

3. **VERIFY THE HVAC IS ACTIVE ON THE BUS**
   1. Turn the ignition on.
   2. With the scan tool, verify the HVAC is active on the bus.

      Is the HVAC active on the bus?

      Yes

      - Go To 4

      No

      - Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM HVAC diagnostic procedure.

4. **CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS**
   1. With the scan tool, read all the DTCs.

      Is there more than one module with active DTCs "Logged Against" the HVAC?

Yes

- Replace/update the HVAC Module in accordance with the Service Information.
- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 5

5. **CLEAR DTC IN MODULE SETTING FAULT**
   1. With the scan tool, select the module setting the DTC against the HVAC.
   2. Clear active DTCs.

   Is this DTC still active?

   Yes

   - Replace/update the module that set this DTC in accordance with the Service Information.
   - Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 6

6. **CYCLE IGNITION**
   1. Cycle the ignition from RUN to OFF three times ending with the key in the RUN position.

   Does this DTC become active?

   Yes

   - Go To 7

   No

   - The condition is not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   - Perform the appropriate verification test for the module. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

7. **CHECK FOR ADDITIONAL LOST COMMUNICATION FAULTS**
   1. With the scan tool, view the modules.

Does the BCM and other CAN IHS BUS modules show Lost Communication with the remaining CAN IHS BUS modules?

Yes

- Go To 8

No

- Replace/update the module that set this DTC in accordance with the Service Information.
- Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

8. **CHECK THE CAN IHS BUS (125K) (+) CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 73: Checking CAN IHS BUS (125K) (+) Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Measure the voltage between the (D157) CAN IHS Bus (125K) (+) circuit and ground.

Is the voltage above 5.0 volts?

Yes

- Repair the short to voltage in the CAN IHS Bus (125K) (+) circuit. The short to voltage is present in one of the CAN IHS Bus (125K) (+) circuits. Use the Star Connectors to isolate portions of the CAN IHS Bus (125K) (+) in order to locate the concern.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 9

9. **CHECK THE CAN IHS BUS (125K) (-) CIRCUIT FOR A SHORT TO GROUND**

Fig. 74: Checking CAN IHS BUS (125K) (-) Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between ground and the (D158) CAN IHS Bus (125K) (-) circuit.

   Is the resistance below 10k Ohms?

   Yes

   - Repair the short to ground in the CAN IHS Bus (125K) (-) circuit. The short to ground is present in one of the CAN IHS Bus (125K) (-) circuits. Use the Star Connectors to isolate portions of the CAN IHS Bus (125K) (-) in order to locate the concern.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace/update the module that set this DTC in accordance with the Service Information.
   - Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U0181-87-LOST COMMUNICATION WITH AUTOMATIC HEADLAMP LEVELING MODULE - MISSING MESSAGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The primary communication network between electronic control modules is the Controller Area Network (CAN) data bus system. The Controller Area Network (CAN) data bus allows all electronic modules connected to the bus to share information with each other. Regardless of whether a message originates from a module on the higher speed CAN C (500K) Bus or on the lower speed bus, CAN Interior High Speed (IHS) (125K) Bus, the message structure and layout is similar, which allows the Body Control Module (BCM) to process and transfer messages between the CAN buses. The BCM stores Diagnostic Trouble Codes (DTCs) for certain bus network faults on the CAN C (500K) Bus and CAN IHS (125K) Bus.

All modules transmit and receive messages over one of these buses. Data exchange between the modules is achieved by serial transmission of encoded data messages (a form of transmission in which data bits are sent sequentially, one at a time, over a single line). Each module can both send and receive serial data simultaneously. Each data bit of a CAN Bus message is carried over the bus as a voltage differential between the two bus circuits which, when strung together, form a message. Each module uses arbitration to sort the message priority if two competing messages are attempting to be broadcast at the same time. Corruption of a single bit within a message will corrupt the entire message. Each message contains a Cyclic Redundancy Check (CRC) which specifies the message size exactly. If the message detected conflicts with the CRC the ECU receiving it will determine the message to be an error and consider that communication has not been possible. Diagnosis of this condition using a lab scope may reveal activity that appears to be Bus data messages even if no actual communication is possible. Communication problems that affect the whole bus, as a result of opens and terminal push outs are more likely to occur on data busses that operate at a high speed than a data bus that

operates at a lower speed.

When an open circuit or terminal push out occurs one or more modules can become isolated from the remainder of the bus. The isolated module will attempt to communicate, but will not be able to receive messages or determine arbitration from other modules. Each time the isolated module attempts to communicate it alters the bus voltage on the intact bus circuit. Without functioning arbitration the isolated module alters the bus voltage while other bus messages are being sent thereby corrupting the messages on the remainder of the bus.

The CAN bus modules are connected in parallel to the two-wire bus using a twisted pair, where the wires are wrapped around each other to provide shielding from unwanted electromagnetic induction, thus preventing interference with the relatively low voltage signals being carried through them. While the CAN bus is operating (active), one of the bus wires will carry a higher voltage and is referred to as the CAN High or CAN bus (+) wire, while the other bus wire will carry a lower voltage and is referred to as the CAN Low or CAN bus (-) wire.

For additional information on the communication network and star connector locations, refer to **COMMUNICATION, DESCRIPTION** .

WHEN MONITORED

With the ignition on for at least five seconds.

Battery voltage between 10 and 16 volts.

Body Control Module (BCM) is configured correctly.

SET CONDITION

Bus messages not received from the Automatic Headlamp Leveling Module (AHLM) for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN C BUS (+) CIRCUIT SHORTED TO VOLTAGE
CAN C BUS (-) CIRCUIT SHORTED TO GROUND
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
BCM NOT CONFIGURED CORRECTLY
AUTOMATIC HEADLAMP LEVELING MODULE (AHLM) POWER AND GROUND
AUTOMATIC HEADLAMP LEVELING MODULE (AHLM)
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**

NOTE: Make sure the battery voltage is between 10 and 16 volts before proceeding.

1. With the scan tool, read active DTCs.

   Is this DTC active?

   Yes

   - Go To 2

   No

   - Refer to **DIAGNOSIS AND TESTING** and perform the STORED LOST COMMUNICATION DTCS diagnostic procedure.

2. **CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS**
   1. With the scan tool, read all active DTCs from all modules.

      NOTE: Check for BCM configuration, CAN C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

      Does the scan tool display any active DTCs to the conditions listed above?

      Yes

      - Go to the **DTC INDEX** and perform the appropriate diagnostic procedure.

      No

      - Go To 3

3. **VERIFY THE AUTOMATIC HEADLAMP LEVELING MODULE (AHLM) IS ACTIVE ON THE BUS**
   1. Turn the ignition on.
   2. With the scan tool, verify the AHLM is active on the bus.

      Is the AHLM active on the bus?

      Yes

      - Go To 4

      No

      - Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM AHLM

diagnostic procedure.

4. **CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS**
   1. With the scan tool, read all the DTCs.

      Is there more than one module with active DTCs "Logged Against" the AHLM?

      Yes

      - Replace/update the AHLM in accordance with the Service Information.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 5
5. **CLEAR DTC IN MODULE SETTING FAULT**
   1. With the scan tool, select the module setting the DTC against the AHLM.
   2. Clear active DTCs.

      Is this DTC still active?

      Yes

      - Replace/update the module that set this DTC in accordance with the Service Information.
      - Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 6
6. **CYCLE IGNITION**
   1. Cycle the ignition from RUN to OFF three times ending with the key in the RUN position.

      Does this DTC become active?

      Yes

      - Go To 7

      No

      - The condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

- Perform the appropriate verification test for the module. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

7. **CHECK FOR ADDITIONAL LOST COMMUNICATION FAULTS**
   1. With the scan tool, view the modules.

      Does the BCM and other CAN C BUS modules show Lost Communication with the remaining CAN C BUS modules?

      Yes

      - Go To 8

      No

      - Replace/update the module that set this DTC in accordance with the Service Information.
      - Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
8. **CHECK THE CAN C BUS (+) CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 75: Checking CAN C BUS (+) Circuit For A Short To Voltage

Courtesy of CHRYSLER GROUP, LLC

1. Measure the voltage between the (D57) CAN C Bus (+) circuit and ground.

   Is the voltage above 5.0 volts?

   Yes

   - Repair the short to voltage in the CAN C Bus (+) circuit. The short to voltage is present in one of the CAN C Bus circuits. Use the Star Connectors to isolate portions of the CAN C Bus in order to locate the concern.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 9

9. **CHECK THE CAN C BUS (-) CIRCUIT FOR A SHORT TO GROUND**

Fig. 76: Checking CAN C BUS (-) Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between ground and the (D58) CAN C Bus (-) circuit.

   Is the resistance below 10k Ohms?

   Yes

   - Repair the short to ground in the CAN C Bus (-) circuit. The short to ground is present in one of the CAN C Bus circuits. Use the Star Connectors to isolate portions of the CAN C Bus in order to locate the concern.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

- Replace/update the module that set this DTC in accordance with the Service Information.
- Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U0184-87-LOST COMMUNICATION WITH RADIO - MISSING MESSAGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The primary communication network between electronic control modules is the Controller Area Network (CAN) data bus system. The Controller Area Network (CAN) data bus allows all electronic modules connected to the bus to share information with each other. Regardless of whether a message originates from a module on the higher speed CAN C (500K) Bus or on the lower speed bus, CAN Interior High Speed (IHS) (125K) Bus, the message structure and layout is similar, which allows the Body Control Module (BCM) to process and transfer messages between the CAN buses. The BCM stores Diagnostic Trouble Codes (DTCs) for certain bus network faults on the CAN C (500K) Bus and CAN IHS (125K) Bus.

All modules transmit and receive messages over one of these buses. Data exchange between the modules is achieved by serial transmission of encoded data messages (a form of transmission in which data bits are sent sequentially, one at a time, over a single line). Each module can both send and receive serial data simultaneously. Each data bit of a CAN Bus message is carried over the bus as a voltage differential between the two bus circuits which, when strung together, form a message. Each module uses arbitration to sort the message priority if two competing messages are attempting to be broadcast at the same time. Corruption of a single bit within a message will corrupt the entire message. Each message contains a Cyclic Redundancy Check (CRC) which specifies the message size exactly. If the message detected conflicts with the CRC the ECU receiving it will determine the message to be an error and consider that communication has not been possible. Diagnosis of this condition using a lab scope may reveal activity that appears to be Bus data messages even if no actual communication is possible. Communication problems that affect the whole bus, as a result of opens and terminal push outs are more likely to occur on data busses that operate at a high speed than a data bus that operates at a lower speed.

When an open circuit or terminal push out occurs one or more modules can become isolated from the remainder of the bus. The isolated module will attempt to communicate, but will not be able to receive messages or determine arbitration from other modules. Each time the isolated module attempts to communicate it alters the bus voltage on the intact bus circuit. Without functioning arbitration the isolated module alters the bus voltage while other bus messages are being sent thereby corrupting the messages on the remainder of the bus.

The CAN bus modules are connected in parallel to the two-wire bus using a twisted pair, where the wires are wrapped around each other to provide shielding from unwanted electromagnetic induction, thus preventing interference with the relatively low voltage signals being carried through them. While the CAN bus is operating (active), one of the bus wires will carry a higher voltage and is referred to as the CAN High or CAN bus (+) wire, while the other bus wire will carry a lower voltage and is referred to as the CAN Low or CAN bus (-) wire.

For additional information on the communication network and star connector locations, refer to

COMMUNICATION, DESCRIPTION .

WHEN MONITORED

With the ignition on for at least five seconds.

Battery voltage between 10 and 16 volts.

Body Control Module (BCM) is configured correctly.

SET CONDITION

Bus messages not received from the Radio for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN IHS BUS (125K) (+) CIRCUIT SHORTED TO VOLTAGE
CAN IHS BUS (125K) (-) CIRCUIT SHORTED TO GROUND
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES

MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**

   NOTE: Make sure the battery voltage is between 10 and 16 volts before proceeding.

   1. With the scan tool, read active DTCs.

      Is this DTC active?

      Yes

      - Go To 2

      No

      - Refer to **DIAGNOSIS AND TESTING** and perform the STORED LOST COMMUNICATION DTCS diagnostic procedure.

2. **CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS**

1. With the scan tool, read all active DTCs from all modules.

   NOTE: Check for BCM configuration, CAN IHS hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

   Does the scan tool display any active DTCs to the conditions listed above?

   Yes

   - Go to the **DTC INDEX** and perform the appropriate diagnostic procedure.

   No

   - Go To 3

3. **VERIFY THE RADIO IS ACTIVE ON THE BUS**
   1. Turn the ignition on.
   2. With the scan tool, verify the Radio is active on the bus.

      Is the Radio active on the bus?

      Yes

      - Go To 4

      No

      - Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM RADIO diagnostic procedure.

4. **CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS**
   1. With the scan tool, read all the DTCs.

      Is there more than one module with active DTCs "Logged Against" the Radio?

      Yes

      - Replace/update the Radio in accordance with the Service Information.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 5

5. **CLEAR DTC IN MODULE SETTING FAULT**
   1. With the scan tool, select the module setting the DTC against the Radio.

2. Clear active DTCs.

   Is this DTC still active?

   Yes

   - Replace/update the module that set this DTC in accordance with the Service Information.
   - Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 6

6. **CYCLE IGNITION**
   1. Cycle the ignition from RUN to OFF three times ending with the key in the RUN position.

      Does this DTC become active?

      Yes

      - Go To 7

      No

      - The condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched and partially broken wires and the wiring harness connectors for broken, bent, pushed out and corroded terminals.
      - Perform the appropriate verification test for the module. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

7. **CHECK FOR ADDITIONAL LOST COMMUNICATION FAULTS**
   1. With the scan tool, view the modules.

      Does the BCM and other CAN IHS BUS modules show Lost Communication with the remaining CAN IHS BUS modules?

      Yes

      - Go To 8

      No

      - Replace/update the module that set this DTC in accordance with the Service Information.

- Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

8. **CHECK THE CAN IHS BUS (+) CIRCUIT FOR A SHORT TO VOLTAGE**
   1. Measure the voltage between the (D157) CAN IHS BUS (+) circuit and ground at the Data Link Connector.

      Is the voltage above 5.0 volts?

      Yes

      - Repair the short to voltage in the CAN IHS BUS (+) circuit. The short to voltage is present in one of the CAN IHS BUS circuits. Use the Star Connectors to isolate portions of the CAN IHS BUS in order to locate the concern.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 9

9. **CHECK THE CAN IHS BUS (-) CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Measure the resistance between ground and the (D158) CAN IHS BUS (-) circuit Data Link Connector.

      Is the resistance below 10k Ohms?

      Yes

      - Repair the short to ground in the CAN IHS BUS (-) circuit. The short to ground is present in one of the CAN IHS BUS circuits. Use the Star Connectors to isolate portions of the CAN IHS BUS in order to locate the concern.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Replace/update the module that set this DTC in accordance with the Service Information.
      - Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U0186-87-LOST COMMUNICATION WITH AUDIO AMPLIFIER - MISSING MESSAGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The primary communication network between electronic control modules is the Controller Area Network (CAN) data bus system. The Controller Area Network (CAN) data bus allows all electronic modules connected to the bus to share information with each other. Regardless of whether a message originates from a module on the higher speed CAN C (500K) Bus or on the lower speed bus, CAN Interior High Speed (IHS) (125K) Bus, the message structure and layout is similar, which allows the Body Control Module (BCM) to process and transfer messages between the CAN buses. The BCM stores Diagnostic Trouble Codes (DTCs) for certain bus network faults on the CAN C (500K) Bus and CAN IHS (125K) Bus.

All modules transmit and receive messages over one of these buses. Data exchange between the modules is achieved by serial transmission of encoded data messages (a form of transmission in which data bits are sent sequentially, one at a time, over a single line). Each module can both send and receive serial data simultaneously. Each data bit of a CAN Bus message is carried over the bus as a voltage differential between the two bus circuits which, when strung together, form a message. Each module uses arbitration to sort the message priority if two competing messages are attempting to be broadcast at the same time. Corruption of a single bit within a message will corrupt the entire message. Each message contains a Cyclic Redundancy Check (CRC) which specifies the message size exactly. If the message detected conflicts with the CRC the ECU receiving it will determine the message to be an error and consider that communication has not been possible. Diagnosis of this condition using a lab scope may reveal activity that appears to be Bus data messages even if no actual communication is possible. Communication problems that affect the whole bus, as a result of opens and terminal push outs are more likely to occur on data busses that operate at a high speed than a data bus that operates at a lower speed.

When an open circuit or terminal push out occurs one or more modules can become isolated from the remainder of the bus. The isolated module will attempt to communicate, but will not be able to receive messages or determine arbitration from other modules. Each time the isolated module attempts to communicate it alters the bus voltage on the intact bus circuit. Without functioning arbitration the isolated module alters the bus voltage while other bus messages are being sent thereby corrupting the messages on the remainder of the bus.

The CAN bus modules are connected in parallel to the two-wire bus using a twisted pair, where the wires are wrapped around each other to provide shielding from unwanted electromagnetic induction, thus preventing interference with the relatively low voltage signals being carried through them. While the CAN bus is operating (active), one of the bus wires will carry a higher voltage and is referred to as the CAN High or CAN bus (+) wire, while the other bus wire will carry a lower voltage and is referred to as the CAN Low or CAN bus (-) wire.

BCM NOT CONFIGURED CORRECTLY
AMPLIFIER POWER AND GROUND
AMPLIFIER
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**

   NOTE: Make sure the battery voltage is between 10 and 16 volts before proceeding.

   1. With the scan tool, read active DTCs.

      Is this DTC active?

      Yes

      - Go To 2

      No

      - Refer to **DIAGNOSIS AND TESTING** and perform the STORED LOST COMMUNICATION DTCS diagnostic procedure.
2. **CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS**
   1. With the scan tool, read all active DTCs from all modules.

      NOTE: Check for BCM configuration, CAN IHS hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

      Does the scan tool display any active DTCs to the conditions listed above?

      Yes

- Go to the **DTC INDEX** and perform the appropriate diagnostic procedure.

No

- Go To 3

3. **VERIFY THE AMPLIFIER IS ACTIVE ON THE BUS**
   1. Turn the ignition on.
   2. With the scan tool, verify the Amplifier is active on the bus.

   Is the Amplifier active on the bus?

   Yes

   - Go To 4

   No

   - Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM AMP (AMPLIFIER) diagnostic procedure.

4. **CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS**
   1. With the scan tool, read all the DTCs.

   Is there more than one module with active DTCs "Logged Against" the AMP?

   Yes

   - Replace/update the Amplifier in accordance with the Service Information. Refer to **AMPLIFIER, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 5

5. **CLEAR DTC IN MODULE SETTING FAULT**
   1. With the scan tool, select the module setting the DTC against the Amplifier.
   2. Clear active DTCs.

   Is this DTC still active?

   Yes

   - Replace/update the module that set this DTC in accordance with the Service Information.
   - Perform the appropriate verification test for the module being replaced. If there is no

verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 6

6. **CYCLE IGNITION**
   1. Cycle the ignition from RUN to OFF three times ending with the key in the RUN position.

      Does this DTC become active?

      Yes

      - Go To 7

      No

      - The condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched and partially broken wires and the wiring harness connectors for broken, bent, pushed out and corroded terminals.
      - Perform the appropriate verification test for the module. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
7. **CHECK FOR ADDITIONAL LOST COMMUNICATION FAULTS**
   1. With the scan tool, view the modules.

      Does the BCM and other CAN IHS BUS modules show Lost Communication with the remaining CAN IHS BUS modules?

      Yes

      - Go To 8

      No

      - Replace/update the module that set this DTC in accordance with the Service Information.
      - Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
8. **CHECK THE CAN IHS BUS (+) CIRCUIT FOR A SHORT TO VOLTAGE**
   1. Measure the voltage between the (D157) CAN IHS BUS (+) circuit and ground at the Data Link Connector.

      Is the voltage above 5.0 volts?

Yes

- Repair the short to voltage in the CAN IHS BUS (+) circuit. The short to voltage is present in one of the CAN IHS BUS circuits. Use the Star Connectors to isolate portions of the CAN IHS BUS in order to locate the concern.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 9

9. **CHECK THE CAN IHS BUS (-) CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Measure the resistance between ground and the (D158) CAN IHS BUS (-) circuit at the Data Link Connector.

      Is the resistance below 10k Ohms?

      Yes

      - Repair the short to ground in the CAN IHS BUS (-) circuit. The short to ground is present in one of the CAN IHS BUS circuits. Use the Star Connectors to isolate portions of the CAN IHS BUS in order to locate the concern.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Replace/update the module that set this DTC in accordance with the Service Information.
      - Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U0199-87-LOST COMMUNICATION WITH DRIVER DOOR MODULE - MISSING MESSAGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The primary communication network between electronic control modules is the Controller Area Network (CAN) data bus system. The Controller Area Network (CAN) data bus allows all electronic modules connected to the bus to share information with each other. Regardless of whether a message originates from a module on the higher speed CAN C (500K) Bus or on the lower speed bus, CAN Interior High Speed (IHS) (125K) Bus, the message structure and layout is similar, which allows the Body Control Module (BCM) to process and transfer messages between the CAN buses. The BCM stores Diagnostic Trouble Codes (DTCs) for certain bus network faults on the CAN C (500K) Bus and CAN IHS (125K) Bus.

All modules transmit and receive messages over one of these buses. Data exchange between the modules is achieved by serial transmission of encoded data messages (a form of transmission in which data bits are sent sequentially, one at a time, over a single line). Each module can both send and receive serial data simultaneously. Each data bit of a CAN Bus message is carried over the bus as a voltage differential between the two bus circuits which, when strung together, form a message. Each module uses arbitration to sort the message priority if two competing messages are attempting to be broadcast at the same time. Corruption of a single bit within a message will corrupt the entire message. Each message contains a Cyclic Redundancy Check (CRC) which specifies the message size exactly. If the message detected conflicts with the CRC the ECU receiving it will determine the message to be an error and consider that communication has not been possible. Diagnosis of this condition using a lab scope may reveal activity that appears to be Bus data messages even if no actual communication is possible. Communication problems that affect the whole bus, as a result of opens and terminal push outs are more likely to occur on data busses that operate at a high speed than a data bus that operates at a lower speed.

When an open circuit or terminal push out occurs one or more modules can become isolated from the remainder of the bus. The isolated module will attempt to communicate, but will not be able to receive messages or determine arbitration from other modules. Each time the isolated module attempts to communicate it alters the bus voltage on the intact bus circuit. Without functioning arbitration the isolated module alters the bus voltage while other bus messages are being sent thereby corrupting the messages on the remainder of the bus.

The CAN bus modules are connected in parallel to the two-wire bus using a twisted pair, where the wires are wrapped around each other to provide shielding from unwanted electromagnetic induction, thus preventing interference with the relatively low voltage signals being carried through them. While the CAN bus is operating (active), one of the bus wires will carry a higher voltage and is referred to as the CAN High or CAN bus (+) wire, while the other bus wire will carry a lower voltage and is referred to as the CAN Low or CAN bus (-) wire.

For additional information on the communication network and star connector locations, refer to **COMMUNICATION, DESCRIPTION** .

WHEN MONITORED

With the ignition on for at least five seconds.

Battery voltage between 10 and 16 volts.

Body Control Module (BCM) is configured correctly.

SET CONDITION

Bus messages not received from the Driver Door Module (DDM) for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN C BUS (+) CIRCUIT SHORTED TO VOLTAGE
CAN C BUS (-) CIRCUIT SHORTED TO GROUND

DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
BCM NOT CONFIGURED CORRECTLY
DRIVER DOOR MODULE (DDM) POWER AND GROUND
DRIVER DOOR MODULE (DDM)
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**

   NOTE: Make sure the battery voltage is between 10 and 16 volts before proceeding.

   1. With the scan tool, read active DTCs.

      Is this DTC active?

      Yes

      - Go To 2

      No

      - Refer to **DIAGNOSIS AND TESTING** and perform the STORED LOST COMMUNICATION DTCS diagnostic procedure.

2. **CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS**
   1. With the scan tool, read all active DTCs from all modules.

      NOTE: Check for BCM configuration, CAN C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

      Does the scan tool display any active DTCs to the conditions listed above?

      Yes

      - Refer to **DTC INDEX** and perform the appropriate diagnostic procedure.

      No

      - Go To 3

3. **VERIFY THE DRIVER DOOR MODULE IS ACTIVE ON THE BUS**
   1. Turn the ignition on.
   2. With the scan tool, verify the Driver Door Module is active on the bus.

Is the Driver Door Module active on the bus?

Yes

- Go To 4

No

- Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM DRIVER DOOR MODULE diagnostic procedure.

4. **CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS**
   1. With the scan tool, read all the DTCs.

   Is there more than one module with active DTCs "Logged Against" the Driver Door Module?

   Yes

   - Replace/update the Driver Door Module in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 5

5. **CLEAR DTC IN MODULE SETTING FAULT**
   1. With the scan tool, select the module setting the DTC against the Driver Door Module.
   2. Clear active DTCs.

   Is this DTC still active?

   Yes

   - Replace/update the module that set this DTC in accordance with the Service Information.
   - Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 6

6. **CYCLE IGNITION**
   1. Cycle the ignition from RUN to OFF three times ending with the key in the RUN position.

   Does this DTC become active?

Yes

- Go To 7

No

- The condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.
- Perform the appropriate verification test for the module. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

7. **CHECK FOR ADDITIONAL LOST COMMUNICATION FAULTS**
   1. With the scan tool, view the modules.

      Does the BCM and other CAN C BUS modules show Lost Communication with the remaining CAN C BUS modules?

      Yes

      - Go To 8

      No

      - Replace/update the module that set this DTC in accordance with the Service Information.
      - Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
8. **CHECK THE CAN C BUS (+) CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 77: Checking CAN C BUS (+) Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Measure the voltage between the (D57) CAN C Bus (+) circuit and ground.

   Is the voltage above 5.0 volts?

   Yes

   - Repair the short to voltage in the CAN C Bus (+) circuit. The short to voltage is present in one of the CAN C Bus circuits. Use the Star Connectors to isolate portions of the CAN C Bus in order to locate the concern.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 9

9. **CHECK THE CAN C BUS (-) CIRCUIT FOR A SHORT TO GROUND**

Fig. 78: Checking CAN C BUS (-) Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between ground and the (D58) CAN C Bus (-) circuit.

   Is the resistance below 10k Ohms?

   Yes

   - Repair the short to ground in the CAN C Bus (-) circuit. The short to ground is present in one of the CAN C Bus circuits. Use the Star Connectors to isolate portions of the CAN C Bus in order to locate the concern.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

- Replace/update the module that set this DTC in accordance with the Service Information.
- Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U01B0-87-LOST COMMUNICATION WITH BATTERY MONITOR MODULE - MISSING MESSAGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 79: Intelligent Battery Sensor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the ignition on.

SET CONDITION

The Body Control Module (BCM) does not receive information from the Intelligent Battery Sensor (IBS).

POSSIBLE CAUSES

Possible Causes
(A916) FUSED (B+) CIRCUIT OPEN
(Z901) GROUND CIRCUIT OPEN
(D401) LIN BUS CIRCUIT OPEN
INTELLIGENT BATTERY SENSOR (IBS)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE (A916) FUSED (B+) CIRCUIT FOR AN OPEN**
    1. Turn the ignition off.
    2. Disconnect the Intelligent Battery Sensor (IBS) C1 harness connector.
    3. Turn the ignition on.
    4. Using a 12-volt test light connected to ground, check the (A916) Fused (B+) circuit at the IBS C1 harness connector.

    Does the test light illuminate brightly?

    Yes

    - Go To 3

    No

    - Repair the open or short to ground in the (A916) Fused (B+) circuit.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (Z901) GROUND CIRCUIT FOR AN OPEN**
   1. Turn the ignition off.
   2. Disconnect the IBS C2 harness connector.
   3. Using a 12-volt test light connected to 12-volts, check the (Z901) Ground circuit at the IBS C2 harness connector.

      Does the test light illuminate brightly?

      Yes

      - Go To 4

      No

      - Repair the open in the (Z901) Ground circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
4. **CHECK THE (D401) LIN BUS CIRCUIT FOR AN OPEN**
   1. Turn the ignition on.
   2. Measure the voltage between ground and the (D401) LIN BUS circuit at the IBS C1 harness connector.

      Is the voltage above 5.0 volts?

      Yes

      - Replace the IBS in accordance with the Service Information.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Repair the open in the (D401) LIN Bus circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

Body Control Module (BCM) - Electrical Diagnostics - Cherokee

DIAGNOSIS AND TESTING

U0200-87-LOST COMMUNICATION WITH PASSENGER DOOR MODULE - MISSING MESSAGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The primary communication network between electronic control modules is the Controller Area Network (CAN) data bus system. The Controller Area Network (CAN) data bus allows all electronic modules connected to the bus to share information with each other. Regardless of whether a message originates from a module on the higher speed CAN C (500K) Bus or on the lower speed bus, CAN Interior High Speed (IHS) (125K) Bus, the message structure and layout is similar, which allows the Body Control Module (BCM) to process and transfer messages between the CAN buses. The BCM stores Diagnostic Trouble Codes (DTCs) for certain bus network faults on the CAN C (500K) Bus and CAN IHS (125K) Bus.

All modules transmit and receive messages over one of these buses. Data exchange between the modules is achieved by serial transmission of encoded data messages (a form of transmission in which data bits are sent sequentially, one at a time, over a single line). Each module can both send and receive serial data simultaneously. Each data bit of a CAN Bus message is carried over the bus as a voltage differential between the two bus circuits which, when strung together, form a message. Each module uses arbitration to sort the message priority if two competing messages are attempting to be broadcast at the same time. Corruption of a single bit within a message will corrupt the entire message. Each message contains a Cyclic Redundancy Check (CRC) which specifies the message size exactly. If the message detected conflicts with the CRC the ECU receiving it will determine the message to be an error and consider that communication has not been possible. Diagnosis of this condition using a lab scope may reveal activity that appears to be Bus data messages even if no actual communication is possible. Communication problems that affect the whole bus, as a result of opens and terminal push outs are more likely to occur on data busses that operate at a high speed than a data bus that operates at a lower speed.

When an open circuit or terminal push out occurs one or more modules can become isolated from the remainder of the bus. The isolated module will attempt to communicate, but will not be able to receive messages or determine arbitration from other modules. Each time the isolated module attempts to communicate it alters the bus voltage on the intact bus circuit. Without functioning arbitration the isolated module alters the bus voltage while other bus messages are being sent thereby corrupting the messages on the remainder of the bus.

The CAN bus modules are connected in parallel to the two-wire bus using a twisted pair, where the wires are wrapped around each other to provide shielding from unwanted electromagnetic induction, thus preventing interference with the relatively low voltage signals being carried through them. While the CAN bus is operating (active), one of the bus wires will carry a higher voltage and is referred to as the CAN High or CAN bus (+) wire, while the other bus wire will carry a lower voltage and is referred to as the CAN Low or CAN bus (-) wire.

For additional information on the communication network and star connector locations, refer to **COMMUNICATION, DESCRIPTION** .

WHEN MONITORED

With the ignition on for at least five seconds.

Battery voltage between 10 and 16 volts.

Body Control Module (BCM) is configured correctly.

SET CONDITION

Bus messages not received from the Passenger Door Module (PDM) for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN C BUS (+) CIRCUIT SHORTED TO VOLTAGE
CAN C BUS (-) CIRCUIT SHORTED TO GROUND
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
BCM NOT CONFIGURED CORRECTLY
PASSENGER DOOR MODULE (PDM) POWER AND GROUND
PASSENGER DOOR MODULE (PDM)
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**

   NOTE: Make sure the battery voltage is between 10 and 16 volts before proceeding.

   1. With the scan tool, read active DTCs.

      Is this DTC active?

      Yes

      - Go To 2

      No

      - Refer to **DIAGNOSIS AND TESTING** and perform the STORED LOST COMMUNICATION DTCS diagnostic procedure.

2. **CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS**
   1. With the scan tool, read all active DTCs from all modules.

      NOTE: Check for BCM configuration, CAN C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

      Does the scan tool display any active DTCs to the conditions listed above?

      Yes

      - Go to the **DTC INDEX** and perform the appropriate diagnostic procedure.

      No

      - Go To 3
3. **VERIFY THE PASSENGER DOOR MODULE IS ACTIVE ON THE BUS**
   1. Turn the ignition on.
   2. With the scan tool, verify the Passenger Door Module is active on the bus.

      Is the Passenger Door Module active on the bus?

      Yes

      - Go To 4

      No

      - Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM PASSENGER DOOR MODULE diagnostic procedure.
4. **CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS**
   1. With the scan tool, read all the DTCs.

      Is there more than one module with active DTCs "Logged Against" the Passenger Door Module?

      Yes

      - Replace/update the Passenger Door Module in accordance with the Service Information.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 5
5. **CLEAR DTC IN MODULE SETTING FAULT**

1. With the scan tool, select the module setting the DTC against the Passenger Door Module.
2. Clear active DTCs.

   Is this DTC still active?

   Yes

   - Replace/update the module that set this DTC in accordance with the Service Information.
   - Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 6

6. **CYCLE IGNITION**
   1. Cycle the ignition from RUN to OFF three times ending with the key in the RUN position.

      Does this DTC become active?

      Yes

      - Go To 7

      No

      - The condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.
      - Perform the appropriate verification test for the module. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

7. **CHECK FOR ADDITIONAL LOST COMMUNICATION FAULTS**
   1. With the scan tool, view the modules.

      Does the BCM and other CAN C BUS modules show Lost Communication with the remaining CAN C BUS modules?

      Yes

      - Go To 8

      No

- Replace/update the module that set this DTC in accordance with the Service Information.
- Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

8. **CHECK THE CAN C BUS (+) CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 1: Checking CAN C BUS (+) Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Measure the voltage between the (D57) CAN C Bus (+) circuit and ground.

   Is the voltage above 5.0 volts?

   Yes

   - Repair the short to voltage in the CAN C Bus (+) circuit. The short to voltage is present in one of the CAN C Bus circuits. Use the Star Connectors to isolate portions of the CAN C Bus in order to locate the concern.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 9

9. **CHECK THE CAN C BUS (-) CIRCUIT FOR A SHORT TO GROUND**

Fig. 2: Checking CAN C BUS (-) Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between ground and the (D58) CAN C Bus (-) circuit.

   Is the resistance below 10k Ohms?

   Yes

   - Repair the short to ground in the CAN C Bus (-) circuit. The short to ground is present in one of the CAN C Bus circuits. Use the Star Connectors to isolate portions of the CAN C Bus in order to locate the concern.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace/update the module that set this DTC in accordance with the Service Information.
- Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U0204-87-LOST COMMUNICATION WITH RIGHT FRONT DOOR MODULE - MISSING MESSAGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The primary communication network between electronic control modules is the Controller Area Network (CAN) data bus system. The Controller Area Network (CAN) data bus allows all electronic modules connected to the bus to share information with each other. Regardless of whether a message originates from a module on the higher speed CAN C (500K) Bus or on the lower speed bus, CAN Interior High Speed (IHS) (125K) Bus, the message structure and layout is similar, which allows the Body Control Module (BCM) to process and transfer messages between the CAN buses. The BCM stores Diagnostic Trouble Codes (DTCs) for certain bus network faults on the CAN C (500K) Bus and CAN IHS (125K) Bus.

All modules transmit and receive messages over one of these buses. Data exchange between the modules is achieved by serial transmission of encoded data messages (a form of transmission in which data bits are sent sequentially, one at a time, over a single line). Each module can both send and receive serial data simultaneously. Each data bit of a CAN Bus message is carried over the bus as a voltage differential between the two bus circuits which, when strung together, form a message. Each module uses arbitration to sort the message priority if two competing messages are attempting to be broadcast at the same time. Corruption of a single bit within a message will corrupt the entire message. Each message contains a Cyclic Redundancy Check (CRC) which specifies the message size exactly. If the message detected conflicts with the CRC the ECU receiving it will determine the message to be an error and consider that communication has not been possible. Diagnosis of this condition using a lab scope may reveal activity that appears to be Bus data messages even if no actual communication is possible. Communication problems that affect the whole bus, as a result of opens and terminal push outs are more likely to occur on data busses that operate at a high speed than a data bus that operates at a lower speed.

When an open circuit or terminal push out occurs one or more modules can become isolated from the remainder of the bus. The isolated module will attempt to communicate, but will not be able to receive messages or determine arbitration from other modules. Each time the isolated module attempts to communicate it alters the bus voltage on the intact bus circuit. Without functioning arbitration the isolated module alters the bus voltage while other bus messages are being sent thereby corrupting the messages on the remainder of the bus.

The CAN bus modules are connected in parallel to the two-wire bus using a twisted pair, where the wires are wrapped around each other to provide shielding from unwanted electromagnetic induction, thus preventing interference with the relatively low voltage signals being carried through them. While the CAN bus is operating (active), one of the bus wires will carry a higher voltage and is referred to as the CAN High or CAN bus (+) wire, while the other bus wire will carry a lower voltage and is referred to as the CAN Low or CAN bus (-)

wire.

For additional information on the communication network and star connector locations, refer to **COMMUNICATION, DESCRIPTION** .

WHEN MONITORED

With the ignition on for at least five seconds.

Battery voltage between 10 and 16 volts.

Body Control Module (BCM) is configured correctly.

SET CONDITION

Bus messages not received from the Adaptive Cruise Control Module for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN C BUS (+) CIRCUIT SHORTED TO VOLTAGE
CAN C BUS (-) CIRCUIT SHORTED TO GROUND
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
BCM NOT CONFIGURED CORRECTLY
ADAPTIVE CRUISE CONTROL MODULE POWER AND GROUND
ADAPTIVE CRUISE CONTROL MODULE
MODULE THAT SET THIS DTC

NOTE: This DTC is for the Adaptive Cruise Control Module and does not address any door module concerns.

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**

   NOTE: This DTC is for the Adaptive Cruise Control Module and does not address any door module concerns.

   NOTE: Make sure the battery voltage is between 10 and 16 volts before proceeding.

   1. With the scan tool, read active DTCs.

      Is this DTC active?

Yes

- Go To 2

No

- Refer to **DIAGNOSIS AND TESTING** and perform the STORED LOST COMMUNICATION DTCS diagnostic procedure.

2. **CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS**
   1. With the scan tool, read all active DTCs from all modules.

      NOTE: Check for BCM configuration, CAN C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

      Does the scan tool display any active DTCs to the conditions listed above?

      Yes

      - Go to the **DTC INDEX** and perform the appropriate diagnostic procedure.

      No

      - Go To 3

3. **VERIFY THE ADAPTIVE CRUISE CONTROL MODULE IS ACTIVE ON THE BUS**
   1. Turn the ignition on.
   2. With the scan tool, verify the Adaptive Cruise Control Module is active on the bus.

      Is the Adaptive Cruise Control Module active on the bus?

      Yes

      - Go To 4

      No

      - Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM ADAPTIVE CRUISE CONTROL MODULE diagnostic procedure.

4. **CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS**
   1. With the scan tool, read all the DTCs.

      Is there more than one module with active DTCs "Logged Against" the Adaptive Cruise Control Module?

      Yes

- Replace/update the Adaptive Cruise Control Module in accordance with the Service Information.
- Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 5

5. **CLEAR DTC IN MODULE SETTING FAULT**
   1. With the scan tool, select the module setting the DTC against the Adaptive Cruise Control Module.
   2. Clear active DTCs.

   Is this DTC still active?

   Yes

   - Replace/update the module that set this DTC in accordance with the Service Information.
   - Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 6

6. **CYCLE IGNITION**
   1. Cycle the ignition from RUN to OFF three times ending with the key in the RUN position.

   Does this DTC become active?

   Yes

   - Go To 7

   No

   - The condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched and partially broken wires and the wiring harness connectors for broken, bent, pushed out and corroded terminals.
   - Perform the appropriate verification test for the module. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

7. **CHECK FOR ADDITIONAL LOST COMMUNICATION FAULTS**
   1. With the scan tool, view the modules.

Does the BCM and other CAN C BUS modules show Lost Communication with the remaining CAN C BUS modules?

Yes

- Go To 8

No

- Replace/update the module that set this DTC in accordance with the Service Information.
- Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

8. **CHECK THE CAN C BUS (+) CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 3: Checking CAN C BUS (+) Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Measure the voltage between the (D57) CAN C Bus (+) circuit and ground.

   Is the voltage above 5.0 volts?

   Yes

- Repair the short to voltage in the CAN C Bus (+) circuit. The short to voltage is present in one of the CAN C Bus circuits. Use the Star Connectors to isolate portions of the CAN C Bus in order to locate the concern.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 9

9. **CHECK THE CAN C BUS (-) CIRCUIT FOR A SHORT TO GROUND**

Fig. 4: Checking CAN C BUS (-) Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between ground and the (D58) CAN C Bus (-) circuit.

Is the resistance below 10k Ohms?

Yes

- Repair the short to ground in the CAN C Bus (-) circuit. The short to ground is present in one of the CAN C Bus circuits. Use the Star Connectors to isolate portions of the CAN C Bus in order to locate the concern.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace/update the module that set this DTC in accordance with the Service Information.
- Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

THEORY OF OPERATION

The primary communication network between electronic control modules is the Controller Area Network (CAN) data bus system. The Controller Area Network (CAN) data bus allows all electronic modules connected to the bus to share information with each other. Regardless of whether a message originates from a module on the higher speed CAN C (500K) Bus or on the lower speed bus, CAN Interior High Speed (IHS) (125K) Bus, the message structure and layout is similar, which allows the Body Control Module (BCM) to process and transfer messages between the CAN buses. The BCM stores Diagnostic Trouble Codes (DTCs) for certain bus network faults on the CAN C (500K) Bus and CAN IHS (125K) Bus.

All modules transmit and receive messages over one of these buses. Data exchange between the modules is achieved by serial transmission of encoded data messages (a form of transmission in which data bits are sent sequentially, one at a time, over a single line). Each module can both send and receive serial data simultaneously. Each data bit of a CAN Bus message is carried over the bus as a voltage differential between the two bus circuits which, when strung together, form a message. Each module uses arbitration to sort the message priority if two competing messages are attempting to be broadcast at the same time. Corruption of a single bit within a message will corrupt the entire message. Each message contains a Cyclic Redundancy Check (CRC) which specifies the message size exactly. If the message detected conflicts with the CRC the ECU receiving it will determine the message to be an error and consider that communication has not been possible. Diagnosis of this condition using a lab scope may reveal activity that appears to be Bus data messages even if no actual communication is possible. Communication problems that affect the whole bus, as a result of opens and terminal push outs are more likely to occur on data busses that operate at a high speed than a data bus that operates at a lower speed.

When an open circuit or terminal push out occurs one or more modules can become isolated from the remainder of the bus. The isolated module will attempt to communicate, but will not be able to receive messages or

determine arbitration from other modules. Each time the isolated module attempts to communicate it alters the bus voltage on the intact bus circuit. Without functioning arbitration the isolated module alters the bus voltage while other bus messages are being sent thereby corrupting the messages on the remainder of the bus.

The CAN bus modules are connected in parallel to the two-wire bus using a twisted pair, where the wires are wrapped around each other to provide shielding from unwanted electromagnetic induction, thus preventing interference with the relatively low voltage signals being carried through them. While the CAN bus is operating (active), one of the bus wires will carry a higher voltage and is referred to as the CAN High or CAN bus (+) wire, while the other bus wire will carry a lower voltage and is referred to as the CAN Low or CAN bus (-) wire.

For additional information on the communication network and star connector locations, refer to **COMMUNICATION, DESCRIPTION** .

WHEN MONITORED

With the ignition on for at least five seconds.

Battery voltage between 10 and 16 volts.

Body Control Module (BCM) is configured correctly.

SET CONDITION

Bus messages not received from the Comfort Seat and Wheel Module (CSWM) for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN IHS BUS (125K) (+) CIRCUIT SHORTED TO VOLTAGE
CAN IHS BUS (125K) (-) CIRCUIT SHORTED TO GROUND
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
BCM NOT CONFIGURED CORRECTLY
CSWM POWER AND GROUND
COMFORT SEAT AND WHEEL MODULE (CSWM)
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**

NOTE: Make sure the battery voltage is between 10 and 16 volts before proceeding.

1. With the scan tool, read active DTCs.

   Is this DTC active?

   Yes

   - Go To 2

   No

   - Refer to **DIAGNOSIS AND TESTING** and perform the STORED LOST COMMUNICATION DTCS diagnostic procedure.

2. **CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS**
   1. With the scan tool, read all active DTCs from all modules.

      NOTE: Check for BCM configuration, CAN IHS hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

      Does the scan tool display any active DTCs to the conditions listed above?

      Yes

      - Go to the **DTC INDEX** and perform the appropriate diagnostic procedure.

      No

      - Go To 3

3. **VERIFY THE CSWM IS ACTIVE ON THE BUS**
   1. Turn the ignition on.
   2. With the scan tool, verify the CSWM is active on the bus.

      Is the CSWM active on the bus?

      Yes

      - Go To 4

      No

      - Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM CSWM (COMFORT SEAT AND WHEEL MODULE) diagnostic procedure.

4. **CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS**
   1. With the scan tool, read all the DTCs.

Is there more than one module with active DTCs "Logged Against" the CSWM?

Yes

- Replace/update the CSWM in accordance with the Service Information. Refer to **MODULE, COMFORT SEAT AND WHEEL, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 5

5. **CLEAR DTC IN MODULE SETTING FAULT**
   1. With the scan tool, select the module setting the DTC against the CSWM.
   2. Clear active DTCs.

   Is this DTC still active?

   Yes

   - Replace/update the module that set this DTC in accordance with the Service Information.
   - Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 6

6. **CYCLE IGNITION**
   1. Cycle the ignition from RUN to OFF three times ending with the key in the RUN position.

   Does this DTC become active?

   Yes

   - Go To 7

   No

   - The condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched and partially broken wires and the wiring harness connectors for broken, bent, pushed out and corroded terminals.
   - Perform the appropriate verification test for the module. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

7. **CHECK FOR ADDITIONAL LOST COMMUNICATION FAULTS**
   1. With the scan tool, view the modules.

      Does the BCM and other CAN IHS BUS modules show Lost Communication with the remaining CAN IHS BUS modules?

      Yes

      - Go To 8

      No

      - Replace/update the module that set this DTC in accordance with the Service Information.
      - Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
8. **CHECK THE CAN IHS BUS (+) CIRCUIT FOR A SHORT TO VOLTAGE**
   1. Measure the voltage between the (D157) CAN IHS BUS (+) circuit and ground at the Data Link Connector.

      Is the voltage above 5.0 volts?

      Yes

      - Repair the short to voltage in the CAN IHS BUS (+) circuit. The short to voltage is present in one of the CAN IHS BUS circuits. Use the Star Connectors to isolate portions of the CAN IHS BUS in order to locate the concern.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 9
9. **CHECK THE CAN IHS BUS (-) CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Measure the resistance between ground and the (D158) CAN IHS BUS (-) circuit at the Data Link Connector.

      Is the resistance below 10k Ohms?

      Yes

      - Repair the short to ground in the CAN IHS BUS (-) circuit. The short to ground is present in one of the CAN IHS BUS circuits. Use the Star Connectors to isolate portions of the CAN IHS BUS in order to locate the concern.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace/update the module that set this DTC in accordance with the Service Information.
- Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U0209-87-LOST COMMUNICATION WITH MEMORY SEAT CONTROL MODULE - MISSING MESSAGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The primary communication network between electronic control modules is the Controller Area Network (CAN) data bus system. The Controller Area Network (CAN) data bus allows all electronic modules connected to the bus to share information with each other. Regardless of whether a message originates from a module on the higher speed CAN C (500K) Bus or on the lower speed bus, CAN Interior High Speed (IHS) (125K) Bus, the message structure and layout is similar, which allows the Body Control Module (BCM) to process and transfer messages between the CAN buses. The BCM stores Diagnostic Trouble Codes (DTCs) for certain bus network faults on the CAN C (500K) Bus and CAN IHS (125K) Bus.

All modules transmit and receive messages over one of these buses. Data exchange between the modules is achieved by serial transmission of encoded data messages (a form of transmission in which data bits are sent sequentially, one at a time, over a single line). Each module can both send and receive serial data simultaneously. Each data bit of a CAN Bus message is carried over the bus as a voltage differential between the two bus circuits which, when strung together, form a message. Each module uses arbitration to sort the message priority if two competing messages are attempting to be broadcast at the same time. Corruption of a single bit within a message will corrupt the entire message. Each message contains a Cyclic Redundancy Check (CRC) which specifies the message size exactly. If the message detected conflicts with the CRC the ECU receiving it will determine the message to be an error and consider that communication has not been possible. Diagnosis of this condition using a lab scope may reveal activity that appears to be Bus data messages even if no actual communication is possible. Communication problems that affect the whole bus, as a result of opens and terminal push outs are more likely to occur on data busses that operate at a high speed than a data bus that operates at a lower speed.

When an open circuit or terminal push out occurs one or more modules can become isolated from the remainder of the bus. The isolated module will attempt to communicate, but will not be able to receive messages or determine arbitration from other modules. Each time the isolated module attempts to communicate it alters the bus voltage on the intact bus circuit. Without functioning arbitration the isolated module alters the bus voltage while other bus messages are being sent thereby corrupting the messages on the remainder of the bus.

The CAN bus modules are connected in parallel to the two-wire bus using a twisted pair, where the wires are wrapped around each other to provide shielding from unwanted electromagnetic induction, thus preventing interference with the relatively low voltage signals being carried through them. While the CAN bus is operating

(active), one of the bus wires will carry a higher voltage and is referred to as the CAN High or CAN bus (+) wire, while the other bus wire will carry a lower voltage and is referred to as the CAN Low or CAN bus (-) wire.

For additional information on the communication network and star connector locations, refer to **COMMUNICATION, DESCRIPTION** .

WHEN MONITORED

With the ignition on for at least five seconds.

Battery voltage between 10 and 16 volts.

Body Control Module (BCM) is configured correctly.

SET CONDITION

Bus messages not received from the Driver Seat Module (DSM) for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN C BUS (+) CIRCUIT SHORTED TO VOLTAGE
CAN C BUS (-) CIRCUIT SHORTED TO GROUND
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
BCM NOT CONFIGURED CORRECTLY
DRIVER SEAT MODULE (DSM) POWER AND GROUND
DRIVER SEAT MODULE (DSM)
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**

   NOTE: Make sure the battery voltage is between 10 and 16 volts before proceeding.

   1. With the scan tool, read active DTCs.

      Is this DTC active?

      Yes

      - Go To 2

No

- Refer to **DIAGNOSIS AND TESTING** and perform the STORED LOST COMMUNICATION DTCS diagnostic procedure.

2. **CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS**
   1. With the scan tool, read all active DTCs from all modules.

NOTE: Check for BCM configuration, CAN C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

Does the scan tool display any active DTCs to the conditions listed above?

Yes

- Go to the **DTC INDEX** and perform the appropriate diagnostic procedure.

No

- Go To 3

3. **VERIFY THE DRIVER SEAT MODULE (DSM) IS ACTIVE ON THE BUS**
   1. Turn the ignition on.
   2. With the scan tool, verify the DSM is active on the bus.

Is the DSM active on the bus?

Yes

- Go To 4

No

- Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM DRIVER SEAT MODULE diagnostic procedure.

4. **CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS**
   1. With the scan tool, read all the DTCs.

Is there more than one module with active DTCs "Logged Against" the DSM?

Yes

- Replace/update the DSM in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 5

5. **CLEAR DTC IN MODULE SETTING FAULT**
   1. With the scan tool, select the module setting the DTC against the DSM.
   2. Clear active DTCs.

      Is this DTC still active?

      Yes

      - Replace/update the module that set this DTC in accordance with the Service Information.
      - Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 6
6. **CYCLE IGNITION**
   1. Cycle the ignition from RUN to OFF three times ending with the key in the RUN position.

      Does this DTC become active?

      Yes

      - Go To 7

      No

      - The condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.
      - Perform the appropriate verification test for the module. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
7. **CHECK FOR ADDITIONAL LOST COMMUNICATION FAULTS**
   1. With the scan tool, view the modules.

      Does the BCM and other CAN C BUS modules show Lost Communication with the remaining CAN C BUS modules?

      Yes

      - Go To 8

No

- Replace/update the module that set this DTC in accordance with the Service Information.
- Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

8. **CHECK THE CAN C BUS (+) CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 5: Checking CAN C BUS (+) Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Measure the voltage between the (D57) CAN C Bus (+) circuit and ground.

   Is the voltage above 5.0 volts?

   Yes

   - Repair the short to voltage in the CAN C Bus (+) circuit. The short to voltage is present in one of the CAN C Bus circuits. Use the Star Connectors to isolate portions of the CAN C Bus in order to locate the concern.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

- Go To 9

9. **CHECK THE CAN C BUS (-) CIRCUIT FOR A SHORT TO GROUND**

Fig. 6: Checking CAN C BUS (-) Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between ground and the (D58) CAN C Bus (-) circuit.

   Is the resistance below 10k Ohms?

   Yes

   - Repair the short to ground in the CAN C Bus (-) circuit. The short to ground is present in one of the CAN C Bus circuits. Use the Star Connectors to isolate portions of the CAN C Bus in order to locate the concern.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace/update the module that set this DTC in accordance with the Service Information.
- Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U0230-87-LOST COMMUNICATION WITH POWER LIFTGATE MODULE - MISSING MESSAGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The primary communication network between electronic control modules is the Controller Area Network (CAN) data bus system. The Controller Area Network (CAN) data bus allows all electronic modules connected to the bus to share information with each other. Regardless of whether a message originates from a module on the higher speed CAN C (500K) Bus or on the lower speed bus, CAN Interior High Speed (IHS) (125K) Bus, the message structure and layout is similar, which allows the Body Control Module (BCM) to process and transfer messages between the CAN buses. The BCM stores Diagnostic Trouble Codes (DTCs) for certain bus network faults on the CAN C (500K) Bus and CAN IHS (125K) Bus.

All modules transmit and receive messages over one of these buses. Data exchange between the modules is achieved by serial transmission of encoded data messages (a form of transmission in which data bits are sent sequentially, one at a time, over a single line). Each module can both send and receive serial data simultaneously. Each data bit of a CAN Bus message is carried over the bus as a voltage differential between the two bus circuits which, when strung together, form a message. Each module uses arbitration to sort the message priority if two competing messages are attempting to be broadcast at the same time. WHEN MONITORED

With the ignition on for at least five seconds.

Battery voltage between 10 and 16 volts.

Body Control Module (BCM) is configured correctly.

SET CONDITION

Bus messages not received from the Power Liftgate Module (PLGM) for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN C BUS (+) CIRCUIT SHORTED TO VOLTAGE
CAN C BUS (-) CIRCUIT SHORTED TO GROUND
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
BCM NOT CONFIGURED CORRECTLY
POWER LIFTGATE MODULE (PLGM) POWER AND GROUND
POWER LIFTGATE MODULE (PLGM)
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**

   NOTE: Make sure the battery voltage is between 10 and 16 volts before proceeding.

   1. With the scan tool, read active DTCs.

      Is this DTC active?

      Yes

      - Go To 2

      No

- Refer to **DIAGNOSIS AND TESTING** and perform the STORED LOST COMMUNICATION DTCS diagnostic procedure.

2. **CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS**
   1. With the scan tool, read all active DTCs from all modules.

      NOTE: Check for BCM configuration, CAN C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

      Does the scan tool display any active DTCs to the conditions listed above?

      Yes

      - Go to the **DTC INDEX** and perform the appropriate diagnostic procedure.

      No

      - Go To 3

3. **VERIFY THE POWER LIFTGATE MODULE (PLGM) IS ACTIVE ON THE BUS**
   1. Turn the ignition on.
   2. With the scan tool, verify the PLGM is active on the bus.

      Is the PLGM active on the bus?

      Yes

      - Go To 4

      No

      - Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM POWER LIFTGATE MODULE diagnostic procedure.

4. **CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS**
   1. With the scan tool, read all the DTCs.

      Is there more than one module with active DTCs "Logged Against" the PLGM?

      Yes

      - Replace/update the PLGM in accordance with the Service Information.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 5

5. **CLEAR DTC IN MODULE SETTING FAULT**
   1. With the scan tool, select the module setting the DTC against the PLGM.
   2. Clear active DTCs.

      Is this DTC still active?

      Yes

      - Replace/update the module that set this DTC in accordance with the Service Information.
      - Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 6
6. **CYCLE IGNITION**
   1. Cycle the ignition from RUN to OFF three times ending with the key in the RUN position.

      Does this DTC become active?

      Yes

      - Go To 7

      No

      - The condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.
      - Perform the appropriate verification test for the module. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
7. **CHECK FOR ADDITIONAL LOST COMMUNICATION FAULTS**
   1. With the scan tool, view the modules.

      Does the BCM and other CAN C BUS modules show Lost Communication with the remaining CAN C BUS modules?

      Yes

      - Go To 8

      No

- Replace/update the module that set this DTC in accordance with the Service Information.
- Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

8. **CHECK THE CAN C BUS (+) CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 7: Checking CAN C BUS (+) Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Measure the voltage between the (D57) CAN C Bus (+) circuit and ground.

   Is the voltage above 5.0 volts?

   Yes

   - Repair the short to voltage in the CAN C Bus (+) circuit. The short to voltage is present in one of the CAN C Bus circuits. Use the Star Connectors to isolate portions of the CAN C Bus in order to locate the concern.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 9

9. **CHECK THE CAN C BUS (-) CIRCUIT FOR A SHORT TO GROUND**

Fig. 8: Checking CAN C BUS (-) Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between ground and the (D58) CAN C Bus (-) circuit.

   Is the resistance below 10k Ohms?

   Yes

   - Repair the short to ground in the CAN C Bus (-) circuit. The short to ground is present in one of the CAN C Bus circuits. Use the Star Connectors to isolate portions of the CAN C Bus in order to locate the concern.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace/update the module that set this DTC in accordance with the Service Information.
- Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U0231-87-LOST COMMUNICATION WITH RAIN SENSING MODULE-MISSING MESSAGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 9: Rain Sensing Module Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the ignition on.

SET CONDITION

The Body Control Module (BCM) does not receive information from the Light Rain Sensor Module (LRSM).

POSSIBLE CAUSES

Possible Causes
(F982) FUSED IGNITION SWITCH OUTPUT CIRCUIT OPEN
(Z912) GROUND CIRCUIT OPEN
(D401) LIN BUS CIRCUIT OPEN
LIGHT RAIN SENSOR MODULE (LRSM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE (F982) FUSED IGNITION SWITCH OUTPUT CIRCUIT FOR AN OPEN**
    1. Turn the ignition off.
    2. Disconnect the LRSM harness connector.
    3. Turn the ignition on.
    4. Using a 12-volt test light connected to ground, check the (F982) Fused Ignition Switch Output circuit at the LRSM harness connector.

    Does the test light illuminate brightly?

    Yes

    - Go To 3

    No

    - Repair the open or short to ground in the (F982) Fused Ignition Switch Output circuit.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (Z912) GROUND CIRCUIT FOR AN OPEN**
   1. Turn the ignition off.
   2. Using a 12-volt test light connected to 12-volts, check the (Z912) Ground circuit at the LRSM harness connector.

      Does the test light illuminate brightly?

      Yes

      - Go To 4

      No

      - Repair the open in the (Z912) Ground circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
4. **CHECK THE (D401) LIN BUS CIRCUIT FOR AN OPEN**
   1. Turn the ignition on.
   2. Measure the voltage between ground and the (D401) LIN BUS circuit at the LRSM harness connector.

      Is the voltage above 5.0 volts?

      Yes

      - Replace the LRSM in accordance with the Service Information.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Repair the open in the (D401) LIN Bus circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U0236-87-LOST COMMUNICATION WITH ELECTRONIC STEERING COLUMN LOCK MODULE - MISSING MESSAGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The primary communication network between electronic control modules is the Controller Area Network (CAN) data bus system. The Controller Area Network (CAN) data bus allows all electronic modules connected to the bus to share information with each other. Regardless of whether a message originates from a module on the higher speed CAN C (500K) Bus or on the lower speed bus, CAN Interior High Speed (IHS) (125K) Bus,

the message structure and layout is similar, which allows the Body Control Module (BCM) to process and transfer messages between the CAN buses. The BCM stores Diagnostic Trouble Codes (DTCs) for certain bus network faults on the CAN C (500K) Bus and CAN IHS (125K) Bus.

All modules transmit and receive messages over one of these buses. Data exchange between the modules is achieved by serial transmission of encoded data messages (a form of transmission in which data bits are sent sequentially, one at a time, over a single line). Each module can both send and receive serial data simultaneously. Each data bit of a CAN Bus message is carried over the bus as a voltage differential between the two bus circuits which, when strung together, form a message. Each module uses arbitration to sort the message priority if two competing messages are attempting to be broadcast at the same time. Corruption of a single bit within a message will corrupt the entire message. Each message contains a Cyclic Redundancy Check (CRC) which specifies the message size exactly. If the message detected conflicts with the CRC the ECU receiving it will determine the message to be an error and consider that communication has not been possible. Diagnosis of this condition using a lab scope may reveal activity that appears to be Bus data messages even if no actual communication is possible. Communication problems that affect the whole bus, as a result of opens and terminal push outs are more likely to occur on data busses that operate at a high speed than a data bus that operates at a lower speed.

When an open circuit or terminal push out occurs one or more modules can become isolated from the remainder of the bus. The isolated module will attempt to communicate, but will not be able to receive messages or determine arbitration from other modules. Each time the isolated module attempts to communicate it alters the bus voltage on the intact bus circuit. Without functioning arbitration the isolated module alters the bus voltage while other bus messages are being sent thereby corrupting the messages on the remainder of the bus.

The CAN bus modules are connected in parallel to the two-wire bus using a twisted pair, where the wires are wrapped around each other to provide shielding from unwanted electromagnetic induction, thus preventing interference with the relatively low voltage signals being carried through them. While the CAN bus is operating (active), one of the bus wires will carry a higher voltage and is referred to as the CAN High or CAN bus (+) wire, while the other bus wire will carry a lower voltage and is referred to as the CAN Low or CAN bus (-) wire.

For additional information on the communication network and star connector locations, refer to **COMMUNICATION, DESCRIPTION** .

WHEN MONITORED

With the ignition on for at least five seconds.

Battery voltage between 10 and 16 volts.

Body Control Module (BCM) is configured correctly.

SET CONDITION

Bus messages not received from the Electronic Steering Column Lock Module for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN C BUS (+) CIRCUIT SHORTED TO VOLTAGE
CAN C BUS (-) CIRCUIT SHORTED TO GROUND
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
BCM NOT CONFIGURED CORRECTLY
ELECTRONIC STEERING COLUMN LOCK MODULE POWER AND GROUND
ELECTRONIC STEERING LOCK (ESL)
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**

   NOTE: Make sure the battery voltage is between 10 and 16 volts before proceeding.

   1. With the scan tool, read active DTCs.

      Is this DTC active?

      Yes

      - Go To 2

      No

      - Refer to **DIAGNOSIS AND TESTING** and perform the STORED LOST COMMUNICATION DTCS diagnostic procedure.

2. **CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS**
   1. With the scan tool, read all active DTCs from all modules.

      NOTE: Check for BCM configuration, CAN C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

      Does the scan tool display any active DTCs to the conditions listed above?

      Yes

      - Refer to the **DTC INDEX** and perform the appropriate diagnostic procedure.

      No

- Go To 3

3. **VERIFY THE ELECTRONIC STEERING COLUMN LOCK MODULE IS ACTIVE ON THE BUS**
   1. Turn the ignition on.
   2. With the scan tool, verify the Electronic Steering Column Lock Module is active on the bus.

      Is the Electronic Steering Column Lock Module active on the bus?

      Yes

      - Go To 4

      No

      - Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM ELECTRONIC STEERING COLUMN LOCK MODULE diagnostic procedure.
4. **CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS**
   1. With the scan tool, read all the DTCs.

      Is there more than one module with active DTCs "Logged Against" the Electronic Steering Column Lock Module?

      Yes

      - Replace/update the Electronic Steering Column Lock Module in accordance with the Service Information.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 5
5. **CLEAR DTC IN MODULE SETTING FAULT**
   1. With the scan tool, select the module setting the DTC against the Electronic Steering Column Lock Module.
   2. Clear active DTCs.

      Is this DTC still active?

      Yes

      - Replace/update the module that set this DTC in accordance with the Service Information.
      - Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 6

6. **CYCLE IGNITION**
   1. Cycle the ignition from RUN to OFF three times ending with the key in the RUN position.

      Does this DTC become active?

      Yes

      - Go To 7

      No

      - The condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.
      - Perform the appropriate verification test for the module. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
7. **CHECK FOR ADDITIONAL LOST COMMUNICATION FAULTS**
   1. With the scan tool, view the modules.

      Does the BCM and other CAN C BUS modules show Lost Communication with the remaining CAN C BUS modules?

      Yes

      - Go To 8

      No

      - Replace/update the module that set this DTC in accordance with the Service Information.
      - Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
8. **CHECK THE CAN C BUS (+) CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 10: Checking CAN C BUS (+) Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Measure the voltage between the (D57) CAN C Bus (+) circuit and ground.

   Is the voltage above 5.0 volts?

   Yes

   - Repair the short to voltage in the CAN C Bus (+) circuit. The short to voltage is present in one of the CAN C Bus circuits. Use the Star Connectors to isolate portions of the CAN C Bus in order to locate the concern.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 9

9. **CHECK THE CAN C BUS (-) CIRCUIT FOR A SHORT TO GROUND**

Fig. 11: Checking CAN C BUS (-) Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between ground and the (D58) CAN C Bus (-) circuit.

   Is the resistance below 10k Ohms?

   Yes

   - Repair the short to ground in the CAN C Bus (-) circuit. The short to ground is present in one of the CAN C Bus circuits. Use the Star Connectors to isolate portions of the CAN C Bus in order to locate the concern.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

- Replace/update the module that set this DTC in accordance with the Service Information.
- Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U0241-87-LOST COMMUNICATION WITH AUTO HIGHBEAM HEADLAMP CONTROL MODULE - MISSING MESSAGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The primary communication network between electronic control modules is the Controller Area Network (CAN) data bus system. The Controller Area Network (CAN) data bus allows all electronic modules connected to the bus to share information with each other. Regardless of whether a message originates from a module on the higher speed CAN C (500K) Bus or on the lower speed bus, CAN Interior High Speed (IHS) (125K) Bus, the message structure and layout is similar, which allows the Body Control Module (BCM) to process and transfer messages between the CAN buses. The BCM stores Diagnostic Trouble Codes (DTCs) for certain bus network faults on the CAN C (500K) Bus and CAN IHS (125K) Bus.

All modules transmit and receive messages over one of these buses. Data exchange between the modules is achieved by serial transmission of encoded data messages (a form of transmission in which data bits are sent sequentially, one at a time, over a single line). Each module can both send and receive serial data simultaneously. Each data bit of a CAN Bus message is carried over the bus as a voltage differential between the two bus circuits which, when strung together, form a message. Each module uses arbitration to sort the message priority if two competing messages are attempting to be broadcast at the same time. Corruption of a single bit within a message will corrupt the entire message. Each message contains a Cyclic Redundancy Check (CRC) which specifies the message size exactly. If the message detected conflicts with the CRC the ECU receiving it will determine the message to be an error and consider that communication has not been possible. Diagnosis of this condition using a lab scope may reveal activity that appears to be Bus data messages even if no actual communication is possible. Communication problems that affect the whole bus, as a result of opens and terminal push outs are more likely to occur on data busses that operate at a high speed than a data bus that operates at a lower speed.

When an open circuit or terminal push out occurs one or more modules can become isolated from the remainder of the bus. The isolated module will attempt to communicate, but will not be able to receive messages or determine arbitration from other modules. Each time the isolated module attempts to communicate it alters the bus voltage on the intact bus circuit. Without functioning arbitration the isolated module alters the bus voltage while other bus messages are being sent thereby corrupting the messages on the remainder of the bus.

The CAN bus modules are connected in parallel to the two-wire bus using a twisted pair, where the wires are wrapped around each other to provide shielding from unwanted electromagnetic induction, thus preventing interference with the relatively low voltage signals being carried through them. While the CAN bus is operating (active), one of the bus wires will carry a higher voltage and is referred to as the CAN High or CAN bus (+) wire, while the other bus wire will carry a lower voltage and is referred to as the CAN Low or CAN bus (-) wire.

For additional information on the communication network and star connector locations, refer to **COMMUNICATION, DESCRIPTION** .

WHEN MONITORED

With the ignition on for at least five seconds.

Battery voltage between 10 and 16 volts.

Body Control Module (BCM) is configured correctly.

SET CONDITION

Bus messages not received from the Automatic High Beam Module (AHBM) for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN C BUS (+) CIRCUIT SHORTED TO VOLTAGE
CAN C BUS (-) CIRCUIT SHORTED TO GROUND
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
BCM NOT CONFIGURED CORRECTLY
AUTOMATIC HIGH BEAM MODULE (AHBM) POWER AND GROUND
AUTOMATIC HIGH BEAM MODULE (AHBM)
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**

   NOTE: Make sure the battery voltage is between 10 and 16 volts before proceeding.

   1. With the scan tool, read active DTCs.

      Is this DTC active?

      Yes

      - Go To 2

      No

      - Refer to **DIAGNOSIS AND TESTING** and perform the STORED LOST

COMMUNICATION DTCS diagnostic procedure.

2. **CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS**
   1. With the scan tool, read all active DTCs from all modules.

      NOTE: Check for BCM configuration, CAN C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

      Does the scan tool display any active DTCs to the conditions listed above?

      Yes

      - Go to the **DTC INDEX** and perform the appropriate diagnostic procedure.

      No

      - Go To 3
3. **VERIFY THE AUTOMATIC HIGH BEAM MODULE (AHBM) IS ACTIVE ON THE BUS**
   1. Turn the ignition on.
   2. With the scan tool, verify the AHBM is active on the bus.

      Is the Passenger Door Module active on the bus?

      Yes

      - Go To 4

      No

      - Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM AUTOMATIC HIGH BEAM MODULE diagnostic procedure.
4. **CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS**
   1. With the scan tool, read all the DTCs.

      Is there more than one module with active DTCs "Logged Against" the AHBM?

      Yes

      - Replace/update the AHBM in accordance with the Service Information.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 5
5. **CLEAR DTC IN MODULE SETTING FAULT**

1. With the scan tool, select the module setting the DTC against the AHBM.
2. Clear active DTCs.

   Is this DTC still active?

   Yes

   - Replace/update the module that set this DTC in accordance with the Service Information.
   - Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 6

6. **CYCLE IGNITION**
   1. Cycle the ignition from RUN to OFF three times ending with the key in the RUN position.

      Does this DTC become active?

      Yes

      - Go To 7

      No

      - The condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.
      - Perform the appropriate verification test for the module. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

7. **CHECK FOR ADDITIONAL LOST COMMUNICATION FAULTS**
   1. With the scan tool, view the modules.

      Does the BCM and other CAN C BUS modules show Lost Communication with the remaining CAN C BUS modules?

      Yes

      - Go To 8

      No

- Replace/update the module that set this DTC in accordance with the Service Information.
- Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

8. **CHECK THE CAN C BUS (+) CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 12: Checking CAN C BUS (+) Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Measure the voltage between the (D57) CAN C Bus (+) circuit and ground.

   Is the voltage above 5.0 volts?

   Yes

   - Repair the short to voltage in the CAN C Bus (+) circuit. The short to voltage is present in one of the CAN C Bus circuits. Use the Star Connectors to isolate portions of the CAN C Bus in order to locate the concern.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 9

9. **CHECK THE CAN C BUS (-) CIRCUIT FOR A SHORT TO GROUND**

Fig. 13: Checking CAN C BUS (-) Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between ground and the (D58) CAN C Bus (-) circuit.

   Is the resistance below 10k Ohms?

   Yes

   - Repair the short to ground in the CAN C Bus (-) circuit. The short to ground is present in one of the CAN C Bus circuits. Use the Star Connectors to isolate portions of the CAN C Bus in order to locate the concern.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace/update the module that set this DTC in accordance with the Service Information.
- Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U0264-87-LOST COMMUNICATION WITH CAMERA MODULE - REAR-MISSING MESSAGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 14: Video Camera Module Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the ignition on.

SET CONDITION

The Body Control Module (BCM) does not receive information from the Rear View Camera Module.

POSSIBLE CAUSES

Possible Causes
(F923) FUSED RUN RELAY CONTROL CIRCUIT OPEN
(Z923) GROUND CIRCUIT OPEN
(D402) LIN BUS CIRCUIT OPEN
REAR VIEW CAMERA MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE (F923) FUSED RUN RELAY CONTROL CIRCUIT FOR AN OPEN**
    1. Turn the ignition off.
    2. Disconnect the Rear View Camera Module harness connector.
    3. Turn the ignition on.
    4. Using a 12-volt test light connected to ground, check the (F923) Fused Run Relay Control circuit at the Rear View Camera Module harness connector.

Does the test light illuminate brightly?

Yes

- Go To 3

No

- Repair the open or short to ground in the (F923) Fused Run Relay Control circuit.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (Z923) GROUND CIRCUIT FOR AN OPEN**
   1. Turn the ignition off.
   2. Using a 12-volt test light connected to 12-volts, check the (Z923) Ground circuit at the Rear View Camera Module harness connector.

   Does the test light illuminate brightly?

   Yes

   - Go To 4

   No

   - Repair the open in the (Z923) Ground circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
4. **CHECK THE (D402) LIN BUS CIRCUIT FOR AN OPEN**
   1. Turn the ignition on.
   2. Measure the voltage between ground and the (D402) LIN BUS circuit at the Rear View Camera Module harness connector.

   Is the voltage above 5.0 volts?

   Yes

   - Replace the Rear View Camera Module in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Repair the open in the (D402) LIN Bus circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U0401-86-IMPLAUSIBLE DATA RECEIVED FROM ECM/PCM - SIGNAL INVALID

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

Incorrect data received from the Powertrain Control Module (PCM).

POSSIBLE CAUSES

Possible Causes
NO COMMUNICATION WITH THE POWERTRAIN CONTROL MODULE (PCM)
DTCS STORED OR ACTIVE IN THE PCM
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
    1. Turn the ignition on.
    2. With the scan tool, read active DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **VERIFY THE PCM IS ACTIVE ON THE CAN BUS**
    1. With the scan tool, verify that the PCM is active on the bus.

    NOTE: If any DTCs are stored in the PCM, repair those first before proceeding.

    Is the PCM active on the bus?

Yes

- Replace and program the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM PCM diagnostic procedure.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U0402-86-IMPLAUSIBLE DATA RECEIVED FROM TCM - SIGNAL INVALID

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

Incorrect data received from the Transmission Control Module (TCM).

POSSIBLE CAUSES

Possible Causes
NO COMMUNICATION WITH THE TRANSMISSION CONTROL MODULE (TCM)
DTCS STORED OR ACTIVE IN THE BCM
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
    1. Turn the ignition on.
    2. With the scan tool, read active DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

- The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **VERIFY THE TCM IS ACTIVE ON THE CAN BUS**
   1. With the scan tool, verify that the TCM is active on the bus.

      Is the TCM active on the bus?

      Yes

      - Replace and program the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM TCM diagnostic procedure.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U0403-86-IMPLAUSIBLE DATA RECEIVED FROM T-CASE - SIGNAL INVALID

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

Incorrect data received from the Drive Train Control Module.

POSSIBLE CAUSES

Possible Causes
NO COMMUNICATION WITH THE DRIVE TRAIN CONTROL MODULE
DTCS STORED OR ACTIVE IN THE BCM
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**

1. Turn the ignition on.
2. With the scan tool, read active DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Go To 2

   No

   - The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **VERIFY THE DRIVE TRAIN CONTROL MODULE IS ACTIVE ON THE CAN BUS**
   1. With the scan tool, verify that the Drive Train Control Module is active on the bus.

      Is the Drive Train Control Module active on the bus?

      Yes

      - Replace and program the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM DRIVE TRAIN CONTROL MODULE diagnostic procedure.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U0404-86-IMPLAUSIBLE DATA RECEIVED FROM ESM - SIGNAL INVALID

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

Incorrect data received from the Electronic Shift Module (ESM).

POSSIBLE CAUSES

Possible Causes
NO COMMUNICATION WITH THE ELECTRONIC SHIFT MODULE (ESM)
DTCS STORED OR ACTIVE IN THE BCM
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
    1. Turn the ignition on.
    2. With the scan tool, read active DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **VERIFY THE ESM IS ACTIVE ON THE CAN BUS**
    1. With the scan tool, verify that the ESM is active on the bus.

    Is the ESM active on the bus?

    Yes

    - Replace and program the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

    No

    - Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM ESM diagnostic procedure.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U0405-86-INVALID DATA RECEIVED FROM CRUISE CONTROL MODULE - SIGNAL INVALID

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

Incorrect data received from the Adaptive Cruise Control Module.

POSSIBLE CAUSES

Possible Causes
NO COMMUNICATION WITH THE ADAPTIVE CRUISE CONTROL MODULE
DTCS STORED OR ACTIVE IN THE BCM
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
    1. Turn the ignition on.
    2. With the scan tool, read active DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **VERIFY THE ADAPTIVE CRUISE CONTROL MODULE IS ACTIVE ON THE CAN BUS**
    1. With the scan tool, verify that the Adaptive Cruise Control Module is active on the bus.

    Is the Adaptive Cruise Control Module active on the bus?

    Yes

    - Replace and program the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM ADAPTIVE CRUISE CONTROL MODULE diagnostic procedure.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U0415-86-IMPLAUSIBLE DATA RECEIVED FROM ABS - SIGNAL INVALID

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

Incorrect data received from the Antilock Brake System Module (ABS).

POSSIBLE CAUSES

Possible Causes
NO COMMUNICATION WITH THE ANTILOCK BRAKE SYSTEM MODULE (ABS)
DTCS STORED OR ACTIVE IN THE BCM
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
    1. Turn the ignition on.
    2. With the scan tool, read active DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **VERIFY THE ABS IS ACTIVE ON THE CAN BUS**
   1. With the scan tool, verify that the ABS is active on the bus.

      Is the ABS active on the bus?

      Yes

      - Replace and program the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM ABS diagnostic procedure.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U0417-86-IMPLAUSIBLE DATA RECEIVED FROM PARK BRAKE CONTROL MODULE - SIGNAL INVALID

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

Incorrect data received from the Park Brake Control Module.

POSSIBLE CAUSES

Possible Causes
NO COMMUNICATION WITH THE PARK BRAKE CONTROL MODULE
DTCS STORED OR ACTIVE IN THE BCM
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
   1. Turn the ignition on.
   2. With the scan tool, read active DTCs.

Does the scan tool display this DTC as active?

Yes

- Go To 2

No

- The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **VERIFY THE PARK BRAKE CONTROL MODULE IS ACTIVE ON THE CAN BUS**
   1. With the scan tool, verify that the Park Brake Control Module is active on the bus.

   Is the Park Brake Control Module active on the bus?

   Yes

   - Replace and program the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM PARK BRAKE CONTROL MODULE diagnostic procedure.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U0423-86-IMPLAUSIBLE DATA RECEIVED FROM CLUSTER/CCN - SIGNAL INVALID

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

Incorrect data received from the Cluster.

POSSIBLE CAUSES

Possible Causes

NO COMMUNICATION WITH THE CLUSTER
DTCS STORED OR ACTIVE IN THE BCM
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
    1. Turn the ignition on.
    2. With the scan tool, read active DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **VERIFY THE CLUSTER IS ACTIVE ON THE CAN BUS**
    1. With the scan tool, verify that the Cluster is active on the bus.

    Is the Cluster active on the bus?

    Yes

    - Replace and program the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

    No

    - Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM CLUSTER diagnostic procedure.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U0424-86-IMPLAUSIBLE DATA RECEIVED FROM HVAC CONTROL MODULE - SIGNAL INVALID

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

Incorrect data received from the HVAC Control Module.

POSSIBLE CAUSES

Possible Causes
NO COMMUNICATION WITH THE HVAC CONTROL MODULE
DTCS STORED OR ACTIVE IN THE BCM
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
    1. Turn the ignition on.
    2. With the scan tool, read active DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **VERIFY THE HVAC CONTROL MODULE IS ACTIVE ON THE CAN BUS**
    1. With the scan tool, verify that the HVAC is active on the bus.

    Is the HVAC active on the bus?

    Yes

    - Replace and program the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM HVAC diagnostic procedure.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U0429-86-IMPLAUSIBLE DATA RECEIVED FROM SCM - SIGNAL INVALID

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

Incorrect data received from the Steering Column Control Module (SCCM).

POSSIBLE CAUSES

Possible Causes
NO COMMUNICATION WITH THE STEERING COLUMN CONTROL MODULE (SCCM)
DTCS STORED OR ACTIVE IN THE BCM
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
   1. Turn the ignition on.
   2. With the scan tool, read active DTCs.

      Does the scan tool display this DTC as active?

      Yes

      - Go To 2

      No

      - The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **VERIFY THE SCCM IS ACTIVE ON THE CAN BUS**

1. With the scan tool, verify that the SCCM is active on the bus.

   Is the SCCM active on the bus?

   Yes

   - Replace and program the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM SCCM diagnostic procedure.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U0452-86-IMPLAUSIBLE DATA RECEIVED FROM RESTRAINTS CONTROL MODULE - SIGNAL INVALID

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

Incorrect data received from the Occupant Restraint Controller (ORC).

POSSIBLE CAUSES

Possible Causes
NO COMMUNICATION WITH THE OCCUPANT RESTRAINT CONTROLLER (ORC)
DTCS STORED OR ACTIVE IN THE BCM
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
   1. Turn the ignition on.
   2. With the scan tool, read active DTCs.

      Does the scan tool display this DTC as active?

      Yes

- Go To 2

No

- The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **VERIFY THE ORC IS ACTIVE ON THE CAN BUS**
   1. With the scan tool, verify that the ORC is active on the bus.

      Is the ORC active on the bus?

      Yes

      - Replace and program the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM ORC diagnostic procedure.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U0455-86-IMPLAUSIBLE DATA RECEIVED FROM OCCUPANT CLASSIFICATION MODULE - SIGNAL INVALID

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

Incorrect data received from the Occupant Classification Module (OCM).

POSSIBLE CAUSES

Possible Causes
NO COMMUNICATION WITH THE OCCUPANT CLASSIFICATION MODULE (OCM)
DTCS STORED OR ACTIVE IN THE BCM

BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
    1. Turn the ignition on.
    2. With the scan tool, read active DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **VERIFY THE OCM IS ACTIVE ON THE CAN BUS**
    1. With the scan tool, verify that the OCM is active on the bus.

    Is the OCM active on the bus?

    Yes

    - Replace and program the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

    No

    - Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM OCM diagnostic procedure.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U045A-86-IMPLAUSIBLE DATA RECEIVED FROM PARKING ASSIST MODULE - SIGNAL INVALID

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

Incorrect data received from the Park Assist Module (PAM).

POSSIBLE CAUSES

Possible Causes
NO COMMUNICATION WITH THE PARK ASSIST MODULE (PAM)
DTCS STORED OR ACTIVE IN THE BCM
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
    1. Turn the ignition on.
    2. With the scan tool, read active DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **VERIFY THE PAM IS ACTIVE ON THE CAN BUS**
    1. With the scan tool, verify that the PAM is active on the bus.

    Is the PAM active on the bus?

    Yes

    - Replace and program the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

    No

- Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM PAM diagnostic procedure.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U0482-86-IMPLAUSIBLE DATA RECEIVED FROM AUTOMATIC HEADLAMP LEVELING MODULE - SIGNAL INVALID

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

Incorrect data received from the Automatic Headlamp Leveling Module (AHLM).

POSSIBLE CAUSES

Possible Causes
NO COMMUNICATION WITH THE AUTOMATIC HEADLAMP LEVELING MODULE (AHLM)
DTCS STORED OR ACTIVE IN THE BCM
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
   1. Turn the ignition on.
   2. With the scan tool, read active DTCs.

      Does the scan tool display this DTC as active?

      Yes

      - Go To 2

      No

      - The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **VERIFY THE AUTOMATIC HEADLAMP LEVELING MODULE (AHLM) IS ACTIVE ON THE CAN BUS**

1. With the scan tool, verify that the Automatic Headlamp Leveling Module (AHLM) is active on the bus.

   Is the Automatic Headlamp Leveling Module (AHLM) active on the bus?

   Yes

   - Replace and program the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM AUTOMATIC HEADLAMP LEVELING MODULE diagnostic procedure.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U0485-86-IMPLAUSIBLE DATA RECEIVED FROM RADIO - SIGNAL INVALID

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

Incorrect data received from the Radio.

POSSIBLE CAUSES

Possible Causes
NO COMMUNICATION WITH THE RADIO
DTCS STORED OR ACTIVE IN THE BCM
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
   1. Turn the ignition on.
   2. With the scan tool, read active DTCs.

      Does the scan tool display this DTC as active?

      Yes

- Go To 2

No

- The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **VERIFY THE RADIO IS ACTIVE ON THE CAN BUS**
   1. With the scan tool, verify that the Radio is active on the bus.

      Is the Radio active on the bus?

      Yes

      - Replace and program the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM RADIO diagnostic procedure.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U049A-86-IMPLAUSIBLE DATA RECEIVED FROM DRIVER DOOR MODULE - SIGNAL INVALID

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

Incorrect data received from the Driver Door Module (DDM).

POSSIBLE CAUSES

Possible Causes
NO COMMUNICATION WITH THE DRIVER DOOR MODULE
DTCS STORED OR ACTIVE IN THE BCM
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
    1. Turn the ignition on.
    2. With the scan tool, read active DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **VERIFY THE DRIVER DOOR MODULE (DDM) IS ACTIVE ON THE CAN BUS**
    1. With the scan tool, verify that the DDM is active on the bus.

    Is the DDM active on the bus?

    Yes

    - Replace and program the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

    No

    - Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM DRIVER DOOR MODULE diagnostic procedure.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U0501-86-IMPLAUSIBLE DATA RECEIVED FROM PASSENGER DOOR MODULE - SIGNAL INVALID

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

Incorrect data received from the Passenger Door Module (PDM).

POSSIBLE CAUSES

Possible Causes
NO COMMUNICATION WITH THE PASSENGER DOOR MODULE (PDM)
DTCS STORED OR ACTIVE IN THE BCM
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
   1. Turn the ignition on.
   2. With the scan tool, read active DTCs.

      Does the scan tool display this DTC as active?

      Yes

      - Go To 2

      No

      - The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **VERIFY THE PASSENGER DOOR MODULE (PDM) IS ACTIVE ON THE CAN BUS**
   1. With the scan tool, verify that the PDM is active on the bus.

      Is the PDM active on the bus?

      Yes

      - Replace and program the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM

PASSENGER DOOR MODULE diagnostic procedure.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U050A-86-IMPLAUSIBLE DATA RECEIVED FROM MEMORY SEAT CONTROL MODULE - SIGNAL INVALID

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

Incorrect data received from the Driver Seat Module (DSM).

POSSIBLE CAUSES

Possible Causes
NO COMMUNICATION WITH THE DRIVER SEAT MODULE (DSM)
DTCS STORED OR ACTIVE IN THE BCM
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
    1. Turn the ignition on.
    2. With the scan tool, read active DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **VERIFY THE DRIVER SEAT MODULE (DSM) IS ACTIVE ON THE CAN BUS**
    1. With the scan tool, verify that the DSM is active on the bus.

Is the DSM active on the bus?

Yes

- Replace and program the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM DRIVER SEAT MODULE diagnostic procedure.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U052A-86-IMPLAUSIBLE DATA RECEIVED FROM HEATED SEAT MODULE - SIGNAL INVALID

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

Incorrect data received from the Comfort Seat and Wheel Module (CSWM).

POSSIBLE CAUSES

Possible Causes
NO COMMUNICATION WITH THE COMFORT SEAT AND WHEEL MODULE (CSWM)
DTCS STORED OR ACTIVE IN THE BCM
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
    1. Turn the ignition on.
    2. With the scan tool, read active DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

No

- The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **VERIFY THE CSWM IS ACTIVE ON THE CAN BUS**
   1. With the scan tool, verify that the CSWM is active on the bus.

   Is the CSWM active on the bus?

   Yes

   - Replace and program the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM CSWM diagnostic procedure.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U0531-86-IMPLAUSIBLE DATA RECEIVED FROM POWER LIFTGATE MODULE - SIGNAL INVALID

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

Incorrect data received from the Power Liftgate Module (PLGM).

POSSIBLE CAUSES

Possible Causes
NO COMMUNICATION WITH THE POWER LIFTGATE MODULE (PLGM)
DTCS STORED OR ACTIVE IN THE BCM
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
    1. Turn the ignition on.
    2. With the scan tool, read active DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **VERIFY THE POWER LIFTGATE MODULE (PLGM) IS ACTIVE ON THE CAN BUS**
    1. With the scan tool, verify that the PLGM is active on the bus.

    Is the PLGM active on the bus?

    Yes

    - Replace and program the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

    No

    - Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM POWER LIFTGATE MODULE diagnostic procedure.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U0537-86-IMPLAUSIBLE DATA RECEIVED FROM ELECTRONIC STEERING COLUMN LOCK MODULE - SIGNAL INVALID

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

Incorrect data received from the Electronic Steering Column Lock Module.

POSSIBLE CAUSES

Possible Causes
NO COMMUNICATION WITH THE ELECTRONIC STEERING COLUMN LOCK MODULE
DTCS STORED OR ACTIVE IN THE BCM
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
   1. Turn the ignition on.
   2. With the scan tool, read active DTCs.

      Does the scan tool display this DTC as active?

      Yes

      - Go To 2

      No

      - The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **VERIFY THE ELECTRONIC STEERING COLUMN LOCK MODULE IS ACTIVE ON THE CAN BUS**
   1. With the scan tool, verify that the Electronic Steering Column Lock Module is active on the bus.

      Is the Electronic Steering Column Lock Module active on the bus?

      Yes

      - Replace and program the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM ELECTRONIC STEERING COLUMN LOCK MODULE diagnostic procedure.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U1008-11-LIN 1 BUS - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 15: Battery Sensor, Alarm Siren, Intrusion & Light Rain Sensing Module Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Body Control Module (BCM) is the Local Interconnect Network (LIN) master for the Ultra-Sonic Anti-tilt Module (UAM), Intelligent Battery Sensor (IBS), Alarm Siren Unit (ASU) and Light Rain Sensing Module (LRSM). The BCM monitors the LIN circuit for any concerns.

WHEN MONITORED

Continuously with the ignition on.

SET CONDITION

When the BCM detects that the LIN Bus is shorted to ground.

POSSIBLE CAUSES

Possible Causes
LIN BUS CIRCUIT SHORTED TO GROUND
INTELLIGENT BATTERY SENSOR (IBS)
ULTRA-SONIC ANTI-TILT MODULE (UAM)
ALARM SIREN UNIT (ASU)
LIGHT AND RAIN SENSING MODULE (LRSM)
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **ULTRA-SONIC ANTI-TILT MODULE (UAM)**
    1. Turn the ignition off.
    2. Disconnect the UAM harness connector.
    3. Turn the ignition on.

4. With the scan tool, read DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Go To 3

   No

   - Replace the UAM in accordance with the Service Information. Refer to **MODULE, ULTRASONIC AND ANTI-TILT, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **ALARM SIREN UNIT (ASU)**
   1. Turn the ignition off.
   2. Disconnect the ASU harness connector.
   3. Turn the ignition on.
   4. With the scan tool, read DTCs.

      Does the scan tool display this DTC as active?

      Yes

      - Go To 4

      No

      - Replace the ASU in accordance with the Service Information.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **INTELLIGENT BATTERY SENSOR (IBS)**
   1. Turn the ignition off.
   2. Disconnect the IBS C1 harness connector.
   3. Turn the ignition on.
   4. With the scan tool, read DTCs.

      Does the scan tool display this DTC as active?

      Yes

      - Go To 5

      No

- Replace the IBS in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **LIGHT AND RAIN SENSING MODULE (LRSM)**
   1. Turn the ignition off.
   2. Disconnect the LRSM harness connector.
   3. Turn the ignition on.
   4. With the scan tool, read DTCs.

      Does the scan tool display this DTC as active?

      Yes

      - Go To 6

      No

      - Replace the LRSM in accordance with the Service Information.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
6. **CHECK THE (D401) LIN BUS CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Disconnect the BCM C6 harness connector.
   3. Measure the resistance between ground and the (D401) LIN Bus circuit at the BCM C6 harness connector.

      Is the resistance above 10K Ohms?

      Yes

      - Replace the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Repair the short to ground in the (D401) LIN Bus circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U1008-12-LIN 1 BUS - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 16: Battery Sensor, Alarm Siren, Intrusion & Light Rain Sensing Module Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Body Control Module (BCM) is the Local Interconnect Network (LIN) master for the Ultra-Sonic Anti-tilt Module (UAM), Intelligent Battery Sensor (IBS), Alarm Siren Unit (ASU) and Light Rain Sensing Module (LRSM). The BCM monitors the LIN circuit for any concerns.

WHEN MONITORED

Continuously with the ignition on.

SET CONDITION

When the BCM detects that the LIN Bus is shorted to battery voltage.

POSSIBLE CAUSES

Possible Causes
LIN BUS CIRCUIT SHORTED TO VOLTAGE
ULTRA-SONIC ANTI-TILT MODULE (UAM)
ALARM SIREN UNIT (ASU)
INTELLIGENT BATTERY SENSOR (IBS)
LIGHT AND RAIN SENSING MODULE (LRSM)
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **ULTRA-SONIC ANTI-TILT MODULE (UAM)**
    1. Turn the ignition off.
    2. Disconnect the UAM harness connector.
    3. Turn the ignition on.
    4. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

- Go To 3

No

- Replace the UAM in accordance with the Service Information. Refer to **MODULE, ULTRASONIC AND ANTI-TILT, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **ALARM SIREN UNIT (ASU)**
   1. Turn the ignition off.
   2. Disconnect the ASU harness connector.
   3. Turn the ignition on.
   4. With the scan tool, read DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Go To 4

   No

   - Replace the UAM in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **INTELLIGENT BATTERY SENSOR (IBS)**
   1. Turn the ignition off.
   2. Disconnect the IBS C1 harness connector.
   3. Turn the ignition on.
   4. With the scan tool, read DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Go To 5

   No

   - Replace the IBS in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **LIGHT AND RAIN SENSING MODULE (LRSM)**
   1. Turn the ignition off.
   2. Disconnect the LRSM harness connector.

3. Turn the ignition on.
4. With the scan tool, read DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Go To 6

   No

   - Replace the LRSM in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

6. **CHECK THE (D401) LIN BUS CIRCUIT FOR A SHORT TO VOLTAGE**
   1. Turn the ignition off.
   2. Disconnect the BCM C6 harness connector.
   3. Turn the ignition on.
   4. Measure the voltage of the (D401) LIN Bus circuit at the BCM C6 harness connector.

      Is voltage present?

      Yes

      - Repair the short to voltage on the (D401) LIN Bus circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Replace the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U1008-67-LIN 1 BUS - SIGNAL INCORRECT AFTER EVENT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 17: Battery Sensor, Alarm Siren, Intrusion & Light Rain Sensing Module Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Body Control Module (BCM) is the Local Interconnect Network (LIN) master for the Ultra-Sonic Anti-tilt Module (UAM), Intelligent Battery Sensor (IBS), Alarm Siren Unit (ASU) and Light Rain Sensing Module (LRSM). The BCM monitors the LIN circuit for any concerns.

WHEN MONITORED

Continuously with the ignition on.

SET CONDITION

The BCM does not receive any response from the LIN 1 Bus devices.

POSSIBLE CAUSES

Possible Causes
LIN 1 BUS CIRCUIT OPEN
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE (D401) LIN BUS CIRCUIT FOR AN OPEN**
    1. Turn the ignition off.
    2. Disconnect the BCM C6 harness connector.
    3. Disconnect the UAM harness connector.
    4. Disconnect the ASU harness connector.
    5. Disconnect the IBS C1 harness connector.
    6. Disconnect the LRSM harness connector.
    7. Measure the resistance or the (D401) LIN Bus circuit between the BCM C6 harness connector and the UAM/ASU/IBS C1/LRSM harness connectors.

    Is the resistance above 5.0 Ohms?

    Yes

- Repair the open in the (D401) LIN Bus circuit.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U1009-11-LIN 2 BUS - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 18: LIN 2 BUS Video Camera Assembly Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Body Control Module (BCM) is the Local Interconnect Network (LIN) master for the Rear View Camera Module. The BCM monitors the LIN 2 Bus circuit for any concerns.

WHEN MONITORED

Continuously with the ignition on.

SET CONDITION

When the BCM detects that the LIN 2 Bus circuit is shorted to ground.

POSSIBLE CAUSES

Possible Causes
LIN 2 BUS CIRCUIT SHORTED TO GROUND
REAR VIEW CAMERA MODULE
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **REAR VIEW CAMERA MODULE**
    1. Turn the ignition off.
    2. Disconnect the Rear View Camera Module harness connector.

3. Turn the ignition on.
4. With the scan tool, read DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Go To 3

   No

   - Replace the Rear View Camera Module in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (D402) LIN BUS CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Disconnect the BCM C6 harness connector.
   3. Measure the resistance between ground and the (D402) LIN Bus circuit at the BCM C6 harness connector.

      Is the resistance above 10K Ohms?

      Yes

      - Replace the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Repair the short to ground in the (D402) LIN Bus circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U1009-12-LIN 2 BUS - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 19: LIN 2 BUS Video Camera Assembly Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Body Control Module (BCM) is the Local Interconnect Network (LIN) master for the Rear View Camera Module. The BCM monitors the LIN 2 Bus circuit for any concerns.

WHEN MONITORED

Continuously with the ignition on.

SET CONDITION

When the BCM detects that the LIN 2 Bus circuit is shorted to battery voltage.

POSSIBLE CAUSES

Possible Causes
LIN 2 BUS CIRCUIT SHORTED TO VOLTAGE
REAR VIEW CAMERA MODULE
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **REAR VIEW CAMERA MODULE**
    1. Turn the ignition off.
    2. Disconnect the Rear View Camera Module harness connector.
    3. Turn the ignition on.
    4. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 3

    No

    - Replace the Rear View Camera Module in accordance with the Service Information.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (D402) LIN BUS CIRCUIT FOR A SHORT TO VOLTAGE**
    1. Turn the ignition off.
    2. Disconnect the BCM C6 harness connector.
    3. Turn the ignition on.
    4. Measure the voltage of the (D402) LIN Bus circuit at the BCM C6 harness connector.

    Is voltage present?

    Yes

    - Repair the short to voltage on the (D402) LIN Bus circuit.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

    No

    - Replace the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U1009-67-LIN 2 BUS - SIGNAL INCORRECT AFTER EVENT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 20: LIN 2 BUS Video Camera Assembly Circuit Diagram

THEORY OF OPERATION

The Body Control Module (BCM) is the Local Interconnect Network (LIN) master for the Rear View Camera Module. The BCM monitors the LIN 2 Bus circuit for any concerns.

WHEN MONITORED

Continuously with the ignition on.

SET CONDITION

The BCM does not receive any response from the LIN 2 Bus circuit devices.

POSSIBLE CAUSES

Possible Causes
LIN 2 BUS CIRCUIT OPEN
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE (D402) LIN BUS CIRCUIT FOR AN OPEN**
    1. Turn the ignition off.
    2. Disconnect the BCM C6 harness connector.
    3. Disconnect the Rear View Camera Module harness connector.
    4. Measure the resistance or the (D402) LIN Bus circuit between the BCM C6 harness connector and the Rear View Camera Module harness connectors.

    Is the resistance above 5.0 Ohms?

    Yes

    - Repair the open in the (D402) LIN Bus circuit.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

    No

    - Replace the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U1045-11-LIN 3 BUS - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 21: Voltage Stability, Steering Column Control & Wireless Charging Pad Modules Circuit Diagram Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Body Control Module (BCM) is the Local Interconnect Network (LIN) master for the Voltage Stability Module, Steering Column Control Module (SCCM) and Wireless Charging Pad Module. The BCM monitors

the LIN circuit for any concerns.

WHEN MONITORED

Continuously with the ignition on.

SET CONDITION

When the BCM detects that the LIN Bus is shorted to ground.

POSSIBLE CAUSES

Possible Causes
LIN BUS CIRCUIT SHORTED TO GROUND
VOLTAGE STABILITY MODULE
WIRELESS CHARGING PAD MODULE
STEERING COLUMN CONTROL MODULE (SCCM)
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **VOLTAGE STABILITY MODULE**
    1. Turn the ignition off.
    2. Disconnect the Voltage Stability Module harness connector.
    3. Turn the ignition on.
    4. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

Yes

- Go To 3

No

- Replace the Voltage Stability Module in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **WIRELESS CHARGING PAD MODULE**
   1. Turn the ignition off.
   2. Disconnect the Wireless Charging Pad Module harness connector.
   3. Turn the ignition on.
   4. With the scan tool, read DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Go To 4

   No

   - Replace the Wireless Charging Pad Module in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
4. **STEERING COLUMN CONTROL MODULE**
   1. Turn the ignition off.
   2. Disconnect the SCCM C2 harness connector.
   3. Turn the ignition on.
   4. With the scan tool, read DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Go To 5

   No

   - Replace the SCCM in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
5. **CHECK THE (D403) LIN BUS CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.

2. Disconnect the BCM C4 harness connector.
3. Measure the resistance between ground and the (D403) LIN Bus circuit at the BCM C4 harness connector.

   Is the resistance above 10K Ohms?

   Yes

   - Replace the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Repair the short to ground in the (D403) LIN Bus circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U1045-12-LIN 3 BUS - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Body Control Module (BCM) is the Local Interconnect Network (LIN) master for the Voltage Stability Module, Steering Column Control Module (SCCM) and Wireless Charging Pad Module. The BCM monitors the LIN circuit for any concerns.

WHEN MONITORED

Continuously with the ignition on.

SET CONDITION

When the BCM detects that the LIN Bus is shorted to voltage.

POSSIBLE CAUSES

Possible Causes
LIN BUS CIRCUIT SHORTED TO VOLTAGE
VOLTAGE STABILITY MODULE
WIRELESS CHARGING PAD MODULE
STEERING COLUMN CONTROL MODULE (SCCM)
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **VOLTAGE STABILITY MODULE**
    1. Turn the ignition off.
    2. Disconnect the Voltage Stability Module harness connector.
    3. Turn the ignition on.
    4. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 3

    No

- Replace the Voltage Stability Module in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **WIRELESS CHARGING PAD MODULE**
   1. Turn the ignition off.
   2. Disconnect the Wireless Charging Pad Module harness connector.
   3. Turn the ignition on.
   4. With the scan tool, read DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Go To 4

   No

   - Replace the Wireless Charging Pad Module in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **STEERING COLUMN CONTROL MODULE**
   1. Turn the ignition off.
   2. Disconnect the SCCM C2 harness connector.
   3. Turn the ignition on.
   4. With the scan tool, read DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Go To 5

   No

   - Replace the SCCM in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **CHECK THE (D403) LIN BUS CIRCUIT FOR A SHORT TO VOLTAGE**
   1. Turn the ignition off.
   2. Disconnect the BCM C4 harness connector.
   3. Turn the ignition on.
   4. Measure the voltage of the (D403) LIN Bus circuit at the BCM C4 harness connector.

   Is voltage present?

Yes

- Repair the short to voltage on the (D403) LIN Bus circuit.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

THEORY OF OPERATION

The Body Control Module (BCM) is the Local Interconnect Network (LIN) master for the Voltage Stability Module, Steering Column Control Module (SCCM) and Wireless Charging Pad Module. The BCM monitors the LIN circuit for any concerns.

WHEN MONITORED

Continuously with the ignition on.

SET CONDITION

The BCM does not receive any response from the LIN 3 Bus circuit devices.

POSSIBLE CAUSES

Possible Causes
LIN 3 BUS CIRCUIT OPEN
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE (D403) LIN BUS CIRCUIT FOR AN OPEN**
    1. Turn the ignition off.
    2. Disconnect the BCM C4 harness connector.
    3. Disconnect the Voltage Stability Module harness connector.
    4. Disconnect the Wireless Charging Pad Module harness connector.
    5. Disconnect the SCCM C2 harness connector.
    6. Measure the resistance or the (D403) LIN Bus circuit between the BCM C4 harness connector and the Voltage Stability Module/Wireless Charging Pad Module/SCCM C2 harness connectors.

    Is the resistance above 5.0 Ohms?

    Yes

    - Repair the open in the (D403) LIN Bus circuit.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

    No

- Replace the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U1046-11-LIN 4 BUS - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 24: Rear View Mirror, Humidity Sensor, Terrain Switch Bank & Auxiliary Switch Bank Modules Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Body Control Module (BCM) is the Local Interconnect Network (LIN) master for the Rear View Mirror, Humidity Sensor Module, Terrain Switch Bank Module and Auxiliary Switch Bank Module. The BCM monitors the LIN circuit for any concerns.

WHEN MONITORED

Continuously with the ignition on.

SET CONDITION

When the BCM detects that the LIN Bus is shorted to ground.

POSSIBLE CAUSES

Possible Causes
LIN BUS CIRCUIT SHORTED TO GROUND
REAR VIEW MIRROR
HUMIDITY SENSOR MODULE
TERRAIN SWITCH BANK MODULE
AUXILIARY SWITCH BANK MODULE
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **HUMIDITY SENSOR MODULE**
    1. Turn the ignition off.

2. Disconnect the Humidity Sensor Module harness connector.
3. Turn the ignition on.
4. With the scan tool, read DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Go To 3

   No

   - Replace the Humidity Sensor Module in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **INSIDE REAR VIEW MIRROR**
   1. Turn the ignition off.
   2. Disconnect the Inside Rear View Mirror harness connector.
   3. Turn the ignition on.
   4. With the scan tool, read DTCs.

      Does the scan tool display this DTC as active?

      Yes

      - Go To 4

      No

      - Replace the Inside Rear View Mirror in accordance with the Service Information.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **TERRAIN SWITCH BANK MODULE**
   1. Turn the ignition off.
   2. Disconnect the Terrain Switch Bank Module harness connector.
   3. Turn the ignition on.
   4. With the scan tool, read DTCs.

      Does the scan tool display this DTC as active?

      Yes

      - Go To 5

No

- Replace the Terrain Switch Bank Module in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **AUXILIARY SWITCH BANK MODULE**
   1. Turn the ignition off.
   2. Disconnect the Auxiliary Switch Bank Module harness connector.
   3. Turn the ignition on.
   4. With the scan tool, read DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Go To 6

   No

   - Replace the Auxiliary Switch Bank Module in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

6. **CHECK THE (D404) LIN BUS CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Disconnect the BCM C8 harness connector.
   3. Measure the resistance between ground and the (D404) LIN Bus circuit at the BCM C8 harness connector.

   Is the resistance above 10K Ohms?

   Yes

   - Replace the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Repair the short to ground in the (D404) LIN Bus circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U1046-12-LIN 4 BUS - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 25: Rear View Mirror, Humidity Sensor, Terrain Switch Bank & Auxiliary Switch Bank Modules Circuit Diagram

THEORY OF OPERATION

The Body Control Module (BCM) is the Local Interconnect Network (LIN) master for the Rear View Mirror, Humidity Sensor Module, Terrain Switch Bank Module and Auxiliary Switch Bank Module. The BCM monitors the LIN circuit for any concerns.

WHEN MONITORED

Continuously with the ignition on.

SET CONDITION

When the BCM detects that the LIN Bus is shorted to voltage.

POSSIBLE CAUSES

Possible Causes
LIN BUS CIRCUIT SHORTED TO VOLTAGE
REAR VIEW MIRROR
HUMIDITY SENSOR MODULE
TERRAIN SWITCH BANK MODULE
AUXILIARY SWITCH BANK MODULE
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **HUMIDITY SENSOR MODULE**
    1. Turn the ignition off.
    2. Disconnect the Humidity Sensor Module harness connector.
    3. Turn the ignition on.
    4. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

- Go To 3

No

- Replace the Humidity Sensor Module in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **INSIDE REAR VIEW MIRROR**
   1. Turn the ignition off.
   2. Disconnect the Inside Rear View Mirror harness connector.
   3. Turn the ignition on.
   4. With the scan tool, read DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Go To 4

   No

   - Replace the Inside Rear View Mirror in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **TERRAIN SWITCH BANK MODULE**
   1. Turn the ignition off.
   2. Disconnect the Terrain Switch Bank Module harness connector.
   3. Turn the ignition on.
   4. With the scan tool, read DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Go To 5

   No

   - Replace the Terrain Switch Bank Module in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **AUXILIARY SWITCH BANK MODULE**
   1. Turn the ignition off.
   2. Disconnect the Auxiliary Switch Bank Module harness connector.
   3. Turn the ignition on.

4. With the scan tool, read DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Go To 6

   No

   - Replace the Auxiliary Switch Bank Module in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

6. **CHECK THE (D404) LIN BUS CIRCUIT FOR A SHORT TO VOLTAGE**
   1. Turn the ignition off.
   2. Disconnect the BCM C8 harness connector.
   3. Turn the ignition on.
   4. Measure the voltage of the (D404) LIN Bus circuit at the BCM C8 harness connector.

      Is voltage present?

      Yes

      - Repair the short to voltage on the (D404) LIN Bus circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Replace the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U1046-67-LIN 4 BUS - SIGNAL INCORRECT AFTER EVENT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 26: Rear View Mirror, Humidity Sensor, Terrain Switch Bank & Auxiliary Switch Bank Modules Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Body Control Module (BCM) is the Local Interconnect Network (LIN) master for the Rear View Mirror, Humidity Sensor Module, Terrain Switch Bank Module and Auxiliary Switch Bank Module. The BCM monitors the LIN circuit for any concerns.

WHEN MONITORED

Continuously with the ignition on.

SET CONDITION

The BCM does not receive any response from the LIN 4 Bus circuit devices.

POSSIBLE CAUSES

Possible Causes
LIN 4 BUS CIRCUIT OPEN
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE (D404) LIN BUS CIRCUIT FOR AN OPEN**
    1. Turn the ignition off.
    2. Disconnect the BCM C8 harness connector.
    3. Disconnect the Humidity Sensor Module harness connector.
    4. Disconnect the Inside Rear View Mirror harness connector.
    5. Disconnect the Terrain Switch Bank Module harness connector.
    6. Disconnect the Auxiliary Switch Bank Module harness connector.
    7. Measure the resistance or the (D404) LIN Bus circuit between the BCM C8 harness connector and the Humidity Sensor Module/Inside Rear View Mirror/Terrain Switch Bank Module/Auxiliary Switch Bank Module harness connectors.

    Is the resistance above 5.0 Ohms?

Yes

- Repair the open in the (D404) LIN Bus circuit.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U1106-87-CAN C SIGNAL MISSING-MISSING MESSAGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The primary communication network between electronic control modules is the Controller Area Network (CAN) data bus system. The Controller Area Network (CAN) data bus allows all electronic modules connected to the bus to share information with each other. Regardless of whether a message originates from a module on the higher speed CAN C (500K) Bus or on the lower speed bus, CAN Interior High Speed (IHS) (125K) Bus, the message structure and layout is similar, which allows the Body Control Module (BCM) to process and transfer messages between the CAN buses. The BCM stores Diagnostic Trouble Codes (DTCs) for certain bus network faults on the CAN C (500K) Bus and CAN IHS (125K) Bus.

All modules transmit and receive messages over one of these buses. Data exchange between the modules is achieved by serial transmission of encoded data messages (a form of transmission in which data bits are sent sequentially, one at a time, over a single line). Each module can both send and receive serial data simultaneously. Each data bit of a CAN Bus message is carried over the bus as a voltage differential between the two bus circuits which, when strung together, form a message. Each module uses arbitration to sort the message priority if two competing messages are attempting to be broadcast at the same time. Corruption of a single bit within a message will corrupt the entire message. Each message contains a Cyclic Redundancy Check (CRC) which specifies the message size exactly. If the message detected conflicts with the CRC the ECU receiving it will determine the message to be an error and consider that communication has not been possible. Diagnosis of this condition using a lab scope may reveal activity that appears to be Bus data messages even if no actual communication is possible. Communication problems that affect the whole bus, as a result of opens and terminal push outs are more likely to occur on data busses that operate at a high speed than a data bus that operates at a lower speed.

When an open circuit or terminal push out occurs one or more modules can become isolated from the remainder of the bus. The isolated module will attempt to communicate, but will not be able to receive messages or determine arbitration from other modules. Each time the isolated module attempts to communicate it alters the bus voltage on the intact bus circuit. Without functioning arbitration the isolated module alters the bus voltage while other bus messages are being sent thereby corrupting the messages on the remainder of the bus.

The CAN bus modules are connected in parallel to the two-wire bus using a twisted pair, where the wires are wrapped around each other to provide shielding from unwanted electromagnetic induction, thus preventing

interference with the relatively low voltage signals being carried through them. While the CAN bus is operating (active), one of the bus wires will carry a higher voltage and is referred to as the CAN High or CAN bus (+) wire, while the other bus wire will carry a lower voltage and is referred to as the CAN Low or CAN bus (-) wire.

For additional information on the communication network and star connector locations, refer to **COMMUNICATION, DESCRIPTION** .

WHEN MONITORED

With the ignition on.

SET CONDITION

The Body Control Module (BCM) detects a short condition on one of the CAN C Bus circuits.

POSSIBLE CAUSES

Possible Causes
CAN C BUS (+) CIRCUIT SHORTED TO GROUND
CAN C BUS (-) CIRCUIT SHORTED TO VOLTAGE
CAN C BUS (+) CIRCUIT SHORTED TO THE CAN C BUS (-) CIRCUIT
STAR CONNECTOR
ANY MODULE CONNECTED TO THE CAN C BUS

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**

NOTE: Disconnecting the Radio Frequency (RF) Hub Module results in a loss of ignition status messages and may cause scan tool communication concerns.

1. Turn the ignition on.
2. With the scan tool, read DTCs.

Does the scan tool display this DTC as active?

Yes

- Go To 2

No

- Test complete, the condition or conditions that originally set this DTC are not present at this

time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK THE CAN BUS (-) CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 27: Checking CAN BUS (-) Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the scan tool.
2. Measure the voltage between ground and the CAN C Bus (-) circuit.

   Is the voltage above 10.0 volts?

   Yes

   - Diagnose the short to voltage in the CAN C Bus (-) circuit. Use the Star Connectors to isolate portions of the bus to assist in determining the location of the concern. Repair the circuit concern or replace the module that when disconnected allowed the bus voltage to return to normal.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 3

3. **CHECK THE CAN C BUS (+) CIRCUIT FOR A SHORT TO GROUND**

Fig. 28: Checking CAN C BUS (+) Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Measure the voltage between ground and the CAN C Bus (+) circuit.

   Is the voltage approximately 0 volt?

   Yes

   - Diagnose the short to ground in the CAN C Bus (+) circuit. Use the Star Connectors to isolate portions of the bus to assist in determining the location of the concern. Repair the circuit concern or replace the module that when disconnected allowed the bus voltage to return to normal.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

- Go To 4

4. **CHECK FOR CORRECT BUS TERMINATION RESISTANCE**

Fig. 29: Checking For Correct BUS Termination Resistance
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect and isolate the negative battery cable.
3. Measure the resistance between the CAN C Bus (+) circuit and the CAN C Bus (-) circuit.

   Is the resistance between 53.5 and 67 Ohms?

   Yes

   - Test complete, the condition or conditions that originally caused this concern are not present

at this time. Using the wiring diagrams as a guide, check the Star Connectors and all related splices for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- For a resistance measurement above 67 Ohms, an open or high resistance is present in the CAN C Bus (+) circuit or the CAN C Bus (-) circuit between the Star Connectors or one of the termination resistors internal to the Star Connector is damaged. Diagnose and repair as necessary.
- For a resistance measurement below 53.5 Ohms, a short between the CAN C Bus (+) circuit and the CAN C Bus (-) is present. Diagnose the short between the CAN C Bus (+) circuit and the CAN C Bus (-) circuit. Use the Star Connectors to isolate portions of the bus to assist in determining the location of the concern. Repair the circuit concern or replace the module that when disconnected allowed the resistance to return to normal.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U1106-88-CAN C SIGNAL MISSING - BUS OFF

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The primary communication network between electronic control modules is the Controller Area Network (CAN) data bus system. The Controller Area Network (CAN) data bus allows all electronic modules connected to the bus to share information with each other. Regardless of whether a message originates from a module on the higher speed CAN C (500K) Bus or on the lower speed bus, CAN Interior High Speed (IHS) (125K) Bus, the message structure and layout is similar, which allows the Body Control Module (BCM) to process and transfer messages between the CAN buses. The BCM stores Diagnostic Trouble Codes (DTCs) for certain bus network faults on the CAN C (500K) Bus and CAN IHS (125K) Bus.

All modules transmit and receive messages over one of these buses. Data exchange between the modules is achieved by serial transmission of encoded data messages (a form of transmission in which data bits are sent sequentially, one at a time, over a single line). Each module can both send and receive serial data simultaneously. Each data bit of a CAN Bus message is carried over the bus as a voltage differential between the two bus circuits which, when strung together, form a message. Each module uses arbitration to sort the message priority if two competing messages are attempting to be broadcast at the same time. Corruption of a single bit within a message will corrupt the entire message. Each message contains a Cyclic Redundancy Check (CRC) which specifies the message size exactly. If the message detected conflicts with the CRC the ECU receiving it will determine the message to be an error and consider that communication has not been possible. Diagnosis of this condition using a lab scope may reveal activity that appears to be Bus data messages even if no actual communication is possible. Communication problems that affect the whole bus, as a result of opens and terminal push outs are more likely to occur on data busses that operate at a high speed than a data bus that operates at a lower speed.

When an open circuit or terminal push out occurs one or more modules can become isolated from the remainder of the bus. The isolated module will attempt to communicate, but will not be able to receive messages or determine arbitration from other modules. Each time the isolated module attempts to communicate it alters the bus voltage on the intact bus circuit. Without functioning arbitration the isolated module alters the bus voltage while other bus messages are being sent thereby corrupting the messages on the remainder of the bus.

The CAN bus modules are connected in parallel to the two-wire bus using a twisted pair, where the wires are wrapped around each other to provide shielding from unwanted electromagnetic induction, thus preventing interference with the relatively low voltage signals being carried through them. While the CAN bus is operating (active), one of the bus wires will carry a higher voltage and is referred to as the CAN High or CAN bus (+) wire, while the other bus wire will carry a lower voltage and is referred to as the CAN Low or CAN bus (-) wire.

For additional information on the communication network and star connector locations, refer to **COMMUNICATION, DESCRIPTION** .

WHEN MONITORED

With the ignition on.

SET CONDITION

The Body Control Module (BCM) detects a short condition on one of the CAN C Bus circuits.

POSSIBLE CAUSES

Possible Causes
CAN C BUS (+) CIRCUIT SHORTED TO GROUND
CAN C BUS (-) CIRCUIT SHORTED TO VOLTAGE
CAN C BUS (+) CIRCUIT SHORTED TO THE CAN C BUS (-) CIRCUIT
STAR CONNECTOR
ANY MODULE CONNECTED TO THE CAN C BUS

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**

NOTE: Disconnecting the Radio Frequency (RF) Hub Module results in a loss of ignition status messages and may cause scan tool communication concerns.

1. Turn the ignition on.
2. With the scan tool, read DTCs.

Does the scan tool display this DTC as active?

Yes

- Go To 2

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK THE CAN BUS (-) CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 30: Checking CAN BUS (-) Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the scan tool.
2. Measure the voltage between ground and the CAN C Bus (-) circuit.

   Is the voltage above 10.0 volts?

Yes

- Diagnose the short to voltage in the CAN C Bus (-) circuit. Use the Star Connectors to isolate portions of the bus to assist in determining the location of the concern. Repair the circuit concern or replace the module that when disconnected allowed the bus voltage to return to normal.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 3

3. **CHECK THE CAN C BUS (+) CIRCUIT FOR A SHORT TO GROUND**

Fig. 31: Checking CAN C BUS (+) Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Measure the voltage between ground and the CAN C Bus (+) circuit.

   Is the voltage approximately 0 volt?

   Yes

   - Diagnose the short to ground in the CAN C Bus (+) circuit. Use the Star Connectors to

isolate portions of the bus to assist in determining the location of the concern. Repair the circuit concern or replace the module that when disconnected allowed the bus voltage to return to normal.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 4

4. **CHECK FOR CORRECT BUS TERMINATION RESISTANCE**

Fig. 32: Checking For Correct BUS Termination Resistance
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect and isolate the negative battery cable.
3. Measure the resistance between the CAN C Bus (+) circuit and the CAN C Bus (-) circuit.

Is the resistance between 53.5 and 67 Ohms?

Yes

- Test complete, the condition or conditions that originally caused this concern are not present at this time. Using the wiring diagrams as a guide, check the Star Connectors and all related splices for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- For a resistance measurement above 67 Ohms, an open or high resistance is present in the CAN C Bus (+) circuit or the CAN C Bus (-) circuit between the Star Connectors or one of the termination resistors internal to the Star Connector is damaged. Diagnose and repair as necessary.
- For a resistance measurement below 53.5 Ohms, a short between the CAN C Bus (+) circuit and the CAN C Bus (-) is present. Diagnose the short between the CAN C Bus (+) circuit and the CAN C Bus (-) circuit. Use the Star Connectors to isolate portions of the bus to assist in determining the location of the concern. Repair the circuit concern or replace the module that when disconnected allowed the resistance to return to normal.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U1109-87-LOST COMMUNICATION WITH LIN STEERING WHEEL CONTROLS-MISSING MESSAGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 33: Steering Wheel Controls Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the ignition on.

SET CONDITION

The Body Control Module (BCM) does not receive information from the Steering Column Control Module (SCCM) for greater than 3 seconds.

POSSIBLE CAUSES

Possible Causes
(A929) FUSED B(+) CIRCUIT OPEN OR SHORTED TO GROUND
(Z917) GROUND CIRCUIT OPEN
(D403) LIN 3 BUS CIRCUIT OPEN
STEERING COLUMN CONTROL MODULE (SCCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE (A929) FUSED B(+) CIRCUIT FOR AN OPEN**
    1. Turn the ignition off.
    2. Disconnect the Steering Column Control Module (SCCM) harness connector.
    3. Turn the ignition on.
    4. Using a 12-volt test light connected to ground, check the (A929) Fused B(+) circuit at the SCCM harness connector.

    Does the test light illuminate brightly?

    Yes

    - Go To 3

    No

    - Repair the open or short to ground in the (A929) Fused B(+) circuit.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
3. **CHECK THE (Z917) GROUND CIRCUIT FOR AN OPEN**
    1. Turn the ignition off.

2. Using a 12-volt test light connected to 12-volts, check the (Z917) Ground circuit at the SCCM harness connector.

   Does the test light illuminate brightly?

   Yes

   - Go To 4

   No

   - Repair the open in the (Z917) Ground circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK THE (D403) LIN 3 BUS CIRCUIT FOR AN OPEN**
   1. Turn the ignition on.
   2. Measure the voltage between ground and the (D403) LIN 3 Bus circuit at the SCCM harness connector.

      Is the voltage above 5.0 volts?

      Yes

      - Replace the Steering Column Control Module (SCCM) in accordance with the Service Information.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Repair the open in the (D403) LIN 3 Bus circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U110A-87-LOST COMMUNICATION WITH SCM CAN-C - MISSING MESSAGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The primary communication network between electronic control modules is the Controller Area Network (CAN) data bus system. The Controller Area Network (CAN) data bus allows all electronic modules connected to the bus to share information with each other. Regardless of whether a message originates from a module on the higher speed CAN C (500K) Bus or on the lower speed bus, CAN Interior High Speed (IHS) (125K) Bus, the message structure and layout is similar, which allows the Body Control Module (BCM) to process and transfer messages between the CAN buses. The BCM stores Diagnostic Trouble Codes (DTCs) for certain bus network faults on the CAN C (500K) Bus and CAN IHS (125K) Bus.

All modules transmit and receive messages over one of these buses. Data exchange between the modules is achieved by serial transmission of encoded data messages (a form of transmission in which data bits are sent sequentially, one at a time, over a single line). Each module can both send and receive serial data simultaneously. Each data bit of a CAN Bus message is carried over the bus as a voltage differential between the two bus circuits which, when strung together, form a message. Each module uses arbitration to sort the message priority if two competing messages are attempting to be broadcast at the same time. Corruption of a single bit within a message will corrupt the entire message. Each message contains a Cyclic Redundancy Check (CRC) which specifies the message size exactly. If the message detected conflicts with the CRC the ECU receiving it will determine the message to be an error and consider that communication has not been possible. Diagnosis of this condition using a lab scope may reveal activity that appears to be Bus data messages even if no actual communication is possible. Communication problems that affect the whole bus, as a result of opens and terminal push outs are more likely to occur on data busses that operate at a high speed than a data bus that operates at a lower speed.

When an open circuit or terminal push out occurs one or more modules can become isolated from the remainder of the bus. The isolated module will attempt to communicate, but will not be able to receive messages or determine arbitration from other modules. Each time the isolated module attempts to communicate it alters the bus voltage on the intact bus circuit. Without functioning arbitration the isolated module alters the bus voltage while other bus messages are being sent thereby corrupting the messages on the remainder of the bus.

The CAN bus modules are connected in parallel to the two-wire bus using a twisted pair, where the wires are wrapped around each other to provide shielding from unwanted electromagnetic induction, thus preventing interference with the relatively low voltage signals being carried through them. While the CAN bus is operating (active), one of the bus wires will carry a higher voltage and is referred to as the CAN High or CAN bus (+) wire, while the other bus wire will carry a lower voltage and is referred to as the CAN Low or CAN bus (-) wire.

For additional information on the communication network and star connector locations, refer to **COMMUNICATION, DESCRIPTION** .

WHEN MONITORED

With the ignition on for at least five seconds.

Battery voltage between 10 and 16 volts.

Body Control Module (BCM) is configured correctly.

SET CONDITION

Bus messages not received from the Steering Column Control Module (SCCM) for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN C BUS (+) CIRCUIT SHORTED TO VOLTAGE

CAN C BUS (-) CIRCUIT SHORTED TO GROUND
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
BCM NOT CONFIGURED CORRECTLY
SCCM POWER AND GROUND
STEERING COLUMN CONTROL MODULE (SCCM)
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**

   NOTE: Make sure the battery voltage is between 10 and 16 volts before proceeding.

   1. With the scan tool, read active DTCs.

      Is this DTC active?

      Yes

      - Go To 2

      No

      - Refer to **DIAGNOSIS AND TESTING** and perform the STORED LOST COMMUNICATION DTCS diagnostic procedure.
2. **CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS**
   1. With the scan tool, read all active DTCs from all modules.

      NOTE: Check for BCM configuration, CAN C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

      Does the scan tool display any active DTCs to the conditions listed above?

      Yes

      - Refer to the **DTC INDEX** and perform the appropriate diagnostic procedure.

      No

      - Go To 3
3. **VERIFY THE SCCM IS ACTIVE ON THE BUS**
   1. Turn the ignition on.

2. With the scan tool, verify the SCCM is active on the bus.

   Is the SCCM active on the bus?

