Supplemental Restraint System (SRS) "AIR BAG" and "SEAT BELT PRE-TENSIONER"

NGEM0081

The Supplemental Restraint System such as "AIR BAG" and "SEAT BELT PRE-TENSIONER", used along with a seat belt, helps to reduce the risk or severity of injury to the driver and front passenger for certain types of collision. The Supplemental Restraint System consists of driver air bag module (located in the center of the steering wheel), front passenger air bag module (located on the instrument panel on passenger side), seat belt pre-tensioners, a diagnosis sensor unit, warning lamp, wiring harness and spiral cable.
Information necessary to service the system safely is included in the **RS section** of this Service Manual.

WARNING:

- **To avoid rendering the SRS inoperative, which could increase the risk of personal injury or death in the event of a collision which would result in air bag inflation, all maintenance should be performed by an authorized NISSAN dealer.**
- **Improper maintenance, including incorrect removal and installation of the SRS, can lead to personal injury caused by unintentional activation of the system. For removal of Spiral Cable and Air Bag Module, see the RS section.**
- **Do not use electrical test equipment on any circuit related to the SRS unless instructed to in this Service Manual. Spiral cable and wiring harnesses (except "SEAT BELT PRE-TENSIONER") covered with yellow insulation either just before the harness connectors or for the complete harness are related to the SRS.**

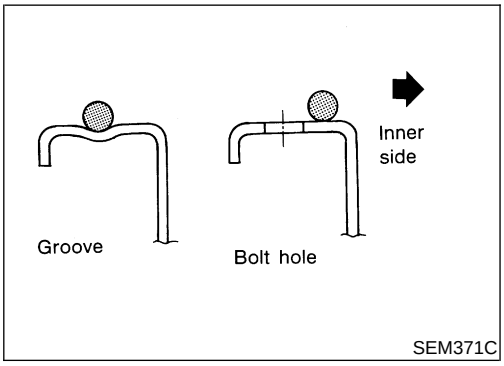
Parts Requiring Angular Tightening

NGEM0001

- Use an angle wrench for the final tightening of the following engine parts:

a) Cylinder head bolts
b) Connecting rod cap nuts

- Do not use a torque value for final tightening.
- The torque value for these parts are for a preliminary step.
- Ensure thread and seat surfaces are clean and coated with engine oil.



Liquid Gasket Application Procedure

NGEM0002

1) Use a scraper to remove all traces of old liquid gasket from mating surfaces and grooves. Also completely clean any oil stains from these portions.
2) Apply a continuous bead of liquid gasket to mating surfaces. (Use Genuine RTV Silicone Sealant Part No. 999MP-A7007 or equivalent.)

- Be sure liquid gasket is 3.5 to 4.5 mm (0.138 to 0.177 in) dia. (for oil pan).
- Be sure liquid gasket is 2.0 to 3.0 mm (0.079 to 0.118 in) dia. (in areas except oil pan).

3) Apply liquid gasket to inner surface around hole perimeter area (unless otherwise specified).
4) Assembly should be done within 5 minutes after coating.
5) Wait at least 30 minutes before refilling engine oil and engine coolant.

Minimum

1,030 (10.5, 149)

Difference limit between cylinders

11. If compression in one or more cylinders is low:

a. Pour a small amount of engine oil into cylinders through spark plug holes.

b. Retest compression.

- **If adding oil improves cylinder compression, piston rings may be worn or damaged. If so, replace piston rings after checking piston.**
- **If pressure stays low, a valve may be sticking or seating improperly. Inspect and repair valve and valve seat. Refer to “VALVE”, EM-56 and “VALVE SEAT”, EM-59. If valve or valve seat is damaged excessively, replace it.**
- **If compression in any two cylinders adjacent cylinders is low, and if adding oil does not improve compression, there is leakage past the gasket surface. If so, replace cylinder head gasket.**

12. Reinstall spark plugs, fuel injector fuse, fuel pump fuse, and reconnect camshaft position sensor harness connector at the distributor.
13. Erase the DTC stored in the ECM.

CAUTION:

Always erase the DTC after checking compression. Refer to “HOW TO ERASE EMISSION-RELATED DIAGNOSTIC INFORMATION”, *EC-79*.

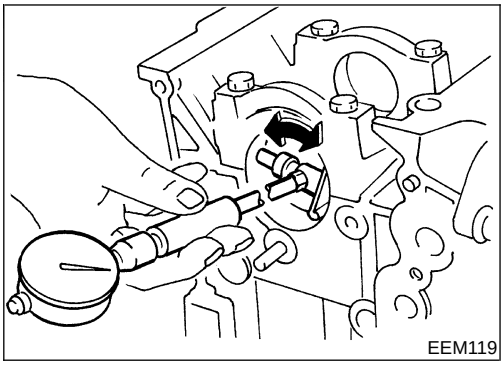
Method A (Using bore gauge and micrometer)

Main bearing

NGEM0067S0801

1. Set main bearings in their proper positions on cylinder block and main bearing cap.



EEM119

2. Install main bearing cap to cylinder block.

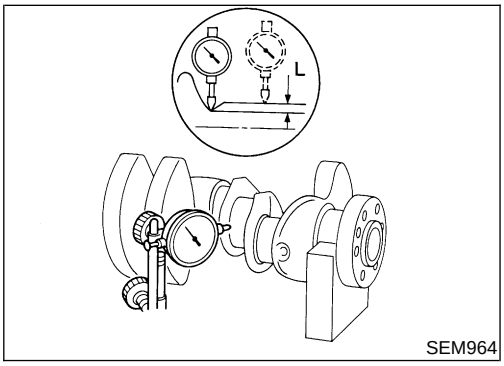
4. Measure outer diameter "Dm" of each crankshaft main journal.
5. Calculate main bearing clearance.
Main bearing clearance = A − Dm

