CAUTION: VEHICLE SERVICING PERFORMED BY UNTRAINED PERSONS COULD RESULT IN SERIOUS INJURY TO THOSE PERSONS OR TO OTHERS.

Subaru Service Bulletins are intended for use by professional technicians ONLY. They are written to inform those technicians of conditions that may occur in some vehicles, or to provide information that could assist in the proper servicing of the vehicle. Properly trained technicians have the equipment, tools, safety instructions, and know-how to do the job correctly and safely. If a condition is described, DO NOT assume that this Service Bulletin applies to your vehicle, or that your vehicle will have that condition.

A: REPLACEMENT

1. REPLACEMENT OF COOLANT

WARNING:

The radiator is of the pressurized type. Do not attempt to open the radiator cap immediately after the engine has been stopped.

- 1) Lift up the vehicle.
- 2) Remove undercover.
- 3) Fit vinyl tube to drain pipe.

- 4) Place a container under vinyl tube.
- 5) Loosen drain cock to drain engine coolant into container.
- 6) For quick draining, open radiator cap.

CAUTION:

Be careful not to spill coolant on the floor.

- 7) Drain coolant from reservoir tank.
- 8) Tighten radiator drain plug securely after draining coolant. (Drain tube may face downward.)

- 9) Fill engine coolant into radiator up to filler neck position.
- 10) Fill engine coolant into reservoir tank up to "FULL" level.

Coolant capacity (fill up to "FULL" level)
Approx. 6.0 ℓ (6.3 US qt, 5.3 Imp qt)

CAUTION: The SUBARU Genuine Coolant containing anti-freeze and anti-rust agents is especially made for SUBARU engines, which has an aluminum crankcase. Always use SUBARU Genuine Coolant, since other coolants may cause corrosion. To prevent cooling system leaks, always add Genuine Subaru Cooling System Conditioner (Part No. SOA635071) whenever the coolant is replaced.

- 11) Securely install radiator cap and reservoir tank cap.
- 12) Run engine for more than five minutes at 2,000 to 3,000 rpm. (Run engine until radiator becomes hot in order to purge air trapped in cooling system.)
- 13) Stop engine and wait until coolant temperature lowers. Then open radiator cap to check

6) Similar to adjustment procedures used for #1 cylinder, adjust #2, #3 and #4 cylinder valve clearances.

NOTE:

Be sure to set cylinder pistons to their respective top dead centers on the compression stroke before adjusting valve clearances.

To set #3, #2 and #4 cylinder pistons to their top dead centers on the compression stroke, turn crankshaft pulley clockwise 90° at a time starting with arrow mark on left-hand camshaft sprocket facing up.

8. Engine Coolant

A: DRAINING OF ENGINE COOLANT

- 1) Lift-up the vehicle.
- 2) Remove under cover.
- 3) Fit vinyl tube to drain pipe.

- 4) Loosen drain cock to drain engine coolant into container.

NOTE:

Remove radiator cap so that engine coolant will drain faster.

B: FILLING OF ENGINE COOLANT

- 1) Fill engine coolant into radiator up to filler neck position.

CAUTION: The Subaru Genuine Coolant containing anti-freeze and anti-rust agents is especially made for SUBARU engines, which have an aluminum crankcase. Always use SUBARU Genuine Coolant, since other coolant may cause corrosion. To prevent cooling system leaks, always add Genuine Subaru Cooling System Conditioner (Part No. SOA635071) whenever the coolant is replaced.

- 2) Fill engine coolant into reservoir tank up to upper level.

- 3) Attach radiator cap and reservoir tank cap properly.
- 4) Install air vent plug.
- 5) Warm-up engine completely for more than five minutes at 2,000 to 3,000 rpm.
- 6) Stop engine and wait until temperature drops to a safe level.
- 7) If engine coolant level drops in radiator, add engine coolant to filler neck position.
- 8) If engine coolant level drops from upper level of reservoir tank, add engine coolant to upper level.
- 9) Attach radiator cap and reservoir tank cap properly.

B: INSPECTION

1. RELATIONSHIP OF SUBARU COOLANT CONCENTRATION AND FREEZING TEMPERATURE

The concentration and safe operating temperature of the SUBARU coolant is shown in the diagram. Measuring the temperature and specific gravity of the coolant will provide this information.

[Example]

If the coolant temperature is 25°C (77°F) and its specific gravity is 1.054, the concentration is 35% (point A), the safe operating temperature is -14°C (7°F) (point B), and the freezing temperature is -20°C (-4°F) (point C).

2. FILLING OF ENGINE COOLANT

- 1) Fill engine coolant into radiator up to filler neck position.

Coolant capacity (fill up to "FULL" level):

AT model

Approx. 6.4ℓ (6.8 US qt, 5.6 Imp qt)

MT model

Approx. 6.3ℓ (6.7 US qt, 5.5 Imp qt)

CAUTION: The SUBARU Genuine Coolant containing antifreeze and anti-rust agents is especially made for SUBARU engine, which has an aluminum crankcase. Always use SUBARU Genuine Coolant, since other coolant may cause corrosion.

NOTE: To prevent cooling system leaks, always add Genuine Subaru Cooling System Conditioner (P/N SOA635071) whenever the coolant is replaced.

- 2) Fill engine coolant into reservoir tank up to upper level.

2. PROCEDURE TO ADJUST THE CONCENTRATION OF THE COOLANT

To adjust the concentration of the coolant according to temperature, find the proper fluid concentration in the above diagram and replace the necessary amount of coolant with an undiluted solution of SUBARU genuine coolant (concentration 50%).

The amount of coolant that should be replaced can be determined using the diagram.

[Example]

Assume that the coolant concentration must be increased from 25% to 40%. Find point A, where the 25% line of coolant concentration intersects with the 40% curve of the necessary coolant concentration, and read the scale on the vertical axis of the graph at height A. The quantity of coolant to be drained is 2.1 liters (2.2 US qt, 1.8 Imp qt). Drain 2.1 liters (2.2 US qt, 1.8 Imp qt) of coolant from the cooling system and add 2.1 liters (2.2 US qt, 1.8 Imp qt) of the undiluted solution of SUBARU coolant.

If a coolant concentration of 50% is needed, drain all the coolant and refill with the undiluted solution only.