   Yes

   - Go To 4

   No

   - Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM SCCM diagnostic procedure.

4. **CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS**
   1. With the scan tool, read all the DTCs.

      Is there more than one module with active DTCs "Logged Against" the SCCM?

      Yes

      - Replace/update the Steering Column Control Module (SCCM) in accordance with the Service Information. Refer to **MODULE, STEERING COLUMN, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 5

5. **CLEAR DTC IN MODULE SETTING FAULT**
   1. With the scan tool, select the module setting the DTC against the SCCM.
   2. Clear active DTCs.

      Is this DTC still active?

      Yes

      - Replace/update the module that set this DTC in accordance with the Service Information.
      - Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 6

6. **CYCLE IGNITION**
   1. Cycle the ignition from RUN to OFF three times ending with the key in the RUN position.

Does this DTC become active?

Yes

- Go To 7

No

- The condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.
- Perform the appropriate verification test for the module. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

7. **CHECK FOR ADDITIONAL LOST COMMUNICATION FAULTS**
   1. With the scan tool, view the modules.

      Does the BCM and other CAN C BUS modules show Lost Communication with the remaining CAN C BUS modules?

      Yes

      - Go To 8

      No

      - Replace/update the module that set this DTC in accordance with the Service Information.
      - Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
8. **CHECK THE CAN C BUS (+) CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 34: Checking CAN C BUS (+) Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Measure the voltage between the (D57) CAN C Bus (+) circuit and ground.

   Is the voltage above 5.0 volts?

   Yes

   - Repair the short to voltage in the CAN C Bus (+) circuit. The short to voltage is present in one of the CAN C Bus circuits. Use the Star Connectors to isolate portions of the CAN C Bus in order to locate the concern.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 9

9. **CHECK THE CAN C BUS (-) CIRCUIT FOR A SHORT TO GROUND**

Fig. 35: Checking CAN C BUS (-) Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between ground and the (D58) CAN C Bus (-) circuit.

   Is the resistance below 10k Ohms?

   Yes

   - Repair the short to ground in the CAN C Bus (-) circuit. The short to ground is present in one of the CAN C Bus circuits. Use the Star Connectors to isolate portions of the CAN C Bus in order to locate the concern.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

- Replace/update the module that set this DTC in accordance with the Service Information.
- Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U110D-87-LOST COMMUNICATION WITH SECURITY SIREN - MISSING MESSAGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 36: Intrusion Module, Siren & Hood Switch Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the ignition on.

SET CONDITION

The Body Control Module (BCM) does not receive information from the Security Siren.

POSSIBLE CAUSES

Possible Causes
(A989) FUSED B(+) CIRCUIT OPEN
(Z906) GROUND CIRCUIT OPEN
(D401) LIN BUS CIRCUIT OPEN
SECURITY SIREN

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE (A989) FUSED B(+) CIRCUIT FOR AN OPEN**
    1. Turn the ignition off.
    2. Disconnect the Security Siren harness connector.
    3. Turn the ignition on.
    4. Using a 12-volt test light connected to ground, check the (F989) Fused B(+) circuit at the Security Siren harness connector.

Does the test light illuminate brightly?

Yes

- Go To 3

No

- Repair the open or short to ground in the (F989) Fused B(+) circuit.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (Z906) GROUND CIRCUIT FOR AN OPEN**
   1. Turn the ignition off.
   2. Using a 12-volt test light connected to 12-volts, check the (Z906) Ground circuit at the Security Siren harness connector.

   Does the test light illuminate brightly?

   Yes

   - Go To 4

   No

   - Repair the open in the (Z906) Ground circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
4. **CHECK THE (D401) LIN BUS CIRCUIT FOR AN OPEN**
   1. Turn the ignition on.
   2. Measure the voltage between ground and the (D401) LIN BUS circuit at the Security Siren harness connector.

   Is the voltage above 5.0 volts?

   Yes

   - Replace the Security Siren in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Repair the open in the (D401) LIN Bus circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U113B-87-LOST COMMUNICATION WITH SWITCH BANK MODULE - MISSING MESSAGE

With the ignition on.

SET CONDITION

The Body Control Module (BCM) does not receive information from the Auxiliary Switch Bank Module for

greater than 3 seconds.

POSSIBLE CAUSES

Possible Causes
(A938) FUSED B(+) CIRCUIT OPEN OR SHORTED TO GROUND
(Z914) GROUND CIRCUIT OPEN
(D404) LIN BUS CIRCUIT OPEN
AUXILIARY SWITCH BANK MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE (A938) FUSED B(+) CIRCUIT FOR AN OPEN**
    1. Turn the ignition off.
    2. Disconnect the Auxiliary Switch Bank Module harness connector.
    3. Turn the ignition on.
    4. Using a 12-volt test light connected to ground, check the (A938) Fused B(+) circuit at the Auxiliary Switch Bank Module harness connector.

    Does the test light illuminate brightly?

    Yes

    - Go To 3

    No

    - Repair the open or short to ground in the (A938) Fused B(+) circuit.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (Z914) GROUND CIRCUIT FOR AN OPEN**
   1. Turn the ignition off.
   2. Using a 12-volt test light connected to 12-volts, check the (Z914) Ground circuit at the Auxiliary Switch Bank Module harness connector.

      Does the test light illuminate brightly?

      Yes

      - Go To 4

      No

      - Repair the open in the (Z914) Ground circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
4. **CHECK THE (D404) LIN BUS CIRCUIT FOR AN OPEN**
   1. Turn the ignition on.
   2. Measure the voltage between ground and the (D404) LIN Bus circuit at the Auxiliary Switch Bank Module harness connector.

      Is the voltage above 5.0 volts?

      Yes

      - Replace the Auxiliary Switch Bank Module in accordance with the Service Information.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Repair the open in the (D404) BCM LIN Bus circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U1190-87-LOST COMMUNICATION WITH HUMIDITY SENSOR - MISSING MESSAGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 38: Rear Defrost Control Circuit Diagram

WHEN MONITORED

With the ignition on.

SET CONDITION

The Body Control Module (BCM) does not receive information from the Humidity Sensor for greater than 3 seconds.

POSSIBLE CAUSES

Possible Causes
(F948) FUSED IGNITION RUN/START CONTROL OUTPUT CIRCUIT OPEN OR SHORTED TO GROUND
(Z912) GROUND CIRCUIT OPEN
(D404) LIN BUS CIRCUIT OPEN
HUMIDITY SENSOR

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
   1. Turn the ignition on.
   2. With the scan tool, read DTCs.

      Does the scan tool display this DTC as active?

      Yes

      - Go To 2

      No

      - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE (F948) FUSED IGNITION RUN/START CONTROL OUTPUT CIRCUIT FOR AN OPEN**
   1. Turn the ignition off.
   2. Disconnect the Humidity Sensor harness connector.
   3. Turn the ignition on.
   4. Using a 12-volt test light connected to ground, check the (F948) Fused Ignition Run/Start Control Output circuit at the Humidity Sensor harness connector.

      Does the test light illuminate brightly?

      Yes

      - Go To 3

No

- Repair the open or short to ground in the (F948) Fused Ignition Run/Start Control Output circuit.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (Z912) GROUND CIRCUIT FOR AN OPEN**
   1. Turn the ignition off.
   2. Using a 12-volt test light connected to 12-volts, check the (Z912) Ground circuit at the Humidity Sensor harness connector.

      Does the test light illuminate brightly?

      Yes

      - Go To 4

      No

      - Repair the open in the (Z912) Ground circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
4. **CHECK THE (D404) LIN BUS CIRCUIT FOR AN OPEN**
   1. Turn the ignition on.
   2. Measure the voltage between ground and the (D404) LIN Bus circuit at the Humidity Sensor harness connector.

      Is the voltage above 5.0 volts?

      Yes

      - Replace the Humidity Sensor in accordance with the Service Information.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Repair the open in the (D404) BCM LIN Bus circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U1193-87-LOST COMMUNICATION WITH DRIVER SIDE BLIND SPOT SENSOR - MISSING MESSAGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The primary communication network between electronic control modules is the Controller Area Network (CAN) data bus system. The Controller Area Network (CAN) data bus allows all electronic modules connected to the bus to share information with each other. Regardless of whether a message originates from a module on the higher speed CAN C (500K) Bus or on the lower speed bus, CAN Interior High Speed (IHS) (125K) Bus, the message structure and layout is similar, which allows the Body Control Module (BCM) to process and transfer messages between the CAN buses. The BCM stores Diagnostic Trouble Codes (DTCs) for certain bus network faults on the CAN C (500K) Bus and CAN IHS (125K) Bus.

All modules transmit and receive messages over one of these buses. Data exchange between the modules is achieved by serial transmission of encoded data messages (a form of transmission in which data bits are sent sequentially, one at a time, over a single line). Each module can both send and receive serial data simultaneously. Each data bit of a CAN Bus message is carried over the bus as a voltage differential between the two bus circuits which, when strung together, form a message. Each module uses arbitration to sort the message priority if two competing messages are attempting to be broadcast at the same time. Corruption of a single bit within a message will corrupt the entire message. Each message contains a Cyclic Redundancy Check (CRC) which specifies the message size exactly. If the message detected conflicts with the CRC the ECU receiving it will determine the message to be an error and consider that communication has not been possible. Diagnosis of this condition using a lab scope may reveal activity that appears to be Bus data messages even if no actual communication is possible. Communication problems that affect the whole bus, as a result of opens and terminal push outs are more likely to occur on data busses that operate at a high speed than a data bus that operates at a lower speed.

When an open circuit or terminal push out occurs one or more modules can become isolated from the remainder of the bus. The isolated module will attempt to communicate, but will not be able to receive messages or determine arbitration from other modules. Each time the isolated module attempts to communicate it alters the bus voltage on the intact bus circuit. Without functioning arbitration the isolated module alters the bus voltage while other bus messages are being sent thereby corrupting the messages on the remainder of the bus.

The CAN bus modules are connected in parallel to the two-wire bus using a twisted pair, where the wires are wrapped around each other to provide shielding from unwanted electromagnetic induction, thus preventing interference with the relatively low voltage signals being carried through them. While the CAN bus is operating (active), one of the bus wires will carry a higher voltage and is referred to as the CAN High or CAN bus (+) wire, while the other bus wire will carry a lower voltage and is referred to as the CAN Low or CAN bus (-) wire.

For additional information on the communication network and star connector locations, refer to **COMMUNICATION, DESCRIPTION** .

WHEN MONITORED

With the ignition on for at least five seconds.

Battery voltage between 10 and 16 volts.

Body Control Module (BCM) is configured correctly.

SET CONDITION

Bus messages not received from the Left Blind Spot Sensor (LBSS) for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN IHS BUS (+) CIRCUIT SHORTED TO VOLTAGE
CAN IHS BUS (-) CIRCUIT SHORTED TO GROUND
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
BCM NOT CONFIGURED CORRECTLY
LBSS POWER AND GROUND
LEFT BLIND SPOT SENSOR (LBSS)
MODULE THAT SET THE DTC

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**

   NOTE: Make sure the battery voltage is between 10 and 16 volts before proceeding.

   1. With the scan tool, read active DTCs.

      Is this DTC active?

      Yes

      - Go To 2

      No

      - Refer to **DIAGNOSIS AND TESTING** and perform the STORED LOST COMMUNICATION DTC diagnostic procedure.

2. **CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS**
   1. With the scan tool, read active DTCs from all modules.

      NOTE: Check for BCM configuration, CAN Interior Bus hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

      Does the scan tool display any active DTCs to the conditions listed above?

      Yes

      - Perform the appropriate diagnostic procedure for any of the above DTCs. Refer to the **DTC INDEX** .

No

- Go To 3

3. **VERIFY THE LBSS IS ACTIVE ON THE BUS**
   1. Turn the ignition on.
   2. With the scan tool, verify the LBSS is active on the bus.

   Is the LBSS active on the bus?

   Yes

   - Go To 4

   No

   - Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM LBSS diagnostic procedure.

4. **CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS**
   1. With the scan tool, read all the DTCs.

   Is there more than one module with active DTCs "Logged Against" the LBSS?

   Yes

   - Replace/update the Left Blind Spot Sensor (LBSS) in accordance with the Service Information. Refer to **SENSOR, BLIND SPOT, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 5

5. **CLEAR DTC IN MODULE SETTING FAULT**
   1. With the scan tool, select the module setting the DTC against the LBSS.
   2. Clear active DTCs.

   Is this DTC still active?

   Yes

   - Replace/update the module that set this DTC in accordance with the Service Information.
   - Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 6

6. **CYCLE IGNITION**
   1. Cycle the ignition from RUN to OFF three times ending with the key in the RUN position.

      Does this DTC become active?

      Yes

      - Go To 7

      No

      - The condition is not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
      - Perform the appropriate verification test for the module. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
7. **CHECK FOR ADDITIONAL LOST COMMUNICATION FAULTS**
   1. With the scan tool, view the modules.

      Does the BCM and other CAN IHS BUS modules show Lost Communication with the remaining CAN IHS BUS modules?

      Yes

      - Go To 8

      No

      - Replace/update the module that set this DTC in accordance with the Service Information.
      - Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
8. **CHECK THE CAN IHS BUS (+) CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 39: Checking CAN IHS BUS (125K) (+) Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Measure the voltage between the (D157) CAN IHS Bus (+) circuit and ground.

   Is the voltage above 5.0 volts?

   Yes

   - Repair the short to voltage in the CAN IHS Bus (+) circuit. The short to voltage is present in one of the CAN IHS Bus (+) circuits. Use the Star Connectors to isolate portions of the CAN IHS Bus (125K) (+) in order to locate the concern.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 9

9. **CHECK THE CAN IHS BUS (-) CIRCUIT FOR A SHORT TO GROUND**

Fig. 40: Checking CAN IHS BUS (125K) (-) Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between ground and the (D158) CAN IHS Bus (-) circuit.

   Is the resistance below 10k Ohms?

   Yes

   - Repair the short to ground in the CAN IHS Bus (-) circuit. The short to ground is present in one of the CAN IHS Bus (-) circuits. Use the Star Connectors to isolate portions of the CAN IHS Bus (125K) (-) in order to locate the concern.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

- Replace/update the module that set this DTC in accordance with the Service Information.
- Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U1194-87-LOST COMMUNICATION WITH PASSENGER SIDE BLIND SPOT SENSOR - MISSING MESSAGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The primary communication network between electronic control modules is the Controller Area Network (CAN) data bus system. The Controller Area Network (CAN) data bus allows all electronic modules connected to the bus to share information with each other. Regardless of whether a message originates from a module on the higher speed CAN C (500K) Bus or on the lower speed bus, CAN Interior High Speed (IHS) (125K) Bus, the message structure and layout is similar, which allows the Body Control Module (BCM) to process and transfer messages between the CAN buses. The BCM stores Diagnostic Trouble Codes (DTCs) for certain bus network faults on the CAN C (500K) Bus and CAN IHS (125K) Bus.

All modules transmit and receive messages over one of these buses. Data exchange between the modules is achieved by serial transmission of encoded data messages (a form of transmission in which data bits are sent sequentially, one at a time, over a single line). Each module can both send and receive serial data simultaneously. Each data bit of a CAN Bus message is carried over the bus as a voltage differential between the two bus circuits which, when strung together, form a message. Each module uses arbitration to sort the message priority if two competing messages are attempting to be broadcast at the same time. Corruption of a single bit within a message will corrupt the entire message. Each message contains a Cyclic Redundancy Check (CRC) which specifies the message size exactly. If the message detected conflicts with the CRC the ECU receiving it will determine the message to be an error and consider that communication has not been possible. Diagnosis of this condition using a lab scope may reveal activity that appears to be Bus data messages even if no actual communication is possible. Communication problems that affect the whole bus, as a result of opens and terminal push outs are more likely to occur on data busses that operate at a high speed than a data bus that operates at a lower speed.

When an open circuit or terminal push out occurs one or more modules can become isolated from the remainder of the bus. The isolated module will attempt to communicate, but will not be able to receive messages or determine arbitration from other modules. Each time the isolated module attempts to communicate it alters the bus voltage on the intact bus circuit. Without functioning arbitration the isolated module alters the bus voltage while other bus messages are being sent thereby corrupting the messages on the remainder of the bus.

The CAN bus modules are connected in parallel to the two-wire bus using a twisted pair, where the wires are wrapped around each other to provide shielding from unwanted electromagnetic induction, thus preventing interference with the relatively low voltage signals being carried through them. While the CAN bus is operating (active), one of the bus wires will carry a higher voltage and is referred to as the CAN High or CAN bus (+) wire, while the other bus wire will carry a lower voltage and is referred to as the CAN Low or CAN bus (-) wire.

For additional information on the communication network and star connector locations, refer to **COMMUNICATION, DESCRIPTION** .

WHEN MONITORED

With the ignition on for at least five seconds.

Battery voltage between 10 and 16 volts.

Body Control Module (BCM) is configured correctly.

SET CONDITION

Bus messages not received from the Right Blind Spot Sensor (RBSS) for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN IHS BUS (+) CIRCUIT SHORTED TO VOLTAGE
CAN IHS BUS (-) CIRCUIT SHORTED TO GROUND
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
BCM NOT CONFIGURED CORRECTLY
RBSS POWER AND GROUND
RIGHT BLIND SPOT SENSOR (LBSS)
MODULE THAT SET THE DTC

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**

   NOTE: Make sure the battery voltage is between 10 and 16 volts before proceeding.

   1. With the scan tool, read active DTCs.

      Is this DTC active?

      Yes

      - Go To 2

      No

      - Refer to **DIAGNOSIS AND TESTING** and perform the STORED LOST COMMUNICATION DTC diagnostic procedure.

2. **CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS**
   1. With the scan tool, read active DTCs from all modules.

      NOTE: Check for BCM configuration, CAN Interior Bus hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

      Does the scan tool display any active DTCs to the conditions listed above?

      Yes

      - Perform the appropriate diagnostic procedure for any of the above DTCs. Refer to the **DTC INDEX** .

      No

      - Go To 3
3. **VERIFY THE RBSS IS ACTIVE ON THE BUS**
   1. Turn the ignition on.
   2. With the scan tool, verify the RBSS is active on the bus.

      Is the RBSS active on the bus?

      Yes

      - Go To 4

      No

      - Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM RBSS diagnostic procedure.
4. **CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS**
   1. With the scan tool, read all the DTCs.

      Is there more than one module with active DTCs "Logged Against" the RBSS?

      Yes

      - Replace/update the Right Blind Spot Sensor (RBSS) in accordance with the Service Information. Refer to **SENSOR, BLIND SPOT, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 5

5. **CLEAR DTC IN MODULE SETTING FAULT**
   1. With the scan tool, select the module setting the DTC against the RBSS.
   2. Clear active DTCs.

      Is this DTC still active?

      Yes

      - Replace/update the module that set this DTC in accordance with the Service Information.
      - Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 6
6. **CYCLE IGNITION**
   1. Cycle the ignition from RUN to OFF three times ending with the key in the RUN position.

      Does this DTC become active?

      Yes

      - Go To 7

      No

      - The condition is not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
      - Perform the appropriate verification test for the module. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
7. **CHECK FOR ADDITIONAL LOST COMMUNICATION FAULTS**
   1. With the scan tool, view the modules.

      Does the BCM and other CAN IHS BUS modules show Lost Communication with the remaining CAN IHS BUS modules?

      Yes

      - Go To 8

      No

- Replace/update the module that set this DTC in accordance with the Service Information.
- Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

8. **CHECK THE CAN IHS BUS (+) CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 41: Checking CAN IHS BUS (125K) (+) Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Measure the voltage between the (D157) CAN IHS Bus (+) circuit and ground.

   Is the voltage above 5.0 volts?

   Yes

   - Repair the short to voltage in the CAN IHS Bus (+) circuit. The short to voltage is present in one of the CAN IHS Bus (+) circuits. Use the Star Connectors to isolate portions of the CAN IHS Bus (125K) (+) in order to locate the concern.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 9

9. **CHECK THE CAN IHS BUS (-) CIRCUIT FOR A SHORT TO GROUND**

Fig. 42: Checking CAN IHS BUS (125K) (-) Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between ground and the (D158) CAN IHS Bus (-) circuit.

   Is the resistance below 10k Ohms?

   Yes

- Repair the short to ground in the CAN IHS Bus (-) circuit. The short to ground is present in one of the CAN IHS Bus (-) circuits. Use the Star Connectors to isolate portions of the CAN IHS Bus (125K) (-) in order to locate the concern.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace/update the module that set this DTC in accordance with the Service Information.
- Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U11B8-87-LOST COMMUNICATION WITH INTEGRATED CENTER STACK (ICS) - MISSING MESSAGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The primary communication network between electronic control modules is the Controller Area Network (CAN) data bus system. The Controller Area Network (CAN) data bus allows all electronic modules connected to the bus to share information with each other. Regardless of whether a message originates from a module on the higher speed CAN C (500K) Bus or on the lower speed bus, CAN Interior High Speed (IHS) (125K) Bus, the message structure and layout is similar, which allows the Body Control Module (BCM) to process and transfer messages between the CAN buses. The BCM stores Diagnostic Trouble Codes (DTCs) for certain bus network faults on the CAN C (500K) Bus and CAN IHS (125K) Bus.

All modules transmit and receive messages over one of these buses. Data exchange between the modules is achieved by serial transmission of encoded data messages (a form of transmission in which data bits are sent sequentially, one at a time, over a single line). Each module can both send and receive serial data simultaneously. Each data bit of a CAN Bus message is carried over the bus as a voltage differential between the two bus circuits which, when strung together, form a message. Each module uses arbitration to sort the message priority if two competing messages are attempting to be broadcast at the same time. Corruption of a single bit within a message will corrupt the entire message. Each message contains a Cyclic Redundancy Check (CRC) which specifies the message size exactly. If the message detected conflicts with the CRC the ECU receiving it will determine the message to be an error and consider that communication has not been possible. Diagnosis of this condition using a lab scope may reveal activity that appears to be Bus data messages even if no actual communication is possible. Communication problems that affect the whole bus, as a result of opens and terminal push outs are more likely to occur on data busses that operate at a high speed than a data bus that operates at a lower speed.

When an open circuit or terminal push out occurs one or more modules can become isolated from the remainder of the bus. The isolated module will attempt to communicate, but will not be able to receive messages or determine arbitration from other modules. Each time the isolated module attempts to communicate it alters the bus voltage on the intact bus circuit. Without functioning arbitration the isolated module alters the bus voltage while other bus messages are being sent thereby corrupting the messages on the remainder of the bus.

The CAN bus modules are connected in parallel to the two-wire bus using a twisted pair, where the wires are wrapped around each other to provide shielding from unwanted electromagnetic induction, thus preventing interference with the relatively low voltage signals being carried through them. While the CAN bus is operating (active), one of the bus wires will carry a higher voltage and is referred to as the CAN High or CAN bus (+) wire, while the other bus wire will carry a lower voltage and is referred to as the CAN Low or CAN bus (-) wire.

For additional information on the communication network and star connector locations, refer to **COMMUNICATION, DESCRIPTION** .

WHEN MONITORED

With the ignition on for at least five seconds.

Battery voltage between 10 and 16 volts.

Body Control Module (BCM) is configured correctly.

SET CONDITION

Bus messages not received from the Integrated Center Stack (ICS) for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN IHS BUS (125K) (+) CIRCUIT SHORTED TO VOLTAGE
CAN IHS BUS (125K) (-) CIRCUIT SHORTED TO GROUND
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
BCM NOT CONFIGURED CORRECTLY
ICS POWER AND GROUND
INTEGRATED CENTER STACK (ICS)
MODULE THAT SET THE DTC

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**

NOTE: Make sure the battery voltage is between 10 and 16 volts before proceeding.

1. With the scan tool, read active DTCs.

   Is this DTC active?

   Yes

- Go To 2

No

- Refer to **DIAGNOSIS AND TESTING** and perform the STORED LOST COMMUNICATION DTC diagnostic procedure.

2. **CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS**
   1. With the scan tool, read active DTCs from all modules.

      NOTE: Check for BCM configuration, CAN Interior Bus hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

      Does the scan tool display any active DTCs to the conditions listed above?

      Yes

      - Go to the **DTC INDEX** and perform the appropriate diagnostic procedure.

      No

      - Go To 3

3. **VERIFY THE ICS IS ACTIVE ON THE BUS**
   1. Turn the ignition on.
   2. With the scan tool, verify the ICS is active on the bus.

      Is the ICS active on the bus?

      Yes

      - Go To 4

      No

      - Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM ICS diagnostic procedure.

4. **CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS**
   1. With the scan tool, read all the DTCs.

      Is there more than one module with active DTCs "Logged Against" the ICS ?

      Yes

      - Replace/update the Integrated Center Stack (ICS) in accordance with the Service Information.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 5

5. **CLEAR DTC IN MODULE SETTING FAULT**
   1. With the scan tool, select the module setting the DTC against the ICS.
   2. Clear active DTCs.

   Is this DTC still active?

   Yes

   - Replace/update the module that set this DTC in accordance with the Service Information.
   - Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 6

6. **CYCLE IGNITION**
   1. Cycle the ignition from RUN to OFF three times ending with the key in the RUN position.

   Does this DTC become active?

   Yes

   - Go To 7

   No

   - The condition is not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   - Perform the appropriate verification test for the module. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

7. **CHECK FOR ADDITIONAL LOST COMMUNICATION FAULTS**
   1. With the scan tool, view the modules.

   Does the BCM and other CAN IHS BUS modules show Lost Communication with the remaining CAN IHS BUS modules?

Yes

- Go To 8

No

- Replace/update the module that set this DTC in accordance with the Service Information.
- Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

8. **CHECK THE CAN IHS BUS (125K) (+) CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 43: Checking CAN IHS BUS (125K) (+) Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Measure the voltage between the (D157) CAN IHS Bus (125K) (+) circuit and ground.

   Is the voltage above 5.0 volts?

Yes

- Repair the short to voltage in the CAN IHS Bus (125K) (+) circuit. The short to voltage is present in one of the CAN IHS Bus (125K) (+) circuits. Use the Star Connectors to isolate portions of the CAN IHS Bus (125K) (+) in order to locate the concern.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 9

9. **CHECK THE CAN IHS BUS (125K) (-) CIRCUIT FOR A SHORT TO GROUND**

Fig. 44: Checking CAN IHS BUS (125K) (-) Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.

2. Measure the resistance between ground and the (D158) CAN IHS Bus (125K) (-) circuit.

   Is the resistance below 10k Ohms?

   Yes

   - Repair the short to ground in the CAN IHS Bus (125K) (-) circuit. The short to ground is present in one of the CAN IHS Bus (125K) (-) circuits. Use the Star Connectors to isolate portions of the CAN IHS Bus (125K) (-) in order to locate the concern.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace/update the module that set this DTC in accordance with the Service Information.
   - Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U11B9-87-LOST COMMUNICATION WITH RF HUB - MISSING MESSAGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The primary communication network between electronic control modules is the Controller Area Network (CAN) data bus system. The Controller Area Network (CAN) data bus allows all electronic modules connected to the bus to share information with each other. Regardless of whether a message originates from a module on the higher speed CAN C (500K) Bus or on the lower speed bus, CAN Interior High Speed (IHS) (125K) Bus, the message structure and layout is similar, which allows the Body Control Module (BCM) to process and transfer messages between the CAN buses. The BCM stores Diagnostic Trouble Codes (DTCs) for certain bus network faults on the CAN C (500K) Bus and CAN IHS (125K) Bus.

All modules transmit and receive messages over one of these buses. Data exchange between the modules is achieved by serial transmission of encoded data messages (a form of transmission in which data bits are sent sequentially, one at a time, over a single line). Each module can both send and receive serial data simultaneously. Each data bit of a CAN Bus message is carried over the bus as a voltage differential between the two bus circuits which, when strung together, form a message. Each module uses arbitration to sort the message priority if two competing messages are attempting to be broadcast at the same time. Corruption of a single bit within a message will corrupt the entire message. Each message contains a Cyclic Redundancy Check (CRC) which specifies the message size exactly. If the message detected conflicts with the CRC the ECU receiving it will determine the message to be an error and consider that communication has not been possible. Diagnosis of this condition using a lab scope may reveal activity that appears to be Bus data messages even if no actual communication is possible. Communication problems that affect the whole bus, as a result of opens and terminal push outs are more likely to occur on data busses that operate at a high speed than a data bus that operates at a lower speed.

When an open circuit or terminal push out occurs one or more modules can become isolated from the remainder of the bus. The isolated module will attempt to communicate, but will not be able to receive messages or determine arbitration from other modules. Each time the isolated module attempts to communicate it alters the bus voltage on the intact bus circuit. Without functioning arbitration the isolated module alters the bus voltage while other bus messages are being sent thereby corrupting the messages on the remainder of the bus.

The CAN bus modules are connected in parallel to the two-wire bus using a twisted pair, where the wires are wrapped around each other to provide shielding from unwanted electromagnetic induction, thus preventing interference with the relatively low voltage signals being carried through them. While the CAN bus is operating (active), one of the bus wires will carry a higher voltage and is referred to as the CAN High or CAN bus (+) wire, while the other bus wire will carry a lower voltage and is referred to as the CAN Low or CAN bus (-) wire.

For additional information on the communication network and star connector locations, refer to **COMMUNICATION, DESCRIPTION** .

WHEN MONITORED

With the ignition on for at least five seconds.

Battery voltage between 10 and 16 volts.

Body Control Module (BCM) is configured correctly.

SET CONDITION

Bus messages not received from the Radio Frequency (RF) Hub Module for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN C BUS (+) CIRCUIT SHORTED TO VOLTAGE
CAN C BUS (-) CIRCUIT SHORTED TO GROUND
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
BCM NOT CONFIGURED CORRECTLY
RFH MODULE POWER AND GROUND
RADIO FREQUENCY HUB (RFH) MODULE
MODULE THAT SET THE DTC

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**

NOTE: **Make sure the battery voltage is between 10 and 16 volts before proceeding.**

1. With the scan tool, read active DTCs.

   Is this DTC active?

   Yes

   - Go To 2

   No

   - Refer to **DIAGNOSIS AND TESTING** and perform the STORED LOST COMMUNICATION DTCS diagnostic procedure.

2. **CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS**
   1. With the scan tool, read all active DTCs from all modules.

      NOTE: Check for BCM configuration, CAN C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

      Does the scan tool display any active DTCs to the conditions listed above?

      Yes

      - Go to the **DTC INDEX** and perform the appropriate diagnostic procedure.

      No

      - Go To 3

3. **VERIFY THE RFH IS ACTIVE ON THE BUS**
   1. Turn the ignition on.
   2. With the scan tool, verify the RFH is active on the bus.

      Is the RFH active on the bus?

      Yes

      - Go To 4

      No

      - Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM RF HUB diagnostic procedure.

4. **CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS**
   1. With the scan tool, read all the DTCs.

Is there more than one module with active DTCs "Logged Against" the RFH?

Yes

- Replace/update the RF Hub Module in accordance with the Service Information. Refer to **MODULE, RADIO FREQUENCY (RF HUB), REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 5

5. **CLEAR DTC IN MODULE SETTING FAULT**
   1. With the scan tool, select the module setting the DTC against the RFH.
   2. Clear active DTCs.

   Is this DTC still active?

   Yes

   - Replace/update the module that set this DTC in accordance with the Service Information.
   - Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 6

6. **CYCLE IGNITION**
   1. Cycle the ignition from RUN to OFF three times ending with the key in the RUN position.

   Does this DTC become active?

   Yes

   - Go To 7

   No

   - The condition is not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   - Perform the appropriate verification test for the module. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

7. **CHECK FOR ADDITIONAL LOST COMMUNICATION FAULTS**
   1. With the scan tool, view the modules.

      Does the BCM and other CAN C BUS modules show Lost Communication with the remaining CAN C BUS modules?

      Yes

      - Go To 8

      No

      - Replace/update the module that set this DTC in accordance with the Service Information.
      - Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
8. **CHECK THE CAN C BUS (+) CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 45: Checking CAN C BUS (+) Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

   1. Measure the voltage between the (D57) CAN C Bus (+) circuit and ground.

Is the voltage above 5.0 volts?

Yes

- Repair the short to voltage in the CAN C Bus (+) circuit. The short to voltage is present in one of the CAN C Bus circuits. Use the Star Connectors to isolate portions of the CAN C Bus in order to locate the concern.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 9

9. **CHECK THE CAN C BUS (-) CIRCUIT FOR A SHORT TO GROUND**

Fig. 46: Checking CAN C BUS (-) Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between ground and the (D58) CAN C Bus (-) circuit.

   Is the resistance below 10k Ohms?

   Yes

   - Repair the short to ground in the CAN C Bus (-) circuit. The short to ground is present in one of the CAN C Bus circuits. Use the Star Connectors to isolate portions of the CAN C Bus in order to locate the concern.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace/update the module that set this DTC in accordance with the Service Information.
   - Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U11F5-87-LOST COMMUNICATION WITH EXTERNAL DISC MODULE - MISSING MESSAGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The primary communication network between electronic control modules is the Controller Area Network (CAN) data bus system. The Controller Area Network (CAN) data bus allows all electronic modules connected to the bus to share information with each other. Regardless of whether a message originates from a module on the higher speed CAN C (500K) Bus or on the lower speed bus, CAN Interior High Speed (IHS) (125K) Bus, the message structure and layout is similar, which allows the Body Control Module (BCM) to process and transfer messages between the CAN buses. The BCM stores Diagnostic Trouble Codes (DTCs) for certain bus network faults on the CAN C (500K) Bus and CAN IHS (125K) Bus.

All modules transmit and receive messages over one of these buses. Data exchange between the modules is achieved by serial transmission of encoded data messages (a form of transmission in which data bits are sent sequentially, one at a time, over a single line). Each module can both send and receive serial data simultaneously. Each data bit of a CAN Bus message is carried over the bus as a voltage differential between the two bus circuits which, when strung together, form a message. Each module uses arbitration to sort the message priority if two competing messages are attempting to be broadcast at the same time. Corruption of a single bit within a message will corrupt the entire message. Each message contains a Cyclic Redundancy Check (CRC) which specifies the message size exactly. If the message detected conflicts with the CRC the ECU receiving it will determine the message to be an error and consider that communication has not been possible. Diagnosis of this condition using a lab scope may reveal activity that appears to be Bus data messages even if no actual communication is possible. Communication problems that affect the whole bus, as a result of opens and terminal push outs are more likely to occur on data busses that operate at a high speed than a data bus that operates at a lower speed.

When an open circuit or terminal push out occurs one or more modules can become isolated from the remainder of the bus. The isolated module will attempt to communicate, but will not be able to receive messages or determine arbitration from other modules. Each time the isolated module attempts to communicate it alters the bus voltage on the intact bus circuit. Without functioning arbitration the isolated module alters the bus voltage while other bus messages are being sent thereby corrupting the messages on the remainder of the bus.

The CAN bus modules are connected in parallel to the two-wire bus using a twisted pair, where the wires are wrapped around each other to provide shielding from unwanted electromagnetic induction, thus preventing interference with the relatively low voltage signals being carried through them. While the CAN bus is operating (active), one of the bus wires will carry a higher voltage and is referred to as the CAN High or CAN bus (+) wire, while the other bus wire will carry a lower voltage and is referred to as the CAN Low or CAN bus (-) wire.

For additional information on the communication network and star connector locations, refer to **COMMUNICATION, DESCRIPTION** .

WHEN MONITORED

With the ignition on for at least five seconds.

Battery voltage between 10 and 16 volts.

Body Control Module (BCM) is configured correctly.

SET CONDITION

Bus messages not received from the External Disc Module (EDM) for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN IHS BUS (125K) (+) CIRCUIT SHORTED TO VOLTAGE
CAN IHS BUS (125K) (-) CIRCUIT SHORTED TO GROUND
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
BCM NOT CONFIGURED CORRECTLY
EDM POWER AND GROUND
EXTERNAL DISC MODULE (EDM)
MODULE THAT SET THE DTC

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**

NOTE: **Make sure the battery voltage is between 10 and 16 volts before proceeding.**

1. With the scan tool, read active DTCs.

   Is this DTC active?

   Yes

   - Go To 2

   No

   - Refer to **DIAGNOSIS AND TESTING** and perform the STORED LOST COMMUNICATION DTC diagnostic procedure.

2. **CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS**
   1. With the scan tool, read active DTCs from all modules.

      NOTE: Check for BCM configuration, CAN Interior Bus hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

      Does the scan tool display any active DTCs to the conditions listed above?

      Yes

      - Go to the **DTC INDEX** and perform the appropriate diagnostic procedure.

      No

      - Go To 3

3. **VERIFY THE EDM IS ACTIVE ON THE BUS**
   1. Turn the ignition on.
   2. With the scan tool, verify the EDM is active on the bus.

      Is the EDM active on the bus?

      Yes

      - Go To 4

      No

      - Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM EDM diagnostic procedure.

4. **CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS**
   1. With the scan tool, read all the DTCs.

Is there more than one module with active DTCs "Logged Against" the EDM?

Yes

- Replace/update the External Disc Module (EDM) in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 5

5. **CLEAR DTC IN MODULE SETTING FAULT**
   1. With the scan tool, select the module setting the DTC against the EDM.
   2. Clear active DTCs.

   Is this DTC still active?

   Yes

   - Replace/update the module that set this DTC in accordance with the Service Information.
   - Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 6

6. **CYCLE IGNITION**
   1. Cycle the ignition from RUN to OFF three times ending with the key in the RUN position.

   Does this DTC become active?

   Yes

   - Go To 7

   No

   - The condition is not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   - Perform the appropriate verification test for the module. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

7. **CHECK FOR ADDITIONAL LOST COMMUNICATION FAULTS**
   1. With the scan tool, view the modules.

      Does the BCM and other CAN IHS BUS modules show Lost Communication with the remaining CAN IHS BUS modules?

      Yes

      - Go To 8

      No

      - Replace/update the module that set this DTC in accordance with the Service Information.
      - Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
8. **CHECK THE CAN IHS BUS (125K) (+) CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 47: Checking CAN IHS BUS (125K) (+) Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Measure the voltage between the (D157) CAN IHS Bus (125K) (+) circuit and ground.

   Is the voltage above 5.0 volts?

   Yes

   - Repair the short to voltage in the CAN IHS Bus (125K) (+) circuit. The short to voltage is present in one of the CAN IHS Bus (125K) (+) circuits. Use the Star Connectors to isolate portions of the CAN IHS Bus (125K) (+) in order to locate the concern.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 9

9. **CHECK THE CAN IHS BUS (125K) (-) CIRCUIT FOR A SHORT TO GROUND**

Fig. 48: Checking CAN IHS BUS (125K) (-) Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between ground and the (D158) CAN IHS Bus (125K) (-) circuit.

   Is the resistance below 10k Ohms?

   Yes

   - Repair the short to ground in the CAN IHS Bus (125K) (-) circuit. The short to ground is present in one of the CAN IHS Bus (125K) (-) circuits. Use the Star Connectors to isolate portions of the CAN IHS Bus (125K) (-) in order to locate the concern.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

- Replace/update the module that set this DTC in accordance with the Service Information.
- Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U1207-87-LOST COMMUNICATION WITH TERRAIN SWITCH BANK MODULE - MISSING MESSAGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 49: Terrain Switch Bank Module Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the ignition on.

SET CONDITION

The Body Control Module (BCM) does not receive information from the Terrain Switch Bank Module (TSBM) for greater than 3 seconds.

POSSIBLE CAUSES

Possible Causes
(A195) FUSED B(+) CIRCUIT OPEN OR SHORTED TO GROUND
(Z912) GROUND CIRCUIT OPEN
(D404) LIN BUS CIRCUIT OPEN
TERRAIN SWITCH BANK MODULE (TSBM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE (A195) FUSED B(+) CIRCUIT FOR AN OPEN**
    1. Turn the ignition off.
    2. Disconnect the Terrain Switch Bank Module (TSBM) harness connector.
    3. Turn the ignition on.
    4. Using a 12-volt test light connected to ground, check the (A195) Fused B(+) circuit at the TSBM harness connector.

Does the test light illuminate brightly?

Yes

- Go To 3

No

- Repair the open or short to ground in the (A195) Fused B(+) circuit.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (Z912) GROUND CIRCUIT FOR AN OPEN**
   1. Turn the ignition off.
   2. Using a 12-volt test light connected to 12-volts, check the (Z912) Ground circuit at the TSBM harness connector.

   Does the test light illuminate brightly?

   Yes

   - Go To 4

   No

   - Repair the open in the (Z912) Ground circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK THE (D404) LIN BUS CIRCUIT FOR AN OPEN**
   1. Turn the ignition on.
   2. Measure the voltage between ground and the (D404) LIN Bus circuit at the TSBM harness connector.

   Is the voltage above 5.0 volts?

   Yes

   - Replace the Terrain Switch Bank Module (TSBM) in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Repair the open in the (D404) BCM LIN Bus circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U1212-87-LOST COMMUNICATION WITH LIN ULTRASONIC AND ANTI-TILT MODULE-

MISSING MESSAGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 50: Intrusion Module, Siren & Hood Switch Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the ignition on.

SET CONDITION

The Body Control Module (BCM) does not receive information from the Ultrasonic Alarm Module (UAM).

POSSIBLE CAUSES

Possible Causes
(A939) FUSED B(+) CIRCUIT OPEN
(Z924) GROUND CIRCUIT OPEN
LIN BUS CIRCUIT OPEN
ULTRASONIC ALARM MODULE (UAM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE (A939) FUSED B(+) CIRCUIT FOR AN OPEN**
    1. Turn the ignition off.
    2. Disconnect the Ultrasonic Alarm Module (UAM) harness connector.
    3. Turn the ignition on.
    4. Using a 12-volt test light connected to ground, check the (A939) Fused B(+) circuit at the Ultrasonic Alarm Module (UAM) harness connector.

    Does the test light illuminate brightly?

    Yes

    - Go To 3

    No

- Repair the open or short to ground in the (A939) Fused B(+) circuit.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (Z924) GROUND CIRCUIT FOR AN OPEN**
   1. Turn the ignition off.
   2. Using a 12-volt test light connected to 12-volts, check the (Z924) Ground circuit at the Ultrasonic Alarm Module (UAM) harness connector.

      Does the test light illuminate brightly?

      Yes

      - Go To 4

      No

      - Repair the open in the (Z924) Ground circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
4. **CHECK THE (D401) LIN BUS CIRCUIT FOR AN OPEN**
   1. Turn the ignition on.
   2. Measure the voltage between ground and the (D401) LIN Bus circuit at the Ultrasonic Alarm Module (UAM) harness connector.

      Is the voltage above 5.0 volts?

      Yes

      - Replace the Ultrasonic Alarm Module (UAM) in accordance with the Service Information. Refer to **MODULE, ULTRASONIC AND ANTI-TILT, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Repair the open in the (D401) LIN Bus circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U1215-87-LOST COMMUNICATION WITH FORWARD FACING CAMERA - MISSING MESSAGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The primary communication network between electronic control modules is the Controller Area Network (CAN) data bus system. The Controller Area Network (CAN) data bus allows all electronic modules connected to the bus to share information with each other. Regardless of whether a message originates from a module on

the higher speed CAN C (500K) Bus or on the lower speed bus, CAN Interior High Speed (IHS) (125K) Bus, the message structure and layout is similar, which allows the Body Control Module (BCM) to process and transfer messages between the CAN buses. The BCM stores Diagnostic Trouble Codes (DTCs) for certain bus network faults on the CAN C (500K) Bus and CAN IHS (125K) Bus.

All modules transmit and receive messages over one of these buses. Data exchange between the modules is achieved by serial transmission of encoded data messages (a form of transmission in which data bits are sent sequentially, one at a time, over a single line). Each module can both send and receive serial data simultaneously. Each data bit of a CAN Bus message is carried over the bus as a voltage differential between the two bus circuits which, when strung together, form a message. Each module uses arbitration to sort the message priority if two competing messages are attempting to be broadcast at the same time. Corruption of a single bit within a message will corrupt the entire message. Each message contains a Cyclic Redundancy Check (CRC) which specifies the message size exactly. If the message detected conflicts with the CRC the ECU receiving it will determine the message to be an error and consider that communication has not been possible. Diagnosis of this condition using a lab scope may reveal activity that appears to be Bus data messages even if no actual communication is possible. Communication problems that affect the whole bus, as a result of opens and terminal push outs are more likely to occur on data busses that operate at a high speed than a data bus that operates at a lower speed.

When an open circuit or terminal push out occurs one or more modules can become isolated from the remainder of the bus. The isolated module will attempt to communicate, but will not be able to receive messages or determine arbitration from other modules. Each time the isolated module attempts to communicate it alters the bus voltage on the intact bus circuit. Without functioning arbitration the isolated module alters the bus voltage while other bus messages are being sent thereby corrupting the messages on the remainder of the bus.

The CAN bus modules are connected in parallel to the two-wire bus using a twisted pair, where the wires are wrapped around each other to provide shielding from unwanted electromagnetic induction, thus preventing interference with the relatively low voltage signals being carried through them. While the CAN bus is operating (active), one of the bus wires will carry a higher voltage and is referred to as the CAN High or CAN bus (+) wire, while the other bus wire will carry a lower voltage and is referred to as the CAN Low or CAN bus (-) wire.

For additional information on the communication network and star connector locations, refer to **COMMUNICATION, DESCRIPTION** .

WHEN MONITORED

With the ignition on for at least five seconds.

Battery voltage between 10 and 16 volts.

Body Control Module (BCM) is configured correctly.

SET CONDITION

Bus messages not received from the Forward Facing Camera for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN C BUS (+) CIRCUIT SHORTED TO VOLTAGE
CAN C BUS (-) CIRCUIT SHORTED TO GROUND
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
BCM NOT CONFIGURED CORRECTLY
FORWARD FACING CAMERA POWER AND GROUND
FORWARD FACING CAMERA
MODULE THAT SET THE DTC

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**

   NOTE: Make sure the battery voltage is between 10 and 16 volts before proceeding.

   1. With the scan tool, read active DTCs.

      Is this DTC active?

      Yes

      - Go To 2

      No

      - Refer to **DIAGNOSIS AND TESTING** and perform the STORED LOST COMMUNICATION DTCS diagnostic procedure.

2. **CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS**
   1. With the scan tool, read all active DTCs from all modules.

      NOTE: Check for BCM configuration, CAN C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

      Does the scan tool display any active DTCs to the conditions listed above?

      Yes

      - Go to the **DTC INDEX** and perform the appropriate diagnostic procedure.

      No

- Go To 3

3. **VERIFY THE FORWARD FACING CAMERA IS ACTIVE ON THE BUS**
   1. Turn the ignition on.
   2. With the scan tool, verify the Forward Facing Camera is active on the bus.

      Is the Forward Facing Camera active on the bus?

      Yes

      - Go To 4

      No

      - Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM FORWARD FACING CAMERA diagnostic procedure.
4. **CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS**
   1. With the scan tool, read all the DTCs.

      Is there more than one module with active DTCs "Logged Against" the Forward Facing Camera?

      Yes

      - Replace/update the Forward Facing Camera in accordance with the Service Information.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 5
5. **CLEAR DTC IN MODULE SETTING FAULT**
   1. With the scan tool, select the module setting the DTC against the Forward Facing Camera.
   2. Clear active DTCs.

      Is this DTC still active?

      Yes

      - Replace/update the module that set this DTC in accordance with the Service Information.
      - Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

- Go To 6

6. **CYCLE IGNITION**
   1. Cycle the ignition from RUN to OFF three times ending with the key in the RUN position.

      Does this DTC become active?

      Yes

      - Go To 7

      No

      - The condition is not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
      - Perform the appropriate verification test for the module. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
7. **CHECK FOR ADDITIONAL LOST COMMUNICATION FAULTS**
   1. With the scan tool, view the modules.

      Does the BCM and other CAN C BUS modules show Lost Communication with the remaining CAN C BUS modules?

      Yes

      - Go To 8

      No

      - Replace/update the module that set this DTC in accordance with the Service Information.
      - Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
8. **CHECK THE CAN C BUS (+) CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 51: Checking CAN C BUS (+) Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Measure the voltage between the (D57) CAN C Bus (+) circuit and ground.

   Is the voltage above 5.0 volts?

   Yes

   - Repair the short to voltage in the CAN C Bus (+) circuit. The short to voltage is present in one of the CAN C Bus circuits. Use the Star Connectors to isolate portions of the CAN C Bus in order to locate the concern.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 9

9. **CHECK THE CAN C BUS (-) CIRCUIT FOR A SHORT TO GROUND**

Fig. 52: Checking CAN C BUS (-) Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between ground and the (D58) CAN C Bus (-) circuit.

   Is the resistance below 10k Ohms?

   Yes

   - Repair the short to ground in the CAN C Bus (-) circuit. The short to ground is present in one of the CAN C Bus circuits. Use the Star Connectors to isolate portions of the CAN C Bus in order to locate the concern.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

- Replace/update the module that set this DTC in accordance with the Service Information.
- Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U1223-87-LOST COMMUNICATION WITH WIRELESS CHARGING PAD MODULE - MISSING MESSAGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 53: Wireless Charging Pad Module Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the ignition on.

SET CONDITION

The Body Control Module (BCM) does not receive information from the Wireless Charging Pad Module for greater than 3 seconds.

POSSIBLE CAUSES

Possible Causes
(A930) FUSED B(+) CIRCUIT OPEN OR SHORTED TO GROUND
(Z912) GROUND CIRCUIT OPEN
(D403) LIN 3 BUS CIRCUIT OPEN
WIRELESS CHARGING PAD MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE (A930) FUSED B(+) CIRCUIT FOR AN OPEN**
    1. Turn the ignition off.
    2. Disconnect the Wireless Charging Pad Module harness connector.
    3. Turn the ignition on.
    4. Using a 12-volt test light connected to ground, check the (A930) Fused B(+) circuit at the Wireless Charging Pad Module harness connector.

Does the test light illuminate brightly?

Yes

- Go To 3

No

- Repair the open or short to ground in the (A930) Fused B(+) circuit.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (Z912) GROUND CIRCUIT FOR AN OPEN**
   1. Turn the ignition off.
   2. Using a 12-volt test light connected to 12-volts, check the (Z912) Ground circuit at the Wireless Charging Pad Module harness connector.

   Does the test light illuminate brightly?

   Yes

   - Go To 4

   No

   - Repair the open in the (Z912) Ground circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
4. **CHECK THE (D403) LIN 3 BUS CIRCUIT FOR AN OPEN**
   1. Turn the ignition on.
   2. Measure the voltage between ground and the (D403) LIN 3 Bus circuit at the Wireless Charging Pad Module harness connector.

   Is the voltage above 5.0 volts?

   Yes

   - Replace the Wireless Charging Pad Module in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Repair the open in the (D403) LIN 3 Bus circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U1224-87-LOST COMMUNICATION WITH VOLTAGE STABILITY MODULE - MISSING MESSAGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 54: Voltage Stability Module Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the ignition on.

SET CONDITION

The Body Control Module (BCM) does not receive information from the Voltage Stability Module for greater than 3 seconds.

POSSIBLE CAUSES

Possible Causes
(F944) FUSED IGNITION RUN/START CIRCUIT OPEN OR SHORTED TO GROUND
(Z911) GROUND CIRCUIT OPEN
(D403) LIN 3 BUS CIRCUIT OPEN
VOLTAGE STABILITY MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE (F944) FUSED IGNITION RUN/START CIRCUIT FOR AN OPEN**
    1. Turn the ignition off.
    2. Disconnect the Voltage Stability Module harness connector.
    3. Turn the ignition on.
    4. Using a 12-volt test light connected to ground, check the (F944) Fused Ignition Run/Start circuit at the Voltage Stability Module harness connector.

    Does the test light illuminate brightly?

    Yes

    - Go To 3

No

- Repair the open or short to ground in the (A929) Fused B(+) circuit.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (Z911) GROUND CIRCUIT FOR AN OPEN**
   1. Turn the ignition off.
   2. Using a 12-volt test light connected to 12-volts, check the (Z911) Ground circuit at the Voltage Stability Module harness connector.

      Does the test light illuminate brightly?

      Yes

      - Go To 4

      No

      - Repair the open in the (Z911) Ground circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
4. **CHECK THE (D403) LIN 3 BUS CIRCUIT FOR AN OPEN**
   1. Turn the ignition on.
   2. Measure the voltage between ground and the (D403) LIN 3 Bus circuit at the Voltage Stability Module harness connector.

      Is the voltage above 5.0 volts?

      Yes

      - Replace the Voltage Stability Module in accordance with the Service Information.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Repair the open in the (D403) LIN 3 Bus circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U1412-86-IMPLAUSIBLE VEHICLE SPEED SIGNAL RECEIVED-SIGNAL INVALID

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Body Control Module (BCM) receives the vehicle speed signal over the CAN C Bus from the Anti-lock Brake Module.

WHEN MONITORED

With the ignition on, and battery voltage above 10.38 volts.

SET CONDITION

The BCM does not receive a vehicle speed signal from the Anti-Lock Brake Module over the CAN C bus for a duration of 4.8 seconds.

POSSIBLE CAUSES

POSSIBLE CAUSES
CAN C BUS CIRCUIT OPEN OR SHORTED
ANTI-LOCK BRAKE (ABS) MODULE
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**

   NOTE: Diagnose and repair any Lost Communication or CAN C BUS DTCs before continuing with this diagnostic procedure.

   1. Turn the ignition on.
   2. With a scan tool, read DTCs.

      Does the scan tool display this DTC as active?

      Yes

      - Go To 2

      No

      - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK OTHER MODULES FOR LOST VEHICLE SPEED MESSAGE DTCS**
   1. With the scan tool, check if any other modules have a Lost Vehicle Speed Message DTC present.

      Were any Lost Vehicle Speed Message DTCs present in any other modules?

      Yes

- Replace and program the Anti-Lock Brake Module (ABS) in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace and program the Body Control Module (BCM) in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U1433-86-IMPLAUSIBLE IGNITION SWITCH STATUS MESSAGE RECEIVED - SIGNAL INVALID

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 55: Radio Frequency Hub Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Body Control Module (BCM) receives an ignition feed from the Radio Frequency (RF) Hub indicating run/start operation is requested. The BCM provides a voltage output through the run/start relay control circuit, which connects to the coil side of the Run/Start Relay. The Body Control Module (BCM) monitors the ignition switch status message received over the Controller Area Network (CAN) bus.

WHEN MONITORED

With the ignition switch on.

SET CONDITION

The BCM detects that the hardwired ignition switch input voltage from the RF Hub module indicates that the ignition switch is in the off position, but the CAN bus message indicates that the ignition switch is the run position for more than 10 seconds.

POSSIBLE CAUSES

Possible Causes
(F20) IGNITION RUN-START CONTROL OUTPUT CIRCUIT OPEN
(F20) IGNITION RUN-START CONTROL OUTPUT CIRCUIT SHORTED TO GROUND
RADIO FREQUENCY (RF) HUB MODULE
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR ACTIVE DTC**

   NOTE: Check to make sure the battery and charging system are operating properly. Battery and/or charging system problems may cause these DTCs to set.

   NOTE: Diagnose any related Powertrain DTC(s) before continuing.

   1. Turn the ignition on.
   2. With the scan tool, read DTCs.

      Does the scan tool display this DTC as active?

      Yes

      - Go To 2

      No

      - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK THE (F20) IGNITION RUN-START CONTROL OUTPUT CIRCUIT AT THE BCM**

1. Turn the ignition off.
2. Disconnect the BCM C8 harness connector.
3. Turn the ignition on.
4. Measure the voltage between ground and the (F20) Ignition Run-Start Control Output circuit.

   Is the voltage above 10.0 volts?

   Yes

   - Replace the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 3

3. **CHECK THE (F20) IGNITION RUN-START CONTROL OUTPUT CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Disconnect the RF Hub Module C1 harness connector.
   3. Measure the resistance between ground and the (F20) Ignition Run-Start Control Output circuit.

      Is the resistance above 10K Ohms?

      Yes

      - Go To 4

      No

      - Repair the short to ground in the (F20) Ignition Run-Start Control Output circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK THE (F20) IGNITION RUN-START CONTROL OUTPUT CIRCUIT FOR AN OPEN**
   1. Measure the resistance of the (F20) Ignition Run-Start Control Output circuit between the RF Hub Module C1 harness connector and the BCM C8 harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Replace the RF Hub Module in accordance with the Service Information. Refer to **MODULE, RADIO FREQUENCY (RF HUB), REMOVAL** .
      - Perform the RADIO FREQUENCY HUB (RF HUB) VERIFICATION TEST. Refer to

STANDARD PROCEDURE .

No

- Repair the open in the (F20) Ignition Run-Start Output circuit.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U1434-86-IMPLAUSIBLE DATA RECEIVED FROM DRIVER BLIND SPOT SENSOR - SIGNAL INVALID

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

Incorrect data received from the Left Blind Spot Sensor (LBSS).

POSSIBLE CAUSES

Possible Causes
NO COMMUNICATION WITH THE LEFT BLIND SPOT SENSOR (LBSS)
DTCS STORED OR ACTIVE IN THE BCM
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
    1. Turn the ignition on.
    2. With the scan tool, read active DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **VERIFY THE LBSS IS ACTIVE ON THE CAN BUS**
   1. With the scan tool, verify that the LBSS is active on the bus.

      Is the LBSS active on the bus?

      Yes

      - Replace and program the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM LBSS diagnostic procedure.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U1435-86-IMPLAUSIBLE DATA RECEIVED FROM PASSENGER SIDE BLIND SPOT SENSOR - SIGNAL INVALID

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

Incorrect data received from the Right Blind Spot Sensor (RBSS).

POSSIBLE CAUSES

Possible Causes
NO COMMUNICATION WITH THE RIGHT BLIND SPOT SENSOR (RBSS)
DTCS STORED OR ACTIVE IN THE BCM
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
   1. Turn the ignition on.
   2. With the scan tool, read active DTCs.

Does the scan tool display this DTC as active?

Yes

- Go To 2

No

- The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **VERIFY THE RBSS IS ACTIVE ON THE CAN BUS**
   1. With the scan tool, verify that the RBSS is active on the bus.

   Is the RBSS active on the bus?

   Yes

   - Replace and program the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM RBSS diagnostic procedure.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U1464-86-IMPLAUSIBLE DATA RECEIVED FROM EPS STEERING TORQUE - SIGNAL INVALID

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

Incorrect steering torque data received from the Electronic Power Steering Module.

POSSIBLE CAUSES

Possible Causes

NO COMMUNICATION WITH THE ELECTRONIC POWER STEERING MODULE
DTCS STORED OR ACTIVE IN THE BCM
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
    1. Turn the ignition on.
    2. With the scan tool, read active DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **VERIFY THE ELECTRONIC POWER STEERING MODULE IS ACTIVE ON THE CAN BUS**
    1. With the scan tool, verify that the Electronic Power Steering Module is active on the bus.

    Is the Electronic Power Steering Module active on the bus?

    Yes

    - Replace and program the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

    No

    - Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM ELECTRONIC POWER STEERING MODULE diagnostic procedure.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U147F-86-IMPLAUSIBLE DATA RECEIVED FROM EXTERNAL DISC MODULE-SIGNAL INVALID

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

Incorrect data received from the External Disc Module (EDM).

POSSIBLE CAUSES

Possible Causes
NO COMMUNICATION WITH THE EXTERNAL DISC MODULE (EDM)
DTCS STORED OR ACTIVE IN THE BCM
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
    1. Turn the ignition on.
    2. With the scan tool, read active DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **VERIFY THE EDM IS ACTIVE ON THE CAN BUS**
    1. With the scan tool, verify that the EDM is active on the bus.

    Is the EDM active on the bus?

    Yes

    - Replace and program the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM EDM diagnostic procedure.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U1480-86-IMPLAUSIBLE DATA RECEIVED FROM INTEGRATED CENTER STACK - SIGNAL INVALID

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

Incorrect data received from the Integrated Center Stack (ICS).

POSSIBLE CAUSES

Possible Causes
NO COMMUNICATION WITH THE INTEGRATED CENTER STACK (ICS)
DTCS STORED OR ACTIVE IN THE BCM
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
    1. Turn the ignition on.
    2. With the scan tool, read active DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **VERIFY THE ICS IS ACTIVE ON THE CAN BUS**
    1. With the scan tool, verify that the ICS is active on the bus.

       Is the PCM active on the bus?

       Yes

       - Replace and program the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
       - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

       No

       - Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM ICS diagnostic procedure.
       - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U148D-86-IMPLAUSIBLE DATA RECEIVED FROM FORWARD FACING CAMERA - SIGNAL INVALID

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

Incorrect data received from the Forward Facing Camera (FFC).

POSSIBLE CAUSES

Possible Causes
NO COMMUNICATION WITH THE FORWARD FACING CAMERA (FFC)
DTCS STORED OR ACTIVE IN THE BCM
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
    1. Turn the ignition on.
    2. With the scan tool, read active DTCs.

       Does the scan tool display this DTC as active?

Yes

- Go To 2

No

- Test Complete. The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded or contaminated terminals.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **VERIFY THE FORWARD FACING CAMERA (FFC) IS ACTIVE ON THE CAN BUS**
   1. With the scan tool, verify that the Forward Facing Camera (FFC) is active on the bus.

   Is the Forward Facing Camera (FFC) active on the bus?

   Yes

   - Replace and program the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM FORWARD FACING CAMERA (FFC) diagnostic procedure.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U1496-8F-IMPLAUSIBLE DATA RECEIVED FROM ULTRASONIC AND ANTI-TILT MODULE - ERRATIC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

The Ultrasonic and Anti-Tilt Module (UAM) detects an internal failure.

POSSIBLE CAUSES

Possible Causes
ULTRASONIC AND ANTI-TILT MODULE (UAM)

DIAGNOSTIC TEST

CHECK FOR AN ACTIVE DTC

1. Turn the ignition on.
2. With the scan tool, read DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Replace the UAM in accordance with the Service Information. Refer to **MODULE, ULTRASONIC AND ANTI-TILT, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Test Complete.

U1497-29-IMPLAUSIBLE DATA RECEIVED FROM WIRELESS CHARGING PAD MODULE-SIGNAL INVALID

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

The Wireless Charging Pad Module detects an internal failure.

POSSIBLE CAUSES

Possible Causes
WIRELESS CHARGING PAD MODULE

DIAGNOSTIC TEST

CHECK FOR AN ACTIVE DTC

1. Turn the ignition on.
2. With the scan tool, read DTCs.

   Does the scan tool display this DTC as active?

Yes

- Replace the Wireless Charging Pad Module in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Test Complete.

U1514-64-ENGINE CONTROLLER SECRET CODE - SIGNAL PLAUSIBILITY FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Ignition on.

SET CONDITION

The BCM receives and invalid SKIM Key message from the Powertrain Control Module (PCM).

POSSIBLE CAUSES

Possible Causes
INCORRECT VIN PROGRAMMED IN THE PCM
PCM (POWERTRAIN CONTROL MODULE)
BCM (BODY CONTROL MODULE)

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
   1. Turn the ignition on.
   2. With the scan tool, read the Active DTCs.

      Does the scan tool display this DTC as active?

      Yes

      - Go To 2

      No

      - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **VERIFY THE VEHICLE IDENTIFICATION NUMBER (VIN) STORED IN THE POWERTRAIN CONTROL MODULE (PCM).**
   1. Using the scan tool, access the VIN number stored in the PCM.

      NOTE: Make sure that a VIN has been programmed into the PCM. If a VIN is not displayed, attempt to program the PCM with the correct VIN before continuing.

   2. Compare the VIN displayed, with the VIN of the vehicle.

      Does the VIN recorded in the PCM match the VIN of the vehicle?

      Yes

      - **Using the scan tool, verify the VIN in the BCM matches the VIN of the vehicle. If it DOES, Go To 3 If it does NOT match, replace the BCM in accordance with the Service Information.**
      - Replace and program the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Using the scan tool, perform the PCM Replaced Procedure to update the VIN in the PCM. Then, Go To 3

3. **PCM STARTING DTCS**
   1. Use the scan tool and erase all DTCs in the BCM and PCM.
   2. Turn the Ignition Off, and wait 15 seconds before turning the Ignition On.
   3. Try to start the engine. If the engine starts, leave it run for one minute and then turn the engine off (ignition on).
   4. Wait one minute, and read the active PCM DTCs.

      Does the scan tool display any Starting related DTCs?

      Yes

      - Refer to the **DTC INDEX** and perform the appropriate Diagnostic Procedure.

      No

      - Go To 4

4. **VERIFY PCM PROGRAMMING**

1. Use the scan tool and erase all DTCs in the BCM and PCM.
2. Turn the Ignition Off, and wait 15 seconds before turning the Ignition On.
3. Wait one minute, and read the active DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Replace and program the Powertrain Control Module in accordance with the Service Information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to the appropriate diagnosis and testing article in engine performance .

   No

   - Repair is complete.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U1514-87-ENGINE CONTROLLER SECRET CODE - MISSING MESSAGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Ignition on.

SET CONDITION

The BCM does not receive a SKIM Key message from the Powertrain Control Module (PCM).

POSSIBLE CAUSES

Possible Causes
PCM (POWERTRAIN CONTROL MODULE)

DIAGNOSTIC TEST

1. **VERIFY PCM DTCs**
   1. Using the scan tool, record and erase all codes in the PCM.
   2. Turn the Ignition Off, and wait fifteen seconds before turning the Ignition On.
   3. Wait one minute, and read the active PCM codes.

      Does the scan tool display any starting, ignition or charging DTCs?

Yes

- Refer to the **DTC INDEX** and perform the appropriate diagnostic procedure(s).

No

- Go To 2

2. **VERIFY PCM PROGRAMMING**
   1. Using the scan tool, erase all codes in the BCM.
   2. Turn the Ignition Off, and wait fifteen seconds before turning the Ignition On.
   3. Wait one minute, and read the active BCM DTCs.

   Does the scan tool display this DTC as Active?

   Yes

   - Program the Powertrain Control Module in accordance with the Service Information.
   - Perform the PCM/TCM PROGRAMMING procedure. For the 2.0L Engine, refer to **PCM/ECM/TCM PROGRAMMING** . For 2.4L Engine, refer to **PCM/TCM PROGRAMMING** .
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to the appropriate diagnosis and testing article in engine performance .

   No

   - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and poor pin fit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U1515-62-STEERING COLUMN LOCK SECRET CODE - SIGNAL COMPARE FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

The BCM receives and invalid SKIM Key message from the Electronic Steering Lock (ESL).

POSSIBLE CAUSES

Possible Causes

ELECTRONIC STEERING LOCK (ESL)
BCM (BODY CONTROL MODULE)

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**

   NOTE: Make sure the battery voltage is between 10 and 16 volts before proceeding.

   1. With the scan tool, read active DTCs.

      Does the scan tool display this DTC as active?

      Yes

      - Go To 2

      No

      - The condition is not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **VERIFY THE ELECTRONIC STEERING LOCK (ESL) IS ACTIVE ON THE BUS**
   1. Turn the ignition on.
   2. With the scan tool, verify the ESL is active on the bus.

      Is the ESL active on the bus?

      Yes

      - Go To 3

      No

      - Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM ESL diagnostic procedure.

3. **CHECK FOR ANY ACTIVE SKIM RELATED DTCS**
   1. With the scan tool, read all active DTCs from all modules.

      NOTE: Check for BCM configuration, VIN Missing/Mismatch or SKIM related DTCs.

Does the scan tool display any active DTCs to the conditions listed above?

Yes

- Go to the **DTC INDEX** and perform the appropriate diagnostic procedure.

No

- Go To 4

4. **BCM PROGRAMMING CHECK**
   1. Using the Scan Tool, verify the BCM is programmed.

      Is the BCM programmed?

      Yes

      - Replace the BCM in accordance with Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .

      No

      - Perform the BCM replacement procedure in accordance with Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .

U1515-64-STEERING COLUMN LOCK SECRET CODE - SIGNAL PLAUSIBILITY FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

The BCM receives and invalid SKIM Key message from the Electronic Steering Lock (ESL).

POSSIBLE CAUSES

Possible Causes
ELECTRONIC STEERING LOCK (ESL)
BCM (BODY CONTROL MODULE)

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**

NOTE: Make sure the battery voltage is between 10 and 16 volts before proceeding.

1. With the scan tool, read active DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Go To 2

   No

   - The condition is not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **VERIFY THE ELECTRONIC STEERING LOCK (ESL) IS ACTIVE ON THE BUS**
   1. Turn the ignition on.
   2. With the scan tool, verify the ESL is active on the bus.

      Is the ESL active on the bus?

      Yes

      - Go To 3

      No

      - Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM ESL diagnostic procedure.

3. **CHECK FOR ANY ACTIVE SKIM RELATED DTCS**
   1. With the scan tool, read all active DTCs from all modules.

      NOTE: Check for BCM configuration, VIN Missing/Mismatch or SKIM related DTCs.

      Does the scan tool display any active DTCs to the conditions listed above?

      Yes

      - Go to the **DTC INDEX** and perform the appropriate diagnostic procedure.

      No

- Go To 4

4. **BCM PROGRAMMING CHECK**
   1. Using the Scan Tool, verify the BCM is programmed.

      Is the BCM programmed?

      Yes

      - Replace the BCM in accordance with Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .

      No

      - Perform the BCM replacement procedure in accordance with Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .

U1515-87-STEERING COLUMN LOCK SECRET CODE - MISSING MESSAGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

The BCM does not receive a SKIM Key message from the Electronic Steering Lock (ESL).

POSSIBLE CAUSES

Possible Causes
ELECTRONIC STEERING LOCK (ESL)
BCM (BODY CONTROL MODULE)

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**

   NOTE: Make sure the battery voltage is between 10 and 16 volts before proceeding.

   1. With the scan tool, read active DTCs.

      Does the scan tool display this DTC as active?

Yes

- Go To 2

No

- The condition is not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **VERIFY THE ELECTRONIC STEERING LOCK (ESL) IS ACTIVE ON THE BUS**
   1. Turn the ignition on.
   2. With the scan tool, verify the ESL is active on the bus.

   Is the ESL active on the bus?

   Yes

   - Go To 3

   No

   - Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM ESL diagnostic procedure.

3. **CHECK FOR ANY ACTIVE SKIM RELATED DTCS**
   1. With the scan tool, read all active DTCs from all modules.

   NOTE: Check for BCM configuration, VIN Missing/Mismatch or SKIM related DTCs.

   Does the scan tool display any active DTCs to the conditions listed above?

   Yes

   - Go to the **DTC INDEX** and perform the appropriate diagnostic procedure.

   No

   - Go To 4

4. **BCM PROGRAMMING CHECK**
   1. Using the Scan Tool, verify the BCM is programmed.

   Is the BCM programmed?

Yes

- Replace the BCM in accordance with Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .

No

- Perform the BCM replacement procedure in accordance with Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .

U1516-64-RF HUB SECRET CODE - SIGNAL PLAUSIBILITY FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

The BCM receives and invalid SKIM Key message from the RF Hub.

POSSIBLE CAUSES

Possible Causes
RADIO FREQUENCY HUB (RF HUB)
BCM (BODY CONTROL MODULE)

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**

NOTE: Make sure the battery voltage is between 10 and 16 volts before proceeding.

1. With the scan tool, read active DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Go To 2

   No

   - The condition is not present at this time. Using the wiring diagrams as a guide, check all

related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **VERIFY THE RF HUB IS ACTIVE ON THE BUS**
   1. Turn the ignition on.
   2. With the scan tool, verify the RF Hub is active on the bus.

   Is the RF Hub active on the bus?

   Yes

   - Go To 3

   No

   - Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM RF HUB diagnostic procedure.

3. **CHECK FOR ANY ACTIVE SKIM RELATED DTCS**
   1. With the scan tool, read all active DTCs from all modules.

   NOTE: Check for BCM configuration, VIN Missing/Mismatch or SKIM related DTCs.

   Does the scan tool display any active DTCs to the conditions listed above?

   Yes

   - Go to the **DTC INDEX** and perform the appropriate diagnostic procedure.

   No

   - Go To 4

4. **BCM PROGRAMMING CHECK**
   1. Using the Scan Tool, verify the BCM is programmed.

   Is the BCM programmed?

   Yes

   - Replace the BCM in accordance with Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .

   No

- Perform the BCM replacement procedure in accordance with Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .

U1516-87-RF HUB SECRET CODE - MISSING MESSAGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

The BCM does not receive a SKIM Key message from the RF Hub.

POSSIBLE CAUSES

Possible Causes
RADIO FREQUENCY HUB (RF HUB)
BCM (BODY CONTROL MODULE)

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**

   NOTE: Make sure the battery voltage is between 10 and 16 volts before proceeding.

   1. With the scan tool, read active DTCs.

      Does the scan tool display this DTC as active?

      Yes

      - Go To 2

      No

      - The condition is not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **VERIFY THE RF HUB IS ACTIVE ON THE BUS**
   1. Turn the ignition on.
   2. With the scan tool, verify the RF Hub is active on the bus.

Is the RF Hub active on the bus?

Yes

- Go To 3

No

- Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM RF HUB diagnostic procedure.

3. **CHECK FOR ANY ACTIVE SKIM RELATED DTCS**
   1. With the scan tool, read all active DTCs from all modules.

      NOTE: Check for BCM configuration, VIN Missing/Mismatch or SKIM related DTCs.

      Does the scan tool display any active DTCs to the conditions listed above?

      Yes

      - Go to the **DTC INDEX** and perform the appropriate diagnostic procedure.

      No

      - Go To 4

4. **BCM PROGRAMMING CHECK**
   1. Using the Scan Tool, verify the BCM is programmed.

      Is the BCM programmed?

      Yes

      - Replace the BCM in accordance with Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .

      No

      - Perform the BCM replacement procedure in accordance with Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .

DIAGNOSTIC CODE INDEX

DIAGNOSTIC CODE INDEX

DTC	Description
B106A-12	REAR DEFROST (EBL) CONTROL CIRCUIT - CIRCUIT SHORT TO BATTERY
B106A-14	REAR DEFROST (EBL) CONTROL CIRCUIT-CIRCUIT SHORT TO GROUND OR OPEN
B1609-11	PANEL DIMMER INPUT - CIRCUIT SHORT TO GROUND
B1609-15	PANEL DIMMER INPUT - CIRCUIT SHORT TO BATTERY OR OPEN
B1620-12	FRONT READING LAMP - CIRCUIT SHORT TO BATTERY
B1621-12	REAR READING LAMP - CIRCUIT SHORT TO BATTERY
B162A-18	LEFT LOW BEAM CONTROL - UNDER CURRENT
B162A-18	LEFT LOW BEAM CONTROL - UNDER CURRENT - EXPORT
B162A-19	LEFT LOW BEAM CONTROL - OVER CURRENT
B162A-19	LEFT LOW BEAM CONTROL-OVER CURRENT - EXPORT
B162E-18	RIGHT LOW BEAM CONTROL - UNDER CURRENT
B162E-18	RIGHT LOW BEAM CONTROL - UNDER CURRENT - EXPORT
B162E-19	RIGHT LOW BEAM CONTROL - OVER CURRENT
B162E-19	RIGHT LOW BEAM CONTROL-OVER CURRENT - EXPORT
B1632-18	LEFT HIGH BEAM CONTROL - UNDER CURRENT
B1632-18	LEFT HIGH BEAM CONTROL - UNDER CURRENT - EXPORT
B1632-19	LEFT HIGH BEAM CONTROL - OVER CURRENT
B1632-19	LEFT HIGH BEAM CONTROL - OVER CURRENT - EXPORT
B1636-18	RIGHT HIGH BEAM CONTROL - UNDER CURRENT
B1636-18	RIGHT HIGH BEAM CONTROL - UNDER CURRENT - EXPORT
B1636-19	RIGHT HIGH BEAM CONTROL - OVER CURRENT
B1636-19	RIGHT HIGH BEAM CONTROL - OVER CURRENT - EXPORT
B163A-18	FRONT LEFT TURN LAMP CONTROL - UNDER CURRENT
B163A-18	FRONT LEFT TURN LAMP CONTROL - UNDER CURRENT - EXPORT
B163A-19	FRONT LEFT TURN LAMP CONTROL - OVER CURRENT
B163A-19	FRONT LEFT TURN LAMP CONTROL - OVER CURRENT - EXPORT
B163E-18	FRONT RIGHT TURN LAMP CONTROL - UNDER CURRENT
B163E-18	FRONT RIGHT TURN LAMP CONTROL - UNDER CURRENT - EXPORT
B163E-19	FRONT RIGHT TURN LAMP CONTROL - OVER CURRENT
B163E-19	FRONT RIGHT TURN LAMP CONTROL - OVER CURRENT - EXPORT
B1642-19	REAR LEFT TURN LAMP CONTROL - OVER CURRENT

B1642-19	REAR LEFT TURN LAMP CONTROL - OVER CURRENT - EXPORT
B1646-19	REAR RIGHT TURN LAMP CONTROL-OVER CURRENT
B1646-19	REAR RIGHT TURN LAMP CONTROL-OVER CURRENT - EXPORT
B165B-18	PARK LAMP CONTROL - UNDER CURRENT
B165B-19	PARK LAMP CONTROL-OVER CURRENT
B1666-18	LEFT REVERSE LAMP CONTROL - UNDER CURRENT
B1666-19	LEFT REVERSE LAMP CONTROL - OVER CURRENT
B166A-12	LEFT TRAILER TOW LAMP CONTROL - CIRCUIT SHORT TO BATTERY
B166A-14	LEFT TRAILER TOW LAMP CONTROL - CIRCUIT SHORT TO GROUND OR OPEN
B166E-12	RIGHT TRAILER TOW LAMP CONTROL - CIRCUIT SHORT TO BATTERY
B166E-14	RIGHT TRAILER TOW LAMP CONTROL - CIRCUIT SHORT TO GROUND OR OPEN

Chime/Buzzer/Driver Assist - Service Information - Cherokee

DESCRIPTION

BLIND SPOT MONITOR SYSTEM

The Blind Spot Monitor (BSM) system is an available factory-installed electronic driving aid. This system provides both blind spot and Rear Cross Path (RCP) monitoring features. While the vehicle is being driven, this system alerts the vehicle operator when it detects other highway licensable vehicles that enter the targeted blind spot and cross path alert zones. These zones lie immediately to the right and behind as well as immediately to the left and behind the vehicle. Due to the surrounding rear vehicle structure or other adjacent stationary obstacles outside of the vehicle, these zones might be more difficult for the vehicle operator to easily monitor.

When the BSM system detects another vehicle within one of the target zones, the system is capable of illuminating an amber triangle icon located in each outside rear view mirror glass, as well as reducing audio system volume and sounding chime tones through the audio system speakers to provide the vehicle operator with both visual and audible alerts. However, it should be noted that this BSM system is intended to supplement and not to replace safe vehicle operating habits, including proper adjustment and use of the standard equipment inside and outside rear view mirrors.

The BSM system includes the following major components, which are described in further detail elsewhere within this service information:

- **Blind Spot Displays** - Vehicles equipped with the BSM system have an amber Light Emitting Diode (LED) unit mounted on the back of each outside rear view mirror glass case behind the translucent outline of a triangle in the mirror glass. The BSM system illuminates the appropriate triangle icon in amber each time a vehicle is detected in one of the blind spot or rear cross path alert zones.
- **Blind Spot Sensors** - Vehicles equipped with the BSM system have both a Left Blind Spot Sensor (LBSS) and a Right Blind Spot Sensor (RBSS). The LBSS and the RBSS each include a RAdio Detection And Ranging (RADAR) sensor and an integral electronic control unit. Each of the two control units is independent, communicates on the Controller Area Network (CAN) data bus with its respective Driver Door Module (DDM) or Passenger Door Module (PDM), which is hard wired to its respective right or left blind spot display. The LBSS and the RBSS are concealed behind their respective right or left outboard end of the rear bumper fascia, just behind each rear wheel opening.
- **Door Modules**

  - An electronic Driver Door Module (DDM) and Passenger Door Module (PDM) receives electronic messages over the Controller Area Network (CAN) data bus from its respective Left Blind Spot Sensor (LBSS) or Right Blind Spot Sensor (RBSS) to control a hard wired output to the BSM display in its respective outside rear view mirror. The door modules are concealed behind the front door trim panels on each front door inside panel.

- **Electronic Vehicle Information Center** - In vehicles equipped with the optional BSM system, the Electronic Vehicle Information Center (EVIC) within the Instrument Cluster (IC) (also known as the

Instrument Panel Cluster/IPC) may display textual warnings and error messages related to the current operating status of the BSM system.

- **Radio Receiver Module** - The virtual buttons in the touch screen of the optional premium Radio Receiver Module (RRM) (also known as the radio or the head unit) provide an interface that allows the vehicle operator to enable, disable and modify certain BSM system settings using the customer programmable features option.

Hard wired circuitry connects the BSM system components to each other through the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other and to the vehicle electrical system through the use of a combination of soldered splices, splice block connectors and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin out and location views for the various wire harness connectors, splices and grounds.

The BSM system components cannot be adjusted or repaired. If any of the BSM system components becomes damaged or ineffective, that component must be replaced.

CHIME WARNING SYSTEM

A chime warning system is standard factory-installed equipment. The chime warning system uses an electromechanical transducer and an electromechanical relay that are soldered onto the electronic circuit board within the Instrument Cluster (IC) (also known as the Instrument Panel Cluster/IPC) to provide audible indications of various vehicle conditions that may require the attention of the vehicle operator or occupants.

The electromechanical transducer generates beep tones and chime tones, while the electromechanical relay generates click tones to emulate the sounds associated with conventional turn signal and hazard warning flasher operation. The microprocessor-based IC utilizes electronic **chime request** messages received from other modules in the vehicle over the Controller Area Network (CAN) data bus along with hard wired inputs to monitor many sensors and switches throughout the vehicle. In response to those inputs, the circuitry and programming of the IC allow it to control the audible outputs that are produced through its on-board transducer and relay.

The IC is capable of producing the following audible outputs:

- **Slow Rate Repetitive Click** - Repeated **click** tones that are issued at a slow rate of about 90 clicks per minute.
- **Fast Rate Repetitive Click** - Repeated **click** tones that are issued at a fast rate of more than about 180 clicks per minute.
- **Single Chime Tone** - A single **beep** or **chime** tone.
- **Slow Rate Repetitive Chime Tones** - Repeated **chime** tones that are issued at a rate of about 50 chimes per minute.
- **Fast Rate Repetitive Chime Tones** - Repeated **chime** tones that are issued at a rate of about 180 chimes per minute.

Hard wired circuitry connects the IC and the various chime warning system switch and sensor inputs to their modules and to each other through the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the IC through the use of a combination of soldered splices, splice block connectors and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin out and location views for the various wire harness connectors, splices and grounds.

The IC chime warning system circuits and components cannot be adjusted or repaired. If the IC circuitry, the on-board transducer or the relay are damaged or ineffective, the IC assembly must be replaced.

FORWARD COLLISION WARNING PLUS

The Forward Collision Warning Plus (FCW+) system is an enhancement to the current vehicles equipped with Adaptive Cruise Control (ACC) and a Forward Facing Camera (FFC). This system uses the FFC for enhanced sensitivity to objects in front of the vehicle. The system utilizes radar and video input to detect whether the vehicle is approaching another vehicle or large obstacle in its path too rapidly and warn/assist the driver in avoiding the incident. The system communicates with other components on the vehicle to apply the brakes and/or to alert the driver through visual and audible warnings. The FCW Plus function operates regardless of whether ACC with stop and go is active or not. The system operates down to 0 mph and provides audible closing/proximity warnings as well as brake pedal vibration.

Forward Collision Warning options and Active Braking settings can be changed. When the vehicle is equipped with a Uconnect® 8.4/8.4A system screen, the Safety and Driving Assistance soft key needs to be selected to access the options menu. When the vehicle is equipped with the Uconnect® 5.0 system, pressing the "+ MORE" hard-key located on the lower right side of the Uconnect® system will bring you to the "Settings" soft key.

The system also monitors the torque sensor inside the EPS to verify the driver's hands remain on the wheel. If no driver's steering input is received for 3-5 seconds, the system alert the driver with audio and visual warning. If the steering wheel continues to receive no torque input from the driver, the FCW+, ACC+ and LDW+ will deactivate. Once the vehicle has achieved road speeds of 60 km/h (37 mph) and below 160 km/h (100 mph), sense the drivers steering input and the FFC can clearly detect the lines in the road, the system will enable again. The system will also disable when the drivers seatbelt is unbuckled while the vehicle is travelling at speeds of 10 mph or greater.

The following is a list of FCW+ operations:

- Utilizes Radar and Video sensors to detect whether the vehicle is approaching another vehicle or large obstacle in its path too rapidly and warn / assist the driver in avoiding / mitigating the incident;
- The driver has the ability to adjust the sensitivity and turn brake support on or off in the radio;
- Prefill: Prepares the brakes for emergency braking;
- Audible & Visual Warnings;
- Brake Jerk: Short deceleration to alert driver;
- CMS (Collision Mitigation System) Up to 1.5 sec of braking to give driver additional reaction time;

- ABA (Advanced Brake Assist) If the driver is not braking enough, ABA will increase the braking to avoid / mitigate the accident. **NOTE: it is important to note the system will use "mitigated" braking to avoid accidents, but will not completely stop the vehicle in all scenarios if an impact is imminent - its purpose is to "warn and assist".**

LANE DEPARTURE WARNING (LDW+)

Haptic Lane Departure Warning Plus (LDW+) - This system is an available option offered on vehicles equipped with Electronic Power Steering (EPS) and the Forward Facing camera (FFC). The system can be turned on or off with a single hard button the Auxiliary Switch Bank Module (ASBM). The LED on the button will inform the driver of the system status when the driver is not on the Drive Assist screen. The system operates when enabled above 60 km/h (37 mph) and below 160 km/h (100 mph).

The LDW+ system issues a warning alert to the driver in case of an unintended lane departure (i.e the driver did not use turn signals beforehand to confirm a planned lane change). The LDW system uses the Forward Facing Camera (FFC) to detect lane markings and measure vehicle position within those lane boundaries. The warning can be audible, visual or haptic feedback to the driver, for example through a vibration in the steering wheel that feels like a virtual "rumble strip" induced by the electronic powered steering (EPS) system. If the driver continues to unintentionally drift out of the lane, the system provides a visual warning to prompt the driver to adjust the vehicle's trajectory to remain within the lane boundaries. When only a single lame marking is detected and the driver unintentionally drifts across the lane marking (again, no turn signal), the LDW system provides a visual warning through the instrument cluster to prompt the driver to remain within the lane. When only a single lane marking is detected, as haptic warning will not be provided. The driver may manually override the haptic warning by applying torque into the steering wheel at any time. The use of the turn signal suppresses the warning.

No Hands Recognition Strategy - When operating conditions have been met, the LDW system will employ a "No Hands Recognition Strategy". The system monitors the torque sensor inside the EPS to verify the driver's hands remain on the wheel. If the hands are not detected, this will cause an audible warning to the driver consisting of left front and right front chimes as well as displaying a visual warning message. The strategy will cancel LDW+ activation if the driver does not return their hands to the wheel.

The driver can configure the torque feedback amount and warning zone start point through personalization settings in the radio. Three settings for each are provided.

The LDW system will indicate the current lane drift condition through the Electronic Vehicle Information Center (EVIC). When the LDW system is ON, the lane lines are gray when the lane boundaries have not been detected and the LDW indicator is solid white.

Changing LDW+ Status:

1. Press the "Controls" soft-key located on the bottom of the Uconnect® system screen.
2. Press the "Settings" soft-key.
3. Press the "Safety and Driving Assistance" soft-key.

Personalization Settings:

- The LDW+ system can be enabled/disabled via an ON/OFF defeat switch with indicator (indicator ON when system is OFF). The indicator will remain ON when a fault is detected in the LDW+ system.
- The LDW+ system retains the last system state (enabled or disabled) from the last ignition cycle when the ignition is changed to the ON/RUN position.
- The LDW+ system has a lane warning sensitivity setting to adjust earliest to latest haptic feedback warning levels (e.g. early, medium, late) located within the personalization settings.
- The LDW+ system retains the last lane warning sensitivity setting from the last ignition cycle when the ignition is changed to the ON/RUN position.
- The LDW+ system has a torque intensity setting to adjust the torque level (e.g. low, medium, high) of the haptic warning located within the personalization settings.
- The LDW+ lane sensitivity and torque intensity settings will not be locked out during driving.

EVIC Lane Detection Display -

3.5 EVIC Screen - Left Lane Departure - Only Left Lane Detected (Right Side Similar) :

- When the LDW system is ON, the LDW indicator is solid white when only the left lane marking has been detected and the system is ready to provide visual warnings in the EVIC if an unintentional lane departure occurs.
- When the LDW system senses that the lane has been approached and is in a lane cross situation, the left thick lane line flashes from gray to flashing white, the left thin line remains solid and the LDW indicator changes from solid white to a flashing yellow.

Left Lane Departure - Both Lanes Detected:

- When the LDW system is ON, the lane lines turn from gray to white to indicate that the lane markings have been detected. The LDW indicator is solid green when both lane marking have been detected and the system is "armed" to provide visual warnings in the EVIC and a torque warning in the steering wheel if an unintentional lane departure occurs.
- When the LDW system sense a lane cross situation, the left thick lane line turns solid white, the right thin line remains solid white. The LDW indicator changes from solid green to solid yellow. At this time torque is applied to the steering wheel in the opposite direction of the lane boundary. For example, if approaching the left side of the lane, the steering wheel will torque to the right side.
- When the LDW system senses the lane has been approached and is in a lane cross situation, the left thick lane line flashes from white to gray, the right thin line remains solid white and the LDW indicator changes from solid yellow to flashing yellow. At this time torque is applied to the steering wheel in the opposite direction of the lane boundary. For example, if approaching the left side of the lane, the steering wheel will torque to the right side.

7.0 EVIC Screen - Left Lane Departure - Only Left Lane Detected (Right Side Similar)

- When the LDW system is on, the lane lines are gray when the lane boundaries have not been detected and the LDW indicator is solid white.

- When the LDW system is ON, the LDW indicator is solid white when only the left lane marking has been

detected and the system is ready to provide visual warning in the EVIC if an unintentional lane departure occurs.

- When the LDW system senses the lane has been approached and is in a lane cross situation, the left lane line flashes think yellow and the right lane line remains grey.

Left Lane Departure - Both Lanes Detected:

- When the LDW system is ON, the lane lines turn from gray to white to indicate that the lane marking have been detected. The LDW indicator is solid green when both lane markings have been detected and the system is "armed" to provide visual warning in the EVIC and a torque warning in the steering wheel if an unintentional lane departure occurs.
- When the LDW system sense a lane cross situation, the left lane line changes to think yellow and the right lane line. The LDW indicator changes from solid green to solid yellow. At this time torque is applied to the steering wheel in the opposite direction of the lane boundary.
- When the LDW system senses the lane has been approached and is in a lane cross situation, the left lane line flashes yellow and the right lane line remains white. The LDW indicator changes from solid yellow to flashing yellow. At this time, torque is applied to the steering wheel in the opposite direction of the lane boundary.

PARK ASSIST SYSTEM

A park assist system is an optional factory-installed electronic parking aid. There are also three distinct versions of the park assist system. The three versions can be readily identified by noting the quantity of ultrasonic sensors installed and the sensor location in the rear or the front and rear bumper fascias. Additional details of each of these versions and their components can be found elsewhere in this service information.

- **Rear Park Assist** - The Rear Park Assist (RPA) alerts the vehicle operator to obstacles located in the path immediately behind the vehicle. This system has four radar sensors, all installed in the rear bumper fascia.
- **Front and Rear Park Assist** - The Front and Rear Park Assist (FRPA) alerts the vehicle operator to obstacles located in the path immediately in front of the vehicle as well as those behind. This system has ten radar sensors, four installed in the rear bumper fascia and six installed in the front bumper fascia. In vehicles equipped with an automatic transmission, the FRPA can also provide an additional autonomous braking alert (also known as stop and release) feature when the automatic transmission gear selector is in Reverse (**R**) and certain obstacles are detected at the rear of the vehicle. The autonomous braking feature is not available in vehicles equipped with a manual transmission.
- **Parallel and Perpendicular Park Assist** - The Parallel and Perpendicular Park Assist (PPPA) includes all of the features of the FRPA, but adds semiautomatic parallel and perpendicular parking assistance features. This system has twelve radar sensors, six installed in the rear bumper fascia and six installed in the front bumper fascia.

Hard wired circuitry connects the RPA, FRPA or PPPA components to the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the RPA, FRPA or PPPA components through the use of a combination of soldered splices, splice block connectors and many different types of wire harness terminal connectors and insulators. Refer to the

appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin out and location views for the various wire harness connectors, splices and grounds.

The RPA, FRPA and PPPA system components cannot be adjusted or repaired. If any of these components is damaged or ineffective, that component must be replaced.

REAR PARK ASSIST

A Rear Park Assist (RPA) system is an optional factory-installed electronic parking aid. During parking and other similar vehicle maneuvers this system alerts the vehicle operator to the approximate relative distance of obstacles located in the path immediately behind the vehicle which, due to the surrounding rear vehicle structure, might be otherwise difficult to perceive. When an obstacle is detected, the system uses graphics and chimes to provide the vehicle operator with visual and audible indications of the presence and proximity of such objects.

The RPA system includes the following major components, which are described in further detail elsewhere in this service information:

- **Body Control Module** - The Body Control Module (BCM) serves as the gateway between the Controller Area Network (CAN) C and the CAN Interior High Speed (IHS) data bus networks used to communicate between the Park Assist Module (PAM), the Instrument Cluster (IC) (also known as the Instrument Panel Cluster/IPC) and the Radio Receiver Module (RRM) (also known as the radio or the head unit).
- **Instrument Cluster** - In vehicles equipped with the optional RPA system, the Electronic Vehicle Information Center (EVIC) within the Instrument Cluster (IC) (also known as the Instrument Panel Cluster/IPC) displays vehicle graphics and amber or red arc sections that illustrate the approximate location and relative distance of obstacles within the rear path of the vehicle. The EVIC also displays textual warnings and error messages along with issuing audible alerts related to the current operating status of the RPA system.
- **Park Assist Module** - Vehicles equipped with the RPA system include a 4 channel Park Assist Module (PAM) (also known as the ParkTronic System/PTS module), which is secured through integral mounting tabs to weld studs on the left quarter inner panel just behind the left rear wheel house, where it is concealed beneath the quarter inside trim within the cargo area of the vehicle.
- **Park Assist Off Switch** - The optional RPA system can be manually disabled or enabled using a park assist Off switch. The park assist Off switch is integral to the instrument panel switch pod (also known as the Accessory Switch Bank Module/ASBM) in the instrument panel center stack below the heater and air conditioner controls. This switch allows the operator to turn the RPA system Off.
- **Park Assist Sensors** - Vehicles equipped with the RPA system have four ultrasonic park assist sensors that are concealed behind the rear bumper fascia. Only the sensor membrane is visible on the outer surface of the rear bumper fascia. Each sensor is snapped into an individual molded plastic mounting bracket located at horizontal intervals along the inside surface of the rear bumper fascia.
- **Radio Receiver Module** - In vehicles equipped with the RPA system, the PAM sends electronic message requests to the RRM to generate audible signals indicating the approximate distance of obstacles from the rear path of the vehicle. The RRM is capable of generating repetitive single chime tones at several varying frequencies or continuous tones through the rear audio system speakers. If the audio system speakers are already in use, the RRM will mute that output during chime tone generation. In addition, the

RRM provides an interface that allows the vehicle operator to manually disable or enable the RPA system using the customer programmable features option.

FRONT AND REAR PARK ASSIST

A Front and Rear Park Assist (FRPA) system is an optional factory-installed electronic parking aid. During parking and other similar vehicle maneuvers this system alerts the vehicle operator to the approximate relative distance of obstacles located in the paths immediately behind and ahead of the vehicle which, due to the surrounding vehicle structures, might be otherwise difficult to perceive. When an obstacle is detected, the system uses graphics and chimes to provide the vehicle operator with visual and audible indications of the presence and proximity of such objects.

The FRPA is also capable of providing an autonomous brake warning (also known as brake and release) feature. When enabled, this feature will alert the vehicle operator when the automatic transmission gear selector is in the Reverse (**R**) position and an object is detected in the rear path of the vehicle by aggressively applying and releasing the brakes. Following an autonomous brake warning application, an icon representing the rear of the vehicle with three red arcs and the text **BRAKE!** will appear in the Electronic Vehicle Information Center (EVIC) within the Instrument Cluster (IC) (also known as the Instrument Panel Cluster/IPC). This brake warning feature is not available in vehicles equipped with a manual transmission.

The FRPA system includes the following major components, which are described in further detail elsewhere in this service information:

- **Antilock Brake Module** - The Antilock Brake Module (ABM) controls the application of the vehicle brakes to implement the autonomous brake warning feature when it receives the appropriate electronic message input over the Controller Area Network (CAN) data bus from the Park Assist Module (PAM).
- **Body Control Module** - The Body Control Module (BCM) serves as the gateway between the Controller Area Network (CAN) C and the CAN Interior High Speed (IHS) data bus networks used to communicate between the Park Assist Module (PAM), the Antilock Brake Module (ABM), the Instrument Cluster (IC) (also known as the Instrument Panel Cluster/IPC) and the Radio Receiver Module (RRM).
- **Instrument Cluster** - In vehicles equipped with the optional FRPA system, the Electronic Vehicle Information Center (EVIC) within the Instrument Cluster (IC) (also known as the Instrument Panel Cluster/IPC) displays vehicle graphics and amber or red arc sections that illustrate the approximate location of obstacles within the front or rear paths of the vehicle. The EVIC also displays textual warnings and error messages along with issuing audible alerts related to the current operating status of the FRPA system.
- **Park Assist Module** - Vehicles equipped with the FRPA system include a 10 channel Park Assist Module (PAM) (also known as the ParkTronic System/PTS module), which is secured through integral mounting tabs to weld studs on the left quarter inner panel just behind the left rear wheel house, where it is concealed beneath the quarter inside trim within the cargo area of the vehicle.
- **Park Assist Off Switch** - The optional FRPA system can be manually disabled or enabled using a park assist Off switch. The park assist Off switch is integral to the instrument panel switch pod (also known as the Accessory Switch Bank Module/ASBM) in the instrument panel center stack below the heater and air conditioner controls. This switch allows the operator to turn the FRPA system Off.
- **Park Assist Sensors** - Vehicles equipped with the FRPA system have ten ultrasonic park assist sensors. Four are concealed behind the rear bumper fascia and six are concealed behind the front bumper fascia.

Only the sensor membrane is visible on the outer surface of the bumper fascia. Each sensor is snapped into an individual molded plastic mounting bracket located at horizontal intervals along the inside surfaces of the front and rear bumper fascias.

- **Radio Receiver Module** - In vehicles equipped with the FRPA system, the PAM sends electronic message requests to the RRM to generate audible signals indicating the approximate distance of obstacles from the front and rear paths of the vehicle. The RRM is capable of generating repetitive single chime tones at several varying frequencies or continuous tones through the front or rear audio system speakers. If the audio system speakers are already in use, the RRM will mute that output during chime tone generation. In addition, the RRM provides an interface that allows the vehicle operator to manually disable or enable the FRPA system using the customer programmable features option.

PARALLEL AND PERPENDICULAR PARK ASSIST

A Parallel and Perpendicular Park Assist (PPPA) system is an optional factory-installed electronic parking aid. During parking and other similar vehicle maneuvers this system alerts the vehicle operator to the approximate relative distance of obstacles located in the paths immediately behind and ahead of the vehicle which, due to the surrounding vehicle structures, might be otherwise difficult to perceive. When an obstacle is detected, the system uses graphics and chimes to provide the vehicle operator with visual and audible indications of the presence and proximity of such objects.

The PPPA is also capable of providing an autonomous brake warning (also known as brake and release) feature. When enabled, this feature will alert the vehicle operator when the automatic transmission gear selector is in the Reverse (**R**) position and an object is detected in the rear path of the vehicle by aggressively applying and releasing the brakes. Following an autonomous brake warning application, an icon representing the rear of the vehicle with three red arcs and the text **BRAKE!** will appear in the Electronic Vehicle Information Center (EVIC) within the Instrument Cluster (IC) (also known as the Instrument Panel Cluster/IPC). This brake warning feature is not available in vehicles equipped with a manual transmission.

Finally, the PPPA provides a semiautomatic parallel and perpendicular park assist feature. When enabled, this feature will identify a suitable parking spot and help to steer the vehicle into a selected parallel or perpendicular parking spot accordingly.

The PPPA system includes the following major components, which are described in further detail elsewhere in this service information:

- **Antilock Brake Module** - The Antilock Brake Module (ABM) controls the application of the vehicle brakes to implement the autonomous brake warning feature when it receives the appropriate electronic message input over the Controller Area Network (CAN) data bus from the Park Assist Module (PAM).
- **Body Control Module** - The Body Control Module (BCM) serves as the gateway between the Controller Area Network (CAN) C and the CAN Interior High Speed (IHS) data bus networks used to communicate between the Park Assist Module (PAM), the Antilock Brake Module (ABM), the Electronic Power Steering (EPS) module, the Instrument Cluster (IC) (also known as the Instrument Panel Cluster/IPC) and the Radio Receiver Module (RRM).
- **Electronic Power Steering Module** - The Electronic Power Steering (EPS) module controls the vehicle steering in order to maneuver the vehicle into a selected parallel or perpendicular parking space based upon electronic message inputs received over the Controller Area Network (CAN) data bus from the Park Assist Module (PAM).

- **Instrument Cluster** - In vehicles equipped with the optional PPPA system, the Electronic Vehicle Information Center (EVIC) within the Instrument Cluster (IC) (also known as the Instrument Panel Cluster/IPC) displays vehicle graphics and amber or red arc sections that illustrate the approximate location of obstacles within the front or rear paths of the vehicle. The EVIC displays graphics and text to support the parallel and perpendicular parking features, textual warnings and error messages along with issuing audible alerts related to the current operating status of the PPPA system.
- **Parallel And Perpendicular Park Assist On Switch** - The Parallel and Perpendicular Park Assist (PPPA) features of the optional PPPA system can be selected and toggled using a PPPA On switch. The PPPA On switch is integral to the instrument panel switch pod (also known as the Accessory Switch Bank Module/ASBM) in the instrument panel center stack below the heater and air conditioner controls. This switch allows the operator to turn the PPPA features On and toggle between the parallel and the perpendicular park assist features.
- **Park Assist Module** - Vehicles equipped with the PPPA system include a 12 channel Park Assist Module (PAM) (also known as the ParkTronic System/PTS module), which is secured through integral mounting tabs to weld studs on the left quarter inner panel just behind the left rear wheel house, where it is concealed beneath the quarter inside trim within the cargo area of the vehicle.
- **Park Assist Off Switch** - The optional PPPA system can be manually disabled or enabled using a park assist Off switch. The park assist Off switch is integral to the instrument panel switch pod (also known as the Accessory Switch Bank Module/ASBM) in the instrument panel center stack below the heater and air conditioner controls. This switch allows the operator to turn the FRPA system Off.
- **Park Assist Sensors** - Vehicles equipped with the PPPA system have twelve ultrasonic park assist sensors. Six are concealed behind the rear bumper fascia and six are concealed behind the front bumper fascia. Only the sensor membrane is visible on the outer surface of the bumper fascia. Each sensor is snapped into an individual molded plastic mounting bracket located at horizontal intervals along the inside surfaces of the front and rear bumper fascias.
- **Radio Receiver Module** - In vehicles equipped with the PPPA system, the PAM sends electronic message requests to the RRM to generate audible signals indicating the approximate distance of obstacles from the front and rear paths of the vehicle. The RRM is capable of generating repetitive single chime tones at several varying frequencies or continuous tones through the front or rear audio system speakers. If the audio system speakers are already in use, the RRM will mute that output during chime tone generation. In addition, the RRM provides an interface that allows the vehicle operator to manually disable or enable the PPPA system using the customer programmable features option.

OPERATION

BLIND SPOT MONITOR SYSTEM

The primary components of the Blind Spot Monitor (BSM) system are the micro-controller based Electronic Control Units (ECU) integral to each of the two RAdio Detection And Ranging (RADAR) sensors, one behind each outboard side of the rear bumper fascia. Each ECU operates on battery current received from a fuse in the interior Power Distribution Center (PDC) whenever the status of the ignition switch is On, and the ECU has a path to ground at all times through a take out and eyelet terminal of the body wire harness that is secured to the body sheet metal. Each of these ECU communicate with each other as well as with other electronic modules in the vehicle over the Controller Area Network (CAN) data bus network.

The BSM system ECU continually monitor all of the BSM system circuits and components for readiness, and will store a Diagnostic Trouble Code (DTC) for any fault that is detected. The ECU also communicate with a diagnostic scan tool over the CAN data bus. When a BSM system ECU stores a DTC, it sends an electronic request message to the Electronic Vehicle Information Center (EVIC) in the Instrument Cluster (IC) (also known as the Instrument Panel Cluster/IPC) and a **SERVICE BLIND SPOT SYSTEM** or **BLIND SPOT SYSTEM TEMPORARILY UNAVAILABLE** textual message is displayed by the EVIC to alert the vehicle operator.

The BSM system ECU also monitor electronic messages received over the CAN data bus from the Radio Receiver Module (RRM) (also known as the radio or the head unit) indicating the customer programmable features settings for the BSM system. The BSM system ECU receive and analyze data inputs directly from the radar sensors, calculate and provide the proper hard wired outputs to illuminate the visual alert displays in their respective right or left outside rear view mirrors, as well as calculate and communicate the proper audible alert output requests to the RRM over the CAN data bus.

The BSM radar sensors allow the BSM system ECU to locate and identify nearby objects of interest meeting the criteria established by algorithms within the system software. The BSM displays provide the vehicle operator with a visual alert indicating that an object of interest has been detected within one of the vehicle detection zones. The BSM audible alerts are then issued by the RRM through the appropriate audio system speakers based upon electronic **audible alert request** messages received from the BSM system ECU. The BSM system ECU also send electronic **radio mute request** messages over the CAN data bus to the RRM whenever an audible alert is requested. This message activates the radio mute function while the audible alert is being sounded, then resumes normal radio function when the alert is completed.

The hard wired circuits between components related to the BSM system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the BSM system or the electronic controls and communication between ECU and other devices that provide some features of this system. The most reliable, efficient and accurate means to diagnose the BSM system or the ECU and communication related to BSM system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

BLIND SPOT MONITOR MODE

Unless disabled in the customer programmable features settings received through the Radio Receiver Module (RRM) (also known as the radio or the head unit), the Blind Spot Monitor (BSM) mode is active only when the manual transmission gear selector is in a position other than Reverse (**R**) or the automatic transmission gear selector is in a position other than Reverse (**R**) or Park (**P**). The BSM mode is intended to provide a visual alert to the driver when a target vehicle (object of interest) is located in the lane adjacent to and just behind either outside rear view mirror (the detection zone), in the blind spot area where vision of target vehicles may be inhibited by the rear structure of the host vehicle. If a turn signal is activated in the host vehicle in the same direction as that in which the target vehicle is located, an audible alert tone will also be generated. The audible alerts of the BSM mode are not active unless the turn signal is activated.

The width of the BSM mode detection zone covers one traffic lane over on each side of the host vehicle, approximately 4.0 meters (13 feet). The length of the BSM mode detection zone starts at the outside rear view mirror and extends approximately 4.5 meters (15 feet) rearward from the rear edge of the rear fascia. The BSM mode visual alerts are activated immediately if an object of interest is within the detection zone and meets the warning criteria. However, the BSM system will not activate these alerts if:

- The object of interest (target vehicle) comes from the rear of the detection zone and passes the host vehicle at a speed greater that 50 kilometers-per-hour (31 miles-per-hour).
- The object of interest (target vehicle) enters the detection zone from the front and remains in the zone for less than 1.5 seconds.
- The object of interest (target vehicle) passes through the detection zone with a relative speed greater than 20 kilometers-per-hour (12 miles-per-hour).
- The object of interest (target vehicle) passes the host vehicle from the opposite direction.

The BSM mode audible alert may be deactivated if the operator prefers using the customer programmable features settings within the RRM. The BSM mode can be configured for visual and audible alerts, visual alerts only or for the entire BSM system (including Rear Cross Path/RCP mode) to be turned Off.

REAR CROSS PATH MODE

Unless disabled in the customer programmable features settings received through the Radio Receiver Module (RRM) (also known as the radio or the head unit), the Blind Spot Monitor (BSM) system provides a feature called Rear Cross Path (RCP) mode. The RCP mode is active only when the transmission gear selector (manual or automatic) is in the Reverse (**R**) position. The RCP mode is intended to aid the driver when backing out of parking spaces where vision of vehicles crossing laterally through the rear path of the host vehicle may be blocked. The host vehicle must proceed slowly and cautiously out of the parking space until the rear end of the vehicle is exposed. The BSM radar sensors will then have a clear view of the crossing traffic and, if an oncoming vehicle (object of interest) is detected, will generate visual and audible alerts to the operator of the host vehicle.

The BSM system monitors the rear detection zones on both sides of the vehicle for objects that are moving toward the side of the vehicle with speeds of from 1 to 3 kilometers-per-hour (1 to 2 miles-per-hour) up to 35 kilometers-per-hour (22 miles-per-hour), such as typically encountered in parking lot situations. In vehicles equipped with the BSM option, the RCP mode is enabled from the factory as a default. The RCP mode can be manually disabled and enabled by the vehicle operator using the customer programmable features option of the RRM.

The RCP mode normally uses the same BSM system customer programmable features settings. However, the RCP mode will always include the audible alert feature, even if it was disabled for the BSM mode using the RRM customer programmable features settings. The audible alert can not be deactivated for the RCP mode. The RCP mode visual alert is illuminated only in the display located on the same side of the vehicle where the object of interest is detected. Likewise, the RCP mode repeating short audible alert is issued only through the audio system speakers located on the same side of the vehicle where the object of interest is detected.

STANDBY MODE

The Blind Spot Monitor (BSM) system remains in standby mode as long as the park brake is applied in a

vehicle with a manual transmission, or while the automatic transmission gear selector lever is in the Park (**P**) position. In the standby mode the system receives vehicle information, responds to changes in customer programmable features settings received through the Radio Receiver Module (RRM) (also known as the radio or the head unit) and can perform limited self-diagnostics indicating hard system fault conditions.

CHIME WARNING SYSTEM

The chime warning system operates on battery current received from the Body Control Module (BCM) on a non-switched fused B(+) circuit so that the system may operate regardless of the ignition switch status. The chime warning system also monitors the ignition switch status so that some chime features are functional only when the status of the ignition switch is On, while other features are functional regardless of the ignition switch status.

In nearly every instance the chime warning system simply provides an audible output to support a visual indication provided by a gauge or an indicator in the Instrument Cluster (IC) (also known as the Instrument Panel Cluster/IPC), or a textual message displayed by the Electronic Vehicle Information Center (EVIC). Outputs of the system include the following:

- **Battery Voltage Low Warning** - The IC transducer will generate one short chime when the **BATTERY VOLTAGE LOW** textual message is displayed in the EVIC. This warning indicates that the monitored electrical system voltage is low. This chime will only occur once during any ignition cycle.
- **Blind Spot Detection Temporarily Unavailable Warning** - The IC transducer will generate one short chime when the **BLIND SPOT DETECTION TEMPORARILY UNAVAILABLE** textual message is displayed in the EVIC. This warning indicates that the optional Blind Spot Monitor (BSM) system has been automatically disabled temporarily.
- **Blind Spot Detection Unavailable - Astronomy Zone Warning** - The IC transducer will generate one short chime when the **BLIND SPOT DETECTION UNAVAILABLE - ASTRONOMY ZONE** textual message is displayed in the EVIC. This warning indicates that the optional Blind Spot Monitor (BSM) system has been automatically turned Off.
- **Blind Spot Detection Unavailable - Wipe Off Rear Bumper Warning** - The IC transducer will generate one short chime when the **BLIND SPOT DETECTION UNAVAILABLE - WIPE OFF REAR BUMPER** textual message is displayed in the EVIC. This warning indicates that the optional Blind Spot Monitor (BSM) system has been automatically disabled due to an accumulation of road film, snow or ice on the rear bumper fascia that must be removed. This chime will occur each time the BSM system features would normally be employed.
- **Blind Spot System Off Warning** - The IC transducer will generate one short chime when the **BLIND SPOT SYSTEM OFF** textual message is displayed in the EVIC. This warning indicates that the optional Blind Spot Monitor (BSM) system has been manually turned Off by the vehicle operator.
- **Brake Fluid Low Warning** - The IC transducer will generate one short chime when the **BRAKE FLUID LOW** textual message is displayed in the EVIC. This warning indicates that the fluid level in the brake master cylinder is low. This chime will only occur once during any ignition cycle.
- **Check Fuel Cap Warning** - The IC transducer will generate one short chime when the **CHECK FUEL CAP** textual message is displayed in the EVIC. This warning indicates that the fuel cap is loose or not installed while the engine is running.
- **Door Open Warning** - The IC transducer will generate repetitive chimes at a slow rate when a **DOOR**

OPEN or **DOORS OPEN** textual message is displayed in the EVIC. This warning indicates that a door is, or multiple doors are not closed or completely latched while the vehicle is moving.

- **Driver Seat Belt Unbuckled Warning** - The IC transducer will generate repetitive chimes at a slow rate when the **DRIVER SEATBELT UNBUCKLED** textual message is displayed in the EVIC. This warning indicates that the driver side front seat belt is unbuckled while the vehicle is moving.
- **Engine Temperature Too Hot Warning** - The IC transducer will generate repetitive chimes at a slow rate when the **ENGINE TEMPERATURE TOO HOT** textual message is displayed in the EVIC. This warning indicates that the monitored engine coolant temperature is too hot. This chime will only recur during an ignition cycle if the engine coolant temperature cycles below the temperature threshold and back to above that threshold once again.
- **Front Seat Belts Unbuckled Warning** - The IC transducer will generate repetitive chimes at a slow rate when the **FRONT SEAT BELTS UNBUCKLED** textual message is displayed in the EVIC. This warning indicates that both the driver side and passenger side front seat belts are unbuckled while the vehicle is moving.
- **Fuel Low Warning** - The IC transducer will generate one short chime when the **FUEL LOW** textual message is displayed in the EVIC. This warning indicates that the monitored fuel level in the fuel tank is low. This chime will only occur once during any ignition cycle.
- **Headlight Out Warning** - The IC transducer will generate one short chime when the **HEADLIGHT OUT** textual message is displayed in the EVIC. This warning indicates that a Diagnostic Trouble Code (DTC) has been set for a fault monitored in a low beam headlight circuit. This chime will only occur once during any ignition cycle.
- **High Beam Headlight Out Warning** - The IC transducer will generate one short chime when the **HIGH BEAM HEADLIGHT OUT** textual message is displayed in the EVIC. This warning indicates that a Diagnostic Trouble Code (DTC) has been set for a fault monitored in a high beam headlight circuit. This chime will only occur once during any ignition cycle.
- **Ignition Or Accessory On, Lights On Warning** - The IC transducer will generate repetitive chimes at a slow rate when the **IGNITION OR ACCESSORY ON, LIGHTS ON** textual message is displayed in the EVIC. This warning indicates that the status of the ignition switch, an accessory system and the exterior lighting is On with the driver side front door open. The chimes will continue to sound until the status of the ignition switch, all accessory systems and the exterior lighting system is Off, or until the driver side front door is closed, whichever occurs first.
- **Inflate Tire Warning** - The IC transducer will generate one short chime when the **INFLATE TIRE TO XX Kpa (PSI)** textual message is displayed in the EVIC. This warning indicates that the Tire Pressure Monitor (TPM) system has detected a tire with a low inflation pressure. This chime will only occur once during any ignition cycle.
- **Key Fob Has Left Vehicle Warning** - The IC transducer will generate repetitive chimes at a slow rate when the **KEY FOB HAS LEFT VEHICLE** textual message is displayed in the EVIC. This warning indicates that the optional Keyless Go (KG) system will not operate until a valid key fob is detected within the vehicle.
- **Key Fob Not Detected Warning** - The IC transducer will generate repetitive chimes at a slow rate when the **KEY FOB NOT DETECTED** textual message is displayed in the EVIC. This warning indicates that the optional Keyless Go (KG) system will not operate until a valid key fob is detected within the vehicle.
- **Key In Ignition And Lights On Warning** - The IC transducer will generate repetitive chimes at a slow rate when the **KEY IN IGNITION AND LIGHTS ON** textual message is displayed in the EVIC. This warning indicates that the key is in the ignition switch and the exterior lighting system is turned On. The

chimes will continue to sound until the key is removed from the ignition switch or the exterior lighting system is turned Off, whichever occurs first.

- **Key In Ignition Warning** - The IC transducer will generate repetitive chimes at a fast rate when the **KEY IN IGNITION** textual message is displayed in the EVIC. This warning indicates that the key is in the ignition switch with the driver side front door open. The chimes will continue to sound until the key is removed from the ignition switch or the driver side front door is closed, whichever occurs first.
- **Left Turn Signal Light Out Warning** - The IC transducer will generate one short chime when the **LEFT TURN SIGNAL LIGHT OUT** textual message is displayed in the EVIC. This warning indicates that a Diagnostic Trouble Code (DTC) has been set for a fault monitored in a left turn signal light circuit. This chime will only occur once during any ignition cycle.
- **Lights On Warning** - The IC transducer will generate repetitive chimes at a slow rate when the **LIGHTS ON** textual message is displayed in the EVIC. This warning indicates that the exterior lighting is turned On while the status of the ignition switch is Off. The chimes will continue to sound until the exterior lighting is turned Off or the ignition switch transitions to a status other than Off, whichever occurs first.
- **Oil Change Due Warning** - The IC transducer will generate one short chime when the **OIL CHANGE DUE** textual message is displayed in the EVIC. This warning indicates that the monitored engine oil change interval has been surpassed. This chime will only occur once during any ignition cycle.
- **Oil Pressure Low Warning** - The IC transducer will generate one short chime when the **OIL PRESSURE LOW** textual message is displayed in the EVIC. This warning indicates that the monitored engine oil pressure is low.
- **Park Assist Sensor Fail Warning** - The IC transducer will generate one short chime when the **PARK ASSIST SENSOR FAIL** textual message is displayed in the EVIC. This warning indicates that a sensor of the optional park assist system has failed.
- **Park Assist System Disabled Warning** - The IC transducer will generate one short chime when the **PARK ASSIST SYSTEM DISABLED** textual message is displayed in the EVIC. This warning indicates that the optional park assist system has been automatically disabled due to a fault in a monitored circuit or component of the system. This chime will occur each time the park assist system features would normally be employed.
- **Park Assist Unavailable - Wipe Off Sensors Warning** - The IC transducer will generate one short chime when the **PARK ASSIST UNAVAILABLE - WIPE OFF SENSORS** textual message is displayed in the EVIC. This warning indicates that the optional park assist system has been automatically disabled due to an accumulation of road film, snow or ice on the sensor membrane that must be removed. This chime will occur each time the park assist system features would normally be employed.
- **Parking Brake Engaged Warning** - The IC transducer will generate one short chime when the **PARKING BRAKE ENGAGED** textual message is displayed in the EVIC. This warning indicates that the parking brake is engaged while the vehicle is moving. This chime will only occur once during any ignition cycle.
- **Parking Light Out Warning** - The IC transducer will generate one short chime when the **PARKING LIGHT OUT** textual message is displayed in the EVIC. This warning indicates that a Diagnostic Trouble Code (DTC) has been set for a fault monitored in a parking light circuit. This chime will only occur once during any ignition cycle.
- **Passenger Seat Belt Unbuckled Warning** - The IC transducer will generate repetitive chimes at a slow rate when the **PASSENGER SEATBELT UNBUCKLED** textual message is displayed in the EVIC. This warning indicates that the passenger side front seat belt is unbuckled while the vehicle is moving.

- **Plate Light Out Warning** - The IC transducer will generate one short chime when the **PLATE LIGHT OUT** textual message is displayed in the EVIC. This warning indicates that a Diagnostic Trouble Code (DTC) has been set for a fault monitored in a license plate light circuit. This chime will only occur once during any ignition cycle.
- **Rain Sensor Failure Warning** - The IC transducer will generate one short chime each time the **RAIN SENSOR FAILURE** textual message is displayed in the EVIC. This warning indicates that a Diagnostic Trouble Code (DTC) has been set for a fault monitored in the rain sensor in vehicles equipped with the optional automatic windshield wiper system. This chime will only occur once during any ignition cycle.
- **Reverse Light Out Warning** - The IC transducer will generate one short chime when the **REVERSE LIGHT OUT** textual message is displayed in the EVIC. This warning indicates that a Diagnostic Trouble Code (DTC) has been set for a fault monitored in a reverse (or backup) light circuit. This chime will only occur once during any ignition cycle.
- **Right Turn Signal Light Out Warning** - The IC transducer will generate one short chime when the **RIGHT TURN SIGNAL LIGHT OUT** textual message is displayed in the EVIC. This warning indicates that a Diagnostic Trouble Code (DTC) has been set for a fault monitored in a right turn signal light circuit. This chime will only occur once during any ignition cycle.
- **Service Airbag System Warning** - The IC transducer will generate one short chime each time the **SERVICE AIRBAG SYSTEM** textual message is displayed in the EVIC. This warning indicates that a Diagnostic Trouble Code (DTC) has been set for a fault monitored in a circuit or component of the Supplemental Restraint System (SRS). This chime will only occur once during any ignition cycle.
- **Service Airbag Warning Light** - The IC transducer will generate one short chime each time the **SERVICE AIRBAG WARNING LIGHT** textual message is displayed in the EVIC. This warning indicates that a Diagnostic Trouble Code (DTC) has been set for a fault monitored in the airbag indicator circuit of the Supplemental Restraint System (SRS). This chime will only occur once during any ignition cycle.
- **Service Antilock Brake System Warning** - The IC transducer will generate one short chime each time the **SERVICE ANTILOCK BRAKE SYSTEM WARNING** textual message is displayed in the EVIC. This warning indicates that a Diagnostic Trouble Code (DTC) has been set for a fault monitored in a circuit or component of the Antilock Brake System (ABS). This chime will only occur once during any ignition cycle.
- **Service Blind Spot System Warning** - The IC transducer will generate one short chime each time the **SERVICE BLIND SPOT SYSTEM** textual message is displayed in the EVIC. This warning indicates that a Diagnostic Trouble Code (DTC) has been set for a fault monitored in a circuit or component of the optional Blind Spot Monitor (BSM) system. This chime will only occur once during any ignition cycle.
- **Service Electronic Braking System Warning** - The IC transducer will generate one short chime each time the **SERVICE ELECTRONIC BRAKING SYSTEM** textual message is displayed in the EVIC. This warning indicates that a Diagnostic Trouble Code (DTC) has been set for a fault monitored in a circuit or component of the electronic braking system. This chime will only occur once during any ignition cycle.
- **Service Electronic Throttle Control Warning** - The IC transducer will generate one short chime each time the **SERVICE ELECTRONIC THROTTLE CONTROL** textual message is displayed in the EVIC. This warning indicates that a Diagnostic Trouble Code (DTC) has been set for a fault monitored in a circuit or component of the Electronic Throttle Control (ETC) system. This chime will only occur once during any ignition cycle.
- **Service Keyless System Warning** - The IC transducer will generate one short chime when the

SERVICE KEYLESS SYSTEM textual message is displayed in the EVIC. This warning indicates that a Diagnostic Trouble Code (DTC) has been set for a fault monitored in a circuit or component of the optional Passive Entry Keyless Go (PEKG) system.

- **Service Park Assist System Warning** - The IC transducer will generate one short chime when the **SERVICE PARK ASSIST SYSTEM** textual message is displayed in the EVIC. This warning indicates that a Diagnostic Trouble Code (DTC) has been set for a fault monitored in a circuit or component of the optional park assist system. This chime will only occur once during any ignition cycle.
- **Service Power Steering Warning** - The IC transducer will generate one short chime when the **SERVICE POWER STEERING** textual message is displayed in the EVIC. This warning indicates that a Diagnostic Trouble Code (DTC) has been set for a fault monitored in a circuit or component of the electric power steering system. This chime will only occur once during any ignition cycle.
- **Service Tire Pressure System Warning** - The IC transducer will generate one short chime each time the **SERVICE TIRE PRESSURE SYSTEM** textual message is displayed in the EVIC. This warning indicates that a Diagnostic Trouble Code (DTC) has been set for a fault monitored in a circuit or component of the Tire Pressure Monitor (TPM) system. This chime will only occur once during any ignition cycle.
- **Traction Control Off Warning** - The IC transducer will generate one short chime when the **TRACTION CONTROL OFF** textual message is displayed in the EVIC. This warning indicates that the Electronic Stability Control (ESC) has been manually turned Off by the vehicle operator.
- **Trunk Open Warning** - The IC transducer will generate repetitive chimes at a slow rate when the **TRUNK OPEN** textual message is displayed in the EVIC. This warning indicates that the trunk (deck lid) is not closed or completely latched while the vehicle is moving.
- **Turn Signal Indication** - The IC relay will generate repetitive clicks at a slow rate whenever a turn signal is active. The clicks will occur at a fast rate when a turn signal bulb outage is detected.
- **Turn Signal On Reminder** - The IC transducer will generate repetitive chimes at a slow rate when the **TURN SIGNAL ON** textual message is displayed in the EVIC. This reminder indicates that a turn signal has been active continuously for 1.6 kilometers (1 mile) with the vehicle moving. The hazard warning flashers will not activate this chime feature.
- **Vehicle Not In Park Warning** - The IC transducer will generate one short chime when the **VEHICLE NOT IN PARK** textual message is displayed in the EVIC. This warning indicates that the PARK position of the transmission is not engaged.
- **Washer Fluid Low Warning** - The IC transducer will generate one short chime when the **WASHER FLUID LOW** textual message is displayed in the EVIC. This warning indicates that the fluid level in the windshield washer reservoir is low. This chime will only occur once during any ignition cycle.

The IC provides chime service for all available features in the chime warning system, except for the audible warning function provided by the Radio Receiver Module (RRM) for the optional park assist system. The IC relies upon its internal programming, numerous hard wired inputs and electronic message inputs received from other electronic modules over the Controller Area Network (CAN) data bus to provide the chime warning system features. The programming of the IC determines the priority of each chime request input that is received, as well as the rate and duration of each chime that is to be generated.

The hard wired circuits between components related to the chime warning system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness

routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the chime warning system or the electronic controls and communication between modules and other devices that provide some features of the chime warning system. The most reliable, efficient and accurate means to diagnose the chime warning system or the electronic controls and communication related to chime warning system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

FORWARD COLLISION WARNING PLUS

The Forward Collision Warning Plus (FCW+) system is only active when the status of the ignition switch is ON and the PRNDL is in D (Drive). The system can be manually disabled and enabled by the vehicle operator using hard button on the Auxiliary Switch Bank Module (ASBM). The default status of FCW+ is "On". The system state is kept in memory from one key cycle to the next. If the system is turned OFF, it will remain OFF when the vehicle is restarted. The minimum speed for FCW+ activation is 5 mph (10 km/h).