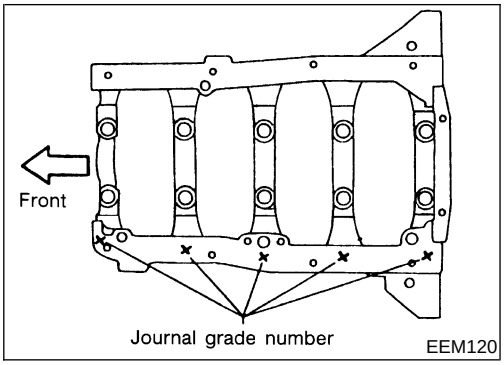
Standard:
0.020 - 0.047 mm (0.0008 - 0.0019 in)
Limit:
0.1 mm (0.004 in)

6. If it exceeds the limit, replace bearing.
7. If clearance cannot be adjusted within the standard of any bearing, grind crankshaft journal and use undersized bearing.



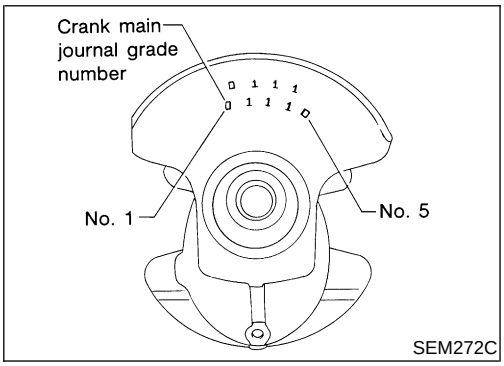
SEM964

a. **When grinding crankshaft journal, confirm that "L" dimension in fillet roll is more than the specified limit.**
"L": 0.1 mm (0.004 in)
b. **Grind crankshaft to use with available service parts. Refer to "Crankshaft", EM-63 and "Available Main Bearing", EM-64.**



8. If crankshaft is reused, measure main bearing clearance and select thickness of main bearing.
   If crankshaft or cylinder block is replaced, select thickness of main bearings as follows:

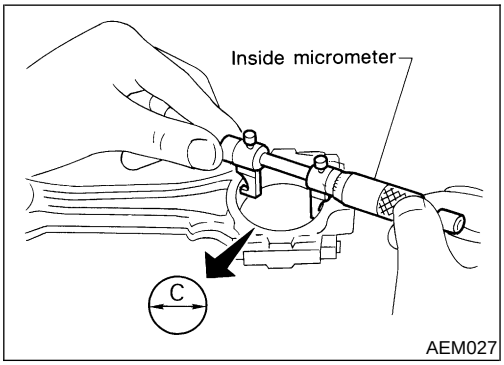
a. Grade number of each cylinder block main journal is punched on the respective cylinder block. These numbers are punched in either Arabic or Roman numerals.



b. Grade number of each crankshaft main journal is punched on crankshaft. These numbers are punched in either Arabic or Roman numerals.

c. Select main bearing with suitable thickness according to the following example or table.
   For example:
   Main journal grade number: 1
   Crankshaft journal grade number: 2
   Main bearing grade number = 1 + 2 = 3 (Yellow)
   Main bearing grade number and identification color:

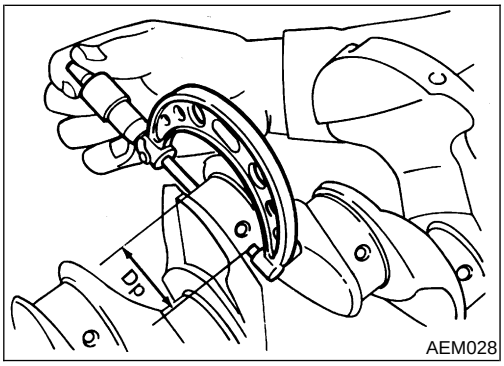
		Main journal grade number		
		0	1	2
Crankshaft journal grade number	0	0 (Black)	1 (Brown)	2 (Green)
	1 or I	1 (Brown)	2 (Green)	3 (Yellow)
	2 or II	2 (Green)	3 (Yellow)	4 (Blue)



Connecting Rod Bearing (Big End)

NGEM0067S0802

1. Install connecting rod bearing to connecting rod and cap.
2. Install connecting rod cap to connecting rod.
- **Tighten bolts to the specified torque.**
3. Measure inner diameter "C" of each bearing.



4. Measure outer diameter "Dp" of each crankshaft pin journal.
5. Calculate connecting rod bearing clearance.

Connecting rod bearing clearance = C − Dp:

Standard

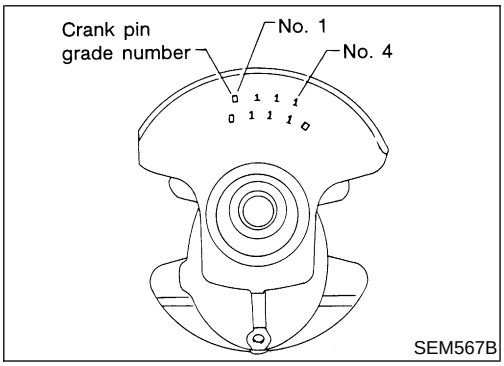
0.010 - 0.035 mm (0.0004 - 0.0014 in)

Limit

0.09 mm (0.0035 in)

6. If it exceeds the limit, replace bearing.
7. If clearance cannot be adjusted within the standard of any bearing, grind crankshaft journal and use undersized bearing.