Components that make up the FCW+ system are the Forward Facing Camera (FFC), Powertrain Control Module (PCM), ASBM and the Adaptive Cruise Control Plus (ACC+) radar sensor/module. The radar module is the component that is responsible for the FCW+, Lane Departure Warning Plus (LDW+) and ACC+ decision making. The radar sensor receives data from the FFC and performs a data fusion with its own sensor data. At this point, the radar determines if a FCW+, LDW+ or ACC+ event needs to occur.

Since there are multiple modules involved in the operation of the FCW+ system, all faults or diagnostic trouble codes should be checked during diagnosis. The system utilizes the radar sensor in front of the vehicle, so any alignment or configuration issues may cause the system to be inoperative. If the ACC radar detects incorrect or compromised information from the FFC, the ACC+/FCW+ will function in an limited capacity. If the data consistency continue to occur from the FFC, a fault code will set.

NOTE: The FCW+ does not stop the vehicles automatically, but alerts and assists the driver to help avoid or mitigate a collision. If the driver does not respond to any of the audible, visual, and haptic warnings, the impact may not be avoided

The FCW+ system uses fusion of the sensor data from the ACC radar and the FFC to detect a probable frontal or forward collision. The following actions will be performed when qualified:

- **Pre Fill -**

  The pre-fill process prepares the brakes for emergency braking by engaging the pump and applying a small amount of pressure to the brakes. This allows for immediate braking. Sufficient pressure applied between the brake pads and the discs means that driver intervention has a more immediate impact.

- **Audible and Visual Warnings -** Audible sounds within the cabin of the vehicle and visual warnings shown within the EVIC are activated when necessary to notify the driver.
- **Brake Jerk -** A short deceleration is performed to alert the driver.
- **Collision Mitigation System (CMS) -** CMS assists braking operation by automatically applying an

appropriate amount of braking force to help avoid or minimize the chances of hitting a vehicle. CMS allows up to 1.5 seconds of braking to give the driver additional reaction time. When CMS activates its automatic brake, it also turns the brake lights on.

- **Advanced Brake Assist (ABA) -** Once the driver presses the brake pedal, advanced brake assist (ABA) will engage If the driver is not applying enough force. ABA will increase the braking force required to avoid or mitigate the accident. If the driver does not react to any of the previous warnings, the collision cannot be avoided.

The hard wired circuits between components related to the FCW+ system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the FCW+ system or the electronic controls and communication between modules and other devices that are provided some features of the FCW+ system. The most reliable, efficient and accurate means to diagnose the system or the electronic controls and communication related to the FCW+ system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

LANE DEPARTURE WARNING (LDW+)

The purpose of the Lane Departure Warning (LDW+) system is to provide a warning alert to the driver in case of an unintended lane departure (i.e the driver did not use turn signals beforehand to confirm a planned lane change).

The LDW+ system will be enabled and ready to provide feedback when the following conditions are met:

- System voltage is in a normal operating range.
- The vehicle ignition is in the ON/RUN state & driver has enabled the system & reverse gear is NOT engaged.
- No LDW+ system faults are present.
- Roads with positive or negative inclination transition (change in road grade) of up to 5%
- Left and Right lane boundaries are both detected simultaneously. (HAPTIC only)
- Vehicle speed is above 37 mph (60 km/h) and below 100 mph (180 km/h)
- No intervention of the safety systems ABS, ESP and DAS Safety Requests, e.g. ABA, ACC takeover request, FCW, etc. Note: After the intervention of a safety system has ended, the LDW+ system can only provide haptic feedback warnings again after a calibratable period has been allowed to elapse.

The LDW+ system will retain the last system state (enabled or disabled) and the last lane warning sensitivity selected in the radio from the last ignition cycle when the ignition is changed to the On/Run position.

The system can be overridden by the driver using a variety of methods, including turn signals, driver steering torque, steering torque rate, and acceleration and deceleration rate. The LDW+ system can also be turned on or off with a single hard button on the switch bank. The LED on the button will inform the driver of the system status when the driver is not on the driver assist screen in the EVIC. The feature will automatically disable when a safety system engages (such as traction control).

The main component of the LDW+ system is the forward facing camera. The camera mounts near the rear view mirror and communicates on the CAN-C bus. The camera also has a dedicated private CAN B bus that connects directly to the radar sensor and that is used for forward collision warning and adaptive cruise control. The camera has the ability to detect alignment faults and is adjusted similar to the smart beam camera.

Another important factor in system operation is road condition. The forward facing camera has the ability to detect the contrast of the surface of the pavement and the white or yellow lines. Roads that are not marked or that have extremely worn markings may not be detected by the camera which will disable the system. While monitoring the EVIC display for driver assist systems, a customer can tell if the system is enabled by the solid lines on the display. This is also important for diagnosing an intermittent or inoperative concern.

The system also monitors the torque sensor inside the EPS to verify the driver's hands remain on the wheel. If no driver's steering input is received, the system will deactivate until all enabling conditions are met. These Include:

- Drivers steering input.
- The FFC can clearly detect the lines in the road.
- There are no Diagnostic Trouble Codes (DTC) present in the steering or LDW+ system.
- Vehicle speed is above 37 mph (60 km/h) and below 100 mph (180 km/h).

COMPONENT RESPONSIBILITY - BODY CONTROL MODULE (BCM)

- Acquisition on the CAN-C bus of the LDW+ system enabled/disabled status from the Forward Facing Camera (FFC) to control the Auxiliary Switch Bank Module (ASBM) LED indication.

- Acquisition on the CAN-C bus of the chime request from the FFC to inform the driver to place his/her hands on the steering wheel.
- Acquisition on the CAN-C bus of the current LDW+ system sensitivity setting from the FFC.
- Acquisition on the CAN-C bus of the current LDW+ system torque intensity setting from the FFC.
- Acquisition on the LIN bus of the LDW+ system enable/disable switch (pressed/not pressed) status from the ASBM.
- Gates the ASBM on/off signal command on LIN to a signal on CAN-C.
- Gates the current ASBM status signal on CAN-C to the BCM concerning an ASBM control signal on the LIN bus.
- Transmission on the CAN-B bus of the chime request to the Radio to inform the driver to place his/her hands on the steering wheel (audible alert).
- Transmission on the CAN-B bus of the LDW+ system current sensitivity setting to the Radio.
- Transmission on the CAN-B bus of the LDW+ system current torque intensity setting to the Radio.
- Transmission on the CAN-C bus of the brake pedal status to the FFC.
- Transmission on the CAN-C bus of the (left/right) turn signal lamp status to the FFC.
- Transmission on the CAN-C bus of the wiper status (parked/not parked) to the FFC.
- Transmission on the CAN-C bus of the LDW+ system enable/disable request to the FFC (gated from LIN).
- Transmission on the CAN-C bus of the LDW+ system sensitivity setting request (gated from CAN-B) to the FFC.
- Transmission on the CAN-C bus of the LDW+ system torque intensity setting request (gated from CAN-B) to the FFC.
- Transmission on the LIN bus of the LDW+ system enable/disable switch indicator control status to the ASBM (gated from CAN-C).

COMPONENT RESPONSIBILITY - ELECTRONIC POWER STEERING (EPS)

- Apply directional torque to the steering wheel based on lane position of vehicle during an unintentional lane departure.
- Manage the Torque Overlay Interface (TOI).
- Acquisition on the CAN-C bus of the torque overlay interface activation request from the FFC.
- Acquisition on the CAN-C bus of the FFC system status from the FFC.
- Acquisition on the CAN-C bus of the FFC drive style status from the FFC.
- Transmission on the CAN-C bus of the steering angle and steering angle rate to the FFC.
- Transmission on the CAN-C bus of the FFC Torque Overlay Interface activation status to the FFC.
- Transmission on the CAN-C bus of the FFC Torque Overlay Interface fault status to the FFC.
- Transmission on the CAN-C bus of the DST Torque Overlay Interface activation status to the FFC.
- Transmission on the CAN-C bus of the EPS temporary deactivation status to the FFC.
- Transmission on the CAN-C bus of the steering column torque to the FFC.
- Transmission on the CAN-C bus of the steering column torque validity to the FFC.

- Transmission on the CAN-C bus of the EPS motor torque to the FFC.
- Transmission on the CAN-C bus of the EPS motor torque validity to the FFC.

COMPONENT RESPONSIBILITY - FORWARD FACING CAMERA (FFC)

- Monitor the road scenario.
- Process the video image.
- Quantify the geometry of the lane boundaries in front of the vehicle.
- Calculate the torque request to control the vehicle response based on lane position of vehicle.
- Evaluate the "Hands Off" condition. When the driver's hands are not detected on the steering wheel, the system provides an audible warning consisting of left front and right front chimes to inform the driver to place his/her hands on the steering wheel.
- Acquisition on the CAN-C bus of the EPS motor torque from the EPS.
- Acquisition on the CAN-C bus of the FFC Torque Overlay Interface activation status from the EPS.
- Acquisition on the CAN-C bus of the FFC Torque Overlay Interface fault status from the EPS.
- Acquisition on the CAN-C bus of the effective torque applied on the steering wheel from the EPS.
- Acquisition on the CAN-C bus of the brake pedal status from the BCM.
- Acquisition on the CAN-C bus of the (left/right) turn signal request status from the SCCM.
- Acquisition on the CAN-C bus of the (left/right) turn signal lamp status from the BCM.
- Acquisition on the CAN-C bus of the wiper status (parked/not parked) from the BCM.
- Acquisition on the CAN-C bus of the LDW+ system enable/disable request from the BCM.
- Acquisition on the CAN-C bus of the customer-selected LDW+ system sensitivity setting from the BCM.
- Acquisition on the CAN-C bus of the customer-selected LDW+ system torque intensity setting from the BCM.
- Acquisition on the CAN-C bus of the ABS status from the BSM.
- Acquisition on the CAN-C bus of the ESC status from the BSM.
- Acquisition on the CAN-C bus of the DAS request active status from the BSM.
- Acquisition on the CAN-C bus of the vehicle speed from the BSM.
- Acquisition on the CAN-C bus of the yaw rate offset from the BSM.
- Acquisition on the CAN-C bus of the lateral acceleration offset from the BSM.
- Acquisition on the CAN-C bus of the longitudinal acceleration offset from the BSM.
- Acquisition on the CAN-C bus of the ACC takeover request from the DASM.
- Acquisition on the CAN-C bus of the Forward Collision Warning system status from the DASM.
- Acquisition on the CAN-C bus of the engine start/stop status from the ECM.
- Acquisition on the CAN-C bus of the gas pedal position from the ECM.
- Acquisition on the CAN-C bus of the reverse gear status from the ECM.
- Acquisition on the CAN-C bus of the steering angle from the EPS.
- Acquisition on the CAN-C bus of the steering angle rate from the EPS.
- Acquisition on the CAN-C bus of the DST Torque Overlay Interface activation status from the EPS.

- Acquisition on the CAN-C bus of the EPS temporary deactivation status from the EPS.
- Acquisition on the CAN-C bus of the yaw rate from the ORC.
- Acquisition on the CAN-C bus of the lateral acceleration from the ORC.
- Acquisition on the CAN-C bus of the longitudinal acceleration from the ORC.
- Transmission on the CAN-C bus of the torque request to the EPS.
- Transmission on the CAN-C bus of the LDW+ system enabled/disabled status to the BCM.
- Transmission on the CAN-C bus of the chime request to the BCM (gateway) to inform the driver to place his/her hands on the steering wheel.
- Transmission on the CAN-C bus of the current LDW+ system sensitivity and torque intensity settings to the BCM and IPC.
- Transmission on the CAN-C bus of the LDW+ lane boundary detection status to the IPC.
- Transmission on the CAN-C bus of the LDW+ warning status to the IPC.
- Transmission on the CAN-C bus of the LDW+ ISO telltale status to the IPC.
- Transmission on the CAN-C bus of the LDW+ display popup status to the IPC.
- Transmission on the CAN-C bus of the LDW+ fault status to the IPC.

COMPONENT RESPONSIBILITY - INSTRUMENT PANEL CLUSTER (IPC)

- Display LDW+ system state, configuration (sensitivity setting, torque intensity setting), lane boundary detection, warning and fault status.
- Acquisition on the CAN-C bus of the LDW+ lane boundary detection status from the FFC.
- Acquisition on the CAN-C bus of the LDW+ warning status from the FFC.
- Acquisition on the CAN-C bus of the LDW+ fault status from the FFC.
- Acquisition on the CAN-C bus of the LDW+ ISO telltale status from the FFC.
- Acquisition on the CAN-C bus of the LDW+ display popup status from the FFC.
- Acquisition on the CAN-C bus of the current LDW+ system sensitivity setting from the FFC.
- Acquisition on the CAN-C bus of the current LDW+ system torque intensity setting from the FFC.

COMPONENT RESPONSIBILITY - AUXILIARY SWITCH BANK MODULE (ASBM)

- Display LDW+ system defeat switch state (LED illuminated = LDW+ System is OFF, i.e. "defeated").
- Transmission on the LIN bus of the LDW+ system enable/disable switch (pressed/not pressed) status to the BCM.
- Acquisition on the LIN bus of the LDW+ system enable/disable switch indicator control status from the BCM.

CAMERA -

The camera is able to detect lane markings of any color (especially yellow and white which common colors for lane markings). The camera is able to detect and quantify the following information regarding the lane boundaries:

- The lateral distance from the center of the vehicle to the left lane boundary.
- The lateral distance from the center of the vehicle to the right lane boundary.
- The heading angle of the vehicle with respect to the center axis of the lane.
- A measurement of the radius of curvature of the road ahead of the vehicle.
- The type of lane boundary, i.e. double line, solid line, dashed line, road edge.
- The camera shall be capable of detecting if the camera lens is occluded and the windshield needs to be cleaned. During this condition, an indication is provided to clean the windshield.
- The camera is capable of self-monitoring and diagnosis to determine whether it is operating properly.
- The effective horizontal field of view of the camera is at a minimum of 36 degrees.
- The effective vertical field of view of the camera is at a minimum of 20 degrees.

IMAGE ACQUISITION -

These functional requirements address a vision-based approach for measurement of vehicle lateral position relative to lane boundaries in the lane of travel.

- In the daytime, the camera shall be able to detect lane markings where lighting and environmental conditions provide good visibility in excess of 30 meters.
- At night, the camera shall be able to detect lane markings with lighting conditions provided by standard, production low beam headlamps, with or without additional sources of road illumination, and where environmental conditions provide good visibility in excess of 30 meters.
- The camera shall be capable of compensating for sudden changes in lighting conditions such as during tunnel entry/exit.
- The LDW+ system shall not have degraded performance from changes of the camera pitch angle due to vehicle dynamics (e.g. during hard braking or acceleration) or under maximum rated vehicle loading conditions, i.e. gross vehicle weight rating (GVWR).
-

The hard wired circuits between components related to the LDW+ system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the LDW+ system or the electronic controls and communication between ECU and other devices that provide some features of this system. The most reliable, efficient and accurate means to diagnose the LDW+ system and related communication operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

PARK ASSIST SYSTEM

Details for the three versions of the park assist system available for this vehicle (Rear Park Assist/RPA, Front and Rear Park Assist/FRPA, or Parallel and Perpendicular Park Assist/PPPA) can be found under dedicated, separate headings within this service information.

The hard wired circuits between components related to the park assist system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the park assist system or the electronic controls and communication between modules and other devices that provide some features of the park assist system. The most reliable, efficient and accurate means to diagnose the park assist system or the electronic controls and communication related to park assist system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REAR PARK ASSIST

The Rear Park Assist (RPA) system is active only when the status of the ignition switch is On, the transmission gear selector lever is in the Reverse (**R**) position and the vehicle speed is less than about 11 kilometers-per-hour (7 miles-per-hour). The system can be manually disabled and enabled by the vehicle operator using the park assist Off push button in the instrument panel switch pod (also known as the Accessory Switch Bank Module/ASBM). In vehicles equipped with this option, the system is enabled from the factory as a default.

Reasons for disabling the system include trailer towing and off road use. With a trailer attached to the vehicle the audible and visual RPA alerts would be incessant whenever the gear selector lever was in the Reverse (**R**) position due to the proximity of the trailer to the rear of the vehicle. Similarly, operating the vehicle off road may cause the RPA alerts to become distracting due to the proximity of large trees or boulders and the extreme rear approach angles that may be encountered while maneuvering on off road trails or terrain.

When the system is disabled, a **PARK ASSIST SYSTEM OFF** graphic and textual message will appear in the EVIC display of the Instrument Cluster (IC) (also known as the Instrument Panel Cluster/IPC) at the beginning of each ignition On cycle, and whenever the gear selector lever is in the Reverse (**R**) position. When the system is enabled, a **PARK ASSIST SYSTEM ON** graphic and textual message will appear in the EVIC display of the IC at the beginning of each ignition On cycle, and a **PARK ASSIST READY** graphic and textual message will appear in the display whenever the gear selector lever is in the Reverse (**R**) position.

The micro-controller based, 4 channel Park Assist Module (PAM) (also known as the ParkTronic System/PTS module) is the central component of the RPA system. It supplies voltage to the park assist sensors, receives and analyzes data from the sensors, calculates and communicates the proper display information to the EVIC display, calculates and communicates the proper audible outputs to the Radio Receiver Module (RRM), performs system diagnostics and communicates with other electronic modules in the vehicle or with a diagnostic scan tool over the Controller Area Network (CAN) data bus. The PAM operates on battery voltage received through a fused ignition (run) fuse in the Power Distribution Center (PDC) and is grounded through a take out of the body wire harness secured to the body sheet metal.

Four ultrasonic park assist sensors in the rear bumper fascia allow the RPA system to locate and identify the proximity of nearby obstacles. These sensors each generate ultrasonic sound pulses when triggered by the PAM, then signal the PAM when an echo of the reflected sound pulses is received. The detection distance range from the rear of the vehicle is about 2 meters (80 inches), and the detection height range from the ground is about 0.2 meters (7.8 inches) to about 0.8 meters (31 inches). The detection area extends somewhat around both rear

corners of the vehicle.

The EVIC display unit provides the vehicle operator with a graphical representation of the vehicle along with numerous illuminated arc sections that indicate the relative location and range of detected objects. The display is visible directly in front of the vehicle operator and operates based upon the electronic message inputs received from the PAM over the CAN data bus. There are three regions at the rear of the vehicle designated for arc alerts: Center, Left and Right. The Center region consists of six zones, while the Right and Left regions consist of two zones. The zones range from furthest to nearest from the rear of the vehicle. The arc sections are illuminated in an amber color until the nearest zone is reached, at which point the arc sections become illuminated red in color.

Meanwhile, the RRM generates audible indications of a detected object by emitting a series of chime tones that grow progressively higher in frequency as the vehicle gets closer to the object. As the vehicle comes within about 30 centimeters (12 inches) of the object, the audible warning changes from a high frequency series of chime tones to a single continuous tone. If the audio system is active when the RRM receives a chime request message from the PAM, the audio output will be muted automatically while the RPA audible warnings are being generated.

When the PAM monitors a problem in any of the RPA system circuits or components, it stores a fault code or Diagnostic Trouble Code (DTC) in its memory circuit, sends an electronic message to the EVIC and the EVIC displays a graphic with a **SERVICE PARK ASSIST SYSTEM** textual message. If the PAM detects that the park assist sensors are inoperative due to an accumulation of road film, mud, ice or snow on the rear fascia, the EVIC will display a **WIPE OFF REAR PARK ASSIST SENSORS** graphic and textual message. When the system is disabled by the PAM due to a detected external error or influence, a **PARK ASSIST SYSTEM DISABLED** graphic and textual message will appear in the EVIC display of the IC whenever a new ignition cycle begins and each time the gear selector lever is in the Reverse (**R**) position.

FRONT AND REAR PARK ASSIST

The Front and Rear Park Assist (FRPA) system is active only when the status of the ignition switch is On, the automatic transmission gear selector lever is in the Drive (**D**) or Reverse (**R**) position, the manual transmission gear selector lever is in the Reverse **R** or is not in Reverse and the vehicle speed is less than about 11 kilometers-per-hour (7 miles-per-hour). The system can be manually disabled and enabled by the vehicle operator using the park assist Off push button in the instrument panel switch pod (also known as the Accessory Switch Bank Module/ASBM). In vehicles equipped with this option, the system is enabled from the factory as a default.

Reasons for disabling the system include trailer towing and off road use. With a trailer attached to the vehicle the audible and visual FRPA alerts would be incessant whenever the gear selector lever was in the Reverse (**R**) position due to the proximity of the trailer to the rear of the vehicle. Similarly, operating the vehicle off road may cause the FRPA alerts to become distracting due to the proximity of large trees or boulders and the extreme front and rear approach angles that may be encountered while maneuvering on off road trails or terrain.

When the system is disabled, a **PARK ASSIST SYSTEM OFF** graphic and textual message will appear in the EVIC display of the Instrument Cluster (IC) (also known as the Instrument Panel Cluster/IPC) at the beginning of each ignition On cycle, whenever the automatic transmission gear selector lever is in the Drive (**D**) or Reverse (**R**) positions, or whenever the manual transmission gear selector lever is in the Reverse (**R**) or not in

Reverse positions. When the system is enabled, a **PARK ASSIST SYSTEM ON** graphic and textual message will appear in the EVIC display of the IC at the beginning of each ignition On cycle, and a **PARK ASSIST READY** graphic and textual message will appear in the display whenever the automatic transmission gear selector lever is in the Drive (**D**) or Reverse (**R**) positions and the vehicle speed is less than about 11 kilometers-per-hour (7 miles-per-hour), or whenever the manual transmission gear selector lever is in the Reverse (**R**) or not in Reverse positions and the vehicle speed is less than about 11 kilometers-per-hour (7 miles-per-hour).

The micro-controller based, 10 channel Park Assist Module (PAM) (also known as the ParkTronic System/PTS module) is the central component of the FRPA system. It supplies voltage to the park assist sensors, receives and analyzes data from the sensors, calculates and communicates the proper display information to the EVIC display, calculates and communicates the proper audible outputs to the Radio Receiver Module (RRM) (also known as the radio or the head unit), performs system diagnostics and communicates with other electronic modules in the vehicle or with a diagnostic scan tool over the Controller Area Network (CAN) data bus. The PAM operates on battery voltage received through a fused ignition (run) fuse in the Power Distribution Center (PDC) and is grounded through a take out of the body wire harness secured to the body sheet metal.

Six ultrasonic park assist sensors in the front bumper fascia and four sensors in the rear bumper fascia allow the FRPA system to locate and identify the proximity of nearby obstacles. These sensors each generate ultrasonic sound pulses when triggered by the PAM, then signal the PAM when an echo of the reflected sound pulses is received. The detection distance range from the front of the vehicle is about 1.2 meters (47 inches), or from the rear of the vehicle is about 2 meters (80 inches). The detection height range from the ground is about 0.2 meters (7.8 inches) to about 0.8 meters (31 inches). The detection area extends somewhat around both front and rear corners of the vehicle.

In vehicles with an automatic transmission, the FRPA has an available autonomous brake warning feature (also known as brake and release). When the transmission gear selector position is Reverse (**R**), an object is detected at the rear of the vehicle at a vehicle velocity based distance value and the ultrasonic sensors are capable of detecting an object the PAM sends an electronic **brake and release** message to the Antilock Brake Module (ABM) over the CAN data bus network. The autonomous brake warning is aggressively performed by the ABM to reduce vehicle speed and pre-fill the brake hydraulic system in an effort to warn and to give the vehicle operator more time to react to a detected object at the rear of the vehicle.

The autonomous brake warning feature is an alert function, not a comfort function; therefore, the brake application will be sharp and sudden to disturb, rather than smooth and discrete. This feature is enabled from the factory as a default, but can be manually disabled or enabled by the vehicle operator using the customer programmable features settings menu of the RRM.

The EVIC display unit provides the vehicle operator with a graphical representation of the vehicle along with numerous illuminated arc sections that indicate the relative location and range of detected objects. The display is visible directly in front of the vehicle operator and operates based upon the electronic message inputs received from the PAM over the CAN data bus. There are three regions at the front or rear of the vehicle designated for arc alerts: Center, Left and Right. The Front Center region consists of five zones, the Rear Center region consist of six zones, while the Right and Left regions at the front and rear both consist of two zones. The zones range from furthest to nearest from the vehicle. The arc sections are illuminated in an amber color until the nearest zone is reached, at which point the arc sections become illuminated red in color.

Meanwhile, the RRM generates audible indications of a detected object by emitting a series of chime tones that grow progressively higher in frequency as the vehicle gets closer to the object. As the vehicle comes within about 30 centimeters (12 inches) of the object, the audible warning changes from a high frequency series of chime tones to a single continuous tone. If the audio system is active when the RRM receives a chime request message from the PAM, the audio output will be muted automatically while the FRPA audible warnings are being generated.

When the PAM monitors a problem in any of the FRPA system circuits or components, it stores a fault code or Diagnostic Trouble Code (DTC) in its memory circuit, sends an electronic message to the EVIC and the EVIC displays a graphic with a **SERVICE PARK ASSIST SYSTEM** textual message. If the PAM detects that the park assist sensors are inoperative due to an accumulation of road film, mud, ice or snow on the front or rear fascia, the EVIC will display a **WIPE OFF FRONT PARK ASSIST SENSORS** or **WIPE OFF REAR PARK ASSIST SENSORS** graphic and textual message. When the system is disabled by the PAM due to a detected external error or influence, a **PARK ASSIST SYSTEM DISABLED** graphic and textual message will appear in the EVIC display of the IC whenever a new ignition cycle begins and each time the automatic transmission gear selector lever is in the Drive (**D**) or Reverse (**R**) position or the manual transmission gear selector lever is in the Reverse (**R**) or not in Reverse positions.

PARALLEL AND PERPENDICULAR PARK ASSIST

The Parallel and Perpendicular Park Assist (PPPA) system is active only when the status of the ignition switch is On, the automatic transmission gear selector lever is in the Drive (**D**) or Reverse (**R**) position, the manual transmission gear selector lever is in the Reverse **R** or is not in Reverse and the vehicle speed is less than about 11 kilometers-per-hour (7 miles-per-hour). The front and rear park assist features of this system can be manually disabled and enabled by the vehicle operator using the Park Assist Off push button in the instrument panel switch pod (also known as the Accessory Switch Bank Module/ASBM). In vehicles equipped with this option, the system is enabled from the factory as a default.

Reasons for disabling the system include trailer towing and off road use. With a trailer attached to the vehicle the audible and visual park assist alerts would be incessant whenever the gear selector lever was in the Reverse (**R**) position due to the proximity of the trailer to the rear of the vehicle. Similarly, operating the vehicle off road may cause the park assist alerts to become distracting due to the proximity of large trees or boulders and the extreme front and rear approach angles that may be encountered while maneuvering on off road trails or terrain.

When the system is disabled, a **PARK ASSIST SYSTEM OFF** graphic and textual message will appear in the EVIC display of the Instrument Cluster (IC) (also known as the Instrument Panel Cluster/IPC) at the beginning of each ignition On cycle, whenever the automatic transmission gear selector lever is in the Drive (**D**) or Reverse (**R**) positions, or whenever the manual transmission gear selector lever is in the Reverse (**R**) or not in Reverse positions. When the system is enabled, a **PARK ASSIST SYSTEM ON** graphic and textual message will appear in the EVIC display of the IC at the beginning of each ignition On cycle, and a **PARK ASSIST READY** graphic and textual message will appear in the display whenever the automatic transmission gear selector lever is in the Drive (**D**) or Reverse (**R**) positions and the vehicle speed is less than about 11 kilometers-per-hour (7 miles-per-hour), or whenever the manual transmission gear selector lever is in the Reverse (**R**) or not in Reverse positions and the vehicle speed is less than about 11 kilometers-per-hour (7 miles-per-hour).

The micro-controller based, 12 channel Park Assist Module (PAM) (also known as the ParkTronic System/PTS module) is the central component of the park assist system. It supplies voltage to the park assist sensors, receives and analyzes data from the sensors, calculates and communicates the proper display information to the EVIC display, calculates and communicates the proper audible outputs to the Radio Receiver Module (RRM), performs system diagnostics and communicates with other electronic modules in the vehicle or with a diagnostic scan tool over the Controller Area Network (CAN) data bus. The PAM operates on battery voltage received through a fused ignition (run) fuse in the Power Distribution Center (PDC) and is grounded through a take out of the body wire harness secured to the body sheet metal.

Six ultrasonic park assist sensors in the front bumper fascia and six sensors in the rear bumper fascia allow the park assist system to locate and identify the proximity of nearby obstacles. These sensors each generate ultrasonic sound pulses when triggered by the PAM, then signal the PAM when an echo of the reflected sound pulses is received. The detection distance range from the front of the vehicle is about 1.2 meters (47 inches), or from the rear of the vehicle is about 2 meters (80 inches). The detection height range from the ground is about 0.2 meters (7.8 inches) to about 0.8 meters (31 inches). The detection area extends somewhat around both front and rear corners of the vehicle. In the PPPA system, the four sensors on the outboard right and left ends of the front and rear fascias have increased range over the other eight sensors and are not interchangeable.

In vehicles with an automatic transmission, the PPPA has an available autonomous brake warning feature (also known as brake and release). When the transmission gear selector position is Reverse (**R**), an object is detected at the rear of the vehicle at a vehicle velocity based distance value and the ultrasonic sensors are capable of detecting an object the PAM sends an electronic **brake and release** message to the Antilock Brake Module (ABM) over the CAN data bus network. The autonomous brake warning is aggressively performed by the ABM to reduce vehicle speed and pre-fill the brake hydraulic system in an effort to warn and to give the vehicle operator more time to react to a detected object at the rear of the vehicle.

The autonomous brake warning feature is an alert function, not a comfort function; therefore, the brake application will be sharp and sudden to disturb, rather than smooth and discrete. This feature is enabled from the factory as a default, but can be manually disabled or enabled by the vehicle operator using the customer programmable features settings menu of the Radio Receiver Module (RRM) (also known as the radio or the head unit).

The EVIC display unit provides the vehicle operator with a graphical representation of the vehicle along with numerous illuminated arc sections that indicate the relative location and range of detected objects. The display is visible directly in front of the vehicle operator and operates based upon the electronic message inputs received from the PAM over the CAN data bus. There are three regions at the front or rear of the vehicle designated for arc alerts: Center, Left and Right. The Front Center region consists of five zones, the Rear Center region consist of six zones, while the Right and Left regions at the front and rear both consist of two zones. The zones range from furthest to nearest from the vehicle. The arc sections are illuminated in an amber color until the nearest zone is reached, at which point the arc sections become illuminated red in color.

Meanwhile, the RRM generates audible indications of a detected object by emitting a series of chime tones that grow progressively higher in frequency as the vehicle gets closer to the object. As the vehicle comes within about 30 centimeters (12 inches) of the object, the audible warning changes from a high frequency series of chime tones to a single continuous tone. If the audio system is active when the RRM receives a chime request message from the PAM, the audio output will be muted automatically while the park assist audible warnings are being generated.

The semiautomatic parallel and perpendicular parking feature is designed to assist the vehicle operator, not to substitute for the vehicle operator. The vehicle operator must stay in full control of the acceleration and braking of the vehicle. The driver initiates the parallel and perpendicular parking feature by using the Parallel And Perpendicular Park Assist On push button in the instrument panel switch pod (also known as the Accessory Switch Bank Module/ASBM).

Once the parallel and perpendicular park feature is turned On, a Active Park Sense Search screen pops up in the EVIC display unit. The initial search screen to pop up will be for the parallel parking feature, but text at the bottom of the EVIC display advises, **Press OK for Perpendicular Park** . The vehicle operator can then press the **OK** push button in the EVIC switch pod on the left horizontal spoke of the steering wheel to toggle back and forth between the parallel parking space and perpendicular parking space search screens. From this point through completion of the selected parking maneuver, the system will automatically coach the vehicle operator through the location of an appropriate parking space and the parking maneuver using both graphical representations and text that pops up within the EVIC display unit.

During parallel and perpendicular parking maneuvers the PPPA system assists the vehicle operator by measuring and identifying an appropriate parking space while driving slowly past the potential space. Then the system calculates the appropriate trajectory and controls the steering wheel to steer the vehicle into the selected space. Depending upon the parking maneuver selected, the PPPA system is capable of steering a vehicle into a parallel or a perpendicular parking space on either the driver side or the passenger side of the vehicle. The PAM controls the measuring and maneuvering of the vehicle by monitoring the ultrasonic sensor inputs and sending the appropriate electronic messages to the Electronic Power Steering (EPS) module over the CAN data bus.

When the PAM monitors a problem in any of the park assist system circuits or components, it stores a fault code or Diagnostic Trouble Code (DTC) in its memory circuit, sends an electronic message to the EVIC and the EVIC displays a graphic with a **SERVICE PARK ASSIST SYSTEM** textual message. If the PAM detects that the park assist sensors are inoperative due to an accumulation of road film, mud, ice or snow on the front or rear fascia, the EVIC will display a **WIPE OFF FRONT PARK ASSIST SENSORS** or **WIPE OFF REAR PARK ASSIST SENSORS** graphic and textual message. When the system is disabled by the PAM due to a detected external error or influence, a **PARK ASSIST SYSTEM DISABLED** graphic and textual message will appear in the EVIC display of the IC whenever a new ignition cycle begins and each time the automatic transmission gear selector lever is in the Drive (**D**) or Reverse (**R**) position or the manual transmission gear selector lever is in the Reverse (**R**) or not in Reverse positions.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - BLIND SPOT MONITOR SYSTEM

WARNING: **To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.**

The following textual messages related to the Blind Spot Monitor (BSM) system may appear within the Electronic Vehicle Information Center (EVIC) display of the Instrument Cluster (IC) (also known as the Instrument Panel Cluster/IPC):

- **BLIND SPOT SYSTEM OFF** - This message to the vehicle operator when the ignition switch first transitions to the On status indicates that the BSM system has been turned Off using the customer programmable features function of the Radio Receiver Module (RRM) (also known as the radio or the head unit).
- **SERVICE BLIND SPOT SYSTEM** - This message to the vehicle operator while the ignition switch status is On indicates that the BSM system is unavailable due to a monitored system fault or faults.
- **BLIND SPOT SYSTEM TEMPORARILY UNAVAILABLE** - This message to the vehicle operator while the ignition switch status is On indicates that the BSM system is temporarily unavailable as a result of one of the following:
  1. **Sensor Blockage** - The amber BSM visual icon in both outside rear view mirrors will be illuminated as long as blockage exists or until the ignition switch status transitions to Off, whichever occurs first.
  2. **Monitored System Fault** - The BSM system has detected a monitored system fault condition and has stored a Diagnostic Trouble Code (DTC). The amber BSM visual icon will be illuminated in both outside rear view mirrors for as long as the condition exists or until the ignition switch status transitions to Off, whichever occurs first.

NOTE: **If the BLIND SPOT SYSTEM TEMPORARILY UNAVAILABLE message is received for a minimum of 5 minutes, please verify that the outboard area at each end of the rear fascia behind the rear wheel openings where the radar sensors are located is not blocked by snow, ice or road debris. If the area is blocked, remove the blockage and verify that the message is no longer present in the EVIC display.**

NOTE: **If the vehicle has experienced any trauma in the outboard area at each end of the rear fascia behind the rear wheel openings where the sensors are located, even if the fascia is not damaged, the radar sensor may have become misaligned. A misaligned radar sensor will result in the BSM system not operating properly.**

The hard wired circuits between components related to the BSM system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the BSM system or the electronic controls and communication between modules and other devices that provide some features of the system. The most reliable, efficient and accurate means to diagnose the BSM system or the electronic controls and communication related to BSM system operation requires the use of a diagnostic scan tool. Refer to **DIAGNOSIS AND TESTING** or **DIAGNOSIS AND TESTING** .

DIAGNOSIS AND TESTING - CHIME WARNING SYSTEM

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

The hard wired circuits between components related to the chime warning system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the chime warning system or the electronic controls and communication between modules and other devices that provide some features of the chime warning system. The most reliable, efficient and accurate means to diagnose the chime warning system or the electronic controls and communication related to chime warning system operation requires the use of a diagnostic scan tool. Refer to **DIAGNOSIS AND TESTING** .

DIAGNOSIS AND TESTING - FORWARD COLLISION WARNING

The hard wired circuits between components related to the Forward Collision Warning (FCW+) system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the FCW+ system or the electronic controls and communication between modules and other devices that provide some features of the FCW+ system. The most reliable, efficient and accurate means to diagnose the FCW+ system or the electronic controls and communication related to FCW+ system operation requires the use of a diagnostic scan tool.

DIAGNOSIS AND TESTING - LANE DEPARTURE WARNING SYSTEM

The hard wired circuits between components related to the Lane Departure Warning (LDW+) system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the LDW+ system or the electronic controls and communication between modules and other devices that provide some features of the

LDW+ system. The most reliable, efficient and accurate means to diagnose the LDW+ system or the electronic controls and communication related to LDW+ system operation requires the use of a diagnostic scan tool.

DIAGNOSIS AND TESTING - PARK ASSIST SYSTEM

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

If a **SERVICE PARK ASSIST SYSTEM** graphic and textual message appears in the Electronic Vehicle Information Center (EVIC) display of the Instrument Cluster (IC) (also known as the Instrument Panel Cluster/IPC), be certain to confirm the following:

- Be certain that the rear bumper fascia (with Rear Park Assist/RPA) is, or the front and rear bumper fascias (with Front and Rear Park Assist/FRPA or with Parallel and Perpendicular Park Assist/PPPA) are free of dirt and debris to keep the system operating properly.
- The presence of jackhammers, large trucks and other sources of vibration in the vicinity of the vehicle could also impact the performance of the system.

The hard wired circuits between components related to the park assist system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the park assist system or the electronic controls and communication between modules and other devices that provide some features of the park assist system. The most reliable, efficient and accurate means to diagnose the park assist system or the electronic controls and communication related to park assist system operation requires the use of a diagnostic scan tool. Refer to **DIAGNOSIS AND TESTING** .

DISPLAY, BLIND SPOT

DESCRIPTION

DESCRIPTION

Fig. 2: Outside Rear View Mirror & Translucent Triangle Icon
Courtesy of CHRYSLER GROUP, LLC

Vehicles equipped with the Blind Spot Monitor (BSM) system have a display that appears in both the right and left outside rear view mirrors (1). The display consists of a translucent triangle icon (2) in the mirror glass that is illuminated by an amber Light Emitting Diode (LED) unit mounted behind the icon on the mirror glass case. When illuminated, only the amber colored triangle is visible on the outer surface of the mirror glass. The LED unit for the display is connected to the vehicle electrical system along with the other wiring for the power mirror through a dedicated take out and connector of the door wire harness.

The BSM displays are each integral to the outside rear view mirror glass and case unit. The displays cannot be adjusted or repaired. If a BSM display is ineffective or damaged, the entire mirror glass and case unit must be replaced. Refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** and **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL** .

OPERATION

OPERATION

The Blind Spot Monitor (BSM) displays provide the vehicle operator with a visual alert that a target vehicle (object of interest) has been detected by the BSM system within one of the BSM or Rear Cross Path (RCP) detection zones. The BSM display is also illuminated momentarily as a bulb test each time the ignition switch status transitions to On as a part of the BSM system self tests. If a BSM display remains illuminated with the park brake applied or with the automatic transmission gear selector lever in the Park (**P**) position, it indicates that the BSM system has registered a system fault and may require service.

Each BSM display is completely controlled by a hard wired output of the Driver Door Module (DDM) or Passenger Door Module (PDM) on the same side of the vehicle as the display. The DDM and PDM receive electronic messages over the Controller Area Network (CAN) data bus from the Blind Spot Module (BSM) integral to the RAdio Detection And Ranging (RADAR) smart sensor (also known as Left Blind Spot Sensor/LBSS or Right Blind Spot Sensor) for the same side of the vehicle. The display units are grounded at all times through a takeout and eyelet terminal of the body wire harness that is secured to the body sheet metal.

The hard wired circuits between the BSM displays and the DDM or PDM may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the BSM displays or the electronic controls and communication between other modules and devices that provide some features of the BSM displays. The most reliable, efficient and accurate means to diagnose the BSM displays or the electronic controls and communication related to BSM display operation requires the use of a diagnostic scan tool.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - BLIND SPOT DISPLAY

The hard wired circuits between the Blind Spot Monitor (BSM) displays and the Driver Door Module (DDM) or Passenger Door Module (PDM) may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the BSM displays or the electronic controls and communication between other modules and devices that provide some features of the BSM displays. The most reliable, efficient and accurate means to diagnose the BSM displays or the electronic controls and communication related to BSM display operation requires the use of a diagnostic scan tool.

REMOVAL

REMOVAL

The Blind Spot Monitor (BSM) display Light Emitting Diode (LED) indicator and icon are integral to the outside rear view mirror glass and case unit. Refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** and **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL** .

INSTALLATION

INSTALLATION

The Blind Spot Monitor (BSM) display Light Emitting Diode (LED) indicator and icon are integral to the outside rear view mirror glass and case unit. Refer to **MIRROR, OUTSIDE REARVIEW, INSTALLATION** and **MIRROR, OUTSIDE REARVIEW, GLASS, INSTALLATION** .

DISPLAY, PARK ASSIST

DESCRIPTION

DESCRIPTION

The park assist graphics share the Electronic Vehicle Information Center (EVIC) display, which is an electronic display unit located near the center of, and soldered onto the printed circuit board of the Instrument Cluster (IC) (also known as the Instrument Panel Cluster/IPC). Refer to **CENTER, ELECTRONIC VEHICLE**

INFORMATION, DESCRIPTION . The park assist display along with the EVIC electronic display unit receive battery current and ground from, and are completely controlled by the IC circuit board.

The park assist graphics are only displayed when the system is active, sound and display mode is enabled, and an object or obstacle is detected within a detection area. The IC then displays the park assist graphic along with the appropriate object detection alert bar and arc sections within the EVIC display to indicate the approximate relative distance and location of the object or obstacle.

The EVIC electronic display unit is serviced only as a complete unit with the IC. The display unit cannot be adjusted or repaired. If ineffective or damaged, the entire IC unit must be replaced.

OPERATION

OPERATION

The park assist display in the Electronic Vehicle Information Center (EVIC) within the Instrument Cluster (IC) (also known as the Instrument Panel Cluster/IPC) provides the vehicle operator with visual feedback by illuminating a vehicle graphic and object detection bar and arc sections in zones at the rear (with Rear Park Assist/RPA) or front and rear (with Front and Rear Park Assist/FRPA or with Parallel and Perpendicular Park Assist/PPPA) of the icon indicating the approximate relative location and distance of an object or obstacle from the vehicle. The fewer bar and arc sections illuminated, the nearer the object. In addition, the nearest bar sections can change from solid illumination to flashing on and off or from amber to red in color as the object or obstacle becomes nearer.

The IC will display the park assist graphics in the EVIC electronic display unit whenever an object is within the detection area and an electronic request message is received from the Park Assist Module (PAM) (also known as the ParkTronic System/PTS module) over the Controller Area Network (CAN) data bus.

Conventional diagnostic methods will not prove conclusive in the diagnosis of the park assist display or the electronic controls and communication between modules and other devices that provide some features of the park assist display. The most reliable, efficient and accurate means to diagnose the park assist display or the electronic controls and communication related to park assist display operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

MODULE, BLIND SPOT

DESCRIPTION

DESCRIPTION

The optional Blind Spot Monitor (BSM) system used in this vehicle has two control modules. One control module is dedicated to each side of the vehicle. A Blind Spot Module (BSM) is integral to the Left Blind Spot Sensor (LBSS) or Right Blind Spot Sensor (RBSS) for the same side of the vehicle. Refer to **SENSOR, BLIND SPOT, DESCRIPTION**.

OPERATION

OPERATION

MODULE, PARK ASSIST

DESCRIPTION

DESCRIPTION

Fig. 3: Park Assist Module, Connector Receptacles & Mounting Tabs
Courtesy of CHRYSLER GROUP, LLC

The Park Assist Module (PAM) (also known as the ParkTronic System/PTS module) (1) is secured with two nuts to weld studs through two mounting tabs (3) integral to the module housing on the left quarter inner panel just behind the left rear wheel house. The module is concealed behind the quarter inner trim within the cargo area of the vehicle. Concealed within the molded plastic PAM housing is a micro-controller and the other electronic circuitry of the module. The module housing is sealed to enclose and protect the internal electronic circuitry.

There are three unique versions of the PAM used that are similar in appearance, but are not interchangeable. The PAM version depends upon the version of the park assist system in the vehicle. The Rear Park Assist (RPA) uses a 4 channel PAM, the Front and Rear Park Assist (FRPA) system uses a 10 channel PAM, and the Parallel and Perpendicular Park Assist (PPPA) uses a 12 channel PAM.

Two or three connector receptacles (2) containing terminal pins are integral to the downward-facing side of the housing. The module is connected to the vehicle electrical system through dedicated take outs and connectors of the body wire harness. The number of connector receptacles and body harness take outs also depends upon which of the three available versions of the park assist system is installed in the vehicle.

The PAM cannot be adjusted or repaired and, if damaged or ineffective, it must be replaced with a new unit. The PAM software is flash programmable.

OPERATION

OPERATION

The micro-controller within the Park Assist Module (PAM) (also known as the ParkTronic System/PTS module) contains the park assist system logic circuits. The PAM uses On-Board Diagnostics (OBD) and can communicate with other electronic modules in the vehicle as well as with the diagnostic scan tool using the Controller Area Network (CAN) data bus. This method of communication is also used for park assist system diagnosis and testing through the 16-way data link connector located on the driver side lower edge of the instrument panel.

The PAM provides source current to the park assist sensors located on the bumper fascia or fascias. The PAM then monitors return inputs from each of the sensors on dedicated hard wired data communication circuits. These sensor inputs allow the PAM to determine when an obstacle is in the path of the vehicle, to calculate the relative location of an obstacle and to determine whether the distance to that obstacle is increasing or decreasing.

Pre-programmed decision algorithms and calibrations allow the PAM micro-controller to determine the appropriate park assist system outputs based upon the inputs received from the park assist sensors and electronic messages received from other modules in the vehicle over the CAN data bus. When the programmed conditions are met, the PAM sends electronic messages to the Instrument Cluster (IC) (also known as the Instrument Panel Cluster/IPC) and the Radio Receiver Module (RRM) (also known as the radio or the head unit) over the CAN data bus to obtain the proper park assist system visual and audible outputs.

In vehicles equipped with an automatic transmission and the optional Front and Rear Park Assist (FRPA) or the Parallel and Perpendicular Park Assist (PPPA), the PAM also communicates with the Antilock Brake Module (ABM) using electronic messaging over the CAN data bus to provide the autonomous brake (also known as

brake and release) warning feature. In vehicles equipped with the optional PPPA, the PAM also communicates with the Electronic Power Steering (EPS) module using electronic messaging over the CAN data bus to provide the semiautomatic parallel and perpendicular parking features.

While the system is active, the PAM micro-controller continuously monitors all of the park assist system electrical circuits and components to determine the system readiness. If a monitored system fault is detected, the PAM sets a Diagnostic Trouble Code (DTC) and sends the appropriate electronic messages to the IC to control the display of the appropriate park assist system graphics and textual messages in the Electronic Vehicle Information Center (EVIC) display within the IC and the generation of the appropriate audible warnings by the IC.

The PAM receives battery current on a fused ignition output (run) circuit through the Power Distribution Center/PDC). The PAM has a path to ground at all times through a ground circuit and take out of the body wire harness that is secured to the body sheet metal. These connections allow the PAM to be operational whenever the status of the ignition switch is On.

The hard wired circuits between components related to the PAM may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the PAM or the electronic controls and communication between modules and other devices that provide some features of the park assist system. The most reliable, efficient and accurate means to diagnose the PAM or the electronic controls and communication related to park assist system operation requires the use of a diagnostic scan tool. Refer to **DIAGNOSIS AND TESTING** .

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - PARK ASSIST MODULE

Refer to **DIAGNOSIS AND TESTING** .

REMOVAL

REMOVAL

Fig. 4: Left Quarter Inner Panel, Connectors & Nuts
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative cable from the battery.
2. Remove the trim from the left quarter inner panel (1). Refer to **PANEL, QUARTER TRIM, REMOVAL** .
3. Disconnect the body wire harness connectors (4) from the Park Assist Module (PAM) (also known as the ParkTronic System/PTS module) (3) connector receptacles on the left quarter inner panel just behind the left rear wheel house.
4. Remove the two nuts (2) that secure the PAM to the weld studs on the quarter inner panel.
5. Remove the PAM from the vehicle.

INSTALLATION

INSTALLATION

Fig. 5: Left Quarter Inner Panel, Connectors & Nuts
Courtesy of CHRYSLER GROUP, LLC

1. Position the Park Assist Module (PAM) (also known as the ParkTronic System/PTS module) (3) onto the weld studs on the left quarter inner panel (1) just behind the left rear wheel house.
2. Install and tighten the two nuts (2) that secure the PAM to the weld studs. Tighten the nuts securely.
3. Reconnect the body wire harness connectors (4) to the PAM connector receptacles.
4. Reinstall the trim onto the left quarter inner panel. Refer to **PANEL, QUARTER TRIM, INSTALLATION** .
5. Reconnect the negative cable to the battery.

NOTE: **If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.**

SENSOR, BLIND SPOT

DESCRIPTION

DESCRIPTION

Fig. 6: Blind Spot Sensor & Connector
Courtesy of CHRYSLER GROUP, LLC

Vehicles equipped with the optional Blind Spot Monitor (BSM) system have two primary components. These components are the two RAdio Detection And Ranging (RADAR) blind spot sensors (1) (also known as the Left or Right Blind Spot Sensors/LBSS or RBSS). In this vehicle, each sensor also includes an internal micro-controller and control circuitry that monitors and controls both the sensor and the blind spot display for the same side of the vehicle. This explains why the sensors are sometimes referred to as smart sensors.

Each sensor with control circuitry is contained and protected within a molded plastic case that includes an integral connector receptacle (2) at one end. The sensors are each connected to the vehicle electrical system through a dedicated take out and connector of the rear bumper fascia wire harness. The two sensors are concealed behind the outboard ends of the rear bumper fascia. Each sensor is snapped into a dedicated molded plastic mounting bracket that is permanently affixed to the inside surface of the fascia just behind the left and right rear wheel openings.

The blind spot sensors and control circuitry cannot be adjusted or repaired. If a sensor is damaged or ineffective, it must be replaced with a new unit. The sensor module software is flash capable. The mounting bracket for each sensor is serviced only as a unit with the rear bumper fascia.

OPERATION

OPERATION

The Blind Spot Monitor (BSM) RAdio Detection And Ranging (RADAR) smart sensors (also known as the Left Blind Spot Sensor/LBSS and Right Blind Spot Sensor/RBSS) are each controlled by their on-board micro-controller and control circuitry. When the micro-controller recognizes that the appropriate conditions exist, it will energize the sensor to generate 25 Gigahertz radar pulses through the blind spot zone on that side of the vehicle. The sensor receives and filters the radar signals being returned from any objects detected within the zone, then transmits the appropriate data identifying the position and speed of identified objects to the micro-controller.

The micro-controller analyzes the sensor data to determine whether any detected objects should be reported. When it is determined that an object should be reported, the micro-controller sends electronic request messages over the Controller Area Network (CAN) data bus to its respective Driver Door Module (DDM) or Passenger Door Module (PDM). The DDM or PDM then controls its respective left or right BSM display directly through a hard wired output. The micro-controller of the LBSS or RBSS also sends electronic messages to the Radio Receiver Module (RRM) (also known as the radio or head unit) to mute any current output through the sound system speakers and to generate chime tones as an audible alert.

Each of the two BSM smart sensors is independent and communicates on the CAN data bus. The sensor performs a bulb test by requesting illumination of the triangle icon in its respective right or left blind spot display for a few seconds each time the status of the ignition switch transitions to On. Each sensor micro-controller also continually monitors the BSM system and the sensor circuits and will store a Diagnostic Trouble Code (DTC) for any fault that is detected.

The hard wired circuits between of the smart sensors may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the smart sensors or the electronic controls and communication between other modules and devices that provide some features of the BSM system. The most reliable, efficient and accurate means to diagnose the smart sensors or the electronic controls and communication related to LBSS or RBSS operation requires the use of a diagnostic scan tool. Refer to **DIAGNOSIS AND TESTING** or **DIAGNOSIS AND TESTING** .

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - BLIND SPOT SENSOR

The hard wired circuits between the Blind Spot Monitor (BSM) smart sensors (also known as the Left Blind Spot Sensor/LBSS and the Right Blind Spot Sensor/RBSS) may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the smart sensors or the electronic controls and communication between modules and other devices that provide some features of the BSM system. The most reliable, efficient and accurate means to diagnose the smart sensors or the electronic controls and communication related to LBSS or RBSS operation requires the use of a diagnostic scan tool.

REMOVAL

REMOVAL

Fig. 7: Blind Spot Sensor, Latch Tabs & Harness Connector
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative cable from the battery.
2. Reach up behind the outboard end of the rear bumper fascia to access and disconnect the rear bumper fascia wire harness connector (4) from the Left Blind Spot Sensor (LBSS) or Right Blind Spot Sensor (RBSS) (3) connector receptacle.
3. Disengage the latch tabs (2) of the BSM sensor mounting bracket and pull the LBSS or RBSS out of the bracket.

INSTALLATION

INSTALLATION

Fig. 8: Blind Spot Sensor, Latch Tabs & Harness Connector

Courtesy of CHRYSLER GROUP, LLC

1. Reach up behind the outboard end of the rear bumper fascia to position the Left Blind Spot Sensor (LBSS) or Right Blind Spot Sensor (RBSS) (3) to the mounting bracket on the inside surface of the fascia (1).
2. Using hand pressure, press the LBSS or RBSS firmly and evenly into the mounting bracket until the latch tabs (2) are fully engaged.
3. Reconnect the rear bumper fascia wire harness connector (4) to the LBSS or RBSS sensor connector receptacle.
4. Reconnect the negative cable to the battery.

NOTE: **If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.**

SENSOR, PARK ASSIST

DESCRIPTION

DESCRIPTION

Fig. 9: Park Assist Sensor
Courtesy of CHRYSLER GROUP, LLC

Vehicles equipped with the park assist system have up to twelve park assist sensors (3). Vehicles with Rear Park Assist (RPA) have four sensors installed in the rear bumper fascia. Vehicles with Front and Rear Park Assist (FRPA) have four sensors in the rear bumper fascia plus six sensors in the front bumper fascia. Each of these sensors is a Generation 5.0 sensor and is identical in construction and is interchangeable.

Vehicles with Parallel and Perpendicular Park Assist (PPPA) have six sensors in the rear fascia and six sensors in the front fascia. However, the sensors in each right and left outward-facing end of the front and rear fascias has a unique Generation 5.1 sensor, while the forward and rearward-facing sensors are still the Generation 5.0 type. The Generation 5.1 sensors offer increased range required to support the parallel and perpendicular parking features of the PPPA system. The only physical difference between the two sensor types besides the part number is the offset location of the indexing feature (2) on the sensor body. This offset indexing feature is designed to match up with an indexing notch in the sensor bracket to prevent installation of a sensor in an incorrect location.

Only the membrane (4) of each sensor is visible through a hole in the outer vertical surface of the fascia. The remainder of each sensor including the sensor mounting bracket, the sensor spacer (also known as the O-ring or decoupling ring) and the sensor wiring connection is concealed behind the fascia. A sensor wire harness behind the fascia connects the sensors to the vehicle electrical system.

The electronic circuitry and a communication chip for each sensor is enclosed and protected within the molded black plastic sensor housing. The housing includes an integral connector receptacle (5) and two integral latch tabs (1). The sensor membrane extends from the surface of the sensor housing, and is finished to match the outer surface of the fascia.

Fig. 10: Park Assist Sensors Numbering System
Courtesy of CHRYSLER GROUP, LLC

The numbering system for the park assist sensors allows for up to twelve sensors on the vehicle, six front and six rear. The sensors are numbered in a clockwise manner starting at the left front fascia. Regardless of whether the vehicle is equipped with RPA, FRPA or PPPA the left front sensor location is always considered the number 1 sensor. The numbering continues in a clockwise direction around the vehicle to the left rear sensor, which is always considered the number 12 sensor.

A resilient O-ring spacer (also known as a decoupling ring) around the circumference of the sensor membrane isolates the membrane from the openings in the fascia. Each sensor is snapped into its own dedicated molded

plastic mounting bracket. Each sensor mounting bracket is heat-staked to the back side of the bumper fascia.

The park assist sensors cannot be adjusted or repaired. If a sensor is ineffective or damaged it must be replaced with a new unit. The sensor spacers are available for individual service replacement. The sensor mounting brackets are serviced only as a unit with the bumper fascia.

OPERATION

OPERATION

The park assist sensors are ultrasonic transceivers that are completely controlled by the Park Assist Module (PAM) (also known as the ParkTronic System/PTS module). The sensors transmit and receive ultrasonic signals. The sensors each receive battery current and ground in parallel from the PAM, but are each connected to individual dedicated serial bus communication circuits to the module.

Each sensor membrane is oscillated, then quieted by the PAM in a pulsing fashion. While the sensor membrane oscillates, it emits an ultrasonic signal. This signal will bounce or echo off of objects within the field of vision for that sensor. While quieted, each membrane receives the echoes of the ultrasonic signals it and the other sensors have transmitted. The sensors then communicate this echo pulse data over the serial bus lines back to the PAM. The micro-controller within the PAM uses the intervals between the ultrasonic transmission and reception data from the sensors to calculate the distance to any obstacles identified by the ultrasonic echoes.

The hard wired circuits between components related to the park assist sensors may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the park assist sensors or the electronic controls and communication between modules and other devices that provide some features of the park assist system. The most reliable, efficient and accurate means to diagnose the park assist sensors or the electronic controls and communication related to park assist sensor operation requires the use of a diagnostic scan tool. Refer to **DIAGNOSIS AND TESTING** .

SWITCH, PARK ASSIST

DESCRIPTION

DESCRIPTION

Fig. 17: Park Assist Switch
Courtesy of CHRYSLER GROUP, LLC

The park assist Off switch (5) and the Parallel and Perpendicular Park Assist (PPPA) On switch (6) are integral to the instrument panel switch pod (1) (also known as the Accessory Switch Bank Module/ASBM), which is secured to the instrument panel center bezel just below the heater and air conditioner controls. Refer to **POD, SWITCH, DESCRIPTION** .

The park assist Off switch push button is clearly identified with a white International Control and Display Symbol graphic for **Parking Aid** and the text **OFF** . The PPPA On switch push button is clearly identified with white International Control and Display Symbol graphics for **Parking** and **Electric Power Steering** along with the text **ON** .

An amber Light Emitting Diode (LED) unit is illuminated behind a small clear plastic jewel-like lens in the park assist Off push button to give a visual indication whenever the park assist system has been manually disabled or if a system fault is monitored. Another amber LED unit is illuminated in the PPPA On push button whenever that system has been enabled. Both switches are only functional while the status of the ignition switch is On. The switch buttons also have panel lamps dimmer controlled illumination for night visibility.

All of the circuitry and components of the park assist Off switch and the PPPA On switch are contained within a molded black plastic instrument panel switch pod housing. A single connector receptacle is integral to the back of the switch pod housing. The switch is connected to the vehicle electrical system through a dedicated take out and connector of the instrument panel wire harness.

The park assist Off switch and the PPPA On switch cannot be adjusted or repaired and, if either switch is ineffective or damaged, the entire instrument panel switch pod unit must be replaced with a new unit.

OPERATION

OPERATION

The status of the park assist Off switch and the Parallel and Perpendicular Park Assist (PPPA) On switch is continually monitored by the circuitry within the instrument panel switch pod (also known as the Accessory Switch Bank Module/ASBM). The switch pod receives battery voltage at all times on a fused battery feed circuit and has a path to ground at all times through the instrument panel wire harness. The inputs to and outputs from the switch pod consist of electronic message communication with the Body Control Module (BCM) over the single wire Local Interface Network (LIN) data bus.

Each time the park assist Off switch or PPPA On switch push button is depressed the switch pod circuitry sends an electronic **switch status** message input to the BCM over the LIN data bus. The BCM then relays an electronic **switch request** message to the Park Assist Module (PAM) over the Controller Area Network (CAN) data bus. The PAM responds to each **switch request** message by toggling the status of the appropriate park assist system feature from enabled to disabled, or from disabled to enabled, then sends an electronic **system status** message back to the BCM over the CAN data bus as confirmation.

The BCM responds to the system status message by sending a message to the switch pod over the LIN data bus to control the park assist Off switch or PPPA On switch Light Emitting Diode (LED) units so that they are illuminated only when appropriate while the status of the ignition switch is On, and are extinguished when the status of the ignition switch is anything except On. If the park assist system is disabled due to a monitored fault or failure, a press of the park assist Off push button will result in the LED flashing on and off for about 5

seconds, then lighting solid.

The hard wired circuits between components related to the park assist Off switch and the PPPA On switch may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the electronic controls and communication between modules and other devices that provide some features of the park assist system. The most reliable, efficient and accurate means to diagnose the park assist Off switch, the PPPA On switch or the electronic controls and communication related to park assist switch operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

DIAGNOSIS AND TESTING

B10C4-11-HEATED STEERING WHEEL CONTROL - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 1: Heated Steering Wheel Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the engine running.

SET CONDITION

The Comfort Seat Wheel Module (CSWM) detects on the Heated Steering Wheel Feed circuit a voltage below its threshold for more than two seconds when the output is turned on.

POSSIBLE CAUSES

Possible Causes
HEATED STEERING WHEEL FEED CIRCUIT SHORTED TO GROUND
HEATED STEERING WHEEL FEED CIRCUIT SHORTED TO THE HEATED STEERING WHEEL RETURN CIRCUIT
HEATED STEERING WHEEL (HSW)
STEERING COLUMN CONTROL MODULE (SCCM)
COMFORT SEAT WHEEL MODULE (CSWM)

DIAGNOSTIC TEST

1. **CHECK IF THE DTC IS ACTIVE**

   NOTE: Make sure the battery is fully charged and the charging system is operating properly before proceeding.

   1. Turn the ignition on.
   2. With the scan tool, record and erase Diagnostic Trouble Codes (DTCs).
   3. Turn the ignition off.
   4. Start the engine and let it run.
   5. Turn the Heated Steering Wheel (HSW) on.
   6. With the scan tool, read DTCs.

   Is this DTC active?

   Yes

   - Go To 2

   No

   - Go To 6

2. **CHECK THE (C91) HEATED STEERING WHEEL FEED CIRCUIT**

   WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

   1. Disconnect the Steering Column Control Module (SCCM) C1 harness connector.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

2. With the scan tool, erase DTCs.
3. Start the engine and let it run.
4. Turn the HSW on.
5. With the scan tool, read DTCs.

   Is this DTC active?

   Yes

   - Go To 3

   No

   - Go To 5

3. **CHECK THE (C91) HEATED STEERING WHEEL FEED CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Disconnect the Comfort Seat Wheel Module (CSWM) C4 harness connector.
   3. Measure the resistance between ground and the (C91) Heated Steering Wheel Feed circuit.

      Is the resistance below 10k Ohms?

      Yes

      - Repair the (C91) Heated Steering Wheel Feed circuit for a short to ground.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 4

4. **CHECK THE (C91) HEATED STEERING WHEEL FEED CIRCUIT FOR A SHORT TO THE (C986) HEATED STEERING WHEEL RETURN CIRCUIT**
   1. Measure the resistance between the (C91) Heated Steering Wheel Feed circuit and the (C986) Heated Steering Wheel Return circuit at the SCCM C1 harness connector.

      Is the resistance below 10k Ohms?

      Yes

- Repair the (C91) Heated Steering Wheel Feed circuit for a short to the (C986) Heated Steering Wheel Return circuit.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace the Comfort Seat Wheel Module (CSWM) in accordance with the Service Information. Refer to **MODULE, COMFORT SEAT AND WHEEL, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **CHECK THE HEATED STEERING WHEEL**

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Remove the Driver Airbag in accordance with the Service Information. Refer to **AIR BAG, DRIVER, REMOVAL** .
2. Disconnect the SCCM C2 harness connector.

NOTE: Before proceeding, thoroughly inspect the wiring harness and connectors between the Heated Steering Wheel (HSW) and the Steering Column Control Module (SCCM). Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

3. Reconnect the SCCM C1 harness connector.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

4. With the scan tool, erase DTCs.
5. Turn the ignition off.
6. Start the engine and let it run.
7. Turn the HSW on.
8. With the scan tool, read DTCs.

Is the same DTC active?

Yes

- Replace the Steering Column Control Module (SCCM) in accordance with the Service Information. Refer to **MODULE, STEERING COLUMN, REMOVAL** .

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace the Heated Steering Wheel (HSW) in accordance with the Service Information. Refer to **WHEEL, STEERING, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

6. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit. Wiggle the wiring and connectors while checking for shorted and open circuits.
   3. Check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Attempt to reproduce the condition by rotating the steering wheel or by adjusting the seat.
   5. With the scan tool, check for any Environmental Data to help identify the conditions in which the DTC was set.
   6. Check Service Bulletins for any possible causes that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Test complete.

B10C4-12-HEATED STEERING WHEEL CONTROL - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 2: Heated Steering Wheel Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the engine running.

SET CONDITION

The Comfort Seat Wheel Module (CSWM) detects voltage on the Heated Steering Wheel Feed circuit for more than two seconds with the output turned off.

POSSIBLE CAUSES

Possible Causes
HEATED STEERING WHEEL FEED CIRCUIT SHORTED TO VOLTAGE
HEATED STEERING WHEEL FEED CIRCUIT SHORTED TO THE FUSED IGNITION RUN CONTROL OUTPUT
HEATED STEERING WHEEL (HSW)
STEERING COLUMN CONTROL MODULE (SCCM)
COMFORT SEAT WHEEL MODULE (CSWM)

DIAGNOSTIC TEST

1. **CHECK IF THE DTC IS ACTIVE**

   NOTE: Make sure the battery is fully charged and the charging system is operating properly before proceeding.

   1. Turn the ignition on.
   2. With the scan tool, record and erase Diagnostic Trouble Codes (DTCs).

      NOTE: It is recommended to record any Environmental Data to help identify the conditions in which the DTC was set.

   3. Turn the ignition off.
   4. Ignition on, engine running.

      NOTE: The Heated Steering Wheel should be in the off position and remain off for the results to be valid.

   5. With the scan tool, read Comfort Seat Wheel Module (CSWM) DTCs.

      Does the scan tool show this DTC as active?

      Yes

      - Go To 2

      No

      - Go To 5

2. **CHECK THE (C91) HEATED STEERING WHEEL FEED CIRCUIT**

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the Steering Column Control Module (SCCM) C5 harness connector.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

2. Measure the voltage between ground and the (C91) Heated Steering Wheel Feed circuit at the SCCM C5 harness connector.

   Is there any voltage present?

   Yes

   - Go To 3

   No

   - Go To 4

3. **CHECK THE (C91) HEATED STEERING WHEEL FEED CIRCUIT FOR A SHORT TO VOLTAGE**
   1. Turn the ignition off.
   2. Disconnect the Heated Steering Module (CSWM) C4 harness connector.
   3. Turn the ignition on.
   4. Measure the voltage between ground and the (C91) Heated Steering Wheel Feed circuit in the CSWM C4 harness connector.

      Is there any voltage present?

      Yes

      - Repair the (C91) Heated Steering Wheel Feed circuit for a short to voltage.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Replace the Comfort Seat Wheel Module (CSWM) in accordance with the Service Information. Refer to **MODULE, COMFORT SEAT AND WHEEL, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK THE STEERING COLUMN CONTROL MODULE**

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Remove the Driver Airbag in accordance with the Service Information. Refer to **AIR BAG, DRIVER, REMOVAL** .
2. Disconnect the SCCM C7 harness connector.

NOTE: Before proceeding, thoroughly inspect the wiring harness and connectors between the Heated Steering Wheel (HSW) and the Steering Column Control Module (SCCM). Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

3. Reconnect the SCCM C5 harness connector.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

4. Measure the voltage between ground and the (C91) Heated Steering Wheel Feed circuit in the SCCM C7 component connector.

   Is there any voltage present?

   Yes

   - Replace the Steering Column Control Module (SCCM) or Clock Spring in accordance with the Service Information. Refer to **MODULE, STEERING COLUMN, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the Heated Steering Wheel (HSW) in accordance with the Service Information. Refer to **WHEEL, STEERING, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit. Wiggle the wiring and connectors while checking for shorted and open circuits.
   3. Attempt to reproduce the condition by rotating the steering wheel or by adjusting the seat.
   4. Check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

5. With the scan tool, check for any Environmental Data to help identify the conditions in which the DTC was set.
6. Check Service Bulletins for any possible causes that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Test complete.

B10C4-13-HEATED STEERING WHEEL CONTROL - CIRCUIT OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 3: Heated Steering Wheel Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the engine running.

SET CONDITION

The Comfort Seat Wheel Module (CSWM) detects on the Heated Steering Wheel Feed circuit a current level below its threshold for more than two seconds when the output is turned on.

POSSIBLE CAUSES

Possible Causes
HEATED STEERING WHEEL FEED CIRCUIT OPEN
HEATED STEERING WHEEL RETURN CIRCUIT OPEN
HEATED STEERING WHEEL (HSW)
STEERING CONTROL MODULE (SCCM)
COMFORT SEAT WHEEL MODULE (CSWM)

DIAGNOSTIC TEST

1. **CHECK IF THE DTC IS ACTIVE**

   NOTE: Make sure the battery is fully charged and the charging system is operating properly before proceeding.

   1. Turn the ignition on.
   2. With the scan tool, record and erase Diagnostic Trouble Codes (DTCs).
   3. Turn the ignition off.
   4. Start the engine and let it run.
   5. Turn the Heated Steering Wheel (HSW) on.
   6. With the scan tool, read DTCs.

   Is this DTC active?

   Yes

   - Go To 2

   No

   - Go To 7

2. **CHECK THE (C91) HEATED STEERING WHEEL FEED CIRCUIT FOR AN OPEN BETWEEN SCCM AND CSWM**
   1. Disconnect the SCCM C1 harness connector.
   2. Disconnect the CSWM C4 harness connector.

   NOTE: Check connectors. Clean and repair as necessary.

   3. Measure the resistance of the (C91) Heated Steering Wheel Feed circuit between the SCCM C1

harness connector and the CSWM C4 harness connector.

Is the resistance below 5.0 Ohms?

Yes

- Go To 3

No

- Repair the (C91) Heated Steering Wheel Feed circuit for an open.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (C986) HEATED STEERING WHEEL RETURN CIRCUIT FOR AN OPEN BETWEEN SCCM AND CSWM**
   1. Measure the resistance of the (C986) Heated Steering Wheel Return circuit between the SCCM C1 harness connector and the CSWM C4 harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 4

      No

      - Repair the (C986) Heated Steering Wheel Return circuit for an open.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
4. **CHECK THE HEATED STEERING WHEEL FOR AN OPEN**

   WARNING: **Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.**

   1. Remove the Driver Airbag in accordance with the Service Information. Refer to **AIR BAG, DRIVER, REMOVAL** .
   2. Disconnect the SCCM C2 harness connector.

      NOTE: **Before proceeding, thoroughly inspect the wiring harness and connectors between the HSW and the Steering Control Module. Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.**

   3. Measure the resistance between the (C91) Heated Steering Wheel Feed circuit and the (C986) Heated Steering Wheel Return circuit at the SCCM C2 harness connector.

Is the resistance 1.85 ± 0.2 Ohms?

Yes

- Refer to 5.

No

- Replace the Heated Steering Wheel (HSW) in accordance with the Service Information. Refer to **WHEEL, STEERING, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **CHECK THE (C91) HEATED STEERING WHEEL FEED CIRCUIT FOR AN OPEN IN THE SCCM**
   1. Reconnect the SCCM C1 harness connector.
   2. Measure the resistance of the (C91) Heated Steering Wheel Feed circuit between the SCCM C2 component connector and the CSWM C4 harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 6

   No

   - Replace the Steering Column Control Module (SCCM) in accordance with the Service Information. Refer to **MODULE, STEERING COLUMN, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

6. **CHECK THE (C986) HEATED STEERING WHEEL RETURN CIRCUIT OPEN FOR AN OPEN IN THE SCCM**
   1. Measure the resistance of the (C986) Heated Steering Wheel Return circuit between the SCCM C2 component connector and the CSWM C4 harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Replace the Comfort Seat Wheel Module (CSWM) in accordance with the Service Information. Refer to **MODULE, COMFORT SEAT AND WHEEL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the Steering Column Control Module (SCCM) in accordance with the Service

Information. Refer to **MODULE, STEERING COLUMN, REMOVAL** .

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

7. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit. Wiggle the wiring and connectors while checking for shorted and open circuits.
   3. Attempt to reproduce condition by rotating the steering wheel or by adjusting the seat.
   4. Check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   5. With the scan tool, check for any Environmental Data to help identify the conditions in which the DTC was set.
   6. Check Service Bulletins for any possible causes that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Test complete.

B11C1-13-STEERING WHEEL HEATER POWER SUPPLY - CIRCUIT OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 4: CSWM CAN IHS, Fused Ignition & Ground Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the engine running.

SET CONDITION

The Comfort Seat Wheel Module (CSWM) detects no voltage on the Fused Ignition Run Control Output circuit

for more than two seconds.

POSSIBLE CAUSES

Possible Causes
FUSED IGNITION RUN CONTROL OUTPUT CIRCUIT OPEN OR SHORTED TO GROUND COMFORT SEAT WHEEL MODULE (CSWM)

DIAGNOSTIC TEST

1. **CHECK IF THE DTC IS ACTIVE**

   NOTE: Make sure the battery is fully charged and the charging system is operating properly before proceeding.

   1. Turn the ignition on.
   2. With the scan tool, record and erase Diagnostic Trouble Codes (DTCs).

      NOTE: It is recommended to record any Environmental Data to help identify the conditions in which the DTC was set.

   3. Turn the ignition off.
   4. Ignition on, engine running.
   5. With the scan tool, read Comfort Seat Wheel Module (CSWM) DTCs.

      Does the scan tool show this DTC as active?

      Yes

      - Go To 2

      No

      - Go To 3

2. **CHECK THE (F922) FUSED IGNITION RUN CONTROL OUTPUT CIRCUIT FOR AN OPEN**
   1. Turn the ignition off.
   2. Disconnect the CSWM C4 harness connector.
   3. Ignition on, engine running
   4. Using a 12-volt test light connected to ground, check the (F922) Fused Ignition Run Control Output circuit at the CSWM C4 harness connector.

      NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly?

Yes

- Replace the Comfort Seat Wheel Module (CSWM) in accordance with the Service Information. Refer to **MODULE, COMFORT SEAT AND WHEEL, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Repair the (F922) Fused Ignition Run Control Output circuit for an open.

NOTE: If the fuse is open, make sure to check the circuit for a short to ground and repair as necessary.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit. Wiggle the wiring and connectors while checking for shorted and open circuits. Attempt to reproduce the condition by adjusting the seat.
   3. Check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. With the scan tool, check for any Environmental Data to help identify the conditions in which the DTC was set.
   5. Check Service Bulletins for any possible causes that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Test complete.

B1E99-11-FRONT LEFT HEATER CONTROL CIRCUIT - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 5: Left Front Seat Cushion & Seat Back Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the engine running.

SET CONDITION

The Comfort Seat Wheel Module (CSWM) detects on the Left Front Seat Heater Control circuit a voltage below 1.0 volt or a current above 10.0 amps for more than two seconds with the output turned on.

POSSIBLE CAUSES

Possible Causes
LEFT FRONT SEAT HEATER CONTROL CIRCUIT SHORTED TO GROUND
SEAT CUSHION HEATER ELEMENT
SEAT BACK HEATER ELEMENT
COMFORT SEAT WHEEL MODULE (CSWM)

DIAGNOSTIC TEST

1. **CHECK IF THE DTC IS ACTIVE**

   NOTE: Make sure the battery is fully charged and the charging system is operating properly before proceeding.

   1. Turn the ignition on.
   2. With the scan tool, record and erase Diagnostic Trouble Codes (DTCs).

      NOTE: It is recommended to record any Environmental Data to help identify the conditions in which the DTC was set.

   3. Turn the ignition off.
   4. Ignition on, engine running.
   5. Turn the Heated Seat on and operate in all modes.
   6. With the scan tool, read Comfort Seat Wheel Module (CSWM) DTCs.

      Does the scan tool show this DTC as active?

      Yes

      - Go To 2

      No

      - Go To 5

2. **CHECK THE (P187) LEFT FRONT SEAT HEATER CONTROL CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Disconnect the CSWM C2 harness connector.
   3. Disconnect the Left Seat Back Heater C1 harness connector.
   4. Disconnect the Left Seat Cushion Heater C1 harness connector.
   5. Measure the resistance between ground and the (P187) Left Front Seat Heater Control circuit in the CSWM C2 harness connector.

Is the resistance below 10K Ohms?

Yes

- Repair or replace the seat wiring harness for a short to ground on the (P187) Left Front Seat Heater Control circuit.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 3

3. **CHECK THE LEFT FRONT SEAT CUSHION HEATER**
   1. Measure the resistance of the Left Front Seat Cushion Heater element between the (P187) Left Front Seat Heater Control circuit and the (Z919) Ground circuit in the Left Seat Cushion Heater connector.

      Is the resistance 5.04 Ohms (± 10%)?

      Yes

      - Go To 4

      No

      - Replace the Left Front Seat Cushion Heater element in accordance with the Service Information. Refer to **PAD, HEATER, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
4. **CHECK THE LEFT FRONT SEAT BACK HEATER**
   1. Measure the resistance of the Left Front Seat Back Heater element between the (P187) Left Front Seat Heater Control circuit and the (Z919) Ground circuit in the Left Seat Back Heater connector.

      Is the resistance 5.13 Ohms (± 10%)?

      Yes

      - Check the Left Front Seat Back and Cushion Heater element pigtail wiring harnesses for a short to ground and repair as necessary. If no problems are found, replace the Comfort Seat Wheel Module (CSWM) in accordance with the Service Information. Refer to **MODULE, COMFORT SEAT AND WHEEL, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Replace the Left Front Seat Back Heater element in accordance with the Service Information. Refer to **PAD, HEATER, REMOVAL** .

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit. Wiggle the wiring and connectors while checking for shorted and open circuits. Attempt to reproduce the condition by adjusting the seat.
   3. Check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. With the scan tool, check for any Environmental Data to help identify the conditions in which the DTC was set.
   5. Check Service Bulletins for any possible causes that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Test complete.

B1E99-12-FRONT LEFT HEATER CONTROL CIRCUIT - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 6: Left Front Seat Cushion & Seat Back Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the engine running.

SET CONDITION

The Comfort Seat Wheel Module (CSWM) detects on the Left Front Seat Heater Control circuit a voltage above 5.0 volts for more than two seconds with the output turned off.

POSSIBLE CAUSES

Possible Causes
LEFT FRONT SEAT HEATER CONTROL CIRCUIT SHORTED TO VOLTAGE COMFORT SEAT WHEEL MODULE (CSWM)

DIAGNOSTIC TEST

1. **CHECK IF THE DTC IS ACTIVE**

   NOTE: Make sure the battery is fully charged and the charging system is operating properly before proceeding.

   1. Turn the ignition on.
   2. With the scan tool, record and erase Diagnostic Trouble Codes (DTCs).

      NOTE: It is recommended to record any Environmental Data to help identify the conditions in which the DTC was set.

   3. Turn the ignition off.
   4. Ignition on, engine running.

      NOTE: The Front Left Seat Heater should be in the off position and remain off for the results of the test to be valid.

   5. With the scan tool, read Comfort Seat Wheel Module (CSWM) DTCs.

      Does the scan tool show this DTC as active?

      Yes

      - Go To 2

      No

      - Go To 4

2. **CHECK THE (P187) LEFT FRONT SEAT HEATER CONTROL CIRCUIT FOR A SHORT TO VOLTAGE**
   1. Turn the ignition off.
   2. Disconnect the Comfort Seat Wheel Module (CSWM) C2 harness connector.

      NOTE: Check connectors - Clean/repair as necessary.

3. Ignition on, engine running.
4. Measure the voltage between ground and the (P187) Left Front Seat Heater Control circuit in the CSWM C2 harness connector.

   Is the voltage 5.0 volts or above?

   Yes

   - Repair the (P187) Left Front Seat Heater Control circuit for a short to voltage.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 3

3. **CHECK THE (P187) LEFT FRONT SEAT HEATER CONTROL CIRCUIT FOR A SHORT TO VOLTAGE DURING SEAT ADJUSTMENT**
   1. Measure the voltage between ground and the (P187) Left Front Seat Heater Control circuit at the CSWM C2 harness connector while adjusting the seat in all positions.

      Is the voltage 5.0 volts or above any time during the seat adjustment?

      Yes

      - Repair the (P187) Left Front Seat Heater Control circuit for a short to voltage.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Replace the Comfort Seat Wheel Module (CSWM) in accordance with the Service Information. Refer to **MODULE, COMFORT SEAT AND WHEEL, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit. Wiggle the wiring and connectors while checking for shorted and open circuits. Attempt to reproduce condition by adjusting the seat.
   3. Check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. With the scan tool, check for any Environmental Data to help identify the conditions in which the DTC was set.
   5. Check Service Bulletins for any possible causes that may apply.

      Were there any problems found?

Yes

- Repair as necessary.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Test complete.

B1E99-13-FRONT LEFT HEATER CONTROL CIRCUIT - CIRCUIT OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 7: Left Front Seat Cushion & Seat Back Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the engine running.

SET CONDITION

The Comfort Seat Wheel Module (CSWM) detects on the Left Front Seat Heater Control circuit a current below 0.5 of an amp for more than two seconds with the output turned on.

POSSIBLE CAUSES

Possible Causes
LEFT FRONT SEAT HEATER CONTROL CIRCUIT OPEN
GROUND CIRCUIT OPEN
SEAT CUSHION HEATER ELEMENT OPEN
SEAT BACK HEATER ELEMENT OPEN
COMFORT SEAT WHEEL MODULE (CSWM)

DIAGNOSTIC TEST

1. **CHECK IF THE DTC IS ACTIVE**

   NOTE: Make sure the battery is fully charged and the charging system is operating properly before proceeding.

   1. Turn the ignition on.
   2. Using a scan tool, record and erase Diagnostic Trouble Codes (DTCs).

      NOTE: It is recommended to record any Environmental Data to help identify the conditions in which the DTC was set.

   3. Turn the ignition off.
   4. Ignition on, engine running.
   5. Turn the Heated Seat on and operate in all modes.
   6. With the scan tool, read Comfort Seat Wheel Module (CSWM) DTCs.

   Does the scan tool show this DTC as active?

   Yes

   - Go To 2

   No

   - Go To 6

2. **CHECK THE (P187) LEFT FRONT SEAT HEATER CONTROL CIRCUIT FOR AN OPEN**
   1. Turn the ignition off.
   2. Disconnect the Left Seat Cushion Heater harness connector.
   3. Disconnect the Left Seat Back Heater harness connector.

      NOTE: Check connectors - Clean/repair as necessary.

4. Ignition on, engine running.
5. With the scan tool, actuate the seat heaters on high.
6. Using a 12-volt test light connected to ground, check the (P187) Left Front Seat Heater Control circuit at the Left Seat Cushion and Left Seat Back Heater harness connectors (harness side).

NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly at both connectors?

Yes

- Go To 3

No

- Repair the (P187) Left Front Seat Heater Control circuit for an open.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (Z919) GROUND CIRCUIT FOR AN OPEN**
   1. With the scan tool, turn off the seat heater actuator.
   2. Turn the ignition off.
   3. Using a 12-volt test light connected to 12-volts, check the (Z919) Ground circuit at the Left Seat Cushion and Left Seat Back Heater harness connectors (harness side).

   Does the test light illuminate brightly at both connectors?

   Yes

   - Go To 4

   No

   - Repair the (Z919) Ground circuit for an open.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
4. **CHECK THE LEFT SEAT CUSHION HEATER ELEMENT FOR AN OPEN**
   1. Measure the resistance between the (P187) Left Front Seat Heater Control circuit and the (Z919) Ground circuit at the Left Seat Cushion Heater connector (component side).

   Is the resistance 5.04 Ohms (± 10%)?

   Yes

   - Go To 5

No

- Replace the Seat Cushion Heater Element in accordance with the Service Information. Refer to **PAD, HEATER, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **CHECK THE LEFT SEAT BACK HEATER ELEMENT FOR AN OPEN**
   1. Measure the resistance between the (P187) Left Front Seat Heater Control circuit and the (Z919) Ground circuit at the Driver Seat Assembly harness connector (seat back side).

      Is the resistance 5.13 Ohms (± 10%)?

      Yes

      - Replace the Comfort Seat Wheel Module (CSWM) in accordance with the Service Information. Refer to **MODULE, COMFORT SEAT AND WHEEL, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Replace the Seat Back Heater Element in accordance with the Service Information. Refer to **PAD, HEATER, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

6. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit. Wiggle the wiring and connectors while checking for shorted and open circuits. Attempt to reproduce the condition by adjusting the seat.
   3. Check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. With the scan tool, check for any Environmental Data to help identify the conditions in which the DTC was set.
   5. Check Service Bulletins for any possible causes that may apply.

      Were there any problems found?

      Yes

      - Repair as necessary.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Test complete.

B1E99-1E-FRONT LEFT HEATER CONTROL CIRCUIT - CIRCUIT RESISTANCE OUT OF RANGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 8: Left Front Seat Cushion & Seat Back Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the engine running and the output turned on.

SET CONDITION

The Comfort Seat Wheel Module (CSWM) detects on the Left Front Seat Heater Control circuit an impedance equal to or above 7.0 Ohms for more than two seconds.

POSSIBLE CAUSES

Possible Causes
ONE HEATING ELEMENT NOT CONNECTED
LEFT FRONT SEAT HEATER CONTROL CIRCUIT HIGH RESISTANCE
GROUND CIRCUIT HIGH RESISTANCE
SEAT CUSHION HEATER ELEMENT
SEAT BACK HEATER ELEMENT
COMFORT SEAT WHEEL MODULE (CSWM)

DIAGNOSTIC TEST

1. **CHECK IF THE DTC IS ACTIVE**

NOTE: Before proceeding, verify the battery is fully charged, the charging system is operating properly, no Battery or System Voltage Diagnostic Trouble Codes (DTCs) are set, and the CSWM Power and Ground circuits are clean and tight.

1. Turn the ignition on.
2. Using a scan tool, record and erase Diagnostic Trouble Codes (DTCs).

NOTE: It is recommended to record any Environmental Data to help identify the conditions in which the DTC was set.

3. Turn the ignition off.
4. Ignition on, engine running.
5. Turn the Heated Seat on and operate in all modes.
6. With the scan tool, read Comfort Seat Wheel Module (CSWM) DTCs.

Does the scan tool show this DTC as active?

Yes

- Go To 2

No

- Go To 6

2. **CHECK THE (P187) LEFT FRONT SEAT HEATER CONTROL CIRCUIT FOR HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Disconnect the CSWM C2 harness connector.
   3. Disconnect the Left Seat Cushion Heater harness connector.
   4. Disconnect the Left Seat Back Heater harness connector.
   5. Connect a jumper wire between the (P187) Left Front Seat Heater Control circuit and B(+) in the CSWM C2 harness connector.
   6. Using a 12-volt test light connected to ground, check the (P187) Left Front Seat Heater Control circuit at the Left Seat Cushion and the Back Heater harness connectors (harness side).

   NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

   Does the test light illuminate brightly at both connectors?

   Yes

   - Go To 3

   No

   - Repair the (P187) Left Front Seat Heater Control circuit for high resistance.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
3. **CHECK THE (Z919) GROUND CIRCUIT FOR HIGH RESISTANCE**
   1. Using a 12-volt test light connected to 12-volts, check the (Z919) Ground circuit at the Left Seat Cushion and Back Heater harness connectors (harness side).

   Does the test light illuminate brightly at both connectors?

   Yes

   - Go To 4

   No

   - Repair the (Z919) Ground circuit for high resistance.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
4. **CHECK THE LEFT SEAT CUSHION HEATER ELEMENT RESISTANCE**
   1. Measure the resistance between the (P187) Left Front Seat Heater Control circuit and the (Z919) Ground circuit at the Left Seat Cushion Heater connector (component side).

   Is the resistance 5.04 Ohms (± 10%)?

Yes

- Go To 5

No

- Replace the Left Seat Cushion Heater Element in accordance with the Service Information. Refer to **PAD, HEATER, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **CHECK THE LEFT SEAT BACK HEATER ELEMENT RESISTANCE**
   1. Measure the resistance between the (P187) Left Front Seat Heater Control circuit and the (Z919) Ground circuit at the Left Seat Back Heater Element connector (component side).

      Is the resistance 5.13 Ohms (± 10%)?

      Yes

      - Replace the Comfort Seat Wheel Module (CSWM) in accordance with the Service Information. Refer to **MODULE, COMFORT SEAT AND WHEEL, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Replace the Left Seat Back Heater Element in accordance with the Service Information. Refer to **PAD, HEATER, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

6. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit. Wiggle the wiring and connectors while checking for shorted and open circuits. Attempt to reproduce the condition by adjusting the seat.
   3. Check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. With the scan tool, check for any Environmental Data to help identify the conditions in which the DTC was set.
   5. Check Service Bulletins for any possible causes that may apply.

      Were there any problems found?

      Yes

      - Repair as necessary.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Test complete.

B1E9A-11-FRONT RIGHT HEATER CONTROL CIRCUIT - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 9: Right Front Seat Cushion & Seat Back Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the engine running.

SET CONDITION

The Comfort Seat Wheel Module (CSWM) detects on the Right Front Seat Heater Control circuit a voltage below 1.0 volt or a current above 10.0 amps for more than two seconds with the output turned on.

POSSIBLE CAUSES

Possible Causes
RIGHT FRONT SEAT HEATER CONTROL CIRCUIT SHORTED TO GROUND
SEAT BACK HEATER ELEMENT
SEAT CUSHION HEATER ELEMENT
COMFORT SEAT WHEEL MODULE (CSWM)

DIAGNOSTIC TEST

1. **CHECK IF THE DTC IS ACTIVE**

NOTE: Make sure the battery is fully charged and the charging system is operating properly before proceeding.

1. Turn the ignition on.
2. Using a scan tool, record and erase Diagnostic Trouble Codes (DTCs).

NOTE: It is recommended to record any Environmental Data to help identify the conditions in which the DTC was set.

3. Turn the ignition off.
4. Ignition on, engine running.
5. Turn the Heated Seat on and operate in all modes.
6. With the scan tool, read Comfort Seat Wheel Module (CSWM) DTCs.

Does the scan tool show this DTC as active?

Yes

- Go To 2

No

- Go To 5

2. **CHECK THE (P188) RIGHT FRONT SEAT HEATER CONTROL CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Disconnect the CSWM C2 harness connector.
   3. Disconnect the Right Front Seat Cushion Heater C1 harness connector.
   4. Disconnect the Right Front Seat Back Heater C1 harness connector.
   5. Measure the resistance between ground and the (P188) Right Front Seat Heater Control circuit at the CSWM C2 harness connector.

      Is the resistance below 10K Ohms?

      Yes

      - Repair or replace the seat wiring harness for a short to ground on the (P188) Right Front Seat Heater Control circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 3
3. **CHECK THE RIGHT FRONT SEAT CUSHION HEATER**
   1. Measure the resistance of the Right Front Seat Cushion Heater element between the (P188) Right Front Seat Heater Control circuit and the (Z916) Ground circuit in the Right Seat Cushion Heater connector.

      Is the resistance 5.04 Ohms (± 10%)?

      Yes

      - Go To 4

      No

      - Inspect the Right Front Seat Cushion Heater element pigtail wiring harness for a short to ground and repair as necessary. If no problems are found, replace the Right Front Seat Cushion Heater element in accordance with the Service Information. Refer to **PAD, HEATER, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
4. **CHECK THE RIGHT FRONT SEAT BACK HEATER**
   1. Measure the resistance of the Right Front Seat Back Heater element between the (P188) Right Front Seat Heater Control circuit and the (Z916) Ground circuit in the Right Front Seat Back Heater connector.

      Is the resistance between 5.13 Ohms (± 10%)?

Yes

- Check the Right Front Seat Back and Cushion Heater element pigtail wiring harnesses for a short to ground and repair as necessary. If no problems are found, replace the Comfort Seat Wheel Module (CSWM) in accordance with the Service Information. Refer to **MODULE, COMFORT SEAT AND WHEEL, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace the Right Front Seat Cushion Heater element in accordance with the Service Information. Refer to **PAD, HEATER, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit. Wiggle the wiring and connectors while checking for shorted and open circuits. Attempt to reproduce the condition by adjusting the seat.
   3. Check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. With the scan tool, check for any Environmental Data to help identify the conditions in which the DTC was set.
   5. Check Service Bulletins for any possible causes that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Test complete.

B1E9A-12-FRONT RIGHT HEATER CONTROL CIRCUIT - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 10: Right Front Seat Cushion & Seat Back Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the engine running.

SET CONDITION

The Comfort Seat Wheel Module (CSWM) detects on the Right Front Seat Heater Control circuit a voltage

above 5.0 volts for more than two seconds with the output turned off.

POSSIBLE CAUSES

Possible Causes
RIGHT FRONT SEAT HEATER CONTROL CIRCUIT SHORTED TO VOLTAGE COMFORT SEAT WHEEL MODULE (CSWM)

DIAGNOSTIC TEST

1. **CHECK IF THE DTC IS ACTIVE**

   NOTE: Make sure the battery is fully charged and the charging system is operating properly before proceeding.

   1. Turn the ignition on.
   2. Using a scan tool, record and erase Diagnostic Trouble Codes (DTCs).

      NOTE: It is recommended to record any Environmental Data to help identify the conditions in which the DTC was set.

   3. Turn the ignition off.
   4. Ignition on, engine running.

      NOTE: The Right Front Seat Heater should be in the off position and remain off for the results of the test to be valid.

   5. With the scan tool, read Comfort Seat Wheel Module (CSWM) DTCs.

      Does the scan tool show this DTC as active?

      Yes

      - Go To 2

      No

      - Go To 4

2. **CHECK THE (P188) RIGHT FRONT SEAT HEATER CONTROL CIRCUIT FOR A SHORT TO VOLTAGE**
   1. Turn the ignition off.
   2. Disconnect the Comfort Seat Wheel Module (CSWM) C2 harness connector.

NOTE: Check connectors - Clean/repair as necessary.

3. Ignition on, engine running.
4. Measure the voltage between ground and the (P188) Right Front Seat Heater Control circuit at the CSWM C2 harness connector.

   Does the voltage read above 5.0 volts?

   Yes

   - Repair the (P188) Right Front Seat Heater Control circuit for a short to voltage.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 3

3. **CHECK THE (P188) RIGHT FRONT SEAT HEATER CONTROL CIRCUIT FOR A SHORT TO VOLTAGE DURING SEAT ADJUSTMENT**
   1. Measure the voltage between ground and the (P188) Right Front Seat Heater Control circuit at the CSWM C2 harness connector while adjusting the seat in all positions.

      Does the voltage read above 5.0 volts any time while adjusting the seat?

      Yes

      - Repair the (P188) Right Front Seat Heater Control circuit for a short to voltage.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Replace the Comfort Seat Wheel Module (CSWM) in accordance with the Service Information. Refer to **MODULE, COMFORT SEAT AND WHEEL, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit. Wiggle the wiring and connectors while checking for shorted and open circuits. Attempt to reproduce the condition by adjusting the seat(s).
   3. Check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. With the scan tool, check for any Environmental Data to help identify the conditions in which the DTC was set.
   5. Check Service Bulletins for any possible causes that may apply.

Were there any problems found?

Yes

- Repair as necessary.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Test complete.

B1E9A-13-FRONT RIGHT HEATER CONTROL CIRCUIT - CIRCUIT OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 11: Right Front Seat Cushion & Seat Back Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the engine running.

SET CONDITION

The Comfort Seat Wheel Module (CSWM) detects on the Right Front Seat Heater Control circuit a current

below 0.5 of an amp for more than two seconds with the output turned on.

POSSIBLE CAUSES

Possible Causes
RIGHT FRONT SEAT HEATER CONTROL CIRCUIT OPEN
GROUND CIRCUIT OPEN
SEAT CUSHION HEATER ELEMENT OPEN
SEAT BACK HEATER ELEMENT OPEN
COMFORT SEAT WHEEL MODULE (CSWM)

DIAGNOSTIC TEST

1. **CHECK IF THE DTC IS ACTIVE**

   NOTE: Make sure the battery is fully charged and the charging system is operating properly before proceeding.

   1. Turn the ignition on.
   2. Using a scan tool, record and erase Diagnostic Trouble Codes (DTCs).

      NOTE: It is recommended to record any Environmental Data to help identify the conditions in which the DTC was set.

   3. Turn the ignition off.
   4. Ignition on, engine running.
   5. Turn the Heated Seat on and operate in all modes.
   6. With the scan tool, read Comfort Seat Wheel Module (CSWM) DTCs.

   Does the scan tool show this DTC as active?

   Yes

   - Go To 2.

   No

   - Go To 6

2. **CHECK THE (P188) RIGHT FRONT SEAT HEATER CONTROL CIRCUIT FOR AN OPEN**
   1. Turn the ignition off.
   2. Disconnect the Right Seat Cushion Heater harness connector.
   3. Disconnect the Right Seat Back Heater harness connector.

NOTE: Check connectors - Clean/repair as necessary.

4. With the scan tool, actuate the seat heaters on high.
5. Using a 12-volt test light connected to ground, check the (P188) Right Front Seat Heater Control circuit at the Right Seat Cushion and Right Seat Back Heater harness connectors (harness side).

NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly at both connectors?

Yes

- Go To 3.

No

- Repair the (P188) Right Front Seat Heater Control circuit for an open.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (Z916) GROUND CIRCUIT FOR AN OPEN**
   1. With the scan tool, stop the seat heater actuation.
   2. Turn the ignition off.
   3. Using a 12-volt test light connected to 12-volts, check the (Z916) Ground circuit at the Right Seat Cushion and Right Seat Back Heater harness connectors (harness side).

   Does the test light illuminate brightly at both connectors?

   Yes

   - Go To 4.

   No

   - Repair the (Z916) Ground circuit for an open.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK THE RIGHT SEAT CUSHION HEATER ELEMENT FOR AN OPEN**
   1. Measure the resistance between the (P188) Right Front Seat Heater Control circuit and the (Z916) Ground circuit at the Right Seat Cushion Heater connector (component side).

   Is the resistance 5.04 Ohms (± 10%)?

   Yes

- Go To 5

No

- Replace the Seat Cushion Heater Element in accordance with the Service Information. Refer to **PAD, HEATER, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **CHECK THE RIGHT SEAT BACK HEATER ELEMENT FOR AN OPEN**
   1. Measure the resistance between the (P188) Right Front Seat Heater Control circuit and the (Z916) Ground circuit at the Right Seat Back Heater harness connector (component side).

      Is the resistance 5.13 Ohms (± 10%)?

      Yes

      - Replace the Comfort Seat Wheel Module (CSWM) in accordance with the Service Information. Refer to **MODULE, COMFORT SEAT AND WHEEL, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Replace the Seat Back Heater Element in accordance with the Service Information. Refer to **PAD, HEATER, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

6. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit. Wiggle the wiring and connectors while checking for shorted and open circuits. Attempt to reproduce the condition by adjusting the seat(s).
   3. Check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. With the scan tool, check for any Environmental Data to help identify the conditions in which the DTC was set.
   5. Check Service Bulletins for any possible causes that may apply.

      Were there any problems found?

      Yes

      - Repair as necessary.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

- Test complete.

B1E9A-1E-FRONT RIGHT HEATER CONTROL CIRCUIT - CIRCUIT RESISTANCE OUT OF RANGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 12: Right Front Seat Cushion & Seat Back Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the engine running.

SET CONDITION

The Comfort Seat Wheel Module (CSWM) detects on the Right Front Seat Heater Control circuit an impedance equal to or above 7.0 Ohms for more than two seconds with the output turned on.

POSSIBLE CAUSES

Possible Causes
RIGHT FRONT SEAT HEATER CONTROL CIRCUIT RESISTANCE HIGH
GROUND CIRCUIT RESISTANCE HIGH
SEAT CUSHION HEATER ELEMENT
SEAT BACK HEATER ELEMENT
COMFORT SEAT WHEEL MODULE (CSWM)

DIAGNOSTIC TEST

1. **CHECK IF THE DTC IS ACTIVE**

NOTE: Before proceeding, verify the battery is fully charged, the charging system is operating properly, no Battery or System Voltage Diagnostic Trouble Codes (DTCs) are set, and the CSWM Power and Ground circuits are clean and tight.

1. Turn the ignition on.
2. Using a scan tool, record and erase Diagnostic Trouble Codes (DTCs).

NOTE: It is recommended to record any Environmental Data to help identify the conditions in which the DTC was set.

3. Turn the ignition off.
4. Ignition on, engine running.
5. Turn the Heated Seat on and operate in all modes.
6. With the scan tool, read Comfort Seat Wheel Module (CSWM) DTCs.

Does the scan tool show this DTC as active?

Yes

- Go To 2

No

- Go To 6

2. **CHECK THE (P188) RIGHT FRONT SEAT HEATER CONTROL CIRCUIT FOR HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Disconnect the CSWM C2 harness connector.
   3. Disconnect the Right Seat Cushion Heater harness connector.
   4. Disconnect the Right Seat Back Heater harness connector.
   5. Connect a jumper wire between the (P188) Right Front Seat Heater Control circuit and B(+) in the CSWM C2 harness connector.
   6. Using a 12-volt test light connected to ground, check the (P188) Right Front Seat Heater Control circuit at the Right Seat Cushion and the Back Heater harness connectors (harness side).

   NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

   Does the test light illuminate brightly at both connectors?

   Yes

   - Go To 3

   No

   - Repair the (P188) Right Front Seat Heater Control circuit for high resistance.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (Z916) GROUND CIRCUIT FOR HIGH RESISTANCE**
   1. Using a 12-volt test light connected to 12-volts, check the (Z916) Ground circuit at the Right Seat Cushion and Back Heater harness connectors (harness side).

   Does the test light illuminate brightly at both connectors?

   Yes

   - Go To 4

   No

   - Repair the (Z916) Ground circuit for high resistance.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK THE RIGHT SEAT CUSHION HEATER ELEMENT RESISTANCE**
   1. Measure the resistance between the (P188) Right Front Seat Heater Control circuit and the (Z916)

Ground circuit at the Right Seat Cushion Heater connector (component side).

Is the resistance 5.04 Ohms (± 10%)?

Yes

- Go To 5

No

- Replace the Right Seat Cushion Heater Element in accordance with the Service Information. Refer to **PAD, HEATER, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **CHECK THE RIGHT SEAT BACK HEATER ELEMENT RESISTANCE**
   1. Measure the resistance between the (P188) Right Front Seat Heater Control circuit and the (Z916) Ground circuit at the Right Seat Back Heater Element connector (component side).

      Is the resistance 5.13 Ohms (± 10%)?

      Yes

      - Replace the Comfort Seat Wheel Module (CSWM) in accordance with the Service Information. Refer to **MODULE, COMFORT SEAT AND WHEEL, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Replace the Right Seat Back Heater Element in accordance with the Service Information. Refer to **PAD, HEATER, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
6. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit. Wiggle the wiring and connectors while checking for shorted and open circuits. Attempt to reproduce the condition by adjusting the seat.
   3. Check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. With the scan tool, check for any Environmental Data to help identify the conditions in which the DTC was set.
   5. Check Service Bulletins for any possible causes that may apply.

      Were there any problems found?

      Yes

- Repair as necessary.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Test complete.

B1E9D-11-FRONT LEFT VENT CONTROL CIRCUIT - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 13: Left Front Seat Cushion & Seat Back Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the engine running.

SET CONDITION

The Comfort Seat Wheel Module (CSWM) detects on the Left Seat Vent Feed circuit a voltage below 1.0 volt or an amperage draw exceeding 1.5 amps for more than 2.0 seconds with the output turned on.

POSSIBLE CAUSES

Possible Causes
LEFT SEAT VENT FEED CIRCUIT SHORTED TO GROUND
LEFT SEAT VENT FEED CIRCUIT SHORTED TO THE LEFT SEAT VENT RETURN CIRCUIT
SEAT CUSHION VENT MOTOR
SEAT BACK VENT MOTOR
COMFORT SEAT WHEEL MODULE (CSWM)

DIAGNOSTIC TEST

1. **CHECK IF THE DTC IS CURRENT**

   NOTE: Make sure the battery is fully charged and the charging system is operating properly before proceeding.

   1. Turn the ignition on.
   2. Using a scan tool, record and erase Diagnostic Trouble Codes (DTCs).

      NOTE: It is recommended to record any Environmental Data to help identify the conditions in which the DTC was set.

   3. Turn the ignition off.
   4. Ignition on, engine running.
   5. Turn the Vented Seat on and wait at least 12 seconds before proceeding.
   6. Using a scan tool, read Comfort Seat Wheel Module (CSWM) DTCs.

      Does the scan tool show this DTC as active?

      Yes

      - Go To 2

      No

      - Go To 7

2. **CHECK THE (P421) LEFT SEAT VENT FEED CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Disconnect the CSWM C5 harness connector.
   3. Measure the resistance between ground and the (P421) Left Seat Vent Feed circuit in the CSWM C5 harness connector.

      Is the resistance below 10K Ohms?

Yes

- Repair the (P421) Left Seat Vent Feed circuit for a short to ground.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 3

3. **CHECK THE LEFT VENT SEAT MOTORS**
   1. Connect a jumper wire between ground and the (P921) Left Seat Vent Return circuit in the CSWM C5 harness connector.
   2. Connect a fused jumper wire between B(+) and the (P421) Left Seat Vent Feed circuit in the CSWM C5 harness connector.

   Are both vent seat motors operative?

   Yes

   - Go To 4

   No

   - Inspect the wiring and connectors to the inoperative motor and repair as necessary. If no problems are found, replace the inoperative motor in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
4. **CHECK THE AMPERAGE OF THE LEFT VENT SEAT MOTORS**
   1. Connect a fused jumper wire between B(+) and the (P421) Left Seat Vent Feed circuit in the CSWM C5 harness connector.
   2. Measure the amperage by connecting an ammeter between ground and the (P921) Left Seat Vent Return circuit in the CSWM C5 harness connector.

   Is the amperage above 1.5 amps?

   Yes

   - Go To 5

   No

   - Replace the Comfort Seat Wheel Module (CSWM) in accordance with the Service Information. Refer to **MODULE, COMFORT SEAT AND WHEEL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
5. **CHECK THE LEFT SEAT CUSHION VENT MOTOR**

1. Disconnect the Left Seat Cushion Vent Motor C2 harness connector.
2. Connect a fused jumper wire between B(+) and the (P421) Left Seat Vent Feed circuit in the Left Seat Cushion Vent Motor connector.
3. Measure the amperage by connecting an ammeter between ground and the (P921) Left Seat Vent Return circuit in the Left Seat Cushion Vent Motor connector.

NOTE: Individual vent motors normally operate between 0.4 and 0.5 amps.

Is the amperage above 0.75 amps?

Yes

- Replace the Seat Cushion Vent Motor in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 6

6. **CHECK THE LEFT SEAT BACK VENT MOTOR**
   1. Disconnect the Left Seat Back Vent Motor C2 harness connector.
   2. Connect a fused jumper wire between B(+) and the (P421) Left Seat Vent Feed circuit in the Left Seat Back Vent Motor connector.
   3. Measure the amperage by connecting an ammeter between ground and the (P921) Left Seat Vent Return circuit in the Left Seat Back Vent Motor connector.

   Is the amperage above 0.75 amps?

   Yes

   - Replace the Seat Back Vent Motor in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Repair or replace the left seat wiring harness for a short to another circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

7. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit. Wiggle the wiring and connectors while checking for shorted and open circuits. Attempt to reproduce the condition by adjusting the seat(s).
   3. Check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension. Verify the seat wiring harness is routed correctly to the Comfort

Seat Wheel Module (CSWM).

4. With the scan tool, check for any Environmental Data to help identify the conditions in which the DTC was set.
5. Check Service Bulletins for any possible causes that may apply.

Were there any problems found?

Yes

- Repair as necessary.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Test complete.

B1E9D-12-FRONT LEFT VENT CONTROL CIRCUIT - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 14: Left Front Seat Cushion & Seat Back Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the engine running.

SET CONDITION

The Comfort Seat Wheel Module (CSWM) detects on the Left Seat Vent Feed circuit a voltage above 5.0 volts for more than two seconds with the output turned off.

POSSIBLE CAUSES

Possible Causes
LEFT SEAT VENT FEED CIRCUIT SHORTED TO VOLTAGE COMFORT SEAT WHEEL MODULE (CSWM)

DIAGNOSTIC TEST

1. **CHECK IF THE DTC IS ACTIVE**

   NOTE: Make sure the battery is fully charged and the charging system is operating properly before proceeding.

   1. Turn the ignition on.
   2. Using a scan tool, record and erase Diagnostic Trouble Codes (DTCs).
   3. Turn the ignition off.
   4. Start the engine and let it run.

      NOTE: The Seat Vent should be in the off position and remain off or the results of the test will be invalid.

   5. Ignition on, engine running.
   6. With the scan tool, read Comfort Seat Wheel Module (CSWM) DTCs.

      Does the scan tool show this DTC as active?

      Yes

      - Go To 2

      No

      - Go To 4

2. **CHECK THE (P421) LEFT SEAT VENT FEED CIRCUIT FOR A SHORT TO VOLTAGE**
   1. Turn the ignition off.
   2. Disconnect the CSWM C5 harness connector.
   3. Start the engine and let it run.
   4. Measure the voltage between ground and the (P421) Left Seat Vent Feed circuit at the CSWM C5 harness connector.

      Is the voltage 5.0 volts or above?

      Yes

- Repair the (P421) Left Seat Vent Feed circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 3

3. **CHECK THE (P421) LEFT SEAT VENT FEED CIRCUIT FOR A SHORT TO VOLTAGE DURING SEAT ADJUSTMENT**
   1. Measure the voltage between ground and the (P421) Left Seat Vent Feed circuit at the CSWM C5 harness connector while adjusting the seat in all positions.

      Is the voltage 5.0 volts or above any time during the seat adjustment?

      Yes

      - Repair the (P421) Left Seat Vent Feed circuit for a short to voltage.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Replace the Comfort Seat Wheel Module (CSWM) in accordance with the Service Information. Refer to **MODULE, COMFORT SEAT AND WHEEL, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit. Wiggle the wiring and connectors while checking for shorted and open circuits. Attempt to reproduce the condition by adjusting the seat(s).
   3. Check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension. Verify the seat wiring harness is routed correctly to the Comfort Seat Wheel Module (CSWM).
   4. Attempt to reproduce the condition(s) by operating all CSWM functions, except for the Left Front Vented Seat, one at a time.
   5. With the scan tool, check for any Environmental Data to help identify the conditions in which the DTC was set.
   6. Check Service Bulletins for any possible causes that may apply.

      Were there any problems found?

      Yes

      - Repair as necessary.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Test complete.

WHEN MONITORED

With the engine running.

SET CONDITION

The Comfort Seat Wheel Module (CSWM) detects on the Left Seat Vent Feed circuit a current below 200 mA for more than 12 seconds with the output turned on.

POSSIBLE CAUSES

Possible Causes
LEFT SEAT VENT FEED CIRCUIT OPEN
LEFT SEAT VENT RETURN CIRCUIT OPEN
SEAT CUSHION VENT MOTOR OPEN
SEAT BACK VENT MOTOR OPEN
COMFORT SEAT WHEEL MODULE (CSWM)

DIAGNOSTIC TEST

1. **CHECK IF THE DTC IS ACTIVE**

NOTE: Make sure the battery is fully charged and the charging system is operating properly before proceeding.

1. Turn the ignition on.
2. Using a scan tool, record and erase Diagnostic Trouble Codes (DTCs).

NOTE: It is recommended to record any Environmental Data to help identify the conditions in which the DTC was set.

3. Turn the ignition off.
4. Ignition on, engine running.
5. Turn the Vented Seat on and wait at least 12 seconds before proceeding.
6. With the scan tool, read Comfort Seat Wheel Module (CSWM) DTCs.

Does the scan tool show this DTC as active?

Yes

- Go To 2

No

- Go To 6

2. **CHECK THE (P421) LEFT SEAT VENT FEED CIRCUIT FOR AN OPEN**
   1. Turn the ignition off.
   2. Disconnect the CSWM C5 harness connector.
   3. Disconnect the Left Seat Cushion Vent Motor.
   4. Disconnect the Left Seat Back Vent Motor.
   5. Connect a fused jumper wire between B(+) and the (P421) Left Seat Vent Feed circuit in the CSWM C5 harness connector.
   6. Using a 12 volt test light connected to ground, check the (P421) Left Seat Vent Feed circuit at the Left Seat Cushion Vent Motor and the Left Seat Back Vent Motor harness connectors.

   NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

   Does the test light illuminate brightly at both harness connectors?

   Yes

   - Go To 3

   No

   - Repair the (P421) Left Seat Vent Feed circuit for an open.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (P921) LEFT SEAT RETURN CIRCUIT FOR AN OPEN**
   1. Disconnect the fused jumper wire between B(+) and the (P421) Left Seat Vent Feed circuit in the CSWM C5 harness connector.
   2. Connect the fused jumper wire between B(+) and the (P921) Left Seat Vent Return circuit in the CSWM C5 harness connector.
   3. Using a 12 volt test light connected to ground, check the (P921) Left Seat Vent Return circuit at the Left Seat Cushion Vent Motor and the Left Seat Back Vent Motor harness connectors.

   Does the test light illuminate brightly at both harness connectors?

   Yes

   - Go To 4

   No

   - Repair the (P921) Left Seat Vent Return circuit for an open.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK THE LEFT SEAT CUSHION VENT MOTOR**
   1. Disconnect the fused jumper wire between B(+) and the (P921) Left Seat Vent Return circuit in the CSWM C5 harness connector.
   2. Connect a fused jumper wire between B(+) and the (P421) Left Seat Vent Feed circuit in the Left Cushion Vent Motor connector.
   3. Measure the amperage by connecting an ammeter between ground and the (P921) Left Seat Vent Return circuit in the Left Cushion Vent Motor connector.

   NOTE: Individual vent motors normally operate between 400 and 500 mA.

   Is the amperage between 300 and 700 mA?

   Yes

   - Go To 5

   No

   - Replace the Seat Cushion Vent Motor in accordance with the Service Information. Refer to **MOTOR, VENTED SEAT, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
5. **CHECK THE LEFT SEAT BACK VENT MOTOR**
   1. Disconnect the fused jumper wire between B(+) and the (P421) Left Seat Vent Feed circuit in the Left Cushion Vent Motor connector.
   2. Connect a fused jumper wire between B(+) and the (P421) Left Seat Vent Feed circuit in the Left Back Vent Motor connector.
   3. Measure the amperage by connecting an ammeter between ground and the (P921) Left Seat Vent Return circuit in the Left Back Vent Motor connector.

   Is the amperage between 300 and 700 mA?

   Yes

   - Replace the Comfort Seat Wheel Module (CSWM) in accordance with the Service Information. Refer to **MODULE, COMFORT SEAT AND WHEEL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the Seat Back Vent Motor in accordance with the Service Information. Refer to **MOTOR, VENTED SEAT, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
6. **CHECK THE WIRING AND CONNECTORS**

1. The conditions necessary to set the DTC are not present at this time.
2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit. Wiggle the wiring and connectors while checking for shorted and open circuits. Attempt to reproduce the condition by adjusting the seat(s).
3. Check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension. Verify the seat wiring harness is routed correctly to the Comfort Seat Wheel Module (CSWM).
4. With the scan tool, check for any Environmental Data to help identify the conditions in which the DTC was set.
5. Check Service Bulletins for any possible causes that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Test complete.

B1E9E-11-FRONT RIGHT VENT CONTROL CIRCUIT - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 16: Right Front Seat Cushion & Seat Back Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the engine running.

SET CONDITION

The Comfort Seat Wheel Module (CSWM) detects a voltage below 1.0 volt or an amperage draw exceeding 1.5

amps on the Right Seat Vent Feed circuit for more than 2.0 seconds with the output turned on.

POSSIBLE CAUSES

Possible Causes
RIGHT SEAT VENT FEED CIRCUIT SHORTED TO GROUND
RIGHT SEAT VENT FEED CIRCUIT SHORTED TO THE RIGHT SEAT VENT RETURN CIRCUIT
SEAT CUSHION VENT MOTOR
SEAT BACK VENT MOTOR
COMFORT SEAT WHEEL MODULE (CSWM)

DIAGNOSTIC TEST

1. **CHECK IF THE DTC IS CURRENT**

   NOTE: Make sure the battery is fully charged and the charging system is operating properly before proceeding.

   1. Turn the ignition on.
   2. Using a scan tool, record and erase Diagnostic Trouble Codes (DTCs).

      NOTE: It is recommended to record any Environmental Data to help identify the conditions in which the DTC was set.

   3. Turn the ignition off.
   4. Ignition on, engine running.
   5. Turn the Vented Seat on and wait at least 12 seconds before proceeding.
   6. Using a scan tool, read Comfort Seat Wheel Module (CSWM) DTCs.

      Does the scan tool show this DTC as active?

      Yes

      - Go To 2

      No

      - Go To 7

2. **CHECK THE (P422) RIGHT SEAT VENT FEED CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Disconnect the CSWM C5 harness connector.
   3. Measure the resistance between ground and the (P422) Right Seat Vent Feed circuit in the CSWM C5 harness connector.

Is the resistance below 10K Ohms?

Yes

- Repair the (P422) Right Seat Vent Feed circuit for a short to ground.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 3

3. **CHECK THE RIGHT VENT SEAT MOTORS**
   1. Connect a jumper wire between ground and the (P922) Right Seat Vent Return circuit in the CSWM C5 harness connector.
   2. Connect a fused jumper wire between B(+) and the (P422) Right Seat Vent Feed circuit in the CSWM C5 harness connector.

   Are both vent seat motors operative?

   Yes

   - Go To 4

   No

   - Inspect the wiring and connectors to the inoperative motor and repair as necessary. If no problems are found, replace the inoperative motor in accordance with the Service Information. Refer to **MOTOR, VENTED SEAT, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
4. **CHECK THE AMPERAGE OF THE RIGHT VENT SEAT MOTORS**
   1. Connect a fused jumper wire between B(+) and the (P422) Right Seat Vent Feed circuit in the CSWM C5 harness connector.
   2. Measure the amperage by connecting an ammeter between ground and the (P922) Right Seat Vent Return circuit in the CSWM C5 harness connector.
   3. Is the amperage above 1.5 amps?

   Yes

   - Go To 5

   No

   - Replace the Comfort Seat Wheel Module (CSWM) in accordance with the Service Information. Refer to **MODULE, COMFORT SEAT AND WHEEL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **CHECK THE RIGHT SEAT CUSHION VENT MOTOR**
   1. Disconnect the Right Seat Cushion Vent Motor C2 harness connector.
   2. Connect a fused jumper wire between B(+) and the (P422) Right Seat Vent Feed circuit in the Right Seat Cushion Vent Motor connector.
   3. Measure the amperage by connecting an ammeter between ground and the (P922) Right Seat Vent Return circuit in the Right Seat Cushion Vent Motor connector.

   NOTE: Individual vent motors normally operate between 0.4 and 0.5 amps.

   Is the amperage above 0.75 amps?

   Yes

   - Replace the Seat Cushion Vent Motor in accordance with the Service Information. Refer to **MOTOR, VENTED SEAT, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 6
6. **CHECK THE RIGHT SEAT BACK VENT MOTOR**
   1. Disconnect the Right Seat Back Vent Motor C2 harness connector.
   2. Connect a fused jumper wire between B(+) and the (P422) Right Seat Vent Feed circuit in the Right Seat Back Vent Motor connector.
   3. Measure the amperage by connecting an ammeter between ground and the (P922) Right Seat Vent Return circuit in the Right Seat Back Vent Motor connector.

   Is the amperage above 0.75 amps?

   Yes

   - Replace the Seat Back Vent Motor in accordance with the Service Information. Refer to **MOTOR, VENTED SEAT, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Repair or replace the left seat wiring harness for a short to another circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
7. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit. Wiggle the wiring and connectors while checking for shorted and open circuits. Attempt to reproduce the

condition by adjusting the seat(s).

3. Check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension. Verify the seat wiring harness is routed correctly to the Comfort Seat Wheel Module (CSWM).
4. With the scan tool, check for any Environmental Data to help identify the conditions in which the DTC was set.
5. Check Service Bulletins for any possible causes that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Test complete.

With the engine running.

SET CONDITION

The Comfort Seat Wheel Module (CSWM) detects voltage above 5.0 volts on the Right Seat Vent Feed circuit

for more than two seconds with the output turned off.

POSSIBLE CAUSES

Possible Causes
RIGHT SEAT VENT FEED CIRCUIT SHORTED TO VOLTAGE COMFORT SEAT WHEEL MODULE (CSWM)

DIAGNOSTIC TEST

1. **CHECK IF THE DTC IS ACTIVE**

   NOTE: Make sure the battery is fully charged and the charging system is operating properly before proceeding.

   1. Turn the ignition on.
   2. Using a scan tool, record and erase Diagnostic Trouble Codes (DTCs).
   3. Turn the ignition off.
   4. Start the engine and let it run.

      NOTE: The Seat Vent should be in the off position and remain off or the results of the test will be invalid.

   5. Ignition on, engine running.
   6. With the scan tool, read Comfort Seat Wheel Module (CSWM) DTCs.

      Does the scan tool show this DTC as active?

      Yes

      - Go To 2

      No

      - Go To 4

2. **CHECK THE (P422) RIGHT SEAT VENT FEED CIRCUIT FOR A SHORT TO VOLTAGE**
   1. Turn the ignition off.
   2. Disconnect the CSWM C5 harness connector.
   3. Start the engine and let it run.
   4. Measure the voltage between ground and the (P422) Right Seat Vent Feed circuit at the CSWM C5 harness connector.

      Is the voltage 5.0 volts or above?

Yes

- Repair the (P422) Right Seat Vent Feed circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 3

3. **CHECK THE (P422) RIGHT SEAT VENT FEED CIRCUIT FOR A SHORT TO VOLTAGE DURING SEAT ADJUSTMENT**
   1. Measure the voltage between ground and the (P422) Right Seat Vent Feed circuit at the CSWM C5 harness connector while adjusting the seat in all positions.

      Is the voltage 5.0 volts or above any time during the seat adjustment?

      Yes

      - Repair the (P422) Right Seat Vent Feed circuit for a short to voltage.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Replace the Comfort Seat Wheel Module (CSWM) in accordance with the Service Information. Refer to **MODULE, COMFORT SEAT AND WHEEL, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit. Wiggle the wiring and connectors while checking for shorted and open circuits. Attempt to reproduce the condition by adjusting the seat(s).
   3. Check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension. Verify the seat wiring harness is routed correctly to the Comfort Seat Wheel Module (CSWM).
   4. Attempt to reproduce the condition(s) by operating all CSWM functions, except for the Right Front Vented Seat, one at a time.
   5. With the scan tool, check for any Environmental Data to help identify the conditions in which the DTC was set.
   6. Check Service Bulletins for any possible causes that may apply.

      Were there any problems found?

      Yes

      - Repair as necessary.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Test complete.

NOTE: Make sure the battery is fully charged and the charging system is operating properly before proceeding.

1. Turn the ignition on.
2. Using a scan tool, record and erase Diagnostic Trouble Codes (DTCs).

NOTE: It is recommended to record any Environmental Data to help identify the conditions in which the DTC was set.

3. Turn the ignition off.
4. Ignition on, engine running.
5. Turn the Vented Seat on and wait at least 12 seconds before proceeding.
6. With the scan tool, read Comfort Seat Wheel Module (CSWM) DTCs.

Does the scan tool show this DTC as active?

Yes

- Go To 2

No

- Go To 6

2. **CHECK THE (P422) RIGHT SEAT VENT FEED CIRCUIT FOR AN OPEN**
   1. Turn the ignition off.
   2. Disconnect the CSWM C5 harness connector.
   3. Disconnect the Right Seat Cushion Vent Motor.
   4. Disconnect the Right Seat Back Vent Motor.
   5. Connect a fused jumper wire between B(+) and the (P422) Right Seat Vent Feed circuit in the CSWM C5 harness connector.
   6. Using a 12 volt test light connected to ground, check the (P422) Right Seat Vent Feed circuit at the Right Seat Cushion Vent Motor and the Right Seat Back Vent Motor harness connectors.

   NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

   Does the test light illuminate brightly at both harness connectors?

   Yes

   - Go To 3

   No

   - Repair the (P422) Right Seat Vent Feed circuit for an open.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (P922) RIGHT SEAT RETURN CIRCUIT FOR AN OPEN**
   1. Disconnect the fused jumper wire between B(+) and the (P422) Right Seat Vent Feed circuit in the CSWM C5 harness connector.
   2. Connect the fused jumper wire between B(+) and the (P922) Right Seat Vent Return circuit in the CSWM C5 harness connector.
   3. Using a 12 volt test light connected to ground, check the (P922) Right Seat Vent Return circuit at the Right Seat Cushion Vent Motor and the Right Seat Back Vent Motor harness connectors.

   Does the test light illuminate brightly at both harness connectors?

   Yes

   - Go To 4

   No

   - Repair the (P922) Right Seat Vent Return circuit for an open.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK THE RIGHT SEAT CUSHION VENT MOTOR**
   1. Disconnect the fused jumper wire between B(+) and the (P922) Right Seat Vent Return circuit in the CSWM C5 harness connector.
   2. Connect a fused jumper wire between B(+) and the (P422) Right Seat Vent Feed circuit in the Right Cushion Vent Motor connector.
   3. Measure the amperage by connecting an ammeter between ground and the (P922) Right Seat Vent Return circuit in the Right Cushion Vent Motor connector.

   NOTE: Individual vent motors normally operate between 400 and 500 mA.

   Is the amperage between 300 and 700 mA?

   Yes

   - Go To 5

   No

   - Replace the Seat Cushion Vent Motor in accordance with the Service Information. Refer to **MOTOR, VENTED SEAT, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **CHECK THE RIGHT SEAT BACK VENT MOTOR**
   1. Disconnect the fused jumper wire between B(+) and the (P422) Right Seat Vent Feed circuit in the Right Cushion Vent Motor connector.
   2. Connect a fused jumper wire between B(+) and the (P422) Right Seat Vent Feed circuit in the Right Back Vent Motor connector.
   3. Measure the amperage by connecting an ammeter between ground and the (P922) Right Seat Vent Return circuit in the Right Back Vent Motor connector.

   Is the amperage between 300 and 700 mA?

   Yes

   - Replace the Comfort Seat Wheel Module (CSWM) in accordance with the Service Information. Refer to **MODULE, COMFORT SEAT AND WHEEL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the Seat Back Vent Motor in accordance with the Service Information. Refer to **MOTOR, VENTED SEAT, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

6. **CHECK THE WIRING AND CONNECTORS**
    1. The conditions necessary to set the DTC are not present at this time.
    2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit. Wiggle the wiring and connectors while checking for shorted and open circuits. Attempt to reproduce the condition by adjusting the seat(s).
    3. Check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension. Verify the seat wiring harness is routed correctly to the Comfort Seat Wheel Module (CSWM).
    4. With the scan tool, check for any Environmental Data to help identify the conditions in which the DTC was set.
    5. Check Service Bulletins for any possible causes that may apply.

    Were there any problems found?

    Yes

    - Repair as necessary.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

    No

    - Test complete.

DIAGNOSTIC TEST

1. **CHECK IF THE DTC IS ACTIVE**

   NOTE: Make sure the battery is fully charged and the charging system is operating properly before proceeding.

   1. Turn the ignition on.
   2. Using a scan tool, record and erase Diagnostic Trouble Codes (DTCs).

      NOTE: It is recommended to record any Environmental Data to help identify the conditions in which the DTC was set.

   3. Turn the ignition off.
   4. Ignition on, engine running.
   5. With the scan tool, read Comfort Seat Wheel Module (CSWM) DTCs.

      Does the scan tool show this DTC as active?

      Yes

      - Go To 2

      No

      - Go To 5

2. **CHECK THE LEFT FRONT SEAT TEMPERATURE SENSOR**
   1. Turn the ignition off.
   2. Disconnect the CSWM C2 harness connector.
   3. Measure the resistance between the (P687) Left Front Heated Seat Temp Sense circuit and the (P968) Heated Seat Sensor Return circuit in the CSWM C2 harness connector.
   4. Compare the measured resistance to the Temperature Sensor Resistance chart.

      Is the resistance within the specifications listed in the chart?

      Yes

      - Go To 3

      No

      - Go To 4

3. **CHECK (P687) LEFT FRONT HEATED SEAT TEMP SENSE CIRCUIT FOR A SHORT TO GROUND**
   1. Measure the resistance between ground and the (P687) Left Front Heated Seat Temp Sense circuit

in the CSWM C2 harness connector.

Is the resistance below 10K Ohms?

Yes

- Repair the (P687) Left Front Heated Seat Temp Sense circuit for a short to ground.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace the Comfort Seat Wheel Module (CSWM) in accordance with the Service Information. Refer to **MODULE, COMFORT SEAT AND WHEEL, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK THE LEFT FRONT SEAT WIRING HARNESS**
   1. Disconnect the Left Seat Cushion Heater harness connector.
   2. Measure the resistance between the (P687) Left Front Heated Seat Temp Sense circuit and the (P968) Heated Seat Sensor Return circuit in the Left Seat Cushion Heater connector.
   3. Compare the measured resistance to the Temperature Sensor Resistance chart.

   Is the resistance within the specifications listed in the chart?

   Yes

   - Repair or replace the Left Front Seat wiring harness for a short.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the Left Front Seat Temperature Sensor (Left Front Seat Cushion Heater Element) in accordance with the Service Information. Refer to **PAD, HEATER, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
5. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit. Wiggle the wiring and connectors while checking for shorted and open circuits. Attempt to reproduce the condition by adjusting the seat(s).
   3. Check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension. Verify the seat wiring harness is routed correctly to the Comfort Seat Wheel Module (CSWM).
   4. With the scan tool, check for any Environmental Data to help identify the conditions in which the DTC was set.
   5. Check Service Bulletins for any possible causes that may apply.

Were there any problems found?

Yes

- Repair as necessary.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Test complete.

DIAGNOSTIC TEST

1. **CHECK IF THE DTC IS ACTIVE**

   NOTE: Make sure the battery is fully charged and the charging system is operating properly before proceeding.

   1. Turn the ignition on.
   2. Using a scan tool, record and erase Diagnostic Trouble Codes (DTCs).

      NOTE: It is recommended to record any Environmental Data to help identify the conditions in which the DTC was set.

   3. Turn the ignition off.
   4. Ignition on, engine running.
   5. With the scan tool, read Comfort Seat Wheel Module (CSWM) DTCs.

      Does the scan tool show this DTC as active?

      Yes

      - Go To 2

      No

      - Go To 6

2. **CHECK THE (P687) LEFT FRONT HEATED SEAT TEMP SENSE CIRCUIT FOR A SHORT TO VOLTAGE**
   1. Turn the ignition off.
   2. Disconnect the CSWM C2 harness connector.
   3. Disconnect the CSWM C3 harness connector (if equipped with rear heated seats).
   4. Ignition on, engine running.
   5. Measure the voltage between ground and the (P687) Left Front Heated Seat Temp Sense circuit at the CSWM C2 harness connector.

      Is there any voltage present?

      Yes

      - Repair the (P687) Left Front Heated Seat Temp Sense circuit or the (P968) Heated Seat Sensor Return circuit for a short to voltage.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 3

3. **CHECK THE SEAT TEMPERATURE SENSOR RESISTANCE**
   1. Turn the ignition off.
   2. Measure the resistance between the (P687) Left Front Heated Seat Temp Sense circuit harness connector and the (P968) Heated Seat Sensor Return circuit in the CSWM C2 harness connector.
   3. Compare the measured resistance to the Temperature Sensor Resistance chart.

   Is the resistance within the specifications listed in the chart?

   Yes

   - Replace the Comfort Seat Wheel Module (CSWM) in accordance with the Service Information. Refer to **MODULE, COMFORT SEAT AND WHEEL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 4

4. **CHECK THE (P687) LEFT FRONT HEATED SEAT TEMP SENSE CIRCUIT OR AN OPEN**
   1. Disconnect the Left Seat Cushion Heater harness connector.
   2. Measure the resistance of the (P687) Left Front Heated Seat Temp Sense circuit between the CSWM C2 connector and the Left Seat Cushion Heater harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 5

   No

   - Repair the (P687) Left Front Heated Seat Temp Sense circuit for an open.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **CHECK THE (P968) HEATED SEAT SENSOR RETURN CIRCUIT FOR AN OPEN**
   1. Measure the resistance of the (P968) Heated Seat Sensor Return circuit between the CSWM C2 harness connector and the Left Seat Cushion Heater harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

   - Replace the Left Front Seat Temperature Sensor (Left Front Seat Cushion Heater Element) in

accordance with the Service Information. Refer to **PAD, HEATER, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Repair the (P968) Heated Seat Sensor Return circuit for an open.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

6. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit. Wiggle the wiring and connectors while checking for shorted and open circuits. Attempt to reproduce the condition by adjusting the seat(s).
   3. Check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension. Verify the seat wiring harness is routed correctly to the Comfort Seat Wheel Module (CSWM).
   4. With the scan tool, check for any Environmental Data to help identify the conditions in which the DTC was set.
   5. Check Service Bulletins for any possible causes that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Test complete.

      Does the scan tool show this DTC as active?

      Yes

      - Go To 2

      No

      - Go To 5

2. **CHECK THE RIGHT FRONT SEAT TEMPERATURE SENSOR**
   1. Turn the ignition off.
   2. Disconnect the CSWM C2 harness connector.
   3. Measure the resistance between the (P688) Right Front Heated Seat Temp Sense circuit and the (P968) Heated Seat Sensor Return circuit in the CSWM C2 harness connector.
   4. Compare the measured resistance to the Temperature Sensor Resistance chart.

      Is the resistance within the specifications listed in the chart?

      Yes

      - Go To 3

      No

      - Go To 4

3. **CHECK (P688) RIGHT FRONT HEATED SEAT TEMP SENSE CIRCUIT FOR A SHORT TO**

GROUND

1. Measure the resistance between ground and the (P688) Right Front Heated Seat Temp Sense circuit in the CSWM C2 harness connector.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the (P688) Right Front Heated Seat Temp Sense circuit for a short to ground.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the Comfort Seat Wheel Module (CSWM) in accordance with the Service Information. Refer to **MODULE, COMFORT SEAT AND WHEEL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK THE RIGHT FRONT SEAT WIRING HARNESS**
   1. Disconnect the Right Seat Cushion Heater harness connector.
   2. Measure the resistance between the (P688) Right Front Heated Seat Temp Sense circuit and the (P968) Heated Seat Sensor Return circuit in the Right Seat Cushion Heater connector.
   3. Compare the measured resistance to the Temperature Sensor Resistance chart.

      Is the resistance within the specifications listed in the chart?

      Yes

      - Repair or replace the Right Front Seat wiring harness for a short.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Replace the Right Front Seat Temperature Sensor (Right Front Seat Cushion Heater Element) in accordance with the Service Information. Refer to **PAD, HEATER, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit. Wiggle the wiring and connectors while checking for shorted and open circuits. Attempt to reproduce the condition by adjusting the seat(s).
   3. Check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension. Verify the seat wiring harness is routed correctly to the Comfort Seat Wheel Module (CSWM).
   4. With the scan tool, check for any Environmental Data to help identify the conditions in which the

DTC was set.

5. Check Service Bulletins for any possible causes that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Test complete.

DIAGNOSTIC TEST

1. **CHECK IF THE DTC IS ACTIVE**

   NOTE: Make sure the battery is fully charged and the charging system is operating properly before proceeding.

   1. Turn the ignition on.
   2. Using a scan tool, record and erase Diagnostic Trouble Codes (DTCs).

      NOTE: It is recommended to record any Environmental Data to help identify the conditions in which the DTC was set.

   3. Turn the ignition off.
   4. Ignition on, engine running.
   5. With the scan tool, read Comfort Seat Wheel Module (CSWM) DTCs.

      Does the scan tool show this DTC as active?

      Yes

      - Go To 2

      No

      - Go To 6

2. **CHECK THE (P688) RIGHT FRONT HEATED SEAT TEMP SENSE CIRCUIT FOR A SHORT TO VOLTAGE**
   1. Turn the ignition off.
   2. Disconnect the CSWM C2 harness connector.
   3. Disconnect the CSWM C3 harness connector (if equipped with rear heated seats).
   4. Ignition on, engine running.
   5. Measure the voltage between ground and the (P688) Right Front Heated Seat Temp Sense circuit at the CSWM C2 harness connector.

      Is there any voltage present?

      Yes

      - Repair the (P688) Right Front Heated Seat Temp Sense circuit or the (P968) Heated Seat Sensor Return circuit for a short to voltage.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 3

3. **CHECK THE SEAT TEMPERATURE SENSOR RESISTANCE**
   1. Turn the ignition off.
   2. Measure the resistance between the (P688) Right Front Heated Seat Temp Sense circuit and the (P968) Heated Seat Sensor Return circuit at the CSWM C2 harness connector.
   3. Compare the measured resistance to the Temperature Sensor Resistance chart.

   Is the resistance within the specifications listed in the chart?

   Yes

   - Replace the Comfort Seat Wheel Module (CSWM) in accordance with the Service Information. Refer to **MODULE, COMFORT SEAT AND WHEEL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 4

4. **CHECK THE (P688) RIGHT FRONT HEATED SEAT TEMP SENSE CIRCUIT OR AN OPEN**
   1. Disconnect the Right Seat Cushion Heater harness connector.
   2. Measure the resistance of the (P688) Right Front Heated Seat Temp Sense circuit between the CSWM C2 connector and the Right Seat Cushion Heater connector (harness side).

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 5

   No

   - Repair the (P688) Right Front Heated Seat Temp Sense circuit for an open.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **CHECK THE (P968) HEATED SEAT SENSOR RETURN CIRCUIT FOR AN OPEN**
   1. Measure the resistance of the (P968) Heated Seat Sensor Return circuit between the CSWM C2 harness connector and the Right Seat Cushion Heater harness connector.

   Is the resistance below 5.0 Ohms?

Yes

- Replace the Seat Temperature Sensor (part of the Seat Cushion Heater Element) in accordance with the Service Information. Refer to **PAD, HEATER, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Repair the (P968) Heated Seat Sensor Return circuit for an open.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

6. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit. Wiggle the wiring and connectors while checking for shorted and open circuits. Attempt to reproduce the condition by adjusting the seat(s).
   3. Check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension. Verify the seat wiring harness is routed correctly to the Comfort Seat Wheel Module (CSWM).
   4. With the scan tool, check for any Environmental Data to help identify the conditions in which the DTC was set.
   5. Check Service Bulletins for any possible causes that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Test complete.

B210C-17-BATTERY VOLTAGE INPUT - CIRCUIT VOLTAGE ABOVE THRESHOLD

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 23: CSWM CAN IHS, Fused Ignition & Ground Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the engine running.

SET CONDITION

If the Comfort Seat Wheel Module (CSWM) detects a voltage above 16.0 volts on the Fused Ignition Run

Control Output circuit.

POSSIBLE CAUSES

Possible Causes
CHARGING SYSTEM VOLTAGE HIGH FUSED IGNITION RUN CONTROL OUTPUT CIRCUIT COMFORT SEAT WHEEL MODULE (CSWM)

DIAGNOSTIC TEST

1. **CHECK FOR CHARGING SYSTEM DIAGNOSTIC TROUBLE CODES (DTCS)**
    1. Turn the ignition on.
    2. Using a scan tool, read Powertrain Control Module (PCM) DTCs.

    Are there any Charging System DTCs set in the PCM?

    Yes

    - Refer to the **DTC INDEX** article for Charging System diagnostic procedures.

    No

    - Go To 2
2. **VERIFY IF THE DTC IS ACTIVE**
    1. Using a scan tool, record and erase DTCs.
    2. Turn the ignition off.
    3. Start the engine and let run for one minute.
    4. Using a scan tool, read Comfort Seat Wheel Module (CSWM) DTCs.

    Is this DTC active?

    Yes

    - Go To 3

    No

    - The conditions that caused this DTC to set are not present at this time. Verify if the seat harness is routed correctly to the CSWM. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors and repair as necessary.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
3. **CHECK THE (F921) FUSED IGNITION RUN CIRCUIT VOLTAGE**

1. Turn the ignition off.
2. Disconnect the CSWM C1 harness connector.

NOTE: Check connectors. Clean and repair as necessary.

3. Start the engine and let idle.
4. Measure the voltage between ground and the (F921) Fused Ignition circuit in the CSWM C1 harness connector and compare it to the voltage at the vehicle battery.

   Is the (F921) Fused Ignition circuit voltage the same as the voltage measured at the battery?

   Yes

   - Replace the Comfort Seat Wheel Module (CSWM) in accordance with the Service Information. Refer to **MODULE, COMFORT SEAT AND WHEEL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Repair the (F921) Fused Ignition Run circuit for the cause of the high voltage condition at the CSWM.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B210C-18-BATTERY VOLTAGE INPUT - UNDER CURRENT

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 24: CSWM CAN IHS, Fused Ignition & Ground Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With engine running.

SET CONDITION

The Comfort Seat Wheel Module (CSWM) detects a voltage below 10.0 volts on the Fused Ignition Run circuit.

POSSIBLE CAUSES

Possible Causes
CHARGING SYSTEM VOLTAGE LOW
FUSED IGNITION RUN CIRCUIT HIGH RESISTANCE
GROUND CIRCUIT HIGH RESISTANCE
COMFORT SEAT WHEEL MODULE (CSWM)

DIAGNOSTIC TEST

1. **CHECK PCM FOR CHARGING SYSTEM DTCS**
    1. Turn the ignition on.
    2. Using a scan tool, read Powertrain Control Module (PCM) DTCs.

    Are there any PCM Charging or Battery DTCs present?

    Yes

    - Refer to the **DTC INDEX** article and perform the appropriate diagnostic procedure(s).

    No

    - Go To 2
2. **CHECK OTHER MODULES FOR DTCS**
    1. With the scan tool, read DTCs.

    Are there any other modules setting a low system voltage DTC?

    Yes

    - This is either an indication of an overall low system voltage or one or more power circuits with a high resistance in its output circuit. Using the wiring schematics as a guide, look for a common power circuit between the modules that set a low voltage DTC and repair as necessary. If it seems to be an overall low system voltage, check the battery and charging system in accordance with the Service Information.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

    No

    - Go To 3
3. **VERIFY IF THE DTC IS ACTIVE**
    1. Using a scan tool, record and erase DTCs.
    2. Turn the ignition off.
    3. Start the engine and let it run for one minute.

4. Using a scan tool, read DTCs.

   Is this DTC active?

   Yes

   - Go To 4

   No

   - Go To 6

4. **CHECK (F921) FUSED IGNITION RUN CIRCUIT FOR HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Disconnect the CSWM C1 harness connector.
   3. Ignition on, engine running.
   4. Using a 12-volt test light connected to ground, check the (F921) Fused Ignition Run circuit in the CSWM C1 harness connector

      NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

      Does the test light illuminate brightly?

      Yes

      - Go To 5

      No

      - Repair the (F921) Fused Ignition Run Control Output circuit for an open or high resistance.
      - Perform BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **CHECK (z919) GROUND CIRCUIT FOR HIGH RESISTANCE**
   1. Using a 12-volt test light connected to 12 volts, check the (z919) Ground circuit in the CSWM C1 harness connector

      Does the test light illuminate brightly?

      Yes

      - Replace the Comfort Seat Wheel Module (CSWM) in accordance with the Service Information. Refer to **MODULE, COMFORT SEAT AND WHEEL, REMOVAL** .
      - Perform BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Repair the (F921) Fused Ignition Run Control Output circuit for an open or high resistance.
- Perform BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

6. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit. Wiggle the wiring and connectors while checking for shorted and open circuits.
   3. Check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Check for Service Information Tune-ups or Service Bulletins for any possible causes that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Test complete.

B21DD-84-SYSTEM VOLTAGE - SIGNAL BELOW ALLOWABLE RANGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 25: CSWM CAN IHS, Fused Ignition & Ground Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the engine running.

SET CONDITION

The Comfort Seat Wheel Module (CSWM) receives a battery voltage below 10.0 volts through the CAN Bus.

POSSIBLE CAUSES

Possible Causes
CHARGING SYSTEM VOLTAGE LOW BODY CONTROL MODULE (BCM) DIAGNOSTIC TROUBLE CODES (DTCS) PRESENT COMFORT SEAT WHEEL MODULE (CSWM)

DIAGNOSTIC TEST

1. **CHECK FOR CHARGING SYSTEM DTCs**
    1. Turn the ignition on.
    2. With the scan tool, read Powertrain Control Module (PCM) DTCs.

    Are there any Charging System DTCs set in the PCM?

    Yes

    - Refer to the **DTC INDEX** article and perform the appropriate diagnostic procedure.

    No

    - Go To 2
2. **CHECK FOR BCM DTCS**
    1. With the scan tool, read Body Control Module (BCM) DTCs.

    Are there any BCM DTCs present?

    Yes

    - Refer to the **BODY CONTROL MODULE (BCM) - DIAGNOSTIC CODE INDEX** article and perform the appropriate diagnostic procedure.

    No

    - Go To 3
3. **CHECK FOR OTHER DTCS IN CSWM**
    1. With the scan tool, read CSWM DTCs.

    Is DTC B210C-18-Battery Voltage Input - Under Current active?

    Yes

    - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

No

- Go To 4

4. **VERIFY IF THIS DTC IS ACTIVE**

NOTE:

- **Make sure the Battery is in good condition. Using a suitable Battery Tester, test the Battery before continuing.**
- **Make sure system voltage is in the normal operating range of approximately 12 to 14 volts before continuing.**
- **Inspect the vehicle for aftermarket accessories that may exceed the Generator System output.**
- **Make sure the generator drive belt is in good operating condition.**
- **Inspect the fuses. If an open fuse is found, use the wire diagram/schematic as a guide, inspect the wiring and connectors for damage.**

1. With the scan tool, record and erase CSWM DTCs.
2. Turn the ignition off.
3. Start the engine and let it run for one minute.
4. With the scan tool, read DTCs.

Is the DTC active?

Yes

- Replace the Comfort Seat Wheel Module (CSWM) in accordance with the Service Information. Refer to **MODULE, COMFORT SEAT AND WHEEL, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 5

5. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this module. Wiggle the wiring and connectors while checking for shorted and open circuits.
   3. Check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Check Service Bulletins for any possible causes that may apply.

   Were there any problems found?

Yes

- Repair as necessary.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Test complete.

B21DD-85-SYSTEM VOLTAGE - SIGNAL ABOVE ALLOWABLE RANGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 26: CSWM CAN IHS, Fused Ignition & Ground Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the engine running.

SET CONDITION

The Comfort Seat Wheel Module (CSWM) receives a status message through the CAN Bus of a system voltage

above 16.0 volts.

POSSIBLE CAUSES

Possible Causes
CHARGING SYSTEM VOLTAGE HIGH BODY CONTROL MODULE (BCM) DIAGNOSTIC TROUBLE CODES (DTCs) PRESENT COMFORT SEAT WHEEL MODULE (CSWM)

DIAGNOSTIC TEST

1. **CHECK FOR CHARGING SYSTEM DTCs**

   NOTE: If present, diagnose and repair DTC U0140-00 Lost Communication With Body Control Module before proceeding with this diagnostic procedure.

   1. Turn the ignition on.
   2. With the scan tool, read Powertrain Control Module (PCM) DTCs.

      Are there any PCM DTCs present?

      Yes

      - Refer to the **DTC INDEX** article and perform the appropriate diagnostic procedure.

      No

      - Go To 2
2. **CHECK FOR BCM DTCS**
   1. With the scan tool, read Body Control Module (BCM) DTCs.

      Are there any BCM DTCs present?

      Yes

      - Refer to the **BODY CONTROL MODULE (BCM) - DIAGNOSTIC CODE INDEX** article and perform the appropriate diagnostic procedure.

      No

      - Go To 3
3. **CHECK FOR OTHER ACTIVE DTCS**
   1. With the scan tool, read Comfort Seat Wheel Module (CSWM) DTCs.

Is the DTC B210C-17-Battery Voltage Input - Circuit Above Threshold active?

Yes

- Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

No

- Go To 4

4. **VERIFY THIS DTC IS ACTIVE**

NOTE:

- **Make sure the Battery is in good condition. Using a suitable Battery Tester, test the Battery before continuing.**
- **Make sure system voltage is in the normal operating range of approximately 12 to 14 volts before continuing.**
- **Inspect the vehicle for aftermarket accessories that may exceed the Generator System output.**
- **Make sure the generator drive belt is in good operating condition.**
- **Inspect the fuses. If an open fuse is found, use the wire diagram/schematic as a guide, inspect the wiring and connectors for damage.**

1. With the scan tool, record and erase DTCs.
2. Turn the ignition Off.
3. Start the engine and let run for one minute.
4. With the scan tool, read DTCs.

Is this DTC active?

Yes

- Replace the Comfort Seat Wheel Module (CSWM) in accordance with the Service Information. Refer to **MODULE, COMFORT SEAT AND WHEEL, REMOVAL** .
- Perform BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 5

5. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this module. Wiggle the wiring and connectors while checking for shorted and open circuits.
   3. Check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent

terminals, and correct pin tension.

4. Check Service Bulletins for any possible causes that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Test complete.

B221A-00-(HSM) HEATED SEAT MODULE INTERNAL

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the engine running.

SET CONDITION

If the Comfort Seat Wheel Module (CSWM) detects an internal component failure.

POSSIBLE CAUSES

Possible Causes
COMFORT SEAT WHEEL MODULE (CSWM)

DIAGNOSTIC TEST

1. **CHECK IF THE DTC IS ACTIVE**
   1. Turn the ignition on.
   2. With the scan tool, record and erase DTCs.
   3. Turn the ignition off.
   4. Start the engine and let it run.
   5. Operate each of the heated systems one at a time.
   6. With the scan tool, read DTCs.

   Is the DTC active?

   Yes

- Replace the Comfort Seat and Wheel Module (CSWM) in accordance with the Service Information. Refer to **MODULE, COMFORT SEAT AND WHEEL, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 2

2. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this module. Wiggle the wiring and connectors while checking for shorted and open circuits.
   3. Check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Check Service Bulletins for any possible causes that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Test complete.

U0011-00-CAN INTERIOR BUS OFF PERFORMANCE

Perform the COMMUNICATION PRE-DIAGNOSTIC PROCEDURE. Refer to **STANDARD PROCEDURE** .

U0140-00-LOST COMMUNICATION WITH BODY CONTROL MODULE

Perform the COMMUNICATION PRE-DIAGNOSTIC PROCEDURE. Refer to **STANDARD PROCEDURE** .

U1446-00-IMPLAUSIBLE HEATED STEERING WHEEL TEMPERATURE MESSAGE RECEIVED

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 27: Heated Steering Wheel Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Heated Steering Wheel (HSW) Temperature Sensor is wired to the Left EVIC Switch. The sensor data is transmitted from the Left EVIC Switch over a LIN Bus through the Steering Column Control Module (SCCM) clockspring to the Body Control Module (BCM). The data is then transmitted by the BCM over the CAN C Bus to the Comfort Seat Wheel Module (CSWM) and other modules.

WHEN MONITORED

With the engine running.

SET CONDITION

The Comfort Seat Wheel Module (CSWM) does not receive the Heated Steering Wheel (HSW) Temperature Sensor Signal from the Steering Column Control Module (SCCM) for more than two seconds.

POSSIBLE CAUSES

Possible Causes
HEATED STEERING WHEEL SIGNAL CIRCUIT OPEN
HEATED STEERING WHEEL SIGNAL CIRCUIT SHORTED TO GROUND
HEATED STEERING WHEEL TEMPERATURE SENSOR
LEFT EVIC SWITCH
STEERING COLUMN CONTROL MODULE (SCCM)

DIAGNOSTIC TEST

1. **CHECK IF THE DTC IS ACTIVE**

   NOTE: Diagnose and repair all active Bus related Diagnostic Trouble Codes (DTCs) including Lost Communication DTCs before diagnosing this DTC.

   1. Turn the ignition on.
   2. Using a scan tool, record and erase Comfort Seat Wheel Module (CSWM) DTCs.
   3. Cycle the ignition off to on.
   4. Using a scan tool, read DTCs CSWWM.

   Is the DTC active?

   Yes

   - Go To 2

   No

   - The conditions that caused this DTC to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals. Attempt to reproduce condition by rotating the steering wheel.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK THE HEATED STEERING WHEEL TEMPERATURE SENSOR**

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Remove the Driver Airbag in accordance with the Service Information.
2. Disconnect the Heated Steering Wheel (HSW) C1 harness connector.

NOTE: Before proceeding, thoroughly inspect the wiring harness and connectors between the HSW and the Left EVIC Switch. Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

3. Measure the voltage between the (C92) Heated Steering Wheel Signal circuit and the (Z92) Ground circuit at the HSW C1 harness connector.

   Is the voltage above 3.5 volts?

   Yes

   - Replace the Heated Steering Wheel (HSW) in accordance with the Service Information. Refer to **WHEEL, STEERING, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 3

3. **CHECK THE (C92) HEATED STEERING WHEEL SIGNAL CIRCUIT FOR AN OPEN**

WARNING: Turn the ignition off, disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the Left EVIC Switch harness connector.
2. Measure the resistance of the (C92) Heated Steering Wheel Signal circuit between the HSW C1 harness connector and the Left EVIC Switch harness connector.

   Is the resistance below 5.0 Ohms?

   Yes

- Go To 4

Yes

- Repair the (C92) Heated Steering Wheel Signal circuit for an open.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK THE (C92) HEATED STEERING WHEEL SIGNAL CIRCUIT FOR A SHORT TO GROUND**
   1. Measure the resistance between ground and the (C92) Heated Steering Wheel Signal circuit.

      Is the resistance below 10K Ohms?

      Yes

      - Repair the (C92) Heated Steering Wheel Signal circuit for a short to ground.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 5
5. **CHECK THE (Z92) GROUND CIRCUIT FOR AN OPEN**
   1. Measure the resistance of the (Z92) Ground Circuit between the Heated Steering Wheel C1 harness connector and the Left EVIC Switch harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 6

      No

      - Repair the (Z92) Ground Circuit for an open.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
6. **CHECK THE LEFT EVIC SWITCH**
   1. Replace the Left EVIC Switch in accordance with the Service Information.
   2. Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      Does this DTC reset performing the Body Verification Test?

      Yes

      - Replace the Steering Column Control Module (SCCM) in accordance with the Service

Information. Refer to **MODULE, STEERING COLUMN, REMOVAL** .

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Test complete.

2014 ACCESSORIES AND EQUIPMENT

Communication - Non-DTC Based Diagnostics - Cherokee

DIAGNOSIS AND TESTING

CAN C BUS NO RESPONSE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The primary communication network between electronic control modules is the Controller Area Network (CAN) data bus system. The Controller Area Network (CAN) data bus allows all electronic modules connected to the bus to share information with each other. Regardless of whether a message originates from a module on the higher speed CAN C (500K) Bus or on the lower speed bus, CAN Interior High Speed (IHS) (125K) Bus, the message structure and layout is similar, which allows the Body Control Module/Central GateWay (BCM or BCMCGW) to process and transfer messages between the CAN buses. The BCM stores Diagnostic Trouble Codes (DTCs) for certain bus network faults on the CAN C (500K) Bus and CAN IHS (125K) Bus.

All modules transmit and receive messages over one of these buses. Data exchange between the modules is achieved by serial transmission of encoded data messages (a form of transmission in which data bits are sent sequentially, one at a time, over a single line). Each module can both send and receive serial data simultaneously. Each data bit of a CAN Bus message is carried over the bus as a voltage differential between the two bus circuits which, when strung together, form a message. Each module uses arbitration to sort the message priority if two competing messages are attempting to be broadcast at the same time. Corruption of a single bit within a message will corrupt the entire message. Each message contains a Cyclic Redundancy Check (CRC) which specifies the message size exactly. If the message detected conflicts with the CRC the ECU receiving it will determine the message to be an error and consider that communication has not been possible. Diagnosis of this condition using a lab scope may reveal activity that appears to be Bus data messages even if no actual communication is possible. Communication problems that affect the whole bus, as a result of opens and terminal push outs are more likely to occur on data busses that operate at a high speed than a data bus that operates at a lower speed.

When an open circuit or terminal push out occurs one or more modules can become isolated from the remainder of the bus. The isolated module will attempt to communicate, but will not be able to receive messages or determine arbitration from other modules. Each time the isolated module attempts to communicate it alters the bus voltage on the intact bus circuit. Without functioning arbitration the isolated module alters the bus voltage while other bus messages are being sent thereby corrupting the messages on the remainder of the bus.

The CAN bus modules are connected in parallel to the two-wire bus using a twisted pair, where the wires are wrapped around each other to provide shielding from unwanted electromagnetic induction, thus preventing interference with the relatively low voltage signals being carried through them. While the CAN bus is operating (active), one of the bus wires will carry a higher voltage and is referred to as the CAN High or CAN bus (+) wire, while the other bus wire will carry a lower voltage and is referred to as the CAN Low or CAN bus (-) wire.

For additional information on the communication network and star connector locations, refer to **COMMUNICATION, DESCRIPTION** .

CAN Bus Voltages (Normal Operation)

CAN-L (-)	0 V	2.4 - 2.5 V	1.3 - 2.3 V	0 V	0.3 - 0.5V	Battery Voltage	Battery Voltage Less 0.75 V	2.45 V
CAN-H (+)	0 V	2.4 - 2.5 V	2.6 - 3.5 V	0.02 V	0 V	Battery Voltage Less 0.75 V	Battery Voltage	2.45 V
CAN-IHS Bus Circuits	**Sleep**		**Bus Active**	**CAN-L Short to Ground**	**CAN-H Short to Ground**	**CAN-L Short to Battery**	**CAN-H Short to Battery**	**CAN-H Short to CAN-L**
CAN-L (-)	0.0 V		1.3 - 2.3 V	0 V	0.3 - 0.5 V	Battery Voltage	Battery Voltage Less 0.75 V	2.45 V
CAN-H (+)	0.0 V		2.6 - 3.5 V	0.02 V	0 V	Battery Voltage Less 0.75 V	Battery Voltage	2.45 V
Notes								
All measurements taken between node ground and CAN terminal with a standard DVOM. DVOM will display average network voltage. Total resistance of CAN networks can be measured with the battery disconnected. The average resistance is approximately 60 Ohms. The termination resistors are integral to the Star Connectors.								

POSSIBLE CAUSES

Possible Causes
CAN C BUS (+) CIRCUIT SHORTED TO GROUND
CAN C BUS (-) CIRCUIT SHORTED TO VOLTAGE
CAN C BUS (+) CIRCUIT SHORTED TO CAN C BUS (-) CIRCUIT
CAN C BUS (+) OR CAN C BUS (-) CIRCUIT OPEN BETWEEN THE STAR CONNECTORS
STAR CONNECTOR
ANY MODULE CONNECTED TO THE CAN C BUS

DIAGNOSTIC TEST

1. **CHECK THE CAN BUS (-) CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 1: Checking CAN BUS (-) Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the scan tool.
2. Measure the voltage between ground and the CAN C Bus (-) circuit.

   Is the voltage above 10.0 volts?

   Yes

   - Diagnose the short to voltage in the CAN C Bus (-) circuit. Use the Star Connectors to isolate portions of the bus to assist in determining the location of the concern. Repair the circuit concern or replace the module that when disconnected allowed the bus voltage to return to normal.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

- Go To 2

2. **CHECK THE CAN C BUS (+) CIRCUIT FOR A SHORT TO GROUND**

Fig. 2: Checking CAN C BUS (+) Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the voltage between ground and the CAN C Bus (+) circuit.

   Is the voltage approximately 0 volt?

   Yes

   - Diagnose the short to ground in the CAN C Bus (+) circuit. Use the Star Connectors to isolate portions of the bus to assist in determining the location of the concern. Repair the circuit concern or replace the module that when disconnected allowed the bus voltage to return to normal.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 3

3. **CHECK FOR CORRECT BUS TERMINATION RESISTANCE**

Fig. 3: Checking For Correct BUS Termination Resistance
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect and isolate the negative battery cable.
3. Measure the resistance between the CAN C Bus (+) circuit and the CAN C Bus (-) circuit.

   Is the resistance between 53.5 and 67 Ohms?

   Yes

   - Test complete, the condition or conditions that originally caused this concern are not present at this time. Using the wiring diagrams as a guide, check the Star Connectors and all related splices for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- For a resistance measurement above 67 Ohms, an open or high resistance is present in the CAN C Bus (+) circuit or the CAN C Bus (-) circuit between the Star Connectors or one of the termination resistors internal to the Star Connector is damaged. Diagnose and repair as necessary.
- For a resistance measurement below 53.5 Ohms, a short between the CAN C Bus (+) circuit and the CAN C Bus (-) is present. Diagnose the short between the CAN C Bus (+) circuit and the CAN C Bus (-) circuit. Use the Star Connectors to isolate portions of the bus to assist in determining the location of the concern. Repair the circuit concern or replace the module that when disconnected allowed the resistance to return to normal.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

NO RESPONSE FROM ABS (ANTILOCK BRAKE SYSTEM MODULE)

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 4: ABS CAN C, Fused B+ & Ground Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

POSSIBLE CAUSES

Possible Causes
FUSED B(+) CIRCUITS OPEN OR SHORTED
FUSED RUN/START RELAY OUTPUT CIRCUIT OPEN OR SHORTED
GROUND CIRCUITS OPEN OR HIGH RESISTANCE

CAN C BUS (+) CIRCUIT OPEN OR HIGH RESISTANCE
CAN C BUS (-) CIRCUIT OPEN OR HIGH RESISTANCE
ANTI-LOCK BRAKE SYSTEM (ABS) MODULE

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**

   NOTE: Check for any TSB(s) related to the condition. If a TSB applies, perform the procedure outlined in the TSB before continuing.

   1. Turn the ignition on.

      NOTE: Make sure the battery voltage is between 10.0 and 16.0 volts.

   2. With the scan tool, read the module status.

      NOTE: Check the BCM for any active CAN hardware DTCs, perform DTC before proceeding.

      Does the scan tool indicate that the module is active on the bus?

      Yes

      - The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 2

2. **CHECK THE (A107) AND (A200) FUSED B(+) CIRCUIT FOR AN OPEN OR SHORT CIRCUIT**
   1. Turn the ignition off.
   2. Disconnect the ABS Module harness connector.
   3. Using a 12-volt test light connected to ground, check each (A107) and (A200) Fused B(+) circuit.

      Does the test light illuminate brightly for each circuit?

      Yes

      - Go To 3

      No

- Repair the Fused B(+) circuits for an open or short.
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (F941) FUSED RUN/START RELAY OUTPUT CIRCUIT FOR AN OPEN OR SHORT CIRCUIT**
   1. Turn the ignition on.
   2. Using a 12-volt test light connected to ground, check the (F941) Fused Run/Start Relay Output circuit.

      Does the test light illuminate brightly?

      Yes

      - Go To 4

      No

      - Repair the (F941) Fused Run/Start Relay Output circuit for an open or short.
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
4. **CHECK THE (Z905) GROUND CIRCUITS FOR AN OPEN OR HIGH RESISTANCE**
   1. Using a 12-volt test light connected to 12-volts, check the (Z905) Ground circuits.

      Does the test light illuminate brightly for each circuit?

      Yes

      - Go To 5

      No

      - Repair the (Z905) Ground circuits for an open or high resistance.
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
5. **(D79) CAN C BUS (+) CIRCUIT OPEN OR HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Disconnect the CAN C Dash C4 Star harness connector.
   3. Measure the resistance of the (D79) CAN C Bus (+) circuit between the CAN C Body C4 Star Connector and the ABS Module harness connector.

      Is resistance below 5.0 Ohms?

      Yes

      - Go To 6

No

- Repair the (D79) CAN C Bus (+) circuit for an open or high resistance.
- Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

6. **(D80) CAN C BUS (-) CIRCUIT OPEN OR HIGH RESISTANCE**
   1. Measure the resistance of the (D80) CAN C Bus (-) circuit between the CAN C Dash C4 Star Connector and the ABS Module harness connector.

      Is resistance below 5.0 Ohms?

      Yes

      - Replace the Anti-lock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Repair the (D80) CAN C Bus (-) circuit for an open or high resistance.
      - Perform the ABS VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

NO RESPONSE FROM ACC (ADAPTIVE CRUISE CONTROL) MODULE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 5: ACC CAN C, Fused Ignition & Ground Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

POSSIBLE CAUSES

Possible Causes
GROUND CIRCUIT OPEN

FUSED IGNITION CIRCUIT OPEN OR SHORTED
CAN C BUS (+) CIRCUIT OPEN
CAN C BUS (-) CIRCUIT OPEN
ADAPTIVE CRUISE CONTROL MODULE/ADAPTIVE SPEED CONTROL SENSOR

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**

   NOTE: Check for any TSB(s) related to the condition. If a TSB applies, perform the procedure outlined in the TSB before continuing.

   1. Turn the ignition on.

      NOTE: Make sure the battery voltage is between 10.0 and 16.0 volts.

   2. With the scan tool, read the module status.

      NOTE: Check the BCM for any active CAN C hardware DTCs, perform DTC before proceeding.

      Does the scan tool indicate that the module is active on the bus?

      Yes

      - The no response condition is not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

      No

      - Go To 2

2. **CHECK THE (Z915) GROUND CIRCUIT FOR AN OPEN**
   1. Turn the ignition off.
   2. Disconnect the Adaptive Cruise Control Module harness connector.
   3. Using a 12-volt test light connected to 12-volts, check the (Z915) Ground circuit.

      Does the test light illuminate brightly?

      Yes

      - Go To 3

      No

- Repair the (Z915) Ground circuit for an open.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (F948) FUSED IGNITION CIRCUIT FOR AN OPEN OR SHORT**
   1. Turn the ignition on.
   2. Using a 12-volt test light connected to ground, check the (F948) Fused Ignition circuit.

      Does the test light illuminate brightly?

      Yes

      - Go To 4

      No

      - Repair the (F948) Fused Ignition circuit for an open.

        NOTE: If the fuse is open, make sure to check the circuit for a short to ground.

      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
4. **CHECK THE (D249) AND (D248) CAN C BUS CIRCUITS FOR AN OPEN**
   1. Turn the ignition off.
   2. Disconnect the dash CAN C C6 Star harness connector.
   3. Measure the resistance of the (D249) CAN C Bus (+) circuit between the Star C6 harness connector and the Adaptive Cruise Control Module harness connector.
   4. Measure the resistance of the (D248) CAN C Bus (-) circuit between the Star C6 harness connector and the Adaptive Cruise Control Module harness connector.

      Are the resistances below 5.0 Ohms?

      Yes

      - Replace and program the Adaptive Cruise Control (ACC) module in accordance with the Service Information. Refer to **MODULE, ADAPTIVE CRUISE CONTROL, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Repair the (D249) or (D248) CAN C Bus circuit for an open.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

NO RESPONSE FROM AHLM (AUTOMATIC HEADLAMP LEVELING MODULE)

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 6: Headlamp Leveling Module Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

POSSIBLE CAUSES

Possible Causes
(F927) RUN RELAY OUTPUT CIRCUIT OPEN OR SHORTED
(Z908) GROUND CIRCUIT OPEN
(D265) CAN C BUS (+) CIRCUIT OPEN
(D264) CAN C BUS (-) CIRCUIT OPEN
AUTOMATIC HEADLAMP LEVELING MODULE (AHLM)

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**

   NOTE: Check for any TSB(s) related to the condition. If a TSB applies, perform the procedure outlined in the TSB before continuing.

   1. Turn the ignition on.

      NOTE: Make sure the battery voltage is between 10.0 and 16.0 volts.

   2. With the scan tool, read the module status.

      NOTE: Check the BCM for any active CAN hardware DTCs, perform DTC before proceeding.

      Does the scan tool indicate that the module is active on the bus?

      Yes

      - The no response condition is not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 2

2. **CHECK THE (F927) RUN RELAY OUTPUT CIRCUIT FOR AN OPEN OR SHORT**
   1. Turn the ignition off.
   2. Disconnect the Automatic Headlamp Leveling Module harness connector.
   3. Turn the ignition on.
   4. Using a 12-volt test light connected to ground, check the (F927) Run Relay Output circuit.

      Does the test light illuminate brightly?

Yes

- Go To 3

No

- Repair the open or short in the (F927) Run Relay Output circuit.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (Z908) GROUND CIRCUIT FOR AN OPEN**
   1. Turn the ignition off.
   2. Using a 12-volt test light connected to 12-volts, check the (Z908) Ground circuit.

   Does the test light illuminate brightly?

   Yes

   - Go To 4

   No

   - Repair the open in the (Z908) Ground circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK THE (D265) AND (D264) CAN C BUS CIRCUITS FOR AN OPEN**
   1. Disconnect the Body CAN C Star Connector C10 harness connector.
   2. Measure the resistance of the (D265) CAN C Bus (+) circuit between the Body CAN C Star Connector C10 harness connector and the Automatic Headlamp Leveling Module harness connector.
   3. Measure the resistance of the (D264) CAN C Bus (-) circuit between the Body CAN C Star Connector C10 harness connector and the Automatic Headlamp Leveling Module harness connector.

   Are the resistances below 5.0 Ohms?

   Yes

   - Replace the Automatic Headlamp Leveling Module in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Repair the open in the (D265) CAN C Bus (+) or (D264) CAN C Bus (-) circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

NO RESPONSE FROM AMP (AMPLIFIER)

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 7: Amplifier CAN IHS, Fused B+ & Ground Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

POSSIBLE CAUSES

Possible Causes

FUSED B (+) CIRCUIT OPEN OR SHORTED
GROUND CIRCUIT OPEN
CAN IHS BUS CIRCUITS OPEN
AMPLIFIER

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**

   NOTE: Check for any TSB(s) related to the condition. If a TSB applies, perform the procedure outlined in the TSB before continuing.

   1. Turn the ignition on.

      NOTE: Make sure the battery voltage is between 10.0 and 16.0 volts.

   2. With the scan tool, read the module status.

      Does the scan tool indicate that the module is active on the bus?

      Yes

      - The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 2

2. **CHECK THE (A931) FUSED B(+) CIRCUIT FOR AN OPEN OR SHORT**
   1. Turn the ignition off.
   2. Disconnect the Radio Amplifier C1 harness connector.
   3. Using a 12-volt test light connected to ground, check the (A931) Fused B(+) circuit.

      Does the test light illuminate brightly?

      Yes

      - Go To 3

      No

      - Repair the open or short in the (A931) Fused B(+) circuit.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (Z912) GROUND CIRCUIT FOR AN OPEN**
   1. Using a 12-volt test light connected to 12-volts, check the (Z912) Ground circuit.

      Does the test light illuminate brightly for each circuit?

      Yes

      - Go To 4

      No

      - Repair the open in the (Z912) Ground circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
4. **(D207) OR (D206) CAN IHS BUS CIRCUIT OPEN**
   1. Disconnect the CAN IHS IP C1 Star Connector.
   2. Measure the resistance of the (D206) CAN IHS Bus (-) circuit between the CAN IHS IP C1 Star Connector and the Radio Amplifier C1 harness connector.
   3. Measure the resistance of the (D207) CAN IHS Bus (+) circuit between the CAN IHS IP C1 Star Connector and the Radio Amplifier C1 harness connector.

      Is resistance below 5.0 Ohms on both circuits?

      Yes

      - Replace the Radio Amplifier in accordance with the Service Information. Refer to **AMPLIFIER, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Repair the open in the (D207) or (D206) CAN IHS Bus circuit. Inspect the connector for damage.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

NO RESPONSE FROM BCM (BODY CONTROL MODULE)

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 8: BCM CAN C, Fused B+ & Ground Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

POSSIBLE CAUSES

Possible Causes
FUSED B(+) CIRCUITS OPEN OR SHORTED
(Z911) GROUND CIRCUIT OPEN
(D45) CAN C BUS (+) CIRCUIT OPEN
(D46) CAN C BUS (-) CIRCUIT OPEN
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**

NOTE: **If the scan tool is unable to identify the vehicle, a CAN C bus concern may be present. Perform the CAN C BUS NO RESPONSE diagnostic procedure. Refer to DIAGNOSIS AND TESTING.**

NOTE: **Check for any TSB(s) related to the condition. If a TSB applies, perform the procedure outlined in the TSB before continuing.**

1. Turn the ignition on.

NOTE: **Make sure the battery voltage is between 10.0 and 16.0 volts.**

2. With the scan tool, read the module status.

NOTE: **Check the BCM for any active CAN hardware DTCs, perform DTC before proceeding.**

Does the scan tool indicate that the module is active on the bus?

Yes

- The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 2

2. **CHECK THE FUSED B(+) CIRCUITS FOR AN OPEN OR SHORT CIRCUIT**
   1. Turn the ignition off.
   2. Using the wiring diagrams as a guide, disconnect the appropriate BCM harness connectors that house the Fused B(+) circuits.
   3. Using a 12-volt test light connected to ground, check each Fused B(+) circuit.

   Does the test light illuminate brightly for each circuit?

   Yes

   - Go To 3

No

- Repair the open or short in the applicable Fused B(+) circuit.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (Z911) GROUND CIRCUITS FOR AN OPEN**
   1. Using a 12-volt test light connected to 12-volts, check the (Z911) Ground circuits.

      Does the test light illuminate brightly for each circuit?

      Yes

      - Go To 4

      No

      - Repair the open in the (Z911) Ground circuit(s).
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
4. **CHECK THE (D45) AND (D46) CAN C BUS (+) CIRCUITS FOR AN OPEN**
   1. Turn the ignition off.
   2. Disconnect the CAN C Body C9 Star Connector.
   3. Measure the resistance of the (D45) CAN C Bus (+) circuit between the CAN C Body C9 Star Connector and the BCM C4 harness connector.
   4. Measure the resistance of the (D46) CAN C Bus (-) circuit between the CAN C Body C9 Star Connector and the BCM C4 harness connector.

      Are the resistances below 5.0 Ohms?

      Yes

      - Replace the BCM in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Repair the open in the (D45) CAN C Bus (+) or (D46) CAN C Bus (-) circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

NO RESPONSE FROM CSWM (COMFORT SEAT AND WHEEL MODULE)

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 9: CSWM CAN IHS, Fused Ignition & Ground Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

POSSIBLE CAUSES

Possible Causes
FUSED IGNITION CIRCUIT OPEN OR SHORTED
GROUND CIRCUIT OPEN
CAN IHS BUS CIRCUIT(S) OPEN

COMFORT SEAT AND WHEEL MODULE (CSWM)

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**

   NOTE: Check for any TSB(s) related to the condition. If a TSB applies, perform the procedure outlined in the TSB before continuing.

   1. Turn the ignition on.

      NOTE: Make sure the battery voltage is between 10.0 and 16.0 volts.

   2. With the scan tool, read the module status.

      NOTE: Check the BCM for any active CAN hardware DTCs, perform DTC before proceeding.

      Does the scan tool indicate that the module is active on the bus?

      Yes

      - A no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 2

2. **CHECK THE (F921) FUSED IGNITION RUN CONTROL OUTPUT CIRCUIT FOR AN OPEN OR SHORT**
   1. Turn the ignition off.
   2. Disconnect the Comfort Seat Wheel Module (CSWM) C1 harness connector.
   3. Turn the ignition on.
   4. Using a 12-volt test light connected to ground, check the (F921) Fused Ignition Run Control Output circuit.

      NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

      Does the test light illuminate brightly?

Yes

- Go To 3

No

- Repair the (F921) Fused Ignition circuit for an open or high resistance.

NOTE: If the fuse is open, make sure to check for a short to ground.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (Z919) GROUND CIRCUIT FOR AN OPEN**
   1. Turn the ignition off.
   2. Using a 12-volt test light connected to 12-volts, check the (Z919) Ground circuit.

   Does the test light illuminate brightly?

   Yes

   - Go To 4

   No

   - Repair the (Z919) Ground circuit for an open or high resistance.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK THE (D163) AND (D164) CAN IHS BUS CIRCUITS FOR AN OPEN**
   1. Disconnect the CAN IHS Star Connector.
   2. Measure the resistance of the (D164) CAN IHS Bus (-) circuit between the CAN IHS Star Connector and the CSWM C1 harness connector.
   3. Measure the resistance of the (D163) CAN IHS Bus (+) circuit between the CAN IHS Star Connector and the CSWM C1 harness connector.

   Are both circuit resistances below 5.0 Ohms?

   Yes

   - Replace the Comfort Seat Wheel Module (CSWM) in accordance with the Service Information. Refer to **MODULE, COMFORT SEAT AND WHEEL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Repair the (D163) or the (D164) CAN IHS Bus circuit(s) for an open or high resistance.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

NO RESPONSE FROM DDM (DRIVER DOOR MODULE)

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 10: DDM CAN IHS, Fused B+ & Ground Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

POSSIBLE CAUSES

Possible Causes
(A924) FUSED B(+) CIRCUIT OPEN OR SHORTED
(Z919) GROUND CIRCUIT OPEN
(D104) CAN IHS BUS (+) CIRCUIT OPEN
(D103) CAN IHS BUS (-) CIRCUIT OPEN
DRIVER DOOR MODULE

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**

   NOTE: Check for any TSB(s) related to the condition. If a TSB applies, perform the procedure outlined in the TSB before continuing.

   1. Turn the ignition on.

      NOTE: Make sure the battery voltage is between 10.0 and 16.0 volts.

   2. With the scan tool, read the module status.

      NOTE: Check the BCM for any active CAN hardware DTCs, perform DTC before proceeding.

      Does the scan tool indicate that the module is active on the bus?

      Yes

      - The no response condition is not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

      No

      - Go To 2

2. **CHECK THE (A924) FUSED B(+) CIRCUIT FOR AN OPEN OR SHORT**
   1. Turn the ignition off.
   2. Disconnect the Driver Door Module C3 harness connector.
   3. Using a 12-volt test light connected to ground, check the (A924) Fused B(+) circuit. Compare the brightness to that of a direct connection to the battery.

      Does the test light illuminate brightly?

Yes

- Go To 3

No

- Repair the open or short in the (A924) Fused B(+) circuit.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (Z919) GROUND CIRCUIT FOR AN OPEN**
   1. Using a 12-volt test light connected to 12-volts, check the (Z919) Ground circuit. Compare the brightness to that of a direct connection to the battery.

      Does the test light illuminate brightly?

      Yes

      - Go To 4

      No

      - Repair the open in the (Z919) Ground circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
4. **CHECK THE (D104) AND (D103) CAN INTERIOR BUS (125K) CIRCUITS FOR AN OPEN**
   1. Measure the resistance of the (D103) CAN Interior Bus (125K) (-) circuit between the IP Star C2 harness connector and the Driver Door Module C3 harness connector.
   2. Measure the resistance of the (D104) CAN Interior Bus (125K) (+) circuit between the IP Star C2 harness connector and the Driver Door Module C3 harness connector.

      Are the resistances below 1.0 Ohms?

      Yes

      - Replace the Driver Door Module in accordance with the Service Information. Refer to **MODULE, DOOR, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Repair the open in the (D104) or (D103) CAN Interior Bus (125K) circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

NO RESPONSE FROM DTCM (DRIVE TRAIN CONTROL MODULE)

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 11: DTCM Private CAN, Fused B+ & Ground Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

POSSIBLE CAUSES

Possible Causes

FUSED B(+) CIRCUIT OPEN OR SHORTED
FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT OPEN OR SHORTED
GROUND CIRCUIT OPEN OR HIGH RESISTANCE
CAN C BUS (+) CIRCUIT OPEN OR HIGH RESISTANCE
CAN C BUS (-) CIRCUIT OPEN OR HIGH RESISTANCE
DRIVE TRAIN CONTROL MODULE (DTCM)

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**

   NOTE: Check for any TSB(s) related to the condition. If a TSB applies, perform the procedure outlined in the TSB before continuing.

   1. Turn the ignition on.

      NOTE: Make sure the battery voltage is between 10.0 and 16.0 volts.

   2. With the scan tool, read the module status.

      NOTE: Check the BCM for any active CAN DTCs and perform the appropriate diagnostics before proceeding. Refer to the BODY CONTROL MODULE (BCM) - DIAGNOSTIC CODE INDEX article .

      Does the scan tool indicate that the module is active on the bus?

      Yes

      - Perform the STORED LOST COMMUNICATION DTCs diagnostic procedure. Refer to **DIAGNOSIS AND TESTING**.

      No

      - Go To 2

2. **CHECK THE (A194) FUSED B(+) CIRCUIT FOR AN OPEN OR SHORT**
   1. Turn the ignition off.
   2. Disconnect the DTCM C1 and C2 harness connectors.
   3. Turn the ignition on.
   4. Using a 12-volt test light connected to ground, check the (A194) Fused B(+) circuit.

      Does the test light illuminate brightly?

      Yes

- Go To 3

No

- Repair the (A194) Fused B(+) circuit for an open or short.
- Perform the DTCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (F946) FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT FOR AN OPEN OR SHORT**
   1. Using a 12-volt test light connected to ground, check the (F946) Fused Ignition Switch Output (Run-Start) circuit.

      Does the test light illuminate brightly?

      Yes

      - Go To 4

      No

      - Repair the (F946) Fused Ignition Switch Output (Run-Start) circuit for an open or short.
      - Perform the DTCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
4. **CHECK THE (Z924) GROUND CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Using a 12-volt test light connected to 12-volts, check the (Z924) Ground circuit.

      Does the test light illuminate brightly?

      Yes

      - Go To 5

      No

      - Repair the (Z924) Ground circuit for an open or high resistance.
      - Perform the DTCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
5. **CHECK THE (D301) CAN C(+) BUS CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
   1. Disconnect the Star Can C Body C11 harness connector. and perform the CAN C DASH STAR CONNECTOR REMOVAL process. Refer to **STANDARD PROCEDURE** .
   2. Measure the resistance of the (D301) CAN C Bus (+) circuit between the Star Can C Body C11 harness connector and the DTCM C1 harness connector.

      Is the resistances below 5.0 Ohms?

Yes

- Go To 6

No

- Repair the (D301) CAN C(+) Bus circuit for an open or high resistance.
- Perform the DTCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

6. **CHECK THE (D302) CAN C(-) BUS CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
   1. Measure the resistance of the (D302) CAN C Bus (-) circuit between the Star Can C Body C11 harness connector and the DTCM C1 harness connector.

      Are the resistances below 5.0 Ohms?

      Yes

      - Replace the Drive Train Control Module (DTCM) in accordance with the Service Information. Refer to **MODULE, DRIVETRAIN CONTROL, REMOVAL** .
      - Perform the DTCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Repair the (D302) CAN C(-) Bus circuit for an open or high resistance.
      - Perform the DTCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

NO RESPONSE FROM EDM (EXTERNAL DISC MODULE)

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 12: EDM CAN I, Fused B+, Signal & Ground Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

POSSIBLE CAUSES

Possible Causes
FUSED B (+) CIRCUIT OPEN
GROUND CIRCUIT OPEN
CAN IHS BUS CIRCUITS OPEN
EXTERNAL DISC MODULE (EDM)

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
   1. Turn the ignition on.

      NOTE: Make sure the battery voltage is between 10.0 and 16.0 volts.

      NOTE: Check the BCM for any active CAN hardware DTCs, perform DTC before proceeding.

   2. With the scan tool, read the module status.

      Does the scan tool indicate that the module is active on the bus?

      Yes

      - The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 2
2. **CHECK THE (A933) FUSED B(+) CIRCUIT FOR AN OPEN OR SHORT**
   1. Turn the ignition off.
   2. Disconnect the EDM harness connector.
   3. Using a 12-volt test light connected to ground, check the (A933) Fused B(+) circuit.

      Does the test light illuminate brightly?

      Yes

      - Go To 3

      No

      - Using the wiring diagrams as a guide, repair the open or short to ground on the (A933) Fused B(+) circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
3. **CHECK THE (Z912) GROUND CIRCUIT FOR AN OPEN**
   1. Using a 12-volt test light connected to 12-volts, check the (Z912) Ground circuit.

Does the test light illuminate brightly?

Yes

- Go To 4

No

- Repair the open in the (Z912) Ground circuit.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK THE (D198) OR (D199) CAN IHS BUS CIRCUIT FOR AN OPEN**
   1. Disconnect the CAN IHS IP Star connector.
   2. Measure the resistance of the (D198) CAN IHS Bus (-) circuit between the CAN IHS IP Star connector and the EDM harness connector.
   3. Measure the resistance of the (D199) CAN IHS Bus (+) circuit between the CAN IHS IP Star connector and the EDM harness connector.

   Is resistance below 5.0 Ohms on both circuits?

   Yes

   - Replace the External Disc Module (EDM) in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Repair the open in the (D198) or (D199) CAN IHS Bus circuit. Inspect the connector for damage.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

NO RESPONSE FROM EPB (ELECTRIC PARKING BRAKE MODULE)

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 13: EPB CAN C, Fused B+, Control Output & Ground Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

POSSIBLE CAUSES

Possible Causes
FUSED B(+) CIRCUITS OPEN OR SHORTED
IGNITION RUN/START CONTROL OUTPUT CIRCUIT OPEN OR SHORTED
GROUND CIRCUITS OPEN OR HIGH RESISTANCE

CAN C BUS (+) CIRCUIT OPEN OR HIGH RESISTANCE
CAN C BUS (-) CIRCUIT OPEN OR HIGH RESISTANCE
ELECTRIC PARKING BRAKE (EPB) MODULE

DIAGNOSTIC TEST

1. **CHECK THE (A917) AND (A919) FUSED B(+) CIRCUIT FOR AN OPEN OR SHORT CIRCUIT**
   1. Turn the ignition off.
   2. Disconnect the EPB Module harness connector.
   3. Using a 12-volt test light connected to ground, check each (A917) and (A919) Fused B(+) circuit.

      Does the test light illuminate brightly for each circuit?

      Yes

      - Go To 2

      No

      - Repair the Fused B(+) circuits for an open or short.
      - Perform the EPB VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE (F941) FUSED RUN/START CONTROL OUTPUT CIRCUIT FOR AN OPEN OR SHORT CIRCUIT**
   1. Turn the ignition on.
   2. Using a 12-volt test light connected to ground, check the (F941) Fused Run/Start Control Output circuit.

      Does the test light illuminate brightly?

      Yes

      - Go To 3

      No

      - Repair the (F941) Fused Run/Start Control Output circuit for an open or short.
      - Perform the EPB VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
3. **CHECK THE (Z923) GROUND CIRCUITS FOR AN OPEN OR HIGH RESISTANCE**
   1. Using a 12-volt test light connected to 12-volts, check the (Z923) Ground circuits.

      Does the test light illuminate brightly for each circuit?

      Yes

- Go To 4

No

- Repair the (Z923) Ground circuits for an open or high resistance.
- Perform the EPB VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **(D61) CAN C BUS (+) CIRCUIT OPEN OR HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Disconnect the CAN C Body C13 Star harness connector.
   3. Measure the resistance of the (D61) CAN C Bus (+) circuit between the CAN C Body C13 Star harness connector and the ABS Module harness connector.

      Is resistance below 5.0 Ohms?

      Yes

      - Go To 5

      No

      - Repair the (D61) CAN C Bus (+) circuit for an open or high resistance.
      - Perform the EPB VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
5. **(D60) CAN C BUS (-) CIRCUIT OPEN OR HIGH RESISTANCE**
   1. Measure the resistance of the (D60) CAN C Bus (-) circuit between the CAN C Body C13 Star harness connector and the ABS Module harness connector.

      Is resistance below 5.0 Ohms?

      Yes

      - Replace the Electric Parking Brake (EPB) Module in accordance with service information. Refer to **MODULE, ELECTRIC PARK BRAKE, REMOVAL** .
      - Perform the EPB VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Repair the (D60) CAN C Bus (-) circuit for an open or high resistance.
      - Perform the EPB VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

NO RESPONSE FROM EPS (ELECTRIC POWER STEERING MODULE)

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 14: EPSM CAN C, Fused B+, Fused Ignition Switch Output & Ground Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

POSSIBLE CAUSES

Possible Causes
FUSED B(+) CIRCUIT OPEN OR SHORTED
IGNITION RUN/START CONTROL OUTPUT CIRCUIT OPEN OR SHORTED
GROUND CIRCUIT OPEN OR HIGH RESISTANCE
CAN C BUS (+) CIRCUIT OPEN OR HIGH RESISTANCE

CAN C BUS (-) CIRCUIT OPEN OR HIGH RESISTANCE
ELECTRIC POWER STEERING (EPS) MODULE

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**

   NOTE: Check for any TSB(s) related to the condition. If a TSB applies, perform the procedure outlined in the TSB before continuing.

   1. Turn the ignition on.

      NOTE: Make sure the battery voltage is between 10.0 and 16.0 volts.

   2. With the scan tool, read the module status.

      NOTE: Check the BCM for any active CAN hardware DTCs, perform the diagnostic procedure for those DTCs before proceeding.

      Does the scan tool indicate that the module is active on the bus?

      Yes

      - The no response condition is not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

      No

      - Go To 2

2. **CHECK THE (A951) FUSED B(+) CIRCUIT FOR AN OPEN OR SHORT**
   1. Turn the ignition off.
   2. Disconnect the Electronic Power Steering (EPS) Module C1 and C2 harness connectors.
   3. Turn the ignition on.
   4. Using a 12-volt test light connected to ground, check the (A951) Fused B(+) circuit.

      Does the test light illuminate brightly?

      Yes

      - Go To 3

      No

- Repair the (A951) Fused B(+) circuit for an open or short.
- Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (F942) FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT FOR AN OPEN OR SHORT**
   1. Using a 12-volt test light connected to ground, check the (F942) Fused Ignition Switch Output (Run-Start) circuit.

      Does the test light illuminate brightly?

      Yes

      - Go To 4

      No

      - Repair the (F942) Fused Ignition Switch Output (Run-Start) circuit for an open or short.
      - Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
4. **CHECK THE (Z907) GROUND CIRCUIT FOR AN OPEN**
   1. Turn the ignition off.
   2. Using a 12-volt test light connected to 12-volts, check the (Z907) Ground circuit.

      Does the test light illuminate brightly?

      Yes

      - Go To 5

      No

      - Repair the (Z907) Ground circuit for an open.
      - Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
5. **CHECK THE (D139) CAN C(+) BUS CIRCUIT FOR AN OPEN**
   1. Disconnect the Star Can C Body C5 harness connector. and perform the CAN C DASH STAR CONNECTOR REMOVAL process. Refer to **STANDARD PROCEDURE** .
   2. Measure the resistance of the (D139) CAN C Bus (+) circuit between the Star Can C Body C5 harness connector and the EPS C1 harness connector.

      Is the resistances below 5.0 Ohms?

      Yes

      - Go To 6

No

- Repair the (D139) CAN C(+) Bus circuit for an open.
- Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

6. **CHECK THE (D138) CAN C(-) BUS CIRCUIT FOR AN OPEN**
   1. Measure the resistance of the (D138) CAN C Bus (-) circuit between the Star Can C Body C5 harness connector and the EPS C1 harness connector.

      Are the resistances below 5.0 Ohms?

      Yes

      - Replace the Electronic Power Steering (EPS) Module in accordance with the Service Information. Refer to **GEAR, REMOVAL** .
      - Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Repair the (D138) CAN C(-) Bus circuit for an open.
      - Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

NO RESPONSE FROM ESM (ELECTRONIC SHIFT MODULE)

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 15: Gear Shift Module (GSM) / Electronic Shift Module (ESM) Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

POSSIBLE CAUSES

Possible Causes
IGNITION OFF/RUN/START CONTROL OUTPUT CIRCUIT OPEN OR SHORTED GROUND CIRCUITS OPEN

CAN BUS CIRCUITS OPEN
ELECTRONIC SHIFT MODULE

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**

   NOTE: Check for any TSB(s) related to the condition. If a TSB applies, perform the procedure outlined in the TSB before continuing.

   1. Turn the ignition on.

      NOTE: Make sure the battery voltage is between 10.0 and 16.0 volts.

   2. With the scan tool, read the module status.

      NOTE: Check the BCM for any active CAN hardware DTCs, perform DTC before proceeding.

      Does the scan tool indicate that the module is active on the bus?

      Yes

      - The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 2

2. **CHECK THE (F1) IGNITION OFF/RUN/START CONTROL OUTPUT CIRCUIT FOR AN OPEN OR SHORT**
   1. Turn the ignition off.
   2. Disconnect the Shift Lever Assembly C1 harness connectors.
   3. Turn the ignition on.
   4. Using a 12-volt test light connected to ground, check the (F1) Ignition Off/Run/Start Control Output circuit.

      Does the test light illuminate brightly?

      Yes

      - Go To 3

No

- Repair the open or short in the (F1) Ignition Off/Run/Start Control Output circuit.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (Z919) GROUND CIRCUITS FOR AN OPEN**
   1. Using a 12-volt test light connected to 12-volts, check the (Z919) Ground circuits at the Shift Lever Assembly harness connector.

      Does the test light illuminate brightly?

      Yes

      - Go To 4

      No

      - Repair the open in the (Z919) Ground circuit(s).
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
4. **CHECK THE (D429) AND (D430) CAN C BUS CIRCUITS FOR AN OPEN**
   1. Turn the ignition off.
   2. Disconnect the CAN C Body C7 Star Connector.
   3. Measure the resistance of the (D430) CAN C Bus (-) circuit between the CAN C Body C10 Star Connector and the Shift Lever Assembly harness connector.
   4. Measure the resistance of the (D429) CAN C Bus (+) circuit between the CAN C Body C10 Star Connector and the Shift Lever Assembly harness connector.

      Are the resistances below 5.0 Ohms?

      Yes

      - Replace the Shift Lever Assembly in accordance with the Service Information.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Repair the open in the (D429) or (D430) CAN C Bus circuit. Inspect the connector for damage.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

NO RESPONSE FROM FFCM (FORWARD FACING CAMERA MODULE)

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 16: FCCM CAN C, Fused Ignition, & Ground Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

POSSIBLE CAUSES

Possible Causes
GROUND CIRCUIT OPEN

FUSED IGNITION CIRCUIT OPEN OR SHORTED
CAN C BUS (+) CIRCUIT OPEN
CAN C BUS (-) CIRCUIT OPEN
FORWARD FACING CAMERA MODULE (FFCM)

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**

   NOTE: Check for any TSB(s) related to the condition. If a TSB applies, perform the procedure outlined in the TSB before continuing.

   1. Turn the ignition on.

      NOTE: Make sure the battery voltage is between 10.0 and 16.0 volts.

   2. With the scan tool, read the module status.

      NOTE: Check the BCM for any active CAN C hardware DTCs and perform the appropriate diagnostic procedure before proceeding.

      Does the scan tool indicate that the module is active on the bus?

      Yes

      - The no response condition is not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

      No

      - Go To 2

2. **CHECK THE (Z912) GROUND CIRCUIT FOR AN OPEN**
   1. Turn the ignition off.
   2. Disconnect the Forward Facing Camera Module harness connector.
   3. Using a 12-volt test light connected to 12-volts, check the (Z912) Ground circuit.

      NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

      Does the test light illuminate brightly?

      Yes

- Go To 3

No

- Repair the (Z912) Ground circuit for an open.
- Perform the FORWARD FACING CAMERA VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (F925) FUSED IGNITION CIRCUIT FOR AN OPEN OR SHORT**
   1. Turn the ignition on.
   2. Using a 12-volt test light connected to ground, check the (F925) Fused Ignition circuit.

   Does the test light illuminate brightly?

   Yes

   - Go To 4

   No

   - Repair the (F925) Fused Ignition circuit for an open.

   NOTE: If the fuse is open, make sure to check the circuit for a short to ground.

   - Perform the FORWARD FACING CAMERA VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK THE (D349) AND (D348) CAN C BUS CIRCUITS FOR AN OPEN**
   1. Turn the ignition off.
   2. Disconnect the Star CAN C harness connector.
   3. Measure the resistance of the (D349) CAN C Bus (+) circuit between the Star CAN C harness connector and the Forward Facing Camera Module harness connector.
   4. Measure the resistance of the (D348) CAN C Bus (-) circuit between the CAN C harness connector and the Forward Facing Camera Module harness connector.

   Is the resistance below 5.0 Ohms on both circuits?

   Yes

   - Using the schematics as a guide, check the FFCM pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Is no problems are found, replace and program the Forward Facing Camera Module (FFCM) in accordance with the Service Information. Refer to **MODULE, FORWARD FACING CAMERA, REMOVAL** .

- Perform the FORWARD FACING CAMERA VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Repair the (D349) or (D348) CAN C Bus circuit for an open.
- Perform the FORWARD FACING CAMERA VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

NO RESPONSE FROM HVAC (A/C HEATER CONTROL MODULE)

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 17: HVAC Module CAN IHS, Fused B+, Fused Ignition Run/Start Control Output & Ground Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

POSSIBLE CAUSES

Possible Causes
FUSED B(+) CIRCUIT OPEN OR SHORTED
GROUND CIRCUITS OPEN
FUSED IGNITION RUN RELAY OUTPUT CIRCUIT OPEN OR SHORTED

CAN IHS BUS (125K) CIRCUITS OPEN
A/C HEATER MODULE

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**

   NOTE: Check for any TSB(s) related to the condition. If a TSB applies, perform the procedure outlined in the TSB before continuing.

   1. Turn the ignition on.

      NOTE: Make sure the battery voltage is between 10.0 and 16.0 volts.

   2. With the scan tool, read the module status.

      NOTE: Check the BCM for any active CAN hardware DTCs, perform DTC before proceeding.

      Does the scan tool indicate that the module is active on the bus?

      Yes

      - The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 2

2. **CHECK THE (A937) FUSED B(+) CIRCUIT FOR AN OPEN OR SHORT**
   1. Turn the ignition off.
   2. Disconnect the A/C Heater Module harness connectors.
   3. Using a 12-volt test light connected to ground, check the (A937) Fused B(+) circuit.

      Does the test light illuminate brightly?

      Yes

      - Go To 3

      No

- Repair the open or short in the (A937) Fused B(+) circuit.
- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (Z912) GROUND CIRCUIT FOR AN OPEN**
   1. Using a 12-volt test light connected to 12-volts, check the (Z912) Ground circuit.

      Does the test light illuminate brightly?

      Yes

      - Go To 4

      No

      - Repair the open in the (Z912) Ground circuit.
      - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
4. **CHECK THE (F949) FUSED IGNITION RUN RELAY OUTPUT CIRCUIT FOR AN OPEN OR SHORT**
   1. Turn the ignition on.
   2. Using a 12-volt test light connected to ground, check the (F949) Fused Ignition Run Relay Output circuit.

      Does the test light illuminate brightly?

      Yes

      - Go To 5

      No

      - Repair the open or short in the (F949) Fused Ignition Run Relay Output circuit.
      - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
5. **CHECK THE (D101) AND (D102) CAN IHS BUS (125K) CIRCUIT FOR AN OPEN**
   1. Turn the ignition off.
   2. Disconnect the CAN IHS IP C6 Star Connector.
   3. Measure the resistance of the (D102) CAN IHS Bus (-) (125K) circuit between the CAN IHS IP C6 Star Connector and the A/C Heater harness connector.
   4. Measure the resistance of the (D101) CAN IHS Bus (+) (125K) circuit between the CAN IHS IP C6 Star Connector and the A/C Heater harness connector.

      Are the resistances below 5.0 Ohms?

      Yes

- Replace the A/C Heater Module in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .
- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Repair the open in the (D101) or (D102) CAN IHS Bus (125K) circuit. Inspect the connector for damage.
- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

NO RESPONSE FROM ICS (INTEGRATED CENTER STACK)

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 18: Integrated Center Stack Switch Bank Module CAN IHS, Fused B+ & Ground Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

POSSIBLE CAUSES

Possible Causes
(A937) FUSED B(+) CIRCUIT OPEN OR SHORTED
(Z914) GROUND CIRCUIT OPEN
(D462) OR (D463) CAN IHS BUS CIRCUIT OPEN
INTEGRATED CENTER STACK (ICS)

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**

   NOTE: Check for any TSB(s) related to the condition. If a TSB applies, perform the procedure outlined in the TSB before continuing.

   1. Turn the ignition on.

      NOTE: Make sure the battery voltage is between 10.0 and 16.0 volts.

   2. With the scan tool, read the module status.

      Does the scan tool indicate that the module is active on the bus?

      Yes

      - The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 2

2. **CHECK THE (A937) FUSED B(+) CIRCUIT FOR AN OPEN OR SHORT**
   1. Turn the ignition off.
   2. Disconnect the Integrated Center Stack Module C1 harness connector.
   3. Using a 12-volt test light connected to ground, check the (A937) Fused B(+) circuit.

      Does the test light illuminate brightly?

      Yes

      - Go To 3

      No

      - Repair the open or short in the (A937) Fused B(+) circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3.
   1. Using a 12-volt test light connected to 12-volts, check the (Z914) Ground circuit.

      Does the test light illuminate brightly?

Yes

- Go To 4

No

- Repair the open in the (Z914) Ground circuit.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK THE (D462) AND (D463) CAN IHS BUS CIRCUITS FOR AN OPEN**
   1. Disconnect the CAN IHS IP Star Connector.
   2. Measure the resistance of the (D462) CAN IHS Bus (-) circuit between the CAN IHS IP Star Connector and the Integrated Center Stack Module C1 harness connector.
   3. Measure the resistance of the (D463) CAN IHS Bus (+) circuit between the CAN IHS IP Star Connector and the Integrated Center Stack Module C1 harness connector.

   Are the resistances below 5.0 Ohms?

   Yes

   - Replace the Integrated Center Stack Module in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Repair the open in the (D462) or (D463) CAN IHS Bus circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

NO RESPONSE FROM IPC (INSTRUMENT PANEL CLUSTER)

Fig. 19: Instrument Cluster CAN C, Fused B+, Fused Ignition & Ground Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

POSSIBLE CAUSES

Possible Causes
FUSED B(+) CIRCUIT OPEN OR SHORTED
GROUND CIRCUIT OPEN

FUSED IGNITION CIRCUIT OPEN OR SHORTED
CAN C BUS CIRCUITS OPEN
CLUSTER

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**

   NOTE: Check for any TSB(s) related to the condition. If a TSB applies, perform the procedure outlined in the TSB before continuing.

   1. Turn the ignition on.

      NOTE: Make sure the battery voltage is between 10.0 and 16.0 volts.

   2. With the scan tool, read the module status.

      NOTE: Check the BCM for any active CAN hardware DTCs, perform DTC before proceeding.

      Does the scan tool indicate that the module is active on the bus?

      Yes

      - The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 2

2. **CHECK THE (A938) FUSED B(+) CIRCUIT FOR AN OPEN**
   1. Turn the ignition off.
   2. Disconnect the Instrument Cluster harness connector.
   3. Using a 12-volt test light connected to ground, check the (A938) Fused B(+) circuit.

      Does the test light illuminate brightly?

      Yes

      - Go To 3

      No

- Repair the (A938) Fused B(+) circuit for an open or high resistance.

NOTE: If the fuse is open, make sure to check for a short to ground.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (Z917) GROUND CIRCUIT FOR AN OPEN**
   1. Using a 12-volt test light connected to 12-volts, check each (Z917) Ground circuit.

      Does the test light illuminate brightly for each circuit?

      Yes

      - Go To 4

      No

      - Repair the (Z917) Ground circuit for an open or high resistance.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
4. **CHECK THE (F949) FUSED IGNITION CIRCUIT FOR AN OPEN OR SHORT**
   1. Turn the ignition on.
   2. Using a 12-volt test light connected to ground, check the (F949) Fused Ignition circuit.

      Does the test light illuminate brightly?

      Yes

      - Go To 5

      No

      - Repair the (F949) Fused Ignition circuit for an open or high resistance.

      NOTE: If the fuse is open, make sure to check for a short to ground.

      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
5. **CHECK THE (D81) AND (D82) CAN C BUS CIRCUITS FOR AN OPEN**
   1. Turn the ignition off.
   2. Disconnect the CAN C IP C4 Star Connector.
   3. Measure the resistance of the (D82) CAN C Bus (-) circuit between the CAN C IP C4 Star Connector and the Instrument Cluster harness connector.
   4. Measure the resistance of the (D81) CAN C Bus (+) circuit between the CAN C IP C4 Star Connector and the Instrument Cluster harness connector.

Are both resistances below 5.0 Ohms?

Yes

- Replace the Instrument Cluster in accordance with the Service Information. Refer to **REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Repair the (D81) or (D82) CAN C Bus circuit(s) for an open or high resistance.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

NO RESPONSE FROM LBSS (LEFT BLIND SPOT SENSOR)

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 20: Rear Blind Spot Sensor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the ignition on.

SET CONDITION

No BUS messages from the Left Blind Spot Sensor (LBSS) are received for greater than 1.05 seconds.

POSSIBLE CAUSES

Possible Causes
FUSED RUN RELAY CONTROL CIRCUIT OPEN
GROUND CIRCUIT OPEN
CAN IHS BUS CIRCUITS OPEN
LEFT BLIND SPOT SENSOR (LBSS)

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
   1. Turn the ignition on.

      NOTE: Make sure the battery voltage is between 10.0 and 16.0 volts.

   2. With the scan tool, read the module status.

      Does the scan tool indicate that the module is active on the bus?

      Yes

      - The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 2
2. **CHECK THE (F923) FUSED RUN RELAY CONTROL CIRCUIT FOR AN OPEN OR SHORT**
   1. Turn the ignition off.
   2. Disconnect the LBSS harness connector.
   3. Using a 12-volt test light connected to ground, check the (F923) Fused Run Relay Control circuit.

      Does the test light illuminate brightly?

      Yes

      - Go To 3

      No

- Repair the open or short in the (F923) Fused Run Relay Control circuit.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (Z923) GROUND CIRCUIT FOR AN OPEN**
   1. Using a 12-volt test light connected to 12-volts, check the (Z923) Ground circuit.

      Does the test light illuminate brightly?

      Yes

      - Go To 4

      No

      - Repair the open in the (Z923) Ground circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
4. **CHECK THE (D215) OR (D216) CAN IHS BUS CIRCUIT FOR AN OPEN**
   1. Disconnect the CAN IHS Body Star connector.
   2. Measure the resistance of the (D216) CAN IHS Bus (-) circuit between the CAN IHS Body Star connector and the LBSS harness connector.
   3. Measure the resistance of the (D215) CAN IHS Bus (+) circuit between the CAN IHS Body Star connector and the LBSS harness connector.

      Is resistance below 5.0 Ohms on both circuits?

      Yes

      - Replace the LBSS in accordance with the Service Information. Refer to **SENSOR, BLIND SPOT, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Repair the open in the (D215) or (D216) CAN IHS Bus circuit. Inspect the connector for damage.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

NO RESPONSE FROM MSMD (MEMORY SEAT MODULE)

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 21: MSDM CAN IHS, Fused B+ & Ground Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

POSSIBLE CAUSES

Possible Causes
FUSED B(+) CIRCUIT OPEN OR SHORTED
GROUND CIRCUIT OPEN

CAN IHS BUS CIRCUIT(S) OPEN
MEMORY SEAT MODULE-DRIVER (MSMD)

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**

   NOTE: Check for any TSB(s) related to the condition. If a TSB applies, perform the procedure outlined in the TSB before continuing.

   1. Turn the ignition on.

      NOTE: Make sure the battery voltage is between 10.0 and 16.0 volts.

   2. With the scan tool, read the module status.

      NOTE: Check the BCM for any active CAN hardware DTCs, perform DTC before proceeding.

      Does the scan tool indicate that the module is active on the bus?

      Yes

      - The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.
      - Perform the POWER SEAT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 2

2. **CHECK THE (A942) FUSED B(+) CIRCUIT FOR AN OPEN**
   1. Turn the ignition off.
   2. Disconnect the Memory Seat Module (MSMD) C1 harness connector.
   3. Turn the ignition on.
   4. Using a 12-volt test light connected to ground, check the (A942) Fused B(+) circuit.

      NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

      Does the test light illuminate brightly?

Yes

- Go To 3

No

- Repair the (A942) Fused B(+) circuit for an open or high resistance.

NOTE: If the fuse is open, make sure to check for a short to ground.

- Perform the POWER SEAT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (Z919) GROUND CIRCUIT FOR AN OPEN**
   1. Turn the ignition off.
   2. Using a 12-volt test light connected to 12-volts, check the (Z919) Ground circuit.

   Does the test light illuminate brightly?

   Yes

   - Go To 4

   No

   - Repair the (Z919) Ground circuit for an open or high resistance.
   - Perform the POWER SEAT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK THE (D165) AND (D166) CAN IHS BUS CIRCUITS FOR AN OPEN**
   1. Disconnect the CAN IHS Star Connector.
   2. Measure the resistance of the (D166) CAN IHS Bus (-) circuit between the CAN IHS Star Connector and the CSWM C1 harness connector.
   3. Measure the resistance of the (D165) CAN IHS Bus (+) circuit between the CAN IHS Star Connector and the CSWM C1 harness connector.

   Are both circuit resistances below 5.0 Ohms?

   Yes

   - Replace and program the Memory Seat Module (MSMD) in accordance with the Service Information. Refer to **MODULE, MEMORY, SEAT, REMOVAL** .
   - Perform the POWER SEAT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

- Repair the (D165) or the (D166) CAN IHS Bus circuit(s) for an open or high resistance.
- Perform the POWER SEAT SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

NO RESPONSE FROM OCM (OCCUPANT CLASSIFICATION MODULE)

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 22: Classification Module (OCM) CAN C BUS, Ignition Run/Start Control Output & Ground Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

POSSIBLE CAUSES

Possible Causes
(F941) IGNITION RUN/START CONTROL OUTPUT CIRCUIT OPEN OR SHORTED
(Z916) GROUND CIRCUIT OPEN
(D13) OR (D14) CAN C BUS CIRCUIT OPEN
OCCUPANT CLASSIFICATION MODULE (OCM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**

   NOTE: Check for any TSB(s) related to the condition. If a TSB applies, perform the procedure outlined in the TSB before continuing.

   1. Turn the ignition on.

      NOTE: Make sure the battery voltage is between 10.0 and 16.0 volts.

   2. With the scan tool, read the module status.

      NOTE: Check the BCM for any active CAN hardware DTCs, perform DTC before proceeding.

      Does the scan tool indicate that the module is active on the bus?

      Yes

      - The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 2

2. **CHECK THE (F941) IGNITION RUN/START CONTROL OUTPUT CIRCUIT FOR AN OPEN OR SHORT**

   NOTE: Check the BCM for any ignition related DTCs before proceeding. If set, refer to the BODY CONTROL MODULE (BCM) - DIAGNOSTIC CODE INDEX article.

   1. Using a 12-volt test light connected to ground, check the (F941) Ignition Run/Start Control Output

circuit.

Does the test light illuminate brightly?

Yes

- Go To 3

No

- Repair the open or short in the (F941) Ignition Run/Start Control Output circuit.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (Z916) GROUND CIRCUIT FOR AN OPEN**
   1. Disconnect the OCM harness connector.
   2. Measure the resistance between ground and the (Z916) Ground circuit.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 4

   No

   - Repair the open in the (Z916) Ground circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK THE (D13) AND (D14) CAN C BUS CIRCUITS FOR AN OPEN**
   1. Turn the ignition off.
   2. Disconnect the CAN C Body C10 Star Connector harness connector.
   3. Measure the resistance of the (D13) CAN C Bus (+) circuit between the CAN C Body C10 Star Connector harness connector and the OCM harness connector.
   4. Measure the resistance of the (D14) CAN C Bus (-) circuit between the CAN C Body C10 Star Connector harness connector and the OCM harness connector.

   Are the resistances below 5.0 Ohms?

   Yes

   - Replace the OCM in accordance with the Service Information. Refer to **MODULE, OCCUPANT CLASSIFICATION, REMOVAL** . Perform the re-zero OCM procedure when the OCM is replaced. Refer to **STANDARD PROCEDURE** .
   - Perform the OCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

- Repair the open in the (D13) CAN C Bus (+) or (D14) CAN C Bus (-) circuit.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

NO RESPONSE FROM ORC (OCCUPANT RESTRAINT CONTROLLER)

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 23: Occupant Restraint Controller Module (ORC) Circuit Diagram

Courtesy of CHRYSLER GROUP, LLC

POSSIBLE CAUSES

Possible Causes
(F929) FUSED IGNITION SWITCH OUTPUT (RUN) CIRCUIT OPEN OR SHORTED
(F945) IGNITION RUN/START CONTROL OUTPUT CIRCUIT OPEN OR SHORTED
(Z913) GROUND CIRCUIT OPEN
(D11) OR (D12) CAN C BUS CIRCUIT OPEN
OCCUPANT RESTRAINT CONTROLLER (ORC) MODULE

Always Perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE .

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**

   NOTE: Check for any TSB(s) related to the condition. If a TSB applies, perform the procedure outlined in the TSB before continuing.

   1. Turn the ignition on.

      NOTE: Make sure the battery voltage is between 10.0 and 16.0 volts.

   2. With the scan tool, read the module status.

      NOTE: Check the BCM for any active CAN hardware DTCs, perform DTC before proceeding.

      Does the scan tool indicate that the module is active on the bus?

      Yes

      - The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 2

2. **CHECK THE (Z913) GROUND CIRCUIT FOR AN OPEN**

WARNING: Turn the ignition off disconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Disconnect the Occupant Restraint Controller Module harness connectors.
2. Connect the (special tool #8443-57, Adapter, Supplemental Restraint System Load Tool) to the ORC harness connectors.
3. Measure the resistance between ground and the (Z913) Ground circuit.

   Is the resistance below 5.0 Ohms?

   Yes

   - Go To 3

   No

   - Repair the open in the (Z913) Ground circuit.
   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (F929) FUSED IGNITION SWITCH OUTPUT (RUN) CIRCUIT FOR AN OPEN OR SHORT**

NOTE: Check the BCM for any ignition related DTCs before proceeding. If set, refer to the BODY CONTROL MODULE (BCM) - DIAGNOSTIC CODE INDEX article.

WARNING: Turn the ignition on, then reconnect the 12-volt battery and wait two minutes before proceeding. Failure to follow these instructions may result in possible serious or fatal injury.

1. Using a 12-volt test light connected to ground, check the (F929) Fused Ignition Switch Output (Run) circuit.

   Does the test light illuminate brightly?

   Yes

   - Go To 4

   No

   - Repair the open or short in the (F929) Fused Ignition Switch Output (Run) circuit.
   - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD**

PROCEDURE .

4. **CHECK THE (F945) IGNITION RUN/START CONTROL OUTPUT CIRCUIT FOR AN OPEN OR SHORT**
   1. Using a 12-volt test light connected to ground, check the (F945) Ignition Run/Start Control Output circuit.

      Does the test light illuminate brightly?

      Yes

      - Go To 5

      No

      - Repair the open or short in the (F945) Ignition Run/Start Control Output circuit.
      - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
5. **CHECK THE (D11) AND (D12) CAN C BUS CIRCUITS FOR AN OPEN**
   1. Turn the ignition off.
   2. Disconnect the CAN C IP C2 Star Connector.
   3. Measure the resistance of the (D11) CAN C Bus (+) circuit between the CAN C IP C2 Star Connector and the Occupant Restraint Controller C1 connector.
   4. Measure the resistance of the (D12) CAN C Bus (-) circuit between the CAN C IP C2 Star Connector and the Occupant Restraint Controller C1 connector.

      Are the resistances below 5.0 Ohms?

      Yes

      - Replace the Occupant Restraint Controller in accordance with the Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .
      - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Repair the open in the (D11) CAN C Bus (+) or (D12) CAN C Bus (-) circuit.
      - Perform the RESTRAINTS SYSTEM VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

NO RESPONSE FROM PCM (POWERTRAIN CONTROL MODULE) - 2.4L

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 24: ASD/Main Control Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

POSSIBLE CAUSES

Possible Causes
FUSED B(+) CIRCUIT OPEN OR SHORTED
GROUND CIRCUIT OPEN
FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT OPEN OR SHORTED

FUSED ASD/MAIN RELAY OUTPUT CIRCUIT OPEN OR SHORTED
CAN C BUS (+) CIRCUIT OPEN
CAN C BUS (-) CIRCUIT OPEN
POWERTRAIN CONTROL MODULE (PCM)

DIAGNOSTIC TEST

1. **TEST FOR AN INTERMITTENT CONDITION**

   NOTE: Check for any TSB(s) related to the condition. If a TSB applies, perform the procedure outlined in the TSB before continuing.

   1. Turn the ignition on.

      NOTE: Make sure the battery voltage is between 10.0 and 16.0 volts.

   2. With the scan tool, read the module status.

      NOTE: Check the BCM for any active CAN hardware DTCs and perform those DTC before proceeding.

      Does the scan tool indicate that the module is active on the bus?

      Yes

      - The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 2

2. **CHECK THE (A209) FUSED B(+) CIRCUIT FOR AN OPEN OR SHORT**
   1. Turn the ignition off.
   2. Disconnect the PCM C1 harness connector.

      CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the GPEC Diagnostic Adaptor to perform the diagnosis.

   3. Connect the (special tool #10436, Adapter, GPEC Diagnostic).

4. Using a 12-volt test light connected to ground, probe the (A209) Fused B(+) circuit at the GPEC Adaptor.

   Does the test light illuminate brightly?

   Yes

   - Go To 3

   No

   - Repair the (A209) Fused B(+) circuit for an open or short.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

3. **CHECK THE (Z909) GROUND CIRCUITS FOR AN OPEN/HIGH RESISTANCE**
   1. Using a 12-volt test light connected to 12 volts, probe the (Z909) Ground circuits at the GPEC Adaptor.

      Does the test light illuminate brightly at each ground circuit?

      Yes

      - Go To 4

      No

      - Repair the (Z909) Ground circuit for an open or high resistance.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

4. **CHECK THE (F942) FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT FOR AN OPEN OR SHORT**
   1. Turn the ignition on.
   2. Using a 12-volt test light connected to ground, probe the (F942) Fused Ignition Switch Output (Run-Start) circuit at the GPEC Adaptor.

      Does the test light illuminate brightly?

      Yes

      - Go To 5

      No

      - Repair the (F942) Fused Ignition Switch Output (Run-Start) circuit for an open or short.

- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

5. **CHECK THE (F342) FUSED ASD RELAY OUTPUT CIRCUITS FOR AN OPEN OR SHORT**
   1. Turn the ignition off
   2. Disconnect the PCM C2 harness connector.

      CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the GPEC Diagnostic Adaptor to perform the diagnosis.

   3. Connect the (special tool #10436, Adapter, GPEC Diagnostic).
   4. Remove the ASD Relay from the Power Distribution Center (PDC).
   5. Connect a jumper between terminal 30 and terminal 87 at the ASD Relay connector in the PDC.
   6. Using a 12-volt test light connected to ground, probe the (F342) Fused ASD Relay Output circuits at the GPEC Adaptor.

      Does the test light illuminate brightly at each ASD Control Output circuit?

      Yes

      - Go To 6

      No

      - Repair the (F342) Fused ASD Relay Output circuit for an open or short.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

6. **CHECK THE (D27) CAN C BUS (+) CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Disconnect the STAR CAN Connector DASH C6 harness connector. and perform the CAN C DASH STAR CONNECTOR REMOVAL process. Refer to **STANDARD PROCEDURE** .
   3. Measure the resistance of the (D27) CAN C Bus (+) circuit between the STAR CAN Connector DASH C6 harness connector and the GPEC Adaptor.

      Is resistance below 5.0 Ohms?

      Yes

      - Go To 7

      No

- Repair the (D27) CAN C Bus (+) circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

7. **CHECK THE (D28) CAN C BUS (-) CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Measure the resistance of the (D28) CAN C Bus (-) circuit between the STAR CAN Connector DASH C6 harness connector and the GPEC Adaptor.

      Is resistance below 5.0 Ohms?

      Yes

      - Replace the Powertrain Control Module in accordance with the Service Information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

      No

      - Repair the (D28) CAN C Bus (-) circuit for an open or high resistance.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

NO RESPONSE FROM PCM (POWERTRAIN CONTROL MODULE) - 3.2L

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 25: ASD/Main Control Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

POSSIBLE CAUSES

Possible Causes
FUSED B(+) CIRCUIT OPEN OR SHORTED
GROUND CIRCUIT OPEN
FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT OPEN OR SHORTED

FUSED ASD/MAIN RELAY OUTPUT CIRCUIT OPEN OR SHORTED
CAN C BUS (+) CIRCUIT OPEN
CAN C BUS (-) CIRCUIT OPEN
POWERTRAIN CONTROL MODULE (PCM)

DIAGNOSTIC TEST

1. **TEST FOR AN INTERMITTENT CONDITION**

   NOTE: Check for any TSB(s) related to the condition. If a TSB applies, perform the procedure outlined in the TSB before continuing.

   1. Turn the ignition on.

      NOTE: Make sure the battery voltage is between 10.0 and 16.0 volts.

   2. With the scan tool, read the module status.

      NOTE: Check the BCM for any active CAN hardware DTCs and perform those DTC before proceeding.

      Does the scan tool indicate that the module is active on the bus?

      Yes

      - The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 2

2. **CHECK THE (A209) FUSED B(+) CIRCUIT FOR AN OPEN OR SHORT**
   1. Turn the ignition off.
   2. Disconnect the PCM C1 harness connector.

      CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the GPEC Diagnostic Adaptor to perform the diagnosis.

   3. Connect the (special tool #10436, Adapter, GPEC Diagnostic).

4. Using a 12-volt test light connected to ground, probe the (A209) Fused B(+) circuit at the GPEC Adaptor.

   Does the test light illuminate brightly?

   Yes

   - Go To 3

   No

   - Repair the (A209) Fused B(+) circuit for an open or short.
   - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

3. **CHECK THE (Z909) GROUND CIRCUITS FOR AN OPEN/HIGH RESISTANCE**
   1. Using a 12-volt test light connected to 12 volts, probe the (Z909) Ground circuits at the GPEC Adaptor.

      Does the test light illuminate brightly at each ground circuit?

      Yes

      - Go To 4

      No

      - Repair the (Z909) Ground circuit for an open or high resistance.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

4. **CHECK THE (F942) FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT FOR AN OPEN OR SHORT**
   1. Turn the ignition on.
   2. Using a 12-volt test light connected to ground, probe the (F942) Fused Ignition Switch Output (Run-Start) circuit at the GPEC Adaptor.

      Does the test light illuminate brightly?

      Yes

      - Go To 5

      No

      - Repair the (F942) Fused Ignition Switch Output (Run-Start) circuit for an open or short.

- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

5. **CHECK THE (F342) FUSED ASD RELAY OUTPUT CIRCUITS FOR AN OPEN OR SHORT**
   1. Turn the ignition off
   2. Disconnect the PCM C2 harness connector.

      CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install the GPEC Diagnostic Adaptor to perform the diagnosis.

   3. Connect the (special tool #10436, Adapter, GPEC Diagnostic).
   4. Remove the ASD Relay from the Power Distribution Center (PDC).
   5. Connect a jumper between terminal 30 and terminal 87 at the ASD Relay connector in the PDC.
   6. Using a 12-volt test light connected to ground, probe the (F342) Fused ASD Relay Output circuits at the GPEC Adaptor.

      Does the test light illuminate brightly at each ASD Control Output circuit?

      Yes

      - Go To 6

      No

      - Repair the (F342) Fused ASD Relay Output circuit for an open or short.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

6. **CHECK THE (D27) CAN C BUS (+) CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Disconnect the STAR CAN Connector DASH C6 harness connector. and perform the CAN C DASH STAR CONNECTOR REMOVAL process. Refer to **STANDARD PROCEDURE** .
   3. Measure the resistance of the (D27) CAN C Bus (+) circuit between the STAR CAN Connector DASH C6 harness connector and the GPEC Adaptor.

      Is resistance below 5.0 Ohms?

      Yes

      - Go To 7

      No

- Repair the (D27) CAN C Bus (+) circuit for an open or high resistance.
- Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

7. **CHECK THE (D28) CAN C BUS (-) CIRCUIT FOR AN OPEN/HIGH RESISTANCE**
   1. Measure the resistance of the (D28) CAN C Bus (-) circuit between the STAR CAN Connector DASH C6 harness connector and the GPEC Adaptor.

      Is resistance below 5.0 Ohms?

      Yes

      - Replace the Powertrain Control Module in accordance with the Service Information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

      No

      - Repair the (D28) CAN C Bus (-) circuit for an open or high resistance.
      - Perform the POWERTRAIN VERIFICATION TEST. Refer to **POWERTRAIN VERIFICATION TEST** .

NO RESPONSE FROM PAM (PARK ASSIST MODULE)

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 26: PAM CAN C, Run Relay Control & Ground Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

POSSIBLE CAUSES

Possible Causes
FUSED RUN RELAY OUTPUT CIRCUIT OPEN OR SHORTED
GROUND CIRCUIT OPEN
CAN C BUS CIRCUIT(S) OPEN
PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**

   NOTE: Check for any TSB(s) related to the condition. If a TSB applies, perform the procedure outlined in the TSB before continuing.

   1. Turn the ignition on.

      NOTE: Make sure the battery voltage is between 10.0 and 16.0 volts.

   2. With the scan tool, read the module status.

      NOTE: Check the BCM for any active CAN hardware DTCs, perform DTC before proceeding.

      Does the scan tool indicate that the module is active on the bus?

      Yes

      - The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 2

2. **CHECK THE (F923) FUSED RUN RELAY OUTPUT CIRCUIT FOR AN OPEN OR SHORT**
   1. Turn the ignition off.
   2. Disconnect the Park Assist Module C1 harness connector.
   3. Turn the ignition on.
   4. Using a 12-volt test light connected to ground, check the (F923) Fused Run Relay Output circuit.

      Does the test light illuminate brightly?

      Yes

      - Go To 3

      No

      - Repair the open or short in the (F923) Fused Run Relay Output circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (Z923) GROUND CIRCUIT FOR AN OPEN**
   1. Turn the ignition off.
   2. Using a 12-volt test light connected to 12-volts, check the (Z923) Ground circuit.

      Does the test light illuminate brightly?

      Yes

      - Go To 4

      No

      - Repair the open in the (Z923) Ground circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
4. **CHECK THE (D77) AND (D78) CAN C BUS CIRCUITS FOR AN OPEN**
   1. Disconnect the CAN C IP Star Connector harness connector.
   2. Measure the resistance of the (D78) CAN C Bus (-) circuit between the CAN C IP Star Connector harness connector and the Park Assist Module C1 harness connector.
   3. Measure the resistance of the (D77) CAN C Bus (+) circuit between the CAN C IP Star Connector harness connector and the Park Assist Module C1 harness connector.

      Are the resistances below 5.0 Ohms?

      Yes

      - Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Repair the open in the (D77) or (D78) CAN C Bus circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

NO RESPONSE FROM PDM (PASSENGER DOOR MODULE)

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 27: PDM CAN IHS, Fused B+ & Ground Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

POSSIBLE CAUSES

Possible Causes
(A925) FUSED B(+) CIRCUIT OPEN OR SHORTED
(Z916) GROUND CIRCUIT OPEN
(D213) CAN IHS BUS (+) CIRCUIT OPEN
(D214) CAN IHS BUS (-) CIRCUIT OPEN

PASSENGER DOOR MODULE

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**

   NOTE: Check for any TSB(s) related to the condition. If a TSB applies, perform the procedure outlined in the TSB before continuing.

   1. Turn the ignition on.

      NOTE: Make sure the battery voltage is between 10.0 and 16.0 volts.

   2. With the scan tool, read the module status.

      NOTE: Check the BCM for any active CAN hardware DTCs, perform DTC before proceeding.

      Does the scan tool indicate that the module is active on the bus?

      Yes

      - The no response condition is not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

      No

      - Go To 2

2. **CHECK THE (A925) FUSED B(+) CIRCUIT FOR AN OPEN OR SHORT**
   1. Turn the ignition off.
   2. Disconnect the Passenger Door Module C3 harness connector.
   3. Using a 12-volt test light connected to ground, check the (A925) Fused B(+) circuit. Compare the brightness to that of a direct connection to the battery.

      Does the test light illuminate brightly?

      Yes

      - Go To 3

      No

      - Repair the open or short in the (A925) Fused B(+) circuit.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (Z916) GROUND CIRCUIT FOR AN OPEN**
   1. Using a 12-volt test light connected to 12-volts, check the (Z916) Ground circuit. Compare the brightness to that of a direct connection to the battery.

      Does the test light illuminate brightly?

      Yes

      - Go To 4

      No

      - Repair the open in the (Z916) Ground circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
4. **CHECK THE (D213) AND (D214) CAN INTERIOR BUS (125K) CIRCUITS FOR AN OPEN**
   1. Measure the resistance of the (D214) CAN Interior Bus (125K) (-) circuit between the Body Star C6 harness connector and the Passenger Door Module C3 harness connector.
   2. Measure the resistance of the (D213) CAN Interior Bus (125K) (+) circuit between the Body Star C6 harness connector and the Passenger Door Module C3 harness connector.

      Are the resistances below 1.0 Ohms?

      Yes

      - Replace the Passenger Door Module in accordance with the Service Information. Refer to **MODULE, DOOR, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Repair the open in the (D213) or (D214) CAN Interior Bus (125K) circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

NO RESPONSE FROM PLGM (POWER LIFTGATE MODULE)

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 28: PLGM CAN IHS, Fused B+ & Ground Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

POSSIBLE CAUSES

Possible Causes
(A111) FUSED B(+) CIRCUIT OPEN OR SHORTED
(Z923) GROUND CIRCUIT OPEN
(D251) CAN IHS BUS (+) CIRCUIT OPEN
(D250) CAN IHS BUS (-) CIRCUIT OPEN
POWER LIFTGATE MODULE

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**

   NOTE: Check for any TSB(s) related to the condition. If a TSB applies, perform the procedure outlined in the TSB before continuing.

   1. Turn the ignition on.

      NOTE: Make sure the battery voltage is between 10.0 and 16.0 volts.

   2. With the scan tool, read the module status.

      NOTE: Check the BCM for any active CAN hardware DTCs, perform DTC before proceeding.

      Does the scan tool indicate that the module is active on the bus?

      Yes

      - The no response condition is not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

      No

      - Go To 2

2. **CHECK THE (A111) FUSED B(+) CIRCUIT FOR AN OPEN OR SHORT**
   1. Turn the ignition off.
   2. Disconnect the Power Liftgate Module C2 harness connector.
   3. Using a 12-volt test light connected to ground, check the (A111) Fused B(+) circuit. Compare the brightness to that of a direct connection to the battery.

      Does the test light illuminate brightly?

      Yes

      - Go To 3

      No

      - Repair the open or short in the (A111) Fused B(+) circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (Z923) GROUND CIRCUIT FOR AN OPEN**
   1. Using a 12-volt test light connected to 12-volts, check the (Z923) Ground circuit. Compare the

brightness to that of a direct connection to the battery.

Does the test light illuminate brightly?

Yes

- Go To 4

No

- Repair the open in the (Z923) Ground circuit.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK THE (D251) AND (D250) CAN INTERIOR BUS (125K) CIRCUITS FOR AN OPEN**
   1. Measure the resistance of the (D250) CAN Interior Bus (125K) (-) circuit between the Power Liftgate Module C2 harness connector and the Body Star C2 harness connector.
   2. Measure the resistance of the (D251) CAN Interior Bus (125K) (+) circuit between the Power Liftgate Module C2 harness connector and the BCM Star C2 harness connector.

   Are the resistances below 1.0 Ohms?

   Yes

   - Replace the Power Liftgate Control Module in accordance with the Service Information. Refer to **MODULE, POWER LIFTGATE CONTROL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Repair the open in the (D251) or (D250) CAN Interior Bus (125K) circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

NO RESPONSE FROM RBSS (RIGHT BLIND SPOT SENSOR)

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 29: Rear Blind Spot Sensor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the ignition on.

SET CONDITION

No BUS messages from the Right Blind Spot Sensor (RBSS) are received for greater than 1.05 seconds.

POSSIBLE CAUSES

Possible Causes
FUSED RUN RELAY CONTROL CIRCUIT OPEN
GROUND CIRCUITS OPEN
CAN IHS BUS CIRCUITS OPEN
RIGHT BLIND SPOT SENSOR (RBSS)

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**

   NOTE: Check for any TSB(s) related to the condition. If a TSB applies, perform the procedure outlined in the TSB before continuing.

   1. Turn the ignition on.

      NOTE: Make sure the battery voltage is between 10.0 and 16.0 volts.

   2. With the scan tool, read the module status.

      Does the scan tool indicate that the module is active on the bus?

      Yes

      - The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 2

2. **CHECK THE (F923) FUSED RUN RELAY CONTROL CIRCUIT FOR AN OPEN OR SHORT**
   1. Turn the ignition off.
   2. Disconnect the RBSS harness connector.
   3. Using a 12-volt test light connected to ground, check the (F923) Fused Run Relay Control circuit.

      Does the test light illuminate brightly?

      Yes

- Go To 3

No

- Repair the open or short in the (F923) Fused Run Relay Control circuit.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (Z917) GROUND CIRCUITS FOR AN OPEN**
   1. Using a 12-volt test light connected to 12-volts, check the (Z917) Ground circuits.

      Does the test light illuminate brightly?

      Yes

      - Go To 4

      No

      - Repair the open in the (Z917) Ground circuits.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
4. **CHECK THE (D217) OR (D218) CAN IHS BUS CIRCUIT FOR AN OPEN**
   1. Disconnect the CAN IHS Body Star connector.
   2. Measure the resistance of the (D218) CAN IHS Bus (-) circuit between the CAN IHS Body Star connector and the RBSS harness connector.
   3. Measure the resistance of the (D217) CAN IHS Bus (+) circuit between the CAN IHS Body Star connector and the RBSS harness connector.

      Is resistance below 5.0 Ohms on both circuits?

      Yes

      - Replace the RBSS in accordance with the Service Information. Refer to **SENSOR, BLIND SPOT, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Repair the open in the (D217) or (D218) CAN IHS Bus circuit. Inspect the connector for damage.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

NO RESPONSE FROM RFH (RADIO FREQUENCY HUB) MODULE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 30: RFH CAN, Fused B+, Security K Line & Ground Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

POSSIBLE CAUSES

Possible Causes
(A910) FUSED B+ CIRCUIT OPEN OR SHORTED
(Z924) GROUND CIRCUIT OPEN
(D39) CAN C BUS (+) CIRCUIT OPEN

(D40) CAN C BUS (-) CIRCUIT OPEN
RFH (RADIO FREQUENCY HUB) MODULE

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**

   NOTE: Check for any TSB(s) related to the condition. If a TSB applies, perform the procedure outlined in the TSB before continuing.

   1. Turn the ignition on.

      NOTE: Make sure the battery voltage is between 10.0 and 16.0 volts.

   2. With the scan tool, read the module status.

      NOTE: Check the BCM for any active CAN hardware DTCs, perform DTC before proceeding.

      Does the scan tool indicate that the module is active on the bus?

      Yes

      - The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 2

2. **CHECK THE (A910) FUSED B(+) CIRCUIT FOR AN OPEN OR SHORT**
   1. Turn the ignition off.
   2. Disconnect the RF Hub Module C1 harness connector.
   3. Using a 12-volt test light connected to ground, check the (A910) Fused B(+) circuit. Compare the brightness to that of a direct connection to the battery.

      Does the test light illuminate brightly?

      Yes

      - Go To 3

      No

- Repair the open or short in the (A910) Fused B(+) circuit.
- Perform the RADIO FREQUENCY HUB (RF HUB) VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (Z924) GROUND CIRCUIT FOR AN OPEN**
   1. Using a 12-volt test light connected to 12-volts, check the (Z924) Ground circuit. Compare the brightness to that of a direct connection to the battery.

      Does the test light illuminate brightly?

      Yes

      - Go To 4

      No

      - Repair the open in the (Z924) Ground circuit.
      - Perform the RADIO FREQUENCY HUB (RF HUB) VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
4. **CHECK THE (D39) AND (D40) CAN C BUS CIRCUITS FOR AN OPEN**
   1. Turn the ignition off.
   2. Disconnect the CAN C Body C8 Star Connector harness connector.
   3. Measure the resistance of the (D39) CAN C Bus (+) circuit between the CAN C Body C8 Star Connector and the RF Hub Module C1 harness connector.
   4. Measure the resistance of the (D40) CAN C Bus (-) circuit between the CAN C Body C8 Star Connector and the RF Hub Module C1 harness connector.

      Are the resistances below 1.0 Ohms?

      Yes

      - Replace the RF Hub Module in accordance with the Service Information. Refer to **MODULE, RADIO FREQUENCY (RF HUB), REMOVAL** .
      - Perform the RADIO FREQUENCY HUB (RF HUB) VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Repair the open in the (D39) CAN C Bus (+) or (D40) CAN C Bus (-) circuit.
      - Perform the RADIO FREQUENCY HUB (RF HUB) VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

NO RESPONSE FROM SCCM (STEERING COLUMN CONTROL MODULE)

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 31: SCCM CA C, Fused B+ & Ground Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

POSSIBLE CAUSES

Possible Causes
(A929) FUSED B(+) CIRCUIT OPEN OR SHORTED

(Z917) GROUND CIRCUIT OPEN
(D97) CAN C BUS (+) CIRCUIT OPEN
(D98) CAN C BUS (-) CIRCUIT OPEN
STEERING COLUMN CONTROL MODULE (SCCM)

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**

   NOTE: Check for any TSB(s) related to the condition. If a TSB applies, perform the procedure outlined in the TSB before continuing.

   1. Turn the ignition on.

      NOTE: Make sure the battery voltage is between 10.0 and 16.0 volts.

   2. With the scan tool, read the module status.

      NOTE: Check the BCM for any active CAN hardware DTCs, perform DTC before proceeding.

      Does the scan tool indicate that the module is active on the bus?

      Yes

      - The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 2

2. **CHECK THE (A929) FUSED B(+) CIRCUIT FOR AN OPEN OR SHORT CIRCUIT**
   1. Turn the ignition off.
   2. Disconnect the Steering Control Module C2 harness connector.
   3. Using a 12-volt test light connected to ground, check the (A929) Fused B(+) circuit.

      Does the test light illuminate brightly?

      Yes

      - Go To 3

No

- Repair the open or short in the (A929) Fused B(+) circuit.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (Z917) GROUND CIRCUIT FOR AN OPEN**
   1. Using a 12-volt test light connected to 12-volts, check the (Z917) Ground circuit.

      Does the test light illuminate brightly?

      Yes

      - Go To 4

      No

      - Repair the open in the (Z917) Ground circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
4. **CHECK THE (D97) AND (D98) CAN C BUS CIRCUITS FOR AN OPEN**
   1. Turn the ignition off.
   2. Disconnect the CAN C IP C3 Star Connector.
   3. Measure the resistance of the (D97) CAN C Bus (+) circuit between the CAN C IP C3 Star Connector and the Steering Control Module harness connector.
   4. Measure the resistance of the (D98) CAN C Bus (-) circuit between the CAN C IP C3 Star Connector and the Steering Control Module harness connector.

      Are the resistances below 5.0 Ohms?

      Yes

      - Replace the Steering Control Module which is integral to the Clockspring in accordance with the Service Information. Refer to **CLOCKSPRING, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Repair the open in the (D97) CAN C Bus (+) or (D98) CAN C Bus (-) circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

NO RESPONSE FROM TCM (TRANSMISSION CONTROL MODULE)

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 32: TCM CAN C, Fused B+, Control Output & Ground Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

POSSIBLE CAUSES

Possible Causes
FUSED B(+) CIRCUIT(S) OPEN OR SHORTED
GROUND CIRCUIT(S) OPEN

IGNITION OFF/RUN/START CONTROL OUTPUT CIRCUIT OPEN OR SHORTED
CAN C BUS CIRCUIT(S) OPEN
TRANSMISSION CONTROL MODULE (TCM)

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**

   NOTE: Check for any TSB(s) related to the condition. If a TSB applies, perform the procedure outlined in the TSB before continuing.

   1. Turn the ignition on.

      NOTE: Make sure the battery voltage is between 10.0 and 16.0 volts.

   2. With the scan tool, read the module status.

      NOTE: Check the BCM for any active CAN hardware DTCs, perform DTC before proceeding.

      Does the scan tool indicate that the module is active on the bus?

      Yes

      - The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 2

2. **CHECK THE (A190) FUSED B(+) CIRCUIT(S) FOR AN OPEN OR SHORT**
   1. Turn the ignition off.
   2. Disconnect the TCM C1 harness connector.
   3. Using a 12-volt test light connected to ground, check the (A190) Fused B(+) circuit.

      Does the test light illuminate brightly?

      Yes

      - Go To 3

      No

- Repair the open or short in the (A190) Fused B(+) circuit(s).
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **TRANSMISSION VERIFICATION TEST-948TE** .

3. **CHECK THE (Z904) GROUND CIRCUITS FOR AN OPEN**
   1. Using a 12-volt test light connected to 12-volts, check the (Z904) Ground circuit(s).

      Does the test light illuminate brightly?

      Yes

      - Go To 4

      No

      - Repair the open in the (Z904) Ground circuit(s).
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **TRANSMISSION VERIFICATION TEST-948TE** .
4. **CHECK THE (F1) IGNITION OFF/RUN/START CONTROL OUTPUT CIRCUIT FOR AN OPEN OR SHORT**
   1. Turn the ignition on.
   2. Using a 12-volt test light connected to ground, check the (F1) Ignition Off/Run/Start Control Output circuit.

      Does the test light illuminate brightly?

      Yes

      - Go To 5

      No

      - Repair the open or short in the (F1) Ignition Off/Run/Start Control Output Circuit.
      - Perform the TRANSMISSION VERIFICATION TEST. Refer to **TRANSMISSION VERIFICATION TEST-948TE** .
5. **CHECK THE (D29) AND (D30) CAN C BUS CIRCUITS FOR AN OPEN**
   1. Turn the ignition off.
   2. Disconnect the CAN C Body C2 Star Connector harness connector.
   3. Measure the resistance of the (D29) CAN C Bus (+) circuit between the CAN C Body C2 Star Connector and the TCM C1 harness connector.
   4. Measure the resistance of the (D30) CAN C Bus (-) circuit between the CAN C Body C2 Star Connector and the TCM C1 harness connector.

      Are the resistances below 5.0 Ohms?

Yes

- Replace and program the Transmission Control Module in accordance with the Service Information. Refer to **MODULE, TRANSMISSION CONTROL, REMOVAL** .
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **TRANSMISSION VERIFICATION TEST-948TE** .

No

- Repair the open in the (D29) or (D30) CAN C Bus circuit.
- Perform the TRANSMISSION VERIFICATION TEST. Refer to **TRANSMISSION VERIFICATION TEST-948TE** .

NO RESPONSE FROM RADIO

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 33: Radio Module CAN IHS, Fused B+ & Ground Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

POSSIBLE CAUSES

Possible Causes
(A933) FUSED B(+) CIRCUIT OPEN OR SHORTED
(Z912) GROUND CIRCUIT OPEN
(D178) AND (D177) CAN INTERIOR BUS (125K) CIRCUITS OPEN
RADIO

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**

   NOTE: Check for any TSB(s) related to the condition. If a TSB applies, perform the procedure outlined in the TSB before continuing.

   1. Turn the ignition on.

      NOTE: Make sure the battery voltage is between 10.0 and 16.0 volts.

   2. With the scan tool, read the module status.

      NOTE: Check the BCM for any active CAN hardware DTCs, perform DTC before proceeding.

      Does the scan tool indicate that the module is active on the bus?

      Yes

      - The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 2

2. **CHECK THE (A933) FUSED B(+) CIRCUIT FOR AN OPEN OR SHORT**
   1. Turn the ignition off.
   2. Disconnect the Radio Module C1 harness connector.
   3. Using a 12-volt test light connected to ground, check the (A933) Fused B(+) circuit.

      Does the test light illuminate brightly?

      Yes

      - Go To 3

      No

      - Repair the open or short in the (A933) Fused B(+) circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (Z912) GROUND CIRCUIT FOR AN OPEN**

1. Using a 12-volt test light connected to 12-volts, check the (Z912) Ground circuit.

   Does the test light illuminate brightly?

   Yes

   - Go To 4

   No

   - Repair the open in the (Z912) Ground circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK THE (D177) OR (D178) CAN IHS BUS (125K) CIRCUIT FOR AN OPEN**
   1. Measure the resistance of the (D178) CAN IHS Bus (125K) (-) circuit between the Radio C1 harness connector and the CAN IHS IP Star Connector C4 harness connector.
   2. Measure the resistance of the (D177) CAN IHS Bus (125K) (+) circuit between the Radio C1 harness connector and the CAN IHS IP Star Connector C4 harness connector.

   Is resistance below 5.0 Ohms on both circuits?

   Yes

   - Replace the Radio Module in accordance with the Service Information. Refer to **RADIO, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Repair the open in the (D177) or (D178) CAN IHS Bus (125K) circuit. Inspect the connector for damage.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

STORED LOST COMMUNICATION DTCS

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on for at least five seconds.

Battery voltage between 10 and 16 volts.

Body Control Module (BCM) is configured correctly.

SET CONDITION

Bus messages not received for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN C BUS CIRCUITS OPEN OR SHORT
CAN C INTERIOR BUS CIRCUITS OPEN OR SHORT
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
BCM NOT CONFIGURED CORRECTLY
POWER OR GROUND FROM THE REPORTING MODULE
MODULE THAT SET THIS DTC
PREVIOUS SERVICE PERFORMED WITHIN THE LAST 100 KEY CYCLES (FUSE/RELAYS REMOVED, WIRING SERVICE, BATTERY DISCONNECT)
LOW BATTERY/JUMP START CONDITION
CHECK FOR RELATED TSBS

DIAGNOSTIC TEST

1. **VERIFY DIAGNOSTIC TROUBLE CODE (DTC) IS STORED**

   NOTE: Stored faults may indicate a customer perceived intermittent condition.

   NOTE: Make sure the battery voltage is between 10 and 16 volts before proceeding.

   1. Turn the ignition on.
   2. With the scan tool, read stored DTCs.

      Is this DTC stored?

      Yes

      - Go To 2

      No

      - Go to and perform the appropriate diagnostic procedure.
2. **CHECK THE ENVIRONMENTAL DATA**
   1. With the scan tool, read the loss of communication environmental data.

      Does the loss of communication environmental odometer data match up to any of the previous service procedures listed in the possible causes or are there any stored CAN C hardware electrical, battery, ignition voltage, VIN missing/mismatch, or BCM configuration DTCs present with matching environmental data?

Yes

- These DTCs may have been the result of other service procedures performed. Clear the DTCs.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 3

3. **VERIFY INTERMITTENT LOST COMMUNICATION DTC - WIRING CONCERNS**
   1. With the scan tool, read all DTCs.

      Is there more than one ECU with stored DTCs "Logged Against" the module and one or more lost communication DTCs stored in the offending module?

      Yes

      - Verify if the vehicle was recently in for this type of service. Otherwise, visually inspect the related wiring harness for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals. Repair as necessary.

      No

      - Go To 4

4. **VERIFY INTERMITTENT LOST COMMUNICATION DTC - OFFENDING MODULE**
   1. With the scan tool, read all DTCs.

      Is there more than one ECU with stored DTCs "Logged Against" the module and NO lost communication DTCs stored in the offending module?

      Yes

      - Check for a TSB related to this offending module.

      No

      - Go To 5

5. **VERIFY INTERMITTENT LOST COMMUNICATION DTC - REPORTING MODULE**
   1. With the scan tool, read all DTCs.

      Is there ONLY ONE ECU with stored DTCs "Logged Against" the module?

      Yes

      - Check for a TSB related to the module that set this DTC.

No

- Verify if the vehicle was recently in for this type of service. Otherwise, visually inspect the related wiring harness for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals. Repair as necessary.

DIAGNOSIS AND TESTING

B173D-11-MIRROR SIGNAL LAMP CONTROL - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 1: Driver Mirror Assembly Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

Continuously.

SET CONDITION

The Door Module senses a short low on the Mirror Turn Signal Driver circuit for more than two seconds with the turn signal switched on.

POSSIBLE CAUSES

Possible Causes
OUTSIDE REARVIEW MIRROR DOOR MODULE

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Cycle the ignition on.
    2. With the scan tool, record and erase the DTCs.
    3. Turn the drivers side turn signal on.
    4. Turn the park lamps on.
    5. Turn the rear defogger on, if equipped with heated mirror.
    6. Press and release the Mirror Select switch to select the Driver Outside Rearview Mirror.
    7. Operate the Mirror Adjust switch in all directions several times while monitoring the scan tool for DTCs.

    NOTE: After adjusting the mirror in one direction wait at least two seconds before adjusting the mirror in the opposite direction, as this will allow time for an active fault to set if present.

    8. With the scan tool, read the DTCs.

    Does the scan tool display: B173D-11-MIRROR SIGNAL LAMP CONTROL - CIRCUIT SHORT TO GROUND?

    Yes

    - Go To 2

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. For vehicle's equipped with folding outside rearview mirrors, repeat the above test with the mirror folded. If this DTC is now active, Go To 2. Otherwise, using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **INSPECT MIRROR CONNECTIONS**

1. Cycle the ignition off.
2. Disconnect the Driver Outside Rearview Mirror C1 and C2 connectors at the Drivers Door Module.
3. Inspect the wiring harness, connectors and the Drivers Door Module.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 3

3. **MIRROR OR MODULE**
   1. Cycle the ignition on.
   2. With the scan tool, record and erase DTCs.
   3. Turn the drivers side turn signal on.
   4. Fold And Unfold the mirrors several time, if equipped with folding mirrors.
   5. Turn the rear defogger on, if equipped with heated mirror.
   6. Turn the park lamps on.
   7. Press and release the Mirror Select switch to select the Driver Outside Rearview Mirror.
   8. Operate the Mirror Adjust switch in all directions several times while monitoring the scan tool for DTCs.

      NOTE: After adjusting the mirror in one direction wait at least two seconds before adjusting the mirror in the opposite direction, as this will allow time for an active fault to set if present.

   9. With the scan tool, read DTCs.

      NOTE: Check for a change in DTCs.

      Does the scan tool display: B173D-13-MIRROR SIGNAL LAMP CONTROL - CIRCUIT OPEN as active?

      Yes

      - With the circuit now OPEN that indicates the short is NOT in the Module. Replace the mirror in accordance with the Service Information. Refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** and **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace the Door Module in accordance with the Service Information. Refer to **MODULE, DOOR, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B173D-12-MIRROR SIGNAL LAMP CONTROL - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 2: Driver Mirror Assembly Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

Continuously.

SET CONDITION

The Door Module senses a short high on the Mirror Turn Signal Driver circuit for more than two seconds with the turn signal switched on.

POSSIBLE CAUSES

Possible Causes
MIRROR TURN SIGNAL DRIVER CIRCUIT FOR A SHORT TO ANY SIGNAL OR DRIVER CIRCUIT
OUTSIDE REARVIEW MIRROR
DOOR MODULE

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**

NOTE: Check the turn signals to be sure they are flashing properly before proceeding.

1. Cycle the ignition on.
2. With the scan tool, record and erase DTCs.
3. Turn the drivers side turn signal on.
4. Turn the park lamps on.
5. Turn the rear defogger on, if equipped with heated mirror.
6. Press and release the Mirror Select switch to select the Driver Outside Rearview Mirror.
7. Operate the Mirror Adjust switch in all directions several times while monitoring the scan tool for DTCs.

NOTE: After adjusting the mirror in one direction wait at least two seconds before adjusting the mirror in the opposite direction, as this will allow time for an active fault to set if present.

8. With the scan tool, read the active DTCs.

Does the scan tool display: B173D-12-MIRROR SIGNAL LAMP CONTROL - CIRCUIT SHORT TO BATTERY?

Yes

- Go To 2

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time. For vehicle's equipped with folding outside rearview mirrors, repeat the above test with

the mirror folded. If this DTC is now active, Go To 2. For others, using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK (P501) DRIVER MIRROR TURN SIGNAL DRIVER CIRCUIT FOR A SHORT TO ANY SIGNAL OR DRIVER CIRCUIT**

Fig. 3: Checking Driver Mirror Turn Signal Driver Circuit For Short To Any Signal Or Driver Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Cycle the ignition off.
2. Turn all accessories off.
3. Disconnect the Driver Outside Rearview Mirror C1 (Component Side) and C2 (Component Side) harness connectors from the Door Module.
4. Measure the resistance between the (P501) Driver Mirror Turn Signal Driver circuit (C2-9) and each Signal and Driver circuit in the Driver Outside Rearview Mirror C1 and C2 (Component Side) harness connectors.

   Is the resistance below 10K Ohms for any measurement?

   Yes

   - Repair the (P501) Driver Mirror Turn Signal Driver circuit for a short to a Signal or Driver circuit. If the wiring harness and harness connectors are okay, replace the Driver Outside Rearview Mirror in accordance with the Service Information. Refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** and **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Inspect the wiring harness and harness connectors for damage and repair as necessary. If the wiring harness and harness connectors are okay, replace the Door Module in accordance with the Service Information. Refer to **MODULE, DOOR, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B173D-13-MIRROR SIGNAL LAMP CONTROL - CIRCUIT OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 4: Driver Mirror Assembly Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

Continuously.

SET CONDITION

The Door Module senses an open between the Mirror Turn Signal Driver circuit and the Mirror Turn Signal Return circuit for more than two seconds with the turn signal switched on.