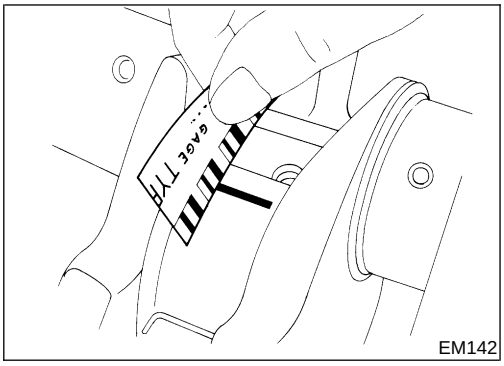
Refer to step 5 of "BEARING CLEARANCE", EM-49.



8. If crankshaft is replaced, select connecting rod bearing according to the following table.

Connecting rod bearing grade number:
These numbers are punched in either Arabic or Roman numerals.

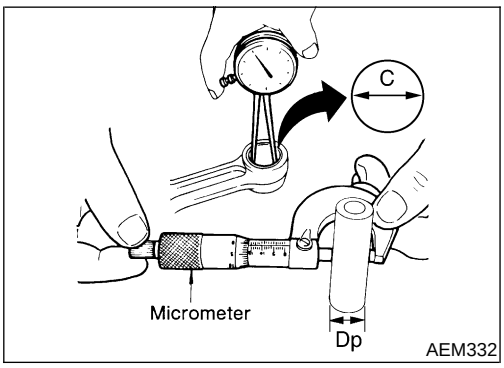
Crank pin grade number	Connecting rod bearing grade number
0	0
1 or I	1
2 or II	2



Method B (Using plastigage)

CAUTION:

- **Do not turn crankshaft or connecting rod while plastigage is being inserted.**
- **When bearing clearance exceeds the specified limit, ensure that the proper bearing has been installed. Then if excessive bearing clearance exists, use a thicker main bearing or undersized bearing so that the specified bearing clearance is obtained.**



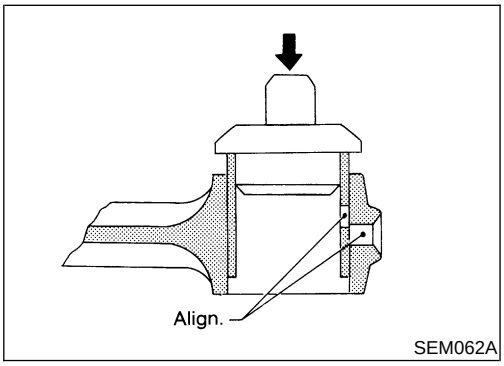
CONNECTING ROD BUSHING CLEARANCE (SMALL END)

NGEM0067S09

1. Measure inner diameter "C" of bushing.
2. Measure outer diameter "Dp" of piston pin.
3. Calculate connecting rod bushing clearance.

C − Dp =
0.005 - 0.017 mm (0.0002 - 0.0007 in) (Standard)
0.023 mm (0.0009 in) (Limit)

If out of specification, replace connecting rod assembly and/or piston set with pin.



REPLACEMENT OF CONNECTING ROD BUSHING (SMALL END)

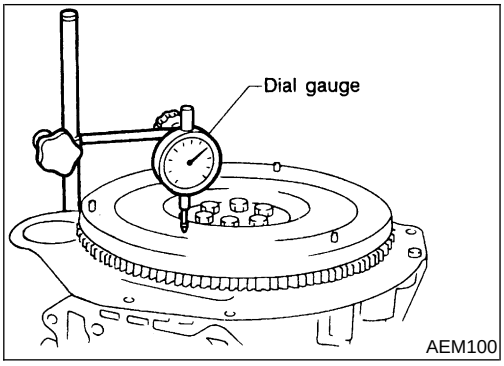
NGEM0067S10

1. Drive in small end bushing until it is flush with end surface of rod.

Be sure to align the oil holes.

2. Ream the bushing until clearance with piston pin is within specification.

Clearance between connecting rod bushing and piston pin:
0.005 - 0.017 mm (0.0002 - 0.0007 in)



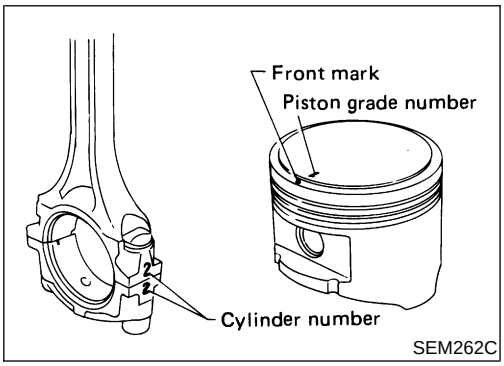
FLYWHEEL RUNOUT

NGEM0067S11

Runout (Total indicator reading):
Flywheel
Less than 0.15 mm (0.006 in)

CAUTION:

- **Be careful not to damage the ring gear teeth.**
- **Do not allow any magnetic materials to contact the ring gear teeth.**
- **Do not resurface the flywheel. Replace as necessary.**