POSSIBLE CAUSES

Possible Causes
MIRROR TURN SIGNAL DRIVER CIRCUIT OPEN TO THE MIRROR TURN SIGNAL LAMP RETURN CIRCUIT
OUTSIDE REARVIEW MIRROR
DOOR MODULE

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Cycle the ignition on.
    2. With the scan tool, record and erase DTCs.
    3. Turn the drivers side turn signal on.
    4. Press and release the Mirror Select switch to select the Driver Outside Rearview Mirror.
    5. With the scan tool, read the active DTCs.

    Does the scan tool display: B173D-13-MIRROR SIGNAL LAMP CONTROL - CIRCUIT OPEN?

    Yes

    - Go To 2

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK (P501) DRIVER MIRROR TURN SIGNAL DRIVER CIRCUIT FOR AN OPEN TO THE (P593) DRIVER MIRROR TURN SIGNAL RETURN CIRCUIT**

Fig. 5: Checking Driver Mirror Turn Signal Driver Circuit For Open To Driver Mirror Turn Signal Return Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (P501) Driver Mirror Turn Signal Driver circuit and the (P593) Driver Mirror Turn Signal Return circuit in the Driver Outside Rearview Mirror C2 (Component Side) harness connector.

   Is the resistance below 30.0 Ohms?

   Yes

   - Replace the Door Module in accordance with the Service Information. Refer to **MODULE, DOOR, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Repair the open in the (P501) Driver Mirror Turn Signal Driver circuit. If the wiring harness and harness connectors are okay, replace the Driver Outside Rearview Mirror in accordance with the Service Information. Refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** and **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B18B5-00-MASTER SWITCH - FRONT LEFT WINDOW SWITCH - STUCK

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

At all times.

SET CONDITION

Whenever the module detects a Front Left Window signal from the master power window switch, for over 30 seconds, this code will set.

POSSIBLE CAUSES

POSSIBLE CAUSES
DRIVER WINDOW/DOOR LOCK SWITCH

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Cycle the ignition on.
    2. With the scan tool, record and erase the DTCs.
    3. Operate the Front Left Window up and down several times.
    4. Wait 30 seconds.
    5. With the scan tool, read the DTCs.

    Does the scan tool display: B18B5-00-MASTER SWITCH-FRONT LEFT WINDOW SWITCH - STUCK?

    Yes

    - Go To 2

    No

    - The conditions that caused this code to set are not present at this time. Operate the switch

several more times. If the switch ever sticks, replace it.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **MASTER POWER WINDOW/DOOR LOCK SWITCH**

NOTE: Anytime this code is active, the switch must be replaced.

Repair

- Replace the Master Window/Door Lock Switch in accordance with the Service Information. Refer to **SWITCH, POWER WINDOW, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B18B6-00-MASTER SWITCH - FRONT RIGHT WINDOW SWITCH - STUCK

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

At all times.

SET CONDITION

Whenever the module detects a Front Right Window signal from the master power window switch, for over 30 seconds, this code will set.

POSSIBLE CAUSES

POSSIBLE CAUSES
DRIVER WINDOW/DOOR LOCK SWITCH

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Cycle the ignition on.
    2. With the scan tool, record and erase the DTCs.
    3. Operate the Front Right Window up and down several times from the master switch.
    4. Wait 30 seconds.
    5. With the scan tool, read the DTCs.

    Does the scan tool display B18B6-00-MASTER SWITCH-FRONT RIGHT WINDOW SWITCH - STUCK?

    Yes

- Go To 2

No

- The conditions that caused this code to set are not present at this time. Operate the switch several more times. If the switch ever sticks, replace it.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **MASTER POWER WINDOW/DOOR LOCK SWITCH**

NOTE: Anytime this code is active, the switch must be replaced.

Repair

- Replace the Driver Window/Door Lock Switch in accordance with the Service Information. Refer to **SWITCH, POWER WINDOW, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B18B7-00-MASTER SWITCH - REAR LEFT WINDOW SWITCH - STUCK

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

At all times.

SET CONDITION

Whenever the module detects a Rear Left Window signal from the master power window switch, for over 30 seconds, this code will set.

POSSIBLE CAUSES

Possible Causes
DRIVER WINDOW/DOOR LOCK SWITCH

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Cycle the ignition on.
    2. With the scan tool, record and erase the DTCs.
    3. Operate the Rear Left Window up and down several times from the master window switch.
    4. Wait 30 seconds.
    5. With the scan tool, read the DTCs.

Does the scan tool display; B18B7-00-MASTER SWITCH - REAR LEFT WINDOW SWITCH - STUCK?

Yes

- Go To 2

No

- The conditions that caused this code to set are not present at this time. Operate the switch several more times. If the switch ever sticks, replace it.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **MASTER POWER WINDOW/DOOR LOCK SWITCH**

NOTE: Anytime this code is active, the switch must be replaced.

Repair

- Replace the Driver Window/Door Lock Switch in accordance with the Service Information. Refer to **SWITCH, POWER WINDOW, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B18B8-00-MASTER SWITCH - REAR RIGHT WINDOW SWITCH - STUCK

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

At all times.

SET CONDITION

Whenever the module detects a Rear Right Window signal from the master power window switch, for over 30 seconds, this code will set.

POSSIBLE CAUSES

POSSIBLE CAUSES
DRIVER WINDOW/DOOR LOCK SWITCH

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Cycle the ignition on.
    2. With the scan tool, record and erase the DTCs.

3. Operate the Rear Right Window up and down several times from the master switch.
4. Wait 30 seconds.
5. With the scan tool, read the DTCs.

   Does the scan tool display; B18B8-00-MASTER SWITCH - REAR RIGHT WINDOW SWITCH - STUCK?

   Yes

   - Go To 2

   No

   - The conditions that caused this code to set are not present at this time. Operate the switch several more times. If the switch ever sticks, replace it.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **MASTER POWER WINDOW/DOOR LOCK SWITCH**

   NOTE: Anytime this code is active, the switch must be replaced.

   Repair

   - Replace the Driver Window/Door Lock Switch in accordance with the Service Information. Refer to **SWITCH, POWER WINDOW, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B18BA-11-WINDOW CONTROL - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 6: Driver Window Motor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

Whenever the module is awake.

SET CONDITION

When both Window Driver circuits (Up and Down) are grounded during a window movement command, this code will set.

POSSIBLE CAUSES

Possible Causes
WINDOW DRIVER DOWN CIRCUIT SHORTED TO GROUND
WINDOW DRIVER UP CIRCUIT SHORTED TO GROUND
WINDOW DRIVER DOWN CIRCUIT SHORTED TO THE WINDOW DRIVER UP CIRCUIT
WINDOW MOTOR
DOOR MODULE

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Cycle the ignition on.
    2. With the scan tool, record and erase the DTCs.
    3. Try to operate the Driver Window up and down several times.
    4. Wait 30 seconds.
    5. With the scan tool, read the DTCs.

    Does the scan tool display; B18BA-11-WINDOW CONTROL - CIRCUIT SHORT TO GROUND as active?

    Yes

    - Go To 2

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **WINDOW MOTOR SHORTED**

Fig. 7: Checking Window Motor For Short
Courtesy of CHRYSLER GROUP, LLC

1. With the scan tool, erase DTCs.
2. Cycle the ignition off.
3. Disconnect the Driver Window Motor harness connector.
4. Cycle the ignition on.
5. Operate the driver window switch up and down several times.
6. Wait 30 seconds.
7. With the scan tool, read active DTCs.

   Does the scan tool display; B18BA-11-WINDOW CONTROL - CIRCUIT SHORT TO GROUND as active?

Yes

- Go To 3

No

- Replace the Driver Window Motor in accordance with service information. Refer to **MOTOR, WINDOW REGULATOR, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **(Q21) DRIVER WINDOW DRIVER DOWN CIRCUIT SHORTED TO GROUND**

Fig. 8: Checking Driver Window Driver (Down) Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Cycle the ignition off.
2. Disconnect the Driver Door Module C4 harness connector.
3. Measure the resistance between Ground and the (Q21) Driver Window Driver Down circuit.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the short to ground in the (Q21) Driver Window Driver Down circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 4

4. **(Q11) DRIVER WINDOW DRIVER UP CIRCUIT SHORTED TO GROUND**

Fig. 9: Checking Driver Window Driver (Up) Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between Ground and the (Q11) Driver Window Driver Up circuit.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the short to ground in the (Q11) Driver Window Driver Up circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 5

5. **(Q21) DRIVER WINDOW DRIVER DOWN CIRCUIT SHORTED TO THE (Q11) DRIVER WINDOW DRIVER UP CIRCUIT**

Fig. 10: Checking Driver Window Driver (Down) Circuit For A Short To The Driver Window Driver (Up) Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (Q21) Driver Window Driver Down circuit and the (Q11) Driver Window Driver Up circuit.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the short between the (Q21) Driver Window Driver Down circuit and the (Q11) Driver Window Driver Up circuit.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace the Driver Door Module in accordance with the Service Information. Refer to **MODULE, DOOR, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B18BA-12-WINDOW CONTROL - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 11: Driver Window Motor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

Whenever the module is awake.

SET CONDITION

When both Window Driver circuits (Up and Down) are supplied with voltage during a window movement command for more than five ms., this code will set.

POSSIBLE CAUSES

Possible Causes
WINDOW DRIVER DOWN CIRCUIT SHORTED TO VOLTAGE
WINDOW DRIVER UP CIRCUIT SHORTED TO VOLTAGE
WINDOW MOTOR
DOOR MODULE

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Cycle the ignition on.
    2. With the scan tool, record and erase the DTCs.
    3. Try to operate the Driver Window up and down several times.
    4. Wait 30 seconds.
    5. With the scan tool, read the DTCs.

    Does the scan tool display; B18BA-12-WINDOW CONTROL - CIRCUIT SHORT TO BATTERY as active?

    Yes

    - Go To 2

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **WINDOW MOTOR SHORTED**
    1. With the scan tool, erase the DTCs.

2. Cycle the ignition off.
3. Disconnect the Driver Window Motor connector.
4. Cycle the ignition on.
5. Operate the driver window switch up and down several times.
6. With the scan tool, read the DTCs.

   Does the scan tool display; B18BA-12-WINDOW CONTROL - CIRCUIT SHORT TO BATTERY?

   Yes

   - Go To 3

   No

   - Replace the Driver Window Motor in accordance with service information.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **(Q21) DRIVER WINDOW DRIVER DOWN CIRCUIT SHORTED TO VOLTAGE**

Fig. 12: Checking Driver Window Driver Down Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Cycle the ignition off.
2. Disconnect the Driver Door Module C4 connector.
3. Cycle the ignition on.
4. Measure the voltage between the (Q21) Driver Window Driver Down circuit and Ground.

   Is there any voltage present?

   Yes

   - Repair the (Q21) Driver Window Driver Down circuit for a short to voltage.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 4

4. **(Q11) DRIVER WINDOW DRIVER UP CIRCUIT SHORTED TO VOLTAGE**

Fig. 13: Checking Driver Window Driver Up Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Measure the voltage between the (Q11) Driver Window Driver Up circuit and Ground.

   Is there any voltage present?

   Yes

   - Repair the (Q11) Driver Window Driver Up circuit for a short to voltage.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace the Driver Door Module in accordance with the Service Information. Refer to **MODULE, DOOR, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B18BA-13-WINDOW CONTROL - CIRCUIT OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 14: Driver Window Motor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

Whenever the module is awake.

SET CONDITION

When one or both Window circuits (Up and Down) are not supplied with voltage, when they should be, during a window movement command for more than five ms., this code will set.

POSSIBLE CAUSES

Possible Causes
WINDOW DOWN CIRCUIT OPEN
WINDOW UP CIRCUIT OPEN
WINDOW MOTOR
DOOR MODULE

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Cycle the ignition on.
    2. With the scan tool, record and erase the DTCs.
    3. Try to operate the Driver Window up and down several times.
    4. Wait 30 seconds.
    5. With the scan tool, read the DTCs.

    Does the scan tool display; B18BA-13-WINDOW CONTROL - CIRCUIT OPEN?

    Yes

    - Go To 2

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **WINDOW MOTOR OR CIRCUIT OPEN**
    1. Cycle the ignition off.
    2. Disconnect the Driver Window Motor harness connector.

3. Connect a test light between the (Q11) Driver Window Driver Up circuit and the (Q21) Driver Window Driver Down circuit.
4. Cycle the ignition on.
5. Trip the driver door latch to the closed position.
6. Operate the driver window switch up and down several times while observing the test light.

   Does the test light illuminate brightly when the switch is pressed in both directions? With the express up window, the test light will only flash momentarily each time the switch is activated.

   Yes

   - Replace the Driver Window Motor in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 3

3. **(Q21) DRIVER WINDOW EXPRESS DOWN DRIVER CIRCUIT OPEN**
   1. Cycle the ignition off.
   2. Disconnect the Driver Door Module C4 harness connector.
   3. Measure the resistance of the (Q21) Driver Window Down Driver circuit between the C4 module connector and the motor connector.

      Is the resistance below 2.0 Ohms?

      Yes

      - Go To 4

      No

      - Repair the open in the (Q21) Driver Window Down Driver circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **(Q11) DRIVER WINDOW DRIVER UP CIRCUIT OPEN**
   1. Measure the resistance of the (Q11) Driver Window Driver Up circuit between the C4 module connector and the motor connector.

      Is the resistance below 2.0 Ohms?

      Yes

      - Replace the Driver Door Module in accordance with the Service Information. Refer to **MODULE, DOOR, REMOVAL** .

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Repair the (Q11) Driver Window Driver Up circuit for an open.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B18BA-4B WINDOW CONTROL-OVER TEMPERATURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 15: Driver Window Motor Circuit Diagram

Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

Continuously.

SET CONDITION

This DTC sets when the window motor is continuously requested to move repeatedly without a sufficient cooling time (1-2 seconds). The Driver Door Module logic has determined the temperature has exceeded 80°C (176°F) and inhibits window operation.

POSSIBLE CAUSES

Possible Causes
HIGH TEMPERATURE FAILURE
DRIVER DOOR WINDOW MOTOR
DRIVER DOOR MODULE

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Cycle the ignition on.
    2. With the scan tool, read and record the DTCs.

    Does the scan tool display; B18BA-4B WINDOW CONTROL-OVER TEMPERATURE as **ACTIVE** ?

    Yes

    - Go To 2

    No

    - Test complete, the conditions that caused this code to set is not present at this time.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CONFIRM WINDOW OPERATION**

    NOTE: This step is being performed only when DTC B18BA-4B is ACTIVE.

    1. Run the window to the full up position and continue to hold the switch for an additional two seconds.
    2. Run the window to the full down position and continue to hold the switch for an additional two seconds.

3. Again run the window to the full up position and continue to hold the switch for an additional two seconds.
4. Lower the window to the full down position then press and release the switch to the express up position.

   Did the window move to the full up position?

   Yes

   - Replace the Driver Door Module in accordance with the Service Information. Refer to **MODULE, DOOR, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 3

3. **CHECKING THE (Q11) DRIVER WINDOW DRIVER UP CIRCUIT AND THE (Q21) DRIVER WINDOW DRIVER DOWN CIRCUIT FOR VOLTAGE**

NOTE: This step is being performed only when DTC B18BA-4B is ACTIVE

1. Cycle the ignition off.
2. Disconnect the Driver Window Motor harness connector.
3. Connect a test light between the (Q11) Driver Window Driver Up circuit and the (Q21) Driver Window Driver Down circuit.
4. Cycle the ignition on.
5. Trip the driver door latch to the closed position.
6. Operate the driver window switch up and down several times while observing the test light.

   Does the test light illuminate brightly when the switch is pressed in both directions? With the express up window, the test light will only flash momentarily each time the switch is activated.

   Yes

   - Replace the Driver Window Motor in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the Driver Door Module in accordance with the Service Information. Refer to **MODULE, DOOR, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1D00-2A-MIRROR FOLD SWITCH INPUT - STUCK

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Whenever the Driver Door Module (DDM) is awake.

SET CONDITION

When the Driver Door Module (DDM) senses the Mirror Fold switch input for more than 30 seconds.

POSSIBLE CAUSES

Possible Causes
OBJECT HOLDING MIRROR FOLD SWITCH IN A PUSHED POSITION
SUBSTANCE CAUSING MIRROR FOLD SWITCH TO GET STUCK IN A PUSHED POSITION
DRIVER WINDOW/DOOR LOCK SWITCH

DIAGNOSTIC TEST

1. **INSPECT DRIVER DOOR SWITCH ASSEMBLY FOR DAMAGE**

   NOTE: Diagnose and repair all LIN Bus related DTCs before performing this test procedure.

   1. Cycle the ignition off.
   2. Inspect the Driver Window/Door Lock Switch for damage.

      Is the switch assembly damaged?

      Yes

      - Replace the Driver Window/Door Lock Switch in accordance with the Service Information. Refer to **SWITCH, POWER WINDOW, REMOVAL** .
      - Perform BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 2

2. **INSPECT FOR OBJECT OR SUBSTANCE CAUSING MIRROR FOLD SWITCH TO STAY OR STICK IN A PUSHED POSITION**
   1. Inspect the Mirror Fold switch for anything that would cause it to stay or stick in a pushed position.

      Is anything present that would cause the Mirror Fold switch to stay or stick in a pushed position?

Yes

- Repair as necessary.
- Perform BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 3

3. **TEST FOR INTERMITTENT CONDITION**
   1. Cycle the ignition on.
   2. With the scan tool, record and erase the DTCs.
   3. Operate the Mirror Fold switch several times and then wait 30 seconds.
   4. With the scan tool, read the DTCs.

   Does the scan tool display: B1D00-2A-MIRROR FOLD SWITCH INPUT STUCK?

   Yes

   - Replace the Driver Window/Door Lock Switch in accordance with the Service Information.
   - Perform BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
   - Perform BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1D04-2A-MIRROR ADJUST SWITCH INPUT - STUCK

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Whenever the Driver Door Module (DDM) is awake.

SET CONDITION

When the DDM senses the Mirror Adjust switch input for more than 30 seconds.

POSSIBLE CAUSES

Possible Causes
OBJECT HOLDING MIRROR ADJUST SWITCH IN A PUSHED POSITION

SUBSTANCE CAUSING MIRROR ADJUST SWITCH TO GET STUCK IN A PUSHED POSITION
DRIVER WINDOW/DOOR LOCK SWITCH

DIAGNOSTIC TEST

1. **INSPECT DRIVER DOOR SWITCH ASSEMBLY FOR DAMAGE**

   NOTE: Diagnose and repair all LIN Bus related DTCs before performing this test procedure.

   1. Cycle the ignition off.
   2. Inspect the Driver Window/Door Lock Switch for damage.

      Is the switch assembly damaged?

      Yes

      - Replace the Driver Window/Door Lock Switch in accordance with the Service Information.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 2
2. **INSPECT FOR OBJECT OR SUBSTANCE CAUSING MIRROR ADJUST SWITCH TO STAY OR STICK IN A PUSHED POSITION**
   1. Inspect the Mirror Adjust switch for anything that would cause it to stay or stick in a pushed position.

      Is anything present that would cause the Mirror Adjust switch to stay or stick in a pushed position?

      Yes

      - Repair as necessary.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 3
3. **TEST FOR INTERMITTENT CONDITION**
   1. Cycle the ignition on.
   2. With the scan tool, record and erase the DTCs.
   3. Press and release either Mirror Select switch.
   4. Operate the Mirror Adjust switch in all positions several times and then wait 30 seconds.

5. With the scan tool, read the DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Replace the Driver Window/Door Lock Switch in accordance with the Service Information. Refer to **SWITCH, POWER WINDOW, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1D4A-2A-MEMORY SWITCH INPUT - STUCK

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously.

SET CONDITION

The Door Module receives a conflicting input from the (G200) Memory Select Switch Mux circuit for more than 30 seconds.

POSSIBLE CAUSES

Possible Causes
OBJECT HOLDING MEMORY SET SWITCH IN A PUSHED POSITION
SUBSTANCE CAUSING MEMORY SET SWITCH TO GET STUCK IN A PUSHED POSITION
(G200) MEMORY SELECT SWITCH MUX CIRCUIT SHORTED TO GROUND
(G200) MEMORY SELECT SWITCH MUX CIRCUIT SHORTED TO THE (G920) MEMORY SELECT SWITCH MUX RETURN CIRCUIT
MEMORY SET SWITCH
DOOR MODULE

DIAGNOSTIC TEST

1. **INSPECT MEMORY SET SWITCH FOR DAMAGE**
   1. Cycle the ignition off.

2. Inspect the Memory Set switch for damage.

   Is the switch damaged?

   Yes

   - Replace the Memory Set switch in accordance with the Service Information. Refer to **SWITCH, MEMORY, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 2

2. **INSPECT FOR OBJECT OR SUBSTANCE CAUSING MEMORY SET SWITCH TO STAY OR STICK IN A PUSHED POSITION**
   1. Inspect the Memory Set switch for anything that would cause it to stay or stick in a pushed position.

      Is anything present that would cause the Memory Set switch to stay or stick in a pushed position?

      Yes

      - Repair as necessary.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 3

3. **TEST FOR INTERMITTENT CONDITION**
   1. Cycle the ignition on.
   2. Using a scan tool, record and erase the Diagnostic Trouble Codes (DTCs).
   3. Press the Memory Set switch several times in all positions.
   4. Cycle the ignition from on to off three times.
   5. Cycle the ignition on then wait 30 seconds.
   6. Using a scan tool, read the Active DTCs.

      Does the scan tool display; B1D4A-2A-MEMORY SWITCH INPUT - STUCK?

      Yes

      - Go To 4

      No

- The conditions that caused this code to set are not present at this time. Verify seat harness is routed correctly. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Attempt to reproduce condition by adjusting the seat.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK MEMORY SET SWITCH FOR A SHORT TO GROUND**
   1. Using a scan tool, erase the DTCs.
   2. Cycle the ignition off.
   3. Disconnect the Memory Set switch connector.
   4. Cycle the ignition three times.
   5. Cycle the ignition on and then wait 30 seconds.
   6. Using a scan tool, read the Active DTCs.

   Does the scan tool display; B1D4A-2A-MEMORY SWITCH INPUT - STUCK?

   Yes

   - Go To 5

   No

   - Replace the Memory Set switch in accordance with the Service Information. Refer to **SWITCH, MEMORY, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **CHECK (G200) MEMORY SELECT SWITCH MUX CIRCUIT FOR A SHORT TO GROUND**
   1. Cycle the ignition off.
   2. Disconnect the Door Module C5 harness connector.
   3. Measure the resistance between ground and the (G200) Memory Select Switch Mux circuit at the Memory Set switch connector.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the (G200) Memory Select Switch Mux circuit for a short to ground.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 6

6. **CHECK (G200) MEMORY SELECT SWITCH MUX CIRCUIT FOR A SHORT TO THE (G920) MEMORY SELECT SWITCH RETURN CIRCUIT**
   1. Measure the resistance between the (G200) Memory Select Switch Mux circuit and the (G920)

Memory Select Switch Return circuit at the Memory Set switch connector.

Is the resistance below 10K Ohms?

Yes

- Repair the (G200) Memory Select Switch Mux circuit for a short to the (G920) Memory Select Switch return circuit.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace the Door Module in accordance with the Service Information. Refer to **MODULE, DOOR, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1DD0-11-MIRROR HEATER CONTROL - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 16: Driver Mirror Assembly Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

Continuously.

SET CONDITION

The Door Module senses a short low on the Mirror Heater Driver circuit for more than two seconds with the heater switched on.

POSSIBLE CAUSES

Possible Causes
MIRROR HEATER DRIVER CIRCUIT SHORTED TO GROUND
MIRROR HEATER DRIVER CIRCUIT SHORTED TO ANY DRIVER MIRROR DRIVER CIRCUIT
MIRROR HEATER DRIVER CIRCUIT SHORTED TO THE MIRROR HEATER RETURN CIRCUIT
MIRROR HEATER DRIVER CIRCUIT SHORTED TO ANY SENSOR GROUND OR RETURN CIRCUIT
OUTSIDE REARVIEW MIRROR
DOOR MODULE

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Cycle the ignition on.
    2. Using a scan tool, record and erase Diagnostic Trouble Codes (DTCs).
    3. Turn the hazard lamps on.
    4. Turn the heated mirrors on.
    5. Turn the park lamps on.
    6. Press and release the Mirror Select switch to select the Driver Outside Rearview Mirror.
    7. Operate the Mirror Adjust switch in all directions several times while monitoring the scan tool for DTCs.

    NOTE: After adjusting the mirror in one direction wait at least two seconds before adjusting the mirror in the opposite direction, as this will allow time for an active fault to set if present.

    8. With the scan tool, read the active DTCs.

    Does the scan tool display: B1DD0-11-MIRROR HEATER CONTROL - CIRCUIT SHORT TO GROUND as active?

    Yes

    - Go To 2

    No

    - The conditions that caused this code to set are not present at this time. For vehicle's equipped with folding outside rearview mirrors, repeat test with mirror folded. If this DTC is now

active, Go To 2. Otherwise, use the wiring diagram/schematic as a guide and inspect the wiring and connectors.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **INSPECT MIRROR CONNECTIONS**
   1. Cycle the ignition off.
   2. Disconnect the Driver Outside Rearview Mirror C1 and C2 connectors at the Drivers Door Module.
   3. Inspect the wiring harness, connectors and the Drivers Door Module. Check for cracks in the mirror glass.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 3

3. **CHECK (C16) DRIVER MIRROR HEATER DRIVER CIRCUIT FOR A SHORT TO THE (C160) DRIVER MIRROR HEATER RETURN CIRCUIT**

Fig. 17: Checking Driver Mirror Heater Driver Circuit For A Short To Driver Mirror Heater Return Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (C16) Driver Mirror Heater Driver circuit and the (C160) Driver Mirror Heater Return circuit at the Driver Outside Rearview Mirror C2 (Component Side) connector.

   Is the resistance below 2.5 Ohms?

   Yes

   - Repair the (C16) Driver Mirror Heater Driver circuit for a short to the (C160) Driver Mirror Heater Return circuit. If the wiring harness and connector are okay, replace the Driver Outside Rearview Mirror in accordance with the Service Information. Refer to **MIRROR,**

OUTSIDE REARVIEW, REMOVAL and **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL** .

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 4

4. **MIRROR OR MODULE**
   1. Cycle the ignition on.
   2. With the scan tool, record and erase DTCs.
   3. Turn the drivers side turn signal on.
   4. Fold And Unfold the mirrors several time, if equipped with folding mirrors.
   5. Turn the rear defogger on.
   6. Turn the park lamps on.
   7. Press and release the Mirror Select switch to select the Driver Outside Rearview Mirror.
   8. Operate the Mirror Adjust switch in all directions several times while monitoring the scan tool for DTCs.

      NOTE: After adjusting the mirror in one direction wait at least two seconds before adjusting the mirror in the opposite direction, as this will allow time for an active fault to set if present.

   9. With the scan tool, read DTCs.

      NOTE: Check for a change in DTCs.

      Does the scan tool display: B1DD0-15-MIRROR HEATER CONTROL - CIRCUIT SHORT TO BATTERY OR OPEN as active?

      Yes

      - With the circuit now OPEN that indicates the short is NOT in the Module. Replace the mirror in accordance with the Service Information. Refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** and **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Replace the Door Module in accordance with the Service Information. Refer to **MODULE, DOOR, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1DD0-15-MIRROR HEATER CONTROL - CIRCUIT SHORT TO BATTERY OR OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 18: Driver Mirror Assembly Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

Continuously.

SET CONDITION

The Door Module senses an open or a short high on the Mirror Heater Driver circuit for more than two seconds.

POSSIBLE CAUSES

Possible Causes
MIRROR HEATER DRIVER CIRCUIT SHORTED TO VOLTAGE
MIRROR HEATER DRIVER CIRCUIT OPEN
MIRROR HEATER RETURN CIRCUIT OPEN
MIRROR HEATER DRIVER CIRCUIT SHORTED TO THE MIRROR HEATER RETURN CIRCUIT
MIRROR HEATER DRIVER CIRCUIT SHORTED TO ANOTHER DRIVER CIRCUIT
OUTSIDE REARVIEW MIRROR
DOOR MODULE

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Turn the ignition on.
    2. Using a scan tool, record and erase Diagnostic Trouble Codes (DTCs).
    3. Turn the turn signal on, if equipped with turn signal mirror.
    4. Turn the approach lamps on, if equipped.
    5. Turn the rear defogger on.
    6. Press and release the Mirror Select switch to select the Driver Outside Rearview Mirror.
    7. Operate the Mirror Adjust switch in all directions several times while monitoring the scan tool for DTCs.

    NOTE: After adjusting the mirror in one direction wait at least two seconds before adjusting the mirror in the opposite direction, as this will allow time for an active fault to set if present.

    8. With the scan tool, read the active DTCs.

    Does the scan tool display: B1D00-15-DRIVER MIRROR HEATER CONTROL - CIRCUIT SHORT TO BATTERY OR OPEN as active?

    Yes

    - Go To 2

    No

    - The conditions that caused this code to set are not present at this time. For vehicle's equipped

with folding outside rearview mirrors, repeat test with mirror folded. If DTC is now active, Go To 2. Otherwise, use the wiring diagram/schematic as a guide and inspect the wiring and connectors.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK (C16) DRIVER MIRROR HEATER DRIVER CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 19: Checking Driver Mirror Heater Driver Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Driver Outside Rearview Mirror C2 (Component Side) connector from the Door Module C2 harness connector.
3. Turn the ignition on.
4. Measure the voltage between ground and the (C16) Driver Mirror Heater Driver circuit in the

Driver Outside Rearview Mirror C2 (Component Side) connector.

Is there any voltage present?

Yes

- Repair the (C16) Driver Mirror Heater Driver circuit for a short to voltage. If the wiring harness and connector are okay, replace the Driver Outside Rearview Mirror in accordance with the Service Information. Refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** and **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 3

3. **CHECK (C16) DRIVER MIRROR HEATER DRIVER CIRCUIT AND (C160) DRIVER MIRROR HEATER RETURN CIRCUIT FOR AN OPEN**

Fig. 20: Checking Driver Mirror Heater Driver Circuit And Driver Mirror Heater Return Circuit For An Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between the (C16) Driver Mirror Heater Driver circuit and the (C160) Driver Mirror Heater Return circuit at the Driver Outside Rearview Mirror C2 (Component Side) connector.

   Is the resistance below 10.0 Ohms?

   Yes

   - Go To 4

No

- Repair the (C16) Driver Mirror Heater Driver circuit or the (C160) Driver Mirror Heater Return circuit for an open. If the wiring harness and connector are okay, replace the Driver Outside Rearview Mirror in accordance with the Service Information. Refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** and **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK (C16) DRIVER MIRROR HEATER DRIVER CIRCUIT FOR A SHORT TO ANOTHER MIRROR DRIVER CIRCUIT**
   1.
   2. Measure the resistance between the (C16) Driver Mirror Heater Driver circuit (C2-4) and each of the Mirror Driver circuits in the Driver Outside Rearview Mirror C2 (Component Side) connectors.

      Is the resistance below 10k Ohms for any measurement?

      Yes

      - Repair all circuits with a resistance below 10k Ohms for a short to the (C16) Driver Mirror Heater Driver circuit. If the wiring harness and connector are okay, replace the Driver Outside Rearview Mirror in accordance with the Service Information. Refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** and **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Inspect the wiring and connectors for damage and repair as necessary. If the wiring and connectors are okay, replace the Door Module in accordance with the Service Information. Refer to **MODULE, DOOR, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1E64-00-LEFT MIRROR SELECT SWITCH - STUCK

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Whenever the Driver Door Module (DDM) is awake.

SET CONDITION

When the DDM senses the Left Mirror Select switch input for more than 30 seconds.

POSSIBLE CAUSES

Possible Causes
OBJECT HOLDING LEFT MIRROR SELECT SWITCH IN A PUSHED POSITION
SUBSTANCE CAUSING LEFT MIRROR SELECT SWITCH TO GET STUCK IN A PUSHED POSITION
DRIVER WINDOW/DOOR LOCK SWITCH

DIAGNOSTIC TEST

1. **INSPECT DRIVER WINDOW/DOOR LOCK SWITCH ASSEMBLY FOR DAMAGE**

   NOTE: Diagnose and repair all LIN Bus related DTCs before performing this test procedure.

   1. Cycle the ignition off.
   2. Inspect the Driver Window/Door Lock Switch assembly for damage.

      Is the switch assembly damaged?

      Yes

      - Replace the Driver Window/Door Lock Switch in accordance with the Service Information. Refer to **SWITCH, POWER WINDOW, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 2
2. **INSPECT FOR OBJECT OR SUBSTANCE CAUSING LEFT MIRROR SELECT SWITCH TO STAY OR STICK IN A PUSHED POSITION**
   1. Inspect the Left Mirror Select switch for anything that would cause it to stay or stick in a pushed position.

      Is anything present that would cause the Left Mirror Select switch to stay or stick in a pushed position?

      Yes

      - Repair as necessary.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 3
3. **TEST FOR INTERMITTENT CONDITION**

1. Cycle the ignition on.
2. With the scan tool, record and erase the DTCs.
3. Press and release the Left Mirror Select switch several times and then wait 30 seconds.
4. With the scan tool, read the DTCs.

   Does the scan tool display: B1E64-00-LEFT MIRROR SELECT SWITCH - STUCK?

   Yes

   - Replace the Driver Window/Door Lock Switch in accordance with the Service Information. Refer to **SWITCH, POWER WINDOW, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1E65-00-RIGHT MIRROR SELECT SWITCH - STUCK

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Whenever the Driver Door Module (DDM) is awake.

SET CONDITION

When the DDM senses the Right Mirror Select switch input for more than 30 seconds.

POSSIBLE CAUSES

Possible Causes
OBJECT HOLDING RIGHT MIRROR SELECT SWITCH IN A PUSHED POSITION
SUBSTANCE CAUSING RIGHT MIRROR SELECT SWITCH TO GET STUCK IN A PUSHED POSITION
DRIVER WINDOW/DOOR LOCK SWITCH

DIAGNOSTIC TEST

1. **INSPECT DRIVER DOOR SWITCH ASSEMBLY FOR DAMAGE**
   1. Cycle the ignition off.

2. Inspect the Driver Window/Door Lock Switch assembly for damage.

   Is the switch assembly damaged?

   Yes

   - Replace the Driver Window/Door Lock Switch in accordance with the Service Information. Refer to **SWITCH, POWER WINDOW, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 2

2. **INSPECT FOR OBJECT OR SUBSTANCE CAUSING RIGHT MIRROR SELECT SWITCH TO STAY OR STICK IN A PUSHED POSITION**
   1. Inspect the Right Mirror Select switch for anything that would cause it to stay or stick in a pushed position.

      Is anything present that would cause the Right Mirror Select switch to stay or stick in a pushed position?

      Yes

      - Repair as necessary.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 3

3. **TEST FOR INTERMITTENT CONDITION**
   1. Cycle the ignition on.
   2. With the scan tool, record and erase the DTCs.
   3. Press and release the Right Mirror Select switch several times and then wait 30 seconds.
   4. With the scan tool, read the DTCs.

      Does the scan tool display: B1E65-00-RIGHT MIRROR SELECT SWITCH STUCK?

      Yes

      - Replace the Driver Window/Door Lock Switch in accordance with the Service Information. Refer to **SWITCH, POWER WINDOW, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

- Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1F02-11-MIRROR VERTICAL MOTOR CONTROL - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 21: Driver Mirror Assembly Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Mirror Vertical Driver circuit supplies battery voltage for the mirror up position and ground for the mirror down position. The Mirror Common Driver supplies battery voltage for the mirror Down position and ground for the mirror up position.

WHEN MONITORED

Continuously.

SET CONDITION

The Door Module senses a short low on the Mirror Vertical Driver circuit for more than 10 ms.

POSSIBLE CAUSES

Possible Causes
MIRROR VERTICAL DRIVER CIRCUIT SHORTED TO GROUND
MIRROR VERTICAL DRIVER CIRCUIT SHORTED TO THE MIRROR HEATER RETURN CIRCUIT
OUTSIDE REARVIEW MIRROR
DOOR MODULE

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Cycle the ignition on.
    2. With the scan tool, record and erase Diagnostic Trouble Codes (DTCs).
    3. Press and release the Mirror Select switch to select the Driver Outside Rearview Mirror.
    4. Turn the hazard lamps on.
    5. Turn on the park lamps (if equipped with auto dimming mirrors).
    6. Turn the rear defogger on, if equipped with heated mirror.
    7. Operate the Mirror Adjust switch in all directions several times while monitoring the scan tool for DTCs.

    NOTE: After adjusting the mirror in one direction wait at least two seconds before adjusting the mirror in the opposite direction, as this will allow time for an active fault to set if present.

    Does the scan tool display; B1F02-11-MIRROR VERTICAL MOTOR CONTROL - CIRCUIT SHORT TO GROUND?

    Yes

    - Go To 2

    No

    - The conditions that caused this code to set are not present at this time. For vehicle's equipped with folding outside rearview mirrors, repeat test with mirror folded. If DTC is now active,

Go To 2. Otherwise, use the wiring diagram/schematic as a guide and inspect the wiring and connectors.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **INSPECT MIRROR CONNECTIONS**
   1. Cycle the ignition off.
   2. Disconnect the Driver Outside Rearview Mirror C1 and C2 connectors at the Drivers Door Module.
   3. Inspect the wiring harness, connectors and the Drivers Door Module.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 3

3. **MIRROR OR MODULE**
   1. Cycle the ignition on.
   2. With the scan tool, record and erase DTCs.
   3. Press and release the Mirror Select switch to select the Driver Outside Rearview Mirror.
   4. Operate the Mirror Adjust switch in all directions several times while monitoring the scan tool for DTCs.

   NOTE: After adjusting the mirror in one direction wait at least two seconds before adjusting the mirror in the opposite direction, as this will allow time for an active fault to set if present.

   5. With the scan tool, read DTCs.

   NOTE: Check for a change in DTCs.

   Does the scan tool display: B1F02-13-MIRROR VERTICAL MOTOR CONTROL - CIRCUIT OPEN as active?

   Yes

   - With the circuit now OPEN that indicates the short is NOT in the Module. Replace the mirror in accordance with the Service Information. Refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** and **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace the Door Module in accordance with the Service Information. Refer to **MODULE, DOOR, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1F02-12-MIRROR VERTICAL MOTOR CONTROL - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 22: Driver Mirror Assembly Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Mirror Vertical Driver circuit supplies battery voltage for the mirror up position and ground for the mirror down position. The Mirror Common Driver supplies battery voltage for the mirror Down position and ground for the mirror up position.

WHEN MONITORED

Continuously.

SET CONDITION

The Door Module senses a short to voltage on the Mirror Vertical Driver circuit during a mirror movement for more than 10 ms.

POSSIBLE CAUSES

Possible Causes
OUTSIDE REARVIEW MIRROR
DOOR MODULE

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Turn the ignition on.
    2. With the scan tool, record and erase Diagnostic Trouble Codes (DTCs).
    3. Press and release the Mirror Select switch to select the Driver Outside Rearview Mirror.
    4. Turn the hazard lamps on.
    5. Turn on the park lamps (if equipped with auto dimming mirrors).
    6. Turn the rear defogger on, if equipped with heated mirror.
    7. Operate the Mirror Adjust switch in all directions several times while monitoring the scan tool for DTCs.

    NOTE: After adjusting the mirror in one direction wait at least two seconds before adjusting the mirror in the opposite direction, as this will allow time for an active fault to set if present.

    Does the scan tool display; B1F02-12-MIRROR VERTICAL MOTOR CONTROL - CIRCUIT SHORT TO BATTERY?

    Yes

    - Go To 2

    No

    - The conditions that caused this code to set are not present at this time. For vehicle's equipped with folding outside rearview mirrors, repeat test with mirror folded. If DTC is now active, Go To 3. Otherwise, use the wiring diagram/schematic as a guide and inspect the wiring and connectors.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **INSPECT MIRROR CONNECTIONS**
   1. Turn the ignition off.
   2. Disconnect the Driver Outside Rearview Mirror C2 connector at the Drivers Door Module.
   3. Inspect the wiring harness, connectors and the Drivers Door Module.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 3

3. **MIRROR OR MODULE**
   1. Turn the ignition on.
   2. With the scan tool, record and erase DTCs.
   3. Press and release the Mirror Select switch to select the Driver Outside Rearview Mirror.
   4. Operate the Mirror Adjust switch in all directions several times while monitoring the scan tool for DTCs.

   NOTE: After adjusting the mirror in one direction wait at least two seconds before adjusting the mirror in the opposite direction, as this will allow time for an active fault to set if present.

   5. With the scan tool, read DTCs.

   NOTE: Check for a change in DTCs.

   Does the scan tool display: B1F02-13-MIRROR VERTICAL MOTOR CONTROL - CIRCUIT OPEN as active?

   Yes

   - With the circuit now OPEN that indicates the short is NOT in the Module. Replace the mirror in accordance with the Service Information. Refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** and **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

- Replace the Door Module in accordance with the Service Information. Refer to **MODULE, DOOR, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1F02-13-MIRROR VERTICAL MOTOR CONTROL - CIRCUIT OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 23: Driver Mirror Assembly Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Mirror Vertical Driver circuit supplies battery voltage for the mirror up position and ground for the mirror down position. The Mirror Common Driver supplies battery voltage for the mirror Down position and ground for the mirror up position.

WHEN MONITORED

Continuously.

SET CONDITION

When the Door Module senses a short high on the Mirror Vertical Driver circuit for more than 10 ms.

POSSIBLE CAUSES

Possible Causes
MIRROR VERTICAL DRIVER CIRCUIT OPEN
MIRROR COMMON DRIVER CIRCUIT OPEN
OUTSIDE REARVIEW MIRROR
DOOR MODULE

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Cycle the ignition on.
    2. With the scan tool, record and erase the Diagnostic Trouble Codes (DTCs).
    3. Press and release the Mirror Select switch to select the Driver Outside Rearview Mirror.
    4. Operate the Mirror Adjust switch in all directions several times.
    5. Cycle the ignition from on to off three times.
    6. Cycle the ignition on.
    7. With the scan tool, read the DTCs.

    Does the scan tool display; B1F02-13-MIRROR VERTICAL MOTOR CONTROL - CIRCUIT OPEN?

    Yes

    - Go To 2

    No

- The conditions that caused this code to set are not present at this time. For vehicles equipped with folding outside rearview mirrors, repeat test with mirror folded. If DTC is now active, Go To 2. Otherwise, use the wiring diagram/schematic as a guide and inspect the wiring and connectors.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK MIRROR AND HARNESS FOR AN OPEN**

Fig. 24: Checking Mirror & Harness For Open
Courtesy of CHRYSLER GROUP, LLC

1. Gain access to the Driver Door Module but do not disconnect the connectors.
2. Using a 12 volt test light, backprobe and connect one lead to the (P71) Driver Mirror Vertical Driver circuit and the other lead to the (P73) Driver Mirror Common Driver circuit in the Driver Outside Rearview Mirror C2 connector.

NOTE: The graphic displays the end view of the connector, backprobe the Wire side.

3. While moving the mirror adjust switch up and down, observe the test light.

   Does the test light illuminate brightly when the switch is moved in either direction?

   Yes

   - Examine and repair the mirror harness for any breaks or damage. If the wiring harness and connector are okay, replace the Driver Outside Rearview Mirror in accordance with the Service Information. Refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** and **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the Driver Door Module (DDM) in accordance with the Service Information. Refer to **MODULE, DOOR, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1F03-11-MIRROR HORIZONTAL MOTOR CONTROL - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 25: Driver Mirror Assembly Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Mirror Horizontal Driver circuit supplies battery voltage for the mirror left position and ground for the mirror right position. The Mirror Common Driver supplies battery voltage for the mirror right position and ground for the mirror left.

WHEN MONITORED

Continuously.

SET CONDITION

The Door Module senses a short low on the Mirror Horizontal Driver circuit for more than two seconds.

POSSIBLE CAUSES

Possible Causes
MIRROR HORIZONTAL DRIVER CIRCUIT SHORTED TO GROUND
MIRROR HORIZONTAL DRIVER CIRCUIT SHORTED TO ANOTHER DRIVER MIRROR DRIVER CIRCUIT
MIRROR HORIZONTAL DRIVER CIRCUIT FOR A SHORT TO ANY RETURN OR GROUND CIRCUITS
OUTSIDE REARVIEW MIRROR
DOOR MODULE

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Cycle the ignition on.
    2. With the scan tool, record and erase Diagnostic Trouble Codes (DTCs).
    3. Press and release the Mirror Select switch to select the Driver Outside Rearview Mirror.
    4. Turn the hazard lamps on.
    5. Turn on the park lamps (if equipped with auto dimming mirrors).
    6. Turn the rear defogger on, if equipped with heated mirror.
    7. Operate the Mirror Adjust switch in all directions several times while monitoring the scan tool for DTCs.

    NOTE: After adjusting the mirror in one direction wait at least two seconds before adjusting the mirror in the opposite direction, as this will allow time for an active fault to set if present.

    Does the scan tool display; B1F03-11-MIRROR HORIZONTAL MOTOR CONTROL - CIRCUIT SHORT TO GROUND?

    Yes

    - Go To 2

    No

- The conditions that caused this code to set are not present at this time. For vehicle's equipped with folding outside rearview mirrors, repeat test with mirror folded. If DTC is now active, Go To 2. Otherwise, use the wiring diagram/schematic as a guide and inspect the wiring and connectors.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **INSPECT MIRROR CONNECTIONS**
   1. Cycle the ignition off.
   2. Disconnect the Driver Outside Rearview Mirror C1 and C2 connectors at the Drivers Door Module.
   3. Inspect the wiring harness, connectors and the Drivers Door Module.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 3

3. **MIRROR OR MODULE**
   1. Cycle the ignition on.
   2. With the scan tool, record and erase DTCs.
   3. Press and release the Mirror Select switch to select the Driver Outside Rearview Mirror.
   4. Operate the Mirror Adjust switch in all directions several times while monitoring the scan tool for DTCs.

   NOTE: After adjusting the mirror in one direction wait at least two seconds before adjusting the mirror in the opposite direction, as this will allow time for an active fault to set if present.

   5. With the scan tool, read DTCs.

   NOTE: Check for a change in DTCs.

   Does the scan tool display: B1F03-13-MIRROR HORIZONTAL MOTOR CONTROL - CIRCUIT OPEN as active?

   Yes

   - With the circuit now OPEN that indicates the short is NOT in the Module. Replace the mirror in accordance with the Service Information. Refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** and **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL** .

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace the Door Module in accordance with the Service Information. Refer to **MODULE, DOOR, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1F03-12-MIRROR HORIZONTAL MOTOR CONTROL - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 26: Driver Mirror Assembly Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Mirror Horizontal Driver circuit supplies battery voltage for the mirror left position and ground for the mirror right position. The Mirror Common Driver supplies battery voltage for the mirror right position and ground for the mirror left.

WHEN MONITORED

Continuously.

SET CONDITION

When the Door Module (DDM) senses a short high on the Mirror Horizontal Driver circuit for more than 10 ms.

POSSIBLE CAUSES

Possible Causes
MIRROR HORIZONTAL DRIVER CIRCUIT SHORTED TO THE MIRROR FOLD DRIVER CIRCUIT
MIRROR HORIZONTAL DRIVER CIRCUIT SHORTED TO THE MIRROR UNFOLD DRIVER CIRCUIT
MIRROR HORIZONTAL DRIVER CIRCUIT SHORTED TO THE MIRROR HEATER DRIVER CIRCUIT
OUTSIDE REARVIEW MIRROR
DOOR MODULE

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Cycle the ignition on.
    2. With the scan tool, record and erase Diagnostic Trouble Codes (DTCs).
    3. Press and release the Mirror Select switch to select the Driver Outside Rearview Mirror.
    4. Turn the hazard lamps on.
    5. Turn on the park lamps (if equipped with auto dimming mirrors).
    6. Turn the rear defogger on, if equipped with heated mirror.
    7. Operate the Mirror Adjust switch in all directions several times while monitoring the scan tool for DTCs.

    NOTE: After adjusting the mirror in one direction wait at least two seconds before adjusting the mirror in the opposite direction, as this will allow time for an active fault to set if present.

    Does the scan tool display; B1F03-12-MIRROR HORIZONTAL MOTOR CONTROL - CIRCUIT SHORT TO BATTERY?

    Yes

    - Go To 2

    No

- The conditions that caused this code to set are not present at this time. For vehicle's equipped with folding outside rearview mirrors, repeat test with mirror folded. If DTC is now active, Go To 2. Otherwise, use the wiring diagram/schematic as a guide and inspect the wiring and connectors.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **INSPECT MIRROR CONNECTIONS**
   1. Cycle the ignition off.
   2. Disconnect the Driver Outside Rearview Mirror C2 connector at the Drivers Door Module.
   3. Inspect the wiring harness, connectors and the Drivers Door Module.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 3

3. **MIRROR OR MODULE**
   1. Cycle the ignition on.
   2. With the scan tool, record and erase DTCs.
   3. Press and release the Mirror Select switch to select the Driver Outside Rearview Mirror.
   4. Operate the Mirror Adjust switch in all directions several times while monitoring the scan tool for DTCs.

   NOTE: After adjusting the mirror in one direction wait at least two seconds before adjusting the mirror in the opposite direction, as this will allow time for an active fault to set if present.

   5. With the scan tool, read DTCs.

   NOTE: Check for a change in DTCs.

   Does the scan tool display: B1F03-13-MIRROR HORIZONTAL MOTOR CONTROL - CIRCUIT OPEN as active?

   Yes

   - With the circuit now OPEN that indicates the short is NOT in the Module. Replace the mirror in accordance with the Service Information. Refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** and **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL** .

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace the Door Module in accordance with the Service Information. Refer to **MODULE, DOOR, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1F03-13-MIRROR HORIZONTAL MOTOR CONTROL - CIRCUIT OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 27: Driver Mirror Assembly Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Mirror Horizontal Driver circuit supplies battery voltage for the mirror left position and ground for the mirror right position. The Mirror Common Driver supplies battery voltage for the mirror right position and ground for the mirror left.

WHEN MONITORED

Continuously.

SET CONDITION

When the Door Module senses a short high on the Mirror Horizontal Driver circuit for more than 10 ms.

POSSIBLE CAUSES

Possible Causes
MIRROR HORIZONTAL DRIVER CIRCUIT OPEN
MIRROR COMMON DRIVER CIRCUIT OPEN
OUTSIDE REARVIEW MIRROR
DOOR MODULE

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Cycle the ignition on.
    2. With the scan tool, record and erase the Diagnostic Trouble Codes (DTCs).
    3. Press and release the Mirror Select switch to select the Driver Outside Rearview Mirror.
    4. Operate the Mirror Adjust switch in all directions several times.
    5. Cycle the ignition from on to off three times.
    6. Cycle the ignition on.
    7. With the scan tool, read the DTCs.

    Does the scan tool display; B1F03-13-MIRROR HORIZONTAL MOTOR CONTROL - CIRCUIT OPEN?

    Yes

    - Go To 2

    No

    111111111111

    - The conditions that caused this code to set are not present at this time. For vehicle's equipped with folding outside rearview mirrors, repeat test with mirror folded. If DTC is now active, Go To 2. Otherwise, use the wiring diagram/schematic as a guide and inspect the wiring and connectors.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK MIRROR AND HARNESS FOR AN OPEN**

Fig. 28: Center Console Intrusion (Right) Sensor Power & Ground Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

1. Gain access to the Driver Door Module but do not disconnect the connectors.

2. Using a 12 volt test light, backprobe and connect one lead to the (P75) Driver Mirror Horizontal Driver circuit and the other lead to the (P73) Driver Mirror Common Driver circuit in the Driver Outside Rearview Mirror (Component Side) C2 connector.

   NOTE: The graphic displays the end view of the connector, backprobe the Wire side.

3. While moving the mirror adjust switch left and right, observe the test light.

   Does the test light illuminate brightly when the switch is moved in either direction?

   Yes

   - Examine and repair the mirror harness for any breaks or damage. If the wiring harness and connector are okay, replace the Driver Outside Rearview Mirror in accordance with the Service Information. Refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** and **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the Driver Door Module (DDM) in accordance with the Service Information. Refer to **MODULE, DOOR, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1F04-11-MIRROR FOLD CONTROL - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 29: Driver Mirror Assembly Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

Continuously.

SET CONDITION

When the Door Module senses a short low on the Mirror Fold Driver circuit or the Mirror Unfold Driver circuit for more than 10 ms.

POSSIBLE CAUSES

Possible Causes
MIRROR FOLD DRIVER CIRCUIT SHORTED TO GROUND
MIRROR UNFOLD DRIVER CIRCUIT SHORTED TO GROUND
MIRROR FOLD DRIVER CIRCUIT SHORTED TO THE MIRROR HEATER RETURN CIRCUIT
MIRROR UNFOLD DRIVER CIRCUIT SHORTED TO THE MIRROR HEATER RETURN CIRCUIT
OUTSIDE REARVIEW MIRROR
DOOR MODULE

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Turn the ignition on.
    2. With the scan tool, record and erase the Diagnostic Trouble Codes (DTCs).
    3. Operate the Mirror Fold switch several times.
    4. Cycle the ignition from on to off three times.
    5. Turn the ignition on.
    6. With the scan tool, read the active DTCs.

    Does the scan tool display; B1F04-11-MIRROR FOLD CONTROL - CIRCUIT SHORT TO GROUND as active?

    Yes

    - Go To 2

    No

    - The conditions that caused this code to set are not present at this time. Repeat the test with the mirror adjusted in several different positions. If the DTC is now active, Go To 2. Otherwise, use the wiring diagram/schematic as a guide and inspect the wiring and connectors.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK (P694) DRIVER MIRROR FOLD DRIVER CIRCUIT AND (P691) DRIVER MIRROR UNFOLD DRIVER CIRCUIT FOR A SHORT TO GROUND**

Fig. 30: Checking Driver Mirror Fold/Unfold Driver Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Driver Outside Rearview Mirror (Component Side) C2 connector from the DDM.
3. Measure the resistance between ground and the (P694) Driver Mirror Fold Driver circuit in the Driver Outside Rearview Mirror (Component Side) connector.
4. Measure the resistance between ground and the (P691) Driver Mirror Unfold Driver circuit in the Driver Outside Rearview Mirror (Component Side) connector.

   Is the resistance below 10k Ohms for either measurement?

   Yes

   - Repair all circuits with a resistance below 10k Ohms for a short to ground. If the wiring

harness and connector are okay, replace the Driver Outside Rearview Mirror in accordance with the Service Information. Refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** and **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL** .

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 3

3. **CHECK (P694) DRIVER MIRROR FOLD DRIVER CIRCUIT AND (P691) DRIVER MIRROR UNFOLD DRIVER CIRCUIT FOR A SHORT TO (C160) DRIVER MIRROR HEATER RETURN CIRCUIT**

Fig. 31: Checking Driver Mirror Fold/Unfold Driver Circuit For A Short To Driver Mirror Heater Return Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (P694) Driver Mirror Fold Driver circuit and the (C160) Driver Mirror Heater Return circuit at the Driver Outside Rearview Mirror (Component Side) C2 connector.
2. Measure the resistance between the (P691) Driver Mirror Unfold Driver circuit and the (C160) Driver Mirror Heater Return circuit at the Driver Outside Rearview Mirror (Component Side) C2 connector.

   Is the resistance below 10k Ohms for either measurement?

   Yes

   - Repair the circuit(s) with a resistance below 10k Ohms for a short to the (C160) Driver Mirror Heater Return circuit. Check the If the wiring harness and connector are okay, replace the Driver Outside Rearview Mirror in accordance with the Service Information. Refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** and **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 4

4. **MODULE OR MIRROR**
   1. Turn the ignition on.
   2. With the scan tool, record and erase the Diagnostic Trouble Codes (DTCs).
   3. Operate the Mirror Fold switch several times.
   4. Operate the mirror switch in all directions.
   5. Cycle the ignition from on to off three times.
   6. Turn the ignition on.
   7. With the scan tool, read the active DTCs.

   NOTE: Check for a CHANGE in the DTCs.

   Does the scan tool display; B1F04-15-MIRROR FOLD CONTROL - CIRCUIT SHORT TO BATTERY OR OPEN as active?

   Yes

   - Check and repair any damaged wiring in the C2 harnesses. If the wiring harness and connector is okay, replace the Driver Outside Rearview Mirror in accordance with the Service Information. Refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** and **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace the Driver Door Module (DDM) in accordance with the Service Information. Refer to **MODULE, DOOR, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1F04-15-MIRROR FOLD CONTROL - CIRCUIT SHORT TO BATTERY OR OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 32: Driver Mirror Assembly Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

Continuously.

SET CONDITION

When the Door Module senses voltage on the Mirror Fold Driver circuit or the Mirror Unfold Driver circuit for more than 10 ms when no voltage should be present or the Fold or Unfold Driver circuit is open.

POSSIBLE CAUSES

Possible Causes
MIRROR FOLD DRIVER CIRCUIT SHORTED TO THE MIRROR HEATER DRIVER CIRCUIT
MIRROR UNFOLD DRIVER CIRCUIT SHORTED TO THE MIRROR HEATER DRIVER CIRCUIT
MIRROR FOLD DRIVER CIRCUIT SHORTED TO VOLTAGE
MIRROR UNFOLD DRIVER CIRCUIT SHORTED TO VOLTAGE
MIRROR FOLD DRIVER CIRCUIT OPEN
MIRROR UNFOLD DRIVER CIRCUIT OPEN
OUTSIDE REARVIEW MIRROR SHORTED
DOOR MODULE

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Turn the ignition on.
    2. With the scan tool, record and erase the Diagnostic Trouble Codes (DTCs).
    3. For vehicles equipped with heated mirrors, turn the rear defogger ON.
    4. Operate the Mirror Fold switch several times.
    5. With the scan tool, read the active DTCs.

    Does the scan tool display; B1F04-15-DRIVER MIRROR FOLD CONTROL - CIRCUIT SHORT TO BATTERY OR OPEN as active?

    Yes, with Heated Mirrors

    - Go To 2

    Yes, without Heated Mirrors

    - Go To 3

    No

    - The conditions that caused this code to set are not present at this time. Repeat the test with the mirror adjusted in several different positions. If the DTC is now active, Go To2 (with heated mirrors) or (without heated mirrors), refer to 3. Otherwise, use the wiring diagram/schematic as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.

      Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK (P694) DRIVER MIRROR FOLD DRIVER CIRCUIT AND (P691) DRIVER MIRROR UNFOLD DRIVER CIRCUIT FOR A SHORT TO (C16) DRIVER MIRROR HEATER DRIVER CIRCUIT**

Fig. 33: Checking Driver Mirror Fold/Unfold Driver Circuit For A Short To Driver Mirror Heater Driver Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Driver Outside Rearview Mirror (Component Side) C2 connector from the Door Module.
3. Measure the resistance between the (P694) Driver Mirror Fold Driver circuit and the (C16) Driver Mirror Heater Driver circuit at the Driver Outside Rearview Mirror (Component Side) connector.
4. Measure the resistance between the (P691) Driver Mirror Unfold Driver circuit and the (C16) Driver Mirror Heater Driver circuit at the Driver Outside Rearview Mirror (Component Side)

connector.

Is the resistance below 10k Ohms for either measurement?

Yes

- Repair the circuit(s) with a resistance below 10k Ohms for a short to the (C16) Driver Mirror Heater Driver circuit. If the wiring harness and connector are okay, replace the Driver Outside Rearview Mirror in accordance with the Service Information. Refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** and **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 3

3. **DRIVER POWER FOLDING MIRROR OPEN**

Fig. 34: Checking Driver Power Folding Mirror For Open
Courtesy of CHRYSLER GROUP, LLC

1. If not done previously, turn the ignition off.
2. If not done previously, disconnect the Driver Outside Rearview Mirror (Component Side) C2 connector from the Door Module.
3. Measure the resistance between the (P694) Folding Mirror Fold Driver and the (P691) Folding Mirror Unfold Driver circuits in the Driver Outside Rearview Mirror C2 connector.

   Is the resistance below 9.0 Ohms?

   Yes

   - Go To 4

No

- Check and repair the harness for an open circuit. If the harness is appears okay, replace the Drivers Power Folding Mirror Assembly in accordance with the Service Information. Refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** and **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **DRIVER POWER FOLDING MIRROR SHORT TO VOLTAGE**

Fig. 35: Checking Driver Power Folding Mirror For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition on.
2. Measure the voltage between ground and the (P694) Folding Mirror Fold Driver circuit in the

Driver Outside Rearview Mirror C2 harness connector.

3. Measure the voltage between ground and the (P691) Folding Mirror Unfold Driver circuit in the Driver Outside Rearview Mirror C2 harness connector.

   Is there any voltage present in either circuit?

   Yes

   - Replace the Drivers Power Folding Mirror Assembly in accordance with the Service Information. Refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** and **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the Drivers Door Module in accordance with the Service Information. Refer to **MODULE, DOOR, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1F06-12-MIRROR CONTROL SENSOR POSITION CIRCUIT - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 36: Driver Mirror Assembly Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

Continuously with ignition on.

SET CONDITION

When the Door Module senses a short to battery on either the 5-volt supply, the mirror horizontal signal or the mirror vertical position signal circuit for more than two seconds, this code will set.

POSSIBLE CAUSES

Possible Causes
MIRROR VERTICAL POSITION SIGNAL CIRCUIT SHORTED TO VOLTAGE
MIRROR VERTICAL POSITION SIGNAL CIRCUIT SHORTED TO ANY DRIVER OR SIGNAL CIRCUIT
MIRROR HORIZONTAL POSITION SIGNAL CIRCUIT SHORTED TO VOLTAGE
MIRROR HORIZONTAL POSITION SIGNAL CIRCUIT SHORTED TO ANY DRIVER OR SIGNAL CIRCUIT
5 VOLT SUPPLY CIRCUIT SHORTED TO ANY CIRCUIT DRIVER CIRCUIT
5 VOLT SUPPLY CIRCUIT SHORTED TO BATTERY
OUTSIDE REARVIEW MIRROR
DOOR MODULE

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Cycle the ignition on.
    2. Using a scan tool, record and erase Diagnostic Trouble Codes (DTCs).
    3. Turn the turn signal on, if equipped with turn signal mirror.
    4. Fold and unfold the mirror several times, if equipped.
    5. Turn the rear defogger on, if equipped with heated mirror.
    6. Press and release the Mirror Select switch to select the Driver Outside Rearview Mirror.
    7. Operate the Mirror Adjust switch in all directions several times while monitoring the scan tool for DTCs.

    NOTE: After adjusting the mirror in one direction wait at least two seconds before adjusting the mirror in the opposite direction, as this will allow time for an active fault to set if present.

    Does the scan tool display: B1F06-12-MIRROR CONTROL SENSOR POSITION CIRCUIT - CIRCUIT SHORT TO BATTERY as active?

    Yes

    - Go To 2

    No

    - The conditions that caused this code to set are not present at this time. For vehicle's equipped

with folding outside rearview mirrors, repeat test with mirror folded. If DTC is now active, Go To 2. Otherwise, using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and poor pin fit. Repair as necessary.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK (A856) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO VOLTAGE**

NOTE: In this step we are measuring the 5-Volt Supply voltage at the Door Module. It should not be over 5.2 volts.

1. Cycle the ignition off.
2. Disconnect the Driver Outside Rearview Mirror C1 and C2 (Component Side) harness connectors from the Door Module C1 and C2 sockets.
3. Cycle the ignition on.
4. Measure the voltage between Ground and the (A856) 5-volt Supply circuit at the Door Module (C1-Pin 10) (Module Side) socket.

Is the Voltage above 5.2 Volts?

Yes

- Replace the Door Module in accordance with the Service Information. Refer to **MODULE, DOOR, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 3

3. **CHECK (A856) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO ANY OF THE CIRCUIT DRIVER CIRCUITS**

NOTE: We are now checking the wiring and the mirror for any crossed circuits.

Fig. 37: Checking 5-Volt Supply Circuit For Short To Any Circuit Driver Circuits
Courtesy of CHRYSLER GROUP, LLC

1. Cycle the ignition off.
2. Measure the resistance between the (A856) 5-Volt Supply circuit (C1-Cavity 10) and all designated circuit Driver circuits in the Driver Outside Rearview Mirror C1 and C2 (Component Side) harness connectors.

   Is the resistance below 20K Ohms between the (A856) 5-Volt Supply and any of the designated Driver circuits?

Yes

- Repair all circuits with a resistance below 20K Ohms for a short to the (A856) 5-Volt Supply circuit. If the wiring harness and connectors are okay, replace the Driver Outside Rearview Mirror in accordance with the Service Information. Refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** and **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 4

4. **CHECK (P67) DRIVER MIRROR VERTICAL POSITION SIGNAL CIRCUIT FOR A SHORT TO ANY CIRCUIT DRIVER CIRCUITS**

Fig. 38: Checking Driver Mirror Vertical Position Signal Circuit For Short To Any Circuit Driver Circuits
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (P67) Driver Mirror Vertical Position Signal circuit (C1-Cavity 7) and all designated circuit Driver circuits in the Driver Outside Rearview Mirror C1 and C2 (Component Side) harness connectors.

   Is the resistance below 20K Ohms between the (P67) circuit and any of the designated Driver circuits?

Yes

- Repair all circuits with a resistance below 20K Ohms for a short to the (P67) Driver Mirror Vertical Position Signal circuit. If the wiring harness and connectors are okay, replace the Driver Outside Rearview Mirror in accordance with the Service Information. Refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** and **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 5

5. **CHECK (P65) DRIVER MIRROR HORIZONTAL POSITION SIGNAL CIRCUIT FOR A SHORT TO ANY CIRCUIT DRIVER CIRCUITS**

Fig. 39: Checking Driver Mirror Horizontal Position Signal Circuit For Short To Any Circuit Driver Circuits
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (P65) Driver Mirror Horizontal Position Signal circuit (C1-Cavity 9) and all the designated circuit Driver circuits in the Driver Outside Rearview Mirror C1

and C2 (Component Side) harness connectors.

Is the resistance below 20K Ohms between the (P65) circuit and any of the designated circuit Driver circuits?

Yes

- Repair all circuits with a resistance below 20K Ohms for a short to the (P65) Driver Mirror Horizontal Position Signal circuit. If the wiring harness and connectors are okay, replace the Driver Outside Rearview Mirror in accordance with the Service Information. Refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** and **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 6

6. **CHECK (P67) DRIVER MIRROR VERTICAL POSITION SIGNAL CIRCUIT FOR A OPEN IN THE DOOR MODULE**

Fig. 40: Driver Outside Rearview Mirror Connector End View
Courtesy of CHRYSLER GROUP, LLC

1. Connect the Driver Outside Rearview Mirror C1 and C2 (Component Side) harness connectors to the Driver Door Module.
2. Cycle the ignition on.
3. Using a scan tool, record and erase the Diagnostic Trouble Codes (DTCs).

4. Using a jumper wire, connected to ground, back probe the (P67) Driver Mirror Vertical Position Signal circuit (C1-Cavity 7).

   NOTE: The graphic shows the connector terminal end view. Back probe the wire end of the terminal. Use caution not to damage the wire.

5. With the scan tool, read the active DTCs.

   Does the scan tool display: B1F06-14-MIRROR CONTROL SENSOR POSITION CIRCUIT - CIRCUIT SHORT TO GROUND OR OPEN as active?

   Yes

   - Go To 7

   No

   - Inspect the wiring and connectors for damage and repair as necessary. If the wiring and connectors are okay, replace the Driver Door Module in accordance with the Service Information. Refer to **MODULE, DOOR, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

7. **CHECK (P65) DRIVER MIRROR HORIZONTAL POSITION SIGNAL CIRCUIT FOR A OPEN**

Fig. 41: Driver Outside Rearview Mirror Harness Connector End View
Courtesy of CHRYSLER GROUP, LLC

1. Using a scan tool, record and erase the Diagnostic Trouble Codes (DTCs).
2. Using a jumper wire, connected to ground, back probe the (P65) Driver Mirror Horizontal Position Signal circuit (C1-Cavity 9).

NOTE: The graphic shows the connector terminal end view. Back probe the

wire end of the terminal. Use caution not to damage the wire.

3. With the scan tool, read the active DTCs.

   Does the scan tool display: B1F06-14-MIRROR CONTROL SENSOR POSITION CIRCUIT - CIRCUIT SHORT TO GROUND OR OPEN as active?

   Yes

   - Replace the Driver Outside Rearview Mirror in accordance with the Service Information. Refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** and **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Inspect the wiring and connectors for damage and repair as necessary. If the wiring and connectors are okay, replace the Driver Door Module in accordance with the Service Information. Refer to **MODULE, DOOR, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1F06-14-MIRROR CONTROL SENSOR POSITION CIRCUIT - CIRCUIT SHORT TO GROUND OR OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 42: Driver Mirror Assembly Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

Continuously with ignition on.

SET CONDITION

When the Door Module senses an open or short to ground on either the 5-volt supply, the mirror horizontal signal or the mirror vertical position signal circuit for more than two seconds, this code will set.

POSSIBLE CAUSES

Possible Causes
MIRROR VERTICAL POSITION SIGNAL CIRCUIT SHORTED TO GROUND
MIRROR VERTICAL POSITION SIGNAL CIRCUIT SHORTED TO ANY SENSOR GROUND OR RETURN CIRCUIT
MIRROR HORIZONTAL POSITION SIGNAL CIRCUIT SHORTED TO GROUND
MIRROR HORIZONTAL POSITION SIGNAL CIRCUIT SHORTED TO ANY SENSOR GROUND OR RETURN CIRCUIT
5 VOLT SUPPLY CIRCUIT SHORTED TO ANY SENSOR GROUND OR RETURN CIRCUIT
5 VOLT SUPPLY CIRCUIT SHORTED TO GROUND
5-VOLT SUPPLY CIRCUIT OPEN AT THE MODULE
MIRROR VERTICAL POSITION SIGNAL CIRCUIT OPEN
MIRROR HORIZONTAL POSITION SIGNAL CIRCUIT OPEN
5-VOLT SUPPLY CIRCUIT OPEN
OUTSIDE REARVIEW MIRROR
DOOR MODULE

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Cycle the ignition on.
    2. Using a scan tool, record and erase the Diagnostic Trouble Codes (DTCs).
    3. Turn the driver side turn signal on.
    4. Operate the power fold and unfold feature, if equipped, several times.
    5. Turn the rear defogger on, if equipped with heated mirror.
    6. Press and release the Mirror Select switch to select the Driver Outside Rearview Mirror.
    7. Operate the Mirror Adjust Switch in all directions several times while monitoring the scan tool for DTCs.

    NOTE: After adjusting the mirror in one direction wait at least two seconds before adjusting the mirror in the opposite direction, as this will allow time for an active DTC to set, if present.

    Does the scan tool display: B1F06-14-MIRROR CONTROL SENSOR POSITION CIRCUIT - CIRCUIT SHORT TO GROUND OR OPEN as active?

    Yes

    - Go To 2

No

- The conditions that caused this code to set are not present at this time. For vehicle's equipped with folding outside rearview mirrors, repeat this test with the mirror folded. If this DTC is now active, Go To 2. Otherwise, using the wiring diagrams as a guide, check all related connectors for signs of water intrusion, corrosion, pushed out or bent terminals and poor pin fit.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK (A856) 5-VOLT SUPPLY CIRCUIT FOR AN OPEN AT THE MODULE**

NOTE: In this step we are measuring the 5-Volt Supply voltage at the Door Module. It should be over 4.7 volts.

1. Cycle the ignition off.
2. Disconnect the Driver Outside Rearview Mirror C1 and C2 (Component Side) harness connectors from the Door Module C1 and C2 sockets.
3. Cycle the ignition on.
4. Measure the voltage between Ground and the (A856) 5-volt Supply circuit at the Door Module (C1-Pin 10) (Module Side) socket.

Is the Voltage above 4.7 Volts?

Yes

- Go To 3

No

- Replace the Door Module in accordance with the Service Information. Refer to **MODULE, DOOR, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK (A856) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO GROUND**

Fig. 43: Checking 5-Volt Supply Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Cycle the ignition off.
2. Measure the resistance between Ground and the (A856) 5-Volt Supply circuit in the Driver Outside Rearview Mirror C1 connector.

   Is the resistance below 10K Ohms

   Yes

   - Repair the short to ground in the (A856) 5-Volt Supply circuit. If the wiring harness and connector is okay, replace the Driver Outside Rearview Mirror in accordance with the Service Information. Refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** and **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL** .

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 4

4. **CHECK (P67) DRIVER MIRROR VERTICAL POSITION SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Fig. 44: Checking Passenger Mirror Vertical Position Signal Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between Ground and the (P67) Driver Mirror Vertical Position Signal circuit in the Driver Outside Rearview Mirror C1 harness connector.

   Is the resistance below 10K Ohms?

Yes

- Repair the (P67) Driver Mirror Vertical Position Signal circuit for a short to ground. If the wiring harness and connector are okay, replace the Driver Outside Rearview Mirror in accordance with the Service Information. Refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** and **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 5

5. **CHECK (P65) DRIVER MIRROR HORIZONTAL POSITION SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Fig. 45: Checking Driver Mirror Horizontal Position Signal Circuit For Short To Ground

Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between Ground and the (P65) Driver Mirror Horizontal Position Signal circuit in the Driver Outside Rearview Mirror C1 harness connector.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the (P65) Driver Mirror Horizontal Position Signal circuit for a short to ground. If the wiring harness and connector are okay, replace the Driver Outside Rearview Mirror in accordance with the Service Information. Refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** and **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 6

6. **CHECK (P67) DRIVER MIRROR VERTICAL POSITION SIGNAL CIRCUIT FOR AN OPEN**

Fig. 46: Checking Driver Mirror Vertical Position Signal Circuit For Open
Courtesy of CHRYSLER GROUP, LLC

1. Connect an ohmmeter between the (P67) Driver Mirror Vertical Position Signal circuit and the (P69) Driver Mirror Sensor Ground circuit in the Driver Outside Rearview Mirror C1 (Component Side) harness connector.
2. Manually move the mirror Up and Down while observing the ohmmeter.

   Does the resistance measure between approximately 1.2K Ohms and 2.4K Ohms as you move the mirror from Up to Down?

   Yes

   - Go To 7

No

- Replace the Driver Outside Rearview Mirror in accordance with the Service Information. Refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** and **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

7. **CHECK (P65) DRIVER MIRROR HORIZONTAL POSITION SIGNAL CIRCUIT FOR AN OPEN**

Fig. 47: Checking Passenger Mirror Horizontal Position Signal Circuit For Open
Courtesy of CHRYSLER GROUP, LLC

1. Connect an ohmmeter between the (P65) Driver Mirror Horizontal Position Signal circuit and the (P69) Driver Mirror Sensor Ground circuit in the Driver Outside Rearview Mirror C1 (Component Side) harness connector.

2. Manually move the mirror from Left to Right while observing the ohmmeter.

   Does the resistance measure between approximately 1.2K Ohms and 2.4K Ohms as you move the mirror from Left to Right?

   Yes

   - Go To 8

   No

   - Replace the Driver Outside Rearview Mirror in accordance with the Service Information. Refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** and **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

8. **CHECK (A856) 5-VOLT SUPPLY CIRCUIT FOR A SHORT TO ANY GROUND OR RETURN CIRCUIT**

Fig. 48: Checking 5-Volt Supply Circuit For A Short To Any Ground Or Return Circuit, Or An Open
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (A856) 5-Volt Supply circuit (C1-10) and all designated Ground and Return circuits in the Driver Outside Rearview Mirror C1 and C2 (Component Side) connectors.

   Is the resistance below 1.2K Ohms between the (A856) 5-Volt Supply circuit and any Ground or Return circuit?

Yes

- Repair the (A856) 5-Volt Supply circuit for a short to the Ground or Return circuit. If the wiring harness and connector are okay, replace the Driver Outside Rearview Mirror in accordance with the Service Information. Refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** and **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 9

9. **CHECK (A856) 5-VOLT SUPPLY CIRCUIT FOR AN OPEN**

Fig. 49: Checking 5-Volt Supply Circuit For A Short To Any Ground Or Return Circuit, Or An Open
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (A856) 5-Volt Supply circuit (C1-10) and all designated Ground and Return circuits in the Driver Outside Rearview Mirror C1 and C2 (Component Side) connectors.

   Is the resistance between 1.2K and 5.0K Ohms between the (A856) 5-Volt Supply circuit and one or more of the Ground or Return circuits?

Yes

- Go To 10

No

- Repair the open in the (A856) 5-Volt Supply circuit. If the wiring harness and connector are okay, replace the Driver Outside Rearview Mirror in accordance with the Service Information. Refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** and **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

10. **CHECK (P67) DRIVER MIRROR VERTICAL POSITION SIGNAL CIRCUIT FOR A SHORT TO ANY CIRCUIT GROUND OR RETURN CIRCUITS**

Fig. 50: Checking Driver Mirror Vertical Position Signal Circuit For Short To Any Circuit Ground Or Return Circuits
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (P67) Driver Mirror Vertical Position Signal circuit (C1-Cavity 7) and all designated circuit Ground or Return circuits in the Driver Outside Rearview Mirror C1 and C2 (Component Side) harness connectors.

   Is the resistance below 20K Ohms between the (P67) circuit and any of the designated circuit Ground or Return circuits?

   Yes

- Repair all circuits with a resistance below 20K Ohms for a short to the (P67) Driver Mirror Vertical Position Signal circuit. If the wiring harness and connectors are okay, replace the Driver Outside Rearview Mirror in accordance with the Service Information. Refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** and **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 11

11. **CHECK (P65) DRIVER MIRROR HORIZONTAL POSITION SIGNAL CIRCUIT FOR A SHORT TO ANY CIRCUIT GROUND OR RETURN CIRCUITS**

Fig. 51: Checking Driver Mirror Horizontal Position Signal Circuit For Short To Any Circuit Ground Or Return Circuits
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (P65) Driver Mirror Horizontal Position Signal circuit (C1-Cavity 9) and all designated circuit Ground or Return circuits in the Driver Outside Rearview Mirror C1 and C2 (Component Side) harness connectors.

   Is the resistance below 20K Ohms between the (P65) circuit and any of the designated circuit Ground or Return circuits?

Yes

- Repair all circuits with a resistance below 20K Ohms for a short to the (P65) Driver Mirror Horizontal Position Signal circuit. If the wiring harness and connectors are okay, replace the Driver Outside Rearview Mirror in accordance with the Service Information. Refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** and **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace the Driver Door Module in accordance with the Service Information. Refer to **MODULE, DOOR, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B210C-16-BATTERY VOLTAGE INPUT - CIRCUIT VOLTAGE BELOW THRESHOLD

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 52: DDM CAN IHS, Fused B+ & Ground Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

At all times.

SET CONDITION

Anytime the module senses a voltage input below 9.0 volts, this code will set.

POSSIBLE CAUSES

POSSIBLE CAUSES
LOW VOLTAGE ENGINE DTC
FUSED B (+) CIRCUIT HAS HIGH RESISTANCE
GROUND CIRCUIT HAS HIGH RESISTANCE
DOOR MODULE

DIAGNOSTIC TEST

1. **CHECK POWERTRAIN CONTROL MODULE (PCM) DTCs**
   1. With the scan tool, read the PCM DTCs.

      Are there any Charging or Battery DTCs present?

      Yes

      - Refer to the **DTC INDEX** article and perform the appropriate diagnostic procedure.

      No

      - Go To 2
2. **TEST FOR INTERMITTENT CONDITION**
   1. With the scan tool, record and erase the DTCs.
   2. Start the engine and run for two minutes.
   3. With the scan tool, read the DTCs in the Door Module.

      Does the scan tool display; B210C-16-BATTERY VOLTAGE INPUT - CIRCUIT VOLTAGE BELOW THRESHOLD?

      Yes

      - Go To 3

      No

      - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
3. **(A924) FUSED B(+) OR (Z919) GROUND CIRCUITS RESISTED**

Fig. 53: Checking Fused B(+) Or Ground Circuits For Resistance
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Driver Door Module C3 harness connector.
3. Test the circuits by connecting a 12-volt test light between the (A924) Fused B(+) circuit and the (Z919) Ground circuits in the door module C3 harness connector. The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

   Does the test light illuminate brightly?

   Yes

   - Replace the Driver Door Module in accordance with the Service Information. Refer to **MODULE, DOOR, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Test the (A924) Fused B(+) and the Ground circuits to determine which one has the high resistance. Repair the circuit for high resistance.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B210C-17-BATTERY VOLTAGE INPUT - CIRCUIT VOLTAGE ABOVE THRESHOLD

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 54: DDM CAN IHS, Fused B+ & Ground Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

At all times.

SET CONDITION

Anytime the module senses voltage input above 15.9 volts, this code will set.

POSSIBLE CAUSES

POSSIBLE CAUSES
HIGH VOLTAGE POWERTRAIN CONTROL MODULE (PCM) DTC DOOR MODULE

DIAGNOSTIC TEST

1. **CHECK POWERTRAIN CONTROL MODULE (PCM) DTCs**
    1. With the scan tool, read the PCM DTCs.

       Are there any Charging or Battery DTCs present?

       Yes

       - Refer to the **DTC INDEX** article and perform the appropriate diagnostic procedure.

       No

       - Go To 2
2. **TEST FOR INTERMITTENT CONDITION**
    1. With the scan tool, record and erase the DTCs.
    2. Start the engine and run for two minutes.
    3. With the scan tool, read the DTCs.

       Does the scan tool display; B210C-17-BATTERY VOLTAGE INPUT - CIRCUIT VOLTAGE ABOVE THRESHOLD?

       Yes

       - Replace the Driver Door Module in accordance with the Service Information. Refer to **MODULE, DOOR, REMOVAL** .
       - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B21DD-84-SYSTEM VOLTAGE - SIGNAL BELOW ALLOWABLE RANGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

At all times.

SET CONDITION

This is a Controller Area Network (CAN) message that the battery voltage was below 7.3 volts for over 10 seconds.

POSSIBLE CAUSES

POSSIBLE CAUSES
LOW SYSTEM VOLTAGE BATTERY OR CHARGING SYSTEM

DIAGNOSTIC TEST

CHECK POWERTRAIN CONTROL MODULE (PCM) DTCs

1. With the scan tool, read PCM DTCs.

   Are there any PCM Charging or Battery DTCs present?

   Yes

   - Refer to the **DTC INDEX** article and perform the appropriate diagnostic procedure.

   No

   - This code is for information only. At some time there was a low battery system voltage. Check the battery and charging system in accordance with the Service Information.

B21DD-85-SYSTEM VOLTAGE - SIGNAL VOLTAGE ABOVE ALLOWABLE RANGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

At all times.

SET CONDITION

This is a Controller Area Network (CAN) message that the system voltage was above 18.4 volts for over 10 seconds.

POSSIBLE CAUSES

POSSIBLE CAUSES
HIGH BATTERY SYSTEM VOLTAGE CHARGING SYSTEM

DIAGNOSTIC TEST

CHECK ENGINE DTCs

1. With the scan tool, read the Powertrain Control Module (PCM) DTCs.

   Are there any PCM Charging or Battery DTCs present?

   Yes

   - Refer to the **DTC INDEX** article and perform the appropriate diagnostic procedure.

   No

   - This code is a CAN system message for information only. Check the charging system in accordance with the Service Information.

B224F-54-DOOR MODULE INTERNAL - MISSING CALIBRATION

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Whenever the window motor is operating.

SET CONDITION

When the Door Module has lost the parameters for window travel, this code will set.

POSSIBLE CAUSES

Possible Causes
MODULE NOT CALIBRATED
EXPRESS WINDOW SWITCH
DOOR MODULE

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Cycle the ignition on.
    2. With the scan tool, record and erase the DTCs.
    3. Operate the Driver Window up and down several times using the Express Up feature.
    4. Wait 30 seconds.
    5. With the scan tool, read the DTCs.

    Does the scan tool display; B224F-54-DOOR MODULE INTERNAL - MISSING CALIBRATION?

    Yes

    - Go To 2

    No

    - The conditions that caused this code to set are not present at this time. If the Express Up feature is operating properly, test complete. If the Express Up feature is not operating properly, continue to step 2. Refer to 2.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **WINDOW MODULE NOT CALIBRATED**
    1. Run the window to the full up position and continue to hold the switch for an additional two seconds.
    2. Run the window to the full down position and continue to hold the switch for an additional two seconds.
    3. Again run the window to the full up position and continue to hold the switch for an additional two seconds.
    4. Lower the window to the full down position then press and release the switch to the express up position.

    Did the window move to the full up position?

    Yes

    - Test complete.

No

- Go To 3

3. **EXPRESS WINDOW SWITCH**
   1. Cycle the ignition off.
   2. Move the Driver Express Switch from the idle position to the up position and then to the express up position.

   Is there two definite detent positions felt?

   Yes

   - Replace the Driver Door Module in accordance with the Service Information. Refer to **MODULE, DOOR, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the Driver Window/Door Lock Switch assembly. Refer to **SWITCH, POWER WINDOW, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B224F-96-DOOR MODULE INTERNAL - COMPONENT INTERNAL FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

At all times.

SET CONDITION

Whenever the module detects an EEPROM failure.

POSSIBLE CAUSES

POSSIBLE CAUSES
DOOR MODULE

DIAGNOSTIC TEST

Replace the Door Module

NOTE: Anytime this code is logged (active or stored), the module must be replaced.

Repair

- Replace the Door Module in accordance with the Service Information. Refer to **MODULE, DOOR, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B25AF-2A-DOOR LOCK/UNLOCK SWITCH - STUCK

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 55: Driver Door Lock/Unlock Switch LIN BUS, Power & Ground Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

Continuously whenever the door module is awake.

SET CONDITION

When the Driver Door Lin Bus circuit is out of range for five seconds.

POSSIBLE CAUSES

Possible Causes
(D903) DRIVER DOOR LIN BUS CIRCUIT SHORTED TO GROUND
(D903) DRIVER DOOR LIN BUS CIRCUIT SHORTED TO THE (D512) DRIVER DOOR LIN BUS RETURN CIRCUIT
(D903) DRIVER DOOR LIN BUS CIRCUIT OPEN
(D512) DRIVER DOOR LIN BUS RETURN CIRCUIT OPEN
DRIVER WINDOW/DOOR LOCK SWITCH
DRIVER DOOR MODULE

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. With the scan tool, record and erase the DTCs.
    2. Operate the Driver Door Lock Switch several times.
    3. Cycle the ignition on and wait 30 seconds.
    4. With the scan tool, read the active DTCs.

    Does the scan tool display; B25AF-2A-DOOR LOCK/UNLOCK SWITCH - STUCK?

    Yes

    - Go To 2

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **DOOR LOCK SWITCH**
    1. Disconnect the Driver Window/Door Lock Switch harness connector.

2. Cycle the ignition on.
3. Measure the voltage between the (D903) Driver Door Lin Bus circuit and the (D512) Driver Door Lin Bus Return circuit.

   Is the voltage between 6.5 and 12.5 volts?

   Yes

   - Replace the Driver Window/Door Lock Switch. Refer to **SWITCH, POWER WINDOW, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 3

3. **(D512) DRIVER DOOR LIN BUS RETURN CIRCUIT OPEN**
   1. Using a 12-volt test light connected to 12-volts, check the (D512) Driver Door Lin Bus Return circuit.

      Does the test light illuminate brightly?

      Yes

      - Go To 4

      No

      - Repair the (D512) Driver Door Lin Bus Return circuit for an open.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **(D903) DRIVER DOOR LIN BUS CIRCUIT OPEN**
   1. Cycle the ignition off.
   2. Disconnect the Driver Door Module C5 harness connector.
   3. Measure the resistance of the (D903) Driver Door Lin Bus circuit between the Door Module C5 harness connector and the Window/Door Lock Switch connector.

      Is the resistance below 2.0 Ohms?

      Yes

      - Go To 5

      No

      - Repair the (D903) Driver Door Lin Bus circuit for an open.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **(D903) DRIVER DOOR LIN BUS CIRCUIT SHORTED TO THE (D512) DRIVER DOOR LIN BUS RETURN CIRCUIT**
   1. Measure the resistance between the (D903) Driver Door Lin Bus circuit and the (D512) Driver Door Lin Bus Return circuit in the Window/Door Lock Switch connector.

      Is the resistance below 10K Ohms?

      Yes

      - Repair the (D903) Driver Door Lin Bus circuit for a short to the (D512) Driver Door Lin Bus Return circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Replace the Driver Door Module in accordance with the Service Information. Refer to **MODULE, DOOR, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B25B0-31-WINDOW POSITION SENSOR - NO SIGNAL

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 56: Driver Window Motor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The window motor contains a hall effect sensor to detect the window position. A hall effect sensor is a transducer that varies its output voltage in response to changes in magnetic field. If the motor loses its counts, it may perform erratically or in very short movements.

WHEN MONITORED

Whenever the module is awake.

SET CONDITION

When one of the window motor hall sensors does not generate a signal during a window movement.

POSSIBLE CAUSES

Possible Causes
WINDOW HALL SENSOR SUPPLY CIRCUIT SHORTED TO VOLTAGE
WINDOW HALL SENSOR A SIGNAL CIRCUIT SHORTED TO GROUND
WINDOW HALL SENSOR RETURN CIRCUIT OPEN
WINDOW HALL SENSOR A SIGNAL CIRCUIT SHORTED TO THE WINDOW HALL SENSOR RETURN CIRCUIT
WINDOW HALL SENSOR A SIGNAL CIRCUIT OPEN
WINDOW HALL SENSOR SUPPLY CIRCUIT OPEN
WINDOW HALL SENSOR RETURN CIRCUIT OPEN
WINDOW MOTOR

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Cycle the ignition on.
    2. With the scan tool, record and erase the DTCs.
    3. Operate the Driver Window switch up and down several times.
    4. Wait 30 seconds.
    5. With the scan tool, read the active DTCs.

    Does the scan tool display: B25B0-31-WINDOW POSITION SENSOR - NO SIGNAL?

    Yes

    - Go To 3

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **(Q305) DRIVER WINDOW HALL SENSOR SUPPLY CIRCUIT SHORTED TO VOLTAGE**

Fig. 57: Checking Driver Window Hall Sensor Supply Circuit For Short
Courtesy of CHRYSLER GROUP, LLC

1. Cycle the ignition off.
2. Disconnect the Driver Door Module C4 harness connector.
3. Cycle the ignition on.
4. Measure the voltage between ground and the (Q305) Driver Window Hall Sensor Supply circuit.

   Is there any voltage present?

   Yes

   - Repair the short to voltage in the (Q305) Driver Window Hall Sensor Supply circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 3

3. **(Q301) DRIVER WINDOW HALL SENSOR A SIGNAL SHORTED TO GROUND**
   1. Cycle the ignition off.
   2. Disconnect the Driver Window Motor harness connector.
   3. Disconnect the Driver Door Module C4 harness connector.
   4. Measure the resistance between ground and the (Q301) Driver Window Hall Sensor A Signal circuit in the Driver Window Motor harness connector.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the short to ground in the Driver Window Hall Sensor A signal circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 5

4. **(Q305) DRIVER WINDOW HALL SENSOR SUPPLY CIRCUIT OPEN**
   1. Measure the resistance of the (Q305) Driver Window Hall Sensor Supply circuit between the Driver Door Module C4 harness connector and the Driver Window Motor harness connector.

   Is the resistance above 2.0 Ohms?

   Yes

   - Repair the open in the (Q305) Driver Window Hall Sensor Supply circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 5

5. **(Q991) DRIVER WINDOW HALL SENSOR RETURN CIRCUIT OPEN**
   1. Measure the resistance of the (Q991) Driver Window Hall Sensor Return circuit between the Driver Door Module C4 harness connector and the Driver Window Motor harness connector.

   Is the resistance above 2.0 Ohms?

   Yes

   - Repair the open in the (Q991) Driver Window Hall Sensor Return circuit.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 6

6. **(Q301) DRIVER WINDOW HALL SENSOR A SIGNAL CIRCUIT OPEN**
   1. Measure the resistance of the (Q301) Driver Window Hall Sensor A Signal circuit between the Driver Door Module C4 harness connector and the Driver Window Motor harness connector.

      Is the resistance above 2.0 Ohms?

      Yes

      - Repair the open in the (Q301) Driver Window Hall Sensor A Signal circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 7

7. **(Q301) DRIVER WINDOW HALL SENSOR A SIGNAL CIRCUIT SHORTED TO THE (Q991) DRIVER WINDOW HALL SENSOR RETURN CIRCUIT**
   1. Measure the resistance between the (Q301) Driver Window Hall Sensor A Signal circuit and the (Q991) Driver Window Hall Sensor Return circuit in the Driver Window Motor harness connector.

      Is the resistance below 10K Ohms?

      Yes

      - Repair the (Q301) Driver Window Hall Sensor A Signal circuit for a short to the (Q991) Driver Window Hall Sensor Return circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Replace the Window Motor in accordance with the Service Information.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B25B1-11-WINDOW POSITION SENSOR POWER SUPPLY - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 58: Driver Window Motor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The window motor contains a hall effect sensor to detect the window position. A hall effect sensor is a transducer that varies its output voltage in response to changes in magnetic field. If the motor loses its counts, it may perform erratically or in very short movements.

WHEN MONITORED

Whenever the module is awake.

SET CONDITION

When the Window Hall Sensor Supply circuit falls below 0.8 of a volt for over 480 ms., this code will set.

POSSIBLE CAUSES

Possible Causes
WINDOW HALL SENSOR SUPPLY CIRCUIT SHORTED TO GROUND
WINDOW MOTOR
DOOR MODULE

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Cycle the ignition on.
    2. With the scan tool, record and erase the DTCs.
    3. Operate the Driver Window up and down several times.
    4. Wait 30 seconds.
    5. With the scan tool, read the DTCs.

    Does the scan tool display; B25B1-11-WINDOW POSITION SENSOR POWER SUPPLY - CIRCUIT SHORT TO GROUND?

    Yes

    - Go To 2

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **WINDOW MOTOR SHORTED**
    1. With the scan tool, erase the DTCs.
    2. Cycle the ignition off.
    3. Disconnect the Driver Window Motor harness connector.
    4. Cycle the ignition on.
    5. Operate the driver window switch up and down several times.
    6. With the scan tool, read the DTCs.

    Does the scan tool display; B25B1-11-WINDOW POSITION SENSOR POWER SUPPLY - CIRCUIT SHORT TO GROUND?

Yes

- Go To 3

No

- Replace the Window Motor in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **(Q305) DRIVER WINDOW HALL SENSOR SUPPLY CIRCUIT SHORTED TO GROUND**

Fig. 59: Checking Driver Window Hall Sensor Supply Circuit For Short
Courtesy of CHRYSLER GROUP, LLC

1. Cycle the ignition off.
2. Disconnect the Driver Door Module C4 harness connector.

3. Measure the resistance between Ground and the (Q305) Driver Window Hall Sensor Supply circuit.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the (Q305) Driver Window Hall Sensor Supply circuit for a short to ground.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the Driver Door Module in accordance with the Service Information. Refer to **MODULE, DOOR, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B285F-11-BLIND SPOT WARNING LIGHT CONTROL - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

When the Driver Door Module (DDM) turns the Blind Spot Indicator on.

SET CONDITION

When the Driver Door Module (DDM) detects a short to ground on the Blind Spot Indicator circuit, this code will set.

POSSIBLE CAUSES

Possible Causes
MIRROR ASSEMBLY
DOOR MODULE

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
   1. Turn the ignition on.
   2. With the scan tool, erase all DTCs.
   3. Cycle the ignition from on to off three times.
   4. Turn the ignition on.
   5. Wait one minute.
   6. With the scan tool, read the active DTCs.

Does the scan tool display: B285F-11-BLIND SPOT WARNING LIGHT CONTROL - CIRCUIT SHORT TO GROUND as Active?

Yes

- Go To 2

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all relate splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension. Repair as necessary.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **INSPECT MIRROR CONNECTIONS**
   1. Turn the ignition off.
   2. Disconnect the Driver Door Module C1 harness connector.
   3. Inspect the wiring and connectors between the mirror and the Drivers Door Module.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 3

3. **MIRROR ASSEMBLY**
   1. Turn the ignition on
   2. With the scan tool, erase the DTCs.
   3. Cycle the ignition from on to off three times.
   4. Turn the ignition on.
   5. Make sure the DDM C1 harness connector is still disconnected.
   6. Wait one minute.

   NOTE: Look for a change in DTCs.

   7. With the scan tool, read the active DTCs.

   Does the scan tool display: B285F-15-BLIND SPOT WARNING LIGHT CONTROL - CIRCUIT SHORT TO BATTERY OR OPEN as Active?

Yes

- Replace the Driver Mirror Assembly in accordance with the Service Information. Refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** and **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace the Driver Door Module in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B285F-15-BLIND SPOT WARNING LIGHT CONTROL - CIRCUIT SHORT TO BATTERY OR OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously.

SET CONDITION

When the Blind Spot Indicator circuit senses high voltage or an open circuit for over 55 ms., this code will set.

POSSIBLE CAUSES

Possible Causes
MIRROR ASSEMBLY
DOOR MODULE

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Cycle the ignition on.
    2. With the scan tool, erase all DTCs.
    3. Cycle the ignition from on to off three times.
    4. Cycle the ignition on.
    5. Wait one minute.
    6. With the scan tool, read the DTCs.

    Does the scan tool display active: B285F-15-BLIND SPOT WARNING LIGHT CONTROL - CIRCUIT SHORT TO BATTERY OR OPEN?

Yes

- Go To 2

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension. Repair as necessary.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **INSPECT MIRROR CONNECTIONS**
   1. Cycle the ignition off.
   2. Disconnect the Drivers Door Module C1 harness connector.
   3. Inspect the wiring and connectors between the mirror and the Drivers Door Module.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 3

3. **MIRROR ASSEMBLY**
   1. Measure the resistance between the (P552) Driver Blind Spot/Approach Return circuit and the (P711) Driver Blind Spot Signal Driver circuit in the DDM C1 harness connector.

   Is the resistance between 550.0 and 650.0 Ohms?

   Yes

   - Replace the Driver Door Module in accordance with the Service Information. Refer to **MODULE, DOOR, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the Driver Mirror Assembly in accordance with the Service Information. Refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** and **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B2860-11-DOOR AMBIENT LIGHT CONTROL - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

An ambient lamp can be a: map pocket, door handle, halo ring, cup holder, etc. It is a LED with a built in circuit board.

WHEN MONITORED

Whenever the ambient lamp is commanded to be on.

SET CONDITION

When the Door Ambient Lamp Driver circuit falls below 3.0 volts for over 2000 ms. and the above conditions are met, this code will set.

POSSIBLE CAUSES

Possible Causes
DOOR AMBIENT LAMP DRIVER CIRCUIT SHORTED TO GROUND
DOOR AMBIENT LAMP DRIVER CIRCUIT SHORTED TO THE DOOR LIGHTING RETURN CIRCUIT
MAP POCKET LAMP
DOOR MODULE

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**

NOTE: Be sure the thumbwheel on the Dimmer Module is turned fully on during this test.

1. Turn the ignition on.
2. With the scan tool, record and erase the DTCs.
3. Cycle the ignition on to off three times and leave in the On position.
4. Turn the park lamps on.
5. Wait one minute.
6. With the scan tool, read the active DTCs.

Does the scan tool display: B2860-11-DOOR AMBIENT LIGHT CONTROL - CIRCUIT SHORT TO GROUND as active?

Yes

- Go To 2

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **DRIVER DOOR MAP POCKET LAMP SHORTED**

Fig. 60: Driver Door Map Pocket Lamp Connector End View
Courtesy of CHRYSLER GROUP, LLC

1. With the scan tool, erase the DTCs.
2. Turn the ignition off.

3. Disconnect the Driver Door Map Pocket Lamp connector.
4. Be sure the park lamps are still on.
5. Turn the ignition on.
6. Wait one minute.
7. With the scan tool, read the active DTCs.

   Does the scan tool display: B2860-11-DRIVER DOOR AMBIENT LAMP - CONTROL CIRCUIT SHORT TO GROUND as Active?

   Yes

   - Go To 3

   No

   - Replace the Driver Door Map Pocket Lamp Assembly.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **(M33) DRIVER DOOR AMBIENT LAMP DRIVER CIRCUIT SHORTED TO GROUND**

Fig. 61: Checking Driver Door Ambient Lamp Driver Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the Driver Door Module C5 harness connector.
3. Measure the resistance between Ground and the (M33) Driver Door Ambient Lamp Driver circuit in the DDM C5 harness connector.

   Is the resistance below 20K Ohms?

   Yes

   - Repair the short to ground in the (M33) Driver Door Ambient Lamp Driver circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

- Go To 4

4. **(M33) DRIVER DOOR AMBIENT LAMP DRIVER CIRCUIT SHORTED TO THE (M34) DRIVER DOOR LIGHTING RETURN CIRCUIT**

Fig. 62: Measuring Resistance Between Driver Door Ambient Lamp Driver Circuit & Driver Door Lighting Return Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (M33) Driver Door Ambient Lamp Driver circuit and the (M34) Driver Door Lighting Return circuit in the DDM C5 harness connector.

   Is the resistance below 20K Ohms?

   Yes

   - Repair the short between the (M33) Driver Door Ambient Lamp Driver circuit and the (M34)

Driver Door Lighting Return circuit.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace the Driver Door Module in accordance with the Service Information. Refer to **MODULE, DOOR, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B2860-15-DOOR AMBIENT LIGHT CONTROL-CIRCUIT SHORT TO BATTERY OR OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

An ambient lamp can be a: map pocket, door handle, halo ring, cup holder, etc. It is a LED with a built in circuit board.

WHEN MONITORED

Whenever the ambient lamp is commanded to be on.

SET CONDITION

When the Door Ambient Lamp Driver circuit is on when it should be off or off when it should be on, for over 2000 ms. and the above conditions are met, this code will set.

POSSIBLE CAUSES

Possible Causes
DOOR AMBIENT LAMP DRIVER CIRCUIT SHORTED TO BATTERY VOLTAGE
DOOR AMBIENT LAMP DRIVER CIRCUIT OPEN
DOOR MAP POCKET LAMP
DOOR MODULE

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**

NOTE: Be sure the thumbwheel on the Dimmer Module is turned fully on during this test.

1. Turn the ignition on.
2. With the scan tool, record and erase the DTCs.
3. Cycle the ignition on to off three times and leave in the Lock position.

4. Turn the park lamps on.
5. Turn the ignition on and wait one minute.
6. With the scan tool, read the active DTCs.

   Does the scan tool display: B2860-15-DOOR AMBIENT LIGHT CONTROL - CIRCUIT SHORT TO BATTERY OR OPEN?

   Yes

   - Go To 2

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **(M33) DRIVER DOOR AMBIENT LAMP DRIVER CIRCUIT SHORTED TO VOLTAGE**

Fig. 63: Measuring Voltage Between Ground & Driver Door Ambient Lamp Driver Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Remove the inner door panel trim in accordance with the Service Information. Refer to **PANEL, DOOR TRIM, REMOVAL** .
3. Leave the Driver Door Map Pocket Lamp connector connected.
4. Disconnect the Driver Door Module C5 harness connector.
5. Turn the ignition on.
6. Turn the Park Lamps on.
7. Measure the voltage between ground and the (M33) Driver Door Ambient Lamp Driver circuit in the Driver Door Module C5 harness connector.

   Is there any voltage present?

Yes

- Repair the (M33) Driver Door Ambient Lamp Driver circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 3

3. **(M33) DRIVER DOOR AMBIENT LAMP DRIVER CIRCUIT OPEN**

Fig. 64: Checking Driver Door Ambient Lamp Driver Circuit For Open
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Be sure the Driver Door Map Pocket Lamp connector is still connected.
3. Turn the ignition on.
4. Connect a fused jumper wire, connected to battery to the (M33) Driver Door Ambient Lamp Driver circuit in the DDM C5 harness connector.
5. Connect a jumper wire, connected to ground to the (M34) Driver Door Lighting Return circuit in the DDM C5 harness connector

   Does the Driver Door Map Pocket Lamp illuminate brightly?

   Yes

   - Replace the Driver Door Module in accordance with the Service Information. Refer to **MODULE, DOOR, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 4

4. **(M33) DRIVER DOOR AMBIENT LAMP DRIVER CIRCUIT OPEN**
   1. Disconnect the Driver Door Map Pocket Lamp harness connector.
   2. Measure the resistance of the (M33) Driver Door Ambient Lamp Driver circuit between the DDM C5 harness connector and the Driver Door Map Pocket Lamp harness connector.

      Is the resistance below 2.0 Ohms between the (M33) Driver Door Ambient Lamp Driver circuit to the Map Pocket Lamp?

      Yes

      - Go To 5

      No

      - Repair the open in the (M33) Driver Door Ambient Lamp Driver circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **(M34) DRIVER DOOR LIGHTING RETURN CIRCUIT OPEN**
   1. Measure the resistance of the (M34) Driver Door Lighting Return circuit between the DDM C5 harness connector and the Driver Door Map Pocket Lamp harness connector.

      Is the resistance below 2.0 Ohms on the (M34) Driver Door Lighting Return circuit to the Map Pocket Lamp?

      Yes

- Replace the Driver Door Ambient Lamp.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Repair the open in the (M34) Driver Door Lighting Return circuit.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B2861-11-MIRROR APPROACH LIGHT CONTROL - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 65: Driver Mirror Assembly Wiring Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

Continuously.

SET CONDITION

The Door Module senses a short low on the Approach Lamp Driver circuit for more than two seconds with the approach lights switched on.

POSSIBLE CAUSES

Possible Causes
MIRROR APPROACH LAMP DRIVER CIRCUIT SHORTED TO GROUND
MIRROR APPROACH LAMP DRIVER CIRCUIT SHORTED TO THE APPROACH LAMP RETURN CIRCUIT
MIRROR APPROACH LAMP DRIVER CIRCUIT SHORTED TO ANY SENSOR GROUND OR RETURN CIRCUIT
OUTSIDE REARVIEW MIRROR
DOOR MODULE

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Cycle the ignition on.
    2. Using a scan tool, record and erase Diagnostic Trouble Codes (DTCs).
    3. Press and release the Mirror Select switch to select the Driver Outside Rearview Mirror.
    4. Turn the driver turn signal on.
    5. Open the driver door to turn the approach lights on. Leave the door open.
    6. Fold and unfold the mirrors (if equipped).
    7. Turn the rear defogger on (if equipped with heated mirrors).
    8. Operate the Mirror Adjust switch in all directions several times while monitoring the scan tool for DTCs.

    NOTE: After adjusting the mirror in one direction wait at least two seconds before adjusting the mirror in the opposite direction, as this will allow time for an active fault to set if present.

    9. With the scan tool, read the DTCs.

    Does the scan tool display: B2861-11-MIRROR APPROACH LAMP CONTROL - CIRCUIT SHORT TO GROUND?

    Yes

    - Go To 2

    No

    - The conditions that caused this code to set are not present at this time. Repeat this test again.

If this DTC is now present, Go To 2. Otherwise, use the wiring diagram/schematic as a guide and inspect the wiring and connectors.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK (P551) DRIVER MIRROR APPROACH LAMP DRIVER CIRCUIT FOR A SHORT TO GROUND**

Fig. 66: Checking Driver Mirror Approach Lamp Driver Circuit For Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Cycle the ignition off.
2. Disconnect the Driver Outside Rearview Mirror C1 and C2 (Component Side) harness connectors from the Door Module.
3. Measure the resistance between ground and the (P551) Driver Approach Lamp Driver circuit at the Driver Outside Rearview Mirror C1 (Component Side) connector.

Is the resistance below 10K Ohms?

Yes

- Repair the (P551) Driver Approach Lamp Driver circuit for a short to ground. If the wiring harness and connector are okay, replace the Driver Outside Rearview Mirror in accordance with the Service Information. Refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** and **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 3

3. **CHECK (P551) DRIVER MIRROR APPROACH LAMP DRIVER CIRCUIT FOR A SHORT TO THE (P552) APPROACH LAMP RETURN CIRCUIT**

Fig. 67: Checking Driver Mirror Approach Lamp Driver Circuit For Short To Approach Lamp Return Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (P551) Driver Approach Lamp Driver circuit and the (P552) Approach Lamp Return circuit at the Driver Outside Rearview Mirror C1 (Component Side) harness connector.

   Is the resistance below 2.0 Ohm?

   Yes

   - Repair the (P551) Driver Approach Lamp Driver circuit for a short to the (P552)Approach Lamp Return circuit. If the wiring harness and connector are okay, replace the Driver Outside

Rearview Mirror in accordance with the Service Information. Refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** and **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL** .

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 4

4. **CHECK (P551) DRIVER MIRROR APPROACH LAMP DRIVER CIRCUIT FOR A SHORT TO ANY DRIVER MIRROR GROUND OR RETURN CIRCUIT**
   1. Measure the resistance between the (P551) Driver Approach Lamp Driver circuit (C1-1) and each of the Driver Mirror Return or Ground circuits (except the ((P552) Approach Lamp Return) in the Driver Outside Rearview Mirror C1 and C2 (Component Side) connectors.

      Is the resistance below 10K Ohms for any measurement?

      Yes

      - Repair all circuits (except the ((P552) Approach Lamp Return) with a resistance below 10K Ohms for a short to the (P551) Driver Approach Lamp Driver circuit. If the wiring harness and connector are okay, replace the Driver Outside Rearview Mirror in accordance with the Service Information. Refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** and **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Inspect the wiring and connectors for damage and repair as necessary. If the wiring and connectors are okay, replace the Door Module in accordance with the Service Information. Refer to **MODULE, DOOR, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B2861-15-MIRROR APPROACH LIGHT CONTROL - CIRCUIT SHORT TO BATTERY OR OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously.

SET CONDITION

The Door Module senses an open or a short high on the Mirror Approach Lamp Driver circuit for more than two seconds.

POSSIBLE CAUSES

Possible Causes
MIRROR APPROACH LAMP DRIVER CIRCUIT SHORTED TO VOLTAGE
MIRROR APPROACH LAMP DRIVER CIRCUIT OPEN
MIRROR APPROACH LAMP RETURN CIRCUIT OPEN
MIRROR APPROACH LAMP DRIVER CIRCUIT OPEN TO THE APPROACH LAMP RETURN CIRCUIT
MIRROR APPROACH LAMP DRIVER CIRCUIT SHORTED TO ANOTHER DRIVER OR SIGNAL CIRCUIT
OUTSIDE REARVIEW MIRROR
DOOR MODULE

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Cycle the ignition on.
    2. Using a scan tool, record and erase Diagnostic Trouble Codes (DTCs).
    3. Cycle the ignition from on to off then back to on.
    4. Press and release the Mirror Select switch to select the Driver Outside Rearview Mirror.
    5. Open the driver door to turn the approach lights on. Leave the door open.
    6. Turn the drivers turn signal on.
    7. Fold and unfold the mirrors (if equipped).
    8. Turn the rear defogger on (if equipped with heated mirrors).
    9. Operate the Mirror Adjust switch in all directions several times while monitoring the scan tool for DTCs.

    NOTE: After adjusting the mirror in one direction wait at least two seconds before adjusting the mirror in the opposite direction, as this will allow time for an active fault to set if present.

    10. With the scan tool, read the DTCs.

    Does the scan tool display: B2861-15-MIRROR APPROACH LIGHT CONTROL - CIRCUIT SHORT TO BATTERY OR OPEN?

    Yes

    - Go To 2

    No

    - The conditions that caused this code to set are not present at this time. Repeat this test again. If this DTC is now present, Go To 2. Otherwise, use the wiring diagram/schematic as a guide and inspect the wiring and connectors.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK (P551) DRIVER MIRROR APPROACH LAMP DRIVER CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 68: Checking Driver Mirror Approach Lamp Driver Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Cycle the ignition off.
2. Disconnect the Driver Outside Rearview Mirror C1 and C2 (Component Side) harness connectors from the Door Module.
3. Cycle the ignition on.
4. Measure the voltage between ground and the (P551) Driver Mirror Approach Lamp Driver circuit in the Driver Outside Rearview Mirror C1 (Component Side) harness connector.

Is there any voltage present?

Yes

- Repair the (P551) Driver Mirror Approach Lamp Driver circuit for a short to voltage. If the wiring harness and connector are okay, replace the Driver Outside Rearview Mirror in accordance with the Service Information. Refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** and **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 3

3. **CHECK (P551) DRIVER MIRROR APPROACH LAMP DRIVER CIRCUIT AND (P552) APPROACH LAMP RETURN CIRCUIT FOR AN OPEN**

Fig. 69: Checking Driver Mirror Approach Lamp Driver Circuit For Short To Approach Lamp Return Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Cycle the ignition off.
2. Measure the resistance between the (P551) Driver Mirror Approach Lamp Driver circuit and the (P552) Approach Lamp Return circuit at the Driver Outside Rearview Mirror C1 (Component Side) connector.

   Is the resistance below 10.0 Ohms?

   Yes

   - Go To 4

No

- Repair the (P551) Driver Mirror Approach Lamp Driver circuit or the (P552) Approach Lamp Return circuit for an open. If the wiring harness and connector are okay, replace the Driver Outside Rearview Mirror in accordance with the Service Information. Refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** and **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK (P551) DRIVER MIRROR APPROACH LAMP DRIVER CIRCUIT FOR A SHORT TO ANOTHER MIRROR DRIVER OR SIGNAL CIRCUIT**

Fig. 70: Checking Driver Mirror Approach Lamp Driver Circuit For Short To Mirror Driver Or Signal Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (P551) Driver Mirror Approach Lamp Driver circuit (C1-1) and each of the designated Mirror Driver and Signal circuits in the Driver Outside Rearview Mirror C1 and C2 (Component Side) connectors.

   Is the resistance below 10K Ohms for any measurement?

   Yes

   - Repair all circuits with a resistance below 10K Ohms for a short to the (P551) Driver Mirror Approach Lamp Driver circuit. If the wiring harness and connector are okay, replace the Driver Outside Rearview Mirror in accordance with the Service Information. Refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** and **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Inspect the wiring and connectors for damage and repair as necessary. If the wiring and connectors are okay, replace the Driver Door Module in accordance with the Service Information. Refer to **MODULE, DOOR, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U0010-00-CAN INTERIOR BUS

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously when the ignition is on.

Battery voltage between 10 and 16 volts.

SET CONDITION

The Body Control Module (BCM) detects a short to ground on the CAN Interior Bus (+) circuit or a short to voltage on the CAN Interior Bus (-) circuit.

POSSIBLE CAUSES

Possible Causes
CAN INTERIOR BUS (+) CIRCUIT SHORTED TO GROUND
CAN INTERIOR BUS (-) CIRCUIT SHORTED TO VOLTAGE

ANY CAN INTERIOR BUS MODULE
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

VERIFY IF THE DTC IS ACTIVE

1. Cycle the ignition on.
2. With the scan tool, read the active DTCs.

   Does the scan tool display this DTC as Active?

   Yes

   - Refer to the **DTC INDEX** article and perform the U0010-00 CAN INTERIOR BUS diagnostic procedure.

   No

   - Refer to **DIAGNOSIS AND TESTING** and perform the STORED LOST COMMUNICATION DTCs diagnostic procedure.

U0011-00-CAN INTERIOR BUS OFF PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

The Body Control Module (BCM) detects a short condition in one of the CAN IHS Bus (125K) circuits for less than one second.

POSSIBLE CAUSES

Possible Causes
CAN IHS BUS (125K) (+) CIRCUIT SHORTED TO GROUND
CAN IHS BUS (125K) (-) CIRCUIT SHORTED TO VOLTAGE
CAN IHS BUS (125K) (+) CIRCUIT SHORTED TO THE CAN IHS BUS (125K) (-) CIRCUIT
ANY CAN IHS BUS MODULE
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
    1. Turn the ignition on.
    2. With the scan tool, record and erase DTCs.
    3. Cycle the ignition from on to off three times.
    4. Turn the ignition on and wait 10 seconds.
    5. With the scan tool, read active DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE CAN IHS BUS CIRCUITS FOR THE CAN IHS BUS (125K) MODULES**

    NOTE: When performing this step, turn the ignition off (wait one minute) before disconnecting any module. When the module is disconnected turn the ignition on.

    NOTE: This step is to determine if the fault is a module or the circuits between the module and the Star Connector.

    1. While monitoring the scan tool, disconnect each CAN IHS Bus (125K) module at the Front CAN IHS Star Connector (except for the BCM and DLC), one at a time.
    2. Check for this DTC to become stored after disconnecting each CAN IHS Bus (125K) module the vehicle is equipped with.

    NOTE: If the DTC becomes stored when a particular module is disconnected, that module or related circuits are causing the DTC to set.

    With all the CAN IHS Bus modules disconnected at the Star Connector (except for BCM and DLC), does the scan tool display this DTC as active?

    Yes

    - Go To 3

No

- Diagnose the wiring and connectors between the Front CAN IHS Star Connector and the module that when disconnected caused this DTC to become stored for damage or shorted circuits. If OK, replace the module that when disconnected caused this DTC to become stored in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE CAN IHS BUS (125K) (-) CIRCUIT FOR A SHORT TO VOLTAGE**
   1. Turn the ignition off.
   2. Disconnect the scan tool.
   3. Disconnect the Front CAN IHS Star Connector for the DLC.
   4. Turn the ignition on.
   5. Measure the voltage between ground and the CAN IHS Bus (125K) (-) circuit.

   Is there any voltage present?

   Yes

   - Repair the short to voltage in the CAN IHS Bus (-) circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 4
4. **CHECK THE CAN IHS BUS (125K) (+) CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Measure the resistance between ground and the CAN IHS Bus (125K) (+) circuit.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 5

   No

   - Repair the short to ground in the CAN IHS Bus (125K) (+) circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
5. **CHECK FOR A SHORT BETWEEN THE CAN IHS BUS (125K) (+) CIRCUIT AND CAN IHS BUS (125K) (-) CIRCUIT**
   1. Measure the resistance between the CAN IHS Bus (125K) (-) and the CAN IHS Bus (125K) (+) circuits.

Is the resistance above 10k Ohms?

Yes

- Go To 6

No

- Repair the short between the CAN IHS Bus (125K) (+) circuit and the CAN IHS Bus (125K) (-) circuit.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

6. **CHECK THE CAN IHS BUS CIRCUITS FOR A BCM CONCERN**
   1. Disconnect the Front CAN IHS Star Connector for the BCM.
   2. Reconnect all other connectors.
   3. Cycle the ignition from on to off three times.
   4. Turn the ignition on and wait 10 seconds.
   5. With the scan tool, read all DTCs.

   Do any modules on the CAN IHS BUS (125K) display this DTC or U0010-00-CAN INTERIOR BUS as active?

   Yes

   - Reconnect all the connectors and retest. If the concern is still present, replace the Star Connector.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Diagnose the wiring and connectors between the Front CAN IHS Star Connector and the BCM. If OK, replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U0037-11-LIN BUS - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 71: Driver Door Lock/Unlock Switch LIN BUS, Power & Ground Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

Continuously when the ignition is on.

SET CONDITION

The module detects a short to ground on the LIN Bus circuit.

POSSIBLE CAUSES

Possible Causes
(D903) DRIVER DOOR LIN BUS CIRCUIT SHORTED TO GROUND
(D903) DRIVER DOOR LIN BUS CIRCUIT SHORTED TO THE (D512) DRIVER DOOR LIN BUS RETURN CIRCUIT
DRIVER WINDOW/DOOR LOCK SWITCH
DRIVER DOOR MODULE (DDM)

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**
    1. Cycle the ignition on.
    2. With the scan tool, read active Door Module DTCs.

    Does the scan tool display: U0037-11-LIN BUS - CIRCUIT SHORT TO GROUND as Active?

    Yes

    - Go To 2

    No

    - Refer to **DIAGNOSIS AND TESTING** and perform the STORED LOST COMMUNICATION DTCs diagnostic procedure.
2. **CHECK THE LIN BUS CIRCUIT**
    1. Cycle the ignition off.
    2. Disconnect the Driver Window/Door Lock Switch C1 harness connector.
    3. Cycle the ignition on.
    4. Measure the voltage between the (D903) Driver Door LIN Bus circuit and the (D512) Driver Door Lin Bus Return circuit in the Driver Window Switch C1 connector.

    Is the voltage above 7.0 volts?

    Yes

    - Replace the Driver Window/Door Lock Switch.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

    No

    - Go To 3
3. **(D903) DRIVER DOOR LIN BUS CIRCUIT SHORTED TO GROUND**

Fig. 72: Measuring Resistance Between Ground & LIN Bus Circuit In Door Module C5 Connector
Courtesy of CHRYSLER GROUP, LLC

1. Cycle the ignition off.
2. Disconnect the Driver Door Module C5 harness connector.
3. Measure the resistance between Ground and the (D903) Driver Door LIN Bus circuit in the Door Module C5 harness connector.

   Is the resistance below 10K Ohms?

   Yes

   - Repair the (D903) Driver Door LIN Bus circuit for a short to the ground.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 4

4. **(D903) DRIVER DOOR LIN BUS CIRCUIT SHORTED TO THE (D512) DRIVER DOOR LIN BUS RETURN CIRCUIT**

Fig. 73: Checking LIN BUS Circuit For A Short To The LIN BUS Return Circuit
Courtesy of CHRYSLER GROUP, LLC

1. Measure the resistance between the (D903) Driver Door LIN Bus circuit and the (D512) Driver Door LIN Bus Return circuit in the Door Module C5 harness connector.

   Is the resistance below 10K Ohms?

   Yes

- Repair the (D903) Driver Door LIN Bus circuit for a short to the (D512) Driver Door LIN Bus Sense Return circuit.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace the Driver Door Module in accordance with the Service Information. Refer to **MODULE, DOOR, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U0140-00-LOST COMMUNICATION WITH BODY CONTROL MODULE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously when the ignition is on.

The battery voltage between 10.0 and 16.0 Volts.

Body Control Module (BCM) is configured correctly.

SET CONDITION

Bus messages not received from the Body Control Module (BCM) for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
BODY CONTROL MODULE POWER AND GROUND
BCM NOT CONFIGURED CORRECTLY
BODY CONTROL MODULE (BCM)
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

VERIFY IF THE DTC IS ACTIVE

NOTE: **Make sure the battery is fully charged before performing any diagnostic procedure.**

With the scan tool, refer to the Network Review Screen to display a high level

view of the vehicle communication network. Modules shown in red are problem areas.

Always diagnose any Body Control Module (BCM) DTCs first before proceeding.

1. Turn the ignition on.
2. With the scan tool, read DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM BCM (BODY CONTROL MODULE) diagnostic procedure.

   No

   - Refer to **DIAGNOSIS AND TESTING** and perform the STORED LOST COMMUNICATION DTC diagnostic procedure.

U0164-00-LOST COMMUNICATION WITH HVAC CONTROL MODULE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously when the ignition is on.

Battery voltage between 9 and 16 volts.

SET CONDITION

Bus messages not received from the HVAC Control Module for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN BUS (+) CIRCUIT SHORTED TO VOLTAGE
CAN BUS (-) CIRCUIT SHORTED TO GROUND
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
BODY CONTROL MODULE (BCM) NOT CONFIGURED CORRECTLY
HVAC POWER AND GROUND
HVAC CONTROL MODULE
MODULE THAT SET THE DTC

DIAGNOSTIC TEST

VERIFY DTC IS ACTIVE

1. Cycle the ignition on.
2. With the scan tool, read the active DTCs.

   Does the scan tool display; U0164-00-LOST COMMUNICATION WITH HVAC CONTROL MODULE as Active?

   Yes

   - Refer to the **DTC INDEX** article and perform the U0164-00-LOST COMMUNICATION WITH HVAC CONTROL MODULE.

   No

   - Refer to **DIAGNOSIS AND TESTING** and perform the STORED LOST COMMUNICATION DTCs diagnostic procedure.

U0200-00-LOST COMMUNICATION WITH PASSENGER DOOR MODULE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on for at least five seconds.

Battery voltage between 9 and 16 volts.

SET CONDITION

Bus messages not received from the Passenger Door Module (PDM) for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
PASSENGER DOOR MODULE (PDM) POWERS AND GROUNDS
PASSENGER DOOR MODULE (PDM)
CAN IHS BUS (+) CIRCUIT OPEN
CAN IHS BUS (-) CIRCUIT OPEN

DIAGNOSTIC TEST

CHECK FOR AN ACTIVE DTC

NOTE: If DTC U0010-00-CAN INTERIOR BUS or U0011-00-CAN INTERIOR BUS OFF PERFORMANCE is set in the Body Control Module (BCM), diagnose this DTC before continuing with this diagnostic procedure.

1. Turn the ignition on.
2. With the scan tool, read active DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM PDM (PASSENGER DOOR MODULE) diagnostic procedure.

   No

   - Refer to **DIAGNOSIS AND TESTING** and perform the STORED LOST COMMUNICATION DTCS diagnostic procedure.

U0209-00-LOST COMMUNICATION WITH MEMORY SEAT CONTROL MODULE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously when the ignition is on.

Battery voltage between 9 and 16 volts.

Ignition Off Draw (IOD) fuse installed.

Body Control Module (BCM) is configured correctly.

SET CONDITION

Bus messages not received from the Memory Seat Module for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN INTERIOR BUS(+) (125k) CIRCUIT SHORTED TO VOLTAGE
CAN INTERIOR BUS(-) (125k) CIRCUIT SHORTED TO GROUND
MEMORY SEAT MODULE POWER AND GROUND
BCM NOT CONFIGURED CORRECTLY
MEMORY SEAT MODULE

MODULE THAT SET THIS DTC

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to COMMUNICATION PRE-DIAGNOSTIC PROCEDURE

DIAGNOSTIC TEST

VERIFY DTC IS ACTIVE

NOTE: Make sure the IOD fuse is installed and the battery is fully charged before proceeding.

1. Turn the ignition on.
2. With the scan tool, read active DTCs.

   Is this DTC active?

   Yes

   - Refer to the **DTC INDEX** article and perform the U0209-LOST COMMUNICATION WITH MEMORY SEAT CONTROL MODULE diagnostic procedure.

   No

   - Refer to **DIAGNOSIS AND TESTING** and perform the STORED LOST COMMUNICATION DTCs diagnostic procedure.

U0422-00-IMPLAUSIBLE DATA RECEIVED FROM BODY CONTROL MODULE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on and the vehicle in reverse.

SET CONDITION

Ambient Temperature data not received from the Body Control Module (BCM).

POSSIBLE CAUSES

Possible Causes
NO COMMUNICATION WITH THE BODY CONTROL MODULE (BCM)
DTCS STORED OR ACTIVE IN THE BCM
DRIVER DOOR MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to COMMUNICATION PRE-DIAGNOSTIC PROCEDURE .

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
    1. Turn the ignition on.
    2. With the scan tool, read Drivers Door Module DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **VERIFY BCM IS ACTIVE ON THE CAN BUS**
    1. With the scan tool, select ECU View.
    2. Verify that the BCM is active on the bus.

    Is the BCM active on the bus?

    Yes

    - Go To 3

    No

    - Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM BCM diagnostic procedure.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
3. **DTCS STORED OR ACTIVE IN THE BCM**
    1. With the scan tool, read BCM DTCs.

    Are any DTCs active or stored in the BCM?