Assembly

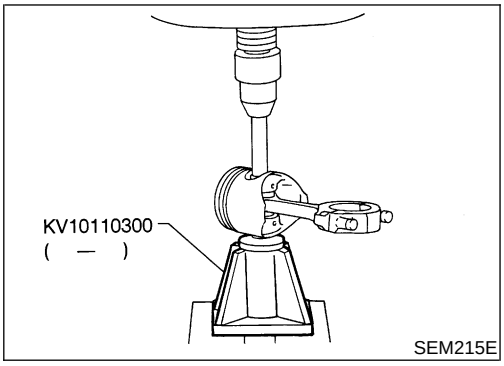
NGEM0068

PISTON

NGEM0068S01

1. Heat piston to 60 to 70°C (140 to 158°F) and assemble piston, piston pin and connecting rod.

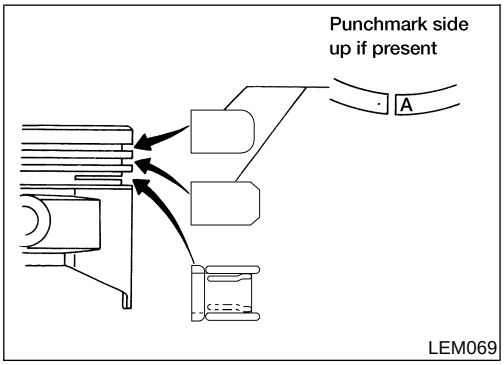
- **Align the direction of piston and connecting rod.**
- **Numbers stamped on connecting rod and cap correspond to each cylinder.**
- **After assembly, make sure connecting rod swings smoothly.**



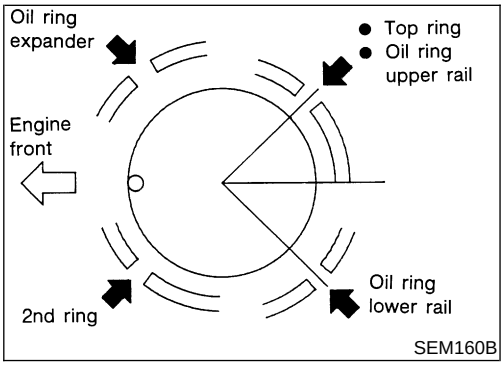
2. Set piston rings as shown.

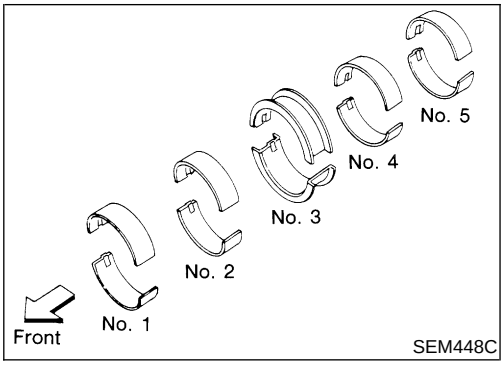
CAUTION:

- **When piston rings are not replaced, make sure that piston rings are mounted in their original positions.**
- **When piston rings are being replaced and no punchmark is present, piston rings can be mounted with either side up.**



3. Align piston rings so that end gaps are positioned as shown.



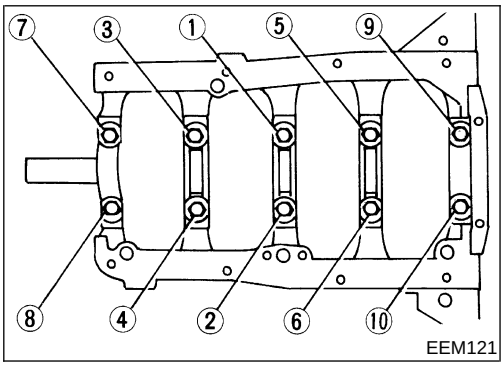


CRANKSHAFT

NGEM0068S02

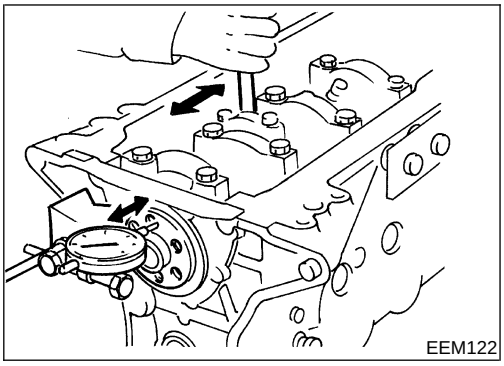
1. Set main bearings in their proper positions on cylinder block and main bearing caps.

- **Confirm that correct main bearings are used. Refer to "Bearing Clearance", EM-49.**
- **Apply new engine oil to bearing surfaces.**



2. Install crankshaft and main bearing caps and tighten bolts to the specified torque. Refer to "Components", EM-44.

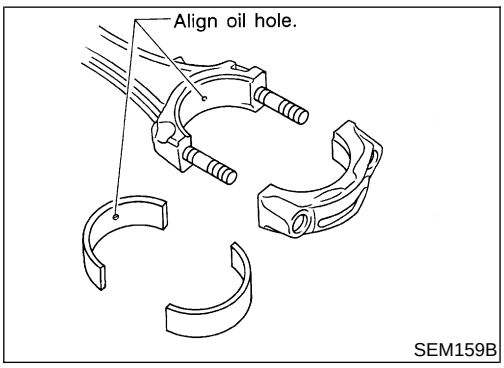
- **Apply new engine oil to the bolt threads and seat surface.**
- **Prior to tightening bearing cap bolts, place bearing cap in its proper position by shifting crankshaft in the axial direction.**
- **Tighten bearing cap bolts gradually in two or three stages. Start with center bearing and move outward as shown in figure.**
- **After securing bearing cap bolts, make sure crankshaft turns smoothly by hand.**