    Yes

- Refer to the **BODY CONTROL MODULE (BCM) - DIAGNOSTIC CODE INDEX** article and perform the appropriate diagnostic procedure.

No

- Replace and program the Driver Door Module in accordance with the Service Information. Refer to **MODULE, DOOR, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U0424-00-IMPLAUSIBLE DATA RECEIVED FROM HVAC CONTROL MODULE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on for at least five seconds.

Battery voltage between 9 and 16 volts.

Body Control Module (BCM) is configured correctly.

SET CONDITION

Whenever the communication data sent over the CAN BUS from the HVAC Control Module is missing part of the message, the message is corrupted, or the message is an irrational value.

POSSIBLE CAUSES

Possible Causes
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
BCM NOT CONFIGURED CORRECTLY
HVAC POWER AND GROUND
HVAC CONTROL MODULE
MODULE THAT SET THE DTC

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**

NOTE: Make sure the battery voltage is between 9 and 16 volts before proceeding.

1. With the scan tool, read active DTCs.

   Is this DTC active?

Yes

- Go To 2

No

- Refer to **DIAGNOSIS AND TESTING** and perform the STORED LOST COMMUNICATION DTC diagnostic procedure.

2. **CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS**
   1. With the scan tool, read active DTCs from all modules.

      NOTE: Check for BCM configuration, Bus hardware electrical issues, VIN Missing/Mismatch, battery or ignition related DTCs.

      Does the scan tool display any active DTCs to the conditions listed above?

      Yes

      - Go to and perform the appropriate diagnostic procedure.

      No

      - Go To 3

3. **VERIFY THE HVAC IS ACTIVE ON THE BUS**
   1. Turn the ignition on.
   2. With the scan tool, verify the HVAC is active on the bus.

      Is the HVAC active on the bus?

      Yes

      - Go To 4

      No

      - Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM HVAC diagnostic procedure.

4. **CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS**
   1. With the scan tool, read all the DTCs.

      Is there more than one module with active DTCs "Logged Against" the HVAC?

      Yes

- Replace/update the HVAC Module in accordance with the Service Information. Refer to **CONTROL, A/C AND HEATER, REMOVAL** .
- Perform the appropriate verification test for the module. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 5

5. **CLEAR DTC IN MODULE SETTING FAULT**
   1. With the scan tool, select the module setting the DTC against the HVAC.
   2. Clear active DTCs.

   Is this DTC still active?

   Yes

   - Replace/update the module that set this DTC in accordance with the Service Information.
   - Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - The condition is not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   - Perform the appropriate verification test for the module. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U050A-00-IMPLAUSIBLE DATA RECEIVED FROM MEMORY SEAT CONTROL MODULE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on for at least five seconds.

Battery voltage between 9 and 16 volts.

Body Control Module (BCM) is configured correctly.

SET CONDITION

Whenever the communication data sent over the CAN BUS from the Memory Seat (MSMD) Module is missing part of the message, the message is corrupted, or the message is an irrational value.

POSSIBLE CAUSES

Possible Causes
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
BCM NOT CONFIGURED CORRECTLY
MEMORY SEAT MODULE POWER AND GROUND
MEMORY SEAT MODULE
MODULE THAT SET THE DTC

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to COMMUNICATION PRE-DIAGNOSTIC PROCEDURE .

DIAGNOSTIC TEST

1. **VERIFY DTC IS ACTIVE**

   NOTE: Make sure the battery voltage is between 9 and 16 volts before proceeding.

   1. With the scan tool, read active DTCs.

      Is this DTC active?

      Yes

      - Go To 2

      No

      - Refer to **DIAGNOSIS AND TESTING** and perform the STORED LOST COMMUNICATION DTC diagnostic procedure.
2. **CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS**
   1. With the scan tool, read active DTCs from all modules.

      NOTE: Check for BCM configuration, Bus hardware electrical issues, VIN Missing/Mismatch, battery or ignition related DTCs.

      Does the scan tool display any active DTCs to the conditions listed above?

      Yes

- Go to and perform the appropriate diagnostic procedure.

No

- Go To 3

3. **VERIFY THE MSMD IS ACTIVE ON THE BUS**
   1. Turn the ignition on.
   2. With the scan tool, verify the MSMD is active on the bus.

   Is the MSMD active on the bus?

   Yes

   - Go To 4

   No

   - Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM MSMD diagnostic procedure.

4. **CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS**
   1. With the scan tool, read all the DTCs.

   Is there more than one module with active DTCs "Logged Against" the MSMD?

   Yes

   - Replace/update the MSMD Module in accordance with the Service Information. Refer to **MODULE, MEMORY, SEAT, REMOVAL** .
   - Perform the appropriate verification test for the module. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 5

5. **CLEAR DTC IN MODULE SETTING FAULT**
   1. With the scan tool, select the module setting the DTC against the MSMD.
   2. Clear active DTCs.

   Is this DTC still active?

   Yes

   - Replace/update the module that set this DTC in accordance with the Service Information.

- Perform the appropriate verification test for the module being replaced. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- The condition is not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
- Perform the appropriate verification test for the module. If there is no verification test for the associated module perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U11FA-00-LOST COMMUNICATION WITH RIGHT BLIND SPOT SENSOR

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 74: Identifying Left/Right Blind Spot Sensor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Blind Spot Monitor (BSM) system has two primary components; a Left Blind Spot Sensor (LBSS) and Right Blind Spot Sensor (RBSS). Each sensor includes an internal microprocessor that monitors and controls both the sensor and the blind spot indicator. The two sensors are concealed behind the outboard ends of the rear bumper fascia.

The microprocessor analyzes the sensor data to determine whether any detected objects should be reported. When it is determined that an object should be reported, the Sensor controls its respective left or right BSM display directly through a hard wired output to the Outside Rearview Mirrors. The sensor also sends an electronic request message over the CAN IHS Bus to the radio. The Radio then mutes any current output through the speakers and generates a chime as an audible alert.

Each sensor performs a bulb test by illuminating the triangle icon in the Outside Rearview Mirror at each ignition ON cycle.

WHEN MONITORED

With the ignition on.

SET CONDITION

The Left Blind Spot Sensor (LBSS) does not receive messages from the Right Blind Spot Sensor (RBSS).

POSSIBLE CAUSES

Possible Causes
FUSED IGNITION OUTPUT (RUN) CIRCUIT OPEN OR SHORTED TO GROUND
GROUND CIRCUIT(S) OPEN
CAN IHS BUS CIRCUIT(S) OPEN
RIGHT BLIND SPOT SENSOR (RBSS)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **(F923) FUSED IGNITION OUTPUT (RUN) CIRCUIT OPEN**

1. Disconnect the Right Blind Spot Sensor (RBSS) harness connector.
2. Turn the ignition on.
3. Using a volt meter, measure the voltage of the (F923) Fused Ignition Output (RUN) circuit.

   Is voltage present?

   Yes

   - Go To 3

   No

   - Repair the (F923) Fused Ignition Switch Output (RUN) circuit for an open or short to ground.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **(Z923) GROUND CIRCUIT(S) OPEN**
   1. Turn the ignition off.
   2. Using an ohm meter, measure the resistance between ground and the (Z923) Ground circuits at the RBSS harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go To 4

      No

      - Repair the (Z923) Ground circuit(s) for an open.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK THE (D217) AND (D218) CAN IHS BUS CIRCUITS FOR AN OPEN**
   1. Turn the ignition on.
   2. Measure the resistance of the (D217) CAN IHS Bus (-) circuit between the Rear CAN IHS Star Connector C4 harness connector and the RBSS harness connector
   3. Measure the resistance of the (D218) CAN IHS Bus (+) circuit between the Rear CAN IHS Star Connector C4 harness connector and the RBSS harness connector.

      Is resistance below 5.0 Ohms on both circuits?

      Yes

      - Replace the Right Blind Spot Sensor in accordance with the Service Information. Refer to **SENSOR, BLIND SPOT, REMOVAL** .

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Repair the (D218) or (D217) CAN IHS Bus circuit for an open. Inspect the connector for damage.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U11FB-00-LOST COMMUNICATION WITH LEFT BLIND SPOT SENSOR

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 75: Identifying Left/Right Blind Spot Sensor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Blind Spot Monitor (BSM) system has two primary components; a Left Blind Spot Sensor (LBSS) and Right Blind Spot Sensor (RBSS). Each sensor includes an internal microprocessor that monitors and controls both the sensor and the blind spot indicator. The two sensors are concealed behind the outboard ends of the rear bumper fascia.

The microprocessor analyzes the sensor data to determine whether any detected objects should be reported. When it is determined that an object should be reported, the Sensor controls its respective left or right BSM display directly through a hard wired output to the Outside Rearview Mirrors. The sensor also sends an electronic request message over the CAN IHS Bus to the radio. The Radio then mutes any current output through the speakers and generates a chime as an audible alert.

Each sensor performs a bulb test by illuminating the triangle icon in the Outside Rearview Mirror at each ignition ON cycle.

WHEN MONITORED

With the ignition on.

SET CONDITION

The Right Blind Spot Sensor (LBSS) does not receive messages from the Left Blind Spot Sensor (RBSS).

POSSIBLE CAUSES

Possible Causes
FUSED IGNITION OUTPUT (RUN) CIRCUIT OPEN OR SHORTED TO GROUND
GROUND CIRCUIT(S) OPEN
CAN IHS BUS CIRCUIT(S) OPEN
LEFT BLIND SPOT SENSOR (RBSS)

DIAGNOSTIC TEST

VERIFY DTC IS ACTIVE

1. Cycle the ignition on.
2. With the scan tool, read the active DTCs.

   Does the scan tool display; U11FB-00- LOST COMMUNICATION WITH LEFT BLIND SPOT SENSOR as Active?

   Yes

   - Refer to **DIAGNOSIS AND TESTING** and perform the U11FB-00- LOST COMMUNICATION WITH LEFT BLIND SPOT SENSOR.

   No

   - Refer to **DIAGNOSIS AND TESTING** and perform the STORED LOST COMMUNICATION DTCs diagnostic procedure.

U113D-00-LOST COMMUNICATION WITH MASTER POWER WINDOW SWITCH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 76: Driver Door Lock/Unlock Switch LIN BUS, Power & Ground Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

Whenever the module is awake.

SET CONDITION

When one or both door modules have lost communication with the Driver Window/Door Lock Switch, this code will set.

POSSIBLE CAUSES

Possible Causes
(Q291) DOOR MODULE FEED TO DOOR SWITCH OPEN
(D903) DRIVER DOOR LIN BUS CIRCUIT SHORT TO GROUND
(D903) DRIVER DOOR LIN BUS CIRCUIT SHORT TO VOLTAGE
(D903) DRIVER DOOR LIN BUS CIRCUIT OPEN
(D512) DRIVER DOOR LIN BUS RETURN CIRCUIT OPEN
DRIVER WINDOW/DOOR LOCK SWITCH
DRIVER DOOR MODULE (DDM)

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**

   NOTE: Make sure the battery is fully charged before proceeding.

   1. Cycle the ignition on.
   2. With the scan tool, record and erase DTCs.
   3. Try to operate the Front Windows up and down several times.
   4. Wait 30 seconds.
   5. With the scan tool, read the active DTCs.

   Does the scan tool display; U113D-00-LOST COMMUNICATION WITH MASTER POWER WINDOW SWITCH?

   Yes

   - Go To 2

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and poor pin fit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **(Q291) DOOR MODULE FEED TO DOOR SWITCH CIRCUIT OPEN**
   1. With the scan tool, erase the DTCs.
   2. Cycle the ignition off.
   3. Disconnect the Driver Window/Door Lock Switch harness connector.

4. Cycle the ignition on.
5. Using a 12-volt test light connected to Ground, check the (Q291) Door Module Feed To Window Switch circuit in the Driver Window/Door Lock Switch harness connector.

   Does the test light illuminate brightly?

   Yes

   - Go To 3

   No

   - Go To 9

3. **CHECK THE LIN BUS CIRCUIT**
   1. Measure the voltage between the (D903) Driver Door LIN Bus circuit and the (D512) Driver Door LIN Bus Return circuit in the Driver Window/Door Lock Switch C1 connector.

      Is the voltage above 8.0 volts?

      Yes

      - Go To 4

      No

      - Go To 5

4. **(D903) DRIVER DOOR LIN BUS CIRCUIT SHORT TO VOLTAGE**

Fig. 77: Checking LIN BUS Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Cycle the ignition off.
2. Disconnect the Driver Door Module C5 harness connector.
3. Cycle the ignition on.
4. Measure the voltage between Ground and the (D903) Driver Door LIN Bus circuit.

   Is there any voltage present?

   Yes

   - Repair the (D903) Driver Door LIN Bus circuit for a short to voltage.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Replace the Driver Window/Door Lock Switch. Refer to **SWITCH, POWER WINDOW, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **(D512) DRIVER DOOR LIN BUS RETURN CIRCUIT OPEN**
   1. Using a 12-volt test light connected to 12-volts, check the (D512) Driver Door LIN Bus Return circuit in the Driver Window/Door Lock Switch C1 harness connector.

      Does the test light illuminate brightly?

      Yes

      - Go To 6

      No

      - Repair the (D512) Driver Door LIN Bus Return circuit for an open.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
6. **(D903) DRIVER DOOR LIN BUS CIRCUIT SHORTED TO VOLTAGE**

Fig. 78: Checking Driver Door Lin Bus Circuit For Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Cycle the ignition on.
2. Measure the voltage between Ground and the (D903) Driver Door LIN Bus circuit in the Door Module C5 harness connector.

   Is there any voltage present?

   Yes

   - Repair the short to voltage in the (D903) LIN Bus circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

- Go To 7

7. **(D903) DRIVER DOOR LIN BUS CIRCUIT SHORTED TO GROUND**
   1. Measure the resistance between Ground and the (D903) Driver Door LIN Bus circuit in the Door Module C5 harness connector.

      Is the resistance below 10K Ohms?

      Yes

      - Repair the short to the ground in the (D903) Driver Door LIN Bus circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 8

8. **(D903) DRIVER DOOR LIN BUS CIRCUIT OPEN**
   1. Measure the resistance of the (D903) Driver Door LIN Bus circuit between the Door Module C5 harness connector and the Driver Window/Door Lock Switch C1 harness connector.

      Is the resistance below 2.0 Ohms?

      Yes

      - Replace the Driver Door Module in accordance with the Service Information. Refer to **MODULE, DOOR, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Repair the (D903) Driver Door LIN Bus circuit for an open.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

9. **(Q291) DOOR MODULE FEED TO DOOR SWITCH WIRE OPEN**
   1. Cycle the ignition off.
   2. Disconnect the Driver Window/Door Lock Switch C1 connector.
   3. Measure the resistance of the (Q291) Door Module Feed To Door Switch circuit between the Door Module C5 harness connector and the Driver Window/Door Lock Switch C1 harness connector.

      Is the resistance below 2.0 Ohms?

      Yes

      - Replace the Driver Door Module in accordance with the Service Information. Refer to **MODULE, DOOR, REMOVAL** .

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Repair the (Q291) Door Module Feed To Door Switch circuit for an open.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U147D-00-IMPLAUSIBLE DATA RECEIVED FROM RIGHT BLIND SPOT SENSOR

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

Incorrect data received from the Right Blind Spot Sensor (RBSS).

POSSIBLE CAUSES

Possible Causes
NO COMMUNICATION WITH THE RIGHT BLIND SPOT SENSOR (RBSS)
DTCS STORED OR ACTIVE IN THE RBSS
RIGHT BLIND SPOT SENSOR (RBSS)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**

NOTE: Diagnose and repair any Right Blind Spot Sensor DTCs before proceeding with this diagnostic procedure.

1. Turn the ignition on.
2. With the scan tool, read active DTCs.

Does the scan tool display this DTC as active?

Yes

- Go To 2

No

- The condition that caused this code to set is not present at this time. Check for an intermittent

condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **VERIFY THE RBSS IS ACTIVE ON THE CAN BUS**
   1. With the scan tool, verify that the RBSS is active on the bus.

      Is the RBSS active on the bus?

      Yes

      - Replace and program the Blind Spot Sensor in accordance with the Service Information. Refer to **SENSOR, BLIND SPOT, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM RBSS diagnostic procedure.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U147E-00-IMPLAUSIBLE DATA RECEIVED FROM LEFT BLIND SPOT SENSOR

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

Incorrect data received from the Left Blind Spot Sensor (LBSS).

POSSIBLE CAUSES

Possible Causes
NO COMMUNICATION WITH THE LEFT BLIND SPOT SENSOR (LBSS)
DTCS STORED OR ACTIVE IN THE LBSS
LEFT BLIND SPOT SENSOR (LBSS)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**

NOTE: Diagnose and repair any Left Blind Spot Sensor DTCs before proceeding with this diagnostic procedure.

1. Turn the ignition on.
2. With the scan tool, read active DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Go To 2

   No

   - The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **VERIFY THE LBSS IS ACTIVE ON THE CAN IHS BUS**
   1. With the scan tool, verify that the LBSS is active on the bus.

      Is the LBSS active on the bus?

      Yes

      - Replace and program the Blind Spot Sensor in accordance with the Service Information. Refer to **SENSOR, BLIND SPOT, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM LBSS diagnostic procedure.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

DIAGNOSIS AND TESTING

C008E-00-ECU INTERNAL PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Ignition on.

SET CONDITION

The Drive Train Control Module (DTCM) runs a self diagnostic test to validate proper controller operation. This DTC will set if the controller has failed one or more internal test.

POSSIBLE CAUSES

Possible Causes
DRIVE TRAIN CONTROL MODULE (DTCM)

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**

1. Turn the ignition on.
2. Using the scan tool, read the DTCs.

   Is the DTC active at this time?

   Yes

   - Replace the Drive Train Control Module (DTCM) in accordance with the Service Information. Refer to **MODULE, DRIVETRAIN CONTROL, REMOVAL** .
   - Perform the DTCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 2

2. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this module. Wiggle the wiring and connectors while checking for shorted and open circuits.
   3. Check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Check Service Bulletins for any possible causes that may apply.

      Were there any problems found?

      Yes

      - Repair as necessary.
      - Perform the DTCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Test complete.

C140B-11-TRANSFER CASE MOTOR - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 1: Transfer Case Motor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the ignition on and no undervoltage or overvoltage condition present.

SET CONDITION

A faulted condition is detected in the H-bridge driver.

POSSIBLE CAUSES

Possible Causes
(T315) SHIFT MOTOR CONTROL A CIRCUIT SHORTED TO GROUND
(T316) SHIFT MOTOR CONTROL B CIRCUIT SHORTED TO GROUND
(T315) SHIFT MOTOR CONTROL A CIRCUIT SHORTED TO THE (T316) SHIFT MOTOR CONTROL B CIRCUIT
ELECTRONICALLY CONTROLLED CLUTCH (ECC)
DRIVE TRAIN CONTROL MODULE (DTCM)

DIAGNOSTIC TEST

1. **VERIFY THE DTC ACTIVE**
    1. Ignition on, engine not running.
    2. With the scan tool, record and erase DTCs.
    3. Test drive the vehicle.
    4. Ignition on, engine not running.
    5. With the scan tool, read DTCs.

    Is the DTC active at this time?

    Yes

    - Go To 2

    No

    - Test complete.
2. **(T315) SHIFT MOTOR CONTROL A CIRCUIT SHORTED TO GROUND**
    1. Turn the ignition off to the lock position.
    2. Disconnect the ECC Actuator C2 harness connector.
    3. Disconnect the DTCM C2 harness connector.
    4. Ignition on, engine not running.
    5. Measure the resistance between ground and the (T315) Shift Motor Control A circuit at the Transfer Case Shift Motor/Mode Sensor Assembly harness connector.

    Is the resistance below 5.0 Ohms?

    Yes

    - Repair the (T315) Shift Motor Control A circuit for a short to ground.
    - Perform the TRANSFER CASE VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 3

3. **(T316) SHIFT MOTOR CONTROL B CIRCUIT SHORTED TO GROUND**
   1. Measure the resistance between ground and the (T316) Shift Motor Control B circuit at the Transfer Case Motor/Mode Sensor Assembly harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Repair the (T316) Shift Motor Control B circuit for a short to ground.
      - Perform the TRANSFER CASE VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Go To 4

4. **(T315) SHIFT MOTOR CONTROL A CIRCUIT SHORTED TO THE (T316) SHIFT MOTOR CONTROL B CIRCUIT**
   1. Measure the resistance between the (T315) Shift Motor Control A circuit and the (T316) Shift Motor Control B circuit at the ECC Actuator harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Repair the (T315) Shift Motor Control A circuit and the (T316) Shift Motor Control B circuit for a short.
      - Perform the TRANSFER CASE VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Replace the Drive Train Control Module (DTCM) in accordance with the Service Information. Refer to **MODULE, DRIVETRAIN CONTROL, REMOVAL** .
      - Perform the DTCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

5. **INTERMITTENT WIRING HARNESS AND CONNECTORS**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
   3. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
   4. Look for the data to change or for the DTC to reset during the wiggle test.

5. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
6. Look for the data to change other than as expected or for the DTC to reset.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the DTCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

C140B-12-TRANSFER CASE MOTOR - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 2: Transfer Case Motor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the ignition on and no undervoltage or overvoltage condition present.

SET CONDITION

A faulted condition is detected in the H-bridge driver.

POSSIBLE CAUSES

Possible Causes
(T315) SHIFT MOTOR CONTROL A CIRCUIT SHORTED TO BATTERY
(T316) SHIFT MOTOR CONTROL B CIRCUIT SHORTED TO BATTERY
(T315) SHIFT MOTOR CONTROL A CIRCUIT SHORTED TO THE (T316) SHIFT MOTOR CONTROL B CIRCUIT
ELECTRONICALLY CONTROLLED CLUTCH (ECC)
DRIVE TRAIN CONTROL MODULE (DTCM)

DIAGNOSTIC TEST

1. **VERIFY THE DTC ACTIVE**
    1. Ignition on, engine not running.
    2. With the scan tool, record and erase DTCs.
    3. Test drive the vehicle.
    4. Ignition on, engine not running.
    5. With the scan tool, read DTCs.

    Is the DTC active at this time?

    Yes

    - Go To 2

    No

    - Test complete.
2. **(T315) SHIFT MOTOR CONTROL A CIRCUIT SHORTED TO BATTERY**
    1. Turn the ignition off to the lock position.
    2. Disconnect the ECC Actuator C2 harness connector.
    3. Disconnect the DTCM C2 harness connector.
    4. Ignition on, engine not running.
    5. Measure the resistance between battery and the (T315) Shift Motor Control A circuit at the Transfer Case Shift Motor/Mode Sensor Assembly harness connector.

    Is the resistance below 5.0 Ohms?

    Yes

    - Repair the (T315) Shift Motor Control A circuit for a short to battery.
    - Perform the DTCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 3

3. **(T316) SHIFT MOTOR CONTROL B CIRCUIT SHORTED TO BATTERY**
   1. Measure the resistance between battery and the (T316) Shift Motor Control B circuit at the Transfer Case Motor/Mode Sensor Assembly harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Repair the (T316) Shift Motor Control B circuit for a short to battery.
      - Perform the DTCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Go To 4

4. **(T315) SHIFT MOTOR CONTROL A CIRCUIT SHORTED TO THE (T316) SHIFT MOTOR CONTROL B CIRCUIT**
   1. Measure the resistance between the (T315) Shift Motor Control A circuit and the (T316) Shift Motor Control B circuit at the ECC Actuator harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Repair the (T315) Shift Motor Control A circuit and the (T316) Shift Motor Control B circuit for a short.
      - Perform the DTCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Go To 5

5. **DRIVE TRAIN CONTROL MODULE (DTCM)**
   1. Turn the ignition off to the lock position.
   2. Replace the Electronically Controlled Clutch (ECC) Actuator in accordance with the Service Information.
   3. Perform the DTCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
   4. With the scan tool, read the DTCs.

      Does the DTC remain active?

      Yes

- Replace the Drive Train Control Module (DTCM) in accordance with the Service Information. Refer to **MODULE, DRIVETRAIN CONTROL, REMOVAL** .
- Perform the DTCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete.

C140B-13-TRANSFER CASE MOTOR - CIRCUIT OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 3: Transfer Case Motor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the ignition on and no system undervoltage or overvoltage condition present.

SET CONDITION

The Drive Train Control Module (DTCM) detects an open circuit on one of the Electronically Controlled Clutch

(ECC) Actuator Motor circuits.

POSSIBLE CAUSES

Possible Causes
(T315) SHIFT MOTOR CONTROL A CIRCUIT OPEN
(T316) SHIFT MOTOR CONTROL B CIRCUIT OPEN
(T315) SHIFT MOTOR CONTROL A CIRCUIT SHORTED TO VOLTAGE
(T316) SHIFT MOTOR CONTROL B CIRCUIT SHORTED TO VOLTAGE
ELECTRONICALLY CONTROLLED CLUTCH (ECC) ACTUATOR
DRIVE TRAIN CONTROL MODULE (DTCM)

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. With the scan tool, record and erase DTCs.
    3. Test drive the vehicle.
    4. Ignition on, engine not running.
    5. With the scan tool, read DTCs.

    Is the DTC active at this time?

    Yes

    - Go To 2

    No

    - Go To 7
2. **(T315) SHIFT MOTOR CONTROL A CIRCUIT OPEN**
    1. Turn the ignition off to the lock position.
    2. Disconnect the ECC Actuator C2 harness connector.
    3. Disconnect the DTCM C2 harness connector.
    4. Measure the resistance of the (T315) Shift Motor Control A circuit from the ECC Actuator C2 harness connector to the DTCM C2 harness connector.

    Is the resistance above 5.0 Ohms?

    Yes

    - Repair the (T315) Shift Motor Control B circuit for an open.
    - Perform the DTCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 3

3. **(T316) SHIFT MOTOR CONTROL B CIRCUIT OPEN**
   1. Measure the resistance of the (T316) Shift Motor Control C circuit from the ECC Actuator C2 harness connector to the DTCM C2 harness connector.

      Is the resistance above 5.0 Ohms?

      Yes

      - Repair the (T316) Shift Motor Control C circuit for an open.
      - Perform the DTCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Go To 4

4. **(T315) SHIFT MOTOR CONTROL A CIRCUIT SHORTED TO VOLTAGE**
   1. Ignition on, engine not running.
   2. Measure the voltage of the (T315) Shift Motor Control A circuit at the ECC Actuator C2 harness connector.

      Is the voltage above 0.5 of a volt?

      Yes

      - Repair the (T315) Shift Motor Control A circuit for a short to voltage.
      - Perform the TRANSFER CASE VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Go To 5

5. **(T316) SHIFT MOTOR CONTROL B CIRCUIT SHORTED TO VOLTAGE**
   1. Measure the voltage of the (T316) Shift Motor Control B circuit at the ECC Actuator C2 harness connector.

      Is the voltage above 0.5 of a volt?

      Yes

      - Repair the (T316) Shift Motor Control B circuit for a short to voltage.
      - Perform the TRANSFER CASE VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 6

6. **ELECTRONICALLY CONTROLLED CLUTCH (ECC) ACTUATOR**
   1. Connect the ECC Actuator C2 harness connector.
   2. Measure the resistance between the (T315) Shift Motor Control A circuit and the (T316) Shift Motor Control B circuit at the DTCM C2 harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Replace the Drive Train Control Module (DTCM) in accordance with the Service Information.
      - Perform the DTCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Replace the shorted Electronically Controlled Clutch (ECC) Actuator in accordance with the Service Information.
      - Perform the DTCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
7. **INTERMITTENT WIRING HARNESS AND CONNECTORS**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
   3. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
   4. Look for the data to change or for the DTC to reset during the wiggle test.
   5. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
   6. Look for the data to change other than as expected or for the DTC to reset.

      Were any problems found?

      Yes

      - Repair as necessary.
      - Perform the TRANSFER CASE VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Test complete.

C140B-4B-TRANSFER CASE MOTOR - OVER TEMPERATURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 4: Transfer Case Motor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the ignition on.

SET CONDITION

A calibrated motor abuse temperature limit has been achieved. The Drive Train Control Module (DTCM) monitors the motor use and has determined that excessive motor activations have occurred. This DTC will be stored after Transfer Case Motor has cooled down.

POSSIBLE CAUSES

Possible Causes
TERRAIN SWITCH BANK MODULE (TSBM)
AMBIENT TEMPERATURE SENSOR
CLUSTER CONTROL NODE (CCN)
DRIVE TRAIN CONTROL MODULE (DTCM)

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**

   NOTE: Diagnose and repair any system voltage or Transfer Case related DTCs in the Drive Train Control Module (DTCM) before continuing with this test.

   1. Ignition on, engine not running.
   2. With the scan tool, clear Stored DTCs in the DTCM and the CCN.
   3. Test drive the vehicle.
   4. During the test drive, move the Transfer Case Selector Switch (if equipped) to each position several times in accordance with the Service Information.
   5. With the scan tool, read DTCs in the DTCM and the CCN.

   Is the DTC active at this time?

   Yes

   - Go To 2

   No

   - Go To 5

2. **AMBIENT TEMPERATURE SENSOR**
   1. With the scan tool, monitor the ambient temperature in the Body Control Module (BCM).

   Is the ambient temperature at room temperature?

   Yes

- Go To 3

No

- Replace the Ambient Temperature Sensor in accordance with the Service Information.
- Perform the TRANSFER CASE VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

3. **TERRAIN SWITCH BANK MODULE (TSBM) WIRING/HARNESS CONNECTOR**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors relative to this circuit.
   2. While monitoring the scan tool data relative to this circuit, wiggle test the wiring and connectors.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the TRANSFER CASE VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 4

4. **TERRAIN SWITCH BANK MODULE (TSBM)**
   1. Turn the ignition off to the lock position
   2. Replace the Terrain Switch Bank Module (TSBM).
   3. Ignition on, engine not running.
   4. With the scan tool, clear Stored DTCs in the CCN and the DTCM.
   5. Test drive the vehicle.
   6. During the test drive, move the Terrain Switch Bank Module (TSBM) to each position several times in accordance with the Service Information.
   7. With the scan tool, read DTCs in the CCN and the DTCM.

   Does the DTC remain active?

   Yes

   - Replace the Drive Train Control Module (DTCM) in accordance with the Service Information. Refer to **MODULE, DRIVETRAIN CONTROL, REMOVAL** .
   - Perform the DTCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

- Test complete.

5. **INTERMITTENT WIRING AND CONNECTORS**
    1. The conditions necessary to set this DTC are not present at this time.
    2. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
    3. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
    4. Look for the data to change or for the DTC to reset during the wiggle test.
    5. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
    6. Look for the data to change other than as expected or for the DTC to reset.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the TRANSFER CASE VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Test complete.

C1415-92-TRANFER CASE MOTOR CURRENT - PERFORMANCE OR INCORRECT OPERATION

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 5: Transfer Case Motor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the ignition on and no system undervoltage or overvoltage condition present.

SET CONDITION

1. Current reading greater than 1A for 200 msec with no motor activation.

2. Current reading never greater than 1A during a completed range or neutral shift.

POSSIBLE CAUSES

Possible Causes
(T315) SHIFT MOTOR CONTROL A CIRCUIT OPEN OR HIGH RESISTANCE
(T316) SHIFT MOTOR CONTROL B CIRCUIT OPEN OR HIGH RESISTANCE
DRIVE TRAIN CONTROL MODULE (DTCM)

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. With the scan tool, record and erase DTCs.
    3. Test drive the vehicle
    4. Ignition on, engine not running.
    5. With the scan tool, read DTCs.

    Is the DTC active at this time?

    Yes

    - Go To 2

    No

    - Go To 4
2. **(T315) SHIFT MOTOR CONTROL A CIRCUIT OPEN OR HIGH RESISTANCE**
    1. Turn the ignition off to the lock position.
    2. Disconnect the Transfer Case Shift Motor/Mode Sensor Assembly harness connector.
    3. Disconnect the DTCM C2 harness connector.
    4. Measure the resistance of the (T315) Shift Motor Control A circuit from the Transfer Case Shift Motor/Mode Sensor Assembly harness connector to the DTCM C2 harness connector.

    Is the resistance above 5.0 Ohms?

    Yes

    - Repair the (T315) Shift Motor Control A circuit for an open or high resistance.
    - Perform the TRANSFER CASE VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

- Go To 3

3. **(T316) SHIFT MOTOR CONTROL B CIRCUIT OPEN OR HIGH RESISTANCE**
   1. Measure the resistance of the (T316) Shift Motor Control B circuit from the Transfer Case Shift Motor/Mode Sensor Assembly harness connector to the DTCM C2 harness connector.

      Is the resistance above 5.0 Ohms?

      Yes

      - Repair the (T316) Shift Motor Control B circuit for an open or high resistance.
      - Perform the TRANSFER CASE VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Replace the Drive Train Control Module (DTCM) in accordance with the Service Information. Refer to **MODULE, DRIVETRAIN CONTROL, REMOVAL** .
      - Perform the DTCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
4. **INTERMITTENT WIRING HARNESS AND CONNECTORS**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
   3. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
   4. Look for the data to change or for the DTC to reset during the wiggle test.
   5. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
   6. Look for the data to change other than as expected or for the DTC to reset.

      Were any problems found?

      Yes

      - Repair as necessary.
      - Perform the DTCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Test complete.

C1440-11-TRANSFER CASE CLUTCH PRESSURE SENSOR - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 6: Transfer Case Motor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the ignition on and no undervoltage or overvoltage condition present.

SET CONDITION

The Drive Train Control Module (DTCM) detects an error from the drivetrain sensor incorporated in the

Electronically Controlled Clutch (ECC).

POSSIBLE CAUSES

Possible Causes
(K604) DRIVETRAIN SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
(K604) DRIVETRAIN SENSOR SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
(K504) DRIVETRAIN SENSOR 5V SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE
ELECTRONICALLY CONTROLLED CLUTCH (ECC)
DRIVE TRAIN CONTROL MODULE (DTCM)

DIAGNOSTIC TEST

1. **VERIFY THE DTC ACTIVE**
    1. Ignition on, engine not running.
    2. With the scan tool, record and erase DTCs.
    3. Test drive the vehicle.
    4. Ignition on, engine not running.
    5. With the scan tool, read DTCs.

    Is the DTC active at this time?

    Yes

    - Go To 2

    No

    - Go To 6
2. **(K604) DRIVETRAIN SENSOR SIGNAL CIRCUIT SHORTED TO GROUND**
    1. Turn the ignition off to the lock position.
    2. Disconnect the ECC Actuator C1 harness connector.
    3. Disconnect the DTCM C1 harness connector.
    4. Measure the resistance between ground and the (K604) Drivetrain Sensor Signal circuit at the DTCM C1 harness connector.

    Is the resistance below 5.0 Ohms?

    Yes

    - Repair the (K604) Drivetrain Sensor Signal circuit for a short to ground.
    - Perform the DTCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 3

3. **(K604) DRIVETRAIN SENSOR SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE**
   1. Measure the resistance of the (K604) Drivetrain Sensor Signal circuit between the ECC Actuator C1 harness connector and the DTCM C1 harness connector.

      Is the resistance above 5.0 Ohms?

      Yes

      - Repair the (K604) Drivetrain Sensor Signal circuit for an open or high resistance.
      - Perform the DTCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Go To 4

4. **(K504) DRIVETRAIN SENSOR 5V SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE**
   1. Measure the resistance of the (K504) Drivetrain Sensor 5V Supply circuit between the ECC Actuator C1 harness connector and the DTCM C1 harness connector.

      Is the resistance above 5.0 Ohms?

      Yes

      - Repair the (K504) Drivetrain Sensor 5V Supply circuit for an open or high resistance.
      - Perform the DTCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Go To 5

5. **ELECTRONICALLY CONTROLLED CLUTCH (ECC)**
   1. Replace the Electronically Controlled Clutch (ECC) in accordance with the Service Information.
   2. Ignition on, engine not running.
   3. With the scan tool, record and erase DTCs.
   4. Test drive the vehicle. If equipped with a Terrain Selector Switch drive the vehicle in each Transfer Case range and verify proper operation in each range.
   5. Ignition on, engine not running.
   6. With the scan tool, read DTCs.

      Does the DTC remain active?

      Yes

- Replace the Drive Train Control Module (DTCM) in accordance with the Service Information. Refer to **MODULE, DRIVETRAIN CONTROL, REMOVAL** .
- Perform the DTCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete.

6. **INTERMITTENT WIRING HARNESS AND CONNECTORS**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
   3. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
   4. Look for the data to change or for the DTC to reset during the wiggle test.
   5. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
   6. Look for the data to change other than as expected or for the DTC to reset.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the DTCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

C1440-12-TRANSFER CASE CLUTCH PRESSURE SENSOR - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 7: Transfer Case Motor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the ignition on and no undervoltage or overvoltage condition present.

SET CONDITION

The Drive Train Control Module (DTCM) detects an error from the drivetrain sensor incorporated in the

Electronically Controlled Clutch (ECC).

POSSIBLE CAUSES

Possible Causes
(K604) DRIVETRAIN SENSOR SIGNAL CIRCUIT SHORTED TO BATTERY
(K594) DRIVETRAIN SENSOR RETURN CIRCUIT OPEN OR HIGH RESISTANCE
(Z924) GROUND CIRCUIT OPEN OR HIGH RESISTANCE
ELECTRONICALLY CONTROLLED CLUTCH (ECC)
DRIVE TRAIN CONTROL MODULE (DTCM)

DIAGNOSTIC TEST

1. **VERIFY THE DTC ACTIVE**
    1. Ignition on, engine not running.
    2. With the scan tool, record and erase DTCs.
    3. Test drive the vehicle.
    4. Ignition on, engine not running.
    5. With the scan tool, read DTCs.

    Is the DTC active at this time?

    Yes

    - Go To 2

    No

    - Go To 6
2. **(K604) DRIVETRAIN SENSOR SIGNAL CIRCUIT SHORTED TO BATTERY**
    1. Turn the ignition off to the lock position.
    2. Disconnect the ECC Actuator C1 harness connector.
    3. Disconnect the DTCM C1 harness connector.
    4. Ignition on, engine not running.
    5. Measure the voltage of the (K604) Drivetrain Sensor Signal circuit between the ECC Actuator C1 harness connector and the DTCM C1 harness connector.

    Is there any voltage present?

    Yes

    - Repair the (K604) Drivetrain Sensor Signal circuit for a short to battery.
    - Perform the DTCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 3

3. **(K594) DRIVETRAIN SENSOR SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE**
   1. Turn the ignition off to the lock position.
   2. Measure the resistance of the (K594) Drivetrain Sensor Return circuit between the ECC Actuator C1 harness connector and the DTCM C1 harness connector.

      Is the resistance above 5.0 Ohms?

      Yes

      - Repair the (K594) Drivetrain Sensor Return circuit for an open or high resistance.
      - Perform the DTCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Go To 4

4. **(Z924) DRIVETRAIN SENSOR RETURN CIRCUIT OPEN OR HIGH RESISTANCE**
   1. Disconnect the Rear Driveline Module (RDM) harness connector.
   2. Measure the resistance of the (Z924) Ground circuit between the RDM harness connector and ground.

      Is the resistance above 5.0 Ohms?

      Yes

      - Repair the (Z924) Ground circuit for an open or high resistance.
      - Perform the DTCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Go To 5

5. **ELECTRONICALLY CONTROLLED CLUTCH (ECC)**
   1. Replace the Electronically Controlled Clutch (ECC) in accordance with the Service Information.
   2. Ignition on, engine not running.
   3. With the scan tool, record and erase DTCs.
   4. Test drive the vehicle. If equipped with a Terrain Selector Switch drive the vehicle in each Transfer Case range and verify proper operation in each range.
   5. Ignition on, engine not running.
   6. With the scan tool, read DTCs.

      Does the DTC remain active?

Yes

- Replace the Drive Train Control Module (DTCM) in accordance with the Service Information. Refer to **MODULE, DRIVETRAIN CONTROL, REMOVAL** .
- Perform the DTCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete.

6. **INTERMITTENT WIRING HARNESS AND CONNECTORS**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
   3. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
   4. Look for the data to change or for the DTC to reset during the wiggle test.
   5. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
   6. Look for the data to change other than as expected or for the DTC to reset.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the DTCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

C1440-1C-TRANSFER CASE CLUTCH PRESSURE SENSOR - CIRCUIT VOLTAGE OUT OF RANGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 8: Transfer Case Motor Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the ignition on and no undervoltage or overvoltage condition present.

SET CONDITION

The Drive Train Control Module (DTCM) detects an error from the drivetrain sensor incorporated in the

Electronically Controlled Clutch (ECC).

POSSIBLE CAUSES

Possible Causes
(K504) DRIVETRAIN SENSOR 5V SUPPLY CIRCUIT SHORTED TO BATTERY
(K504) DRIVETRAIN SENSOR 5V SUPPLY CIRCUIT SHORTED TO GROUND
ELECTRONICALLY CONTROLLED CLUTCH (ECC)
DRIVE TRAIN CONTROL MODULE (DTCM)

DIAGNOSTIC TEST

1. **VERIFY THE DTC ACTIVE**
    1. Ignition on, engine not running.
    2. With the scan tool, record and erase DTCs.
    3. Test drive the vehicle.
    4. Ignition on, engine not running.
    5. With the scan tool, read DTCs.

    Is the DTC active at this time?

    Yes

    - Go To 2

    No

    - Go To 5
2. **(K504) DRIVETRAIN SENSOR 5V SUPPLY CIRCUIT SHORTED TO BATTERY**
    1. Turn the ignition off to the lock position.
    2. Disconnect the ECC Actuator C1 harness connector.
    3. Disconnect the DTCM C1 harness connector.
    4. Ignition on, engine not running.
    5. Measure the voltage of the (K504) Drivetrain Sensor 5V Supply circuit between the ECC Actuator C1 harness connector and the DTCM C1 harness connector.

    Is there any voltage present?

    Yes

    - Repair the (K504) Drivetrain Sensor 5V Supply circuit for a short to battery.
    - Perform the DTCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 3

3. **(K504) DRIVETRAIN SENSOR 5V SUPPLY CIRCUIT SHORTED TO GROUND**
   1. Turn the ignition off to the lock position.
   2. Disconnect the ECC Actuator C1 harness connector.
   3. Disconnect the DTCM C1 harness connector.
   4. Measure the resistance between ground and the (K504) Drivetrain Sensor 5V Supply circuit at the DTCM C1 harness connector.

      Is the resistance below 5.0 Ohms?

      Yes

      - Repair the (K504) Drivetrain Sensor 5V Supply circuit for a short to ground.
      - Perform the DTCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Go To 4

4. **ELECTRONICALLY CONTROLLED CLUTCH (ECC)**
   1. Replace the Electronically Controlled Clutch (ECC) in accordance with the Service Information.
   2. Ignition on, engine not running.
   3. With the scan tool, record and erase DTCs.
   4. Test drive the vehicle. If equipped with a Terrain Selector Switch drive the vehicle in each Transfer Case range and verify proper operation in each range.
   5. Ignition on, engine not running.
   6. With the scan tool, read DTCs.

      Does the DTC remain active?

      Yes

      - Replace the Drive Train Control Module (DTCM) in accordance with the Service Information. Refer to **MODULE, DRIVETRAIN CONTROL, REMOVAL** .
      - Perform the DTCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Test complete.

5. **INTERMITTENT WIRING HARNESS AND CONNECTORS**
   1. The conditions necessary to set this DTC are not present at this time.

2. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
3. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
4. Look for the data to change or for the DTC to reset during the wiggle test.
5. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
6. Look for the data to change other than as expected or for the DTC to reset.

Were any problems found?

Yes

- Repair as necessary.
- Perform the DTCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete.

C1440-64-TRANSFER CASE CLUTCH PRESSURE SENSOR - SIGNAL PLAUSIBILITY FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on and no undervoltage or overvoltage condition present.

SET CONDITION

The Drive Train Control Module (DTCM) detects an error from the drivetrain sensor incorporated in the Electronically Controlled Clutch (ECC).

POSSIBLE CAUSES

Possible Causes
CHECK HYDRAULIC SYSTEM FOR FLUID LEAKS OR MECHANICAL FAILURE
ELECTRONICALLY CONTROLLED CLUTCH (ECC)
DRIVE TRAIN CONTROL MODULE (DTCM)

NOTE: If any other DTCs are present, repair them first before continuing with this diagnostic procedure.

DIAGNOSTIC TEST

1. **VERIFY THE DTC ACTIVE**
    1. Ignition on, engine not running.
    2. With the scan tool, record and erase DTCs.
    3. Test drive the vehicle.
    4. With the scan tool, read DTCs.

    Is the DTC active at this time?

    Yes

    - Go To 2

    No

    - Go To 4
2. **CHECK HYDRAULIC SYSTEM FOR FLUID LEAKS OR MECHANICAL FAILURE**
    1. Turn the ignition off.
    2. Check the fluid levels in the ECC.
    3. Visually inspect all the ECC for damage or mechanical problems.

    Where any problems found?

    Yes

    - Repair as necessary.
    - Perform the DTCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Go To 3
3. **REAR DIFFERENTIAL BLEED ROUTINE**
    1. Ignition on, engine not running.
    2. With the scan tool, under "Miscellaneous Functions" perform the Rear Differential bleed routine.

    Did the Rear Differential bleed routine successfully complete?

    Yes

    - Replace the Drive Train Control Module (DTCM) in accordance with the Service Information. Refer to **MODULE, DRIVETRAIN CONTROL, REMOVAL** .
    - Perform the DTCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

- Replace the Electronically Controlled Clutch (ECC) in accordance with the Service Information.
- Perform the DTCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

4. **INTERMITTENT WIRING HARNESS AND CONNECTORS**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
   3. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
   4. Look for the data to change or for the DTC to reset during the wiggle test.
   5. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
   6. Look for the data to change other than as expected or for the DTC to reset.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the DTCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

C1477-4B-TRANSFER CASE CLUTCH - OVER TEMPERATURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Ignition on.

SET CONDITION

The Drive Train Control Module (DTCM) detects an overheat condition due to excessive usage of components from hard driving conditions (Mud, Sand, Snow, 2WD Chassis dynamometer etc.) or ambient temperatures.

POSSIBLE CAUSES

Possible Causes
DRIVING CONDITIONS
AMBIENT TEMPERATURE SENSOR
ELECTRONICALLY CONTROLLED CLUTCH (ECC)

DRIVE TRAIN CONTROL MODULE (DTCM)

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. With the scan tool, record and erase DTCs.
    3. Test drive the vehicle. If equipped with a Terrain Selector Switch drive the vehicle in each Transfer Case range and verify proper operation in each range.
    4. Ignition on, engine not running.
    5. With the scan tool, read DTCs.

    Is the DTC active at this time?

    Yes

    - Go To 2

    No

    - Go To 5
2. **AMBIENT TEMPERATURE SENSOR**
    1. With the scan tool, monitor the ambient temperature in the BCM.

    Is the ambient temperature at room temperature?

    Yes

    - Go To 3

    No

    - Replace the Ambient Temperature Sensor in accordance with the Service Information. Refer to **SENSOR, AMBIENT TEMPERATURE, REMOVAL** .
    - Perform the TRANSFER CASE VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
3. **VERIFY SET CONDITION**

    NOTE: Check with customer on driving terrain (e.g. mud, sand, snow) for set condition.

    1. With the scan tool, erase DTCs.
    2. Allow the System to cool down.

3. Test drive the vehicle. If equipped with a Terrain Selector Switch drive the vehicle in each Transfer Case range and verify proper operation in each range.
4. With the scan tool, read DTCs.

   Does the DTC remain active?

   Yes

   - Go To 4

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   - Perform the TRANSFER CASE VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

4. **ELECTRONICALLY CONTROLLED CLUTCH (ECC)**
   1. Replace the Electronically Controlled Clutch (ECC) accordance with the Service Information.
   2. Ignition on, engine not running.
   3. With the scan tool, record and erase DTCs.
   4. Test drive the vehicle. If equipped with a Terrain Selector Switch drive the vehicle in each Transfer Case range and verify proper operation in each range.
   5. Ignition on, engine not running.
   6. With the scan tool, read DTCs.

      Does the DTC remain active?

      Yes

      - Replace the Drive Train Control Module (DTCM) in accordance with the Service Information. Refer to **MODULE, DRIVETRAIN CONTROL, REMOVAL** .
      - Perform the DTCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Test complete.

5. **INTERMITTENT WIRING AND CONNECTORS**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
   2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
   3. Look for the data to change or for the DTC to reset during the wiggle test.

4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
5. Look for the data to change other than as expected or for the DTC to reset.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the TRANSFER CASE VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C1492-00-PTU INTERNAL PERFOMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

The Drive Train Control Module (DTCM) has detected an internal failure in the Power Transfer Unit (PTU).

POSSIBLE CAUSES

Possible Causes
POWER TRANSFER UNIT (PTU)

DIAGNOSTIC TEST

VERIFY THE DTC IS ACTIVE

1. Ignition on, engine not running.
2. With the scan tool, read DTCs in the Drive Train Control Module (DTCM).

   Is the DTC active at this time?

   Yes

- Replace the Power Transfer Unit (PTU) in accordance with the Service Information.
- Perform the DTCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

C1493-00-RDM INTERNAL PERFOMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

The Drive Train Control Module (DTCM) has detected an internal failure in the Rear Driveline Module (RDM).

POSSIBLE CAUSES

Possible Causes
REAR DRIVELINE MODULE (RDM)

DIAGNOSTIC TEST

VERIFY THE DTC IS ACTIVE

1. Ignition on, engine not running.
2. With the scan tool, read DTCs in the Drive Train Control Module (DTCM).

   Is the DTC active at this time?

   Yes

   - Replace the Rear Driveline Module (RDM) in accordance with the Service Information.
   - Perform the DTCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

C1494-92-PTU FORK POSITION - PERFORMANCE OR INCORRECT OPERATION

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

The Drive Train Control Module (DTCM) has detected an internal or mechanical failure in the Power Transfer Unit (PTU).

POSSIBLE CAUSES

Possible Causes
MECHANICAL DAMAGE POWER TRANSFER UNIT (PTU) DRIVE TRAIN CONTROL MODULE (DTCM)

NOTE: If DTC U1203-00 is present, perform the diagnostics for this DTC before continuing with this diagnostic procedure.

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. With the scan tool, record and erase DTCs.
    3. Test drive the vehicle. If equipped with a Terrain Selector Switch drive the vehicle in each Transfer Case range and verify proper operation in each range.
    4. Ignition on, engine not running.
    5. With the scan tool, read DTCs.

    Is the DTC active at this time?

    Yes

    - Go To 2

    No

    - Go To 4
2. **CHECK FOR MECHANICAL FAILURES**
    1. Turn the ignition off.

2. Visually inspect the PTU for damage or mechanical problems.

   Where any problems found?

   Yes

   - Repair as necessary.
   - Perform the DTCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 3

3. **POWER TRANSFER UNIT (PTU)**
   1. Replace the Power Transfer Unit (PTU) in accordance with the Service Information.
   2. Ignition on, engine not running.
   3. With the scan tool, record and erase DTCs.
   4. Test drive the vehicle. If equipped with a Terrain Selector Switch drive the vehicle in each Transfer Case range and verify proper operation in each range.
   5. Ignition on, engine not running.
   6. With the scan tool, read DTCs.

   Does the DTC remain active?

   Yes

   - Replace the Drive Train Control Module (DTCM) in accordance with the Service Information. Refer to **MODULE, DRIVETRAIN CONTROL, REMOVAL** .
   - Perform the DTCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

4. **INTERMITTENT WIRING AND CONNECTORS**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
   3. While monitoring the scan tool data relative to this circuit, wiggle test the wiring and connectors.
   4. Look for the data to change or for the DTC to reset during the wiggle test.

   Were any problems found?

   Yes

   - Repair as necessary.

- Perform the TRANSFER CASE VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time.

C1495-16-PTU - CIRCUIT VOLTAGE BELOW THRESHOLD

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 9: Drive Train Control Module, Rear Driveline Module & Power Transfer Unit System Voltage Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

Continuously.

SET CONDITION

The Drive Train Control Module (DTCM) detects that the Power Transfer Unit (PTU) system voltage is below 8.5 volts for 60 seconds.

POSSIBLE CAUSES

Possible Causes
POWER TRANSFER UNIT (PTU) POWER CIRCUITS OPEN OR HIGH RESISTANCE
POWER TRANSFER UNIT (PTU) GROUND CIRCUIT OPEN OR HIGH RESISTANCE
POWER TRANSFER UNIT (PTU)
DRIVE TRAIN CONTROL MODULE (DTCM)

NOTE: If any other DTCs are present, repair them first before continuing with this diagnostic procedure.

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. With the scan tool, record and erase DTCs.
    3. Test drive the vehicle. If equipped with a Terrain Selector Switch drive the vehicle in each Transfer Case range and verify proper operation in each range.
    4. Ignition on, engine not running.
    5. With the scan tool, read DTCs.

    Is the DTC active at this time?

    Yes

    - Go To 2

    No

    - Go To 5
2. **POWER CIRCUITS OPEN OR HIGH RESISTANCE**
    1. Disconnect the PTU harness connector.
    2. Ignition on, engine not running.
    3. With a 12-volt test light connected to ground, check the (F946) Fused Ignition Switch Output circuit and the (A197) Fused B+ circuit in the PTU harness connector.

NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly for each of the circuits?

Yes

- Go To 3

No

- Repair the Power circuit(s) for an open circuit or high resistance.
- Perform the DTCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

3. **GROUND CIRCUIT OPEN OR HIGH RESISTANCE**
   1. Turn the ignition off to the lock position
   2. With a 12-volt test light connected to B+, check the (Z904) Ground circuit in the PTU harness connector.

NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly for each of the Ground circuits?

Yes

- Go To 4

No

- Repair the Ground circuit for an open circuit or high resistance.
- Perform the DTCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

4. **POWER TRANSFER UNIT (PTU)**
   1. Replace the Power Transfer Unit (PTU) in accordance with the Service Information.
   2. Ignition on, engine not running.
   3. With the scan tool, record and erase DTCs.
   4. Test drive the vehicle. If equipped with a Terrain Selector Switch drive the vehicle in each Transfer Case range and verify proper operation in each range.
   5. Ignition on, engine not running.
   6. With the scan tool, read DTCs.

Does the DTC remain active?

Yes

- Replace the Drive Train Control Module (DTCM) in accordance with the Service Information. Refer to **MODULE, DRIVETRAIN CONTROL, REMOVAL** .
- Perform the DTCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete.

5. **INTERMITTENT WIRING AND CONNECTORS**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
   3. While monitoring the scan tool data relative to this circuit, wiggle test the wiring and connectors.
   4. Look for the data to change or for the DTC to reset during the wiggle test.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the TRANSFER CASE VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C1495-17-PTU - CIRCUIT VOLTAGE ABOVE THRESHOLD

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously.

SET CONDITION

The Drive Train Control Module (DTCM) detects that the Power Transfer Unit (PTU) system voltage is above 16.0 volts for 60 seconds.

POSSIBLE CAUSES

Possible Causes
POWER TRANSFER UNIT (PTU)
DRIVE TRAIN CONTROL MODULE (DTCM)

NOTE: **If any other DTCs are present, repair them first before continuing with this diagnostic procedure.**

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. With the scan tool, record and erase DTCs.
    3. Test drive the vehicle. If equipped with a Terrain Selector Switch drive the vehicle in each Transfer Case range and verify proper operation in each range.
    4. Ignition on, engine not running.
    5. With the scan tool, read DTCs.

    Is the DTC active at this time?

    Yes

    - Go To 2

    No

    - Go To 3
2. **POWER TRANSFER UNIT (PTU)**
    1. Replace the Power Transfer Unit (PTU) in accordance with the Service Information.
    2. Ignition on, engine not running.
    3. With the scan tool, record and erase DTCs.
    4. Test drive the vehicle. If equipped with a Terrain Selector Switch drive the vehicle in each Transfer Case range and verify proper operation in each range.
    5. Ignition on, engine not running.
    6. With the scan tool, read DTCs.

    Does the DTC remain active?

    Yes

    - Replace the Drive Train Control Module (DTCM) in accordance with the Service Information. Refer to **MODULE, DRIVETRAIN CONTROL, REMOVAL** .
    - Perform the DTCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Test complete.
3. **INTERMITTENT WIRING AND CONNECTORS**

1. The conditions necessary to set this DTC are not present at this time.
2. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
3. While monitoring the scan tool data relative to this circuit, wiggle test the wiring and connectors.
4. Look for the data to change or for the DTC to reset during the wiggle test.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the TRANSFER CASE VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C1495-98-PTU - COMPONENT OR SYSTEM OVER TEMPERATURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Ignition on.

SET CONDITION

The Drive Train Control Module (DTCM) detects an overheat condition due to excessive usage of components from hard driving conditions (Mud, Sand, Snow, 2WD Chassis dynamometer etc.) or ambient temperatures.

POSSIBLE CAUSES

Possible Causes
DRIVING CONDITIONS
AMBIENT TEMPERATURE SENSOR
POWER TRANSFER UNIT (PTU)
DRIVE TRAIN CONTROL MODULE (DTCM)

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
   1. Ignition on, engine not running.
   2. With the scan tool, record and erase DTCs.

3. Test drive the vehicle. If equipped with a Terrain Selector Switch drive the vehicle in each Transfer Case range and verify proper operation in each range.
4. Ignition on, engine not running.
5. With the scan tool, read DTCs.

   Is the DTC active at this time?

   Yes

   - Go To 2

   No

   - Go To 5

2. **AMBIENT TEMPERATURE SENSOR**
   1. With the scan tool, monitor the ambient temperature in the BCM.

      Is the ambient temperature at room temperature?

      Yes

      - Go To 3

      No

      - Replace the Ambient Temperature Sensor in accordance with the Service Information. Refer to **SENSOR, AMBIENT TEMPERATURE, REMOVAL** .
      - Perform the TRANSFER CASE VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

3. **VERIFY SET CONDITION**

   NOTE: Check with customer on driving terrain (e.g. mud, sand, snow) for set condition.

   1. With the scan tool, erase DTCs.
   2. Allow the System to cool down.
   3. Test drive the vehicle. If equipped with a Terrain Selector Switch drive the vehicle in each Transfer Case range and verify proper operation in each range.
   4. With the scan tool, read DTCs.

      Does the DTC remain active?

      Yes

- Go To 4

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
- Perform the TRANSFER CASE VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

4. **POWER TRANSFER UNIT (PTU)**
   1. Replace the Rear Power Transfer Unit (PTU) accordance with the Service Information.
   2. Ignition on, engine not running.
   3. With the scan tool, record and erase DTCs.
   4. Test drive the vehicle. If equipped with a Terrain Selector Switch drive the vehicle in each Transfer Case range and verify proper operation in each range.
   5. Ignition on, engine not running.
   6. With the scan tool, read DTCs.

   Does the DTC remain active?

   Yes

   - Replace the Drive Train Control Module (DTCM) in accordance with the Service Information. Refer to **MODULE, DRIVETRAIN CONTROL, REMOVAL** .
   - Perform the DTCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

5. **INTERMITTENT WIRING AND CONNECTORS**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
   2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
   3. Look for the data to change or for the DTC to reset during the wiggle test.
   4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
   5. Look for the data to change other than as expected or for the DTC to reset.

   Were there any problems found?

   Yes

- Repair as necessary.
- Perform the TRANSFER CASE VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time.

C1496-92-PTU MOTOR POSITION - PERFORMANCE OR INCORRECT OPERATION

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

The Drive Train Control Module (DTCM) has detected an internal or mechanical failure in the Power Transfer Unit (PTU).

POSSIBLE CAUSES

Possible Causes
MECHANICAL DAMAGE
POWER TRANSFER UNIT (PTU)
DRIVE TRAIN CONTROL MODULE (DTCM)

NOTE: If DTC U1203-00 is present, perform the diagnostics for this DTC before continuing with this diagnostic procedure.

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. With the scan tool, record and erase DTCs.
    3. Test drive the vehicle. If equipped with a Terrain Selector Switch drive the vehicle in each Transfer Case range and verify proper operation in each range.
    4. Ignition on, engine not running.
    5. With the scan tool, read DTCs.

    Is the DTC active at this time?

Yes

- Go To 2

No

- Go To 4

2. **CHECK FOR MECHANICAL FAILURES**
   1. Turn the ignition off.
   2. Visually inspect the PTU for damage or mechanical problems.

   Where any problems found?

   Yes

   - Repair as necessary.
   - Perform the DTCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 3

3. **POWER TRANSFER UNIT (PTU)**
   1. Replace the Power Transfer Unit (PTU) in accordance with the Service Information.
   2. Ignition on, engine not running.
   3. With the scan tool, record and erase DTCs.
   4. Test drive the vehicle. If equipped with a Terrain Selector Switch drive the vehicle in each Transfer Case range and verify proper operation in each range.
   5. Ignition on, engine not running.
   6. With the scan tool, read DTCs.

   Does the DTC remain active?

   Yes

   - Replace the Drive Train Control Module (DTCM) in accordance with the Service Information. Refer to **MODULE, DRIVETRAIN CONTROL, REMOVAL** .
   - Perform the DTCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

4. **INTERMITTENT WIRING AND CONNECTORS**
   1. The conditions necessary to set this DTC are not present at this time.

2. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
3. While monitoring the scan tool data relative to this circuit, wiggle test the wiring and connectors.
4. Look for the data to change or for the DTC to reset during the wiggle test.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the TRANSFER CASE VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C1498-92-RDM FORK POSITION - PERFORMANCE OR INCORRECT OPERATION

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

The Drive Train Control Module (DTCM) has detected an internal or mechanical failure in the Rear Driveline Module (RDM).

POSSIBLE CAUSES

Possible Causes
MECHANICAL DAMAGE
REAR DRIVELINE MODULE (RDM)
DRIVE TRAIN CONTROL MODULE (DTCM)

NOTE: If DTC U1204-00 is present, perform the diagnostics for this DTC before continuing with this diagnostic procedure.

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
   1. Ignition on, engine not running.

2. With the scan tool, record and erase DTCs.
3. Test drive the vehicle. If equipped with a Terrain Selector Switch drive the vehicle in each Transfer Case range and verify proper operation in each range.
4. Ignition on, engine not running.
5. With the scan tool, read DTCs.

   Is the DTC active at this time?

   Yes

   - Go To 2

   No

   - Go To 4

2. **CHECK FOR MECHANICAL FAILURES**
   1. Turn the ignition off.
   2. Visually inspect the RDM for damage or mechanical problems.

      Where any problems found?

      Yes

      - Repair as necessary.
      - Perform the DTCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Go To 3

3. **REAR DRIVELINE MODULE (RDM)**
   1. Replace the Rear Driveline Module (RDM) in accordance with the Service Information.
   2. Ignition on, engine not running.
   3. With the scan tool, record and erase DTCs.
   4. Test drive the vehicle. If equipped with a Terrain Selector Switch drive the vehicle in each Transfer Case range and verify proper operation in each range.
   5. Ignition on, engine not running.
   6. With the scan tool, read DTCs.

      Does the DTC remain active?

      Yes

      - Replace the Drive Train Control Module (DTCM) in accordance with the Service

Information. Refer to **MODULE, DRIVETRAIN CONTROL, REMOVAL** .
- Perform the DTCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete.

4. **INTERMITTENT WIRING AND CONNECTORS**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
   3. While monitoring the scan tool data relative to this circuit, wiggle test the wiring and connectors.
   4. Look for the data to change or for the DTC to reset during the wiggle test.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the TRANSFER CASE VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C1499-92-RDM MOTOR POSITION - PERFORMANCE OR INCORRECT OPERATION

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

The Drive Train Control Module (DTCM) has detected an internal or mechanical failure in the Rear Driveline Module (RDM).

POSSIBLE CAUSES

Possible Causes
MECHANICAL DAMAGE REAR DRIVELINE MODULE (RDM) DRIVE TRAIN CONTROL MODULE (DTCM)

NOTE: If DTC U1204-00 is present, perform the diagnostics for this DTC before continuing with this diagnostic procedure.

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. With the scan tool, record and erase DTCs.
    3. Test drive the vehicle. If equipped with a Terrain Selector Switch drive the vehicle in each Transfer Case range and verify proper operation in each range.
    4. Ignition on, engine not running.
    5. With the scan tool, read DTCs.

    Is the DTC active at this time?

    Yes

    - Go To 2

    No

    - Go To 4
2. **CHECK FOR MECHANICAL FAILURES**
    1. Turn the ignition off.
    2. Visually inspect the RDM for damage or mechanical problems.

    Where any problems found?

    Yes

    - Repair as necessary.
    - Perform the DTCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Go To 3
3. **REAR DRIVELINE MODULE (RDM)**
    1. Replace the Rear Driveline Module (RDM) in accordance with the Service Information.
    2. Ignition on, engine not running.
    3. With the scan tool, record and erase DTCs.
    4. Test drive the vehicle. If equipped with a Terrain Selector Switch drive the vehicle in each Transfer Case range and verify proper operation in each range.

5. Ignition on, engine not running.
6. With the scan tool, read DTCs.

   Does the DTC remain active?

   Yes

   - Replace the Drive Train Control Module (DTCM) in accordance with the Service Information. Refer to **MODULE, DRIVETRAIN CONTROL, REMOVAL** .
   - Perform the DTCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

4. **INTERMITTENT WIRING AND CONNECTORS**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
   3. While monitoring the scan tool data relative to this circuit, wiggle test the wiring and connectors.
   4. Look for the data to change or for the DTC to reset during the wiggle test.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the TRANSFER CASE VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C149B-16-RDM - CIRCUIT VOLTAGE BELOW THRESHOLD

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 10: Drive Train Control Module, Rear Driveline Module & Power Transfer Unit System Voltage Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

Continuously.

SET CONDITION

The Drive Train Control Module (DTCM) detects that the Rear Driveline Module (RDM) system voltage is below 8.5 volts for 60 seconds.

POSSIBLE CAUSES

Possible Causes
REAR DRIVELINE MODULE (RDM) POWER CIRCUITS OPEN OR HIGH RESISTANCE
REAR DRIVELINE MODULE (RDM) GROUND CIRCUIT OPEN OR HIGH RESISTANCE
REAR DRIVELINE MODULE (RDM)
DRIVE TRAIN CONTROL MODULE (DTCM)

NOTE: If any other DTCs are present, repair them first before continuing with this diagnostic procedure.

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. With the scan tool, record and erase DTCs.
    3. Test drive the vehicle. If equipped with a Terrain Selector Switch drive the vehicle in each Transfer Case range and verify proper operation in each range.
    4. Ignition on, engine not running.
    5. With the scan tool, read DTCs.

    Is the DTC active at this time?

    Yes

    - Go To 2

    No

    - Go To 5
2. **POWER CIRCUITS OPEN OR HIGH RESISTANCE**
    1. Disconnect the PTU harness connector.
    2. Ignition on, engine not running.
    3. With a 12-volt test light connected to ground, check the (F946) Fused Ignition Switch Output circuit and the (A196) Fused B+ circuit in the RDM harness connector.

NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly for each of the circuits?

Yes

- Go To 3

No

- Repair the Power circuit(s) for an open circuit or high resistance.
- Perform the DTCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

3. **GROUND CIRCUIT OPEN OR HIGH RESISTANCE**
   1. Turn the ignition off to the lock position
   2. With a 12-volt test light connected to B+, check the (Z924) Ground circuit in the RDM harness connector.

NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly for each of the Ground circuits?

Yes

- Go To 4

No

- Repair the Ground circuit for an open circuit or high resistance.
- Perform the DTCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

4. **REAR DRIVELINE MODULE (RDM)**
   1. Replace the Rear Driveline Module (RDM) in accordance with the Service Information.
   2. Ignition on, engine not running.
   3. With the scan tool, record and erase DTCs.
   4. Test drive the vehicle. If equipped with a Terrain Selector Switch drive the vehicle in each Transfer Case range and verify proper operation in each range.
   5. Ignition on, engine not running.
   6. With the scan tool, read DTCs.

Does the DTC remain active?

Yes

- Replace the Drive Train Control Module (DTCM) in accordance with the Service Information. Refer to **MODULE, DRIVETRAIN CONTROL, REMOVAL** .
- Perform the DTCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete.

5. **INTERMITTENT WIRING AND CONNECTORS**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
   3. While monitoring the scan tool data relative to this circuit, wiggle test the wiring and connectors.
   4. Look for the data to change or for the DTC to reset during the wiggle test.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the TRANSFER CASE VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C149B-17-RDM - CIRCUIT VOLTAGE ABOVE THRESHOLD

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously.

SET CONDITION

The Drive Train Control Module (DTCM) detects that the Rear Driveline Module (RDM) system voltage is above 16.0 volts for 60 seconds.

POSSIBLE CAUSES

Possible Causes
REAR DRIVELINE MODULE (RDM)
DRIVE TRAIN CONTROL MODULE (DTCM)

NOTE: **If any other DTCs are present, repair them first before continuing with this diagnostic procedure.**

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. With the scan tool, record and erase DTCs.
    3. Test drive the vehicle. If equipped with a Terrain Selector Switch drive the vehicle in each Transfer Case range and verify proper operation in each range.
    4. Ignition on, engine not running.
    5. With the scan tool, read DTCs.

    Is the DTC active at this time?

    Yes

    - Go To 2

    No

    - Go To 3
2. **REAR DRIVELINE MODULE (RDM)**
    1. Replace the Rear Driveline Module (RDM) in accordance with the Service Information.
    2. Ignition on, engine not running.
    3. With the scan tool, record and erase DTCs.
    4. Test drive the vehicle. If equipped with a Terrain Selector Switch drive the vehicle in each Transfer Case range and verify proper operation in each range.
    5. Ignition on, engine not running.
    6. With the scan tool, read DTCs.

    Does the DTC remain active?

    Yes

    - Replace the Drive Train Control Module (DTCM) in accordance with the Service Information. Refer to **MODULE, DRIVETRAIN CONTROL, REMOVAL** .
    - Perform the DTCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Test complete.
3. **INTERMITTENT WIRING AND CONNECTORS**

1. The conditions necessary to set this DTC are not present at this time.
2. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
3. While monitoring the scan tool data relative to this circuit, wiggle test the wiring and connectors.
4. Look for the data to change or for the DTC to reset during the wiggle test.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the TRANSFER CASE VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C149B-98-RDM - COMPONENT OR SYSTEM OVER TEMPERATURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Ignition on.

SET CONDITION

The Drive Train Control Module (DTCM) detects an overheat condition due to excessive usage of components from hard driving conditions (Mud, Sand, Snow, 2WD Chassis dynamometer etc.) or ambient temperatures.

POSSIBLE CAUSES

Possible Causes
DRIVING CONDITIONS
AMBIENT TEMPERATURE SENSOR
REAR DRIVELINE MODULE (RDM)
DRIVE TRAIN CONTROL MODULE (DTCM)

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
   1. Ignition on, engine not running.
   2. With the scan tool, record and erase DTCs.

3. Test drive the vehicle. If equipped with a Terrain Selector Switch drive the vehicle in each Transfer Case range and verify proper operation in each range.
4. Ignition on, engine not running.
5. With the scan tool, read DTCs.

   Is the DTC active at this time?

   Yes

   - Go To 2

   No

   - Go To 5

2. **AMBIENT TEMPERATURE SENSOR**
   1. With the scan tool, monitor the ambient temperature in the BCM.

      Is the ambient temperature at room temperature?

      Yes

      - Go To 3

      No

      - Replace the Ambient Temperature Sensor in accordance with the Service Information. Refer to **SENSOR, AMBIENT TEMPERATURE, REMOVAL** .
      - Perform the TRANSFER CASE VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

3. **VERIFY SET CONDITION**

   NOTE: Check with customer on driving terrain (e.g. mud, sand, snow) for set condition.

   1. With the scan tool, erase DTCs.
   2. Allow the System to cool down.
   3. Test drive the vehicle on dry paved road. If equipped with a Terrain Selector Switch drive the vehicle in each Transfer Case range and verify proper operation in each range.
   4. With the scan tool, read DTCs.

      Does the DTC remain active?

      Yes

- Go To 4

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
- Perform the TRANSFER CASE VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

4. **REAR DRIVELINE MODULE (RDM)**
   1. Replace the Rear Driveline Module (RDM) in accordance with the Service Information.
   2. Ignition on, engine not running.
   3. With the scan tool, record and erase DTCs.
   4. Test drive the vehicle. If equipped with a Terrain Selector Switch drive the vehicle in each Transfer Case range and verify proper operation in each range.
   5. Ignition on, engine not running.
   6. With the scan tool, read DTCs.

   Does the DTC remain active?

   Yes

   - Replace the Drive Train Control Module (DTCM) in accordance with the Service Information. Refer to **MODULE, DRIVETRAIN CONTROL, REMOVAL** .
   - Perform the DTCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

5. **INTERMITTENT WIRING AND CONNECTORS**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
   2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
   3. Look for the data to change or for the DTC to reset during the wiggle test.
   4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
   5. Look for the data to change other than as expected or for the DTC to reset.

   Were there any problems found?

   Yes

- Repair as necessary.
- Perform the TRANSFER CASE VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time.

C2129-16-BATTERY VOLTAGE - CIRCUIT VOLTAGE BELOW THRESHOLD

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 11: Drive Train Control Module, Rear Driveline Module & Power Transfer Unit System Voltage Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

Continuously.

SET CONDITION

The Drive Train Control Module (DTCM) detects that system voltage is below 8.5 volts for 60 seconds with engine RPM greater than 1500.

POSSIBLE CAUSES

Possible Causes
CHARGING SYSTEM DTCS PRESENT
DRIVE TRAIN CONTROL MODULE (DTCM) POWER CIRCUITS OPEN OR HIGH RESISTANCE
DRIVE TRAIN CONTROL MODULE (DTCM) GROUND CIRCUIT OPEN OR HIGH RESISTANCE
DRIVE TRAIN CONTROL MODULE (DTCM)

DIAGNOSTIC TEST

1. **CHARGING SYSTEM DTCS PRESENT**
    1. Ignition on, engine not running.
    2. With the scan tool, read DTCs in the Powertrain Control Module.

    Are there any Charging System or related voltage DTCs present?

    Yes

    - Perform the appropriate Charging System DTC diagnostic procedures before continuing with this test. Refer to the **DTC INDEX** article .

    No

    - Go To 2
2. **VERIFY THE DTC IS ACTIVE**
    1. With the scan tool, read DTCs in the DTCM.

    Is the DTC active at this time?

    Yes

    - Go To 3

    No

    - Go To 5
3. **POWER CIRCUITS OPEN OR HIGH RESISTANCE**

1. Disconnect the DTCM C1 harness connector.
2. Ignition on, engine not running.
3. With a 12-volt test light connected to ground, check the (F946) Fused Ignition Switch Output circuit in the DTCM C1 harness connector and the (A194) Fused B+ circuit in the DTCM C2 harness connector.

NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly for each of the circuits?

Yes

- Go To 4

No

- Repair the Fused B+ circuit(s) for an open circuit or high resistance.
- Perform the DTCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

4. **(Z924) GROUND CIRCUIT OPEN OR HIGH RESISTANCE**
   1. Turn the ignition off to the lock position
   2. Disconnect the DTCM C2 harness connector.
   3. With a 12-volt test light connected to B+, check the (Z924) Ground circuit in the DTCM C2 harness connector.

NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly for each of the Ground circuits?

Yes

- Replace the Drive Train Control Module (DTCM) in accordance with the Service Information. Refer to **MODULE, DRIVETRAIN CONTROL, REMOVAL** .
- Perform the DTCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Repair the (Z924) Ground circuit for an open circuit or high resistance.
- Perform the DTCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

5. **INTERMITTENT WIRING AND CONNECTORS**
   1. The conditions necessary to set this DTC are not present at this time.

2. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
3. While monitoring the scan tool data relative to this circuit, wiggle test the wiring and connectors.
4. Look for the data to change or for the DTC to reset during the wiggle test.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the TRANSFER CASE VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C2129-17-BATTERY VOLTAGE - CIRCUIT VOLTAGE ABOVE THRESHOLD

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously.

SET CONDITION

The Drive Train Control Module (DTCM) detects that system voltage is above 16.0 volts for 60 seconds with engine RPM greater than 1500.

POSSIBLE CAUSES

Possible Causes
CHARGING SYSTEM DTCS PRESENT
DRIVE TRAIN CONTROL MODULE (DTCM)

DIAGNOSTIC TEST

1. **CHARGING SYSTEM DTCS PRESENT**
   1. Ignition on, engine not running.
   2. With the scan tool, read DTCs in the Powertrain Control Module.

      Are there any Charging System or related voltage DTCs present?

      Yes

- Refer to the **DTC INDEX** article and perform the appropriate diagnostic procedure.

No

- Go To 2

2. **VERIFY THE DTC IS ACTIVE**
   1. With the scan tool, read DTCs in the DTCM.

      Is the DTC active at this time?

      Yes

      - Replace the Drive Train Control Module (DTCM) in accordance with the Service Information. Refer to **MODULE, DRIVETRAIN CONTROL, REMOVAL** .
      - Perform the DTCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Go To 3

3. **INTERMITTENT WIRING AND CONNECTORS**
   1. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
   2. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
   3. Look for the data to change or for the DTC to reset during the wiggle test.
   4. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times.
   5. Look for the data to change other than as expected or for the DTC to reset.

      Were any problems found?

      Yes

      - Repair as necessary.
      - Perform the TRANSFER CASE VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Test complete, the condition or conditions that originally set this DTC are not present at this time.

C2206-00-VEHICLE CONFIGURATION MISMATCH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Ignition on.

SET CONDITION

This DTC will set if the vehicle type is not identified or incorrectly identified.

POSSIBLE CAUSES

Possible Causes
DRIVE TRAIN CONTROL MODULE (DTCM)
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

VERIFY THE DTC IS ACTIVE

NOTE: Diagnose and repair any Powertrain Control Module VIN or Communication DTCs before continuing with this test.

1. Ignition on, engine not running.
2. With the scan tool, read and record the DTCs.
3. With the scan tool, read and record the Environmental Data to help identify the conditions in which the DTC was set.
4. With the scan tool, erase the DTCs.
5. Cycle the ignition switch from off to on.
6. With the scan tool, read the DTCs.

   Is the DTC active at this time?

   Yes

   - With the scan tool select BCM under the ECU selection then Misc Functions and Restore Vehicle Configuration.

   No

   - Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

C2223-00-ECU CONFIGURATION MISMATCH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously with system voltage between 10.0 and 16.0 volts Electric Parking Brake (EPB) Module is not in Plant-Mode.

SET CONDITION

Body Control Module (BCM) does not expect the Electric Parking Brake (EPB) Module to be present.

POSSIBLE CAUSES

Possible Causes
BODY CONTROL MODULE (BCM) DOES NOT DETECT THE ELECTRIC PARKING BRAKE (EPB)
DRIVE TRAIN CONTROL MODULE (DTCM) NOT PROGRAMED

DIAGNOSTIC TEST

DRIVE TRAIN CONTROL MODULE (DTCM) NOT PROGRAMED

This Diagnostic Trouble Code will set if the Body Control Module (BCM) is not configured for Drive Train Control Module (DTCM).

- Program the BCM with the correct sales code. Refer to **STANDARD PROCEDURE** .
- Perform the DTCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

U0002-00-CAN C BUS OFF PERFORMANCE

Perform the COMMUNICATION PRE-DIAGNOSTIC PROCEDURE. Refer to **COMMUNICATION PRE-DIAGNOSTIC PROCEDURE** .

U0100-00-LOST COMMUNICATION WITH ECM/PCM

Perform the COMMUNICATION PRE-DIAGNOSTIC PROCEDURE. Refer to **COMMUNICATION PRE-DIAGNOSTIC PROCEDURE** .

U0101-00-LOST COMMUNICATION WITH TCM

Perform the COMMUNICATION PRE-DIAGNOSTIC PROCEDURE. Refer to **COMMUNICATION PRE-DIAGNOSTIC PROCEDURE** .

U0121-00-LOST COMMUNICATION WITH ANTI-LOCK BRAKE SYSTEM (ABS) CONTROL MODULE

Perform the COMMUNICATION PRE-DIAGNOSTIC PROCEDURE. Refer to **COMMUNICATION PRE-DIAGNOSTIC PROCEDURE** .

U0131-00-LOST COMMUNICATION WITH ELECTRIC POWER STEERING CONTROL MODULE

Perform the COMMUNICATION PRE-DIAGNOSTIC PROCEDURE. Refer to **COMMUNICATION PRE-DIAGNOSTIC PROCEDURE** .

U0140-00-LOST COMMUNICATION WITH BODY CONTROL MODULE

Perform the COMMUNICATION PRE-DIAGNOSTIC PROCEDURE. Refer to **COMMUNICATION PRE-DIAGNOSTIC PROCEDURE** .

U0151-00-LOST COMMUNICATION WITH OCCUPANT RESTRAINT CONTROLLER (ORC)

Perform the COMMUNICATION PRE-DIAGNOSTIC PROCEDURE. Refer to **COMMUNICATION PRE-DIAGNOSTIC PROCEDURE** .

U0401-IMPLAUSIBLE DATA RECEIVED FROM ECM/PCM

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously with the ignition on, one valid CAN message received at least once.

SET CONDITION

When the Drive Train Control Module (DTCM) detects an incorrect CAN message from the Power Control Module (PCM).

POSSIBLE CAUSES

Possible Causes
BODY CONTROL MODULE (BCM) NOT CONFIGURED CORRECTLY
ABS MODULE CAN BUS DTCS
ENGINE DTCS
DRIVE TRAIN CONTROL MODULE (DTCM)

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**

NOTE: This DTC must be active for the results of this test to be valid.

1. Turn the ignition on.
2. With the scan tool, record and erase DTCs.
3. Cycle the ignition switch from off to on.

4. With the scan tool, read DTCs.

   Is the DTC active at this time?

   Yes

   - Go To 2

   No

   - Go To 4

2. **CHECK IF BCM CAN BUS DTCs ARE PRESENT**
   1. With the scan tool, read BCM DTCs.

      Are there any BCM CAN BUS DTCs present?

      Yes

      - Perform the appropriate diagnostic procedure. Refer to the **DIAGNOSTIC CODE INDEX** .

      No

      - Go To 3

3. **CHECK TO SEE ANY IF POWERTRAIN CONTROL MODULE (PCM) DTCS ARE PRESENT**
   1. With the scan tool, read PCM DTCs.

      Are there any PCM DTCs present?

      Yes

      - Perform the appropriate diagnostic procedure. Refer to the **DTC INDEX** article .

      No

      - Replace the Drive Train Control Module (DTCM) in accordance with Service Information. Refer to **MODULE, DRIVETRAIN CONTROL, REMOVAL** .
      - Perform the DTCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

4. **INTERMITTENT WIRING AND CONNECTORS**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle test the wiring harness and connectors while checking for shorted and open circuits.
   4. Using the scan tool, monitor the data related to this circuit while performing the wiggle test. Look for the data to change or for the DTC to reset.

Were there any problems found?

Yes

- Repair as necessary.
- Perform the DTCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete.

U0402-IMPLAUSIBLE DATA RECEIVED FROM TCM

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on for four seconds, no CAN bus circuit error condition present, no lost communication with Transmission Control Module (TCM) condition present and no system undervoltage or overvoltage condition present.

SET CONDITION

The Drive Train Control Module (DTCM) is receiving implausible data for gear or PRNDL position from the TCM.

POSSIBLE CAUSES

Possible Causes
CAN BUS OPEN OR SHORTED CONDITION TRANSMISSION CONTROL MODULE (TCM) DTCS PRESENT DRIVE TRAIN CONTROL MODULE (DTCM)

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**

NOTE: Diagnose all CAN B and C communication DTCs before continuing.

1. Ignition on, engine not running.
2. With the scan tool, read DTCs.

Is the DTC active at this time?

Yes

- Go To 3

No

- Test complete. The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

2. **CHECK FOR BCM DTCS**
   1. With the scan tool, read BCM DTCs.

      Are there any BCM DTCs present?

      Yes

      - Perform the appropriate diagnostic procedure. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 3
3. **CHECK FOR TCM DTCS**
   1. Ignition on, engine not running.
   2. With the scan tool, read the DTCs in the TCM.

      Are there any TCM DTCs present?

      Yes

      - Perform the appropriate diagnostic procedure.

      No

      - Using the schematics as a guide, check the Drive Train Control Module (DTCM) pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Drive Train Control Module (DTCM) in accordance with the Service Information. Refer to **MODULE, DRIVETRAIN CONTROL, REMOVAL** .
      - Perform the DTCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

U0415-IMPLAUSIBLE DATA RECEIVED FROM ABS

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on for Four seconds, no CAN BUS circuit error condition present, no lost communication with

ABS condition present, and no system undervoltage or overvoltage condition present.

SET CONDITION

The Drive Train Control Module (DTCM) is receiving implausible data for vehicle speed, wheel speeds, brake switch status, longitudinal acceleration, yaw rate, or lateral acceleration from the ABS controller.

POSSIBLE CAUSES

Possible Causes
BODY CONTROL MODULE (BCM) DTCS
ANTILOCK BRAKE SYSTEM (ABS) MODULE DTCS PRESENT
DRIVE TRAIN CONTROL MODULE (DTCM) DTCS
DRIVE TRAIN CONTROL MODULE (DTCM)

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**

   NOTE: This DTC must be active for the results of this test to be valid.

   1. Turn the ignition on.
   2. With the scan tool, record and erase DTCs.
   3. Cycle the ignition switch from off to on.
   4. With the scan tool, read DTCs.

   Is the DTC active at this time?

   Yes

   - Go To 2

   No

   - Go To 4

2. **CHECK IF BCM CAN BUS DTCS ARE PRESENT**
   1. With the scan tool, read BCM DTCs.

   Are there any BCM CAN BUS DTC's present?

   Yes

   - Perform the appropriate diagnostic procedure. Refer to **MODULE, BODY CONTROL, REMOVAL** .

No

- Go To 3

3. **ABS DTCS PRESENT**
   1. Ignition on, engine not running.
   2. With the scan tool, read DTCs in the Antilock Brake Controller.

      Are there any DTCs present?

      Yes

      - Perform the appropriate diagnostic procedure. Refer to **DIAGNOSIS AND TESTING** .

      No

      - Replace the Drive Train Control Module (DTCM) in accordance with the Service Information.
      - Perform DTCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
4. **INTERMITTENT WIRING HARNESS AND CONNECTORS**
   1. The conditions necessary to set this DTC are not present at this time.
   2. Using the wiring diagram/schematic as a guide, inspect the wiring harness and connectors.
   3. Wiggle test the wiring harness and connectors while monitoring the scan tool data relative to this circuit.
   4. Look for the data to change or for the DTC to reset during the wiggle test.
   5. While monitoring the scan tool data relative to this circuit, move the selector switch to each position several times (if equipped).

      Were there any problems found?

      Yes

      - Repair as necessary.
      - Perform DTCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Test complete.

U0420-00-INVALID DATA RECEIVED FROM POWER STEERING CONTROL MODULE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously with the ignition on, one valid CAN message received at least once, and no CAN C Bus Off Performance DTC present.

SET CONDITION

When the Drive Train Control Module (DTCM) detects an incorrect CAN message from the Electric Power Steering (EPS) Module.

POSSIBLE CAUSES

Possible Causes
DRIVE TRAIN CONTROL MODULE (DTCM) CAN BUS DTCS
BODY CONTROL MODULE (BCM) DTCS
ELECTRIC POWER STEERING (EPS) MODULE DTCS
DRIVE TRAIN CONTROL MODULE (DTCM)

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, record and erase DTCs.
    3. Cycle the ignition from off to on.
    4. With the scan tool, read DTCs.

    Is the DTC active at this time?

    Yes

    - Go To 2

    No

    - Go To 5
2. **CHECK FOR BODY CONTROL MODULE (BCM) DTCS**
    1. With the scan tool, read BCM DTCs.

    Are there any BCM CAN Bus DTCs present?

    Yes

    - Perform the appropriate diagnostic procedure. Refer to the **DIAGNOSTIC CODE INDEX** .

    No

- Go To 3

3. **CHECK FOR DRIVE TRAIN CONTROL MODULE (DTCM) CAN BUS DTCS**
   1. With the scan tool, read DTCM DTCs.

      Are there any DTCM CAN Bus DTCs present?

      Yes

      - Perform the appropriate diagnostic procedure. Refer to the **DIAGNOSTIC CODE INDEX**.

      No

      - Go To 4

4. **CHECK OTHER MODULES FOR DTCS**
   1. With the scan tool, read DTCs.

      Are there any other modules reporting implausible communication DTCs against the EPS Module?

      Yes

      - Replace the Electric Power Steering (EPS) Module in accordance with the Service Information. Refer to **GEAR, REMOVAL** .

      No

      - Using the schematics as a guide, check the DTCM pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Dive Train Control Module (DTCM) in accordance with the Service Information. Refer to **MODULE, DRIVETRAIN CONTROL, REMOVAL** .
      - Perform the DTCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

5. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this module. Wiggle the wiring and connectors while checking for shorted and open circuits.
   3. Check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Check Service Bulletins for any possible causes that may apply.

      Were there any problems found?

      Yes

      - Repair as necessary.

- Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Test complete.

U0422-IMPLAUSIBLE DATA RECEIVED FROM BODY CONTROL MODULE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously with the ignition on, one valid CAN message received at least once, and no U0002-00-CAN C Bus Off Performance DTC present.

SET CONDITION

When the Drive Train Control Module (DTCM) detects an incorrect CAN message from the Body Control Module (BCM).

POSSIBLE CAUSES

Possible Causes
DRIVE TRAIN CONTROL MODULE (DTCM) CAN BUS DTCS
BODY CONTROL MODULE (BCM) DTCS
POWERTRAIN CONTROL MODULE (PCM) DTCS
DRIVE TRAIN CONTROL MODULE (DTCM)

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**

NOTE: This DTC must be active for the results of this test to be valid.

1. Perform any Technical Service Bulletins (TSBs) that may apply.
2. Turn the ignition on.
3. With the scan tool, record and erase the DTCs.
4. Cycle the ignition switch from off to on.
5. With the scan tool, read the DTCs.

Is the DTC active at this time?

Yes

- Go To 2

No

- Perform the DTCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

2. **CHECK POWERTRAIN CONTROL MODULE (PCM) CAN BUS DTCS ARE PRESENT**
   1. With the scan tool, read the PCM DTCs.

      Are there any PCM CAN BUS DTCs present?

      Yes

      - Perform the appropriate diagnostic procedures. Refer to the **DTC INDEX** article .
      - Perform the DTCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Go To 3

3. **CHECK BODY CONTROL MODULE (BCM) CAN BUS DTCS ARE PRESENT**
   1. With the scan tool, read the BCM DTCs.

      Are there any BCM CAN BUS DTCs present?

      Yes

      - Perform the appropriate diagnostic procedures. Refer to the **DIAGNOSTIC CODE INDEX** .
      - Perform the DTCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Using the schematics as a guide, check the Drive Train Control Module (DTCM) pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Drive Train Control Module (DTCM) accordance with Service Information. Refer to **MODULE, DRIVETRAIN CONTROL, REMOVAL** .
      - Perform the DTCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

U0452-00-IMPLAUSIBLE DATA RECEIVED FROM RESTRAINTS CONTROL MODULE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously with the ignition on, one valid CAN message received at least once, and no CAN C Bus Off Performance DTC present.

SET CONDITION

When the Drive Train Control Module (DTCM) detects an incorrect CAN message from the Occupant Restraint Controller (ORC).

POSSIBLE CAUSES

Possible Causes
DRIVE TRAIN CONTROL MODULE (DTCM) CAN BUS DTCS
BODY CONTROL MODULE (BCM) DTCS
OCCUPANT RESTRAINT CONTROLLER (ORC) DTCS
DRIVE TRAIN CONTROL MODULE (DTCM)

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, record and erase DTCs.
    3. Cycle the ignition from off to on.
    4. With the scan tool, read DTCs.

    Is the DTC active at this time?

    Yes

    - Go To 2

    No

    - Go To 5
2. **CHECK FOR BODY CONTROL MODULE (BCM) DTCS**
    1. With the scan tool, read BCM DTCs.

    Are there any BCM CAN Bus DTCs present?

    Yes

    - Perform the appropriate diagnostic procedure. Refer to the **DIAGNOSTIC CODE INDEX** .

    No

- Go To 3

3. **CHECK FOR DRIVE TRAIN CONTROL MODULE (DTCM) CAN BUS DTCS**
   1. With the scan tool, read DTCM DTCs.

      Are there any DTCM CAN Bus DTCs present?

      Yes

      - Perform the appropriate diagnostic procedure. Refer to the **DIAGNOSTIC CODE INDEX**.

      No

      - Go To 4

4. **CHECK OTHER MODULES FOR DTCS**
   1. With the scan tool, read DTCs.

      Are there any other modules reporting implausible communication DTCs against the ORC?

      Yes

      - Replace the Occupant Restraint Controller (ORC) in accordance with the Service Information. Refer to **MODULE, OCCUPANT RESTRAINT CONTROLLER, REMOVAL** .

      No

      - Using the schematics as a guide, check the DTCM pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Dive Train Control Module (DTCM) in accordance with the Service Information. Refer to **MODULE, DRIVETRAIN CONTROL, REMOVAL** .
      - Perform the DTCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

5. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this module. Wiggle the wiring and connectors while checking for shorted and open circuits.
   3. Check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Check Service Bulletins for any possible causes that may apply.

      Were there any problems found?

      Yes

- Repair as necessary.
- Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Test complete.

U1203-00-PTU LOST COMMUNICATION WITH DTCM

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 12: Drive Train Control Module, Rear Driveline Module & Power Transfer Unit System Voltage Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the ignition on.

SET CONDITION

The Drive Train Control Module (DTCM) has lost communication with the Power Transfer Unit (PTU).

POSSIBLE CAUSES

Possible Causes
FUSED B(+) CIRCUIT OPEN OR SHORTED
FUSED IGNITION RUN/START CONTROL OUTPUT CIRCUIT OPEN OR SHORTED
GROUND CIRCUIT OPEN
PRIVATE CAN (+) CIRCUIT OPEN
PRIVATE CAN (-) CIRCUIT OPEN
POWER TRANSFER UNIT (PTU)
DRIVE TRAIN CONTROL MODULE (DTCM)

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**

   NOTE: Make sure the battery voltage is between 10.0 and 16.0 volts.

   1. Ignition on, engine not running.
   2. With the scan tool, record and erase DTCs.
   3. Cycle the ignition from off to on.
   4. With the scan tool, read DTCs.

   Is the DTC active at this time?

   Yes

   - Go To 2

   No

   - Go To 8

2. **CHECK THE (A197) FUSED B(+) CIRCUIT FOR AN OPEN OR SHORT**
   1. Turn the ignition off.
   2. Disconnect the PTU harness connector.
   3. Turn the ignition on.
   4. Using a 12-volt test light connected to ground, check the (A197) Fused B(+) circuit.

Does the test light illuminate brightly?

Yes

- Go To 3

No

- Repair the (A197) Fused B(+) circuit for an open or short.
- Perform the DTCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

3. **CHECK THE (F946) FUSED IGNITION (RUN-START) CONTROL OUTPUT CIRCUIT FOR AN OPEN OR SHORT**
   1. Using a 12-volt test light connected to ground, check the (F946) Fused Ignition (Run-Start) Control Output circuit.

      Does the test light illuminate brightly?

      Yes

      - Go To 4

      No

      - Repair the (F946) Fused Ignition (Run-Start) Control Output circuit for an open or short.
      - Perform the DTCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
4. **CHECK THE (Z904) GROUND CIRCUIT FOR AN OPEN**
   1. Turn the ignition off.
   2. Using a 12-volt test light connected to 12-volts, check the (Z904) Ground circuit.

      Does the test light illuminate brightly?

      Yes

      - Go To 5

      No

      - Repair the (Z904) Ground circuit for an open.
      - Perform the DTCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
5. **CHECK THE (D469) PRIVATE CAN (+) CIRCUIT FOR AN OPEN**
   1. Disconnect the DTCM C1 harness connector.
   2. Measure the resistance of the (D469) PRIVATE CAN C (+) circuit between the PTU harness connector and the DTCM C1 harness connector.

Is the resistances below 5.0 Ohms?

Yes

- Go To 6

No

- Repair the (D469) PRIVATE CAN C (+) circuit for an open.
- Perform the DTCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

6. **CHECK THE (D468) PRIVATE CAN C(-) CIRCUIT FOR AN OPEN**
   1. Measure the resistance of the (D468) PRIVATE CAN C (-) circuit between the PTU harness connector and the DTCM C1 harness connector.

   Are the resistances below 5.0 Ohms?

   Yes

   - Go To 7

   No

   - Repair the (D468) PRIVATE CAN C (-) circuit for an open.
   - Perform the DTCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

7. **DRIVE TRAIN CONTROL MODULE (DTCM)**
   1. Replace the Drive Train Control Module (DTCM) in accordance with the Service Information. Refer to **MODULE, DRIVETRAIN CONTROL, REMOVAL** .Perform the DTCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
   2. Ignition on, engine not running.
   3. With the scan tool, record and erase DTCs.
   4. Cycle the ignition from off to on.
   5. With the scan tool, read DTCs.

   Does the DTC remain active?

   Yes

   - Replace the Power Transfer Unit (PTU) in accordance with the Service Information.
   - Perform the DTCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

8. **INTERMITTENT WIRING AND CONNECTORS**
    1. The conditions necessary to set this DTC are not present at this time.
    2. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
    3. While monitoring the scan tool data relative to this circuit, wiggle test the wiring and connectors.
    4. Look for the data to change or for the DTC to reset during the wiggle test.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the TRANSFER CASE VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time.

U1204-00-RDM LOST COMMUNICATION WITH DTCM

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 13: Drive Train Control Module, Rear Driveline Module & Power Transfer Unit System Voltage Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

With the ignition on.

SET CONDITION

The Drive Train Control Module (DTCM) has lost communication with the Rear Driveline Module (RDM).

POSSIBLE CAUSES

Possible Causes
FUSED B(+) CIRCUIT OPEN OR SHORTED
FUSED IGNITION RUN/START CONTROL OUTPUT CIRCUIT OPEN OR SHORTED
GROUND CIRCUIT OPEN
PRIVATE CAN (+) CIRCUIT OPEN
PRIVATE CAN (-) CIRCUIT OPEN
REAR DRIVELINE MODULE (RDM)
DRIVE TRAIN CONTROL MODULE (DTCM)

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**

   NOTE: Make sure the battery voltage is between 10.0 and 16.0 volts.

   1. Ignition on, engine not running.
   2. With the scan tool, record and erase DTCs.
   3. Cycle the ignition from off to on.
   4. With the scan tool, read DTCs.

   Is the DTC active at this time?

   Yes

   - Go To 2

   No

   - Go To 8

2. **CHECK THE (A196) FUSED B(+) CIRCUIT FOR AN OPEN OR SHORT**
   1. Turn the ignition off.
   2. Disconnect the PTU harness connector.
   3. Turn the ignition on.
   4. Using a 12-volt test light connected to ground, check the (A196) Fused B(+) circuit.

Does the test light illuminate brightly?

Yes

- Go To 3

No

- Repair the (A196) Fused B(+) circuit for an open or short.
- Perform the DTCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

3. **CHECK THE (F946) FUSED IGNITION (RUN-START) CONTROL OUTPUT CIRCUIT FOR AN OPEN OR SHORT**
   1. Using a 12-volt test light connected to ground, check the (F946) Fused Ignition (Run-Start) Control Output circuit.

      Does the test light illuminate brightly?

      Yes

      - Go To 4

      No

      - Repair the (F946) Fused Ignition (Run-Start) Control Output circuit for an open or short.
      - Perform the DTCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
4. **CHECK THE (Z924) GROUND CIRCUIT FOR AN OPEN**
   1. Turn the ignition off.
   2. Using a 12-volt test light connected to 12-volts, check the (Z924) Ground circuit.

      Does the test light illuminate brightly?

      Yes

      - Go To 5

      No

      - Repair the (Z924) Ground circuit for an open.
      - Perform the DTCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
5. **CHECK THE (D469) PRIVATE CAN (+) CIRCUIT FOR AN OPEN**
   1. Disconnect the DTCM C1 harness connector.
   2. Measure the resistance of the (D469) PRIVATE CAN C (+) circuit between the PTU harness connector and the DTCM C1 harness connector.

Is the resistances below 5.0 Ohms?

Yes

- Go To 6

No

- Repair the (D469) PRIVATE CAN C (+) circuit for an open.
- Perform the DTCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

6. **CHECK THE (D468) PRIVATE CAN C(-) CIRCUIT FOR AN OPEN**
   1. Measure the resistance of the (D468) PRIVATE CAN C (-) circuit between the PTU harness connector and the DTCM C1 harness connector.

   Are the resistances below 5.0 Ohms?

   Yes

   - Go To 7

   No

   - Repair the (D468) PRIVATE CAN C (-) circuit for an open.
   - Perform the DTCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

7. **DRIVE TRAIN CONTROL MODULE (DTCM)**
   1. Replace the Drive Train Control Module (DTCM) in accordance with the Service Information. Refer to **MODULE, DRIVETRAIN CONTROL, REMOVAL** .Perform the DTCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
   2. Ignition on, engine not running.
   3. With the scan tool, record and erase DTCs.
   4. Cycle the ignition from off to on.
   5. With the scan tool, read DTCs.

   Does the DTC remain active?

   Yes

   - Replace the Rear Driveline Module (RDM) in accordance with the Service Information.
   - Perform the DTCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

8. **INTERMITTENT WIRING AND CONNECTORS**
    1. The conditions necessary to set this DTC are not present at this time.
    2. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
    3. While monitoring the scan tool data relative to this circuit, wiggle test the wiring and connectors.
    4. Look for the data to change or for the DTC to reset during the wiggle test.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the TRANSFER CASE VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Test complete, the condition or conditions that originally set this DTC are not present at this time.

U1206-00-LOST COMMUNICATION WITH ELECTRONIC PARK BRAKE MODULE

Perform the COMMUNICATION PRE-DIAGNOSTIC PROCEDURE. Refer to **STANDARD PROCEDURE** .

U1484-00-IMPLAUSIBLE DATA RECEIVED FROM ELECTRONIC PARK BRAKE MODULE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously with the ignition on, one valid CAN message received at least once, and no CAN C Bus Off Performance DTC present.

SET CONDITION

When the Drive Train Control Module (DTCM) detects an incorrect CAN message from the Electric Parking Brake (EPB) Module.

POSSIBLE CAUSES

Possible Causes
DRIVE TRAIN CONTROL MODULE (DTCM) CAN BUS DTCS
BODY CONTROL MODULE (BCM) DTCS
ELECTRIC PARKING BRAKE (EPS) MODULE

DRIVE TRAIN CONTROL MODULE (DTCM)

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, record and erase DTCs.
    3. Cycle the ignition from off to on.
    4. With the scan tool, read DTCs.

    Is the DTC active at this time?

    Yes

    - Go To 2

    No

    - Go To 5
2. **CHECK FOR BODY CONTROL MODULE (BCM) DTCS**
    1. With the scan tool, read BCM DTCs.

    Are there any BCM CAN Bus DTCs present?

    Yes

    - Perform the appropriate diagnostic procedure. Refer to the **DIAGNOSTIC CODE INDEX** .

    No

    - Go To 3
3. **CHECK FOR DRIVE TRAIN CONTROL MODULE (DTCM) CAN BUS DTCS**
    1. With the scan tool, read DTCM DTCs.

    Are there any DTCM CAN Bus DTCs present?

    Yes

    - Perform the appropriate diagnostic procedure. Refer to **DIAGNOSIS AND TESTING**.

    No

    - Go To 4
4. **CHECK OTHER MODULES FOR DTCS**

1. With the scan tool, read DTCs.

   Are there any other modules reporting implausible communication DTCs against the EPB Module?

   Yes

   - Replace the Electric Parking Brake (EPB) Module in accordance with the Service Information. Refer to **MODULE, ELECTRIC PARK BRAKE, REMOVAL** .

   No

   - Using the schematics as a guide, check the DTCM pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Dive Train Control Module (DTCM) in accordance with the Service Information. Refer to **MODULE, DRIVETRAIN CONTROL, REMOVAL** .
   - Perform the DTCM VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

5. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this module. Wiggle the wiring and connectors while checking for shorted and open circuits.
   3. Check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Check Service Bulletins for any possible causes that may apply.

      Were there any problems found?

      Yes

      - Repair as necessary.
      - Perform the EPS VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Test complete.

STANDARD PROCEDURE

DTCM VERIFICATION TEST

DIAGNOSTIC TEST

PERFORM DTCM VERIFICATION TEST

CAUTION: Before removing the DTCM harness connectors, clean the connectors and locking cam area of dirt and debris. Failure to do so can result in the connector being jammed or damage to the locking cams on the harness connector or module. Do not force the assist arm when releasing or installing the harness connector.

NOTE: If the Powertrain Control Module (PCM) or Body Control Module (BCM) was replaced, refer to the service information for proper programming procedures.

1. Disconnect all jumper wires and reconnect all previously disconnected components and connectors.
2. Make sure that all accessories are turned off.
3. Make sure that the battery is fully charged.
4. With the scan tool, record and erase all DTC(s) from the DTCM.
5. Start and run the engine for two minutes while operating all functions of the system that caused the original concern.

   NOTE: When a Stabilizer System DTC diagnostic is complete and all repairs have been made, running the Stabilizer Motor System Test and/or LED System Test can also provide verification that the DTC has been repaired and the system is operating normally.

6. Turn the ignition off, wait five seconds, then turn the ignition on. Using the scan tool, read DTC(s) from the DTCM.

   Are any DTCM DTC(s) present or is the original condition still present?

   Yes

   - The repair is not complete. Perform the appropriate diagnostic procedure for the DTC or symptom that is still present.

   No

   - The repair is complete.

TRANSFER CASE VERIFICATION TEST

DIAGNOSTIC TEST

1. Disconnect all jumper wires and reconnect all previously disconnected components and connectors.
2. Make sure that all accessories are turned off.
3. Make sure that the battery is fully charged.
4. With the scan tool, record and erase all DTC(s) from the Drive Train Control Module (DTCM) and the Cluster/CCN.

5. Test drive the vehicle. If equipped with a selector switch drive the vehicle in each Transfer Case range and verify proper operation in each range.
   - To select or deselect 2WD, AWD or 4HI mode, vehicle speed must be below 88 Kmh (55 mph) with all wheels at vehicle speed.
   - Shifts will not take place with a wheel speed difference of greater than 21 Kmh (13 mph) between the front and rear wheels.
   - To select or deselect 4LO (if equipped), vehicle speed must be below 5 Kmh (3 mph) with the ignition on, engine not running and the transmission in neutral (automatic transmission) or the clutch pedal pressed (manual transmission).
   - To select or deselect Transfer Case Neutral (if equipped), vehicle speed must be 0 Kmh (0 mph) with the ignition on, engine not running, the brake pedal applied, and the transmission in neutral (automatic transmission) or the clutch pedal pressed (manual transmission). Press the Neutral button (if equipped) on the Transfer Case Selector Switch until the Neutral Indicator is illuminated.

     WARNING: Apply the parking brake. The vehicle may roll with the Transfer Case in neutral.

   -
   - To verify that the Transfer Case is in Neutral, shift the automatic transmission into reverse and release the brake pedal for three seconds or shift the manual transmission into gear and slowly release the clutch pedal. There should be no vehicle movement if the Transfer Case is in Neutral.
6. With the scan tool, read DTCs in the Drive Train Control Module (DTCM) and in the Cluster Control Node (CCN).

   Are any DTCs present in the DTCM or CCN?

   Yes

   - Perform the appropriate diagnostic procedure. Refer to the **DIAGNOSTIC CODE INDEX** and the **DTC INDEX** article.

   No

   - Test complete.

2014 ACCESSORIES AND EQUIPMENT

Electronic Control Modules - Service Information - Cherokee

STANDARD PROCEDURE

FLASH PROGRAMMING

NOTE: The wiTECH diagnostic application is the preferred method for flashing ECUs.

NOTE: Help using the wiTECH diagnostic application for flashing an ECU is available by selecting "Help" then "Help Contents" at the top of the wiTECH diagnostic application window.

NOTE: The wiTECH software level must be at the latest release to perform this procedure.

NOTE: The StarMobile Desktop Client may also be used to perform this flash procedure.

FOBIK PROGRAMMING

The Radio Frequency Hub (RF-Hub) may be programmed to recognize up to a total of eight FOBIKs. When replacing or adding a FOBIK, the integrated key must be cut to match the door lock cylinder in the vehicle for which it will be used. Once an additional or new key has been cut, the **RF-Hub must be programmed to recognize it as a valid FOBIK** . When programming a FOBIK it may be necessary to have the vehicle PIN. Follow the instructions on the scan tool screen.

This procedure will require you to log into DealerCONNECT and enter a PIN when requested. The PIN is temporary and will be active for 12 hours. After 12 hours, a new PIN will need to be obtained from DealerCONNECT.

NOTE: All FOBIKs that are to be used in this vehicle must remain on the front seat near the center console but behind the shifter.

NOTE: Do not put a Laptop or any wireless device (cell phone, audio device, etc.) on top of or near the center console. The RF Antenna is below the console.

1. Turn the ignition on.
2. With the scan tool select RFH.
3. Go to "View", select "Data" tab. Verify "Number of Key/Fob programmed" to make sure programmed FOBIKs do not exceed eight
4. Turn the ignition to the off/lock position. The ignition must be left off throughout this procedure on

vehicles equipped with the RF-Hub.

5. With the scan tool select; "Misc. Functions" "Program Ignition FOBIKs".

NOTE: Premium System (KIN) - When programming a FOBIK, hold it near or on the center console top. When you are instructed to "Press the Unlock button" it is important that you do not hold the button. Press it One time quickly.

NOTE: Baseline System (IGNM) - When programming a FOBIK, place the new, un-programmed FOBIK into the ignition, leave in the LOCK position.

6. Have the Sentry Key PIN available as this will be required to be entered into the scan tool.
7. Press "Continue" and follow the instructions on the screen.
8. When the programming is completed the screen will display "Programming of Ignition FOBIK successful, continue to program another or close". Select "Close" or "Continue" to program another FOBIK.
9. Verify successful programming by removing the FOBIK (IGNM) from the ignition and pressing the various buttons to verify operation. Vehicle should unlock. Go to RFH "View", select "Data" tab to verify "Number of key/FOBIK programmed" equal the new Programmed FOBIK count.

MODULE PROXI REQUIREMENTS

NOTE: When replacing a module, a PROXI Alignment Procedure may need to be completed for that module.

The PROXI Alignment Procedure is needed to learn the PROXI Configuration from the BCM. This PROXI information configures the modules based on the content of the vehicle.

Refer to the chart below for the list of which modules do and do not require the PROXI Alignment Procedure.

MODULE	REQUIRES PROXI
ABS	YES
AMP	YES
BCM	MASTER OF THE PROXI CONFIGURATION DATA
CSWM	YES
CTM (Magnetti Marelli)	YES
CTM (Pieker)	NO
EDM	YES
EPS	YES
ESM	YES

HVAC	YES
ICS	NO
IPC	YES
LBSS	YES
OCM	YES
ORC	YES
PAM	YES
PCM (2.0L) Diesel	YES
PCM (2.4L)	YES
PCM (3.2L)	YES
RADIO	YES
RBSS	YES
RFH	YES
SCCM	NO
TCM	NO

NOTE: Some modules require several steps to replace the ECU. See the appropriate ECU replacement procedure Service Information for a full list of replacement steps.

PROGRAM THE BCM (BODY CONTROL MODULE)

NOTE: After installing a brand new BCM, the scan tool will be unable to identify the vehicle. Manual VIN entry into the scan tool must be used to continue scan tool communication.

1. Turn the ignition on.
2. With the scan tool, perform the following procedure in the BCM Miscellaneous Functions: Restore BCM PROXI Configuration*.

   NOTE: NOTE: The Restore BCM PROXI Configuration uses the VIN and sales code information from DealerCONNECT to reconfigure the vehicle. After running the Restore BCM PROXI Configuration, the scan tool will restart to begin a new diagnostic session with the vehicle.

3. If instructed by the scan tool, run the following procedure in the BCM Miscellaneous Functions: PROXI Configuration Alignment*.
4. With the scan tool, perform the following procedure in the RFH Miscellaneous Functions: BCM Replaced*.

* - Denotes that a user message indicating that the scan tool procedure is required may automatically display to the technician during the tool connection process

NOTE: Customer programmable features in the BCM may need to be reset back to the customers preferred settings.

PROGRAM THE IPC (INSTRUMENT PANEL CLUSTER)

1. Connect the scan tool.
2. Turn the ignition ON to the RUN position (engine not running).
3. With the scan tool, clear all DTCs.
4. Turn ignition OFF then ON to the RUN position and confirm DTCs are cleared.
5. If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.
6. With the scan tool under RF Hub (RFH), under Miscellaneous Functions menu, "Update Front and Rear Axle Nominal Tire Pressure Values" to program the tire pressure threshold values.

PROGRAMMING THE PCM

The secret key is an ID code that is unique to each KIN. This code is programmed and stored in the KIN, the PCM, and each ignition key transponder chip. When the PCM or KIN is replaced, it is necessary to program the Secret Key Code into the new module using a diagnostic scan tool. Follow the programming steps outlined in the diagnostic scan tool for **PCM REPLACED** , **KIN REPLACED** , or **BCM REPLACED** under **MISCELLANEOUS FUNCTIONS** for the **KEYLESS IGNITION NODE** menu item as appropriate.

NOTE: Programming the PCM or KIN is done using a diagnostic scan tool and a PIN to enter secure access mode. If three attempts are made to enter secure access mode using an incorrect PIN, secure access mode will be locked out for one hour. To exit this lockout mode, turn the ignition to the RUN position for one hour and then enter the correct PIN. Be certain that all accessories are turned OFF. Also, monitor the battery state and connect a battery charger if necessary.

CAUTION: Read all notes and cautions for programming procedures.

NOTE: If you are also replacing the KIN and/or Ignition Keys/FOBIKS refer to the module/programming order replacement guide before starting. Refer to STANDARD PROCEDURE.

1. Connect a battery charger to the vehicle.
2. Connect the scan tool.
3. Have a unique vehicle PIN readily available before running the routine.
4. Ignition key should be in RUN position.
5. Select "ECU View".

6. Select "KIN".
7. Select "Miscellaneous Functions."
8. Select "PCM Replaced".
9. Enter the PIN when prompted.
10. Verify the correct information.
11. Cycle ignition key after the successful routine completion.

PROGRAMMING THE RF-HUB

NOTE: If a BCM is also going to be replaced at this time, check the "RF-HUB, BCM, FOBIK REPLACEMENT AND PROGRAMMING ORDER GUIDE" before proceeding. Refer to STANDARD PROCEDURE.

NOTE: Do not put a laptop or any wireless device (cell phones, audio devices etc.) near the top of the center console (the RKE antenna is located below the center console).

1. After the RF-Hub has been replaced with new unit, connect the diagnostic scan tool to the Data Link Connector (DLC).
2. Navigate to the RF-Hub (RFH) in the "Vehicle View" of the diagnostic scan tool.
3. With the scan tool select "RF-Hub" and perform the "RF-HUB Replace" routine.

NOTE: This procedure will require you to log into DealerCONNECT and enter a PIN when requested. The PIN is temporary and will be active for 12 hours. After 12 hours, a new PIN will need to be obtained from DealerCONNECT.

4. Select "Misc. Function" and perform the "PROXI Configuration Alignment" routine.
5. Put all the FOBiKs used in this vehicle on the front seat away from the console.
6. With the scan tool select: "Program ignition FOBIKs" in the Miscellaneous Functions menu and follow the instructions on the screen.

NOTE: When programming a FOBIK, have it in your hand resting on the console.

NOTE: When you are instructed to "Press the Unlock button" it is important that you do not hold the button. Press it One time quickly.

NOTE: This procedure will require you to log into DealerCONNECT and enter a PIN when requested. The PIN is temporary and will be active for 12 hours. After 12 hours, a new PIN will need to be obtained from DealerCONNECT.

7. After all the FOBIKs have been programmed, turn the ignition on and with the scan tool select "BCM".
8. Update the Front and Rear Axle Normal Tire Pressure Values.

9. Program the Tire Sensor IDs.
10. Turn the ignition to the OFF position, wait 30 seconds, then cycle the ignition back to the ON/RUN position.
11. Check for any active RF-Hub DTCs. If any are present, go to **DTC INDEX** and perform the appropriate procedure.
12. Turn the ignition off and check each FOBiK for proper operation.
13. Finish the installation procedure (if necessary). Refer to **MODULE, RADIO FREQUENCY (RF HUB), INSTALLATION**.
14. Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

KL MODULE REPLACEMENT GUIDE (RF-HUB, PCM, BCM, ESL)

NOTE: **NOTE: If using 14.01 tool software and replacing the RF-Hub, the 'PROXI Configuration Alignment' procedure may need to be ran before running the 'Program Ignition FOBIKs' procedure in addition to the 'PROXI Configuration Alignment' procedure already documented in the below charts .**

VEHICLE SCAN AND CONFIGURATION REPORTS

YouTube	A multimedia supplement to the instructions contained in this article is available. To view the multimedia example of the condition described go to; **http://www.youtube.com/user/Mitchell1Tips** **then type, "A00641406.vid1" into the "Search Channel" box.**

COMMUNICATION

DESCRIPTION

DESCRIPTION

The primary on-board communication network between microprocessor-based electronic control modules in this vehicle is the Controller Area Network (CAN) data bus system. A data bus network minimizes redundant wiring connections; and, at the same time, reduces wire harness complexity, sensor current loads and controller hardware by allowing each sensing device to be connected to only one module (also referred to as a node). Each node reads, then broadcasts its sensor data over the bus for use by all other nodes requiring that data. Each node ignores the messages on the bus that it cannot use.

The CAN bus is a two-wire multiplex system. Multiplexing is any system that enables the transmission of multiple messages over a single channel or circuit. The CAN bus is used for communication between most vehicle nodes. However, in addition to the CAN bus network, certain nodes may also be equipped with a Local Interface Network (LIN) data bus. The LIN data bus is a single wire low-speed (9.6 Kbps) serial link bus used to provide direct communication between a LIN master module and certain switch or sensor inputs.

There are two separate CAN bus systems used in the vehicle. They are designated: the CAN-IHS, and the CAN-C. The CAN-IHS and CAN-C systems provide on-board communication between all of the nodes that are

connected to them. The CAN-C is the faster of the two systems providing near real-time communication (500 Kbps). The CAN-C is used typically for communications between more critical nodes, while the slower CAN-IHS (125 Kbps) system is used for communications between less critical nodes.

The added speed of the CAN data bus is many times faster than previous data bus systems. This added speed facilitates the addition of more electronic control modules or nodes and the incorporation of many new electrical and electronic features in the vehicle.

The central CAN gateway or hub module integral to the BCM is connected to CAN-IHS and CAN-C buses. This gateway physically and electrically isolates the CAN buses from each other and coordinates the bi-directional transfer of messages between them. The BCM is located under the left hand side of the instrument panel.

OPERATION

OPERATION

YouTube	A multimedia supplement to the instructions contained in this article is available. To view the multimedia example of the condition described go to; **http://www.youtube.com/user/Mitchell1Tips** **then type, "A00641406.vid2" into the "Search Channel" box.**

The primary communication network between electronic control modules on this vehicle is the Controller Area Network (CAN) data bus system. The Controller Area Network (CAN) data bus allows all electronic modules connected to the bus to share information with each other. Regardless of whether a message originates from a module on the higher speed CAN C (500K) Bus or on the lower speed CAN Interior High Speed (IHS) (125K) Bus the message structure and layout is similar, which allows the Body Control Module (BCM) to be a Central Gateway to process and transfer messages between the CAN C and CAN IHS buses. The BCM also stores Diagnostic Trouble Codes (DTCs) for certain bus network faults.

The CAN bus nodes are connected in parallel to the two-wire bus using a twisted pair, where the wires are wrapped around each other to provide shielding from unwanted electromagnetic induction, thus preventing interference with the relatively low voltage signals being carried through them. The twisted pairs have between 33 and 50 twists per meter (yard). While the CAN bus is operating (active), one of the bus wires will carry a higher voltage and is referred to as the CAN High or CAN bus (+) wire, while the other bus wire will carry a lower voltage and is referred to as the CAN Low or CAN bus (-) wire. Refer to the CAN Bus Voltages table.

CAN BUS VOLTAGES TABLE

CAN Bus Voltages (Normal Operation)								
CAN-C Bus Circuits	**Sleep**	**Recessive (Bus Idle)**	**Dominant (Bus Active)**	**CAN-L Short to Ground**	**CAN-H Short to Ground**	**CAN-L Short to Battery**	**CAN-H Short to Battery**	**CAN-H Short to CAN-L**
CAN-L (-)	0 V	2.3 - 2.5 V	1.3 - 2.3 V	0 V	0.3 - 0.5V	Battery Voltage	Battery Voltage Less 0.75	2.45 V

							V	
CAN-H (+)	0 V	2.5 - 2.7 V	2.6 - 3.5 V	0.02 V	0 V	Battery Voltage Less 0.75 V	Battery Voltage	2.45 V
CAN-IHS Bus Circuits	**Key-Off (Bus Asleep)**		**Key-On (Bus Active)**	**CAN-L Short to Ground**	**CAN-H Short to Ground**	**CAN-L Short to Battery**	**CAN-H Short to Battery**	**CAN-H Short to CAN-L**
CAN-L (-)	0.0V		1.3 - 2.3 V	0 V	0.3 - 0.5 V	Battery Voltage	Battery Voltage Less 0.75 V	2.45 V
CAN-H (+)	0.0 V		2.6 - 3.5 V	0.02 V	0 V	Battery Voltage Less 0.75 V	Battery Voltage	2.45 V
Notes								
All measurements taken between node ground and CAN terminal with a standard DVOM. DVOM will display average network voltage. Total resistance of CAN networks can be measured with the battery disconnected. The average resistance is approximately 60 Ohms. The termination resistors are integral to the Star Connectors.								

The CAN-IHS bus network remains active until all nodes on that network are ready for sleep. This is determined by the network using tokens in a manner similar to polling. When the last node that is active on the network is ready for sleep, and it has already received a token indicating that all other nodes on the bus are ready for sleep, it broadcasts a **bus sleep acknowledgment** message that causes the network to sleep. Once the CAN-IHS bus network is asleep, any node on the bus can awaken it by transmitting a message on the network.

In the CAN system, available options are configured into the BCM at the assembly plant, but additional options can be added in the field using the diagnostic scan tool. The configuration settings are stored in non-volatile memory. The BCM stores a Diagnostic Trouble Code (DTC) in one of two caches for any detected active or stored faults in the order in which they occur. One cache stores powertrain (P-Code), chassis (C-Code) and body (B-Code) DTCs, while the second cache is dedicated to storing network (U-Code) DTCs.

CONNECTOR, DATA LINK

DESCRIPTION

DESCRIPTION

Fig. 1: Identifying Data Link Connector (DLC)
Courtesy of CHRYSLER GROUP, LLC

The Data Link Connector (DLC) (1) is a 16-way molded plastic connector that is part of the instrument panel wire harness. This connector is located at the lower edge of the instrument panel, outboard of the steering column. The connector insulator is retained by integral snap features within a rectangular cutout in a mounting bracket integral to the lower instrument panel and inboard of the inside hood release on the inner cowl side trim.

OPERATION

OPERATION

The Data Link Connector (DLC) is an industry-standard 16-way connector that permits the connection of a diagnostic scan tool to the Controller Area Network (CAN) data bus for interfacing with, configuring, and retrieving Diagnostic Trouble Code (DTC) data from the electronic modules that reside on the data bus network of the vehicle.

CONNECTOR, STAR DIAGNOSTIC

DESCRIPTION

DESCRIPTION

Star connectors provide a simple method of diagnosing CAN Bus communication faults through the use of connection points for all modules on the bus. The connectors can be used to eliminate a module or group of modules in order to diagnose issues with the CAN Bus circuits and connectors to the modules or the modules themselves.

There are two locations for the STAR diagnostic connectors on this vehicle:

- The location of IP side CAN Connectors - behind the glove box on the passenger side. These connectors slide right to left in order to remove from the mounting bracket.
- The location of Body side CAN Connectors - under the center console. The rear potion of the console is removed to access the connectors. These connectors are mounted to a bracket underneath the console. They are removed from the bracket by pulling rearward.

MODULE, ADAPTIVE CRUISE CONTROL

DESCRIPTION

DESCRIPTION

2849199

Fig. 2: Adaptive Speed Control Sensor, One Fixed Ball Stud, Two Adjustable Ball Studs & Radar Dome
Courtesy of CHRYSLER GROUP, LLC

The adaptive speed control sensor (1) (also known as the Adaptive Cruise Control/ACC sensor or module, or the radar sensor or module) is located on a bracket secured near the center of the underside of the front bumper support behind the front fascia. The stamped steel ACC sensor mounting bracket is secured by two screws to a bracket on the bumper support member. This sensor is also a component of the Forward Collision Warning (FCW) feature.

One fixed ball stud (4) and two adjustable ball studs (3) secure the sensor housing through a snap fit into three molded plastic ball socket clips installed in the mounting bracket. The sensor pivots on the fixed ball stud while the two adjustable ball studs allow the sensor to be vertically aligned after installation using an ACC vertical alignment special tool and a 3.5 millimeter hex nut driver special tool. Horizontal alignment is performed electronically using a diagnostic scan tool during a ten minute drive at a steady, predetermined speed following completion of the vertical alignment.

The ACC sensor electronic circuitry is sealed and protected within a die cast aluminum housing. A molded

plastic cover and a lens or radar dome (5) faces forward through an opening in the center of the front fascia lower airflow grille texture that is trimmed with a bezel snapped into the texture opening. A molded plastic sensor bezel or mirror cover with a center clearance hole for the sensor lens snaps over the sensor and conceals a small square mirror in one corner of the sensor cover that is used for calibration purposes during the sensor manufacturing process.

The ACC sensor includes an applied connector receptacle (2) that is sealed and secured to the sensor housing with screws and faces downward when installed on the mounting bracket. The ACC sensor is connected to the vehicle electrical system through a single dedicated takeout and connector of the FEM wire harness.

The adjustable ball studs and the ACC sensor cannot be repaired. If ineffective or damaged the entire sensor unit must be replaced. The three plastic ball socket clips in the sensor mounting bracket must also be replaced each time the ACC sensor is removed from and reinstalled onto the mounting bracket.

OPERATION

OPERATION

The microprocessor in the adaptive speed control sensor (also known as the Adaptive Cruise Control/ACC sensor or module, or as the radar sensor or module) contains the logic circuits and controls many of the features of the adaptive speed control system. The ACC sensor receives battery voltage on a fused ignition switch output (run) circuit and is grounded at all times through a hard wired remote ground point. These connections allow the ACC sensor to operate only when the ignition switch is in the ON position. Likewise, the ACC sensor sleeps whenever the ignition switch is in any position except ON.

The ACC sensor is also a Radio Detection And Ranging (RADAR) transceiver. The ACC sensor transmits electromagnetic signal bursts at an operating frequency of 77 gigahertz. Those signal bursts are scattered by any objects they strike within the 40 degree field of view of the transceiver, which changes the strength and frequency of the signal. The ACC sensor antenna receives and interprets the returned signals to detect any objects in the path of the vehicle as well as their speed and direction.

The ACC sensor receives electronic **speed control switch status** message inputs from the Steering Control Module (SCM) integral to the Steering Column Control Module (SCCM) over the Controller Area Network (CAN) data bus. The sensor also monitors electronic message inputs from the Powertrain Control Module (PCM), the Antilock Brake Module (ABM) (also known as the Controller Antilock Brake/CAB or the Electronic Stability Control/ESC module) and the Transmission Control Module (TCM).

The ACC sensor logic processes all of those inputs, then provides the appropriate electronic message outputs over the CAN data bus to the PCM, the TCM and the ABM to control and maintain the separation setting selected by the vehicle operator between the vehicle and any preceding vehicles. The ACC sensor also provides electronic message outputs to the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN) and the Electronic Vehicle Information Center (EVIC) to invoke the Forward Collision Warning (FCW) features.

Among other features, the sensor also contains an electronic ambient temperature sensor and a heating element. When appropriate ambient temperatures are sensed, the heating element is energized by the sensor control circuitry to keep the sensor lens or radar dome clear of ice and snow accumulations that might otherwise blind

the sensor to proper reception of returned signals.

For those models equipped with the Forward Facing Camera (FFC), the FFC has a function that serves as a redundancy check with what the ACC radar is reading. If the two readings between the FFC and the ACC radar are not completely identical, the system will become disabled and set a Diagnostic Trouble Code (DTC). When the ACC system is paired with the FFC option, this is known as the ACC+ system.

The ACC sensor microprocessor continuously monitors all of its internal electronics to determine the sensor readiness. If the ACC sensor detects a monitored sensor fault, it sets and stores a DTC. The ACC sensor uses On-Board Diagnostics (OBD) and can communicate with other electronic modules in the vehicle as well as with the diagnostic scan tool using the CAN data bus. This method of communication is used for control of the indicators and indications provided to the vehicle operator through the EMIC and the EVIC. The ACC sensor is also Flash programmable, allowing the sensor software to be updated using a diagnostic scan tool.

The hard wired inputs for the ACC sensor may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the ACC sensor or the electronic controls or communication between other modules and devices that provide features of the adaptive speed control and FCW system features. The most reliable, efficient, and accurate means to diagnose the ACC sensor or the electronic controls and communication related to adaptive speed control or FCW system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - ACC SYSTEM

The hard wired circuits to the adaptive speed control sensor (also known as the Adaptive Cruise Control/ACC sensor or module, or the radar sensor or module) may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the ACC sensor or the electronic controls and communication between modules and other devices that provide some features of the adaptive speed control and Forward Collision Warning (FCW) systems. The most reliable, efficient, and accurate means to diagnose the ACC sensor or the electronic controls and communication related to adaptive speed control or FCW system operation requires the use of a diagnostic scan tool. Refer to **DIAGNOSIS AND TESTING** .

STANDARD PROCEDURE

STANDARD PROCEDURE - ADAPTIVE SPEED CONTROL SENSOR ALIGNMENT

The adaptive speed control sensor (also known as the Adaptive Cruise Control/ACC sensor or module, or the radar sensor or module) requires alignment whenever the ACC sensor is removed and reinstalled, whenever front end structural repairs are performed or whenever a Diagnostic Trouble Code (DTC) indicates ACC sensor adjustment is required. Sensor alignment consists of performing the mechanical vertical alignment described in

the following procedure, followed by the electronic horizontal alignment that is performed with a diagnostic scan tool and the appropriate diagnostic information.

VEHICLE PREPARATION FOR SENSOR VERTICAL ALIGNMENT

1. Repair or replace any ineffective, worn or damaged body components. Repair any loose or cracked fascia components that might interfere with the sensor field of view. The radar dome of the sensor module should be roughly centered in the opening of the fascia.
2. Verify proper tire inflation pressures.
3. Remove any accumulations of mud, snow or ice from the vehicle underbody.
4. Verify that there is no load in the vehicle (cargo or passengers), except for the driver.

NOTE: The vehicle MUST be placed upon a wheel alignment or frame rack to achieve the proper sensor vertical alignment results. If a wheel alignment or frame rack is not available, then a verified level surface can be used. When using the wheel alignment rack, the fore - after specifications must be within 0 (+/- 0.2) degrees.

5. Rock the vehicle side-to-side three times to allow the suspension to stabilize.
6. Jounce the front and rear suspension three times by pushing downward on the front and rear bumpers and releasing.
7. Verify correct vehicle suspension height.

SENSOR VERTICAL ALIGNMENT

Fig. 3: Adaptive Speed Control Sensor, Bracket, Vertical Alignment Tool & Plunger
Courtesy of CHRYSLER GROUP, LLC

1. The adaptive speed control sensor (4) (also known as the Adaptive Cruise Control/ACC sensor or module and the radar sensor or module) is located on a bracket (6) secured near the center of the underside of the front bumper support member of the Front End Module (FEM) behind the front fascia.
2. Unsnap and remove the molded plastic ACC fascia closeout bezel in the center of the grille texture insert of the lower air intake opening of the front fascia to gain access to the ACC adjustment screws.
3. Remove the smaller plastic bezel (mirror cover) from over the front of the sensor housing.
4. Using standard glass cleaner and a clean soft towel, remove any dirt or road salt from the convex molded dark plastic lens (radar dome) on the face of the sensor as well as from the suction cup of the vertical alignment tool (3).
5. Carefully slide the vertical alignment tool over the sensor housing until the suction cup rests against the lens of the sensor.

NOTE: **It may take several attempts to get the suction cup of the special tool to fasten securely to the sensor. If necessary, lightly wet the suction cup with clean water to help improve adhesion.**

6. Depress the plunger (1) of the vertical alignment tool to engage the suction cup and attach the special tool securely to the lens of the sensor.

Fig. 4: Sensor & Ball Stud
Courtesy of CHRYSLER GROUP, LLC

7. Use the 3.5 millimeter hex nut driver (Special Tool No. (special tool #10243-2, Driver, Nut)) to rotate the vertical adjustment ball stud (2) that secures the sensor (1) to the mounting bracket as necessary to center the bubble of the spirit level between the two center marks on the vial of the level located on the top of the vertical alignment tool.
8. Depress the center release button of the special tool to release the suction cup from the sensor lens and

remove the special tool from the sensor.

9. Perform the ACC sensor horizontal alignment using a diagnostic scan tool and the appropriate diagnostic information.
10. Reinstall the smaller plastic bezel (mirror cover) onto the front of the sensor housing. Care must be taken to orient the bezel properly to ensure proper retention.
11. Reinstall the molded plastic ACC fascia closeout bezel into the center of the grille texture insert of the lower air intake opening of the front fascia.

REMOVAL

REMOVAL

Fig. 5: Identifying ACC Module, Connector, Fasteners & Screws
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery cable from the negative battery post.
2. Raise and support the vehicle.
3. Remove the wire harness to ACC bracket routing fasteners (2).
4. Disconnect the electrical harness from the electrical connector (3) of the ACC module assembly (4).
5. Remove two bolts (1) securing the ACC module assembly bracket to the support cross bracing.
6. Remove the ACC module assembly with bracket from the vehicle to bench.
7. Remove the four retainers that secure the ACC module assembly to the ACC bracket.

INSTALLATION

INSTALLATION

Fig. 6: Identifying ACC Module, Connector, Fasteners & Screws
Courtesy of CHRYSLER GROUP, LLC

1. If the ACC module is removed from the bracket, align the module to the bracket so that all four fastener locations are properly seated. Use the given fasteners to secure the ACC module to the bracket.
2. Raise and suppose the vehicle.
3. Position the ACC module assembly with bracket (4) to the vehicle for installation. Insert both bolts (1) that secure the bracket to the support cross bracing.
4. Connect and seat the wiring harness end to the ACC module connector (3).
5. Connect the wire harness routing fasteners (2) on the harness to the ACC module bracket assembly.
6. Lower the vehicle.
7. Connect the negative battery cable to the negative terminal of the battery.
8. Perform calibration procedures. Refer to **MODULE, ADAPTIVE CRUISE CONTROL, STANDARD PROCEDURE**.

MODULE, ANTI-LOCK BRAKE SYSTEM

DESCRIPTION

DESCRIPTION

Fig. 7: Antilock Brake Module & Hydraulic Control Unit
Courtesy of CHRYSLER GROUP, LLC

The Antilock Brake Module (ABM) is a microprocessor-based device which monitors the antilock brake system (ABS) during normal braking and controls it when the vehicle is in an ABS stop or when in a traction control situation. The ABM utilizes a 38-way electrical connector on the vehicle wiring harness. The power source for the ABM is through the ignition switch in the RUN or ON position.

The ABM (1) is mounted to the HCU (2) as part of the Integrated Control Unit (ICU). The ICU is located in the engine compartment below the master cylinder on the front suspension cradle/crossmember. For information on the ICU, refer to **INTEGRATED CONTROL UNIT (ICU), DESCRIPTION** .

OPERATION

OPERATION

NOTE: The Electronic Stability Control (ESC) may also be referred to as Electronic Stability Program (ESP) depending on the vehicle model year and configuration. Certain components may also reference ESP, ESC, or use the traction control symbol.

The primary functions of the Antilock Brake Module (ABM) are to:

- Monitor the antilock brake system for proper operation.
- Detect wheel locking or wheel slipping tendencies by monitoring the speed of all four wheels of the vehicle.
- Control fluid modulation to the wheel brakes while the system is in an ABS mode.
- Store diagnostic information.
- Provide communication to the scan tool while in diagnostic mode.
- Illuminate the amber ABS warning indicator lamp.

- Illuminate the ESC function lamp in the message center on the instrument panel when a traction control event occurs.
- Illuminate the ESC function lamp when the amber ABS warning indicator lamp illuminates.

The ABM constantly monitors the antilock brake system for proper operation. If the ABM detects a fault, it will turn on the amber ABS warning indicator lamp and disable the antilock braking system. The normal base braking system will remain operational.

NOTE: If the vehicle is equipped with traction control, the ESC function lamp will illuminate anytime the amber ABS warning indicator lamp illuminates.

The ABM continuously monitors the speed of each wheel through the signals generated by the wheel speed sensors to determine if any wheel is beginning to lock. When a wheel locking tendency is detected, the ABM commands the ABM command coils to actuate. The coils then open and close the valves in the HCU that modulate brake fluid pressure in some or all of the hydraulic circuits. The ABM continues to control pressure in individual hydraulic circuits until a locking tendency is no longer present.

The ABM contains a self-diagnostic program that monitors the antilock brake system for system faults. When a fault is detected, the amber ABS warning indicator lamp is turned on and the fault diagnostic trouble code (DTC) is then stored in a diagnostic program memory. A latched fault will disable certain system functionality for the current ignition cycle. An unlatched fault will disable certain system functionality until the fault condition disappears. These DTC's will remain in the ABM memory even after the ignition has been turned off. The DTC's can be read and cleared from the ABM memory by a technician using a scan tool. If not cleared with a scan tool, the fault occurrence and DTC will be automatically cleared from the ABM memory after the identical fault has not been seen during the next 3, 500 miles. Drive-off may be required for the amber ABS warning indicator lamp to go out on the next ignition cycle.

REMOVAL

REMOVAL

1. To replace the ABM, the ICU assembly must be removed. Refer to **INTEGRATED CONTROL UNIT (ICU), REMOVAL** .

Fig. 8: ABM Mounting Screws - With Traction Control
Courtesy of CHRYSLER GROUP, LLC

2. Remove the four screws (1) attaching the ABM (2) to the HCU.

Fig. 9: ABM Assembly To HCU
Courtesy of CHRYSLER GROUP, LLC

CAUTION: When removing the ABM from the HCU, be sure to completely separate the two components (approximately 38 mm (1.5 inches)) before removing the ABM. Otherwise, damage to the pressure sensor or pump motor connection may result, requiring HCU replacement. Do not to touch the sensor terminals on the HCU side or the contact

pads on the ABM side as this may result in contamination and issues in the future.

3. Separate the ABM (1) from the HCU (2).

INSTALLATION

INSTALLATION

1. Clean any debris off the mating surfaces of the HCU and ABM.

CAUTION: When installing new O-rings or solenoid valve stem seals, do not use any type of lubricant.

Fig. 10: Solenoid Valve Seal
Courtesy of CHRYSLER GROUP, LLC

2. **New** solenoid valve stems seals (1) and (2) must be installed. **Do not reuse solenoid valve stem seals.**

Fig. 11: Internal Pump Connector O-Ring
Courtesy of CHRYSLER GROUP, LLC

3. Replace the pump/motor connector O-ring (1) if it is not new. Be sure the O-ring is properly seated in the mounting groove (2).

Fig. 12: ABM Assembly To HCU
Courtesy of CHRYSLER GROUP, LLC

4. Align components and install the ABM (1) on the HCU (2).

Fig. 13: ABM Mounting Screws - With Traction Control
Courtesy of CHRYSLER GROUP, LLC

5. Install the four screws (1) attaching the ABM (2) to the HCU. Tighten the mounting screws to 2 N.m (17 in. lbs.).
6. Install the ICU into the vehicle. Refer to **INTEGRATED CONTROL UNIT (ICU), INSTALLATION** .

MODULE, BLIND SPOT

DESCRIPTION

DESCRIPTION

The optional Blind Spot Monitor (BSM) system used in this vehicle has two control modules. One control module is dedicated to each side of the vehicle. The blind spot modules are each integral to the blind spot sensor for the same side of the vehicle. Refer to **SENSOR, BLIND SPOT, DESCRIPTION** .

OPERATION

OPERATION

MODULE, BODY CONTROL

DESCRIPTION

DESCRIPTION

Fig. 14: Identifying Body Control Module (BCM) & Integral Receptacles
Courtesy of CHRYSLER GROUP, LLC

The CUSW - Body Control Module is an electronic control unit that manages the main body functions of the vehicle thus performing gateway functions between high and low speed CAN and between LIN and CAN

networks. Moreover, the BCM is an interconnecting unit that provides protected supply to many electrical loads by means of fuses.

The BCM is made by two main PCBs:

- The power PCB, that contains fuses, relays and power connections;
- The Logic PCB that contains the microcontroller and the main solid state devices.

Power PCB and Logic PCB are in the same case. The relays on the power PCB are soldered in place and are not individually serviceable.

The Body Control Module (BCM) (2) is mounted in the dashboard, left of the steering wheel, behind a removable aesthetical cover that allows the access to fuses mounted on the component and those found in the adjacent Junction Block (JB) (also known as the interior Power Distribution Center/PDC). The BCM has a molded plastic case that has integral receptacles in three clusters (1) for individual fuses on the rearward facing surface.

The BCM is secured with screws within two stamped metal brackets that form a mounting yoke. The yoke is then secured with screws to the metal support structure of the instrument panel. The BCM is connected to the vehicle electrical system through eight wire harness connections. Six connector receptacles are integral to the rearward facing surface of the BCM case, while two connector receptacles are integral to the forward facing surface of the case.

The BCM software is flash programmable. Otherwise, the BCM cannot be adjusted or repaired and, if damaged or ineffective, the entire BCM must be replaced. The mounting brackets for the BCM as well as the fuses found in the BCM are individually serviceable.

OPERATION

OPERATION

A Body Control Module (BCM) is an electronic control unit with a microcontroller that controls and integrates many of the main body electronic functions and features of the vehicle. Many of the functions and features provided by the BCM are possible because of numerous hard wired inputs and outputs, but most of these features are only possible or are enhanced because the BCM communicates electronically with other electronic modules in the vehicle as well as with a diagnostic scan tool using the Controller Area Network (CAN) data bus.

The BCM is a gateway between the high and low speed CAN data bus networks as well as a Local Interface Network (LIN) master node. This method of communication allows the sharing of sensor information, which reduces wire harness complexity, internal controller hardware and component sensor current loads. At the same time, this system provides increased reliability, enhanced diagnostics and allows the addition of many new feature capabilities. This method of communication is used by the BCM to acquire vehicle configuration data, including customer programmable features.

Software programming allows the BCM microcontroller to monitor all of these inputs and provide the appropriate outputs through high side drivers, low side drivers, on-board relays, Pulse-Width Modulation

(PWM) and electronic messages to other modules in the vehicle. Some of the functions and features that the BCM supports or controls include:

BCM INPUTS AND OUTPUT MANAGEMENT QUICK REFERENCE			
ON/OFF signal acquisition	High/Low beam headlight commands	Relay ON/OFF output management	Front/Rear washer pump
	Hand brake command		Projector front lighting
	Hazard command		Fog lights
	Fog light command		Door deadlock
	Left/Right turn command		Front/Rear windshield wiper
	Parking light command		Trunk
	Open/Close door switch	Direct management of ON/OFF output on loads and diagnosis functions	Front parking lights (Left and Right)
	Headlamp washing command		Rear parking lights (Left and Right)
	Hood switch		Front turn lights (Left and Right)
	Brake fluid level		Rear turn lights (Left and Right)
	Stop/Start enabling		Lateral turn lights (Left and Right)
Analog signal acquisition	Fuel level		License plate light (Left and Right)
	External temperature		Stop lights (Left and Right)
	Roof lamp command	Direct management of ON/OFF output on loads.	Rear Windows LED
	Stop light command		Emergency LED
Vehicle Speed Acquisition		Master functionality of CAN-B network (diagnosis, commands, and data).	Protocol errors management and monitoring
Door Lock Sensor acquisition and Management			Timing control
LIN Communication Management		Multi-master functionality of CAN-C towards ECM.	Protocol errors management and monitoring
Courtesy/Convenience with Timed and Dimming Management			Timing control

- **Brake Fluid Level** - The BCM continuously monitors the brake fluid level sensor through a hard-wired input to monitor the brake fluid level. The BCM transmits an electronic message over the Can data bus to Instrument Cluster (IC) to illuminate the Low Fluid indicator based on the input signal received from the fluid level sensor.
- **Enhanced Accident Response Support** - The BCM monitors an input from the Occupant Restraint Controller (ORC) and, following an airbag deployment, will immediately disable the power lock output, unlock all doors by activating the power unlock output, then enables the power lock output if the power lock switch input remains inactive for two seconds. The BCM also monitors an input from the Powertrain Control Module (PCM) to automatically turn ON the interior lighting after an airbag deployment event, 10 seconds after the vehicle speed is zero. The interior lighting remains illuminated until the ignition switch is turned to the OFF position, at which time the interior lighting returns to normal operation and control. These Enhanced Accident Response System (EARS) features are each dependent upon a functional vehicle electrical system following the vehicle impact event.
- **Exterior Lighting Switch Support** - The BCM continuously monitors the headlamp switch position to activate or deactivate the exterior lighting. The headlamp switch provides the appropriate resistor multiplexed output hardwired to the BCM. The BCM reads and responds to this input by energizing or de-energizing the right and left park lamp feed circuits and the right and left high or low beam driver circuits through internal High Side Drivers (HSD) and by sending an electronic confirmation message back to the IC, which controls the high beam indicator as appropriate. The BCM also remembers which headlamp beams were last selected with the multi-function switch, and energizes those beams by default the next time the headlamps are turned ON. If the vehicle is equipped with optional automatic headlamps and the **A** (Automatic) position is selected, the BCM also monitors an electronic **ambient light level** message received over the CAN data bus from the Heat, Ventilation and Air Conditioning (HVAC) control module based upon a hard wired input from the rain sensor to turn the exterior lighting ON and OFF automatically while the ignition switch is in the ON position. The BCM also controls the fog lamps, cargo lamp, CHMSL, tail/stop lamps, reverse lamps and turn signals.
- **Fuel Level Data Support** - The BCM provides a current source for and receives a hard-wired analog input from the fuel level sending unit located on the fuel pump module in the fuel tank. Based upon this input, the BCM uses electronic messaging to transmit this data over the CAN data bus for use by other electronic modules in the vehicle. The IC calculates the proper fuel gauge needle position and to control low fuel indicator operation based on these messages.
- **Hazard Lamp Circuit Control** - The BCM monitors an input from the hazard switch and receives a hard-wired analog input from the switch. The BCM reads and responds to this input by energizing or de-energizing the right and left park lamp feed circuits through internal HSD units and by sending an electronic confirmation message to the IC over the CAN data bus, which controls the hazard light indicators as appropriate.
- **Headlamp Washer Control** - On vehicles equipped with headlamp washers, the BCM controls a relay in the Power distribution Center (PDC) based on electronic messages received over the Can data bus.
- **Ignition On and Ignition Accessory/On Relay Control** - The BCM monitors electronic **ignition switch status** messages received over the CAN bus from the RF hub and a hard-wired input from the ignition switch on the instrument panel, and provides high side driver outputs to control both the ignition ON and ignition ACCESSORY/ON relays in the Power Distribution Center (PDC) as appropriate.
- **Interior Lamp Load Shedding** - The BCM provides a battery saver feature which will automatically turn OFF all interior lamps if they remain ON after a timed interval of about eight minutes.
- **Interior Lighting Control** - The BCM monitors electronic messages and hard-wired inputs from the

interior lighting switch, the door ajar switches, the liftgate ajar, and liftgate flip-up glass ajar switches (where applicable), the reading lamp switches and the RF hub to provide courtesy lamp control. This includes support for timed illuminated entry with theater-style fade-to-OFF and courtesy illumination DEFEAT features.

- **Local Interface Network Master Module** - The BCM is the master module for the LIN data bus. In this role it gathers information from the compass sensor, and the Intelligent Battery Sensor (IBS), then either acts on that information directly or places electronic messages on the CAN data bus for use by other modules
- **Power Inverter Support** - The BCM monitors a hard-wired input from the power inverter to determine the inverter status, then transmits electronic **inverter status** messages to other electronic modules in the vehicle over the CAN data bus.
- **Power Lock System Control** - The BCM monitors inputs from the power lock switches and the RF hub to provide control of the power lock motors through high side and low side driver outputs. This includes support for rolling door locks (also known as automatic door locks), automatic door unlock, and a door lock inhibit mode.
- **Remote Radio Switch Support** - The BCM receives electronic message inputs from the remote radio switches on the steering wheel over the CAN data bus, then provides electronic **radio request** messages over the CAN data bus to support the remote radio switch function.
- **Remote Start System Support** - The BCM receives electronic message inputs from the RF hub and then displays the appropriate remote start system textual reminder messages to the vehicle operator within the EVIC display.
- **Shipping Mode** - The new Chrysler Telematics Platform (CTP) vehicles no longer have a IOD fuse to use when transporting or storing for a long period of time. The BCM has a mode that takes the place of pulling the IOD fuse called **"Shipping Mode"** that is easily enabled or disabled.
- **Steering Wheel Switch Support** - The SCM receives electronic message inputs from the steering wheel switches on the steering wheel over the CAN data bus to control and configure many of the EVIC displays and functions.
- **Vehicle Theft Security System Control** - The BCM monitors inputs from the door ajar switches, and the RF hub, on vehicles so equipped. The intrusion module provides electronic **horn** and **lighting request** messages to the BCM for the appropriate VTSS alarm output features.
- **Washer Fluid Level** - The continuously monitors the washer fluid level sensor through a hard-wired input to monitor washer fluid level. the BCM transmits an electronic message over the Can data bus to Instrument Cluster (IC) to illuminate the Low Washer Fluid indicator based on the input signal received from the fluid level sensor.

The BCM stores and compares vehicle configuration data with other Electronic Control Units (ECU) in the vehicle. This process is referred to as PRogramming Of Configuration of Systems Integrated (PROCSI) (also known as PROXI). If a configuration mismatch is detected, the BCM sets a Diagnostic Trouble Code (DTC). A configuration mismatch will require the performance of a Restore BCM PROXI Configuration routine, or a PROXI Configuration Alignment routine using a diagnostic scan tool.

The BCM uses On-Board Diagnostics (OBD) to monitor all of the systems and circuits it controls, then sets active and stored Diagnostic Trouble Codes (DTC) for any monitored system faults it detects. The BCM will also send electronic message requests to the Instrument Cluster (IC) (also known as the Instrument Panel Cluster/IPC) for the display of certain textual warning messages related to some detected system conditions or

faults.

The hard wired inputs and outputs of the BCM may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the BCM electronic controls or the communication between modules and other devices that provide some features of the BCM-controlled systems. The most reliable, efficient and accurate means to diagnose the BCM or the electronic controls and communication related to BCM-controlled systems operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

BATTERY SAVER MODE/BATTERY SAVER ON MESSAGE - IF EQUIPPED

When the "Battery Saver Mode" or "Battery Saver On" message is displayed, the vehicle will turn off certain electrical functions to reduce battery energy consumption. This will occur during periods when the battery is not being adequately charged. During this time, the following features (if equipped) may be turned off or will operate at a reduced power level: heated seats and heated steering wheel, heated or cooled cup-holder, rear defroster and heated mirrors, heating and air conditioning, power inverter, audio and telematics system. This condition is temporary and recoverable.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - BODY CONTROL MODULE

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

The hard wired inputs and outputs of the Body Control Module (BCM) may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the BCM electronic controls or the communication between modules and other devices that provide some features of the BCM-controlled systems. The most reliable, efficient and accurate means to diagnose the BCM or the electronic controls and communication related to BCM-controlled systems operation requires the use of a diagnostic scan tool. Refer to **DIAGNOSIS AND TESTING** .

REMOVAL

REMOVAL

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

Fig. 15: Identifying Body Control Module (BCM) & Integral Receptacles
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the knee blocker cover from the instrument panel. Refer to **COVER, STEERING COLUMN OPENING, REMOVAL** .
3. Remove the lower left side A-Pillar extension trim.
4. Disconnect up to eight wire harness connectors from the connector receptacles of the Body Control Module (BCM).
5. Remove the four screws (1) that secure the yoke-like BCM mounting brackets to the instrument panel support structure outboard of the steering column.
6. Remove the BCM and mounting brackets from the instrument panel as a unit.
7. Remove the four screws that secure the BCM to the mounting brackets (2).
8. Unsnap and remove the BCM from the mounting brackets.

INSTALLATION

INSTALLATION

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

Fig. 16: Identifying Body Control Module (BCM) & Integral Receptacles
Courtesy of CHRYSLER GROUP, LLC

1. Snap the Body Control Module (BCM) (2) into the mounting brackets.
2. Install and tighten the screws (1) that secure the BCM to the mounting brackets. Tighten the screws to 2.5 N.m (30 in. lbs.).
3. Position the BCM and the yoke-like BCM mounting brackets (4) to the instrument panel support structure outboard of the steering column as a unit.
4. Install and tighten the screws that secure the BCM mounting bracket to the instrument panel support structure. Tighten the screws to 2.5 N.m (30 in. lbs.).
5. Reconnect up to eight wire harness connectors to the connector receptacles of the BCM. Six integral connector receptacles are located on the rearward facing surface of the BCM housing and two are on the forward facing surface.
6. Reinstall the steering column opening cover onto the instrument panel. Refer to **COVER, STEERING COLUMN OPENING, INSTALLATION** .
7. Reconnect the battery negative cable.
8. Perform BCM module programming with the scan tool. Refer to **STANDARD PROCEDURE**.

NOTE: If this Electronic Control Unit (ECU) is being replaced with a new unit, a

diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.

MODULE, COMBINED REAR VIEW MIRROR

DESCRIPTION

DESCRIPTION

The Combined Rear View Multiple Mirror Module (CRVV) is an available factory installed component on this vehicle. The Internal Electrochromatic Mirror feature automatically changes reflectance of the internal mirror to provide maximum nighttime vision, while giving relief from glare caused by headlights from the rear during night driving. This feature shall function normally in any case of (Remote Starts, StopStart). The CRVV combines the following modules and items:

- Electro-Mechanical Mirror Module (EMCC).
- Compass Module. **Note:** If the radio module supports dead-reckoning, stand-alone compass module will not be present on the vehicle.
- Auto High Beam Features.
- Two hard wired telematic microphones integral to the housing.

The CRVMM is secured to the same mounting button on the inside of the windshield glass and in the same manner that is used to mount the standard equipment mirrors.

OPERATION

OPERATION

Electrochromic Inside Rear View Mirror - Refer to **MIRROR, AUTOMATIC DAY AND NIGHT, DESCRIPTION** for description and operation characteristics of the EM mirror assembly.

Compass Module - Refer to **MODULE, COMPASS, DESCRIPTION** for a description and operation of the Compass Module.

Auto High Beam Module (AHBM) - The AHBM is integral to the Combined Rear View mirror Module (CRVMM). For description and operation of the Smart Beam lighting system, refer to **OPERATION** .

REMOVAL

REMOVAL

Refer to **MIRROR, REARVIEW, REMOVAL** for removal of the Combined Rearview Mirror Module (CRVMM).

INSTALLATION

INSTALLATION

Refer to **MIRROR, REARVIEW, INSTALLATION** for installation of the Combined Reaview Mirror Module.

MODULE, COMFORT SEAT AND WHEEL

DESCRIPTION

DESCRIPTION

Fig. 17: Locating Heated Seat Module
Courtesy of CHRYSLER GROUP, LLC

The Comfort Seat and Wheel Module (CSWM) (also known as the Heated Seat Module) is located under the driver front seat. It has a single electrical connector (1) and a push pin style retainer that secures it to the seat pan (4). The module can be accessed from under the Driver seat with the seat in the full back and up position.

The CSWM is a 125 kBd CAN-I controller providing outputs to the power seats, heated seat pads, heated steering wheel, and ventilating up to 2 seats.

The CSWM is a microprocessor designed to use the Local Interface Network (LIN) data bus messages from the instrument cluster, sometimes referred to as the Cab Compartment Node (CCN). The CCN receives inputs from the heated seat switches and in turn signals the heated seat module to operate the heated seat elements for both front seats.

Heated Seats - The CSWM directly provides power to the seat heating elements in the seat cushions and backs for seat heating. A thermistor sensor feedback from each seat heating elements to the CSWM regulates the

heater outputs to prevent any seat temperature to rise above set points. Seat heating has 2 selectable heat settings which are HI and LO. Depending on thermistor reading, the CSWM will start the heater output by adjusting the PWM heat level according to the calibration table.

Vented Seats - The CSWM vents the two front seats by providing variable analog voltages driving the external blowers in the seats. The seat venting has two selectable speeds for the fans. For seat venting, each press of the switch button will cause the seat to change venting modes. The CSWM will turn on the vented seats only with the engine running

Heated Steering Wheel - The CSWM directly provides power to the steering wheel heating element. The heated steering wheel is an option only available with at least the presence of front heated seats. During normal operation, the CSWM will switch on the power for the heated wheel only if the engine is running. A thermistor sensor feedback from the steering wheel heating element via the CAN bus to the CSWM regulates the heater output to prevent the wheel temperature to rise above the maximum threshold temperature set point.

OPERATION

OPERATION

The heated seat module (also known as the Custom Seat and Wheel Module - CSWM) operates on fused battery current received from the ignition switch. The module is grounded to the body at all times through the electrical connector. Inputs to the module include Local Interface Network (LIN) data bus messages and standard hardwired 12 volt power and ground. In response to the LIN inputs the heated seat module will control the battery current to the appropriate heated seat elements.

When a heated seat switch LIN data bus signal is received by the heated seat module, the module energizes the selected heated seat element. The Low heat set point is about 38° C (100.4° F), and the High heat set point is about 42° C (107.6° F).

The CSWM will automatically transition the output from high to low after a maximum period of 60 minutes has elapsed. The CSWM will automatically transition the output from low to off after a maximum period of 45 minutes has elapsed.

In addition to operating the heated seat elements, the heated seat module sends LED illumination messages to the instrument cluster, sometimes referred to as the Cab Compartment Node (CCN) via the LIN data bus. The CCN then sends the LED illumination message to the accessory switch bank so that the appropriate LEDs are illuminated for any given heating level. Pressing the switch once will select high-level heating. Pressing the switch a second time will select low-level heating. Pressing the switch a third time will shut the heating elements off.

If the heated seat module detects a heated seat element OPEN or SHORT circuit, it will record and store the appropriate Diagnostic Trouble Code (DTC).

Driver and Passenger Seat Heat Systems

- The element consists of a cushion element connected in parallel with a back element.
- The seat cushion has a thermistor to provide feedback to the CSWM.

- The seat cushion and seat back has a thermostat to automatically open the feed to the heated seat system.
- The heated seat cushion and seat back have a thermostat to automatically open the feed to turn the heated seat system off if the temperature reaches or exceeds 135 °F (+/- 9 ° F).

- Vented Seats - Refer to **OPERATION** .
- Heated Seats - Refer to **OPERATION** .
- Heated Steering Wheel - Refer to **OPERATION** .

If the CSWM detects a heated seat element OPEN or SHORT circuit, it will record and store the appropriate diagnostic trouble code (DTC).

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - HEATED SEAT MODULE

In order to obtain conclusive testing, the heated seat system and the Local Interface Network (LIN) data bus circuit must be checked. **Any diagnosis of the heated seat system should begin with, the use of a scan tool and the appropriate diagnostic service information.**

Refer to the appropriate wiring information for complete circuit schematic or connector pin-out information.

NOTE: Vehicles equipped with the heated seat option utilize a low voltage cut-off feature. This feature turns off power to the heated seat system anytime vehicle voltage is below 11.7v or above 15.5v. Be certain to check the vehicle electrical system for proper voltage anytime the power seat system appears inoperative.

Before any testing of the heated seat system is attempted, the battery should be fully-charged.

REMOVAL

REMOVAL

Fig. 18: Locating Heated Seat Module
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The Heated Seat Module mounting tab can be damaged during module removal and installation. Use care to properly align tab to prevent binding that could result in tab breakage.

1. Position the driver front seat to the full rearward position.
2. Disconnect and isolate the battery negative cable.
3. Disconnect the wire harness connector (4) from the heated seat module (3).
4. Unsnap the heated seat module retaining tab (2) from the seat pan (1).
5. Remove the heated seat module (3) from the vehicle.

INSTALLATION

INSTALLATION

Fig. 19: Locating Heated Seat Module
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The Heated Seat Module mounting tab can be damaged during module removal and installation. Use care to properly align tab to prevent binding that could result in tab breakage.

1. Install the heated seat module (3) into the vehicle.
2. Position the retaining tab (2) with the mounting hole in the seat pan (1). Firmly apply even pressure to the module (3) until the mounting tab is fully seated.
3. Connect the wire harness connector (4) to the heated seat module (3).
4. Connect the battery negative cable.
5. Check for proper heated seat system operation.

If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.

MODULE, COMPASS

DESCRIPTION

DESCRIPTION

On vehicles equipped with the Combined Rear View Mirror Module (CRVMM), the Remote Compass Module (RCM) is located internal to the CRVMM. The RCM is only serviced by replacing the CRVMM assembly.

Some models "dead reckoning" navigation system. The RCM is located internally to the radio with this option.

If the compass position sensor (Remote Compass Module) is inoperative and requires replacement, refer to **MIRROR, REARVIEW, REMOVAL** for models equipped with a CRVMM assembly.

If the compass position sensor (Remote Compass Module) is inoperative and requires replacement, refer to **RADIO, REMOVAL** .

MODULE, DOOR

DESCRIPTION

DESCRIPTION

Fig. 20: Identifying Front Door Control Module
Courtesy of CHRYSLER GROUP, LLC

This vehicle can be equipped with two electronic front door control modules (1) (also known as a Driver Door Module/DDM, a Passenger Door Module/PDM or Front Door Multiplex/MUX Modules), one each on both the driver and passenger front doors. Each door control module is concealed behind the front door trim panel where it is secured through two integral mounting tabs (2) to the door hardware module carrier by two screws. The front door control modules are located in the upper front corner of the front door hardware carriers, just below the mirror flag area of the front door.

Each door control module contains a microprocessor and is connected to the various switches on that door. In the case of the driver side module, it communicates with some switches over a Local Interface Network (LIN) data bus. Both the driver and passenger side module also receive various hard wired switch inputs and provide numerous hard wired outputs to various devices located on their respective doors. In addition, both front door control modules communicate with each other and with other electronic modules in the vehicle over the Controller Area Network (CAN) Interior High Speed (IHS) data bus system.

Concealed and protected within the molded plastic door control module housing is the printed circuit board and the other electronic circuitry of the module. The front door control modules are connected to the vehicle electrical system through up to eight connector receptacles that are integral to the module housing.

A door control module cannot be adjusted or repaired and, if damaged or ineffective, it must be replaced. The door control module software is flash programmable.

OPERATION

OPERATION

The microprocessor-based electronic front door control modules (also known as a Driver Door Module/DDM, a Passenger Door Module/PDM or Front Door Multiplex/MUX Modules) contain logic circuits that monitor various hard wired low current, multiplexed inputs from the power window, power lock, power mirror and memory switches on their respective door. They also receive Controller Area Network (CAN) Interior High Speed (IHS) data bus electronic message-based external inputs from the opposing front door control module as well as from other electronic modules in the vehicle. The front door control modules also monitor hard wired power window motor Hall effect sensors and memory mirror position sensor inputs.

In addition, the front door control module on the driver side front door receives electronic message inputs from the driver side front door switch module over the Local Interface Network (LIN) data bus network. The program logic within the front door control module allows the microprocessor to prioritize all of these inputs and determine the tasks it needs to perform. These tasks are then completed either by controlling hard wired outputs to the various motors, actuators or lamps on its own or the rear doors, or by sending electronic message requests over the CAN-IHS bus to the appropriate electronic module in the vehicle.

The front door control modules are powered by a fused B(+) circuit and are grounded at all times so that they can operate regardless of the ignition switch position. Both driver and passenger door control modules provide active and stored Diagnostic Trouble Codes (DTC) through On-Board Diagnostics (OBD) and communicate with a diagnostic scan tool using the CAN data bus.

The hard wired circuits between components related to the electronic front door control modules (also known as a Driver Door Module/DDM, a Passenger Door Module/PDM or Front Door Multiplex/MUX Modules) may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the front door control modules or the electronic controls and communication between modules and other devices that provide some features of the door modules. The most reliable, efficient, and accurate means to diagnose the front door control modules or the electronic controls and communication related to module operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - DOOR MODULES

The hard wired circuits between components related to the electronic front door control modules (also known as a Driver Door Module/DDM, a Passenger Door Module/PDM or Front Door Multiplex/MUX Modules) may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the front door control modules or the electronic controls and communication between modules and other devices that provide some features of the door modules. The most reliable, efficient, and accurate means to diagnose the front door control modules or the electronic controls and communication related to module operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

REMOVAL

Fig. 21: Driver Door Module
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the lower trim panel from the inside of the front door to access the Driver Door Module (1) (DDM). Refer to **PANEL, DOOR TRIM, REMOVAL** .

Fig. 22: Driver Door Module & Connectors
Courtesy of CHRYSLER GROUP, LLC

3. Disconnect each of the electrical connectors (2) from the connector receptacles of the door control module.

Fig. 23: Driver Door Module & Fasteners
Courtesy of CHRYSLER GROUP, LLC

4. Remove the two screws (3) that secure the door control module to the front door hardware module carrier (1).

5. Remove the door control module from the door hardware module carrier.

INSTALLATION

INSTALLATION

Fig. 24: Driver Door Module & Fasteners
Courtesy of CHRYSLER GROUP, LLC

1. Position the door control module to the front door hardware module carrier.
2. Install and tighten the two screws (3) that secure the door control module to the front door hardware module carrier. Tighten the screws securely.

Fig. 25: Driver Door Module & Connectors
Courtesy of CHRYSLER GROUP, LLC

3. Reconnect each of the electrical connectors (2) to the connector receptacles of the door control module (1).

Fig. 26: Driver Door Module
Courtesy of CHRYSLER GROUP, LLC

4. With the DDM (1) securely in place and reconnect, install the lower trim panel to the inside of the front door. Refer to **PANEL, DOOR TRIM, INSTALLATION** .

5. Reconnect the battery negative cable.
6. Perform the manual relearn procedure. Refer to **STANDARD PROCEDURE** .

MODULE, DRIVETRAIN CONTROL

DESCRIPTION

DESCRIPTION

Fig. 27: Identifying Drivetrain Control Module (DTCM) & Nuts
Courtesy of CHRYSLER GROUP, LLC

The DriveTrain Control Module (DTCM) (2) is located in the right rear corner of the vehicle, under the rear sill plate. It communicates with other systems over the CAN bus.

REMOVAL

REMOVAL

Fig. 28: Identifying Drivetrain Control Module (DTCM) & Nuts
Courtesy of CHRYSLER GROUP, LLC

1. Open the liftgate.
2. Disconnect the battery negative cable.
3. Remove the liftgate sill plate. Refer to **PLATE, SCUFF, DOOR SILL, REMOVAL** .
4. Remove the load floor. Refer to **LOAD FLOOR, CARGO, REMOVAL** .
5. Disconnect the electrical connectors.
6. Remove the two nuts (1) holding the module in place.
7. Remove the Drive Train Control Module (DTCM).

INSTALLATION

INSTALLATION

Fig. 29: Identifying Drivetrain Control Module (DTCM) & Nuts
Courtesy of CHRYSLER GROUP, LLC

1. Install the DriveTrain Control Module (DTCM) (2) to the mounting studs.
2. Install the mounting nuts (1) and tighten to 8 N.m (71 in. lbs.).
3. Connect the electrical connectors.
4. Install the load floor. Refer to **LOAD FLOOR, CARGO, INSTALLATION** .
5. Install the liftgate sill plate. Refer to **PLATE, SCUFF, DOOR SILL, INSTALLATION** .
6. Connect the battery negative cable.
7. Verify correct operation.

MODULE, ELECTRIC PARK BRAKE

DESCRIPTION

DESCRIPTION

0508007142

Fig. 30: Identifying Electronic Park Brake Module
Courtesy of CHRYSLER GROUP, LLC

The Electric Park Brake (EPB) module is located in the back left side of the interior near the spare tire and is attached by a slide locking retainer and fastener.

OPERATION

OPERATION

The Electric Park Brake module receives 12 volt constant power and 12 volt key on ignition signal power. It controls the on/off output command for the Electric Park Brake (EPB), the electromechanical motor gear unit that drives both rear brake caliper pistons during park brake mode.

NOTE: Once the EPB is applied, it does not need 12 volts to maintain clamp load and cannot be manually released if voltage is lost.

Input to the EPB module for the on/off action is received from the EPB manual switch and a C-CAN line from the EVIC, Uconnect, ESC, and other controllers including the Scan Tool (For Service Mode).

The output of the module is controlled by the following normal conditions:

Manual Apply

- The EPB module will apply the parking brakes when the EPB switch is pulled and the vehicle is at a stop (Ignition On or Off). The EPB module can also apply the brakes while the vehicle is moving if the EPB switch is pulled to request a dynamic apply, where hydraulic braking is actuated via ESC control.

Manual Release

- EPB module will release the EPB when the EPB switch is pushed and the brake pedal is applied, **seat belt** is on with the ignition on.

Auto Park Brake

NOTE: This mode is shipped from the factory in "off" mode.

- The EPB will apply when the vehicle is moved into the "park" position or whenever the ignition is turned "off" with a manual transmission. This occurs when the driver selects this option from the Uconnect menu which commands the EPB module to apply the EPB.

Drive Away Release

- When in any drive gear, the EPB module will automatically release the EPB when throttle input and engine torque is detected.

Safe Hold

- If the EPB module detects that the vehicle is not secure (transmission not in park, door open, etc.) it will actuate the EPB. This is hard programmed into the module and is not able to be turned off.

Loss of Voltage

- EPB module is not able to manually release EPB when voltage is lost.

External Apply

- Other vehicle systems can request the EPB module to apply the EPB if necessary to secure vehicle.

Service Mode

- The EPB module can be commanded to retract the EPB (actuators) through the Uconnect (customer usable method) and through the Scan Tool.

NOTE: EPB fault light flashes continuously in service mode. Actuating the EPB switch will remove the vehicle from service mode.

CAUTION: If the electric park brake (EPB) switch is actuated with the caliper removed from the caliper bracket and still connected electrically, the EPB motor will fully extend causing damage to the caliper piston. Disconnect and isolate the negative battery cable before servicing any EPB component.

At any time, the EPB switch can be actuated. Depending on the speed of the vehicle when the EPB switch is

actuated, the EPB module will output different commands under the following conditions:

Static Apply (under 5 kph) - Actuates the EPB motors attached to the rear calipers.

Dynamic Apply (over 5 kph) - Actuates the hydraulic braking system.

EPB module fail-safe include that the EPB can be applied ignition off, EPB cannot be released with ignition off, brake pedal must be applied and **seat belt** must be on when releasing the EPB.

Fig. 31: Identifying Brake Warning And EPB Fault Lamp
Courtesy of CHRYSLER GROUP, LLC

EPB module illuminates the red BRAKE warning lamp when EPB is applied. EPB module faults are indicated through the amber EPB fault lamp and EVIC messages when present.

REMOVAL

REMOVAL

0508007142

Fig. 32: Identifying Electronic Park Brake Module
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect negative (ground) cable from the battery and isolate it.
2. Remove the cargo load floor panel. Refer to **LOAD FLOOR, CARGO, REMOVAL** .
3. Push in on tab to release the lever (1) on the electrical connector (2) and disconnect from the EPB (Electric Park Brake) module (4).
4. Using a suitable tool, gently slide retainer (3) from stud.
5. Remove fastener (5) and remove the EPB module (4).

INSTALLATION

INSTALLATION

0508007142

Fig. 33: Identifying Electronic Park Brake Module
Courtesy of CHRYSLER GROUP, LLC

1. Position EPB (Electric Park Brake) module (4) onto mounting studs.
2. Install nut (5) and tighten to 6 N.m (53 in. lbs.).
3. Push retainer (3) onto stud.
4. Connect electrical connector (2) to the EPB module (4) and push the lever (1) down to lock into position.
5. Install the load floor cargo panel. Refer to **LOAD FLOOR, CARGO, INSTALLATION** .
6. Connect negative (ground) cable to the battery.
7. Perform PROXI configuration. Refer to **STANDARD PROCEDURE** .

MODULE, FORWARD FACING CAMERA

DESCRIPTION

DESCRIPTION

Fig. 34: Forward Facing Camera Module
Courtesy of CHRYSLER GROUP, LLC

The Forward Facing Camera Module (FFC) is a stand-alone monocular camera mounted to the inside interior of the front windshield, within the Combined Rear View Mirror Module (CRVMM) housing, that captures and processes video images. The camera will perform the following functions on this model:

- **Automatic High Beam Control (AHBC)**

  - Based on ambient situations, the AHBC feature will control the vehicle high-beam headlights automatically, relieving the driver of the manual operation of the high beam headlights. The AHBC feature automatically turns off the high beams when there is oncoming traffic, preceding traffic, presence of a village, high ambient lighting due to a town or twilight/dusk, when the vehicle driving speed to low, delay and fog.

- **Object detection for supporting data fusion (ACC+)**

  - The FFC acts as a secondary radar for the ACC system. The camera provides additional object, lane and environmental conditions for data fusion. The FFC will also perform redundancy checks with the ACC master radar to verify accurate detection.

- **Lane Departure Warning (LDW+)** - LDW+ utilizes camera-based machine vision sensor to detect and measure vehicle position within lane boundaries (when enabled). The system can be turned on of off with a single hard button on the Auxiliary Switch Bank Module (ASBM). The driver can configure the torque feedback amount and warning zone start point through the personalization settings in the radio. Three settings for each are provided.
- **Forward Collision Warning Plus (FCW+)** - The FFC in conjunction with the radar sensor is used to

detect whether the vehicle is approaching another vehicle or large obstacle in its path too rapidly and will warn/assist the driver in avoiding/mitigating the incident (when enabled). The driver has the ability to adjust the sensitivity and turn brake support on or off in the radio.

The camera and bracket are not adjustable or repairable and must be replaced if inoperable or damaged.

OPERATION

OPERATION

The Forward Facing Camera (FFC) is powered by a battery feed from the Power Distribution Center (PDC) so that it is only active when ignition is set to the run position.

Auto High Beam Control -

The FFC reports on the CAN C bus to the BCM for messages needed for the AHBC functionality, and for further detailed operating parameters of the AHBC system.

- Refer to **OPERATION** for further description and functionality of the smart beam system.

Adaptive Cruise Control Plus and Forward Collision Warning Plus (ACC+/FCW+) -

The FFC reports to the Adaptive Cruise Control (ACC) radar to create the enhanced ACC+ as well as the FCW+ operation. These components share a private CAN B bus where data from the FFC is sent to the ACC module for data fusion.

- Refer to **DESCRIPTION** for further description and functionality of the FCW+ system.
- Refer to **DESCRIPTION** for further ACC+ operation information.

Lane Departure Warning Plus (LDW+) -

The LDW+ feature uses the FFC to identify visible lane markings and to track lane boundaries. The FFC requests haptic responses from the Electric Power Steering (EPS) system when required.

- Refer to **DESCRIPTION** for further description and functionality of the LDW+ system.

The hard wired circuits between components related to the FFC system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the FFC system or the electronic controls and communication between ECU and other devices that provide some features of this system. The most reliable, efficient and accurate means to diagnose the FFC and communication related to the FFC system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

STANDARD PROCEDURE

FORWARD FACING CAMERA - CALIBRATION PROCEDURE

The Forward Facing Camera (FFC) Calibration need to be performed when the FFC and/or windshield has been replaced. Perform the following steps:

- Connect the scan tool and start the vehicle.
- Navigate to the "Misc Functions" menu under the FFC and place the camera in "In Plant Mode" with the scan tool.
- The screen will now prompt you to drive the vehicle for calibration. The vehicle needs to be driven at speeds of 65 km/h (40 mph) and in the straightest road condition possible. You need a lane with lines (dashed or solid) on both sides of the vehicle. This averages to roughly ten minutes of drive time, terrain permitting.
- After the camera learns the calibration, the scan tool FFC view will show calibrated.
- Return to the "Misc Functions" menu and exit "In Plant Mode." Service calibration DTCs should be in the stored status at this point.
- Clear those DTCs.

REMOVAL

REMOVAL

Fig. 35: Forward Facing Camera & Connector
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Separate the rear view mirror trim covers to gain access to the Forward Facing Camera (FFC). Refer to

MIRROR, REARVIEW, REMOVAL .

3. Disconnect the electrical connector (1) from the Forward Facing Camera (2).
4. The Camera is attached to a bracket in a hook and rotate fashion. Rotate the camera clockwise to release from the bracket.

INSTALLATION

INSTALLATION

0811003749

Fig. 36: Forward Facing Camera Bracket, Tabs & Locks
Courtesy of CHRYSLER GROUP, LLC

1. Install the Forward Facing Camera to the bracket on the windshield. Position the FFC to the bracket attachment point (1) making sure that the alignment tabs are proper (2) and set the FFC in place until the bracket locks (3) engage.

Fig. 37: Forward Facing Camera & Connector
Courtesy of CHRYSLER GROUP, LLC

2. Connect the electrical connector (1) to the back of the Forward Facing Camera (2).
3. Assemble the rear view mirror covers into place. Refer to **MIRROR, REARVIEW, INSTALLATION** .
4. Connect the negative battery cable to the battery post.
5. Perform the Forward Facing Camera procedure. Refer to **MODULE, FORWARD FACING CAMERA, STANDARD PROCEDURE**.

MODULE, GLOW PLUG

DESCRIPTION

DESCRIPTION

Fig. 38: Glow Plug Module & Connectors
Courtesy of CHRYSLER GROUP, LLC

The Glow Plug Module is located on the left side of the engine compartment, between the Powertrain Control Module (PCM) and the master cylinder.

OPERATION

OPERATION

When the ignition (key) switch is placed in the ON position, a signal is sent to the PCM relating current engine coolant temperature. This signal is sent from the engine coolant temperature sensor.

The glow plug control module receives information about the glow function from the engine control module. The start of glow plug operation, the period of glow plug operation, the actuation frequency and the pulse duty factor are therefore determined by the engine control module.

REMOVAL

REMOVAL

Fig. 39: Glow Plug Module & Connectors
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the negative battery cable.
2. Disconnect the two glow plug harness connector (3).
3. Remove the nut (1) and the glow plug module (2).

INSTALLATION

INSTALLATION

Fig. 40: Glow Plug Module & Connectors
Courtesy of CHRYSLER GROUP, LLC

1. Install the glow plug module (2) and securely tighten the retaining nut (1).

2. Connect the Glow Plug Module harness connector (3).
3. Connect negative battery cable.

MODULE, HEADLAMP LEVELING

DESCRIPTION

DESCRIPTION

Vehicles equipped with the optional headlamp leveling system are also equipped with an Automatic Headlamp Leveling Module (AHLM). The AHLM is located on a bracket behind the passenger side knee air bag, to the right of the HVAC unit.

This module works in conjunction with the front and rear axle (leveling) sensors, the headlamp leveling motors, and electronic message inputs received over the Controller Area Network (CAN) data bus from other electronic modules in the vehicle. The module provides automatic headlamp beam aim adjustment to compensate for changes in vehicle height caused by changes in vehicle loading, acceleration, deceleration, and YAW rate.

Concealed within the module housing is the circuitry of the module itself, which includes a microprocessor. The module is connected to the vehicle electrical system through an integral connector receptacle by a take out and connector of the headlamp and dash wire harness.

The AHLM cannot be adjusted or repaired and, if ineffective or damaged, the module must be replaced. The AHLM is Flash programmable.

OPERATION

OPERATION

The microprocessor in the Automatic Headlamp Leveling Module (AHLM) contains the logic circuits and controls all of the features of the headlamp leveling system. The AHLM uses On-Board Diagnostics (OBD) and communicates with other electronic modules and related components in the vehicle as well as with a diagnostic scan tool using the Controller Area Network (CAN) data bus. The AHLM is also a Local Interface Network (LIN) master node and uses this method of communication to communicate with the two stepper motors within each right and left front lamp unit.

The AHLM e microprocessor continuously monitors electronic message inputs from the Body Control Module (BCM). The AHLM also energizes or de-energizes the front and rear axle sensors as appropriate to monitor the vehicle height. When the axle sensors are energized, the AHLM monitors and evaluates the Pulse Width Modulated (PWM) return signals from those sensors.

The AHLM uses these inputs to determine vehicle speed, accelerator pedal position, vehicle yaw rate and ABS status. It then uses internal programming algorithms to compute the proper electronic message control outputs to provide over the LIN bus to the LIN slave headlamp leveling stepper motor to adjust the headlamp beams horizontally as required. The AHLM also continuously monitors return inputs from the leveling motor to confirm stepper motor responsiveness as well as the proper positioning of the headlamp beams.

The AHLM receives battery voltage on a fused ignition switch output (RUN) circuit, and is grounded at all times through a hard wired remote ground point. These connections allow the AHLM to operate only when the ignition switch is in the ON position. The AHLM also monitors all of the AHLM circuits and components, then sets active and stored Diagnostic Trouble Codes (DTC) for any monitored system faults it detects.

The hard wired circuits of the AHLM may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the AHLM or the electronic controls or communication between modules and other devices that provide some features of the AHLM. The most reliable, efficient, and accurate means to diagnose the AHLM or the electronic controls and communication related to AHLM operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - HEADLAMP LEVELING

The hard wired circuits between components related to the headlamp leveling system and the Automatic Headlamp Leveling Module (AHLM) (also known as the Headlamp Leveling Module/HLM) may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the AHLM or the electronic controls and communication between modules and other devices that provide some features of the headlamp leveling system or the AHLM. The most reliable, efficient, and accurate means to diagnose the headlamp leveling system, the AHLM or the electronic controls and communication related to headlamp leveling or AHLM operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

STANDARD PROCEDURE

STANDARD PROCEDURE - AHLM CALIBRATION

NOTE: The following procedure is necessary and should be performed ONLY after an Automatic Headlamp Leveling Module (AHLM) is replaced with a new (uncalibrated) unit.

1. Before beginning, the vehicle should be empty with between 1/4 and 1/2 tank of fuel.
2. Perform a mechanical Front Lamp Alignment of the headlamps. Refer to **STANDARD PROCEDURE** .
3. Calibrate the AHLM. Follow the steps outlined in the diagnostic scan tool under the AHLM Electronic Control Unit (ECU), Miscellaneous Functions.

REMOVAL

REMOVAL

WARNING: To avoid serious or fatal injury when working on the High Intensity Discharge (HID) headlamp system, be certain to take the proper precautions. The headlamp switch must be in the OFF position. Disconnect and isolate the battery negative cable. There is a risk of fatal injury caused by contact with high voltage used in the HID headlamps. There is a risk of explosion or fire caused by highly flammable materials in the vicinity of damaged HID lighting elements. There is a risk of injury caused by exposure to Ultra Violet (UV) light, a risk of burns caused by high component operating temperatures, a risk of mercury poisoning through glass splinters produced by bursting HID lighting elements. There is also a risk of poisoning caused by inhalation of mercury vapors and by toxic salts and mercury compounds being ingested or coming into contact with the skin. Do not come into contact with parts that are under high voltage. Persons with active electronic implants (e.g. heart pacemakers) must never work on HID headlamps. Wear insulated safety shoes, safety glasses and protective gloves. Remove flammable materials and ensure sufficient ventilation in the working area.

Fig. 41: Identifying Automatic Headlamp Leveling Module (AHLM) & Passenger Side Knee Blocker
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Disconnect the wire harness connector from the connector receptacle on the side of the AHLM.
3. Remove the four screws that secure the cover plate and the Automatic Headlamp Leveling Module (AHLM) (1) (also known as the Headlamp Leveling Module/HLM) located in the passenger cabin underneath the glove box, to the left the passenger side knee blocker (2).

4. Remove the AHLM from the vehicle.

INSTALLATION

INSTALLATION

WARNING: To avoid serious or fatal injury when working on the High Intensity Discharge (HID) headlamp system, be certain to take the proper precautions. The headlamp switch must be in the OFF position. Disconnect and isolate the battery negative cable. There is a risk of fatal injury caused by contact with high voltage used in the HID headlamps. There is a risk of explosion or fire caused by highly flammable materials in the vicinity of damaged HID lighting elements. There is a risk of injury caused by exposure to Ultra Violet (UV) light, a risk of burns caused by high component operating temperatures, a risk of mercury poisoning through glass splinters produced by bursting HID lighting elements. There is also a risk of poisoning caused by inhalation of mercury vapors and by toxic salts and mercury compounds being ingested or coming into contact with the skin. Do not come into contact with parts that are under high voltage. Persons with active electronic implants (e.g. heart pacemakers) must never work on HID headlamps. Wear insulated safety shoes, safety glasses and protective gloves. Remove flammable materials and ensure sufficient ventilation in the working area.

0811005861

Fig. 42: Identifying Automatic Headlamp Leveling Module (AHLM) & Passenger Side Knee Blocker
Courtesy of CHRYSLER GROUP, LLC

1. Position the Automatic Headlamp Leveling Module (AHLM) (1) (also known as the Headlamp Leveling Module/HLM) for installation.
2. Install and tighten the four screws that secure the cover plate and the AHLM to the lamp housing. Tighten the screws securely.
3. Connect the wire harness connector to the connector receptacle on the side of the AHLM.
4. Reconnect the battery negative cable.

NOTE: On vehicles equipped with the optional High Intensity Discharge (HID) headlamps, when the Automatic Headlamp Leveling Module (AHLM) is replaced with a new unit, a diagnostic scan tool MUST be used to initialize and calibrate the new AHLM before the automatic headlamp leveling system can operate properly. Refer to MODULE, HEADLAMP LEVELING, STANDARD PROCEDURE.

MODULE, HVAC

DESCRIPTION

DESCRIPTION

080671660

Fig. 43: A/C Heater Module & Mounting Tabs
Courtesy of CHRYSLER GROUP, LLC

The A/C heater module (2) is a microprocessor designed to operate the heating and A/C system, using the Controller Area Network (CAN) data bus. The A/C heater module has a plastic housing with two integral electrical connector receptacles and three mounting tabs (1).

The A/C heater module is located on the top of the air distribution housing, behind the radio or Integrated center stack screen, depending on how equipped.

OPERATION

OPERATION

The A/C heater module utilizes integrated circuitry and information carried over the Controller Area Network (CAN) data bus to monitor many sensors and switch inputs throughout the vehicle. In response to those inputs, the internal circuitry and programming of the A/C heater module allows it to control electronic functions and features of the heating and A/C system.

Some of the inputs received by the A/C heater module over the CAN bus are as follows:

- A/C Request
- Ambient Air Temperature
- Electric Back Light (EBL) Request
- Electrical System Voltage
- Engine Coolant Temperature
- Engine Speed
- Humidity, Windshield Glass Temperature and Dewpoint (ATC only)
- Refrigerant Pressure
- Vehicle Identification Number
- Vehicle Odometer

Some of the messages broadcasted by the A/C heater module on the CAN bus are as follows:

- A/C Clutch Engage
- Auto Headlamp Signal
- EBL Status

The A/C heater module receives the following information over hardwired circuits:

- Auto Headlamp Signal
- Evaporator Temperature
- Interior Air Temperature
- Left and Right Sun Load

The A/C heater module monitors and controls the following over hardwired circuits:

- Driver and Passenger Blend Door Positions
- Blower Motor Speed
- Mode Door Position

- Recirculation Door Position

The A/C heater module is diagnosed using a scan tool. Prior to replacing an A/C heater module, run the calibration procedure to verify that the concern is not an air door calibration issue. Refer to **STANDARD PROCEDURE** .

The A/C heater module cannot be adjusted or repaired and must be replaced if inoperative or damaged.

REMOVAL

REMOVAL

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.

1. Disconnect and isolate the negative battery cable.
2. Remove the A/C and Heater Control. Refer to **CONTROL, A/C AND HEATER, REMOVAL** .

080671661

Fig. 44: A/C Heater Module Retaining Screws & Connectors
Courtesy of CHRYSLER GROUP, LLC

3. Disconnect the wire harness connectors (1) from the A/C heater module.
4. Remove the three A/C heater module retaining screws (2).
5. Remove the A/C heater module from the HVAC housing.

INSTALLATION

INSTALLATION

080671661

Fig. 45: A/C Heater Module Retaining Screws & Connectors
Courtesy of CHRYSLER GROUP, LLC

1. Position the A/C heater module to the HVAC housing.
2. Install the three retaining screws (2) that secure the A/C heater module to the HVAC housing.
3. Tighten all the screws that secure the A/C heater module to the HVAC housing to 2 N.m (17 in. lbs.).
4. Connect the wire harness connectors (1) to the A/C heater module.
5. Install the A/C and Heater Control. Refer to **CONTROL, A/C AND HEATER, INSTALLATION** .
6. Connect the negative battery cable.
7. Initiate the Actuator Calibration function using a scan tool. Refer to **STANDARD PROCEDURE** .

NOTE: **If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.**

MODULE, IGNITION NODE

DESCRIPTION

DESCRIPTION

Fig. 46: Ignition Node Module
Courtesy of CHRYSLER GROUP, LLC

The Ignition Node Module (IGNM) is a rotary type ignition switch and is used on the base and midline vehicles. It will accept either a steel cut key (Sentry Key Immobilizer Module (SKIM) only) or a Remote Keyless Entry (RKE) FOBIK.

The IGNM is encased in a bracket mounted in the instrument panel and is held in by four (4) screws.

OPERATION

OPERATION

Following are brief descriptions of the systems that the Ignition Node Module (IGNM) controls.

IGNITION SWITCH

IGNITION SWITCH

The Ignition Node Module (IGNM) incorporates an integral ignition switch that consists of four rotary positions with three detent positions and one spring-loaded position. The one extreme clockwise position is a spring-loaded momentary contact **"START"** position. When released from the **"START"** position, the switch will automatically return to the detent **"RUN"** position. The other position includes a detent **"ACCESSORY"** position and a detent **"OFF"** position.

SENTRY KEY IMMOBILIZER SYSTEM (SKIS)

All modules of the IGNM have transponder chips in all keys and FOBIKS. Upon failure of proper Sentry Key Immobilizer (SKIS) communication to the Remote Frequency Hub Module, (RFHM), the RFHM will not allow the vehicle to crank. The engine will not re-crank on the key cycle that the failure occurred, a full key down sequence must be performed for the engine to crank again. Refer to **OPERATION** .

REMOTE KEYLESS ENTRY (RKE)

The midline model of the IGNM has the Remote Keyless Entry (RKE) feature. The FOBIK uses Radio Frequency (RF) signals to communicate with the Radio Frequency Hub (RF-Hub) and the RF-Hub relays the RKE requests to other modules in the vehicle over the CAN data bus. The IGNM itself does not control any of the RKE functions. Refer to **OPERATION** .

KEY REMOVAL INHIBIT

The Key Removal Inhibit has a motor driven gear internal to the IGNM to facilitate this feature. This prevents the key from going past accessory (to off) if the gear shifter is not in Park.

REMOVAL

REMOVAL

Fig. 47: Removing/Installing Switch Mounting Screws
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the and isolate the negative battery cable.
2. Remove the dash end cap. Refer to **CAP, INSTRUMENT PANEL END, REMOVAL** .
3. Remove the steering column opening cover.
4. Remove the chin bezel located above the floor console. One fastener snaps to the console. Refer to **CONSOLE, FLOOR, REMOVAL** .
5. Disconnect the wire harness connector from the Ignition Node Module (IGNM).
6. Remove 4 screws that retain the IGNM in place.
7. Disconnect the wiring harness connector from the back of the IGNM.
8. Remove the IGNM from the backside of the instrument panel.

INSTALLATION

INSTALLATION

Fig. 48: Removing/Installing Switch Mounting Screws
Courtesy of CHRYSLER GROUP, LLC

1. Install the Ignition Node Module (IGNM) into the Instrument Panel from the backside.
2. Pull the Ignition Node Module into place.
3. Install 4 screws the IGNM and tighten.
4. Connect Electrical harness connector into IGNM.
5. Install the chin bezel. Refer to **CONSOLE, FLOOR, INSTALLATION** .
6. Install the steering column opening cover and connect the wire harness connectors.
7. Install dash end cap. Refer to **CAP, INSTRUMENT PANEL END, INSTALLATION** .
8. Connect negative battery cable.
9. If IGNM is being replaced, program the module. Refer to **STANDARD PROCEDURE** .

MODULE, MEMORY SEAT

DESCRIPTION

DESCRIPTION

Fig. 49: Memory Seat Module (MSM)
Courtesy of CHRYSLER GROUP, LLC

When equipped, the Memory Seat Module (MSM) (1) is located underneath the driver seat. It is used in conjunction with the other modules in the memory system to recall the driver seat to two different driver preset seat position preferences. The memory seat module is able to store and recall all driver side power seat positions (fore/aft, up/down, tilt and recline), outside mirror position, power steering column position and up to twelve radio station presets (six AM and six FM), on vehicles with a factory installed radio connected to the Controller Area Network (CAN) data bus network. The memory system will also store and recall the last radio station listened to for each driver, even if it is not one of the twelve preset stations.

The memory seat system will automatically recall the settings when a button of the memory switch located in the driver door trim panel is pressed, or when the doors are unlocked using the Remote Keyless Entry (RKE) transmitter (if the "RKE Linked to Memory" feature is enabled). If the vehicle has more than two drivers the RKE transmitter recall of memory features can be disabled. This is a customer programmable feature.

OPERATION

OPERATION

The Memory Seat Module (MSM) receives battery current through a fuse in the Power Distribution Center (PDC). The memory system remains operational, regardless of ignition position. When a driver memory seat switch button or FOBIK transmitter button (when programmed) is pushed, signal is sent to the MSM over the Controller Area Network (CAN) bus. The MSM is responsible for the 12 volt Direct Current (DC) feed and ground path to the power seat adjuster motors and to the other memory system components.

The MSM also receives hard-wired input from the hall effect sensors, mounted on each of the driver power seat adjuster motors, driver side view mirror motors and power adjustable steering column motors, when equipped. The programmed software in the MSM allows it to know where the driver seat, mirror and steering column are located in there designed travel by a pulse count, generated from hall effect sensors. This way, when a memory seat switch is pressed the MSM will power these components until the correct preset location is achieved. The MSM will prevent the seat memory recall function from being initiated, if the transmission gear selector is not

in the Park position. These inputs are monitored over the CAN bus by the MSM.

A memory setting is saved by pressing the "Set" button, then pressing either the memory "1" or "2" button within five seconds of pressing the "Set" button. The key needs to be out of the ignition in order for this setting to save.

A memory setting is recalled by pressing either the memory "1" or "2" button, or by pressing the unlock button on a "linked" FOBIK transmitter.

The MSM performs the following functions:

- Positions the driver power seat (fore/aft, up/down, tilt and recline positions).
- Sends the memory save or recall (number 1 or number 2) command over the CAN data bus circuit to the other memory system components, radio station pre-sets and power mirror positions.
- Provides for the easy entry/exit feature.

When a memory button is pressed (number 1 or number 2) on the memory seat switch, it provides resistive signal to the MSM. The MSM will then position the driver seat to the pre-set location. When a FOBIK transmitter button is pressed, depending on which transmitter (number 1 or number 2), the KIN receiver sends the recall request and FOBIK number (number 1 or number 2) data message. The FOBIK transmitter function depends on if the MSM is programmed to trigger the recall (linked FOBIKs).

A FOBIK is "linked" to a memory setting by performing the following steps:

1. Remove the Key Fob from the ignition (or change the ignition to OFF, for vehicles equipped with Keyless Enter-N-Go).
2. Select desired memory profile (1) or (2).
3. Press and release the LOCK button on the RKE transmitter within 5 seconds of selecting the memory profile.

The MSM has the capacity to store two linked fobs only. If one is lost or damage, a third can not be programmed successfully. In order to remove stored keys and to add the new key, the MSM module needs to forget what links already exist. Using the scan tool, enter the MSM and then select MISC FUNCTIONS. Reset/Erase the saved settings in this menu. Once this has been completed, you will need to re-link the original FOBIK as well as linking the new FOBIK. Remember that linking requires the key/FOBIK to be out of the ignition.

The memory seat system "Easy Entry and Exit" feature provides the driver with more room to enter or exit the vehicle. When the driver seat is in a memorized position, it will move rearward 55 millimeters (2.2 inches) or to the end of its travel, whichever occurs first, when the key is removed from the ignition switch lock cylinder. This is a customer programmable feature. The seat will return to the pre-set position when the ignition is pressed to RUN.

The memory seat system "learns" the seat, mirror and column motors maximum end positions when the motor reaches the limit of travel in any direction and stalls. Subsequently, movement will stop just short of that position to avoid extra stress on the motors and mechanisms. If the system learned a maximum position as a

result of an obstruction, as for instance if a large object was placed on the floor behind the seat, the system can relearn the "true" maximum position through manually operating the power seat after the obstruction is removed.

NOTE: It is normal for the power accessories contained in the memory system to stop at the maximum "learned" position and then continue to the "true" maximum position when the control switch is released and then applied in the same direction a second time.

Certain functions and features of the memory seat system rely upon resources shared with other electronic modules in the vehicle over the CAN bus. The CAN bus allows the sharing of sensor information. This helps to reduce wire harness complexity, internal controller hardware and component sensor current loads. At the same time, the memory seat system provides increased reliability, enhanced diagnostics and allows the addition of new feature capabilities.

NOTE: Anytime a new Memory Seat Module (MSM) or a driver power seat motor or seat track is replaced, the MSM must be cleared of all learned parameters using a scan tool and the Power Seat System Verification test must be performed.

The use of a scan tool is needed for diagnosis of the MSM, CAN bus and other electronic modules. Refer to **DIAGNOSIS AND TESTING** .

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - MEMORY SEAT MODULE (MSM)

In order to obtain conclusive testing of the memory system, the Controller Area Network (CAN) data bus, and all of the electronic modules that provide inputs to, or receive outputs from the memory system components must be checked. **Any diagnosis of the memory system/module should begin with, the use of a scan tool and the appropriate diagnostic service information.**

Refer to the appropriate wiring information for complete circuit schematic or connector pin-out information.

NOTE: Vehicles equipped with the memory/heated seat option utilize a low voltage cut-off feature. This feature turns off the 12v power to the power seat system anytime vehicle voltage is below 11.7v. Be certain to check the vehicle electrical system for proper voltage anytime the power seat system appears inoperative.

Before any testing of the power seat system is attempted, the battery should be fully-charged.

REMOVAL

REMOVAL

NOTE: The scan tool standardization process must be performed on the Memory Seat

Module (MSM) any time a new MSM is installed or the existing MSM is reflashed.

Fig. 50: Electrical Connectors, Memory Seat Module (MSM), Two Rear MSM Retaining Tabs, Bracket & Tabs
Courtesy of CHRYSLER GROUP, LLC

NOTE: Depending on how equipped, more memory seat module electrical connectors may be present than shown in the illustration.

1. Disconnect and isolate the negative battery cable.
2. Remove the fasteners that secure the driver seat to the body and tip the seat rearward to gain access to the underneath of the seat. Refer to **SEAT, REMOVAL** and **SEAT, REAR, REMOVAL** .
3. Disconnect the electrical connectors (3 and 6) from the Memory Seat Module (MSM) (1).
4. Disengage the two rear MSM retaining tabs (5 and 7) from the bracket (8) by carefully pushing the rear of the MSM upward.
5. Disengage the two front MSM retaining tabs (2 and 4) from the bracket by pulling the MSM rearward.
6. Remove the MSM from underneath the driver seat.

INSTALLATION

INSTALLATION

Fig. 51: Electrical Connectors, Memory Seat Module (MSM), Two Rear MSM Retaining Tabs, Bracket & Tabs
Courtesy of CHRYSLER GROUP, LLC

NOTE: Depending on how equipped, more memory seat module electrical connectors may be present than shown in the illustration.

1. Position the Memory Seat Module (MSM) (1) to the driver seat and engage the two front retaining tabs (2 and 4) to the bracket (8).

CAUTION: Properly align the rear Memory Seat Module (MSM) retaining tabs to the bracket, prior to engagement. Failure to follow these instructions may result damage to the MSM rear retaining tabs.

2. Align the two rear MSM retaining tabs (5 and 7) to the bracket and carefully pull downward down on the MSM to engage the tabs. Make sure the retaining tabs are fully engaged to the bracket.
3. Connect the electrical connectors (3 and 6) to the MSM.
4. Install the driver seat. Refer to **SEAT, INSTALLATION** and **SEAT, REAR, INSTALLATION** .
5. Reconnect the negative battery cable.

NOTE: Anytime a new Memory Seat Module (MSM) is replaced, the MSM must be cleared of all learned parameters using a scan tool and the Power Seat System Verification test must be performed.

6. Using a scan tool, select Clear All MSM Learned Parameters, found under the Memory Seat Module, Miscellaneous Functions tab.
7. Perform the Power Seat System Verification test. Refer to **STANDARD PROCEDURE** .
8. Verify proper memory seat system operation.

MODULE, POWER LIFTGATE CONTROL

DESCRIPTION

DESCRIPTION

0821006691

Fig. 52: Identifying Power Liftgate Module (PLGM) & Connector Receptacles
Courtesy of CHRYSLER GROUP, LLC

Vehicles equipped with an optional power-operated liftgate are equipped with a Power LiftGate Module (PLGM) (also known as the Power LiftGate/PLG control module). The PLGM is concealed behind the liftgate sill scuff plate and trim, on the inside of the back rear cargo area. The PLGM is secured by two integral mounting tabs and an integral latch tab (1) to slots in the sheet metal.

Concealed and protected within the molded plastic housing of the PLGM is the printed circuit board and the other electronic circuitry of the module. The module contains a microprocessor and communicates with other electronic modules in the vehicle over the Controller Area Network (CAN) Interior High Speed (IHS) data bus system. Two connector receptacles (2) integral to the PLGM housing are connected to the vehicle electrical system through two dedicated take outs and connectors of the body wire harness.

A PLGM cannot be adjusted or repaired and, if damaged or ineffective, it must be replaced. The PLGM software is flash programmable.

OPERATION

OPERATION

The microprocessor-based electronic Power LiftGate Module (PLGM) (also known as the Power LiftGate/PLG control module) contains the electronic logic circuitry and software that is used to monitor the numerous switch and sensor inputs and control the outputs that operate and provide the various electronic features of the power liftgate system.

In addition, the PLGM receives electronic message inputs from and shares its hard wired switch and sensor

resources through electronic message outputs to other electronic control modules in the vehicle over the Controller Area Network (CAN) Interior High Speed (IHS) data bus network. The program logic within the PLGM allows the microprocessor to prioritize all of these inputs and determine the task it needs to perform. The task is then completed by controlling hard wired outputs to the liftgate Power Drive Unit (PDU) and latch mechanisms, which lock, unlock, open and close the liftgate. If enabled through the Electronic Vehicle Information Center (EVIC) customer programmable features, the PLGM also provides a hard wired output that controls the power liftgate warning chime unit.

The PLGM is powered by a fused B(+) circuit and is grounded at all times so that it can operate the liftgate regardless of the ignition switch position. The module monitors both active and stored Diagnostic Trouble Codes (DTC) through On-Board Diagnostics (OBD) and communicates with a diagnostic scan tool using the CAN data bus.

The PLGM uses adaptive memory that allows the power liftgate system to learn and adapt to the many variables that may be required to operate the liftgate. If a replacement power liftgate system component is installed or a mechanical liftgate adjustment is made, the PLGM is required to relearn the effort and time to open or close the liftgate. This learn cycle can be initiated only with a diagnostic scan tool connected to the Data Link Connector (DLC). Refer to **MODULE, POWER LIFTGATE CONTROL, STANDARD PROCEDURE**.

The hard wired inputs and outputs of the PLGM may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the electronic controls and communication between modules and other devices that provide some features of the power liftgate system. The most reliable, efficient and accurate means to diagnose the PLGM or the electronic controls and communication related to operation of the power liftgate system requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - PLGM

The hard wired circuits between components related to the power liftgate system and the Power LiftGate Module (PLGM) (also known as the Power LiftGate/PLG control module) may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the PLGM or the electronic controls and communication between modules and other devices that provide some features of the power liftgate system or the PLGM. The most reliable, efficient, and accurate means to diagnose the power liftgate system, the PLGM or the electronic controls and communication related to power liftgate or PLGM operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

STANDARD PROCEDURE

STANDARD PROCEDURE - POWER LIFTGATE LEARN/RELEARN PROCEDURE

The Power LiftGate Module (PLGM) uses adaptive memory that allows the power liftgate system to learn and adapt to the many variables (travel limits, resistance to travel, etc.) that may be required to operate the liftgate. After 8 miles have been recorded on the vehicle odometer (in-plant mode), anytime the liftgate is fully opened and fully closed using the power liftgate system, the PLGM will learn or relearn from that cycle. If a replacement power liftgate system component is installed or a mechanical liftgate adjustment is made, the PLGM can relearn the effort and time required to open or close the liftgate. This learn/relearn cycle can be initiated using the power liftgate switches, using the Remote Keyless Entry (RKE) FOB with Integrated Key (FOBIK) or with a diagnostic scan tool connected to the Data Link Connector (DLC).

To perform a power liftgate learn/relearn cycle, do the following:

1. Connect a diagnostic scan tool to the DLC and check for any power liftgate system active or stored Diagnostic Trouble Codes (DTC). Correct and erase any active or stored DTC.
2. Close the liftgate.
3. Using the scan tool, select the **Power LiftGate Module (PLGM)** menu item. Then select, **Misc Functions** and select the **Calibrate Liftgate** routine.
4. After the **Calibrate Liftgate** routine completes, use the scan tool to check the **Routine Status** for a **Pass** or **Fail** message. If the **Routine Status** is **Fail** , the scan tool will display the reason for the failure to aid in further system diagnosis and in rerunning the **Calibrate Liftgate** routine.
5. Follow the instructions displayed in the scan tool to complete the test.
6. Use any switch or RKE FOBIK to be certain the liftgate can be powered open and closed successfully.
7. The liftgate learn cycle is now complete.

NOTE: If the power liftgate will not complete a full cycle a problem exists with the power liftgate system.

In order to obtain conclusive testing of the power liftgate system, the Controller Area Network (CAN) data bus and all of the electronic modules that provide inputs to, or receive outputs from the PLGM, as well as all of the power liftgate system components must be checked. **Any diagnosis of the power liftgate system should begin with the use of a diagnostic scan tool and the appropriate diagnostic procedures.**

REMOVAL

REMOVAL

Fig. 53: Power LiftGate Module (PLGM) & Harness Connectors
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the rear cargo load floor. Refer to **LOAD FLOOR, CARGO, REMOVAL** .
3. Disconnect the two body wire harness (2) connectors from the PLGM connector receptacles.
4. Depress the latch feature integral to the left end of the PLGM housing and pull the top of the PLGM out and away from the mounting bracket.
5. Disengage the two tabs integral to the upper end of the PLGM housing from the slots.
6. Remove the PLGM (1) from the vehicle.

INSTALLATION

INSTALLATION

Fig. 54: Power LiftGate Module (PLGM) & Harness Connectors
Courtesy of CHRYSLER GROUP, LLC

1. Position the PLGM (1) to the vehicle for installation.
2. Seat the module in to the mounting bracket making sure it is snapped into place securely.
3. Connect the two body wire harness connectors (2) to the PLGM housing.
4. Install the rear cargo load floor. Refer to **LOAD FLOOR, CARGO, INSTALLATION** .
5. Connect the negative battery cable to the negative battery terminal.
6. Verify the power liftgate operates properly. for the power liftgate learn/relearn procedure. Refer to **MODULE, POWER LIFTGATE CONTROL, STANDARD PROCEDURE**.

MODULE, POWER TOP CONTROL, FULL OPEN RETRACTABLE ROOF

DESCRIPTION

DESCRIPTION

The Electronic Control Unit (ECU) (sometimes referred to as the Power Top Control Module) is located at the rear of the vehicle roof next to the Full Open Retractable Roof (FORR) motors. The ECU is mounted to the FORR frame assembly with two screws. Three wire harness connectors are used to supply inputs to the ECU and send outputs to the FORR motors.

The ECU communicates via the Controller Area Network (CAN) data bus circuit and can be diagnosed and receive software updates with the use of a diagnostic scan tool.

OPERATION

OPERATION

This vehicle is available with the Full Open Retractable Roof (FORR) option. Marketed as Sky Slider™, the unit is made of reinforced acrylic cloth, similar to a convertible top. The FORR system receives battery feed through the "sunroof" relay and a 25 amp mini fuse located in the Power Distribution Center (PDC). The FORR system power is supplied when the ignition switch is in the RUN and ACCESSORY positions. The sunroof will operate normally with the key in any position while the Accessory Delay system is active.

The FORR utilizes a single Electronic Control Unit (ECU) (sometimes referred to as the Power Top Control Module) to control the movement of the power top. The ECU sends a reference voltage to and receives inputs back from the power top switch via a hardwired connection. The ECU responds to the switch input by controlling one or both of the power top motors via a hardwired connection.

The ECU is a new non-CAN based sunroof module unique to the KL SkySlider

STANDARD PROCEDURE

STANDARD PROCEDURE - INITIALIZE SUNROOF MODULE

NOTE: The temperature must be between 5°C (41°F) to 45°C (113°F) for initialization to be performed. Outside of this temperature range, an initialization will not start and if requested by a diagnostics scan tool, the Electronic Control Unit (ECU), (sometimes referred to as the Power Top control Module) sends the proper reject code.

NOTE: Vehicle voltage must be maintained between 13V - 15V during initialization.

1. Put a battery changer on the vehicle.
2. Using a scan tool, clear all codes.
3. From the scan tool, select "SUNRF" in the list of modules on the scan tool.
4. Select "More Options".
5. Select "System Tests".
6. Select "Sunroof Initialization".
7. Follow the on-screen prompts.

REMOVAL

REMOVAL

Fig. 55: Electrical Connectors
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Drop rear of headliner down as needed to gain access to the module. Refer to **HEADLINER, REMOVAL** .
3. Disconnect the electrical connectors (3) from the module.
4. Remove the two screws (1) and separate the module (2) from the roof system.

INSTALLATION

INSTALLATION

Fig. 56: Electrical Connectors
Courtesy of CHRYSLER GROUP, LLC

1. Position the module (2) onto the power full open retractable roof assembly.
2. Install the two mounting screws (1).
3. Connect the electrical connectors (3).
4. Install the headliner. Refer to **HEADLINER, INSTALLATION** .
5. Connect the battery negative cable.
6. Re-initialize roof assembly. Refer to **STANDARD PROCEDURE** .

MODULE, POWERTRAIN CONTROL

DESCRIPTION

POWERTRAIN CONTROL MODULE (PCM)

The Powertrain Control Module (PCM) is a digital computer containing a microprocessor. The PCM receives input signals from various switches and sensors referred to as Powertrain Control Module Inputs. These inputs are as follows:

- Air Conditioning Pressure Transducer
- ASD/Main Relay
- Battery Voltage
- Brake Switch
- Camshaft Position Sensor
- Crankshaft Position Sensor
- Distance Sensor (from transmission control module)
- EGR Position Feedback (if equipped)
- Engine Coolant Temperature Sensor
- Heated Oxygen Sensors
- Ignition sense
- Inlet Air Temperature Sensor
- Knock Sensor
- Manifold Absolute Pressure (MAP) Sensor
- Park/Neutral (from trans range sensor)
- Power Steering Pressure Switch
- Proportional Purge Sense
- CAN C Bus
- Speed Control
- Transmission Control Relay (Switched B+)

- Transmission Pressure Switches
- Transmission Temperature Sensor
- Transmission Input Shaft Speed Sensor
- Transmission Output Shaft Speed Sensor
- Vehicle Speed

Based on the above inputs, the PCM adjusts various engine and vehicle operations through devices referred to as Powertrain Control Module Outputs. These outputs are as follows:

- Air Conditioning Clutch Relay
- Data Link Connector (CAN C Bus)
- Double Start Override
- EGR Solenoid (if equipped)
- Fuel Injectors
- Generator Field
- High Speed Fan Relay
- Ignition Coils
- Natural Vacuum Leak Detection
- Low Speed Fan Relay
- MTV Actuator
- Proportional Purge Solenoid
- SRV Valve
- Speed Control Relay
- Speed Control Vent Relay
- Speed Control Vacuum Relay
- Torque Reduction Request
- Transmission Control Relay
- Transmission Solenoids
- 5 Volt Output

Based on inputs it receives, the PCM adjusts fuel injector pulse width, idle speed, ignition timing, and canister purge operation and EGR, if equipped. The PCM regulates the cooling fans, air conditioning and speed control systems. The PCM changes generator charge rate by adjusting the generator field.

The PCM adjusts injector pulse width (air-fuel ratio) based on the following inputs.

- Manifold Absolute Pressure
- Engine Speed (crankshaft position sensor)
- Battery Voltage
- Inlet Air Temperature Sensor

- Engine Coolant Temperature
- Exhaust Gas Oxygen Content (heated oxygen sensors)
- Throttle Position

The PCM adjusts engine idle speed through the idle air control motor based on the following inputs.

- Brake Switch
- Engine Coolant Temperature
- Engine Speed (crankshaft position sensor)
- Park/Neutral
- Transaxle Gear Engagement
- Throttle Position
- Vehicle Speed (from Transmission Control Module)

The PCM adjusts ignition timing based on the following inputs.

- Inlet Air Temperature
- Engine Coolant Temperature
- Engine Speed (crankshaft position sensor)
- Knock Sensor
- Manifold Absolute Pressure
- Park/Neutral (from trans range sensor)
- Transaxle Gear Engagement
- Throttle Position

The camshaft and crankshaft signals are sent to the PCM. If the PCM does not receive both signals within approximately one second of engine cranking, it deactivates the fuel pump. When deactivated, power is shut off to the fuel injectors, ignition coils, fuel pump and the heating element in each oxygen sensor.

The PCM contains a voltage converter that changes battery voltage to a regulated 5.0 volts. The 5.0 volts power the camshaft position sensor, and crankshaft position sensor. The PCM also provides a regulated 5.0 volts supply for the, manifold absolute pressure sensor, throttle position sensor and EGR (if equipped).

The PCM engine control strategy prevents reduced idle speeds until after the engine operates for 320 km (200 miles). If the PCM is replaced after 320 km (200 miles) of usage, update the mileage in new PCM. PCM/ECM Reprogramming. Refer to the appropriate Testing & Diagnostics article in Engine Performance .

REMOVAL

DIESEL

Fig. 57: Powertrain Control Module (PCM) & Harness Connectors
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the negative battery cable.
2. Disconnect the Powertrain Control Module (2) (PCM) wire harness connectors (1).

Fig. 58: Powertrain Control Module (PCM), Nuts & Bolts
Courtesy of CHRYSLER GROUP, LLC

3. Remove nut (3), bolts (2) and the Powertrain Control Module (PCM) (1).

2.4L/3.2L

CAUTION: Do not disconnect the Powertrain Control Module (PCM) electrical connectors before the ignition key is in the off position and the battery cable disconnected. If these steps are not preformed damage to the PCM may result from a voltage spike.

Fig. 59: Powertrain Control Module Electrical Connectors & Nuts
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the battery negative cable.
2. Disconnect the Powertrain Control module electrical connector (1).
3. Remove the nuts (2, 3) that secure the PCM to the PCM mount

Fig. 60: Battery Tray, PCM Mount & Bolts
Courtesy of CHRYSLER GROUP, LLC

4. If required, remove the PCM mount (3).

INSTALLATION

DIESEL

Fig. 61: Powertrain Control Module (PCM), Nuts & Bolts

Courtesy of CHRYSLER GROUP, LLC

1. Check pin connectors in Powertrain Control Module (PCM) and the wire harness connectors for corrosion or damage. Also check pin heights in connectors. Pin heights should all be the same. Repair as necessary before installing harness connectors.
2. Install the PCM (1) and securely tighten bolts (2), nut (3).

Fig. 62: Powertrain Control Module (PCM) & Harness Connectors
Courtesy of CHRYSLER GROUP, LLC

3. Connect the PCM wire harness connector (1).
4. Connect the negative battery cable.
5. Use a diagnostic scan tool to reprogram new PCM with vehicles original Vehicle Identification Number (VIN) and original vehicle mileage. Refer to the appropriate Testing & Diagnostics article in Engine Performance .

2.4L/3.2L

Fig. 63: Battery Tray, PCM Mount & Bolts
Courtesy of CHRYSLER GROUP, LLC

CAUTION: If a new powertrain control module is being installed, use a scan tool to reprogram the new module with the original vehicle identification number (VIN) and original mileage. If this step is not performed, a Diagnostic Trouble Code (DTC) will set.

1. If removed, install the PCM mount (3). Tighten the bolts (2) to 5 N.m (44 in. lbs.).

Fig. 64: Powertrain Control Module Electrical Connectors & Nuts

Courtesy of CHRYSLER GROUP, LLC

2. Position the PCM onto the mount.
3. Install the ground wire. Tighten the nut (2) to 7 N.m (62 in. lbs.).
4. Install the nuts (3) Tighten to 7 N.m (62 in. lbs.).
5. Install the PCM electrical connectors.
6. Connect the battery negative cable.

NOTE: **If the module is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment.**

MODULE, RADIO FREQUENCY (RF HUB)

DESCRIPTION

DESCRIPTION

Fig. 65: Radio Frequency Hub Module & Connector Receptacles
Courtesy of CHRYSLER GROUP, LLC

The Radio Frequency Hub Module (RFHM) (2) (also known as the RF Hub/RFH) is a primary component of several standard and optional electronic systems in the vehicle. The RFHM is a Radio Frequency (RF) and Low Frequency (LF) receiver, contains controlling logic for a number of systems and communicates with other

electronic modules and nodes in the vehicle over the Controller Area Network (CAN) data bus as well as over a private serial bus. There are several models of the RFHM that support NAFTA, BUX and Japan markets. Different signal supporting options include automatic transmission, manual transmission, Rotary ignition system using IGNM switch, Passive Entry Keyless go system using smart door handles and KIN switch, and remote start.

Systems and features supported by the RFHM include:

- **Brake Transmission Shift Interlock (BTSI) System**
- **Ignition Switch System**
- **Passive Entry (PE) Keyless Go (KG) System**
- **Remote Keyless Entry (RKE) System**
- **Remote Start System**
- **Sentry Key Immobilizer System (SKIS)**
- **Tire Pressure Monitor (TPM) System**
- **Vehicle Theft Alarm (VTA) System**

Concealed and protected within the molded black plastic RFHM housing is the microprocessor and the other electronic circuitry of the module. The RFHM is located in the rear cargo area headliner. It is secured through two mounting tabs integral to the module housing by two plastic push-in fasteners.

Depending upon vehicle equipment, either one or two connector receptacles (1 and 3) integral to the RFHM housing are connected to the vehicle electrical system through dedicated take outs and connectors of the body wire harness. In vehicles with the optional remote start system, a remote start antenna is located adjacent to the RFHM on the shelf support and is connected directly to the RFHM through a third integral connector receptacle (2).

The RFHM cannot be adjusted or repaired and, if damaged or ineffective, it must be replaced.

OPERATION

OPERATION

The Radio Frequency Hub Module (RFHM) (also known as the RF Hub/RFH) is an integrated receiver (or base station) in the vehicle that communicates with other electronic modules in the vehicle over either the Controller Area Network (CAN) data bus or a private serial bus to support the following standard and optional vehicle features or systems.

- **Brake Transmission Shift Interlock System (for automatic Transmission only)** - The RFHM contains the controlling logic for the Brake Transmission Shift Interlock (BTSI) solenoid. The RFHM monitors the key position from the IGnition Node Module (IGNM) received over a private serial bus, hard wires brake input as well as inputs received over the CAN data bus to perform the BTSI solenoid control functions.
- **Ignition Systems** - Depending upon how the vehicle is equipped, Rotary Switch system or Keyless GO system. For rotary system, IGnition Node Module IGNM coil communicate with FOBIK through LF signals (125 KHz) then communicates it to RFHM through a private serial bus, then RFHM sends CAN

data bus to BCM for IGNTION status after valid key is verified. The RFHM also contains the controlling logic for the KG (KIN) back lighting features.

- **Passive Entry** - If Smart door handles or exterior deck lid release switch is activated, RFHM fires and monitors LF signals from five Low Frequency (LF) antennas which wake up and communicate with the FOBIK, and RF signals from FOBIK to verify the key,, if valid key is recognized by RFHM then RFHM sends CAN data bus to BCM to lock or unlock the vehicle.
- **Remote Keyless Entry** - The RFHM is an RF receiver that monitors RF signals from Remote Keyless Entry (RKE) transmitter (FOBIK) and relays the appropriate electronic messages BCM module over the CAN data bus to support the features of RKE functions.
- **Remote Start System** - The RFHM is an RF receiver that monitors RF signals received through the remote start antenna (longer range) from the Remote Keyless Entry (RKE) transmitter or the Passive Entry Keyless Go (PEKG) FOBIK and relays the appropriate electronic messages to BCM over the CAN data bus to support all RKE functions including optional remote start function.
- **Sentry Key Immobilizer System** - RFHM uses a new high security encryption system called "Advanced Encryption Standard -AES" for Sentry Key Immobilizer System (SKIS). The new system marries FOBIKs, RFHM, BCM, ELV (if so equipped" and ECM with unique secret keys for each vehicle. Swapping parts ARE NOT ALLOWED in the new system, FOBIK are not allow to program for more than one Vehicle. Replacing any part of the system shall be done only in Chrysler authorize dealers using Chrysler diagnostic tool.
- **Tire Pressure Monitor System** - The RFHM is an RF receiver that monitors RF signals received from the Tire Pressure Monitor (TPM) sensors and relays the appropriate electronic messages to other electronic modules in the vehicle over the CAN data bus to support the features of the TPM system.
- **Vehicle Theft Alarm System** - The RFHM is an RF receiver that monitors RF signals received from the Remote Keyless Entry (RKE) transmitter or the Passive Entry Keyless Go (PEKG) FOB with Integrated Key (FOBIK) and relays the appropriate electronic messages to other electronic modules in the vehicle over the CAN data bus to support the features of the optional VTA system.

The RFHM is connected to a fused B(+) circuit and has a path to a clean ground at all times. These connections allow it to remain functional regardless of the ignition switch status. Any input to the RFHM that controls a vehicle system function that does not require that the ignition switch status be ON such as depressing a button on an RKE or FOBIK transmitter, prompts the RFHM to wake up and transmit on the CAN data bus.

The Body Control Module (BCM) stores and compares vehicle configuration data with the RFHM as well as with other Electronic Control Units (ECU) in the vehicle. This process is referred to as PRogramming Of Configuration of Systems Integrated (PROCSI) (also known as PROXI). If a configuration mismatch is detected, the BCM sets a DTC. A configuration mismatch DTC will require the performance of a Restore BCM PROXI Configuration routine, or a PROXI Configuration Alignment routine using a diagnostic scan tool.

RFHM uses On-Board Diagnostics (OBD) to monitor all of the Functions and circuits it controls, then sets active and stored Diagnostic Trouble Codes (DTC) for any monitored function faults it detects. RFHM will also send electronic message requests to the Instrument Cluster (IC) (also known as the Instrument Panel Cluster/IPC) through the gate way module (BCM) for the display of certain textual warning messages related to some detected functions conditions or faults.

The hard wired inputs and outputs of the RFHM may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not

prove conclusive in the diagnosis of the RFHM electronic controls or the communication between modules and other devices that provide some features of the RFHM controlled systems. The most reliable, efficient and accurate means to diagnose the RFHM or the electronic controls and communication related to RFHM-controlled systems operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

REMOVAL

Fig. 66: RF Hub & Harness Connectors
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the negative battery cable from the battery terminal.
2. Remove the rear cargo area sliding cover.
3. Fold both rear seats down.
4. Remove upper C pillar trim panel cover and fastener on both left and right side of the vehicle.
5. Position aside the both upper C pillar trim panels.
6. Pull down the rear of the headliner to gain access to the RF Hub assembly.
7. Remove both body harness connectors (2) (if so equipped) and the antenna connectors (3) (if so equipped) from the RF Hub (1).
8. Remove both fasteners securing the RF Hub to the roof of the vehicle.
9. Remove the RF Hub assembly.

INSTALLATION

INSTALLATION

Fig. 67: RF Hub & Harness Connectors
Courtesy of CHRYSLER GROUP, LLC

1. Position the RF HUB (1) in place for installation.
2. Use two fasteners to secure the RF HUB in position.
3. Connect both body harness connectors (2) (if so equipped) and the antenna connectors (3) (if so equipped) to the RF Hub (1).
4. Secure the rear of the headliner to an installed position.
5. Seat both C pillar panels into an installed position.
6. Install the fastener and cap into place on both C pillar panels.
7. Install the rear cargo sliding cover.
8. Position both rear seats to their upright position.
9. Connect the negative battery cable to the negative battery post.
10. Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

NOTE: Replace and Program the module(s) per the "RF-Hub, BCM, PCM, FOBik and ELV Replacement and Programming Order Guide". Refer to STANDARD PROCEDURE.

NOTE: If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI

Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.

MODULE, STEERING COLUMN

DESCRIPTION

DESCRIPTION

Fig. 68: Steering Column Control Module (SCCM) & Clockspring
Courtesy of CHRYSLER GROUP, LLC

The Steering Control Module (SCM) for this vehicle is a microcontroller based electronic unit internal to the molded plastic Steering Column Control Module (SCCM) mounting housing (2). The SCCM mounting housing is located near the top of the steering column directly below the steering wheel. The SCCM mounting housing includes the left (lighting) multifunction switch (1), the right (wiper) multifunction switch (3) and the SCM, which is also a Local Interface Network (LIN) master node and a gateway to the Controller Area Network (CAN) data bus. The clockspring (4) is secured by four screws over the top of the SCCM mounting housing. For additional information on the clockspring, refer to **CLOCKSPRING, DESCRIPTION** . For additional information on the left multifunction switch, refer to **SWITCH, MULTIFUNCTION, DESCRIPTION** . For additional information on the right multifunction switch, refer to **SWITCH, MULTIFUNCTION, RIGHT, DESCRIPTION** .

The SCCM mounting housing is aligned on the steering column jacket by a rib integral to the upper steering column housing that is engaged in a groove in the mounting flange of the SCCM mounting housing. A plastic latch feature of the SCCM mounting flange then snaps over a small lug that is also integral to the outer circumference of the upper steering column housing, and a metal clamp with a single screw tightens the flange

to the steering column. There are lugs cast into the outer circumference of the steering wheel hub that engage the inner circumference of the clockspring rotor hub to drive the clockspring and to disengage a small red plastic spring-loaded blocker that locks the clockspring rotor hub to the clockspring housing until the steering wheel is properly installed. The steering wheel hub disengages the blocker when properly installed. The steering wheel must be tightened to specification to ensure proper clockspring function.

The SCCM mounting housing includes an integral connector insulator that faces toward the instrument panel. However, the terminal pins that populate this insulator are integral to the clockspring and are connected to the vehicle electrical system through a take out and connector of the instrument panel wire harness. The SCCM mounting housing also has an interconnect receptacle that faces toward the steering wheel. This receptacle accepts the fixed terminal pins of the clockspring half of the interconnect, which consists of several circuits that pass through the clockspring dedicated to connecting the SCM to the vehicle electrical system.

The SCCM mounting housing, the multifunction switches as well as the SCM LIN master node and CAN gateway electronics unit cannot be adjusted or repaired. If ineffective or damaged the entire SCCM mounting housing, left multifunction switch, right multifunction switch and SCM must be replaced as a unit. The clockspring is available for separate service replacement.

OPERATION

OPERATION

Besides serving as the carrier for the clockspring, the left (lighting) multifunction switch and the right (wiper) multifunction switch, the Steering Column Control Module (SCCM) mounting housing contains an electronic circuit board, sometimes referred to as the Steering Control Module (SCM). The SCM is a Local Interface Network (LIN) bus master node and a gateway for the Controller Area Network (CAN) data bus. Refer to **COMMUNICATION, DESCRIPTION**. For additional information on the clockspring, refer to **CLOCKSPRING, OPERATION** . For additional information on the left multifunction switch, refer to **SWITCH, MULTIFUNCTION, OPERATION** . For additional information on the right multifunction switch, refer to **SWITCH, MULTIFUNCTION, RIGHT, OPERATION** .

The microcontroller based SCM provides power and ground to the multifunction switches, then utilizes integrated circuitry to monitor hard wired digital return inputs from the switches. Except for the circuits for the standard equipment Driver AirBag (DAB), which are pass-through circuits of the clockspring, the SCM also provides power and ground to all of the electronics carried on the steering wheel through the stand alone LIN module or, if the vehicle is so equipped, the LIN module integral to the speed control switch pod in the right horizontal steering wheel spoke. The stand alone LIN module or the integral LIN circuitry of the speed control switch pod are each a LIN slave node.

The steering wheel-mounted electronics monitored by the SCM include the horn switch, the standard equipment odometer switch pod, the optional equipment speed control switch pod, the remote radio switches, the optional hands-free communication switches and the optional Electronic Vehicle Information Center (EVIC) control switch pod. The LIN slave node monitors the changing states of these switches through both hard wired analog and digital return inputs, then communicates those switch states to the LIN master node circuitry of the SCM over the LIN data bus. In response to those inputs, the SCM CAN gateway circuitry then transmits electronic message outputs communicating all of the monitored switch state changes to other electronic modules in the vehicle over the CAN data bus.

The SCM is connected to a fused B(+) circuit and has a path to a clean ground at all times. These connections allow it to remain functional regardless of the ignition switch status. Any input to the SCM that controls a vehicle system function that does not require that the ignition switch status be On such as depressing the horn switch, prompts the SCM to wake up and transmit on the CAN data bus.

The Body Control Module (BCM) stores and compares vehicle configuration data with the SCM as well as with other Electronic Control Units (ECU) in the vehicle. This process is referred to as PRogramming Of Configuration of Systems Integrated (PROCSI) (also known as PROXI). If a configuration mismatch is detected, the BCM sets a DTC. A configuration mismatch DTC will require the performance of a Restore BCM PROXI Configuration routine, or a PROXI Configuration Alignment routine using a diagnostic scan tool.

The hard wired circuits between components related to the SCM may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the SCM or the electronic controls and communication between modules and other devices that provide some features of the SCM. The most reliable, efficient and accurate means to diagnose the SCM or the electronic controls and communication related to SCM operation requires the use of a diagnostic scan tool. Refer to **DIAGNOSIS AND TESTING** .

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - STEERING COLUMN MODULE

WARNING: **To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.**

The hard wired circuits between components related to the Steering Control Module (SCM) may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the SCM or the electronic control and communication features of the SCM. The most reliable, efficient and accurate means to diagnose the SCM or the electronic control and communication features related to SCM operation requires the use of a diagnostic scan tool. Refer to **DIAGNOSIS AND TESTING** .

REMOVAL

REMOVAL

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

Fig. 69: Steering Column Control Module (SCCM) Mounting Housing, Multifunction Switches Unit, Steering Column & Fasteners
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative cable from the battery.
2. Remove the clockspring from the Steering Column Control Module (SCCM) mounting housing, Steering Control Module (SCM) and multifunction switches unit (1). Refer to **CLOCKSPRING, REMOVAL** .
3. Remove the screw (3) from the clamp (2) that secures the collar of the SCCM mounting housing, SCM and multifunction switches unit to the steering column (5). The screw head is accessed from the underside of the steering column.
4. Firmly grasp both sides of the SCCM mounting housing and pull it sharply upward to unsnap the latch feature of the collar from the retention tab (4) at about the 1 o'clock position on the top of the steering

column housing.

5. Remove the SCCM mounting housing, SCM and multifunction switches from the vehicle as a unit.

INSTALLATION

INSTALLATION

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

1012006663

Fig. 70: Steering Column Control Module (SCCM) Mounting Housing, Multifunction Switches Unit, Steering Column & Fasteners
Courtesy of CHRYSLER GROUP, LLC

1. Align the notch (4) in the collar on the back of the Steering Column Control Module (SCCM) mounting housing, Steering Control Module (SCM) and multifunction switches unit (1) to the alignment tab at the 12 o'clock position on the top of the steering column housing (5).
2. Using both hand, press the SCCM mounting housing downward over the top of the steering column firmly and evenly until the latch feature of the collar snaps into place over the retention tab (3) at about

the 1 o'clock position on the top of the steering column housing. The retention tab must be fully within the opening of the collar clamp (2) as shown in the illustration.

NOTE: The SCCM mounting housing must be held firmly while tightening the clamp screw to keep it from rotating clockwise on the column housing.

3. Install and tighten the screw into the clamp that secures the collar of the SCCM mounting housing, SCM and multifunction switches unit to the steering column. The screw is installed from the underside of the steering column. Tighten the screw to 6.5 N.m (57 in. lbs.).
4. Reinstall the clockspring onto the SCCM mounting housing, SCM and multifunction switches unit.
5. Reconnect the negative cable to the battery.

NOTE: If this Electronic Control Unit (ECU) is being replaced with a new unit, a diagnostic scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under the Body Control Module (BCM) Miscellaneous Functions menu.

MODULE, TRANSMISSION CONTROL

OPERATION

OPERATION

The TCM regulates the amount of hydraulic pressure used to engage the clutches and the Torque Converter Clutch (TCC), in addition to directing hydraulic pressure to engage or release any given clutch for any given required gear. The TCM will actuate the valves via solenoids based on the position of the shifter, transmission fluid temperature, engine operating conditions, traction conditions and driver demands. During a shift, the TCM will actuate the solenoids to match the gear ranges to the optimal torque range of the engine based on the position of the accelerator pedal, shifter and vehicle speed as determined by the PCM based on input from the Vehicle Speed Sensor (VSS) and ABS module. Due to the complexity of the 948TE transmission control system, always refer to **DIAGNOSIS AND TESTING** when attempting to diagnose transmission problems.

REMOVAL

REMOVAL

1. Position vehicle on a suitable hoist with the transaxle in neutral. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Release the hood latch and open the hood.
3. Raise the vehicle enough to gain access to the left front wheel.
4. Remove the left front wheel. Refer to **REMOVAL** .
5. Through the opening rearward of the suspension strut, remove the lower bolts holding the TCM to the transaxle located below the power brake booster.

6. Lower the vehicle.
7. Remove the engine cover.

Fig. 71: Identifying Wire Connector Lock To TCM
Courtesy of CHRYSLER GROUP, LLC

8. Disengage the lock (1) holding the wire connector to the TCM.
9. Separate the wire connector from the TCM.
10. Remove the bolts holding the top of the TCM to the transaxle.
11. Separate the TCM from the vehicle.

INSTALLATION

INSTALLATION

NOTE: **When replacing a Transmission Control Module (TCM), the TCM must be programmed. Failure to properly program the TCM may result in the illumination of the Malfunction Indicator Lamp (MIL) and setting DTC(s).**

NOTE: **If this electronic Control Unit (ECU) is being replaced with a new unit, a diagnostics scan tool MUST be used to align the PROXI configuration data into the new ECU. Follow the routine outlined in the diagnostic scan tool for PROXI Configuration Alignment under Body Control Module (BCM) Miscellaneous Functions menu.**

NOTE: **The Valve Body Solenoid Learn procedure must be performed when the TCM and/or valve body is replaced. Failure to perform the Valve Body Solenoid Learn procedure will result in reduced shift quality.**

1. Place the TCM in position on the vehicle.
2. Install the bolts to hold the top of the TCM to the transaxle. Refer to **SPECIFICATIONS** .
3. Insert the wire connector into the TCM.

Fig. 72: Identifying Wire Connector Lock To TCM
Courtesy of CHRYSLER GROUP, LLC

4. Engage the lock to hold the wire connector to the TCM.
5. Install the engine cover.
6. Raise the vehicle.
7. Through the opening rearward of the suspension strut, install the lower bolts to hold the TCM to the transaxle located below the power brake booster. Refer to **SPECIFICATIONS** .
8. Install the left front wheel. Refer to **INSTALLATION** .
9. Lower the vehicle to the ground
10. Perform TCM programming and verification. Refer to **STANDARD PROCEDURE** .
11. Close the hood.
12. Road test the vehicle to verify the repair.

MODULE, KEYLESS IGNITION NODE

DESCRIPTION

DESCRIPTION

Fig. 73: Keyless Ignition Node
Courtesy of CHRYSLER GROUP, LLC

Keyless Ignition Node (KIN) is part of the new ignition system.

Used on the High end vehicles featuring "Keyless Go".

The KIN module is located in the instrument panel to the left of the center stack.

The KIN is encased in a mounting bracket which is secured to the instrument panel by four (4) screws.

Similar to the LX/JC vehicles except for the mounting bracket.

OPERATION

OPERATION

The KIN module contains the customer interface for ignition switch activation in the form of a momentary switch. Pressing the Start/Stop Button is the method of activation by the customer. The actual ignition status is communicated to the vehicle via a Start Button sense line to the RF HUB. The RF HUB transmits the ignition status on the CAN C communication bus to the vehicle. The KIN contains an LF coil which is used to communicate with and authenticate Fobiks during Back Up mode. A dedicated KIN communication line is used when authenticating or programming Fobiks. The KIN also has the ability to display the ignition status to the customer via three LEDs which illuminate the OFF, ACC, RUN states in a status ring around the Start/Stop Button. A fourth LED provides backlighting illumination for the Start/Stop Button itself.

After the driver is buckled and the shifter is in Park, the driver then pushes the KIN's SSB (Keyless Ignition Node's Start/Stop Button) while pushing the brake pedal as if braking while coming to a stoplight. (For manual transmission vehicles the clutch pedal is fully pressed instead of the brake pedal to initiate a start procedure). Before the vehicle is allowed to start, a 'FOB authentication' cycle must be completed. Once successfully completed, the RF Hub next sends the BCM the ignition switch position, which equates to a 'request to start' command. The process of starting a vehicle without the act of using a bladed key or FOBIK is called 'Keyless Go'.

For further information regarding the Passive Entry system, refer to **OPERATION** .

For further information regarding the Keyless GO system, refer to **OPERATION** .

REMOVAL

REMOVAL

1. Disconnect the negative battery cable.
2. Remove the lower steering column opening trim. Refer to **COVER, STEERING COLUMN OPENING, REMOVAL** .
3. Remove the chin bezel located above the floor console. One fastener and snaps to console.
4. Remove the four (4) screws that retain the keyless ignition node.
5. Disconnect the harness connector and remove the keyless ignition node.

INSTALLATION

INSTALLATION

1. Connect the wire harness to the keyless ignition node.
2. Secure the keyless ignition node to the instrument panel.
3. Install the chin bezel.
4. Install the kneeblocker/lower steering column opening trim. Refer to **COVER, STEERING COLUMN OPENING, INSTALLATION** .
5. Connect the negative battery cable.
6. If KIN is being replaced, program the module. Refer to **STANDARD PROCEDURE** .

NOTE: **This procedure will require you to log into DealerCONNECT and enter a PIN when requested. The PIN is temporary and will be active for 12 hours. After 12 hours, a new PIN will need to be obtained from DealerCONNECT.**

DIAGNOSIS AND TESTING

B1A92-09-STEERING LOCK MOTOR - COMPONENT FAILURES

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 1: Electronic Steering Lock Module Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Electronic Steering Lock (ESL) Module prevents the Steering Wheel from turning once the Ignition Switch is turned OFF or if the Immobilizer System does not receive the correct security code. A Lock/Unlock Motor inside the ESL Module incorporates a locking mechanism that locks or unlocks the steering wheel. The ESL Module communicates with several Electronic Control Units (ECUs) via Controller Area Network (CAN). The Antilock Brake System (ABS) Module provides a vehicle speed signal to the ESL Module by way of a dedicated circuit and a CAN message. The Vehicle Speed signal is used by the ESL Module to determine if it is

safe to lock the steering wheel. The Body Control Module (BCM) transmits the Lock/Unlock commands via CAN message to the ESL Module.

WHEN MONITORED

Ignition switch is ON.

System voltage is above a calibrated threshold.

SET CONDITION

An internal failure has been detected.

POSSIBLE CAUSES

Possible Causes
ELECTRONIC STEERING LOCK (ESL) MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURES.

DIAGNOSTIC TEST

1. **CHECK IF DTC IS CURRENT**
    1. With the scan tool, read ESL DTCs.
    2. Record the Environmental Data and any DTCs.
    3. With the scan tool, erase DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. With the scan tool, read ESL DTCs.

    Did the DTC reset?

    Yes

    - Using the schematics as a guide, check the Electronic Steering Lock (ESL) terminals and connectors for corrosion, damage or pushed out terminals. Pay particular attention to the power and ground circuits. If no problems are found, replace the ESL Module in accordance with the Service Information.
    - Perform the Electronic Steering Lock (ESL) Verification Test. Refer to **STANDARD PROCEDURES**.

    No

    - Go to 2.

2. **CHECK WIRING AND CONNECTORS**
    1. The conditions necessary to set the DTC are not present at this time.
    2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
    3. Wiggle the wires while checking for shorted and open circuits.
    4. Check for any Service Bulletins that may apply.

    Were there any problems found?

    Yes

    - Repair as necessary.
    - Perform the Electronic Steering Lock (ESL) Verification Test. Refer to **STANDARD PROCEDURES**.

    No

    - Test complete.

B1A92-71-STEERING LOCK MOTOR - ACTUATOR STUCK

    - Go to 2.

2. **CHECK WIRING AND CONNECTORS**
    1. The conditions necessary to set the DTC are not present at this time.
    2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
    3. Wiggle the wires while checking for shorted and open circuits.
    4. Check for any Service Bulletins that may apply.

    Were there any problems found?

    Yes

    - Repair as necessary.
    - Perform the Electronic Steering Lock (ESL) Verification Test. Refer to **STANDARD PROCEDURES**.

    No

    - Test complete.

B1A93-64-STEERING LOCK MOTOR SENSOR - SIGNAL PLAUSIBILITY FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 3: Electronic Steering Lock Module Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Electronic Steering Lock (ESL) Module prevents the Steering Wheel from turning once the Ignition Switch is turned OFF or if the Immobilizer System does not receive the correct security code. A Lock/Unlock Motor inside the ESL Module incorporates a locking mechanism that locks or unlocks the steering wheel. The ESL Module communicates with several Electronic Control Units (ECUs) via Controller Area Network (CAN). The Antilock Brake System (ABS) Module provides a vehicle speed signal to the ESL Module by way of a dedicated circuit and a CAN message. The Vehicle Speed signal is used by the ESL Module to determine if it is

safe to lock the steering wheel. The Body Control Module (BCM) transmits the Lock/Unlock commands via CAN message to the ESL Module.

WHEN MONITORED

Ignition switch is ON.

System voltage is above a calibrated threshold.

SET CONDITION

An internal failure has been detected.

POSSIBLE CAUSES

Possible Causes
ELECTRONIC STEERING LOCK (ESL) MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURES.

B212E-23-IGNITION RUN/ACC CONTROL - SIGNAL STUCK LOW

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 4: Electronic Steering Lock Module Circuit Diagram

THEORY OF OPERATION

The Electronic Steering Lock (ESL) Module prevents the Steering Wheel from turning once the Ignition Switch is turned OFF or if the Immobilizer System does not receive the correct security code. A Lock/Unlock Motor inside the ESL Module incorporates a locking mechanism that locks or unlocks the steering wheel. The ESL Module communicates with several Electronic Control Units (ECUs) via Controller Area Network (CAN). The Antilock Brake System (ABS) Module provides a vehicle speed signal to the ESL Module by way of a dedicated circuit and a CAN message. The Vehicle Speed signal is used by the ESL Module to determine if it is

safe to lock the steering wheel. The Body Control Module (BCM) transmits the Lock/Unlock commands via CAN message to the ESL Module.

WHEN MONITORED

Ignition switch is ON.

SET CONDITION

ESL Module supply voltage is not within specification.

POSSIBLE CAUSES

Possible Causes
(A910) BATTERY SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE
(A910) BATTERY SUPPLY CIRCUIT SHORTED TO GROUND
(F944) IGNITION VOLTAGE SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE
(F944) IGNITION VOLTAGE SUPPLY CIRCUIT SHORTED TO GROUND
(F944) IGNITION VOLTAGE SUPPLY CIRCUIT SHORTED TO BATTERY
(Z917) GROUND CIRCUIT OPEN OR HIGH RESISTANCE
ELECTRONIC STEERING LOCK (ESL) MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURES.

DIAGNOSTIC TEST

1. **CHECK IF DTC IS CURRENT**
    1. With the scan tool, read ESL DTCs.
    2. Record the Environmental Data and any DTCs.
    3. With the scan tool, erase DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. With the scan tool, read ESL DTCs.

    Did the DTC reset?

    Yes

    - Go to 2.

    No

    - Go to 10.

2. **CHECK FOR POWERTRAIN CONTROL MODULE (PCM) CHARGING SYSTEM DTCS**
   1. With the scan tool, read PCM DTCs.

      Does the scan tool display any PCM charging system related DTCs?

      Yes

      - Repair PCM Charging System related DTCs. Refer to the **DTC INDEX** article .
      - Perform the Electronic Steering Lock (ESL) Verification Test. Refer to **STANDARD PROCEDURES**.

      No

      - Go to 3.
3. **CHECK FUSES**
   1. Check fuse F67 (15A).
   2. Check fuse F23 (10A).

      Are one or more fuses blown?

      Yes

      - Go to 8.

      No

      - Go to 4.
4. **CHECK (Z917) GROUND CIRCUIT**
   1. Reinstall fuses if removed.
   2. Turn the Ignition Switch OFF.
   3. Disconnect the ESL Module harness connector.
   4. Measure the resistance between ground and the (Z917) circuit.

      Is the resistance below 5.0 Ohms?

      Yes

      - Go to 5.

      No

      - Repair the open or high resistance in the (Z917) ground circuit.
      - Perform the Electronic Steering Lock (ESL) Verification Test. Refer to **STANDARD**

PROCEDURES.

5. **CHECK (A910) BATTERY SUPPLY CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
   1. Turn the Ignition ON, Engine not running.
   2. Measure the voltage between (A910) Battery Supply circuit and ground.

      Is the voltage above 9 volts?

      Yes

      - Go to 6.

      No

      - Repair the open or high resistance in the (A910) Battery Supply circuit.
      - Perform the Electronic Steering Lock (ESL) Verification Test. Refer to **STANDARD PROCEDURES**.
6. **CHECK (F944) IGNITION VOLTAGE SUPPLY CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
   1. Measure the voltage between (F944) Ignition Voltage Supply circuit and ground.

      Is the voltage above 9 volts?

      Yes

      - Go to 7.

      No

      - Repair the (F944) Ignition Voltage Supply circuit for an open or high resistance.
      - Perform the Electronic Steering Lock (ESL) Verification Test. Refer to **STANDARD PROCEDURES**.
7. **CHECK (A9101) BATTERY SUPPLY CIRCUIT SHORTED TO (F944) IGNITION VOLTAGE SUPPLY CIRCUIT**
   1. Turn the Ignition Switch OFF.
   2. Remove fuses F67 (15A) and F23 (10A).
   3. Measure the resistance between the (A910) circuit and the (F944) circuit at the ESL Module harness connector.

      Is there continuity between the (A910) circuit and the (F944) circuit?

      Yes

      - Repair the (A910) circuit and the (F944) circuit for a short to each other.

- Perform the Electronic Steering Lock (ESL) Verification Test. Refer to **STANDARD PROCEDURES**.

No

- Replace the ESL Module in accordance with the Service Information.
- Perform the Electronic Steering Lock (ESL) Verification Test. Refer to **STANDARD PROCEDURES**.

8. **CHECK (A910) CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the Ignition Switch OFF.
   2. Remove fuse F67 (15A).
   3. Disconnect the ESL Module harness connector.
   4. Measure the resistance between ground and the (A910) Battery Supply circuit at the ESL Module harness connector.
   5. Measure the resistance between the (A910) Battery Supply circuit and all other circuits in the ESL Module harness connector.

   Is there continuity between the (A910) Battery Supply circuit and ground or another circuit?

   Yes

   - Repair the (A910) Battery Supply circuit for a short to ground or another circuit.
   - Perform the Electronic Steering Lock (ESL) Verification Test. Refer to **STANDARD PROCEDURES**.

   No

   - Go to 9.

9. **CHECK (F944) CIRCUIT FOR A SHORT TO GROUND**
   1. Remove fuse F23 (10A).
   2. Measure the resistance between ground and the (F944) Ignition Supply circuit at the ESL Module harness connector.
   3. Measure the resistance between the (F944) Ignition Supply circuit and all other circuits in the ESL Module harness connector.

   Is there continuity between the (F944) Ignition Supply circuit and ground or another circuit?

   Yes

   - Repair the (F944) Ignition Supply circuit for a short to ground or another circuit.
   - Perform the Electronic Steering Lock (ESL) Verification Test. Refer to **STANDARD PROCEDURES**.

No

- Replace the ESL Module in accordance with the Service Information.
- Perform the Electronic Steering Lock (ESL) Verification Test. Refer to **STANDARD PROCEDURES**.

10. **CHECK WIRING AND CONNECTORS**
    1. The conditions necessary to set the DTC are not present at this time.
    2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
    3. Wiggle the wires while checking for shorted and open circuits.
    4. Check for any Service Bulletins that may apply.

    Were there any problems found?

    Yes

    - Repair as necessary.
    - Perform the Electronic Steering Lock (ESL) Verification Test. Refer to **STANDARD PROCEDURES**.

    No

    - Test complete.

B2199-16-BATTERY VOLTAGE - CIRCUIT VOLTAGE BELOW THRESHOLD

U0002-00-CAN C BUS OFF PERFORMANCE

Perform the COMMUNICATION PRE-DIAGNOSTIC PROCEDURE. Refer to **STANDARD PROCEDURE** .

U0002-88-CAN C BUS OFF PERFORMANCE

Perform the COMMUNICATION PRE-DIAGNOSTIC PROCEDURE. Refer to **STANDARD PROCEDURE** .

U0121-00-LOST COMMUNICATION WITH ANTI-LOCK BRAKE SYSTEM (ABS) CONTROL MODULE

Perform the COMMUNICATION PRE-DIAGNOSTIC PROCEDURE. Refer to **STANDARD PROCEDURE** .

U0140-00-LOST COMMUNICATION WITH BODY CONTROL MODULE

Perform the COMMUNICATION PRE-DIAGNOSTIC PROCEDURE. Refer to **STANDARD PROCEDURE** .

U0415-29-IMPLAUSIBLE DATA RECEIVED FROM ABS - SIGNAL INVALID

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 9: Electronic Steering Lock Module Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Electronic Steering Lock (ESL) Module prevents the Steering Wheel from turning once the Ignition Switch is turned OFF or if the Immobilizer System does not receive the correct security code. A Lock/Unlock Motor inside the ESL Module incorporates a locking mechanism that locks or unlocks the steering wheel. The ESL Module communicates with several Electronic Control Units (ECUs) via Controller Area Network (CAN). The Antilock Brake System (ABS) Module provides a vehicle speed signal to the ESL Module by way of a dedicated circuit and a CAN message. The Vehicle Speed signal is used by the ESL Module to determine if it is safe to lock the steering wheel. The Body Control Module (BCM) transmits the Lock/Unlock commands via CAN message to the ESL Module.

WHEN MONITORED

Ignition Switch is ON.

System voltage is above a calibrated value.

SET CONDITION

Loss of communication or implausible data from ABS module.

POSSIBLE CAUSES

Possible Causes
ANTILOCK BRAKE SYSTEM (ABS) MODULE DTCS

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURES.

DIAGNOSTIC TEST

1. **CHECK IF DTC IS CURRENT**
    1. With the scan tool, read ESL DTCs.
    2. Record the Environmental Data and any DTCs.
    3. With the scan tool, erase DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. With the scan tool, read ESL DTCs.

    Did the DTC reset?

    Yes

    - Go to 2.

    No

- Go to 3.

2. **CHECK ABS DTCS**
   1. With the scan tool, read ABS DTCs.

      Are ABS DTCs present?

      Yes

      - Repair ABS DTCs. Refer to **DIAGNOSIS AND TESTING** .
      - Perform the Electronic Steering Lock (ESL) Verification Test. Refer to **STANDARD PROCEDURES**.

      No

      - Using the schematics as a guide, check the Electronic Steering Lock (ESL) terminals and connectors for corrosion, damage or pushed out terminals. Pay particular attention to the power and ground circuits. If no problems are found, replace the ESL Module in accordance with the Service Information.
      - Perform the Electronic Steering Lock (ESL) Verification Test. Refer to **STANDARD PROCEDURES**.

3. **CHECK WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. Check for any Service Bulletins that may apply.

      Were there any problems found?

      Yes

      - Repair as necessary.
      - Perform the Electronic Steering Lock (ESL) Verification Test. Refer to **STANDARD PROCEDURES**.

      No

      - Test complete.

U0422-29-IMPLAUSIBLE DATA RECEIVED FROM BODY CONTROL MODULE - SIGNAL INVALID

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 10: Electronic Steering Lock Module Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Electronic Steering Lock (ESL) Module prevents the Steering Wheel from turning once the Ignition Switch is turned OFF or if the Immobilizer System does not receive the correct security code. A Lock/Unlock Motor inside the ESL Module incorporates a locking mechanism that locks or unlocks the steering wheel. The ESL Module communicates with several Electronic Control Units (ECUs) via Controller Area Network (CAN). The Antilock Brake System (ABS) Module provides a vehicle speed signal to the ESL Module by way of a dedicated circuit and a CAN message. The Vehicle Speed signal is used by the ESL Module to determine if it is

safe to lock the steering wheel. The Body Control Module (BCM) transmits the Lock/Unlock commands via CAN message to the ESL Module.