3. Measure crankshaft end play.

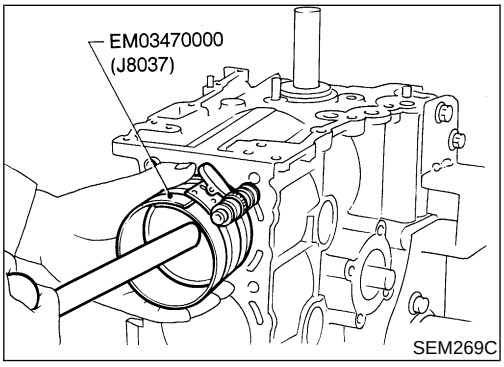
Crankshaft end play:
Standard
0.05 - 0.18 mm (0.0020 - 0.0071 in)
Limit
0.3 mm (0.012 in)

If beyond the limit, replace No. 3 bearing with a new one.



4. Install connecting rod bearings in connecting rods and connecting rod caps.

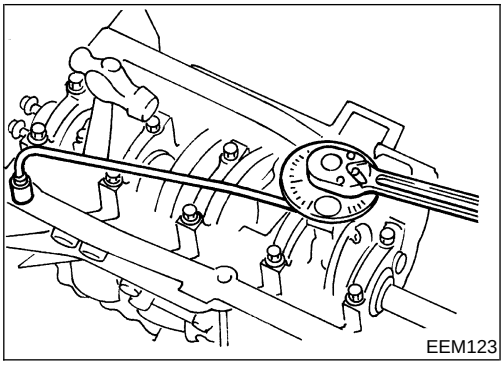
- **Confirm that correct bearings are used.**
  Refer to "Connecting Rod Bearing (Big End)", EM-50.
- **Install bearings so that oil hole in connecting rod aligns with oil hole of bearing.**
- **Apply new engine oil to bearing surfaces, bolt threads and seating surfaces.**



5. Install pistons with connecting rods.

a. Install them into corresponding cylinders with Tool.

- **Arrange so that front mark on piston head faces toward front of engine.**
- **Make sure connecting rod does not scratch cylinder wall.**
- **Make sure connecting rod bolts do not scratch crankshaft journals.**
- **Apply new engine oil to piston rings and sliding surface of piston.**



EEM123

b. Install connecting rod bearing caps.
Tighten connecting rod bearing cap nuts using the following procedure.

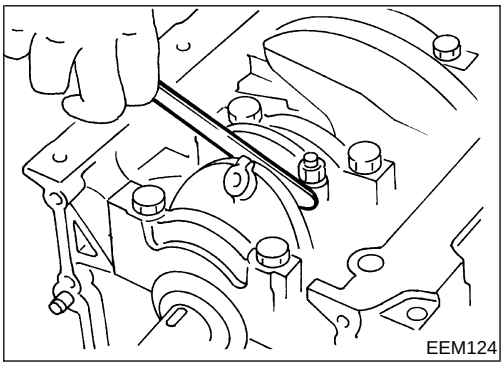
Connecting rod bearing nut:

(1) Tighten to 14 - 16 N·m

(1.4 - 1.6 kg-m, 10 - 12 ft-lb).

(2) Tighten bolts $60^{+5}/_{-0}$ degrees clockwise with an angle wrench.

If an angle wrench is not available, tighten them to 38 - 44 N·m (3.9 - 4.5 kg-m, 28 - 33 ft-lb).



EEM124

6. Measure connecting rod side clearance.

Connecting rod side clearance:

Standard

MEASUREMENT OF COMPRESSION PRESSURE

1. Warm up engine.
2. Turn ignition switch OFF.
3. Release fuel pressure.
   Refer to ***EC-637***, “Releasing Fuel Pressure”.
4. Remove all spark plugs.

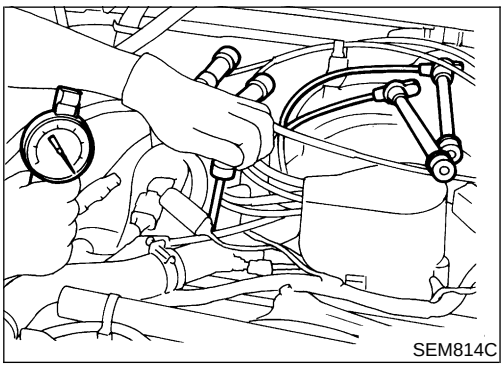
- **Clean area around plug with compressed air before removing the spark plugs.**

5. Disconnect camshaft position sensor harness connector at the distributor.
6. Remove fuel injector fuse **3** on FUSE BLOCK (J/B) behind the instrument lower panel. Refer to “FUSE BLOCK — JUNCTION BOX (J/B)”.

20 mm (0.79 in) dia.

Use compressor tester whose end (rubber portion) is less than 20 mm (0.79 in) dia. Otherwise, it may be caught by cylinder head during removal.

SEM387C



SEM814C

7. Attach a compression tester to No. 1 cylinder.
8. Depress accelerator pedal fully to keep throttle valve wide open.
9. Crank engine and record highest gauge indication.
10. Repeat the measurement on each cylinder as shown above.

- **Always use a fully-charged battery to obtain specified engine speed.**

Compression pressure: kPa (kg/cm^2, psi)/300 rpm

Standard

1,196 (12.2, 173)

Minimum

883 (9.0, 128)

Difference limit between cylinders

98 (1.0, 14)

11. If cylinder compression in one or more cylinders is low, pour a small amount of engine oil into cylinders through spark plug holes and retest compression.