WHEN MONITORED

Ignition switch is ON.

System voltage is above a calibrated value.

SET CONDITION

Loss of communication or implausible data from BCM.

POSSIBLE CAUSES

Possible Causes
BODY CONTROL MODULE (BCM) DTCS

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURES.

DIAGNOSTIC TEST

1. **CHECK IF DTC IS CURRENT**
    1. With the scan tool, read ESL DTCs.
    2. Record the Environmental Data and any DTCs.
    3. With the scan tool, erase DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. With the scan tool, read ESL DTCs.

    Did the DTC reset?

    Yes

    - Go to 2.

    No

    - Go to 3.
2. **CHECK BCM DTCS**
    1. With the scan tool, read BCM DTCs.

    Are BCM DTCs present?

Yes

- Repair BCM DTCs. Refer to the **BODY CONTROL MODULE (BCM) - DIAGNOSTIC CODE INDEX** article .
- Perform the Electronic Steering Lock (ESL) Verification Test. Refer to **STANDARD PROCEDURES**.

No

- Using the schematics as a guide, check the Electronic Steering Lock (ESL) terminals and connectors for corrosion, damage or pushed out terminals. Pay particular attention to the power and ground circuits. If no problems are found, replace the ESL Module in accordance with the Service Information.
- Perform the Electronic Steering Lock (ESL) Verification Test. Refer to **STANDARD PROCEDURES**.

3. **CHECK WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. Check for any Service Bulletins that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the Electronic Steering Lock (ESL) Verification Test. Refer to **STANDARD PROCEDURES**.

   No

   - Test complete.

U1110-29-LOST VEHICLE SPEED MESSAGE - SIGNAL INVALID

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 11: Electronic Steering Lock Module Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Electronic Steering Lock (ESL) Module prevents the Steering Wheel from turning once the Ignition Switch is turned OFF or if the Immobilizer System does not receive the correct security code. A Lock/Unlock Motor inside the ESL Module incorporates a locking mechanism that locks or unlocks the steering wheel. The ESL Module communicates with several Electronic Control Units (ECUs) via Controller Area Network (CAN). The Antilock Brake System (ABS) Module provides a vehicle speed signal to the ESL Module by way of a dedicated circuit and a CAN message. The Vehicle Speed signal is used by the ESL Module to determine if it is

safe to lock the steering wheel. The Body Control Module (BCM) transmits the Lock/Unlock commands via CAN message to the ESL Module.

WHEN MONITORED

Ignition Switch ON.

SET CONDITION

Vehicle Speed Signal is received from CAN and not received on (B22) Vehicle Speed Signal circuit.

POSSIBLE CAUSES

Possible Causes
(B22) VEHICLE SPEED SIGNAL CIRCUIT OPEN
(B22) VEHICLE SPEED SIGNAL CIRCUIT SHORT TO GROUND
(B22) VEHICLE SPEED SIGNAL CIRCUIT SHORTED TO ANOTHER CIRCUIT
ABS MODULE DTCS
ELECTRONIC STEERING LOCK (ESL) MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURES.

DIAGNOSTIC TEST

1. **CHECK IF DTC IS CURRENT**
    1. With the scan tool, read ESL DTCs.
    2. Record the Environmental Data and any DTCs.
    3. With the scan tool, erase DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. With the scan tool, read ESL DTCs.

    Did the DTC reset?

    Yes

    - Go to 3.

    No

    - Go to 5.
2. **CHECK FOR ABS MODULE DTCS**
    1. With the scan tool, read ABS DTCs.

Are ABS Vehicle Speed or Wheel Speed DTCs present?

Yes

- Repair ABS DTCs before proceeding, refer to **DIAGNOSIS AND TESTING** .
- Perform the Electronic Steering Lock (ESL) Verification Test. Refer to **STANDARD PROCEDURES**.

No

- Go to 3.

3. **CHECK (B22) CIRCUIT FOR AN OPEN**
   1. Turn the Ignition Switch OFF.
   2. Disconnect the ESL Module harness connector.
   3. Disconnect the ABS Module harness connector.
   4. Measure the resistance of the (B22) circuit between the ABS Module harness connector and the ESL Module harness connector.

   Is the resistance below 5.0 ohms?

   Yes

   - Go to 4.

   No

   - Repair the (B22) circuit for an open.
   - Perform the Electronic Steering Lock (ESL) Verification Test. Refer to **STANDARD PROCEDURES**.

4. **CHECK (B22) CIRCUIT FOR A SHORT TO GROUND OR SHORT TO ANOTHER CIRCUIT**
   1. Measure the resistance between ground and the (B22) circuit at the ABS Module harness connector.
   2. Measure the resistance between the (B22) circuit and all other circuits in the ABS Module harness connector.

   Is there continuity between the (B22) circuit and ground or another circuit?

   Yes

   - Repair the (B22) circuit for a short to ground or short to another circuit.
   - Perform the Electronic Steering Lock (ESL) Verification Test. Refer to **STANDARD PROCEDURES**.

   No

- Using the schematics as a guide, check the Electronic Steering Lock (ESL) terminals and connectors for corrosion, damage or pushed out terminals. Pay particular attention to the power and ground circuits. If no problems are found, replace the ESL Module in accordance with the Service Information.
- Perform the Electronic Steering Lock (ESL) Verification Test. Refer to **STANDARD PROCEDURES**.

5. **CHECK WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. Check for any Service Bulletins that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the Electronic Steering Lock (ESL) Verification Test. Refer to **STANDARD PROCEDURES**.

   No

   - Test complete.

U1220-87-LOST STEERING LOCK REQUEST MESSAGE - MISSING MESSAGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 12: Electronic Steering Lock Module Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Electronic Steering Lock (ESL) Module prevents the Steering Wheel from turning once the Ignition Switch is turned OFF or if the Immobilizer System does not receive the correct security code. A Lock/Unlock Motor inside the ESL Module incorporates a locking mechanism that locks or unlocks the steering wheel. The ESL Module communicates with several Electronic Control Units (ECUs) via Controller Area Network (CAN). The Antilock Brake System (ABS) Module provides a vehicle speed signal to the ESL Module by way of a dedicated circuit and a CAN message. The Vehicle Speed signal is used by the ESL Module to determine if it is

safe to lock the steering wheel. The Body Control Module (BCM) transmits the Lock/Unlock commands via CAN message to the ESL Module.

WHEN MONITORED

Ignition switch is ON.

System voltage is above a calibrated value.

DIAGNOSTIC TEST

1. **CHECK IF DTC IS CURRENT**
    1. With the scan tool, read ESL DTCs.
    2. Record the Environmental Data and any DTCs.
    3. With the scan tool, erase DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. With the scan tool, read ESL DTCs.

    Did the DTC reset?

    Yes

    - Go to 3.

    No

    - Go to 5.
2. **CHECK FOR ABS MODULE DTCS**
    1. With the scan tool, read ABS DTCs.

Are ABS Vehicle Speed or Wheel Speed DTCs present?

Yes

- Repair ABS DTCs before proceeding. Refer to **DIAGNOSIS AND TESTING** .
- Perform the Electronic Steering Lock (ESL) Verification Test. Refer to **STANDARD PROCEDURES**.

No

- Go to 3.

3. **CHECK (B22) CIRCUIT FOR AN OPEN**
   1. Turn the Ignition Switch OFF.
   2. Disconnect the ESL Module harness connector.
   3. Disconnect the ABS Module harness connector.
   4. Measure the resistance of the (B22) circuit between the ABS Module harness connector and the ESL Module harness connector.

   Is the resistance below 5.0 ohms?

   Yes

   - Go to 4.

   No

   - Repair the (B22) circuit for an open.
   - Perform the Electronic Steering Lock (ESL) Verification Test. Refer to **STANDARD PROCEDURES**.

4. **CHECK (B22) CIRCUIT FOR A SHORT TO GROUND OR SHORT TO ANOTHER CIRCUIT**
   1. Measure the resistance between ground and the (B22) circuit at the ABS Module harness connector.
   2. Measure the resistance between the (B22) circuit and all other circuits in the ABS Module harness connector.

   Is there continuity between the (B22) circuit and ground or another circuit?

   Yes

   - Repair the (B22) circuit for a short to ground or short to another circuit.
   - Perform the Electronic Steering Lock (ESL) Verification Test. Refer to **STANDARD PROCEDURES**.

   No

- Using the schematics as a guide, check the Electronic Steering Lock (ESL) terminals and connectors for corrosion, damage or pushed out terminals. Pay particular attention to the power and ground circuits. If no problems are found, replace the ESL Module in accordance with the Service Information.
- Perform the Electronic Steering Lock (ESL) Verification Test. Refer to **STANDARD PROCEDURES**.

5. **CHECK WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. Check for any Service Bulletins that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the Electronic Steering Lock (ESL) Verification Test. Refer to **STANDARD PROCEDURES**.

   No

   - Test complete.

U1433-64-IMPLAUSIBLE IGNITION SWITCH STATUS MESSAGE RECEIVED - SIGNAL PLAUSIBILITY FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 14: Electronic Steering Lock Module Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Electronic Steering Lock (ESL) Module prevents the Steering Wheel from turning once the Ignition Switch is turned OFF or if the Immobilizer System does not receive the correct security code. A Lock/Unlock Motor inside the ESL Module incorporates a locking mechanism that locks or unlocks the steering wheel. The ESL Module communicates with several Electronic Control Units (ECUs) via Controller Area Network (CAN). The Antilock Brake System (ABS) Module provides a vehicle speed signal to the ESL Module by way of a dedicated circuit and a CAN message. The Vehicle Speed signal is used by the ESL Module to determine if it is

safe to lock the steering wheel. The Body Control Module (BCM) transmits the Lock/Unlock commands via CAN message to the ESL Module.

WHEN MONITORED

Ignition switch is ON.

System voltage is above a calibrated value.

SET CONDITION

Loss of communication or implausible data from BCM.

POSSIBLE CAUSES

Possible Causes
BODY CONTROL MODULE (BCM) DTCS

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURES.

DIAGNOSTIC TEST

1. **CHECK IF DTC IS CURRENT**
    1. With the scan tool, read ESL DTCs.
    2. Record the Environmental Data and any DTCs.
    3. With the scan tool, erase DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. With the scan tool, read ESL DTCs.

    Did the DTC reset?

    Yes

    - Go to 2.

    No

    - Go to 3.
2. **CHECK BCM DTCS**
    1. With the scan tool, read BCM DTCs.

    Are BCM DTCs present?

Yes

- Repair BCM DTCs. Refer to the **BODY CONTROL MODULE (BCM) - DIAGNOSTIC CODE INDEX** article .
- Perform the Electronic Steering Lock (ESL) Verification Test. Refer to **STANDARD PROCEDURES**.

No

- Using the schematics as a guide, check the Electronic Steering Lock (ESL) terminals and connectors for corrosion, damage or pushed out terminals. Pay particular attention to the power and ground circuits. If no problems are found, replace the ESL Module in accordance with the Service Information.
- Perform the Electronic Steering Lock (ESL) Verification Test. Refer to **STANDARD PROCEDURES**.

3. **CHECK WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. Check for any Service Bulletins that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the Electronic Steering Lock (ESL) Verification Test. Refer to **STANDARD PROCEDURES**.

   No

   - Test complete.

U1517-62-BODY CONTROLLER SECRET CODE - SIGNAL COMPARE FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 15: Electronic Steering Lock Module Circuit Diagram

   4. Check for any Service Bulletins that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the Electronic Steering Lock (ESL) Verification Test. Refer to **STANDARD PROCEDURES**.

   No

   - Test complete.

U1517-87-BODY CONTROLLER SECRET CODE-MISSING MESSAGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 16: Electronic Steering Lock Module Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Electronic Steering Lock (ESL) Module prevents the Steering Wheel from turning once the Ignition Switch is turned OFF or if the Immobilizer System does not receive the correct security code. A Lock/Unlock Motor inside the ESL Module incorporates a locking mechanism that locks or unlocks the steering wheel. The ESL Module communicates with several Electronic Control Units (ECUs) via Controller Area Network (CAN). The Antilock Brake System (ABS) Module provides a vehicle speed signal to the ESL Module by way of a dedicated circuit and a CAN message. The Vehicle Speed signal is used by the ESL Module to determine if it is

safe to lock the steering wheel. The Body Control Module (BCM) transmits the Lock/Unlock commands via CAN message to the ESL Module.

WHEN MONITORED

Ignition switch is ON.

System voltage is above a calibrated value.

SET CONDITION

Loss of communication or implausible data from BCM.

POSSIBLE CAUSES

Possible Causes
BODY CONTROL MODULE (BCM) DTCS

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURES.

DIAGNOSTIC TEST

1. **CHECK IF DTC IS CURRENT**
    1. With the scan tool, read ESL DTCs.
    2. Record the Environmental Data and any DTCs.
    3. With the scan tool, erase DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. With the scan tool, read ESL DTCs.

    Did the DTC reset?

    Yes

    - Go to 2.

    No

    - Go to 3.
2. **CHECK BCM DTCS**
    1. With the scan tool, read BCM DTCs.

    Are BCM DTCs present?

Yes

- Repair BCM DTCs. Refer to the **BODY CONTROL MODULE (BCM) - DIAGNOSTIC CODE INDEX** article .
- Perform the Electronic Steering Lock (ESL) Verification Test. Refer to **STANDARD PROCEDURES**.

No

- Using the schematics as a guide, check the Electronic Steering Lock (ESL) terminals and connectors for corrosion, damage or pushed out terminals. Pay particular attention to the power and ground circuits. If no problems are found, replace the ESL Module in accordance with the Service Information.
- Perform the Electronic Steering Lock (ESL) Verification Test. Refer to **STANDARD PROCEDURES**.

3. **CHECK WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.
   3. Wiggle the wires while checking for shorted and open circuits.
   4. Check for any Service Bulletins that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the Electronic Steering Lock (ESL) Verification Test. Refer to **STANDARD PROCEDURES**.

   No

   - Test complete.

STANDARD PROCEDURES

ELECTRONIC STEERING LOCK (ESL) PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

DIAGNOSTIC TEST

NOTE: Perform the following pre-diagnostic troubleshooting procedures prior to performing any diagnostic test.

NOTE: Always perform diagnostics with a fully charged battery to avoid false symptoms.

1. Using the wiring diagram/schematic as a guide, inspect the wiring and harness connector terminals related to the ESL Module for physical damage and corrosion. Make sure related ground circuits are clean and tight. Clean or repair as necessary.
2. Inspect the vehicle for any aftermarket accessories that may have been installed incorrectly.
3. With a Scan Tool, read PCM, BCM, ABS, and RFHM DTCs. Repair all Communication and Security DTCs prior to performing ESL Module diagnostic procedures.
4. With the scan tool, read and record all ESL Module DTCs. Record the ESL Module software version and variant ID (configuration or level).
5. If the ESL Module was recently replaced, make sure the ESL Module was properly programmed.
6. Check for Service Information Tune-ups or Technical Service Bulletins (TSB) that may apply.

   Were there any repairs made that fixed the vehicle?

   Yes

   - Testing complete.
   - Perform the Electronic Steering Lock (ESL) Verification Test. Refer to **STANDARD PROCEDURES**.

   No

   - Perform the appropriate diagnostic procedure.

ELECTRONIC STEERING LOCK (ESL) VERIFICATION TEST

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

ELECTRONIC STEERING LOCK (ESL) VERIFICATION TEST

1. **FIRST**
   1. Connect any disconnected harness connectors.
   2. Replace any blown fuses.
   3. With the Scan Tool, erase DTCs.
   4. Cycle the Ignition Switch from ON to OFF.
   5. Start the Engine.

      Did the Engine start?

      Yes

- Go to 2

No

- With the Scan Tool, read DTCs and refer to the appropriate Diagnostic Procedure.

2. **SECOND**
   1. Attempt to turn the steering wheel.

      Did the steering wheel turn?

      Yes

      Go to 3.

      No

      - With the Scan Tool, read DTCs and refer to the appropriate Diagnostic Procedure. If no DTCs are present, check for mechanical binding in the steering column and steering linkage. Refer to the appropriate Service Procedure.
3. **THIRD**
   1. Turn the Ignition Switch OFF.
   2. Attempt to turn the steering wheel.

      Did the steering wheel turn?

      Yes

      - With the Scan Tool, read DTCs and refer to the appropriate Diagnostic Procedure. If no DTCs are present, inspect ESL Module locking pin for proper movement. Refer to the appropriate Service Procedure.

      No

      - Testing is complete.

ELECTRONIC STEERING LOCK (ESL) PROGRAMMING PROCEDURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

NOTE: When replacing an ESL Module, the ESL Module must be programmed.

NOTE: Failure to properly program the ESL Module may result in the illumination of the Malfunction Indicator Lamp (MIL) and setting DTC(s).

NOTE: While performing the ESL Module programming procedure, the vehicle battery must be maintained between 10 and 16 volts. Ambient temperature must be between 0° C (32° F) 60° C (140° F). Vehicle must be in Park with brake pedal depressed.

1. Turn the Ignition ON, Engine not running.
2. With the scan tool, verify the ESL Module is communicating on the CAN BUS and it is not programmed.

   NOTE: If the Scan Tool indicates that the ESL Module is already programmed, replace the ESL Module.

   NOTE: If the Scan Tool can not communicate with the ESL Module, check the harness connections. If the harness connections are good, replace the ESL Module.

3. Following the menu on the scan tool, program the ESL Module.
4. With the scan tool, erase DTCs.
5. With the scan tool, read ESL Module DTCs.

   Does the scan tool display any DTCs?

   Yes

   - Perform the appropriate diagnostic procedure(s).

   No

   - Test Complete
   - Perform the Electronic Steering Lock (ESL) Verification Test. Refer to **STANDARD PROCEDURES**.

External Audio/Video Module - Electrical Diagnostics - Cherokee

DIAGNOSTIC CODE INDEX

DIAGNOSTIC CODE INDEX

DTC	Description
B1421-00	AUDIO CD READ ERROR/INOPERABLE DISC
B157D-2A	CD/DVD EJECT BUTTON - STUCK
B210D-00	BATTERY VOLTAGE LOW
B210E-00	BATTERY VOLTAGE HIGH
B2220-4B	CD CHANGER INTERNAL - OVER TEMPERATURE
U0010-00	CAN INTERIOR BUS
U0011-00	CAN INTERIOR BUS OFF PERFORMANCE
U0019-00	CAN B BUS
U0020-00	CAN B BUS OFF PERFORMANCE
U0140-00	LOST COMMUNICATION WITH BODY CONTROL MODULE
U0184-00	LOST COMMUNICATION WITH RADIO
U0422-00	IMPLAUSIBLE DATA RECEIVED FROM BODY CONTROL MODULE
U0485-00	IMPLAUSIBLE DATA RECEIVED FROM RADIO

DIAGNOSIS AND TESTING

B1421-00-AUDIO CD READ ERROR/INOPERABLE DISC

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously with the ignition on and the radio CD player turned on.

SET CONDITION

The code will set if a CD that is cracked, defective or not formatted as a music CD is installed in the External Disc Module.

POSSIBLE CAUSES

Possible Causes
CD READ FAILURE EXTERNAL DISC MODULE (EDM)

DIAGNOSTIC TEST

EXTERNAL DISC MODULE

1. With the scan tool, erase the DTCs.
2. Replace the problem CD with a good, clean, unscratched, music CD.
3. Turn the radio CD player on.
4. With the scan tool, read the active DTCs.

   Does the Scan Tool display: B1421-00- AUDIO CD READ ERROR/INOPERABLE DISC?

   Yes

   - Eject the inoperative CD and replace the External Disc Module (EDM) in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Test Complete.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B157D-2A-CD/DVD EJECT BUTTON - STUCK

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on. External Disc Module (EDM) active.

SET CONDITION

The External Disc Module (EDM) detects a closed switch for 60 seconds.

POSSIBLE CAUSES

Possible Causes
EXTERNAL DISC MODULE (EDM)

DIAGNOSTIC TEST

VERIFY OPERATION OF THE BUTTON

1. With the scan tool, erase DTCs.
2. Press and release the button three times.
3. Wait 60 seconds.

4. With the scan tool, read DTCs.

   Is DTC: B157D-2A- CD/DVD EJECT BUTTON-STUCK active?

   Yes

   - Replace the External Disc Module (EDM) in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Test complete.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B210D-00-BATTERY VOLTAGE LOW

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 1: CD Changer Audio Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

At all times.

SET CONDITION

Anytime the module senses voltage input below 9.0 volts, this code will set.

POSSIBLE CAUSES

Possible Causes
LOW VOLTAGE ENGINE DTC
FUSED B(+) CIRCUIT HAS HIGH RESISTANCE
GROUND CIRCUIT HAS HIGH RESISTANCE
EXTERNAL DISC MODULE (EDM)

DIAGNOSTIC TEST

1. **CHECK ENGINE DTCs**
    1. With the scan tool, read active Powertrain Control Module (PCM) DTCs.

       Are there any Charging or Starting DTCs present?

       No

       - Refer to the **DTC INDEX** article and perform the appropriate diagnostic procedure.

       Yes

       - Go To 2
2. **TEST FOR INTERMITTENT CONDITION**
    1. With the scan tool, record and erase the DTCs.
    2. Start the engine and run for two minutes.
    3. With the scan tool, read the active DTCs.

       Does the scan tool display; B210D-00-BATTERY VOLTAGE LOW?

       Yes

       - Go To 3

       No

       - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
       - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
3. **(A933) FUSED B(+) OR (Z912) GROUND CIRCUITS RESISTED**
    1. Disconnect the External Disk Module harness connector.
    2. Connect a 12-volt test light between the (A933) Fused B(+) circuit and the (Z912) Ground circuit in the door module connector. The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly?

Yes

- Replace the External Disc Module in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Test the Fused B(+) and the Ground circuit to determine which one has the high resistance. Repair the circuit for high resistance.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B210E-00-BATTERY VOLTAGE HIGH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 2: CD Changer Audio Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

At all times.

SET CONDITION

Anytime the module senses voltage input above 15.9 volts, this code will set.

POSSIBLE CAUSES

Possible Causes
HIGH VOLTAGE ENGINE DTC EXTERNAL DISC MODULE (EDM)

DIAGNOSTIC TEST

1. **CHECK ENGINE DTCs**
    1. With the scan tool, read Powertrain Control Module (PCM) DTCs.

       Are there any Charging or Starting DTCs present?

       Yes

       - Refer to the **DTC INDEX** article and perform the appropriate diagnostic procedure.

       No

       - Go To 2
2. **TEST FOR INTERMITTENT CONDITION**
    1. With the scan tool, record and erase the DTCs.
    2. Start the engine and run for two minutes.
    3. With the scan tool, read the active DTCs.

       Does the scan tool display; B210E-00-BATTERY VOLTAGE HIGH?

       Yes

       - Replace the External Disc Module (EDM) in accordance with the Service Information.
       - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

       No

       - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals and correct pin tension.
       - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B2220-4B-CD CHANGER INTERNAL - OVER TEMPERATURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously with the ignition on and the Radio and External Disc Module turned on.

SET CONDITION

The code will set if the External Disc Module temperature rises above 60°C (140°F). The player may also shut down.

POSSIBLE CAUSES

Possible Causes
VEHICLE INTERIOR TEMPERATURE EXTERNAL DISC MODULE

DIAGNOSTIC TEST

RADIO

1. Move the vehicle to a shaded area and allow it to cool down.
2. Turn the ignition on when the vehicle interior is no warmer than the ambient temperature.
3. With the scan tool, erase the DTCs.
4. Turn the Radio and External Disc Module on and wait 90 seconds.
5. With the scan tool, read the active DTCs.

   Does the Scan Tool display: B2220-4B-CD CHANGER INTERNAL-OVER TEMPERATURE?

   Yes

   - Replace the CD Player in accordance with the Service Information.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Test Complete.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U0010-00-CAN INTERIOR BUS

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The primary communication network between electronic control modules is the Controller Area Network (CAN) data bus system. The Controller Area Network (CAN) data bus allows all electronic modules connected to the bus to share information with each other. Regardless of whether a message originates from a module on the higher speed CAN C (500K) Bus or on the lower speed bus, CAN Interior High Speed (IHS) (125K) Bus,

the message structure and layout is similar, which allows the Body Control Module/Central Gateway (BCM or BCMCGW) to process and transfer messages between the CAN buses. The BCM stores Diagnostic Trouble Codes (DTCs) for certain bus network faults on the CAN C (500K) Bus and CAN IHS (125K) Bus.

All modules transmit and receive messages over one of these buses. Data exchange between the modules is achieved by serial transmission of encoded data messages (a form of transmission in which data bits are sent sequentially, one at a time, over a single line). Each module can both send and receive serial data simultaneously. Each data bit of a CAN Bus message is carried over the bus as a voltage differential between the two bus circuits which, when strung together, form a message. Each module uses arbitration to sort the message priority if two competing messages are attempting to be broadcast at the same time. Corruption of a single bit within a message will corrupt the entire message. Each message contains a Cyclic Redundancy Check (CRC) which specifies the message size exactly. If the message detected conflicts with the CRC the ECU receiving it will determine the message to be an error and consider that communication has not been possible. Diagnosis of this condition using a lab scope may reveal activity that appears to be Bus data messages even if no actual communication is possible. Communication problems that affect the whole bus, as a result of opens and terminal push outs are more likely to occur on data busses that operate at a high speed than a data bus that operates at a lower speed.

When an open circuit or terminal push out occurs one or more modules can become isolated from the remainder of the bus. The isolated module will attempt to communicate, but will not be able to receive messages or determine arbitration from other modules. Each time the isolated module attempts to communicate it alters the bus voltage on the intact bus circuit. Without functioning arbitration the isolated module alters the bus voltage while other bus messages are being sent thereby corrupting the messages on the remainder of the bus.

The CAN bus modules are connected in parallel to the two-wire bus using a twisted pair, where the wires are wrapped around each other to provide shielding from unwanted electromagnetic induction, thus preventing interference with the relatively low voltage signals being carried through them. While the CAN bus is operating (active), one of the bus wires will carry a higher voltage and is referred to as the CAN High or CAN bus (+) wire, while the other bus wire will carry a lower voltage and is referred to as the CAN Low or CAN bus (-) wire.

For additional information on the communication network. Refer to **COMMUNICATION, DESCRIPTION** .

WHEN MONITORED

With the ignition on.

SET CONDITION

The Body Control Module (BCM) detects a short condition in one of the CAN IHS Bus (125K) circuits for less than one second.

POSSIBLE CAUSES

Possible Causes
(D157) CAN IHS BUS (125K) (+) CIRCUIT SHORTED TO GROUND
(D158) CAN IHS BUS (125K) (-) CIRCUIT SHORTED TO VOLTAGE

(D157) CAN IHS BUS (125K) (+) CIRCUIT SHORTED TO THE (D158) CAN IHS BUS (125K) (-) CIRCUIT
ANY CAN IHS BUS MODULE
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**
   1. Turn the ignition on.
   2. With the scan tool, record and erase DTCs.
   3. Cycle the ignition from on to off three times.
   4. Turn the ignition on and wait 10 seconds.
   5. With the scan tool, read active DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Go To 2

   No

   - Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **CHECK THE CAN IHS BUS CIRCUITS FOR A CONCERN WHILE DISCONNECTING THE CAN IHS BUS MODULES**

   NOTE: When performing this step, turn the ignition off (wait one minute) before disconnecting any module. When the module is disconnected turn the ignition on.

   NOTE: The BCM contains pass-through circuits which are used to connect the Front and Rear CAN IHS Star Connectors.

   1. While monitoring the scan tool, disconnect each CAN IHS Bus (125K) module at the CAN IHS Star Connectors (except for the BCM and DLC), one at a time.
   2. Check for this DTC to become stored after disconnecting each CAN IHS Bus (125K) module the vehicle is equipped with.

   NOTE: If the DTC becomes stored when a particular module is disconnected, that module or related circuits are causing the DTC to set.

With all the CAN IHS Bus modules disconnected at the Star Connectors (except for BCM and DLC), does the scan tool display this DTC as active?

Yes

- Go To 3

No

- Diagnose the wiring and connectors between the CAN IHS Star Connector and the module that when disconnected caused this DTC to become stored for damage or shorted circuits. If OK, replace the module that when disconnected caused this DTC to become stored in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (D158) CAN IHS BUS (125K) (-) CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 3: Checking CAN IHS BUS (125K) (-) Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the scan tool.
3. Turn the ignition on.
4. Measure the voltage between ground and the (D158) CAN IHS Bus (125K) (-) circuit.

   Is the voltage above 10.0 volts?

   Yes

   - Repair the short to voltage in the (D158) CAN IHS Bus (125K) (-) circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 4

4. **CHECK THE (D157) CAN IHS BUS (125K) (+) CIRCUIT FOR A SHORT TO GROUND**

Fig. 4: Checking CAN IHS BUS (125K) (+) Circuit For A Short To Ground

Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between ground and the (D157) CAN IHS Bus (125K) (+) circuit.

   Is the resistance above 10k Ohms?

   Yes

   - Go To 5

   No

   - Repair the short to ground in the (D157) CAN IHS Bus (125K) (+) circuit.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **CHECK FOR CORRECT BUS TERMINATION RESISTANCE**

Fig. 5: Checking For Correct BUS Termination Resistance
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect and isolate the negative battery cable.
3. Measure the resistance between the (D157) CAN IHS Bus (125K) (+) circuit and the (D158) CAN IHS Bus (125K) (-) circuit.

   Is the resistance between 53.5 and 67 Ohms?

   Yes

   - Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - For a resistance measurement above 67 Ohms, an open or high resistance is present in the CAN IHS Bus (125K) (+) circuit or the CAN IHS Bus (125K) (-) circuit between the Star Connectors or one of the termination resistors internal to the Star Connector is damaged. Diagnose and repair as necessary.
   - For a resistance measurement below 53.5 Ohms, a short between the CAN IHS Bus (125K) (+) circuit and the CAN IHS Bus (125K) (-) is present. Diagnose the short between the CAN IHS Bus (125K) (+) circuit and the CAN IHS Bus (125K) (-) circuit. Use the Star Connectors to isolate portions of the bus to assist in determining the location of the concern. Diagnose and repair as necessary.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U0011-00-CAN INTERIOR BUS OFF PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The primary communication network between electronic control modules is the Controller Area Network (CAN) data bus system. The Controller Area Network (CAN) data bus allows all electronic modules connected to the bus to share information with each other. Regardless of whether a message originates from a module on the higher speed CAN C (500K) Bus or on the lower speed bus, CAN Interior High Speed (IHS) (125K) Bus, the message structure and layout is similar, which allows the Body Control Module/Central Gateway (BCM or BCMCGW) to process and transfer messages between the CAN buses. The BCM stores Diagnostic Trouble Codes (DTCs) for certain bus network faults on the CAN C (500K) Bus and CAN IHS (125K) Bus.

All modules transmit and receive messages over one of these buses. Data exchange between the modules is achieved by serial transmission of encoded data messages (a form of transmission in which data bits are sent sequentially, one at a time, over a single line). Each module can both send and receive serial data simultaneously. Each data bit of a CAN Bus message is carried over the bus as a voltage differential between the two bus circuits which, when strung together, form a message. Each module uses arbitration to sort the

message priority if two competing messages are attempting to be broadcast at the same time. Corruption of a single bit within a message will corrupt the entire message. Each message contains a Cyclic Redundancy Check (CRC) which specifies the message size exactly. If the message detected conflicts with the CRC the ECU receiving it will determine the message to be an error and consider that communication has not been possible. Diagnosis of this condition using a lab scope may reveal activity that appears to be Bus data messages even if no actual communication is possible. Communication problems that affect the whole bus, as a result of opens and terminal push outs are more likely to occur on data busses that operate at a high speed than a data bus that operates at a lower speed.

When an open circuit or terminal push out occurs one or more modules can become isolated from the remainder of the bus. The isolated module will attempt to communicate, but will not be able to receive messages or determine arbitration from other modules. Each time the isolated module attempts to communicate it alters the bus voltage on the intact bus circuit. Without functioning arbitration the isolated module alters the bus voltage while other bus messages are being sent thereby corrupting the messages on the remainder of the bus.

The CAN bus modules are connected in parallel to the two-wire bus using a twisted pair, where the wires are wrapped around each other to provide shielding from unwanted electromagnetic induction, thus preventing interference with the relatively low voltage signals being carried through them. While the CAN bus is operating (active), one of the bus wires will carry a higher voltage and is referred to as the CAN High or CAN bus (+) wire, while the other bus wire will carry a lower voltage and is referred to as the CAN Low or CAN bus (-) wire.

For additional information on the communication network. Refer to **COMMUNICATION, DESCRIPTION** .

WHEN MONITORED

With the ignition on.

SET CONDITION

The Body Control Module (BCM) detects a short condition in one of the CAN IHS Bus (125K) circuits for less than one second.

POSSIBLE CAUSES

Possible Causes
(D157) CAN IHS BUS (125K) (+) CIRCUIT SHORTED TO GROUND
(D158) CAN IHS BUS (125K) (-) CIRCUIT SHORTED TO VOLTAGE
(D157) CAN IHS BUS (125K) (+) CIRCUIT SHORTED TO THE (D158) CAN IHS BUS (125K) (-) CIRCUIT
ANY CAN IHS BUS MODULE
BODY CONTROL MODULE (BCM)

DIAGNOSTIC TEST

1. **TEST FOR INTERMITTENT CONDITION**

1. Turn the ignition on.
2. With the scan tool, record and erase DTCs.
3. Cycle the ignition from on to off three times.
4. Turn the ignition on and wait 10 seconds.
5. With the scan tool, read active DTCs.

Does the scan tool display this DTC as active?

Yes

- Go To 2

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK THE CAN IHS BUS CIRCUITS FOR A CONCERN WHILE DISCONNECTING THE CAN IHS BUS MODULES**

NOTE: When performing this step, turn the ignition off (wait one minute) before disconnecting any module. When the module is disconnected turn the ignition on.

NOTE: The BCM contains pass-through circuits which are used to connect the Front and Rear CAN IHS Star Connectors.

1. While monitoring the scan tool, disconnect each CAN IHS Bus (125K) module at the CAN IHS Star Connectors (except for the BCM and DLC), one at a time.
2. Check for this DTC to become stored after disconnecting each CAN IHS Bus (125K) module the vehicle is equipped with.

NOTE: If the DTC becomes stored when a particular module is disconnected, that module or related circuits are causing the DTC to set.

With all the CAN IHS Bus modules disconnected at the Star Connectors (except for BCM and DLC), does the scan tool display this DTC as active?

Yes

- Go To 3

No

- Diagnose the wiring and connectors between the CAN IHS Star Connector and the module that when disconnected caused this DTC to become stored for damage or shorted circuits. If OK, replace the module that when disconnected caused this DTC to become stored in accordance with the Service Information.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (D158) CAN IHS BUS (125K) (-) CIRCUIT FOR A SHORT TO VOLTAGE**

Fig. 6: Checking CAN IHS BUS (125K) (-) Circuit For A Short To Voltage
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect the scan tool.
3. Turn the ignition on.
4. Measure the voltage between ground and the (D158) CAN IHS Bus (125K) (-) circuit.

Is the voltage above 10.0 volts?

Yes

- Repair the short to voltage in the (D158) CAN IHS Bus (125K) (-) circuit.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 4

4. **CHECK THE (D157) CAN IHS BUS (125K) (+) CIRCUIT FOR A SHORT TO GROUND**

Fig. 7: Checking CAN IHS BUS (125K) (+) Circuit For A Short To Ground
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Measure the resistance between ground and the (D157) CAN IHS Bus (125K) (+) circuit.

   Is the resistance above 10k Ohms?

Yes

- Go To 5

No

- Repair the short to ground in the (D157) CAN IHS Bus (125K) (+) circuit.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **CHECK FOR CORRECT BUS TERMINATION RESISTANCE**

Fig. 8: Checking For Correct BUS Termination Resistance
Courtesy of CHRYSLER GROUP, LLC

1. Turn the ignition off.
2. Disconnect and isolate the negative battery cable.
3. Measure the resistance between the (D157) CAN IHS Bus (125K) (+) circuit and the (D158) CAN IHS Bus (125K) (-) circuit.

   Is the resistance between 53.5 and 67 Ohms?

Yes

- Replace the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- For a resistance measurement above 67 Ohms, an open or high resistance is present in the CAN IHS Bus (125K) (+) circuit or the CAN IHS Bus (125K) (-) circuit between the Star Connectors or one of the termination resistors internal to the Star Connector is damaged. Diagnose and repair as necessary.
- For a resistance measurement below 53.5 Ohms, a short between the CAN IHS Bus (125K) (+) circuit and the CAN IHS Bus (125K) (-) is present. Diagnose the short between the CAN IHS Bus (125K) (+) circuit and the CAN IHS Bus (125K) (-) circuit. Use the Star Connectors to isolate portions of the bus to assist in determining the location of the concern. Diagnose and repair as necessary.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U0019-00-CAN B BUS

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously when the ignition is on.

Battery voltage between 10 and 16 volts.

Body Control Module (BCM) is configured correctly.

SET CONDITION

The Body Control Module (BCM) detects a short condition in one of the CAN IHS Bus (125K) circuits for less than one second.

DIAGNOSTIC TEST

VERIFY DTC IS ACTIVE

NOTE: Make sure the battery is fully charged before proceeding.

1. Turn the ignition on.
2. With the scan tool, read the active DTCs.

Does the scan tool display: U0019-00-CAN B BUS active?

Yes

- **For this code, perform the U0010-00-CAN INTERIOR BUS diagnostic procedure in this service information.**

No

- Refer to **DIAGNOSIS AND TESTING** and perform the STORED LOST COMMUNICATION DTCs diagnostic procedure.

U0020-00-CAN B BUS OFF PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously when the ignition is on.

The battery voltage between 10.0 and 16.0 Volts.

Body Control Module (BCM) is configured correctly.

SET CONDITION

Bus messages not received from the Body Control Module (BCM) for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN IHS BUS (125K) CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
BODY CONTROL MODULE (BCM) POWER AND GROUND
BCM NOT CONFIGURED CORRECTLY
BODY CONTROL MODULE (BCM)
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

VERIFY DTC IS ACTIVE

NOTE: Make sure the battery is fully charged before proceeding.

1. Turn the ignition on.

2. With the scan tool, read the active DTCs.

   Does the scan tool display; U0020-00-CAN B BUS OFF PERFORMANCE as active?

   Yes

   - **For this code, perform the U0011-00-CAN INTERIOR BUS OFF PERFORMANCE diagnostic procedure in this service information.**

   No

   - Refer to **DIAGNOSIS AND TESTING** and perform the STORED LOST COMMUNICATION DTCs diagnostic procedure.

U0140-00-LOST COMMUNICATION WITH BODY CONTROL MODULE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously when the ignition is on.

The battery voltage between 10.0 and 16.0 Volts.

Body Control Module (BCM) is configured correctly.

SET CONDITION

Bus messages not received from the Body Control Module (BCM) for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
BODY CONTROL MODULE POWER AND GROUND
BCM NOT CONFIGURED CORRECTLY
BODY CONTROL MODULE (BCM)
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

VERIFY DTC IS ACTIVE

1. Turn the ignition on.

2. With the scan tool, read the active DTCs.

   Does the scan tool display; U0140-00-LOST COMMUNICATION WITH BODY CONTROL MODULE as active?

   Yes

   - Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM BCM (BODY CONTROL MODULE) diagnostic procedure.

   No

   - Refer to **DIAGNOSIS AND TESTING** and perform the STORED LOST COMMUNICATION DTCs diagnostic procedure.

U0184-00-LOST COMMUNICATION WITH RADIO

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously when the ignition is on.

The battery voltage is between 10 and 16 volts.

Body Control Module (BCM) is configured correctly.

SET CONDITION

Bus messages not received from the Radio for approximately two to five seconds.

POSSIBLE CAUSES

Possible Causes
CAN BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
RADIO POWER AND GROUND
BCM NOT CONFIGURED CORRECTLY
RADIO
MODULE THAT SET THIS DTC

DIAGNOSTIC TEST

VERIFY THE DIAGNOSTIC TROUBLE CODE (DTC) IS ACTIVE

NOTE: Make sure the battery is fully charged before proceeding.

1. Turn the ignition on.
2. With the scan tool, read the active DTCs.

   Is this DTC active?

   Yes

   - Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM RADIO diagnostic procedure.

   No

   - Refer to **DIAGNOSIS AND TESTING** and perform the STORED LOST COMMUNICATION DTCs diagnostic procedure.

U0422-00-IMPLAUSABLE DATA RECEIVED FROM BODY CONTROL MODULE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

At all times with Ignition in Run/Start.

SET CONDITION

Incorrect data received from the Body Control Module (BCM).

POSSIBLE CAUSES

Possible Causes
NO COMMUNICATION WITH THE BODY CONTROL MODULE (BCM)
DTCS STORED OR ACTIVE IN THE BCM
RADIO (RRM)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**
   1. Turn the ignition on.
   2. With the scan tool, read the active DTCs.

      Does the scan tool display this DTC as active?

      Yes

- Go To 2

No

- The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **VERIFY THE BCM IS ACTIVE ON THE CAN BUS**
   1. With the scan tool, select ECU View.
   2. Verify that the BCM is active on the bus.

   Is the BCM active on the bus?

   Yes

   - Replace the Radio (RRM) in accordance with the Service Information. Refer to **RADIO, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM BCM diagnostic procedure.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U0485-00-IMPLAUSIBLE DATA RECEIVED FROM RADIO

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

With the ignition on.

SET CONDITION

Incorrect data received from the Radio.

POSSIBLE CAUSES

Possible Causes
NO COMMUNICATION WITH THE RADIO DTCS STORED OR ACTIVE IN THE RADIO

RADIO
MODULE THAT SET THE DTC

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DIAGNOSTIC TROUBLE CODE (DTC)**

   NOTE: Diagnose and repair any Radio DTCs before proceeding with this diagnostic procedure.

   1. Turn the ignition on.
   2. With the scan tool, read active DTCs.

      Does the scan tool display this DTC as active?

      Yes

      - Go To 2

      No

      - The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chafed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **VERIFY THE RADIO IS ACTIVE ON THE CAN BUS**
   1. With the scan tool, verify that the Radio is active on the bus.

      Is the Radio active on the bus?

      Yes

      - Replace/update the module that set this DTC in accordance with the Service Information.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Refer to **DIAGNOSIS AND TESTING** and perform the NO RESPONSE FROM RADIO diagnostic procedure.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2014 ACCESSORIES AND EQUIPMENT

Forward Facing Camera Module (FFCM) - Electrical Diagnostics - Cherokee

DIAGNOSTIC CODE INDEX

DIAGNOSTIC CODE INDEX

DTC	Description
C008E-00	ECU INTERNAL PERFORMANCE
C008F-00	CALIBRATION NOT LEARNED
C14A4-00	SENSOR ADJUSTMENT REQUIRED
C14A5-00	SENSOR BLINDED
C211B-16	IGNITION RUN/START INPUT - CIRCUIT VOLTAGE BELOW THRESHOLD
C211B-17	IGNITION RUN/START INPUT - CIRCUIT VOLTAGE ABOVE THRESHOLD
C2206-00	VEHICLE CONFIGURATION MISMATCH
C2210-00	ECU OVERTEMPERATURE
C2212-00	ECU IN PLANT MODE
U0002-00	CAN C BUS OFF PERFORMANCE
U0011-00	CAN INTERIOR BUS OFF PERFORMANCE
U0100-00	LOST COMMUNICATION WITH ECM/PCM
U0129-00	LOST COMMUNICATION WITH BRAKE SYSTEM CONTROL MODULE
U0131-00	LOST COMMUNICATION WITH ELECTRIC POWER STEERING CONTROL MODULE
U0140-00	LOST COMMUNICATION WITH BODY CONTROL MODULE
U0151-00	LOST COMMUNICATION WITH OCCUPANT RESTRAINT CONTROLLER (ORC)
U0212-00	LOST COMMUNICATION WITH SCM
U0401-00	IMPLAUSIBLE DATA RECEIVED FROM ECM/PCM
U0418-00	IMPLAUSIBLE DATA RECEIVED FROM BRAKE SYSTEM CONTROL MODULE
U0422-00	IMPLAUSIBLE DATA RECEIVED FROM BODY CONTROL MODULE
U0428-00	IMPLAUSIBLE DATA RECEIVED FROM STEERING ANGLE SENSOR MODULE
U0452-00	IMPLAUSIBLE DATA RECEIVED FROM RESTRAINTS CONTROL MODULE

DIAGNOSIS AND TESTING

C008E-00-ECU INTERNAL PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Ignition on.

SET CONDITION

The Forward Facing Camera Module (FFCM) runs a self diagnostic test to validate proper controller operation. This DTC will set if the controller has failed one or more internal test.

POSSIBLE CAUSES

Possible Causes
FORWARD FACING CAMERA MODULE (FFCM)

DIAGNOSTIC TEST

1. **CHECK IF THE DTC IS ACTIVE**
   1. Turn the ignition on.
   2. Using the scan tool, read Forward Facing Camera Module (FFCM) DTCs.

      Does the scan tool display this DTC as active?

      Yes

      - Replace and program the Forward Facing Camera Module (FFCM) in accordance with the Service Information. Refer to **MODULE, FORWARD FACING CAMERA, REMOVAL** .
      - Perform the FORWARD FACING CAMERA VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Go To 2
2. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this module. Wiggle the wiring and connectors while checking for shorted and open circuits.
   3. Check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Check Service Bulletins for any possible causes that may apply.

      Were there any problems found?

      Yes

      - Repair as necessary.
      - Perform the FORWARD FACING CAMERA VERIFICATION TEST. Refer to

STANDARD PROCEDURE.

No

- Test complete.

C008F-00-CALIBRATION NOT LEARNED

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Ignition on.

SET CONDITION

The Forward Facing Camera Module (FFCM) detects that the camera system has not been calibrated.

POSSIBLE CAUSES

Possible Causes
FORWARD FACING CAMERA NOT CALIBRATED FORWARD FACING CAMERA MODULE (FFCM)

DIAGNOSTIC TEST

PERFORM THE FORWARD FACING CAMERA - CALIBRATION PROCEDURE

1. With the scan tool, perform the Forward Facing Camera - Calibration Procedure. Refer to **MODULE, FORWARD FACING CAMERA, STANDARD PROCEDURE** .
2. Perform the FORWARD FACING CAMERA VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   Does this DTC reset after performing the Forward Facing Camera Verification Test?

   Yes

   - Check for any technical bulletins that may apply. If no other problems are found, replace and program the Forward Facing Camera Module (FFCM) in accordance with the Service Information. Refer to **MODULE, FORWARD FACING CAMERA, REMOVAL** .
   - Perform the FORWARD FACING CAMERA VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test Complete.

C14A4-00-SENSOR ADJUSTMENT REQUIRED

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Ignition on.

SET CONDITION

The Forward Facing Camera Module (FFCM) detects that the camera system has not been installed properly.

POSSIBLE CAUSES

Possible Causes
FORWARD FACING CAMERA NOT INSTALLED PROPERLY
FORWARD FACING CAMERA MODULE (FFCM)

DIAGNOSTIC TEST

CHECK IF THE FORWARD FACING CAMERA IS INSTALLED PROPERLY

1. Check if the Forward Facing Camera is installed properly. Refer to **MODULE, FORWARD FACING CAMERA, INSTALLATION** .
2. With the scan tool, perform the Forward Facing Camera - Calibration Procedure. Refer to **MODULE, FORWARD FACING CAMERA, STANDARD PROCEDURE** .
3. Perform the FORWARD FACING CAMERA VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   Does this DTC reset after performing the Forward Facing Camera Verification Test?

   Yes

   - Check for any technical bulletins that may apply. If no other problems are found, replace and program the Forward Facing Camera Module (FFCM) in accordance with the Service Information. Refer to **MODULE, FORWARD FACING CAMERA, REMOVAL** .
   - Perform the FORWARD FACING CAMERA VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test Complete

C14A5-00-SENSOR BLINDED

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Ignition on.

SET CONDITION

The Forward Facing Camera Module (FFCM) detects that the camera system view is blocked or obstructed.

POSSIBLE CAUSES

Possible Causes
FORWARD FACING CAMERA OBSTRUCTED FORWARD FACING CAMERA MODULE (FFCM)

DIAGNOSTIC TEST

1. **CHECK IF THE DTC IS ACTIVE**
   1. Using a scan tool, read Forward Facing Camera Module (FCCM) DTCs.

      Is this DTC active?

      Yes

      - Go To 2

      No

      - No repair is necessary. Make sure the lens area is free of dirt, damage, and other obstructions. Clear the DTC and verify proper operation of the FFC system.
      - Perform the FORWARD FACING CAMERA VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
2. **INSPECT FCCM MOUNTING AND LENS ALIGNMENT**

   NOTE: Make sure the FCCM lens is free from dirt and debris (mud, dirt, ice, road debris) that would compromise the function of the FFC system.

   1. Perform a thorough visual and physical inspect of the FCCM and the mounting bracket and location.
   2. Check for:
      - Debris on windshield obstructing lens
      - Damaged or out of alignment lens
      - Damage to the FCCM module

Were there any problems found?

Yes

- Repair as necessary in accordance with the Service Information.
- Perform the FORWARD FACING CAMERA VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Replace and program the Forward Facing Camera Module (FFCM) in accordance with the Service Information. Refer to **MODULE, FORWARD FACING CAMERA, REMOVAL** .
- Perform the FORWARD FACING CAMERA VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C211B-16-IGNITION RUN/START INPUT - CIRCUIT VOLTAGE BELOW THRESHOLD

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 1: Adaptive Cruise Control Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

Continuously with the ignition on.

SET CONDITION

If the voltage to the Forward Facing Camera Module (FFCM) is below 9.0 volts.

POSSIBLE CAUSES

Possible Causes
RELATED DTCS PRESENT IN PCM
LOW BATTERY VOLTAGE
FUSED IGNITION OPEN OR HIGH RESISTANCE
GROUND CIRCUIT OPEN OR HIGH RESISTANCE
FORWARD FACING CAMERA MODULE (FFCM)

DIAGNOSTIC TEST

1. **RELATED DTCS PRESENT IN PCM**
    1. Turn the ignition on.
    2. With the scan tool, read Powertrain Control Module (PCM) DTCs.

    Are there any charging system or battery related DTCs present?

    Yes

    - Refer to the **DTC INDEX** article and perform the appropriate diagnostic procedure.

    No

    - Go To 2
2. **CHECK IF THE DTC IS ACTIVE**
    1. With the scan tool, read Forward Facing Camera Module (FFCM) DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 3

    No

    - The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    - Perform the FORWARD FACING CAMERA VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

3. **CHECK THE (F925) FUSED IGNITION CIRCUIT FOR AN OPEN**
   1. Turn the ignition off.
   2. Disconnect the FFCM harness connector.
   3. Turn the ignition on.
   4. Using a 12-volt test light connected to ground, check the (F925) Fused Ignition circuit in the FFCM harness connector.

      NOTE: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

      Does the test light illuminate brightly?

      Yes

      - Go To 4

      No

      - Repair the (F925) Fused Ignition circuit for an open or high resistance.
      - Perform the FORWARD FACING CAMERA VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
4. **CHECK THE (Z915) GROUND CIRCUIT OPEN OR HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Using a 12-volt test light connected to 12-volts, check the ground and the (Z915) Ground circuit in the FFCM harness connector.

      Does the test light illuminate brightly?

      Yes

      - Replace and program the Forward Facing Camera Module (FFCM) in accordance with the Service Information. Refer to **MODULE, FORWARD FACING CAMERA, REMOVAL** .
      - Perform the FORWARD FACING CAMERA VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Repair the (Z915) Ground circuit for an open or high resistance.
      - Perform the FORWARD FACING CAMERA VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C211B-17-IGNITION RUN/START INPUT - CIRCUIT VOLTAGE ABOVE THRESHOLD

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Fig. 2: Adaptive Cruise Control Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

Continuously with the ignition on.

SET CONDITION

If the voltage to the Forward Facing Camera Module (FFCM) is above 16.0 volts.

POSSIBLE CAUSES

Possible Causes
RELATED DTC(S) PRESENT IN THE PCM
HIGH BATTERY VOLTAGE
FORWARD FACING CAMERA MODULE (FFCM)

DIAGNOSTIC TEST

1. **RELATED DTCS PRESENT IN THE PCM**
    1. Ignition on, engine running.
    2. With the scan tool, read Powertrain Control Module (PCM) DTCs.

    Are there any charging system or battery related DTCs present in the PCM?

    Yes

    - Refer to the **DTC INDEX** article and perform the appropriate diagnostic procedure.

    No

    - Go To 2
2. **CHECK IF THE DTC IS ACTIVE**
    1. Ignition on, engine running.
    2. With the scan tool, read DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Replace and program the Forward Facing Camera Module (FFCM) in accordance with the Service Information. Refer to **MODULE, FORWARD FACING CAMERA, REMOVAL** .
    - Perform the FORWARD FACING CAMERA VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Go To3

3. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this module. Wiggle the wiring and connectors while checking for shorted and open circuits.
   3. Check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Check Service Bulletins for any possible causes that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the FORWARD FACING CAMERA VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

C2206-00-VEHICLE CONFIGURATION MISMATCH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Ignition on.

SET CONDITION

If the Forward Facing Camera Module (FFCM) detects if the vehicle type is not identified or incorrectly identified over the Can Bus.

POSSIBLE CAUSES

Possible Causes
BODY CONTROL MODULE (BCM) NOT CONFIGURED FORWARD FACING CAMERA MODULE (FFCM)

DIAGNOSTIC TEST

1. **VERIFY IF THE DTC IS ACTIVE**

NOTE: Diagnose and repair any Powertrain Control Module (PCM) Vehicle

Identification Number (VIN) or Communication DTCs before continuing with this test.

1. Ignition on, engine not running.
2. With the scan tool, erase Forward Facing Camera Module (FFCM) DTCs.
3. Cycle the ignition switch from off to on.
4. With the scan tool, read FFCM DTCs.

Is this DTC active?

Yes

- Go To 2

No

- The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension and repair as necessary. If no problems are found, test complete.
- Perform the FORWARD FACING CAMERA VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

2. **CHECK THE BCM FOR PROPER CONFIGURATION**
   1. With the scan tool perform the Body Control Module (BCM) Restore Vehicle Configuration.
   2. With the scan tool, perform the Forward Facing Camera Module (FFCM) Calibration Procedure.
   3. With the scan tool, erase Forward Facing Camera Module (FFCM) DTCs.
   4. Cycle the ignition from off to on.
   5. With the scan tool, read FFCM DTCs.

   Does this DTC reset?

   Yes

   - Verify that the proper Vehicle Identification Number (VIN) is stored in the PCM and BCM. Check for any Service Bulletins that may apply. If no problems are found, replace and program the Forward Facing Camera Module (FFCM) in accordance with the Service Information. Refer to **MODULE, FORWARD FACING CAMERA, REMOVAL** .
   - Perform the FORWARD FACING CAMERA VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test Complete.

C2210-00-ECU OVERTEMPERATURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Ignition on.

SET CONDITION

If the Forward Facing Camera Module (FFCM) detects the internal module temperature is above 105° C (221° F).

POSSIBLE CAUSES

Possible Causes
FORWARD FACING CAMERA MODULE (FFCM) OVER TEMPERATURE FORWARD FACING CAMERA MODULE (FFCM)

DIAGNOSTIC TEST

1. **CHECK IF THE DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. With the scan tool, read Forward Facing Camera Module (FCCM) DTCs.

    Is this DTC active?

    Yes

    - Go To 2

    No

    - The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension and repair as necessary. If no problems are found, test complete.
    - Perform the FORWARD FACING CAMERA VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
2. **CHECK FOR RELATED CONDITIONS**
    1. With the scan tool, read Powertrain Control Module (PCM) ambient air temperature.

    Is the ambient air temperature above 105° C (221° F)

    Yes

- Move the vehicle to a cooler location and recheck.
- Perform the FORWARD FACING CAMERA VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Check for any Service Bulletins that may apply. If no problems are found, replace and program the Forward Facing Camera Module (FFCM) in accordance with the Service Information. Refer to **MODULE, FORWARD FACING CAMERA, REMOVAL** .
- Perform the FORWARD FACING CAMERA VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

C2212-00-ECU IN PLANT MODE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Ignition on.

SET CONDITION

The Forward Facing Camera Module (FFCM) detects that it is in the in-plant mode.

POSSIBLE CAUSES

Possible Causes
FORWARD FACING CAMERA MODULE (FFCM) CALIBRATION PROCEDURE NEEDS TO BE PERFORMED

DIAGNOSTIC TEST

PERFORM THE FORWARD FACING CAMERA CALIBRATION PROCEDURE

NOTE: This DTC must be active before proceeding.

1. With the scan tool, perform the Forward Facing Camera - Calibration Procedure. Refer to **MODULE, FORWARD FACING CAMERA, STANDARD PROCEDURE** .
2. Perform the FORWARD FACING CAMERA VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   Does this DTC reset after performing the verification test?

   Yes

- Check for any Service Bulletins that may apply. If no problems are found, replace and program the Forward Facing Camera Module (FFCM) in accordance with the Service Information. Refer to **MODULE, FORWARD FACING CAMERA, REMOVAL** .
- Perform the FORWARD FACING CAMERA VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test Complete.

U0002-00-CAN C BUS OFF PERFORMANCE

Perform the COMMUNICATION PRE-DIAGNOSTIC PROCEDURE. Refer to **STANDARD PROCEDURE** .

U0011-00-CAN INTERIOR BUS OFF PERFORMANCE

Perform the COMMUNICATION PRE-DIAGNOSTIC PROCEDURE. Refer to **STANDARD PROCEDURE** .

U0100-00-LOST COMMUNICATION WITH ECM/PCM

Perform the COMMUNICATION PRE-DIAGNOSTIC PROCEDURE. Refer to **STANDARD PROCEDURE** .

U0129-00-LOST COMMUNICATION WITH BRAKE SYSTEM CONTROL MODULE

Perform the COMMUNICATION PRE-DIAGNOSTIC PROCEDURE. Refer to **STANDARD PROCEDURE** .

U0131-00-LOST COMMUNICATION WITH ELECTRIC POWER STEERING CONTROL MODULE

Perform the COMMUNICATION PRE-DIAGNOSTIC PROCEDURE. Refer to **STANDARD PROCEDURE** .

U0140-00-LOST COMMUNICATION WITH BODY CONTROL MODULE

Perform the COMMUNICATION PRE-DIAGNOSTIC PROCEDURE. Refer to **STANDARD PROCEDURE** .

U0151-00-LOST COMMUNICATION WITH OCCUPANT RESTRAINT CONTROLLER (ORC)

Perform the COMMUNICATION PRE-DIAGNOSTIC PROCEDURE. Refer to **STANDARD PROCEDURE** .

U0212-00-LOST COMMUNICATION WITH SCM

Perform the COMMUNICATION PRE-DIAGNOSTIC PROCEDURE. Refer to **STANDARD PROCEDURE** .

U0401-00-IMPLAUSIBLE DATA RECEIVED FROM ECM/PCM

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously with the ignition on.

SET CONDITION

When the Forward Facing Camera Module (FFCM) receives an implausible (default/error value, toggle error or parity error) message from the Powertrain Control Module (PCM).

POSSIBLE CAUSES

Possible Causes
BODY CONTROL MODULE (BCM) DTCS PRESENT
POWERTRAIN CONTROL MODULE (PCM) DTCS PRESENT
POWERTRAIN CONTROL MODULE (PCM)
FORWARD FACING CAMERA MODULE (FFCM)

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, record and erase Forward Facing Camera Module (FFCM) DTCs.
    3. Cycle the ignition from off to on.
    4. With the scan tool, read FFCM DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Go To 5
2. **CHECK FOR BODY CONTROL MODULE (BCM) DTCS**
    1. With the scan tool, read BCM DTCs.

Are there any BCM CAN Bus DTCs present?

Yes

- Refer to the **BODY CONTROL MODULE (BCM) - DIAGNOSTIC CODE INDEX** article and perform the appropriate diagnostic procedure.

No

- Go To 3

3. **CHECK FOR POWERTRAIN CONTROL MODULE (PCM) DTCS**
   1. With the scan tool, read PCM DTCs.

   Are there any PCM DTCs present?

   Yes

   - Refer to the **DTC INDEX** article and perform the appropriate diagnostic procedure.

   No

   - Go To 4

4. **CHECK OTHER MODULES FOR DTCS**
   1. With the scan tool, read DTCs.

   Are there any other modules reporting implausible communication DTCs against the PCM?

   Yes

   - Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information. Refer to **MODULE, POWERTRAIN CONTROL, REMOVAL** .
   - Perform the FORWARD FACING CAMERA VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Using the schematics as a guide, check the FFCM pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Is no problems are found, replace and program the Forward Facing Camera Module (FFCM) in accordance with the Service Information. Refer to **MODULE, FORWARD FACING CAMERA, REMOVAL** .
   - Perform the FORWARD FACING CAMERA VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

5. **CHECK THE WIRING AND CONNECTORS**

1. The conditions necessary to set the DTC are not present at this time.
2. Using the schematics as a guide, inspect the wiring and connectors specific to this module. Wiggle the wiring and connectors while checking for shorted and open circuits.
3. Check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
4. Check Service Bulletins for any possible causes that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the FORWARD FACING CAMERA VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

U0418-00-IMPLAUSIBLE DATA RECEIVED FROM BRAKE SYSTEM CONTROL MODULE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously with the ignition on.

SET CONDITION

When the Forward Facing Camera Module (FFCM) receives an implausible (default/error value, toggle error or parity error) message from the Antilock Brake System (ABS) Module.

POSSIBLE CAUSES

Possible Causes
ANTILOCK BRAKE SYSTEM (ABS) MODULE DTCS PRESENT
BODY CONTROL MODULE (BCM) DTCS PRESENT
ANTILOCK BRAKE SYSTEM (ABS) MODULE
FORWARD FACING CAMERA MODULE (FFCM)

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
   1. Turn the ignition on.

2. With the scan tool, record and erase Forward Facing Camera Module (FFCM) DTCs.
3. Cycle the ignition from off to on.
4. With the scan tool, read FFCM DTCs.

   Does the scan tool display this DTC as active?

   Yes

   - Go To 2

   No

   - Go To 5

2. **CHECK FOR BODY CONTROL MODULE (BCM) DTCS**
   1. With the scan tool, read BCM DTCs.

      Are there any BCM CAN Bus DTCs present?

      Yes

      - Refer to the **BODY CONTROL MODULE (BCM) - DIAGNOSTIC CODE INDEX** article and perform the appropriate diagnostic procedure.

      No

      - Go To 3

3. **CHECK FOR ANTILOCK BRAKE SYSTEM (ABS) MODULE DTCS**
   1. With the scan tool, read ABS DTCs.

      Are there any ABS DTCs present?

      Yes

      - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

      No

      - Go To 4

4. **CHECK OTHER MODULES FOR DTCS**
   1. With the scan tool, read DTCs.

      Are there any other modules reporting implausible communication DTCs against the ABS?

      Yes

- Replace and program the Antilock Brake System (ABS) Module in accordance with the Service Information. Refer to **MODULE, ANTI-LOCK BRAKE SYSTEM, REMOVAL** .
- Perform the FORWARD FACING CAMERA VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Using the schematics as a guide, check the FFCM pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Is no problems are found, replace and program the Forward Facing Camera Module (FFCM) in accordance with the Service Information. Refer to **MODULE, FORWARD FACING CAMERA, REMOVAL** .
- Perform the FORWARD FACING CAMERA VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

5. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this module. Wiggle the wiring and connectors while checking for shorted and open circuits.
   3. Check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Check Service Bulletins for any possible causes that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the FORWARD FACING CAMERA VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

U0422-00-IMPLAUSIBLE DATA RECEIVED FROM BODY CONTROL MODULE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously with the ignition on.

SET CONDITION

When the Forward Facing Camera Module (FFCM) receives an implausible (default/error value, toggle error or parity error) message from the Body Control Module (BCM).

POSSIBLE CAUSES

Possible Causes
BODY CONTROL MODULE (BCM) DTCS PRESENT
BODY CONTROL MODULE (BCM)
FORWARD FACING CAMERA MODULE (FFCM)

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, record and erase Forward Facing Camera Module (FFCM) DTCs.
    3. Cycle the ignition from off to on.
    4. With the scan tool, read FFCM DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Go To 4
2. **CHECK FOR BODY CONTROL MODULE (BCM) DTCS**
    1. With the scan tool, read BCM DTCs.

    Are there any BCM CAN Bus DTCs present?

    Yes

    - Refer to the **BODY CONTROL MODULE (BCM) - DIAGNOSTIC CODE INDEX** article and perform the appropriate diagnostic procedure.

    No

    - Go To 3
3. **CHECK OTHER MODULES FOR DTCS**
    1. With the scan tool, read DTCs.

    Are there any other modules reporting implausible communication DTCs against the BCM?

Yes

- Replace and program the Body Control Module (BCM) in accordance with the Service Information. Refer to **MODULE, BODY CONTROL, REMOVAL** .
- Perform the FORWARD FACING CAMERA VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Using the schematics as a guide, check the FFCM pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Is no problems are found, replace and program the Forward Facing Camera Module (FFCM) in accordance with the Service Information. Refer to **MODULE, FORWARD FACING CAMERA, REMOVAL** .
- Perform the FORWARD FACING CAMERA VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

4. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this module. Wiggle the wiring and connectors while checking for shorted and open circuits.
   3. Check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Check Service Bulletins for any possible causes that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the FORWARD FACING CAMERA VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

U0428-00-IMPLAUSIBLE DATA RECEIVED FROM STEERING ANGLE SENSOR MODULE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously with the ignition on.

SET CONDITION

When the Forward Facing Camera Module (FFCM) receives an implausible (default/error value, toggle error or parity error) message from the Steering Angle Sensor (SAS). The SAS is part of the Steering Column Control Module (SCCM).

POSSIBLE CAUSES

Possible Causes
STEERING COLUMN CONTROL MODULE (SCCM) DTCS PRESENT
BODY CONTROL MODULE (BCM) DTCS PRESENT
STEERING COLUMN CONTROL MODULE (SCCM) MODULE
FORWARD FACING CAMERA MODULE (FFCM)

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, record and erase Forward Facing Camera Module (FFCM) DTCs.
    3. Cycle the ignition from off to on.
    4. With the scan tool, read FFCM DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

    - Go To 5
2. **CHECK FOR BODY CONTROL MODULE (BCM) DTCS**
    1. With the scan tool, read BCM DTCs.

    Are there any BCM CAN Bus DTCs present?

    Yes

    - Refer to the **BODY CONTROL MODULE (BCM) - DIAGNOSTIC CODE INDEX** article and perform the appropriate diagnostic procedure.

    No

    - Go To 3
3. **CHECK FOR STEERING ANGLE SENSOR/STEERING COLUMN CONTROL MODULE DTCS**

1. With the scan tool, read SCCM DTCs.

   Are there any SCCM DTCs present?

   Yes

   - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

   No

   - Go To 4

4. **CHECK OTHER MODULES FOR DTCS**
   1. With the scan tool, read DTCs.

      Are there any other modules reporting implausible communication DTCs against the SAS/SCCM?

      Yes

      - Replace and program the Steering Column Control Module (SCCM) in accordance with the Service Information. Refer to **MODULE, STEERING COLUMN, REMOVAL** .
      - Perform the FORWARD FACING CAMERA VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Using the schematics as a guide, check the FFCM pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Is no problems are found, replace and program the Forward Facing Camera Module (FFCM) in accordance with the Service Information. Refer to **MODULE, FORWARD FACING CAMERA, REMOVAL** .
      - Perform the FORWARD FACING CAMERA VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

5. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this module. Wiggle the wiring and connectors while checking for shorted and open circuits.
   3. Check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Check Service Bulletins for any possible causes that may apply.

      Were there any problems found?

      Yes

- Repair as necessary.
- Perform the FORWARD FACING CAMERA VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete.

U0452-00-IMPLAUSIBLE DATA RECEIVED FROM RESTRAINTS CONTROL MODULE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

Continuously with the ignition on.

SET CONDITION

When the Forward Facing Camera Module (FFCM) receives an implausible (default/error value, toggle error or parity error) message from the Occupant Restraint Controller (ORC).

POSSIBLE CAUSES

Possible Causes
OCCUPANT RESTRAINT CONTROLLER (ORC) DTCS PRESENT
BODY CONTROL MODULE (BCM) DTCS PRESENT
OCCUPANT RESTRAINT CONTROLLER (ORC)
FORWARD FACING CAMERA MODULE (FFCM)

DIAGNOSTIC TEST

1. **VERIFY THE DTC IS ACTIVE**
    1. Turn the ignition on.
    2. With the scan tool, record and erase Forward Facing Camera Module (FFCM) DTCs.
    3. Cycle the ignition from off to on.
    4. With the scan tool, read FFCM DTCs.

    Does the scan tool display this DTC as active?

    Yes

    - Go To 2

    No

- Go To 5

2. **CHECK FOR BODY CONTROL MODULE (BCM) DTCS**
   1. With the scan tool, read BCM DTCs.

      Are there any BCM CAN Bus DTCs present?

      Yes

      - Refer to the **BODY CONTROL MODULE (BCM) - DIAGNOSTIC CODE INDEX** article and perform the appropriate diagnostic procedure.

      No

      - Go To 3

3. **CHECK FOR OCCUPANT RESTRAINT CONTROLLER (ORC) DTCS**
   1. With the scan tool, read ORC DTCs.

      Are there any ORC DTCs present?

      Yes

      - Refer to the **OCCUPANT RESTRAINT CONTROLLER (ORC) - DIAGNOSTIC CODE INDEX** article and perform the appropriate diagnostic procedure.

      No

      - Go To 4

4. **CHECK OTHER MODULES FOR DTCS**
   1. With the scan tool, read DTCs.

      Are there any other modules reporting implausible communication DTCs against the ORC?

      Yes

      - Replace and program the Occupant Restraint Controller (ORC) in accordance with the Service Information.
      - Perform the FORWARD FACING CAMERA VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Using the schematics as a guide, check the FFCM pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. Is no problems are found, replace and program the Forward Facing Camera Module

(FFCM) in accordance with the Service Information. Refer to **MODULE, FORWARD FACING CAMERA, REMOVAL** .
- Perform the FORWARD FACING CAMERA VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

5. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the schematics as a guide, inspect the wiring and connectors specific to this module. Wiggle the wiring and connectors while checking for shorted and open circuits.
   3. Check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Check Service Bulletins for any possible causes that may apply.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the FORWARD FACING CAMERA VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

STANDARD PROCEDURE

FORWARD FACING CAMERA VERIFICATION TEST

DIAGNOSTIC TEST

FORWARD FACING CAMERA VERIFICATION TEST

1. Disconnect all jumper wires and reconnect all previously disconnected components and connectors.
2. With the scan tool, erase Forward Facing Camera (FFCM) DTCs.
3. Make sure that all accessories are turned off and that the battery is fully charged.
4. If the FFCM was replaced or moved in any way, with the scan tool, perform the Forward Facing Camera - Calibration Procedure. Refer to **MODULE, FORWARD FACING CAMERA, STANDARD PROCEDURE** .
5. With the scan tool, read FFCM DTCs.

   Are there any DTCs present in the FFCM?

   Yes

- Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

No

- Repair is complete.

BUMPERS

FASCIA, FRONT

REMOVAL

REMOVAL

Fig. 1: Upper Close Out Panel Cover Components
Courtesy of CHRYSLER GROUP, LLC

1. Open the hood.
2. Remove the push pin fasteners and remove the radiator closeout panel (1).

Fig. 2: Identifying Fender & Fascia Bracket Fasteners
Courtesy of CHRYSLER GROUP, LLC

3. Remove the fender (1) and fascia bracket fasteners (2).

Fig. 3: Identifying Fender To Fascia Fastener
Courtesy of CHRYSLER GROUP, LLC

4. Disconnect the negative battery cable.
5. Raise and support the vehicle.
6. Remove the engine belly pan. Refer to **BELLY PAN, REMOVAL**.
7. Remove the front wheel flare. Refer to **MOLDING, FRONT WHEEL OPENING, REMOVAL** .
8. Accessing from the wheelhouse, remove the fender to fascia fastener (1). Repeat for the opposite side.

Fig. 4: Identifying Upper Fascia Closeout Panel, Radiator Support & Fasteners
Courtesy of CHRYSLER GROUP, LLC

9. Remove the lower fasteners (4).
10. Remove the eight push pin fasteners (2) from the upper fascia closeout panel (1).
11. Remove the upper fascia closeout panel (1) from the vehicle.
12. Remove the two fascia to upper radiator support push pins (1) located above the headlamp. Repeat on the opposite side.
13. Remove the fascia to upper radiator fasteners (2, 3, 6).
14. Carefully pull out on the upper and lower fascia sides (4, 5) to disengage the fascia retaining tabs. Repeat on the opposite side.
15. Remove the fascia from the vehicle.
16. Accessing from under the vehicle, disconnect the active grille shutter wire harness.
17. If equipped, disconnect the fog lamps.

Fig. 5: Identifying Upper Fascia Closeout Panel, Upper & Lower Fascia Sides & Fasteners
Courtesy of CHRYSLER GROUP, LLC

INSTALLATION

INSTALLATION

Fig. 6: Identifying Upper Fascia Closeout Panel, Upper & Lower Fascia Sides & Fasteners
Courtesy of CHRYSLER GROUP, LLC

1. With the help of an assistant, position the fascia to the vehicle.
2. Align and hand tap the fascia sides (4, 5) to engage the fascia retaining tabs. Repeat on the opposite side.
3. Install the fascia to upper radiator fasteners (2, 3, 6). Tighten the fasteners securely.
4. Install the four fascia to upper radiator support push pins (1).

Fig. 7: Identifying Fender & Fascia Bracket Fasteners
Courtesy of CHRYSLER GROUP, LLC

5. Install the fascia bracket fasteners (1) and (2).

Fig. 8: Upper Close Out Panel Cover Components

Courtesy of CHRYSLER GROUP, LLC

6. Position the upper radiator closeout panel (1) back into place and install the push pin fasteners.

Fig. 9: Identifying Fender To Fascia Fastener
Courtesy of CHRYSLER GROUP, LLC

7. Raise the vehicle.
8. Install the fender to fascia fastener (1). Tighten the fastener securely. Repeat for the opposite side.
9. If equipped, connect the fog lamps.
10. Accessing from under the vehicle, connect the active grille shutter wire harness.
11. Position the fascia lower closeout panel (1), install the thirteen fasteners (2) securing the fascia lower close out panel. Tighten the fasteners securely.
12. Install the front splash shield. Refer to **SHIELD, SPLASH, FRONT WHEELHOUSE, INSTALLATION** .
13. Lower the vehicle.
14. Connect the negative battery cable.
15. Close the hood.

FASCIA, REAR

REMOVAL

REMOVAL

Fig. 10: Identifying Rear Fascia Assembly & Fasteners
Courtesy of CHRYSLER GROUP, LLC

1. Open the liftgate.
2. Disconnect the negative battery cable.
3. Raise and support the vehicle.
4. Remove the wheelhouse splash shields. Refer to **SHIELD, SPLASH, REAR WHEELHOUSE, REMOVAL** .
5. Remove the push pin retainer (3) that secures the underside of the rear fascia assembly.

Fig. 11: Fender To Fascia Fastener
Courtesy of CHRYSLER GROUP, LLC

6. Accessing from the wheelhouse, remove the fender to fascia fastener (1). Repeat for the opposite side.

Fig. 12: Identifying Rear Fascia Assembly, Fender To Fascia Fastener & Push Pin Retainers
Courtesy of CHRYSLER GROUP, LLC

7. Remove the quarter panel wheel opening flare molding. Refer to **MOLDING, REAR WHEEL OPENING, REMOVAL** .
8. Remove the bolts (3).
9. Pull out on the fascia (4) at the wheel house opening (2) to disengage the fascia from the retaining bracket. Repeat on the opposite side.
10. With the help of an assistant, pull rearward to disengage the fascia (1) from the rear retaining bracket. **Do not completely remove at this time.**
11. Disconnect the vehicle wiring harness (2).
12. Remove the fascia (1) from vehicle.

INSTALLATION

INSTALLATION

Fig. 13: Identifying Rear Fascia Assembly, Fender To Fascia Fastener & Push Pin Retainers
Courtesy of CHRYSLER GROUP, LLC

1. With the help of an assistant, position the fascia (4) to the vehicle.
2. Connect the vehicle wiring harness.
3. With the help of an assistant and using firm pressure, align and push forward to engage the fascia to the rear retaining bracket.

4. Align the fascia (4) with the retaining brackets at the tail lamp (1) and wheelhouse openings (2). Using firm pressure push in to engage. Repeat on the opposite side.

Fig. 14: Fender To Fascia Fastener
Courtesy of CHRYSLER GROUP, LLC

5. Accessing from the wheelhouse, install the fastener (1) that secures the rear fascia assembly to the rear quarter. Tighten the fastener securely. Repeat for opposite side.

Fig. 15: Identifying Rear Fascia Assembly & Fasteners
Courtesy of CHRYSLER GROUP, LLC

6. Install the fasteners (3) that secures the rear fascia assembly to the underbody.
7. Install the wheelhouse splash shields. Refer to **SHIELD, SPLASH, REAR WHEELHOUSE, INSTALLATION** .
8. Connect the negative battery cable.

REINFORCEMENT, BUMPER, FRONT

REMOVAL

REMOVAL

UPPER REINFORCEMENT

Fig. 16: Upper Bumper Reinforcement & Fasteners
Courtesy of CHRYSLER GROUP, LLC

1. Remove front fascia. Refer to **FASCIA, FRONT, REMOVAL**.
2. Remove the fasteners (2) securing the upper bumper reinforcement (1) to the frame/front end module. Repeat on the opposite side and remove the upper bumper reinforcement (1).

LOWER REINFORCEMENT

Fig. 17: Lower Bumper Reinforcements & Fasteners
Courtesy of CHRYSLER GROUP, LLC

1. Remove front fascia. Refer to **FASCIA, FRONT, REMOVAL**.

2. Remove the fasteners (2) securing the lower bumper reinforcement (1) to the frame/front end module. Remove the lower bumper reinforcement (2).
3. If necessary, repeat steps for the opposite side.

INSTALLATION

INSTALLATION

2311036493

Fig. 18: Identifying Front Bumper Reinforcement, Bolts & Adaptive Cruise Control Module
Courtesy of CHRYSLER GROUP, LLC

1. Position the front bumper reinforcement (2) and install the bolts (1). Tighten the front bumper reinforcement bolts to the proper. Refer to **SPECIFICATIONS**.
2. Install the adaptive cruise control module (3). Refer to **MODULE, ADAPTIVE CRUISE CONTROL, INSTALLATION** .
3. Install the front fascia. Refer to **FASCIA, FRONT, INSTALLATION**.

UPPER REINFORCEMENT

Fig. 19: Upper Bumper Reinforcement & Fasteners
Courtesy of CHRYSLER GROUP, LLC

1. Position the upper bumper reinforcement (1) to the frame/front end module.
2. Install the fasteners securing the upper bumper reinforcement (1) to the frame/front end module. Tighten the fasteners to 45 N.m (33 ft. lbs.). Repeat on the opposite side.
3. Install the front fascia. Refer to **FASCIA, FRONT, INSTALLATION**.

LOWER REINFORCEMENT

Fig. 20: Lower Bumper Reinforcements & Fasteners
Courtesy of CHRYSLER GROUP, LLC

1. Position the lower bumper reinforcement (1) to the frame/front end module.
2. Install the fasteners (2) securing the lower bumper reinforcement (1) to the frame/front end module. Tighten the fasteners to 45 N.m (33 ft. lbs.).
3. Install the front fascia. Refer to **FASCIA, FRONT, INSTALLATION**.
4. If necessary, repeat steps for opposite side.

REINFORCEMENT, BUMPER, REAR

REMOVAL

REMOVAL

STANDARD BUMPER

Fig. 21: Identifying Rear Bumper Reinforcement & Nuts
Courtesy of CHRYSLER GROUP, LLC

1. Remove rear fascia. Refer to **FASCIA, REAR, REMOVAL**.
2. Remove nuts (1) attaching rear bumper reinforcement (3) to frame rail.
3. Remove bumper reinforcement (3) from vehicle.

TRAILHAWK BUMPER

NOTE: Trailer hitch shown, bumper beam similar.

Fig. 22: Identifying Rear Fascia, Trailer Hitch & Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Remove the rear fascia. Refer to **FASCIA, REAR, REMOVAL**.
2. Remove the bolts (3, 4) and remove the hitch (1).

INSTALLATION

INSTALLATION

STANDARD BUMPER

Fig. 23: Identifying Rear Bumper Reinforcement & Nuts
Courtesy of CHRYSLER GROUP, LLC

1. Position rear bumper reinforcement (3) on vehicle.

2. Install nuts (1) attaching the bumper reinforcement to frame rail.
3. Tighten nuts (2) to 28 N.m (21 ft lbs).
4. Install rear fascia. Refer to **FASCIA, REAR, INSTALLATION**.

TRAILHAWK BUMPER

NOTE: Trailer hitch shown, bumper beam similar.

Fig. 24: Identifying Rear Fascia, Trailer Hitch & Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Position the bumper beam (1) into the frame openings (2).
2. Install the bolts (3, 4) and tighten to 165 N.m (122 ft lbs)
3. Install the rear fascia. Refer to **FASCIA, REAR, INSTALLATION**.

FRAME

WARNING

WARNINGS

WARNING: **Use an Occupational Safety and Health Administration (OSHA) approved breathing filter, when spraying paint or solvents in a confined area. Failure to follow these instructions may result in possible serious or fatal injury.**

- **avoid prolonged skin contact with petroleum or alcohol based cleaning solvents.**

- **do not stand under a hoisted vehicle that is not properly supported on safety stands. Failure to follow these instructions may result in possible serious or fatal injury.**

CAUTION: When holes are drilled or punched in an inner body panel, verify the depth of space to the outer body panel, electrical wiring or other components. Damage to the vehicle can result.

- **do not weld exterior panels unless combustible material on the interior of vehicle is removed from the repair area. Fire or hazardous conditions, can result.**
- **always have a fire extinguisher ready for use when welding.**
- **disconnect the negative (-) cable clamp from the battery when servicing electrical components that are live when the ignition is off. Damage to electrical system can result.**
- **do not use abrasive chemicals or compounds on painted surfaces. Damage to finish can result.**
- **do not use harsh alkaline based cleaning solvents on painted or upholstered surfaces. Damage to finish or color can result.**
- **do not hammer or pound on plastic trim panel when servicing interior trim. Plastic panels can break.**

RESTRAINT WARNINGS

WARNING: To avoid potential physical injury, or damage to sensitive electronic circuits and systems, always disconnect and isolate the battery negative (ground) cable and the positive cable, then ground the positive cable to discharge the ORC capacitor before performing any welding operations on the vehicle. Failure to take the proper precautions could result in accidental airbag deployment, possible damage to the Supplemental Restraint System (SRS) circuits and components, and possible damage to other electronic circuits and components. Whenever a welding process is being performed within 30 cm (12 in) of an electronic module/harness, then that module/harness should be relocated out of the way, or disconnected. Always protect against component or vehicle damage from weld spatter by using weld blankets and screens. Failure to follow these instructions may result in serious or fatal injury.

WARNING: To avoid serious or fatal injury on vehicles equipped with the Supplemental Restraint System (SRS), never attempt to repair the electrically conductive circuits or wiring components related to the SRS for which there is no MOPAR wiring repair kit. It is important to use ONLY the recommended splicing kit and procedure. For applicable and available MOPAR wiring repair kits, please visit the MOPAR Connector Web Site at

the following address on the Internet: (http://dto.vftis.com/mopar/disclaimer.asp). Inappropriate repairs can compromise the conductivity and current carrying capacity of those critical electrical circuits, which may cause SRS components not to deploy when required, or to deploy when not required. Only minor cuts or abrasions of wire and terminal insulation where the conductive material has not been damaged, or connector insulators where the integrity of the latching and locking mechanisms have not been compromised may be repaired using appropriate methods.

WARNING: **To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog. Failure to follow these instructions may result in possible serious or fatal injury.**

WARNING: **To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.**

WARNING: **To avoid potential physical injury or damage to sensitive electronic circuits and systems, always disconnect and isolate the battery negative (ground) cable and the positive cable, then ground the positive cable to discharge the Occupant Restraint Controller (ORC) capacitor before performing any welding operations on the vehicle. Failure to take the proper precautions could result in accidental airbag deployment, possible damage to the Supplemental Restraint System (SRS) circuits and components, and possible damage to other electronic circuits and components. Whenever a welding process is being performed within 12 inches (30 centimeters) of an electronic module or wiring harness, then that module or harness should be relocated out of the way, or**

disconnected. Always protect against component or vehicle damage from weld spatter by using weld blankets and screens.

WARNING: **To avoid serious or fatal injury, do not attempt to dismantle an airbag unit or tamper with its inflator. Do not puncture, incinerate or bring into contact with electricity. Do not store at temperatures exceeding 93° C (200° F). An airbag inflator unit may contain sodium azide and potassium nitrate. These materials are poisonous and extremely flammable. Contact with acid, water, or heavy metals may produce harmful and irritating gases (sodium hydroxide is formed in the presence of moisture) or combustible compounds. An airbag inflator unit may also contain a gas canister pressurized to over 17.24 kPa (2500 psi). Failure to follow these instructions may result in possible serious or fatal injury.**

WARNING: **To avoid serious or fatal injury when handling a seat belt tensioner retractor. Exercise proper care to keep fingers out from under the retractor cover and away from the seat belt webbing where it exits from the retractor cover. Failure to follow these instructions may result in possible serious or fatal injury.**

WARNING: **To avoid serious or fatal injury, replace all Supplemental Restraint System (SRS) components only with parts specified in the Chrysler Mopar® Parts Catalog. Substitute parts may appear interchangeable, but internal differences may result in inferior occupant protection.**

WARNING: **To avoid serious or fatal injury, the fasteners, screws, and bolts originally used for the Supplemental Restraint System (SRS) components must never be replaced with any substitutes. These fasteners have special coatings and are specifically designed for the SRS. Anytime a new fastener is needed, replace it with the correct fasteners provided in the service package or specified in the Chrysler Mopar® Parts Catalog.**

WARNING: **To avoid serious or fatal injury when a steering column has an airbag unit attached, never place the column on the floor or any other surface with the steering wheel or airbag unit face down. Failure to follow these instructions may result in possible serious or fatal injury.**

USE OF HEAT DURING REPAIR

WARNING: **Chrysler Group LLC engineering's position on the use of heat during collision repair is as follows:**

- **Any body panel or frame component damaged which is to be repaired and reused, must be repaired using the "cold straightening" method. No heat may be used during the**

straightening process.

- **During rough straightening prior to panel replacement, damaged panels or frame components may be heated to assist in body/frame realignment. The application of heat must be constrained to the parts which will be replaced and not allowed to affect any other components.**

This "no heat" recommendation is due to the extensive use of high strength and advanced high strength steels in Chrysler Group LLC products. High-strength materials can be substantially and negatively affected from heat input which will not be obviously known to the repairer or consumer.

Ignoring these recommendations may lead to serious compromises in the ability to protect occupants in a future collision event, reduce the engineered qualities and attributes, or decrease the durability and reliability of the vehicle.

This statement supersedes any previously released information by the Chrysler Group LLC.

Failure to follow these instructions may result in serious or fatal injury.

SPECIFICATIONS

FRAME DIMENSIONS

NOTE: **Frame dimensions are listed in metric scale millimeter (mm). All dimensions are from center to center of Principal Locating Point (PLP), or from center to center of PLP and fastener location.**

VEHICLE PREPARATION

Position the vehicle on a level work surface. Using screw or bottle jacks, adjust the vehicle PLP heights to the specified dimension above a level work surface. Vertical dimensions can be taken from the work surface to the locations indicated were applicable.

INDEX

DESCRIPTION	FIGURE

CROSSMEMBER, FRONT SUSPENSION

REMOVAL

REMOVAL

Fig. 27: Floor Carpet, Intermediate Shaft, Coupling Bolt & Steering Gear Pinion Shaft
Courtesy of CHRYSLER GROUP, LLC

NOTE: Before proceeding, refer to FRONT, WARNING .

1. Disconnect battery negative cable.
2. Using a steering wheel holder, lock the steering wheel in place to keep it from rotating. This keeps the clockspring in the proper orientation.
3. Remove pinch bolt (3) and separate intermediate shaft (2) from steering gear shaft.

Fig. 28: Identifying Stabilizer Bar Link, Nuts & Ball Joint Nut
Courtesy of CHRYSLER GROUP, LLC

4. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
5. Remove the wheel mounting bolts, then the tire and wheel assembly.
6. If equipped, remove the engine belly pan. Refer to **BELLY PAN, REMOVAL**.
7. At each end of the stabilizer bar, while holding the stabilizer bar link stud stationary, remove the nut (3) securing the link (2) to the stabilizer bar and position aside.

Fig. 29: Removing/Installing The Lower Ball Joint Nut To Control Arm
Courtesy of CHRYSLER GROUP, LLC

NOTE: Discard the ball joint retaining nut. Use a NEW nut when installing the ball joint.

8. Remove the ball joint to control arm retaining nut (4).
9. Remove the outer tie rod retaining nut (7) and separate the outer tie rod end (7) from the knuckle

Fig. 30: Opening Between Control Arm Front Mounting Bolt & Front Fascia Support Beam & Pry Bar
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Use care when separating the ball joint stud from the knuckle so the ball joint boot does not get cut.**

NOTE: **After separating the control arm from the knuckle, do not let it swing rapidly back up, this can tear the ball joint dust boot.**

10. Insert a pry bar (2) in the opening (1) between the control arm front mounting bolt and the front fascia support beam.
11. Separate the lower control arm from the knuckle by prying down with the pry bar (2).
12. Remove the lower load beam. Refer to **LOAD BEAM, LOWER, REMOVAL**.

191069435

Fig. 31: Steering Gear Control Module & Harness Connectors
Courtesy of CHRYSLER GROUP, LLC

13. Disconnect the downstream oxygen sensor harness connector.
14. Remove the exhaust extension pipe.
15. Disconnect the harness connectors (2) at the steering gear control module (1).

191069436

Fig. 32: Steering Gear Connector & Tie Strap
Courtesy of CHRYSLER GROUP, LLC

16. Disconnect the steering gear connector (1) from the body harness connector at the bottom of the dash panel.
17. Separate the steering gear harness from the crossmember by removing the tie strap (2) from the crossmember.
18. Remove the rear engine mount.

NOTE: **Before lowering the front suspension crossmember, the location of the crossmember must be marked on the body of the vehicle. Do this so the crossmember can be relocated, upon reinstallation, against the body of vehicle in the same location as before removal. If the front suspension crossmember is not reinstalled in exactly the same location as before removal, the preset front wheel alignment settings (caster and camber) may be lost.**

19.
20. Mark the position of the cross member with a grease pencil or equivalent.

Fig. 33: Upper Crossmember Mounting Bolt
Courtesy of CHRYSLER GROUP, LLC

21. Support the crossmember with a transmission jack, or equivalent.
22. Remove the upper mounting bolt (1) from each side of the crossmember.

Fig. 34: Crossmember Rear Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

23. Remove the four rear mounting bolts (1, 3) that secure the crossmember (2) to the vehicle
24. Slowly lower the crossmember with the jack and remove from the vehicle.

INSTALLATION

INSTALLATION

Fig. 35: Crossmember Rear Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Slowly raise the crossmember (2) into mounted position using the transmission jack matching the crossmember to the marked locations on the body made during removal.
2. Install four mounting bolts (1, 3) and tighten to 189 N.m (139 ft lbs).

Fig. 36: Upper Crossmember Mounting Bolt
Courtesy of CHRYSLER GROUP, LLC

3. Install the upper mounting bolt (1) on each side of the crossmember and tighten to 120 N.m (86 ft lbs).

Fig. 37: Steering Gear Connector & Tie Strap
Courtesy of CHRYSLER GROUP, LLC

4. Connect the steering harness connector (1) to the body harness connector at the bottom of the dash panel.
5. Install the tie strap (2) to the crossmember.

191069435

Fig. 38: Steering Gear Control Module & Harness Connectors
Courtesy of CHRYSLER GROUP, LLC

6. Connect the harness connectors (2) at the steering gear module (1).
7. Install the rear engine mount. Refer to **INSULATOR, ENGINE MOUNT, RIGHT, INSTALLATION** for 2.0L Diesel, **INSULATOR, ENGINE MOUNT, LEFT, INSTALLATION** for 2.0L Diesel, **INSULATOR, ENGINE MOUNT, REAR, INSTALLATION** for 2.0L Diesel, **INSULATOR, ENGINE MOUNT, LEFT, INSTALLATION** for 2.4L, **INSULATOR, ENGINE MOUNT, REAR, INSTALLATION** for 2.4L, **INSULATOR, ENGINE MOUNT, RIGHT, INSTALLATION** for 2.4L, **INSULATOR, ENGINE MOUNT, LEFT, INSTALLATION** for 3.2L, **INSULATOR, ENGINE MOUNT, RIGHT, INSTALLATION** for 3.2L, **INSULATOR, ENGINE MOUNT, REAR, INSTALLATION** for 3.2L.
8. Install the exhaust extension pipe.
9. Connect the downstream oxygen sensor harness connector.
10. Install the lower load beams (1). Refer to **LOAD BEAM, LOWER, INSTALLATION**.

Fig. 39: Removing/Installing The Lower Ball Joint Nut To Control Arm
Courtesy of CHRYSLER GROUP, LLC

11. Insert the lower ball joint into the control arm, install a **NEW** nut (4) and tighten to 25 N.m Plus 175° (18 ft lbs Plus 175°).
12. Install the outer tie rod end (8) into the knuckle and install a **NEW** retaining nut (7) and tighten to 25 N.m Plus 80° (18 ft lbs Plus 80°).

Fig. 40: Identifying Stabilizer Bar Link, Nuts & Ball Joint Nut
Courtesy of CHRYSLER GROUP, LLC

13. Install the stabilizer link stud into the stabilizer bar and install the nut.
14. Hold the stabilizer link stud stationary and tighten the nut to 63 N.m (46 ft lbs).

Fig. 41: Floor Carpet, Intermediate Shaft, Coupling Bolt & Steering Gear Pinion Shaft
Courtesy of CHRYSLER GROUP, LLC

15. If equipped, install the engine belly pan. Refer to **BELLY PAN, INSTALLATION**.
16. Install the tire and wheel assembly. Refer to **INSTALLATION** .
17. Lower the vehicle.
18. Install the intermediate shaft (2) to the steering gear pinion shaft (4).
19. Install a **NEW** pinch bolt (3) and tighten to specification. Refer to **COLUMN, SPECIFICATIONS** .
20. Remove the steering wheel holder.
21. Connect the battery negative cable.
22. Check and adjust wheel alignment as necessary. Refer to **FRONT SUSPENSION & WHEEL ALIGNMENT** .

CROSSMEMBER, REAR SUSPENSION

REMOVAL

REMOVAL

ALL WHEEL DRIVE

Fig. 42: Identifying Rear Suspension Crossmember (All Wheel Drive)
Courtesy of CHRYSLER GROUP, LLC

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove the muffler. Refer to **MUFFLER, EXHAUST, REMOVAL** .
3. Remove the rear stabilizer bar. Refer to **STABILIZER BAR, REAR SUSPENSION, REMOVAL** .
4. Remove the rear driveline module. Refer to **REMOVAL** .
5. Remove the remaining knuckle. Refer to **KNUCKLE, REAR, REMOVAL** .
6. Separate the vent tube from the crossmember.

Fig. 43: Identifying Ride Height Sensor
Courtesy of CHRYSLER GROUP, LLC

7. Remove the ride height sensor (1), if equipped.

Fig. 44: Identifying Wire Harness From Crossmember
Courtesy of CHRYSLER GROUP, LLC

8. Separate the wire harness (1) from the crossmember.

Fig. 45: Identifying Rear Crossmember & Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

9. Remove the rear crossmember mounting bolts (2, 3) and remove the rear crossmember (4) from the vehicle (1).
10. If necessary, remove the spring links. Refer to **LINK, CAMBER, REMOVAL** , **LINK, TOE,**

REMOVAL and **LINK, SPRING, REMOVAL** .

11. If necessary, remove the bushings. Refer to **ISOLATOR, REAR CROSSMEMBER, DIFFERENTIAL, REMOVAL** and **ISOLATOR, REAR CROSSMEMBER, FRAME, REMOVAL**.

FRONT WHEEL DRIVE

Fig. 46: Identifying Rear Suspension Crossmember (All Wheel Drive)
Courtesy of CHRYSLER GROUP, LLC

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove both rear knuckles. Refer to **KNUCKLE, REAR, REMOVAL** .
3. Remove the muffler. Refer to **MUFFLER, EXHAUST, REMOVAL** .
4. Remove the rear stabilizer bar. Refer to **STABILIZER BAR, REAR SUSPENSION, REMOVAL** .
5. Separate the vent tube from the crossmember.

Fig. 47: Identifying Ride Height Sensor
Courtesy of CHRYSLER GROUP, LLC

6. Remove the ride height sensor, if equipped.

Fig. 48: Identifying Wire Harness From Crossmember
Courtesy of CHRYSLER GROUP, LLC

7. Separate the wire harness from the crossmember.

Fig. 49: Identifying Rear Crossmember & Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

8. Remove the rear crossmember mounting bolts (2, 3) and remove the rear crossmember (4) from the vehicle.
9. If necessary, remove the spring links. Refer to **LINK, CAMBER, REMOVAL** , **LINK, TOE, REMOVAL** and **LINK, SPRING, REMOVAL** .
10. If necessary, remove the bushings. Refer to **ISOLATOR, REAR CROSSMEMBER, DIFFERENTIAL, REMOVAL** and **ISOLATOR, REAR CROSSMEMBER, FRAME, REMOVAL**.

INSTALLATION

INSTALLATION

ALL WHEEL DRIVE

Fig. 50: Identifying Rear Crossmember & Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

1. If necessary, install the bushings. Refer to **ISOLATOR, REAR CROSSMEMBER, DIFFERENTIAL, INSTALLATION** and **ISOLATOR, REAR CROSSMEMBER, FRAME, INSTALLATION**.
2. If necessary, install the spring links. Refer to **LINK, CAMBER, INSTALLATION** , **LINK, TOE, INSTALLATION** and **LINK, SPRING, INSTALLATION** .
3. Install the rear crossmember (2) to the body and install the mounting bolts (1, 3) and tighten to 150 N.m (111 ft. lbs.).
4. Install the rear stabilizer bar. Refer to **STABILIZER BAR, REAR SUSPENSION, INSTALLATION** .

Fig. 51: Identifying Wire Harness From Crossmember
Courtesy of CHRYSLER GROUP, LLC

5. Connect the wire harness (1) to the crossmember.

Fig. 52: Identifying Rear Suspension Crossmember (All Wheel Drive)
Courtesy of CHRYSLER GROUP, LLC

6. Connect the vent tube (1) to the crossmember.

Fig. 53: Identifying Ride Height Sensor
Courtesy of CHRYSLER GROUP, LLC

7. Install the ride height sensor (1), if equipped.
8. Install the rear driveline module. Refer to **INSTALLATION** .

9. Install the knuckles as necessary. Refer to **KNUCKLE, REAR, INSTALLATION** .
10. Install the exhaust to the vehicle. Refer to **MUFFLER, EXHAUST, INSTALLATION** .
11. Lower the vehicle and tighten the following fasteners with the vehicle at normal ride height:
    - Lower transversal link to rear crossmember: 90 N.m (66 ft. lbs.) Plus 45°.
    - Upper transversal link to rear crossmember: 90 N.m (66 ft. lbs.) Plus 45°.
    - Upper transversal link to lower control arm: 80 N.m (59 ft. lbs.) Plus 45°.
12. Perform a wheel alignment. Refer to **WHEEL ALIGNMENT, STANDARD PROCEDURE** then tighten the lower transversal link to lower control arm bolt to 130 N.m (96 ft. lbs.).

FRONT WHEEL DRIVE

Fig. 54: Identifying Rear Crossmember & Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

1. If necessary, install the bushings. Refer to **ISOLATOR, REAR CROSSMEMBER, DIFFERENTIAL, INSTALLATION** and **ISOLATOR, REAR CROSSMEMBER, FRAME, INSTALLATION**.
2. If necessary, install the spring links. Refer to **LINK, CAMBER, INSTALLATION** , **LINK, TOE, INSTALLATION** and **LINK, SPRING, INSTALLATION** .
3. Install the rear crossmember (2) to the body and install the mounting bolts (1, 3) and tighten to 150 N.m (111 ft. lbs.).
4. Install the rear stabilizer bar. Refer to **STABILIZER BAR, REAR SUSPENSION, INSTALLATION** .

Fig. 55: Identifying Wire Harness From Crossmember
Courtesy of CHRYSLER GROUP, LLC

5. Connect the wire harness (1) to the crossmember.

Fig. 56: Identifying Rear Suspension Crossmember (All Wheel Drive)
Courtesy of CHRYSLER GROUP, LLC

6. Connect the vent tube (1) to the crossmember.

Fig. 57: Identifying Ride Height Sensor
Courtesy of CHRYSLER GROUP, LLC

7. Install the ride height sensor (1), if equipped.
8. Install the knuckles as necessary. Refer to **KNUCKLE, REAR, INSTALLATION** .
9. Install the exhaust to the vehicle. Refer to **MUFFLER, EXHAUST, INSTALLATION** .
10. Lower the vehicle and tighten the following fasteners with the vehicle at normal ride height:
    - Lower transversal link to rear crossmember: 90 N.m (66 ft. lbs.) Plus 45°.
    - Upper transversal link to rear crossmember: 90 N.m (66 ft. lbs.) Plus 45°.
    - Upper transversal link to lower control arm: 80 N.m (59 ft. lbs.) Plus 45°.
11. Perform a wheel alignment. Refer to **WHEEL ALIGNMENT, STANDARD PROCEDURE** then tighten the lower transversal link to lower control arm bolt to 130 N.m (96 ft. lbs.).

HITCH, TRAILER

REMOVAL

REMOVAL

Fig. 58: Identifying Rear Fascia, Trailer Hitch & Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Remove the rear fascia. Refer to **FASCIA, REAR, REMOVAL**.
2. Remove the bolts (3, 4) and remove the hitch (1).

INSTALLATION

INSTALLATION

Fig. 59: Identifying Rear Fascia, Trailer Hitch & Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Position the hitch (1) back into the frame openings (2).

2. Install the bolts (3, 4) and tighten to 165 N.m (122 ft. lbs.)

HOOK(S), TOW, FRONT

REMOVAL

REMOVAL

Fig. 60: Identifying Front Tow Hook, Bracket & Fasteners
Courtesy of CHRYSLER GROUP, LLC

1. Remove the bolts and remove the nut (4).
2. Remove the tow hook (2)
3. Remove the bolts (5) and remove the bracket.

INSTALLATION

INSTALLATION

Fig. 61: Identifying Front Tow Hook, Bracket & Fasteners
Courtesy of CHRYSLER GROUP, LLC

1. Install the bracket (5) and install the bolts (3)
2. Install the hook (2).
3. Install the bolts and install the nut (4).

HOOK(S), TOW, REAR

REMOVAL

REMOVAL

Fig. 62: Identifying Rear Tow Hook & Bolts

Courtesy of CHRYSLER GROUP, LLC

1. Install the hook (1) and install the bolts (2).

ISOLATOR, REAR CROSSMEMBER, DIFFERENTIAL

REMOVAL

REMOVAL

Fig. 64: Installing The Half Shaft Onto The Rear Drive Module
Courtesy of CHRYSLER GROUP, LLC

1. Remove the rear differential (1) as necessary to gain enough access to the differential support isolators. Refer to **REMOVAL** .

Fig. 65: Bolts & Stabilizer Bar
Courtesy of CHRYSLER GROUP, LLC

2. Remove the bolts (1) and lower the stabilizer bar (2).

1304019335

Fig. 66: Identifying Special Tools Over Isolator Crossmember Assembly
Courtesy of CHRYSLER GROUP, LLC

NOTE: Prior to using special tools, lubricate Press, Ball Joint: C-4212F (A) threads to provide ease of use and promote tool longevity.

3. Assemble tools over isolator crossmember assembly as shown:
   1. (special tool #C-4212F, Press, Ball Joint)
   2. (special tool #8858-6, Remover)
   3. (special tool #8861-2, Receiver, Ball Joint)
4. Tighten Press, Ball Joint C-4212F (1) screw-drive, pressing isolator out of the crossmember.

INSTALLATION

INSTALLATION

Fig. 67: Identifying Special Tools Over Isolator Crossmember Assembly
Courtesy of CHRYSLER GROUP, LLC

NOTE: Prior to using special tools, lubricate Press, Ball Joint: C-4212F (3) threads to provide ease of use and promote tool longevity.

1. Assemble tools over isolator crossmember assembly as shown:
    1. (special tool #C-4212F, Press, Ball Joint)
    2. (special tool #9031-4, Installer, Bushing)
    3. Pusher 9958-3 of (special tool #9958, Remover/Installer, Axle Bushing)
2. Tighten Press, Ball Joint C-4212F (A) screw-drive, pressing isolator into crossmember. Install isolator until isolator can flange contacts surface of crossmember.
3. Remove the tools.

Fig. 68: Bolts & Stabilizer Bar
Courtesy of CHRYSLER GROUP, LLC

4. Position the stabilizer bar (2) and install the upper and lower stabilizer bar to cradle bolts (1) and tighten to 110 N.m (81 ft. lbs.).
5. Install the rear differential. Refer to **INSTALLATION** .

ISOLATOR, REAR CROSSMEMBER, FRAME

REMOVAL

REMOVAL

Fig. 69: Identifying Special Tools Over Isolator Crossmember Assembly
Courtesy of CHRYSLER GROUP, LLC

1. Remove the rear crossmember. Refer to **CROSSMEMBER, FRONT SUSPENSION, REMOVAL** and **CROSSMEMBER, REAR SUSPENSION, REMOVAL**.

NOTE: **Prior to using special tools, lubricate Press, Ball Joint: C-4212F (3) threads to provide ease of use and promote tool longevity.**

2. Assemble tools over isolator crossmember assembly as shown:
   a. (special tool #9958-3, Installer, Bushing)
   b. (special tool #10106-2, Receiver, Depth Setting)
   c. (special tool #C-4212F, Press, Ball Joint)
3. Tighten Press, Ball Joint C-4212F (c) screw-drive, pressing isolator out of the crossmember.

INSTALLATION

INSTALLATION

Fig. 70: Installing Isolator On Crossmember Using Special Tools
Courtesy of CHRYSLER GROUP, LLC

1. Position isolator (1) on crossmember (2) isolator bore.

NOTE: **Prior to using special tools, lubricate Press, Ball Joint (3) threads to provide ease of use and promote tool longevity.**

2. Assemble tools over isolator as shown:
   1. (special tool #10106-2, Receiver, Depth Setting)
   2. (special tool #9958-3, Installer, Bushing)
   3. (special tool #C-4212F, Press, Ball Joint)
3. Tighten Press, Ball Joint screw-drive, pressing isolator (5) into crossmember (4). Install isolator until isolator can flange contacts surface of crossmember.
4. Remove tools.
5. Install the rear suspension crossmember. Refer to **CROSSMEMBER, FRONT SUSPENSION, INSTALLATION** and **CROSSMEMBER, REAR SUSPENSION, INSTALLATION**.

LOAD BEAM, LOWER

REMOVAL

REMOVAL

Fig. 71: Identifying Vertical Bracket & Nuts
Courtesy of CHRYSLER GROUP, LLC

1. Remove the front fascia. Refer to **FASCIA, FRONT, REMOVAL**.
2. Remove the vertical bracket (1) from the side of the lower load beam.

Fig. 72: Lower Bumper Reinforcements & Fasteners
Courtesy of CHRYSLER GROUP, LLC

3. Remove the bolts (2) and the lower load beam extensions (1).

Fig. 73: Identifying Lower Load Beam Bracket
Courtesy of CHRYSLER GROUP, LLC

4. Remove the four bolts and the lower load beam bracket (1).

Fig. 74: Front Fascia Support Beams
Courtesy of CHRYSLER GROUP, LLC

5. Remove the lower load beams (1).

INSTALLATION

INSTALLATION

Fig. 75: Identifying Lower Load Beam Bracket
Courtesy of CHRYSLER GROUP, LLC

1. Position a lower load beam on the vehicle and install the lower load beam bracket (1) and bolts. Repeat for both lower load beams.

Fig. 76: Lower Bumper Reinforcements & Fasteners
Courtesy of CHRYSLER GROUP, LLC

2. Position the lower load beam extensions (1) and install the bolts (2).
3. Tighten the lower load beam extension bolts (2) to specification. Refer to **SPECIFICATIONS** .
4. Tighten the lower load beam bracket bolts to specification. Refer to **FRAME, SPECIFICATIONS**.

Fig. 77: Identifying Vertical Bracket & Nuts
Courtesy of CHRYSLER GROUP, LLC

5. Install the vertical brace (1) and tighten the bolts.
6. Install the front fascia. Refer to **FASCIA, FRONT, INSTALLATION**.

UNDER BODY PROTECTION

BELLY PAN

REMOVAL

REMOVAL

Fig. 78: Identifying Engine Belly Pan & Fasteners
Courtesy of CHRYSLER GROUP, LLC

1. Raise and support the vehicle.
2. Remove the nine fasteners (3) securing the engine belly pan (2).
3. Remove the engine belly pan (2) from the underside of the vehicle.

INSTALLATION

INSTALLATION

Fig. 79: Identifying Engine Belly Pan & Fasteners
Courtesy of CHRYSLER GROUP, LLC

1. Insert the tabs (1) into the slots on the fascia and Position the engine belly pan (1) to the underside of the vehicle.
2. Install the nine fasteners (3) securing the engine belly pan (2). Tighten the fasteners securely.

PLATE, SKID, FRONT

REMOVAL

REMOVAL

TRANSMISSION SKID PLATE

Fig. 80: Identifying Front Skid Plate, Transmission Skid Plate & Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove the bolts (2) from the frame and the front skid plate (3).
3. Remove the transmission skid plate (1).

FRONT SKID PLATE

Fig. 81: Identifying Front Skid Plate & Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .

2. Remove the transmission skid plate. Refer to **PLATE, SKID, FRONT, REMOVAL**.
3. Remove the bolts (2) and the front skid plate (1).

RIGHT SKID PLATE

Fig. 82: Identifying Right Skid Plate & Fasteners
Courtesy of CHRYSLER GROUP, LLC

NOTE: Right side skid plate shown, left side skid plate is similar.

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove the bolts (1), the nut (3) and the right skid plate (2).

INSTALLATION

INSTALLATION

TRANSMISSION SKID PLATE

Fig. 83: Identifying Front Skid Plate, Transmission Skid Plate & Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Position the transmission skid plate (1) and install the bolts (2).
2. Tighten the bolts to specification. Refer to **SPECIFICATIONS**.

FRONT SKID PLATE

Fig. 84: Identifying Front Skid Plate & Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Position the front skid plate (1) and install the bolts (2).
2. Tighten the bolts to specification. Refer to **SPECIFICATIONS**.

3. Install the transmission skid plate. Refer to **PLATE, SKID, FRONT, INSTALLATION**.

RIGHT SKID PLATE

Fig. 85: Identifying Right Skid Plate & Fasteners
Courtesy of CHRYSLER GROUP, LLC

NOTE: Right skid plate shown, left skid plate is similar.

1. Position the right skid plate (2). Install the bolts (1) and nut (3).
2. Tighten the fasteners to specification. Refer to **SPECIFICATIONS**.

SHIELD, UNDERBODY

REMOVAL

REMOVAL

Fig. 86: Identifying Underbody Shield, Vehicle Underbody & Fasteners
Courtesy of CHRYSLER GROUP, LLC

NOTE: Right side shown, left side typical.

1. Raise and support the vehicle.
2. Remove the two push pin fasteners (4)
3. Remove the two retaining nuts (3) that secure the underbody shield (1) to the vehicle underbody (2).
4. Remove the seven fasteners that secure the underbody shield (1) to the vehicle underbody (2).
5. Remove the underbody shield (1) from the vehicle.

INSTALLATION

INSTALLATION

Fig. 87: Identifying Underbody Shield, Vehicle Underbody & Fasteners
Courtesy of CHRYSLER GROUP, LLC

NOTE: Right side shown, left side typical.

1. Position the underbody shield (1) to the vehicle.
2. Install the two retaining nuts (3) that secure the underbody shield (1) to the vehicle underbody (2). Tighten to 4 N.m (35 in. lbs.).
3. Install the two push pin fasteners (4) that secure the underbody shield (1).
4. Install the seven fasteners that secure the underbody shield (1) to the vehicle underbody (2). Tighten to 5 N.m (44 in. lbs.).
5. Lower the vehicle.

2014 ACCESSORIES AND EQUIPMENT

Heated Glass - Service Information - Cherokee

DESCRIPTION

DESCRIPTION

CAUTION: Grid lines can be damaged or scraped off with sharp instruments. Care should be taken when cleaning or removing foreign materials, decals or stickers from the rear glass. Normal glass cleaning solvents or hot water used with soft toweling is recommended.

The rear window defogger system consists of two vertical bus bars and a series of grid lines fired onto the inside surface of the rear window.

The front windshield wiper defogger system (if equipped) consists of three horizontal grid lines fired onto the inside surface of the front windshield.

The defrost for each system is turned on or off by a push-buttons. The soft switch is located in the Uconnect touch screen menu. The hard switch is located on the center of the instrument panel center bezel. (Refer to **DESCRIPTION**)

Circuit protection is provided by fuses located in the power distribution center (PDC). The heater mirrors, rear defrost and front windshield wiper de-icer each have a separate fuse.

OPERATION

OPERATION

The defogger system can be controlled by a momentary switch located in the A/C-heater control. An amber indicator will illuminate whenever either switch is pushed to the ON position.

The defogger system can also be controlled by momentary soft switches located in the U-Connect® touch screen. The front or rear defrost switch will illuminate when selected for use.

When the rear window defogger switch is pressed to ON with the ignition switch in RUN, the switch sends a request signal over the CAN Bus to the Power Distribution Center (PDC) to energize the internal high side driver. When energized, the high side driver provides battery current to the rear window defogger grid lines and to the heated side view mirrors. The grid lines heat the glass to help clear the rear window and side mirror surfaces of fog or frost.

The front window defogger switch is pressed to ON with the ignition switch in RUN, the switch sends a signal over the CAN bus to a relay grid located inside the PDC. That relay is actuated by a low-side driver in the BCM.

The Wiper Deicer system is automatically activated when the outside ambient temperature is less than 40 degrees F (5C) and either the rear defrost system or full front defrost system is active. The wiper blade Deicer will be able to unfreeze both wiper blades from the windshield in 8 minutes or less at minus 10 degrees F (-23C) if the vehicle is stationary.

The defogger and Deicer system will automatically turn off after an initial programmed time interval of about ten minutes, as long as the ignition switch is in RUN. After the initial time interval has expired, if either switch is pressed to ON again during the same ignition cycle, the defogger system will automatically turn off after about five minutes.

Repair of the defogger grid lines, bus bars, terminals or pigtail wires can be accomplished using the Mopar® Rear Window Defogger Repair Kit (Part Number 04549275) or equivalent. Refer to **GRID, DEFOGGER, STANDARD PROCEDURE**.

The defogger control system is diagnosed using a scan tool. Refer to **DIAGNOSIS AND TESTING** .

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - ELECTRIC BACK LIGHT (EBL) SYSTEM

NOTE: Illumination of the rear window defogger indicator lamp in the instrument cluster does not necessarily mean that electrical current is reaching the rear window glass heating grid.

NOTE: Refer to SYSTEM WIRING DIAGRAMS for circuit descriptions and diagrams.

Operation of the EBL system can be confirmed by the following:

Fig. 1: Rear Window Glass Grid Test
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical heated rear window glass shown.

1. Use a scan tool and check for Diagnostic Trouble Codes (DTCs) related to the Body Control Module (BCM) and the lower accessory switchbank. If no DTCs are found, go to Step 2. If any DTCs are found, repair as required.
2. Turn the ignition to RUN and press the rear window defogger switch to on. Rear window defogger operation can be checked by feeling the surfaces of the rear window glass. A distinct difference in temperature between the grid lines (5) and the adjacent clear glass should be detected within three to four minutes of operation.
3. If a temperature difference is not detected, use a 12 volt Direct Current (DC) voltmeter and contact the rear glass heating grid terminal A (1) with the negative lead, and terminal B (2) with the positive lead. The voltmeter should read battery voltage. If the voltmeter does not read battery voltage, check the following:
   - Confirm the ignition is in RUN.
   - Confirm the rear window defogger switch is on.
   - Confirm the EBL feed wire (3) is connected to the heating grid positive terminal and that there is continuity between the heating grid and the EBL relay in the Power Distribution Center (PDC).
   - Confirm the EBL ground wire (6) is connected to the heating grid negative terminal and that there is continuity to ground.
   - Confirm the EBL relay in the PDC is operational. Refer to **SYSTEM WIRING DIAGRAMS** .
4. If broken defogger grid lines or bus bars are suspected, use a 12 volt DC voltmeter and contact terminal A with the negative lead and each rear glass heating grid line at its mid-point C (4) with the positive lead. The voltmeter should read approximately 6 volts at each grid line mid-point. If the voltmeter does not read approximately 6 volts, repair the open grid line(s) or bus bar(s). Refer to **GRID, DEFOGGER, STANDARD PROCEDURE**.
5. If the EBL system operation has been verified but the rear window defogger indicator in the instrument cluster does not illuminate, replace the switch bank.

GRID, DEFOGGER

STANDARD PROCEDURE

STANDARD PROCEDURE - GRID LINE AND TERMINAL REPAIR

WARNING: **Materials contained in the Repair Kit (Part Number 04549275) may cause skin or eye irritation. The kit contains epoxy resin and amine type hardener, which are harmful if swallowed. Avoid contact with the skin and eyes. For skin contact, wash the affected areas with soap and water. For contact with the eyes, flush with plenty of water. Do not take internally. If taken internally, induce vomiting and call a physician immediately. Use with adequate ventilation. Do not use near fire or flame. Contains flammable solvents. Keep out of the reach of children. Failure to follow these instructions may result in serious or fatal injury.**

Repair of the rear glass heating grid lines, bus bars, terminals or pigtail wires can be accomplished using the Mopar® Rear Window Defogger Repair Kit (Part Number 04549275) or equivalent.

Fig. 2: Grid Line Repair - Typical
Courtesy of CHRYSLER GROUP, LLC

1. Mask the repair area with masking tape (3) so that the conductive epoxy can be applied neatly. Extend the epoxy application onto the grid line (2) or the bus bar on each side of the break (1).
2. Follow the instructions in the repair kit for preparing the damaged area.
3. Remove the package separator clamp and mix the two conductive epoxy components thoroughly within the packaging. Fold the package in half and cut the center corner to dispense the epoxy.
4. Apply the epoxy through the slit in the masking tape or template. Overlap both ends of the break by at least 19 millimeters (0.75 inch).
5. For a terminal or pigtail wire replacement, mask the adjacent areas so the epoxy can be extended onto the adjacent grid line as well as the bus bar. Apply a thin layer of epoxy to the area where the terminal or pigtail wire was fastened and onto the adjacent grid line.
6. Apply a thin layer of conductive epoxy to the terminal or bare wire end of the pigtail and place it in the proper location on the bus bar. To prevent the terminal or pigtail wire from moving while the epoxy is curing, it must be wedged or clamped.
7. Carefully remove the masking tape or template.

CAUTION: Do not allow the glass surface to exceed 204° C (400° F) when using a heat gun, or the glass may fracture.

8. Allow the epoxy to cure 24 hours at room temperature, or carefully use a heat gun for 15 minutes. When using a heat gun, hold it approximately 25.4 centimeters (10 inches) from the repair and do not allow the glass surface to exceed 204° C (400° F).
9. After the conductive epoxy is properly cured, remove the wedge or clamp from the terminal or pigtail wire.
10. Connect the wire harness leads to the grid terminals or pigtail wires and verify EBL operation.

SWITCH, DEFOGGER

DESCRIPTION

DESCRIPTION

0812002401

Fig. 3: Rear Window Defogger Switch
Courtesy of CHRYSLER GROUP, LLC

The momentary push-button switch for the rear window defogger (EBL) system can be located in the A/C-heater control in the center of the instrument panel.

0812002402

Fig. 4: Heated Mirror System Switches
Courtesy of CHRYSLER GROUP, LLC

There is an option for the switches to be located within the U-Connect touch screen. An amber indicator will illuminate to indicate when the EBL system is turned on for either switch.

OPERATION

OPERATION

An amber indicator will illuminate when either window defogger switch is activated. When activated, the switch sends a request signal to the Body Control Module (BCM) to energize the internal EBL high side driver to provide battery current to the appropriate window defogger grid lines and to the heated side view mirrors, when equipped.

NOTE: The defrogger system turns off automatically after 10 minutes of initial operation. Each following activation cycle of the defrost system will last 5 minutes.

The defogger/deicer system will automatically turn off after an initial programmed time interval of about 10 minutes as long as the ignition switch is in RUN. After the initial time interval has expired, if the window defogger switch is pressed to ON again during the same ignition cycle, the defogger/deicer system will automatically turn off after about 5 minutes. The defogger/deicer system will also turn off if the ignition switch is turned to any position other than RUN or by manually pressing the window defogger switch a second time.

The window defogger switch is diagnosed using a scan tool. Refer to **DIAGNOSIS AND TESTING** .

The window defogger switch and indicator cannot be adjusted or repaired. The switch bank (hard switch) or the radio (soft switch) must be replaced if diagnostics lead to switch replacement.

Heated Mirrors - Service Information - Cherokee

DESCRIPTION

DESCRIPTION

Fig. 1: Heated Outside Rear View Mirrors & Window Defogger
Courtesy of CHRYSLER GROUP, LLC

Electrically heated outside rear view mirrors (1) are optional on some models. Vehicles with this option can be visually identified by the International Standards Organization (ISO) icon for rear window defogger (2), which appears on the corner of the outside rear view mirror glass.

The heated mirror system operates in concert with the rear window defogger system, also know as the Electric Back Light (EBL). The EBL system is controlled by the rear window defogger switch, located in the A/C heater control or a soft switch locating in the U-Connect touch screen menu. An amber indicator lamp in the control will illuminate to indicate when the heated mirror system is on. Refer to **SWITCH, DEFOGGER, DESCRIPTION** .

The heated mirror system will automatically turn off after a programmed time interval of about ten minutes as long as the ignition is in RUN. After the initial time interval has expired, if the rear window defogger system is turned on again during the same ignition cycle, the heated mirror system will automatically turn off after about five minutes. The heated mirror system will also turn off if the ignition is set to any position other than RUN, or by manually pressing the rear window defogger switch a second time.

Circuit protection is provided by a fuse located in the Power Distribution Center (PDC).

OPERATION

OPERATION

When equipped, the heated mirror system is activated when the rear window defogger (EBL) system is turned on. Refer to **OPERATION** . When the heated mirror system is activated, an electric heater grid located behind the glass of each outside rear view mirror becomes energized and produces heat to help clear the mirror of ice, snow, or fog.

If the outside mirror heating grids are both inoperative, refer to **DIAGNOSIS AND TESTING** .

The heating grid behind each outside mirror glass cannot be repaired and the mirror assembly must be replaced if the heating grid is found inoperative or damaged. Refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** and **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL** .

Heated Seats - Service Information - Cherokee

DESCRIPTION

DESCRIPTION

Vehicles with the optional heated seat system can be visually identified by the two heated seat switches located in the Radio Receiver Module (RRM), in the center of the instrument panel. The heated seat system allows the driver and front seat passenger to select from two different levels of electrical seat heating (HI and LO).

The heated seat system includes the following major components:

- **Heated Seat Switches** - Two heated seat switches are used per vehicle, one for each front heated seat. Both switches are integral to the Radio Receiver Module (RRM). Refer to **SWITCH, HEATED SEAT, DESCRIPTION**.
- **Comfort Seat and Wheel Module** - One Comfort Seat and Wheel Module (CSWM) is used per vehicle. The CSWM is mounted under the driver seat and contains the control logic and software for the front heated seat system. Refer to **MODULE, COMFORT SEAT AND WHEEL, DESCRIPTION** .
- **Heated Seat Elements** - Four heated seat elements are used per vehicle. Two heated seat elements for each seat, one on the seat back cushion and the other on the seat bottom cushion. The heated seat elements are hard-wired to the CSWM. Refer to **PAD, HEATER, DESCRIPTION**.

OPERATION

OPERATION

The Comfort Seat and Wheel Module (CSWM) directly provides power to the seat heating elements in the seat cushions and backs for seat heating. Fused ignition switch output (run) circuits are used, so that the heated seat system will only operate when the ignition switch is in the On position and the engine is running. The module responds to heated seat thermistor sensor feedback from each heating element and ignition switch status inputs by controlling the electrical output to the front seat heating elements. The heated seat system will turn off automatically whenever the ignition switch is turned to any position except On.

Pressing a heated seat switch once will select high-level heating and pressing the same switch a second time will select low-level heating. Pressing the switch a third time will shut the heating elements off. When the switch is pressed, the CSWM energizes an integral solid-state relay, which supplies battery current to the heating elements. If high-level heating is initially selected, the heated seat control system will automatically switch to a lower level temperature after 50 minutes of continuous operation at the desired temperature level. Operation in the low-level setting automatically turns to off after 45 minutes.

The driver seat heat system and passenger seat heat system each consist of a cushion element connected in parallel with a back element. Both systems have a seat cushion with a thermistor sensor that provides feedback to the CWSM. Both systems seat cushion and seat back have a thermostat that will request the heated seat to turn off if the temperature reaches or exceeds 135 °F (+/- 9 ° F). The CSWM will also turn off the heated seat

elements if an open or short in the heating element circuit is detected.

Auto On Feature

The Auto On feature is a customer configurable feature that when enabled will activate the driver heated seat and heated steering wheel on engine start based on ambient temperature. If Auto On feature is enabled, and the ambient temperature is at or below 40° F the CSWM will activate the driver heated seat and heated steering wheel feature at the high level during engine start. This feature also works with Remote Start.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - HEATED SEAT SYSTEM

NOTE: **Vehicles equipped with the heated seat option utilize a voltage cut-off feature. This feature turns off power to the heated seat system anytime vehicle voltage is below 9.0 volts or above 16.0 volts. Be certain to check the vehicle electrical system for proper voltage anytime the heated seat system appears inoperative.**

NOTE: **If a Diagnostic Trouble Code (DTC) can not be verified, it is a good indication that an intermittent fault condition may be present. To help find an intermittent problem, sit in the seat in question and move around the heating elements within the seat while testing continuity. Wiggle the heated seat wire harness and electrical connectors while testing continuity.**