- **If adding oil improves cylinder compression, piston rings may be worn or damaged. If so, replace piston rings after checking piston.**
- **If pressure stays low, a valve may be sticking or seating improperly. Inspect and repair valve and valve seat. Refer to “Valve Seat”, EM-117. If valve or valve seat is damaged excessively, replace them.**
- **If compression in any two adjacent cylinders is low and if adding oil does not improve compression, there is leakage past the gasket surface. If so, replace cylinder head gasket.**

12. Reinstall spark plugs, fuel injector fuse, fuel pump fuse, and reconnect camshaft position sensor harness connector at the distributor.
13. Erase the DTC stored in the ECM.

CAUTION:
Always erase the DTC after checking compression.
Refer to *EC-666*, "HOW TO ERASE EMISSION-RELATED DIAGNOSTIC INFORMATION".

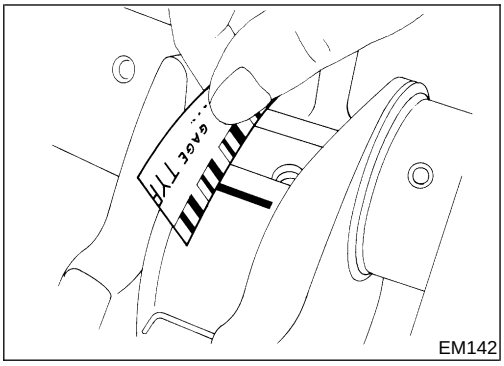
5. Calculate connecting rod bearing clearance.

Connecting rod bearing clearance (C − Dp):
Standard
0.024 - 0.064 mm (0.0009 - 0.0025 in)
Limit
0.090 mm (0.0035 in)

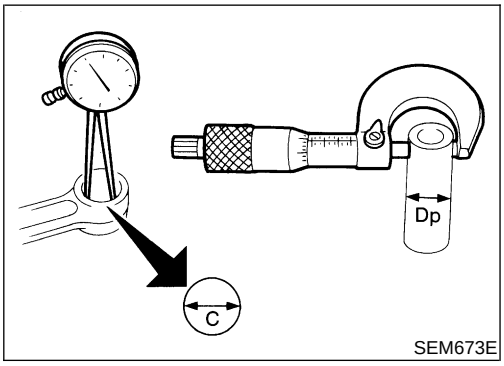
6. If it exceeds the limit, replace bearing.
7. If clearance cannot be adjusted within the standard of any bearing, grind crankshaft journal and use undersized bearing. Refer to step 7 of "Available Main Bearing", EM-123.



Method B (Using plastigage)

CAUTION:

- **Do not turn crankshaft or connecting rod while plastigage is being inserted.**
- **When bearing clearance exceeds the specified limit, ensure that the proper bearing has been installed. Then if excessive bearing clearance exists, use a thicker main bearing or undersized bearing so that the specified bearing clearance is obtained.**



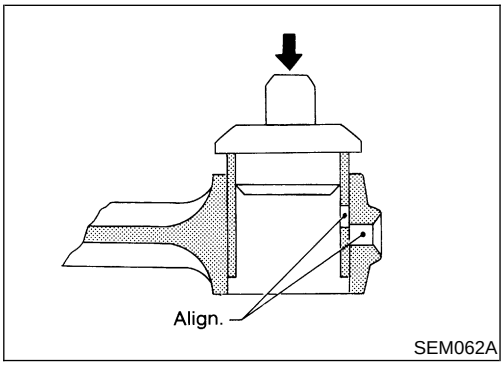
CONNECTING ROD BUSHING CLEARANCE (SMALL END)

NGEM0024S09

1. Measure inner diameter "C" of bushing.
2. Measure outer diameter "Dp" of piston pin.
3. Calculate connecting rod bushing clearance.

Connecting rod bushing clearance = C − Dp
Standard: 0.005 - 0.017 mm (0.0002 - 0.0007 in)
Limit: 0.023 mm (0.0009 in)

If it exceeds the limit, replace connecting rod assembly or connecting rod bushing and/or piston set with pin.



REPLACEMENT OF CONNECTING ROD BUSHING (SMALL END)

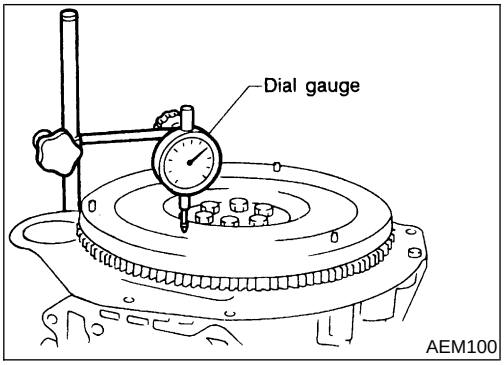
NGEM0024S10

1. Drive in small end bushing until it is flush with end surface of rod.

Be sure to align the oil holes.

2. After driving in small end bushing, ream the bushing so that clearance between connecting rod bushing and piston pin is the specified value.

Clearance between connecting rod bushing and piston pin:
0.005 - 0.017 mm (0.0002 - 0.0007 in)



FLYWHEEL/DRIVE PLATE RUNOUT

NGEM0024S11

Runout (Total indicator reading):

Flywheel (M/T model)

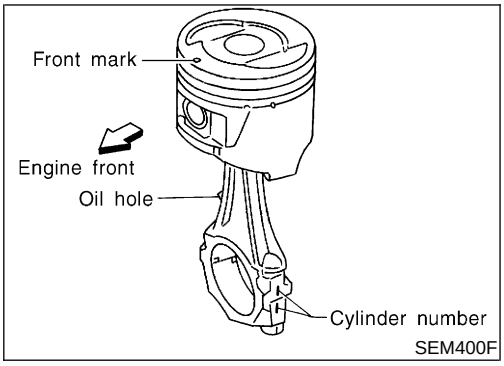
Less than 0.15 mm (0.0059 in)

Drive plate (A/T model)

Less than 0.15 mm (0.0059 in)

CAUTION:

- **Be careful not to damage the ring gear teeth.**
- **Check the drive plate for deformation or cracks.**
- **Do not allow any magnetic materials to contact the ring gear teeth.**
- **Do not surface flywheel or drive plate. Replace as necessary.**



Assembly

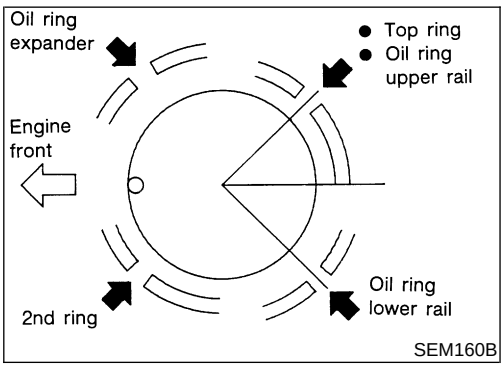
NGEM0025

PISTON

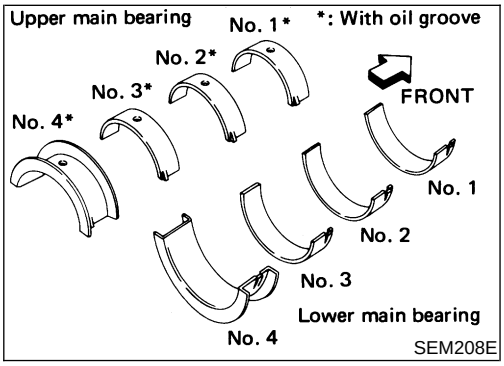
NGEM0025S01

1. Install new snap ring on one side of piston pin hole.
2. Heat piston to 60 to 70°C (140 to 158°F) and assemble piston, piston pin, connecting rod and new snap ring.

- **Align the direction of piston and connecting rod.**
- **Numbers stamped on connecting rod and cap correspond to each cylinder.**
- **After assembly, make sure connecting rod swings smoothly.**



3. Set piston rings as shown.



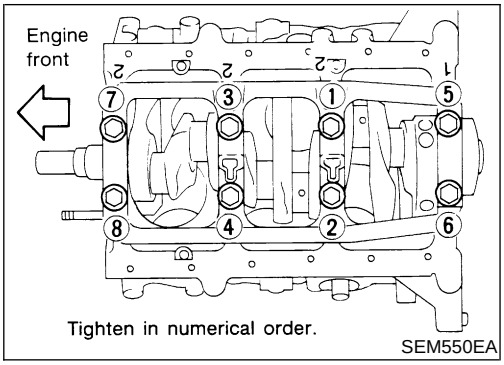
CRANKSHAFT

NGEM0025S02

1. Set main bearings in their proper positions on cylinder block and main bearing cap.

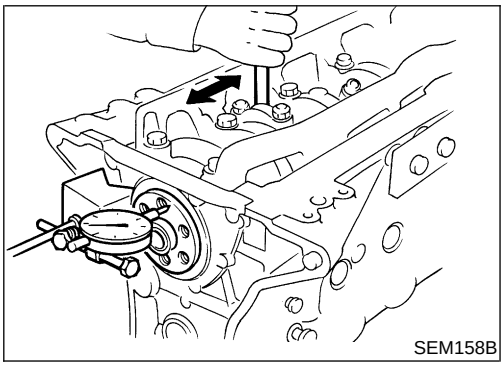
- **Confirm that correct main bearings are used.**
- **Apply new engine oil to bearing surfaces.**

Refer to "BEARING CLEARANCE", EM-108.



2. Install crankshaft and main bearing caps and tighten bolts to the specified torque.

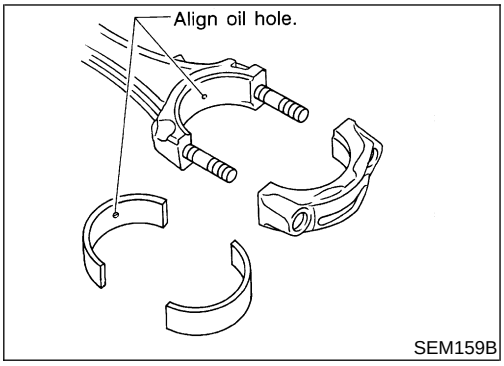
- **Prior to tightening bearing cap bolts, place bearing cap in its proper position by shifting crankshaft in the axial direction.**
- **Tighten bearing cap bolts gradually in two or three stages. Start with center bearing and move outward sequentially.**
- **After securing bearing cap bolts, make sure crankshaft turns smoothly by hand.**
- **Lubricate threads and seat surfaces of the bolts with new engine oil.**



3. Measure crankshaft end play.

Crankshaft end play:
Standard
0.050 - 0.170 mm (0.0020 - 0.0067 in)
Limit
0.30 mm (0.0118 in)

If beyond the limit, replace bearing with a new one.

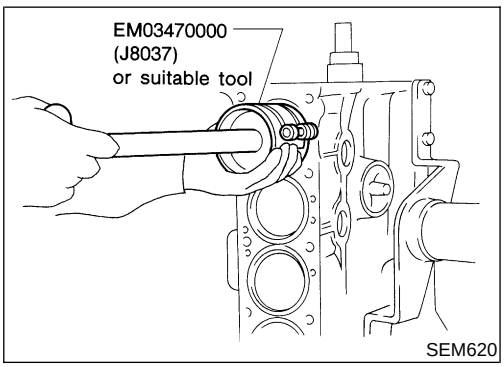


4. Install connecting rod bearings in connecting rods and connecting rod caps.

- **Confirm that correct bearings are used.**

Refer to "Connecting Rod Bearing (Big End)", EM-109.

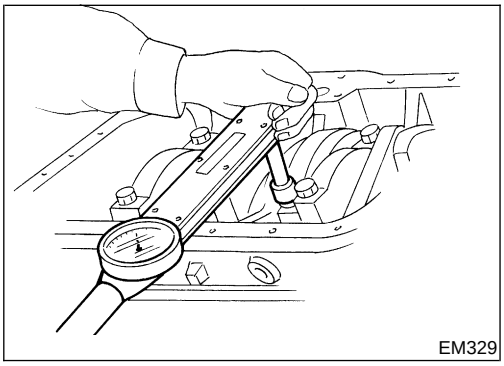
- Install bearings so that oil hole in connecting rod aligns with oil hole of bearing.



5. Install pistons with connecting rods.

a. Install them into corresponding cylinders with Tool.

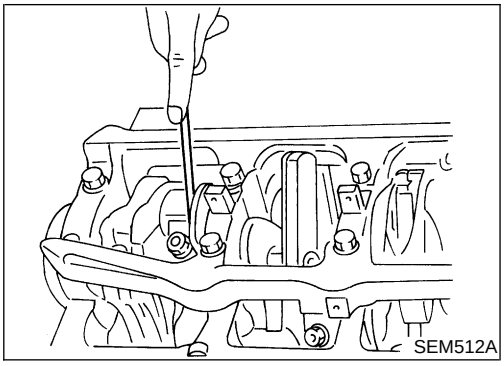
- **Be careful not to scratch cylinder wall by connecting rod.**
- **Arrange so that front mark on piston head faces toward front of engine.**



b. Install connecting rod bearing caps.

- **Lubricate threads and seat surfaces with new engine oil.** Tighten connecting rod bearing cap nuts to the specified torque.

: Connecting rod bearing nut
(1) Tighten to 14 to 16 N·m (1.4 to 1.6 kg-m, 10 to 12 ft-lb).
(2) Turn nuts 60 to 65 degrees clockwise. If an angle wrench is not available, tighten nuts to 38 to 44 N·m (3.9 to 4.5 kg-m, 28 to 33 ft-lb).



SEM512A

6. Measure connecting rod side clearance.

Connecting rod side clearance:

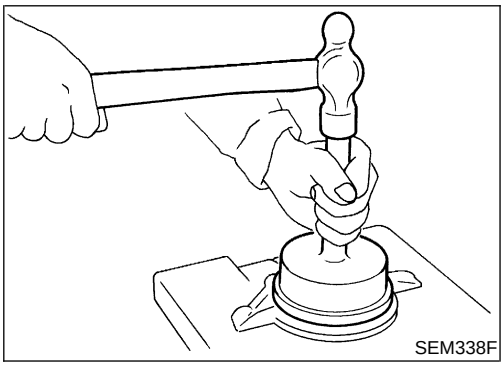
Standard

0.20 - 0.35 mm (0.0079 - 0.0138 in)

Limit

0.40 mm (0.0157 in)

If beyond the limit, replace connecting rod and/or crankshaft.

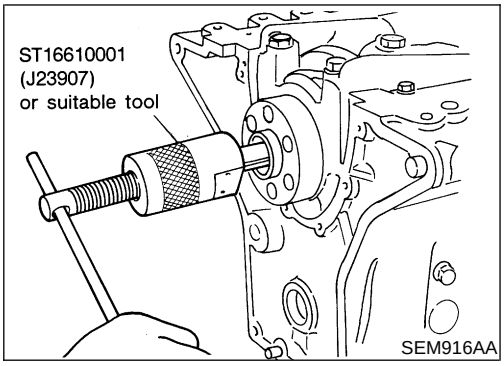


SEM338F

7. Install rear oil seal retainer.

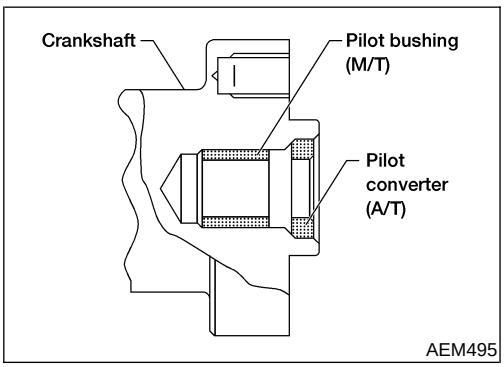
REPLACING PILOT BUSHING (M/T) OR PILOT CONVERTER (A/T)

NGEM0025S03



SEM916AA

1. Remove pilot bushing (M/T) or pilot converter (A/T).



AEM495

2. Install pilot bushing (M/T) or pilot converter (A/T).
